Bulletin
OF
STATE BOARD OF EQUALIZATION

Proceedings of Twelfth and Thirteenth Annual Conventions

of

COUNTY ASSESSORS' ASSOCIATION OF CALIFORNIA

Including Papers read on Tax Law and Administration

WHEREAS, Since our last convention our associate member, Honorable Alfred Bourne Nye, State Controller, has departed this life.

WHEREAS, We wish to testify to the true worth of the deceased: His make-up was that of the true gentleman, a firm believer in all that was correct in the social walks of life and in the administration of the many public duties which were cast upon him by the civil laws; a man beloved by all who were fortunate in his acquaintance and by all who were thrown in contact with him in social and business life.

We mourn the death of Mr. Nye. California has lost an able official, and this association, and the people generally, have lost a tried and true friend; therefore,

Resolved, That these resolutions be spread upon the minutes of this association and a copy be furnished the widow of the deceased.

ALEXANDER BROWN,
ED. J. KAY,
T. M. EBY,
Committee.

PROCEEDINGS OF THE COUNTY ASSESSORS' ASSOCIATION OF CALIFORNIA, IN TWELFTH ANNUAL CONVENTION.

Held at Jackson. Amador County, November, 1913.

Geo. P. Cummings, *President*, Fresno. Thos. M. Robinson, *Secretary*, Deputy Alameda County.

The Twelfth Annual Convention of the County Assessors' Association of California, was held in the city of Jackson, Tuesday, November 4, 5, 6 and 7, 1913.

At 10 o'clock a. m., Tuesday, November 4, 1913, the association convened in St. Rocco Theatre, Jackson, Amador County.

President Geo. P. Cummings called upon Clarence E. Jarvis, who after a few remarks, introduced Hon. W. J. McGee, Assistant Treasurer of the United States, who welcomed the assessors and members of the association to Jackson.

Response by Geo. P. Cummings, President.

ROLL CALL.

On roll call, the following answered to their names:

Clarence E. Jarvis and wife, Amador County; W. M. Nuner and wife, Calaveras County; Geo. O. Meese and wife, Contra Costa County; Geo. Reiber and wife, El Dorado County; Geo. P. Cummings, Fresno County; W. M. Weaver, Imperial County; Geo. W. Murray, Kings County; Ed. W. Hopkins, Los Angeles County; P. H. Cochrane, Marin County; F. A. Bondshu, Mariposa County; Robert Corlett and wife, Napa County; James Sleeper, Orange County; Ed. J. Kay, Sacramento County; M. M. Moulton, San Diego County; John Ginty, San Francisco County; Wm. A. Horton and wife, Santa Cruz County; M. D. Lack and wife, Shasta County; Ed. E. Long and wife, Solano County; Geo. A. Threlfall and wife, Stanislaus County; C. E. McQuaid, Sutter County.

Chief Deputies and Deputies.

Geo. A. Gordon, Amador County; J. C. Hanna, Contra Costa County; N. S. Dabert, Contra Costa County; Thos. M. Robinson, Alameda County; B. F. Hillhouse, Yolo County.

State Board of Equalization.

Edw. Rolkin, John Mitchell, R. E. Collins and wife, Thos. M. Eby, Secretary; John S. Chambers, State Controller.

Honorary Members.

H. J. Squires, City Assessor of Berkeley; A. O. Adams, Tax Agent; W. V. Hill, Tax Agent; Frank Mattison, Tax Agent; Wm. H. Kline, Tax Agent; E. B. Davis and wife, Tax Agent; Alex. Brown, Manager, Anti-single Tax Association; Geo. E. Mitchell, Tax Agent; E. A. DeCamp, Tax Agent.

On motion, State Controller John S. Chambers, Assistant United States Treasurer W. J. McGee and Dr. W. G. Eggleston, member Home Rule in Taxation, were made honorary members.

MINUTES.

As the regular minutes of the Eleventh Annual Convention of the Assessors' Association were printed in the report of the State Board of Equalization, the reading of same was dispensed with.

Communications and telegrams were received, read and filed as follows:

From A. L. Cowell, Field Secretary for Panama-Pacific International Exposition, inviting the association to meet in the city of San Francisco during the Fair year, 1915.

From E. R. Alvord, Mayor of Merced, L. G. Wordin, President Chamber of Commerce, and C. E. Kocher, President Merchants' Exchange, inviting the association to meet in the city of Merced in 1914, also three telegrams to the same effect.

The following named sent letters of regret for not being able to attend this session of the convention: A. E. Parish, Assessor Kings County, Washington; Alfred Sutro; T. E. Bevan, Assessor of Yuba County; J. H. Hollister, Assessor San Luis Obispo County; D. E. Mulkey, Assessor Modoc County; C. F. Horner, Assessor Alameda County; T. C. Cogan, honorary member; N. W. Thompson, member Senate; H. L. Foster, honorary member; B. B. Gregory, honorary member; J. Fred Traggarth, honorary member; C. F. Bonner, Assessor Madera County; A. E. Morton, Assessor Butte County; F. A. Waters, honorary member; Chas. E. Jewett, honorary member; Jno. W. Moore, Assessor San Joaquin County; Edw. Haynes, honorary member and City Assessor of Sacramento; John A. Britton, honorary member; W. H. Gibson, Assessor Mendocino County; F. P. Meserve, Assessor San Bernardino County; W. F. Montague, Assessor Riverside County; H. E. Harrison, Assessor Yolo County; Alex. McCabe, Secretary to Governor H. W. Johnson, for the Governor; Fred H. Merritt, Assessor Lake County; C. D. Hayward, Assessor San Mateo County.

RAILROAD FARE.

Letters from Southern Pacific and Atchison, Topeka and Santa Fe railroad companies granting one and one third rates if fifty or more are in attendance at the convention, read.

The president called upon John S. Chambers, State Controller, for a few remarks. Mr. Chambers responded and thanked the convention for the honor of being made a member of the association.

On motion of Alex. Brown, it was duly seconded and carried, that when this convention adjourn, that it do so out of respect for A. B. Nye, State Controller, deceased, who was a valuable member of this association and that a committee of three be appointed by the Chair to prepare and present to this association before adjournment suitable resolutions of respect on his death.

Thereupon the Chair named as such committee, Alex. Brown, T. M. Eby and Ed J. Kay.

The following motion was presented by Mr. John Ginty, Assessor of San Francisco, which was discussed at some length by Assessors Jarvis, Bondshu, Corlett and Cummings.

Resolved, That a committee be appointed to investigate the law and see if it is necessary to amend the constitution of the state so that in case of any legislation or constitutional law be adopted that would reduce the compensation of the assessor during his elective term of office by

abolishing of commissions heretofore received by the assessor; and if a constitutional amendment is necessary, then to prepare an initiative amendment to the constitution of the state to meet the situation, and that a copy of such be sent to each assessor so that proper signatures could be secured to place the amendment on the ballot at the next election.

Thereupon the Chair appointed a committee to draft such an amendment—Ginty, Bondshu, Weaver and Eby.

Mr. Jarvis called the attention of the convention to the contemplated auto trip to Electra to view the great dam and electric engineering works, where a lunch would be served, and that on return the deep mines would be visited.

On motion, a recess was taken until 2 p. m.

Mr. John Mitchell was called upon and read a paper on National Tax Association. After conclusion of reading his paper, Mr. Mitchell was asked many questions regarding it, which, in answering gave much added information on the subject. (This paper, as well as all others presented to the convention, appears elsewhere in this bulletin.)

Mr. John Ginty read a communication regarding the meeting of the National Tax Association as to their contemplated meeting during the year 1915 in California, which would possibly be held in San Francisco and on the grounds of the exposition, where a large building is in course of construction for the purpose of holding conventions.

Dr. W. G. Eggleston presented and read a paper on "Home Rule in Taxation." Many questions were propounded and answered which gave much light on the subject.

Announcement was made that the Women's Improvement Club of Jackson will entertain all visiting ladies in their hall and same will be open at all times to the ladies as a rest room during their sojourn in Jackson.

The Women's Improvement Club held a reception to the visiting ladies at Masonic Hall; an elaborate program had been arranged for the occasion; the hall was beautifully and artistically decorated for the occasion.

A recess was taken until Wednesday morning, November 5, 1913, at 10 a. m.

Monday night, after the arrival of the assessors, a public reception was given in the St. Rocco dance hall, during which punch was served by members of the Women's Improvement Club and a short but pleasing program rendered. The decoration was most elaborate. The walls were completely covered with ferns; trees rose from the floor at pleasing intervals and the lights were hung with green boughs. The rustic benches tastefully arranged gave the place the appearance of a veritable park. The program follows:

Selection by orchestra.

Address by Clarence E. Jarvis, Assessor of Amador County.

Address by G. P. Cummings, Assessor of Fresno County, President of the association.

Selections by the orchestra.

Vocal solo, Hoit Vicini.

Violin solo, Billie Fendicott.

Vocal solo, Mrs. E. Thompson.

Vocal solo, M. J. O'Connor.

Selection by orchestra.

Wednesday, November 5, 1913.

The convention was called to order at 10 a. m., President Geo. P. Cummings in the chair.

Members coming in after roll call yesterday were marked present.

The president called the attention of the members to the invitation to take an auto trip to Electra November 6th, as extensive preparations had been made for the entertainment; lunch would be served, compliments of the Pacific Gas and Electric Company, and returning, a visit will be made to the various great gold mines of this district.

Prof. Carl C. Plehn was presented and read a paper, subject "Currency Bill." This paper proved to be very instructive as well as interesting.

Assessor Clarence E. Jarvis presented and read a paper, subject, "State Automobile Tax," as set forth in bill adopted at the last session of the state legislature. Following the reading, the subject was discussed at some length.

It was announced that the ladies would be entertained by the Women's Improvement Club of Sutter Creek from 2 to 5 o'clock this afternoon:

That at 6:10 o'clock this afternoon, Mr. Rolkin will tender a banquet to the members of the association and their guests:

That all are invited to attend the Pioneer dance as announced on the program.

Recess taken until 2 p. m.

The convention was called to order at 2 p. m. and regular order of business resumed.

Mr. Alex. Brown, manager of the California State Tax Association, presented and read a paper, subject, "Tax Associations." This paper was discussed by several members of the association.

On motion of Assessor Ed W. Hopkins of Los Angeles County, duly seconded and carried, that this association endorse this formation of tax associations throughout the State of California.

Assessor F. A. Bondshu of Mariposa County presented and read a paper, subject, "Public Opinion of Assessments." This paper was greatly appreciated and discussed.

The committee heretofore appointed to draft suitable resolutions on the death of Controller A. B. Nye, reported, and the resolution was read and unanimously adopted by a standing vote.

Geo. E. Mitchell presented and read a paper, subject, "Income Tax." This paper was very interesting and gave much needed information on the subject.

REPORTS OF COMMITTEES.

The Legislative Committee reported verbally that all members keep fully informed as to all bills effecting changes in the state revenue laws proposed at the last meeting of the state legislature; that copies of all bills introduced were mailed to each assessor; that the committee behind it had done some efficient work and was constantly in attendance in the legislature; that the committee had incurred an expense of \$105.20 and recommended that an assessment be levied upon each assessor to meet this expense.

On motion of Ed J. Kay, chairman of Ways and Means Committee, that an assessment of \$2.00 be levied on each assessor to meet this expense—motion duly seconded and carried.

The Committee on Program and Order of Business reported that the program had been printed and distributed to each member of the association.

Assessor Geo. W. Murray, Treasurer, filed his report as follows:

Treasurer's Report of County Assessors' Association of California for Year Ending November 4, 1913.

Receipts.

Balance on hand Dec. 10, 1912-----	\$62 23
Received from assessments during year-----	215 00
	<hr/>
Total on hand and received-----	\$277 23

Disbursements.

Dec. 13, 1912, C. E. Jarvis, printing, envelopes and stamps-----	\$10 50
Apr. 1, 1913, Frank Mattison, on account for services as legislative agent -----	200 00
	<hr/>
Total disbursements -----	\$210 50

Summary.

Total receipts -----	\$277 23
Total disbursements -----	210 50
	<hr/>
Balance on hand November 4, 1913-----	\$66 73

GEO. W. MURRAY, Treasurer.

Deputy Assessor Chas. O. King of Santa Clara presented and read a paper, subject, "The Elimination of Fraudulent Land Subdivisions."

President Geo. P. Cummings at this time thanked the association for the honor conferred upon him as president of the association for the term just about to close.

He also, in behalf of the association, thanked those who had presented papers for instruction and entertainment of the association.

Also, he extended thanks to all those who had in any way made their meeting a success, by entertainment or otherwise.

ELECTION OF OFFICERS.

The following officers were nominated and elected for the ensuing term:

President, Assessor Ed W. Hopkins of Los Angeles County; vice-president, Assessor E. E. Long of Solano County; secretary, Assistant Assessor Thos. M. Robinson of Alameda County; treasurer, Assessor Geo. W. Murray of Kings County.

PLACE OF MEETING.

Thirteenth Annual Convention Assessors' Association, State of California.

The city of Merced was unanimously chosen as the next meeting place of the association.

DATE OF MEETING.

On motion, the date of meeting was left to the president of the association, but that same be held about September 1, 1914, or after the November election.

President Hopkins thanked the association for the honor conferred upon him, and named the following committees:

Legislative.

Ed J. Kay, *Chairman*.

M. D. Laek	C. E. Jarvis
H. C. Schroeder	P. H. Cochrane
C. F. Bonner	Clio L. Lloyd.

Ways and Means.

M. M. Moulton, *Chairman*.

Geo. O. Meese	G. P. Cummings
H. E. Harrison	James Sleeper
C. F. Horner	W. A. Horton

Executive.

John Ginty, *Chairman*.

W. M. Nuner	Jas. P. Berry
Edith A. Coons	W. M. Weaver
Robert Corlett	Geo. Reiber

Program and Order of Business.

A. G. Clough, *Chairman*.

F. A. Bondshu	E. E. Long
C. D. Hayward	J. W. Moore
J. B. Ryan	A. E. Morton

There being no further business to come before the association, it was, on motion, adjourned.

NATIONAL TAX ASSOCIATION.

By HON. JOHN MITCHELL, Chairman State Board of Equalization.

Some two months ago Governor Johnson appointed me the delegate from California to attend the conference of the National Tax Association to be held October 23d to 25th this year at Buffalo, N. Y.

In 1907 there was held at Columbus, Ohio, the first National Tax Conference, under the auspices of the National Tax Association. Delegates to the conference were appointees of the governors of the different states, or representatives of colleges and universities which maintain regular courses in economics or public finance. Annually, since 1907, there has been a similar conference held in the different years at Toronto, Ont., Louisville, Ky., Milwaukee, Wis., Richmond, Va., Des Moines, Iowa, and this year at Buffalo, N. Y. Nearly every state has been represented at one or more of the meetings, but this is the first time California has had representation. Each conference is a law unto itself, and conducts its affairs as it sees fit.

All the conferences and also the National Tax Association, which calls them, strictly examine into questions relating to state and local taxation and do not concern themselves at all with questions of taxation of the general government. The proceedings of each conference

have been published in a volume entitled "State and Local Taxation," and the six volumes already in print constitute the most complete and best publications there are relating at once to the theory and practice of taxation in the American states. No subject is of more vital and personal importance to all citizens and taxpayers at the present time than the proper solution of the vexed problem of how to secure, efficiently and equitably, the revenue needed to defray state and local expenditures. Public expenditures are everywhere increasing enormously and the need of careful, scientific and accurate study of ways and means for providing the necessary revenue is apparent. In many states existing laws enacted long ago under far different conditions, are found in many cases to be inadequate to meet present conditions fairly and equitably, and in consequence much thought is being given to the problem by the legislatures, special commissions, and executives. The association furnishes a practical agency for adequately meeting the situation. Under its auspices representatives from all the various states meet, when addresses are delivered upon various topics by students of economic problems, administrators, representative taxpayers and experienced investigators. Thus careful consideration is assured with the opportunity to compare conditions in widely separated locations, and note the effect of the operation of various forms of legislation designed to cure existing evils, free from local or political influences. A great advantage, also, is the opportunity for practical discussion by public officials charged with the duties of administration and by the taxpayers, as such, who are free to express their views and to receive full and fair discussion thereof.

There has been for many years an intelligent study and criticism of the various forms of taxation in the several states relating to public service and private corporations, insurance companies, banks, etc.—a careful and searching investigation and analysis of the general property tax and of the causes which have led to its almost complete failure everywhere in the United States. The information gathered and the studies made are of great value to every state which desires to increase the justice and the equality of its tax burdens. As I have already stated, the men who have attended and taken part in the sessions of the national tax conferences are experts in the field of taxation. The continued and earnest deliberations of such men is a good thing, and in my judgment California ought never to be unrepresented in the annual tax conferences, so that we may thus know of current thought and tendencies in matters of state and local taxation. In the administration of our own laws and the performance of our duties we would find it of constant advantage to have a personal acquaintance with officials of other states, with many of whom we are obliged frequently to communicate, and whose rulings and procedure we must observe.

The Seventh Annual Conference just held in Buffalo was welcomed to the city by Mayor Fuhrman and President Schurman of Cornell University. President Schurman, in the course of his speech, declared that the rising tide of taxation must be checked, for it had become portentous, if not alarming; that the conference was composed of men who occupy a high position on the one hand as scholars and thinkers, and, on the other hand, as practical administrators in the field of taxation—the men to whom the states and municipalities must look for guidance in solving this urgent and important problem. That the

country was now demanding the services of the expert as well as the practical man. In short, he said that the age of the expert had arrived and that no function of government is more potent and vital than the taxing power.

It is perhaps unnecessary for me to undertake here to enumerate the papers presented at the conference, but some of the papers read were more than interesting and instructive. One paper that would have been enjoyed by this convention was one entitled, "Term, Salary and Method of Selecting Assessors." In some states, as you may know, the assessors are appointed by the state tax commission and are under their control and are appointed for a term of three or four months each year. In a paper entitled "Equalization Boards, Methods and Possibilities," I was much surprised to hear myself quoted from the paper read before this convention last year on valuations. Another paper entitled, "The Somers System," was read, and I have had some seventy-five copies of the proposed system mailed here to Mr. Jarvis, so that you each could have a copy of this paper. The system did not meet with approval of the conference and Mr. Pleydell, of New York, made a long speech against it and demonstrated with charts the weak points of the system, and it had few supporters, if any.

Perhaps the paper that created the most stir was the one entitled "New York's Needs," by E. E. Woodbury, former chairman state Board Tax Commission of New York State. Among other things, he said: "We are today in New York confronted with a condition of state and municipal extravagance which is at once unwarranted, startling and dangerous. The aggregate of our taxes are mounting higher and higher year by year, and our bonded indebtedness, mortgaging the future, is increasing at an enormous rate, some of the securities having paid as high as one per cent per month." He said that the present day expenditures were extravagant and excessive; that the rate of increase in taxes was five times greater than the increase in population. The funded debt of New York City on July 31, 1913, was \$1,337,673,000, a total increase in four years of 45 per cent. During the four years past the value of real property increased 17.62 per cent, and the tax value of personal property decreased 26.59 per cent. He quoted Judge McCall (the candidate for Mayor on the Tammany ticket) who said that if a halt is not called the owners of real estate may contemplate the coming of the hour when confiscation is at hand. Real estate is now assessed at its full value in New York City. The same tendencies to extravagance prevail in most cities of the state. The total assessed value of property in the state was \$11,101,778,000, the percentage of assessed real property was 96 per cent, and the percentage of personal property 4 per cent, and the personal property assessed is growing smaller every year. Mr. Woodbury went quite extensively into figures and showed that in New York state that about \$10,000,000,000 of personal property was not taxed at all. In regard to the Mortgage Tax Law, Mr. Woodbury said:

The *least* that we can ask or recommend in respect of the mortgage tax law is that it be so amended as to be just and equitable as between individuals and corporations. As respects property the mortgage tax law is an exemption rather than a taxing law. It is a tax upon a privilege—the right to record—measured by the amount secured. Its imposition carries no obligation to record the mortgage. This is left entirely optional with the mortgagor; but recording usually follows as

a matter of self-interest and protection. The rate of the recording tax is 50 cents on each \$100 secured or major part thereof—the equivalent of five mills on the dollar. The present law became effective July 1, 1906, and superseded a law in force for one year preceding, known as the Mortgage Tax Law of 1905, which imposed an *annual* tax of five mills on each dollar secured by mortgage upon real property. The act of 1905 was a law *taxing* mortgages and the present law is a *recording* tax. Upon payment of the recording tax, under the present law, the mortgage and the debt secured thereby is exempted from taxation for all time. The mortgage running one year, or less, pays the same tax as the mortgage running fifty years or more. The holder of the individual mortgage with an average life of five years pays this tax at the end of each five-year period when reinvestment occurs, or ten times in fifty years as against one payment by the fifty-year corporate trust mortgage, or four times in twenty years, which I have taken as the average life of corporate trust mortgages.

The exemption of mortgages from taxation should not extend for a period longer than five years (the average life of the individual mortgage), and at the end of that period they should be required to pay a tax of five mills on each dollar outstanding, or be subject to taxation in some other form. Let us see what would be the result if we should impose this tax on unpaid amounts secured by mortgage at the end of each five-year period.

The five-year average life mortgage pays anyway on reinvestment a new recording tax.

The average amount secured by outstanding mortgages, as I have estimated, is six billion dollars, and two thirds of this amount, four billion dollars, is represented by corporate trust mortgages having an average life of twenty years or more. At the end of each five-year period the tax on this amount at five mills on each dollar would amount to twenty million dollars, or an average for the five-year period of four million dollars annually, and would be in addition to the initial recording tax collected. This would materially increase the state and local revenues, relieve the burdens upon real estate in a small measure and eliminate the present discrimination existing in favor of corporate trust mortgages against the holders of individual mortgages.

The much heralded Secured Debt Law was handled without gloves, and among other things he said:

The secured debt law imposes no tax, but extends a privilege to the owners of a certain class of bonds and other investment securities of paying tax of one half per centum on the face value thereof and secure complete exemption forever. The only inducement for a person to pay this tax is that he is being or is liable to be taxed thereon. So long as he is in no danger, there is no occasion to pay, but as soon as danger arises he is given, under this law, a safe haven of refuge to escape taxation for all time by the payment of a nominal amount. This is not taxation. It is exemption. The report of the New York Tax Department, to which I have been referring, says: "Practically all the revenue under the secured debt law has been paid into the New York office of the State Comptroller and presumably has been paid by residents of the city of New York." I have no reason to doubt this statement, nor do I doubt that it has been a great boon and comfort to many wealthy men in that city to secure this relief from taxation at so small a cost. But what of the real estate owners in New York who are paying more than three and one half times this amount of taxes annually and who must continue to do so probably for all time? Are they satisfied? Is it just to them? Will they submit to it? Can you keep piling the burdens of taxation upon them and relieve this class of property from taxation? These are questions which will sooner or later have to be answered and if I mistake not, the answer will be in the negative. We are told that this is a new source of revenue. I fail to follow the reasoning. I can see that it is a new resourceful exemption, but the source is always the same—the ownership of these bonds and securities by taxable persons of the community. It may be true, as

claimed, that we have, up to the present time, derived more revenue from these bonds and securities under this law than we would have obtained under the old law, but even if that is so, it does not establish that the law is right or justified, because, after all, the fundamental question is whether it fairly measures the amount of tax which this class of property should pay as compared with the amount paid by other property. I venture to say that, as a rule, the owners of these bonds and other securities are just as able to pay a reasonable tax thereon as most of the owners of real estate, and I can conceive of no just reason why they should not be required to do so.

I do not believe that any one will seriously contend that this law reaches more than a small fraction of the property which is, optionally, subject to its provisions, a small fraction of the bonds and other investment securities subject to its provisions which are included in the estimate of over three billion, six hundred million of bonds and credits, exclusively of those secured by mortgages in the state, shown in the New York Tax Department report.

One of the principal arguments advanced by the advocates of the present mortgage recording tax law as a reason for supplanting the annual mortgage tax law of 1905 was that to exempt from taxation debts secured by mortgages upon real property in the state would encourage investments in this class of securities; would encourage dealings in real property; would encourage improvements thereon, and thereby enhance the wealth and general prosperity of the state. If we assume this argument to be sound and as constituting sufficient reason for establishing a policy of the practical exemption from taxation of moneys invested in mortgage securities in this state, then the converse of the proposition would seem to hold good. That where moneys are invested in mortgages upon real property situated wholly without the state, the exemption should not be granted, because, first, it does not tend to advance the prosperity of our state, but, on the contrary, tends in an opposite direction, and, second, it tends to withdraw moneys from the state for investment in foreign mortgages whenever a higher rate of return can be obtained. Now these investments in foreign mortgage securities are placed upon a par with, and receive the same advantage by way of exemption from taxation as do mortgage investments in this state. I believe this to be contrary to good state policy and a betrayal of the real estate interests in this state.

The tax under this law should be made an annual one—not necessarily at the rate fixed, but at some rate which is deemed fair and just, and its payment made mandatory. And I would apply the same general treatment to all other forms of credits now taxable under the general property tax law, varying the administration features, where necessary, to accomplish the result. Otherwise, the law should be repealed. This would require the owner to make out a list of the securities and credits owned by him, and file the same with the proper designated official who is to fix the tax, according to the rate prescribed by statute. I am aware that the cry will at once go up, in opposition to a listing plan or requirement, that it is inquisitorial in character; but we have the system, and have operated under it for years, as affecting corporations made up of individuals, and will soon be preparing lists, under the Federal Income Statute, of the most inquisitorial nature.

It is an anomalous condition of our taxing system that we subject properties of varying character to taxation, and require our taxing officials to value them for taxation purposes, and, at the same time deprive these officials of the power to obtain information from practically the only source from which it can be obtained—the owner. In reality there is no difference in principle between requiring an owner to furnish a list of his securities and credits and in requiring him to furnish a statement of the true consideration paid for his real estate which is now being advocated by many of those who oppose a listing of securities.

I have quoted fully on these two subjects because I believe Mr. Woodbury's reasons are sound and worthy of consideration by the members of this convention.

New York State has an income from various sources of some forty millions. The corporation tax amounts to some ten millions. In-

heritance tax comes to ten millions. Stock transfer to nearly five millions. Miscellaneous sources, some three millions. Mortgage tax, two millions, and the excise tax, about nine millions, five hundred thousand, making a total of about forty millions annually. This year an ad valorem tax was levied, which raised about ten millions more, and I was told on good authority that it was absolutely unnecessary. All corporation taxes are levied and collected by the Comptroller. The excise tax is under the control of the Excise Commissioner. The principal work of the Tax Commission is to place a value on special privileges and sit as a board of equalization.

One of the most interesting and profitable discussions came under the head of "Reports from Public Officials on Progress Accomplished since 1912 Conference." Reports were read from many states and California's progress was duly reported in a paper by the delegate from this state. There are many things that would be of interest to this convention that I should like to discuss, but time forbids. There are many things that I have learned that may result in benefit to California. Let us hope so.

On my way to the convention, and while in the East, I took the opportunity to visit many states and to call on the taxing officials. I found out all I could about the working of their tax systems. I was most cordially received and shown everything there was to see. The intent of my study was to hunt out, if possible, ideas and methods that might be adopted with advantage in California; to find out all the new and progressive ideas and methods. I did find out many things, of which you may hear more later. Among the states particularly visited were Minnesota, Wisconsin, Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania and New York. After all is said and done, I feel that California, while it may learn many things from the East, is to be congratulated as being far in the vanguard of tax theory and administration. This is the only state in the union that has complete and *successful* separation of state from local taxation. Our state taxes compared well with the best in the East. In every instance they seemed to me to be more effective and more equitable. The great corporations here are out of politics, so far as their taxes are concerned, as well as in other respects, while that is not the case in many other states. Our local system under the county assessors is far more effective than that in the eastern states. Here the office of assessor is one of dignity and esteem, and the assessor regards his work with pride. It is far different in other states, where the assessors are elected yearly or appointed and have small districts, little pay, and where they devote but a few months to the work, attending at the same time to their own private affairs. Why, in some states the assessor is not even eligible for reelection, a device which insures that he will take but little interest in his work. The resulting inequalities are truly shocking. During one of the discussions the president of the tax commission from Denver, Colorado, said:

One of the best things that has come to my attention recently is the fact that in San Francisco, California, the assessor receives a salary of eight thousand a year, while the most paid the county officers is four thousand.

They seemed to think this most remarkable, and the speaker was roundly applauded.

So, in nearly every way California leads. Nevertheless, we can not afford to stand still, to go to sleep. Eastern states are alive to the need of tax reform. They are working hard to secure better conditions. If we want to stay in the lead we shall have to work and to watch what others are doing. We may be better off than others, but that does not mean that we are perfect. There is work to do, much work to do, both in matters of state and of local taxation. We must stay in the vanguard and continue to show the effete East the way.

THE ELIMINATION OF FRAUDULENT LAND SUBDIVISIONS.

By CHARLES O. KING, Deputy Assessor Santa Clara County.

This is a subject that should seriously demand the attention of every assessor in this state, and through the assessors in this convention here assembled, provide ways and means by which the persistent and constantly increasing fraudulent subdivisions of land now and for years past, foisted upon the public, be forever eliminated in California.

For many years past, in nearly every prominent county in this state, scores of worthless and fraudulent land subdivisions have been foisted upon the investing public, most of them having no pecuniary value whatever to the purchaser, and launched under the present ineffectual laws governing the method of subdivision and reordination of the maps and plats of the same.

Worthless tracts of almost inaccessible lands have been "subdivided" and platted under various high-sounding names, the "subdivisions" allowed reordination, fraudulent corporations organized and the lands sold in twenty-five or fifty-foot frontage lots, or small subdivisions as a "park," or under some other alluring title, often as an "addition" to some well known town or city, when in fact they are miles away from any desirable location, either in city or country.

This detestable method of land swindling is still pursuing its unobstructed way in many portions of this state. Misleading and oftentimes dishonest circulars and letters are sent broadcast over the land to capture the investing public, and to swell the ill-gotten gains of professional promoters in this nefarious business.

It would seem to me that the time has come in this state to put a quietus upon this class of land operations, and that this convention of assessors should be the medium whereby this detestable business should come to an end.

Now, and upon the completion of the Panama Canal, California is preparing to admit to her grand estate hundreds of thousands of home-seekers from various parts of the world, also other thousands of our own citizens from the eastern parts of our nation. What has been done in the past in this fraudulent character, will be continued indefinitely in the future, unless a barrier be erected in front of these and other purveyors of fraud that will effectually put an end to the depredations of these conscienceless manipulators and promoters.

The present laws governing the method of land subdivision, and the method of making the same a public record, are inadequate to prevent this class of parasites from foisting their illegitimate properties through their misleading and dishonest methods, upon those who desire to own a foot or so of "God's acres" in this favored state.

It is useless to say that "a fool and his money are soon parted," or

that the innocent victims ought to have investigated their purchases before they paid the price. The very source of this nefarious business is that of dishonesty and fraud. Therefore it should effectively and forever be stopped in its inception by an amendment to the present laws, that will protect those whose means of acquiring the necessary information as to the value of their investments are so limited that in the great majority of instances they rely entirely upon the printed or oral statements of the promoters or agents of these fraudulent concerns.

The amendments necessary to perfect the present laws relating to this subject, would be simple, yet effective. As a basic proposition, no land subdivision is worthy to be advertised or sold unless it has been honestly surveyed. An honest survey and subdivision should mean that not only the exterior boundaries have been actually surveyed and the corner or exterior angle posts set, but that each and every lot and subdivision within such exteriors should also be surveyed and posts (duly designated by number) actually set at each corner of such lot or subdivision. That every map or plat of said subdivision should have delineated thereon all such posts and the designated numbers thereof. That before the plat or map be allowed of record, a certificate and an affidavit of both the owner and of the surveyor be written upon and made a part of such map and plat, reciting that the tract had been actually surveyed and subdivided and that all of the boundary and lot stakes as aforesaid had been actually set in and upon the land. The certificate and affidavit of said owner and surveyor to be attested in legal form before a notary public or other officer authorized to administer an oath.

That all roads, streets, lands or alleys thereon, together with the width thereof and the frontage and depth of all lots or subdivisions, with the field notes thereof (courses and distances) be marked plainly thereon.

By an amendment to the present laws, of this character, the public would be more effectually safeguarded, as in that case a tract of land so actually surveyed and subdivided must necessarily be of a better class than hundreds of those so-called "subdivisions" that under the present laws are simply platted upon paper without actual survey being made, and (as at present) a simple certificate of ownership and of "subdivision" endorsed upon the map or plat filed for record.

Aside from the fraudulent nature of these so-called "subdivisions" the counties wherein they are located are at a direct financial loss in the assessment and collection of taxes upon these illegitimate subdivisions.

As soon as the purchaser discovers its worthless character he or she promptly refuses to pay taxes thereon.

The assessment value must necessarily be the lowest valuation of any taxable property upon the rolls.

Even though the taxes be paid, it entails a loss to the county for the labor, material, postage and expense of carrying it through to finality. But thousands of them are delinquent upon the rolls, thus causing additional expense of such delinquency, advertising and sale; so, in the end, a considerable loss is entailed each and every year, as long as they remain subject to assessment.

But entirely and aside from any pecuniary loss that may be sustained, the fact that the present laws do not properly safeguard the purchaser

(who oftentimes is led to believe his holdings are of value, or may at some future time be utilized as a home or otherwise), who is made the victim of these professional mountebanks, the state should eliminate this dishonesty and fraud by an amendment to the present laws, that will effectually end all such fraudulent transactions, and thus render it reasonably safe for an innocent purchaser to acquire a lot or small tract of land having an actual value in itself.

I submit the foregoing to this convention for its endorsement and for its remedial action in the matter.

HOME RULE IN TAXATION.

By W. G. EGGLESTON, Single Tax Society.

By a two thirds majority in each chamber, the 1913 legislature of California submitted the following constitutional amendment for home rule in taxation, to be voted on at the regular general election in November, 1914:

Any county, city and county, city or town, may exempt from taxation for local purposes in whole or in part any one or more of the following classes of property: Improvements in, on or over land; shipping; household furniture; live stock; merchandise; machinery; tools; farming implements; vehicles; other personal property except franchises. Any ordinance or resolution of any county, city and county, city or town, exempting property from taxation, as in this section provided, shall be subject to a referendum vote as by law provided for ordinances or resolutions. Taxes levied upon property not exempt shall be uniform.

When the legislature, by a vote of two to one in each chamber, advises the voters to approve an amendment to the constitution, several questions arise. I say the legislature "advises" the voters to approve the amendment for home rule in taxation, because it is unreasonable to suppose that the present legislature of California would submit an amendment for a radical change in the constitution without believing that such change would be of benefit to the state, especially when we take into consideration the arguments made in the legislature by the advocates and opponents of the amendment for home rule in taxation. The questions that naturally arise in connection with this amendment are these:

1. Why did the legislature submit the amendment? 2. What does the amendment mean? 3. Is any similar amendment or law in force anywhere else, and, if so, has it been found to be practicable? 4. Is the proposed amendment applicable to conditions in California?

1. Why did the legislature submit the amendment? The general answer to this question is, because the constitution now compels all counties, cities and towns (including the city and county of San Francisco) to assess and tax property in the same way, "uniformly" and at "cash value" for all purposes; because that provision of the constitution is violated; because the present tax system is not satisfactory to even a considerable minority of the people; because the amendment gives a much larger measure of self-government, or home rule, to counties, cities and towns; and because a method of taxation that is satisfactory to one community may not be satisfactory to another community.

Theoretically, California has a uniform system of assessment and taxation; but the legislature probably knows, and every assessor does know, that assessments are not uniform, and therefore taxation is

not uniform. In no county or city in California, so far as I have been able to discover, is there any attempt to assess property at "cash value," as the law requires, and in most counties and cities the different kinds of property are not assessed uniformly. In the last two months I have sent letters to most of the municipal assessors, asking for certain information, one of the questions being, "At what percentage do you assess property?" Here are some of the replies to that question:

"Our property values are not over 50 per cent, but we have to call it 60 per cent"; "50 to 60 per cent"; "about 60 per cent"; "60 and 65 per cent"; "100 per cent on real estate, 50 per cent on improvements, 40 per cent on personal property"; "real estate and improvements at 60 per cent, personal property at 50 per cent"; "real estate 50 per cent, improvements 25 per cent, personal property at what it is worth." In their latest annual financial report, the trustees of the city of Piedmont say they assess real estate at 83 per cent, improvements at 14.5 per cent and personal property at 2.5 per cent. Such assessments do not comply with the written law; but they do comply somewhat with the unwritten law of public opinion. Not only is that true, but some assessors admit that they have adopted a personal home rule tax law for their municipalities, and that the home rule tax laws they have enacted and put into effect are giving better results and more satisfaction than could be obtained by enforcing the written law of the state. Moreover, we find newspapers praising assessors for violating the state law—not because they are violating the written law, but because they are getting good results by sidestepping the law.

For example, newspapers in California have given favorable mention to the city assessor of Berkeley because of his announced intention to cut down the percentage of assessments on improvements and personal property and raise the percentage on real estate. Newspapers in California and other states have featured what they call the "Piedmont tax system" as a distinct advance; and even the most reactionary papers have not criticized the Berkeley and Piedmont assessors for what they are doing. Nor do I criticize them for it, because they are enforcing the law of public opinion as far as they can or dare do so. But what I wish to emphasize is this fact:

Public opinion in California sustains and approves violation of the "uniform, cash value" assessment law; and the only logical conclusion is that the people wish to get away from the present law. As shown in the cases of Piedmont and Berkeley, the people instinctively feel that the lower the assessments and taxes on improvements and personal property, the better for personal comfort, and for business and industry.

Again, one of the greatest English jurists—was it Blackstone?—said, "It is the business of legislators to find the law, and then declare it." He meant that laws are not made, but grow out of public opinion; and that legislators should first find out what public opinion is in regard to any matter, and then write law that conforms to that public opinion. But in regard to an amendment to the state constitution, the legislature can do no more than find out, as nearly as possible, what public opinion is, and then ask the people to say whether or not the proposed amendment is in accord with public opinion. Therefore, the legislature has submitted this broad and very elastic amendment for home rule in taxation.

2. What does the amendment mean? It means, in regard to improvements, that any county, city or town may, for local purposes, exempt all improvements from tax, or may exempt any percentage of the value of improvements from tax. But what are improvements?

An improvement is any useful, valuable product of labor attached to the land. Farm improvements are more than buildings, fences, vines, fruit trees and other useful things commonly assessed as improvements. In addition to these things, "improvements" include all the things done to the land, by spending money or labor, in order to make it more fit for cultivation, and therefore more fertile. Clearings, drainage, ditches, leveling, the filling of "cat holes"—all these are improvements; and all may be exempt from tax under the home rule tax amendment. They are all actually exempt from tax in the three great "Prairie Provinces" of Western Canada and in British Columbia, because the law defines them as "improvements." They are exempt in New Zealand and Australia.

I wish to emphasize this matter, because it is just here that so many farmers are deceived. Farmers are told by opponents of the home rule tax amendment that it is merely a shrewd scheme for taking taxes off the skyscrapers in the cities and putting higher taxes on "farms." They do not tell the farmers that the greater part of the value of a farm is the improvement and personal property value, all of which may be exempt from tax under this amendment; nor do they tell them that one vacant city lot, or the lot under one skyscraper is often worth more than fifty or one hundred farms. But the amendment does not compel any county or other municipality to make a change unless the people wish to make a change.

In regard to personal property, the amendment makes several classes, any or all of which may be exempt from tax entirely, or may be taxed on any valuation up to 100 per cent of its cash value. For example, household furniture may be wholly or partly exempt; and the same is true of shipping, live stock, merchandise, machinery, tools, farming implements, vehicles and other personal property except franchises. A municipality, acting under the amendment, may exempt any one or more, or all of these classes of personal property, or may tax any one or more, or all of them, at any percentage of valuation up to 100 per cent of their value. But the amendment does not compel any municipality to exempt any personal property; it permits the people to do as they please about taxing or exempting such property.

Now, to return to the matter that troubles so many farmers, in regard to improvements and the home rule tax amendment. Let us take two examples from one of the great agricultural counties of California. First, 50 acres of good fruit land, never cleared, never touched by scraper, hoe or plow, owned by a speculator. Last year it was assessed \$20 an acre, and the tax this year was \$18, or 36 cents an acre.

Separated from that piece of raw land by a fence is a well improved farm of 50 acres, leveled and ditched, and with the following assessments:

45 acres at \$60 an acre-----	\$2,700 00
5 acres at \$30 an acre-----	150 00
Dwelling -----	1,100 00
Other buildings -----	350 00
Fences -----	15 00
Fruit trees -----	150 00
Vines -----	100 00
Personal property -----	750 00
Total assessment -----	\$5,315

With the same amount of land, this farmer is assessed and taxed more than five times as much as the speculator. Putting all his property on the acre basis, the farmer is assessed \$106.30 an acre and taxed \$1.913 an acre while the speculator is assessed \$20 an acre and taxed 36 cents an acre.

Now, assuming that the assessor has made a correct valuation of the 50 acres belonging to the speculator—\$20 an acre—then the farmer's 50 acres would be assessed \$20 an acre, and no more, if the people of that county decide to exempt improvements; because there is no difference in the "prairie" value or "raw value" of the two 50-acre tracts, and each tract is the same distance from market. So, if the people of that county decide to exempt all improvements, but to tax personal property, for raising county taxes, the farmer's assessments would be:

50 acres at \$20 an acre-----	\$1,000 00
Personal property -----	750 00
Total assessment -----	\$1,750 00

And if the people of the county decide to exempt all personal property, or household furniture, live stock, vehicles and farm implements, that farmer's assessment would be \$20 an acre for 50 acres, or \$1,000—which is the amount of the speculator's assessment for his 50 acres.

Now, that is precisely the way farmers are assessed in Manitoba, Saskatchewan, Alberta and in most of the country municipalities of British Columbia; and the law says they must be assessed that way. The home rule tax amendment is purposely worded so that California farmers may be assessed in that way if they prefer that to the present method. It is also drawn so that the farmers of any county who prefer the present method may keep it, while farmers in any other county may make a change if they wish to do so.

Now, another comparison, showing assessment and tax figures of a British Columbia farmer and of a speculator just across the fence from him. I saw both pieces of land a year ago, took a picture of the farm, and got the figures from the assessor.

A. H. Dodd, the speculator, and John Tarves, the farmer, have adjoining tracts of land within half a mile of Cloverdale, in the rural municipality of Surrey, which is between the Washington state line and the Fraser River. Each tract contains 9.29 acres. Dodd's land was all "wild" when I saw it, and not a day's labor had ever been expended upon it. It was assessed \$600.

John Tarves' land was also assessed \$600. His buildings were assessed but not taxed. His personal property was not even assessed, because the law does not permit a municipality to tax personal property. He had 5 acres in a high state of cultivation, fenced, planted in fruit

trees, vines and vegetables, with a good dwelling, other buildings, water mill and tank. But his total taxable assessment was on the raw or "prairie land" value of the land. That is, he was assessed for "land value" but not for the labor value in the land, and he did not pay one cent more in taxes than Dodd, the speculator.

Just one more comparison, this time between two small farmers, one in the rural municipality of Sumas, British Columbia, the other in Whatcom County, Washington. The farms are separated only by the international boundary line, one mile west of Sumas City, Washington. The land is precisely the same on the two farms. I have seen the farms, and have pictures of them.

J. W. Winson has 20 acres in Sumas municipality, B. C., assessed \$22.50 an acre, or \$450 in all. Improvements in Sumas municipality are taxed 20 cents on the \$100 for school purposes only, at not more than half the actual value. Winson's total tax last year was \$9.80, of which \$1 was the school tax on his dwelling and other houses. Winson had 10 acres improved and 10 acres unimproved, but all his land was assessed the same amount per acre.

How about his American neighbor, Henry Schlueter? He has 15 acres; 5 acres unimproved assessed \$22 an acre, or \$110 total; and 10 acres improved assessed \$44 an acre, or \$440 total. The value of his personal property and improvements on land was so low as to be exempt under the tax law of Washington. His tax was \$24.75, against Winson's tax of \$9.80.

You will notice that the raw or "prairie value" of the land was almost the same in each case—\$22.50 in Sumas municipality, and \$22 in Whatcom County. But with only 15 acres, and no assessment on his house or personal property, the assessment of Schlueter's land was \$100 more than the assessment of Winson's 20 acres in British Columbia. Winson's "land tax" was on the "land value" of 20 acres, or the value due to population. Schlueter was taxed on the \$330 of "land value" of 15 acres, and on the \$220 of "Schlueter value" in 10 acres. Winson's land is better improved than Schlueter's and while Winson's house is a real home, Schlueter's house is merely a fairly good little barn with a chimney.

Under the present law in California, the assessor has no right to assess improved farm land on the same basis with unimproved land of the same natural farm value. Under the home rule tax amendment the assessor will have that right if the people of his county desire it. Under the present law the man with an improved farm must pay from two to six times as much tax per acre as the speculator who has a piece of raw land. Under the home rule tax amendment the man with an improved farm will pay no more tax per acre than the speculator with land that is naturally as fertile and as near to market, provided the people of the county wish to exempt improvements and personal property.

The matter is made plain, I think, if we divide all taxable values on farms into two classes: First, "land values," which is the value given to land by population and industry; second, "farmer value," which is the value put into the land and on the land by the farmer—and this includes not only the personal property on the farm, and such improvements as buildings, fruit trees, vines, fences and ditches, but also whatever value has been added to the land by the farmer to make the land more fit for cultivation.

Under the home rule tax amendment, the "land value," which is due to population and industry, can not be exempt from taxation, but the "farmer value" may be exempt from taxation for local purposes if the people of the county wish to exempt it.

In cities and towns the personal property and improvements may be exempt from taxation for county purposes if the people of the county wish to exempt them, and taxed for city or town purposes if the people of the city or town prefer to tax them. Or, improvements and personal property may be exempt for city or town purposes and taxed for county purposes.

3. Is any similar amendment or law in force anywhere else, and, if so, has it been found to be practicable? Yes, laws similar to but not quite identical with the California amendment for home rule in taxation have been in force for a number of years in New Zealand and Australia, and for more than thirty years in the four western provinces of Canada—Manitoba, Saskatchewan, Alberta and British Columbia. Government reports from New Zealand and Australia show that the law permitting exemptions of improvements is giving satisfaction; and by personal investigation, extending over two months last fall and winter, I know that what the Western Canadians call the "Local Option Tax Law" is giving great satisfaction.

I shall not dwell on what I found in Western Canada, because I have with me copies of a pamphlet giving the facts as I found them, as the Minnesota Tax Commission found them, when it visited Western Canada last year, and as some Western Canadian assessors stated them to me in writing.

It may be said, briefly, that the Western Canadian laws do not permit municipalities to tax personal property of any kind. Personal property on farms is exempt from tax in Manitoba, Saskatchewan and Alberta, and in British Columbia every farmer is exempt on \$1,000 worth of personal property; and after 1916 there will be no tax on personal property in British Columbia.

Farm dwellings, barns, fruit trees, crops and improvements made in the land itself are exempt from tax in Manitoba, Saskatchewan and Alberta by the provincial laws. In those provinces, all improvements in cities and towns may be exempt from tax by the municipal councils, and it is contrary to law to assess improvements at more than 50 per cent of their value.

In British Columbia, no municipality is permitted to tax personal property, and the municipality may not tax improvements on more than 50 per cent of their value. Most of the municipalities have quit taxing improvements, and some of them tax improvements for only one purpose—as for fire protection or for schools; but under the California amendment for home rule in taxation, if improvements or personal property are taxed at all, they must be taxed for all purposes. Many of the Canadian municipalities that exempt improvements are rural municipalities, where the farmers have a majority of the votes.

It is worth while to call attention to this fact in regard to our home rule tax amendments: Changing the system of taxation does not necessarily mean a permanent change. If the people make a change and find that it is not satisfactory, they can make another change; they can go back to the old system. That is the case in British Columbia, Saskatchewan and Manitoba. In those provinces, the municipal

council decides at the beginning of each year whether or not improvements shall be taxed—that is, improvements on the land, for they are not allowed to tax improvements in the land itself.

We can have no better proof that the law is satisfactory than the fact that, while some municipalities quit taxing improvements as much as thirty years ago, and even more, no municipality has ever gone back to the old system of taxing improvements after having adopted the policy of exemption. That fact outweighs any amount of theory.

Only a few days ago I learned of the Wright-Bridgeford irrigation law of California, enacted in 1909, which permits new irrigation districts to tax "land values" only, and to exempt labor values or "farmer values" from taxation, and permits old irrigation districts to do the same. On April 20, 1911, the Oakdale Leader, edited by the Hon. David W. Tulloch, a member of the legislature, spoke of the satisfactory working of the law in the Oakdale Irrigation District, saying:

"This means that you do not have to pay taxes on your house, barns, and growing crops for irrigation revenues. The man who does not improve his land bears the irrigation burden equally with the man who does improve."

Mr. Tulloch writes me that "Modesto, through a vote of her land owners, voted twice on the subject. The first time it was defeated, and the second time it passed, by the vote of property owners alone." Mr. Tulloch says also:

"There is no use talking, the building in Modesto has progressed wonderfully since the irrigation tax was taken off of improvements. Where wooden shacks stood on corners, three and four-story brick buildings stand today. That part is wonderful."

However, while I believe that all labor and industry, and every producer would be benefited by exempting all personal property and all improvements, those in the land as well as those on the land, from tax, and raising public money by taxing nothing except the "land values" created by the people, my object in coming here is to advocate the Home Rule Tax Amendment rather than any particular method of taxation. I advocate it because it gives the people of municipalities more freedom in self-government. And that brings me to the fourth and last question:

4. Is the proposed amendment applicable to conditions in California? I think it is, because we have divorced state and local taxation.

I should like to see all taxes on personal property and improvements in California wiped out. But I would not abolish them if I could, because that is a matter for the people to determine, and for the people of each county, city and town to determine for themselves. That is local self-government.

The more freedom in self-government the people have, the better for them and for the state. There was a time when the people of a California city or town had nothing to say about amending their charters; but that time is past. There was a time when the people of our cities and towns had no control over their councils, either by referendum or recall; but that time is past, and the California idea is spreading over the whole country and even into Canada. Yet while California is far ahead of Western Canada in these matters, it is behind Western Canada in the matter of home rule or local option in taxation.

The amendment for home rule in taxation will enable the people of counties, cities and towns to try experiments in taxation, just as the local option tax laws of Western Canada enable the people of municipalities to try experiments in taxation. The amendment will not compel any county, city or town to act, but will permit them to act if they wish to do so.

A vote against the amendment is a vote to prohibit the people of any county, city or town from acting under the amendment. The people of Amador and Inyo counties may not wish to make any change in their system of taxation, but if they vote against the amendment they vote to compel the people of Humboldt and Riverside counties to keep the present tax system. On the other hand, when the people of San Francisco and San Diego vote for the amendment, they do not vote to compel any county, city or town to make a change, but merely vote to give the people of all the counties, cities and towns the right to make changes if they wish to do so.

As I have pointed out, California has more than 150 home rule tax laws enacted and enforced by county and city assessors. I do not blame the assessors. I commend them for obeying the law of public opinion as far as they can. But the amendment for home rule in taxation will enable the people of each county, city and town to say what their public opinion is, and how far they wish to go in exempting or taxing certain classes of property. It is better to have one wide, elastic home rule tax law, enacted by the people, and broad enough to express different phases of public opinion in different communities, than to have a uniform, iron-clad tax law that is not sustained by public opinion.

The real question is: Should the people of California have more freedom; should they have freedom to find out for themselves what is best for them?

CURRENCY REFORM.

By PROF. CARL C. PLEHN, University of California.

After the crisis of 1907, now six years ago, the people of the United States set themselves somewhat seriously to work, to correct some of the accumulated evils in our monetary system.

Congress hastily passed a bill, the Aldrich-Vreeland act, designed to meet certain special monetary difficulties in time of crisis. In substance this bill merely provided for an emergency currency to take the place of the clearing house certificates. Fortunately we have not yet had to test the efficacy of this measure.

The ponderous machinery of government commissions was then set to work and ground out a great mass of data.

The first notable grist of the mills was the Aldrich bill. This excellent measure promised a central bank of reserve and issue, and a district federation of the existing banks which would possibly have resulted in a true branch banking system. But the greatest feature of that bill was the promise that it contained, of creating new business methods, to wit, the more general use of domestic bills of exchange.

This fine ship was wrecked on the reef of politics, and only a few of her timbers have ever come ashore.

The democratic congress then undertook the task. It has encountered two difficulties. The first was that it dare not openly use any of the

provisions of the republican Aldrich bill. The second was that the strongest and most experienced members of the party were too busy with the new tariff to give the currency bill attention.

The consequence has been a will-o'-the-wisp bill, the provisions of which never stay the same long enough for one to get a good look at them. But fleeting as are the glimpses the public has had of the "lights dancing over the marshes," those glimpses have provoked a whirlwind of discussion. This discussion has been of the most futile kind. Features of the bill of minor importance have been elevated to the first place and the real merits of the proposed plan have scarcely been touched. Moreover, the bill as it finally passed the house is so badly written that it is most difficult to understand what the real provisions are, or what is intended.

The stormy public discussion is not unlike that of two learned philosophers, who debated in public with great heat and for many hours, whether the human mind could grasp the idea of the "absolute." At the close of the debate each vigorously declared that if the other had the slightest conception of what the "absolute" was they could easily have come to an agreement.

The bill being now in the senate, it is a foregone conclusion that it will come out a very different bill, and possibly it may be one as to the meaning and intent of which we can, some of us, agree. As it is, it is hardly worth while trying to hold the discussion down to any one phase of the bill itself.

It is, however, interesting to endeavor to set up some kind of an ideal standard by which to test any tangible product in the shape of a bill which may come out of the fog in the near future. That shall be my endeavor at present. I do not for a moment suppose that we can attain the ideal in one jump. But it is worth while to know whether we are jumping up or jumping down.

There are a good many things the matter with our present currency system. Most of them are inheritances from worse conditions, but they are not nice heirlooms. Some of them may be enumerated. They are:

1. Considerably over half of our money in circulation is bad money, and most of that bad money is in the hands of the public, the good being, for the most part, in the United States treasury and in the banks. The term "bad money" is used advisedly. It is not intended to imply counterfeit or depreciated money. But the United States, not being bankrupt or pauperized, is in a position to be very fastidious about its money. Any money not ideally perfect is for the United States "bad money." The *best* money is the only "good" money.

2. We have too much money in circulation, especially too much bad money, with the result that the natural ebb and flow of gold is seriously retarded and actual inflation a constant menace.

3. We have far too little elasticity, there being but one elastic element, namely gold, in our present circulation, and there being practically no elasticity in our paper money.

4. We have no *true* bank note currency, and our banking practices are such as to afford but little basis for a true bank note system.

We need, as rapidly as is consistent with safety, to get rid of all our present paper money, except possibly the gold certificates, to reduce the circulation of silver, and to reduce the amount of the gold certificates.

We need to get gold into actual circulation and into the pockets of the people. The use of paper money is a pernicious habit, a habit formed in the "cheap money" eras of frontier life. It is a filthy habit, as dangerous to physical health as to monetary health. Moreover, paper money is inconvenient in use.

We need bank notes. But they should be true bank notes, based on actual business transactions, secured by genuine domestic or foreign bills of exchange, themselves, in turn, secured by the credit of (1) the seller and his banker, (2) the buyer and his banker, and secured further by being a lien on the goods sold and on the proceeds of the sale. In short, we need true bank notes; no other kind of bank notes are sound.

We need further to reduce and curtail our excessive use of a deposit currency, substituting therefor a true bank currency, and restricting checks to their proper field. The natural fields for checks are investment transactions and remittances.

I shall take up these points in the foregoing order.

I start with the principle that no money is good which needs a legal tender law, to make it circulate. A legal tender law, when not superfluous, is an open confession that the money to which it is attached is bad money. By force of habit, derived from our long sad experience with colonial paper money, and with the notes of the revolutionary period, we did, at the start, attach a legal tender law to our gold coins and it is still there, but a more superfluous measure is not to be found in the statute books.

The gold coin of the United States needs no other sponsor than a sound mint law and good honest mechanical work by the coiners. If we did nothing else at present than redeem the greenbacks and then repeal every legal tender act, we should make great progress.

Our present circulation, omitting money held by the United States treasurer, but including money more or less rigidly held in bank reserves, is made up as follows:

Gold	\$607,000,000 00
Silver	212,000,000 00
Gold certificates	943,000,000 00
Silver certificates	469,000,000 00
U. S. Treasury notes, greenbacks.....	338,000,000 00
(This is a new estimate; we are responsible for \$347,000,000.00.)	
National bank notes	705,000,000 00
Treasury notes of 1890 and miscellaneous.....	3,000,000 00
<hr/>	
Total	\$3,277,000,000 00
Deposit currency	8,250,000,000 00
<hr/>	
Grand total	\$11,527,000,000 00

Omitting, for the present, all consideration of the deposit currency, we may analyze the others.

The 607 millions of gold coin are, of course, perfect as money from every point of view. But pity it is that so little, even of the 607 millions, is in actual circulation.

The 943 millions of gold certificates are likewise excellent. But in so far as they are a concession to the bad habit of using paper money, they are unnecessary.

The silver, except in so far as it is actually used and necessary for making change, is a form of credit money of more than doubtful character.

The silver certificates are many degrees worse than the silver dollars.

The old greenbacks are the worst of the lot. They are purely fiat money, issued in time of war, and standing like the remnant of a half overthrown dam across the current of a stream. They are a perpetual menace in every time of stress and storm, threatening to throw the stream from its course, and to make it overflow its banks.

The national bank notes form another unyielding obstruction in the bed of the stream. Secured mainly by bonds, in a most cumbersome way, and very nearly as inelastic as the treasury notes, they constitute a very similar menace to that offered by the greenbacks. These notes were invented as a temporary expedient and solely as a means of selling bonds in the time of war. They are in no sense adapted to continued use. Although always redeemable and never discredited, they are very bad money. They are bad because they are forced into circulation by law and because they are not retired when the need for retirement arises. They are only in a slight degree better than fiat money would be if issued by a nation at peace, and restricted in volume.

The treasury notes of 1890 are almost as bad as the greenbacks, but fortunately they represent now but a small rock in the stream. The only advantage they possess is that by executive, but not legalized order, they *are* redeemed in gold.

Taken in the large, we may say that fully half our money in circulation is bad money, inelastic and dangerous. This half is kept at par with good money by the most fragile of legal devices, devices which have already failed of their purpose once and may do so again. I refer to the panic of 1893 and the days of Cleveland.

We could pay off over a hundred million, or one eighth of our public debt, if relieved of the necessity of backing up our bad money. It costs us over \$3,000,000 a year for that one item alone.

We have been and are suffering from unduly high prices. The housewives know this best. But it is easily demonstrated statistically. This entails suffering, as all creditors, of every class, know.

The money invested in five per cent bonds bought at par twenty years ago and redeemed at par today will buy today only about 60 per cent of what it would have bought twenty years ago. The unlucky holder has received for each \$1,000 bond 5 per cent per annum, in constantly shrinking purchasing power, say about \$800 in interest, measured in buying power, and has lost \$400 on the principal in purchasing power. The investment has netted him about 2 per cent per annum. This loss is not, to be sure, all due, nor even half due, to local currency evils. Of that more later.

The general level of prices is variously estimated at from thirty-five to fifty per cent and even more above the previous high level of 1890 and seventy per cent or more over the last low level of 1896.

There has just come from the press of the University of California a memorial volume by Professor Wesley Clair Mitchell, formerly of the department of economics of that institution, containing a most exhaustive study of "Business Cycles" from 1890 to 1911. This work, which I believe ranks with Jevon's Investigation into Currency and Finance in scientific accuracy and importance, reviews most completely

all statistics of currency, prices, volume of trade and other factors determining the course of business. I have taken most of the following figures from that work as the best authenticated that can be had.

The total monetary stock in the United States:

1890	Millions	Per cent	Per cent
Total -----	\$1,629	100	
In treasury -----	256	15.7	
Outside -----	1,373	84.3	100
Banks -----	492	30.2	35.8
Public -----	881	54.1	64.2

1911	Millions	Per cent	Per cent
Total -----	\$3,556	100	
Treasury -----	342	9.6	
Outside -----	3,214	90.4	100
Banks -----	1,573	44.2	48.9
Public -----	1,641	46.1	51.1

AVERAGES FOR TWO DECADES.

1890-1899	Millions	Per cent	Per cent
Total -----	\$1,761.4	100	
Treasury -----	217.2	12.3	
Outside -----	1,544.2	87.7	100
Banks -----	606.4	34.3	39.1
Public -----	937.8	53.4	60.9

1900-1909	Millions	Per cent	Per cent
Total -----	\$2,784.8	100	
Treasury -----	312.9	11.4	
Outside -----	2,471.9	88.6	100
Banks -----	1,045.3	37.2	42
Public -----	1,426.6	51.4	58

The total stock of money increased from 1890 to 1911 far more than twofold. The average for the whole of the second decade was 58 per cent larger than for the first.

The treasury holdings increased between 1890 and 1911 about 20 per cent, although the second decade shows an average of 44 per cent more.

The money in use outside the treasury nearly doubled between 1890 and 1911, and the average for the second decade was 60 per cent greater than for the first.

Bank holdings of money increased over threefold, and the average of the second decade was 72 per cent over that of the first. This is all the more significant when we note that the ratio of capital liabilities to deposit liabilities fell from about a third to less than 20 per cent. But, furthermore, the banks used to hold one third of the money as against one half now. This vast increase is the foundation for a far greater increase in deposit currency.

The money in the hands of the public increased 70 per cent and the average for the second decade over that of the first increased about 52 per cent.

But we are not through yet with the evidences of inflation. We have still to examine the deposit currency. Professor Mitchell presents the following summary of the best estimates:

DEPOSIT CURRENCY.

	Millions	Per cent
1890 -----	\$2,264	100
1911 -----	8,242	364
Averages: First decade -----	2,752	100
Second decade -----	5,978	217

TOTAL OF ALL CURRENCY DOING MONEY WORK.

	Millions	Per cent
1890 -----	\$3,637	100
1911 -----	11,456	318

FISHER'S ESTIMATES OF VELOCITY.

	Per cent
1896 checks -----	36.2
money -----	18.6
1911 checks -----	49.9
money -----	20.9

VOLUME OF BUSINESS.

Fisher 1896	191 Index
1909	387 Index 2 fold.
Hence price level 170.	

Put into simple language, these significant figures mean this.

We are now transacting something over twice as much business as we were in 1890, *but* we are using practically four times as much currency to do it with. If the currency in use in 1890 be regarded as adequate, then *by that standard* we have *twice as much now as we need*. As a matter of fact, of course, the amount of currency in 1890 is not a fair standard for comparison, because world conditions have changed. But the comparison gives us a vivid idea of the changed conditions. These statements are, of course, in round numbers and not given with the necessary reservations. But in the face of such enormous changes, small fractions are not significant.

The statement just made is based on the following computation. For every 100 dollars of currency of all kinds, including checks, in use in 1890, we now have 318 in use. But they circulate more rapidly, turning over on the average more than one third more frequently, hence, they have an efficiency equal to 430. Divide this 430 by 2, because there are two transactions for every dollar now, as against one in 1890, discarding fractions, we have about 200 as a result—or the two dollars for one, roughly, which was used above.

How has this come about? It has come from two sources. First, a larger production of gold in the world, some of which, but far less than our proper share, has found its way into our circulation. This has increased the volume of money of final redemption directly, and it has indirectly increased the volume of deposit currency very greatly.

The world's production of gold was, in 1890, 119 millions of dollars, and in 1911, 462 millions. During the decade 1890 to 1899 it averaged

196.6 millions, and in the next decade, 358.1 millions. The monetary stock of gold in the United States in 1890 was 648 millions, and in 1911, 1,797 millions, an increase of not quite threefold. This in itself has helped to raise prices the world over. But ours have risen more and faster, despite the fact that there are indisputable economic reasons for expecting ours to fall. The chief responsibility for our *undue* rise lies in the second cause.

The second source is that although we already had a too large wad of paper money stuffed into our circulation, we have been poking more and more in by artificial means. We have increased the silver dollars (and silver certificates) from 380 to 565 millions or deducting 140 millions for treasury notes of 1890 withdrawn, 425 millions, and national bank notes from 186 millions to 728 millions. In short, we have deliberately added a total of 587 millions to that part of the circulation composed of undesirables. That we have not actually driven gold out of the country is due, in part, to the fact that what we have is held here by law, in various reserves, and by force of custom.

If the greenbacks, the silver certificates and the artificial bond secured bank notes had not stood in the way, we could, in this wonderful era of gold production, have easily overcome the misfortunes of our past and filled our circulation with the good, sound, healthy, yellow blood of gold.

What a series of plagues we have had to endure in money matters! In colonial times and revolutionary times all sorts of bad and depreciated paper money, then after a short period of moderate health, wildcat bank money, then the greenbacks, and now the greenbacks, silver certificates and bond secured bank notes, all together! After all, what a sweet and easy time Job had of it? Even his sympathetic comforters were not like our politicians, nor was one of them the prototype of "Coin Harvey" or "Bryan."

We come now to consider the matter of "elasticity." There are two kinds of "elasticity" that a sound monetary system requires. One is that natural and perfect "elasticity" of gold in a pure gold currency system. The most delicate piece of economic mechanism in the world is that of the foreign exchanges. Like the governor on a steam engine, it instantly, and every moment adjusts the power to the load. In a country with a gold currency it instantly draws in a new supply of gold when needed, just as the governor lets in new steam, and as promptly sends it away across the seas when not needed, just as the governor closes the steam valve. No thermostat works so smoothly and so accurately. In foreign exchange gold, the money of ultimate redemption, pays the balances, but the great bulk of payments is made by a sort of clearing system by means of drafts. The draft—a foreign bill of exchange—is the type of a true bank note, and is in foreign trade what a true bank note should be in domestic trade. It comes into being every time a *bona fide* sale is made; it lives as long as that transaction is incomplete; it dies and disappears as soon as its work is done. This is the second kind of "elasticity," the calling into being of notes representing actual transactions and the *recalling* of them the moment the transaction is complete.

There is no such thing as a legal tender law in international trade, nor is there any international bank act. There is no need of the one, nor of the other.

An ideal national monetary system would be closely analagous to the existing international system. It would have gold as the money of ultimate redemption and gold only; it would have bank notes issued against domestic bills of exchange only, and retiring as the bills retired.

There is nothing new in this doctrine. It has been recognized as sound for centuries and every departure from it has brought disaster. One of the most brilliant passages in Adam-Smith reads as follows:

The gold and silver money which circulates in any country, and by means of which the produce of its land and labor is annually circulated and distributed to the proper consumers, is, in the same manner as the ready money of the dealer, all dead stock. It is a very valuable part of the capital of the country, which produces nothing to the country. The judicious operations of banking, by substituting paper in the room of a great part of this gold and silver, enables the country to convert a great part of this dead stock into active and productive stock; into stock which produces something to the country. The gold and silver money which circulates in any country may very properly be compared to a highway, which, while it circulates and carries to market all the grass and corn of the country, produces itself not a single pile of either. The judicious operations of banking, by providing, if I may be allowed so violent a metaphor, a sort of wagon-way through the air, enable the country to convert, as it were a great part of its highways into good pastures and cornfields, and thereby to increase very considerably the annual produce of its land and labor. The commerce and industry of the country, however, it must be acknowledged, though they may be somewhat augmented, can not be altogether so *sécure*, when they are thus, as it were, suspended upon the Dædalian wings of paper money, as when they travel about upon the solid ground of gold and silver. Over and above the accidents to which they are exposed from the unskillfulness of the conductors of this paper money, they are liable to several others, from which no prudence or skill of those conductors can guard them.

Why we have never developed a wider use of the domestic bill of exchange is one of the most perplexing puzzles in American banking history. It is partly explained by the decentralized character of our banking system, a decentralization forced upon us by too much statute law on the subject. It is partly explained by our unfortunate monetary experience, especially in the era of wildcat banking, which made each bank suspicious of every distant bank. It is partly explained by the presence of the bond secured note system, and the prohibition of the use of other notes, which has continued even into an era of otherwise sounder financial conditions. But this, itself, requires some rational explanation, which can not be found. It is partly explained by the poverty in capital of frontier life as compared with the wealth thereof in land and natural resources, a poverty which persisted so long as there was a frontier, and which fastened upon us the wretched fallacy which identifies "money" with "capital," the fallacy of free silver and Bryan. It is partly explained by our frequent periods of inflation and the constant menace of inflation. But these all together are not a complete explanation.

The fact remains, explainable or not, that each isolated bank has to take care of itself as best it may and knows little of any other bank or banks, except its own one or two correspondents. Eager, moreover, to keep its bond-secured notes in circulation, it has no desire, even if the law permitted it to do so, to build up a real note system.

The consequence is that it is still, to a large extent, regarded as a disgrace to be "drawn upon." This prejudice remains in spite of the

fact that to be drawn upon is the normal, natural, and above all, the cheapest way of paying a bill. The merchant who buys a bill of goods, discounts his note at the bank and remits his payment. The transaction rests on a one-name paper—or at best on a paper endorsed by another merchant in the same town. Sometimes, even for direct commercial transactions, collateral is required. This note generally lies at the bank of first discount until maturity. The maker would in many cases resent a rediscount. There are many exceptions, of course, but the exceptions should be the rule.

Suppose, however, it were the universal practice—not as now, the occasional practice—for the seller to draw on the buyer as soon as the goods are shipped. He discounts the bill at his bank, and has his money ready for new business. The draft with accompanying documents, the bill of lading, shipping receipt, etc., goes through bank channels and is presented to the buyer who accepts it. Once accepted it can be readily rediscounted anywhere until the date of payment rolls around. Such paper is secured by two men, the seller and the buyer, by the goods, and by the two banks, one virtually passing on the credit of the seller and the other on that of the buyer. The solvency and business stability of two towns is back of it instead of one only.

Now, let us suppose that, on such a security, bank notes were issued, and that they must be retired as soon as the bill is paid, or reissued only against new bills. It must be clear that such notes could never be in excess of the needs and never below them. These notes and the drafts themselves would replace a large part of the deposit currency, and with proper cash or gold reserves to insure their immediate redemption at all times and with a gold deposit equal to all notes in excess of the unpaid bills of exchange held as security would be as secure as any note issue could be. They must, however, be as regularly as possible sent home for redemption.

There is little use of true domestic bills of exchange now and no general market for them. It is asserted that one of the purposes of the pending currency bill is to create such a market. The section on note issues, however, is one of the blindest in the bill. At first reading, it looks like a mere substitute for the Aldrich-Vreeland act. But for an emergency currency, the omission of bonds and stocks as collateral is almost fatal.

The bill proposes that the district federal reserve banks shall issue notes secured by "notes and bills accepted for rediscount." In another section it restricts the "discount" powers of the federal reserve banks, and "rediscount" seems to mean "discount." The powers of "discount" or "rediscount," whichever may be meant, are limited to "notes and bills of exchange arising from commercial transactions." It appears that the clause "arising from commercial transactions" is meant to modify "notes" as well as "bills of exchange," for there is appended this explanation: "that is, notes and bills of exchange issued or drawn for agricultural, industrial, or commercial purposes, or the proceeds of which have been used, or may be used, for such purposes." Having thus tried twice to express his idea and realizing that he had only made it more obscure, the author of this jumble of words added "nothing herein contained shall be construed to prohibit such notes and bills of exchange, secured by staple agricultural products, or other goods,

wares, or merchandise, from being eligible for such discount." We are finally left to guess that all this verbosity was meant to cover every kind of note or bill of exchange except "notes or bills issued or drawn for the purpose of carrying or trading in stocks, bonds, or other investment securities."

If this guess is good, though there are others just as plausible, then the bill means this. There shall be a number of districts, all the banks in each of which shall be associated together in support of a district bank of reserve and of issue. The district bank of each district is called, in the bill, the federal reserve bank, which is anything but a distinctive name, and has been called in the public discussion the "regional" bank. Why, when we already have a perfectly good word "district," we should beat-about the bush and invent a new word, not yet in the dictionary, is as hard to see as it is to fathom the meaning of this bill.

The district banks are each to hold the reserves of the associated banks. These reserves may be invested in prime mercantile paper, that is notes, indorsed by any bank in the district, except notes of stock-brokers, or in domestic bills of exchange, likewise bought by and indorsed by one or more of the associated banks. Against these notes, or bills of exchange, the district bank may issue bank notes. There must be a gold reserve of $33\frac{1}{3}$ per cent against the notes, and they are to be returned for redemption as fast as they may come into the hands of any district bank.

So far is good. But the next essential to real bank notes is lacking, or if it is in the bill, I have not been able to find it owing to the obscurity of the language. That essential is that whenever the outstanding bank notes exceed the discounted paper held as security, there shall be a deposit or reserve in gold of dollar for dollar.

The absence of this provision and the insertion of a provision to the effect that these "notes (the bank notes) shall be obligations of the United States," and "shall be redeemed in gold or lawful money on demand at the Treasury Department of the United States, in the city of Washington, District of Columbia, or at any federal reserve bank," would, together tend to make these notes stay out unredeemed. Of course, the United States does not intend to assume any such obligation and the bill itself confesses to the fraud by making the federal reserve banks liable and by taking 5 per cent of the $33\frac{1}{3}$ per cent reserve into the treasury. The government's guarantee does not add anything to the notes, but it will tend to prevent their regular redemption which is as essential as is sound security for their issue.

Ostensibly to make room for these new issues, the present national bank notes are to be retired at the rate of five per cent per annum, and the 2 per cent bonds are to be redeemed in 3 per cent bonds. The retirement of the national bank notes can but receive unqualified approval, but why not the greenbacks too? Moreover, the ostensible reason is false. These new notes are a substitute for deposit currency, and, if not artificially forced into and held in circulation by being made a government obligation, will not cause any inflation. In other words, every payment made by true bank notes is a payment which would at present be made by a check.

The note issue provisions are the meat in the cocoanut. The rest of the bill is of small importance, except as affecting this one paramount issue.

The main question is, will this bill promote a freer use of domestic exchange? I am inclined to believe it will—or perhaps, it would be better to say—I hope it will. I am not unmindful of the fact that complete success in that direction is not possible without a great central bank, with adequate branches. But it seems to me the bill establishes the branches and opens the way so widely to the establishment of a central bank of reserve, discount and issue, that the latter will inevitably follow in a few years.

As to whether the new banks shall be controlled by the government, by the banks, or by stockholders obtained by popular subscription to the stock, seems to me a matter of indifference. In any case, a man big enough to be entrusted with the job will be big enough to run the banks for soundness and for no other purpose.

Whether the national banks be compelled to buy the stock, or permitted to subscribe, or prohibited from holding stock, is equally a minor detail. A working organization can be obtained in either way.

The progress being made by the senate with the revision of the bill promises well for improvements. We may yet get a central bank with sufficient branches to make a convenient and stable basis for true bank notes. But whisper it not aloud, that is the Aldrich bill again.

After the bill is passed, the banks will have to start a campaign of education to get the business men to use its facilities. It will take time to teach them to draw, instead of waiting for a remittance. But all that is possible.

The main thing is to advance toward the promised land, and to cease wandering in the desert.

THE AUTOMOBILE TAX.

By CLARENCE E. JARVIS, County Assessor, Amador County.

The last California legislature passed a motor vehicle act which was approved by the Governor; it goes into effect December 31, 1913, when the owner of each automobile in the state under this act will be required to pay an annual registration fee on his automobile, so much per horsepower. This the owner already calls a tax.

The motor vehicle act in part reads:

SEC. 7. The State Treasurer shall collect fees as follows: For the registration of every automobile less than 20 horsepower, \$5.00; for every automobile above 20 horsepower but less than 30 horsepower, \$10.00; for every automobile of 30 horsepower but less than 40 horsepower, \$15.00; for every automobile of 40 horsepower but less than 50 horsepower, \$20.00; for every automobile of 50 horsepower but less than 60 horsepower, \$25.00; for every automobile of 60 horsepower and above, \$30.00.

Section 35 in part reads: All fees or other moneys paid to or collected by the State Treasurer, under the provisions of this act, shall be placed in fund, known as the "Motor Vehicle Fund." That one half of the net receipts under this act shall be returned to the counties from which received, as determined by the places of residence of the persons to whom the licenses are issued, and all such amounts returned shall be paid into the road funds of the several counties receiving the same.

In the event that any county has not established a road fund, its proportion of the receipts shall be retained by the state, until pro-

vision for such road fund has been made, and it shall then be paid over. For the purpose of this section, the city and county of San Francisco shall be considered a county.

Section 39 in part reads: The remaining moneys in the Motor Vehicle Fund shall be expended, under sole direction of the Department of Engineering, for maintenance of state highways, without specific appropriation by the legislature, in addition to all sums already or hereafter appropriated by the legislature for the same purpose. Moneys shall be drawn from said Motor Vehicle Fund for the purposes of this act, upon warrants drawn by the Controller of the State, upon demands made by the departments and audited by the State Board of Control.

In quoting the above sections, I have used those parts which directly affect the taxpayers and show the collection and disposal of and to what fund the registration fee is paid.

As this is a new tax and one which we assessors will have to contend with in making up our next rolls, I thought it proper to bring it before this convention for discussion. Some doubt that the Motor Vehicle Act is constitutional.

Now, in my opinion, this act is going to make a great deal of dissatisfaction amongst taxpayers who own automobiles, and in consequence the local assessors will come in for some of the complaints when they enforce the constitution of the state by collecting the personal property tax on the automobile, so much on its full cash value.

And when you levy the personal property value on his automobile the first Monday in March, the taxpayer will tell you he has already paid a tax to the state. "Do you mean to double tax me?"

I contend he has somewhat of a complaint; if it is just and fair for an auto state tax, then why should not all teams that use the roads be placed in the same state act? Is it not true that he profits by the increased revenue that the autos contribute, by having better roads, less wagon repair and a longer life to his horses, which help to make up his investment?

The success of the farmer who has to compete with farmers who are advantageously situated for prompt and quick transportation facilities is somewhat handicapped—if he uses a wagon for transportation—for various reasons.

Now, to overcome this, the farmer sells his wagon and horses, that he pays only a local tax on, and purchases a motor vehicle to make delivery of his eggs, butter and produce. For this privilege, he now has to pay a state fee and a local tax. It is hard to convince him this is not a double tax.

The state has levied a fee of so much per horsepower. This will be an annual fee during the life of the automobile. The counties, of course, will have to meet the loss of value each year to the automobile in valuation. In other words, in five years, the state would be getting the same fee for an old machine, while the county, about 10 per cent valuation on first cost.

It is said the money is put to good uses, for it makes good roads and develops our state. This is true.

If this act is constitutional, would it not have been a better plan to place all this money in a general highway fund? Then it could be spent where it is most needed, in counties where it would bring about rapid development, which now lack such development on account of inaccessible roads and lack of revenue from local taxation.

In Ohio, the motorists at this time are making a bitter fight to prevent that state from collecting this same horsepower tax, and are asking for an injunction restraining the Secretary of State from collecting the 1914 fees.

The Ohio motorists charge that the fees are excessive and that the law, being really a revenue-raising measure, and not primarily one of regulation, is unconstitutional.

The solution I would offer to the automobile tax is—by amendment to our state constitution—that motor vehicles be made operative property, and should be assessed by the state only.

For example, I own an automobile and go to San Francisco from Jackson and take my family of five, also make the return trip. Now, my railroad fare would be \$51.00 and the state would lose 5 per cent in gross receipts of that amount, which is \$2.55, under amendment No. 1.

The automobile is surely cutting down the state's revenue from the transportation companies, and should be classed as operative property.

TAX ASSOCIATION.

By Hon. ALEXANDER BROWN, Manager State Tax Associations.

The subject, Tax Associations, which has been allotted me by your programme committee, is one which affords a large and fruitful field for discussion, particularly along economic lines in connection with the administration of state, county and municipal governments.

That public affairs should be conducted on the same sound business basis that large corporations and successful business firms handle their affairs, is being gradually forced home to the taxpayers; and they are awakening to the fact that the millions of dollars which they expend annually in maintaining their different arms of government, should show value received.

However, a mere awakening of the public to some particular wrong, or extravagance on the part of public officials, is productive of no material benefit. Some method whereby they can be kept awake and on the watch is absolutely essential to correction of the evils which may be found to exist.

From my viewpoint of experience, the task confronting an association, which has for its object the awakening of public sentiment, that extravagance may be eradicated and economy substituted, is no easy one. Lethargy has cradled and rocked the people so long that everybody's business is nobody's business, and a long and hard pull will be necessary to educate them to a full realization that, while they have been paying close attention to their private business, their much larger business, public affairs, has been jogging along much as it pleased.

Now do not understand me as finding fault with public officials. My complaint is directed to a system which permits the appropriation and expenditure of the people's money, collected under the tax laws in an amount beyond their means. When you find a state or subdivision thereof, spending money for public purposes at a rate per year greater than the increase in material wealth and population, rest assured there is an overdrawn bank account.

In an address recently delivered by President Wilson, he said:

Most of the badly governed cities of the civilized world are on this side of the Atlantic, most of the well governed are on the other side, and the reason is not accidental.

We set out upon our political adventures as a nation with one distinct object, namely, to put the control of government in the hands of the people, and now behold: when our experiment is a hundred and thirty years old we discover that we have neither efficiency nor control, and so we are at the beginning again. We must at once devote ourselves to finding means to make our governments, whether in our cities, in our states, or in the nation, representative, responsible and efficient.

President Wilson's criticism of this country's inefficiency in the management of governmental affairs, coupled with a drastic comparison, is not palatable to those who pay the taxes, and yet it is for the common good that our shortcomings be candidly presented and a remedy sought.

Wherever bad management of public affairs is shown and extravagance and graft crept in, an analysis will invariably show the system responsible. Men when elected to public office which entails expenditure of public funds are as a rule honest and economical, but the elastic provisions of our laws permit the door of extravagance to open and the taxpayer foots the bill.

No remedy for existing evils in our tax system will come from the inside. Relief must come from the outside and such a movement has been inaugurated in this state.

The Alameda County Tax Association was organized something more than two years ago. Men prominent in business affairs gave their financial and personal support to the movement. Experts were employed to investigate the system in force among the different county and municipal offices; their reports issued in bulletin form were interesting and startling. It was conclusively shown that an immense saving could be made in conducting some branches of the county government with no loss in efficiency. A recent report of the association presented incontrovertible evidence that the cost to the taxpayers of Alameda County for elections held in 1910 and 1912 exceeded by thousands of dollars the amount which should have been expended.

The registration, primary and general election cost Alameda County, in 1910, \$149,009.53. The tax association shows in complete detail that the cost should have been \$39,869.78, showing a waste of the taxpayers' money of \$114,248.62. It is unnecessary to say that the taxpayers of Alameda County are now fully awake to the fact that there is something radically wrong with the tax system that permits such waste in public affairs.

The Alameda County Tax Association is attempting nothing meteoric. Its active president, Mark L. Requa, directs personally all the work. Careful investigation is made into every detail connected with the subject under examination. No complaint is voiced or fault found unless a remedy can be offered.

The unquestioned fairness of this association's work in showing the astounding waste of public funds, has brought them the endorsement of the people of that county, and its many civic organizations are strongly supporting the work.

At a recent mass meeting, the association was asked to appoint an engineer to investigate why the cost of building the city hall, auditorium and public schools was costing a large excess over the city engineer's estimate. So you see the association has become a sort of clearing-house for public expenditures. The association is practical. It sees no need for numerous city assessors, tax collectors and treasurers, when

one in each instance can accomplish the work. It believes in centralization because it produces efficiency and economy. It believes in a general manager form of local government, such as some few cities have already adopted. With public sentiment awakened and supporting them, it is but a matter of time when the administration of public affairs in Alameda County will be conducted on a strictly business basis. The work accomplished by the Alameda association naturally attracted widespread attention. Men prominent in business and professional life met and discussed the advisability of organizing a statewide tax association. The success attained by the Alameda body and the unquestioned field for similar economic corrections on a broader scale seemed to justify the launching of such a movement.

A meeting was called in San Francisco for October 22, 1913. The result of the call was a large attendance of prominent men, and the organization of the California State Tax Association.

Edwin R. Seligman, Professor of Political Economy in the Columbia University and president of the National Tax Association, said in a recent letter:

You are, of course, acquainted with the chaotic and unsatisfactory character of our state and local taxation. This new organization was designed to bring together the practical administrator, the business man and the scientific expert, in an endeavor to improve the situation and to afford a much needed relief to the taxpayer, by elucidating the principles of a sounder and more equitable method than exists today and by showing how these principles may be applied in practical life. I have been so struck by the good that has already been accomplished that notwithstanding a multitude of other occupations, I have consented to serve for a time as president of the association in the hope of furthering its usefulness. In a democracy like ours, public opinion, which is the sole moving force of legislation, must be educated by precisely such organizations, and in few domains of government activity, which come home to the average business man, is the need of an enlightened public opinion so pronounced as in the matter of equitable taxation.

The men who founded the California State Tax Association embody the component fitness Professor Seligman suggests. They represent the highest type of citizenship, business ability and professional training. Their sole object will be to enter into a thorough research in all matters connected with taxation and revenue.

Mr. John S. Drum, president of the California State Tax Association, briefly summarized, in his address at the meeting held October 22d, the objects of the association which are as follows:

There is nothing more important to the progress and welfare of a state and of the counties and municipalities existing therein, than an intelligent and economical expenditure of public funds. Despite this, the expenditure of tax moneys is given very little practical business attention. Although millions of dollars are annually handled and expended by the political bodies of the state, the tax-paying public knows little if anything of the manner in which this is done. Men engaged in various business pursuits, to be successful, must know, and do know, all the details of their own particular business. They know how such business must be administered on the soundest economical basis, and yet if you ask them anything about the much greater business in which they are interested, to wit, the proper maintenance of the state, county and municipal governments, which are the largest of our business corporations, and which expend the largest sums of money, you will find that they know nothing about it, and give it no attention. The result of such indifference is to leave the door wide open to extravagance, and political bodies are thus able to live beyond their means, just the same as individuals.

At present the data on the subject of revenue and taxation show that our increase in taxation exceeds our growth in population and increase in property wealth. California is upon the threshold of great intensive development, and steps should be taken at this time to reconstruct a fiscal system that shall be based upon the soundest principles of equity and economy.

The California State Tax Association intends to be absolutely nonpartisan and nonpolitical in character. There is no intent of criticising public officers. It is the system of revenue and tax administration that is wrong, and the taxpayers themselves are properly charged with the duty of changing and endeavoring to reform it. The work of the State Tax Association should be along research lines, covering everything pertaining to revenue and taxation, with the purpose always of seeking to correct existing evils and to promote economy in the collection and expenditure of public funds, both state and local, and to advocate and urge a direct interest on the part of taxpayers generally in the matter. To do this it is absolutely necessary to educate taxpayers to the importance of the subject. This can be done largely by publicity, through the preparation and distribution of pamphlets giving important facts and data pertaining to the subject.

Our state, county and local governments must be handled on a business basis. Efficiency in organization and management is imperative. In some instances this can be attained by consolidation of offices and departments, in others by the abolition of duplication of duties; also, by the employment of highly efficient and well paid men, of proper training, to control large public enterprises.

It is the intention of the association to organize active tax bodies in the principal counties of the state. These local bodies will cooperate with, and be encouraged and educated by the state association. Legitimate competition between countries in matters of economy and prevention of waste will be brought about to correct revenue and taxation defects, as they exist at present.

The Alameda County Tax Association has already shown what can be achieved through active and intelligent work, if persevered in. Great economies have already been put into effect, and it is the hope of the officers of this association to reduce the expenses of government 30 or 40 per cent.

President Drum has comprehensively outlined the association's proposed work.

There is no intention to attempt a whirlwind reform. Such movements fall by the wayside. To the contrary the work undertaken will be carefully done and consequently slow. All data will be issued from time to time in bulletin or pamphlet form and given full publicity; in fact publicity is the keynote to success, in a work of this character.

It is hoped the press throughout the state will aid the association in its efforts to reach and interest the people as success can be achieved only through an enlightened public opinion.

PUBLIC OPINION ON ASSESSMENTS.

By F. A. BONDSIU, County Assessor, Mariposa County.

Mr. President and fellow assessors:

I take it for granted that no apology is in order when an assessor is called upon to perform any task, therefore I will make no excuse for this paper, for no matter how difficult the task an assessor "must not make reply, his but to do and die." Otherwise he has no business to be an assessor.

Public opinion on assessments is the subject your Mr. Jarvis as a member of the programme committee has assigned me, and if I say anything that will not exactly coincide with the opinion of the people of Amador County, all they have to do is to blame it all to Jarvis, for if there is a person on earth whom the people often blame for the misdeeds

of another it is the assessor. For an instance of this we will take the case of an assessor who, contrary to public opinion in the first instance, concludes that property is increasing in value in his county and that the assessment should be raised a little higher than it has been for the past ten or twenty years, and he determines to comply with the law a little closer in assessing at nearer the actual cash value. He therefore makes a raise all along the line. The public, or at least some of them, also raise—a howl. He appeases their wrath for the time to some extent by explaining that the raise in assessments will produce a corresponding reduction in rates and the tax will be the same. This looks correct and figures will not lie, and Mr. Taxpayer is satisfied so long as he has to pay no more taxes.

Everything is satisfactory until Mr. Taxpayer gets his tax bill and finds it is more than it was the previous year, and Mr. Assessor is again called upon to explain, and he finds upon investigation that his figures were all right, but that the board of supervisors had upset his calculations. They had taken advantage of the fact that the roll was raised and therefore the opportunity had arrived to spend more money than usual and still not have any greater tax rate. They felt secure in the estimation of the public so long as they made no greater tax rate than the previous year, but who was to be called to account for this increased tax bill? The assessor of course! It might be said that public opinion should not weigh with an assessor in making assessments. Let us see: the government of our state is accomplished only through the consent of the people who are governed. This is done indirectly by the people when they elect legislators upon whom rests the responsibility of passing such laws at Sacramento as will provide a manner of collecting revenue sufficient for the expense of the state and county governments, and also directly by the people when they vote directly for the adoption of amendments to our constitution providing for taxation of property. Therefore they are in a measure responsible for whatever tax laws they burden themselves with, and should abide by the methods laid down for an assessor to pursue.

On the assessor rests the responsibility of carrying out the provisions of such laws as are passed, and providing a basis for the principal source of revenue for the county at least: and that basis is the valuation he puts upon property. Therefore, if the legislature passes a law, which provides "that all taxable property shall be assessed at its full cash value," shall the assessor carry out this provision according to the strict letter of the law? If he does so, what would the dear public do to him? I venture to say that nothing short of a recall would be attempted, yet he would be perfectly justified in making his assessments on that basis, and I challenge any one to show good reasons why property should not be assessed at its full cash value. Now that the separation of state and county taxation has been successfully accomplished, this method could work no hardship on the taxpayer of the county whose taxes are used exclusively for county purposes and we could have a basis for assessments that would be fixed and more stable than adopting a certain percentage of the actual cash value.

In the matter of making assessments the public I believe should be taken into our confidence to a certain extent, and their opinion taken for what it is worth and not for more. The assessor is and should be an expert in his line, and it is my observation outside of my own county

that the average assessor is quite an expert in matters of assessments and is as fully entitled to this appellation as most experts in other lines. He should not be influenced by the opinion of people whose knowledge is necessarily limited to the valuation of one class of property only, and who have to pay taxes on this particular class of property, for in this age of close financing it is a struggle to see who can close up their business at the end of the year with as small an expense account as possible, and any effort to reduce the tax expense, at the expense of some other class of property, is justified in the minds of many people and corporations. The money has to be raised and if any person escapes it must be at the expense of some other taxpayer. The assessor must therefore be proof against the advice of persons representing special interests in any one class of property, for if he listens to the man who has timber assessments only to be taxed, he will hear convincing arguments that such property should not be taxed the same as other property, that it yields no income till the timber is cut and then but one crop; and he will hear all about how to conserve the forests by keeping the assessment down.

The farmer can usually show us that for the past twenty years he has made barely enough to keep out of debt and keep his taxes paid. The mine owner can easily show us that his property has never paid a dividend, and that you are assessing something that is not in sight, of unknown value. Yet Mr. Mine Owner often wants from \$5,000 to \$10,000 for his mine and sometimes gets it. Mr. Farmer wants from ten to forty dollars per acre for his land and often gets it. Mr. Timber Land Owner, if he has first class timber, holds the same at from \$40 to \$100 per acre and always gets it, if he is willing to sell.

Therefore, we can not be guided so much, it seems, by the income of the property for county assessments, as by the market value if we are to get at the actual value; nor can we be influenced by the opinion of one class of property owners as arrayed against another class, but we must listen patiently to all of them and prove to their satisfaction that we are not favoring one class of property more than another, for each class of property owner thinks he is assessed out of all proportion and can only be satisfied if you can show him that he is not treated worse than the other fellow.

The average taxpayer pays any other bill with less protest than he does his tax bill, and still it is just as much of a debt that he is in honor bound to pay as any other indebtedness, yet many people think taxation is somewhat of a holdup anyhow, and it is obvious whom they think is the main holdup man.

This holdup idea in the minds of the people is most forcibly exemplified in their conduct respecting the payment of poll tax. If there was ever a form of taxation that most people think is abominable, it is the poll tax, and for an expression of public opinion on this subject, just watch the result of the vote of the people on this matter when the constitutional amendment abolishing this form of taxation comes up at the next general election.

And to add to the unpopularity of this form of taxation, the boards of supervisors of many counties, including my own county have taken advantage of the law on the statute books which permits them to levy an additional poll tax called a road poll tax, which must be collected by the assessor at the same time he collects the state poll tax. The col-

lection of this additional poll tax for road purposes calls forth a storm of abuse from a large percentage of the persons subject to such tax, and my experience has been that about fifty per cent of the people would absolutely refuse to pay this tax if not forced to do so under section 3848, which compels the employer to deduct it from the wages of employees. I have had to invoke this section of the code in my county, for it would be unfair to those who pay willingly to permit any one to escape.

Do not understand me as condemning such a form of taxation, for it has merit and is the only method yet devised to obtain a cent of taxes from a certain class of foreigners who are ineligible to citizenship. I mention it merely to illustrate public opinion on this form of assessment.

Now in conclusion, I will suggest that we give the public as fair and impartial assessments, based on such knowledge of the subject as we can gain by experience and the cooperation of the State Board of Equalization and the State Tax Association who are always at our hand with expert assistance in these matters, and that we invite the public to cooperate with us in our efforts to have the legislature pass such laws as will enable us to extract sufficient money from the taxpayers with the least amount of friction, to the end that the public will eventually have a better understanding of our motives in making assessments.

FEDERAL INCOME TAX.

Introduced by Hon. Cordell Hull of Tennessee. Adopted October 4, 1913.

By GEO. E. MITCHELL, Tax Agent.

Without entering into any discussion as to the political reason why an income tax was adopted by the 1913 Congress of the United States, the fact remains, that we now have such a revenue measure, and from all political indications this income tax is now and will continue to be a definite and permanent part of our revenue system.

It is for this reason that a brief discussion of some of the main provisions of the measure, relating to the income of individuals only, is of some importance and possibly may be of interest to you at this time.

Briefly stated, this income tax imposes a tax of 1 per cent on all annual incomes over \$3,000 and under \$20,000. On incomes over \$20,000 an additional progressive surtax is imposed rising by steps until a tax of 6 per cent on incomes of \$500,000 or over is reached.

Many citizens feel that such a tax on personal incomes should only be resorted to in times of war or under stress of some extraordinary emergency. This tax measure has also been criticized by its opponents, along the lines that an income tax is too inquisitorial in its general provisions and out of harmony with American ideas of legitimate privacy. It is also claimed that this tax will be costly to collect, and that it places a premium upon concealment and evasion thus inviting the practice of fraud. Another objection to this measure was that it would create class legislation by taxing some incomes at only 1 per cent and others at 6 per cent, etc.

One important question, however, is presented by the adoption of this income tax, and that is the principle involved in taxing wealth or at least of recognizing the obligations of wealth simply because it is wealth and taxing the same on a progressive rate in accordance with the income produced.

Be that as it may, we now have the income tax and undoubtedly we will continue to pay taxes on our incomes (provided we are fortunate enough to have such a thing) in the future. Past experience shows that the federal courts invariably sustain all revenue laws not inconsistent with the constitution and it is safe to assume that the exempted many will never give their votes or consent to a reconsideration of this question.

PERSONS AFFECTED.

It has been estimated by the treasury experts that the number of fortunate or unfortunate persons to whom this tax would apply was about 425,000, thus showing that only this number of people in the United States have an annual income of over \$3,000. Thus we have created a new class of a privileged class. A witty writer puts it, "Do you belong to the new *four hundred thousand club*?"

Statistics show that the average income in the United States is under \$1,000 per year. The estimates by experts show that about 300,000 persons have an income between \$3,000 and \$10,000, or about three fourths of the total number of persons affected by this tax; 350 persons have incomes from \$500,000 to \$1,000,000 per year, and 100 persons have incomes over \$1,000,000 per year.

We might all say right here that we would be perfectly willing to pay this tax provided we had an income of \$1,000,000 per year, in fact be willing to drop off a cipher or two and still be satisfied. The estimates for California vary somewhat, but about 90,000 persons will be affected. We show up fairly well, and these figures show that 500 Californians have incomes of \$100,000 and over each year.

HISTORY.

This is not the first time an income tax has been in existence in the United States. Back in the sixties such a tax was adopted as a war measure. The tax imposed at that time was 3 per cent on incomes above \$600 and 5 per cent provided the income exceeded \$5,000. In 1864 the rate was increased to 5 per cent and in 1865 the rate was again increased to 10 per cent on all incomes over \$5,000, which rate stood until 1867 when a flat rate of 5 per cent was imposed on all incomes in excess of \$2,000. In 1871 about \$18,000,000 per annum was collected through this tax.

In short this Civil War income tax was excessive in comparison with the present law. Again in 1894 an income tax was imposed of $\frac{1}{4}$ of 1 per cent on the gross receipts of certain classes of corporations with \$4,000 and over, and again in 1909 another income tax was imposed of 1 per cent on the net income in excess of \$5,000 for all corporations. This last income tax produced about \$35,000,000 per annum.

COMPARISONS.

As a matter of comparison let us see what other and older countries than ours are doing in this matter of an income tax. We take the liberty of quoting from a speech by Congressman Hull, who introduced this measure in the United States Congress.

Fifty-two countries and states have taken this step and whenever given a reasonable trial this form of tax has never been repealed save in the United States. England, Australia, and most of the English colonies, Prussia and the numerous other German states, Switzerland, Spain, Italy, Norway, Sweden, Holland, Hungary, Greece, Japan, Denmark, Austria and numerous other important countries have this tax in operation, while France is on the verge of adopting a comprehensive income tax law in lieu of numerous other taxes. In many or most cases other countries have adopted and maintained this tax for the twofold purpose of securing revenue and equalizing the burdens of taxation.

EXAMPLE.

As already shown, the rate imposed by our new income tax law is 1 per cent on incomes over \$3,000, which would mean that provided your income was \$5,000 per year the tax rate of 1 per cent would apply to only \$2,000, and the tax paid would amount to but \$20. Certainly this does not seem excessive when we compare the amount allowed for exemption and the tax rate applied to other countries.

Great Britain.—First introduced in 1799, \$200 exemption; now 3½ per cent on incomes over \$800 and under \$10,000, and close to 6 per cent on incomes in excess of \$10,000 and up to \$15,000. England produces about \$200,000,000 through income taxes.

Prussia—Exemption is \$225.

Austria—Exemption, \$250.

Italy—Income tax rises to 20 per cent on large incomes.

New Zealand—Exemption, \$1,500; 5 per cent tax on incomes over \$6,500.

Japan—\$500 incomes are taxed nearly 4 per cent; \$100,000 incomes are taxed over 20 per cent.

ANNUAL INCOME.

We all have a pretty fair idea of what our annual income amounts to, and under the provisions of this act, all incomes from whatever source must be returned. This includes income from salaries, trades, professions, rentals, interest, etc.

Two general methods are provided relating to the tax imposed:

(a) The "normal tax," which constitutes a tax of 1 per cent on the net income regardless of what amount said income may be.

(b) In addition to this normal tax of 1 per cent there is levied an "additional tax" on the net incomes of individuals (but not corporations) when said incomes range:

From \$20,000 to \$50,000	-----1	per cent additional.
From 50,000 to 75,000	-----2	per cent additional.
From 75,000 to 100,000	-----3	per cent additional.
From 100,000 to 250,000	-----4	per cent additional.
From 250,000 to 500,000	-----5	per cent additional.
Over 500,000	-----6	per cent additional.

EXEMPTIONS AND DEDUCTIONS.

Let us now see what exemptions the law allows and what deductions can be made to arrive at the actual net income per year.

First—There is an exemption of \$3,000 but only $\frac{5}{6}$ for 1913.

Second—Then for an individual (which term also includes partnerships, but not corporations) a further exemption is allowed of—

(a) \$1,000 for a married man with a wife living with him. (If he is really married.)

(b) \$1,000 for a married woman with a husband living with her.

The law simply says that "a married man with a wife living with him," is entitled to this \$1,000 deduction. We presume, however, that the framers of this act intended that the married man would live with his own wife, although the act does not so specify.

This particular \$1,000 exemption looks like a fine on bachelors and spinsters. The men, however, have no excuse; they ought to be married anyway. In fact, it would be a bad state of affairs, and the wife would be a pretty poor manager, when she could not hold the family income down to \$4,000 per year (\$4,000 for a man and wife; \$6,000 for brother and sister).

The original act included further exemptions for married persons having minor children dependent upon them, but for some reason this exemption was eliminated. We must therefore conclude that the framers of this measure are not in favor of big families. (I should worry!)

The salary of the present president of the United States and the federal judges now in office is also exempted for certain constitutional reasons. It was held that the salaries of these officials during their respective terms of office could not be diminished for any purpose, taxing or otherwise, but as none of us expect to become president or assume the duties of a federal judge, we are not concerned about this exemption. The salary of all other federal employees is, however, subject to the tax.

Another exemption from income is the salaries of state employees or any political subdivision of a state, meaning the employees of a county, city, town or district. (We ought all of us now, to hustle around and secure some state or city job, so we can brag a little that some of our income is exempt.) It is presumed that this exemption was to allow any state in the Union that contemplated adopting an income tax of its own, to tax the salaries of its own officials.

STATE INCOME TAX.

By the way, the State of Wisconsin now has an income tax with an exemption of \$800 for a single person, \$1,200 for a married person and \$200 for each minor child. The rate ranges from 1 per cent to 6 per cent. A man residing in Wisconsin will now be compelled to pay two income taxes, one to the federal government and the other to the State of Wisconsin, aggregating approximately 10 per cent on the larger part of this income.

Right here, don't forget that the constitution of this state already contains a most liberal clause permitting an income tax.

Under section 11, article XIII, "Income taxes may be assessed to and collected from persons, corporations, joint stock associations or companies resident or doing business in this state or any one or more of them, in such cases and amounts and in such manner as shall be prescribed by law."

The legislature can at any time adopt a revenue measure, taxing incomes in the State of California. The provisions of our constitutional section are very broad. The income of citizens may or may not be taxed, likewise the income of corporations. Certain classes of income can be exempted and others taxed, so be prepared, for this is yet possibly to come about.

OTHER DEDUCTIONS.

1. Provided you are in business you can deduct the expenses actually incurred for carrying on said business, but you can not deduct your personal living or family expenses.

2. Interest paid on any indebtedness, also all taxes and losses sustained during the year which have not been compensated by insurance or otherwise. Provided anyone owes you money and you can't collect it, and you keep a set of books, and you keep the books correctly, and enter this bad debt in said books for the year you considered the party who owed it not good pay, you can deduct the amount of said debt from your income. If we could only add up all of our past bad debts, and deduct them, we never would have to pay any income tax. (Income from poker and horse racing.)

3. Provided your house needs painting or the water pipe leaks or the girls' room needs papering. Such items can be classed under the term "depreciation" and can be deducted. (Betterments and additions, rooms added, etc.)

4. Now we come to a double barreled provision, one that shoots both ways, going and coming. Provided you are employed by some one else and your annual salary exceeds \$3,000, the other fellow makes your return for this income tax, which is called or classed as "withheld at source," and provided you have any other income outside of your salary, you must either make the return of this other income to your employer on or before January 29, 1914, or make return direct to the Collector of Internal Revenue. Just to keep people honest a small fine of \$300 is thrown in here for any fraudulent notice given to "withheld at source." (Your employer or corporation, etc.)

On the other hand, provided you employ any one whose salary is in excess of \$3,000 you, personally, must make the return and pay the tax for said party (of course holding the amount of said tax out of his salary.) The law holds you personally responsible for the amount of this tax. The same provisions of the law applies, should you be a guardian of a minor, or a trustee for anyone or the executor or agent of an estate or for an absent person.

REAL ESTATE AND LEASES.

5. Provided you have leased any of your property for a sum in excess of \$3,000 per year, or \$250 per month. Your tenant is required to make the return and pay the tax; you have nothing to do with the matter, that is, in so far as this particular amount of income is under consideration; also provided anyone pays you interest on a mortgage, you may hold on their property, they make this return for you and they pay the tax. For any other income you must file your own return with the collector, unless your income is over \$20,000, then "additional." Provided you purchased a piece of real estate this year and sold it the same year, it would appear that any profit realized is to be considered as income for that year. Provided the real estate had been acquired some year prior to the adoption of this measure, and sold this year, then the profit arising from said sale should be prorated in accordance with the number of years the land was held by you and the number of years the law has been in effect.

FAILURE TO RECEIVE BLANKS.

The enactment of this income tax law is a notice to all persons that the tax is due and payable at certain times. While, undoubtedly, the Collector of Internal Revenue will try and forward the necessary blanks and statements to every one, failure to receive such blanks is no excuse. Thus, provided you failed to make the proper returns within the legal time specified, the penalty imposed is a fine of not less than \$20 or more than \$1,000.

Under the provisions of this measure, it would seem that the law contemplates that every one should make some kind of a return, and it is left to the discretion of the Collector to ascertain whether or not you are subject to a tax. So if you do not receive a blank, you will have to hunt one up yourself and file same within the prescribed time, if you have over a \$3,000 income.

The act provides that the income returned for this year shall embrace the period only from March 1, 1913, to December 31, 1913, both dates inclusive. Blanks will be mailed to you about January 1, 1914. You must file your return on or before March 1, 1914. On or before June 30, 1914, taxes must be paid.

In addition to the penalty imposed for failure to render a return, a further penalty for making a false or fraudulent return is imposed. Making such a return is classed as a misdemeanor and is punishable by a fine of not over \$2,000 or not more than one year imprisonment or both, and the cost of prosecution.

RETURNS SECRET.

All tax statements and returns of all kinds relating in any way to this income tax are not open to inspection by the public except by direct permission of the President of the United States.

A fine of \$1,000 or imprisonment not exceeding one year or both, and also dismissal from office is the penalty imposed for any Collector of Internal Revenue, Deputy Collector, or any other employee of the United States, who shall divulge or make known in any manner information of any kind contained in any report.

There is one very common thing about the income tax and that is its elasticity. Any tax measure that can be stretched to meet emergencies is always considered a practical measure. It must be flexible to provide for all emergencies. Provided enough income can not be obtained by taxing incomes at the rate of 1 per cent, then all that is necessary is to increase this rate to $1\frac{1}{2}$ per cent or 2 per cent or we can take the other end of the proposition and do what they do in Germany, lower the exemption from \$3,000 to \$1,000.

During the year the German Emperor was celebrating his silver jubilee, the imperial parliament of Germany increased the expenditure for armament over the previous year \$250,000,000. This increase of \$250,000,000 was not secured by raising the percentage of taxation upon the incomes of Germany by increasing the rate a little higher. Instead it was raised by lowering the exemption from \$2,500 to \$1,250, thereby placing the increased burden of this \$250,000,000 almost entirely upon the moderately well-to-do people of Germany whose incomes range between \$1,250 and \$2,500 a year.

PROCEEDINGS
OF
Thirteenth Annual Convention County
Assessors' Association
HELD AT
Merced, Merced County, December 7, 8, 9, 1914

WHEREAS, An All Wise Providence has in His wisdom seen fit to remove from our midst our much esteemed associate and coworker John H. Hollister of San Luis Obispo County, and

WHEREAS, His sterling worth, true manhood and sincerity have made and left an everlasting impression on the members of this Association; therefore, be it

Resolved, That in the death of John H. Hollister this Association has lost one of its most esteemed members; and that while we bow in humble submission to the will of Him who doeth all things well, we are yet constrained to say—

“There was, there is, no greater, grander, manlier man.”

M. D. LACK,

CLIO L. LLOYD,

MONTGOMERY M. MOULTON,

Committee.

THIRTEENTH ANNUAL SESSION OF COUNTY ASSESSORS' ASSOCIATION.

Proceedings of the County Assessors' Association of the State of California,
Thirteenth Annual Session.

The Association was called to order at the city of Merced, California, at 10 o'clock a.m., December 7, 1914, in the city hall.

President Ed W. Hopkins, assessor of Los Angeles County, in the chair.

The president introduced Mr. H. P. Spencer, cashier Farmers and Merchants Bank of Merced, who on behalf of the mayor and the civic bodies and the people of Merced, extended a hearty welcome to the assessors and their friends, and hoped that their visit to Merced would be a source of enjoyment and that the meeting would be a successful one.

Mr. Spencer said in part:

"Merced, if I may be pardoned for making reference to home matters for a moment, has some attainments that may well be mentioned, and as to her ambition, she is determined to foster and uphold the more rational and ethical aims of the booster spirit, and put behind it the energy and liberality of her people, until she shall stand in the very front rank among the inland cities of our great state.

"Referring specifically to some of the matters of which she may justly be proud, I may suggest in the first place that she is situated almost in the center of the great San Joaquin valley and that she sits like a jewel the thrifty husbandman that these, too, can be grown at splendid profit, upon the bosom of a former desert. She is well and substantially built. Her streets are broad and clean and she has more miles of asphalt pavement than any other city of the same size in the state. It is claimed, and I think without contradiction, that under normal conditions, our banks carry larger per capita deposits than those of any similar city in the Union.

"While we have not the latest, and perhaps most to be commended form of city government, we have an administration that is progressive and up to date, and one in which we have the utmost confidence.

"We are the natural gateway to one of the most stupendous of the many 'wonders of the world'—the Yosemite National Park. One has recently said that 'in this famous park there is grouped a greater galaxy of startling and charmingly beautiful scenic aggregations, within a radius of convenient accessibility, than in any place in the wide, wide world.' There stands in over-awing majesty that gigantic old rock El Capitan, the domes of Cathedral Spires, the peaks and towers of the Three Brothers, the Three Graces and Sentinel Rock, and when satiated with these and similar wonders, one can feast his eyes upon the graceful beauty of Bridal Veil Falls and the filmy grace of Yosemite Falls and the charming individuality of Nevada Falls, or dip his cup for a refreshing draught from the cool waters of Mirror Lake—one of the most strikingly beautiful lakes in the world. I felicitate you, gentlemen, upon the fact that you are to lighten convention routine by a visit to this wonderful park during this season.

“I will mention further what some of you may already know, that Merced is surrounded by a vast stretch of well tilled and fertile acres, yielding in abundance those products that are contributing to the wealth and happiness of our people. If you will but visit our chamber of commerce rooms and examine the specimens you shall find there of the products of our soil. I think I may have your confirmation of our claim as to land fertility. This is the natural home of the fig and olive. The almond and English walnut groves are demonstrating to the thrifty husbandman that these too can be grown at splendid profit. This, too, is the home of the Merced sweet potato—than which there is none better. It stands without a peer and readily commands the highest market price. The blue ribbons we have won on our luscious fruits, over all competitors, are carefully guarded in the archives at said chamber of commerce, and speak for themselves. I would like also to mention our dairy and hog interests, which are rapidly growing. The profits from the output of these branches of our industry are no longer inconsiderable.

“While all this is essentially true, we do not expect you to sharpen your pencils and begin to figure out how you can increase the assessed valuation of our county, but take these as passing rhetorical statements.

“I will tell you further that there are about us, now indifferently tilled, thousands upon thousands of acres of as good land as our genial sun shines upon, which must and will be brought under intensive cultivation because of the larger and more efficient system of irrigation which is easily within our reach, and which will doubtless soon—possibly very soon—be appropriated.

“We venture the opinion, gentlemen, that from the Sierras to the sea there is no place where nature has been more lavish in her gift of fertile acres, or in providing a more salubrious climate—no place where she has given stronger encouragement to thrifty men to wrest from her abundant storehouse the wealth of the soil, and build for themselves and their posterity prosperous and beautiful homes, than right here in Merced County.”

Assessor Clarence E. Jarvis responded, thanking Mr. Spencer for his kind words of welcome.

President Ed W. Hopkins addressed the Association, reviewing the work of the Association since the last session and of the many matters that should be taken up at this meeting and thoroughly discussed.

Secretary Thos. M. Robinson called the roll and the following named answered “present”:

Assessors—Amador County, Clarence E. Jarvis; Butte County, A. E. Morton and wife; Kern County, Edith F. Coons; Los Angeles County, Ed W. Hopkins and wife; Mariposa County, F. A. Bondshu; Mendocino County, W. S. Van Dyke; Merced County, A. G. Clough and wife; Napa County, Robert Corlett; Orange County, James Sleeper; Riverside County, C. B. Bayley; San Mateo County, C. D. Hayward; Santa Barbara County, Clio L. Lloyd; Shasta County, M. D. Lack; Siskiyou County, Stuart Taylor; Stanislaus County, Geo. A. Threlfall and wife; Ventura County, John A. Barry; Fresno County, Geo. P. Cummings and wife; Inyo County, W. W. Yandell; Kings County, Geo. W. Murray; Madera County, C. F. Bonner; Madera County, F. E. Briscoe (elect); Sacramento County, Ed. J. Kay and wife; San

Francisco County, John Ginty; Santa Clara County, Mrs. L. A. Spitzer and daughter; Solano County, Ed. E. Long and wife; San Diego County, M. M. Moulton; Tulare County, Thos. H. Blair.

Deputies—Alameda County, Thos. M. Robinson; Alameda County, J. C. Hedemark; Merced County, Fay Robinson; Kern County, Miss Bertha Brite.

State Board of Equalization—Richard E. Collins, Jeff McElvaine, John C. Corbett (elect), Thos. M. Eby, secretary, and wife; John S. Chambers, State Controller; Prof. Carl C. Plehn, State Tax Expert.

Associated Members—Harry J. Squires, assessor city of Berkeley; Chas. E. Jewett, A. O. Adams, W. V. Hill, F. A. Waters and wife, Los Angeles; L. E. W. Pioda, San Francisco; J. H. Ellis, Merced; Geo. E. Mitchell, San Francisco; A. W. Baker, Oakland; E. A. De Camp and wife, Los Angeles; H. P. Spencer, Merced; M. A. Grant, Redlands; J. W. Madrill, Los Angeles.

On motion, Mr. H. P. Spencer of Merced, M. A. Grant of Redlands and Bertha Brite, deputy assessor of Kern County, were elected associate members.

Communications.

The following communications were received, read and filed expressing regrets for not being able to attend the meeting of the Association: J. C. Hanna and Geo. O. Meese of Contra Costa County; John W. Moore of San Joaquin County; Washington Dodge of San Francisco; Edward Rolkin, member of State Board of Equalization; Adam F. Sutton of Colusa County; Alfred Sutro of San Francisco; C. E. McQuaid of Sutter County; W. M. Weaver of Imperial County, and J. R. Allen of San Francisco.

The following invitations were received, read, accepted and filed: Elks Club of Merced and Native Sons of the Golden West, inviting the Association to avail themselves freely of their halls, club rooms and facilities.

The committee on programme and order of business reported as follows:

December 7, 1914.
10 a.m.

Meeting to be called to order.

Address of welcome, H. P. Spencer, cashier Farmers & Merchants Bank of Merced.

Response, Clarence E. Jarvis, assessor Amador County.

Opening address, Ed W. Hopkins, president Assessors' Association.

Reading of minutes of last session, Thos. M. Robinson, secretary.

Reports of committees.

2 p.m.

Address, "Needed Legislation," Geo. P. Cummings, assessor of Fresno County.

Paper, "State Revenues," John S. Chambers, state controller.

Paper, "Corporation Assessments," Geo. E. Mitchell, tax expert of San Francisco.

2:30 p.m.

The Merced Improvement Club of Merced will entertain the ladies with a reception at Hotel El Capitan.

8:30 p.m.

Dance at Hotel El Capitan.

Tuesday, December 8.

10 a.m.

Address, "Somers's System of Equalizing Values," M. A. Grant, expert.

Paper, "Federal and State Income Tax," Prof. Carl C. Plehn, state tax expert.

2 p.m.

Paper, "Torrens Land Laws in Other Countries," John Ginty, assessor of San Francisco County.

Paper, "Exemptions," M. M. Moulton, assessor of San Diego County.

Paper, "Historical," E. A. De Camp, tax expert of Los Angeles.

2 p.m.

Visiting ladies tendered an automobile ride through the City of Merced and suburbs.

8 p.m.

Invitation extended by the Native Sons of the Golden West to members of Association and ladies to a reception in their hall.

Wednesday, December 9.

10 a.m.

Paper, "National Tax Association," John Mitchell, chairman State Board of Equalization.

2 p.m.

Election of officers, appointment of committees, selection of place of meeting of fourteenth annual session of Assessors' Association.

7 p.m.

Banquet at Hotel El Capitan under the auspices of Merced County Chamber of Commerce.

The Association was called to order at 2 p.m.

Assessor Geo. P. Cummings of Fresno County addressed the convention on "Needed Legislation." Discussion followed. Those taking part were Thos. M. Eby, Geo. A. Threlfall, John Ginty, C. E. Jarvis and M. D. Lack.

Paper presented and read by State Controller John S. Chambers, entitled "State Revenues."

Discussion, John Ginty, A. E. De Camp and Clarence E. Jarvis.

Paper presented and read by Geo. Mitchell, entitled "Corporation Assessments." (Not to be printed in the minutes.)

Discussion, Clio L. Lloyd, Prof. Carl C. Plehn, John Ginty, Thos. M. Eby, Clarence E. Jarvis, M. D. Lack and E. E. Long.

Assessor F. A. Bondshu announced that on Thursday morning, December 10, an excursion by special train will leave for Yosemite Valley and stops will be made at Merced Falls, Yosemite Lumber Company, several gold mines; returning, the assessors will leave the valley, arriving at Merced City at 1 p.m. Saturday, in time to connect with all trains north and south.

Adjournment until tomorrow morning 10 a.m.

Thursday, December 10.

Association called to order at 10 a.m., President Ed W. Hopkins presiding.

Mr. M. A. Grant of Redlands was introduced and entered into full explanations of the workings of the "Somers' system of equalizing property values."

Discussion, Geo. P. Cummings, M. D. Lack, James Sleeper, Thos. M. Eby, Ed. J. Kay and M. M. Moulton.

Paper, subject "Federal and State Income Tax," presented by Prof. Carl C. Plehn, state tax expert. The paper was fully illustrated by maps showing percentages of tax on incomes from lowest to highest.

Discussion, John Mitchell, Ed W. Hopkins, John Ginty, Geo. A. Threlfall, Thos. M. Eby.

Assessor Ed J. Kay requested that all assessors whose salaries were affected by the abolishment of all head tax, should remain a few moments after adjournment for recess. He also requested that Thos. M. Eby, John Ginty and Prof. Plehn remain and meet with the assessors.

The president, on motion, appointed Assessor M. D. Lack, Ed W. Hopkins and M. M. Moulton a committee to draft resolutions of condolence on the death of Assessor J. H. Hollister of San Luis Obispo County.

A motion, that when the convention adjourns for the day, that it does so out of respect for J. H. Hollister, deceased, was carried by a standing vote.

The ladies accompanying the assessors were at this time presented to the Association and were received by words of welcome by President Hopkins, who called upon Mrs. Thos. M. Eby, who thanked the Association for its kindness to the ladies and stated that they had organized an auxiliary association under the name of "Associated Assessors' Convention," and that the assessors would no doubt be proud of this new association, as it was the purpose of the ladies to work in full accord with the assessors.

On motion a recess was declared until 2 p.m.

At 2 p.m. the Association resumed its business.

The president announced that J. D. Burks was unavoidably detained and therefore could not present his paper, "New York City Assessment Plan." The president stated that he would endeavor to secure the paper so that it could be written in the minutes; that Mr. Burks was a graduate of the California State University and was thoroughly posted on methods of assessments.

The following resolution was presented by Assessor M. D. Lack and unanimously adopted:

WHEREAS, The press of individual and personal business has caused the retirement from our counsels and revenue business of this state one of our most valued members in the person of the Hon. Edward Rolkin; and

WHEREAS, We appreciate that his truly straightforward and painstaking counsel has been of much value to ourselves as well as the State of California; therefore, be it

Resolved, That this Association extend to the Hon. Edward Rolkin its most sincere wish for his abundant success in private life and may he in the future as in the past, continue to be one of the state's most valued citizens; and be it further

Resolved, That as an expression of our appreciation, we make the Hon. Edward Rolkin a life member of this' Association and present him with a life membership suitably engraved.

M. D. LACK,
E. E. LONG,
ED J. KAY.

On motion, the committee was instructed to prepare the life membership card to be presented to the Hon. Edward Rolkin.

Paper, "Torrens Land Laws in Other Countries," presented and read by John Ginty, assessor of city and county of San Francisco.

Discussion, Geo. P. Cummings, Ed. J. Kay, M. M. Moulton, James Sleeper, Thos. M. Eby and President Hopkins.

Miss Edith F. Coons, assessor of Kern County, elected first woman county assessor in the State of California, was introduced and responded thanking the Association for its kindness to her and hoped that her tenure of office would be entirely satisfactory to the people of her county and that her membership in the Association would give her many new ideas which would be put to good purpose in Kern County.

Paper, subject "Exemptions," presented and read by Assessor Montgomery M. Moulton of San Diego County.

Discussion; F. A. Bondshu, E. E. Long, Ed W. Hopkins, Ed J. Kay, Thos. M. Eby, A. G. Clough, Robert Corlett, C. D. Hayward, Clio L. Lloyd and Geo. A. Threlfall.

Assessor M. D. Lack reported to the Association that the assessors present whose salaries were affected by the constitutional amendment carried at the last general election, abolishing the payment of poll tax and other head tax, the commission received from the collections of same now constituting a part of the compensation of assessors' salary, was discussed by said assessors and a plan agreed upon to be taken up with the Governor, and that said plan would be presented to him by Assessor Ed. J. Kay of Sacramento County and John S. Chambers, state controller.

Paper, subject "Historical," presented and read by E. A. De Camp.

The president called to the attention of the Association that at 8 p.m. the assessors and friends would attend a reception tendered by the Native Sons of the Golden West at I. O. O. F. Hall, and desired all to attend.

John Mitchell, chairman of the State Board of Equalization, was called upon and addressed the Association, explaining the methods followed in the meetings of the National Tax Association and read a paper, subject "Increase in Public Expenditures," by Dr. Thomas S. Adams, secretary of National Tax Association, which paper, in the way of a report, was presented at the eighth annual conference of said association.

President Hopkins addressed the Association and urged the enforcement of the revenue laws of the state by the assessors of the several counties; that every assessor should be compelled by law to attend the meeting of this Association, so that matters coming before it could be fully discussed, which would enable each assessor to arrive at some uniformity of the ways of assessing property uniformly in tax bills, and in fact, uniformity in all matters pertaining and relating to assessments. The matter of making up the military roll was also taken up by him and the same was discussed at some length by Assessors Geo. P. Cummings, Ed. J. Kay, Robert Corlett and F. A. Bondshu.

Mr. E. P. E. Troy of San Francisco was called upon and addressed the Association on the subject, "Single Tax."

On motion a recess was taken until 10 o'clock tomorrow morning.

Wednesday, December 9, 1914.

The Association was called to order at 10 o'clock a.m., President Hopkins presiding, and the regular order of business resumed.

Assessor F. A. Bondshu addressed the Association, subject, "Timber Lands;" that an equal assessment could not be made on timber lands without the same be cruised by one competent and qualified; that the cruising of all timber lands should be done by the state and that a constitutional amendment should be prepared, submitted to the people and carried, requiring the state to cruise all timber lands and file same as a public record, so that assessors could properly place an equitable assessment thereon. Discussion, Assessors M. D. Lack, C. F. Bonner, C. E. Jarvis, Stuart Taylor and W. S. Van Dyke.

State constitutional amendment No. 15, adding section 1a to the constitution, providing for exemption from taxation of educational institutions, buildings, grounds within which same are located, not exceeding 100 acres of land, equipment, securities and income used exclusively for educational purposes, of any educational institution of collegiate grade within the state not conducted for profit, was read in full by Assessor Clio L. Lloyd and discussed by Assessors John Ginty, Ed J. Kay and Thos. M. Eby, secretary of State Board of Equalization, and it was the consensus of opinion that the legislature should pass proper laws for carrying out its provisions and define its operation.

TREASURER'S REPORT.

The treasurer's report shows receipts during the term-----	\$104 73
Disbursements -----	105 20
	\$ 47

On motion of Clio L. Lloyd, the annual dues were placed at \$2, payable at once.

On motion a recess was taken until 2 p.m.

At 2 p.m. the convention convened and resumed its business.

The following officers were nominated and elected for the ensuing term:

President, E. E. Long, assessor Solano County.

Vice President, Montgomery M. Moulton, assessor San Diego County.

Secretary, Thos. M. Robinson, assistant assessor Alameda County.

Treasurer, Geo. W. Murray, assessor Kings County.

Each of the officers elect addressed the Association.

The secretary read certain resolutions handed in by the Associate Assessors' Convention (the ladies' auxiliary) asking that the annual banquet of the County Assessors' Association in the future be held on the second day after opening of the convention.

On motion, same was unanimously adopted.

John Ginty, assessor of San Francisco County, presented letters from A. L. Cowell, assistant director of Congress of Panama-Pacific International Exposition, and from Chas. C. Moore, President of said Exposition, asking that the next annual meeting of the County Assessors' Association of the State of California be held in the city of San Francisco.

On motion of Assessor Ed W. Hopkins, it was unanimously carried that San Francisco be selected in which to hold the next annual meeting of this Association and that the date and time of meeting be left to the San Francisco assessor. John Ginty, to hereafter fix.

On motion the president was authorized to appoint a permanent committee to be known as the "Reference and Information Committee," said committee to be a clearing house of the Association for all matters affecting legislation where assessments and revenue laws are concerned; said committee to make an annual report; the president to name said committee within thirty days.

On motion it is the sense of this Association that, if possible, our next meeting should be held jointly with that of the National Tax Association.

On motion the secretary was instructed to take up the matter of railroad fares with the railroad companies.

Several eulogistic remarks were made by Secretary Robinson and E. A. De Camp commendatory of L. A. Spitzer, late assessor of Santa Clara County, and regrets that his good wife, now assessor of said county, should retire from said office. Mrs. Spitzer feelingly responded and thanked the Association for its kindness to both her husband and herself for the many courtesies extended to both.

On motion a vote of thanks was extended to Assessors F. A. Bondshu of Mariposa County, A. G. Clough of Merced, Chamber of Commerce of Merced County, the Elks Club, Native Sons of the Golden West of Merced, the Merced "Sun," and all the people of Merced for the entertainment and hospitality which has during this session of the Association been extended for the benefit and pleasure of its members.

On motion a vote of thanks was extended to Past President Ed. W. Hopkins for his faithful service during the past year and for the many courtesies he has extended to all the members of the Association.

On motion of Assessor Hopkins, the legislative committee was instructed to prepare an amendment to the constitution to be submitted to the people, changing the date of the commencement of the assessment from the first Monday in March to the first Monday in January, each year, and further, that a bill be prepared to be placed before the state legislature requiring all property owners to file their annual statement of their property within ten days after service of such statement.

Discussions, Assessors John Ginty, A. G. Clough, Ed J. Kay, T. M. Eby, Ed W. Hopkins, M. M. Moulton and others.

President E. E. Long announced the following committees:

LEGISLATIVE.

Assessor Ed. J. Kay, Sacramento County, chairman.

Clarence E. Jarvis, Amador County
P. H. Cochrane, Marin County
Robert Corlett, Napa County
George P. Cummings, Fresno
County

John Ginty, San Francisco County
M. D. Lack, Shasta County
Ed. W. Hopkins, Los Angeles
County

WAYS AND MEANS.

Assessor Montgomery M. Moulton. San Diego County, chairman.

A. E. Morton, Butte County
James Sleeper, Orange County
Geo. A. Threlfall, Stanislaus
County

F. A. Bondshu, Mariposa County
C. D. Hayward, San Mateo County
John A. Barry, Ventura County

EXECUTIVE.

Assessor A. G. Clough, Merced County, chairman.

Thos. H. Blair, Tulare County
C. B. Bayley, Riverside County
Geo. W. Murray, Kings County

Miss Edith F. Coons, Kern County
Stuart Taylor, Siskiyou County
Wm. A. Horton, Santa Cruz County

PROGRAM AND ORDER OF BUSINESS.

Assessor John Ginty, San Francisco County, chairman.

C. F. Horner, Alameda County
Geo. O. Meese, Contra Costa County
J. W. Moore, San Joaquin County

H. E. Harrison, Yolo County
J. C. Smith, Sonoma County
Clio L. Lloyd, Santa Barbara County

A recess taken until 7:30 p.m., at which time all were invited to attend a banquet tendered by the Merced County Chamber of Commerce to the assessors and their visiting friends in the spacious banquet hall at El Capitan Hotel.

Adjournment.

THE STATE BUDGET AND REVENUE.

By JOHN S. CHAMBERS, Controller.

MR. CHAIRMAN AND GENTLEMEN:

It was suggested to me that I talk to you today on the subject of "State Revenue." The topic is a pretty broad one, as I think all of you will admit, and I hardly know what phase of it to take up.

But inasmuch as I have been working for a month past, in conjunction with the State Board of Control, on the budget which it is our duty to submit to the coming legislature, I think it may prove interesting to you if I tell you how the budget is prepared and go from that to the revenue situation, considering the probability of a deficit due to the loss of the corporation license tax and the poll tax, and the suggestions that have been made for meeting this condition.

I think if I take one of the state institutions, say the Napa Hospital, and explain how we arrived at our conclusions as to what to recommend for its support and salary roll and special appropriations for buildings and general development, it will answer for all the others.

DEPARTMENTS NOT DIFFICULT.

It is comparatively a simple matter to make recommendations for the various boards and departments. There are few complications as to them. The estimates as a rule merely call for so much for salaries, traveling expenses, if any, postage, telegraphing, expressage, printing and so on. Occasionally it is necessary to decide whether this person's salary or that should be raised, whether more clerical help is required or whether the amount allowed two years ago for this expense or that

should be increased this year. Once in a while, of course, something unexpected occurs, but the task of preparing a budget as to the departments, generally speaking, is not a difficult one.

INSTITUTIONS PRESENT HARD PROBLEM.

But with the state institutions the problem is far harder of solution. The element of uncertainty is very much greater, especially with the hospitals, prisons and reform schools. But there is one thing that is certain as to them—their population, unfortunately, never grows less. The main problem is to figure on how great the increase will be so as to provide sufficient funds to pay nurses, attendants and guards and to buy food and clothing.

PROCEDURE—BLANKS SENT OUT.

Suppose, now, we take up the procedure. About the first of October a printed form was sent out from Sacramento to all the institutions with a request that certain data be supplied, such as the new sums asked and exact amount of the appropriations granted by the last legislature for support, salaries and special purposes; other receipts, as from pay patients, the sale of manufactured or farm products and so on, which constitute what we call the Contingent Fund; housing capacity, present population, population for certain periods, estimated population for the next two fiscal years and the yearly per capita cost for both support and salaries. Other information is also requested but not as so directly bearing on the budget.

MEETINGS AT SACRAMENTO.

After these reports are received dates are set for the official representatives of the various institutions to meet in Sacramento with the Board of Control and the Controller to discuss in detail the estimates sent in, to designate among their specials what they deem the most important, to urge by argument, if they see fit, the recommendation of all or any one of the items of their estimates and to reply to such questions as the members of the Board or the Controller may ask. In short, such conferences are clearing houses where the requests of the institutions are carefully sifted that the needs may be ascertained and recommended insofar as the state's revenue will permit—and the real needs are cared for, I am glad to say. Other demands more or less necessary are approved or disapproved as the condition of the treasury suggests.

NAPA, AS AN ILLUSTRATION.

We will assume that the Board of Managers of the Napa Hospital ask so much for salaries and so much for support for the next two fiscal years, beginning July 1, 1915, the amounts being in excess of those appropriated two years ago. This they justify on the ground that the number of patients will increase by so many the first year and so many more the second, basing the figures upon the percentage of such growth in the past for a defined period, as ten years. This point settled, then must come an agreement as to how many more nurses, attendants and so on will be required properly to care for the enlarged population. Then the per capita cost for support and salaries is considered. The increase in dollars and cents should agree, or practically so, with the increase in the number of patients and the number of employees.

THE PER CAPITA.

It is not contended that this per capita is accurate. Of course, the cost of buildings and general development do not enter into it, but there are so many things to be reckoned with that we concede it to be approximate rather than exact. But it answers the purpose very well indeed.

It is not nearly so uncertain as the estimate as to the increase in population. It is much easier to tell what it has cost to feed, clothe and attend a man than to say how many men it will be necessary to care for during a two-year period that does not begin for seven months yet. But, nevertheless, the system is working out in a very satisfactory manner.

HOW THE SPECIALS ARE CONSIDERED.

When the decks have been cleared as to support and salaries, the special items are taken up one by one. A certain number of cottages are asked and also additions to this building or that for the housing of patients. Assuming there are sufficient accommodations for the present population and that the new construction is needed for the anticipated increase in the number of patients, the housing capacity of the proposed cottages and wings is estimated to see if it corresponds with the estimate as to the population increase. Also, the cost of building the new structures is supposed to be based upon figures furnished by the State Engineering Department.

You will see from this how carefully everything is done. The purpose is to get as near to bedrock facts as possible, to leave as little to chance as can be left, to stop guessing and log-rolling and proceed along systematic lines.

Even where it is necessary to enlarge the receiving hospital, where the patient's stay is temporary, the kitchen, dining rooms, or assembly hall and so on, or build new structures of the kind, it must be shown that the capacity is strained now or will be by an increase in population, sufficient to justify the appropriation sought.

If, as at Napa two years ago, \$10,000 is given to reclaim a rich tract of land along the river, the assumption is that when these acres come under cultivation it will not be necessary to purchase as much alfalfa or vegetables as in the past. And the records are supposed to prove it or explain why.

I think I probably have said enough along this line. I aimed merely to give you a general idea of how the institutions are handled and to show the pains taken to ascertain essential facts. The detail is vast, but when taken up along systematic lines, the task is not as burdensome as it would seem.

NOT BINDING ON LEGISLATURE.

All of you understand, of course, that the budget as prepared by the Board of Control and the Controller for submission to the Governor and the Legislature, is binding upon neither. It is for their guidance, and two years ago served its purpose well. And I think it always will. The Governor and the Legislature are given a vast amount of data not only carefully gathered, but put into shape to meet the financial requirements of the situation. Convinced of this, they are not likely to ignore the recommendations made or to exceed them greatly.

About the time the hearings are completed as to the institutions and the departments, the Board of Control, the Board of Equalization and the Controller begin to estimate the probable receipts of the next biennial period. This done as near as may be, the Board of Control and the Controller again meet carefully to go over the institution and department appropriation estimates that they may be cut, if necessary, to correspond with the probable revenue.

This is a very hard undertaking. It must be said that the officials and institution managers play fair. They ask either for what they think they need at the time or should have for the proper development of their charges. Unfortunately, their demands can not always be met. The requisite funds may not be available. And it is natural, too, that the officials of an institution, ambitious to develop it and interested in their work, should occasionally ask more than should be granted.

In short, the estimates are trimmed to meet the revenue in sight, after first being denuded of demands not important enough or too excessive to be carried over for the final pruning.

THE REVENUE OUTLOOK.

The budget now under way will not be completed until toward the close of the month. I could not if I so desired, and it was permissible, tell you what it will aggregate. But I would like to talk to you a while on the revenue outlook, basing what I may say as to expenditures upon general calculations and assuming the estimate as to receipts to be approximately correct.

As all of you know, the state has been deprived of the revenue it formerly derived from the corporation license tax, amounting to over \$800,000 a year, and now has lost the poll tax which brought in as much more. In other words, the approaching biennial period has been deprived of receipts that would have aggregated in the two years over three and a quarter million dollars. It would take an extremely elastic tax system to withstand such an attack as this.

THE DEFICIT.

As a result, a deficit, in my opinion, is certain. Just how much this will amount to no one, of course, can say now. Not only is the budget not completed, but the legislature and the Governor have had no opportunity yet to act, the one to grant appropriations with a free hand, perhaps, and the other to wield his veto power as seems wise to him. Moreover, even when all this has been done, it remains for time to prove the correctness or incorrectness of the estimates as to receipts.

But this uncertainty is not enough to obstruct a pretty clear view of the future. We know that two important sources of revenue have been taken away and that while this may be offset to some extent by gains in other receipts, there is still a considerable gap to close. Moreover, California is a rapidly growing state and her governmental expenses show decided increases year by year, aside from what may be appropriated for general development purposes. We are cutting off at one end, to put it concisely, and spending more at the other.

It may not be good business for me to hazard a statement—and I want to make it clear that what I say now is subject to correction as

additional data is secured—but I feel convinced the deficit for the coming fiscal year, which will begin July 1, 1915, will be not less than \$2,000,000. As the corporation license tax and the poll tax together were bringing over \$1,600,000 a year and growing, it is clear what has caused the trouble.

CUT TO NECESSITIES.

This means, of course, that many things the departments and institutions should have, but not necessities, will be denied. Buildings that could be used to advantage now, let us say, but which are not indispensable will have to wait two years at least. But there are other expenditures which not only can not be omitted or curtailed, but which, in fact may have to be increased. The state's position is very different from that of the individual. Sufficient money must be provided for the proper support of a growing government. The schools, hospitals and prisons must be cared for. This does not mean waste or extravagance, but simply that there is a plain limit to where curtailment can be applied. That the brakes will be put on is assured, but a certain amount of speed must be maintained. The state can not stop nor hold back too hard.

NEW SOURCES OF REVENUE.

In other words, the anticipated deficit must be overcome by securing a greater revenue. Numerous suggestions have been made, but I will refer only to those that are likely seriously to be considered. These suggestions are: to raise the rates on all or several of the public utility corporations and the banks; to levy an ad valorem tax; a liquor traffic tax; an income tax; a license tax upon all lines of business not conducted by corporations which are now taxed otherwise, and the restoration of the old corporation license tax.

CORPORATION RATES.

It is to be assumed that the corporation rates would not be raised without an investigation by the legislature. In 1913, the State Board of Equalization submitted to the legislature a report on "The Relative Burden of State and Local Taxes in 1912," which showed that the burden on the property taxed for other than state purposes was 1.15 per cent of the true value and for property on which the corporation rates had been based for state tax purposes, 1 per cent. There is no reason to assume that conditions materially have changed in two years. If the percentages worked out at that time were correct there is every reason to believe they still are.

GENERAL PROPERTY TAX.

It was expressly provided in Senate Constitutional Amendment No. 1, so called, as adopted in 1910, that should the revenue to be derived from the taxes levied on the corporations be deemed insufficient, the Board of Equalization then was empowered to levy a general property tax sufficient to meet the deficiency. In other words, it apparently was not the expectation of the framers of the amendment that the taxes on corporations plus other receipts of the state would prove sufficient at all times for the support of the state government.

A doubt certainly existed or the provision for an ad valorem levy would not have been made. The present situation justifies the doubt. The revenue from the tax on corporations plus other receipts will not prove sufficient to meet the expense of maintaining the state government during the next fiscal year.

Shall the legislature, then, let the law take its course, putting the issue up to the Board of Equalization, or shall it turn to other sources for relief?

The easiest way would be to follow the path suggested by the law, although there might be protests because of the assertions so frequently made that the corporations must support the state and the people should pay no state tax. That idea has been instilled into their minds. Yet a tax along any of the other lines suggested also is likely to create discussion, but as none of them would fall upon the people as a whole like an ad valorem, the protests probably would not be so vehement.

A general property tax of five cents per \$100 of assessed valuation would bring in almost enough to meet the requirements of the situation.

LIQUOR TRAFFIC TAX.

The suggestion that a state tax be placed upon the liquor traffic has met with a great deal of approval. In some quarters, however, it is believed the Prohibitionists would oppose such legislation on the ground that it would tend to anchor the business more firmly, to say nothing of the state giving approval to it by such a law.

But regarding it from the revenue point of view only, a tax of the kind easily would bring in sufficient money to overcome the deficit. In round numbers there are 16,000 dealers in liquor in California. A tax of \$100 per dealer would bring in \$1,600,000 a year and the rate could be made \$150 just as easily.

It is not proposed that the state shall interfere with the local control of liquor establishments. That point need not be involved at all. The matter of issuing licenses would still rest with the city and county authorities; all the state would do would be to tax such establishments after they are licensed and engage in business. I am of the opinion that the legislature will give serious thought to this plan.

AN INCOME TAX.

The fact that the federal government has levied an income tax, however light it may be found or incomplete, is likely to prove a serious obstacle in the path of the state, should it be desired to follow suit. A tax of the kind would have to be developed, too, and so would not give prompt relief. There are many, however, who have given deep thought to matters of taxation who favor such a course.

BUSINESS LICENSE TAX.

A suggestion that inasmuch as corporations are taxed on their franchises, individuals in business and copartnerships also should be taxed, has attracted attention. Despite the benefits that incorporation brings, complaint often is made that unincorporated competitors, who are not taxed, have the advantage to that extent. Should the individual and the copartnership be taxed it would be in the shape of a business license tax and unquestionably would bring in a large revenue.

RESTORATION OF OLD LICENSE TAX.

There is a possibility that the old corporation license tax may be restored. But if so, other revenue also would be needed since it was not bringing in when abolished much over \$800,000 a year.

It was not a popular tax, using the expression in a comparative sense, at any time. It was abolished following the decision of the Supreme Court in the Mulford case which appeared to exempt foreign corporations doing business in California from the tax. Under such circumstances, the tax was removed from local corporations because it would have been unconstitutional to place them on a more unfavorable footing than their foreign competitors.

MANY LETTERS RECEIVED.

Some time ago, I addressed a number of letters to men who have made a study of taxation, telling them that a deficit seemed certain, outlining the suggestions made for relief and asking for an expression of opinion.

Of the replies received the large majority favored an ad valorem tax, under the circumstances. Many favored the liquor tax. The income and business license taxes were not popular. A number made new suggestions, but none of great importance.

The decision, of course, rests with the legislature and the Governor. I have tried to outline the situation briefly as I see it. I hope, at any rate, what I have had to say proved interesting and I thank you for having been given an opportunity to appear before you.

THE FEDERAL INCOME TAX.

Address by CARL C. PLEHN, University of California.

The spectacle of a great nation establishing a new and far-reaching tax without pressing need of the revenues to be derived therefrom is most novel. Fiscal history presents no parallel.

It was freely admitted by administration officials that the revenue from this source was not needed at the time of its adoption. It was a very naive assumption that the reduction of the tariff would necessarily reduce the revenues from that source. It is, of course, too early to forecast the full effect on the revenues of the recent tariff revision. Especially is this true now that the war conditions conceal the real effect. But going on general principles we should expect an increase rather than a reduction of revenue from the tariff changes. Save for the graduated reduction on sugar, the free list has not been greatly extended on revenue yielding commodities. The rest of the reductions have been designed to increase importations. The simple principle is that the higher the "protection" afforded by the tariff, the lower the *revenue* received by the government. Complete "protection" yields no government revenue.

It is also too early and on account of the war now impossible to forecast the effect of the tariff on the cost of living. But if our Democratic friends have reduced the protective features enough to materially reduce the cost of living, it would follow logically that they have increased importations and increased the revenues.

It seems clear that the *raison d'être* of the income tax is to be found not in any fiscal needs, nor even in a desire for fiscal reform. It is to be found rather in the social psychology of our time. It is wanted whether necessary or not. The demand for it is an expression of class interest and class conflict. As such, of course, the tax is not without historical parallels; in fact, it has been duplicated in history untold times. Taxation is a favorite weapon in social warfare.

The income tax of 1894 had much the same origin. But at that time, due to the industrial depression, the reduction of the tariff and the extension of the free list did threaten a reduction of revenues, and the reduction did materialize. So there was a sound fiscal reason as well for the tax.

That tax was, however, held to be unconstitutional. The decision in this case was most unfortunate and ill-timed and has given stimulus to a popular revolt against all constitutional government, and more especially against representative government, the end of which has not yet come. It was a decision based on glaring historical errors, on the grossest misinterpretation of words, and on a total misconception of economic principles. It satisfied no broad minded scholar, lawyer or statesman, and outraged public sentiment. As Chief Justice White said, it deprived the government of "an inherent attribute of its being, a necessary power of taxation." The decision turned on two points. First, the meaning of the phrase "direct tax" as used in the Constitution and second, whether the exemption of incomes under \$4,000 constituted a breach of the guarantee of the equal protection of the law.

As a result we have now an income tax, and an unnecessary one. Moreover, that decision has much to do with the income tax being a federal income tax when logically this tax belongs to the states. In 1894, the states did not need that source of revenue, nor, had they needed it, did they have the administrative machinery for its enforcement. In the twenty years that have elapsed since then state activities have increased and the revenue is needed by them. Furthermore, in most advanced states the necessary machinery has been developed or owing to the increased purity and efficiency of government could readily be created.

Yet in all that time but one state, Wisconsin, established an income tax. *Per contra*, the states have almost unanimously installed inheritance taxes. Why did they let one go so meekly while they resented

so promptly the threatened usurpation by the federal government of the other? The explanation lies in the resentment kindled by the decision of the court in 1895 and the stubborn intent to have a federal income just because of that decision.

I take it, therefore, that the Democrats have correctly interpreted the will of the majority in giving us an income tax, necessary or not.

But it is nevertheless true that an income tax does not fit into a general system of taxation as a federal tax. Federal governments, except in time of special stress, depend on and should depend on indirect taxes. Such taxes, because of ease of collection, great revenue yielding power and universality of incidence have always been used and will be used. They can not be state taxes, because that means internecine fiscal warfare, but they can be federal taxes. Income taxes, and all other personal and property taxes belong to the states because the states deal with personal and property rights, while the federal government does not.

The loss of the income tax comes at a very unfortunate juncture. The states are just starting on a career of social and economic revolution, which—whether we approve or not—is advancing most rapidly. We have in our own state, increased educational activities, increased service in scientific research for the benefit of industry, agriculture and commerce, increased supervision and control of private enterprise, social and industrial insurance in various forms, and large increases in public industries. The old system of state and local taxation is strained already to the breaking point and new sources are imperative. If we are really cut off from the income tax, which is almost the only remaining untouched source, the states must either surrender these activities to the federal government or abandon them. It is a dilemma either horn of which is equally uncomfortable. There is, however, a third alternative. Years ago, before there was any hope that the states could administer such a tax, leading tax scholars advocated that the federal government collect the tax on behalf of the states. It may be that we can get some relief by a distribution to the states of the proceeds of the federal tax. But the political shoals in that direction look serious. Still another possibility is in sight. Wisconsin does not propose to abandon her income tax despite the federal tax, and the federal law contemplates that states may have an income tax and permits the opening of the federal income tax returns to state income tax officials.

The income tax as a substitute for the ineffective tax on personal property commends itself to a certain sense of justice in the American public.

In the evolution of taxation throughout the civilized world, underneath the turmoil of warring factions and the never ceasing efforts

of some one class to roll off the burden of taxation onto the other classes, we can discern more or less clearly the slow development of new ideals of justice in taxation. Equality, variously conceived and variously defined, is the constant aim. Justice appeals strongly to human nature, but what constitutes justice in taxation in one age does not often seem to be regarded as justice in another. At one time, with practical equality of wealth, of ability and of opportunity between taxpayers, the simple, uniform poll tax is regarded as equal. Varying "opportunities" then give rise to varying degrees of property and varying returns of differing abilities, and with consequently growing public needs, property and ability are both called upon as measures of taxation and new tests and new standards of equality arise. In general, the aim, often blindly seen, is that the members of the state shall contribute to the common end, each in proportion to its strength. Strength or ability, or faculty, to use our good old New England term now nearly obsolete, is variously measured. At one time property serves as a measure; at another, expenditure; at another—the pendulum swinging back to property—it is the yield or produce of property, but the ultimate and best test is, undoubtedly, income.

The weaknesses and necessities of fiscal administration, the fracturing of government into branches (such as federal, state, and local), all militate against any single test, and call for a combination, a system of taxes, and the use of co-related tests of faculty. For ease of collection and steadiness of revenue, excise and customs taxes are unsurpassed. These fall on consumption, and reach the man who does not know he is taxed. They can be federal taxes only—else we should have constant interstate warfare. Personal and property taxes on the other hand are best fitted for use where the taxpayer can see "where the money goes"—that is, if he has eyes to see with, and vision is not obscured by the closed curtains of the fiscal offices, which is not always the case. The fitting of many taxes together into a just system is the most difficult task which confronts fiscal legislation.

Hence it is that the income tax wherever found is usually a progressive tax with the exemption of the minimum of subsistence and other exemptions and differences intended to compensate for other taxes. Graduation or progression—the increase in the rate in proportion as the base or income increases—comes into being primarily through the effort to allow for other taxes. But once established, the continuation of the progression upwards requires another justification. This justification current economic theory provides in the so-called theory of marginal utility. This well-known theory runs as follows: Every human want is satiable. A single drink of water is pleasant, but the "water cure" as applied by our troops to recalcitrant Philip-

pinos was painful. Somewhere between the two, the utility of more water at any one time ceases and as that point is approached each addition to the store already in one's stomach yields less and less satisfaction. The utility attributed to the marginal dose is transferred back over all the rest. While we can multiply our wants unendingly, provided we can continue to find new means of satisfying the new wants, nevertheless, the satisfaction obtained even from a multiplication of wants lessens in a manner analogous to the decrease of satisfactions from the repeated doses of some one pleasure. Moreover, we call some wants necessary, while others we say are satisfied by comforts and still others by luxuries, a graduation which clearly implies a difference in the intensity of the want. To be deprived of luxuries is not to suffer as much as when deprived of necessities.

Hence the utility of a dollar when it is one in an income of ten thousand dollars per annum is far less than the utility of one in an income of one thousand dollars. This idea enters into the theory of taxation in this form. Equality of burden implies equality of sacrifice. It involves less sacrifice to pay ten per cent, or one thousand dollars, out of ten thousand dollars than to pay one hundred dollars out of one thousand dollars. Another way of stating the same idea has been called "the leave them as you find them theory." That is to say: Leave each taxpayer in the same position relative to his fellows after paying the tax as before.

Unfortunately no definite mathematical scale of progression is suggested by any of the theories, nor can any be possible that would fit all the varieties of human living. But the principle is generally accepted. While we never take exception to the existence of consumer's rent as resulting from price, and see nothing wrong in a rich man paying but ten cents for an apple when he would willingly pay a dollar rather than go without, yet we lament the absence of a rule in progressive taxation.

Bound up in the argument for progression is the argument for the recognition of different faculty for one sort of income from that of another sort. The income of a "remittance man" who spends his time in elegant leisure is not considered in the same class as that of the industrious mechanic, even though they be of the same amount each. Gladstone called the latter "industrious" income, the former "lazy."

From the idea that the minimum of subsistence should be exempt, it is an easy step to recognize differences in burdens on income. Exemptions are increased for additional members of the family, special expenses and the like.

While exemption—from all taxation—even for the minimum of subsistence is not economically justifiable, and progression in any chosen

rate is hard to sustain against attack, yet everywhere these two principles are accepted. They are an expression of the social philosophy now controlling, and, right or wrong, about all we can do with them is to observe what they are.

There are two different kinds of classes of direct income taxes.* The differences between the two lie in the point of view and in the administration. One of them starts out to find "incomes," as if they were *things* which could be treated without reference to their recipients. It has, of course, to take the recipients of the incomes into consideration in the end, but it does so as a sort of afterthought. In this kind "incomes" are taxed, so far as possible, "at their sources" and a declaration of the amount of each resident's income from each and every source is not universally required. The other starts with the several taxpayers and requires a statement from each as to his or her income. After that it may take cognizance of the source and character of the different incomes.

The best example of the first class is the British property and income tax. The best example of the second is the Prussian income tax. We shall see, in a moment, that the ultimate goal aimed at and reached is, or may be, the same in each case. Yet the differences are, as to point of view, starting point and route, very important, nevertheless. The British income tax is as nearly impersonal as possible, while the Prussian is just as personal as can be. The one is not particularly inquisitorial, the other is very inquisitorial. The one is suited to a people who do not especially love to be governed; the other to a people with a wholesome respect, inborn or acquired, for bureaucracy. The British tax is called "the property and income tax;" the Prussian, simply "the income tax." In Germany the British tax is properly designated as an *Ertragsteuer*, but the Prussian, they call an *Einkommensteuer*.

The British income tax originated in a medley of taxes on property, each different kind of property being subject to taxation more or less in proportion to its value as determined by its income producing power. These old British taxes transplanted to America reverted, like many a transplanted plant or animal, to their original type and became our general property tax. But on British soil they gradually grew into the income tax. In their very origin, they were, therefore, impersonal.

The Prussian income tax is a tax which evolved directly from a poll tax, step by step, in one uninterrupted growth. There was first a uniform poll tax. This next became a class tax ("stand-steuer"), under which the nobles were required to pay higher taxes than the other classes and the peasants the least. Then the class tax was

*There are, of course, many kinds of indirect income taxes; taxes, that is, which use some external signs like occupation, horses and equipages, windows and doors in one's house, as evidences of income. But with these we are not concerned.

graduated within each class according to the incomes. The next step was to drop out the reference to class or rank and to make the tax a classified income tax, in which the classification, or grouping, depended on the amount of income, and not on rank or class at all. Finally the groups, or grades, as to income were made so small that the effect was that of a continuously increasing tax rate according to income, and then later surtaxes were added to reach certain kinds of income supposed to be capable of paying proportionately more than other kinds.

Despite the fact that they are so different in origin, in point of view, and in methods, the two kinds of taxes accomplish, as has been said, very similar results.

We can make the explanation of these taxes shorter if we stop first to set forth certain definitions. Tax rates for any kind of taxes, but perforce for income taxes, may be "uniform," "proportional," "progressive" or "regressive." The meaning of these terms is most easily explained by starting with the "proportional." This form of tax rate aims to take the same proportion, or percentage, of the value or size of the income, property, or other base to which the rate applies. Thus for example, a tax of \$2.15 on every one hundred dollars of assessed valuation of property is a "proportional" tax; so is 10 per cent of the gross receipts; or 4 per cent of personal income. When the rate is a flat rate, or a fixed sum, regardless of quality, value, or any measure other than quantity, the rate is "uniform." A poll tax is a good example of this, so is a specific duty of, say, \$1.00 per yard of cloth imported.

When, however, the rate proportionally considered increases more rapidly than the base, it is called "progressive." Thus a tax of 1 per cent on incomes in excess of \$3,000 and not in excess of \$20,000, with additional rates on incomes in excess of \$20,000, is called "progressive." Inverted "progression," or a system of rates decreasing as the base increases is called "regressive." "Regressive," "proportional" and "progressive" are terms in series. "Uniform" is a term outside of this series. Tested by the same basis of comparison as is involved in "regressive" and "progressive," namely the way in which they depart from the "proportional," "uniform" rates are generally "regressive," inasmuch as they impose a heavier burden, in proportion, on the small than on the large. (If the reader will examine the charts at the end of this article the definitions will be found to be illustrated.)

We are interested here mainly in the idea of "progression." It takes but a moment's thought to see that "progression" may be of many different kinds and degrees. Thus you may have regular progression, where the rates advance away from the proportional by uniform additions (arithmetical) or multiplications (geometrical) or by some other uniform mathematical rule. Or you may have irregular

progression in an infinite number of ways. Most income taxes have irregular progressive rates, yet there is usually a very large element of intended regularity. The regularity most often aimed at, but rarely carried out consistently, is that form of "progression" for which the term "degressive" has been coined. A "degressive" rate is that form of a "progressive" rate in which the rate approaches, and may, by an arbitrary break in the application of the rule, actually reach a fixed proportional limit. Progression easily becomes confiscation if carried out logically under any of the rules commonly known. But as confiscation kills the goose, from which we wish to continue plucking feathers, it is always avoided. The simplest way of creating a degressive rate is to say that the maximum rate shall be, say, 5 per cent, but that the 5 per cent shall apply only to the excess over a fixed amount. Thus, for example, if in an income tax \$1,000 be exempt and the rate be 5 per cent on the excess over that, then a man having an annual income of \$2,000 will pay \$50 or $2\frac{1}{2}$ per cent of his entire income; one having \$10,000 will pay \$450 or $4\frac{1}{2}$ per cent and by the time you reach \$100,000 the proportion of total income taken is $4\frac{95}{100}$ per cent or nearly 5 per cent.

Let us now return to the British and to the Prussian income taxes and to an examination of their similarities. Each, today, imposes a tax on all incomes over an assumed minimum for existence. People having the assumed minimum, however, are in both countries hard hit by excise taxes and customs duties, so this is an exemption from the income tax, not from all taxes.

Each, today, aims at a fairly uniform "degressive" tax. The British "degression" is nearly regular, having only three breaks, brought about by twice changing the amount of free income, or the deduction allowed, and finally by abolishing the deduction altogether. The Prussian does not allow any deduction from incomes over the exempt amount, but sets up a series of classes, or grades, of income and imposing a flat or uniform rate on all incomes in each class, or grade. Consequently, within each grade the rate is regressive. But taken in the large, the rates are "degressive," ending in "proportional."

Each, today, imposes a heavier tax on income regarded as "unearned," or "non-meritorious," than on earned or meritorious incomes. But in bringing this about the British plan makes an "abatement" of the tax on earned incomes, while the Prussian singles out the unearned incomes for an additional tax or surtax.

As our new federal tax is distinctly of the British type, a brief resume of the history of that tax may be of interest. This tax was the direct outcome of the great struggle between France and England. England's revenues in the eighteenth century were mostly from cus-

toms, duties and excises. The mediaeval system of taxes on property and produce had become nearly a mere tradition. The only live part of it was the old land tax. But the land owners were in control of parliament and in 1798 they made this tax a redeemable rent charge. That is, they provided that by paying into the treasury a capital sum, the interest on which was assumed to be sufficient to pay the tax in perpetuity, the land owner was to be free from the land tax forever thereafter. In the course of a few decades about half of the land owners of England bought this freedom, and, finally, nearly all redeemed their land from taxation.

At that time there was a passably good excuse for this procedure, as it gave England a lump sum which might have been used to reduce the enormous public debt, and which did enable that debt to be converted on better terms than could otherwise have been had. Today, under Lloyd George's leadership, the people of England have decided that the landlords drove a good bargain for themselves and a bad one for the people, and the public, therefore, repudiated the old contract for free land and have undertaken to tax, at least, the increment in the value of land that has come since 1798. Naturally, the landlords resent the "breach of contract."

The war with the colonies had necessitated new taxes, but they fell mostly on the excises. Again after 1793 new laws imposed new taxes, but they were inadequate. British credit fell and French victories increased. The poor could pay no more, the rich, although entrenched in parliament, were the only resource, and Pitt proposed "a general tax on persons possessed of property commensurate, as far as practicable, with their means." He outlined the scheme as follows: "That the plan should be diffused as extensively as possible; that it should be regulated fairly and equally as possible, without the necessity of such investigation of property as the customs, the manners, the pursuits of the people would render odious and vexatious. That it should exclude those who are least able to contribute or furnish means of relief; that it should distinguish the gradation of classes; that it should admit of those abatements, which, in particular instances, it might be prudent to make."

Pitt's speech in parliament on December 14, 1798, was a reply to the opposition of "wealth entrenched in power," and has been rightly extolled as the finest of its kind. The first bill enacted January 12, 1798, we must perforce pass over with but a word, for it was so bound up with the old taxes that it can not be set forth within the limits of this short paper. In substance it trebled the assessments of the old taxes and aimed at making the taxes very crudely proportional to *income spent*—income that is, which showed in the taxpayer's way of living. This pseudo income tax was shamefully evaded and bitterly opposed.

In 1799, Pitt became convinced that building on the foundation of the old taxes was impossible. The foundation was too rotten. He, therefore, proposed a true income tax; that is one on *income as received*. This tax was killed by the bitterness of the opposition as soon as the war was over, in 1802. But the war broke out again in 1803 and Addington, who had reluctantly consented to the repeal of the law, asked for its re-enactment, but as a war tax only. It is interesting to note that he called it a tax "on the lands and property" and again on "rents and funds." The law of 1803 established the principles of the present tax. Incomes were grouped in various "schedules" and, so far as possible, the tax was "stopped at the source." The reasons for this were drawn from the previous experience with evasions and false returns. The government explained: "Thus the charge is gradually diffused from the first possessor to the ultimate proprietor; and one of the greatest causes of defalcation, arising from the necessity of protecting private transactions from exposure, experienced under the Income Act, is avoided; at the same time protecting the private transactions of life from the public eye, whilst the revenue is more effectually guarded."

Incomes under sixty pounds were exempted, the rates between sixty pounds and one hundred fifty pounds were low, and the normal tax of five per cent began at one hundred and fifty pounds. Further abatements were allowed for persons with more than two children. Here, then, we have the exemption of the minimum of existence, digression, and abatements.

"Stoppage at the source" was also introduced and this at once doubled the efficiency of the tax, for, although the rate was reduced from ten per cent to five per cent, the yield was about the same.

But the tax was still bitterly opposed and when peace came in sight in 1814, the government announced its intention to keep its promise and let the tax go. But when Napoleon escaped from Elba, the government repented. However, a bill to continue the tax at half rates was beaten, as Taylor says, "amidst the greatest cheering and the loudest exultation ever witnessed within the halls of the English Senate." It was even ordered that all the records of the tax be destroyed.

Nearly 16,000,000 pounds of annual revenue being lost, the excise and other multifarious taxes had to be increased. Sydney Smith's brilliant characterization of the resulting situation is still worth quoting. It was in 1820 that he wrote: "We can inform Brother Jonathan what is the inevitable consequence of being too fond of glory. Taxes upon every article which enters into the mouth or covers the back or is placed under the foot. Taxes upon everything which it is pleasant to see, hear, feel, smell, or taste. Taxes upon warmth, light and loco-

motion. Taxes on everything on earth or under the earth, on everything that comes from abroad or is grown at home. Taxes on the raw material, taxes on every fresh value that is added to it by the industry of man. Taxes on the sauces which pamper man's appetite and the drug which restores him to health; on the ermine which decorates the judge, and the rope which hangs the criminal; on the poor man's salt and the rich man's spice; on the brass nails of the coffin and the ribbons of the bride; at bed or board, couchant or levant, we must pay. The schoolboy whips his taxed top; the beardless youth manages his taxed horse with a taxed bridle, on a taxed road, and the dying Englishman, pouring his medicine, which has paid seven per cent, into a spoon which has paid fifteen per cent, flings himself back upon a chintz bed, which has paid twenty-two per cent, and expires in the arms of an apothecary who has paid a license of one hundred pounds for the privilege of putting him to death. His whole property is then immediately taxed from two to ten per cent, besides the probate judge's fees demanded for burying him in the chancel; his virtues are handed down to posterity on taxed marble, and he will then be gathered to his fathers to be taxed no more."

The income tax was not restored until 1842, but the time passed without some agitation for the re-enactment of the simpler tax. The true problem of taxation is ever how to secure simplicity and uniformity.

By 1842, however, England was confronted in fact with conditions very similar to those which we are falsely alleged to have been confronted with in 1913. The necessity for repealing the corn laws and the maturing of other inroads upon the revenues called for a new source of revenue. Sir Robert Peel, never a believer in the income tax, turned to it reluctantly as the only resource. It was introduced as a temporary measure, but it stayed on and on for the next twenty years, always "on trial," always regarded as a bad but a necessary tax. Thus Gladstone, advocating its renewal in 1853 for a period of seven years, said: "There are circumstances attending its operation which make it difficult, perhaps impossible, at any rate, in our opinion, not desirable, to maintain it as a portion of the permanent and ordinary finances of the country. The public feeling of its inequality is a fact most important in itself. The inquisition it entails is a most serious disadvantage, and the frauds to which it leads are an evil such as it is not possible to characterize in terms too strong." It is essential, he thought, to allay the feeling "that the country is about to be entrapped unawares into its perpetuation." He proceeded to unfold his plans "to lay the ground for placing parliament in such a position that at a given period it may, if it shall think fit, part with the tax." Here, however, he put fairly and squarely before the house the alternative:

“If you determine to renew the income tax, will you make its early extinction your first and sole object, or will you, in order to bring to completion the noble work of commercial reform which is so far advanced, once more associate the income tax with a remission of duties, extensive in itself and beneficial to the community? We have considered fully these two alternatives,” added Gladstone, “and we have decided deliberately in favour of the second.” In other words, Gladstone proposed that the tax be renewed for two years at 7d. in the pound, for two more years at 6d. in the pound, and for three more years at 5d. in the pound; so that at the end of seven years, or in 1860, the tax would expire. Before this seven year promise could be fulfilled, war again intervened, the tax was continued, and in 1860 Disraeli said of it, “Alas, at the end of seven years, the long suffering nation found itself in possession not of the much desired Rachel, but of the ill-favored Leah.”

Custom deadens pain and opposition slowly ceased, except in academic expressions. England has now had the income tax continuously for nearly three quarters of a century.

In 1907 and again in 1910 new principles were introduced. The first was that already referred to as an abatement for earned incomes. We may take the Chancellor's own statement on this point. “Comparing two individuals, one ‘who derives, we will say, £1,000 a year from a perfectly safe investment in the funds, perhaps accumulated and left to him by his father,’ and, on the other hand, ‘a man making the same nominal sum by personal labour in the pursuit of some arduous and perhaps precarious profession, or some form of business,’ he maintained that ‘to say that those two peoples are, from the point of view of the state, to be taxed in the same way is, to my mind, flying in the face of justice and common sense.’ . . . ‘What is an earned income?’ ‘It is not easy to draw a distinction, but we can but do our best.’ He declared that earned incomes included incomes of all officers and employees paid by salaries, including clergymen; of every class of professional men; and of all traders whose income is derived substantially from their own personal labor. He conceded that to distinguish in this third class between incomes which are either wholly earned or partly earned and partly unearned, ‘means a degree of logical precision where there will be the greatest possible difficulty in hindering overlapping in dubious cases.’ The most practical way of dealing with the problem, therefore, he held, was to confine the differential treatment to earned incomes which do not exceed £2,000—not, as the select committee had recommended, £3,000. That is to say, the lower rate on unearned incomes was to be limited to persons whose total income from all sources does not exceed £2,000. The Chancellor suggested for the coming year the full rate of one shilling in the pound

as the normal tax on unearned incomes, and the lower rate of 9d. for earned incomes. The benefit of the lower rate was to be granted by abatement, and the abatement in the case of mixed incomes was always to be made from the earned, and not from the unearned, portion.

Coming now to our new income tax, there are five points of general interest: (1) The two classes of persons liable to the tax; (2) The character of the taxable income, the exemptions, and the deductions; (3) The progression in the rates; (4) The stoppage at the source; (5) The "return."

I think it is safe to assume that you are all fairly familiar with the details of the bill so that I can confine myself to a rather general discussion.

In taxing both natural and legal, or artificial, persons, we have apparently taken a leaf out of the books of the continental states and not followed the mother country. But this arose accidentally from the fact that we happened to have a tax on artificial persons or corporations already and did not want to lose the revenues therefrom. The combination of these two taxes has not been made very perfectly, inasmuch as natural persons whose incomes are exempt are not allowed to claim a refund for the taxes on dividends from corporations received by them, while all others are allowed to deduct such dividends in computing the taxable income. In other words, this tax, like the excise and customs duties, continues to fall on those natural persons who are exempt from the income tax.

The definition of taxable income is more remarkable for the obvious effort to include everything possible, than for its clearness. The idea seems to be to reach net, realized, money income. The insistence on money income gives rise to several minor inequalities. Thus the rental value of a home in which the owner resides is not included, although a tenant may not deduct rent paid by him, and the farmer need not include the value of produce consumed by the family, he pays only on what he sells. Ease of administration seems to have over-ruled logic. The right granted to deduct taxes paid, including the income tax itself of the previous year, is relatively unimportant, although the logic of it makes one dizzy.

The exemptions are remarkably large—\$3,000 and \$4,000 are not the minimum of subsistence, even in a country rolling in wealth. Nor can it be contended that the excises, customs, duties and state and local taxes falling on incomes of three and four thousand are heavy enough to entitle such incomes to exemption from the income tax. If we assume that an income of from \$1,000 to \$1,200 is the average "small person's" earnings, which is about the truth, then allowing for other taxes, we should arrive at exemptions of from \$1,500 to \$2,000 as appropriate in

this country. In Prussia only incomes under nine hundred marks or \$214 are exempt. In Great Britain the exemption amounts to \$778 only.

The exemption of personal incomes derivable from state and other public funds, whether as salaries or as interest but especially as salaries, is wholly unjustifiable and is, moreover, based on a false interpretation of the constitution. To be sure, the federal government can not tax a state agency, as that involves the power to destroy the state. But a uniform tax on all persons, including state and local officers, is in no rational sense likely to impair the efficiency of state or local governments. By the same reasoning that lies back of this exemption, state employees might demand untaxed tobacco and free importation of any goods they needed for personal consumption.

The exemption of interest paid on public bonds rests upon somewhat different grounds from the exemption of state salaries. As a matter of public policy, it can be, perhaps, justified. It is a question of how the interest rate would be affected. It is, therefore, possibly just as well that the Supreme Court has held that Congress has no power to tax such income, although the reasoning by which that decision was reached is extremely faulty.

No abatements are allowed, except the one included in the exemption of a man and wife living together. That is, there are no allowances for children, for sickness, or other calamities, insurance or payments on the principal of debt, or any of the other things considered in Europe. This is, of course, justified in view of the large general exemption.

No difference is recognized between different kinds of income, unless the surtaxes, which go by amount only, may be construed as a rough attempt to tax unearned income more heavily. Of course, it is substantially true that a large part of incomes in excess of \$20,000 are "unearned" or "lazy."

The grading of incomes for the surtaxes is curiously irregular. The first grade is \$20,000, the second \$30,000, the third and fourth \$25,000 each, then follows one of \$150,000, and then one of \$250,000. The carrying of the underlying exemptions on through even to the highest incomes is mathematically very pretty but quite superfluous.

The progression in the rates is most interesting. The rates rise sharply from the exempted minimum to .8 of 1 per cent at \$20,000, using for illustration the income of a man and wife. At \$20,000 there is an elbow and the rate that was slowly approaching the proportional at 1 per cent takes a leap upward and reached 1 per cent at \$24,000. At \$50,000 there is another elbow, but much slighter than at \$20,000. Two per cent is reached at \$74,000 and a third elbow comes at \$75,000. The crook in this elbow is so slight that it can hardly be seen on the

chart. The same is true, only more so, as to the elbow at \$100,000. Three per cent is reached at \$124,500, and 4 per cent at \$249,000. The change at \$250,000 is wholly imperceptible, the line being nearly straight. At \$499,000, 5 per cent is reached. At \$500,000 it takes twelve decimal places to enable one to express in the last three of them the change in direction of the curve; 6 per cent is reached at \$999,000. An income of \$100,000,000 would pay a tax of 6.99001 per cent and for larger incomes the tax approaches, but never reaches, 7 per cent. It takes 6.9999+ to show the difference between seven per cent and the tax rate at \$1,000,000,000. This is the only important income tax in which the rates are always digressive, and never rise vertically hence we have elbows, not grades. It is a strictly progressive tax, not a graduated tax.

The high rates are, however, mostly ornamental, as they apply only to excessively large incomes. Rates which do not reach 2 per cent until the income reaches \$74,000 and are under 1 per cent up to \$24,000 look piddling beside the real income taxes of Europe. On the chart I have had to use a rather large vertical scale in order that you might see the American tax at all, and, consequently, the British and the Prussian are, perhaps, exaggerated. But the relative positions are correct. Note the rapid rise of the Prussian tax from a little over $\frac{1}{2}$ per cent at \$214 to 3 per cent at \$2,000. It reaches 4 per cent or nearly so by the time ours reaches 1 per cent. Note the soaring ambition of the British tax which goes in four great bounds from nothing at \$778 to 5 per cent at \$3,500. That is assuming a one shilling rate. But one shilling has often been exceeded. In other words, the maximum British rate is reached before our tax begins.

Taxed at the source, so far as the normal tax is concerned, are all payments in the sum of \$3,000 or over per annum, also all payments by corporations whether large or small, other than salaries under \$3,000.

To avoid the necessity of refunding to persons entitled to exemption, money collected at the source, the law permits the payee to file with the payer a certificate claiming exemption. This is a new device in income tax administration, and one, the practicability of which looks very doubtful. In Great Britain the tax is collected at the source in every instance, and the taxpayer is allowed to come forward and claim a refund, on presenting his declaration of total income. This has the obvious advantages of forcing a declaration and of simplicity. Our method seems to assume a lack of faith, on the taxpayer's part, in Uncle Sam. or a fear of red tape and delay, neither of which should be justifiable. Most of the friction and the outcry against complexity arises from this cause.

The "return," or sworn declaration, is required of all persons having taxable incomes. It is especially necessary as an administrative measure for all incomes where the tax can not be stopped at the source, such as personal or professional earnings, business profit, and for the surtaxes. With stoppage at the source, however, the tax is not one based on self-assessment.

Considered as a whole the income tax law is very much better than the law of 1894 and the Civil War income tax laws. Much real progress has been made. The defects as we have found are:

1. The failure to provide a proper union between the tax on persons and the tax on corporations.
2. The failure to include all net realized income, whether received in money or not.
3. The failure to recognize differing burdens on incomes of equal amount.
4. The failure to distinguish earned from unearned incomes.
5. Unwarranted exemptions, especially state and local government salaries, and too large abatements.
6. The tardiness of the progression and the irregular grading of incomes for the surtaxes. If the rates were regraded so as to reach a sub-maximum at, say, \$25,000 and the real maximum at, say, \$100,000, the demands of progression would be more accurately served. The numerous surtaxes are very complex. One rate with proper arrangement for rebates would be simpler and better.
7. Stoppage at the source should be universal and excess taxes refunded by the government. Allowing taxpayers to dicker with each other and certifiating between the taxpayer and a non-official collector is a great weakness. It is also undignified.

Stoppage at the source should also be extended where feasible to cover the higher rates.

Those of us who have watched the forces at work which gave us the income tax have long known that it was coming. It is an inevitable growth of democracy. The tax will work better from year to year as the law is amended and the administrative machinery perfected.

We can hardly agree with Justice Field when he said, in the decision on the income tax of '94, "The present assault upon capital is but the beginning. It will be the stepping stone to others larger and more sweeping till our political conditions will become a war of the poor against the rich; a war constantly growing in intensity and bitterness."

There is too much evidence in the bill of clear apprehension of a guiding principle of justice to admit of any such indictment. Yet trivial as the tax is compared with those of other nations, it is the beginning of a new era, it marks the coming of greater efficiency in American tax systems.

CHART I.

Showing the progression (degressive progression) in the rates of the Federal Income Tax for incomes up to \$500,000.

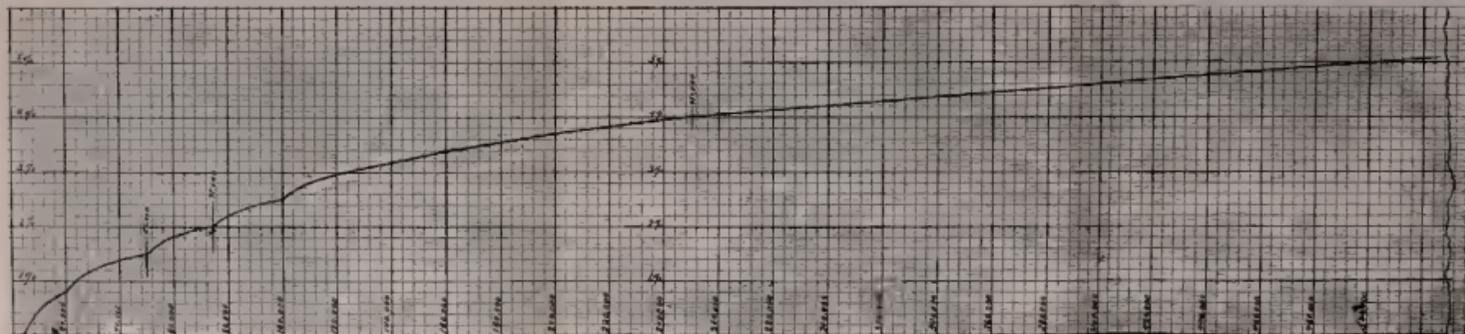

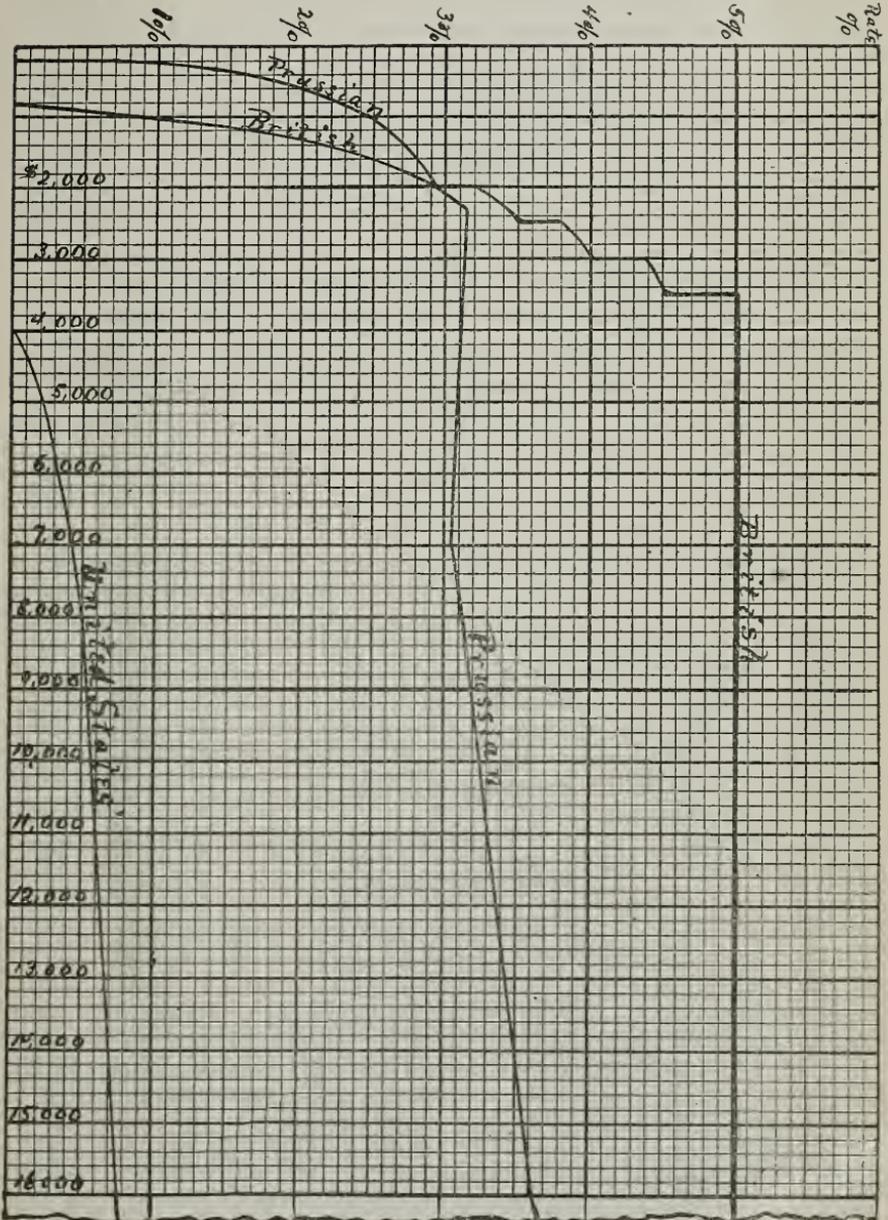

Chart II.

Showing the character of the "progression" in the rates of the British, Prussian, and United States income taxes as applied to incomes under \$16,000.

N. B. Both the Prussian and the British income tax rates are now much higher than shown here. The chart shows the old normal rates. On account of the small scale to which the chart is drawn only the main trend of the Prussian rates can be shown. The line should be a zigzag or saw-toothed one, because the rates are uniform for grades or groups and hence the percentage is lower for the upper limit of each grade than for the lower limit.

METHODS OF THE NEW YORK DEPARTMENT OF TAXES AND ASSESSMENTS.

Illustrating a Scientific Basis for Taxation.

By JESSE D. BURKS, Director Efficiency Department, City of Los Angeles.

It may be assumed without hesitation, I suppose, that the fundamental purpose in the assessment of property values by a tax officer is to provide a uniform and equitable basis for distributing the cost of government.

There are many conceivable bases for a system of taxation. One of these is income, which has recently been adopted by the federal government as one means of supplementing its revenues. Similarly imports, exports, manufactured products, inheritances, and other standards may be adopted as the means for placing the cost of government at points where it should properly fall. For the purposes of municipal and county taxation, the usual method of raising revenue is to lay a uniform tax upon the values of real and personal property.

Most taxes are, of course, in a very important sense, income taxes; that is, the taxes are paid out of somebody's income. The purpose of an assessment or valuation of property of one kind or another is to determine the amount of the taxes which shall be levied upon the income of the property owner. The theory of a system of taxation based upon real estate values is that the amount of real property possessed by a taxpayer is the best available index of the amount that may be properly collected from each taxpayer to meet the cost of conducting the government.

Viewing the assessment as merely an index of the amount of the taxes to be paid from each property owner's income, it will be seen at once that the important consideration in making the assessment is not whether the property shall be assessed at its full value or at only a part of that value. The important thing is that the assessment should be fair and equitable so that it may serve as a true index of the amount of tax to be paid by each taxpayer. Obviously, if a certain amount of money is to be collected in the form of taxes, the amount to be paid by each individual will be the same whether property be assessed at one tenth, one half, 90 per cent, or double its "real" value—so long as each piece of property is assessed fairly and equitably. On the other hand, unfair or inequitable assessment of values means that one man is thereby forced to pay part of the cost of government which should properly be borne by another; and the taxpayer whose assessment is relatively low is automatically relieved of making his proper contribution to the cost of government.

A truly democratic standard must therefore, lay great emphasis upon the system of assessment which will insure the greatest possible degree of uniformity and fairness in the valuation of property for taxation. Any method or device which will tend to insure such results should be seized upon and developed to its highest efficiency.

Among the causes of unfair or inequitable taxation, lack of expertness on the part of assessment officers is, of course, common. This cause, however, is most readily detected and most easily remedied by the proper application of the merit system to the selection of assessment officers. It will be a simple matter to secure a higher and higher grade of ability in this branch of the public service.

A more subtle and less easily remedied cause of unfair and inequitable taxation is the defective methods so commonly followed in the making of assessments. The organization and administrative procedure of many assessments offices would make it impossible for an officer, however high his ability, to reach equitable and satisfactory results. It is with the idea of suggesting a few important features of a scientific procedure in making assessments that the following brief outline of the methods employed by the New York Department of Taxes and Assessments is presented.

1. The valuation of lands and improvements are separately determined. By breaking up the total valuation into its two main factors, an important step is thus taken in the direction of detail analysis and standardization of values in place of the confused guess-work valuation which must necessarily obtain where no such separation is systematically made.

2. Accurate block and lot maps are provided and currently corrected. Blocks are numbered consecutively and the separate parcels in each block are also numbered consecutively. The city is divided into sections; the maps for each section being bound in volumes of suitable size with a key map in front. The length of all boundary lines is shown on the maps in feet and inches. On valuable lots of irregular shape, the area is shown in square feet; on larger parcels the area is shown in acres.

Thus there are at all times available in the office of the tax department detail maps showing the exact boundaries of every separately assessed parcel of real estate in the city.

3. Land value maps are prepared and currently revised showing the valuation per front foot of an average "inside lot" on each of the four sides of every square in the city.

Such maps are the most useful aid toward the comparison and equalization of assessments. "Unit values" are carefully determined by taking into consideration all available evidences of value—such as previous assessment; sale price and amount loaned on mortgages; records of building department; court appraisals; rental values; appraisal of owners, sellers, real estate experts, and fire underwriters; location, situation, and use of property; and trend of improvements. Unit values so determined greatly facilitate the actual assessment of individual parcels and are an invaluable check upon the judgment of individual assessors.

4. A uniform and systematic allowance is made for corner influence, variations in depth and irregularity in shape, and the advantages of single ownership of several adjoining lots ("plottage").

5. Standard valuation units ("factors of value"), based upon a square foot of floor area, are adopted for each type of new building commonly found in the city. A definite rate of depreciation for each type of building is uniformly applied.

6. Property is uniformly assessed at one hundred per cent of its "true value" which is taken to mean the amount which a purchaser who wishes to buy, but is not compelled to buy, would give to a person who wishes to sell, but is not compelled to sell. By utilizing information that is readily available, such a true valuation is usually not difficult to ascertain.

The agreement of a willing buyer and a willing seller has been found to be a far more reasonable basis for appraisal than the "forced sale" basis or the "50 per cent" basis which are assumed by some tax offices. A full valuation in the sense just defined furnishes one of the most certain checks against unfair and inequitable assessment, because it brings into the open, more nearly than any other method, the facts upon which reasonable comparison and protest can be made.

7. Adequate provision is made for systematic publicity in all matters pertaining to the assessment of property. The land value maps for each section of the city are published in separate pamphlets for general distribution. A complete list of the assessed values of all real estate is also published for distribution; each pamphlet containing the assessments of a particular district. Taxpayers are thus enabled to judge intelligently as to the equity and efficiency with which assessments are being made.

An annual report is published for general distribution. This report not only describes the organization and personnel of the assessing body, but includes specific information regarding such subjects as the following—method of making assessments; analysis of values with statements regarding increases and decreases by districts; aggregate assessments and tax rates for a period of years in parallel columns; forms and amounts of taxable property and exemptions; number of assessments made and average cost; balance sheet of financial transactions; summary of new tax legislation and legal interpretation; constructive suggestions for improving the work of the department.

Only the main features of the New York assessment system can be mentioned in an outline so brief as this one must be. Readers who may be interested in a description of the entire system in greater detail will certainly meet with a cordial response if they will write for information to Mr. Lawson Purdy, President of the Department of Taxes and Assessments of the city of New York. One of the most convincing evidences of the efficiency with which assessments are made by this department is the fact that appraisals of 545,000 separate parcels of real estate, aggregating \$8,000,000,000 in value, on which taxes of \$150,000,000 are collected each year, are made to the satisfaction of the great majority of property owners in a city of 5,000,000 citizens.

THE TORRENS LAND ACT IN OTHER LANDS.

By JOHN GINTY, Assessor of the City and County of San Francisco.

Mr. President and Members of the County Assessors' Association of California:

Your committee on program has honored me by a request that I prepare a paper on the Torrens Land Act, especially as to its application in other localities.

Having prepared an address on this same subject which I delivered at the meeting of the California Bankers' Association in 1908, it was necessary at that time to secure a large amount of data regarding previous results and the application of the Torrens Land Act as well as similar laws in transferring titles to properties. Although that paper was prepared and written for bankers, financiers and millionaires, being in the banking business at the time, I assume

assessors to be in the same class, so am now quoting from that address some of the examples of the application and results, which show the benefits of the Torrens Land Act in different locations where it is now in use.

HISTORY.

The principle upon which the Torrens Land Act is founded is not as modern a development as many persons imagine. Similar laws requiring a registry of title and the government to assume the responsibility of correct titles through the recording office, were in force in Vienna as early as the year 1368, in Prague in 1377, in Munich in 1440, in Austria in 1811, in Saxony in 1843, in Hungary in 1849, and in 1857 a commission was appointed by the British Parliament to compare the Torrens system of registering land titles with the system of recording deeds, and the result was the passage of a bill enabling a land owner to register an indefeasible title. In 1897 this law was amended to compel every purchaser of land to register in the proper office at least a possessory title, which is a prima facie title, and does not destroy existing claims. It will prevent new claims from arising, and after a term of limitation, the possessory title becomes absolute and indefeasible.

The city of London was divided into eight parts, and the new law was made applicable to part one in January, 1899; part two, March, 1899; parts three and four, October, 1899; part five, January, 1900; part six, May, 1900; part seven, November, 1900, and part eight, the largest district, July 1, 1902.

Sir Robert Torrens, from whom the act takes its name, was the collector of customs in South Australia in 1858. He was familiar with shipping laws, among which was the Merchants' Shipping Act of 1854, which is similar to the United States shipping laws, regulating the mortgaging and sale of ships, and requires the owner to register his title to the vessel. It occurred to him that there was not so much difference between the titles to ships and the title of land, and there was no reason why an act providing for the registry of one could not be made to apply equally as well to the other. Realizing that the important thing with reference to any property, whether land or ships, real or personal, the two great divisions of property, is the right to have and to hold, and to dispose of it. He could see no reason why the government should furnish a certificate as evidence of one's ownership of a vessel and should not do the same thing with reference to land.

Ohio was the first state to adopt the Torrens Act. Because of numerous glaring defects in the law as framed in that state, the act was declared unconstitutional by the Supreme Court. Next came Illinois with an act which was declared unconstitutional. The errors in the first act were avoided in the law, as enacted later, and sustained by the Supreme Court. Then came the Massachusetts act, which was virtually upheld by the Supreme Court of the United States, by a dismissal of the writ of error. The acts of California, Oregon, Colorado, Minnesota, Philippine Islands and the Territory of Hawaii, followed in the order named. The Massachusetts, Minnesota and Illinois acts, like the Australian act, provides for an insurance of the title.

In California the subject was first introduced in the legislature of 1893, where it met with strong opposition. The question was referred to a commission of five persons, four of whom were lawyers, to investigate its application elsewhere, and to prepare a new system for the State of California. The commission's report was submitted at the session of 1897, when the legislature passed the act now in force. This law was upheld by the Supreme Court of California in 1907.

GENERAL METHOD.

Land titles are brought under the Torrens Act by an action, similar to a suit to quiet a title, thereby establishing a new foundation or basis of title that will resist attack. From that time on, the abstract and attorney's opinion are dispensed with. Future sales of the property are made by endorsement of the certificate of title and acknowledgment before a proper officer and surrender of the certificate to the recorder, who issues in its place a new certificate, making it as easy to transfer real property as to transfer certificates of stock in a corporation. The grantee, when receiving his certificate from the recorder, is compelled to send or leave a receipt bearing his signature, or, if unable to write, other evidence enabling the recorder to detect a subsequent forged conveyance. This is a safeguard that is not now fully covered by a notary's certificate.

The object of the law is to simplify the transfer of real property and give a perfect title without the present expense and delay of obtaining an abstract and having a lawyer pass on the title every time it is sold. It would seem, if our boastful civilization and universal education have any merit, it ought to be possible to devise a law by which a person of ordinary education would be able to sell and convey land as easily and as quickly as he could a horse or any other personal property. The present system of recording land titles is said to be a relic of common law feudalism, and yet for a variety of reasons, lawyers and laymen have clung to it as tenaciously as to an article in their confession of faith. Why the man who owns stock, bonds, merchandise, or a man who raises cattle, or agricultural products, should be able to sell or borrow money on them without delay and at no expense, while the owner of the land, on which these crops are grown, must be subject to expense and delay of an abstract or attorney's opinion, if he wishes to sell or borrow money on the land, is a condition of affairs, regarding which no one can give a satisfactory reason.

EXEMPLIFICATION.

The writer of this paper was fortunate enough to attend the World's Fair Real Estate Congress held in Chicago in 1893, when the subject presented was the Torrens Land Act. As there were representatives from the countries where the act had been in force, I will quote some of them—one by a president of a loan and trust company in Ontario. He stated that a friend dropped into the bank, and said: "I want to borrow ten thousand dollars on my farm; you know the place and know I have lived on it for twenty years. Here is my abstract, and on the last page is my attorney's opinion of the title when I bought it." The president said, "I know your place very well, having tramped all over it in my hunting trips, and I will not charge you the customary

appraisers' fees, but the rules of the bank require all abstracts to be made by our abstractor and passed on by our attorney. Your abstract and attorney's opinion may be all right, but it would never do for the bank to take everybody's opinion or abstract, for some day some one might perpetrate a fraud on us; besides, as we did not employ your abstractor or your attorney, we could have no recourse on them should an error be found. We paid them nothing, and they did not warrant the title to us."

Continuing, the speaker said:

"In order to obtain the loan, he had to conform to our rules and pay our abstractor, our attorney and interest on the ten thousand dollars from the day of the application, as we set aside the money from our loanable funds, and as we pay interest to our depositors, we can not hold the money and lose the interest accruing to our depositors, unless you pay us interest. The old abstract was sent to our abstractor, who said, 'I will continue the abstract from date of this abstract, but I will not warrant the old abstract to be correct. I can not warrant other abstractors' work. If you expect to hold me responsible, I shall make you a new abstract.' The president said, 'We shall hold you responsible, so go ahead and hurry up the abstract.' The abstractor pleaded a rush of work, and would not promise it inside of ten days or two weeks. In ten days we had the abstract, and sent it to the attorney with instructions to hurry up his opinion. Our attorney pleaded a rush of work—cases set for trial in various courts, etc.—and would not promise it inside of ten days or two weeks. In another ten days we received the abstract with a satisfactory opinion, accompanied by a bill of twenty-five dollars for attorney's fees. We remonstrated that the bill was large for reading a few pages of abstract sheets, as the title was perfect, and nothing had to be done. 'Yes,' the lawyer replied, 'it does seem high for a few minutes' work, but consider the risk, the insurance I give you. Now, if the title proves defective, and it should appear that I ought to have discovered it, you will want me to pay you the ten thousand dollars you loaned on the property.' As the borrower had agreed in his application to pay all abstract and attorneys' fees, and as it was not coming out of the bank's funds, we paid the bill, musing all the time how we would be able to collect a ten-thousand-dollar loss from an attorney, whose available assets were less than twenty-five hundred dollars. Next the abstractor's bill for twenty-five dollars was presented, and again we demurred to the price, as it only proved the old abstract to be correct. The abstractor smiled, and said, 'Of course, I got it out in less than a day, but if I had made a mistake, you would want me to pay for the loan you might lose on it; the twenty-five dollars is little enough for my insurance of a correct abstract.' The bill was paid, and I wondered what I would get in a suit, as the abstractor's assets were mostly his books, which were exempt from execution. It cost the borrower twenty-five dollars for the abstract, twenty-five dollars for the attorney's fee and twenty days' interest, before his hand touched any part of the ten thousand dollars loaned him.

Since that time we have the Torrens system of land registration, and the same borrower, having paid that loan, again made an application to borrow ten thousand dollars. I invited him into the office, while I called up the recorder on the 'phone and asked if there had

been any liens attached to certificate No. ——— since it was issued. The recorder said, 'Hold the line,' and in a few minutes replied, 'No further liens.' I sent our messenger boy on his wheel to the recorder's office to have the certificate transferred to the bank as trustee, the borrower having endorsed and acknowledged it before the notary in the bank. The messenger soon returned, and it took just twenty-five minutes from the time the borrower entered the front door of the bank until he went out the same door with the ten thousand dollars in his pocket, and all the expense he was obliged to pay was the notary's fee and the recorder's fee, which was about the same as recording an ordinary trust deed.

"It used to be when I read the evening paper at home, I came across the scare headlines, 'A lost heir found; the title to much valuable property will be affected,' and I can charge more than one troubled night's rest to the reading of such articles in the paper, for I would recollect we had some loans in that tract, and speculating on possible losses is not conducive to happy dreams."

Another gentleman, evidently a real estate boomer, said that in his city a tract of one hundred acres was sold to a party who intended to subdivide it into lots. The cost of the abstract was twenty-five dollars, the attorney's fees fifty dollars—total cost of the transfer expenses, seventy-five dollars. He subdivided the land into one thousand lots, of the usual twenty-five foot frontage, and sold them to one thousand different persons, each person getting a separate abstract and his attorney's opinion, so that he could hold the abstractor and attorney for damages, if any loss should arise. This second transfer, as you see, cost seventy-five thousand dollars in transfer charges. The next month these purchasers sold out at a profit to one thousand new purchasers—another seventy-five thousand dollars' cost for abstracts and opinions.

Evidently the gentleman referred to a genuine southern California boom in real estate, as the property was turned over sometimes once a week, sometimes once a month, *always at a profit*, but at the end of the year the total transfer charges exceeded the original cost of the property many times; and as the size of the abstract increased with each sale and the attorneys' fees climbed in the same proportion, I presume the President or Wall Street had to create a panic and stop that boom, or all the circulating medium of the United States would be required to pay the expenses of the transfers.

CALIFORNIA LAW.

The California law on the Torrens system is quite voluminous, and I will only briefly outline it. Under it county recorders are made registrars of titles. The law is not compulsory. The state or county does not insure the title, the framers of the law believing that the precaution taken to give everybody notice, the responsibility imposed on the abstractor, and the qualification of the examiner of the title, are so complete that an erroneous decree of the court would be practically impossible; and the simplicity of transfers after the first registration prevents errors.

The owner of land files with the county clerk a verified petition, addressed to the superior court of the county in which the land is located. The petition shall set forth the name, occupation, place of residence and post office address of the applicant, whether married or

single, the description of the land, applicant's interest in the land, and whether it is subject to homestead, occupied or vacant, the name and the interest of the occupant, whether the land is subject to easement, liens or incumbrances, and the name and address of each holder, and the nature and amount of his claim, whether any other person has any interest in the land, and if so, the name and address of each person, and the nature of his interest, and the names and post office addresses of all owners of adjoining lands. If application is made by a corporation, its name, when and where incorporated, its principal place of business, and the names and post office addresses of its president and secretary.

A plat, or survey, of the land, made by the county surveyor or licensed surveyor, must accompany the application, and if reference is made to recorded maps, the book and page of the records must be shown. An abstract of title must be filed with the application, verified by the affidavit of the searcher making it, or if made by a corporation, then by the certificate of such corporation under its seal. The abstractor must execute a bond to the people of the State of California for at least ten thousand dollars, which amount may be increased from time to time as the court may deem necessary. This bond must be conditioned for the payment of all damages and costs resulting from error or insufficiency in the abstracts.

The first step after filing the petition is the examination of the abstract, which may be done by the court itself, or by a referee appointed by the court, who must be an attorney in good standing, skilled in the examination of titles, and having not less than three years' practice before the court in which the proceeding is pending.

After examination of the abstract, if it appears that the title to the land described in the petition is substantially as alleged, the court must set a date for the hearing of the petition, and notice must be given to all parties interested and to the owners of adjoining land. This notice is served same as a summons in a civil action. Upon the hearing, the court examines into the applicant's title, and objections to his claim, if any. If it appears that the applicant is the owner of the land, the court shall make a decree to that effect. This decree must set forth all liens and encumbrances on the land, with the name of the holder and their nature, amount and order.

This decree is in effect a decree quieting the title, subject to appeal as in all cases, and is final and conclusive as against the right of all persons known or unknown.

A certified copy of the decree is then filed in the office of the registrar of titles, who immediately issues a certificate of title to the owner, as shown by the decree. This certificate contains the description of the property, and the nature, amount and order of the liens, if any. The registrar then makes an entry in a book kept by him for that purpose, showing the name of the person to whom the certificate was issued, its number, the day, hour and minute of its issuance, the name of the person to whom the duplicate was delivered, and the book and page where the original certificate is recorded.

The law expressly disclaims any intention to prescribe a particular form of certificate, but provides that it may be in substantially these words:

STATE OF CALIFORNIA,
 City and County of San Francisco. } ss.

John Smith, by occupation lawyer, residing at 203 Third Street in the City and County of San Francisco, State of California, is the owner of an estate in fee simple in the following described land (describing it as in the decree), subject, however, to the estates, easements, liens, encumbrances, and charges hereon noted:

1. Mortgage to the Hibernia Savings and Loan Society for the sum of one thousand dollars, dated January 1st, 1906, payable one year after date with interest at six per cent (6%) per annum, interest payable quarterly.

2. Materialman's lien in favor of Sierra Lumber Co. for two hundred and fifty dollars, filed July 3d, 1906.

3. State and County taxes for the year 1906.

4. Lien for street grading, one hundred dollars, filed February 1st, 1906, etc.

In witness whereof, I have hereunto set my hand and caused my official seal to be affixed this 3d day of August, 1906.

E. G.,

Registrar of Titles in and for the city and county of San Francisco, State of California.

The registrar must keep a book to be known as the register of titles, in which he shall enter all original certificates of title in the order of their number with blanks for the entry of subsequent encumbrances. Each certificate, with the blanks, shall constitute a separate page of this book, and subsequent notations, relating to the title, shall be entered in the blanks on this page. Each duplicate certificate of title shall be numbered the same as the page of the register, on which registration of title is entered.

When land is brought under the operation of this statute for the first time, it is deemed to be registered when the registrar shall have marked upon the certificate of title, in duplicate, the volume and folio of the register, in which the original is to be found. From that time on the registered owner, except in case of fraud to which he is a party, holds the land subject to such mortgages, liens, charges and interests as may be noted in the certificate in the registrar's office, and free from all other encumbrances, except of course, other matters which may arise from time to time.

A registered owner may transfer his whole interest, or a part of it, by the ordinary deed, or by endorsement and surrender of the certificate. The registrar then issues in duplicate, and registers, a new certificate, certifying the title to the land to be in the new purchaser. On the new certificate issued he notes the date of the transfer, name of transferee, the volume and page in which the new certificate is registered. Then he cancels the surrendered certificate, and issues one or more certificates, according to circumstances. In case of an assignment of a mortgage on land, the assignment is filed in the office of the registrar, who notes the transfer on the page in which the original certificate is contained and also upon the mortgage on file, which is intended to be transferred. A release, or satisfaction of mortgage, on all or any part of the land mortgaged, is effected in the same way as in the case of a transfer. If only a part of the land is to be released, the entry shall be made accordingly; if the release is for the whole tract mortgaged, the registrar must stamp across the mortgage on file the word "cancelled," and make a corresponding notation on the original certificate and on the duplicate or certified copy.

No document, affecting registered land, or any interest therein, is notice to any person dealing with such land until the same is filed with the registrar, and a memorial thereof entered upon the register of the last certificate issued.

When a suit is dismissed, or a judgment satisfied, released or modified, or any writ of execution or attachment has been released, it is the duty of the sheriff or clerk of the court, as the case may be, to certify to and file with the registrar, an instrument showing such discharge or release. The registrar then enters a memorial of the discharge or release on the register. A judgment can not be a lien on registered land until a certified copy of the judgment, under the hand and seal of the clerk of the court, is filed with the registrar and a memorial entered upon the register. The same is true of mechanics' liens. The act does not alter the existing mechanics' lien laws, but it requires a notice to be filed and registered before the lien can be enforced against the registered land. All notices of assessments for street improvements, sewers, etc., must be filed with the registrar by the city clerk before registered land can be charged with such assessment.

Section 35 provides: "After land has been registered, no title thereto adverse or in derogation to the title of the registered owner shall be acquired by adverse possession," and section 77 provides, that the purchaser of registered land sold for taxes, shall within one day after such purchase, file in the office of the registrar a written notice of his purchase. In such case the registrar enters a memorial of the notice upon the certificate of title, and mails a copy of the notice to each person named in the certificate or in the memorials. Unless such notice is given, the land shall be forever released from the effects of the sale.

Before the registrar can issue any certificate of title to a person presenting a tax deed to registered land, the purchaser must file with the clerk of the superior court an application for a decree showing the title to be vested in him. All persons appearing upon the register to have any interest in the land, and also the person shown by the tax collector's books to have paid the tax last paid before the sale on which the deed is issued, must be notified of the petition, and at the hearing, the person presenting the deed must show affirmatively that he has complied with all the requirements of the statute to entitle him to a deed. This feature of the law will not be relished by the tax title shark and land jumper, for the opportunity to acquire title by stealth or without the knowledge of all interested in the land is made virtually impossible.

The first certificate of title issued to the owner of land, in accordance with the terms of the decree of the court, is absolutely conclusive against all parties after the lapse of five years. That statute disregards the usual rule with reference to infants, insane persons, and others under disability, for it expressly provides that actions must be brought by such persons, or their guardians, within five years after the first registration, and also provides that before any action to establish a claim against registered lands can proceed, it must be shown to the court that the person bringing the action had no actual notice of the original proceeding to register the lands in time to appear and file his objections; and if he had notice, and did not appear, his default is subject to the same penalties and limitation of appeal as a default in any civil action.

The registrar is also required to keep the usual indexes of certificates issued by him.

As will be seen, the original registered certificate on file in the registrar's office contains a notation and reference to every lien, or claim, that is required under the present laws in any or all the city and county offices, and is open to inspection to contemplated purchasers, creditors or interested parties, and kept in such a simple form, that any one who can read may understand the title and what liens may exist against the property.

The original act was found to be cumbersome, and initiative amendment No. 22 on the ballot at the last election, which was carried by a substantial majority, provides for the following changes, to wit:

Section 5. Provides that several individual owners of several parcels of land may join in one petition, thereby largely reducing expenses.

Section 6. Dispenses with special surveys where the land may be identified by reference to an official map; dispenses with abstracts of title where adverse possession and payment of taxes for five years is alleged and proved.

Section 8. Removes the necessity of waiting five years for registering title acquired from the State of California after sale to the state for taxes and held by the state for five years.

Section 14. Provides for setting petition for trial and for entry of decree to accord with other amendments. Also for jury trial.

Section 17. Making it optional for all executors and administrators, while the property is in course of probate administration, to petition the court to register all land to be distributed in probate after giving the notice required by the Torrens Act and requiring the decree of distribution, in addition to distributing land to the heir or devisee, at the same time, to order such land registered.

Section 47. Providing that all papers affecting registered land have endorsed thereon certain facts necessary to enable the recorder to segregate such papers from others affecting unregistered land.

Section 57. Provides for both husband and wife signing the transfer of community property.

Section 100. Revising the fees of the registrar under the Torrens Act and providing for the accumulation of an assurance fund in the hands of the state treasurer.

Section 105. Providing for the creation of an assurance fund, for its investment by the state treasurer and for the method by which any person suffering loss by reason of the operation of the Torrens Act may recover his actual damages out of such fund.

Section 108. Giving registrars the power to maintain attorneys of good standing for the purpose of assisting in the proper conduct of proceedings and registration under the Torrens Act.

LEGAL DECISIONS.

The attacks against the California law, as well as that of other states, as disclosed by Supreme Court decisions, has been mainly on the grounds that it might deprive persons of their property without due process of law; that publication of notice is not due process of

law; that it imposes on the registrar judicial functions, and that the statute of limitation is too short. The courts, in sustaining the law, cite the following cases:

Arndt vs. Griggs, 134 U. S. 316:

What the tenure by which land within the bounds of a state is held, and the manner and form of its acquisition, transfer and descent, shall be determined by the state in which it lies.

The well being of every community requires that the title of real estate shall be secure, and that there be convenient and certain methods of determining any unsettled questions respecting it. The duty in accomplishing this is local in its nature; it is not a matter of national concern, or vested in the general government; it remains with the state, and as this duty is one of the state, the manner of discharging it must be determined by the state.

In *U. S. vs. Fox*, 94 U. S. 315, Justice Field said:

The titles and mode of disposition of real property within the state, whether *inter vivos* or testamentary, are not matters placed under the control of federal authority.

In *Hamilton vs. Brown*, 161 U. S. 247, the court held that the legislature may provide for determining and quieting the title of real estate within the limits of the state, and within the jurisdiction of the court, after actual notice to all known claimants, and notice by publication to all other persons. In brief, the United States Supreme Court has held that the state has jurisdiction over its lands, and a judgment affecting title to real property, when given in accordance with the laws of the state, is a decree *in rem*, or against the land; and hence the court's finding is valid in that jurisdiction, since it is the expression of the sovereign authority over the land.

The constitutional questions of the power to create the lands law has been decided in the affirmative by the highest courts in Massachusetts, Illinois, Minnesota, California and Colorado. Hon. Wm. H. Taft recommended it, and had it embodied in the laws of the Philippine Islands, where titles were very badly complicated. The official organ of the California State Realty Federation, entitled "California Real Estate," in its issue of September, 1914, has a brief reference to twenty-two letters from registrars in Australia, New Zealand, Honolulu, and counties in the United States, stating the act in their communities is giving satisfaction, and with but slight claims for losses from defective certification; in fact, the interest alone on the amount paid into the reserve or insurance fund was more than enough to meet the losses. I have had the privilege of reading the original letters, and the quotations from the letters are correct.

There is an old adage, that the proof of the pudding is in the eating, and with a view to learning if the Torrens system gave satisfaction, where it had been used, I addressed letters to banks in New Zealand, Australia, Manila, Honolulu, Chicago, St. Paul, Minneapolis, Duluth, Boston, Toronto, London, Vienna, Prague, Geneva, and Berlin, inquiring if it was their custom to accept registrars' certificates in lieu of abstracts: whether there was insurance; the cost of registry of real estate valued at five thousand dollars; the method of loaning on a certificate, and finally if the system was considered practical.

As it would take too long to read all their replies, and many answers are so similar, a few selections will suffice.

The Boston Five Cent Savings Bank, of Boston, Massachusetts, with assets exceeding thirty-nine million dollars, referred my letter to their attorney to answer, who replied as follows:

Question 1.—The banks as well as individuals, accept the registrar's certificate of title to land registered under the Torrens system with as much confidence as if it were an abstract approved by the best conveyancer. The system of registering requires a careful abstract by an examiner approved by the court. This is kept on file and notice is given to all possible parties whose title to nearby land is, or may be, affected by the registration of the title in question. This aids toward securing absolute correct abstract of title, and allows every opportunity for discovery of errors.

Question 2.—The state insures the title to land registered. A charge of one tenth of 1 per cent of the assessed value of the land is paid at the time of registration, which goes into an assurance fund. So far as I know there have been no losses.

Question 3.—In making a loan the original certificate may be kept by the trustee or pledgee. No transaction, other than attachment or liens, etc., can be made without the presentation of the original and duplicate certificates. Actual mortgage transactions are made by deeds in the usual form, and references of the deed and minutes about it are noted on the certificate.

Question 4.—The system has worked well and is practical. A part of our system is the creation of a special court, having powers practically the same as the superior court, which, however, concerns itself with nothing but the registration of land titles and the trials of technical points in cases of disputed titles. The result is that the judges of that court become highly specialized in the law of real property, and their opinions are regarded as high authority in supreme court of the state.

The Canada Permanent Mortgage Corporation of Toronto, having a paid up capital of six million dollars, answered as follows:

Question 1.—All persons loaning money on real estate under the Torrens system, accept the registrar's certificate of title, as it is absolute.

Question 2.—The government insures the title against all errors, and if the property has once been put under the Torrens system, the charge for the issuance of the registrar's certificate, which is the government's insurance of the title, is only a nominal sum of one dollar in addition to the registrar's usual charges, which are very moderate. The expense of putting the property under the Torrens system depends upon the number of transactions that have been in the property.

Question 3.—Our Torrens system provides a special form of mortgage, or as it is called here, "a charge" on the certificate of ownership, and one dollar is charged for the registration of the charge.

Question 4.—The system is eminently practical.

The Minnesota Loan and Trust Company of Minneapolis, replies:

Question 1.—It is generally the rule that banks and others loaning money accept the certificate of title.

Question 2.—The state insures the title; the fee is one tenth of one per cent. In this county there have been registered more than 500 titles, and I understand the loss has been merely nominal.

Question 3.—In loaning money, a mortgage is given as usual.

The Duluth Savings Bank replies:

Banks or persons loaning money accept the Torrens certificate of title in lieu of abstract. The state and county insure the title. There have been no losses. From our own experience and that of others, we think it is the *only* system whereby the record of title to property is so easily ascertained, as all evidences of transfers are made upon the certificates and can be depended upon as absolute.

The First National Bank of Chicago, replies:

We have had a few pieces of property so registered and have had no difficulty in disposing of them. We have had little or no occasion to consider it. We enclose publication from the recorder's office.

The Chicago City Bank replies:

Question 1.—Some banks and persons loaning money accept the certificate, while others do not. The certificate is growing in favor.

Question 2.—Cook County insures the title—cost one tenth of one per cent. No losses have been made in the ten years it has been in operation.

Question 3.—The cost of registration of a piece of property, valued at \$5,000, is \$24, plus the insurance fee, \$5; total, \$29, providing no more than six instruments on the abstract; over six, seventy-five cents for each document.

Question 4.—Our experience with the workings of the different ways of showing title, convinces us that the Torrens system is the *only* system. We are sure that in time the Torrens system will crowd out all other systems now in vogue.

From the printed reports of the Registrar of Chicago, I quote the following:

Upon an ordinary sale or mortgage of registered lands, the entire transaction can be closed in an hour without the need of any abstract of title, and the cost will be but \$3. Registered titles are generally accepted in sale and mortgage transactions by leading real estate and mortgage firms. The statutory fees for registering titles are as follows: Clerk of court on filing application, \$5; registrar for examination of title, \$15; publication of notice, \$2; total, \$24. Sheriff's fee for serving on defendant, \$1 for each person. The owner must furnish abstract up to October 9, 1871, the day of the great fire. After that date the registrar will continue the abstract. After two years from date of registration, no person, whatever may be his claim, may question the validity of the title so registered.

REPORT OF THE TORRENS DEPARTMENT, DATED SEPTEMBER 24, 1906.

Total number of certificates issued, 5,621; total value of land when registered, \$8,662,960; number of separate lots registered, 10,712; number of whole blocks not included in the foregoing, 88; number of acres registered, not included in the foregoing, 25,000. From a list of prominent parties who have had their property registered, I find the names of thirteen attorneys, twenty-one banks and bankers, twenty-four capitalists, the Catholic bishop, twenty-six wholesale merchants, the president of the Rock Island Railroad, and the president of the Chicago, Milwaukee and St. Paul Railway.

Under the system a careful check is made upon the accuracy of all papers filed, and if any doubt is raised, it is settled at once; unlike the old system, where errors lay dormant for years.

The average transfer costs are \$3, whether the property is valued at \$100,000 or \$100. All abstract expense is thus eliminated. The responsibility of Cook County for errors of the registrar or his subordinates, is preferable to the guaranty of any private individual or corporation, however responsible.

The answers from foreign countries all stated that the principle of registry of title was practical and gave satisfaction, and I will close with a report from Austria and Prussia.

In Austria, where registry of title has been universal since 1811, seventy-five per cent of the sales and mortgages are for two hundred and fifty dollars, or under. The Prussian registry fee begins at ten cents for sales and six cents for mortgages of five dollars, or under, and there are nine gradations for values between five dollars and two hundred and fifty dollars—a simple and cheap system of transfer is evidently an absolute necessity there. Mortgages are mainly held

by real credit institutions or land banks. The debenture bonds of these banks appear among the highest forms of securities in great numbers, in the daily published list of the stock exchanges, often at a premium over the best government bonds.

That the registry system is adequate to meet any complication liable to arise in California, I quote from a registry certificate of a small estate in upper Austria, in which the land is charged with forty-nine entries relating to liens, among which are—

1. Right of way;
2. Obligation (dated 1817) to maintain and repair the banks of a brook;
6. Obligation to maintain A. B. (a former owner) for life, lodging, clothing, food (but no money specified);
11. Transfer of mortgage with raising of the interest;
18. Right to gather litter of cattle in the public forest, for a small payment, charge on the land;
- 19-20-21-22. Mortgage to four persons in unequal shares, the sum due to each being specified;
23. Right to put six sheep out to graze at two kreutzers (about one cent) a head, which payment is charged on the land;
26. Right to turn out a horse to graze, for a small payment charged on the land;
32. Obligation to give free lodging to one girl and two boys (named) till marriage;
35. Execution for arrears of interest (interest more than three years in arrears is not otherwise a charge on the land);
43. Agreement (of 1872) as to repair of a common drain with next house.

The remaining thirty-eight intermediate and succeeding numbers of liens against the land, are for mortgages, satisfaction, assignments and stipulations, raising the rate of interest, leases, etc.

In conclusion I quote from a paper delivered by Professor Heard before the State Bar Association of Illinois in which he states careful estimates place the cost of making abstracts and obtaining attorneys' opinions on the same in the state of Illinois amount to over ten million dollars annually. None but a rich country could stand this unnecessary waste due to an obsolete system of recording deeds.

EXEMPTIONS.

By MONTGOMERY M. MOULTON, County Assessor, San Diego County.

The theory that taxation should be on lines of equality, and that all property should bear its just proportion of the cost of government is not recognized in the spirit which prompts our legislators and our people to constantly provide tax exemptions for various classes of property and classes of citizens. It is true that the California constitution provides for fewer such exemptions than do many other states of the union, but it is noticeable that at every general election in this state one or more constitutional amendments are offered which have for their object the granting of additional tax exemptions. Plausible and apparently convincing arguments are presented in support of those amendments, and even our assessors are sometimes found to be in favor of them.

In various other states provisions are made for tax exemptions of a

hundred and one different classes of personal property, for fraternal societies, charitable institutions, churches (in addition to their houses of worship), hospitals and many other kinds of property, and for exemptions or partial exemptions in favor of war veterans, sons of veterans, physically disabled persons, widows, and unmarried females of certain ages. We are welcoming to this state as new citizens a constantly increasing number of people from other sections of the nation who bring with them the ideas of government with which they are familiar, and who insist that our constitution and our laws should be amended and made to resemble in some degree the constitution and statutes "back home." Especially do these new citizens bewail the absence of the various tax exemptions with which they have been favored elsewhere. Those who believe that all should contribute to the public revenues proportionately to their wealth should be on guard against this ever present desire to grant tax exemption favors.

In view of the tendency to extend the privileges of tax exemption to additional classes of citizens and to other classes of property, I recommend that legislation should be enacted to require counties to compile statistics which will show the effect of the various constitutional provisions which allow exemption. I do not refer here to the property which is publicly owned, but to all other property which is untaxed—owned by churches, veterans, steamship companies, and to educational institutions not publicly owned. The state board of equalization now requires the assessor of each county to report the valuation of property dropped from the county roll on account of the military service of citizens of the state and the valuation of the personal property not taxed because of the householders' exemption. I believe that this report should include the valuation of vessels hereafter untaxed and of property exempted because of its religious or educational use. The state board of equalization and the state controller should be able to report the total value of all property not taxed because of the various exemption provisions.

This tax exemption can be extended only by a vote of the people of the state, and should more classes of property and more classes of citizens be thus favored the assessors will probably not complain as it is our duty to administer the laws as we find them; but I believe that complete information concerning the effect of the existing exemption provisions would have its influence upon future constitutional amendment elections.

INCREASE IN PUBLIC EXPENDITURES.

By DR. THOMAS S. ADAMS, Secretary National Tax Association, and State Tax Commissioner of Wisconsin.

(Read by Hon. John Mitchell, Chairman, State Board of Equalization.)

The last fifteen years have witnessed a striking expansion in the functions and cost of government. Public expenditures have increased far more rapidly than population and in all probability more rapidly than wealth or income. Certain it is that taxes have become not only a source of irritation and inconvenience, but a serious handicap to industry and a noticeable deterrent to enterprise and investment.

The seriousness of this movement is enhanced by the fact that a large number, probably a majority, of electors pay little or no direct taxes. They probably contribute a fair share—possibly more than their share

—to the expense of government in the customs and internal revenue duties and other indirect taxes which they pay in the form of increased prices. But the fact that they pay is not brought home to them in any vital way and they accept the direct state and local taxes which our representatives vote unrestrained by the potent check involved in direct taxpaying.

A POLITICAL ANOMALY.

And the historical aspect of the question makes it doubly serious. Scarcely a decade has passed in the last century and a half unmarked by revolution or serious political protest against the increase in functions and cost of government; yet the protestants, when ushered into office and political control, found themselves unable to stem the tide. We pass no opinion upon the beneficence of this phenomenon. But in view of the unbroken historical expansion of government we can not consistently hold out the hope in this day and generation it can permanently be stopped.

This statement has no bearing in any direction upon current socialistic controversy. If subsequent history should prove emphatically that socialistic predictions have been ill-founded, we have no doubt, nevertheless, that it will witness a practically unbroken expansion in the activities of government. What can be fairly expected and resolutely required is that, for a considerable time at least and until private wealth and income have greatly increased, the future expansion of governmental activity shall be financed out of the savings which are so patently possible.

Upon this point also there is a practical unanimity of qualified opinion. Great opportunities for saving exist within the lines of present American government. In most city and state governments there are some departments which overlap, while others are engaged in work which is no longer necessary. Careful consolidation of departments would in many instances reduce general and overhead expense. Government employees as a rule work neither so long nor so earnestly as those in private employment. Supplies and equipment are not purchased to advantage, nor properly charged and checked when distributed; specifications for bids are loosely or carelessly drawn in many cases; labor-saving devices are slowly and sometimes reluctantly introduced; there is great waste in public printing.

NO INCENTIVE FOR ECONOMY.

Above all there is not the same incentive or reward for economy and consolidation and the elimination of waste in public as in private enterprise. The impulse to save is largely inhibited. Civil service reform has worked a marked improvement in the personnel of many governments, while graft and the misuse of public funds have ceased to be widespread and general evils. But civil service appointment has not and probably can not effect very large savings, and the simple elimination of graft frequently leaves mere inanition and inactivity. In brief, the machinery of government is marked by a maximum of internal friction and displays little of that innate capacity to overcome lassitude and throw off disease which marks high vitality and efficient organization. The elimination of waste usually comes from without after a political

upheaval. The innate power of adaptation to new conditions and the elimination of functions or members which have become useless is almost absent.

While great saving may be accomplished within the government organization which now exists, the elimination of this waste would be easier and the improvement more permanent if certain fundamental defects in our political system could be remedied.

EDUCATION OF ELECTORS AND OFFICE HOLDERS.

First.—The first of these is the lack of intimate knowledge of what the government is doing. The electorate is sovereign, the ultimate master. It must pass judgment upon the work which its servants do. The electorate does not have this knowledge; the legislature does not have it; frequently the elective executive officers do not have it in any comprehensive way. Electors vote and the legislature passes appropriation bills without authentic facts before them. Administrative officers are frequently condemned for the things they do well, and applauded—or at least not condemned—for the things they do poorly. The effect of this upon the ambition and initiative of administrative officials can scarcely be exaggerated. Their work is frequently of a regulative character. It naturally irritates those who are regulated, however tactfully and considerately performed. It makes enemies, but—although it may be manifestly in the public interest—it does not make friends of corresponding number and strength.

Ignorance of public work, its difficulties, its effect and its cost and indifference—the product of ignorance—are probably the most fundamental causes of inefficiency in the public service. They can be remedied only by developing an adequate agency to measure governmental performance, ascertain results and costs on a comprehensive scale and continuously bring the facts home to the public.

A CHECK AND BALANCE ON VARIOUS DEPARTMENTS.

At present there is in most places no such agency. The members of city councils and state legislatures change so frequently, serve for terms so short and work in an atmosphere which makes it practically impossible for them to ascertain accurately what the departments of government are doing. Elective executives of the higher type, such as mayors and governors, are usually elected for a term so short and are necessarily so preoccupied with matters purely political, that they can not find time to ascertain with certainty whether the work of each department is being conducted at a cost commensurate with the results achieved. We have no criticism to pass at this point. On the contrary, when we consider the conditions under which such officials usually work, the uncertainty of their tenure of office, the cost in time and money of securing nomination and election, we can only wonder that they find as much time and energy as they frequently do find to devote to the real work of their office and securing a real acquaintanceship with the efficiency of the various administrative departments.

PRIVATE ORGANIZATIONS DOING SPLENDID WORK.

The main problem of ignorance and inertia is being attacked by efficiency bureaus and taxpayers' associations, formed for the most

part under private auspices. They have a great and a permanent work to do and it should receive every encouragement. But the public itself must develop similar agencies. Just how this should be constituted is a question upon which it is unnecessary to pronounce here. They may be developed as a subsidiary agency of the legislature, or the chief executive officer, or may be detached from both and allied with a quasi-independent civil service bureau. But the work of regularly testing governmental performances and publishing the results is an indispensable requisite of the introduction of real efficiency.

DISCUSSION OF RESPONSIBILITY.

Second.—Another fundamental defect is found in the diffusion of power and responsibility. The people elect a legislature to carry out their will and then ordinarily split it into two parts in order that the one may check the other. Executive officers are then also elected, taking their mandate directly from the people to check and be checked by the legislative houses. Above all, the courts and a constitution often operate to further check others. This is organization for impotence, not for results. Government becomes under such conditions a farcical game of "passing the buck." Responsibility is shifted from the legislature to the executive, to the judiciary, to the constitution, back to the people and on again through the same vicious circle. Much time and the best brains of those in the public service are used in overcoming internal friction. If the people want little done, and that little done in an expensive way, we have developed a marvelously effective way of satisfying the people's desire. If the people want something done, and want it done economically, responsibility and power must be definitely localized.

This does not mean "more legislation" or "more government." It means only economical accomplishment of whatever the majority decides to undertake. Neither does it mean the sacrifice of local democracy and home rule. It means only the definite allocation of power and correlative responsibility. Concretely, it means the simplification of governmental machinery, reduction in the size of legislative bodies, shortening of the ballot, closer relationship between executive and legislative departments, introduction of the budget, and the development of the function of continuous examination and public display of administrative performance and efficiency.

PRESENT TAXATION METHODS FAULTY.

Third.—In this connection it should be pointed out that the burden imposed by increasing public expenditures is aggravated by the methods of taxation employed by the federal, state and local governments. The indirect taxes imposed by the federal government may be both a necessary and on the whole a desirable form of taxation. If this be true, however, the federal government should take pains to ascertain and make public how this burden affects the different sections of the country and different classes of the population. To impose hundreds of millions of taxes without knowing where they fall, at least in an approximate and general way, is to invite the errors that follow upon ignorance and misapprehension.

Secondly, our state and local taxes on business fall upon the successful and unsuccessful alike; weigh nearly as heavily upon the new

enterprise whose future is uncertain as upon the established business whose success is reasonably assured. All this arises from the American practice of taxing investment and realized wealth, rather than income. We do not assert that business enterprises, as distinguished from land and investment, are taxed either too much or too little. But there is strong reason to believe that whatever amounts should be raised from business enterprise should be raised by different methods, methods which will place a greater relative burden upon business concerns whose earnings are high and well assured, and a smaller relative burden upon new enterprises and those which have not reached the dividend-paying stage. Concretely, we recommend that this association arrange through committee for an investigation and report upon the methods of taxing business enterprise.

RECOMMENDATIONS.

1. Testimony of qualified observers is practically unanimous to the effect that enormous savings may be accomplished within the limits of government as now organized. The burden of taxation has become a positive check to business enterprise. Under the circumstances it should be insisted that further extensions of governmental activity shall for a considerable period at least be financed out of savings.

2. To accomplish this result it is necessary to overcome the existing indifference of the electorate and then to ascertain where economies can be effected and how successfully introduced. To these ends we recommend:

First.—That this association adopt a resolution urging congress to direct the census bureau to publish annually for a selected group of states, counties, towns, villages and cities, statistics of expenditure, taxation, public debt and wealth, including in this group—similar to the registration area used in vital statistics—those states and political subdivisions whose financial accounts are published promptly and in such form as will permit of consolidated statement.

Second.—That a resolution be passed urging every state legislature which has not already done so to require all political subdivisions to publish annually a brief statement showing the increase or decrease in expenditures, receipts, taxes and public debt.

Third.—To measure governmental performance and ascertain where economies may be introduced, national and state governments should establish bureaus of efficiency properly manned and equipped.

Fourth.—To make such bureaus effective, modern government must be simplified and the existing diffusion of power and responsibility corrected. The short ballot, and those modifications which logically go along with it, should be introduced. A single legislative chamber, reduction in the number of elective executive officers, closer relationship between legislative and executive departments of government, a budget which emphasizes the spirit but wastes no time and effort on the form of this procedure—are probably all necessary accompaniments of any movement permanently to reduce public expenditures and increase public efficiency.

Fifth.—To get these movements under way and overcome existing indifference, a systematic propaganda should be undertaken for the betterment of existing conditions along the lines named. Such a movement can offend few persons or interests worth considering. Practically every one agrees that whatever functions government under-

takes should be performed as economically as possible. We recommend accordingly the organization of a national taxpayers' efficiency association—or the assumption of this work by the National Tax Association—designed to awaken the people to the menace involved in the growth of expenditures, secure the publication of simple understandable statistics on this point, point out where economies may be effected, inform minor civil divisions in particular of the bureaus or agencies from which they may secure expert help in reorganizing their accounts and reducing cost, and in short to spread and strengthen the work now being developed by the public and private efficiency bureaus already in existence.

HISTORY.

By E. A. DE CAMP, Tax Agent.

Usually a university has a class day, a part of the proceedings are enlivened by class history, edited by some incompetent, willing to do the bidding of the president.

As applied to this Association, representing fifty-eight counties, there should be as many classes.

Lest some libel suit be born about now I protect myself. Hopkins said, "De Camp, Barney Oldfield sure can run an auto; Bill Mulholland can run his aqueduct through Borland, and Jones, Inyo and Mono county, since the law lets them tax property of a city or county, but none of those fellows know how to run politics; they were all afraid of me. I just beat the Drys to a finish and then the Wets. You see, I scared Frank Meserve out of his job in San Berdoo; while Montague was entertaining the widows at Frank Miller's Free Show at the Glenwood, Riverside, I beat him out of his legitimate supporters. Nobody elected, so I will just send a man out and assess that county myself.

Now, history is all I want, remember none of those up country fellows, like Jarvis and Kay or Jim Sleeper get in on this program without they see me first. Now, don't put in too much of your stuff, because I get credit for it anyhow. Now here is copy of Sacramento Bee, Police Gazette and Bonshu's Woman's Home Disturber. Articles marked Ed. don't mean Ed Kay—those are my articles; pieces in Los Angeles Herald marked Ed. not Ed. Maier; they are mine, don't forget. He assured me that 'Virtue hath its own reward.' I get off right there. It used to be E. W. Hopkins before history attacked him. Now it's Ed. W. Sure some class. Elected both primary and regular. What show has Horner of Oakland to get in any book, when Alex Brown and John Mitchell have been spending a life time in trying to establish a place in the Hall of Fame, ex-assessor of Alameda County. Yes, John Mitchell goes over the state when he spots a would-be big man, he prevails on him to take the name of Mitchell. Puts his name on old machinery like the brands of Plumas County cattle. Attorneys, Hotel Men, Auto Promoters, all fall to the spell, but Geo. E., who disclaims any family prestige, but Alameda County can best be proud of our worthy secretary, Thomas M. Robinson. In corporate parlance the assistant is bigger than the president. Is the assistant to the assessor bigger than the boss himself? Perhaps in Alameda. Then look at the family, Hopkins; there was Mark on the cigar boxes; Mark, one of the Big 4 railroaders, Moses, his brother,

then Edward W., his son (Moses' son, not the assessor's) and notice Stephen Hopkins of the Declaration signers, little shaky like our subject. He is sure jealous of Montgomery Moulton; unlike Ginty he did not take Jules Verne's route to the bottom of the sea, with any seriousness; he dug up the Bon Homme Richard from the mud flats of San Diego, then made a dual personality of Neptune and Paul Jones and exhibited himself to the admiring ladies of Tecarte and Tia Juana at 50 cents per, but he finished up by descending the Eureka shaft at Amador by colliding with Jarvis. Was he a Fardown, a Tipperary man or from Sligo? Heaven only knows. Sure, such is Moulton's history; all he does is to make history await assaults of Mitchell.

John Barry goes down as a success; was reelected; is the original good fellow; discoverer of Topa-Topa Mountain, Ojai, Matilija and Oxnard, with a goodly following of old timers. He sure will live.

Joseph P. Berry was left on our list and sympathizes with Montague Class, but why so? The home of the white chicken and the red wine—good old Sonoma, far better than Long Beach.

T. E. Bevan has and has had the destinies of the old and new; has he made a cleanup of Yuba Dam?

Blair of Visalia of the class above the common, was a product of the regular and the primary; hats off to him.

F. A. Bondshu, assistant to our host, representing both sexes, single, physically perfect, a gem among the rough diamonds of the San Joaquin. No wonder we have to note the everlasting shadows cast on Assessor Bonner. How could it be otherwise? Clough and Bondshu, the Yosemite twins. Bondshu the only political independent in the Blue Book of 1911 at \$1650 per. Scenery thrown in.

Pat Cochran, owner of Mill Valley, Mount Tamalpais, San Rafael and San Quentin and anything else in Marin County, will you be good? If not, he will see that you are.

Let us welcome Edith F. Coons, first legitimate assessor furnished by her sex. Kern County acknowledges her as some class, but history might have been changed and combination of talent produced had Bill Nuner seen Kern County first, but would it not have disturbed the present chief deputy of Angels Camp? No apologies in future from Brother Nuner.

While Kern County preserves sex efficiency we have to note the loss of Mrs. Spitzer. All are proud of that name, because of the dean of the Association. A tribute to his memory—Lewis A. Spitzer.

Hurrah! Clio Lloyd was reelected, to what? To succeed himself or to be the assistant to Miss Rich of the Normal? Oh, well, what would the Press of Santa Barbara be with Clio left out? What would these meetings be without Santa Barbara, its climate and assessor?

Hopkins, looking over my shoulder, "Get rid of Kay." No chance to make history in Sacramento, with the State Board of Equalization on the job, with Tom Eby as the ever bright and shining diamond pointed center, ever dimming the hopes of the assessor. Flanked on both sides, he is a wonder. Black Ryan, his predecessor—1853, but halt! Ed Kay is a prophet in his own country. Eleventh report of the State Board, page 99: Kay in his Los Angeles speech says, "I sincerely believe the largest affirmative vote will be polled, abolishing the poll tax." How is it that the assessor of Sacramento County was a better guesser than the entire State Board, Chambers included?

Here is where the Board get theirs. First we bow to the fact we have lost our dear friend Nye, but we shall worry along with Chambers.

Loss No. 2—Edward Rolkins. Corbett may be a younger, possibly a handsomer man, but he will have to spend many sleepless nights in interpreting those wonderful after dinner speeches, to spend hours among Rolkins' friends to provide appropriate repartees to those toasts; if he don't, honest Jeff, Collins and Mitchell will swipe all the honors, woe be Moulton, Kay and Nuner, who may dispute their correctness.

The state has other duties. If ever there was an honest citizen and assessor just like your mother used to fix up for breakfast, it is Geo. Murray of Kings; he is in the select pre-re-elected class and the Board must see that he alone cares for the destinies of Tulare Lake and Mussel Slough, just because Tom Blair was in the especially pure primary-re-elected class at Visalia. Let Murray have Tulare Lake; it is not in Tulare County. Even if Tom Blair is of the unwashed, he can't have the lake. The ownership of the Nevada Death Valley riches must be cared for. How can Uncle Bill Dudley boost his \$300 salary? Poll tax gone. With Nevada, Borland was wont to slip down on the Carson Valley narrow gauge. Protect him.

The assessors have nothing on Jarvis. They tried him in 1913; he slipped down a shaft while they were helping the ladies at Electra and Sutter Creek. Jarvis is head of the class, but he must be satisfied if he was not served with an Ingersoll like Hopkins.

Care must be taken of Corlett; he is in the re-elected class, but he must remain in the Napa soda and sulphur water district and not bother Geo. Cummings, although the latter is prone to reach out even to Kern and name Cummings Valley and while boosting for Fresno, he points to Sonoma and San Bernardino vineyards and claims them all, in various stages of fermentation.

Mountains are fine, but don't pay state taxes. Something must be done to make good. Lack of Shasta, Siskiyou and Fairchild captured the mountain. Blair got Mount Whitney away from Jones of Inyo; it was needed to equalize Death Valley.

Enjoin McQuaid; he has Yuba Dam and should let Kay keep Fort Sutter, though it is not in county of that name. Pacify Wemple of Susanville. Mount Lassen was placed in charge of the Almighty and Louie Winter over in Tehama, but like many mountains and people is trying to get back to Lassen County. Mulkey must have his God given rights to Goose Lake and be kept free from star route poachers. Whoever wins in Placer, Keener or Broyers, will have Hangtown and should by right wash anybody in Lake Tahoe and throw him over into Nevada.

The Board knows that the surveyors beat Wemple and Lassen County out of the money; it is their duty to see that he keeps Honey Lake with all its sweetness. Yet Young of Quincy will get the next legislature to move it down to Squaw Valley.

It is expecting much of Del Norte and that sturdy Democrat, Malone, to startle the world's financiers far off the lines of travel, but go up in your car and see what they have at Klamath to make life worth the living. Of Capren and little Sierra County it is enough to say they have added their share in the yellow million of the Cali-

ifornia product. Santa Cruz and Horton, with Frank Mattison in the background, will always be a bright picture. Gibson from Ukiah and Hayward from San Mateo, unfortunate that searchlights from Ginty's stronghold should dim their lights, may have to await the world to come to be of the favored few. At Jackson that plaintive, hopeful letter from dear Jack Hollister that he had started on his last canvass, never to report to his dear San Luis; his field was broad, from Siskiyou to San Diego, from the Sierras to the Pacific, he was always welcome; Los Angeles or San Francisco.

There must be an end to bad things, but without a word of those stalwart financial twins, Jim Sleeper, the walnut baron of Orange County, and the Rev. Bill Weaver, the cotton king of Imperial, would be sad. The same of Geo. Meese and his Port Costa or Attelites. Hopkins says, "Just now you have overlooked Markham and his rice crop in Glenn; don't forget Merritt and Hudson that beat him in Lake, and Moore, the chief Apache of Stockton and his \$11,500 salary." Morton of Butte is reelected and we want the president to be on the job for life, barring good behavior, then you will be my assistant; get in something about Riebor and Ryon over in Tuolumne, Schroder in Nevada City and Smith at Salinas, the family Class 1, then Sutton of Colusa. Threlfall of Modesto (that's pretty close to our new camp).

Old man Tooby up at Eureka, some class, too, as he has a real railroad run through him. Then there is Daddy Tourtellotte of Trinity, whether he be the Son and—I don't know, but fine! Remember that watch is always out of order; we must look around for another somehow. Elections are very wearing on the pocket.

Now, Hop. says, "wind her up with all's well that ends well." Give a toast to the tax agents. There is so little good in the best of them, but not a bit on the worst of them. that it hardly becomes the assessors to tolerate any of them.

TWENTY-THIRD BIENNIAL REPORT

OF THE

STATE BOARD OF HEALTH

OF

CALIFORNIA

FOR THE

Fiscal Years from July 1, 1912, to June 30, 1914

CALIFORNIA
STATE PRINTING OFFICE
1914

THE CALIFORNIA STATE BOARD OF HEALTH.

MEMBERSHIP OF THE BOARD.

MARTIN REGENSBURGER, M.D., <i>President</i>	San Francisco.
JAMES H. PARKINSON, M.D., <i>Vice-President</i>	Sacramento.
DONALD H. CURRIE, M.D., <i>Secretary and Executive Officer</i>	Sacramento.
WALLACE A. BRIGGS, M.D.....	Sacramento.
W. LEMOYNE WILLS, M.D.....	Los Angeles.
O. STANSBURY, M.D.....	Chico.
EDWARD F. GLASER, M.D.....	San Francisco.

ADMINISTRATIVE ORGANIZATION.

- Bureau of Administration.**
JOHN F. LEINEN, Director and Assistant to the Secretary.
Divisions: Correspondence and Accounts; Permits, Complaints, and Sanitary Reports; Legal Opinions and Prosecutions; Publications
- Bureau of Vital Statistics.**
GEORGE D. LESLIE, PH.B., Director and Statistician.
Divisions: Births, Marriages, Deaths; Morbidity Returns.
- Bureau of Foods and Drugs.**
MYER E. JAFFA, M.S., Director.
Divisions: Division of Inspections; Division of Laboratory Examinations; Division of Food and Drug Standards.
- Bureau of Hygienic Laboratory.**
WILBUR A. SAWYER, M.D., Director.
Divisions: Biological Examinations; Preventive Therapeutics; Epidemiological Investigations.
- Bureau of Tuberculosis.**
BURT F. HOWARD, M.D., Director.
Divisions: Inspection, Supervision and Rating of Institutions; Registration of Cases.
- Bureau of Registration of Nurses.**
ANNA C. JAMMÉ, R.N., Director.
Divisions: Examination and Registration of Nurses; Inspection of Hospitals and Training Schools.
- Bureau of Sanitary Engineering.**
CHARLES GILMAN HYDE, C.E., Acting Director.
Divisions: Sewage Disposal; Water Supplies; Camp Sanitation.

SPECIAL OFFICERS OF THE BOARD.

	LOUIS H. ROSEBERRY, A.B.
Attorney for the Board.....	Security Savings Bank Building, Los Angeles
	CHARLES GILMAN HYDE, C.E.
Consulting Engineer for the Board.....	University of California
	F. F. GUNDRUM, M.D.
Division Bacteriologist.....	Inverness Building, Sacramento
	W. W. CROSS, M.D.
Division Bacteriologist.....	Patterson Block, Fresno, California
	WALTER V. BREM, M.D.
Division Bacteriologist.....	Brockman Building, Los Angeles

LETTER OF TRANSMITTAL.

OFFICE OF CALIFORNIA STATE BOARD OF HEALTH,
SACRAMENTO, July 15, 1914.

To His Excellency, HIRAM W. JOHNSON,
Governor of California.

DEAR SIR: In accordance with the state law, I herewith transmit to you the Twenty-third Biennial Report of the State Board of Health of California for the sixty-fourth and sixty-fifth fiscal years.

Respectfully submitted.

DONALD H. CURRIE,
Secretary of the State Board of Health.

CONTENTS.

	PAGE.
LETTER OF TRANSMITTAL.....	iii
REPORT OF THE SECRETARY.....	1
Plague—Smallpox—Leprosy—Yellow Fever—Asiatic Cholera—Typhoid Fever—Rabies—Hookworm—Diphtheria.	
REPORT OF THE BUREAU OF ADMINISTRATION.....	8
Report of Field Operations Under the Joint Supervision of the State Board of Health and the United State Public Health Service—Sanitary inspections—Financial Statement.	
REPORT OF THE BUREAU OF VITAL STATISTICS.....	22
I. Summary of Statistics: 1913 and 1912.....	22
II. Statistics of Births: 1913 and 1912.....	51
III. Statistics of Deaths: 1913 and 1912.....	81
IV. Statistics of Marriages: 1913 and 1912.....	196
V. Morbidity Reports: 1913.....	240
REPORT OF THE BUREAU OF FOODS AND DRUGS.....	247
General Report—Laboratory Work—Tables of Samples Examined—Summary of Analytical Work—General Summary—Conclusions and Recommendations.	
REPORT OF THE BUREAU OF THE HYGIENIC LABORATORY....	289
Development of the Laboratory—Division of Biologic Examinations—Branch Laboratories—Depositories for Mailing Outfits—Division of Preventive Therapeutics—Division of Epidemiological Investigations—Research—Instruction in Public Health—Laboratory Staff—Building and Equipment.	
REPORT OF THE BUREAU OF TUBERCULOSIS.....	319
Duties of the Director—County Hospitals—State Institutions—Private Charities—Registration—Tuberculosis Morbidity.	
REPORT OF THE BUREAU OF REGISTRATION OF NURSES.....	334
Registration—Inspection of Training Schools—Accrediting of Training Schools—Examination—Development.	

OUTLINE OF VITAL STATISTICS REPORT.

NOTE—The vital statistics are presented for calendar, instead of fiscal years, to correspond with the annual mortality reports of the Federal Census Bureau.

LIST OF STATISTICAL TABLES.

I. Summary.

TABLE No.	PAGE.
1. Main and minor geographic divisions of California, with counties included in each-----	26
2. Birth, death and marriage totals, with increase and rate per 1,000 population, for California: 1906 to 1913-----	27
3. Birth, death and marriage totals, with increase, for geographic divisions: 1913 and 1912-----	29
4. Birth, death and marriage totals, with increase, for counties: 1913 and 1912-----	31
5. Birth and death totals, with increase, for individual cities and rest of state: 1913 and 1912-----	33
6. Birth and death totals compared, for geographic divisions: 1913 and 1912-----	35
7. Birth and death totals compared, for individual cities and rest of state: 1913 and 1912-----	36
8. Estimated midyear population, births, deaths and marriages, and rates per 1,000 population, for geographic divisions: 1913 and 1912-----	39
9. Estimated midyear population, births, deaths and marriages, and rates per 1,000 population, for counties: 1913 and 1912-----	42-43
10. Estimated midyear population, births and deaths, and rates per 1,000 population, for individual cities and rest of state: 1913 and 1912-----	46-47
11. Deaths reported for registration districts (cities, towns and rural parts of counties): 1913 and 1912-----	49-50
 II. Births. 	
1. Births classified by sex, with per cents, for geographic divisions: 1913 and 1912-----	52
2. Births classified by sex, with per cents, for cities and rest of state: 1913 and 1912-----	55
3. Births classified by race, with per cent white, for geographic divisions: 1913 and 1912-----	54
4. Births classified by race, with per cent white, for cities and rest of state: 1913 and 1912-----	55
5. Births classified by sex and race, with per cents by sex, for cities and rest of state: 1913 and 1912-----	56
6. White mothers classified by nativity, with per cents, for geographic divisions: 1913 and 1912-----	57
7. White mothers classified by nativity, with per cents, for cities and rest of state: 1913 and 1912-----	59
8. Per cent distribution, by sex, of white children with mothers classified by nativity, for geographic divisions: 1913 and 1912-----	60
9. Per cent distribution, by sex, of white children with mothers classified by nativity, for cities and rest of state: 1913 and 1912-----	61
10. Per cent distribution, by nativity, of white brides and white mothers, for geographic divisions: 1913 and 1912-----	62
11. Comparison of per cent distribution, by nativity, of white brides and white mothers, for geographic divisions: 1913 and 1912-----	63
12. Per cent distribution, by nativity, of single white brides and white mothers, for geographic divisions: 1913 and 1912-----	65
13. Comparison of per cent distribution, by nativity, of single white brides and white mothers, for geographic divisions: 1913 and 1912-----	67
14. Births classified by sex and race, and by sex and nativity of mothers, for counties: 1913-----	70-71
15. Births classified by sex and race, and by sex and nativity of mothers, for counties: 1912-----	72-73

III. Deaths.	
1. Deaths from certain principal causes, with proportion per 1,000 total deaths and death rate per 100,000 population, for California: 1909 to 1913.....	88-89
2. Deaths from certain principal causes, with proportion per 1,000 total deaths, for main geographic divisions: 1913 and 1912.....	93
3. Deaths from certain principal causes, with proportion per 1,000 total deaths, for minor geographic divisions: 1913 and 1912.....	94-95
4. Deaths from certain principal causes with proportion per 1,000 total deaths, for metropolitan area and rural counties of Northern and Central California: 1913 and 1912.....	98
5. Deaths from certain principal causes, with proportion per 1,000 total deaths, for freeholders' charter cities and rest of state: 1913 and 1912.....	101
6. Number and per cent of deaths from tuberculosis, for geographic divisions: 1913 and 1912.....	105
7. Number and per cent of deaths from tuberculosis, for individual cities and rest of state: 1913 and 1912.....	106
8. Deaths from tuberculosis classified by length of residence in California, with per cents, for geographic divisions: 1913 and 1912.....	108
9. Deaths from tuberculosis classified by length of residence in California, with per cents, for individual cities and rest of state: 1913 and 1912.....	111-112
10. Deaths from tuberculosis classified by length of residence (in months), with per cents, for Southern California: 1913 and 1912.....	113
11. Number and per cent of deaths occurring each month from tuberculosis, for California: 1913 and 1912.....	114
12. Deaths classified by sex, with per cents, for geographic divisions: 1913 and 1912.....	115
13. Deaths from certain principal causes classified by sex, with per cents, for California: 1913 and 1912.....	116
14. Deaths classified by race, with per cent white, for geographic divisions: 1913 and 1912.....	117
15. Deaths from certain principal causes classified by race, with per cent white, for California: 1913 and 1912.....	119
16. White decedents classified by nativity, with per cents, for geographic divisions: 1913 and 1912.....	121
17. White decedents dying from certain principal causes classified by nativity, with per cents, for California: 1913 and 1912.....	123
18. Deaths classified by age periods, for geographic divisions: 1913 and 1912.....	125
19. Per cent distribution of deaths, by age periods, for geographic divisions: 1913 and 1912.....	127
20. Deaths from certain principal causes classified by age periods, for California: 1913 and 1912.....	130-131
21. Per cent distribution, by age periods, of deaths from certain principal causes, for California: 1913 and 1912.....	132

24.	Deaths 15 years and over classified by sex and occupation, with per cents by sex, for California: 1913 and 1912-----	138
25.	Deaths of males 15 years and over engaged in gainful occupations, classified by kind of occupation, with per cents, for California: 1913 and 1912-----	139
26.	Per cent distribution, by selected causes, of deaths of males and females 15 years and over classified by occupation, for California: 1913 and 1912-----	140-143
27.	Deaths from each specified disease and class of diseases, classified by sex, race, nativity, and age periods, for California: 1913-----	148-157
28.	Deaths from each specified disease and class of diseases, classified by sex, race, nativity, and age periods, for California: 1912-----	158-167
29.	Deaths from certain principal causes, with proportion per 1,000 total deaths, for counties arranged geographically: 1913-----	168-173
30.	Deaths from certain principal causes, with proportion per 1,000 total deaths, for counties arranged geographically: 1912-----	174-179
31.	Deaths from certain principal causes, with proportion per 1,000 total deaths, for freeholders' charter cities arranged geographically: 1913-----	180-183
32.	Deaths from certain principal causes, with proportion per 1,000 total deaths, for freeholders' charter cities arranged geographically: 1912-----	184-187
33.	Deaths of males and females 15 years and over from selected causes, classified by occupation, with per cents, for California: 1913----	188-191
34.	Deaths of males and females 15 years and over from selected causes, classified by occupation, with per cents, for California: 1912-----	192-195

IV. Marriages.

1.	Marriages classified by number in order, with per cents, for geographic divisions: 1913 and 1912-----	199
2.	Grooms classified by marital condition, with per cents, for geographic divisions: 1913 and 1912-----	202
3.	Brides classified by marital condition, with per cents, for geographic divisions: 1913 and 1912-----	205
4.	Brides classified by race, nativity, and marital condition, with per cent distribution by marital condition, for California: 1913 and 1912----	209
5.	White brides classified by marital condition, with per cents, for geographic divisions: 1913 and 1912-----	212
6.	Per cent distribution, by marital condition, of white brides classified by nativity, for geographic divisions: 1913 and 1912-----	214
7.	White brides classified by nativity, with per cents, for geographic divisions: 1913 and 1912-----	217
8.	Per cent distribution, by nativity, of white brides classified by marital condition, for geographic divisions: 1913 and 1912-----	220
9.	Marriages classified by number in order and marital condition of parties, with per cents, for counties: 1913-----	224-225
10.	Marriages classified by number in order and marital condition of parties, with per cents, for counties: 1912-----	226-227
11.	Brides classified by race, nativity, and marital condition, with per cent distribution by marital condition, for geographic divisions: 1913-----	228-229
12.	Brides classified by race, nativity, and marital condition, with per cent distribution by marital condition, for geographic divisions: 1912-----	230-231

TABLE No.	PAGE.
13. White brides classified by marital condition and nativity, with per cent distribution by nativity, for geographic divisions: 1913-----	232
14. White brides classified by marital condition and nativity, with per cent distribution by nativity, for geographic divisions: 1912-----	233
15. Brides classified by race and nativity, with per cent distribution of white brides by nativity, for counties: 1913 and 1912-----	234-235
16. Brides classified by race, nativity, and marital condition, for counties: 1913 -----	236-237
17. Brides classified by race, nativity, and marital condition, for counties: 1912 -----	238-239

V. Morbidity Reports.

GROUP I. Communicable Diseases. Seasonal prevalence and mortality during 1913, by months-----	243
GROUP II. Communicable Diseases. Seasonal prevalence during 1913, by months -----	243
Typhoid Fever. Number of cases reported in California during 1913, by months -----	244
Smallpox. Number of cases reported in California during 1913, by months---	244
Poliomyelitis (Infantile Paralysis). Number of cases reported in California during 1913, by months-----	246
Cerebro Spinal Meningitis (Epidemic). Number of cases reported in California during 1913, by months-----	246

REPORT OF THE SECRETARY.

The death rates in California during the past two years, and the morbidity reports during the same period of time, indicate that there has been a general decrease in the prevalence and distribution of most of the communicable diseases. The opening of the Panama Canal would lead to the supposition, however, that there may be an increase in the number of cases of communicable disease in the future. Since the morbidity and mortality reports for the past two years are presented in another portion of the Board's Twenty-second Biennial report, the Secretary desires to summarize the diseases that are most dangerous to California, and, therefore, those which have to be watched most carefully. I have, with this idea in view, passed in review the more dangerous communicable diseases, not only those that exist within the State, but those that exist in nearby countries, or at least in countries with which we have constant commercial intercourse, and it is the intention, in so far as space will permit, to consider each of these in a brief way, both from the standpoint of our apparent danger from them, as well as our best defense against them.

The list which I present below is not given in the order of their importance. In fact, their relative importance is a difficult matter to determine, but I have started out by considering five of the six diseases which the Federal Government protects us from through its quarantine stations and medical inspectors in foreign ports, and proceeded from this group to those diseases that, although preventable, are like the proverbial poor, "always with us."

PLAGUE.

A reference to the Public Health reports will show that from without we have Ecuador reporting cases of this disease, and from past history of that section and our knowledge of plague, it is safe to regard the whole west coast of South America as infected, and to also regard with considerable suspicion the west coast of Mexico, especially in the neighborhood of Mazatlan, which some ten years ago suffered from a severe outbreak. For reasons of safety we must consider that once plague is reported from a locality, unless it can be shown that considerable laboratory examination is being continually carried on with regular results, that locality must remain indefinitely under suspicion. In addition to these, the following foreign countries having traffic with America: the Philippines, Australia, Hawaii, Java, certain Chinese and Japanese ports, are either constantly reported as being infected, or have been so reported in recent times.

The Public Health Service, through its quarantine offices in San Francisco and other California ports, is keeping close watch of this disease from foreign countries, and, therefore, this danger of future infection of California is reduced to a minimum.

When we leave the subject of plague in foreign countries, we must next consider an outbreak among rats in Seattle, Washington. We there find that measures are being taken under the supervision of the United States Public Health Service for the protection of California ports; so, danger from that source is very slight. There are dangers, however, in the Northwest cities which had constant intercourse with

Seattle previous to the discovery of plague in that place. From last reports these places had not adopted systematic measures looking to the discovery of infected rats. These places must be regarded as real sources of danger, unfortunately; for until a city has examined its rats and reported some of them infected, the National Quarantine Stations are not permitted to adopt measures on vessels arriving in California from such places, and therefore, these other parts of the Northwest must be considered as possible sources of danger to us.

In our own State we find that there has been no infection among ground squirrels reported for some time past. This fact would not ordinarily have great significance, because at this season of the year only adult squirrels are in existence. Most of these adults have been immunized by an annual spring outbreak that has been occurring for some years past, but this particular year, it is believed by Surgeon John D. Long, U. S. Public Health Service, in charge of this work, will mark the disappearance of the disease. He hopes to destroy all squirrels in the known infected zones of Contra Costa, Alameda, and Santa Clara counties, and by the first of July to complete his work in the remaining infected counties of Stanislaus, Merced, San Joaquin, San Benito, Monterey, and Santa Cruz. This infection of ground squirrels, so far as we can believe circumstantial evidence, spread from an outbreak among rats at the Port Costa grain wharves in 1903 and swept from there to all the counties mentioned in the preceding list. While it remains it is a constant menace to the people of the infected districts, and it is to be hoped that its eradication will occur at an early date.

SMALLPOX.

The dangers of this disease from foreign countries and adjoining states is relatively prevalent compared to the dangers of the spread from foci that exist within the state. While no extensive outbreaks have occurred recently, the disease is widespread in this state, and that fact, together with apparently growing anti-vaccination sentiment in some sections, makes this disease one of the more serious dangers to the State's health. Fortunately, as in other parts of the United States, since late in the nineties, the type has been mild in character, and the mortality correspondingly low. It is not safe, however, to regard this mildness of type as a permanent feature of the disease. Vaccination is the only dependable measure against this danger, is simple to perform, and compared to the dangers of the mildest type of this disease, is harmless.

Anti-vaccination sentiment, for the most part, is based upon three fundamental mistakes:

1. Ignorance of or inability to weigh the evidence presented by history; that in the pre-vaccination period of our own race or the more recent history of uncivilized people, before vaccination was performed, practically all people born had smallpox and of these one in four died. While on the other hand, since this great discovery was made, well-vaccinated communities never experience a serious outbreak of the disease.

2. The belief that climate, mode of living or general sanitation can prevent the spread of this disease among the unvaccinated; there is no reason to believe that our better mode of life has any influence on the communicability of this disease.

3. That vaccination is dangerous; to this we may say that there is no potent drug used in medicine, no surgical procedure, that has not caused death, and so, if we search the literature of vaccination, we find death from it also; but, what is this mortality compared to the mortality of smallpox? It is difficult to answer this question, but it is certain that it is not more than as 1 is to 10,000, and yet, in spite of this, we find persons comparing the dangers of one to the dangers of the other!

To illustrate the peculiar fear that some have of this measure in comparison with other more serious procedures, the writer doubts that those who dread vaccination would have the least hesitation in allowing any one of the other three below mentioned measures performed, if their condition demanded it: the removal of tonsils, the administration of a hypodermic injection, or the placing of a hot water bottle at the feet; yet, the writer has observed one death from each of the above procedures—the first from infection, the second from shock, the last from scalding. During the same time that these were observed, although he has seen thousands vaccinated, he has never seen the loss of life or limb result. It is to be hoped that some day, some one will start a *pro-vaccination* society, and if such an organization employs one half the zeal in searching for proof that vaccination has done inestimable good and very little harm that the anti-vaccinationists have employed in unearthing the few fatal results in history, there would remain very few unvaccinated persons among the logical-minded members of a community.

Until some such movement is launched to offset this dangerous and foolish popular error, ours must continue to be the only civilized country of the world that does not uniformly vaccinate its children.

LEPROSY.

There has never been any great amount of this disease in California. At any given moment 30 or less cases are to be found in the isolation hospitals of the State, and most of these are imported cases, or, at least, those who have acquired their infection in other countries.

Undoubtedly, some cases have acquired their infection here. Without the literature available at this moment the writer recalls two cases of undoubted California origin, reported by Montgomery of San Francisco; but while few cases *have* originated here, there is no doubt that infection can be acquired anywhere, provided a sufficient number of persons come in intimate contact with lepers. The danger of this disease here is in the influx of persons from certain other countries; notably, China, Japan, Hawaii and Mexico. The incidence of this disease is high among all the people just mentioned and each of these nations sends frequent visitors to our shores. Such persons, of course, are inspected at our National Quarantine Stations, but often it is impossible to detect cases in their early stages. Physicians throughout the State should bear these facts in mind and keep a lookout for suspicious symptoms among those people from infected areas, who come to them for treatment. By this means, many cases will be detected that might otherwise escape and infect others.

At a meeting of the Board on February 7, 1914, a resolution was passed which made leprosy a quarantinable disease under the laws of the State.

YELLOW FEVER.

Cases of this disease are frequently reported from the west coast of Mexico and from the equatorial and subtropical portions of South America's west coast. We have direct traffic from both of these areas and several vessels have entered San Francisco in the last ten or fifteen years having had cases of this disease during their voyages. Owing to the length of the voyage from most parts of the areas mentioned, and the efficient quarantine inspections of California ports upon entering, the chances of cases of this disease reaching shore are very small. To further add to our security is the fact, according to Professor Herms of the University of California, that so far as the University has authoritative information, the yellow fever mosquito, *Stegomyia colopus*, does not exist in California. This is a most favorable circumstance, but it also points out the importance of keeping this mosquito from entering in the future. It is true that most of our maritime traffic from countries having this mosquito, notably Mexico and Hawaii, enters at the port of San Francisco. The weather at that port is usually too cold to be conducive to the mosquito flying ashore from its harbor on the vessel, but there are days that are warm enough to permit of such flight and there is little reason to doubt that in the interior of the State there are many localities where this mosquito would thrive in the same way that the *Anopheles* and *Culex* do.

In adopting precautions to prevent California from becoming infested with this species, we must also remember that Louisiana and Texas, only a few days removed from us, have this mosquito in great abundance and if once introduced on a western bound Pullman car, it would be likely to become established here. We believe this subject is important enough to be taken up with the Federal authorities to make it part of their new inspection of coaches.

ASIATIC CHOLERA.

From our public health reports it will be seen at present that, with the exception of the extensive outbreak of this disease at the site of the recent Turko-Balkan war and nearby countries, no great prevalence of the disease is recorded.

The countries mentioned are too remote at present to be of importance to us, but inasmuch as cholera carriers have been demonstrated to disseminate this virulent micro-organism for a period of sixty days or more, the outbreak in southeastern Europe may become of importance to us with the opening of the Panama Canal.

At present our only source of danger is from Asiatic ports, where in certain countries, at least, the disease is epidemic.

Our quarantine stations do all in their power to protect us from this danger, including the systematic examination of the discharges of immigrants from cholera ports. But in spite of such precautions, owing to the difficulty of detecting some cholera carriers, it is possible for the disease to become introduced. "The jumps" this disease can make were shown in the Hawaiian outbreak of the spring of 1911, when cholera appeared in Honolulu, the nearest known cases being in Japan, ten or twelve days away by the fastest steamers.

The country which has, during ordinary times, made itself most secure against the spread of typhoid fever, is safest against the spread of cholera, should that disease once be introduced, and remote is our

danger from this disease at the present time. The extremely deadly nature of cholera makes an additional reason why we should do everything to prevent food and water supplies from being contaminated directly or indirectly by sewage.

TYPHOID FEVER.

Practically our only danger here is from the spread of the disease from existing foci; the imported cases are too rare to be of much relative importance. At this time of the year the chief danger lies in the contamination of streams from surface washing, incident to heavy rains, as well as the infection of ground waters by the same means. Later in the year the fly becomes an important factor, especially about insanitary camps, insanitary "health resorts" and other places where the fly is allowed to visit food supplies and cesspools, alternately, at such intervals as its fancy dictates.

Physicians, as well as the general public, should closely observe and report to their local health officers all pollution of streams. They should also report all insanitary stables where flies are bred (according to entomologists, 90 per cent of the common fly *musca domestica* breeds in such places) as well as cesspools and unprotected food supplies. Health officers are requested to report such conditions to this office, which will give its services freely in assisting them to abate such nuisances.

The Board has now employed Mr. E. T. Ross, of many years experience in the U. S. Public Health Service, as Sanitary Inspector. One of Mr. Ross' chief duties will be to cooperate with the health officers of the cities and counties in their efforts to abate nuisances which tend to spread typhoid fever. This office, working through its local health officers and Mr. Ross, intends to devote much attention to this important matter.

RABIES.

This subject has been too well covered by Dr. Sawyer's several reports for the Secretary to feel called upon to discuss it from any of its scientific aspects, but in passing this terrible, but at the same time preventable disease, the writer desires to make the following remarks:

This office regards the passage and enforcement of local ordinances requiring the muzzling of canines in infected districts of the utmost importance, and will support the efforts of the local health officers to the limit of its powers.

It is not intended here to enter into a discussion of the *need*; the evidence that the disease is prevalent among dogs in certain parts of California is sufficient to convince any tribunal within the borders of this State. Nor is it our intention to express an opinion as to whether it is better to legislate for the convenience of dogs or for the lives of children; we may feel called upon, if the occasion arise, to discuss this matter with the mother voters of infected districts at some later date—but not here. Nor, as a lover of dogs, will the writer here urge that it is better for the dogs to be inconvenienced than to die in horror. The Secretary *will* state, however, that if any county fails to protect its citizens from this disease, he will do all in his power to have the general laws of the State applied from the time the matter comes to his attention until the following meeting of the Board, and shall then recommend to

that body that such application be continued until the county has adopted a proper ordinance.

HOOKWORM.

A great deal has been said in recent years of the danger of this State becoming infested by the hookworm parasite. While this has not been borne out, probably, by data that we have at present, we must bear in mind that we possess a large area of sandy soil similar to that in which, in other countries, experience has demonstrated this disease is especially prone to spread. We also have a large mining population which is notably susceptible to this parasite.

With these conditions favoring its development and spread, once thoroughly introduced, we must also remember that we have at present immigrants from Asia, where the disease is very common, and Portuguese colonists showing a high percentage of infection, coming to us after a short stay in the Hawaiian Islands.

Later, when the canal opens, we will have an influx of immigrants from the Mediterranean countries, where the parasite is common. Besides these foreign sources of infection, we have constant railway communication with many areas of our Southern States, where the percentage of infected persons is very high.

Up to the present there has been no great influx of persons from these districts of the classes that are ordinarily infected (poorer members of farming communities), but we do have some, especially negroes, and they may play a part in the introduction of the parasite.

With these ideas in view, this office has requested that Professor C. W. Stiles visit the State at his earliest convenience, and make a special survey from a hookworm infection standpoint.

In connection with this subject, the foreign translation from the Italian is of interest to the health authorities of the State.

"The Measures Against Hookworm in Italy," by Pieraccini ('Il Levato, May 30, 1913), states that a commission appointed by Parliament for the study of the proposal and establishment in Italy of a monopoly of the State for the sale of phymol, makes the following observations: That hookworm infection is an occupational disease affecting almost exclusively those who have to work with the soil, such as gardeners, farmers, miners, etc. It is also a disease which affects chiefly the lower grades of society, not only lowering the resistance of the adult, but also stamping the children of infected adults, as is observed by the retarded or arrested development of the former. The tendency of this disease in Italy has been to spread. Not only is this true of the European varieties, but returning emigrants have brought back the American hookworm, *Necator Americanus*. The measures recommended are the manufacture, sale and administration by the State of phymol, which drug is prompt and efficient in its action against this disease, and is not dangerous when properly administered to children. The State sells this drug for ten centimes a dose, in the same manner that they distribute quinine at low cost in malarial districts. They may recommend that an intelligent search be made among those engaged in certain occupations, to learn if they are carriers of the disease, to recommend sanitary methods of sewage disposal, especially in mines and places where this disease is most often found.

DIPHtheria.

This disease is widespread throughout the State. During the year 1913, 1,659 cases were reported. From the numbers of population considered there has been no very large outbreak during the year. There exists a sufficient number of cases, however, to justify health officers to urge the physicians of their respective localities to promptly report all cases that come under their observation, also in order that cases may be recognized with greater accuracy to urge that these physicians send cultures from all suspected throats to the Hygienic Laboratory at Berkeley. Not only should such cultures be sent during the active stage of the disease, but also during convalescence period before the quarantine restrictions have been removed. Frequent swabs should also be made from the throats of other occupants of the house, such as parents, brothers, sisters, nurses, attendants, etc. It is only in comparatively recent times that we fully grasp the fact that this is one of the diseases that is carried by the non-ill bacilli carrier and the mild unrecognized cases of the disease. Until we have, by the means above indicated, discovered a great percentage of these dangerous cases and adopted proper quarantine measures against them, there is little hope of eradication, even in the restricted sense of the term.

Of all the many difficult problems that come up for public health administration, probably one of the least easy to solve satisfactorily is a case of bacilli carriers. It is apparent that upon theoretical grounds, at least, we should keep a person quarantined so long as he contains micro-organisms dangerous to his fellows. In the case of diphtheria this means we should keep him under surveillance as long as bacilli are found in his throat. The practical drawback to this plan is that it often requires restriction of the liberty of the carrier for weeks, months or even years. For this reason any measures that are claimed to succeed in removing the pathogenic micro-organisms from the throats of diphtheria patients are worthy of combined clinical and laboratory investigation.

DONALD H. CURRIE,
Secretary.

REPORT OF BUREAU OF ADMINISTRATION.

JOHN F. LEINEN, Director.

Report of Field Operations Under the Joint Supervision of the State Board of Health and the United States Public Health Service.

Senate Bill No. 160, passed by the California legislature and approved by the Governor of California June 7, 1913, became effective August 10, 1913. The State Board of Health passed the following resolution, under date of August 20, 1913:

Whereas, There has been found within the territory comprised in the counties of Contra Costa, Alameda, Santa Clara, Santa Cruz, Monterey, San Benito, Merced, Stanislaus and San Joaquin, of the State of California, a total of one thousand eight hundred and forty-three (1,843) ground squirrels (*Citellus Beccheyi*) which have been proven by laboratory investigation to have been infected with a contagious and infectious disease, to wit, bubonic plague; and

Whereas, An act of the legislature of the State of California, approved June 7, 1913, provides: "Whenever any land, place, building, structure, wharf, pier, dock, vessel or water craft is infested with rodents, insects or other vermin which are liable to convey or spread contagious or infectious disease from an existing focus declared by the State Board of Health, it shall be the duty of said Board to at once notify the person, firm, copartnership, company or corporation, owning said land, place, building, structure, wharf, pier, dock, vessel or water craft, of the existence of said rodents, insects or other vermin and said notice shall direct said owner to proceed immediately to exterminate and destroy said rodents, insects or other vermin, and to continue in good faith such measures as may be necessary to prevent their return. In the event that said owner fails, refuses or neglects to proceed as above provided, within ten days from date of receipt of said notice, the State Board of Health may at once proceed to exterminate and destroy said rodents, insects or other vermin, and take such measures as may be necessary to prevent their return, and the cost of the above measures shall be repaid to the State Board of Health by the board of supervisors or other governing body of the county, city and county, city or town wherein the work is done at its next meeting after the bill is presented and the appropriation provided in section 1 of this act shall be reimbursed by the amount so paid, and may again be expended in a similar manner"; therefore, be it

Resolved, That the territory comprised within the aforesaid counties is hereby declared to be an existing focus of contagious and infectious disease; and be it further

Resolved, That the Secretary of this Board be directed to notify the supervisors of the above named counties of the passage of this resolution, and of the intention of the State Board of Health to proceed in accordance with the provisions of the act of the state legislature, approved June 7, 1913.

As soon as this resolution became effective, the following plan of operations was placed in effect:

1. All the counties mentioned in the resolution were divided into districts of approximately forty thousand acres each.

2. Each county was placed under the direction of a supervising inspector, responsible to headquarters; each forty-thousand-acre district was placed under the charge of a field inspector, responsible to the supervising inspector.

3. The field inspectors were directed to serve notices, as provided by law, upon the owners of infested lands.

4. At the expiration of ten days, the field inspector reinspected the property, to determine whether eradication measures had been instituted by the owner. If measures of eradication had not been instituted by the owner, as the law required, the field inspector requested the owner of the land to state a definite date, as early as possible, when he would begin work.

5. If the work of squirrel destruction had not been instituted on or before the date agreed upon, the field inspector reported the facts to

the supervising inspector. The supervising inspector then collected such data as were necessary for the information of the officer in charge, and forwarded the same to headquarters with a request for instructions.

6. When the report above mentioned was received at headquarters, the supervising inspector was either directed to go upon the land as soon as possible and destroy the squirrels that infested the same, or a force of State employees was directed by headquarters to proceed upon the land and do the work. When the work was completed, a statement of the expense incurred was submitted to the owner, and he was given an opportunity to pay the same, if he so desired. If the bill was not paid, as presented, the same was forwarded to the State Board of Health to be collected in the manner provided by the act of the California legislature, approved June 7, 1913.

It became necessary during the fiscal year to proceed upon the lands of fifty-three persons, comprising a total of 11,300 acres. An idea of the co-operation obtained from individuals in the destruction of squirrels may be gathered from the fact that out of a total of 33,350 inspections of ranches made during the fiscal year, only 53 ranches had to be proceeded upon in a summary manner, as provided by law.

Inspection Operations.

During the year inspection of land and serving of notices has been carried on as outlined earlier in this report. Operations have been conducted in the following counties: Contra Costa, San Benito, Santa Clara, Merced, Stanislaus, Alameda, San Joaquin, Santa Cruz, and Monterey. A total of 33,350 inspections over an area of 5,722,438 acres has been made during the year. Reinspections have been made over 6,903,307 acres, and a total of 1,909,728 acres has been treated by landowners as a result of the inspections made and notices served.

Hunting Operations.

Total number of ranches on which plague infected squirrels have been found since August, 1908, 252; total number of ranches hunted over during fiscal year, 2,525.

Squirrels shot	18,012
Squirrels found dead.....	414
Total	18,426
Squirrels examined	18,322
Squirrels infected with plague.....	177

At the close of the fiscal year ended June 30, 1913, there were 135,146 acres of known infected land. During the fiscal year infection was found on 15,005 acres of land where infection had never before existed. The total area of infected land June 30, 1914, 150,151 acres. In addition to the 150,151 acres of infected land just mentioned, there were 90,405 acres of land which immediately surrounded or adjoined the infected land, which were subjected to the same intensive treatment that was given to the actually infected territory. The total area of infected and adjoining lands is therefore 240,556 acres.

All of the infected and adjoining land has been thoroughly treated, and so far as is possible to determine, it is believed that plague infection has been entirely eradicated, except on about 20,000 acres which require further treatment to complete the eradication of infection. This

land is now being worked and it is believed that squirrels will have been practically eradicated, and all known infection wiped out, by the first of August, nineteen fourteen.

Summary of Hunting Operations for the Period April 1 to July 1, 1912, 1913 and 1914.

	1912	1913	1914
Ranches hunted over.....	723	990	1,464
Total number squirrels shot.....	19,335	16,186	13,162
Hunters engaged (average).....	9	17	21
Average days each man hunted.....	64.4	49.4	57.2
Squirrels per hunter per day.....	33.3	19.2	10.5
Squirrels shot per ranch.....	26.7	16.3	8.5
Infected squirrels shot during period.....	506	283	44
Per cent of squirrels infected.....	2.61	1.74	0.34

Hunting operations over infected and adjoining territory are practically completed.

The forty-four squirrels mentioned in the preceding tables were found as follows:

County	Ranch	Infected Squirrels	Completed or Working
San Benito	McCray	2	Completed
San Benito	Paieines	7	Working
Monterey	Kelley	1	Completed
Contra Costa	Vasco Grant	5	Working
Contra Costa	Crocker	1	Working
Contra Costa	Walnut Creek District (small lots— area 714 acres).....	17	Working
Alameda	Fredericks	11	Working

Of the forty-four infected squirrels shot during the hunting season of 1914, only two had the disease in the septicæmic form. These two squirrels were found as follows:

One on the McCray ranch in San Benito County.

One on the Vasco Grant in Contra Costa County.

As may be seen from the summary of hunting operations above given, there has been a reduction in the number of squirrels shot per hunter per day in 1914, as compared to the same period in 1912, of 68.5 per cent; as compared to 1913, there has been a reduction of 45.3 per cent. The reduction in the number of squirrels shot per ranch in 1914 as compared to 1912, is 68.2 per cent, and as compared to 1913 is 47.9 per cent. The reduction of infection in 1914 as compared to 1912 is 91.4 per cent; as compared to 1913, is 84.5 per cent.

Human Cases.

Two human cases of plague occurred during the fiscal year. One case was that of a cook in a railroad camp in Contra Costa County. The disease was bubonic in type and resulted fatally. The other case occurred at Walnut Creek, in Contra Costa County, was mild bubonic in type, atypical in course, and the patient made a prompt recovery.

Special Projects.

During the latter part of the fiscal year ended June 30, 1913, it developed that many landowners were more inclined to proceed with

the eradication of squirrels from their lands if expert supervision could be provided—as past experience had indicated to them that good and permanent results at a low cost, could not be obtained by the methods that had been followed out in the past. After a number of requests of this character had been received, the plan was adopted of providing an expert foreman to supervise the work on any tract of land where the owner would furnish adequate labor, and material sufficient to complete the work of squirrel destruction in a manner satisfactory to the service. During the fiscal year 107 requests for supervision were received and as a result 625,154 acres were freed from squirrels. In every instance complete satisfaction was expressed by the landowners with the results that had been obtained, and the statement was made that a sufficient number of men would be kept at the work of squirrel extermination to prevent reinfestation of the lands that had been cleaned, by squirrels that infested adjoining territory.

General Considerations.

The operations of Senate Bill No. 160, passed by the California legislature and approved by the Governor June 7, 1913, have been very satisfactory. But little opposition has been encountered, and in no instance have legal measures been resorted to by any individual to evade compliance with the law. In several instances intimations were received that a strong desire existed to test the constitutionality of the law, but by careful handling and the exercise of some patience, these landowners were finally induced to comply with the requirements of the law without resorting to legal measures. These individuals have since expressed themselves as entirely satisfied with the work as carried out, and in several instances they have exerted themselves to induce others to comply promptly and consistently, with uniformly good results.

The belief that had heretofore existed throughout the State, that the problem of squirrel destruction was impossible of solution, is gradually losing ground, and representatives of counties in which plague infection has never been found have requested this office to lend assistance in the organization of a campaign of squirrel destruction within said counties. Inasmuch as plague infection had never been demonstrated within these counties, it was impossible to comply with the requests beyond giving such general advice as seemed appropriate. Landowners generally have begun to appreciate, as never before, the economic benefits that are accruing, and will accrue, to them as the result of the destruction of the squirrels which had heretofore infested their properties and caused them great losses each year, due to the destructive tendencies of these rodents; and numbers of individuals have expressed their determination to carry on the work of squirrel destruction to final completion in order to protect the investment that has already been made in work of this character.

As nearly as can be learned, about fifteen hundred squirrel destructors have been used by the various agencies engaged in squirrel destruction. A total of 402,280 acres of land have been treated by this means with, as nearly as can be determined, an average efficiency of from 95 per cent to 100 per cent for the first application.

During the year a new method of using waste balls in the destruction of ground squirrels has been devised. Heretofore the expense attached

to the use of the waste ball method has been between three and three quarters and five cents per hole, for labor and material. As a result of the system in use during the past rainy season the expense per hole has been reduced to about two cents for labor and material. The system in use is, briefly, as follows:

A unit gang of seven laborers was required. A live, active man was selected to place the balls in the holes. He was kept supplied with a bucket of saturated waste balls and a bundle of galvanized iron pins with a white flag attached, similar to the pins used by engineers. The "ball man" placed a ball in each hole encountered and placed a pin close to it. Two "torch men" followed, igniting the balls. Three men with mattocks followed the torch men, covered the holes, and removed the pins. A supply man was utilized to keep the ball man supplied with material, that no time be lost. Where sufficient labor was available, one supply man could keep two gangs of six moving constantly, thus obviating the necessity for the services of one supply man. By this means, in heavy infestation, four hundred to five hundred holes per man per day have been treated. The average for all infestation runs in the neighborhood of two hundred to three hundred holes per man per day, depending upon the topography of the ground. The efficiency of the method has run between 85 per cent and 95 per cent. The principal advantage of this method is that the ground can be rapidly covered and all burrows and colonies are filled with poisonous fumes in a very short space of time, thus insuring the destruction of the majority of the squirrels before they are able to dig out and escape. This method, however, is applicable only in the wet season when the ground is damp, and there is no danger of the dissipation of the gas through cracks in the ground or danger of starting grass or grain fires where dry vegetation exists. A total of 503,125 acres were treated by this method.

The following table will show the results of operations as reported by field inspectors and supervising inspectors from the various counties. This table was compiled from the daily report cards of the various inspectors and has been verified as nearly as possible by surveys made from time to time by representatives from headquarters. It is believed that the figure of 73.8 per cent eradicated is as nearly accurate as it is possible to obtain.

Table Showing Infestation in Plague Infected Counties in California, to June 30, 1914.

RECAPITULATION.

County	Total Area (Acres)	Area Eradicated (Acres)	Percentage Eradicated	Area Squirrels 1 to 5 (Acres)	Percentage Eradicated and 1 to 5	Area Squirrels 5 to 15 (Acres)	Area Squirrels 15 and over (Acres)

REPORT OF BUREAU OF VITAL STATISTICS.

GEORGE D. LESLIE, STATISTICIAN.

I. SUMMARY OF STATISTICS: 1913 AND 1912.

SYNOPSIS.

Birth, Death and Marriage Totals.—The California birth total has more than doubled since the first year's registration of 20,974 for 1906, having risen steadily to 39,330 for 1912, and 43,852 for 1913.

The excess of births over deaths first shown in 1911 was as great as 5,253, or 13.6 per cent, in 1913.

The death total, exclusive of stillbirths, has oscillated slightly since the start at 29,303 in 1906, being 36,709 in 1912 and 38,599 in 1913.

The marriages have fluctuated greatly from the total of 21,317 for 1906, numbering 31,276 for 1912, but only 31,383 for 1913.

In 1912 to 1913 births increased by no less than 4,522, or 11.5 per cent; deaths by 1,890, or 5.1 per cent; and marriages by merely 107, or 0.3 per cent.

The birth rate has grown steadily ever since 1906, while the death and marriage rates each fell at times in the eight-year period.

The increase in 1912 to 1913 for both births and deaths was relatively greater for the territory south of Tehachapi than for that to the north, while the gain in marriages was confined among geographic divisions to Southern California.

Increases appeared for thirty-seven of the whole fifty-eight counties in births, for thirty-eight in deaths, and for twenty-seven in marriages.

The rates of gain in births surpassed the State average (11.5) in the following twenty-two counties: Alpine, Inyo, Mendocino, Sutter, San Diego, Placer, Imperial, Contra Costa, Sonoma, Madera, Yolo, Tehama, San Joaquin, Yuba, Sacramento, Tulare, Amador, Los Angeles, Kern, Alameda, Monterey and Orange.

The increases in deaths were over 10.0 per cent in sixteen counties, as follows: Lassen, Imperial, Madera, Modoc, Placer, Amador, Yuba, Plumas, Siskiyou, Mariposa, Contra Costa, Solano, Monterey, Sutter, Sierra, and Calaveras.

The gains in marriages exceeded 10.0 per cent in the following thirteen counties: Inyo, Trinity, Yolo, Imperial, Yuba, Sutter, San Diego, Napa, Shasta, Siskiyou, Del Norte, Contra Costa, and San Joaquin.

For freeholders' charter cities as a class the rate of gain in births was 11.8 against 5.4 in deaths, while for all the rest of the State the per cents of increase were 11.0 and 4.8 for births and deaths, respectively.

Increases in births were shown by eighteen of thirty-one chartered cities and in deaths by twenty cities.

The gains in births surpassed the city average, 11.8 per cent, in thirteen cities, as follows: Petaluma, San Diego, Santa Monica, Long Beach, San Bernardino, Richmond, Sacramento, Berkeley, Watsonville, Pasadena, Oakland, Los Angeles, and San Jose.

The increases in deaths exceeded the average for cities, 5.4 per cent, in the following thirteen cities: Long Beach, Modesto, Salinas, Napa, Vallejo, Eureka, Richmond, Grass Valley, Fresno, Los Angeles, San Diego, San Bernardino, and Sacramento.

Birth and Death Totals Compared.—The birth registration exceeded the death total in 1913 for all geographic divisions except only the coast counties of northern California, the total excess of births over deaths being as great as 5,253, or 13.6 per cent, in 1913 against merely 2,621, or 7.1 per cent, in 1912.

The excess of births over deaths for chartered cities was 18.0 per cent in 1913, and 11.2 per cent in 1912, as compared with only 6.7 and 0.8 per cent respectively for the rest of California.

More births than deaths were reported in both 1913 and 1912 for seventeen cities, as follows: Santa Rosa in Northern California; San Francisco, Alameda, Berkeley, Oakland, Richmond, Monterey, San Luis Obispo, Palo Alto, San Jose, Watsonville, Fresno, Sacramento, and Vallejo in Central California; and Los Angeles, Pasadena, and Riverside in Southern California.

The thirty-two chartered cities in 1913 and the thirty-one in 1912 reported altogether 63.3 and 63.1 per cent of the birth registration for the whole State, as compared with only 60.9 and 60.8 per cent, respectively, of the California death total, birth registration being more complete within these cities than outside them.

Birth, Death and Marriage Rates.—For 1913 and 1912, respectively, the California birth rates per 1,000 population were 16.4 and 15.2, the death rates 14.4 and 14.2, and the marriage rates 11.7 and 12.1.

The latest birth rates are by far the highest since 1906, as are marriage rates also in less degree, though recent death rates are about the same as for 1906 to 1908.

The birth, death and marriage rates, especially births, are considerably higher for Southern California than for Central or Northern California.

The rates in each case are higher for the metropolitan area than for the rural counties north of Tehachapi as well as for San Francisco than for the other bay counties.

The individual counties with birth rates above the State averages in both 1913 and 1912 were: Sacramento, San Diego, Stanislaus, Los Angeles, Fresno, Orange, and San Francisco.

The counties with death rates above the general averages in both years were: Napa, San Diego, San Joaquin, Lake, Sacramento, Yuba, El Dorado, San Bernardino, San Francisco, Santa Clara, Los Angeles, and Nevada.

Marin and Orange, near San Francisco and Los Angeles, invariably show by far the highest marriage rates. Other counties with marriage rates above the State averages in the last two years were: San Diego, Sacramento, San Francisco, Los Angeles, and San Mateo.

The birth rates are much higher for chartered cities, 18.1 and 17.0 in 1913 and 1912, than for all the rest of the State, merely 14.1 and 13.0.

The death rates are also somewhat higher within cities, 15.3 and 15.2, than outside them, only 13.3 and 12.9.

The birth rates exceeded the city averages both years in Watsonville, Richmond, Modesto, Fresno, Santa Rosa, San Diego, Sacramento, Los Angeles, San Luis Obispo, and San Jose.

The death rates surpassed the averages for cities each year in Modesto, San Diego, San Bernardino, Richmond, Long Beach, Eureka, Watsonville, Santa Monica, Stockton, Sacramento, Santa Rosa, San Luis Obispo, Santa Barbara, and San Francisco.

On the other hand, there were relatively low death rates in both 1913 and 1912 for Palo Alto, Berkeley, Monterey, Alameda, Oakland, Pasadena, Pomona, Petaluma, Vallejo, Santa Cruz, and Fresno.

INTRODUCTION.

Sources of Information.—The California law of 1905 for the registration of vital statistics requires the prompt reporting of every birth, death or marriage occurring in the State by the immediate filing of a prescribed form of certificate for each such event with the proper local registrar for transmittal in monthly returns to the State Bureau of Vital Statistics. The local registrars are the health officers of cities having freeholders' charters, for both births and deaths, and the clerks in other cities and incorporated towns for deaths alone. Each county recorder, besides being local registrar for all marriages anywhere in the county, is also local registrar for births occurring outside freeholders' charter cities, as well as for deaths happening outside all cities and incorporated towns. County recorders as local registrars of deaths for the unincorporated portions of counties furthermore appoint subregistrars to receive death certificates and issue burial or removal permits at points remote from county seats.

The California law requires a physician or other person assisting at a birth to file a certificate, properly filled out, within five days thereafter with the health officer for a birth occurring in any freeholders' charter city or with the county recorder for a birth taking place outside cities of this class. In case of a birth occurring without the attendance of a physician, midwife or nurse, the parents or next of kin are required by law to file the birth certificate with the proper local registrar within ten days after the event.

As to deaths, the State law holds each undertaker responsible for obtaining and filing a satisfactory death certificate with the local registrar (or subregistrar) of the district where any death occurs prior to the interment or other disposition of the body, the statute forbidding any disposition of the remains except by authority of the local registrar's (or subregistrar's) permit obtainable only by the filing of a complete and satisfactory death certificate.

With reference to marriages, the California law requires all persons who perform the marriage ceremony in this State to file the prescribed form of marriage certificate, properly filled out, with the county recorder as local registrar within three days after the performance by them of any marriage ceremony.

Indexing of Records.—The original certificates of births, deaths and marriages thus filed with local registrars are required by law to be forwarded to the State Registrar on or before the fifth day of the following month. In the State Bureau of Vital Statistics the births, deaths and marriages throughout California are indexed separately

and systematically on appropriate cards sorted and arranged by names in alphabetical order carried to minute subdivisions. For the period from about July 1, 1905, when the law was put into operation, to the end of 1913 the index cards for California aggregate nearly 300,000 each for births as well as deaths, and over 400,000 for marriages, the marriage index cards being made in duplicate and then sorted separately to cover both grooms and brides. For eight and a half years there are thus altogether 1,000,000 index cards on file in the State bureau as references to the names of children born, persons dead, and couples married in California.

Tabulation of Statistics.—In the State Bureau of Vital Statistics the statistical information on the original birth certificates there filed has been tabulated to the present time merely by direct tallying of certain items from the original certificates. Likewise, statistical data have been compiled as yet from the original marriage certificates simply by sorting and counting the certificates in selected groups. The birth and marriage tabulations are thus necessarily limited within a somewhat restricted range permitting no further expansion.

For deaths, however, tabulation cards have been in use since the organization of the State bureau in 1905 which allow a wide range in the scope of statistical tabulations relating to mortality. In the California Bureau of Vital Statistics the statistical data on the death certificates are transferred to tabulation cards such as are used in the Federal Census Bureau by means of a punching machine. The tabulation cards are punched to show for each death the following particulars: Sex, color (or race), month of death, age, conjugal (or marital) condition, birthplace, birthplace of father, birthplace of mother (by countries for the foreign born), occupation, cause of death, and length of residence in California. Occupations and causes of death are necessarily designated by index numbers, the key for occupations being like that used in the Vital Statistics Division of the Federal Census Bureau, and the key for deaths agreeing with the International Classification of Causes of Death. Each tabulation card also shows, by certain holes punched according to a definite system, the registration district (the county and the freeholders' charter city or other city or town), as well as the local registered number of the certificate to which the card corresponds.

Although the tabulation cards are meant to be sorted and counted by electrical tabulating devices such as are used in the Federal Census Bureau and other statistical offices, the cards in the California Bureau of Vital Statistics have so far been sorted and tabulated only by hand. On this account the tabulations have necessarily been limited to causes of death, and, in addition, to only sex, race, nativity (of white decedents), age periods and occupations for both 1913 and 1912, together with marital or conjugal condition for 1913 alone. Because of the lack of clerical assistance it has also been impossible to make these detailed tabulations for leading cities or individual counties, but only for certain geographic divisions, data being published in some cases merely for the State as a whole. However, total deaths have been tabulated by causes for freeholders' charter cities as well as for all counties in both 1913 and 1912.

Geographic Divisions.—For convenience in tabulation the fifty-eight counties of California have been grouped in three main and eight minor geographic divisions. The three main divisions are Northern, Central, and Southern California. The line between Northern and Central California has been drawn at the southern boundary of Placer, Sutter, Colusa, Napa, and Sonoma counties, or the northern boundary of El Dorado, Sacramento, Yolo, and Marin counties. This dividing line extends irregularly from Lake Tahoe to the Pacific Ocean somewhat north of San Francisco Bay. The line between Central and Southern California has been drawn at the southern boundary of Inyo, Kern, and San Luis Obispo counties, or the northern boundary of San Bernardino, Los Angeles, Ventura, and Santa Barbara counties. This line is familiarly located by Tehachapi pass.

In both Northern and Central California, divisions have been made between the coast and the interior counties. In each case the coast counties include some counties not actually contiguous to the Pacific Ocean but yet on the westward side of the Coast Range. Moreover, in Central California, San Francisco and the other bay counties (Alameda, Contra Costa, Marin, and San Mateo) have been made minor geographic divisions. Similarly, in Southern California, Los Angeles has been made a minor geographic division in contrast with the other seven counties south of Tehachapi.

The three main and eight minor geographic divisions are as follows, the counties in each group being arranged alphabetically for the sake of ready reference:

TABLE 1.—Main and Minor Geographic Divisions of California, with Counties Included in Each.

BIRTH, DEATH AND MARRIAGE TOTALS.

The State.—Under the law of 1905 for the registration of vital statistics in California, returns are now available for the eight calendar years, 1906 to 1913, inclusive. Figures for the State as a whole are summarized in the table which follows, giving the birth, death and marriage totals, together with the increase and rate per 1,000 population, for the eight-year period covered by the operations of the present law.

TABLE 2.—Birth, Death and Marriage Totals, with Increase and Rate per 1,000 Population, for California: 1906 to 1913.

Year	Total	Increase		Rate per 1,000 population
		Number	Per cent	
Births.				
1913	43,852	4,522	11.5	16.4
1912	39,330	4,502	12.9	15.2
1911	34,828	2,690	8.4	14.0
1910	32,138	1,256	4.1	13.4
1909	30,828	2,805	10.0	13.4
1908	28,077	3,403	13.8	12.7
1907	24,674	3,700	17.6	11.6
1906	20,974			10.3
Deaths.				
1913	38,599	1,890	5.1	14.4
1912	36,709	2,697	7.9	14.2
1911	34,012	1,614	5.0	13.7
1910	32,398	1,413	4.6	13.5
1909	30,985	*302	*1.0	13.4
1908	31,287	192	0.6	14.1
1907	31,095	1,792	6.1	14.6
1906	29,303			14.4
Marriages.				
1913	31,883	107	0.3	11.7
1912	31,276	3,973	14.6	12.1
1911	27,303	2,366	9.5	11.0
1910	24,937	2,020	8.3	10.4
1909	22,917	1,178	5.4	9.9
1908	21,739	*1,266	*5.5	9.8
1907	28,005	1,688	7.9	10.8
1906	21,317			10.5

*Decrease.

While the death and marriage totals for California have fluctuated somewhat in the eight years, each having decreased once though increasing thereafter, the birth total has grown steadily in successive years, rising from 20,974 in 1906 to 24,674 in 1907, 28,077 in 1908, 30,882 in 1909, 32,138 in 1910, 34,828 in 1911, 39,330 in 1912, and 43,852 in 1913. Beginning with 1911, moreover, the aggregate birth registration in California has exceeded the annual death total in increasing degree, the excess of births over deaths rising from 816, or 2.4 per cent, in 1911 to 2,621, or 7.1 per cent, in 1912, and to no less than 5,253, or 13.6 per cent, in 1913. Stillbirths are excluded from birth and death tabulations in all cases throughout this report.

The death total, exclusive of stillbirths, rose from 29,303 for 1906 to 31,095 for 1907 and to only 31,287 for 1908, falling back to 30,985 for 1909 but then rising again to 32,398 for 1910, 34,012 for 1911, 36,709 for 1912, and 38,599 for 1913.

The increase of 1,792, or 6.1 per cent, for 1906 to 1907 was followed by a gain of only 192, or 0.6 per cent, for 1907 to 1908 and a loss of 302, or 1.0 per cent, for 1908 to 1909, the death total for 1909 being thus less by 110 than that for 1907. However, the increase of 1,413, or 4.6 per cent for 1909 to 1910, was succeeded by the still greater gains of 1,614, or 5.0 per cent, for 1910 to 1911, of 2,697, or 7.9 per cent, for 1911 to 1912, and of 1,890, or 5.1 per cent, for 1912 to 1913.

The marriage total, beginning with 21,317 for 1906, rose to an early maximum of 23,005 for 1907, dropping then to 21,739 for 1908, but rising thereafter to 22,917 for 1909, 24,937 for 1910, 27,303 for 1911, 31,276 for 1912, and 31,383 for 1913. The early increase of 1,688, or 7.9 per cent, for 1906 to 1907 was followed by a decrease of 1,266, or 5.5 per cent, for 1907 to 1908 offset in part by the succeeding gain of 1,178, or 5.4 per cent, for 1908 to 1909. The gains in marriages were then successively greater, both absolutely and relatively, in the whole period 1909 to 1912, the increase being 2,020, or 8.8 per cent, for 1909 to 1910, 2,366, or 9.5 per cent, for 1910 to 1911, and 3,973, or 14.6 per cent, for 1911 to 1912. In 1912 to 1913, however, the increase in marriages was only 107, or 0.3 per cent, this small gain, like the sharp drop in the marriage total for 1908, indicating that matrimony is avoided during periods of hard times.

With reference to successive increases in births shown in Table 2, it must be remembered that the number and per cent of increase necessarily grow less and less as registration becomes more and more complete, since the early gains were swollen by improved registration while recent gains include little except the natural growth of population. Thus, the greatest relative increase shown is that of 3,700, or 17.6 per cent, for 1906 to 1907, due mainly to improved registration, yet the greatest real gain, largely in births occurring, is that of 4,522, or 11.5 per cent, for 1912 to 1913 or the preceding increase, slightly greater in degree, of 4,502, or 12.9 per cent, for 1911 to 1912.

Moreover, the birth rate per 1,000 population was highest of all, 16.4, for 1913 and next highest, 15.2, for 1912, the birth rate having moved upward ever since 1906, while the death and marriage rates have each suffered some diminution in the course of the eight-year period. Thus the death rates of 14.4 and 14.2 for 1913 and 1912, respectively, though somewhat above the death rates for 1909 to 1911 are yet not far from the same as the higher death rates for the earlier years, 1906 to 1908. Furthermore, the marriage rate of 11.7 for 1913, while less than that of 12.1 for 1912, is much greater than the marriage rate for any year between 1906 and 1911.

Geographic Divisions.—The following table gives the birth, death and marriage totals for the several geographic divisions in the last two years, together with the number and per cent of increase for 1912 to 1913.

TABLE 3.—Birth, Death and Marriage Totals, with Increase, for Geographic Divisions: 1913 and 1912.

Geographic division	Births				Deaths		Marriages		Increase: 1912 to 1913

*Decrease.

In 1912 to 1913 the increase shown for California as a whole was 4,522, or 11.5 per cent, in births against only 1,890, or 5.1 per cent, in deaths and merely 107, or 0.3 per cent, in marriages.

The rate of gain in births was 15.5 for Southern California (being 15.0 for Los Angeles alone and 16.9 for the remaining seven counties), as compared with 9.1 for Northern and Central California together. Similarly the per cent of increase in deaths was 7.7 for the counties south of Tehachapi (being 9.2 for Los Angeles and 4.5 for the other seven) against merely 3.7 for the territory north of Tehachapi. The increase in marriages in 1912 to 1913 was practically confined among geographic divisions to Southern California, the rate of gain being 1.3 for Los Angeles and no less than 9.0 for the other counties, or 4.0 for the whole territory south of Tehachapi, in contrast with a decrease of 1.9 per cent in marriages in Northern and Central California together.

Counties.—Table 4 shows the birth, death and marriage totals for counties as well as the numerical increase in 1912 to 1913.

*Decrease.

†No change.

It appears from this table that in 1912 to 1913 the birth registration increased in thirty-seven counties, remained stationary in one, and decreased in twenty. The death total rose in thirty-eight counties, stood still in three, and fell off in seventeen. The marriages increased in only twenty-seven counties, showed no change in three, and even decreased in twenty-eight.

For the thirty-seven counties showing increases in births the rates of gain ranged as follows: Alpine, 100.0; Inyo, 66.7; Mendocino, 65.7; Sutter, 59.6; San Diego, 45.9; Placer, 40.4; Imperial, 39.7; Contra Costa, 30.8; Sonoma, 30.4; Madera, 22.4; Yolo, 21.1; Tehama, 20.4; San Joaquin and Yuba, each 19.0; Sacramento, 18.4; Tulare, 17.7; Amador, 17.4; Los Angeles, 15.0; Kern, 14.6; Alameda, 13.2; Monterey and Orange, each 13.0; Modoc, 11.4; San Mateo, 11.1; Mariposa, 8.7; San Francisco, 8.6; San Bernardino, 7.8; Calaveras, 7.2; Tuolumne, 6.8; San Luis Obispo, 5.6; Santa Clara, 5.3; Riverside, 4.0; Lake, 3.9; Kings, 2.5; Merced, 2.2; Santa Cruz, 1.8; and Solano, 1.7.

For the thirty-eight counties reporting more deaths in 1913 than in 1912, the per cents of increase were as follows: Lassen, 100.0; Imperial, 70.5; Madera, 51.5; Modoc, 43.8; Placer, 40.7; Amador, 33.3; Yuba, 24.8; Plumas, 22.9; Siskiyou, 22.8; Mariposa, 21.7; Contra Costa, 19.6; Solano, 17.8; Monterey, 16.8; Sutter, 15.2; Sierra, 15.0; Calaveras, 13.3; Marin, 9.9; Los Angeles, 9.2; Kings and San Diego, each 8.0; Humboldt, 7.9; Inyo and Sacramento, each 7.3; San Benito, 7.0; Fresno and Nevada, each 5.9; Merced, 5.7; Tulare, 5.6; Shasta, 5.5; Orange, 5.0; Santa Clara, 4.0; San Francisco, 3.5; San Mateo, 3.3; Sonoma, 3.2; Tuolumne, 2.3; Napa, 1.3; Alameda, 0.9; and San Bernardino, 0.6.

The per cents of increase in marriages for the twenty-seven counties showing gains in 1912 to 1913 were as follows: Inyo, 92.3; Trinity, 40.0; Yolo, 34.4; Imperial, 33.1; Yuba, 32.4; Sutter, 28.6; San Diego, 24.3; Napa, 18.9; Shasta, 16.5; Siskiyou, 14.7; Del Norte, 14.3; Contra Costa, 13.8; San Joaquin, 11.6; Merced, 6.5; Colusa, 6.3; Solano, 6.1; Santa Barbara, 5.7; Orange, 5.3; Tulare, 4.9; San Bernardino, 4.6; Plumas, 4.0; Amador, 3.2; Tehama, 2.8; Santa Clara, 2.0; Alameda, 1.9; Los Angeles, 1.3; and San Luis Obispo, 0.5.

Cities.—Birth and death totals are available only for freeholders' charter cities of which there were thirty-two in 1913, thirty-one in 1912, twenty-nine in 1911, twenty-six in 1910 and 1909, and twenty-four in 1908 and 1907. The additional city, San Rafael, shown for 1913 but not for 1912, reported only 39 births and 92 deaths, so that the totals for thirty-two cities in 1913 and thirty-one in 1912 are quite closely comparable. The following table presents birth and death totals for the several chartered cities in 1913 and 1912, together with the number and per cent of increase in each case.

TABLE 5.—Birth and Death Totals, with increase, for Individual Cities and Rest of State: 1913 and 1912.

City	Births		Deaths		Increase 1912 to 1913

Rest of State	16,093	14,503	15,080	14,387	1,590	693	11.0	4.8

*Decrease.

For chartered cities as a class the birth total was 27,759 in 1913 and 24,827 in 1912, the gain being 2,932, or 11.8 per cent. The death total for cities was 23,519 in 1913 and 22,322 in 1912, the increase being 1,197, or 5.4 per cent.

For all the rest of the State the birth total was 16,093 in 1913 and 14,503 in 1912 (a gain of 1,590, or 11.0 per cent), while the death total was 15,080 in 1913 and 14,387 in 1912 (an increase of 693, or 4.8 per cent). The absolute and relative gains in both birth and death totals, especially births, were greater for chartered cities as a class than for the rest of California as a population group.

Of the thirty-one chartered cities shown for both 1913 and 1912, eighteen reported increases in birth registration for 1913 over 1912, while thirteen indicated decreases. Altogether twenty of the thirty-one cities reported more deaths in 1913 than in 1912 while eleven showed fewer deaths in the later year.

For the eighteen freeholders' chartered cities showing increases in birth registration the rates of gain ranged as follows: Petaluma, 64.6; San Diego, 53.7; Santa Monica, 32.9; Long Beach, 30.1; San Bernardino, 30.0; Richmond, 27.5; Sacramento, 18.8; Berkeley, 17.2; Watsonville, 15.4; Pasadena, 15.2; Oakland, 13.4; Los Angeles, 13.1; San Jose, 12.0; Vallejo, 9.9; San Francisco, 8.6; Santa Rosa, 6.4; Alameda, 4.2; and Riverside, 1.1.

For the twenty chartered cities reporting increased death totals the per cents of increase were as follows: Long Beach, 48.8; Modesto, 29.9; Salinas, 29.8; Napa, 27.2; Vallejo, 25.0; Eureka, 18.0; Richmond, 17.8; Grass Valley, 14.5; Fresno, 9.7; Los Angeles, 9.4; San Diego, 8.7; San Bernardino, 8.4; Sacramento, 7.4; Santa Monica, 4.8; Santa Rosa, 4.3; Berkeley, 3.9; San Francisco, 3.5; Oakland, 2.7; Pomona, 2.0; and Monterey, 1.5.

BIRTH AND DEATH TOTALS COMPARED.

Geographic Divisions.—Comparison of the birth and death totals for geographic divisions in 1913 and 1912, given in Table 6, shows that the birth registration exceeded the death total each year for Los Angeles, for San Francisco and other divisions of Central California, and for the interior counties of Northern California, as well as in 1913 alone for the counties south of Tehachapi outside Los Angeles. The excess of deaths over births shown for the coast counties of Northern California both years was considerably less in 1913 than in 1912. Improvement in the completeness of birth registration is also indicated by the fact that for the many geographic divisions reporting each year more births than deaths, the excess of births over deaths was generally greater both absolutely and relatively in 1913 than in 1912. Hence the excess of births over deaths for California as a whole was no less than 5,253, or 13.6 per cent, in 1913 against only 2,621, or 7.1 per cent, in the preceding year. The detailed figures are as follows:

TABLE 6.—Birth and Death Totals Compared, for Geographic Divisions: 1913 and 1912.

Geographic Division	1913		1912		Excess of births over deaths			
	Births	Deaths	Births	Deaths	Number		Per cent	
					1913	1912	1913	1912
THE STATE	43,852	38,599	39,330	36,709	5,253	2,621	13.6	7.1

Rest of State	16,093	15,080	14,503	14,387	1,013	116	6.7	0.8

*Excess of deaths over births.

For chartered cities as a class the excess of births over deaths was 4,240, or 18.0 per cent, in 1913 as compared with 2,505, or 11.2 per cent, in 1912. Similarly, for all the rest of the State the births exceeded the deaths by 1,013, or 6.7 per cent, in 1913 against merely 116, or 0.8 per cent, in 1912. The much greater excess of births over deaths shown each year for cities as a class than for the rest of the State taken together indicates that there is more complete registration of births within cities than outside them.

Of the thirty-two chartered cities shown for 1913, twenty reported more births than deaths, while of the thirty-one such cities in 1912 twenty-two showed an excess of births over deaths. Altogether seventeen cities reported more births than deaths in both 1913 and 1912. These seventeen cities were as follows: Santa Rosa in Northern California;

San Francisco, Alameda, Berkeley, Oakland, Richmond, Monterey, San Luis Obispo, Palo Alto, San Jose, Watsonville, Fresno, Sacramento, and Vallejo in Central California; and Los Angeles, Pasadena, and Riverside in Southern California. The three additional cities showing an excess of births over deaths for 1913 alone were Petaluma, Santa Monica and San Diego.

Reference to Table 7 shows that the relative excess of births over deaths was notably great in certain cities with per cents as follows for 1913 and 1912, respectively: Watsonville, 107.8 and 74.2; Richmond, 86.8 and 72.6; Fresno, 56.2 and 72.3; Berkeley, 61.6 and 43.3; Oakland, 34.5 and 21.8; Los Angeles, 32.6 and 28.2; Santa Rosa, 26.0 and 23.6; San Jose, 29.6 and 10.8; Alameda, 28.3 and 9.8; Vallejo, 17.6 and 33.8; and Sacramento, 15.8 and 4.7. The relative excess of births over deaths was particularly great for other cities, also, for 1913 alone, as follows: Petaluma, 52.9; Pasadena, 35.7; and Riverside, 22.1.

It may be noted that of the total birth registration for all California altogether 63.3 per cent was reported by the thirty-two chartered cities in 1913 and 63.1 per cent by the thirty-one such cities in 1912. Similarly, of the total deaths in the State some 60.9 per cent occurred in the thirty-two chartered cities in 1913 and 60.8 per cent in the thirty-one cities of this class in 1912. It appears, therefore, from the greater per cent of total births than of total deaths shown for freeholders' charter cities, as well as from the much greater excess of births over deaths within cities than outside them, that birth registration is somewhat more complete within these leading cities than in the outside rural territory.

BIRTH, DEATH AND MARRIAGE RATES.

Population Estimates.—Since the publication of the Federal Census results for 1910, population estimates can be obtained with strict accuracy on the basis of county and city totals for June 1, 1900, and April 15, 1910, the estimates being made for the sake of uniformity as of July 1, or the middle of each year. The estimated midyear population for both 1910 and 1911 has been calculated on the assumption that the numerical increase has been the same each month since April 15, 1910, as it was each month between June 1, 1900, and April 15, 1910. The average monthly increase is obtained by dividing the increase for the whole decade by 118.5 (the number of months between June 1, 1900, and April 15, 1910), and the total increase to July 1, 1912, is then got by multiplying by 26.5 (the number of months between April 15, 1910, and July 1, 1912), the increase to July 1, 1913, being obtained similarly by multiplying by 38.5 (the number of months between April 15, 1910, and July 1, 1913). The estimated midyear population for 1912 and 1913 is found, finally, by adding to the population enumerated April 15, 1910, the estimated increase to July 1, 1912 or 1913, as the case may be.

For the ten counties with few inhabitants showing decreases between 1900 and 1910, the census population of April 15, 1910, has been taken as the midyear estimate for both 1912 and 1913. Moreover, special estimates have been obtained from the Federal Census Bureau for six

cities (Berkeley, Oakland, Fresno, Los Angeles, Pasadena and Sacramento) to cover corrections for territory annexed between 1900 and 1910 or since 1910.

The estimated midyear population for Alameda County, for instance, was obtained as follows:

Population enumerated April 15, 1910-----	246,131
Population enumerated June 1, 1900 -----	130,197
Increase, June 1, 1900, to April 15, 1910 (118.5 months) -----	115,934
Increase, April 15, 1910, to July 1, 1913 ($\times 38.5 \div 118.5$)-----	57,666
Increase, April 15, 1910, to July 1, 1912 ($\times 26.5 \div 118.5$)-----	25,926
Estimated midyear population, 1913-----	283,797
Estimated midyear population, 1912-----	272,057

Similarly, the estimated midyear population for Alameda city was obtained thus:

Population enumerated April 15, 1910-----	23,383
Population enumerated June 1, 1900-----	16,464
Increase, June 1, 1900, to April 15, 1910 (118.5 months)-----	6,919
Increase, April 15, 1910, to July 1, 1913 ($\times 38.5 \div 118.5$)-----	2,248
Increase, April 15, 1910, to July 1, 1912 ($\times 26.5 \div 118.5$)-----	1,547
Estimated midyear population, 1913-----	25,631
Estimated midyear population, 1912-----	24,930

Geographic Divisions.—The following table gives the estimated midyear population, births, deaths and marriages, and rates per 1,000 population for the several geographic divisions in both 1913 and 1912.

TABLE 8.—Estimated Midyear Population, Births, Deaths and Marriages, and Rates per 1,000 Population, for Geographic Divisions: 1913 and 1912.

Rural counties-----	931,266	12,802	12,446	8,787	13.7	13.4	9.4

For California in 1913 and 1912 the estimated midyear population was 2,671,491 and 2,579,874, respectively, giving birth rates of 16.4 and 15.2, death rates of 14.4 and 14.2, and marriage rates of 11.7 and 12.1.

It may be added that for preceding years the estimated midyear population of California was as follows: 1911, 2,488,256; 1910, 2,396,639; 1909, 2,306,001; 1908, 2,215,615; 1907, 2,125,240; and 1906, 2,034,861. For populations thus estimated the birth rates were 14.0 for 1911, 13.4 for both 1910 and 1909, 12.7 for 1908, 11.6 for 1907, and 10.3 for 1906; the death rates were, respectively, 13.7, 13.5, 13.4, 14.1, 14.6, and 14.4; and the marriage rates were, respectively, 11.0, 10.4, 9.9, 9.8, 10.8, and 10.5.

The birth rates for 1913 and 1912 are thus by far the highest in the whole eight-year period, while the death rates for 1913 and 1912 are about the same as for 1906 to 1908, and the marriage rates for 1913 and 1912, like the birth rates, are above the rates for all preceding years from 1906 to 1911.

The birth rates for 1913 and 1912, as for previous years, are somewhat higher for the territory south of Tehachapi than for that to the north, being 18.7 and 17.1 for Southern California against 15.3 and 14.4 for Northern and Central California together. The birth rates for Central California alone were 15.9 in 1913 and 14.9 in 1912, but only 12.5 and 11.6 for Northern California alone. Each year the birth rate was somewhat higher for the coast counties than for the interior counties north of Tehachapi. The rates were also much higher both years for the metropolitan area, comprising San Francisco and the other bay counties, 16.2 and 15.1, than for the rural counties of Northern and Central California, 14.5 and 13.7. The rates were likewise higher for San Francisco, 17.1 in 1913 and 16.0 in 1912, than for the other bay counties, 15.1 and 13.9, respectively. The birth rates were also higher for Los Angeles, 19.5 and 18.0, than for the rest of Southern California, 16.9 and 15.1.

The death rates for 1913 and 1912 are slightly more for Southern California, 15.6 and 15.3, than for the territory north of Tehachapi, 13.8 and 13.7, being 13.9 and 13.8 for Central California alone and 13.6 and 13.0 for Northern California. Each year the death rate was somewhat higher for the coast than for the interior counties north of Tehachapi. In both years, moreover, the death rates were higher for the metropolitan area (14.1 each year) than for the rural counties of Northern and Central California (13.6 in 1913 and 13.4 in 1912); for San Francisco, the metropolis (15.9 and 15.6), than for the group of other bay counties (12.1 and 12.3); and for Los Angeles (15.8 and 15.4) than for the rest of Southern California (15.2 each year).

The marriage rates for 1913 and 1912 are somewhat higher for the territory south of Tehachapi than for that to the north, being 13.6 and 13.7 for Southern California against 10.8 and 11.3 for Northern and Central California together. The marriage rates were 11.6 in 1913 and 12.2 in 1912 for Central California as compared with only 7.3 and 7.5 for Northern California. Each year the rate was much higher for the coast counties than for the interior counties north of Tehachapi. The marriage rates were also higher both years for the

metropolitan area (12.8 and 13.6) than for the rural counties of Northern and Central California (9.1 and 9.4) and were likewise higher for San Francisco alone (13.5 and 14.1) than for the group of other bay counties (12.1 and 12.9). On the other hand, however, the rates were lower for Los Angeles (12.4 and 12.9) than for the rest of Southern California (16.1 and 15.4).

Counties.—Table 9 presents similar figures on birth, death and marriage rates per 1,000 estimated midyear population for counties arranged alphabetically for the sake of ready reference.

TABLE 9.—Estimated Midyear Population, Births, Deaths and Marriages, and Rates per 1,000 Population, for Counties: 1913 and 1912.

The individual counties with birth rates above the State averages of 16.4 and 15.2 in 1913 and 1912, respectively, are as follows: Sacramento, 21.1 and 18.4; San Diego, 21.8 and 15.6; Stanislaus, 19.8 and 21.9; Los Angeles, 19.5 and 18.0; Fresno, 18.5 and 20.0; Orange, 18.4 and 16.9; and San Francisco, 17.1 and 16.0. The birth rate was also above the general average only for 1913 (16.4) in the following counties: Sutter, 21.9; Alpine, 19.4; Contra Costa, 17.5; Madera, 17.0; and Placer, 16.8. Similarly, the birth rate was above the State average for 1912 alone (15.2) in the following counties: Glenn, 16.7; Merced, 16.4; San Benito, 16.3; Butte, 16.0; Santa Barbara, 16.6; and Santa Clara, 15.3.

Among the individual counties, Napa shows the highest death rates, 25.6 for 1913 and 25.7 for 1912, this unenviable prominence being explained, however, by the many deaths of aged persons occurring at the Napa State Hospital and the Veterans' Home of California located in this county of relatively small population. The death rates in 1913 and 1912, respectively, were next highest for the following counties: San Diego, 19.3 and 18.8; San Joaquin, 17.1 and 20.1; Lake, 17.6 and 18.1; Sacramento, 17.4 and 16.7; Yuba, 17.7 and 14.4; El Dorado, 15.9 and 17.2; San Bernardino, 15.9 and 16.5; San Francisco, 15.9 and 15.6; Santa Clara, 15.8 and 15.6; Los Angeles, 15.8 and 15.4; and Nevada, 15.7 and 14.8. These are the counties with death rates above the State averages of 14.4 for 1913 and 14.2 for 1912. The death rate also exceeded the general average only for 1913 (14.4) in each of the following additional counties: Amador, 16.7; Imperial, 16.6; Placer, 15.8; and Lassen, 15.1. The death rate was likewise above the State average of 14.2 for 1912 alone in Trinity, 18.5.

Among the individual counties, Marin, adjoining San Francisco, shows by far the highest marriage rates, 35.7 in 1913 and 47.5 in 1912, while Orange, adjoining Los Angeles, shows the second highest rates, 34.6 and 34.2 in 1913 and 1912, respectively. The marriage rates are also notably high for the following counties: San Diego, 19.5 and 16.4; Sacramento, 15.2 and 15.7; San Francisco, 13.5 and 14.1; Los Angeles, 12.4 and 12.9; and San Mateo, 12.2 and 12.9. These are the counties with marriage rates above both State averages, 11.7 for 1913 and 12.1 for 1912. The marriage rate was also above the State average of 11.7 for 1913 alone for Imperial (12.8) and San Joaquin (12.4) and was likewise above the general average of 12.1 only for Kings (13.5).

The counties mentioned as having high marriage rates will be recognized generally as counties having large cities. Moreover, the marriage rates are much higher for the metropolitan area than for the rural counties north of Tehachapi. It seems, therefore, that there is a strong tendency for marriageable persons living in the country to go to an urban center to be married; if not to the metropolis itself, then to the largest city accessible for a satisfactory celebration of the event. On the other hand, there is a counter movement by which couples living in metropolitan centers like San Francisco or Los Angeles select for their place of marriage not the metropolis proper, but instead a sub-urban city or town. This is shown by the very great proportion of

marriages to resident inhabitants for Marin and San Mateo counties in the suburbs of San Francisco and for Orange County, adjoining Los Angeles. In short, country swains like to celebrate marriage in large cities, while couples belonging to a metropolis are apt to prefer the suburbs.

Cities.—Table 10 gives the birth and death rates per 1,000 estimated midyear population for the thirty-two freeholders' charter cities in 1913 and the thirty-one such cities in 1912, in comparison with all the rest of the State as a whole.

TABLE 10.—Estimated Midyear Population, Births and Deaths, and Rates per 1,000 Population, for Individual Cities and Rest of State: 1913 and 1912.

The birth rate per 1,000 population is much higher for chartered cities as a class, 18.1 in 1913 and 17.0 in 1912, than for all the rest of the State, merely 14.1 and 13.0 respectively. The death rate is also somewhat higher for chartered cities, 15.3 and 15.2 in 1913 and 1912, respectively, than for the rest of California, only 13.3 and 12.9.

The birth rates exceeded the city averages of 18.1 and 17.0 for 1913 and 1912, respectively, in the following cities: Watsonville, 39.4 and 34.8; Richmond, 38.3 and 31.2; Modesto, 25.6 and 29.2; Fresno, 22.9 and 24.0; Santa Rosa, 22.9 and 24.0; San Diego, 25.1 and 17.1; Sacramento, 21.2 and 18.4; Los Angeles, 19.9 and 18.8; San Luis Obispo, 18.1 and 22.0; and San Jose, 18.7 and 17.1. The birth rate was also above the city average for 1913 alone (18.1) for Santa Monica, 20.2; Petaluma, 19.9; and Long Beach, 19.7. Similarly, the birth rate surpassed the city average only for 1912 (17.1) for Eureka, 20.4, and for Salinas, 18.5.

The death rates surpassed the city averages of 15.3 in 1913 and 15.2 in 1912 for the following cities: Modesto, 35.2 and 28.2; San Diego, 23.0 and 22.2; San Bernardino, 21.6 and 20.9; Richmond, 20.5 and 18.1; Long Beach, 21.1 and 15.2; Eureka, 19.2 and 16.9; Watsonville, 19.0 and 20.0; Santa Monica, 18.7 and 18.8; Stockton, 18.3 and 23.9; Sacramento, 18.3 and 17.6; Santa Rosa, 17.8 and 17.3; San Luis Obispo, 17.3 and 19.2; Santa Barbara, 17.1 and 18.3; and San Francisco, 15.9 and 15.6. The death rate also exceeded the city average of 15.3 in 1913 alone for Salinas (19.1), Napa (18.4), and Grass Valley (15.7). Likewise the death rate was above the city average of 15.2 only in 1912 for Riverside, 16.0, and for San Jose, 15.4.

On the other hand, the death rates were remarkably low in both 1913 and 1912 for certain cities, as follows: Palo Alto, 5.7 and 8.4; Berkeley, 9.2 and 9.4; Monterey, 11.3 and 11.7; Alameda, 11.3 and 13.0; Oakland, 12.5 and 12.8; Pasadena, 12.3 and 14.9; Pomona, 13.2 and 13.5; Petaluma, 13.0 and 14.2; Vallejo, 13.7 and 11.2; Santa Cruz, 13.5 and 14.7; and Fresno, 14.7 and 13.9. The death rates were also notably low in 1913 alone for Riverside, 13.2; San Rafael, 13.9; and San Jose, 14.4.

II. STATISTICS OF BIRTHS: 1913 AND 1912.

SYNOPSIS.

Births By Sex, Race and Maternal Nativity.—The 43,852 babies in 1913 included 22,699 boys and 21,153 girls, while of the 39,330 in 1912 the males were 20,231 and the females 19,099. The per cent male was 51.8 in 1913 against 51.4 in 1912, the preponderance of males increasing somewhat.

For births in freeholders' charter cities, the per cents male were 51.4 and 51.2 in 1913 and 1912, respectively, against 52.3 and 51.8 for the rest of California. The per cent male increased both within cities and outside them.

The race distribution of births in 1913 was: White, 40,864; Japanese, 2,215; Chinese, 381; negro, 343, and Indian, 49. The figures for 1912 were: White, 37,194; Japanese, 1,467; Chinese, 321; negro, 319, and Indian, 29. The per cent white decreased steadily through the past eight years, thus: 98.4 (1906), 97.7, 96.8, 96.3, 96.1, 95.5, 94.6 and 93.2 (1913).

For chartered cities the per cent white was 93.9 in 1913 and 94.6 in 1912, while for the rest of the State the per cents were 91.9 and 94.5, respectively.

The preponderance of males is greater, both within cities and outside them, among the few non-Caucasian babies than among the many white infants.

The nativity of the white mothers in 1913 and 1912 was: Born in other states, 16,305 and 14,613; born in California, 12,864 and 11,864; and foreign born, 11,695 and 10,717.

The per cent distribution of white mothers was for 1913 and 1912, respectively: Other states, 39.9 and 39.3; California, 31.5 and 31.9; and foreign countries, 28.6 and 28.8. The annual average per cents for 1909 to 1913 were: Other American, 38.0; Californian, 33.4; and foreign, 28.6.

For cities the per cent of mothers born in other states was 38.5 in 1913 and 37.8 in 1912; the per cents foreign born were 31.4 and 31.9; and the per cents born in California were 30.1 and 30.3. For the rural districts the per cents in 1913 and 1912 were, respectively: Other states, 42.3 and 41.9; California, 33.9 and 34.6; and foreign, only 23.8 and 23.5.

Statistical tables have been prepared to show the proportion of the sexes among children born to white mothers classified by nativity. However, differences between geographic divisions and between urban and rural districts prevent the drawing of general conclusions about the effect of maternal nativity on the preponderance of male births.

Nativity of Brides and Mothers.—Comparison of the per cent distribution of white brides and mothers, by nativity, shows that throughout California a larger portion of the brides than of the mothers were born in this State. Similarly, but in less degree, a larger proportion of the brides than the mothers were natives of other states. On the other hand, a much larger proportion of the mothers than of the brides in California were foreign born.

There is likewise an excess in the per cent born in California among single brides over that among mothers, though there is relatively little

difference in the per cents born elsewhere in the United States for single brides and mothers. However there is a great excess in the per cent born abroad among mothers over that for single brides.

It seems, therefore, that in California, as elsewhere in the United States, the fecundity of foreign born women is greater than that of native women, whether born in California or other states.

BIRTHS BY SEX, RACE AND MATERNAL NATIVITY.

See.—The following table gives the classification of births by sex, with per cents, for the several geographic divisions in both 1913 and 1912:

TABLE 1.—Births Classified by Sex, with Per Cents, for Geographic Divisions*: 1913 and 1912.

Geographic Division	Births						Per cent male		Per cent female	
	Total		Male		Female		1913	1912	1913	1912

Metropolitan area-----	13,288	12,012	6,873	6,180	6,415	5,852	51.7	51.0	48.3	49.0
Rural counties-----	13,795	12,802	7,145	6,675	6,650	6,127	51.8	52.1	48.2	47.9

*For list of counties included in geographic divisions, see page 26.

The proportion of the sexes among the 43,852 children born in California in 1913 was: Male, 22,699, or 51.8 per cent; and female, 21,153, or 48.2 per cent. Among the 39,330 born in 1912, the proportion of the sexes was: Male, 20,231, or 51.4 per cent; and female, 19,099, or 48.6 per cent. It may be added that for 1909 to 1913 the annual average per cent male was 51.8, and the per cent female was 48.2.

In 1913 the male births exceeded the female by 1,546 or 7.3 per cent, while in 1912 the excess of boys over girls was only 1,132 or 5.9 per cent. The male births exceeded the female in every main and minor geographic division in both 1913 and 1912. The per cent male was highest in 1913 for the coast counties of Central California (53.2) and in 1912 for the interior counties of Northern California (52.9). Each year the per cent was lowest (50.3) for the coast counties of Northern California.

The per cents male were somewhat lower for the metropolitan area each year (51.7 and 51.0) than for the rural counties north of

Tehachapi (51.8 and 52.1), but were generally higher for San Francisco alone (51.6 and 51.4) than for the adjoining bay counties (51.9 and 50.5). Similarly, the per cents male for Los Angeles (52.0 and 51.4) were somewhat higher than for the other counties south of Tehachapi (51.2 and 50.5).

The following table shows, for 1913 and 1912, the classification of births by sex, with per cent distributions, for the freeholders' charter cities in contrast with the rest of the State. There were thirty-two chartered cities in 1913 and thirty-one in 1912:

TABLE 2.—Births Classified by Sex, with Per Cents, for Cities and Rest of State: 1913 and 1912.

Population Group	Births						Per cent male		Per cent female	
	Total		Male		Female		1913	1912	1913	1912
	1913	1912	1913	1912	1912	1913				
CALIFORNIA	43,852	39,330	22,699	20,231	21,153	19,099	51.8	51.4	48.2	48.6
Freeholders' charter cities	27,759	24,827	14,278	12,721	13,481	12,106	51.4	51.2	48.6	48.8
Rest of state.....	16,093	14,503	8,421	7,510	7,672	6,993	52.3	51.8	47.7	48.2

This table shows that among the 27,759 births in freeholders' charter cities in 1913 the proportion of the sexes was: Male, 14,278, or 51.4 per cent; and female, 13,481, or 48.6 per cent. The proportion of the sexes among the 24,827 births in chartered cities in 1912 was: Male, 12,721, or 51.2 per cent; and female, 12,106, or 48.8 per cent.

In California, outside chartered cities, there were 16,093 births, classified by sex, as follows: Male, 8,421, or 52.3 per cent; and female, 7,672, or 47.7 per cent. For the State outside cities in 1910 the 14,503 births were distributed by sex, as follows: Male, 7,510, or 51.8 per cent; and female, 6,993, or 48.2 per cent.

The per cents male were somewhat less each year for chartered cities as a class (51.4 and 51.2) than for all the rest of the State (52.3 and 51.8). However, the increase in the proportion of males for 1913, as compared with 1912, shown for California as a whole, appears also both within cities and outside them.

Race.—The following table gives the classification of births by race, as well as the per cent white, for the several geographic divisions in 1913 and 1912.

TABLE 3.—Births Classified by Race, with Per Cent White, for Geographic Divisions: 1913 and 1912.

<i>Southern California</i> -----	14,516	13,835	206	6	26	443	95.3
Los Angeles -----	10,408	9,852	183	1	17	355	94.7
Other counties -----	4,108	3,983	23	5	9	88	97.0
<i>Northern and Central California</i> -----	24,814	23,359	113	23	295	1,024	94.1
Coast counties -----	15,996	15,128	77	11	228	552	94.6
Interior counties -----	8,818	8,231	36	12	67	472	93.3
Metropolitan area -----	12,012	11,382	74	-----	212	344	94.8
Rural counties -----	12,802	11,977	39	23	83	680	93.6

It appears from this table that the race distribution of the 43,852 births in California in 1913 was: White, 40,864, or 93.2 per cent; Japanese, 2,215; Chinese, 381; negro, 343; and Indian, 49. In 1912 the race distribution of the 39,330 births was: White, 37,194, or 94.6 per cent; Japanese, 1,467; Chinese, 321; negro, 319; and Indian, 29. Each year the Japanese were decidedly the leading non-Caucasian race represented in births, with the Chinese and negroes next in order but far behind, and with Indians barely shown at all. It may be added that for 1909 to 1913 the annual average per cent white was 95.1. Moreover, the per cent white decreased steadily in the whole eight years covered

by the present registration law, the successive per cents being as follows: 98.4 (1906), 97.7, 96.8, 96.3, 96.1, 95.5, 94.6, and 93.2 (1913).

In 1913 and 1912 the per cent white was highest for Northern California (95.1 and 96.8), next for Southern California (94.4 and 95.3), and lowest for Central California (92.0 and 93.7). Among the minor geographic divisions the per cent white ranged from 97.4 and 97.8 for the coast counties of Northern California in 1913 and 1912, respectively, to merely 87.7 and 91.7 for the coast counties of Central California.

Each year the per cents white were less for Los Angeles (93.6 and 94.7) than for the other counties of Southern California (96.1 and 97.0). However, the per cents white were somewhat greater for San Francisco than for the other bay counties, being 94.4 and 95.0 for the metropolis proper against 94.0 and 94.4 for the suburbs.

The following table gives the race distribution of births, with the per cent white, for the thirty-two chartered cities in 1913 and the thirty-one in 1912, in contrast with the rest of the State:

TABLE 4.—Births Classified by Race, with Per Cent White, for Cities and Rest of State: 1913 and 1912.

Population group	Births						Per cent white
	Total	White	Negro	Indian	Chinese	Japanese	
1913.							
CALIFORNIA.....	43,852	40,864	343	49	381	2,215	93.2
Freeholders' charter cities...	27,759	26,076	303	8	314	1,058	93.9
Rest of state.....	16,093	14,788	40	41	67	1,157	91.9
1912.							
CALIFORNIA.....	39,330	37,194	319	29	321	1,467	94.6
Freeholders' charter cities...	24,827	23,494	276	3	261	793	94.6
Rest of state.....	14,503	13,700	43	26	60	674	94.5

This table shows that among the 27,759 births in chartered cities in 1913, the race distribution was: White, 26,076, or 93.9 per cent; Japanese, 1,058; Chinese, 314; negro, 303; and Indian, 8. The race distribution of the 24,827 births in cities in 1912 was: White, 23,494, or 94.6 per cent; Japanese, 793; negro, 276; Chinese, 261; and Indian, 3.

For the State, exclusive of chartered cities, there were 16,093 births in 1913, distributed by race, as follows: White, 14,788, or 91.9 per cent; Japanese, 1,157; Chinese, 67; Indian, 41; and negro, 40. There were 14,503 births outside cities in 1912, distributed by race, as follows: White, 13,700, or 94.5 per cent; Japanese, 674; Chinese, 60; negro, 43; and Indian, 26.

In both 1913 and 1912 the per cent white was somewhat greater for births within cities (93.9 and 94.6) than for births outside them (91.9 and 94.5). The general decrease in the per cent white, for 1913 as compared with 1912, was common to both chartered cities and rural districts.

Sex and Race.—In the table below births of whites and non-Caucasians are classified by sex, with per cents, for both 1913 and 1912. There were so few births of non-Caucasians in some geographic divisions that figures are presented here only for the thirty-two chartered cities in 1913 and the thirty-one in 1912, as contrasted with the rest of the State.

TABLE 5.—Births Classified by Sex and Race, with Per Cents, by Sex, for Cities and Rest of State: 1913 and 1912.

Population group.	Births						Per cent male		Per cent female	
	Total		Male		Female		1913	1912	1913	1912
	1913	1912	1913	1912	1913	1912				
White.										
CALIFORNIA.....	40,864	37,194	21,057	19,093	19,807	18,101	51.5	51.3	48.5	48.7
Freholders' charter cities	26,076	23,494	13,377	12,030	12,699	11,464	51.3	51.2	48.7	48.8
Rest of state.....	14,788	13,700	7,680	7,063	7,108	6,637	51.9	51.6	48.1	48.4
Non-Caucasian.										
CALIFORNIA.....	2,988	2,133	1,642	1,138	1,346	998	55.0	53.3	45.0	46.7
Freholders' charter cities	1,083	1,333	901	691	782	642	53.5	51.8	46.5	48.2
Rest of state.....	1,905	803	741	447	564	356	56.8	55.7	43.2	44.3

This table shows, in brief, that the preponderance of males was much greater, both within cities and outside them, among the few non-Caucasian births than among the many white births. Thus, in 1913 and 1912, respectively, the per cents male were 55.0 and 53.3 for non-Caucasians against only 51.5 and 51.3 for whites in the State as a whole; 53.5 and 51.8 for non-Caucasians against 51.3 and 51.2 for whites in chartered cities as a class; and no less than 56.8 and 55.7 for non-Caucasians against only 51.9 and 51.6 for whites in all the rest of California.

Nativity of White Mothers.—The analysis of births by race may be extended to a consideration of births according to the nativity of white mothers—classified as born in California, born in other states, or foreign born—as given in the following table, by numbers and per cents, for the several geographic divisions in both 1913 and 1912:

TABLE 6.—White Mothers Classified by Nativity, with Per Cents, for Geographic Divisions: 1913 and 1912.

Geographic division	White mothers				Per cent		
	Total	Born in California	Born in other states	Foreign born	Born in California	Born in other states	Foreign born
1913.							
THE STATE-----	40,864	12,864	16,305	11,695	31.5	39.9	28.6
<i>Northern California</i> -----	3,725	1,879	1,036	780	50.5	28.6	20.9

Coast counties-----	15,128	6,219	3,467	5,442	41.1	22.9	36.0
Interior counties-----	8,231	3,262	3,211	1,758	39.6	39.0	21.4
Metropolitan area-----	11,382	4,541	2,493	4,345	39.9	21.9	38.2
Rural counties-----	11,977	4,940	4,182	2,855	41.3	34.9	23.8

It appears from this table that of the mothers of the white children born in this State totaling 40,864 and 37,194 in 1913 and 1912, respectively, those who were themselves born in other states numbered 16,305 and 14,613; those who were Californians like their children were 12,864 and 11,864; and the foreign born mothers were 11,695 and 10,717. The per cent distribution of white mothers was as follows for 1913 and 1912, respectively: Other states, 39.9 and 39.3; California, 31.5 and 31.9; and foreign countries, 28.6 and 28.8. It may be added that for 1909 to 1913 the annual average per cents were as follows: Other American, 38.0; Californian, 33.4; and foreign, 28.6.

The proportion of white mothers born in other states is very high for Southern California, but is quite low for Northern and Central California. The per cents born elsewhere in the United States were 58.2 and 57.4 for the counties south of Tehachapi in 1913 and 1912 as compared with 28.4 and 28.6 for those to the north, being 28.6 and 30.2 for Northern California and only 28.3 each year for Central California. The per cent was 57.8 each year for Los Angeles against 59.1 in 1913 and 56.3 in 1912 for the other counties south of Tehachapi. However, the per cents were only 22.3 and 21.9 for the metropolitan area as compared with 34.4 and 34.9 for the rural counties north of Tehachapi, and were merely 18.4 and 17.6 for San Francisco against 27.5 and 27.9 for the other bay counties.

The proportion of mothers who were themselves native daughters is very high for both Northern and Central California but very low for Southern California. The per cents of mothers born in the Golden State in 1913 and 1912, respectively, were 50.5 and 48.9 for Northern California and 39.3 and 39.1 for Central California, or 40.9 and 40.6 for both together as compared with merely 16.5 and 17.2 for the counties south of Tehachapi. The per cents were as little as 15.0 and 15.2 for Los Angeles against 20.1 and 22.3 for the other counties of Southern California. The per cents were likewise less for the metropolitan area than for the rural counties north of Tehachapi, being 40.3 and 39.9 for the former against 41.5 and 41.3 for the latter. The per cents were also somewhat less for San Francisco than for the other bay counties, being 39.8 and 39.4 for main city against 41.1 and 40.6 for the surrounding suburbs.

The proportion of foreign born mothers of the white race is notably high only for Central California, especially in San Francisco and the other bay counties. The per cents born abroad in 1913 and 1912, respectively, were 32.4 and 32.6 for Central California as compared with merely 25.3 and 25.4 for Southern California and 20.9 each year for Northern California. The per cents for the counties north of Tehachapi were 30.7 and 30.8, being no less than 37.4 and 38.2 for the metropolitan area against only 24.1 and 23.8 for the rural counties. The per cents born abroad were as great as 41.8 and 43.0 among mothers in the metropolis proper as compared with 31.4 and 31.5 for those in the suburban counties.

The next table gives numbers and per cents, showing the nativity of white mothers for the thirty-two chartered cities in 1913 and the thirty-one in 1912, as compared with all the rest of California:

TABLE 7.—White Mothers Classified by Nativity, with Per Cents, for Cities and Rest of State: 1913 and 1912.

Population group	White mothers				Per cent		
	Total	Born in California	Born in other states	Foreign born	Born in California	Born in other states	Foreign born
1913.							
CALIFORNIA.....	40,864	12,864	16,305	11,695	31.5	39.9	28.6
Freeholders' charter cities...	26,076	7,846	10,048	8,182	30.1	38.5	31.4
Rest of state.....	14,788	5,018	6,257	3,513	33.9	42.3	23.8
1912.							
CALIFORNIA.....	37,194	11,864	14,613	10,717	31.9	39.3	28.8
Freeholders' charter cities...	23,494	7,118	8,878	7,498	30.3	37.8	31.9
Rest of state.....	13,700	4,746	5,735	3,219	34.6	41.9	23.5

This table shows that of the 26,076 mothers of white children born in freeholders' charter cities in 1913 altogether 10,048, or 38.5 per cent, were natives of other states; 8,182, or 31.4 per cent, were foreign born; and 7,846, or 30.1 per cent, were natives of California. Of the 23,494 white mothers bearing children in chartered cities in 1912, those born in other states were 8,878, or 37.8 per cent; those born abroad were 7,498, or 31.9 per cent; and those born in California were 7,118, or 30.3 per cent.

In the State outside cities there were 14,788 births of white children in 1913, with mothers born as follows: Other states, 6,257, or 42.3 per cent; California, 5,018, or 33.9 per cent; and foreign countries, 3,513, or 23.8 per cent. In 1912 there were 13,700 white children born in the rural part of the State, with maternal nativity as follows: Other states, 5,735, or 41.9 per cent; California, 4,746, or 34.6 per cent; and foreign, 3,219, or 23.5 per cent.

The per cents American born, whether in California or other states, were less each year for chartered cities than for rural districts, while the per cent foreign born was much greater within cities than outside them. The excess in the per cent of mothers born in this State for rural districts over that for cities was 3.8 in 1912 (33.9 against 30.1), and 4.3 in 1912 (34.6 against 30.3). Similarly, the excess in the per cent born elsewhere in the United States for the rural over the urban districts was 3.8 in 1913 (42.3 against 38.5), and 4.1 in 1912 (41.9 against 37.8). On the other hand, the excess in the per cent foreign born among white mothers in cities over that among mothers in the country districts was no less than 7.6 in 1913 (31.4 against 23.8), and 8.4 in 1912 (31.9 against 23.5).

Both within cities and outside them the women bearing most children in California are those who were themselves born in other states. Foreign born mothers are second for births in chartered cities, but a poor third for births outside cities. California born mothers are a good second for births in the rural districts, and even a close third for births in urban territory.

Sex and Nativity of White Mothers.—In the study of sex and race, *ante*, it was found that the preponderance of male births was much greater among non-Caucasians than among whites. The following table has been prepared to show the proportion of the sexes among children born to white mothers classified by nativity. Only the per cent distribution, by sex, is given here, but the absolute figures are presented in Table 18, *post*.

TABLE 8.—Per Cent Distribution, by Sex, of White Children with Mothers Classified by Nativity, for Geographic Divisions: 1913 and 1912.

Geographic division	White children											
	Per cent male among those with mothers—						Per cent female among those with mothers—

Rural counties.....	51.6	51.8	50.4	52.1	51.7	50.7	48.4	48.2	49.6	47.9	48.3	49.3

The per cents of male births in California in 1913 and 1912, respectively, were 51.9 and 51.0 for native daughters, 51.3 and 51.9 for mothers born in other states, and 51.4 and 50.9 for foreign born mothers. For 1909 to 1913 the annual average per cents were as follows: Californians, 51.6; other Americans, 51.7; and foreign born, also 51.7. The per cents for native daughters and foreign born mothers were substantially the same each year, while the per cent for other Americans was lower than both for 1913 though somewhat higher than both for 1912.

Differences like those here noted between the per cents for the State in 1913 and 1912 occur also among the per cents for the several geographic divisions each year, so that it is impossible to draw general conclusions from these figures about the effect of maternal nativity on the preponderance of male births.

The following table presents similar figures for freeholders' charter cities in contrast with the rest of California. The numbers on which the per cents are based appear in Table 19, *post*.

TABLE 9. Per Cent Distribution, by Sex, of White Children with Mothers Classified by Nativity, for Cities and Rest of State: 1913 and 1912.

Population group	White children											
	Per cent male among those with mothers—						Per cent female among those with mothers—					
	Born in California		Born in other states		Foreign born		Born in California		Born in other states		Foreign born

CALIFORNIA	51.9	51.0	51.3	51.9	51.4	50.9	48.1	49.0	48.7	48.1	48.6	49.1
Freeholders' charter cities	51.6	50.4	51.3	51.9	51.0	51.1	48.4	49.6	48.7	48.1	49.0	48.9
Rest of state.....	52.3	52.0	51.3	51.8	52.6	50.5	47.7	48.0	48.7	48.2	47.4	49.5

In chartered cities the per cents of male births in 1913 and 1912, respectively, were 51.6 and 50.4 for Californian mothers and 51.3 and 51.9 for other Americans, as compared with 51.0 and 51.1 for mothers born abroad. For 1909 to 1913, the annual average per cents male were as follows, according to maternal nativity: California, 51.7; other states, also 51.7; and foreign countries, 51.5. That is, in cities where the three elements of the population are about equally represented, the preponderance of male births is somewhat greater, generally speaking, for Californian and other American mothers than for those born in foreign countries though, after all, not so very far from the same for each of the three classes.

In rural districts, where the foreign born element is least numerous, the per cents male in 1913 and 1912 were 52.3 and 52.0 among children of native daughters and 51.3 and 51.8 among children of other Americans, as compared with 52.6 and 50.5 among children of foreign born mothers. For 1909 to 1913 the annual average per cents male for mothers classified by nativity, were as follows: Californian, 51.7; other Americans, 51.6; and foreign, 52.3. The Californian and other American mothers outnumber by far the foreign born in rural districts, while the preponderance of male births is generally greater in country sections for mothers born abroad than for natives of California or other states.

NATIVITY OF BRIDES AND MOTHERS.

Nativity of White Brides and Mothers.—Some facts of interest are disclosed by a comparison of the nativity of white brides and mothers in California. Accordingly, the following table is presented giving, for the several geographic divisions in 1913 and 1912, the per cent distribution of white brides and white mothers by nativity:

TABLE 10.—Per Cent Distribution, by Nativity, of White Brides and White Mothers, for Geographic Divisions: 1913 and 1912.

Geographic division	Per cent born in California		Per cent born in other states		Per cent foreign born	
	White brides	White mothers	White brides	White mothers	White brides	White mothers
1913.						
THE STATE.....	35.9	31.5	44.1	39.9	20.0	28.6
<i>Northern California</i>	57.1	50.5	28.5	28.6	14.4	20.9
Coast counties	58.1	50.4	21.7	22.9	20.2	26.7

Coast counties	48.6	41.1	26.5	22.9	24.9	36.0
Interior counties	48.3	39.6	37.1	39.0	14.6	21.4
Metropolitan area	46.8	39.9	26.6	21.9	26.6	38.2
Rural counties	50.6	41.3	33.4	34.9	16.0	23.8

It appears from this table that the per cents of white brides born in California in 1913 and 1912 were 35.9 and 37.6 but that the per cents of native daughters among white mothers were only 31.5 and 31.9, respectively. The excess in the per cent born in California among brides over that among mothers was 4.4 in 1913 (35.9 against 31.5) and 5.7 in 1912 (37.6 against 31.9). In every main and minor geographic division in both 1913 and 1912 a larger per cent of white brides than of white mothers were natives of this State.

The per cents of white brides born in other states were 44.1 and 42.6 in 1913 and 1912, while the per cents born elsewhere in the United

States were considerably less among white mothers, 39.9 and 39.3, respectively. The excess in the per cent born in other states for brides over that for mothers was 4.2 in 1913 (44.1 against 39.9) and 3.3 in 1912 (42.6 against 39.3). For the interior counties of Central California in both 1913 and 1912, and for the coast counties of Northern California in 1913 alone and the interior counties of Northern California in 1912 alone, the per cents born elsewhere in the United States were greater among white mothers than among white brides. For the remaining geographic divisions, however, a larger per cent of the white brides than of the white mothers in California were born in other states.

The per cents foreign born were only 20.0 and 19.8 among white brides against no less than 28.6 and 28.8 in 1913 and 1912 among white mothers. The per cent born abroad among mothers exceeded that among brides by 8.6 in 1913 (28.6 against 20.0) and by 9.0 in 1912 (28.8 against 19.8). In every geographic division each year a much larger per cent of the white mothers than of the white brides were foreign born.

Comparison of the annual average per cents for the State as a whole in 1909 to 1913 shows that among native daughters the excess in the per cent for brides over that for mothers was 5.0 (38.4 against 33.4); among other Americans the excess in the per cent for brides over that for mothers was 4.1 (42.1 against 38.0); and among the foreign born the converse excess in the per cent for mothers over that for brides was as great as 9.1 (28.6 against 19.5).

The following table shows, for the several geographic divisions in 1913 and 1912, the results of comparing the per cent distribution, by nativity, of white brides and mothers:

TABLE 11.—Comparison of Per Cent Distribution, by Nativity, of White Brides and White Mothers, for Geographic Divisions: 1913 and 1912.

Geographic division	Excess in per cent born in California for white brides over that for white mothers		Excess in per cent born in other states for white brides over that for white mothers		Excess in per cent foreign born for white mothers over that for white brides	
	1912	1913	1913	1912	1913	1912
THE STATE-----	4.4	5.7	4.2	3.3	8.6	9.0
<i>Northern California</i> -----	6.6	8.6	-0.1	-0.8	6.5	7.8

<i>Northern and Central California</i> ---	5.9	7.9	3.1	1.2	9.0	9.1
Coast counties-----	5.0	7.5	5.6	3.6	10.6	11.1
Interior counties-----	7.3	8.7	-0.8	-1.9	6.5	6.8
Metropolitan area-----	4.7	6.9	6.4	4.7	11.1	11.6
Rural counties-----	7.3	9.3	0.2	-1.5	7.5	7.8

The per cents born in California were considerably greater each year among brides than among mothers, and the per cents born in other states were likewise greater, though in less degree, among brides than among mothers. On the other hand, the per cents foreign born were much greater each year for white mothers than for white brides.

The excess in the per cent born in California for brides over that for mothers was much greater for the counties north of Tehachapi, 5.9 in 1913 and 7.9 in 1912, than for those to the south, 2.5 and 2.4 respectively. However, the proportion of native daughters among both brides and mothers is much greater anyway in Northern and Central California than in Southern California. The excess in the per cents for brides over those for mothers was somewhat less for the metropolitan area (4.7 in 1913 and 6.9 in 1912) than for the rural counties north of Tehachapi (7.3 and 9.3, respectively). The excess was likewise less for the metropolis proper (2.6 and 4.3) than for the suburban counties (6.8 and 9.6).

The excess in the per cent born in other states for brides over that for mothers was considerably greater for the counties south of Tehachapi (5.5 in 1913 and 6.1 in 1912) than for those to the north (3.1 and 1.2, respectively). It must be remembered, however, that the proportion of both brides and mothers born in other states is particularly great for Southern California, but relatively small for Northern as well as Central California. In the metropolitan area a much larger proportion of the brides than of the mothers were born elsewhere in the United States, the excess in the per cent for brides being 6.4 for 1913 and 4.7 in 1912; in the rural counties north of Tehachapi, however, the excess in the per cent for brides was only 0.2 for 1913, while for 1912 there was even an excess in the per cent for mothers of 1.5. The excess in the per cent born in other states among brides over that among mothers was considerably greater for San Francisco (7.6 and 6.5) than for the other bay counties (4.4 and 1.5).

The marked excess in the per cent foreign born among mothers over that among brides was greatest in Central California (9.6 in 1913 and 9.7 in 1912); next in Southern California (8.0 and 8.5); and least in Central California (6.5 and 7.8). It is in these geographic divisions that the proportions foreign born among both mothers and brides are likewise greatest in the same order as here stated for the excess of foreign mothers over foreign brides. For Northern and Central California together the excess in the per cent of foreign born mothers over that of foreign born brides was 9.0 in 1913 and 9.1 in 1912. In the metropolitan area, where the foreign born element mainly abounds, the excess in the per cent of foreign born mothers over that of foreign born brides was as great as 11.1 in 1913 and 11.6 in 1912 as compared with only 7.5 and 7.8, respectively, for the rural counties north of Tehachapi. However, while San Francisco has a much larger proportion of foreign born inhabitants than the other bay counties, yet the excess in the per cent of foreign born mothers over that of foreign brides was somewhat less for the metropolis proper (10.2 and 10.8) than for the suburban counties (11.2 and 11.1).

Nativity of Single White Brides and White Mothers.—Since the marriages in which the brides were single are more apt to be blessed with children than those in which the brides were widowed or divorced, it

may be even more instructive to compare the nativity of white mothers, not merely with that of all white brides, but rather with the nativity of the single white brides alone. The following table has, therefore, been prepared to show, for the several geographic divisions in 1913 and 1912, the per cent distribution, by nativity, of single white brides and white mothers:

TABLE 12.—Per Cent Distribution, by Nativity, of Single White Brides and White Mothers, for Geographic Divisions: 1913 and 1912.

Geographic division	Per cent born in California		Per cent born in other states		Per cent foreign born	
	Single white brides	White mothers	Single white brides	White mothers	Single white brides	White mothers
1913.						
THE STATE-----	38.6	31.5	41.3	39.9	20.1	28.6
<i>Northern California</i> -----	62.8	50.5	23.9	28.6	13.3	20.9
Coast counties-----	63.1	50.4	17.8	22.9	19.1	26.7

Metropolitan area-----	47.7	40.3	25.8	22.3	26.5	37.4
Rural counties-----	52.2	41.5	31.2	34.4	16.6	24.1
1912.						
THE STATE-----	40.2	31.9	39.8	39.3	20.0	28.8
<i>Northern California</i> -----	61.2	48.9	25.7	30.2	13.1	20.9
Coast counties-----	59.9	46.2	20.7	24.8	19.4	29.0
Interior counties-----	62.6	51.0	30.8	34.2	6.6	14.8
<i>Central California</i> -----	49.7	39.1	27.2	28.3	23.1	32.6
San Francisco-----	45.2	39.4	21.4	17.6	33.4	43.0
Other bay counties-----	53.4	40.6	27.0	27.9	19.6	31.5
Coast counties-----	58.1	43.8	23.6	26.7	18.3	29.5
Interior counties-----	48.2	36.0	35.2	40.6	16.6	23.4
<i>Southern California</i> -----	21.8	17.2	61.3	57.4	16.9	25.4
Los Angeles-----	19.4	15.2	62.2	57.8	18.4	27.0
Other counties-----	26.2	22.3	59.8	56.3	14.0	21.4
<i>Northern and Central California</i> ---	51.1	40.6	27.0	28.6	21.9	30.8
Coast counties-----	51.2	41.1	23.6	22.9	25.2	36.0
Interior counties-----	51.1	39.6	34.3	39.0	14.6	21.4
Metropolitan area-----	48.9	39.9	24.0	21.9	27.1	38.2
Rural counties-----	53.6	41.3	30.4	34.9	16.0	23.8

When the contrast is drawn between the nativity of single white brides and of white mothers, the excess heretofore noted in the per cents foreign born among mothers over brides is found also in the per cents for mothers over the single brides alone. However, while the per cents born in other states were considerably greater for all brides than for mothers in both 1913 and 1912, the per cents born elsewhere in the United States were notably greater for single white brides than for white mothers only in 1913, being also greater but only slightly so for single white brides than for white mothers in 1912. On the other hand, the excess in the per cent born in California among brides as compared with mothers remains very great when the widowed and divorced brides are eliminated and only the single brides are considered.

The table shows that the per cent of single white brides born in California was no less than 38.6 in 1913 and 40.2 in 1912, while the corresponding per cents for white mothers were only 31.5 and 31.9, respectively. The excess in the per cent of native daughters among single white brides over that among mothers was 7.1 in 1913 (38.6 as compared with 31.5) and was 8.3 in 1912 (40.2 as compared with 31.9). In all parts of the State both years a considerably larger proportion of the single white brides than of the mothers were born in California.

The per cent of single white brides born in other states was 41.3 in 1913 as compared with 39.9 for white mothers, an excess of 1.4 in the per cent for brides. In 1912, however, the per cent born elsewhere in the United States was only 39.8 for single white brides, against 39.3 for white mothers, an excess of only 0.5 in the per cent for brides. The excess in the per cent of single white brides born in other states over that for white mothers observed for 1913 was confined, moreover, to the metropolitan area and the adjacent coast counties as well as to Southern California as a whole, while in 1912 there was a similar excess in the per cent of single brides over that for mothers merely for San Francisco besides Southern California. In several of the geographic divisions, therefore, especially for 1912, the per cents born elsewhere in the United States were somewhat greater among mothers than among single brides.

The per cents foreign born in 1913 and 1912 were only 20.1 and 20.0 among single white brides in contrast with no less than 28.6 and 28.8 among white mothers. The per cent born abroad for mothers surpassed that for single brides by 8.5 in 1913 (28.6 against 20.1) and by 8.8 in 1912 (28.8 against 20.0). In every geographic division each year the per cent foreign born was decidedly higher for white mothers than for single white brides.

Comparison of the annual average per cents for California in 1909 to 1913 shows that among native daughters the excess in the per cent for single brides over that for mothers was as great as 7.8 (41.2 against 33.8); among other Americans the excess in the per cent for single brides over that of mothers was merely 1.3 (39.3 against 38.0); and among the foreign born the converse excess in the per cent for mothers over that for single brides was no less than 9.1 (28.6 against 19.5).

The following table gives a measure of the contrast between the per cent distribution, by nativity, of single white brides and white mothers for the several geographic divisions in 1913 and 1912:

TABLE 13.—Comparison of Per Cent Distribution, by Nativity, of Single White Brides and White Mothers, for Geographic Divisions: 1913 and 1912.

Geographic division	Excess in per cent born in California for single white brides over that for white mothers		Excess in per cent born in other states for single white brides over that for white mothers		Excess in per cent foreign born for white mothers over that for single white brides	
	1913	1912	1913	1912	1913	1912
THE STATE-----	7.1	8.3	1.4	0.5	8.5	8.8
<i>Northern California</i> -----	12.3	12.3	-4.7	-4.5	7.6	7.0
Coast counties-----	12.7	13.7	-5.1	-4.1	7.6	9.6
Interior counties-----	12.1	11.6	-3.5	-3.4	8.6	8.2
<i>Central California</i> -----	8.7	10.6	0.7	-1.1	9.4	9.5
San Francisco-----	4.5	5.8	4.6	3.8	9.1	9.6
Other bay counties-----	10.6	12.8	1.6	-0.9	12.2	11.9
Coast counties-----	10.6	14.3	1.5	-3.1	12.1	11.2
Interior counties-----	10.6	12.2	-4.5	-5.4	6.1	6.8
<i>Southern California</i> -----	4.4	4.6	3.6	3.9	8.0	8.5
Los Angeles-----	3.5	4.2	5.2	4.4	8.7	8.6
Other counties-----	4.9	3.9	0.7	3.5	5.6	7.4
<i>Northern and Central California</i> ---	8.9	10.5	-0.1	-1.6	8.8	8.9
Coast counties-----	8.1	10.1	2.5	0.7	10.6	10.8
Interior counties-----	10.3	11.5	-4.0	-4.7	6.3	6.8
Metropolitan area-----	7.4	9.0	3.5	2.1	10.9	11.1
Rural counties-----	10.7	12.3	-3.2	-4.5	7.5	7.8

The single white brides surpassed the white mothers in the per cents born in California and in other states, though in much greater degree for California than for other Americans, while the mothers surpassed greatly the single brides in the per cent foreign born each year. Generally speaking, there was a marked excess in the per cent born in California among single brides over that among mothers; relatively little difference in the per cents born elsewhere in the United States for single brides and mothers; and a very great excess in the per cent born abroad among mothers over that for single brides.

The excess in the per cent born in California among single brides over that among mothers was much greater for Northern and Central California, 8.9 in 1913 and 10.5 in 1912, than for Southern California, 4.4 and 4.6, respectively. In all cases, however, the proportions born in the Golden State are much greater for the counties north of Tehachapi than for those to the south. The excess in the per cents born in California for single brides over those for mothers was somewhat less for the metropolitan area (7.4 in 1913 and 9.0 in 1912), than for the rural counties north of Tehachapi (10.7 and 12.3), and was likewise less for

San Francisco (4.5 and 5.8) than for the other bay counties (10.6 and 12.8).

The relatively small excess in the per cent born in other states among single brides over that among mothers shown each year was limited to San Francisco besides Southern California as a whole for both 1913 and 1912, though appearing also for the other bay counties and the coast counties of Central California in 1913 alone. The excess in the per cent born elsewhere in the United States among single brides over that among mothers was thus practically confined to the metropolitan area north of Tehachapi (3.5 and 2.1), especially San Francisco alone (4.6 and 3.8), as well as Southern California as a whole (3.6 and 3.9), particularly Los Angeles alone (5.2 and 4.4). For the rural counties of Northern and Central California, on the other hand, there was a great excess in the per cents born elsewhere in the United States among mothers over the per cents among single brides (3.2 and 4.5), especially for Northern California alone (4.7 and 4.5).

The decided excess in the per cent foreign born among mothers over that among single brides was greatest in Central California (9.4 and 9.5); next in Southern California (8.0 and 8.5); and least in Northern California (7.6 and 7.8). It is in Central, Southern, and Northern California, in the order stated for the excess of mothers, that the per cents foreign born are likewise greatest among both mothers and brides. For Northern and Central California the per cent born abroad among mothers exceeded that among brides by 8.8 in 1913 and 8.9 in 1912. In the metropolitan area, where the foreign born element is especially prominent, the excess in the per cent foreign born for mothers over that for single brides was as great as 10.9 and 11.1 in 1913 and 1912, as compared with only 7.5 and 7.8 for the rural counties north of Tehachapi. Yet while the foreign born population is more massed in San Francisco than in the suburbs, the excess in the per cent born abroad among mothers over that among single brides was somewhat less for the main city (9.1 and 9.6) than for the suburban counties (12.2 and 11.9).

Conclusion.—The comparison of the nativity of white brides and mothers here made gives a rough measure of the relative fecundity of American and foreign born women in California. The figures indicate that in this State, as in the whole country, the foreign born women are more prone to bear children than are the American born, whether natives of California or of other states. For the proportion foreign born is much greater among mothers than among brides, whether the comparison is made for all brides or only the single ones. However, the proportion born elsewhere in the United States than California is considerably less among mothers than among all brides, though about the same for mothers as for single brides alone. The proportion born in the Golden State, moreover, is also considerably less among mothers than among either all or only the single brides.

However, these conclusions are only tentative, because the registration of births in California does not yet seem to be quite so complete as the registration of marriages. The deficiency in the registration of births is probably greatest for births in the families of Californians and other Americans, since foreign born families from training abroad appear to realize the importance of promptly registering the births of their children. This deficiency in the registration of the births of children born to American mothers may account in part for the fact that the figures for California in 1913 and 1912 indicate that the fecundity of foreign born women is greater than that of native women. However, the recent data for California agree with the results of earlier statistical investigations in other states, so that it is quite safe to conclude that foreign born women surpass the natives, whether born in California or elsewhere, in the proclivity to bear children.

III. STATISTICS OF DEATHS: 1913 AND 1912.

SYNOPSIS.

Causes of Death.—Diseases of the circulatory system (heart disease, etc.) constitute the principal group of causes of death in California. The per cent of total deaths for this group being 16.3 in 1913 and 17.4 in 1912 against the annual average of 16.3 for 1909 to 1913, and the death rates per 100,000 population being 235.1 and 247.2 as compared with the annual average of 226.3 for the last five years.

Tuberculosis, however, is the leading single cause of death in this State, causing about one seventh of all deaths (14.0 per cent for both 1913 and 1912 against the average of 14.6 for 1909 to 1913). The tuberculosis death rate per 100,000 population was 202.2 in 1913 and 198.8 in 1912 against 202.4 for the five-year period.

The per cents of total deaths for diseases of the respiratory system (pneumonia, etc.) were 9.9 and 10.5 (against the average of 10.0), while the death rates per 100,000 population for this class of diseases were 142.5 and 148.9 (against the average of 138.4).

For diseases of the nervous system the per cents were 9.6 and 8.9 as compared with the average of 9.3, and the death rates were 139.2 in 1913 and 126.6 in 1912 as compared with the average of 128.7 for 1909 to 1913.

Other prominent causes of death in 1913 and 1912 were: Diseases of the digestive system, miscellaneous violence, cancer, and Bright's disease.

Typhoid fever, as usual, was the most fatal epidemic disease, causing 1.1 per cent of all deaths in 1913 and 1.2 per cent in 1912 against the average of 1.3 for the five-year period just ended. However, the deaths from typhoid fever decreased generally through the whole eight years last past, the successive totals being as follows: 657 (1906), 558, 540, 461, 477, 444, 454, and 436 (1913).

Other notable epidemic diseases present in 1913 and 1912 were: Whooping-cough, diphtheria and croup, measles, influenza, malarial fever, scarlet fever, smallpox (causing 15 deaths in 1913 and 16 in 1912), and plague (causing 2 deaths in 1913 against none in 1912).

Geographic Divisions.—Analysis of causes of death in different localities reveals marked contrasts between the several geographic divisions in the relative prevalence of various diseases.

In the coast counties of both Northern and Central California, as well as in Southern California outside Los Angeles, relatively high proportions of all deaths are due to diseases of the nervous system, the explanation being the presence of state hospitals in these three geographic divisions.

The interior counties of Northern California show high proportions for miscellaneous deaths from violence, as drowning, railroad injuries, other accidents, etc.

In the interior counties of both Central and Northern California, and also in the counties south of Tehachapi other than Los Angeles, the proportions are very high for typhoid fever.

Each year large proportions of all deaths in San Francisco and the other bay counties were from diseases of the circulatory system (heart disease, etc.) and also from pneumonia, San Francisco, furthermore, leading especially in the proportion of suicides among all decedents.

The proportion of deaths from tuberculosis was very high indeed each year in Los Angeles, as well as in the other counties of Southern California, on account of the many deaths occurring among newcomers from the East.

Contrast between mortality in the metropolitan area and in the rural counties north of Tehachapi shows that the urban territory excels in deaths from heart disease, Bright's disease, cancer, pneumonia, digestive ailments (except diarrhea), and suicide, as well as from diphtheria and croup, while the country districts excel in deaths from diseases of the nervous system, infantile diarrhea, accidental violence and "old age," as well as typhoid fever, malarial fever, scarlet fever, whooping-cough and measles.

Much the same contrast appears between mortality in chartered cities as a class and in all the rest of the State as a whole, the deaths from diarrhea and enteritis (under 2 years) being notably less within-cities than outside them.

Tuberculosis.—The "great white plague" caused 5,402 deaths in 1913 and 5,128 in 1912, the per cent being 14.0 each year against the average of 14.6 for 1909 to 1913. The average per cent of total deaths from tuberculosis in the five years last past was no less than 18.6 for Southern California against only 12.6 for Northern and Central California together.

Among cities, the annual average per cent of tuberculosis deaths was highest for San Bernardino, Riverside, Pasadena, Los Angeles, Stockton, and San Diego, all except Stockton (with a state hospital) being in Southern California. The per cent was relatively low for Richmond, Long Beach, Berkeley, Santa Monica, Alameda, Palo Alto, Salinas, Vallejo, Santa Cruz, Oakland, and Fresno, all these cities except Long Beach and Santa Monica being north of Tehachapi.

Classification of deaths from tuberculosis by length of residence shows that north of Tehachapi many native Californians and old time residents succumb to this disease. The annual average per cent of native Californians among tuberculosis victims in 1909 to 1913 was 38.8 for Northern and Central California together against only 15.8 for Southern California, being 29.0 for the entire State. Similarly, the average per cent who had lived here at least 10 years was 28.4 for the territory north of Tehachapi as compared with only 20.2 for that to the south, being 24.9 for the State as a whole.

South of Tehachapi, on the other hand, deaths from tuberculosis occur largely among newly arrived consumptives. The annual average per cent of tuberculosis victims who had lived in the State less than 10 years was as great as 55.8 for Southern California against merely 18.1 for the territory north of Tehachapi and 34.2 for the whole State. Moreover, the length of residence in California was less than a year for an average of 16.8 per cent of the tuberculosis victims south of Tehachapi, the corresponding average per cent for the entire State being only 9.2. In fact, of all who died of tuberculosis in Southern California, an average of 1.8 per cent had been in the State less than

a month, 6.3 per cent less than three months, and altogether 11.1 per cent less than half a year.

Among tuberculosis victims in cities, the average per cents for residents of less than 10 years' standing in 1909 to 1913 were as follows: Pasadena, 66.4; Riverside, 59.9; San Diego, 58.6; San Bernardino, 57.4, and Los Angeles, 57.0. Moreover, the average per cents for residents of less than a single year's standing were thus: San Diego, 21.3; Pasadena, 19.1; Riverside, 18.0; Los Angeles, 15.9, and San Bernardino, 15.2.

Figures for 1910 to 1913 indicate that the months of greatest mortality from tuberculosis for California as a whole are February, March, April and May, while deaths from this disease are relatively least numerous in August, September, October and November.

In short, the death rate of California is evidently swollen considerably by deaths occurring here from disease contracted elsewhere. For where tuberculosis is most prevalent a large proportion of the victims are residents of very short standing. Moreover, infection from these newly arrived consumptives accounts for some of the deaths among native Californians and old-time residents.

Sex.—Of 38,599 decedents in 1913, the males were 23,807 and the females 14,792, while among the 36,709 in 1912 the males were 22,634 and the females 14,075. The per cent male was 61.7 for both 1913 and 1912 against the average of 62.0 for 1909 to 1913. Each year the per cent male was highest for Northern California and next for Central California.

The per cents male were above the general average for deaths from suicide, other violence, typhoid fever, pulmonary tuberculosis, Bright's disease, and heart disease, etc. The female decedents outnumbered the males each year only for whooping-cough, cancer, scarlet fever, influenza, and measles.

Race.—In 1913 the white decedents numbered 36,501; the Chinese, 707; the Japanese, 613; the negroes, 595, and the Indians, 183. The figures for 1912 were: White, 34,732; Chinese, 741; negroes, 543; Japanese, 524, and Indian, 169. The per cent white in each case was 94.6, or the same as the average for the last five years. Each year the per cent white was highest for Southern California.

The per cents white were very high for deaths from diphtheria and croup, influenza, measles, cancer, Bright's disease, and diseases of the circulatory, nervous, and respiratory systems.

The proportion of Caucasians among all decedents was low each year for typhoid fever, which causes many deaths of Japanese, and for tuberculosis, which kills many Chinese and negroes.

Nativity.—Of the white decedents in 1913 and 1912 those born in other states were 14,297 and 13,617; the foreign born were 11,404 and 10,936; those born in California were 9,675 and 9,143; and the nativity was unknown for 1,125 and 1,036. The per cent distribution of white decedents in 1913 and 1912, respectively, was: Other states, 39.2 each year; foreign countries, 31.2 and 31.5; California, 26.5 and 26.3; and unknown, 3.1 and 3.0. For 1909 to 1913, moreover, the annual average per cents were: Other American, 38.1; foreign, 31.7; Californian, 27.2; and unknown, 3.0.

The proportion born elsewhere in the United States is very high for Southern California, especially Los Angeles. The proportion foreign

born is notably great only for Central California, especially for San Francisco and the other bay counties. The proportion of native Californians among decedents was greatest each year in Central California, and next in Northern California.

The proportion of native Californians is especially great for deaths from early infancy, diarrhea and enteritis, whooping-cough, measles diphtheria and croup, scarlet fever, meningitis, tuberculosis other than pulmonary, pneumonia, typhoid fever, malarial fever and childbirth.

The per cents born in other states were above the general averages for deaths from influenza, diseases of the nervous system other than meningitis, Bright's disease, cancer, diseases of the circulatory system, diarrhea and enteritis (2 years and over), pulmonary tuberculosis, and general diseases other than tuberculosis and cancer (*i. e.*, diabetes, alcoholism, etc.).

The proportions foreign born were above the general averages for deaths from heart disease, etc., cancer, Bright's disease, suicide and other violence, and diseases of the respiratory, nervous and digestive systems except pneumonia, meningitis and diarrhea, respectively.

Age Periods.—The deaths in 1913 and 1912, respectively, were distributed by age periods as follows: Under 1 year, 4,336 and 3,942; 1 to 4 years, 1,631 and 1,616; 5 to 14 years, 1,048 and 977; 15 to 24 years, 2,273 and 2,252; 25 to 34 years, 3,762 and 3,636; 35 to 44 years, 4,215 and 4,062; 45 to 54 years, 4,670 and 4,489; 55 to 64 years, 5,037 and 4,747; and 65 years and over, 11,627 and 10,988.

The corresponding per cents for 1913 and 1912 were: Under 1 year, 11.2 and 10.8; 1 to 4 years, 4.2 and 4.4; 5 to 14 years, 2.7 each year; 15 to 24 years, 5.9 and 6.1; 25 to 34 years, 9.8 and 9.9; 35 to 44 years, 10.9 and 11.1; 45 to 54 years, 12.1 and 12.2; 55 to 64 years, 13.1 and 12.9; and 65 years and over, 30.1 and 29.9. Moreover, the annual average per cent distribution for 1911 to 1913 was: Under 1 year, 10.8; 1 to 4 years, 4.2; 5 to 14 years, 2.7; 15 to 24 years, 6.2; 25 to 35 years, 9.9; 35 to 44 years, 11.2; 45 to 54 years, 12.1; 55 to 64 years, 13.0; and 65 years and over, 29.9.

The median age of California decedents, half being younger and half older, was 49.36 years for 1913, and 49.16 years for 1912, as compared with 48.83 years for 1911.

The per cents of deaths under 15 years vary irregularly among geographic divisions. However, the per cents are relatively high at 15 to 44 years for Southern California, probably on account of deaths from tuberculosis; at 45 to 64 years for Central California, especially San Francisco; and at 65 years and over for Northern California.

Under 1 year occur large proportions of deaths from early infancy and infantile diarrhea, whooping-cough, measles, meningitis, and pneumonia.

At 1 to 4 years the diseases especially fatal are measles, scarlet fever, diphtheria and croup, whooping-cough, meningitis, diarrhea and enteritis, tuberculosis of other organs than the lungs, malarial fever, pneumonia and other diseases of the respiratory system, and miscellaneous violence (accidental injuries, etc.).

At 5 to 14 years the diseases causing exceptionally large proportions of deaths are diphtheria and croup, scarlet fever, meningitis, tuberculosis other than pulmonary, measles, typhoid fever, malarial fever, mis-

cellaneous violence, whooping-cough, diarrhea and other diseases of the digestive system, and general diseases other than tuberculosis and cancer.

The proportion of deaths is notably high for successive productive ages as follows: At 15 to 24 years for childbirth, typhoid fever, tuberculosis, suicide and other violence, and diseases of the digestive system other than diarrhea: at 25 to 34 years for childbirth, tuberculosis, typhoid fever, suicide and other violence: at 35 to 44 years for childbirth, suicide and other violence, tuberculosis, typhoid fever, general diseases (diabetes, alcoholism, etc.), and diseases of the digestive system except diarrhea: at 45 to 54 years for cancer, suicide and other violence, general diseases, diseases of the digestive system except diarrhea, pulmonary tuberculosis, Bright's disease, and diseases of the nervous system except meningitis; and at 55 to 64 years for cancer, Bright's disease, heart disease, etc., diseases of the nervous system except meningitis, general diseases, and diseases of the digestive system except diarrhea.

At 65 years and over the per cents are particularly high for deaths from influenza, miscellaneous causes (including "old age"), diseases of the circulatory system (heart disease, etc.), diseases of the respiratory system except pneumonia, diseases of the nervous system except meningitis, Bright's disease, senile diarrhea, and cancer.

Marital Condition of Decedents.—Exclusive of children under 15, the classification of the 19,946 male decedents in 1913 was: Single, 6,448; married, 8,837; widowed, 2,966; divorced, 290; and unknown, 1,405. The marital condition of the 11,638 females aged 15 and over was: Single, 1,427; married, 5,579; widowed, 4,322; divorced, 150; and unknown, 160.

The per cent distribution was as follows for male and female decedents, respectively: Single, 32.3 and 12.3; married, 44.3 and 47.9; widowed, 14.9 and 37.1; divorced, 1.5 and 1.3; and unknown, 7.0 and 1.4. Male decedents exceed in the per cent single, and females in the per cent widowed, the proportion married being about the same for each sex.

Among men the per cent single was much greater, and the per cent married much less, for the territory north of Tehachapi than for that to the north, similar contrasts appearing among women but in only slight degree. Southern California excels in the proportion of widowers and Northern and Central California in the proportion of widows among decedents.

The per cents single, among both men and women, were above general averages for deaths from typhoid fever, tuberculosis, suicide and other violence.

The proportion married was high among men for cancer, nervous diseases, Bright's disease, digestive ailments, and heart disease, etc., and among women for typhoid fever, tuberculosis, suicide, miscellaneous causes, cancer, digestive ailments, and Bright's disease.

In general, the per cents for both widowers and widows were particularly great for heart disease, etc., Bright's disease, nervous diseases, and respiratory troubles.

Occupations and Causes of Death.—Of the decedents aged 15 years and over for whom occupations were reported, totaling 18,231 in 1913, and 17,415 in 1912, the males numbered 17,045 and 16,391 while the females were only 1,186 and 1,024, respectively, the per cents male being 93.5 and 94.1 and female merely 6.5 and 5.9.

The per cents of deaths from typhoid fever were notably high among men in the following specific occupations: Engineers and surveyors, sailors and pilots, barbers and hairdressers, lumbermen and raftsmen, common laborers, draymen, stock raisers, hotel and boarding-house keepers, iron and steel workers, steam railroad employees, farmers, and merchants. The proportions were also high among women workers for nurses, clerks, and school teachers.

Tuberculosis caused relatively more deaths among both men and women workers than among men without occupation or women with only home duties. The per cents of deaths from tuberculosis were particularly high for the following occupations of men: Plumbers, clerks, waiters, tailors, musicians, barbers, hucksters, common laborers, butchers, iron and steel workers, engineers and surveyors, bakers, draymen, saloonkeepers, painters, printers, machinists, and steam railroad employees. The proportions of deaths from tuberculosis were also relatively high for clerks, teachers and servants among women wage earners. On the other hand, the proportions of deaths from tuberculosis were very low indeed for policemen, bankers, merchants, lawyers, physicians, boot and shoemakers, hostlers, lumbermen, farmers, soldiers, and stock raisers.

Miscellaneous violence, like tuberculosis, caused relatively more deaths among both men and women reporting gainful occupations than among those without wage-earning employments. The per cents of deaths from accidents were especially high among men in the following occupations: Lumbermen, railroad employees, hucksters, engineers and surveyors, draymen, common laborers, machinists, stationary engineers, iron and steel workers, sailors, plumbers, and miners. The proportions of deaths from violence on the other hand, were remarkably small among lawyers, physicians, clergymen, merchants, pharmacists, tailors, hotel and boarding-house keepers, boot and shoe makers, brick masons, clerks, cabinetmakers, printers, and musicians.

The statistics show varying relations between occupations and causes of deaths for persons in different occupations dying from cancer, diseases of the circulatory system, Bright's disease, diseases of the nervous, respiratory and digestive systems, and from suicide.

CAUSES OF DEATH.

The State.—Table 1, on pages 88–89, gives the number of deaths in California from certain principal causes, as well as the proportion per 1,000 total deaths and also the death rate per 100,000 estimated midyear population for each year in the five-year period just ended. The table also presents annual average proportions and rates for the five years, 1909 to 1913.

Table 1 shows that diseases of the circulatory system, heart disease, etc., constitute the principal group of causes of death in California. Diseases of the circulatory system caused 16.3 per cent of all deaths in 1913 and 17.4 per cent in 1912, against the annual average of 16.3 for 1909 to 1913. The death rates per 100,000 population for this class of diseases were 235.1 and 247.2 in 1913 and 1912, respectively, as compared with the annual average of 226.3 for the five years just ended.

TABLE 1.—Deaths from Certain Principal Causes, with Proportion per 1,000

Cause of death	Deaths					Annual average: 1909 to 1913
	1913	1912	1911	1910	1909

*Less than one tenth of 1 per thousand.

Tuberculosis, however, is the leading single cause of death in California. Each year about one seventh of all deaths in the State were due to this disease, the per cent being 14.0 for both 1913 and 1912 against the average of 14.6 for 1909 to 1913. In 1913, as in 1912 also, 11.8 per cent of all deaths in California were from tuberculosis of the lungs and 2.2 per cent from tuberculosis of other organs, the averages for 1909 to 1913 being 12.4 and 2.2. The death rate per 100,000 population for all forms of tuberculosis was 202.2 in 1913 and 198.8 in 1912 against the average of 202.4 for the last five years.

Next after diseases of the circulatory system and various forms of tuberculosis taken together come diseases of the respiratory system, pneumonia, etc. Diseases of this class caused 9.9 per cent of all deaths in 1913 and 10.5 per cent in 1912 as compared with the average of 10.0 for 1909 to 1913. Pneumonia and broncho-pneumonia caused 7.6 per cent of all deaths in 1913 and 8.1 per cent in 1912, while other diseases of the respiratory system caused 2.3 and 2.4 per cent, respectively. The death rate per 100,000 population for all diseases of the respiratory system was 142.5 in 1913 and 148.9 in 1912 against the average of 138.4 for 1909 to 1913.

For meningitis and other diseases of the nervous system in 1913 and 1912, respectively, the per cents of all deaths were 9.6 and 8.9 against the five-year average of 9.3, while the death rates per 100,000 population were 139.2 and 126.6 against the average of 128.7. Meningitis alone caused 1.1 per cent of all deaths in 1913 and 0.8 per cent in 1912.

Diseases of the digestive system (diarrhea and enteritis, etc.) caused 9.4 per cent of all deaths in 1913 and 9.3 per cent in 1912 against the average of 9.2, and showed death rates of 136.0 and 131.6 in 1913 and 1912 as compared with the average of 127.5 for 1909 to 1913. The deaths from diarrhea and enteritis among children under 2 years of age were 3.3 per cent of the total deaths at all ages in 1913 and 2.9 per cent in 1912.

Violence other than suicide caused 8.1 per cent of all deaths in 1913 and 8.0 per cent in 1912 against the average of 8.0, while suicides alone caused 2.2 per cent of all deaths each year as well as for the whole five-year period.

Cancers of various kinds caused 6.6 per cent of all deaths in 1913 and 6.3 per cent in 1912 as compared with the average of 6.3, while Bright's disease and nephritis caused 6.2 per cent of all deaths in 1913 and 6.0 per cent in 1912 against the average of 6.2.

Of the epidemic diseases, typhoid fever was by far the most fatal each year, the deaths therefrom in 1913 and 1912 numbering 436 and 454 and the per cents being 1.1 and 1.2 against the average of 1.3 for 1909 to 1913. In 1913 and 1912, respectively, the deaths from whooping-cough numbered 128 and 193 with per cents of 0.3 and 0.5 against the five-year average of 0.6; the deaths from diphtheria and croup totaled 186 and 158 with per cents of 0.5 and 0.4 against the average of 0.6; and the deaths from measles numbered 154 and 134 with a per cent of 0.4

each year against the average of 0.4. Deaths reported from influenza numbered 220 in 1913 and 146 in 1912 (or considerably more for the last two than for earlier years), the per cents being 0.6 and 0.4, respectively, as compared with the average of only 0.4 for 1909 to 1913.

Fewer deaths were reported in 1913 than in 1912 both for typhoid fever and whooping-cough, though somewhat more were reported in 1913 than in 1912 for diphtheria and croup as well as measles.

For typhoid fever, in fact, the death total decreased quite steadily in general throughout the whole eight years last past as follows: 657 (1906), 558, 540, 461, 477, 444, 454, and 436 (1913). The per cent of total deaths from typhoid fever was only 1.1 in 1913 and 1.2 in 1912 against the annual average of 1.3 for 1909 to 1913. Similarly, the death rate per 100,000 population for typhoid fever was merely 16.3 in 1913 and 17.6 in 1912 as compared with 18.3 for the five-year period just ended.

Deaths from other epidemic diseases occurred as follows in 1913 and 1912, respectively: Malarial fever, 77 and 101; scarlet fever, 85 and 34; and smallpox, 15 and 16. Two deaths from plague were reported for 1913, but none for 1912.

Main Geographic Divisions.—Table 2, which follows, gives for the three main geographic divisions in 1913 and 1912 the number of deaths from certain principal causes, as well as the proportion from each cause per 1,000 total deaths. The death rates per 100,000 population are not shown for geographic divisions, because of the difficulty of estimating population for different localities with sufficiently equal accuracy to justify the comparison of detailed death rates for individual causes of death.

Table 2 shows that the proportions per 1,000 total deaths for typhoid fever were particularly high for Central California each year, 12.9 and 13.9 in 1913 and 1912 against State averages of 11.3 and 12.4. For 1913 alone, moreover, the proportion for Northern California was slightly above the State average, 12.0 against 11.3.

The proportions for whooping-cough were above the State averages of 3.3 in 1913 and 5.3 in 1912 for Southern California both years, 5.1 and 6.6.

The proportions for diphtheria and croup also exceeded the State averages of 4.8 and 5.3 for Southern California both years, 5.1 and 4.7, as well as for Central California in less degree, 4.9 and 4.5.

The proportions for measles surpassed the State averages of 4.0 and 3.6 only for Southern California in 1913 alone, 6.8, and for Central California in 1912 alone, 5.7.

For Northern California the proportions are particularly high for deaths from violence other than suicide, being no less than 108.5 and 102.3 for this main division against 81.2 and 80.4 for the whole State, as well as for diseases of the nervous system other than meningitis, being 92.8 and 89.4 for this main division against 85.9 and 80.6 for the State in 1913 and 1912, respectively.

Central California excels in the proportions for diseases of the circulatory system (heart disease, etc.), 174.1 and 182.0 against State aver-

ages of 162.7 and 173.7; for cancer, 71.4 and 65.9 against 66.4 and 62.8; and for pneumonia and broncho-pneumonia, 81.8 and 86.3 against 76.1 and 80.9.

Southern California leads decidedly in the proportions for tuberculosis. The proportions per 1,000 total deaths for tuberculosis of the lungs were no less than 147.9 and 150.2 for this main division against only 117.5 and 117.6 for the entire State, and for tuberculosis of other organs were 21.9 and 24.6 for this division against 22.4 and 22.1 for the State.

Minor Geographic Divisions.—Table 3 on the following pages presents similar figures for the eight minor geographic divisions.

TABLE 2.—Deaths from Certain Principal Causes, with Proportion per 1,000 Total Deaths, for Main Geographic Divisions:* 1913 and 1912.

391	172	45.8	53.8	72.6	42.7	37.1	52.3	47.7	44.0	41.6

From the proportions per 1,000 total deaths shown for minor geographic divisions it appears that the high proportions for typhoid fever noted for Central California each year and for Northern California in 1913 were practically confined to the interior counties. The proportions for typhoid fever were relatively high each year for the interior counties of both Central and Northern California and for the counties of Southern California other than Los Angeles, as well as for the coast counties of Northern California in 1912 alone. As compared with State averages of 11.3 and 12.4 in 1913 and 1912, respectively, the proportions per 1,000 total deaths were no less than 19.2 and 23.5 for the interior counties of Central California; 14.4 and 10.7 for the interior counties of Northern California; 12.7 and 14.3 for Southern California except Los Angeles, and 12.1 for the coast counties of Northern California in 1912 alone.

The proportions of whooping-cough were above the State averages of 3.3 and 5.3 both years for Los Angeles, 4.8 and 6.7, and for the other counties of Southern California, 5.8 and 6.3, as well as in 1912 alone for the other bay counties and the interior counties of Central California, 6.1 in each case.

The proportion for diphtheria and croup was above the State average of 4.8 in 1913 for the bay counties other than San Francisco, 6.7; for the interior counties of Central California, 5.4; and for Los Angeles, 5.9. The proportion was above the average of 4.3 for 1912 for San Francisco, 4.6; the other bay counties, 6.0; the interior counties of Central California, 4.6; Los Angeles, 4.5; and the other counties of Southern California, 5.1.

The proportion for measles was above the general average of 4.0 in 1913 for the interior counties of Northern California, 4.8; the interior counties of Central California, 4.6; Los Angeles, 7.5; and the other counties of Southern California, 5.1. The proportion was above the average of 3.6 in 1912 for the interior counties of Northern California, 3.7; San Francisco, 7.4; the coast counties of Central California, 8.6; and the interior counties of Central California, 5.1.

The coast counties of Northern California have very high proportions for diseases of the nervous system other than meningitis, 105.2 and 115.1 in 1913 and 1912 against State averages of only 85.9 and 80.6. This is accounted for by the fact that many of the deaths reported for this geographic division occurred at the Mendocino and Napa State Hospitals. The proportions for diseases of the nervous system are also quite high for the coast counties of Central California, 121.8 and 99.0, and for the counties south of Tehachapi except Los Angeles, 98.0 and 95.5, the former division including the Agnews State Hospital and the latter the Southern California State Hospital.

The interior counties of Northern California show proportions that are very high indeed, 124.5 and 111.5 against State averages of only 81.2 and 80.4, for miscellaneous deaths from violence, as drowning, railroad injuries, other accidents, etc.

The proportions for diseases of the circulatory system (162.7 and 173.7 for the State in 1913 and 1912) are particularly high for San Francisco (206.1 and 204.6), for the other bay counties (184.7 and 189.0), for the adjoining coast counties of Central California (192.5 and 197.7), and for the coast counties of Northern California (191.6 and 195.4).

The proportions for pneumonia and broncho-pneumonia (76.1 for the State in 1913 and 80.9 in 1912) are especially high for San Francisco (85.6 and 80.3) and the other bay counties (89.9 and 92.4), as well as for the interior counties of Central California (77.1 and 89.4).

The proportions of total deaths at all ages for diarrhea and enteritis among children under 2 years of age, 32.9 in 1913 and 28.8 in 1912 for the State, were notably high for the interior counties of Central California, 45.5 and 38.9, and for Southern California outside Los Angeles, 51.8 and 38.4.

In San Francisco the proportions per 1,000 total deaths for cancer were no less than 81.8 in 1913 and 73.9 in 1912 against State averages of 66.4 and 62.8. Similarly, the proportions for suicide were as great as 31.4 and 30.0 for San Francisco as compared with 21.7 and 21.9 for the State as a whole.

The proportions for tuberculosis of the lungs, 117.5 in 1913 and 117.6 in 1912 for the State, were no less than 149.0 and 151.2 for Los Angeles and as great as 145.4 and 148.2 for the other counties south of Tehachapi. Similarly, against State averages of 22.4 and 22.1 for tuberculosis of other organs, the proportions per 1,000 total deaths were 19.6 in 1913 and 26.2 in 1912 for Los Angeles and 27.0 and 21.3, respectively, for the rest of Southern California.

Urban and Rural Districts.—The table which follows has been prepared to bring out the contrast between mortality conditions in urban and rural districts, figures like those in preceding tables being given here for the metropolitan area, comprising San Francisco and the other bay counties (Alameda, Contra Costa, Marin, and San Mateo), as compared with the rural counties of Northern and Central California:

TABLE 4.—Deaths from Certain Principal Causes, with Proportion per 1,000 Total Deaths, for Metropolitan Area and Rural Counties of Northern and Central California: 1913 and 1912.

Cause of death	Northern and Central California		Metropolitan area		Rural counties

Diseases of early infancy	37.0	35.8	33.1	38.1	40.5	33.8
Suicide	23.8	24.0	29.7	27.7	18.5	20.7
Other violence	83.8	85.3	68.9	68.7	97.0	100.0
All other causes	45.1	47.2	38.6	40.5	51.0	53.4

There were not far from the same number of deaths each year in the metropolitan area as in all the other counties north of Tehachapi, the totals being respectively, 11,604 and 12,965 in 1913, and 11,236 and 12,446 in 1912. However, there are marked differences between the whole urban area and the rural districts in the distribution of deaths by main causes.

The proportion per 1,000 total deaths for typhoid fever was only 10.3 in 1913 and 9.5 in 1912 for the metropolitan area as compared with 15.0 and 17.0 for the rural counties. Similarly, the proportions for malarial fever were only 1.0 and 1.3 for the urban territory against 4.7 and 5.9 for the country districts. The proportions for scarlet fever were likewise only 1.7 and 0.2 for the urban territory as compared with 3.5 and 1.2 for the rural sections.

The proportions for whooping-cough were 1.8 and 4.6 for the metropolitan area against 2.7 and 4.4 for the rural counties, and the proportions for measles were 1.0 and 5.4 for the former against 3.6 and 5.2 for the latter. The proportions for both whooping-cough and measles were much less for the metropolitan area than for the rural counties in 1913, though about the same for each population group in 1912.

However, the proportion for diphtheria and croup was greater in both 1913 and 1912 for the urban territory, 5.2 each year, than for the rural territory, 4.2 and 3.1.

The proportion of deaths from diseases of the circulatory system (heart disease, etc.) is very much higher for the urban territory than for the country districts, the proportions per 1,000 total deaths for the former in 1913 and 1912 being as great as 197.6 and 198.4 against only 152.9 and 169.5 for the latter. The proportions for Bright's disease and nephritis, which often occur with heart disease, were also generally higher for the metropolitan area (61.3 and 54.4) than for the rural counties (57.5 and 55.7).

Other important cases in which the proportions per 1,000 total deaths were higher in both 1913 and 1912 for the urban territory than for the country districts are as follows: Cancer, 80.8 and 73.8 against 56.8 and 54.0; pneumonia and broncho-pneumonia, 87.3 and 85.1 against 75.0 and 84.9; diseases of the digestive system other than diarrhea and enteritis, 57.4 and 62.3 against 54.1 and 52.6; and suicide, 29.7 and 27.7 against 18.5 and 20.7.

On the other hand, the proportions were higher in both 1913 and 1912 for the rural counties than for the metropolitan area in the following notable instances: Diseases of the nervous system other than meningitis, 91.6 and 80.5 as compared with 77.1 and 73.5; diarrhea and enteritis (under 2 years), 34.7 and 29.8 as compared with 25.4 and 27.9; violence other than suicide (*i. e.*, sundry accidents), 97.0 and 100.0 as compared with 68.9 and 68.7; and miscellaneous causes (including "old age"), 51.0 and 53.4 as compared with 38.6 and 40.5.

In short, there are relatively more deaths in the metropolitan area than in the rural counties north of Tehachapi from heart disease, Bright's disease, cancer, pneumonia, digestive ailments (except diarrhea), and suicide, as well as from diphtheria and croup. However, there is a relatively greater mortality in country districts than in

the urban territory from diseases of the nervous system, infantile diarrhea, accidental violence, and "old age," as well as from typhoid fever, malarial fever, and scarlet fever, besides (generally) whooping-cough and measles.

Cities and Rest of State.—A further contrast between mortality conditions in city and country districts is available for 1913 and 1912 by comparing deaths in chartered cities as a class with deaths in all the rest of the State. There were thirty-two freeholders' charter cities in 1913 and thirty-one in 1912, the additional city being San Rafael. Table 5 on the following page shows for 1913 and 1912 the number of deaths from certain principal causes, as well as the proportion from each cause per 1,000 total deaths, for chartered cities as a class and for the rest of the State as a whole.

TABLE 5.—Deaths from Certain Principal Causes, with Proportion per 1,000 Total Deaths, for Freeholders' Charter Cities and Rest of State: 1913 and 1912.

Cause of death	California		Freeholders' charter cities		Rest of state

*Less than one tenth of 1 per thousand.

Of the 38,599 deaths in California in 1913, altogether 23,519, or 60.9 per cent, occurred in the thirty-two freeholders' charter cities and 15,080, or 39.1 per cent, occurred in all the rest of the State. Of the 36,709 deaths in 1912, the number within the thirty-one chartered cities was 22,322, or 60.8 per cent, and the number outside these cities was 14,387, or 39.2 per cent. Each year about three fifths of the deaths in California occurred within chartered cities and about two fifths outside them.

The proportion per 1,000 total deaths for typhoid fever was only 11.1 in 1913 and 10.8 in 1912 for chartered cities as a class against 11.5 and 14.7, respectively, for all the rest of the State as a whole. The proportions were also less for chartered cities than for the rest of California for malarial fever, 1.0 and 1.4 against 3.5 and 4.9; for scarlet fever, 1.7 and 0.6 against 3.1 and 1.5; for whooping-cough, 3.0 and 5.2 against 3.8 and 5.3; and (generally) for measles, 3.3 and 3.9 against 5.0 and 3.2.

Relatively more deaths occur within cities than outside them, however, from diseases of the circulatory system (heart disease, etc.). The proportions per 1,000 total deaths in 1913 and 1912, respectively, were 173.5 and 179.2 for chartered cities as compared with 145.9 and 165.1 for the rest of the State. For Bright's disease and nephritis, often reported with heart disease, the proportions were likewise generally higher within chartered cities, 64.2 and 59.5, than outside them, 58.4 and 59.5.

The proportions per 1,000 total deaths were also higher in 1913 as well as 1912 for chartered cities than for the rest of California in the following important cases: Cancer, 75.3 and 71.2 against 52.6 and 49.8; pneumonia and broncho-pneumonia, 77.9 and 81.5 against 73.3 and 79.9; diseases of the digestive system other than diarrhea and enteritis, 55.6 and 59.7 against 45.6 and 45.0; suicide, 23.3 and 24.3 against 19.2 and 18.1; and diphtheria and croup, 5.4 and 4.4 against 3.8 and 4.2.

On the other hand, the proportions were higher in both 1913 and 1912 outside cities than within them in certain notable instances, as follows: Diseases of the nervous system other than meningitis, 90.1 and 86.5 as compared with 83.2 and 76.8; diarrhea and enteritis (under 2 years), 39.8 and 32.5 as compared with 28.5 and 26.4; violence other than suicide (*i. e.*, various accidental injuries), 101.8 and 98.4 as compared with 67.9 and 68.9; and miscellaneous causes (including "old age"), 50.0 and 48.0 as compared with 43.4 and 44.4.

In other words, there are relatively more deaths within chartered cities than outside them from heart disease, Bright's disease, cancer, pneumonia, digestive ailments (except diarrhea), and suicide, besides diphtheria and croup among epidemic diseases. Mortality is relatively greater outside cities than within them, however, from diseases of the nervous system (except meningitis), diarrhea and enteritis (under 2 years), accidental injuries, and "old age," as well as from typhoid fever, malarial fever, scarlet fever, and whooping cough, besides (generally) measles of the epidemic diseases.

Individual Counties.—Preceding figures for deaths in main and minor geographic divisions in 1913 and 1912 are supplemented by extended tables giving similar figures for the fifty-eight counties in both years. The counties are arranged in geographic order, by minor geographic

divisions, but for the sake of ready reference the counties in each group are listed alphabetically. The grouping of the counties according to geographic location facilitates the analysis of mortality conditions in any minor geographic division by immediate reference to the counties included in the group.

These tables, because of their length, are placed with other general tables toward the end of the section on deaths, but for convenience in reference the titles are given here as follows:

TABLE 29.—Deaths from certain principal causes, with proportion per 1,000 total deaths, for counties arranged geographically: 1913.

TABLE 30.—Deaths from certain principal causes, with proportion per 1,000 total deaths, for counties arranged geographically: 1912.

Individual Cities.—Corresponding figures for individual chartered cities appear in Tables 31 and 32, *post*. In these tables the cities are arranged in rough geographic order to facilitate comparisons between neighboring cities or between cities in the same portion of the State.

The tables for individual chartered cities in 1913 and 1912, like similar tables for counties, appear with other general tables toward the close of the section on deaths. However, the titles of these city tables are here given as follows:

TABLE 31.—Deaths from certain principal causes, with proportion per 1,000 total deaths, for freeholders' charter cities arranged geographically: 1913.

TABLE 32.—Deaths from certain principal causes, with proportion per 1,000 total deaths, for freeholders' charter cities arranged geographically: 1912.

TUBERCULOSIS IN CALIFORNIA.

The State.—Tuberculosis is the leading single cause of death in California, being the cause of about one seventh of all deaths. Of 38,599 deaths reported to the State Bureau of Vital Statistics for 1913, altogether 5,402 were from tuberculosis, and of 36,709 deaths reported for 1912, some 5,128 were also from the "great white plague," the per cent being 14.0 each year against the average of 14.6 for the five years last past.

For comparison it may be noted that in 1913 and 1912, respectively, the totals for all diseases of the circulatory system (heart disease, etc.) were 6,281 and 6,376; for diseases of the respiratory system (pneumonia, etc.) were only 3,806 and 3,840; for diseases of the nervous system were only 3,720 and 3,267; and for diseases of the digestive system were only 3,634 and 3,395.

From tuberculosis of the lungs there were 4,536 deaths in 1913 as compared with 4,316 in 1912, while from tuberculosis of other organs there were 866 deaths in 1913 against 812 in 1912. The distribution

of deaths from tuberculosis of the lungs and other organs was as follows for California in 1913 and 1912, respectively:

	1913	1912
Deaths from tuberculosis (all forms)-----	5,402	5,128
Tuberculosis of the lungs-----	4,536	4,316
Tuberculosis of other organs-----	866	812
Acute miliary tuberculosis-----	108	130
Tuberculous meningitis-----	323	291
Abdominal tuberculosis-----	234	222
Pott's disease-----	49	42
White swellings-----	21	11
Tuberculosis of other organs-----	70	64
Disseminated tuberculosis-----	61	52

The proportion per 1,000 total deaths in 1913 was 117.5 for tuberculosis of the lungs and 22.4 for tuberculosis of other organs, or 139.9 for all forms of this disease. Of each 1,000 deaths in California in 1912, there were 117.6 from tuberculosis of the lungs and 22.1 from tuberculosis of other organs, or 139.7 from tuberculosis of all forms. For 1909 to 1913, moreover, the annual average proportion per 1,000 total deaths was 124.5 for pulmonary tuberculosis and 21.7 for other forms, or altogether 146.2 for all forms.

For an estimated State population of 2,671,491 in 1913 the death rate per 100,000 population is 169.8 for tuberculosis of the lungs and 32.4 for tuberculosis of other organs, or altogether 202.2 for all forms of this disease. Similarly, for an estimated population of 2,579,874 in 1912 the death rate per 100,000 is 167.3 for pulmonary tuberculosis and 31.5 for other forms, or 198.8 for all kinds. In short, the tuberculosis death rate per 100,000 population was no less than 202.2 in 1913 and 198.8 in 1912, the annual average being as great as 202.4 for the five year period, 1909 to 1913.

The general death rate per 1,000 population was 14.4 for California in 1913 and 14.2 in 1912, the rates being swollen greatly by deaths from tuberculosis. It will be shown that many deaths from tuberculosis in California occur among persons of short residence in the State, who evidently came here when too far gone with the disease to be cured. It is also quite likely that many other cases arising here are directly due to this imported infection.

Geographic Divisions.—Southern California is an especially popular resort for consumptives, and here nearly one fifth of all deaths are due to tuberculosis. The table which appears below shows the number and per cent of deaths from tuberculosis for the several geographic divisions of the State in both 1913 and 1912, together with the annual average per cents for 1909 to 1913 as additional data.

TABLE 6.—Number and Per Cent of Deaths from Tuberculosis, for Geographic Divisions:* 1913 and 1912.

Geographic division	Deaths		Tuberculosis				Annual average per cent: 1909 to 1913
	1913	1912	Number		Per cent		
			1913	1912	1913	1912	
THE STATE -----	38,599	36,709	5,402	5,128	14.0	14.0	14.6
<i>Northern California</i> -----	4,267	4,029	465	462	10.9	11.5	11.3

Interior counties -----	8,347	7,959	1,058	934	12.7	11.7	12.6
Metropolitan area -----	11,604	11,236	1,396	1,391	12.0	12.4	12.6
Rural counties -----	12,965	12,446	1,624	1,459	12.5	11.7	12.7

*For list of counties included in geographic divisions, see page 26.

Table 6 shows that for Southern California the per cent of total deaths from tuberculosis was 17.0 in 1913 and 17.5 in 1910 against the annual average of 18.6 for 1909 to 1913. Thus nearly one fifth of all deaths are due to tuberculosis in Los Angeles and the other counties south of Tehachapi, the annual average per cent for the five years last past being practically the same (18.6 against 18.5) for Los Angeles alone as for all the rest of Southern California.

North of Tehachapi, however, only about one eighth of all deaths are from tuberculosis, the per cents for Northern and Central California together being 12.3 in 1913 and 12.0 in 1912 against the average of 12.6 for 1909 to 1913. The annual average per cent in the five year period just ended was 13.0 for Central California and only 11.3 for Northern California, the prevalence of tuberculosis decreasing toward the north. The per cent was below the State figure for both 1913 and 1912, as well as below the average for all California in 1909 to 1913, for every main and minor geographic division north of Tehachapi, the interior counties of Northern California showing the minimum per cents, 10.1 in 1913 and 10.7 in 1912, as well as the lowest average, 10.7, for the five years last past.

The per cent of deaths from tuberculosis is virtually the same for the metropolitan area as for the rural counties north of Tehachapi, the annual average in 1909 to 1913 being 12.6 for the former against 12.7 for the latter. Within the metropolitan area, however, the annual average per cent is somewhat greater for San Francisco, 13.0, than for the other bay counties, 12.2.

Cities.—The following table gives the number and per cent of deaths from tuberculosis in 1913 and 1912, and in addition the annual average

per cents for 1909 to 1913, for chartered cities in contrast with the rest of the State, as well as for the individual cities:

TABLE 7.—Number and Per Cent of Deaths from Tuberculosis, for Individual Cities and Rest of State: 1913 and 1912.

City	Deaths		Tuberculosis				Annual average per cent: 1909 to 1913

Rest of State.....	15,080	14,387	2,164	2,030	14.4	14.1	14.9

*Per cent for single year, 1913. †Average for two years, 1912 and 1913. §Average for three years, 1911 to 1913.

In the thirty-two freeholders' charter cities in 1913 the deaths from tuberculosis numbered 3,238, or 13.8 per cent, and in the thirty-one chartered cities in 1912 the deaths from this disease totaled 3,098, or 13.9 per cent. In the State outside cities the deaths from tuberculosis were 2,164, or 14.4 per cent of all, in 1913 and 2,030, or 14.1 per cent, in 1912.

For chartered cities as a class the per cent of deaths from tuberculosis was slightly less in 1913 than in 1912, 13.8 against 13.9, while for the State outside these cities the per cent was slightly greater in 1913 than in 1912, 14.4 as compared with 14.1. Moreover, the annual average per cent of deaths from tuberculosis in 1909 to 1913 was slightly less for chartered cities, 14.5, than for all the rest of the State, 14.9.

From the annual average per cents for 1909 to 1913 it appears that the mortality from tuberculosis was relatively greatest in the following cities: San Bernardino, 26.7; Riverside, 21.1; Pasadena, 20.4; Los Angeles, 18.1; Stockton, 16.9; and San Diego, 16.3. On the other hand, the annual average per cent of deaths from tuberculosis in the five year period was only 8.2 for Richmond, 8.8 for Long Beach, 9.3 for Berkeley, 9.4 for Santa Monica, 9.9 for Alameda, 10.0 for Palo Alto, 10.1 for Salinas, 10.5 for Vallejo, 10.7 for Santa Cruz, 11.2 for Oakland, and 11.3 for Fresno.

Length of Residence (Geographic Divisions).—The heavy mortality from tuberculosis in California is due largely to the immigration of people so badly afflicted with this disease that they can not recover, even under the most favorable climatic conditions, though they may lengthen their lives somewhat by coming to this land of sunshine. For it appears that many who died of tuberculosis in California had been residents of the Golden State for only a short time. This is shown for the several geographic divisions in 1913 and 1912 in the following table, giving numbers and per cents by length of residence:

TABLE 8.—Deaths from Tuberculosis Classified by Length of Residence in California, with Per Cents, for Geographic Divisions: 1913 and 1912.

Geographic division	Total	Length of residence					Per cent				
		Under 1 year	1 to 9 years	10 years and over	Life	Unknown	Under 1 year	1 to 9 years	10 years and over	Life	Unknown

Analysis of the per cents in Table 8, for 1913 and 1912, is facilitated by the annual averages for 1909 to 1913 presented in the following tabular statement for selected geographic divisions:

Geographic division.	Annual average per cent of deaths from tuberculosis: 1909 to 1913				
	Under 1 year	1 to 9 years	10 years and over	Life	Unknown
THE STATE.....	9.2	25.0	24.9	29.0	11.9
<i>Northern and Central California</i>	3.5	14.6	28.4	38.8	14.7
Metropolitan area	3.1	13.0	26.7	41.5	15.7
San Francisco	3.0	10.7	24.9	40.7	20.7
Other bay counties.....	3.3	16.7	29.5	42.8	7.7
Rural counties	4.0	15.9	30.0	36.4	13.7
<i>Southern California</i>	16.8	39.0	20.2	15.8	8.2
Los Angeles	17.1	40.0	20.3	14.2	8.4
Other counties	16.4	37.0	19.8	19.2	7.6

It appears from Table 8 and the tabular statement presented herewith that the per cent of tuberculosis victims in California who were natives of the State, having been here for life, was only 28.1 in 1913 and 27.8 in 1912, against the average of 29.0 for 1909 to 1913. The per cents for those born elsewhere who were residents of 10 years' standing were 25.6 and 25.7 in 1913 and 1912 against the average of 24.9, while the per cents for those who had lived in California only from 1 to 9 years were 27.0 and 26.0 against the average of 25.0. The per cent of all deaths from tuberculosis occurring among persons who had been in the State less than a year was 10.0 in 1913 and 9.8 in 1912, as compared with the average of 9.2 for 1909 to 1913. The length of residence was unknown for 9.3 per cent of the tuberculosis victims in 1913 and for 10.7 per cent in 1912, against the annual average of 11.9 for the five year period.

Reference to the annual average per cents for 1909 to 1913 in the preceding tabular statement shows that the per cent of tuberculosis victims who were natives of the State was no less than 38.8 for Northern and Central California against merely 15.8 for the territory south of Tehachapi. The average per cent of tuberculosis victims born in the State was 41.5 for the metropolitan area as compared with 36.4 for the rural counties north of Tehachapi, but was only 40.7 for the metropolis proper against 42.8 for the suburban counties.

The average per cent of deaths from tuberculosis among residents of 10 years' standing was 28.4 for the territory north of Tehachapi against only 20.2 for that to the south. The average per cent was 26.7 for the metropolitan area against 30.0 for the rural counties of Northern and Central California, and was 24.9 for San Francisco against 29.5 for the other bay counties.

In 1909 to 1913, by the annual averages, altogether 34.2 of the deaths from tuberculosis in California as a whole occurred among residents of less than 10 years' standing, 25.0 per cent having lived here from 1 to 9 years and 9.2 per cent under 1 year.

The average per cent for residents of less than 10 years' standing is above the State figure, 34.2, only for Southern California, 55.8, the per cent being 57.1 for Los Angeles and 53.4 for the other counties south of Tehachapi. On the other hand, the corresponding average per cent was only 18.1 for the territory north of Tehachapi, being only 16.1 for the metropolitan area against 19.9 for the rural counties and merely 13.7 for San Francisco against 20.0 for the suburban counties.

It seems, therefore, that in Southern California, where nearly one fifth of all deaths are from tuberculosis, considerably more than half of these deaths occurred among persons who had been in the State less than 10 years when they died. In fact, about one sixth of all tuberculosis victims south of Tehachapi had resided in California less than a year, the annual average per cent in 1909 to 1913 being 17.1 for Los Angeles and 16.4 for the other counties, or 16.8 for Southern California as a whole.

Length of Residence (Cities).—The preceding figures on length of residence for geographic divisions in 1913 and 1912 are supplemented by those in the following table for the several chartered cities in contrast with the rest of the State, the cities being arranged according to geographic location. The absolute figures are shown for each of the thirty-two chartered cities in 1913 and the thirty-one in 1912, but the per cents have been calculated only for those cities reporting at least 25 deaths from tuberculosis in either year, respectively.

TABLE 9.—Deaths from Tuberculosis Classified by Length of Residence in California, with Per Cents, for Individual Cities and Rest of State: 1913 and 1912.

City	Total	Length of residence					Per cent

*Per cents not shown for totals less than 25.

As before, analysis of the per cents in this table, for 1913 and 1912, is aided by the annual averages for 1909 to 1913 presented herewith for chartered cities in contrast with the rest of the State as well as for selected individual cities, *i. e.*, all having at least 25 deaths from tuberculosis in each of the five years last past.

City	Annual average per cent of deaths from tuberculosis: 1909 to 1913				
	Under 1 year	1 to 9 years	10 years and over	Life	Unknown
CALIFORNIA	9.2	25.0	24.9	29.0	11.9
Freeholders' charter cities	9.4	26.1	24.9	28.1	11.5
Rest of State	8.9	23.3	24.9	30.3	12.6
Selected cities:					
<i>Northern and Central California.</i>					
San Francisco	3.0	10.7	24.9	40.7	20.7
Alameda	2.2	15.8	34.6	45.5	1.9
Berkeley	5.5	20.5	24.6	48.3	1.1
Oakland	3.1	18.0	30.0	41.1	7.8
San Jose	4.3	15.2	23.3	48.6	2.6
Fresno	8.2	23.2	28.8	31.1	8.7
Sacramento	3.9	16.7	25.5	34.8	19.1
Stockton	1.2	18.4	42.4	28.5	9.5
<i>Southern California.</i>					
Los Angeles	15.9	41.1	22.1	13.2	7.7
Pasadena	19.1	47.3	23.8	9.0	0.8
Riverside	18.0	41.9	18.5	18.4	3.2
San Bernardino	15.2	42.2	16.9	8.6	17.1
San Diego	21.3	37.3	24.6	12.9	3.9

It appears from this tabular statement that the distribution of tuberculosis deaths according to length of residence in California is not far from the same for chartered cities as for all the rest of the State. The annual average per cent in 1909 to 1913 for native Californians was 28.1 for chartered cities against 30.3 for the rest of the State. For residents of 10 years' standing and over the average per cent was exactly the same, 24.9, within cities as outside them, while for residents of less than 10 years' standing the per cent was altogether 35.5 for cities as a class against 32.2 for the rural territory as a whole. The average per cent of unknown length of residence was 11.5 for chartered cities as compared with 12.6 for the rest of the State.

Several of the cities in Southern California show a large proportion of deaths from tuberculosis among persons who had lived in California a comparatively short time. For residents of less than 10 years' standing the annual average per cent in 1909 to 1913 totaled as much as 66.4 for Pasadena, 59.9 for Riverside, 58.6 for San Diego, 57.4 for San Bernardino, and 57.0 for Los Angeles.

Moreover, the annual average per cent of tuberculosis victims who had lived in California less than a year was quite high in cities of Southern California, as follows: San Diego, 21.3; Pasadena, 19.1; Riverside, 18.0; Los Angeles, 15.9; and San Bernardino, 15.2.

Southern California.—In fact, many who died of tuberculosis in Southern California cities or in the whole territory south of Tehachapi had lived in the State only a few months. This appears clearly from the following table giving numbers and per cents by length of residence in months for Southern California in 1913 and 1912:

TABLE 10.—Deaths from Tuberculosis Classified by Length of Residence (in Months), with Per Cents, for Southern California: 1913 and 1912.

Geographic division	Length of residence									
	Total under 1 year		Under 1 month		1 to 2 months		3 to 5 months		6 to 11 months	
	1913	1912	1913	1912	1913	1912	1913	1912	1913	1912
Numbers.										
<i>Southern California</i> -----	425	383	51	42	105	94	118	107	151	140
Los Angeles -----	277	270	33	29	56	70	79	70	109	101
Other counties --	148	113	18	13	49	24	39	37	42	39
Per Cents.										
<i>Southern California</i> -----	17.8	16.8	2.1	1.8	4.4	4.1	5.0	4.7	6.3	6.2
Los Angeles -----	16.9	17.1	2.0	1.9	3.4	4.4	4.8	4.4	6.7	6.4
Other counties --	19.9	16.1	2.4	1.8	6.6	3.4	5.2	5.3	5.7	5.6

Table 10 for 1913 and 1912 may be supplemented by the annual average per cents for 1909 to 1913 presented in the following tabular statement:

Geographic division.	Annual average per cent of deaths from tuberculosis: 1909 to 1913				
	Total under 1 year	Under 1 month	1 to 2 months	3 to 5 months	6 to 11 months
<i>Southern California</i> -----	16.8	1.8	4.5	4.8	5.7
Los Angeles -----	17.1	1.8	4.3	4.9	6.1
Other counties -----	16.4	2.0	4.8	4.5	5.1

From the supplementary annual average per cents for 1909 to 1913 it appears that of all who died of tuberculosis in Southern California 1.8 per cent had been in the State less than a month, altogether 6.3 per cent less than three months, and altogether 11.1 per cent less than six months. Of all the tuberculosis victims in Los Angeles, an average of 11.0 per cent had resided in California less than half a year, the corresponding figure being 11.3 for the other counties south of Tehachapi.

Month of Death.—The following table gives the number and per cent of deaths occurring each month from tuberculosis for California as a whole in both 1913 and 1912, together with the corresponding per cents for 1911 and 1910 and annual average per cents for the four year period, 1910 to 1913:

TABLE 11.—Number and Per Cent of Deaths Occurring Each Month from Tuberculosis, for California: 1913 and 1912.

Month	Deaths		Tuberculosis				Corresponding per cent		Annual average per cent: 1910 to 1913
	1913	1912	Number		Per cent		1911	1910	
			1913	1912	1913	1912			
STATE TOTAL	38,599	36,709	5,402	5,128	14.0	14.0	15.0	15.0	14.5
January	4,146	3,437	525	474	12.7	13.8	15.0	16.0	14.4
February	3,165	3,104	468	489	14.8	15.8	14.7	17.2	15.6
March	3,408	3,409	532	502	15.6	14.7	17.2	16.6	16.0
April	3,238	3,046	494	474	15.3	15.6	16.9	16.5	16.1
May	3,258	3,044	445	497	13.7	16.3	17.9	16.2	16.0
June	3,089	2,788	456	372	14.8	13.3	15.2	15.0	14.6
July	3,075	2,992	414	385	13.5	12.9	15.4	13.3	13.8
August	2,948	2,697	378	373	12.8	13.8	14.0	14.7	13.8
September	2,809	2,656	405	316	14.4	11.9	14.9	12.9	13.5
October	3,026	2,971	434	344	14.3	11.6	12.8	12.3	12.8
November	2,988	3,019	407	409	13.6	13.5	12.6	15.2	13.7
December	3,449	3,546	444	493	12.9	13.9	13.6	14.2	13.7

It appears from Table 11 that the per cent of deaths from tuberculosis was highest for March (15.6) in 1913, for May (16.3 and 17.9) in both 1912 and 1911, and for February (17.2) in 1910. From the annual average per cents for the whole four years, 1910 to 1913, it seems that the period of greatest mortality from tuberculosis covers the months of February, March, April and May, while the time when deaths from this disease are relatively least numerous extends over the months of August, September, October, and November. The high mortality from tuberculosis in California in the spring months may be ascribed in part to deaths occurring at this season among consumptives who came from the east in earlier winter months only to succumb finally to their dread malady after a comparatively short residence here.

Conclusion.—These figures give only a minimum statement of the extent to which the general death rate of California is swollen by the deaths of persons who were stricken with tuberculosis elsewhere, and who simply came here in the hope of recovering, or with the expectation of at least lengthening their lives in the glorious climate of the Golden State. The statistics cover only the deaths that occur among these recent residents, in many cases quite soon after their arrival in this land of sunshine. No data are available to tell what proportion of deaths

from tuberculosis among native Californians and old-time residents are directly due to imported infection by the presence here of sick people from other places. It is quite evident, however, that the death rate of California is swollen somewhat by the unhealthfulness, not of this State, but of other states, being increased, in fact, by the wide fame of California as a curative health resort. For the leading single cause of death the State is one which finds most of its victims among newcomers seeking restored health and finding longer, happier life in the balmy atmosphere of California.

DEATHS BY SEX, RACE, NATIVITY AND AGE PERIODS.

Sex.—The proportion of the sexes among decedents is given in the following table for the several geographic divisions in 1913 and 1912, both numbers and per cents being shown :

TABLE 12.—Deaths Classified by Sex, with Per Cents, for Geographic Divisions: 1913 and 1912.

Rural counties -----	12,965	12,446	8,403	8,123	4,562	4,323	64.8	65.3	35.2	34.7

Table 12 shows that of 38,599 persons who died in California in 1913, altogether 23,807 or 61.7 per cent were male, and 14,792 or 38.3 per cent were female. Similarly, among the 36,709 deaths in 1912, the males were 22,634 or 61.7 per cent, and the females were 14,075 or 38.3 per cent, the per cents by sex being the same for 1913 as for 1912. It may be added that for 1909 to 1913, the annual average per cent male was 62.0, and the per cent female was 38.0.

Each year the per cent male was highest for Northern California, 67.3 in 1913 and 68.0 in 1912, and next for Central California, 62.2 and 62.0, the per cent being 63.0 each year for Northern and Central California together against 59.3 in 1913 and 59.2 in 1912 for Southern California.

The per cents male were highest among minor geographic divisions for the interior counties of Northern California, 68.5 and 68.8; next

for the coast counties of Northern California, 66.1 and 67.3; and next for the interior counties of Central California, 65.0 and 65.9. The per cents male were lowest of all each year for Los Angeles, 58.1 and 57.8, and next for the bay counties other than San Francisco, 59.5 and 58.7.

The per cents male were much less for the metropolitan area (61.1 and 60.5) than for the rural counties north of Tehachapi (64.8 and 65.3), but were much greater for San Francisco (62.1 and 61.8) than for the group of other bay counties (59.5 and 58.7).

Sex and Cause of Death.—The following table shows for California as a whole in both 1913 and 1912, the deaths from certain principal causes classified by sex, with the per cents male and female:

TABLE 13.—Deaths from Certain Principal Causes Classified by Sex, with Per Cents, for California: 1913 and 1912.

Other violence.....	3,133	2,952	2,572	2,395	561	557	82.1	81.1	17.9	18.9
All other causes.....	1,774	1,682	1,021	950	753	732	57.6	56.5	42.4	43.5

This table shows that in both 1913 and 1912 the per cents male were highest for deaths from the following important causes: Suicide, 81.5 and 84.3; other violence, 82.1 and 81.1; typhoid fever, 67.4 and 68.1; tuberculosis of the lungs, 67.5 and 66.2; Bright's disease and nephritis, 64.3 and 64.4; and diseases of the circulatory system, 62.4 and 62.5.

On the other hand, except of course for deaths from childbirth, the per cent female was notably high each year only for whooping-cough, 59.4 in 1913 and 54.9 in 1912; cancer, 51.6 and 52.5; scarlet fever, 50.6 and 61.8; influenza, 50.9 and 52.1; and measles, 51.3 and 50.0. In all other cases the male decedents outnumbered the female, for some diseases greatly.

Race.—The race distribution of persons dying in the several geographic divisions in 1913 and 1912 is given in the following table, together with the per cent white among decedents:

TABLE 14.—Deaths Classified by Race, with Per Cent White, for Geographic Divisions: 1913 and 1912.

Geographic division	Deaths						Per cent white
	Total	White	Negro	Indian	Chinese	Japanese	
1913.

Interior counties	6,385	5,593	92	31	186	183	91.9
<i>Southern California</i>	13,027	12,483	281	30	74	159	95.8
Los Angeles	8,890	8,480	233	6	52	119	95.4
Other counties	4,137	4,003	48	24	22	40	96.8
<i>Northern and Central California</i>	23,682	22,249	262	139	667	365	93.9
Coast counties	15,723	14,903	153	63	424	170	94.8
Interior counties	7,959	7,346	104	71	243	195	92.3
Metropolitan area	11,236	10,643	141	5	350	97	94.7
Rural counties	12,446	11,606	121	134	317	268	93.3

It appears from Table 14 that in 1913 the white decedents numbered 36,501, or 94.6 per cent; the Chinese, 707; the Japanese, 613; the negroes, 595; and the Indians, 183. For 1912, the figures were as follows: White, 34,732, or 94.6 per cent; Chinese, 741; negro, 543. Japanese, 524; and Indian, 169.

The per cent white for California as a whole was exactly the same in both 1913 and 1912 as the annual average per cent of 94.6 for the five-year period, 1909 to 1913.

In 1913 and 1912, respectively, the per cents white were 95.5 and 95.8 for Southern California as compared with 94.1 and 93.9 for Northern and Central California together, the per cents for Northern California being 94.1 and 94.8 and for Central California being 94.0 and 93.8.

Among minor geographic divisions, the per cents white were above the State average of 94.6 each year in the following cases: Southern California outside Los Angeles, 96.1 and 96.8; coast counties of Northern California, 95.5 and 95.9; Los Angeles, 95.2 and 95.4; and bay counties other than San Francisco, 94.9 and 95.2. The per cent white was also above the average in 1913 alone for San Francisco, 95.2.

The per cent white was somewhat greater each year for the metropolitan area (95.1 and 94.7) than for the rural counties north of Tehachapi (93.1 and 93.3), but was not far from the same for the metropolis proper (95.2 and 94.4) as for the suburban counties (94.9 and 95.2).

Each year the deaths among Chinese occurred mainly in San Francisco and suburbs and in the interior counties of Central California. The deaths of Japanese occurred mainly in the interior counties of Central California and also in Los Angeles. The number of negro decedents was particularly great only for Los Angeles in both years. Almost two thirds of the Indian deaths each year were in Northern California.

Race and Cause of Death.—The following table shows for California in 1913 and 1912 the deaths from certain principal causes classified by race, as well as the per cent white in each case:

TABLE 15.—Deaths from Certain Principal Causes Classified by Race, with Per Cent White, for California: 1913 and 1912.

Bright's disease and nephritis -----	2,185	2,079	34	6	53	13	95.1
Childbirth -----	363	347	3	1		12	95.6
Diseases of early infancy -----	1,369	1,300	14	5	7	43	95.0
Suicide -----	803	758	9		16	20	94.4
Other violence -----	2,952	2,754	43	25	73	57	93.3
All other causes -----	1,682	1,615	21	12	15	19	96.0

The per cents white were above the general average of 94.6 in both 1913 and 1912 for deaths from the following important causes: Diphtheria and croup, 96.2 and 99.4; influenza, 98.2 and 95.9; measles, 94.8 and 97.0; cancer, 97.3 and 97.4; diseases of the circulatory system, 96.7 and 96.4; diseases of the nervous system other than meningitis, 96.2 and 96.6; Bright's disease and nephritis, 95.7 and 95.1; and diseases of the respiratory system other than pneumonia and broncho-pneumonia, 95.0 and 95.5.

The table shows, however, that the per cents white are very low indeed for typhoid fever, 91.5 and 91.6, as well as for tuberculosis, being 90.7 and 91.5 for the pulmonary form and 91.9 and 90.4 for all other kinds.

From further analysis of the figures in the table it appears that the proportion of Caucasians among all dying from typhoid fever is relatively small, because many deaths from this disease occur among the Japanese, and that the proportion of Caucasians among tuberculosis victims is relatively small, because the "great white plague" is especially fatal among Chinese and negroes.

Thus, the per cents Japanese among all dying from typhoid fever were no less than 5.7 in 1913 (25 among 436) and 5.5 in 1912 (25 among 454), while the per cent Japanese among all decedents was only 1.6 in 1913 and 1.4 in 1912.

Likewise, the Chinese and negroes are strongly represented among the victims of pulmonary tuberculosis in California, the Chinese who died from tuberculosis of the lungs numbering 180 in 1913 and 167 in 1912, and the negroes numbering, respectively, 130 and 110. While the per cent Chinese was only 1.8 in 1913 and 2.0 in 1912 among all decedents in California, the per cents Chinese were no less than 4.0 and 3.9 for deaths from tuberculosis of the lungs. Similarly, while the per cent negro was only 1.5 each year among all decedents, the per cent negro was as great as 2.8 in 1913 and 2.5 in 1912 among those dying from pulmonary tuberculosis alone. For tuberculosis of other organs than the lungs the per cents in 1913 and 1912, respectively, were notably high for Japanese, 3.4 and 3.9, as well as for negroes, 3.0 and 2.5.

Nativity of White Decedents.—In further analysis of deaths by race, the nativity of white decedents is worth considering. Accordingly, Table 16, which follows, has been prepared classifying white decedents as born in California, born in other states, foreign born, or nativity unknown.

TABLE 16.—White Decedents Classified by Nativity, with Per Cents, for Geographic Divisions: 1913 and 1912.

Geographic divisions	White decedents					Per cent			
	Total	Born in California	Born in other states	Foreign born	Unknown	Born in California	Born in other states	Foreign born	Unknown
1913.

Rural counties -----	11,606	3,395	4,369	3,476	366	29.3	37.6	29.9	3.2

Table 16 shows that of the 36,501 white decedents in California in 1913 and the 34,732 in 1912, those who were born in other states totaled 14,297 and 13,617; the foreign born numbered 11,404 and 10,936; the native Californians were 9,675 and 9,143; and the nativity was unknown for 1,125 in 1913 and 1,036 in 1912. The per cent distribution of white decedents by nativity was as follows for 1913 and 1912, respectively: Other states, 39.2 each year; foreign countries, 31.2 and 31.5; California, 26.5 and 26.3; and unknown, 3.1 and 3.0. It may be added that for 1909 to 1913 the annual average per cents were as follows: Other American, 38.1; foreign, 31.7; Californian, 27.2; and unknown, 3.0.

The proportion of California decedents born in other states is very high for the counties south of Tehachapi, especially Los Angeles, the per cents being 52.4 and 52.8 for Southern California in 1913 and 1912, and no less than 54.2 and 54.4, respectively, for Los Angeles. On the other hand, the per cents born in other states were only 31.5 and 31.6 in 1913 and 1912 for the counties north of Tehachapi, being 38.6 each year for Northern California and merely 30.0 and 30.1 for Central California. The per cents born elsewhere in the United States than California were much less for the metropolitan area (25.6 and 24.9) than for the rural counties (36.9 and 37.6), and were also much less for San Francisco (22.5 and 21.3) than for the other bay counties (30.4 each year).

The proportion of foreign born decedents is particularly great only in Central California, where the per cent foreign born was 36.5 in 1913 and 36.6 in 1912, the corresponding per cents being only 31.5 and 30.6 for Northern California and merely 23.7 and 24.2 for Southern California. The per cent foreign born was 35.6 each year for Northern and Central California together, being 41.5 in 1913 and 41.8 in 1912 for the urban territory as compared with 30.3 and 29.9 for the rural districts. The per cent of foreign born decedents in San Francisco was as great as 44.1 in 1913 and 44.5 in 1912 against 37.4 and 37.6, respectively, for the group of suburban counties.

The per cent of native Californians among white decedents was greatest each year for Central California, 30.8 in 1913 and 30.7 in 1912, and next for Northern California, 25.8 and 27.1, the per cents being 29.9 and 30.1 for both of these main divisions together in contrast with only 20.7 and 19.6 for Southern California as a whole. The per cents born in California were somewhat higher for the metropolitan area, 30.2 and 31.0, than for the rural counties north of Tehachapi, 29.6 and 29.3 in 1913 and 1912, respectively.

Nativity and Cause of Death.—The following table gives numbers and per cent showing the nativity of Caucasians dying from certain principal causes in California in 1913 and 1912:

TABLE 17.—White Decedents Dying from Certain Principal Causes Classified by Nativity, with Per Cents, for California: 1913 and 1912.

Cause of death	White decedents					Per cent			
	Total	Born in California	Born in other states	Foreign born	Unknown	Born in California	Born in other states	Foreign born	Unknown

The per cents born in California were above the general averages of 26.5 in 1913 and 26.3 in 1912 for deaths from the following important causes: Early infancy, 99.7 and 99.8; diarrhea and enteritis, under 2 years, 95.7 each year; whooping-cough, 86.7 and 88.8; measles, 80.1 and 83.9; diphtheria and croup, 71.0 and 73.9; scarlet fever, 60.0 and 53.0; meningitis, 55.4 and 60.4; tuberculosis other than pulmonary, 49.0 and 48.9; pneumonia and broncho-pneumonia, 35.8 and 34.6; typhoid fever, 32.1 and 38.2; malarial fever, 44.1 and 31.4; diarrhea and enteritis, 2 years and over, 30.3 and 27.0; and childbirth, 29.7 and 27.1.

The per cents born in other states were above the general average of 39.2 in both 1913 and 1912 for deaths from the following notable causes: Influenza, 57.4 and 58.6; diseases of the nervous system other than meningitis, 51.3 and 48.5; Bright's disease and nephritis, 49.2 and 52.0; cancer, 48.2 and 48.4; diseases of the circulatory system, 47.9 and 49.0; tuberculosis of the lungs, 41.5 and 42.2; diarrhea and enteritis, 2 years and over, 40.8 and 43.9; and general diseases other than tuberculosis and cancer, 39.9 and 40.9.

The per cents foreign born were above the general averages of 31.2 and 31.5 in 1913 and 1912, respectively, for deaths from the following causes: Diseases of the circulatory system, 40.9 and 40.3; cancer, 39.5 and 39.7; diseases of the respiratory system other than pneumonia, 36.4 and 41.4; Bright's disease and nephritis, 35.1 and 33.9; diseases of the nervous system other than meningitis, 34.2 and 34.3; suicide, 34.0 and 34.3; other violence, 33.2 and 33.6; and diseases of the digestive system other than diarrhea, 32.2 and 36.3.

The per cents of unknown nativity, 3.1 in 1913 and 3.0 in 1912 for all causes, are very high indeed for suicides, 14.8 and 16.4, as well as for deaths from other violence (drowning, accidental injuries, etc.), 11.1 and 11.0, respectively.

Age Periods.—The following table gives for the several geographic divisions in 1913 and 1912 the classification of decedents by nine selected age periods, representing in a rough way, infancy, childhood, youth, five productive ages, and old age:

TABLE 18.—Deaths Classified by Age Periods, for Geographic Divisions: 1913 and 1912.

Geographic divisions	Deaths									
	All ages	Under 1 year	1 to 4 years	5 to 14 years	15 to 24 years	25 to 34 years	35 to 44 years	45 to 54 years	55 to 64 years	65 years and over

Table 18 shows that of the 38,599 deaths in 1913 and the 36,709 in 1912, those occurring at the five productive age periods from 15 to 64 totaled altogether 19,957 and 19,186, respectively; those at the period of old age, 65 years and over, totaled 11,627 and 10,988; those in infancy or the first year of life numbered 4,336 and 3,942; those in childhood, 1 to 4 years, numbered 1,631 and 1,616; and those in youth, 5 to 14 years, numbered 1,048 and 977. The death totals at successive productive ages were as follows in 1913 and 1912, respectively: 15 to 24 years, 2,273 and 2,252; 25 to 34 years, 3,762 and 3,636; 35 to 44 years, 4,215 and 4,062; 45 to 54 years, 4,670 and 4,489; and 55 to 64 years, 5,037 and 4,747.

To facilitate comparisons between geographic divisions, the absolute numbers in the preceding table have been reduced to per cents, as given in Table 19.

TABLE 19.—Per Cent Distribution of Deaths, by Age Periods, for Geographic Divisions: 1913 and 1912.

Geographic division	Per cent of deaths

The per cent distribution given in Table 19 shows that the deaths at the five productive age periods from 15 to 64 years totaled 51.8 per cent of all in 1913 and 52.2 per cent in 1912; the deaths at the period of old age, 65 years and over, were 30.1 and 29.9, respectively; the deaths in infancy, or the first year of life, 11.2 and 10.8; the deaths in childhood, 1 to 4 years, 4.2 and 4.4; and the deaths in youth, 5 to 14 years, 2.7 each year. The per cent distribution of total deaths occurring at successive productive ages in 1913 and 1912, respectively, was as follows: 15 to 24 years, 5.9 and 6.1; 25 to 34 years, 9.8 and 9.9; 35 to 44 years, 10.9 and 11.1; 45 to 54 years, 12.1 and 12.2; and 55 to 64 years, 13.1 and 12.9.

The annual average per cents by five age periods covering the whole five years from 1909 to 1913, inclusive, were as follows: Productive ages, 52.4; old age, 29.5; infancy, 11.0; childhood, 4.3; and youth, 2.8.

Data on deaths by the whole nine age periods shown in Tables 18 and 19 are available only for the three years last past, the annual average per cents for 1911 to 1913 being as follows: Under 1 year, 10.8; 1 to 4 years, 4.2; 5 to 14 years, 2.7; 15 to 24 years, 6.2; 25 to 34 years, 9.9; 35 to 44 years, 11.2; 45 to 54 years, 12.1; 55 to 64 years, 13.0; and 65 years and over, 29.9.

It appears from Table 19, moreover, that 44.7 per cent of all deaths in 1913, and 45.0 per cent in 1912, occurred at under 45 years, so that 55.3 and 55.0 per cent of the deaths in 1913 and 1912, respectively, were at ages of 45 years and over.

Furthermore, the median age of California decedents, half the decedents being younger and half of them older than the age here given, was 49.36 years for 1913 and 49.16 years for 1912 as compared with 48.83 years for 1911.

Reference to Table 19 indicates, as to geographic divisions, that the per cent of deaths in infancy, or the first year of life, was very low in both 1913 and 1912 for Northern California, but was rather high for Central as well as Southern California, the per cents varying somewhat irregularly among the minor geographic divisions. The same observation may also be made as to the proportion of deaths in childhood, 1 to 4 years, while for deaths in youth, 5 to 14 years, no very marked variations appear between the several geographic divisions.

In regard to deaths at successive productive ages covering the whole period from 15 to 64 years it seems that at the ages of 15 to 24, as well as at 25 to 34 and 35 to 44 years, the per cent of deaths is relatively high for Southern California, probably on account of the great mortality from tuberculosis at these ages in this section. At 45 to 54 years as well as at 55 to 64 years, however, the per cent of deaths is particularly high for Central California, especially San Francisco. In fact, for the whole period from 35 to 64 years the per cents are much greater for the metropolitan area than for the rural counties north of Tehachapi.

The proportion of deaths at the period of old age, 65 years and over, is especially great only for Northern California among the main geographic divisions. However, among minor geographic divisions the per cent of deaths at 65 years and over was above the general average

each year not only for both the coast and interior counties of Northern California, but also for the coast counties of Central California and, in less degree, for the bay counties other than San Francisco.

Age and Cause of Death.—Tables 20 and 21 on the following pages show for California in 1913 and 1912 first, the number of deaths from certain principal causes classified by nine age periods, and second, the per cent distribution, by nine age periods, of the deaths from each of these causes.

TABLE 20.—Deaths from Certain Principal Causes Classified by Age Periods, for California: 1913 and 1912.

Cause of death	Deaths.							55 to 64 years	65 years and over

From Table 21, giving the per cent distribution, it appears that the per cents of deaths in infancy, or the first year of life, were above the general averages of 11.2 and 10.8 in 1913 and 1912, respectively, for deaths from the following causes: Early infancy (premature birth, congenital debility, etc.), 100.0 per cent each year; diarrhea and enteritis, under 2 years, 84.7 and 83.6; whooping cough, 51.5 and 57.0; measles, 28.6 and 21.6; meningitis, 20.3 and 23.1; and pneumonia and broncho-pneumonia, 19.5 and 18.3.

The per cents of deaths in childhood, 1 to 4 years, were above the general averages of 4.2 and 4.4 in 1913 and 1912 for deaths from the following causes: Measles, 53.2 and 56.0; scarlet fever, 51.8 and 50.0; diphtheria and croup, 50.5 and 49.4; whooping-cough, 43.0 and 37.3; meningitis, 24.4 and 27.9; diarrhea and enteritis, 2 years and over, 25.7 and 23.7; tuberculosis of other organs than the lungs, 20.7 and 19.0; diarrhea and enteritis, under 2 years, 15.3 and 16.4; malarial fever, 11.7 and 11.9; pneumonia and broncho-pneumonia, 9.0 and 9.6; other diseases of the respiratory system, 4.7 and 5.7; and miscellaneous violence, 5.3 and 5.5.

The per cent of deaths in youth, 5 to 14 years, was above the general average of 2.7 each year for deaths from the following causes: Diphtheria and croup, 38.2 in 1913 and 38.6 in 1912; scarlet fever, 37.6 and 32.3; meningitis, 15.8 and 12.0; tuberculosis other than pulmonary, 11.5 and 11.6; measles, 11.0 and 11.9; typhoid fever, 10.1 and 11.7; malarial fever, 9.1 and 8.9; miscellaneous violence (accidental injuries, etc.), 6.2 and 5.8; whooping-cough, 4.7 and 4.2; diarrhea and enteritis, 2 years and over, 7.0 and 3.1; other diseases of the digestive system, 3.8 and 3.4; and general diseases other than tuberculosis and cancer, 4.3 and 3.6.

The proportion of deaths occurring at 15 to 24 years exceeded the general averages of 5.9 and 6.1 for deaths from important causes as follows: Childbirth, 26.8 and 29.8; typhoid fever, 24.8 and 26.9; tuberculosis of the lungs, 15.9 and 16.2; tuberculosis of other organs, 12.8 and 14.1; miscellaneous violence, 13.7 and 13.4; suicide, 9.7 and 8.2; and diseases of the digestive system other than diarrhea, 5.9 and 6.7.

The proportion of deaths occurring at 25 to 34 years surpassed the general averages of 9.8 and 9.9 for deaths from the following important causes: Childbirth, 47.9 and 42.7; tuberculosis of the lungs, 26.2 and 26.3; typhoid fever, 25.5 and 23.3; suicide, 22.7 and 24.4; other violence, 20.2 and 21.1; and tuberculosis other than pulmonary, 15.4 and 18.1.

The proportion of deaths occurring at 35 to 44 years exceeded the general averages of 10.9 and 11.1 for deaths from the following causes: Childbirth, 25.3 and 27.5; suicide, 24.8 and 24.6; pulmonary tuberculosis, 21.8 and 22.0; miscellaneous violence, 16.4 and 17.1; typhoid fever, 16.3 and 13.4; general diseases other than tuberculosis and cancer (*i. e.*, diabetes, alcoholism, etc.), 15.1 and 15.4; diseases of the digestive system other than diarrhea, 12.5 and 13.6; and tuberculosis other than pulmonary, 11.9 and 12.7.

The proportion of deaths occurring at 45 to 54 years surpassed the general averages of 12.1 and 12.2 for deaths from the following important causes: Cancer, 21.1 and 20.4; suicide, 19.1 and 21.2; general diseases other than tuberculosis and cancer, 17.7 and 17.8; diseases of the digestive system other than diarrhea, 16.2 and 16.4; pulmonary tuberculosis, 15.2 and 15.8; Bright's disease and nephritis, 14.7 and

16.2; diseases of the nervous system other than meningitis, 14.4 and 13.3; and miscellaneous violence, 13.6 and 13.7.

The proportion of deaths occurring at 55 to 64 years exceeded the general averages of 13.1 and 12.9 for deaths from the following causes: Cancer, 25.8 and 26.7; Bright's disease and nephritis, 18.8 and 20.0; diseases of the circulatory system, 18.4 and 18.2; diseases of the nervous system other than meningitis, 18.2 and 17.6; general diseases other than tuberculosis and cancer, 17.6 and 16.2; and diseases of the digestive system other than diarrhea, 14.7 and 16.4.

The per cents of deaths at the period of old age, 65 years and over, were above the general averages of 30.1 and 29.9 in 1913 and 1912 for deaths from the following important causes: Influenza, 61.8 and 64.4; miscellaneous causes, including "old age" or senility, 57.6 and 57.2; diseases of the circulatory system, 55.6 and 54.9; diseases of the respiratory system other than pneumonia, 53.0 and 53.4; diseases of the nervous system other than meningitis, 49.3 and 46.0; Bright's disease and nephritis, 44.8 and 42.7; diarrhea and enteritis, 2 years and over, 37.4 and 39.0; and cancer, 37.3 and 36.9.

MARITAL CONDITION OF DECEDENTS.

Geographic Divisions.—Table 22 presents, by numbers and per cents, the marital condition of male and female decedents aged 15 years and over for the several geographic divisions in 1913 alone, children under 15 years of age being excluded from the analysis of decedents according to marital condition.

TABLE 22.—Deaths of Males and Females 15 Years and Over Classified by Marital Condition, with Per Cents, for Geographic Divisions: 1913.

Sex and geographic division	Deaths 15 years and over						Per cent				
	Total	Single	Married	Widowed	Divorced	Unknown	Single	Married	Widowed	Divorced	Unknown
Males.

Exclusive of children under 15 years of age, the male decedents in California in 1913 totaled 19,946, and the females 11,638. The marital condition of the male decedents aged 15 years and over was: Single, 6,448; married, 8,837; widowed, 2,966; divorced, 290; and unknown, 1,405. For the female decedents 15 years and over the distribution was: Single, 1,427; married, 5,579; widowed, 4,322; divorced, 150; and unknown, 160. The per cent distribution by marital condition for male and female decedents, respectively, was as follows: Single, 32.3 and 12.3; married, 44.3 and 47.9; widowed, 14.9 and 37.1; divorced, 1.5 and 1.3; and unknown, 7.0 and 1.4. The proportion married was not far from the same among men as among women (44.3 against

47.9). However, the per cent single was much greater among men than among women (32.3 against 12.3) while, on the other hand, the per cent widowed was much less for men than for women (14.9 against 37.1).

The per cent single among men was much higher for the territory north of Tehachapi than for that to the south, being 37.1 for Northern California and 34.4 for Central California or 34.9 for both together, as compared with only 27.4 for Southern California. The per cent for single men was somewhat less for the metropolitan area (33.5) than for the rural counties north of Tehachapi (36.1), but was much greater for San Francisco (36.7) than for the other bay counties (28.0).

The per cent single among women varies comparatively little for various geographic divisions, being only slightly greater for Southern California (12.7) than for Northern and Central California together (12.0), for the metropolitan area (12.1) than for the rural counties north of Tehachapi (11.8), and for San Francisco (12.8) than for the adjacent suburban counties (11.1).

The proportion of married men among decedents was considerably greater for the territory south of Tehachapi than for that to the north, the per cent being 50.6 for Southern California against 42.3 for Central California and only 36.0 for Northern California, or 41.1 for all north of Tehachapi. The per cent of married men was 44.0 for the metropolitan area against only 38.6 for the rural counties of Northern and Central California. However, the per cent was merely 40.8 for San Francisco as compared with 49.2 for the adjoining bay counties.

The proportion of married women varies relatively little among geographic divisions, the per cent being slightly greater for Southern California (49.0) than for the territory north of Tehachapi (47.3), slightly less for the metropolitan area (44.9) than for the rural counties (49.8), and slightly greater for the metropolis proper (46.0) than for the adjoining suburbs (43.4).

The proportion of widowers among decedents was somewhat greater for the territory south of Tehachapi (15.3) than for that to the north (14.6) as well as for the metropolitan area (15.3) than for the rural counties (14.1), but was much less for San Francisco alone (14.3) than for the group of other bay counties (17.0).

The per cent of widows among decedents was 40.2 for Northern California and 37.6 for Central California, or 38.0 for both together as compared with 35.7 for Southern California. The per cent was 40.4 for the metropolitan area against 35.4 for the rural counties north of Tehachapi, but was only 38.6 for the metropolis proper against 43.1 for the suburban counties.

Causes of Death.—Table 23 presents numbers and per cents showing the deaths from twelve selected causes of males and females 15 years and over classified by marital condition for California as a whole in 1913.

TABLE 23.—Deaths from Selected Causes of Males and Females 15 Years and Over Classified by Marital Condition, with Per Cents, for California: 1913.

Other violence	416	79	199	120	9	9	19.0	47.8	28.8	2.2	2.2
All other causes	1,541	137	883	480	18	23	8.9	57.3	31.1	1.2	1.5

It appears from Table 23 that the per cent of single men among decedents was above the general average of 32.3 for deaths from tuberculosis, 49.5; typhoid fever, 44.7; miscellaneous violence, 41.8; and suicide, 34.6.

The per cent single among women was likewise above the general average of 12.3 for these same causes as follows: Typhoid fever, 28.8; tuberculosis, 26.4; miscellaneous violence 19.0; and suicide, 17.4.

The per cent of married men among decedents, as compared with the average of 44.3, was particularly high for the following causes of death: Cancer, 56.2; diseases of the nervous system, 52.7; Bright's disease and nephritis, 49.0; diseases of the digestive system, 48.7; and diseases of the circulatory system, 46.5.

The per cent of married women among decedents, in comparison with the average of 47.9, was especially great for the following causes:

Typhoid fever, 58.6; tuberculosis, 58.3; suicide, 57.4; sundry miscellaneous causes, 57.3; cancer, 52.2; diseases of the digestive system, 50.4; and Bright's disease and nephritis, 48.4.

The per cent of widowers exceeded the average of 14.9 in the following important instances: Diseases of the circulatory system, 22.3; sundry miscellaneous causes, 21.7; Bright's disease and nephritis, 19.2; diseases of the nervous system, 17.9; diseases of the respiratory system, 17.2; and cancer, 16.5.

The per cent of widows surpassed the average of 37.1 in notable cases as follows: Diseases of the circulatory system, 50.0; diseases of the nervous system, 48.2; diseases of the respiratory system, 47.7; and Bright' disease and nephritis, 40.6.

OCCUPATIONS AND CAUSES OF DEATH.

Occupations.—The table below gives, for deaths 15 years and over, the number of men and women for whom some occupation was reported in contrast with those for whom no gainful occupation was shown, the figures being for the whole State in both 1913 and 1912:

TABLE 24.—Deaths 15 Years and Over Classified by Sex and Occupation, with Per Cents by Sex, for California: 1913 and 1912.

	Deaths						Per cent male		Per cent female	
	Total		Male		Female		1913	1912	1913	1912
	1913	1912	1913	1912	1913	1912				
15 YEARS AND OVER	31,584	30,174	19,946	19,001	11,638	11,173	63.2	63.0	36.8	37.0
Occupation reported.....	18,231	17,415	17,045	16,391	1,186	1,024	93.5	94.1	6.5	5.9
No gainful occupation.....	13,353	12,759	2,901	2,610	10,452	10,149	21.7	20.5	78.3	79.5

Exclusive of children under 15 years of age, who would all be without gainful occupation in statistical terminology, the decedents aged 15 years and over totaled 31,584 in 1913 and 30,174 in 1912. The males numbered 19,946 and 19,001 in 1913 and 1912, and the females numbered 11,638 and 11,173, respectively. Among all decedents aged 15 years and over the per cents male were 63.2 in 1913 and 63.0 in 1912, while the per cents female were 36.8 and 37.0, respectively.

Of the decedents 15 years and over for whom occupations were reported (totaling 18,231 and 17,415 in 1913 and 1912, respectively), the males numbered 17,045 in 1913 and 16,391 in 1912 while the females numbered only 1,186 and 1,024, respectively. Among decedents reporting occupations the per cents male in 1913 and 1912 were no less than 93.5 and 94.1 while the per cents female were merely 6.5 and 5.9.

Of the decedents 15 years and over without gainful occupation (totaling 13,353 and 12,759 in 1913 and 1912, respectively), the men were merely 2,901 in 1913 and 2,610 in 1912, while the women (housewives and others not working for wages) were no less than 10,452 and 10,149, respectively. Among decedents without gainful occupation the per cents male in 1913 and 1912, respectively, were only 21.7 and 20.5, while the per cents female were as great as 78.3 and 79.5.

Main Kinds of Occupation.—The following table shows the distribution of male decedents 15 years and over, engaged in the main kinds of occupations, the data being for California in both 1913 and 1912 with additional per cents for 1911:

TABLE 25.—Deaths of Males 15 Years and Over Engaged in Gainful Occupations, Classified by Kind of Occupation, with Per Cents, for California: 1913 and 1912.

Kind of occupation	Males 15 years and over				
	Deaths		Per cent		
	1913	1912	1913	1912	1911
ALL OCCUPATIONS.....	17,045	16,391	100.0	100.0	100.0
Professional	961	939	5.6	5.7	5.0
Clerical and official.....	1,334	1,212	7.8	7.4	6.9
Mercantile and trading.....	1,302	1,303	7.6	8.0	7.2
Public entertainment	407	372	2.4	2.3	2.2
Personal service, police and military.....	569	450	3.3	2.7	3.2
Laboring and servant.....	3,597	3,420	21.1	20.9	22.0
Manufacturing and mechanical industry.....	3,486	3,349	20.5	20.4	20.7
Agriculture, transportation, and other outdoor.....	5,278	5,208	31.0	31.8	32.0
All other occupations.....	111	138	0.7	0.8	0.8

For 1913 and 1912, respectively, the male decedents for whom occupations were shown totaled 17,045 and 16,391 and were distributed by main kinds of occupations as follows: Agriculture, transportation and other outdoor pursuits, 5,278 and 5,208 or 31.0 and 31.8 per cent; laboring and servant work, 3,597 and 3,420 or 21.1 and 20.9 per cent; manufacturing and mechanical industry, 3,486 and 3,349 or 20.5 and 20.4 per cent; mercantile and trading occupations, 1,302 and 1,303 or 7.6 and 8.0 per cent; clerical and official positions, 1,334 and 1,212 or 7.8 and 7.4 per cent; professional callings, 961 and 939 or 5.6 and 5.7 per cent; and various minor kinds of occupations, altogether 1,087 and 960 or 6.4 and 5.8 per cent.

Causes of Death and Specific Occupations.—Table 26 presents in detail the per cent distribution, by selected causes, of deaths of males and females 15 years and over classified by occupation for California in both 1913 and 1912. The per cent distribution thus shown is presented not only for the main kinds of occupations but also, under each main kind of occupation, for every specific occupation showing annually at least 50 deaths in the State as a whole. It may be noted that the absolute numbers on which are based the per cents summarized here in Table 26 may be found in Tables 33 and 34, *post*, which are presented for reference among detailed or general tables following this text discussion of deaths.

TABLE 26.—Per Cent Distribution, by Selected Causes, of Deaths of Males and

Occupation (Showing annually at least 50 deaths)	Deaths		Per cent of deaths

It appears from Table 26 that among all decedents 15 years and over the per cent of deaths from typhoid fever was 1.2 in both 1913 and 1912, the per cents being 1.3 and 1.4 among men but only 1.0 and 0.9 among women of the age stated. In 1913 and 1912, respectively, the per cents of deaths from typhoid fever were notably high for the following occupations of men: Engineers and surveyors, 3.6 and 2.8; sailors, pilots and oystermen, 3.3 and 1.6; barbers and hairdressers, 2.5 and 4.0; lumbermen and raftsmen, 2.3 and 2.2; laborers (not agricultural), 2.0 each year; draymen, hackmen and teamsters, 2.0 and 1.5; stock raisers, herders and drovers, 2.0 and 1.4; hotel and boarding-house keepers, 1.8 and 2.0; iron and steel workers, 1.4 and 2.4; steam railroad employees, 1.6 and 1.4; farmers, planters and farm laborers, 1.5 and 1.9; and merchants and dealers, 1.4 each year. Among women the per cents of deaths from typhoid fever were 2.5 and 5.9 for nurses and midwives, 4.8 and 1.5 for bookkeepers, clerks and copyists, and 1.8 and 2.0 for teachers in schools.

The "great white plague," tuberculosis, caused 15.4 per cent of all deaths at 15 years and over in both 1913 and 1912, the per cents being 16.6 and 16.1 for men and 13.4 and 14.1 for women of potential working age. The per cents were 17.2 and 16.8 among men reporting occupations as compared with only 12.5 and 12.4 for men without gainful occupation, and were likewise 17.2 and 23.4 among women wage earners against only 13.0 and 13.2 for housewives and other non-workers.

The per cents of deaths from tuberculosis equalled or exceeded the averages of 17.2 and 16.8 among men at work for several specific occupations in both 1913 and 1912 as follows: Plumbers and gas and steam fitters, 30.5 and 31.9; bookkeepers, clerks and copyists, 29.5 and 31.4; servants (waiters, cooks), 27.3 and 24.6; tailors, 25.8 and 26.9; musicians and teachers of music, 20.3 and 40.7; barbers and hairdressers, 22.9 and 24.0; hucksters and peddlers, 24.0 and 19.2; laborers (not agricultural), 22.3 and 20.7; butchers, 22.3 and 16.8; iron and steel workers, 22.2 and 17.9; engineers and surveyors, 21.0 and 18.4; bakers, 20.7 and 18.0; draymen, hackmen and teamsters, 19.6 and 20.1; saloon keepers and restaurant keepers, 19.1 and 16.9; painters, glaziers and varnishers, 18.7 and 23.1; compositors, printers and pressmen, 18.3 and 28.6; machinists, 18.4 and 19.4; and steam railroad employees, 17.9 and 17.6. For women workers the per cents of deaths from tuberculosis were 27.0 and 39.7 among bookkeepers, clerks and copyists, 23.6 and 21.8 among teachers in schools, and 17.6 and 22.1 among servants.

On the other hand, the per cents of deaths from tuberculosis were very low indeed in both 1913 and 1912 for men engaged in the following occupations: Policemen, watchmen and detectives, 8.1 and 6.4; bankers, brokers and officials of companies, 8.7 and 8.3; merchants and dealers, 8.8 and 10.1; lawyers, 7.6 and 14.3; physicians and surgeons, 12.3 and 7.5; boot and shoe makers, 10.5 and 9.4; livery stable keepers and hostlers, 7.9 and 10.7; lumbermen and raftsmen, 10.1 and 11.5; farmers, planters and farm laborers, 11.1 and 9.8; soldiers, sailors and marines (U. S.), 12.1 and 11.7; and stock raisers, herders and drovers, 12.0 each year.

The per cents of deaths produced by cancers were 8.0 and 7.6 in 1913 and 1912 for all decedents aged 15 years and over, being only 6.2 and 5.7 among men but no less than 11.3 and 10.8 among women. For men, the per cents of deaths from cancer were notably high among masons

(brick and stone), 9.4 and 9.0; stock raisers, herders and drovers, 7.1 and 10.6; merchants and dealers, 8.6 and 8.4; boot and shoe makers, 9.5 and 6.2; policemen, watchmen and detectives, 8.1 and 7.4; farmers, planters and farm laborers, 8.0 and 7.8; machinists, 7.7 and 7.1; blacksmiths, 7.7 and 6.8; gardeners, florists, nurserymen and vine growers, 7.6 and 8.8; carpenters, 7.5 and 7.0; lawyers, 6.9 and 7.5; clergymen, 6.8 and 7.3; collectors, auctioneers and agents, 6.7 and 8.0; and compositors, printers and pressmen, 6.4 and 6.1. For women, the per cents of deaths from cancer were 19.0 and 10.7 among dressmakers and seamstresses, 18.3 and 14.1 among nurses and midwives, and 16.4 and 12.9 among teachers in schools.

The per cents of diseases of the circulatory system (heart disease, etc.) were 19.6 and 20.7 in 1913 and 1912 among all decedents 15 years and over, being 19.4 and 20.6 among men and 19.9 and 20.9 among women. The per cents were particularly great for the following specific occupations of men: Physicians and surgeons, 29.7 and 25.9; merchants and dealers, 25.9 and 29.1; boot and shoe makers, 25.7 and 27.1; lawyers, 23.6 and 27.1; bankers and brokers, 24.3 and 25.4; cabinetmakers and upholsterers, 23.8 and 22.0; carpenters, 23.2 and 24.2; apothecaries, pharmacists, etc., 22.7 and 28.3; clergymen, 23.0 and 20.2; blacksmiths, 22.7 and 23.7; masons (brick and stone), 23.5 and 20.2; livery stable keepers and hostlers, 22.2 and 23.2; gardeners and nurserymen, 21.8 and 23.3; farmers and planters, 21.7 and 23.3; miners and quarrymen, 21.6 each year; and sailors and pilots, 19.7 and 20.1. Among women wage earners the per cents of deaths from heart disease were 19.5 and 22.3 for nurses and midwives and 17.9 and 21.7 for servants.

The per cents for Bright's disease and nephritis, which often occur with heart disease, were 7.4 and 7.1 in 1913 and 1912 for all decedents 15 years and over, being 7.5 and 7.3 among men and 7.1 and 6.7 among women. The per cents were notably high for men engaged in the following occupations: Physicians and surgeons, 12.9 and 12.2; lawyers, 11.8 and 15.0; boot and shoe makers, 10.5 and 14.6; masons (brick and stone), 10.6 and 11.2; bankers and brokers, 10.9 and 10.4; clergymen, 9.5 and 12.8; collectors and agents, 10.0 and 9.4; gardeners and nurserymen, 11.7 and 8.3; livery stable keepers and hostlers, 9.5 and 12.5; merchants and dealers, 9.0 and 7.9; policemen and detectives, 8.9 and 9.6; butchers, 8.5 and 8.0; farmers and planters, 8.0 and 8.2; cabinet makers and upholsterers, 7.9 and 8.5; saloon keepers and restaurant keepers, 7.7 and 8.5; carpenters, 7.7 and 8.2; and engineers and firemen (not locomotive), 7.2 and 7.9. For women workers, the per cents of deaths from Bright's disease and nephritis were 12.6 and 4.8 among dressmakers and seamstresses and 8.2 and 6.7 among servants.

For diseases of the nervous system the per cents in 1913 and 1912 were 10.5 and 9.4 for all decedents, 9.7 and 9.0 for males, and 11.8 and 10.1 for females. The per cents were particularly great among men in the following occupations: Lawyers, 17.4 and 14.3; physicians and surgeons, 9.7 and 18.4; livery stable keepers and hostlers, 12.7 and 12.5; policemen and detectives, 16.1 and 9.6; merchants and dealers, 13.3 and 9.0; blacksmiths, 12.9 and 10.7; farmers and planters, 11.7 and 9.7; tailors, 11.7 and 8.9; painters, glaziers and varnishers, 11.4 and 9.8; boot and shoe makers, 11.4 and 9.4; bankers and brokers, 10.9 each year; stock raisers, herders and drovers, 10.8 and 11.6; collectors and agents, 10.9

and 10.3; carpenters, 10.0 and 10.4; and saloon keepers and restaurant keepers, 9.7 and 9.9. The per cents were 13.6 and 13.8 for school teachers among women workers.

For diseases of the respiratory system, the per cents in 1913 and 1912 were 8.7 and 9.2 for all decedents, 8.5 and 9.0 for men, and 9.0 and 9.6 for women. The per cents were notably high for the following occupations of men: Gardeners and nurserymen, 12.2 and 11.4; draymen, hackmen and teamsters, 11.2 and 10.8; clergymen, 10.8 and 12.9; policemen and detectives, 10.5 and 13.8; sailors and pilots, 9.8 and 12.7; farmers and planters, 9.5 and 11.2; stockraisers, herders and drovers, 8.9 and 12.0; and butchers, 9.2 and 9.7.

For diseases of the digestive system, the per cents in 1913 and 1912 were 6.3 and 6.7 among all decedents, 6.1 and 6.3 among males, and 6.6 and 7.3 among females. The per cents were notably high for men in the following occupations: Saloon keepers and restaurant keepers, 8.7 and 11.4; compositors, printers and pressmen, 8.3 and 10.2; soldiers, sailors and marines (U. S.), 7.9 and 10.1; butchers, 6.9 and 15.0; hotel and boarding-house keepers, 7.3 and 12.0; cabinetmakers and upholsterers, 9.5 and 6.8; engineers and firemen (not locomotive), 8.7 and 7.0; merchants and dealers, 6.9 and 7.7; clergymen, 6.7 and 8.3; and physicians and surgeons, 6.5 and 7.5. The per cents were 8.5 and 11.8 for nurses and midwives and 10.5 and 7.1 for dressmakers and seamstresses among women wage earners.

Suicides formed 2.6 per cent of all deaths at 15 years and over in both 1913 and 1912, the per cents being 3.4 and 3.6 among men and 1.3 and 1.1 among women of potential working age. The per cents of suicides were 3.4 and 3.5 for men reporting occupations as compared with 3.5 and 3.8 for those not working or on the retired list. Among women, however, the per cents of suicides were greater for wage earners, 2.1 and 1.9, than for housewives and others without gainful occupation, 1.3 and 1.0.

The occupations of men surpassing the average per cents of 3.4 and 3.5 for suicides were as follows: Barbers and hair dressers, 6.6 and 6.0; bakers, 6.5 and 4.5; cabinetmakers and upholsterers, 6.4 and 5.1; plumbers and gas and steam fitters, 6.1 and 4.3; tailors, 5.5 and 8.2; machinists, 5.6 and 5.3; saloonkeepers and restaurant keepers, 5.4 and 4.8; servants (waiters, cooks), 5.0 and 6.5; boot and shoe makers, 4.8 and 4.1; collectors and agents, 4.6 and 5.0; bookkeepers, clerks and copyists, 4.6 and 4.2; musicians and teachers of music, 4.7 and 3.7; architects, artists and teachers of art, 3.9 and 6.8; engineers and surveyors, 3.6 and 4.0; merchants and dealers, 4.1 and 3.7; policemen and detectives, 4.0 and 4.3; laborers (not agricultural), 4.0 and 3.8; hotel and boarding-house keepers, 3.7 and 8.0; and steam railroad employees, 3.7 and 3.6. Among women reporting gainful occupations, the per cents of suicides were quite high for bookkeepers, clerks and copyists, 3.2 and 4.4; servants, 2.1 and 3.7; and dressmakers and seamstresses, 2.1 and 2.4.

For deaths from violence other than suicide, the per cents in 1913 and 1912 were 8.6 and 8.5 for all decedents 15 years and over, being as great as 11.5 and 11.3 among men but only 3.6 and 3.7 among women of this age. For each sex, especially females, the proportion dying from accidental injuries was greater among those reporting occupations than among those without gainful occupation. The per cents were

11.7 in 1913 and 11.5 in 1912 for men workers against 10.1 each year for men not employed, and were 6.0 and 6.1 for women wage earners as compared with 3.3 and 3.4 for housewives and other non-workers.

The occupations of men with more than the average per cents of 11.7 and 11.5 for deaths from miscellaneous violence were as follows: Lumbermen and raftsmen, 29.5 and 33.1; steam railroad employees, 26.7 and 28.1; hucksters and peddlers, 20.0 and 19.2; engineers and surveyors, 18.8 and 17.2; draymen, hackmen and teamsters, 17.5 and 18.4; laborers (not agricultural), 16.5 and 18.0; machinists, 16.3 and 17.1; engineers and firemen (not locomotive), 15.9 and 16.9; iron and steel workers, 17.9 and 14.3; sailors and pilots, 15.2 and 17.6; plumbers and gas and steam fitters, 14.6 and 13.8; and miners and quarrymen, 13.0 and 14.5.

On the other hand, the occupations of men with remarkably small per cents of deaths from accidents were the following: Lawyers, 2.8 and 3.0; physicians and surgeons, 4.5 and 2.7; clergymen, 4.0 and 4.6; merchants and dealers, 4.6 and 5.6; apothecaries, pharmacists, etc., 4.6 and 7.5; tailors, 3.9 and 5.2; hotel and boarding-house keepers, 3.7 and 6.0; boot and shoe makers, 5.7 and 1.0; masons (brick and stone), 5.9 and 4.5; bookkeepers, clerks and copyists, 6.0 and 5.1; cabinetmakers and upholsterers, 6.3 and 5.1; compositors, printers and pressmen, 7.3 and 3.1; and musicians and teachers of music, 6.2 in both 1913 and 1912.

TABLE 27.—Deaths from Each Specified Disease and Class of Diseases, Classified

Cause of death	Total deaths	Male	Female	White	Negro	Indian	Chinese
IV. DISEASES OF THE RESPIRATORY SYSTEM							
No.	3,806	2,266	1,540	3,579	54	22	73
83. Diseases of the nasal fossæ.....	2	1	1	2			
87. Diseases of the larynx.....	13	9	4	11			1
88. Diseases of the thyroid body.....	16	1	15	16			
89. Acute bronchitis.....	194	94	100	181	2	1	7
90. Chronic bronchitis.....	243	123	117	234		3	5
91. Broncho-pneumonia.....	953	511	442	901	14	3	10
92. (a) Lobar pneumonia.....	1,175	757	418	1,102	26	3	25
(b) Pneumonia (undefined).....	810	501	309	751	8	11	17
93. Pleurisy.....	105	68	37	97			3
94. Pulmonary congestion, pul. apoplexy..	153	103	50	145	3	1	4
95. Gangrene of the lung.....	9	7	2	9			
96. Asthma.....	107	67	40	105	1		1
97. Pulmonary emphysema.....	2	2		2			
98. Other diseases of the respiratory system (tuberculosis excepted).....	24	19	5	23			
V. DISEASES OF THE DIGESTIVE SYSTEM							
No.	3,634	2,126	1,508	3,394	38	25	57
99. Diseases of the mouth and adnexa....	19	12	7	17	1		
100. Diseases of the pharynx.....	29	15	14	28	1		
101. Diseases of the œsophagus.....	6	5	1	5	1		
102. Ulcer of the stomach.....	154	101	53	148	1		3
103. Other diseases of stomach (cancer excepted).....	262	147	115	249	2	3	3
104. Diarrhœa and enteritis (under 2 years)..	1,270	708	562	1,162	11	13	8
105. Diarrhœa and enteritis (2 years and over).....	369	195	174	343	4	6	9
106. Ankylostomiasis.....							
107. Intestinal parasites.....	6	5	1	5			
108. Appendicitis and typhlitis.....	366	237	129	349	4		4
109. (a) Hernias.....	105	67	38	102	1		2
(b) Intestinal obstructions.....	282	157	125	252	6	1	13
110. Other diseases of the intestines.....	55	29	26	52			
111. Acute yellow atrophy of the liver.....	13	8	5	12			
112. Hydatid tumor of the liver.....							
113. Cirrhosis of the liver.....	418	296	122	405	4	1	8
114. Biliary calculi.....	58	20	38	58			
115. Other diseases of the liver.....	159	89	70	151	1	1	4
116. Diseases of the spleen.....	3	2	1	3			
117. Simple peritonitis (nonpuerperal).....	39	20	19	35			1
118. Other diseases of digestive system (except cancer and tuberculosis).....	21	13	8	18	1		2

XI. DISEASES OF EARLY INFANCY							
151. (a) Premature birth	1,369	771	598	1,300	14	5	7
(b) Congenital debility, "atrophy," "marasmus," etc.	795	445	350	757	8	2	6
152. Other diseases peculiar to early infancy	283	156	127	267	3	2	
153. Lack of care	283	164	119	268	3	1	1
	8	6	2	8			

TABLE 28.—Deaths from Each Specified Disease and Class of Diseases, Classified

Cause of death	Total deaths	Male	Female	White	Negro	Indian	Chinese
XII. OLD AGE	651	342	309	629	8	7	7
No. 154. Senility	651	342	309	629	8	7	7
XIII. AFFECTIONS PRODUCED BY EXTERNAL CAUSES	3,755	3,072	683	3,512	52	25	89
155. Suicide by poison	145	110	35	141	1		2
156. Suicide by asphyxia	93	70	23	92	1		
157. Suicide by hanging or strangulation	82	68	14	68			8
158. Suicide by drowning	34	24	10	33	1		
159. Suicide by firearms	349	318	31	332	5		3
160. Suicide by cutting or piercing instruments	72	68	4	65	1		2
161. Suicide by jumping from a high place	13	8	5	12			1
162. Suicide by crushing	9	8	1	9			
163. Other suicides	6	3	3	6			
164. Poisoning by food	79	46	33	73	3		
165. Other acute poisonings	70	30	40	67			1
166. Conflagration	69	50	19	57	3	3	6
167. Burns (conflagration excepted)	154	83	71	146	3	1	2
168. Absorption of deleterious gases (conflagration excepted)	117	95	22	112	4		1
169. Accidental drowning	318	290	28	300	3	1	3
170. Traumatism by firearms	92	83	9	87		4	
171. Traumatism by cutting or piercing instruments	16	13	3	14			2
172. Traumatism by fall	374	252	122	366	4	1	2
173. Traumatism in mines and quarries	56	56		55		1	
174. Traumatism by machines	78	78		71	1	1	2
175. (a) Railroad accidents and injuries	355	325	30	340	1	5	4
(b) Street car accidents and injuries	110	81	29	102	3		2
(c) Automobile accidents and injuries	194	143	51	189	1		3
(d) Injuries by other vehicles	152	139	13	137	2	1	3
(e) Landslide, other crushing	69	69		67	1	1	
176. Injuries by animals	67	64	3	62	1		1
177. Starvation	11	9	2	9	1	1	
178. Excessive cold	10	9	1	10			
179. Effects of heat	17	14	3	17			
180. Lightning	2	2		2			
181. Electricity (lightning excepted)	50	49	1	50			
182. Homicide by firearms	243	209	34	190	8	1	35
183. Homicide by cutting or piercing instruments	47	41	6	45	1		
184. Homicide by other means	53	36	17	50	1		1
185. Fractures (cause not specified)	9	5	4	9			
186. Other injuries	140	124	16	127	2	4	5
XIV. ILL-DEFINED DISEASES	19	14	5	15	1		1
187. Ill-defined organic disease	3	1	2	3			
188. Sudden death							
189. (a) Cause of death ill-defined	9	6	3	8			
(b) Cause of death not specified, or unknown	7	7		4	1		1

IV. STATISTICS OF MARRIAGES: 1913 AND 1912.

SYNOPSIS.

General Marriage Statistics.—Of the 31,383 marriages in 1913 and the 31,276 in 1912, those which were the first for both parties numbered 22,494 and 22,811, respectively, the per cents being 71.7 and 72.9 against the annual average of 72.8 for 1909 to 1913. The per cent distribution of marriages by number in order was about the same for 1912 as for the five year period, while 1913 shows comparatively few first marriages for both parties but relatively many where one or both parties had been married before.

The proportion of first marriages was considerably higher each year for San Francisco than for any other geographic division, though not as high as for certain small counties in the interior. The proportion of marriages where both parties were single is very low indeed, however, for Marin and San Mateo counties adjoining San Francisco, as well as for Orange adjoining Los Angeles.

In 1913 there were 3,606 marriages of single men with widows or divorcees, but only 2,469 marriages of single women with widowers or divorced men, the corresponding figures for 1912 being 3,422 and 2,387. Each year only six counties showed exceptions to the rule that there are more unions of bachelors with widows than of maids with widowers.

In 2,814 cases, or 8.9 per cent of all, in 1913 and in 2,656, or 8.5 per cent, in 1912, the marriages were the second or over for both grooms and brides. Marriages where both parties were widowed or divorced occur less in the metropolis than in the suburbs, and less in the whole urban area than in sparsely settled rural counties.

In 1913 and 1912, respectively, the single grooms numbered 26,100 and 26,233; the widowed 2,739 and 2,602; and the divorced 2,544 and 2,441. The per cents single were 83.2 and 83.9 as compared with the annual average of 83.8 for 1909 to 1913.

The single brides totaled 24,963 and 25,198 in 1913 and 1912, respectively; the widowed 3,181 and 3,014; and the divorced 3,239 and 3,064. The per cents single were 79.6 and 80.6 against the annual average of 80.6 for the last five years.

The per cents divorced, among both grooms and brides, were somewhat greater in 1913 and 1912 than the respective averages for 1909 to 1913. Through the past seven years, in fact, the per cent of divorcees among brides increased steadily, thus; 7.4 (1907), 7.7, 8.4, 9.5, 9.6, 9.8, and 10.3 (1913).

The years 1912 and 1913 are the first since the beginning of registration in 1905 to show divorcees ahead of widows in the number remarrying.

The widows outnumbered the widowers by 442, or 16.1 per cent, in 1913 and by 412, or 15.8 per cent, in 1912. Similarly, the divorcees outnumbered the divorced men by 695, or 27.3 per cent, in 1913 and by 623, or 25.5 per cent, in 1912.

The per cents widowed and divorced, both among grooms and brides, generally speaking, were greater each year for the counties south of Tehachapi than for those to the north.

More widowers, as well as widows, remarry in the country districts than in urban centers and, in the latter, more remarry in the suburbs than in the metropolis proper.

Divorced men and women likewise marry again considerably more in the surrounding suburbs than within the main city.

The high marriage-rates for suburban counties are largely due to the fact that these places are preferred by city couples, especially by divorced persons marrying once more.

Nativity of California Brides.—Of the 31,383 brides in 1913 only 1,294, or 4.1 per cent, were non-Caucasians, and of 31,276 in 1912 only 1,444, or 4.6 per cent, belonged to other than the white race. The Japanese, Chinese and Indian brides were nearly all single, while the negro brides included many widows and divorcees.

The white brides totaled 30,089 in 1913 and 29,832 in 1912, and among them the single were 23,853 and 23,931, respectively; the widowed, 3,070 and 2,916; and the divorced, 3,166 and 2,985.

The white brides were classified by nativity as follows: California, 10,804 and 11,203 in 1913 and 1912, respectively; other states, 13,271 and 12,713; and foreign born, 6,014 and 5,916.

The per cents single among all white brides were only 79.3 and 80.2 in 1913 and 1912 against the annual average of 80.4 for 1909 to 1913. On the other hand, the per cents divorced were no less than 10.5 and 10.0 as compared with the average of 9.6 for the last five years. In fact, the per cent of divorcees among white brides increased steadily ever since 1907, thus: 7.4 (1907), 7.7, 8.4, 9.6, 9.7, 10.0, and 10.5 (1913).

For Californian, other American, and foreign born white brides alike, the per cents single in 1913 and 1912 were generally below the average for 1909 to 1913; the per cents widowed substantially the same as the average; and the per cents divorced, almost without exception, considerably above the average. Each class of brides also shows a steady increase in the per cent divorced between 1907 and 1913.

The proportion of widows among all white brides was greater in 1913 and 1912 for Southern California than for Northern or Central California, while the proportion of divorcees was somewhat less each year for the counties south of Tehachapi than for those to the north.

Widows remarry more in country districts than in urban centers, but divorcees remarry more in the metropolitan area than in the rural counties. However, both widows and divorcees remarry more in suburban counties, like Marin and San Mateo, than in San Francisco, the metropolis proper.

In substantially each element of the population—Californian, other American, or foreign—more divorcees, as well as widows, remarry in the suburban territory than within the metropolis itself.

The per cent distribution of white brides by nativity was as follows for 1913 and 1912: California, 35.9 and 37.6; other states, 44.1 and 42.6; and foreign, 20.0 and 19.8. The annual average per cents for 1909 to 1913 were: California, 38.4; other states, 42.1; and foreign, 19.5.

Over half the white brides in both 1913 and 1912 were native daughters in as many as thirty counties, all north of Tehachapi. On the other hand, over half the brides both years were born in other states in only seven counties in or near Southern California, while at least one fourth

of the brides each year were foreign born merely in San Francisco and two other counties.

In 1913 and 1912, respectively, the per cents born in California among the single white brides were 38.6 and 40.2 against the average of 41.2 for 1909 to 1913; among the divorced were 30.2 and 31.3 against the average of 31.7; and among the widowed were 20.8 and 22.4 against the average of 22.4. In all parts of the State the native daughters form the bulk of the single brides and a large proportion of the divorced, but a small proportion of the widowed.

In 1913 and 1912 the per cents born elsewhere in the United States than here, among the divorced were 56.3 and 55.9 against the average of 55.2 for the past five years; among the widowed were 53.2 and 51.9 against the average of 52.1; and among the single were only 41.3 and 39.8 against the average of 39.3. In general, a larger proportion of the divorcees than of the widows remarrying in California were born elsewhere in the United States, while relatively few of the single brides here were born in other states.

The per cents foreign born in 1913 and 1912, respectively, among the widowed were 26.0 and 25.7 as compared with the average for 1909 to 1913 of 25.5; among the single were 20.1 and 20.0 as compared with the average of 19.5; and among the divorced, were only 13.5 and 12.8 as compared with the average of 13.1. Throughout California, as a rule, the proportion of foreign born brides is highest among the widowed, and next among the single, being very low indeed among the divorced.

While the bulk of the single brides were born in California or other states, the great bulk of the divorcees were born elsewhere in the United States, and most of the widows were likewise born outside of California, either in other states or abroad. The proportion foreign born, though relatively great among widows, is especially small among divorcees, nearly all the divorced brides being natives of California or other states.

GENERAL MARRIAGE STATISTICS.

Number in Order.—Table 1, which follows, shows the number in order of marriages, with per cents, for the three main and eight minor geographic divisions, as well as certain other groups of counties, in both 1913 and 1912. Similar figures for individual counties, arranged alphabetically, may be found in Tables 9 and 10, *post*.

TABLE 1.—Marriages Classified by Number in Order, with Per Cents, for Geographic Divisions:* 1913 and 1912.

Geographic division	Total marriages	Number of marriage				Per cent of marriages

*For list of counties included in geographic divisions, see page 26.

It appears from Table 1 that of 31,383 marriages in California in 1913, altogether 22,494 were first marriages for both parties; 3,606 were first marriages for the grooms only; 2,469 were first marriages for the brides only; and 2,814 were second marriages or over for both grooms and brides. Of the 31,276 marriages in 1912, there were 22,811 in which neither party had been married before; 3,422 where only the grooms were single; 2,387 where only the brides were single; and 2,656 where both grooms and brides were widowed or divorced.

Analysis of the per cents for the State is facilitated by a calculation of annual averages for 1909 to 1913, the five-year period just ended, as given in the following tabular statement:

Number in order	Per cent of marriages					
	Annual average: 1909 to 1913	1913	1912	1911	1910	1909
STATE TOTAL -----	100.0	100.0	100.0	100.0	100.0	100.0
First of both parties-----	72.8	71.7	72.9	73.0	72.5	73.6
First of groom only-----	11.0	11.5	11.0	11.2	11.0	10.5
First of bride only-----	7.8	7.9	7.6	7.7	8.0	8.0
Second or over of both-----	8.4	8.9	8.5	8.1	8.5	7.9

The per cent distribution of marriages by number in order for 1912 alone was about the same as the respective annual average per cents for 1909 to 1913. In 1913, however, the per cent of marriages which were the first for both parties, 71.7, falls much below the average of 72.8 for the five-year period. On the other hand, the per cents of marriages which were the first for the groom or the bride only, and also which were the second or over for both parties, stand somewhat higher for 1913 alone than the corresponding averages for 1909 to 1913.

Reference to Table 1, *ante*, indicates that the per cent of first marriages for both parties was much higher in both 1913 and 1912 for the territory north of Tehachapi, 73.0 and 74.6, respectively, than for Southern California, 69.6 and 70.2. The per cents for Northern California were 73.3 and 76.4, and for Central California were 73.0 and 74.4.

The per cent of first marriages was somewhat greater each year for the metropolitan area, 73.2 and 75.1, than for the rural counties north of Tehachapi, 72.7 and 74.0. Within the metropolitan area, however, there are wide differences between the per cents for San Francisco and for the other bay counties, the per cents for the metropolis proper being no less than 76.1 in 1913 and 78.8 in 1912 (or the highest among geographic divisions), but only 69.6 and 70.2, respectively, for the group of suburban counties (Alameda, Contra Costa, Marin and San Mateo). Similarly, the per cents of first marriages were 70.7 and 71.5 for Los Angeles, but as low as 67.6 and 67.8 for the other counties south of Tehachapi.

Examination of Tables 9 and 10, *post*, shows that the proportion of marriages which were the first for both parties is very high for certain small counties. Thus, all of the 5 marriages in Mariposa in 1913 were first marriages for both parties, while the per cent of first mar-

riages was also very high in 1912 for Sierra (90.9), Sutter (89.3), and Mariposa (87.5).

On the other hand the per cents of first marriages are very low indeed for individual counties adjoining San Francisco and Los Angeles. Thus, for counties adjoining San Francisco the per cents were only 65.9 and 65.5 for San Mateo in 1913 and 1912, and as low as 63.3 and 63.2, respectively, for Marin. Likewise, the per cents of first marriages for Orange County, adjoining Los Angeles, were only 62.9 in 1913 and 63.4 in 1912. There are only a few other counties in the State where in 1913 or 1912 less than 70.0 per cent of the marriages were first marriages for both parties, the additional counties in 1913 being Amador, Calaveras, Kern, Mono, Plumas, Riverside, Sacramento, San Diego, Santa Cruz, Shasta, Sierra, Siskiyou, Sutter, Yolo, and Yuba, and in 1912 Alpine, Del Norte, Inyo, Sacramento, San Bernardino, San Diego, Santa Barbara, and Yuba.

In 1913 there were 3,606 marriages, which were the first for only the grooms, as compared with only 2,469, which were the first for only the brides. Similarly in 1912, the first marriages for only the grooms numbered 3,422 against only 2,387 for the first marriages of the brides alone. The excess of first marriages of grooms over first marriages of brides was 1,137, or 46.1 per cent, in 1913, and 1,035, or 43.4 per cent, in 1910. In other words, the number of single men marrying widowed or divorced women is greater by over two fifths than the number of single women marrying widowed or divorced men. No main or minor geographic division of California shows any departure from this rule, that there are more unions of bachelors with widows than of maids with widowers. In fact, there are exceptions to the rule, and only slight exceptions at that, for only six of the whole fifty-eight counties in either 1913 or 1912, the six for 1913 being Colusa, El Dorado, Humboldt, Imperial, Solano, and Tulare, and the six for 1912 being Lake, Lassen, Modoc, Placer, Sutter, and Tulare. In Trinity and Tuolumne in 1913, and in Calaveras, Colusa, Inyo, and Shasta in 1912 there were exactly the same number of marriages where only the grooms were single as where only the brides were single. But in all the remaining counties of the State the rule holds good that there are more marriages between bachelors and widows than between maidens and widowers.

Further reference to Table 1, *ante*, shows that the per cent of marriages which were the second or over for both grooms and brides (8.9 per cent for the State in 1913 and 8.5 per cent for 1912) is higher for Southern California than for Northern and Central California. The per cents in 1913 and 1912, respectively, were 10.5 and 10.3 for the counties south of Tehachapi as compared with 8.0 and 7.4 for those to the north, being 8.6 and 8.0 for Northern California and 7.9 and 7.3 for Central California. The per cent of marriages where both parties were widowed or divorced was highest of all each year for the counties of Southern California other than Los Angeles, 11.4 in 1913 and 11.0 in 1912 against 10.0 and 9.9, respectively, for Los Angeles alone. In Northern and Central California the per cents for the rural counties were 8.5 and 8.2 in 1913 and 1912 as compared with 7.6 and 6.8, respectively, for the metropolitan area. Within the metropolitan area, moreover, the per cents were no less than 9.0 in 1913 and 8.5 in 1912 for the suburban counties against only 6.5 and

5.4, respectively, or the lowest of all each year, for San Francisco alone. Marriages between widowed or divorced men and women occur less in San Francisco than in the suburbs and less in an urban center like San Francisco or Los Angeles than in sparsely settled rural districts. Thus, it appears from Tables 9 and 10, *post*, that the counties in which over one tenth of the marriages were between widowers and widows were suburban or rural counties, as follows: Lassen, Madera, Marin, Orange, Riverside, Sacramento, San Diego, Santa Barbara, Shasta, Siskiyou, Sonoma, Tehama, and Trinity in 1913; and Butte, El Dorado, Inyo, Lake, Marin, Orange, Riverside, San Diego, San Mateo, Santa Clara, and Yuba in 1912.

Status of Grooms.—The table which follows gives for each geographic division in 1913 and 1912 the civil status or marital condition of the grooms—whether single, widowed, or divorced—at the time of marriage. Similar figures for individual counties, arranged alphabetically, appear in Tables 9 and 10, *post*.

TABLE 2.—Grooms Classified by Marital Condition, with Per Cents, for Geographic Divisions: 1913 and 1912.

Geographic division	Grooms				Per cent		
	Total	Single	Widowed	Divorced	Single	Widowed	Divorced
1913

Interior counties	5,874	4,983	452	439	84.8	7.7	7.5
Metropolitan area	10,812	9,297	727	788	86.0	6.7	7.3
Rural counties	8,787	7,435	674	678	84.6	7.7	7.7

Table 2 shows that of 31,383 grooms in 1913, some 26,100, or 83.2 per cent, were single; 2,739, or 8.7 per cent, widowed; and 2,544, or 8.1 per cent, divorced. Of the 31,276 grooms in 1912, the single were 26,233, or 83.9 per cent; the widowed 2,602, or 8.3 per cent; and the divorced 2,441, or 7.8 per cent.

The following tabular statement summarizes the per cents for the State for the five years, 1909 to 1913:

Marital condition	Per cent of grooms					
	Annual average: 1909 to 1913	1913	1912	1911	1910	1909
STATE TOTAL -----	100.0	100.0	100.0	100.0	100.0	100.0
Single -----	83.8	83.2	83.9	84.2	83.5	84.1
Widowed -----	8.7	8.7	8.3	8.5	8.8	9.0
Divorced -----	7.5	8.1	7.8	7.3	7.7	6.9

The per cent for single grooms in 1913 (83.2) falls below the average of 83.8 for 1909 to 1913, while the per cent in 1912 (83.9) was virtually the same as the five-year average. The per cent for widowed grooms was exactly the same in 1913 as for the five-year period (8.7), though in 1912 (8.3) it stood below the average. The per cents divorced in both 1913 and 1912 (8.1 and 7.8, respectively) were somewhat above the five-year average of only 7.5.

It appears from Table 2, *ante*, that in 1913 and 1912 relatively more grooms were single in Northern and Central California than in Southern California. The per cent single for the counties north of Tehachapi was 84.6 in 1913 and 85.4 in 1912, while for the counties to the south the per cents were only 80.8 and 81.4, respectively.

There is relatively little difference between the per cents for the metropolitan area (84.8 and 86.0) and for the rural counties (84.5 and 84.6) of Northern and Central California. However, there are wide differences in the metropolitan area between the per cents for San Francisco and the other bay counties. The per cent of single grooms in the metropolis proper was 86.8 in 1913 and 88.2 in 1912, these being the maximum per cents among geographic divisions, while for the suburban counties the per cents were, respectively, 82.1 and 83.1, or about the lowest outside Southern California. The per cents single were 81.6 and 82.1 for Los Angeles in 1913 and 1912, but only 79.5 and 80.1, respectively, for the other counties south of Tehachapi.

Examination of Tables 9 and 10, *post*, shows that the individual counties in which at least 90.0 per cent of the grooms were single were (in 1913) Calaveras, Del Norte, Lake, Mariposa, Mono, Nevada, Plumas, San Benito, Sierra, and Tuolumne, and (in 1912) Alpine, Del Norte, Mariposa, Mono, Plumas, Sierra, Siskiyou, and Trinity. On the other hand, those in which only 80.0 per cent or less of the grooms were single were Marin, Orange, Riverside, San Diego, and Trinity in 1913, and Inyo, Lake, Lassen, Orange, San Diego, and Yuba in 1912.

Reference to Table 2, *ante*, shows that the proportion of widowers among the grooms is much greater for Southern California than for Northern or Central California. The per cent widowed for the coun-

ties south of Tehachapi was 10.4 in 1913 and 10.3 in 1912 as compared with 7.7 and 7.1, respectively, for the counties to the north. The per cents were 10.1 and 10.2 for Los Angeles, and 10.9 and 10.4 for the other counties south of Tehachapi in 1913 and 1912, respectively. North of Tehachapi, the per cents were only 7.3 and 6.7 for the metropolitan area against 8.1 and 7.7 for the rural counties. Within the metropolitan area, moreover, the per cents were only 6.7 in 1913 and 5.9 in 1912 for the metropolis proper as compared with 8.2 and 7.9 for the suburban counties. Generally speaking, more widowers remarry in the rural counties than in metropolitan centers, and in the metropolitan district more remarry in the suburbs than in the main city.

The individual counties (shown in Tables 9 and 10, *post*) in which widowers formed at least one tenth (10.0 per cent) of all grooms in 1913 were: El Dorado, Santa Clara, Sutter, Tehama, Trinity, and Tulare north of Tehachapi; and Los Angeles, Riverside, San Diego, and Santa Barbara, in Southern California. In 1912 the counties in which 10.0 per cent or more of all grooms were widowers were: Butte, Inyo, Lake, Lassen, Merced, Modoc, Yolo, and Yuba, in Northern and Central California; and Los Angeles, Orange, San Bernardino, San Diego, and Santa Barbara, south of Tehachapi.

Further reference to Table 2, *ante*, shows that the proportion of divorced grooms, as of the widowed, is greater for the counties south of Tehachapi than for those to the north. The per cents divorced in 1913 and 1912, respectively, were 8.8 and 8.3 for Southern California as compared with 7.7 and 7.6 for Central California and 7.5 and 6.8 for Northern California, or 7.7 and 7.5 for both together. The per cents were 8.3 and 7.7 for Los Angeles in 1913 and 1912 against 9.6 and 9.5, respectively, for the other counties of Southern California. North of Tehachapi, however, the per cents divorced are not far from the same for the metropolitan area (7.9 and 7.3) as for the rural counties (7.4 and 7.7). Within the metropolitan area the per cents divorced are much less for San Francisco than for the suburbs, being only 6.5 and 5.9 for the metropolis proper as compared with 9.7 and 9.0 for the other bay counties. Thus, not nearly so many divorced men remarry in the main city itself as in the adjoining suburban counties.

The counties (given in Tables 9 and 10, *post*), having at least 7.5 per cent of the grooms in 1913 divorced were: Alameda, Butte, Contra Costa, El Dorado, Glenn, Kern, Lassen, Madera, Marin, Monterey, Napa, San Joaquin, San Mateo, Santa Clara, Santa Cruz, Shasta, Siskiyou, Solano, Sonoma, Tuolumne, and Yuba, north of Tehachapi; and Los Angeles, Orange, Riverside, and San Diego, in Southern California. The counties with 7.5 per cent or more divorced grooms in 1912 were: Alameda, Amador, Butte, Colusa, Inyo, Lake, Lassen, Madera, Marin, Napa, Sacramento, San Joaquin, San Luis Obispo, San Mateo, Santa Clara, Shasta, Sierra, Tuolumne, and Yuba, in Northern and Central California; and Los Angeles, Orange, Riverside, San Diego, and Santa Barbara, south of Tehachapi. The per cent of divorced grooms was notably high each year for Marin (12.0 and 11.2) and for San Mateo (11.5 and 10.9), adjoining San Francisco, as well as for Orange (13.1 and 11.4), adjoining Los Angeles.

Status of Brides.—The following table shows for the several geographic divisions in 1913 and 1912 the civil status or marital condition of the brides—whether single, widowed, or divorced—on the wedding day. Similar figures for individual counties, in alphabetical order, appear in Tables 9 and 10, *post*.

TABLE 3.—Brides Classified by Marital Condition, for Geographic Divisions: 1913 and 1912.

Geographic division	Brides				Per cent		
	Total	Single	Widowed	Divorced	Single	Widowed	Divorced
1913							
THE STATE-----	31,383	24,963	3,181	3,239	79.6	10.1	10.3
<i>Northern California</i> -----	2,287	1,831	231	225	80.1	10.1	9.8
Coast counties-----	1,131	917	112	102	81.1	9.9	9.0
Interior counties-----	1,156	914	119	123	79.1	10.2	10.6

Coast counties-----	13,725	11,258	1,133	1,334	82.0	8.3	9.7
Interior counties-----	5,874	4,775	529	570	81.3	9.0	9.7
Metropolitan area-----	10,812	8,893	840	1,076	82.3	7.8	9.9
Rural counties-----	8,787	7,137	822	828	81.2	9.4	9.4

It appears from this table that of 31,383 brides in 1913, the single numbered 24,963, or 79.6 per cent; the widowed 3,181, or 10.1 per cent; and the divorced 3,239, or 10.3 per cent. Of the 31,276 brides in 1912, altogether 25,198, or 80.6 per cent, were single, 3,014, or 9.6 per cent, were widowed; and 3,064, or 9.8 per cent, were divorced.

The tabular statement which follows gives a summary of the per cents for the State for the five year period just ended:

Marital condition	Per cent of brides					
	Annual average: 1909 to 1913	1913	1912	1911	1910	1909
STATE TOTAL -----	100.0	100.0	100.0	100.0	100.0	100.0
Single -----	80.6	79.6	80.6	80.7	80.5	81.6
Widowed -----	9.9	10.1	9.6	9.7	10.0	10.0
Divorced -----	9.5	10.3	9.8	9.6	9.5	8.4

The per cent for single brides in 1913 (79.6) falls considerably below the five year average but in 1912 (80.6) was exactly the same as the average. The per cent widowed was somewhat more in 1913 (10.1) while somewhat less in 1912 (9.6) than the average of 9.9 for 1909 to 1913. The per cents for divorced brides, however, in both 1913 and 1912 (10.3 and 9.8, respectively) stand above the annual average of 9.5 for the five year period just ended. It may be added, furthermore, that the per cent divorced among brides has risen steadily ever since 1907, as follows: 1907, 7.4; 1908, 7.7; 1909, 8.4; 1910, 9.5; 1911, 9.6; 1912, 9.8; and 1913, 10.3.

Moreover, from the beginning of registration under the law of 1905, there were more widows than divorcees among brides each year until 1912, when divorcees outnumbered widows by 50 (3,064 against 3,014), divorcees likewise surpassing widows among brides in 1913 by 58 (3,239 against 3,181).

It may be noted that in 1913 the widowed grooms numbered only 2,739 against 3,181 for the brides, and that in 1912 the widowers totaled 2,602 and the widows 3,014. That is, the widows outnumbered the widowers by 442, or 16.1 per cent, in 1913, and by 412, or 15.8 per cent, in 1912. In 1913 the divorced grooms numbered only 2,544 and the brides 3,239, while in 1912, similarly, the divorced men remarrying totaled 2,441 and the women 3,064. In other words, the number of divorced women remarrying exceeded that of divorced men by 695, or 27.3 per cent, in 1913, and by 623, or 25.5 per cent, in 1912.

It appears from Table 3, *ante*, that in 1913 and 1912 relatively more brides were single in the counties north of Tehachapi than in those to the south. The per cent single among brides was 80.4 in 1913 and 81.8 in 1912 for Northern and Central California together against only 78.2 and 78.5 for Southern California. The per cents for the metropolitan area were 80.9 and 82.3 in 1913 and 1912, as compared with 79.7 and 81.2, respectively, for the rural counties north of Tehachapi. The per cent of single brides for San Francisco was 82.8 in 1913 and 85.2 in 1912, these being the maximum per cents among geographic divisions. At the same time, however, the per cent for the other bay counties was merely 78.5 each year, or the lowest outside Southern California. The per cents single were 79.1 and 79.5 for Los Angeles in 1913 and 1912, against only 76.7 each year for the other counties south of Tehachapi.

Examination of Tables 9 and 10, *post*, shows that the individual counties in which at least 90.0 per cent of the brides were single were Colusa, Mariposa, and Tuolumne in 1913, and Sierra and Sutter in

1912. On the other hand, the counties in which only 80.0 per cent or less of the brides were single were as follows: In 1913, Amador, Calaveras, Kern, Lassen, Los Angeles, Madera, Marin, Mendocino, Modoc, Mono, Orange, Plumas, Riverside, Sacramento, San Bernardino, San Diego, San Joaquin, San Mateo, Santa Barbara, Santa Cruz, Shasta, Sierra, Siskiyou, Sonoma, Sutter, Tehama, Trinity, Yolo, and Yuba; and in 1912, Alpine, Butte, Del Norte, El Dorado, Inyo, Lake, Los Angeles, Marin, Merced, Monterey, Napa, Nevada, Orange, Riverside, Sacramento, San Bernardino, San Diego, San Joaquin, San Mateo, Santa Barbara, Santa Clara, Santa Cruz, Solano, Trinity, Tuolumne, and Yuba.

Reference to Table 3, *ante*, shows that the proportion of widows among brides, as of widowers among grooms, is much higher in Southern California than for Northern or Central California. The per cent of widowed brides for the counties south of Tehachapi was 11.9 in 1913 and 11.6 in 1912 as compared with 9.0 and 8.5, respectively, for the counties to the north, the per cents being 10.1 and 8.5 for Northern California and 8.9 and 8.5 for Central California. The per cents were 11.5 and 11.4 for Los Angeles in 1913 and 1912 against 12.6 and 11.9 for the other counties of Southern California. The per cents for the metropolitan area were 8.4 and 7.8 as compared with 9.7 and 9.4 for the rural counties north of Tehachapi. The per cents for San Francisco were only 7.6 and 6.6 in 1913 and 1912 against 9.5 and 9.3, respectively, for the other bay counties. As with widowers, so with widows, somewhat more remarry in the country districts than in urban centers, and, in the latter, more remarry in the suburbs than in the metropolis proper.

The individual counties (shown in Tables 9 and 10, *post*) in which widows formed at least one tenth (10.0 per cent) of all brides in 1913 were: Amador, Calaveras, El Dorado, Inyo, Kern, Lake, Marin, Mendocino, Modoc, Mono, Napa, Plumas, Sacramento, San Benito, San Joaquin, Santa Cruz, Shasta, Sonoma, Sutter, Tehama, Trinity, Tuolumne, Yolo, and Yuba, in Northern and Central California; and Los Angeles, Orange, Riverside, San Bernardino, and San Diego, in Southern California. In 1912 the counties in which 10.0 per cent or more of the brides were widows were: North of Tehachapi—Amador, Butte, Del Norte, El Dorado, Inyo, Marin, Mendocino, Merced, Monterey, Napa, Nevada, Plumas, Sacramento, San Benito, San Joaquin, Santa Clara, Santa Cruz, Solano, Stanislaus, Trinity, Yolo, and Yuba; and south of Tehachapi—Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Santa Barbara.

Further reference to Table 3, *ante*, shows that the proportion of divorced brides, unlike that of grooms, is slightly less for Southern California than for Northern or Central California, generally speaking. The per cent divorced among brides was 9.9 each year for the counties south of Tehachapi against 10.4 in 1913 and 9.7 in 1912 for those to the north, being 9.8 and 8.5 for Northern California and 10.7 and 9.9 for Central California. The per cents were 9.4 and 9.1 for Los Angeles in 1913 and 1912 as compared with no less than 10.7 and 11.4 for the other counties of Southern California. North of Tehachapi, however, the per cents divorced among brides are practically the same for the metropolitan area as for the rural counties, being 10.7 and 10.6, respectively, in 1913 and, similarly, 9.9 and 9.4 in 1912. Within the metropolitan area, on the contrary, the per cent of divorced brides (as of

grooms) is much less for San Francisco than for the other bay counties, the per cents divorced among brides being only 9.6 and 8.2 for the metropolis proper against as much as 12.0 and 12.2 for the suburban territory. While there is no very marked difference between the metropolitan area and the rural districts in the per cent divorced, whether among grooms or brides, yet there is a sharp contrast between the metropolis proper and the surrounding suburbs in the proportion of divorced persons among those remarrying, since both divorcees and divorced men remarry less in the main city than in the adjacent suburbs.

The individual counties (given in Tables 9 and 10, *post*) in which at least 7.5 per cent of all brides in 1913 were divorced were: Alameda, Amador, Butte, Calaveras, Contra Costa, Del Norte, Kern, Lassen, Madera, Marin, Mendocino, Merced, Monterey, Napa, Placer, Plumas, Sacramento, San Francisco, San Joaquin, San Luis Obispo, San Mateo, Santa Clara, Santa Cruz, Shasta, Sierra, Siskiyou, Sonoma, Stanislaus, Sutter, Tehama, Tulare, Yolo, and Yuba, in Northern and Central California; and Imperial, Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Santa Barbara, in Southern California. The counties with 7.5 per cent or more divorced brides in 1912 were: North of Tehachapi—Alameda, Alpine, Calaveras, Colusa, Contra Costa, Del Norte, Inyo, Kern, Kings, Lake, Lassen, Madera, Marin, Mariposa, Merced, Mono, Napa, Nevada, Sacramento, San Francisco, San Joaquin, San Luis Obispo, San Mateo, Santa Clara, Santa Cruz, Shasta, Sierra, Siskiyou, Solano, Sonoma, Tehama, Trinity, Tuolumne, and Yuba; and south of Tehachapi—the whole eight counties, viz.: Imperial, Los Angeles, Orange, Riverside, San Bernardino, San Diego, Santa Barbara, and Ventura. The per cent of divorced brides was especially high each year for Marin (16.6 in 1913 and 16.7 in 1912) and for San Mateo (17.6 and 17.7), adjacent to San Francisco, as well as for Orange (13.3 and 15.0), adjacent to Los Angeles.

In general, the proportion widowed and divorced, both among grooms and brides, is notably high for counties like Marin and San Mateo in the north and Orange in the south, adjacent to the great cities of San Francisco and Los Angeles. Analysis of marriage rates showed that there is a tendency on the part of many couples belonging to these cities to go to the suburbs to be married. This preference for a suburban town rather than the city proper as a place of marriage is most marked on the part of widowed and divorced persons marrying again, especially on the part of the divorced. The secretive divorcee even more than the romantic maiden enjoys the seclusion of a suburban Gretna Green.

NATIVITY OF CALIFORNIA BRIDES.

Race and Nativity.—The table below gives for California in 1913 and 1912 a classification of brides by race, nativity, and marital condition, as well as the per cent distribution by marital condition. The table also shows, for both years, the racial distinction of the non-Caucasian brides.

TABLE 4.—Brides Classified by Race, Nativity, and Marital Condition, with Per Cent Distribution by Marital Condition, for California: 1913 and 1912.

Race or nativity	Brides				Per cent		
	Total	Single	Wid-owed	Di-vorced	Single	Wid-owed	Di-vorced
1913							
THE STATE -----	31,383	24,963	3,181	3,239	79.6	10.1	10.3
White -----	30,089	23,853	3,070	3,166	79.3	10.2	10.5
Born in California -----	10,804	9,209	638	957	85.2	5.9	8.9
Born in other states -----	13,271	9,856	1,634	1,781	74.3	12.3	13.4
Foreign born -----	6,014	4,788	798	428	79.6	13.3	7.1
Non-Caucasian -----	1,294	1,110	111	73	85.8	8.6	5.6
Negro -----	464	322	83	59	69.4	17.9	12.7
Indian -----	70	52	11	7	74.3	15.7	10.0
Chinese -----	42	35	6	1	83.3	14.3	2.4
Japanese -----	718	701	11	6	97.7	1.5	0.8
1912							
THE STATE -----	31,276	25,198	3,014	3,064	80.6	9.6	9.8
White -----	29,832	23,931	2,916	2,985	80.2	9.8	10.0
Born in California -----	11,203	9,617	652	934	85.9	5.8	8.3
Born in other states -----	12,713	9,529	1,514	1,670	75.0	11.9	13.1
Foreign born -----	5,916	4,785	750	381	80.9	12.7	6.4
Non-Caucasian -----	1,444	1,267	98	79	87.7	6.8	5.5
Negro -----	433	283	83	67	65.3	19.2	15.5
Indian -----	67	57	5	5	85.1	7.5	7.4
Chinese -----	38	34	2	2	89.5	5.3	5.2
Japanese -----	906	893	8	5	98.6	0.9	0.5

Considering first the non-Caucasian brides, one will observe that among them the per cents single were 85.8 in 1913 and 87.7 in 1912; the widowed 8.6 and 6.8; and the divorced 5.6 and 5.5. The per cents single were 97.7 and 98.6 among Japanese brides; 83.3 and 89.5 among the Chinese; 74.3 and 85.1 among Indians; and only 69.4 and 65.3 among negro brides. The per cents widowed were 17.9 and 19.2 for negro brides but only 15.7 and 7.5 for Indians and 14.3 and 5.3 for Chinese, being merely 1.5 and 0.9 for Japanese. Similarly, the per cents divorced were 12.7 and 15.5 for negro brides but only 10.0 and 7.4 for Indians and 2.4 and 5.2 for Chinese, being merely 0.8 and 0.5 for Japanese brides.

The per cents for non-Caucasians differ greatly from the per cents for white brides, the proportion of single brides among the non-Caucasians being relatively large on account of the preponderance of single brides among the Japanese, now the most numerous non-Caucasian element in the population of California. Incidentally, it may be noted that over nine tenths of all marriages of Japanese in California take place at San Francisco, the per cent of all Japanese marriages in the State occurring at this port being 93.3 for 1913 and 95.7 for 1912.

It seems that expectant Japanese bridegrooms from various points in the interior come to San Francisco to await the arrival of trans-Pacific steamships bringing groups of "picture brides" direct from the Flowery Kingdom.

However, the 1,294 non-Caucasian brides in 1913 form merely 4.1 per cent of the State total, while the 1,444 in 1912 form only 4.6 per cent. The Japanese brides in 1913 and 1912, numbered 718 and 906, representing per cents of 2.3 and 2.9 of State aggregates; the negro brides numbered 464 and 433 (or 1.5 and 1.4 per cent); the Indian brides 70 and 67 (or 0.2 per cent each year); and the Chinese brides 42 and 38 (or 0.1 per cent each year). On account of the relatively small (though increasing) proportion of non-Caucasians among California brides, and also because of the wide divergence between the non-Caucasian races in this State (with Japanese and Chinese from the Orient out-numbering somewhat American born negroes and Indians), attention will be directed in the following discussion only to the facts for the whites.

Of the 30,089 white brides in 1913 and the 29,832 in 1912, the single were 23,853 and 23,931, respectively; the widowed 3,070 and 2,916; and the divorced 3,166 and 2,985.

The white brides born in California numbered 10,804 and 11,203 in 1913 and 1912, and among them there were, respectively, 9,209 and 9,617 single; 638 and 652 widowed; and 957 and 934 divorced.

The brides born in other states totaled 13,271 and 12,713 in 1913 and 1912, of whom the single were, respectively, 9,856 and 9,529; the widowed 1,634 and 1,514; and the divorced 1,781 and 1,670.

The foreign born white brides were 6,014 in 1913 and 5,916 in 1912, among whom there were, respectively, 4,788 and 4,785 single; 798 and 750 widowed; and 428 and 381 divorced.

Analysis of the per cents in Table 4 for various classes of white brides is aided by the presentation in the following tabular statement of the annual averages for the five year period just ended:

Nativity	Annual average per cent of white brides: 1909 to 1913			
	Total	Single	Widowed	Divorced
STATE TOTAL.....	100.0	80.4	10.0	9.6
Born in California.....	100.0	86.3	5.7	8.0
Born in other states.....	100.0	75.1	12.3	12.6
Foreign born.....	100.0	80.5	13.0	6.5

The per cents for single white brides in 1913 especially, and for 1912 in less degree, 79.3 and 80.2, respectively, fall below the annual average of 80.4 for 1909 to 1913. The per cents for widowed brides, 10.2 and 9.8, are not far from the same as the average of 10.0, while the per cents for the divorced, 10.5 and 10.0, stand somewhat above the average of 9.6 for the five year period. It may be added that the per cent divorced among all white brides rose steadily throughout the past seven years, as follows: 7.4 (1907), 7.7, 8.4, 9.6, 9.7, 10.0, and 10.5 (1913).

Among white brides born in California, the per cents single in 1913 and 1912, respectively, 85.2 and 85.9, are considerably below the average of 86.3; the per cents widowed, 5.9 and 5.8, are about the same as the

average of 5.7; and the per cents divorced, 8.9 and 8.3, are somewhat above the average of 8.0. The per cent divorced among native California brides increased successively through the whole seven year period thus: 6.0 (1907), 6.3, 7.0, 7.7, 8.0, 8.3, and 8.9 (1913).

Among white brides born in other states the per cents single in the last two years, 74.3 and 75.0, are somewhat below the average of 75.1 for 1909 to 1913; the per cents widowed, 12.3 and 11.9, are about the same as the five year average of 12.3; and the per cents divorced, 13.4 and 13.1, are much above the average of 12.6. For brides born in other states the per cents divorced were successively 10.0, 10.4, 11.1, 12.8, 12.8 again, 13.1, and 13.4 in 1907 to 1913, increasing generally through the seven years.

Among foreign born white brides, the per cents single in 1913 and 1912, 79.6 and 80.9, were one below and one above the annual average of 80.5; the per cents widowed, 13.3 and 12.7, were one above and one below the average of 13.0; and the per cents divorced, 7.1 and 6.4, were likewise one above and one below the average of 6.5. The per cents divorced among foreign born brides were successively 4.8, 5.3, 6.0, 6.6, 6.3, 6.4, and 7.1 in 1907 to 1913, having fluctuated somewhat through the seven years. Moreover, the per cent divorced among foreign born white brides, 6.5 as an average for the last five year period, is much less than among brides born in California, 8.0, or than among those born in other states, 12.6.

Status of White Brides.—Table 5 below, shows, by numbers and per cents, the civil status or marital condition of the white brides at the time of marriage—whether single, widowed, or divorced—for the several geographic divisions of the State in both 1913 and 1912.

TABLE 5.—White Brides Classified by Marital Condition, with Per Cents, for Geographic Divisions: 1913 and 1912.

Geographic division	White brides				Per cent

Rural counties -----	8,664	7,037	810	817	81.2	9.4	9.4

This table shows that the per cent single among white brides was higher each year for the counties north of Tehachapi than for those to the south. The per cents single in 1913 and 1912, respectively, were 79.8 and 81.0 for the counties north of Tehachapi against 78.4 and 78.9 for those to the south, being 80.2 and 82.9 for Northern California alone and 79.8 and 80.8 for Central California alone. The per cent single

in 1913 was exactly the same for the metropolitan area as for the rural counties north of Tehachapi, but in 1912 was 80.9 for the former against 81.2 for the latter. The per cent of single white brides was relatively high for San Francisco in both 1913 and 1912, 80.9 and 82.9, respectively, while comparatively low in both instances for the group of other bay counties, 78.6 each year. The per cents single were 79.4 and 80.0 for Los Angeles, as compared with 76.8 and 76.9 for the other counties south of Tehachapi.

The proportion of widows among white brides is higher for Southern California than for Northern or Central California. The per cents widowed for the counties south of Tehachapi were 11.7 and 11.3 in 1913 and 1912, respectively, against 9.2 and 8.8 for those to the north, being 10.0 and 8.5 for Northern California and 9.1 and 8.8 for Central California. The per cents for Los Angeles were 11.2 and 11.1, and for the rest of Southern California were 12.5 and 11.8 in 1913 and 1912, respectively. The per cents were 8.9 and 8.3 for the metropolitan area as compared with 9.6 and 9.4 for the rural counties of Northern and Central California. For San Francisco the per cents widowed were only 8.3 and 7.5, or the minimum each year; but for the other bay counties the per cents were considerably higher, 9.5 and 9.2. Of white widows it may therefore be said, as of widowers and widows of all races taken together, that more remarry in rural districts than in urban centers, but that in the metropolitan area more remarry in the suburbs than in the main city.

The proportion of divorcees among white brides, unlike that of widows, is somewhat less for the counties south of Tehachapi than for those to the north. The per cents divorced in 1913 and 1912, respectively, were 9.9 and 9.8 for Southern California against 11.0 and 10.2 for Northern and Central California together, being 9.8 and 8.6 for Northern California and 11.1 and 10.4 for Central California. The per cents were 9.4 and 8.9 for Los Angeles in 1913 and 1912 against no less than 10.7 and 11.3 for the other counties of Southern California. North of Tehachapi, on the other hand, the proportion of divorcees is somewhat greater for the metropolitan area than for the rural counties, the per cents for the former being 11.3 and 10.8 against 10.6 and 9.4 for the latter. Within the urban district, however, the proportion of divorcees among white brides is much less for San Francisco than for the other bay counties, the per cents being only 10.8 and 9.6 for the metropolis proper, but as much as 11.9 and 12.2 for the surrounding suburbs. Divorcees, unlike widows, remarry more in the metropolitan area than in the rural counties, while both divorcees and widows, like divorced men and widowers, remarry more in the suburbs of a great city than within the metropolis itself.

Status of White Brides (by Nativity).—The following table shows, for the several geographic divisions in 1913 and 1912, the civil status or marital condition—as single, widowed, or divorced—of the white brides classified by nativity—as born in California, born in other states, or foreign born. For convenience in presentation, the absolute numbers are omitted and only the per cent distributions are given here. The absolute numbers may be found, however, in Tables 11 and 12, *post*.

TABLE 6.—Per Cent Distribution, by Marital Condition, of White Brides Classified by Nativity, for Geographic Divisions: 1913 and 1912.

Geographic division	White brides								
	Per cent single among those—			Per cent widowed among those—			Per cent divorced among those—

Metropolitan area -----	84.6	72.9	82.3	5.6	10.4	11.0	9.8	16.7	6.7
Rural counties -----	86.1	73.9	81.0	6.2	12.5	12.9	7.7	13.6	6.1

Table 6 shows that the per cents single were no less than 85.2 in 1913 and 85.9 in 1912 among white brides born in California as compared with 79.6 and 80.9 among foreign born white brides and only 74.3 and 75.0 among those born in other states, the average per cents single for 1909 to 1913 being 86.3 for California born brides, 80.5 for the foreign, and merely 75.1 for brides born in other states. For every part of the State in both 1913 and 1912, except San Francisco in 1912 with the foreign born excelling, the per cent single is highest of all among brides born in California. As a rule, too, the per cent single is next highest among foreign born brides and lowest of all among those born elsewhere in the United States than here, a slight exception appearing for only one minor geographic division in 1912 alone.

In both 1913 and 1912 the per cent single was much higher for each class of brides in Los Angeles than for those in the other counties of Southern California. However, for the metropolitan area, as compared with the rural counties north of Tehachapi, the per cent single was notably higher each year for the former than for the latter only in the case of foreign born brides. Yet for San Francisco, in contrast with its suburbs, the per cent single was higher for the main city than for the suburban counties, not only among brides born abroad each year, but also among those born in California and in other states as well, in 1912, the per cents for Californian and other American brides in 1913 being about the same for San Francisco as for the other bay counties.

The per cents widowed were no less than 13.3 and 12.7 in 1913 and 1912 among foreign born brides and 12.3 and 11.9 among those born in other states against merely 5.9 and 5.8 among white brides born in California, the average per cents for the last five years being 13.0 for the foreign born and 12.3 for other Americans but merely 5.7 for native Californians. In general, the per cent widowed in 1913 and 1912 is highest of all among foreign born white brides, slight exceptions appearing for only San Francisco and one or two other minor geographic divisions in either year. Without exception, the per cent widowed is decidedly lowest among white brides born in the Golden State.

Generally speaking, the per cent widowed was less among each class by nativity for Los Angeles than for the other counties south of Tehachapi; for the metropolitan area than for the rural counties north of Tehachapi; and for San Francisco than for the other bay counties. No marked exceptions appear in either 1913 or 1912 to the general rule that in each element of the population more widows remarry in rural districts than in urban centers, and in the latter more remarry in the suburbs than in the main city.

The per cents divorced were as great as 13.4 and 13.1 in 1913 and 1912 among white brides born in other states, but only 8.9 and 8.3 among those born in California and 7.1 and 6.4 among the foreign born, the average per cents for 1909 to 1913 being 12.6 for other Americans but merely 8.0 for Californians and 6.5 for the foreign born. Everywhere in California in both 1913 and 1912, generally speaking, the per cent divorced was greatest among brides born in other states, next among those born in this State, and lowest of all among the foreign born. Slight exceptions to the rule, due to unusually high per cents divorced among foreign born brides, appear in the interior counties of Northern California both years as well as in one or two other minor geographic divisions each year.

The per cent divorced was much less in both 1913 and 1912 among all classes of brides except native Californians in Los Angeles than in the other counties of Southern California, and was likewise generally less for each element except other Americans in San Francisco than in the adjoining bay counties. However, the per cents divorced were greater each year for the metropolitan area than for the rural counties north of Tehachapi for each class of brides without any exception whatever. The rule that widows remarry more in rural districts than in urban centers has been found to hold good for each class of white brides, whether born in California, in other states, or in foreign countries. Similarly, the rule that divorcees, unlike widows, remarry more in the metropolitan area than in the rural counties holds true for each of the three elements of the population. Divorcees and widows are alike, however, in that for substantially each element of the population—Californian, other American, or foreign—many more remarry in the suburban territory than within the metropolis proper.

Nativity of White Brides.—The following table shows, by numbers and per cents, the nativity of white brides—as born in California, born in other states, or foreign born—for the several geographic divisions in 1913 and 1912. Corresponding figures, with others, may be found for individual counties, arranged alphabetically, in Table 15, *post*.

It appears from this table that of 30,089 white brides in 1913 and 29,832 in 1912, those born in California were 10,804 and 11,203; those born in other states were 13,271 and 12,713; and the foreign born were 6,014 and 5,916. The per cents born in California were, respectively, 35.9 and 37.6; in other states, 44.1 and 42.6; and abroad, 20.0 and 19.8. It may be added that for 1909 to 1913 the annual average per cents were as follows: California, 38.4; other states, 42.1; and foreign born, 19.5.

The proportion of native daughters among the brides is very high indeed for Northern as well as Central California, but very low indeed for Southern California. The per cents born in California in 1913 and 1912 were 57.1 and 57.5 for Northern California and 45.3 and 47.3 for Central California, or 46.8 and 48.5 for both together, against as little as 19.0 and 19.6 for Southern California. The per cents were only 16.9 and 17.7 for Los Angeles and 22.6 and 23.1 for the other counties south of Tehachapi. North of Tehachapi, likewise, the per cents were less for the metropolitan area (45.0 and 46.8) than for the rural counties (48.8 and 50.6), and also less for San Francisco (42.4 and 43.7) than for the other bay counties (47.9 and 50.2).

The proportion of white brides born elsewhere in the United States than California is very high indeed for the counties south of Tehachapi, but is quite low for those to the north. The per cent of brides born in other states was 63.7 in 1913 and 63.5 in 1912 for Southern California, being no less than 64.6 and 63.8 for Los Angeles and 62.1 and 63.0 for the other counties. On the other hand, the corresponding per cents for the counties north of Tehachapi were only 31.5 and 29.8, being 31.9 and 29.8 for Central California and 28.5 and 29.4 for Northern California. The per cents born in other states were 28.7 and 26.6 for the metropolitan area as compared with 34.6 and 33.4 for the rural counties. For San Francisco the per cents were only 26.0 and 24.1 against 31.9 and 29.4 for the other bay counties.

The proportion of foreign born brides is notably high only for Central California, especially in San Francisco and its suburbs. The per cents foreign born among white brides in 1913 and 1912, respectively, were 22.8 and 22.9 for Central California as compared with only 17.3 and 16.9 for Southern California and 14.4 and 13.1 for Northern California. The per cent for the counties north of Tehachapi was 21.7 each year, being no less than 26.3 in 1913 and 26.6 in 1912 for the metropolitan area, but merely 16.6 and 16.0 for the rural counties. The per cents foreign born were as great as 31.6 and 32.2 for San Francisco as compared with 20.2 and 20.4 for the other counties on the bay. Similarly, the per cents were greater for Los Angeles (18.5 each year) than for the other counties south of Tehachapi (15.3 in 1913 and 13.9 in 1912).

Inspection of Table 15, *post*, shows that one half or more of the white brides in both 1913 and 1912 were native daughters, the per cent being far above 50.0 in most cases, in the following thirty counties: Amador, Butte, Calaveras, Colusa, El Dorado, Humboldt, Lake, Lassen, Marin, Mariposa, Mendocino, Modoc, Mono, Monterey, Napa, Nevada, Placer, Plumas, Sacramento, San Benito, San Joaquin, San Luis Obispo, Shasta,

Solano, Sonoma, Sutter, Trinity, Tuolumne, Yolo, and Yuba. The per cent was also over 50.0 for Glenn and Sierra in 1913 alone, as well as for Alpine, Inyo, Madera, San Mateo, Santa Clara, Santa Cruz, and Tehama in 1912 alone.

In contrast with the long list of counties, all north of Tehachapi, with half the brides born in California, the counties with at least this proportion of white brides born in other states include only Imperial, Kern, Los Angeles, Orange, Riverside, San Bernardino, and San Diego for both 1913 and 1912, as well as Inyo, Mono, and Tulare in 1913 and Del Norte (by chance) in 1912, these few counties being mainly in or near Southern California.

Moreover, at least one fourth (25.0 per cent) of the white brides were foreign born in both 1913 and 1912 only in Contra Costa and Kings besides San Francisco, with the highest per cents foreign born each year, though at least 25.0 per cent of the brides were born abroad also in Amador and Humboldt in 1912 alone.

Nativity of White Brides (by Status).—Table 8, below, shows for the several geographic divisions in 1911 and 1910, the nativity (as born in California, born in other states, or foreign born) of white brides classified by civil status or marital condition—as single, widowed, or divorced. For convenience in presentation, only the per cent distributions are given here, though the absolute numbers appear in Tables 13 and 14, *post*.

TABLE 8.—Per Cent Distribution, by Nativity, of White Brides Classified by Marital Condition, for Geographic Divisions: 1913 and 1912.

Geographic division	White brides

Rural counties	53.6	33.3	41.3	30.4	44.6	48.3	16.0	22.1	10.4

Analysis of the per cents for the State in Table 8, as well as for Table 7, preceding it, is facilitated by the annual averages for 1909 to 1913 presented in the following tabular statement:

Marital condition	Annual average per cent of white brides: 1909 to 1913			
	Total	Born in California	Born in other states	Foreign born
STATE TOTAL.....	100.0	38.4	42.1	19.5
Single.....	100.0	41.2	39.3	19.5
Widowed.....	100.0	22.4	52.1	25.5
Divorced.....	100.0	31.7	55.2	13.1

It appears from Table 8 that in 1913 and 1912, respectively, the per cents born in California among the single brides were 38.6 and 40.2 against the average of 41.2 shown in the tabular statement; among the divorced were 30.2 and 31.3 against the average of 31.7; and among the widowed were 20.8 and 22.4 against the average of 22.4. In all parts of the State both years the native daughters formed the bulk of the single brides and a large proportion of the divorced, but a small proportion of the widowed brides.

The per cents born in the Golden State among the single, widowed, and divorced brides were very much less for Southern California each year than for Northern or Central California. Generally speaking, the per cents born in California were also less for Los Angeles in all cases than for the other counties south of Tehachapi, the only exception being for divorced brides in 1912. With the same exception, the per cents born in this State were likewise less for the metropolitan area than for the rural counties north of Tehachapi. Except for divorced brides in 1913 and the widowed in 1912, each only slightly, the rule is also that within the metropolitan area the proportion of native daughters among each class of brides is less for the metropolis proper than for the surrounding suburbs.

In 1913 and 1912, respectively, the per cents born in other states than California among the divorced were 56.3 and 55.9 against the average for 1909 to 1913 of 55.2; among the widowed were 53.2 and 51.9 against the average of 52.1; and among the single were only 41.3 and 39.8 against the average of 39.3. Except for three minor geographic divisions in 1913 and one in 1912, a larger proportion each year of the divorcees than of the widows remarrying were born elsewhere in the United States than California. In Los Angeles the per cents born in other states were no less than 74.3 and 74.0 among the divorced brides in 1913 and 1912, and 68.0 and 67.5 among the widowed; for the other counties south of Tehachapi the per cents for divorcees were as great as 74.7 and 77.9, and for widows were 65.8 and 69.9.

The per cents born in other states among single, widowed, and divorced brides were much greater each year for Southern California than for Northern or Central California. North of Tehachapi the per cents born in other states were less among brides of each class in the

metropolitan area than in the rural counties, and were also less in San Francisco than in the other bay counties in all cases except the divorced for 1912 alone. The per cents born elsewhere in the United States were generally greater for Los Angeles, however, than for the rest of Southern California, especially in 1913.

The per cents foreign born in 1913 and 1912, respectively, among the widowed were 26.0 and 25.7 as compared with the average for the last five years of 25.5; among the single were 20.1 and 20.0 as compared with the average of 19.5; and among the divorced were only 13.5 and 12.8 as compared with the average of 13.1. Except for two minor geographic divisions in 1913 alone, the per cent of foreign born brides was highest in every instance each year among the widowed, next highest among the single, and lowest of all among the divorced.

The per cents foreign born were higher for San Francisco than for the other bay counties in all cases except the divorced for 1913 alone, and were likewise higher without exception for the metropolitan area than for the rural counties north of Tehachapi. The per cent foreign born was also higher among all classes of brides in Los Angeles than in the rest of Southern California.

Of all the single brides in 1913 and 1912, the per cents born in California were 38.6 and 40.2; the per cents born in other states were 41.3 and 39.8; and the per cents foreign born were 20.1 and 20.0. For 1909 to 1913, moreover, the annual average per cents were: California, 41.2; other states, 39.3; and foreign, 19.5. That is, California girls and other Americans each form about two fifths of the single brides in this State, while only about one fifth of the single brides here were born abroad.

Of the widows remarrying in 1913 and 1912, the per cents born elsewhere in the United States than California were 53.2 and 51.9; the per cents foreign born were 26.0 and 25.7; and the per cents born in California were 20.8 and 22.4. Moreover, the annual average per cents for the last five years were: Other states, 52.1; foreign countries, 25.5; and California, 22.4. As compared with the per cent distributions of all white brides taken together, the per cents for the widowed are very high for those born outside California, whether in other states or foreign countries, while the per cents are relatively very low for the widowed brides born in the Golden State.

Of all the divorcees remarrying in 1913 and 1912, the per cents born in other states were as great as 56.3 and 55.9; the per cents born in California were 30.2 and 31.3; and the per cents foreign born were only 13.5 and 12.8. Furthermore, the annual average per cents for 1909 to 1913 were: Other American, 55.2; Californian, 31.7; and foreign, only 13.1. In short, American women born in other states comprise the great bulk of the divorced brides in California, and while the native daughters form a considerable proportion of the divorcees remarrying, the foreign born constitute a very small proportion indeed.

Conclusion.—That the native daughters should constitute the bulk of the single brides necessarily follows from the fact that most of the marriageable young women in California were born and reared in the glorious climate of this Golden State. That the great bulk of the widowed brides were born outside California, and only a comparatively small proportion were born within the Golden State, would naturally be expected from the fact that very few women born in California are old enough to have been married and become widows, so that most of the widows remarrying here must necessarily have come from other states or foreign countries. The very great disparity between the proportions for the American born and the foreign born among divorced brides is evidently due to a difference in the attitude toward divorce and remarriage between the American and foreign elements of the white population.

Marital Condition of Parties, with Per Cents, for Counties: 1913.

Bride		Per cent of marriages				Per cent of grooms			Per cent of brides

V. MORBIDITY REPORTS.

Smallpox.

During 1913, 803 cases of smallpox were reported in California. But 15 of these cases proved fatal, showing that the disease, generally, was of a mild character. The virulent form, however, appeared in Alameda and Imperial counties. The counties reporting the largest number of cases were Los Angeles 105, San Joaquin 83, Alameda 66, Sacramento 61, Butte 55, Nevada 52, and Imperial 42. The disease was endemic in San Joaquin and Nevada counties for many months. A considerable number of cases also appeared in Santa Clara and Kern counties; there was no outbreak of widespread extent, however. Nearly all of the cases were very mild, appearing suddenly, but no great numbers of people were affected at any one time. Most of the epidemics covered periods of three and four months, but no more than 23 cases were reported during any one month in the same place. The fact that the disease has been of such a mild form, throughout the year, however, does not indicate that there should be any cessation in the practice of vaccination, as the virulent cases appeared very suddenly, along with other cases that were mild in character.

Typhoid Fever.

During 1913, 1,474 cases of typhoid fever were reported. It is interesting to note that this disease, which has always been rated as a rural disease, is more prevalent in the large centers of population, according to reports, than it is in the rural districts. Alameda, Los Angeles and San Francisco counties, combined, reported 828 cases, more than half of the total number reported, while Sacramento reported 206 cases. Of course the use of polluted river water for domestic purposes in Sacramento is responsible for this large number of cases; although it is true that a large proportion of these cases were in persons who came into Sacramento from outside points. This is also true of Oakland, Los Angeles and San Francisco. While typhoid fever must still be rated as a rural disease in California, it is significant that but 440 cases were reported from the counties outside of Alameda, Los Angeles, San Francisco and Sacramento. Investigations conducted in San Francisco and Sacramento would tend to show that at least 50 per cent of urban cases are in persons who have returned from trips into the country; and it is safe to assume that for about one half of all cases occurring in cities, the disease was contracted in the rural districts. More cases of this disease are reported during the summer months than at any other time of the year, the climax coming generally in October when the number is almost invariably highest. During October, 1913, no less than 284 cases were reported. Of this number, 70 were in Los Angeles County, 56 in Alameda County, 54 in San Francisco and 23 in Sacramento. During July of the same year, however, Sacramento reported 57 cases. There were no outbreaks of sudden, widespread importance in any section of the State, although during July of 1913, 15 cases were reported from Stanislaus County, and a considerable number of cases were reported from Fresno County during the summer, as well as from Monterey, Tehama and Humboldt counties. In none of these places, however, was there any epidemic of grave importance. About 25 per cent of all cases reported, resulted fatally. The highest rate of mortality was

during November. The end of the vacation season brings the largest number of cases and the greatest number of deaths from the disease. The rate of mortality is higher in the winter months than it is in the summer months, although there were twice as many cases reported during the summer months as the winter months.

Tuberculosis.

In actual numbers, more cases of this disease were reported in 1913, than for any of the communicable diseases. The total for the year was 2,571, but some idea of how neglectfully this disease is reported may be gained, when it is stated, that there were 5,402 deaths during the same period. The disease was much more satisfactorily reported during the latter part of the year, when active steps were taken to secure reports from health officers and physicians. The division of communicable disease and the department of tuberculosis doubled their efforts to secure such reports with results that are fairly satisfactory, although there is still great room for improvement.

It is very difficult to secure reports from physicians, of cases of malaria and tuberculosis. This is due to the long chronic nature of the diseases and also to the reticence of both physician and patient to having the case reported. The reports by months for 1913 have no bearing upon the seasonal prevalence of the disease, for the reason that comparatively few reports were received early in the year. It is a well known fact, of course, that more cases of the disease make their appearance during the winter months than during the summer months, and the figures as submitted in this report must not be considered of any value as regards seasonal prevalence.

Whooping-cough.

The total number of cases for the year 1913 was 628. Most of these occurred during the spring and fall months, the maximum number being reported during October, 134, and the minimum number during February, when there were only three cases.

Diphtheria.

Six hundred and fifty-nine cases, with 184 deaths were reported during the year. In contrast with measles and mumps, this disease was more prevalent during the fall months of October, November and December, than during the spring and summer. There were no epidemics of importance, the cases having been well scattered throughout the entire State, the greatest number of cases, of course, having been reported from the large centers of population.

Scarlet Fever.

Like diphtheria, this disease was more prevalent during the fall months, the minimum number having been reported during August and September. There were 1,695 cases, with 85 deaths, reported. Most of these cases were in the large centers of population although, like diphtheria, the disease was widespread throughout all sections of the State.

Rabies.

Five cases of human rabies were reported during the year, making a total of 26 deaths from this disease since it first appeared in California.

Poliomyelitis.

There were 90 cases of poliomyelitis reported during 1913. Thirty-three of these cases were fatal. This is a much better record than for previous years, when there have been epidemics of grave importance. Most of these cases were reported during the fall months, October and November, although a considerable number were reported during July and August. The disease, however, was not nearly so widespread as during 1911 and 1912, when several hundred cases were reported. During those years, epidemics of serious import occurred.

Pellagra.

Eight cases of pellagra were reported during the year. With but one or two exceptions, these cases were all imported from other states, most of the patients concerned having come from the southern states. This disease has not yet made its appearance in California to such an extent as to cause the alarm which it has caused in many of the southern states. It is believed that not a single case of local origin has appeared in California.

Leprosy.

Ten cases of leprosy were reported during 1913. Most of these were discovered in Los Angeles and San Francisco, and in all cases the lepers were confined, in accordance with the provisions of the code. This makes the total number of lepers in California about 30, the greater part of whom are Mexicans in southern California.

Trachoma.

Fourteen cases of trachoma were reported. These cases were discovered in the schools for Indians and in the larger cities of the State. Ten of these cases were reported during November, but this indicated no particular outbreak of the disease.

Cerebrospinal Meningitis (Epidemic).

Sixty-seven cases of this disease were reported during the year, 49 of which proved fatal. Fifteen of these cases were in San Francisco, 14 in Los Angeles, 8 in Sacramento and 5 in San Bernardino counties. The largest number of cases to be reported during any one month was during March, when 8 cases were reported from Los Angeles. The disease appeared in 16 counties of the State, the mountain counties and most of the coast counties having reported no cases.

Chickenpox.

Chickenpox, like measles and mumps, was more prevalent during the spring months; 1,394 cases, in all, were reported; 290 cases were reported during January and but 26 during August.

Measles.

Out of 1,796 cases of measles reported during 1913, 154 proved fatal. Most of the fatal cases were in children under five years of age. The disease was more prevalent during the late winter and early spring months, very few cases having been reported during the late summer and early fall.

Mumps.

In numbers, mumps was next of importance after tuberculosis; 2,218 cases of the disease were reported, most of which occurred during March, April and May. The disease was widespread in the large centers of population throughout the State, but was of comparatively short duration, more than one half of the entire number having occurred during March and April.

REPORT OF BUREAU OF FOODS AND DRUGS.

By M. E. JAFFA, M.A., Director.

The report herewith submitted is the fourth biennial report of the activity of the State Food and Drug Laboratory for the period from July, 1912, to July, 1914. The data indicates the examination of 2,687 samples. This number is slightly lower than the corresponding figure for the previous biennial period. This is due to the fact that the last biennial report contained the results of work up to the first of August, while this report, herewith presented, covers the period ending June 30, 1914. If we add to the above figure the number of samples examined during the month of July, 1914, the total figure represents practically the same number of samples as was examined during the previous biennial period. It must, however, be understood that the number of samples examined is no criterion of the amount or the kind of work which is done at the laboratory.

The State Food and Drug Laboratory does not examine samples of milk and dairy products, except in a very few instances. The main bulk of this work is conducted under the supervision of the State Dairy Bureau. The samples of food products and drugs submitted to the State Laboratory require considerable work, far more than is necessary for the examination of milk or dairy products.

The cooperative work of the State Laboratory in the matter of the examination of supplies furnished state institutions has formed an important part of the work during the past two years. The supplies referred to consist, not only of all forms of food, food products, and drugs, but miscellaneous articles, such as blankets, coal, cutlery, oils, soaps, etc. Excellent results have followed such cooperation, in that the supplies furnished state institutions have greatly improved in quality, so that there is practically no waste with reference to the matter of food and drugs, and the financial saving has been very appreciable.

The laboratory has further been engaged in the matter of the examination of samples of sewage, sewage wastes, and factory wastes submitted by the State Fish and Game Commission and different cities.

As stated in the last report, the personnel of the Bureau of Food and Drugs should be increased. The force of inspectors has been added to so that there are now five inspectors working in connection with the Food and Drug Laboratory, three of these being food and drug inspectors, and two food inspectors only. It is the policy of the board, however, to hereafter appoint only those inspectors who can qualify for both food and drug inspection. The personnel of the laboratory will, we are glad to say, be increased, in that one more chemist is to be appointed very shortly. Even with this increase the force is far too small to adequately cope with the conditions that now exist in this State. The number of inspectors should be doubled and more chemists should be at work in the laboratory.

The State Laboratory has also been active in connection with educational enterprises. Too much importance cannot be placed on this branch of the activity of the laboratory. Lectures have been given before different associations, clubs, etc., and these were accompanied by exhibits which have been the means of interesting a very large number of con-

sumers. It is toward this class that educational work can be best directed.

The inspectors, as they travel over the State, are still meeting with the same cooperative spirit among dealers and manufacturers that was referred to in the last report. There are very few instances where the inspectors are not cordially received and the advice and suggestions in connection with the enforcement of the law gratefully accepted.

No reference is made here to the law, amendments, etc., as such data is published in detail elsewhere and can be obtained upon application to the Director of the State Laboratory, Berkeley, California.

Laboratory Work.

The data here reported represents the summary of chemical and microscopical examination of food and drugs and miscellaneous supplies furnished by state institutions. In addition, however, to the analytical work, as has been stated, much time is consumed with correspondence and interviews.

The data represented by the tables following are arranged alphabetically for the sake of convenient reference.

Baking Powders.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Baking powders -----		1		17	18
August 1, 1912, to August 1, 1913— Baking powders -----		2		23	25
August 1, 1913, to July 1, 1914— Baking powders -----		1		7	8
Totals, 1912-1914 -----		3		30	33

It was stated in the last biennial report that no government standards for baking powders had been adopted. We regret to say that the same condition still obtains, and until the United States Department of Agriculture does adopt some standard with reference to this product and issues rules and regulations concerning the labeling, etc., no detailed studies will be profitable. All that is necessary under present conditions is that a baking powder be composed of materials ordinarily used, and that no injurious or deleterious substances be incorporated in the powder, and that the label must be a truthful one. Any false or misleading statement on the label would constitute a violation of the food law. As shown by the table, thirty-three samples have been examined, with the result that thirty were found to be unobjectionable in the eyes of the law.

Baking Sodas.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to August 1, 1913— Baking sodas -----				4	4
August 1, 1913, to July 1, 1914— Baking sodas -----				2	2
Totals, 1912-1914 -----				6	6

As will be seen by the table, six samples of baking soda were submitted to the laboratory. These were samples from state institutions and were found to comply in all respects with the law.

Beers.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Beers -----			3	48	51
August 1, 1912, to July 1, 1914— Beers -----		2		2	4

In view of the fact that the United States Department of Agriculture has not published any standards for beers, no extensive investigations were carried on in connection with this product. A decision with reference to beers is expected in the very near future. As soon as such decision is issued the laboratory will take up this question in detail. Under present conditions it would not be a profitable source of investigation.

Beverages.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Beverages -----	23	40	94	155	312
August 1, 1912, to August 1, 1913— Beverages -----		6	9	20	35
August 1, 1913, to July 1, 1914— Beverages -----	1	1	4	5	11
Totals, 1912-1914 -----	1	7	13	25	46

For the period covered by this report forty-six samples of beverages were examined. Many different varieties of soft drinks were included. Fifty per cent of those tested were found to conform in every respect to the provisions of the California Food Act. The mislabeling consists in the main of the dealers and manufacturers not stating on the label the presence of artificial colors and flavors as required by law.

Breads.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Breads -----	5		5	6	16
August 1, 1912, to August 1, 1913— Breads -----			7	3	10
August 1, 1913, to July 1, 1914— Breads -----		1	3	1	5
Totals, 1912-1914 -----		1	10	4	15

Eighteen samples of breads were tested at the laboratory. Of these, thirteen were labeled gluten bread, but only four were entitled to such label. The remainder were mislabeled, in that the nitrogen content was far below that called for by a gluten bread, which should contain not less than four per cent of nitrogen.

Butter.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Butter -----	2	10	19	11	42
August 1, 1912, to August 1, 1913— Butter -----		2		5	7
August 1, 1913, to July 1, 1914— Butter -----	1	3		2	6
Totals, 1912-1914 -----	1	5		7	13

As stated before, the State Dairy Bureau has special charge of the enforcement of the Dairy Act, and, therefore, conducts examinations of milk, butter and cheese. At the same time, samples of butter and dairy products have been submitted to the State Laboratory by inspectors and state institutions. Thirteen samples have been thus submitted. No adulterations, as such, were found. It is true that the percentage of fat in two samples was low, being less than 82 per cent, but this figure is still in excess of that called for by the state law—namely, 80 per cent. Several samples were found to be short weight, with the result that successful court prosecutions were conducted. In this connection, it is very encouraging to be able to state that very little short-weight butter is to be found on the California markets today.

Cereals and Cereal Products.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Cereals -----	8	1	-----	27	36
August 1, 1912, to August 1, 1913— Cereals -----	-----	-----	-----	7	7
August 1, 1913, to July 1, 1914— Cereals -----	-----	-----	-----	14	14
Totals, 1912-1914 -----	-----	-----	-----	21	21

As indicated by the above, twenty-one samples of different cereals were examined, with the result that they were all found to be in conformity with the state law. Owing to the result of state inspection and the cooperation of the manufacturers, very few cereals of poor quality are to be found throughout the State. There are, however, a few stores in small places where the stock of cereals is kept too long, with the result that they become contaminated with weevils or other insects, and are thus rendered unfit for human consumption.

Cheese.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to August 1, 1913— Cheese -----	-----	1	-----	-----	1
August 1, 1913, to July 1, 1914— Cheese -----	-----	1	-----	1	2
Totals, 1912-1914 -----	-----	2	-----	1	3

Only three samples of cheese were submitted, again due to the fact that the State Dairy Bureau has this matter under its jurisdiction. There was nothing objectionable with the samples, except that in one case the label was incomplete because the guaranty legend did not indicate a serial number, as the law requires, and in another the word "type" did not appear on the label.

Chocolate and Cocoa.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Chocolate and cocoa-----			5	10	15
August 1, 1912, to August 1, 1913— Chocolate and cocoa-----		1	15	3	19
August 1, 1913, to July 1, 1914— Chocolate and cocoa-----	1		11	6	18
Totals, 1912-1914-----	1	1	26	9	37

It will be noted from an inspection of the foregoing table that thirty-seven samples of chocolate and cocoa were examined during the period covered by this report. Of these, twenty-eight were found to be in violation of the law, the main infringement being that the substance was labeled "chocolate" when analysis indicated that the label should have been cocoa, or in some cases, a mixture of chocolate and cocoa. The same condition of affairs exists now with reference to this product, as indicated in the last report. It must be thoroughly understood, as stated previously, that there is nothing objectionable in any way to cocoa as a beverage. For many it is far more suitable than chocolate, in that the cocoa contains less fat than does the chocolate. At the same time, the cocoa is cheaper than the chocolate, and for that reason continued inspection and analysis is necessary to protect both the honest manufacturer and the consumer.

Coffee.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Coffee-----	8		1	24	33
August 1, 1912, to August 1, 1913— Coffee-----			3	116	119
August 1, 1913, to July 1, 1914— Coffee-----			1	41	42
Totals, 1912-1914-----			4	157	161

One hundred and sixty-one samples of coffee have been tested at the laboratory during the past biennial period. Of these by far the larger portion consisted of samples submitted by state institutions to ascertain whether or not they met the required specifications. In very few instances were any infringements found, and these were due mainly to the presence of chicory in the coffee, such not being indicated on the label.

Six samples of coffee extracts, so called, were submitted to the laboratory by inspectors for examination. These, in the main, represent very old goods, which were manufactured previous to the passage of the food law. They are illustrations of the practice of a good many country grocers, who still retain on their shelves goods which should have been removed years ago. The examination of these extracts show that they are both adulterated and mislabeled, in that they contain no caffeine. Extract of coffee should contain more caffeine than is found in coffee itself.

Coffee Substitutes.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to July 1, 1914— Coffee substitutes -----	-----	4	-----	27	31

The infringements of the food law in connection with coffee substitutes lies mainly in the exaggerated statements concerning the nutritive value of these products. For those who find coffee injurious, coffee substitutes are to be recommended, but those using such should be familiar with the fact that there is very little nutriment in the decoctions made from the cereal compounds. Very little nutriment originally contained in any of the cereals is dissolved by treatment with water. If, however, the coffee substitutes contain fruits, sugars, etc., naturally these will appear in the preparations when made. It can be safely said though that the main nourishment in these coffee substitutes lies in the cream or milk and sugar used. The hygienic value of a hot drink is not here discussed; it is merely a question of nutritive value of these coffee substitutes. In this connection it should also be said that coffee or tea, as such, carry no nutriment, but possess the stimulating effect which for some may be injurious, and for others not.

Mixtures, Coffee, Etc.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to July 1, 1914— Coffee, mixtures, etc.-----	-----	-----	1	1	2

There is no objection to the manufacture and sale of such mixtures, provided they are properly labeled, and in this connection it should be said that the labels should plainly and prominently indicate the mixture contained in the package. When such is done there is no infringement whatever, and for many a mixture of coffee and chicory is preferred to plain coffee; but the chicory being much cheaper than coffee, emphasizes from a pecuniary standpoint the necessity of proper labeling.

Colors.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Colors -----	27	14		49	90
August 1, 1912, to August 1, 1913— Colors -----	2			2	4
August 1, 1913, to July 1, 1914— Colors -----				1	1
Totals, 1912-1914 -----	2			3	5

The United States Department of Agriculture still allows the use of artificial colors in food and food products, provided the use of such colors is indicated on the label, in accordance with the Food Inspection Decisions of the Department. The colors which are allowed are indicated in Food Inspection Decisions 76 and 77. These colors are expensive, and in consequence thereof there are on the market many cheaper colors which are sold to dealers. The dealer, however, has protection if he will be careful to require of the manufacturer or jobber a guaranty properly worded.

Condiments.

It is very encouraging to report that the number of adulterated and misbranded sauces and condiments is far less than was the case two years ago. Each year the percentage of sauces conforming to the law is greater. For the period covered from January, 1908, to August, 1912, upwards of 50 per cent of the samples examined were found to be in violation of the law. During the past year less than 20 per cent of the samples tested were found to be objectionable, and of these the main infringement was mislabeling; the percentage of actual adulteration being less than 5 per cent.

Confectionery.

August 1, 1913, to July 1, 1914— Confectionery -----	2			7	9
Totals, 1912-1914 -----	2	5		26	33

Of the thirty-three samples of candy examined only seven infringements were noted. Of these but two could be placed in the adulterated class. Many of the colors and flavors which are used in candy are artificial, but are allowed by law, and it should be said to the credit of the candy manufacturers that they are, as a class, cooperating with the Board of Health in the matter of properly labeling candies containing artificial colors and flavors.

Crackers.

Totals, 1912-1914 -----				6	6

Very few samples of cream were analyzed, such examinations as were made being incidental to the inspection of restaurants. There was nothing objectionable found with the samples submitted.

Eggs.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Eggs -----	1	89	2	30	122
August 1, 1912, to August 1, 1913— Eggs -----	6	21	-----	28	55
August 1, 1913, to July 1, 1914— Eggs -----	2	8	-----	18	28
Totals, 1912 to 1914-----	8	29	-----	46	83

The tabulated data published in the previous report showed that practically 75 per cent of the eggs examined were mislabeled, in that they were labeled "fresh" when they were either old or cold storage. The figures submitted for this report would indicate a considerable improvement in this direction, as less than one third of the samples examined were found to be misbranded. It is to be hoped that this improvement will continue. Since the publication of the last report, the cold storage law has gone into effect, regulating the sale of foods under cold storage, including eggs and butter. The wording with reference to these two articles of food is as follows:

The term "cold stored" as used in this act shall be construed to mean the keeping of "articles of food," excepting eggs and butter, in "cold storage" for a period exceeding thirty days; *provided, however,* that when the term "cold stored" is used in connection with eggs and butter, it shall mean the keeping of these "articles of food" in "cold storage" for any length of time whatever. The term "articles of food" as used in this act shall be construed to mean and include fresh meat, and fresh meat products (except in process of manufacture), fresh fruit and vegetables, fish, shellfish, game, poultry, eggs, butter and cheese.

Egg Substitutes.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1913, to July 1, 1914— Egg substitutes -----	-----	-----	1	3	4

Seven samples of egg substitutes were received at the laboratory, the examination of which resulted as above indicated.

It may be said in discussing this article that if a material is to be used as a substitute for egg it should have to some extent the food value of the egg. It is well known that eggs are one of the best foods for man, and from the standpoint of nutrition an ordinary baking powder, with a little extra starch or flour and with one tenth per cent or so of albumen cannot be called, under any circumstances, a substitute for eggs. Such substitutes, it would seem, are nothing more or less than baking powders, and it will be noticed that the label generally states, "No baking powder required when this is used." Naturally not, because two doses of baking powder are not required for one cake.

It may be said, from the legal standpoint, in view of the fact that such labels often state, "the powder is not made from eggs," that there is no objection, but it would appear that the word "substitute" implies and involves a material, in the case of eggs, having the food value equal to that of eggs, or approximating that of eggs—otherwise, how is it a sub-

stitute? Eggs are used in baking for the purpose of increasing the food value and palatability, as much as for the mechanical effect. Again, when eggs are used, baking powder is also used in nine cases out of ten, and in ten cases out of ten by the best class of housewives and housekeepers.

In this connection, it is of interest to note that the Department of Agriculture has issued a circular of information with reference to this subject, as follows:

The Department of Agriculture has recently received letters from a number of persons who desire to place a product on the market under the name "Egg Powder" or "Egg Substitute." These designations would undoubtedly lead the ordinary purchaser to believe the product either to be made from eggs or to have the effect of eggs in baking. In reality, the product is nothing but a baking powder containing a considerable excess of ground rice as a filler and colored yellow with powdered tumeric.

The Food and Drugs Act prohibits the sale of food products under false or misleading names and as it is evident that a product of this kind cannot be regarded in any way as a substitute for eggs in baking, its sale as an egg powder or egg substitute is not sanctioned by the department.

An examination of the foregoing table would convey the impression that during the past biennial period little improvement had been made

in the quality of the extracts which are placed on the California market. This is not in accordance with the facts of the case. There is a decided improvement with reference to the output of these products. The data represents the examination of samples submitted, but does not cover the inspection of samples on the market. There has been great advance in the matter of labeling extracts, which advance is not apparent in the above table. The inspectors, in taking up samples of these extracts, exercise a certain amount of discretion in collecting samples which they really suspect require examination. Therefore, while the per cent of nonconformity with the law is practically as great as is shown by figures for previous years, there is, however, in accordance with the foregoing, actual improvement in these matters. It is very encouraging to note that the sale of dilute extracts is prohibited in this State, unless such dilute extracts are properly labeled. This action is taken in accordance with the advice received from the Bureau of Chemistry, as indicated by the statement quoted below.

The infringements are similar to those reported previously: For lemon extracts, low content of oil and artificial color; for vanilla extracts, the presence of coumarin and vanillin not reported on label; for essence of peppermint, low content of oil; for Jamaica ginger, dilute in every respect, the label not indicating such dilution; for pineapple and banana extracts, artificial colors and flavors not indicated on the label.

The board is of the opinion that sub-standard extracts should bear a plain statement on the label to show their actual strength, some such phrase as one half strength, or one fourth strength, etc. This statement of strength should so appear on the package in color and background that it will be as clearly legible as the main portion of the label.

Fish, Shellfish, Etc.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Fish -----	7	9	-----	61	77
August 1, 1912, to August 1, 1913— Fish -----	-----	3	-----	15	18
August 1, 1913, to July 1, 1914— Fish -----	1	-----	-----	2	3
Totals, 1912-1914 -----	1	3	-----	17	21

The main infringements found in the examination of the samples of fish here recorded were due to the use of benzoate of soda as a preservative, such use not being indicated on the label. In one case, however, the fish was found to be decomposed, putrid, and unfit for human consumption. More extensive investigation of samples of dried fish is hardly called for, in view of the fact that these enter very largely into interstate commerce, and, therefore, the federal laboratories control the inspection and examination of all such foods and food products.

Flour.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Flour -----	3	11	1	85	100
August 1, 1912, to August 1, 1913— Flour -----				72	72
August 1, 1913, to July 1, 1914— Flour -----				56	56
Totals, 1912-1914 -----				128	128

One hundred and twenty-eight samples of flour were submitted to the laboratory. By far the larger number of these samples were sent from state institutions, representing their deliveries for consumption at the respective institutions.

The specifications for flour to be delivered to the state institutions call for a gluten (protein) content of not less than 10 per cent. Nineteen samples were found to be below the requirements in this respect, in that the content of gluten was less than 10 per cent, the minimum being 7.86 per cent. It must be remembered, however, that such flours, while not meeting the specifications of the state institutions, still cannot be considered as adulterated, mislabeled, or misbranded within the meaning of the California Pure Food Act. The standard for flour under this act is as follows:

Flour is the fine, clean, sound product made by bolting wheat meal, and contains not more than thirteen and one half (13.5) per cent of moisture, not less than one and twenty-five hundredths (1.25) per cent of nitrogen, not more than one (1) per cent of ash, and not more than fifty hundredths (0.50) per cent of fiber.

It is, therefore, seen that even the flour which rated the lowest in protein (7.86) is still above the state standard, as indicated.

Fruit.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Fruit -----		7	2	25	34
August 1, 1912, to August 1, 1913— Fruit -----	2	3		11	16
August 1, 1913, to August 1, 1914— Fruit -----	1			12	13
Totals, 1912-1914 -----	3	3		23	29

The samples of fruits examined consist of frozen lemons, frozen oranges, and dried fruits. The only infringements found were in the cases of the lemons and oranges, which were badly frozen and should not have been exposed or offered for sale. It should be stated, to the credit of the lemon and orange growers, that they use their best effort to prevent the use of frozen fruit by the consumer, and in this matter cooperated very heartily with the State Board of Health.

Honey.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Honey -----		4	10	34	48
August 1, 1912, to August 1, 1913— Honey -----				5	5
August 1, 1913, to July 1, 1914— Honey -----				4	4
Totals, 1912-1914 -----				9	9

While only a few samples of honey were examined during the past two years a very large number were inspected, with the result that only those which were suspected of being adulterated or misbranded were submitted to the laboratory by the inspectors. The analytical data shows that even in these cases the inspector was mistaken, in that none of the samples tested evidenced any infringements of the law.

Ice Cream.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Ice cream -----	18	8	18	170	214
August 1, 1912, to August 1, 1913— Ice cream -----		5	10	84	99
August 1, 1913, to July 1, 1914— Ice cream -----		2		18	20
Totals, 1912-1914 -----		7	10	102	119

One hundred and seventeen samples of ice cream were examined, with the result that only ten were found to be adulterated, in that the percentage of fat was below the standard of 12 per cent. two samples examined showing less than 6 per cent of butter fat.

Ice.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to July 1, 1914— Ice -----				7	7

The examination of ice above reported was made at the request of the President of the State Board of Health, with the object of detecting any pollution which might be present. It was feared that the pollution of ice was more or less responsible for some of the typhoid fever cases existing in the bay region.

Official samples were secured by an inspector of the State Food and Drug Laboratory. Each sample of ice was brought to the laboratory as a

large cake. A portion of the inner part was taken. The pieces were rinsed with sterile water and were allowed to melt in a sterile container. The sample thus procured was examined according to the standard methods of water analysis of the American Public Health Association. The bacterial count of organisms which developed on agar plates incubated at 37 degrees was determined in each instance and tests were made in all cases for the presence of colon bacilli. It is encouraging to state that in all cases the test for colon bacilli was negative.

The chemical examinations of the different samples showed no pollution.

Jams and Jellies.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Jams and jellies-----	19	27	1	78	125
August 1, 1912, to August 1, 1913— Jams and jellies-----		1	2	12	15
August 1, 1913, to July 1, 1914— Jams and jellies-----		3	1	27	31
Totals, 1912-1914-----		4	3	39	46

It will be noticed that of the forty-six samples tested but seven were found to be in any way objectionable in the eyes of the law, the infringements consisting of the substitution of a cheaper jelly or jam than the one stated on the label, in most cases the cheaper jelly being apple.

Lard.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Lard-----	5	1		9	15
August 1, 1912, to August 1, 1913— Lard-----			1	2	3
August 1, 1913, to July 1, 1914— Lard-----				2	2
Totals, 1912-1914-----			1	4	5

A comprehensive examination of lards, meat, and meat food products in general is undertaken by the Bureau of Animal Industry, which maintain a well equipped laboratory in San Francisco. Nearly all the lards that are sold in this State are manufactured by establishments which are under federal inspection. It is therefore not necessary that the State Food and Drug Laboratory devote much attention to this food product. Five samples only were submitted, with the result that one was found adulterated, in that it contained 4 per cent of foreign fats.

Liquors.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Liquors -----	5	7	5	30	47
August 1, 1912, to August 1, 1913— Liquors -----		2	6	13	21
August 1, 1913, to July 1, 1914— Liquors -----	1	4	8	10	23
Totals, 1912-1914 -----	1	6	14	23	44

The infringements in connection with liquors consist in the main of brandies and whiskies being sold or offered for sale containing less than the required amount of alcohol, the standard for whisky being 40 per cent by volume of alcohol. Samples of whisky have been examined showing but 32 per cent of this ingredient. Another infringement is the substitution of port wine for cordials. Another form of infringement of the law is in the matter of labeling, in that the label would seem to indicate that the article is of foreign production, whereas in truth and in fact it is made within the state limits. This fact should be indicated on the label.

Meats.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total

Totals-----	21	5	4	84	114
Totals, 1912-1914-----	41	32	55	195	323

The above table indicates very markedly the necessity of continued and stringent inspection of meat and meat food products. Out of 323

samples examined about one third were found to be either adulterated or mislabeled. Unfortunately the adulterations still consist in the addition to the meat of sulfites, the use of which is prohibited by the State Board of Health in meat and meat food products.

As stated previously, benzoate of soda may be used, provided the amount used and the use of the same is properly stated on the label or on a placard or sign properly worded and prominently displayed in the store where such prepared meat is offered for sale. In a previous report reference was made to the use by butchers of certain compounds containing benzoate of soda and bearing a guaranty legend and serial number. It must be again emphasized that if a butcher uses such a compound, containing benzoate of soda, he must so indicate such use by the sign just referred to. The preparation sold to the butcher merely acts as a carrier for the benzoate of soda, and because the label on a package of such a preparation contains a guaranty legend the butcher is not relieved of the responsibility of displaying the proper label or sign.

There still appears to be a misunderstanding in the minds of some butchers regarding the use of cereals in sausage or chopped meat. As has been stated in previous reports, the law fully countenances such admixture, but the label or placard must plainly and properly inform the purchaser that such meat or meat food product contains cereal. The name of the cereal need not be given.

Milk (Fresh).

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Milk -----	18	3	19	76	116
August 1, 1912, to August 1, 1913— Milk -----		4	5	18	27
August 1, 1913, to July 1, 1914— Milk -----			3	5	8
Totals, 1912-1914 -----		4	8	23	35

The extensive inspection and examination of milk by the State Dairy Bureau makes it unnecessary for the State Food and Drug Laboratory to devote much time and attention to this food, important as it is. About thirteen samples only were submitted in connection with the inspection of restaurants, hotels, etc. Of these, eight were found to be below standard, in that the fat content was less than 3 per cent.

Four samples of milk were submitted to the laboratory labeled as certified milk. These, upon examination, were found not to be certified milk, in that the milk was not produced in accordance with the state law covering certified milks. Those in question were ordinary milks improperly labeled.

Buttermilk, Dry.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to August 1, 1913— Dry buttermilk -----				1	1

A sample of dry buttermilk was examined, with the result that it was found to be true to name and fully met the standards for such a food product.

Milk, Evaporated.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Evaporated milk -----	15		1	65	81
August 1, 1912, to August 1, 1913— Evaporated milk -----	2	1	2	37	43
August 1, 1913, to July 1, 1914— Evaporated milk -----			12	8	20
Totals, 1912-1914 -----	2	1	14	45	63

With reference to the examination of evaporated milk—that is, unsweetened condensed milk—it must be said that there is still sold on the California markets samples of this food product which do not meet the requirements of Food Inspection Decision 131, which requires that the total solids shall not be less than 26.5 per cent, or the fat not less than 7.8 per cent, or the sum of the total solids and of fat, not less than 34.3 per cent. The infringement in a very few of the samples examined was the fat content being below the legal requirements. The total solids in some cases did not reach 24.5 per cent. In those with a fat content of above 8 per cent the total solids, plus the fat content, did not amount to more than 32.5 per cent, whereas the standard is 34.3 per cent. It may also be said in this connection that a large number of samples showed that the requirement 34.3 per cent for the sum of the total solids, plus the fat, was not an excessive figure, in that the figures for such samples in some cases reached as high as 38.6 per cent, others 36.7 per cent, and others 37.3 per cent, etc.

Miscellaneous Materials.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total

August 1, 1913, to July 1, 1914—					
Oils, edible -----				7	7
Totals, 1912-1914 -----		1		29	30

The data submitted for olive oils in the last report shows that there was no adulteration of olive oil found. During the period covered by this report thirty samples of olive oil were tested, with the result that no adulteration was found. There was only one case of misbranding, and that was as to locality, etc. There have been complaints made to the laboratory to the effect that olive oil on the market is adulterated, but upon careful investigation of each complaint and an examination of a sample of oil collected as result of such complaint no evidences of violations were found. It may be truly said that the olive oils as found on the market are pure. It is true there are a large number of different varieties of olive oil, no two being alike with reference to taste, color, or general appearance. If a consumer has been accustomed to one brand of oil made from one variety of olives and then changes to another brand, which is decidedly different in color and taste, there is a natural inference on the part of the consumer that such oil is not pure.

There is also a great difference in color and taste between the imported olive oil and the California olive oil, but, so far as examinations have been made, the imported is as pure as is the California.

Pastes.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Pastes -----	1	10	5	34	50
August 1, 1912, to August 1, 1913— Pastes -----		5	4	10	19
August 1, 1913, to July 1, 1914— Pastes -----		2	9	13	24
Totals, 1912-1914 -----		7	13	23	43

Forty-three samples of pastes, which include macaroni, vermicelli, noodles, etc., were submitted by inspectors and state institutions to the laboratory for examination and analysis. The result of the tests indicates that a little less than 50 per cent were in violation of the law. These violations are, in the main, of two classes: (1) the coloring of macaroni, vermicelli, etc., and the label on the package not indicating such additional color, (2) the selling of pastes labeled egg noodles, which in fact contain very little, if any, egg, whereas genuine egg noodles contain as much as or more than one and one half eggs per pound of flour. It is to be regretted that the Department of Agriculture, Bureau of Chemistry, has not yet issued any standards in this respect. What is needed for the best work is a standard indicating the number of eggs per pound of flour which should be used in the manufacture of egg noodles. The number of eggs incorporated in the noodles should correspond very closely to that customarily used by the housewife when making this product.

Pastry Fillers and Cake Icings.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to August 1, 1913— Cake icings, etc.-----	3				3
August 1, 1913, to July 1, 1914— Cake icings, etc.-----	1	2		1	4
Totals, 1912-1914 -----	4	2		1	7

Seven samples of pastry fillers and cake icings have been examined, the main infringements being misleading statements on the labels concerning the value of these pastry fillers and cake icings as compared with egg.

Preservatives.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Preservatives -----		1		5	6
August 1, 1912, to August 1, 1913— Preservatives -----				5	5
August 1, 1913, to July 1, 1914— Preservatives -----				2	2
Totals, 1912-1914 -----				7	7

Under this heading it must not be inferred from the data here submitted that preservatives are allowed in food and food products. The data merely indicates that the preserving compounds examined were permissible under the law, in that they contain either sodium benzoate, saltpeter, or harmless compounds not prohibited by the food law.

Rice.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Rice -----		11	6	30	47
August 1, 1912, to August 1, 1913— Rice -----		2		3	5
August 1, 1913, to July 1, 1914— Rice -----				11	11
Totals, 1912-1914 -----		2		14	16

The inspection of the rice, as sold or offered for sale by the dealers throughout the State, shows, with the exception of a very few cases, this product to be properly labeled—that is, if the rice is coated or polished the label so indicates. The polished rice has not the same nutritive value as the unpolished, but, like the golden yellow dried fruit, presents a better appearance to the consumer, and therefore has a ready sale.

Sago and Tapioca.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Sago and tapioca.....	9			4	13
August 1, 1912, to August 1, 1913— Sago and tapioca.....				4	4
August 1, 1913, to July 1, 1914— Sago and tapioca.....				2	2
Totals, 1912-1914				6	6

During the biennial period, 1912 to 1914, but six samples of sago and tapioca were examined. These showed no evidences whatever of adulteration, mislabeling, or misbranding. As these articles enter largely into interstate commerce in original packages, the federal government is also inspecting and examining such products periodically.

Salt.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Salt				2	2
August 1, 1912, to August 1, 1913— Salt		3		15	18
August 1, 1913, to July 1, 1914— Salt				3	3
Totals, 1912-1914		3		18	21

Of the twenty-one samples of table salt which were tested at the laboratory, a large number were collected officially by the inspectors, the remainder being submitted by state institutions representing the supplies furnished them. Misbranding was found to occur in three cases due to incorrect declaration of place of manufacture and extravagant claims as to the quality of the products. As far as the purity is concerned, they all proved to be of very high grade and thoroughly satisfactory for either table purposes or dairy use.

Soapbark Preparations and Foam Producers.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1913, to July 1, 1914— Soapbark -----	4	-----	-----	1	5

Five samples of foam producers were examined with the result that only one was found not to contain saponin. The use of saponin is to be discouraged in the foam preparations. There are other compounds which are equally as good and do not contain this injurious ingredient.

Soups, Canned.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Soups, canned -----	-----	-----	-----	6	6
August 1, 1912, to August 1, 1913— Soups, canned* -----	-----	-----	-----	-----	-----
August 1, 1913, to July 1, 1914— Soups, canned -----	-----	-----	-----	1	1

*None received.

The State Laboratory has not examined canned soups or canned meats to any extent, due to the fact that these food products are manufactured by establishments which carry on interstate business. These establishments, therefore, are under federal inspection and are governed by its strict rules and regulations. Under these conditions it would be more or less a waste of time to duplicate the work carried on by the federal laboratories. More particularly is this true when it is remembered that the California law and the national law are practically identical.

Spices.

An inspection of the figures in the above table will indicate a marked improvement in the quality and purity of the spices. It will be noticed that there are very few violations recorded for the past two years. It may be said that practically all of the old spices are off the market and that the stock found in the stores of the country merchants are of good quality and properly labeled. An exception, perhaps, to this may be found in mace. Bombay mace, a variety having very little value as a spice, is frequently substituted for true mace or mixed with true mace. This substitution should not be practiced unless the label clearly indicates this fact.

Starch.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to August 1, 1913— Starches -----				4	4
August 1, 1913, to July 1, 1914— Starches -----				6	6
Totals, 1912-1914 -----				10	10

The data here recorded for starch was obtained by testing ten samples of this product as submitted by the different State Hospitals. Specifications were in some cases for wheat starch, in other cases, potato starch, etc. The samples submitted corresponded to the labels and met the specifications required. It might be said in this connection that probably in the future there will be a much more extended use of starch than at present. This is emphasized by the following extract from a publication by the United States Department of Agriculture:

Potato, arrowroot, and probably tapioca and sago starch pastes are not made more easily digestible by long continued cooking. On the other hand, the cereal starches are made more easily digestible by long cooking, though the change occurs very slowly and perhaps the increased digestibility is not sufficiently great to justify the trouble, under ordinary circumstances at least, for separated starch such as is used in cookery. However, in the case of starch still inclosed in cellulose cells, as in many starchy foods, the long continued cooking may be necessary. The commercial preparations of corn starch require 30 to 40 minutes' cooking because of the improvement in flavor which results.

Skin formation as well as lumps should be avoided in cooking starch—the latter contain raw starch, the former reverted amyloextrin, and both are very slow of digestion.

The selection of potato starch instead of corn or wheat starch for thickening sauces, in accordance with the custom of French cooks, is rational, since it contains no rose amylose and so forms a clearer and more digestible sauce, and since it does not require 40 minutes' boiling for improvement in flavor, as is the case with corn starch.

Sugars.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912— Sugars -----	3	3	8	23	37
August 1, 1912, to August 1, 1913— Sugars -----	1		1	9	11
August 1, 1913, to July 1, 1914— Sugars -----			1	14	15
Totals, 1912-1914 -----	1		2	23	26

The examination of sugars did not reveal any adulteration in the sugars as such. The infringements noted were in connection with compounds containing sugar and acid prepared for making lemonade. In one instance, the label indicated lemon and citric acid, whereas tartaric acid was found. In two other samples, the sugar was artificially colored without such fact being indicated on the label.

Syrups.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912—					
Syrups, table -----	8	16	29	76	129

Totals -----	2	12	4	25	43
Sugars -----			1	14	15
August 1, 1913, to July 1, 1914—					
Syrups, table -----		1	4	9	14
Syrups, flavoring -----		4	4	2	10
Totals -----		5	8	11	24
Totals, 1912-1914 -----	2	17	12	36	67

Sixty-seven samples of syrups were examined during the biennial period covered by this report. The data shows that there is still a very large percentage of mislabeling in connection with these foods, the chief infringement being that the syrups were of a lower grade than that indicated by the label. There were some cases of misbranding with reference to name and address of manufacture.

Tea.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
August 1, 1912, to August 1, 1913—					
Tea -----	1			90	91
August 1, 1913, to July 1, 1914—					
Tea -----				45	45
Totals, 1912-1914 -----	1			135	136

The examinations of tea were undertaken as part of the cooperative work between the State Board of Health and the Board of Control, which has been previously referred to. The one sample which was adulterated, as indicated by the table, was not submitted from a state institution but was collected by an inspector. The tea was found to be colored with Prussian blue, which is in violation of the law.

Canned Vegetables.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	
January 1, 1908, to August 1, 1912— Vegetables, canned -----		3	2	6	11
August 1, 1912, to August 1, 1913— Vegetables, canned -----	2	1		19	22
August 1, 1913, to July 1, 1914— Vegetables, canned -----	33	1		18	52
Totals, 1912-1914 -----	35	2		37	74

It will be noticed that seventy-four samples of canned vegetables have been examined in the past two years. The majority of these samples were canned peas colored with copper sulfate. The sale of peas and other vegetables colored with copper sulfate was prohibited by the issuance from the United States Department of Agriculture, of Food Inspection Decisions 148 and 149. These decisions were issued as a result of the work of the referee board, the conclusions of this board being as follows:

(a) Copper salts used in the coloring of vegetables as in commercial practice can not be said to reduce or lower or injuriously affect the quality or strength of such vegetables as far as the food value is concerned;

(b) Copper salts used in the greening of vegetables may have the effect of concealing inferiority, inasmuch as the bright green color imparted to the vegetables simulates a state of freshness they may not have possessed before treatment;

(c) In attempting to define a large daily quantity of copper regard must be had to the maximum amount of greened vegetables which might be consumed daily. A daily dose of 100 grams of coppered peas or beans, which are the most highly colored vegetables in the market, would not ordinarily contain more than 100 to 150 milligrams of copper. Such a bulk of greened vegetables is so large, however, that it would hardly be chosen as a part of a diet for many days in succession. Any amount of copper above 150 milligrams daily may, therefore, be considered excessive in practice. A small quantity is that amount which in the ordinary use of vegetables may be consumed over longer periods. From this point of view 10 to 12 milligrams of copper may be regarded as the upper limit of a small quantity.

It appears from our investigations that, in certain directions, even such small quantities of copper may have a deleterious action and must be considered injurious to health.

The Food and Drugs Act of June 30, 1906, provides that a food is adulterated "if it contain any added poisonous or other added deleterious ingredient which may render such article injurious to health." The act also provides that a food is adulterated "if it be . . . colored . . . in a manner whereby damage or inferiority is concealed." It is apparent from the findings of the referee board that all foods greened with copper salts are positively adulterated under the first above quoted provision of the law, and that in certain cases foods may be adulterated under the second above quoted provision.

Food Inspection Decision 149 reads:

Paragraph 4 of Food Inspection Decision 148 is hereby modified to read as follows: "The secretary of agriculture, therefore, will regard as adulterated, under the Food and Drugs Act, foods greened with copper salts which, on and after January 1, 1913, are offered for entry into the United States or are manufactured or offered for sale in the District of Columbia or the territories, or which, on and after May 1, 1913, are shipped in interstate commerce."

This decision became automatically part of the California law, in accordance with section 3 of the state law. The inspectors of the State Board of Health warned the retailers concerning this matter carefully, but in many instances such warnings were not heeded. There followed, therefore, a collection of official samples and the dealers in question were

cited to appear before the State Board. The figures indicating the work of the last year proves that this activity was necessary, in that out of fifty-one samples collected thirty-three were found adulterated, that is, the peas were colored with copper sulfate. It is to be hoped that the next report will show that no more peas colored with copper sulfate are being sold.

Vinegars.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912—					
Vinegars, cider -----	1	14	58	245	318

Vinegars, cider -----	1		13	37	51
Vinegars, wine -----			4	5	9
Totals -----	1		17	42	60
Totals, 1912-1914 -----	1	2	21	87	111

The necessity for continued inspection and examination of vinegars is well emphasized by the table here presented. During the past two years, sixty samples of vinegar were examined, with the result that seventeen were found to be adulterated and misbranded, the adulterations in the main being due to the substitution of some other vinegar for cider vinegar, the label not indicating such substitution.

Water.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total
January 1, 1908, to August 1, 1912—					
Water -----		53		10	63
August 1, 1912, to August 1, 1913—					
Water -----			2	2	4
August 1, 1913, to July 1, 1914—					
Water -----		3		25	28
Totals, 1912-1914 -----		3	2	27	32

Twenty-eight samples of waters were tested at the State Laboratory from August, 1912, to July, 1914. The samples submitted included those from city water supplies, mineral waters, well waters, etc. The infringements noted, three in number, were due to false statements, on the labels, concerning either the origin or the character of the water.

MISCELLANEOUS MATERIALS.

Blankets.

The examination of blankets was undertaken as part of the cooperative work between the State Board of Health and the State Board of Control in the matter of examining supplies furnished to state institutions. Seventy-one samples of blankets were submitted during the biennial period covered by this report. Of these, twenty-one failed to meet the specifications in that they contained upwards of thirty per cent of cotton, such percentages ranging from thirty-four to seventy-two. It is understood that for certain purposes, a cotton blanket is to be preferred to a woolen blanket, but when specifications call for a blanket containing not more than thirty per cent of cotton, the blankets submitted should be in accordance with such data.

Coal.

Seven samples of coal were submitted from state institutions with the result that all were found to meet specifications. The samples represented first class articles.

Cutlery.

The laboratory has received eleven samples of cutlery—knives, forks, and spoons—from state institutions. The examinations indicated that only one was deficient in the amount of nickel called for in the specifications, in that the sample contained six per cent, whereas the specifications call for not less than ten.

Lubricating Oils.

Forty samples of oil were submitted by different state institutions to the laboratory for examination, the results of the chemical tests showing thirty to meet the specifications, while ten were deficient in that the flash point was lower than it should have been, indicating a poorer quality of oil.

Soaps.

The laboratory has examined eight different samples of soaps, soft and hard, including washing and toilet soaps, with the result that all were found to fully meet the requirements specified by the State Board of Control.

Factory Wastes.

Eighteen samples of factory wastes were examined during the past two years. Of these thirteen were submitted by the State Fish and Game Commission. The analyses were made to determine the presence or absence of appreciable amounts of crude oil, lampblack, and tar. These wastes were discharged into San Francisco Bay and therefore it was necessary to conduct the examinations just referred to in order to determine whether or not the state law, which prohibits the depositing of certain materials injurious to fish into the bay, was being violated. All samples examined were found to contain either lampblack or crude petroleum or both.

Sewage.

During the first year of the biennial period, nine samples of sewage were examined, representing cooperative work between the city of Stockton and the State Board of Control. This was to determine the chemical composition of the sewage of the city of Stockton in connection with a comprehensive examination of such sewage by the American Engineering Corporation of San Francisco, C. E. Grunsky, president.

Reagents.

Another small piece of cooperative work in connection with chemical analyses, was the testing of seven samples of reagents used in water analysis for the department of health of the city of Stockton. Four of these were found to meet the requirements, while three did not.

Per cent-----	1.8	5.7	38.2	54.3	100

The reports of the visits of drug inspectors during the last year would indicate that the conditions are greatly improved. The improvement may be noted along several different lines.

(1) With reference to labeling: The labels for nearly all the drugs are now in accordance with the provisions of the California Drugs Act. It is true there are exceptions.

(2) The crude drugs, such as herbs, etc., are in far better condition at present writing than was instanced two years ago. Statements have been published to the effect that a large proportion of the herbs now on sale in the drug stores are wormy and unfit for use. The reports of the drug inspectors made to the State Laboratory would certainly appear to refute absolutely such statements.

(3) Old proprietary remedies and new, are labeled in accordance with the provisions of the drugs acts, both state and federal.

The tables here presented, while indicating the numbers of drugs analyzed and those which conform to the law, do not represent the total amount of work which has been accomplished along this line. A con-

siderable number of alkaloidal drugs have been tested, but the examinations were not completed in time to be included in this report. It may be said, though, in advance, that the results of such examinations indicate that these important drugs conform to the usually accepted standards for such remedies. It has been stated by some that these drugs, now sold in California, are not up to standard, but considerably below. Examinations made at the State Laboratory do not confirm such statements. The data in connection with the examination of drugs included in the last report and summarized in the above tables, indicate that over one hundred samples of headache remedies were examined, with the result that nearly all were found to be mislabeled. As a result of this activity shown by the laboratory in the examination of these remedies, it is a difficult matter for the inspector to find any of these remedies now mislabeled. The mislabeling consisted in the failure of the manufacturer to indicate on the label the use of certain drugs, in the preparation of the remedy, such as phenacetin, acetanilide, etc.

An inspection of the figures, showing the percentages of infringements, etc., for the last biennial period and those heretofore recorded, indicates that the percentage of drugs conforming to the law is increased 100 per cent. The data for the previous report shows that only about 25 per cent of the drugs examined conformed in all respects to the law. The corresponding figure for the last biennial period is in excess of 50 per cent. The improvement, however, is really greater than that indicated by the figures in the table, for the reason that the inspectors exercise a certain amount of discretion in the collection of samples and submit to the laboratory only those which are suspected of being adulterated or misbranded. In former years samples were submitted without the use of such discretion in order to ascertain the exact condition of the different remedies and drugs as sold.

A large number of samples of spiritus ætheris nitrosi and spiritus ammoniæ have been collected and examined. The results are not ready for presentation at this time. There has been considerable criticism made in connection with this investigation on the ground that both sweet spirit of nitre and aromatic spirit ammonia were of such volatile nature that it was impossible to have them retain their strength, in accordance with the standard, for any length of time. The answer to such criticisms is that these are two very important drugs, and, while they are of a volatile nature, the loss will not be as great as is claimed by any means, if the drug is prepared and kept in accordance with the directions given in the United States Pharmacopœia. Such preparations should not be kept for any length of time. New batches should be made up periodically.

The report of the Food and Drug Commissioner of Michigan for 1913, contains results of an investigation on the deterioration of spirits of nitrous ether. The details of this report are exceedingly interesting and important and it therefore appears that it would not be out of order to reprint the data here.

Spirits of nitrous ether or commonly called spirits of nitre, is defined by the 5th revision of the United States Pharmacopœia as "An alcoholic solution of ethyl nitrite yielding, when freshly prepared and tested by the method given in the U.S.P., not less than 4 per cent of the ethyl nitrite.

That this 4 per cent of ethyl nitrite is easily lost under improper conditions is a matter of common knowledge among those who have anything to do with this preparation. Reports of various state departments charged with the enforcement of the

drug laws show that this preparation has caused more or less trouble. It appears that the fault lies mainly in the manner in which it is stored. In the state of Michigan the records of the laboratory show that during the year of 1912 over 75 per cent of the samples examined were found to fall below the required standard of the U.S.P. When some of the manufacturers of these preparations were asked to explain why their spirits of nitrous ether did not conform to the U.S.P. their reply was that it is impossible to keep such a volatile preparation for any length of time and have it of standard strength. However, investigation into the manner in which such pharmacists stored their preparations generally disclosed the fact that they were not keeping it in strict accordance with the U.S.P. directions; only making a half-hearted attempt, if making any at all, to store it as their pharmacopœia told them to.

In order that we might enlighten these people, this laboratory started an experiment some time ago, to determine the keeping qualities, so to speak, of spirits of nitrous ether. The plan of the experiment was to duplicate as nearly as possible conditions as may be found in any medium class drug store, by selecting bottles of various sizes and colors, by storing in a semi-dark place and at a temperature that could not be called cool. Thus it will be seen that the directions of the U.S.P. were not followed to the letter but were only attempted and carried out in an incomplete manner.

The experiment was conducted as follows: On March 5, 1911, a quantity of spirits of nitrous ether was made up and placed in seven bottles. The bottles used were ordinary half pound and one pound bottles, two of which were of amber glass, one green glass, and four flint glass bottles, such as may be found in any drug store. Each bottle when filled was securely fitted with an ordinary cork stopper. The bottle was then thoroughly shaken and an assay made of its contents.

The bottles were again securely stoppered and placed in a semi-dark place in a room adjoining the working laboratory, the temperature of which is about the same as that in the laboratory, viz., 65 degrees—75 degrees F. At the end of three months the bottles were removed and the contents assayed. This procedure was continued for a period of fifteen months, assaying the contents of the bottles at intervals of three months each, except the time between the fourth and fifth assays, when a period of four months elapsed, and the results tabulated in the following table:

TABLE I.

Size of bottle	Kind number	First assay, March 5, 1911. Time of filling	Second assay, June 5, 1911	Third assay, Sept. 5, 1911	Fourth assay, Nov. 5, 1911	Fifth assay, March 5, 1912	Sixth assay, June 5, 1912
1. 12 ounce -----	Amber	3.98	3.95	3.83	3.73	3.70	3.56
2. 12 ounce -----	Amber	3.99	3.86	3.73	3.61	3.53	3.45
3. 16 ounce -----	Green	3.95	3.88	3.81	3.71	3.66	3.60
4. 8 ounce -----	Flint	3.57	3.68	3.52	2.14	2.14	1.88
5. 8 ounce -----	Flint	3.94	3.77	3.42	3.41	1.25	-----
6. 16 ounce -----	Flint	3.95	3.72	3.42	3.42	3.20	2.94
7. 8 ounce -----	Flint	3.92	3.39	3.39	3.10	3.10	2.89

TABLE II.

Loss at end of—	2 months. 7 samples	6 months. 7 samples	9 months. 7 samples	12 months. 7 samples	15 months. 6 samples
Maximum -----	0.53	0.53	1.83	2.69	2.09
Minimum -----	0.03	0.14	0.25	0.28	0.35
Average -----	0.207	0.37	0.65	1.01	0.90

TABLE III.

Loss of samples stored in colored bottles at the end of—	3 months	6 months	9 months	12 months	15 months
Maximum -----	0.13	0.26	0.38	0.46	0.54
Minimum -----	0.03	0.14	0.25	0.28	0.35
Average -----	0.07	0.18	0.29	0.34	0.44

A study of the table will show that for the first six months the samples retained their strength very well, the maximum loss under these conditions being only .53 per cent with an average for the whole of only .37 per cent. The greatest loss during the entire time seems to be in the samples stored in the flint glass bottles, although with the exception of sample 4 the remainder kept fairly well for the first nine months. During the latter part of the experiment, however, the samples in the flint glass bottles decreased considerably, while those in the amber and green colored bottles decreased in strength only a small amount in the whole fifteen months and the decrease was quite regular; the maximum being but .54 per cent with an average of .44 per cent. It would therefore appear that spirits of nitrous ether, when manufactured properly so that it will contain 4 per cent ethyl nitrite when freshly prepared and stored in small dark colored bottles in a cool place will remain standard strength for a long period of time. The pharmacist should make up this preparation in such quantity that the whole can be disposed of in a period of six months. He then should have no fear that he is not dispensing a U.S.P. article all the time.

This laboratory is conducting a similar set of experiments which we confidently expect will confirm the results of the Michigan laboratory. This laboratory is also studying the deterioration of aromatic spirits of ammonia. The full details of this investigation will be published in the next report and also in The Monthly Bulletin of the State Board of Health as soon as the investigation is completed. As far as the experiment has progressed, seven weeks, it would appear that during the first ten days there was a loss of less than one per cent, and during the last five weeks there has been practically no loss whatever. In other words, the strength has remained constant and the loss for the seven weeks of the experiment has therefore been less than one per cent. This is greatly in contrast with the results of the examination of samples collected by inspectors, the majority of which show a loss of from 25 to 75 per cent. Such deficiencies are due to carelessness in the manufacture and keeping of the drug, in other words, not following out the directions of the United States Pharmacopœia.

SUMMARY OF ANALYTICAL WORK.

August 1, 1912, to July 1, 1914.

The results of the chemical and microscopical work of the State Laboratory for 1912-1914 are summarized in the subjoined tables:

A. FOODS AND FOOD PRODUCTS.
1912-1913.

Material	Number adulterated	Number misbranded	Number adulterated and misbranded	Number not in violation of California Pure Food Act	Total

Totals, miscellaneous materials.....	36	135	171
Per cent	21.06	78.94	100

It is encouraging to note in connection with the general summary for 1912 to 1914, above indicated, that the percentage of samples complying with the law is 72.3, which is far higher than any corresponding figure reported since the establishment of the laboratory (see Table I). The percentage of adulteration is low and similarly, with reference to the percentage of misbranding. It is true that the percentage of adulteration and misbranding is slightly higher than that noted for the previous year. One of the main food products which has caused this increase is pork sausage, the infringement consisting of a substitution of other meats for pork and the presence of cereals not stated on the label. This was the condition of affairs in 1912 and 1913. During the following year, 1913-1914, very few cases of misbranding were noted, indicating a marked improvement in this respect. The improvement just referred to is emphasized when we repeat statements that have been made in the foregoing data to the effect that inspectors, both food and drug, exercise far greater discretion in the submitting of samples than was possible in former years.

The following table shows the percentage of adulteration and misbranding for the seven years, 1908 to 1914. It will be noted by an inspection of the figures that with the exception of the year from 1910-1911, there has been a steady decrease in the percentage of adulteration and misbranding, and therefore, an increase in the percentage of samples complying in all respects with the Food and Drugs Act.

I. GENERAL SUMMARY, 1908-1914.
Food and Drugs.

	Per cent adulterated	Per cent mis-branded	Per cent adulterated and mis-branded	Per cent complying with the law	Total
To August, 1908	20.9	9.0	13.0	57.1	100
To August, 1909	9.7	22.8	9.9	57.6	100
To August, 1910	5.9	21.1	14.6	58.2	100
To August, 1911	14.3	36.1	2.4	47.2	100
To August, 1912	4.8	15.6	12.2	67.4	100
To July, 1914	5.0	8.7	14.0	72.3	100

It might not be out of place to repeat here a paragraph mentioned in the last report.

“While it is now generally understood that the names of certain definite substances must appear on the label, there are still many other instances in which some manufacturers and dealers think that a substance that is *allowed* need not be mentioned. This is especially true of such things as benzoate of soda, permissible artificial colors and flavors, and the addition of cereal to meat food products, etc.

“It is becoming more evident every year that the cases of wilful violation of the law are very few, and that there is very little tendency to backsliding on the part of those who have once succeeded in bringing their products up to standard.”

Conclusions and Recommendations.

While, as has been stated in previous reports and also in this report, that the quality and standard of food and drugs is increasing, it is only possible to keep on improving in this direction by constant and continued field and laboratory work. Without doubt, if the laboratory was discontinued we would have on the markets in a very short time, the same kind and quality of foods and drugs which were to be found galore previous to January, 1907, and for some time later. The necessary activity, however, can not be carried on without proper funds for the employment of inspectors, chemists, etc., and for properly maintaining a laboratory. The necessary work may therefore be divided into three heads—field work, laboratory work, and office work. The following itemized statement indicates the minimum which should be allowed, not, by any means, the maximum:

	Estimate 1915- 1917
Field work—	
Eight food and drug inspectors, salary	\$23,000.
Expenses of inspectors for traveling, purchasing samples, etc.	15,000
Laboratory work—	
Three analytical chemists, salary	10,600
Chemical apparatus and supplies	4,000
Laboratory help, janitor work, etc.	1,200
Office work—	
Stenographers, two	5,600
Clerk	1,200
Stationery, stamps, expressage, telephone service, etc.	1,500
Total	\$62,100

This amount, \$62,100, does not include the salary of the director or assistant to the director, as these salaries are not included in the special appropriation but are paid for as are other state salaries.

A state like California should have at the command of the State Food and Drug Laboratory at least twelve inspectors, not eight as asked for. There should be at least six chemists working in the laboratory and the office force should also be increased.

The above estimate, however, does not include any item for building. The present quarters of the State Food and Drug Laboratory are far too limited for proper or extensive work. There should be at the disposal of the bureau at least twice the laboratory space now available.

It must be repeated, and with enforced emphasis, the necessity for the carrying on of research work in a food and drug laboratory in addition to the necessary routine work incidental to the examination and analysis of samples officially submitted. There are a very large number of problems in food and drug chemistry and nutrition which should be solved by the personnel of a food laboratory, particularly when operated under the auspices of the State Board of Health. Until such work is carried on, it would not appear that the laboratory is fulfilling its best purpose.

REPORT OF BUREAU OF HYGIENIC LABORATORY.

By W. A. SAWYER, M. D., Director.

The Development of the Laboratory.

During the two years ending June 30, 1914, the number of routine bacteriological examinations performed at the State Hygienic Laboratory in the interest of the public health was 75 per cent greater than during the previous biennial period. The more expensive and time-consuming examinations increased in number at a still faster rate. For instance, the number of examinations of drinking water for pollution was doubled, and over three times as many heads of animals were examined for evidence of rabies.

The increase in the quantity of the work, while it shows a greater appreciation of the services of the laboratory by local health officials and physicians, does not represent the progress in the adaptation of the laboratory to the needs of the state so much as do the new functions. During the biennial period, by the performance of free Wassermann tests at the State Hygienic Laboratory, syphilis has at last been recognized as a very important preventable disease. Recognizing that the provisions for the control of typhoid fever are at present inadequate to give reasonable protection to a large part of the citizens of the state, the manufacture and free distribution of antityphoid vaccine was instituted, so that the individual can to a certain extent make up for the failure of protection by the public.

Although the work of the bureau has developed, it still falls far short of its proper variety and amount. The lack of workers in the field along lines of epidemiology and sanitary engineering greatly hampers the laboratory work in communicable diseases and water pollution, and renders much of the work unsatisfactory. The majority of the local health officials have insufficient time and not enough special training in public health to act helpfully as our local representatives. This is due principally to the ridiculously small salaries offered. Until health officers are full-time public servants with special training we can not expect a marked decrease in preventable disease, but the state can do a great deal through maintaining marked efficiency and high scientific standards in the laboratories and field forces of this bureau. The most urgent lines of development will be outlined under the separate headings of this report.

Division of Biological Examinations.

In the Division of Biological Examinations is done the greater part of the present work of the bureau. At the main laboratory in Berkeley and its three branches in Los Angeles, Fresno, and Sacramento, various diagnostic examinations are made which are of importance in the control of communicable disease. The work is strictly limited to examinations of public health interest, and tests of value only to individuals are not performed, not even in response to the plea of charity. The laboratory has only one purpose, the protection of the public health.

The work of the division includes the examination of tissue for anthrax, of swabs and cultures for diphtheria, of smears of pus for gonococcus infection, of feces for hookworm disease, of blood for ma-

laria, of tissue for plague, of brain tissue for rabies, of blood serum for syphilis (Wassermann test), of sputum for tuberculosis, of blood for typhoid fever (Widal test), and occasionally of other specimens which have a distinct bearing on public health. The staff of the laboratory are not permitted to work privately for fees, and all the examinations at the laboratory are made without charge.

In addition to the diagnostic tests, many bacteriological examinations of public water supplies for pollution are performed with the purpose of protecting against water-borne diseases, especially typhoid fever.

The laboratory is increasing its usefulness to our state institutions. It performs tests of their water supplies on request. A considerable number of the routine diagnostic tests are performed for state institutions, especially the infirmary of the University of California. Wassermann tests for syphilis have been performed for many of the prisoners in the state prisons at Folsom and San Quentin. Examinations for anthrax and rabies are performed for the State Veterinarian and his deputies. These very necessary examinations would involve considerable expense if performed by private bacteriologists.

Comparison with the Work of Preceding Biennial Periods.

In Table I there has been brought together the statistics for the several biennial periods since the beginning of the laboratory on July 1, 1905. Special attention is called to the growth of the work of the last biennial period over that of the preceding one. There was an increase of 75 per cent in the total number of tests in the Division of Biological Examinations. Every kind of examination shared in the increase.

Results of Examinations by Months and Diseases.

In Table II are brought together the numbers of examinations made in the division during the various months of the biennial period ending June 30, 1914. The number of examinations giving positive results are shown as well as the total numbers.

TABLE I.
Increase in Number of Examinations, July 1, 1905, to June 30, 1914.

Anthrax.

Examinations are frequently made for anthrax in animals, and rarely for the same disease in man. A single specimen is sometimes sent for the determination of the nature of a disease which is killing hundreds of animals. Whenever anthrax is found to be present in the tissues of an animal, the State Veterinarian is given a carbon copy of the laboratory report, so that the information may have its greatest usefulness in the control of this disease.

Diphtheria.

This disease continues to present a serious problem in the state. The laboratory distributes a mailing outfit for sending to the laboratory swabs from the noses and throats of patients or carriers. The results of the examinations are communicated to the physician and also to the local health officer, who has charge of instituting and raising the quarantine required by law. The cultures are examined at the main laboratory at Berkeley and also at the three branches.

Gonococcus Infections.

There has been an increase in the number of specimens examined for the presence of the gonococcus. When the health authorities will give this disease the attention which is indicated by its prevalence and destructiveness, the diagnosis of gonorrhoea and ophthalmia neonatorum will cease to be in so many cases a matter of opinion, and the laboratory will receive many times the present number of specimens.

Hookworm.

The laboratory stands ready to examine specimens of feces for hookworm and to furnish containers in which samples can be mailed.

Malaria.

Special mailing cases containing two glass slides and directions for securing samples of blood are furnished to physicians. The number of examinations from the districts of California in which malaria is prevalent are few, as many physicians are satisfied with the diagnosis of malaria based on symptoms alone.

Bubonic Plague.

During the biennial period three cases of plague in man were investigated and were proved to be bubonic plague. All of the cases were undoubtedly contracted from endemic plague existing among the ground squirrels, and possibly other rodents, of the region in which the cases appeared.

Case 1.—A Japanese woman, 24 years old, living on a berry farm two miles north of San Juan in San Benito County, became sick on June 4, 1913. On June 6th she was first seen by a physician. At that time there was marked prostration, high fever (104° F.), and a painful left femoral bubo. Her condition became steadily worse and she died on June 13th. On the day before her death a severe sore throat developed accompanied by dyspnoea. On this day the case was seen by the county health officer. The bubo was operated upon and some of the glandular tissue was sent to the State Hygienic Laboratory. Examination at the laboratory showed bacilli having the appearance of the plague bacillus. A guinea-pig was inoculated. The animal died in six days, and the plague bacillus was isolated from the typical lesions and identified. A

parallel laboratory examination in the laboratory of the United States Public Health Service in San Francisco gave the same results. An investigation was made in the field by the director of the State Hygienic Laboratory.

A hunter employed by the United States Public Health Service shot a plague-infected squirrel in San Benito County, six miles northeast from Hollister, on June 9, 1913, showing that the disease existed in ground squirrels in the county at the time of the human case.

Case 2.—A man, J. W. K., 55 years old, entered the Contra Costa County Hospital at Martinez on September 8, 1913. He had been working on a ranch near Pittsburg, Contra Costa County. His illness became rapidly worse. He was delirious on September 9th and, on the following day, a femoral bubo with considerable local edema developed. He died in the morning of September 11th. The diagnosis of plague was made by the attending physician. A local investigation was made by Surgeon Currie of the United States Public Health Service. Material from the bubo was obtained for examination at the State Hygienic Laboratory.

At the State Hygienic Laboratory plague bacilli were demonstrated and definitely identified by microscopical examination, cultural tests, and animal inoculation. A similar investigation in the laboratory of the United States Public Health Service gave the same results.

Surgeon Currie reported that there were circumstances which pointed to infection from the rats in and about the house in which the man had slept on the ranch. The rat infection was undoubtedly secondary to the squirrel epizootic of plague which had been present for several years in Contra Costa County.

Case 3.—A man, E. W. H., 38 years old, residing in Walnut Creek, Contra Costa County, and working in San Francisco, became sick at Walnut Creek on May 17, 1914. He had a chill, high fever (104° F.), and slight delirium. On the following day the case was investigated locally by Assistant Surgeon N. E. Wayson of the United States Public Health Service. A left femoral bubo had appeared on that day. On May 23d the patient was again seen by Dr. Wayson, and material was obtained from the bubo for laboratory examination. The plague bacillus was isolated and identified at the laboratory of the United States Public Health Service. Tissues from a guinea-pig, inoculated by Dr. Wayson with a culture from the bubo, were sent to the State Hygienic Laboratory, where the plague bacillus was isolated and identified by microscopic and cultural tests and animal inoculation.

Investigation by Dr. Wayson led to the conclusion that the disease had been contracted from plague-infected ground squirrels in the vicinity of Walnut Creek, Contra Costa County. The patient recovered from the infection.

Rabies.

Taking the state as a whole, rabies (hydrophobia) in animals has increased markedly during the biennial period. In certain areas the disease has diminished while in others it made its first appearance.

The heads of animals are sent to the laboratory and the brain tissue is examined for evidence of rabies. This work is specially important, as many of the rabid dogs bite human beings, and the decision with regard to the necessity for Pasteur treatment of persons bitten by dogs often hinges on the laboratory examination. Table III gives the statistics for the examinations for rabies by months and Table IV gives the number of specimens showing positive evidence of rabies from each county.

TABLE III.
Examinations for Rabies by Months.

The nine human cases of rabies (shown in Table III) which were confirmed by laboratory examination of the brain tissue at the State Hygienic Laboratory, together with five other cases of human rabies which came to the attention of the laboratory staff during the biennial period, are briefly described below:

Case 1.—A girl, A. B., 6 years old, died of rabies in Los Angeles on July 15, 1912. She had been severely bitten on the right cheek by a strange dog on May 27th. No tissue was obtained for laboratory examination.

Case 2.—A man, J. J. R., about 60 years of age, died in San Francisco from rabies on July 20, 1912. He had been bitten in the left thumb by his own dog on June 18, 1912. On July 15th, this man began to show symptoms of rabies. Some of his brain tissue was inoculated into a rabbit at the State Hygienic Laboratory. The rabbit came down with rabies in 17 days and Negri bodies were found in its brain tissue.

Case 3.—A boy, F. O., 16 years old, died of rabies on July 22, 1912, in San Francisco. He had been bitten in the left hand by a strange dog 78 days before the boy showed the first symptoms of rabies on

July 19, 1912. At the State Hygienic Laboratory, rabbits were inoculated with some of the brain tissue. They developed rabies, and Negri bodies were found in their brain tissue.

Case 4.—A woman, M. J. S., 37 years old, died of rabies on November 23, 1912, in San Francisco. She had been bitten in the left hand by a stray dog two months before. At the laboratory of the San Francisco Health Department, Negri bodies were found in her brain tissue and rabbits which were inoculated with brain tissue developed rabies.

Case 5.—A boy, S. N., age 10, died of rabies in Sacramento December 9, 1912. There was no history of a bite. The symptoms began on December 6th. Portions of brain tissue were examined at the State Hygienic Laboratory. Negri bodies were found in the tissue, and rabies was transmitted to animals by inoculation with the brain tissue.

Case 6.—A girl, N. C. O., age 6, died of rabies on February 1, 1913, in San Francisco. She had been bitten by her own dog three weeks before she showed the first symptoms on January 29th. A portion of her brain tissue was examined at the State Hygienic Laboratory and Negri bodies were found. The diagnosis was also confirmed by animal inoculation.

Case 7.—A man, A. C., age 23, died of rabies on May 22, 1913, in San Francisco. He had been bitten by a dog two months before. A portion of the man's brain was examined at the State Hygienic Laboratory. Many large Negri bodies were found.

Case 8.—A girl, J. B., age 4 years, died of rabies in San Francisco May 26, 1913. She had been severely bitten under the right eye on April 25th. Within 24 hours, the Pasteur treatment was begun at the San Francisco Health Department with fresh virus from the State Hygienic Laboratory. The intensive course of treatment was given, ending May 16th. On May 20th, too soon for the establishment of a strong immunity by the treatment, the symptoms of rabies began. A portion of the brain tissue was examined at the State Hygienic Laboratory. Negri bodies were found, and rabies was produced in rabbits by inoculation with the brain tissue.

Case 9.—A man, C. R. L., about 30 years old, residing near Sebastopol in Sonoma County, died of rabies at Santa Rosa on September 17, 1913. He had been bitten in the right wrist by his own dog while hunting near Bodega Bay on August 12th. The first symptoms of rabies appeared on September 13th. Examination of his brain at the State Hygienic Laboratory revealed Negri bodies. Rabies was produced in rabbits by inoculation with the brain tissue.

Case 10.—A girl, F. I. W., aged $5\frac{1}{2}$ years, died of rabies at Newcastle, Placer County, on July 25, 1913. She had been bitten in the arm by a strange dog on July 2d. The symptoms of rabies began on July 22d. There was no autopsy.

Case 11.—A Japanese man, G. K., 32 years old, died of rabies in Los Angeles on August 6, 1913. He had been bitten on the arms by a rabid dog at San Bernardino on June 30th. On August 4th he had distinct symptoms of rabies. This man had been instructed to take immediately the free Pasteur treatment furnished by the State Board of Health at Los Angeles, but he had not followed the advice. There was no autopsy.

Case 12.—A man, P. G., aged 57, died of rabies on November 15, 1913, in Placer County Hospital in Auburn, where he had been taken from his home in Lincoln, Placer County. He had been inoculated while opening the mouth of his sick dog about October 27, 1913. Symptoms began about November 11th. A portion of the brain was examined at the State Hygienic Laboratory. Numerous Negri bodies were found in the tissue. This confirmed the diagnosis of rabies.

Case 13.—A colored boy, C. B., aged 5 years, died of rabies at Oxnard, Ventura County, on November 19, 1913. He had been severely bitten through the left ear by a rabid dog on September 30, 1913. Rabies in the dog was proved by examination at the State Hygienic Laboratory. The boy was sent to the southern branch of the State Hygienic Laboratory at Los Angeles for treatment, which was begun on October 5th and was completed on October 25th. It was stated that the symptoms began with "nervousness" on November 9th. There was no autopsy.

Case 14.—A boy, W. E., aged 5 years, died of rabies in Oakland on March 25, 1914. He had been severely bitten over the right eye, on the right eyelid and on the right cheek on February 11th. On the following day, intensive antirabic treatment was begun at the State Hygienic Laboratory. The treatment was finished on March 4th. On March 22d. the symptoms of rabies began with nervousness and refusal to eat. Some of the brain tissue was examined at the State Hygienic Laboratory. Negri bodies were found and rabies was transmitted by inoculation to a rabbit.

Syphilis.

In April, 1914, the State Hygienic Laboratory began making free Wassermann tests for physicians of California. The work increased during the last three months of the biennial period, reaching a total of 142 examinations. This work is very important as it recognizes the responsibility of the state for the prevalence of this preventable disease. The laboratory is permitted to make the tests only when the physician states that his patient is unable to pay the cost of a reliable test. This last regulation, while instituted chiefly to prevent an overwhelming number of specimens at the beginning, has been proved to be unnecessary. No such restriction on the basis of financial status exists in connection with any of the other laboratory examinations, and this limitation is against the general policy and spirit of the laboratory. Examinations should be made only on the basis of danger to the public health. Now that the restriction has been found to be unnecessary, I respectfully recommend to the State Board of Health that they remove it. After such action, the people will be able to see that syphilis has been recognized by the board as a disease of great public health importance. The reporting of this disease, already required by law, will become more efficient if the state takes an active part in ascertaining its extent through free laboratory examinations.

Tuberculosis.

During the biennial period, 908 examinations of sputum for tubercle bacilli were made. An outfit is furnished for sending the specimens through the mails.

Typhoid Fever.

The laboratory makes Widal tests for typhoid fever when specimens of blood are sent in the regular mailing outfits, which are furnished free to physicians. In connection with special investigations of the State Board of Health and on the written request of health officials, when the protection of the public health demands such tests, specimens of feces and urine will be examined with a view of detecting the typhoid carrier state. Blood cultures will be examined, especially when typhoid vaccination has made the Widal test inapplicable.

Water Pollution.

Samples of public water supplies are examined bacteriologically for the presence of pollution on the request of the health officials. Examinations are made only when the samples have been submitted in the sterile containers and ice box sent out by the laboratory.

The number of water examinations has increased greatly owing to the increased interest in the prevention of typhoid fever and on account of the requirements of the United States Public Health Service regarding water used for drinking purposes on interstate carriers. The work is unsatisfactory because too much emphasis is placed on a single laboratory test. It is very important that the laboratory work should supplement the field investigation of a sanitary engineer in the employ of the State Board of Health. Then the board could collect really valuable information regarding the public water supplies of the state, and could take efficient steps for the enforcement of the laws against stream pollution.

Examinations for Towns and Cities.

The 7,512 examinations performed during the biennial period were made for 394 towns and cities and their surrounding country. Cities having a population greater than 20,000 are not served, as they are expected to furnish their own free laboratory service. The work of the laboratory is more evenly distributed geographically than ever before.

In Table V will be shown the number of specimens sent from each town or city. When specimens are credited to the larger cities, which have their own laboratories, it means that physicians living in those cities submitted samples from out-of-town patients, or else that the work was done for state institutions situated within the cities.

The Branch Laboratories.

Owing to the large size of the state, it has been found necessary to maintain three branch laboratories. At these branches part-time bacteriologists examine cultures for diphtheria, sputum for tuberculosis, blood for typhoid fever, and blood smears for malaria. The branches also administer free antirabic treatment for the Division of Preventive Therapeutics. They cut down the time necessary to obtain laboratory results in those examinations whose value depends largely on prompt reports.

The Southern California Branch.

The Southern California Branch is located in Los Angeles. It serves the following counties: Imperial, Inyo, Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Santa Barbara. The branch was in the charge of Dr. Stanley P. Black at 423 Auditorium Building up to the resignation of Dr. Black on January 26, 1914. On that date the work was taken over by Dr. Walter V. Brem and the branch was moved to 1209 Brockman Building.

During the biennial period 726 diagnostic examinations were made as follows: diphtheria 538, of which 200 gave positive results; gonococcus infections 2, positive 1; hookworm 2, positive 0; rabies 2, positive 2; tuberculosis 35, positive 13; typhoid 147, positive 15.

The San Joaquin Valley Branch.

The San Joaquin Valley Branch is in charge of Dr. W. W. Cross and is situated in Fresno. On June 1, 1914, the laboratory was moved from 32 Patterson Block to 710 Griffith-McKenzie Building.

The total number of tests for the biennial period was 379, divided between examinations for the different diseases as follows: anthrax 2, positive 0; diphtheria 216, positive 32; gonococcus infections 2, positive 0; hookworm 3, positive 0; malaria 3, positive 1; tuberculosis 58, positive 17; typhoid 93, positive 12; miscellaneous 2, positive 0.

The San Joaquin Valley Branch serves the following counties: Fresno, Kern, Kings, Madera, Mariposa, Merced, Stanislaus, Tulare, and Tuolumne.

The Northern California Branch.

Dr. F. F. Gundrum has charge of the Northern California Branch of the State Hygienic Laboratory at 406 Inverness Building, Sacramento. This branch does work for the following counties: Alpine, Amador, Butte, Calaveras, Colusa, El Dorado, Glenn, Lassen, Modoc, Mono, Nevada, Placer, Sacramento, San Joaquin, Shasta, Sierra, Siskiyou, Sutter, Tehama, Trinity, Yolo, and Yuba.

During the biennial period the following 1,163 examinations were made: diphtheria 615, of which 193 gave positive results; gonococcus infections 7, positive 5; hookworm 1, positive 0; malaria 59, positive 16; tuberculosis 217, positive 39; typhoid 262, positive 89; miscellaneous 2, positive 0.

The State Hygienic Laboratory in Berkeley.

In addition to doing certain kinds of examinations for the remainder of the state, the main laboratory on the campus of the University of California in Berkeley does all the kinds of examinations for the following counties: Alameda, Contra Costa, Del Norte, Humboldt, Lake, Marin, Mendocino, Monterey, Napa, San Benito, San Luis Obispo, San Mateo, Santa Clara, Santa Cruz, and Solano.

All the water examinations, special laboratory investigations, and examinations for rabies are done in Berkeley. The greater part of the work shown in Table II was done there.

Depositories for Mailing Outfits.

The establishment of branch laboratories decidedly shortened the time between the sending of a sample to the laboratory and the receipt of the report. Few health officials or physicians, however, kept on hand a stock of fresh diphtheria culture outfits or of the various other mailing outfits sufficient for an emergency. As a result, it was frequently necessary to delay until a letter could be written and a supply could be received from the State Hygienic Laboratory in Berkeley. The absence of a proper mailing outfit has tempted many a physician to send cultures for diphtheria on old dried culture media which had long been useless, or to send infectious material through the mails in insufficient and illegal containers.

To correct these conditions the laboratory has established a system of depositories for mailing outfits in drug stores in our principal towns and smaller cities. By applying at a depository as the need arises a health official or physician may receive, without charge, mailing outfits for sending various specimens for examination. This system should save expense for the laboratory by diminishing the large number of mailing outfits sent out to individual physicians to be kept for emergency, and should greatly diminish unnecessary and dangerous delay.

The following table shows the depositories which have been established. With very few exceptions, the recommendations of the local health officers were followed, and, if the table seems to show the neglect of any particular county, it is because the proper recommendations for depositories were not sent in response to request. At the end of the biennial period 169 depositories had been established and stocked. Each had received all the kinds of mailing outfits which are furnished, and also a small window sign announcing the depository:

Division of Preventive Therapeutics.

The work of the Division of Preventive Therapeutics includes the manufacture and free administration of the Pasteur antirabic virus to persons who have been inoculated with the saliva of rabid animals and can not afford to purchase the preventive treatment, and also the manufacture and free distribution to physicians of antityphoid vaccine.

Pasteur Antirabic Treatment.

During the biennial period the Hygienic Laboratory has manufactured all the virus used by the State Board of Health. Two new stations for the administration of the virus were arranged for at San Diego and Mare Island, making ten laboratories at which the treatment can be obtained if needed. On March 17, 1914, Dr. H. A. Thompson, City Pathologist of San Diego, was appointed a deputy to administer the free treatment to people of San Diego. On the same day Dr. M. F. Gates, medical inspector in the United States Navy, was similarly deputized to give the treatment at the Naval Hospital on Mare Island. The laboratories and the treatments given at each are shown in Table VII. The counties from which the patients were sent are shown in Table VIII. As an emergency measure and a courtesy, treatment for two persons was sold at cost to the State Board of Health of Oregon.

TABLE VII.
Pasteur Treatments, July 1, 1912, to June 30, 1914.

Place of administration	Number of cases.	Treatments completed	Deaths	Diagnosis in biting animal based on—

The animals infecting the wounds that necessitated the Pasteur treatment were 416 dogs, 21 cats, 7 cows, and 5 horses. In 9 cases the infection came from cases of human rabies. Seven treatments were given to laboratory workers as precautionary measures, and one to a physician who inoculated himself accidentally while giving the Pasteur treatment.

Deaths from rabies occurred in three of the 466 patients. These fatal cases of rabies are described as cases Nos. 8, 13, and 14, in the section of this report on "Rabies" under the "Division of Biological Examinations." The intervals of time between the end of treatment and the onset of symptoms were 4, 15, and 18 days, respectively. These patients were children, aged 4, 5, and 5 years, respectively. They had been severely bitten about the head by rabid dogs, and the production of immunity by the intensive antirabic treatment was not established fast enough and in sufficient intensity to protect against these three unusually severe inoculations.

No serious complications during treatment occurred. In two cases local abscesses were reported and were probably due to faults in asepsis in preparing the virus for administration. When we consider that the 456 treatments which were completed include 11,400 hypodermic injections of a suspension of tissue which had been ground in an open mortar just prior to administration, it is not surprising that two doses produced local abscesses. In two cases there were malaise and nausea in the middle of the course of treatment. In one case there was transient urticaria. One patient complained of pain in the leg which had been bitten. One case developed an extensive inflammation of his joints, which was probably due to an infection contracted prior to his treatment. One patient, who had been taking the treatment as a precautionary measure owing to frequent exposure to rabid animals, shortly after the end of treatment developed transient hoarseness and weakness of the legs lasting about two weeks. It is not certain that these manifestations had a relation to the treatment, but the condition may have been a very mild manifestation of the process which in rare instances produces a transient paralysis after the Pasteur treatment. One patient complained of neuralgia of the left side of the face for a week shortly after the end of treatment, and another had a troublesome occasional spasmodic contraction of the muscles on the side of the neck, pulling down the jaw. This came on a month after the end of treatment.

It is apparent that some of these complications among 466 patients probably had no relation to treatment, and in some of the cases they may have been due to the original inoculation by a rabid animal. On the whole the record is satisfactory, as the majority of the patients had been bitten by animals proved rabid by the finding of Negri bodies or by animal inoculation (330 out of 466, or 71 per cent) and most of the others gave a history of being bitten by animals which were in all probability rabid, but which could not be investigated in the laboratory.

Typhoid Vaccine.

On March 1, 1914, the laboratory began the manufacture and free distribution of antityphoid vaccine to the physicians of California. The vaccine was prepared from a number of strains of the typhoid bacillus which had been isolated in California. The improved method of Gay and Claypole of the University of California was followed. In this

method the vaccine is killed with alcohol instead of heat, is ground to a fine powder, and is sensitized by treatment with a strong antityphoid immune serum. The number of treatments issued was not large during the spring and early summer, but the work was well under way before the end of the biennial period, and the laboratory was prepared for the heavy demand which occurred during the late summer and fall when typhoid fever was prevalent. Vaccine was distributed as follows on the request of physicians:

March, 1914	-----To	35	physicians for	347	patients
April, 1914	-----To	34	physicians for	650	patients
May, 1914	-----To	43	physicians for	383	patients
June, 1914	-----To	59	physicians for	442	patients
Total	-----To	171	physicians for	1,822	patients

Vaccine was furnished in large lots for the immunization of militia-men, of employees of lumber camps, and of state prisoners.

All physicians receiving the vaccine were asked to fill out and return data cards giving particulars regarding the treatment. They were especially urged to report at once the development of typhoid fever at any time subsequent to treatment. Only 748 of the data cards were filled out and returned. The severity of the reactions can be classified from the physicians' reports as follows: None, 485; slight, 189; moderate, 58; severe, 16; total, 748. In three cases abscesses occurred at the site of inoculation. These may have been due to failure to sterilize the syringes properly or to a local necrosis without infection.

Much of the vaccine is sent into communities where typhoid fever is prevalent, and frequently the vaccine is administered to persons already exposed to typhoid cases. In spite of this fact only four cases of typhoid fever were reported in persons receiving vaccine from the laboratory. One of these cases developed typhoid fever before he had received his third dose of the vaccine. He had been exposed two weeks before he was vaccinated. The other three cases had been exposed to typhoid fever in their own families and came down 7 days, 11 days, and 25 days, respectively, after the last dose of vaccine. As it takes approximately a month for typhoid vaccination to produce a high degree of immunity, at least two of these three cases can not be regarded as true failures.

Division of Epidemiological Investigations.

The Division of Epidemiological Investigations deals with the study and control of outbreaks of communicable disease. These investigations are carried on in the field as well as in the laboratory. They are very important as they deal chiefly with health emergencies. Local health officials, outside of our largest cities, are seldom in a position to carry on an intensive investigation of the causes of an outbreak of disease. When the causes are known, rational measures for control can be instituted, and the public is better protected and less annoyed than when the measures are not based on actual conditions discovered by trained epidemiologists.

Although some of the special investigations listed in the following report are not strictly limited to the field of epidemiology, they will be reported here for convenience.

1. An investigation of the conditions in the steerage of the steamship Newport. Begun on June 27, 1912.

2. A determination of the Hygienic Laboratory phenol coefficient of five disinfectants submitted by the Mendocino State Hospital, for the State Board of Control. The samples were received on July 1, 1912.

3. A bacteriological examination of clams from the shore between Sausalito and Mill Valley. Begun on July 9, 1912.

4. An investigation of a fourth case of human rabies in San Francisco. The patient was visited on July 19, 1912.

5. An investigation of a fifth case of human rabies in San Francisco. Begun on July 22, 1912.

6. An investigation of typhoid cases from the steamship "President." Begun on August 2, 1912.

7. An investigation of specimens of feces from a typhoid carrier. Begun on August 9, 1912.

8. An investigation of the bactericidal power of "Chloro-Naphtholeum." Begun on September 18, 1912.

9. An investigation of the bactericidal power of two samples of "Sanitation Drip." Begun on September 18, 1912.

10. An investigation of a death in San Anselmo reported as typhus fever, and found to be typhoid fever. Begun on September 26, 1912.

11. A bacteriological examination of six samples of ice, for colon bacilli. The examination was part of a larger investigation by the State Food and Drug Laboratory. Begun on September 27, 1912.

12. An investigation of the transmission of poliomyelitis by means of the stable fly (*Stomoxys Calcitrans*). Begun on October 18, 1912.

13. An investigation of diphtheria cases in Sutter Creek. Sutter Creek was visited on November 27, 1912.

14. An investigation of two cases of suspected poliomyelitis in Sacramento. Sacramento was visited on December 9, 1912.

15. An investigation of an epidemic of dysentery at Madison. Begun in Madison and Woodland on December 10, 1912.

16. An investigation of a case of human rabies in Sacramento. Begun on December 11, 1912.

17. An investigation of five cases of smallpox in Berkeley. Begun on January 8, 1913.

18. A bacteriological examination of samples from the water supply of Sacramento. Sacramento was visited on January 12, 1913.

19. An investigation of the typhoid fever situation at Antioch. Antioch was visited on January 15, 1913.

20. An investigation of a case of chronic glanders in man, at Hayward. Begun on January 24, 1913.

21. An investigation of an outbreak of diphtheria at Hayward. Hayward was visited on January 27, 1913.

22. An investigation of a case of infantile paralysis near San Leandro. The patient was visited on January 28, 1913.

23. An investigation of smallpox of several grades of severity in one family in Oakland. The patients were visited on January 29, 1913.

24. An investigation of a seventh case of human rabies in San Francisco. Begun on February 3, 1913.

25. An investigation of a case of pneumococic meningitis, and a case of suspected meningitis of unknown etiology at Richmond. Begun at Richmond on February 7, 1913.

26. An investigation of the typhoid situation at Colusa. Colusa was visited on February 12, 1913.

27. An investigation of a sixth case of human rabies in San Francisco. Begun on February 24, 1913.
28. A bacteriological examination of cement and coal dusts. Begun on March 7, 1913.
29. An investigation of the slaughterhouse and fertilizer plant at Elmhurst. Begun on March 7, 1913.
30. An investigation of the conditions of the quarantine of a mild case of scarlet fever in Berkeley. Begun on March 8, 1913.
31. An investigation of scarlet fever in the State Deaf, Dumb and Blind Institute, at Berkeley. Begun on March 8, 1913.
32. An investigation of the methods of sterilization in common use in barber shops. Begun on March 17, 1913.
33. An investigation of an outbreak of smallpox in the State Hospital at Stockton. Stockton was visited on March 21, 1913.
34. An investigation of a case of suspected poliomyelitis at Alameda. The patient was visited on March 31, 1913.
35. An investigation of methods of disinfecting books. Begun on April 17, 1913.
36. An investigation of scarlet fever and diphtheria at Lakeport. Lakeport was visited on May 8, 1913.
37. An investigation of the virulence of diphtheria bacilli in the throats of carriers. Reported May 13, 1913.
38. An investigation of an eighth case of human rabies in San Francisco. Begun on May 23, 1913.
39. An investigation of a ninth case of human rabies in San Francisco. Begun on May 27, 1913.
40. An investigation of smallpox at Walnut Creek. Walnut Creek was visited on May 31, 1913.
41. An investigation of an outbreak of severe diarrhoea at Bay Point. Begun on June 10, 1913.
42. An investigation of a case of human plague near San Juan, San Benito County. Begun on June 13, 1913.
43. An investigation into the possibility of the transmission of diseases by the mouthpiece of the public telephone. Begun on June 18, 1913.
44. An investigation of a typhoid outbreak at Irvington. Irvington was visited on July 12, 1913.
45. An investigation of the alleged purification of air by the ozone machine. Reported on July 22, 1913.
46. An investigation of poliomyelitis in Siskiyou County. The region was visited on August 24, 1913.
47. An investigation of a case of human plague at Martinez. Begun on September 11, 1913.
48. An investigation of smallpox in San Jose. San Jose was visited on September 16, 1913.
49. An investigation of a human case of rabies in Santa Rosa. Begun on September 16, 1913.
50. An investigation of the source of a typhoid infection supposed to have been contracted in Monterey County. Begun on October 3, 1913.
51. An investigation of a case of optic neuritis developing during Pasteur treatment. Begun on October 26, 1913.

52. An investigation of smallpox cases at Modesto. Modesto was visited on October 28, 1913.
53. An investigation of a human case of rabies at Los Angeles. Reported on October 30, 1913.
54. An investigation of cases of streptococci infection simulating plague at Kennett. Kennett was visited on November 8, 1913.
55. A bacteriological examination of two samples of wine. Begun on November 11, 1913.
56. An investigation of two cases of trichinosis at the University of California Infirmary. Reported on November 14, 1913.
57. An investigation of an outbreak of epidemic poliomyelitis in Humboldt County. Reported in November, 1913.
58. An investigation of a human case of rabies at Newcastle, Placer County. Reported December 4, 1913.
59. An investigation of the lesions produced by the poisonous tick, *ornithodoros coriaccus*. Reported in December, 1913.
60. An investigation of a human case of rabies in Lincoln. Reported on December 11, 1913.
61. An investigation of the epidemiology of rabies in California and its control. Reported December 13, 1913.
62. An investigation of the apparent recovery of a case of human glanders at Hayward. The patient was visited on January 5, 1914.
63. An investigation of smallpox in Santa Cruz. Santa Cruz was visited on January 10, 1914.
64. An investigation of rabies in Sonoma County. Santa Rosa was visited on January 13, 1914.
65. An investigation of a human case of rabies in Oxnard, Ventura County. Reported on January 24, 1914.
66. An investigation of a case of epidemic cerebrospinal meningitis in Albany. The patient was visited on February 5, 1914.
67. An investigation of the smallpox situation at Cupertino, Santa Clara County. Cupertino was visited on February 14, 1914.
68. A bacteriological examination of eggs brought in cold storage from the Orient. Begun on February 27, 1914.
69. An investigation of the rabies situation in Sonoma County. Santa Rosa was visited on March 19, 1914.
70. An investigation of a human case of rabies in Oakland. Begun on March 23, 1914.
71. A study of the literature on the effect of the septic tank on pathogenic bacteria in sewage. Begun on March 24, 1914.
72. An investigation of the possibility of contamination of the water supply of the city of Chico. Chico was visited on March 26, 1914.
73. An investigation of a case of paralysis following the Pasteur treatment. Begun on March 30, 1914.
74. An investigation of a typhoid outbreak at Hanford. The investigation was begun on April 2, 1914. A carrier was discovered who had infected ninety-three persons.
75. An investigation of the effect of quinine on rabies in dogs. Reported in May, 1914.
76. An investigation into the incomplete sterilization of certain dishes by baking. Reported in May, 1914.
77. An investigation of milk sauces as culture media. Reported in May, 1914.

78. An investigation of cheese responsible for food poisoning. Reported in May, 1914.

79. An investigation by physiological tests of the strengths of tinctures of digitalis and strophanthus found in the market. Reported in June, 1914.

80. An investigation into the bacterial content of tomato products. Reported in June, 1914.

81. An investigation of a case of human plague at Walnut Creek, Contra Costa County. Begun on June 5, 1914.

Research.

Research is being carried on in the laboratory with a view to solving important public health problems. A thorough study was made of two typhoid carriers, and an extensive investigation into the methods of transmission of poliomyelitis (infantile paralysis) was carried on. This latter investigation was made jointly by the Bureau of the Hygienic Laboratory and the Department of Agriculture of the University of California. Professor W. B. Herms of that Department co-operated with the director of the laboratory in planning and carrying on the work.

Instruction in Public Health.

The laboratory has continued to loan to teachers its bacteriological instruction outfits. During the biennial period 49 outfits were issued on request.

Demands for lectures or papers on public health subjects are met by members of the staff when compliance does not interfere with the necessary routine and special investigations of the Bureau. During the biennial period the Director has given 28 lectures or talks on public health topics and the Chief Bacteriologist has given 5 talks.

A considerable part of the correspondence of the laboratory consists of letters of information sent in reply to the practical questions of health officials and the general public.

In addition to the more popular reports to be found in the bulletins of the State Board of Health, the laboratory staff have published in scientific journals eight papers dealing with the work of the Bureau.

Laboratory Staff.

At the beginning of the biennial period, on July 1, 1912, Dr. J. C. Geiger became Chief Bacteriologist, succeeding Miss Esther M. Skolfield, who had been Acting Chief Bacteriologist since March 1, 1912. Miss Skolfield remained on the staff as Assistant Bacteriologist until March 15, 1914, when she resigned and was succeeded by Miss Violet M. Bathgate. On January 20, 1914, Miss Grace A. Macmillan was appointed Laboratory Assistant and was assigned to work in connection with the Wassermann tests for syphilis, and the manufacture of sensitized typhoid vaccine. On January 26, 1914, Dr. Walter V. Brem took charge of the Southern Branch of the State Hygienic Laboratory, succeeding Dr. Stanley P. Black. On April 1, 1914, Miss Vera Brown became Assistant Stenographer on a half-time basis. On July 1, 1913, Mr. J. Taylor Jordan resigned the position of Laboratory Helper. Mr. Judson E. Krueger was employed in this capacity until August 1, 1913, when Mr. Leon C. Banker took the position, which he held until the end of the biennial period.

On June 30, 1914, the laboratory staff was as follows:

Wilbur A. Sawyer, A.B., M.D.	Director
Jacob C. Geiger, M.Ph., M.D.	Chief Bacteriologist
Violet M. Bathgate, B.S.	Assistant Bacteriologist
Grace A. Macmillan	Laboratory Assistant
Walter V. Brem, M.D.	In charge of Southern California Branch
W. W. Cross, M.D.	In charge of San Joaquin Valley Branch
Fred F. Gundrum, M.D.	In charge of Northern California Branch
Florence B. Shackelford	Stenographer
Vera Brown (half time)	Assistant Stenographer
Leon C. Banker	Laboratory Helper

Building and Equipment.

Since its establishment in 1905, the State Hygienic Laboratory has been housed on the campus in Berkeley in rooms assigned to it without charge by the University of California. On October 4, 1913, owing to the overcrowding of the laboratory quarters, the offices and laboratories were moved to rooms on the ground floor of the same building and in a new addition built by the university. In this way the university generously provided for the immediate needs of the laboratory. A special building should be constructed by the state to house in one building the various laboratories of the State Board of Health, including the Food and Drug Laboratory.

Respectfully submitted.

W. A. SAWYER, Director,
Bureau of the Hygienic Laboratory.

REPORT OF BUREAU OF TUBERCULOSIS.

BURT F. HOWARD, M. D., Director.

This bureau has been in operation ten months, having been created by an act of the people of California represented in Senate and Assembly on June 13, 1913, while the director of the bureau did not assume his duties until September 1, 1913.

The object of the bureau, in general, is to institute certain investigations which have for their purpose the attainment of a rational solution of California's tuberculosis problem, and to undertake "the control and eradication of tuberculosis" whenever the time is ripe for such an undertaking.

There are indications that the people of California are awakening to the importance of organized effort to combat this preventable disease which is the chief single cause of death in California, and annually kills over five thousand persons.

Evidence of this awakening as represented in state legislation is as follows:

In 1904 a bill appropriating \$150,000 for a state sanatorium was introduced, but failed.

In 1907 the legislature passed a law requiring the notification of tuberculosis, but not distinct from other communicable diseases. An anti-spitting law was passed, and \$2,000 was appropriated for the dissemination of knowledge to prevent the spread of tuberculosis.

In 1909 the State Board of Health was granted \$2,000 for a tuberculosis exhibition campaign, and was empowered to contract for the treatment of indigent tuberculous residents in private or public sanatoria, the bills to be met by the patient's home county.

This provision for the treatment of incipient tuberculosis is legally in force "until such time as there shall be established by law in this State a state hospital for the medical treatment of persons afflicted with incipient pulmonary tuberculosis.

Various local ordinances indicate interest in this subject, one of the more important being the resolution passed in 1911 by the San Francisco Board of Education, requiring that "all new school buildings to be erected should set aside one or more rooms for open air school purposes."

In 1911 the California Tuberculosis Commission was appointed by the State Board of Health, with an available appropriation of \$5,000 for continuing the education of the public concerning tuberculosis, and conducting certain investigations into the cause and prevention of tuberculosis.

The establishment of the Bureau of Tuberculosis was the result of one of the recommendations of this commission, and its work (as indicated in the accompanying outline Table No. 1) is the first step in the fulfillment of the plan of the commission for a definite program for the prevention of tuberculosis.

Duties of the Director of the Bureau of Tuberculosis as Specified in the Law and Assigned by the State Board of Health.

I. ADMINISTRATION OF DEPARTMENT.

1. Supervision over hospitals, dispensaries, sanatoria, farm colonies and other institutions for tuberculosis. Recommendations for appointments, promotions, dismissals, etc.
2. Attending educational meetings and conferences for the purpose of bringing about the establishment of the above dispensaries, etc.
3. Correspondence.
 - (a) As secretary of the Advisory Board.
 - (b) Educational—Advising officers of the penal and charitable institutions, etc.
 - (c) General—Replying to inquiries regarding the bureau, state laws, hospitals, etc.
4. Preparation of monthly and biennial reports of the work of the bureau.

II. INSPECTION.

- A. Inspection of public tuberculosis institutions.
 - (a) Tuberculosis Department of state insane hospitals.
 - (b) Tuberculosis Department of state prisons.
 - (c) Tuberculosis Department of county hospitals.
 - (d) Tuberculosis Department of Veterans' Home.
- B. Inspection of private tuberculosis institutions.
 - (a) Tuberculosis departments of private hospitals.
 - (b) Private sanatoria.
 - (c) Private dispensaries.
 - (d) Private camps, etc.
- C. Preparation of reports, accounts and correspondence relating to inspections.

III. REGISTRATION OF CASES.

1. Publicity.
 - (a) Informing physicians and health officers of the law (by means of letters, press articles, lectures, etc.).
 - (b) Creating public sentiment in favor of registration (by means of letters, press articles, lectures, etc.).
2. Registration.
 - (a) Filing reports of living cases.
 - (b) Removing from register the names of those who have died.
 - (c) Classification of data obtained.

IV. OTHER DUTIES ASSIGNED BY THE BOARD OF HEALTH.

- (a) Executive, during absence of secretary or other executive officer of the Board of Health.
- (b) Encouraging the establishment of dispensaries by private or municipal funds.
- (c) Miscellaneous duties not specified in the law, as inspection of nuisances, attendance on conferences, medical meetings, investigation of complaints, etc.

EXPLANATORY DATA.

As there is no fund for hospitals, etc., there are at present no administrative duties under paragraph "I," section "1." Paragraph "I," section "2" is intended to cover a portion of the publicity work necessary to the establishment of a comprehensive scheme for combating tuberculosis.

As no Advisory Board has been appointed, there are at present no duties to be performed in the capacity of its secretary. Educational correspondence includes the mailing of printed matter which has for its purpose the prevention of tuberculosis. "Advising officers of the penal and charitable institutions," specified in the law, is included in paragraph I, section 3 (b), because a portion of this work may be done by correspondence.

"Reports relating to inspections" is intended to cover the passage of the law which requires "rating on sanitary construction, enforcement of sanitary measures, adequate provision for medical and nursing attendance, provision for proper food and such other matters of administration as may be designated."

The fund appropriated for the use of the bureau (\$7,500) was so small as to necessarily restrict its operations chiefly to the two points specified in the law, namely, the work of inspection of institutions and promotion of "the complete and proper registration of all tuberculous persons within the State," and whatever has been accomplished this year may be considered as merely preparatory to what is to be undertaken in the years to come.

A list of institutions inspected follows, together with the date when they were inspected and the number of beds available for tuberculosis.

17. Trinity -----	Weaverville.	
18. Tuolumne -----	Sonora.	

It will be observed that our county hospitals make provision of 825 beds for pulmonary tuberculosis, that the private sanatoria provide 732, and that private hospitals provide 102, or a total of 1,659 beds available in the State, besides those in the state insane hospitals, prisons, homes and federal institutions which have about 200 beds for the use of restricted classes only.

As the average number of deaths in the State, from this cause, during 1912 and 1913 was 5,265, and the average duration of the disease may be said to be three years, it may readily be estimated that there are at present in the State over fifteen thousand (15,000) persons who will probably die from tuberculosis. The actual number in whom the disease could be discovered is conservatively estimated at five to ten times the number of deaths, which would make the number of tuberculous persons in California at present from twenty-five to fifty thousand.

Thus it will be seen that existing institutions, both public and private, can care for but a small proportion of the tuberculous, *i. e.*, one in ten of those who are destined to die of tuberculosis, and hence are actively infectious, and perhaps one in twenty of those who actually need hospital care either with the expectation of recovery or for the sake of protecting the family from the danger of an otherwise unavoidable intimate association.

County Hospitals.

Let us consider what our county hospitals are doing with reference to the tuberculosis problem. It will be observed that Los Angeles County provides the largest number of beds for tuberculosis, namely 200. On consulting the tables of deaths it will be seen that the average number of deaths of this county, in the years 1912 and 1913, is 1,606. Evidently the disproportion between the number of beds provided and the demand holds here as well as throughout the State. In this county other provision for hospital care brings the total number of beds avail-

able up to 518, possibly one eighth of the number of those needing the sort of care which can best be given in hospitals.

While the investigations of this bureau reveal the fact that numerically there is a great shortage in the provision of hospital care for tuberculosis, the inspections disclose also wide variations in the character of the provision for these cases, as may be judged from the reports on file with the Secretary of the Board of Health. Many of these hospitals have a department devoted strictly to the care of tuberculous persons, and give these cases the best possible attention. Others make no pretense of either maintaining a department or making the hospital attractive to this class of sufferers. In most of the smaller counties the "county hospital" and the poor farm or almshouse are one, and the opprobrium which is attached to the poor farm prevents free use of the hospital by the tuberculous except as a last resort; consequently the class of patients found in our county hospitals is usually advanced in the disease.

Thirty-nine county hospitals reserve beds for tuberculous persons, the total amounting to 825 beds. Eighteen make no special provision for the tuberculous, though when cases are discovered among the inmates they are sometimes assigned to private rooms or tents.

Private sanatoria and private hospitals receiving tuberculosis provide for over 700 cases. In the main they are of great benefit to the community in which they exist, both from an educational standpoint and because of the prevention of infection by the actual number of active cases withdrawn from the community.

Institutions conducted as a whole or in part by the State have not in the past made complete provision for isolation of tuberculous cases. There is at present, however, a distinct tendency to correct this defect, and a portion of the work of this bureau has been to assist in bringing about a change for the better in this respect.

As but one inspection has been made in the majority of cases, it is impossible to report accurately at this time as to the benefit of state inspections of county hospitals, private hospitals, and sanatoria. Recommendations accompanied the majority of all reports submitted, duplicates being sent to superintendents of institutions inspected, as well as to the Board of Health. The following extract from one of these reports will serve as an example of the type of recommendations sent to some of the better county hospitals:

We have here a well made tuberculosis hospital, well furnished and well kept, and yet there were but 12 beds occupied by tuberculous patients out of the 42 available. With 269 deaths in 1910 and 1911 in the county from pulmonary tuberculosis one would naturally suppose that there might be at least 100 applicants waiting for an opportunity to be treated here.

It might be well to consider possible causes for this discrepancy with a view to providing better results here and avoiding mistakes elsewhere, if any can be discovered.

First—The site is a little remote from friends and relatives of patients. This would not be so noticeable if there were electric car service or if steam cars were more convenient.

Second—While the farm is large enough to afford privacy to the institution as a whole, the tuberculous patients are too near the others for the sort of privacy demanded by the long stay required in this disease. This is particularly noticeable because of the proximity of the buildings assigned to smallpox and other contagious diseases, which are so near that patients are sometimes advised not to use the stairway

and porch at that end of the tuberculosis building which is near the contagious wards. This in itself probably results, in some cases, in a feeling of uneasiness and restraint.

Third—An ideal institution of this size, if located by itself, would be provided with an assembly room and library to facilitate the entertainment of patients. There would be no serious objection to the use of a library by tuberculous patients in common with other patients, if books were properly protected and disinfected.

Fourth—It frequently is the case, and may possibly be so here, that where patients are treated in a general hospital they feel that they do not receive their proportion of medical care because acute cases which remain a short time in the hospital make such insistent demands on the time of the attending physicians. This difficulty has been met in some institutions by having a staff of visiting physicians who are specialists in tuberculosis or at least particularly interested in the subject of tuberculosis. This feature is also desirable as a means of increasing the interest in tuberculosis among physicians and providing an opportunity for special study of this disease.

Fifth—Nurses in training should have the advantage of special instruction in tuberculosis nursing, and an effort be made to place this kind of nursing on a par with other branches of nursing service. If possible there should be a night nurse on duty when there are advanced cases, or at least a nurse subject to call.

The object in general of these recommendations is to make the patients feel that they are being treated along scientific lines which will result in recovery where recovery is possible.

Such provision should be made for their social life as to make a prolonged stay endurable, if not enjoyable. This is perhaps the most difficult problem of all, and with the heterogeneous types which at present apply for admission is not completely practicable. However, it is probably more practicable and better to induce patients to remain for a proper time than it would be to enforce compulsory residence if there were laws permitting such procedure.

As the inspection of institutions constitutes an important part of the work of the bureau, perhaps the best way to give an idea of this work will be to summarize a portion of the reports.

Recommendations which have been made to county hospitals have in general included the following points:

Site.—Where the county is small or thinly populated it is recommended that it unite with a neighboring county or counties in erecting and maintaining a tuberculosis hospital, as recommended by the Tuberculosis Commission.

That the site selected be as near the communities served as practicable and accessible by street car if near a large town, except in such cases as those in which a marked climatic advantage is to be obtained by a more remote site within the county, as the foothills in counties where the summers are excessively hot.

That the tuberculosis hospital should be independent of the poor farm and remote from it, where possible.

If built on the county hospital grounds that it should not be grouped with the infectious disease wards in the rear of the main buildings, but should have a site with a pleasant outlook, including trees and lawns especially where tents, tent houses, or pavilions are used.

Construction.—Permanent buildings are advised in preference to temporary cheap structures as being less expensive to operate and more comfortable for the average case received which is usually well advanced in the disease. However, in many parts of the State, under favorable climatic conditions simple pavilions properly furnished are considered appropriate.

Small wards (six to eight beds), a reasonable proportion of private rooms for the very ill or dying, and either private closets or lockers for all have been advocated.

In some instances the cottage plan is recommended, but usually as accessory to a central plant, either for the purpose of housing female patients who are oftentimes in the minority, or for the sake of providing private rooms in connection with hospitals which have an inadequate supply, or finally for the purpose of offering specially attractive accommodations to patients who desire to pay a part or all of the expense of their maintenance. In most instances buildings of a single story are preferred, and buildings over two stories are considered undesirable because they make an easy outdoor life difficult.

Equipment.—Equipment is recommended which will make the outdoor life comfortable and practicable, such as an abundance of clothing, both personal and for bedding, reclining chairs and appropriate shade.

Such medical equipment as is especially necessary for this class of cases, also a proper laboratory equipment, and provision for disposal of the sputum.

Administration.—Medical and nursing attendance. Where possible it is advised that there should be a resident medical officer, or at least a registered nurse. A consulting staff is considered desirable in all cases. A nurse for each ten bed patients is recommended; one for each fifteen ambulant patients, and one registered nurse for each fifty patients.

Aside from the medical management other administrative matters touched upon are as follows: Are pay patients desirable from an administrative standpoint? If patients are allowed or required to pay, will this increase the number of self-respecting citizens who apply for admission, raise the tone of the institution and induce patients to come early in the disease, and even make possible the provision of increased accommodations? Some hospitals are criticized as being overcrowded, and larger hospitals advised. The plan of caring for patients by per capita contracts is not generally recommended except as provided for by the "Act to provide for the medical treatment of indigent residents afflicted with incipient pulmonary tuberculosis," of April 14, 1909. While it is possible to properly conduct a tuberculosis ward in connection with a general hospital it is usually recommended that the tuberculosis department have a building apart from the general hospital, free from the oppressive atmosphere of the latter and so attractive to early cases.

In general the recommendations which have been made in connection with reports of inspections have aimed to be along modern and approved lines, which are said to be "simple construction, good food, cleanliness, rest or light employment, and a happy, friendly atmosphere."

State Institutions.

Prisons.—Under the law requiring that the department of tuberculosis shall "advise officers of the penal and charitable institutions regarding the proper care of tuberculous inmates," an investigation of conditions in the state prisons was made and extended to certain county prisons and city jails, disclosing the fact that some of the latter were so constructed and conducted as to constitute a menace to the state prisons by sending to them patients destined to develop tuberculosis as a result of the insanitary conditions of the first imprisonment. It

was found that there was no state inspection of a large group of these smaller prisons, because of lack of appropriation for this purpose and the investigations begun by this department were conducted only as opportunity offered in connection with inspections of county hospitals and other institutions treating tuberculosis which could be visited on the same trip and without loss of time. These investigations, however, were discontinued upon the receipt of legal advice as to the duties of this bureau.

The two prisons of California have tuberculosis problems which are somewhat similar, owing to the fact that both institutions were constructed in part at a time when less attention was given to sanitary detail than at present. While even some of the modern structures fall short of the ideal as to the admission of light, the older cells, which are still in use and often overcrowded, are dark and poorly ventilated. The management is well aware of these defects and is making every effort to improve conditions so far as practicable. There is still much room for improvement in the matter of overcrowding.

Increased space is particularly desirable in order that receiving cells may be available for the isolation of prisoners pending physical examination. Segregation of open cases of tuberculosis is practiced in both prisons, and San Quentin is enlarging and improving the tuberculosis wards. The fact that the hours of work and rest are well regulated, apparently has a tendency to prevent the development of tuberculosis which would undoubtedly result if patients were continuously confined in the cells which they occupy at night. The good effect of this plan might be materially increased by an improvement of the working conditions of some of those following indoor occupations.

State Hospitals.—Some of the faults referred to in connection with the prisons are also true, in a lesser degree, of the insane hospitals. While some of the construction is not what it should be in respect to making provision for the admission of light and air, yet this defect would work but little harm were it not for the constant tendency to overcrowding. The older buildings were generally planned with a liberal amount of air space and the patients' rooms were usually fairly well lighted. Some of the buildings erected in recent years show a tendency to undue economy in restricting the space allotted to each patient. Considering the favorable climate of California institutions of this character should make every effort to provide an almost constant outdoor life for all patients, as this would tend to lower the death rate from tuberculosis without being objectionable from the standpoint of the psychiatrist. While various recommendations have been made respecting conditions predisposing to tuberculosis in the state insane hospitals, it is the purpose of this bureau to confine further inspections strictly to departments devoted to the care of tuberculosis when these shall have been established.

Soldiers' Home.—Increased accommodation for the care of tuberculous inmates was recommended for this institution because of the fact that present accommodations were not adequate for the complete segregation of this class of patients. An entirely new ward is very much needed.

Private Charities.

In the history of the tuberculosis movement it has often been the case that measures undertaken for the prevention of tuberculosis have been originally instituted by private philanthropy, and the burden later assumed by the local or state government. Hence this report would be incomplete without reference to certain well established charities in this state.

Barlow Sanatorium opened September 1, 1903, for the care of the indigent tuberculous of Los Angeles County, who have been resident in the county for one year, and who are in no condition for active work. This institution was found to have developed into a remarkably efficient and complete institution, during this tenth year of its existence treating and discharging 61 cases. The average number of patients in the sanatorium throughout the year was 40, there being 43 beds in all. Patients who have the best chance for improvement or recovery are chosen from the waiting list, and a charge of not over \$5.00 per week is made to patients or friends of patients. The per capita weekly cost this year was \$9.11 and the annual deficit met by subscription, including money raised for improvements and new buildings amounted to \$13,129.13.

La Vina, near Pasadena, opened July 26, 1909, receiving all classes of cases who are residents of the vicinity, renders the public remarkable service by removing from the community cases which would otherwise be a source of infection, particularly heads of families who are a burden as well as a danger to their children. The maximum charge for resident patients, who are able to pay, is \$7.00 per week; if this is a hardship they may pay less, and no one is refused or discharged for want of means. Non-residents are received in emergencies at actual cost. The original cost and the large annual deficit of about \$15,000.00 has been met by private charity.

Arequipa, Marin County, opened September 9, 1911, for wage-earning women. While it does not call itself a charity it is in reality to be classed with the two preceding, in that it offers good sanatorium treatment at a moderate cost, a plan which serves to preserve the self-respect of the individual; at the same time the institution demands no inconsiderable donations of money, time and supplies.

Other institutions have been attempted by private charitable organizations, but have been obliged either to vary the cost of accommodations to such an extent as to remove it from this class of essentially charitable institutions or to discontinue owing to inability to meet the deficit. The three institutions mentioned might each serve to offer an example of desirable features which may well be incorporated in public tuberculosis hospitals.

Other private charities inspected are the dispensaries, of which there are six in California, one at each of the following places named in the order of their founding: Los Angeles, San Francisco, San Diego, Oakland, Berkeley, and San Jose. During the greater part of their existence these dispensaries, which have for their primary object the discovery of cases of tuberculosis, the education of the community, the aftercare and employment of patients, and assistance to their families, have been supported mainly by private charity and consequently have been obliged to place more emphasis on those lines of work which are obvious and make the strongest appeal. Upon inquiry it has been found that these institutions are willing to cooperate with

the State in the matter of epidemiological and sociological studies which may serve as a basis for future scientific handling of the tuberculosis problem.

*Tuberculosis patients are received, but there is no definite number of beds assigned.

As will be seen by referring to the tables, there are a number of private general hospitals which have tuberculosis departments. A feature which this Bureau has aimed to encourage because it increases the accommodations for those suffering from this disease who are so often excluded from general hospitals, or received under protest, to the detriment of the morale of the institution. A well conducted tuberculosis department of a general hospital is of great benefit to the general public, both by its education of nurses in training to a proper understanding of methods of treatment and prophylaxis, and because it has a tendency to induce a reasonable and humane attitude toward the consumptive. Again, where such hospitals are used for clinical purposes by medical students, the presence in them of pulmonary tuberculosis is an opportunity for very necessary education in diagnosis.

Registration.

Realizing that proper registration of tuberculosis cases is essential to any plan for the control or eradication of tuberculosis, this Bureau has aimed to accomplish as much as possible in this line with the limited funds available. An effort has been made to bring the matter to the attention of physicians, first by sending to 284 health officials a letter calling attention to the law; later by writing to the secretary of each of the county societies, requesting that the subject of registration be given special attention in the local society, and that the letter be read to each society. This letter was also published in the "California State Journal of Medicine." The subject of registration was presented briefly to the health officers at the October meeting in Venice, and also to the San Joaquin County Medical Society and the San Diego County Medical Society. Wherever possible use has been made of local tuberculosis societies or personal appeal with the purpose of educating the public to a realization of the importance of this work.

Signed letters have been mailed to 2,113 physicians and health officers enclosing blanks for the reporting of tuberculosis. As funds do not permit dealing directly with all physicians in the State, in the larger cities it has been left to the health officers to distribute report blanks and to aim to stimulate morbidity returns. The results of this work are shown by an increase in the number of cities and counties reporting tuberculosis, which has been very gratifying, and also by a noticeable increase in the number of cases reported. By referring to the accompanying tables it will be seen that morbidity reports are available for 1912 and 1913. There are no records of tuberculosis morbidity previous to 1912 on file in this office.

*Total for six months.

Total reported September, 1913, to June, 1914, inclusive.....4,078

As the work of this Bureau did not begin until September, 1913, it is too soon to draw conclusions or to make extensive comparisons. It may be noted, however, that deaths are much more fully reported than cases, and that during the ten months since the establishment of this bureau, the number of cases reported shows a tendency to approach that of the annual death rate from tuberculosis.

Great pains have been taken to devise a standard card for making these reports which shall furnish the most important sociological and medical data. A circular letter was sent to a number of eastern states and a study made of the replies received and the results compared with blanks at present in use in this State. While not perfect the card seems to be bringing in very good returns. It is the plan of the bureau to distribute no more cards directly to physicians, but to work through local health officers, as this is the method indicated by the law. While it is not the intention of the bureau to publish the names of patients, these are essential for identification in a disease which is of such long standing as tuberculosis, and one in which there is so much migration. The form of card used is as follows:

CALIFORNIA STATE BOARD OF HEALTH
Bureau of Tuberculosis

REPORT OF A CASE OF TUBERCULOSIS

The state law requires you to report all cases of Tuberculosis. Write plainly with non-faded ink.

<p>Name of patient ----- Age ----- Sex ----- Street and No. ----- City ----- County ----- Previous Address ----- Home address ----- Dwelling: detached, flat, tenement, boarding, hotel, hospital, other ----- Housing: good, fair, poor. Financial condition: independent, wage earner, indigent. Occupation ----- yrs. ----- mos. ----- Occupational conditions: Good, fair, poor ----- Former occupation ----- yrs. ----- mos. ----- Nativity: State ----- Foreign ----- Race or Color ----- How long resident of Cal.? ----- City? ----- County? ----- Family: No. persons ----- Has family received sanitary instructions? ----- Tuberculosis: in father, mother, brothers, -----, sisters -----, husband, wife, children, -----, others ----- Bacteriological examination T. B., pos. -----, neg. -----, by whom ----- Approximate date of Diagnosis ----- Prognosis ----- Result ----- Physician's signature ----- Date -----</p>	<p>Single Married Widowed Divorced Separated</p> <p>Type of Disease Tuberculosis of Lungs Larynx Lymph Glands Peritoneum Bones Intestines Skin</p>
--	--

NOTICE.—The attending physician will fill out the above form and return to the local health authority for transmission to the State Board of Health. Draw a line through words not needed.

It will be seen that by underlining certain words or drawing a line through words that are not needed, very little writing is necessary to give a report which will supply much useful information to the department.

Approximately 4,000 names and addresses have been reported since January, 1913, and have been transcribed upon cards for the purpose of making a study of the location and migration of individuals and eliminating the records of those who have died. As there are approximately 3,000 deaths each month which must be compared with the register, it is a matter requiring no inconsiderable clerical labor to keep this tuberculosis register a record of the living.

Much of the work of this bureau is of too heterogeneous a nature to be included in a report of this kind. Certain inspections, investigations and executive duties have been undertaken by the director in his capacity as assistant secretary. In this capacity also he attended the Surgeon General's Conference, June 18th, a meeting of state and territorial boards of health, June 19th and 20th, and a conference with the Commissioner of Indian Affairs, June 20th, in Washington, D. C., and the annual meeting of the American Medical Association, June 22d, in Atlantic City, New Jersey.

Following this he made an investigation of the methods used in Pennsylvania for the control of tuberculosis, including an inspection of the three state sanatoria, numerous dispensaries, as well as a study of methods in use in the central offices at Philadelphia and Harrisburg. Conferences were held with officers of the National Association for the Study and Prevention of Tuberculosis at New York and with prominent officials and workers in Massachusetts, New York, Illinois and Colorado, and also inspections made of hospitals, dispensaries and of methods used in these states for the treatment or control of tuberculosis.

While in Washington an opportunity was taken to inquire into the status of a bill known as the Shafroth-Calloway Bill which has been introduced as the result of the activities of the Texas Anti-Tuberculosis Association, and provides for the establishment of federal hospitals for consumptive strangers in the southwest. California has been asked to lend its support to this measure as a means for equalizing the burden

which it must bear in the care of indigent strangers attracted by the reputation of its climate.

The following papers have been prepared during the year :

"Rating the Efficiency of Hospitals and Institutions for the Tuberculous" (read at Venice, October, 1913).

"A Word to Teachers on Health," issued by Edward Hyatt, Superintendent of Public Instruction, in the series of leaflets on Health Conservation authorized by the legislature of 1913.

"A New Movement in Public Health Work," read before the Sacramento Nurses' Association, January 7, 1914.

"The Tuberculosis Commission and the Tuberculosis Bureau," read before the San Joaquin County Medical Society, January 30, 1914.

"Registration," written for the Colfax "Tea Bee."

"The Bureau of Tuberculosis, its Work and Plans," read before the annual meeting of the California Association for the Study and Prevention of Tuberculosis, held jointly with the forty-fourth annual meeting of the Medical Society of the State of California, Santa Barbara, April, 1914.

The following reports of inspections have been filed with the secretary of the Board of Health :

REPORT OF BUREAU OF REGISTRATION OF NURSES.

ANNA C. JAMME, Director.

The act authorizing the establishment of a department of examination and registration of graduate nurses, under the State Board of Health, was approved June 12, 1913. In accordance with its organization, this department became a bureau of the State Board of Health, and according to the provisions of the law a director was appointed on October 4, 1913, and the work of the bureau was immediately commenced.

The organization embraces:

1. REGISTRATION.

A. Registration of applicants without examination, under section 3 of the law.

B. Registration of applicants without examination who are already registered in another state or foreign country, under section 8.

C. Registration of applicants with examination, who are graduates of accredited schools for nurses, under section 4.

2. INSPECTION OF TRAINING SCHOOLS.

3. ACCREDITING OF TRAINING SCHOOLS.

4. EXAMINATION.

5. DEVELOPMENT.

Four thousand eight hundred and thirty-three applicants were registered and certificates issued, under section 3. These applicants were obliged to qualify by presentation of their diploma or a certificate signed by the present superintendent of the training school in which they received their course of instruction. This certificate testified to a general training, good moral standing and completion of theoretical and practical course. A certificate of health signed by a physician accompanied the application.

The registration of applicants who are already registered in another state or foreign country is required in order that such applicants may be known as "Registered Nurses" and use the title R. N. after their name in this state. Before such registration is granted, it is first ascertained if the laws of the state or foreign country issuing the certificate of registration are equivalent to those provided for by the California law. It is further ascertained if the applicant is or intends to become in good faith a resident of this state.

The inspection of training schools for nurses includes a yearly inspection by the director of the bureau. This inspection includes a study of the conditions under which the pupils receive their training; the character of the hospital, and if it affords a general training; its capacity; nature of its service and its equipment. Educational requirements for the admission of pupils to the training schools; the number and qualifications of the nurse instructors and the subjects taught by class and demonstration. The staff of medical lecturers; equipment for teaching nurses, as class rooms, library, diet kitchen, laboratory, etc. The nature and amount of instruction, the plan followed in practical and theoretical

work and time allowed for practical experience in each department of the hospital.

Inspection is made for the purpose of accrediting the schools maintaining the standard required. A report of each inspection is made to the State Board of Health. The requirements for training schools for nurses are as follows:

The school for nurses or the hospital with which it is connected must be either incorporated or be conducted by a public body.

The hospital must have a capacity of not less than 35 beds and a daily average of 25 patients.

The hospital must afford proper facilities for conducting a school for nurses. It must provide experience in the following departments of nursing: Medicine, Surgery, Obstetrics, and Pediatrics. It must provide a systematic course of theoretical instruction in medical, surgical and obstetrical nursing and the divisions under these major subjects.

Due attention must be given to the home life of the student. There must be a living room, a class room, a demonstration room and adequate equipment for teaching purposes. There must be a sufficient number of airy sleeping rooms; individual rooms are recommended. There must also be special provision for night nurses' rooms.

The diet must be simple, wholesome, well cooked and ample.

The head of the training school must be a registered nurse and must possess qualifications requisite for the administration of the school; she must have ability for teaching, she must be capable of guiding the students in moral discipline and of maintaining a high standard of educational and moral efficiency in the school.

A force of instructors must be maintained sufficient and competent for the instruction herein specified.

A complete record must be kept of the students in the school; their qualifications for admission; their class and lecture work; their practical work; their moral standing and general ability and efficiency.

ADMISSION.

Candidates for admission to training schools for nurses should present the following evidence:

1. A complete high school education, or a two-year high school course or its equivalent in a recognized school, together with two years of special study, or an occupation that would be considered preparatory to the study of nursing.

2. Home training and influences fitted to form good moral character and lay the foundation for the future work of the nurse.

3. Good physical condition. A complete physical examination must be made by a physician before application is accepted. Physical and mental development shall be taken into consideration in connection with the age of the candidate, but, in general, it is advised that a pupil shall not be under 20 years or over 35 years of age.

It is recommended that students shall be admitted *in classes* at stated periods during the year.

COURSE OF INSTRUCTION.

The course of instruction, theoretical and practical, must cover a period of three years in the training school.

When schools can not provide opportunity for practical experience in any one major branch, they must affiliate with other approved schools giving the required experience. The studies shall be as follows:

	Classes, hours	Lectures, hours
1. Nursing ethics -----	10	-----
2. Anatomy -----	10	12
3. Physiology -----	8	8
4. Hygiene -----	6	6
5. Bacteriology -----	6	6
6. Dietetics -----	12	12
7. Materia medica -----	10	8
8. Urinalysis -----	-----	8
9. Medicine -----	12	8
10. Surgery -----	12	8
11. Obstetrics -----	15	10
12. Pediatrics -----	12	10
13. Contagion -----	8	12
14. Mental diseases -----	4	4
15. Eye, ear, nose and throat -----	-----	8

PRACTICAL EXPERIENCE.

	Months
1. Preparatory course -----	3
2. Medical nursing -----	4
3. Surgical nursing -----	4
4. Operating rooms, dressing rooms and dispensary -----	4
5. Obstetrical nursing -----	4
6. Children -----	3
7. Contagion -----	3
8. Dietetics -----	2
9. Night duty -----	4
10. Vacation -----	2
11. Open time -----	3

In the instruction of male nurses, hospitals shall provide lectures and practical experience in genito-urinary diseases instead of obstetric nursing.

Graduates of training schools complying with the above requirements, who have completed with credit the three years' work outlined, and have received the diploma of the school, will be eligible for examination by the State Board of Health. Candidates who pass, successfully, this examination will be entitled to the certificate of Registered Nurse.

RECOMMENDATIONS.

The State Board of Health recommends the following considerations with a view of raising the educational and technical standard of training schools:

1. When a school is so situated and endowed with facilities as to be able to enlarge the curriculum, it is unhesitatingly recommended to do so.

2. Where schools are small and unable to obtain the necessary equipment they shall form a connection with a high school or college for some of the required studies, as chemistry, hygiene, anatomy or dietetics.

3. Whenever practicable, lectures and classes should be held during the day instead of the evening.

4. There shall be a study room provided where there is absolute quiet.

5. There shall also be a recitation and lecture room.

6. There shall be special time set aside each day for study.

7. Emphasis shall not be placed on the number of lectures, but on classes, demonstrations, and laboratory work; also, on the written and oral quiz on each lecture.

8. There shall be a special instructor of nurses in each school. Teaching requires time for preparation which the superintendent of nurses, who may also be the superintendent of the hospital, is unable to give to it.

9. The classroom study shall be properly correlated with the practical opportunity offered in the wards and rooms of the hospital.

10. Good reference libraries shall be established, and a definite outline of required reading on subjects allied to nursing prescribed during the course.

11. Social diversions as offered by good drama, opera, concerts, musicales and lectures should be encouraged and special forms of recreation should be provided in the nurses' home.

12. Whenever possible, student government should be maintained. Students should be regarded as *women* and capable of maintaining dignity in all matters pertaining to the moral and social atmosphere of their home.

This standard curriculum has been established in order that uniform methods of teaching may be adopted in the preparation of pupils for state examination.

The examination of candidates for registration will be held according to section 2, of the law, which states that such examination shall be held every six months. Candidates shall be examined in the following subjects:

Anatomy and physiology.	Children's diseases.
Hygiene.	Contagious diseases.
Bacteriology.	Medical nursing.
Materia Medica.	Surgical nursing.
Urinalysis.	Obstetrical nursing.
	Ethics.

There are in the state eighty-three schools for nurses, and upwards of eighteen hundred pupils at present in training in these schools. Forty-nine have been inspected and a report of each submitted to the board. Of the number reported, twenty-nine are complying with the requirements of the law and have been accredited by the board for a period of one year. The remaining number will be accredited as they meet the requirements.

During the first year of its work, the bureau has come in touch with every hospital, sanitarium and training school in the state. It has sought to aid schools where deficiency exists in the course of instruction and practical experience as also to promote the better housing and care of nurses during their period of training.

Addresses and talks have been given by the director, on request to graduate nurses organizations, to pupils in training and to other organizations on the work of the bureau.

The development of the work will embrace the following:

1. Establishing uniform methods of teaching in the schools for nurses in the state.

2. Assisting the schools located in towns and rural districts, to meet requirements by affiliation for a definite length of time with larger institutions, where a wider experience may be obtained.

3. To advocate preliminary education relative to the study of nursing in high schools and colleges of the state.

4. To advocate the special preparation of nurses for teaching in schools of nursing.

THE PERSONNEL OF THE COMMISSION.

EXECUTIVE BOARD.*

- Dr. George H. Kress, Los Angeles, Chairman,
President (1911-1912) California Society for the Study and Prevention of Tuberculosis, Professor of Hygiene, Los Angeles Medical Department, University of California, formerly in charge of Helping Station, Los Angeles Tuberculosis Society.
- Dr. Chas. C. Browning, Los Angeles,
A tuberculosis specialist, formerly medical director in several sanatoria, member of faculty University of Southern California, Tuberculosis Division, Department of Medicine.
- Dr. R. G. Brodrick, San Francisco,
Health Officer of San Francisco, formerly executive secretary San Francisco Association for the Study and Prevention of Tuberculosis.
- Mr. A. Bonnheim, Sacramento,
President, California Public Health League, Member Board of Directors Alta Sanitarium for Tuberculosis, maintained as a part of the equipment of the White Crusaders.
- Miss Katherine C. Felton, San Francisco,
Secretary, San Francisco Associated Charities.
- Mr. Guy P. Jones, Sacramento,
Secretary to the Commission.

ADVISORY BOARD.

- Rev. Chas. F. Aked, San Francisco,
Minister, First Congregational Church.
- Dr. John L. Avey, Redlands,
State Senator.
- J. J. Bakewell, Jr., San Francisco,
Architect, and formerly director, San Francisco Association for the Study and Prevention of Tuberculosis, member executive committee San Francisco Housing Association.
- Dr. W. Jarvis Barlow, Los Angeles,
Medical Director, Barlow Sanatorium for Tuberculosis, Professor of Medicine, Los Angeles Medical Department, University of California.
- Rev. Dana Bartlett, Los Angeles,
Member Los Angeles Housing Commission.
- Chas. H. Bentley, San Francisco,
Sales Manager, California Fruit Cannery Association.
- Chas. A. Bliss, Sacramento,
Member 1911 Assembly.
- L. D. Bohnett, San Jose,
Member 1911 Assembly.
- Dr. Richard G. Boone, Berkeley,
Lecturer in Education, University of California.
- C. B. Boothe, Los Angeles,
Former president, State Tuberculosis Association.
- A. E. Boynton, Oroville,
State Senator, 1911.
- Dr. Philip King Brown, San Francisco,
Medical Director of Arequipa Sanatorium for Early Cases of Tuberculosis in Wage-Earning Women.
- Mrs. Samuel Brust, San Diego,
Secretary, San Diego Society for the Study and Prevention of Tuberculosis.
- A. Caminetti, Jackson,
State Senator, 1911.
- Rev. D. O. Crowley, San Francisco,
Director Youths' Directory and Vice-President, Associated Charities, member executive committee San Francisco Housing Association.
- Miss Margaret B. Curry, San Francisco,
Chairman, Social Science Section, California Club.
- Frederick W. Dohrmann, San Francisco,
Member Central Council Associated Charities, San Francisco.
- Dr. Geo. H. Evans, San Francisco,
Member of Executive Council, San Francisco Association for the Study and Prevention of Tuberculosis, President (1912-1913) California Association for the Study and Prevention of Tuberculosis.
- Dr. N. K. Foster, Oakland,
Director Department of Health and Sanitation, Oakland Schools.

*The purpose in publishing a few of the activities of each member of the Commission, is to give a definite idea of the qualifications of the persons appointed, and the wide range of knowledge of medical, social, economic and business conditions collectively represented.

- Prof. J. H. Francis, Los Angeles,
City Superintendent Public Schools.
- J. E. Gardner, Watsonville,
Former Attorney for State Board of Health.
- Dr. Frederick P. Gay, Berkeley,
Professor of Pathology, University of California.
- Dr. Minerva Goodman, Stockton,
Medical Superintendent of Stockton Red Cross Tuberculosis Hospital.
- Thos. F. Griffen, Modesto,
Member of 1911 Assembly.
- Miss Alice Griffith, San Francisco,
Secretary of Housing Association, San Francisco Associated Charities.
- Dr. C. M. Haring, Berkeley,
Agricultural Experiment Station, Assistant Professor Veterinary Science, University of California.
- Dr. Geo. H. Hart, Los Angeles,
City Veterinarian of Los Angeles Health Department, formerly with Pathological Division, Bureau of Animal Industry, Washington, D. C.
- Dr. Frederick W. Hatch, Sacramento,
General Superintendent of State Hospitals for the Insane.
- John E. Hoyle, San Quentin,
Warden of San Quentin State Prison.
- Edward Hyatt, Sacramento,
State Superintendent of Public Instruction.
- Dr. John C. King, Banning,
Director, Tuberculosis Sanatorium.
- Walter Macarthur, San Francisco,
Editor Coast Seaman's Journal, member executive committee San Francisco Housing Association.
- Mrs. M. W. Kincaid, San Francisco,
Member San Francisco Board of Education.
- Martin A. Meyer, San Francisco,
Rabbi, Temple Emanu-El.
- Mrs. Robert O. Moody, Berkeley,
Formerly Instructor in Biology, Cornell University.
- Dr. H. N. Morrison, Los Angeles,
Chief Surgeon of Santa Fe.
- Dr. Gale G. Moseley, Redlands,
Superintendent of Redlands Settlement Sanatorium.
- John I. Nolan, San Francisco,
Secretary, San Francisco Labor Council.
- A. E. Nye, Sacramento,
State Controller.
- Dr. Wm. Ophuls, San Francisco,
Professor of Pathology, Stanford University Medical Department.
- Dr. Geo. C. Pardee, Oakland,
Chairman of the State Conservation Commission.
- Dr. Robert A. Peers, Colfax,
Medical Director of the Colfax School for the Tuberculous.
- Dr. F. M. Pottenger, Monrovia,
Medical Director, Pottenger Sanatorium for Diseases of the Throat and Lungs.
- Dr. Geo. F. Reinhardt, Berkeley,
Professor of Hygiene and Director Infirmary, University of California.
- Dr. Chester L. Roadhouse, Berkeley,
Instructor in Veterinary Science, University of California.
- W. A. Sutherland, Fresno,
Member of 1911 Assembly.
- Dr. Geo. E. Tucker, Riverside,
Secretary of the California Society for the Study and Prevention of Tuberculosis, Riverside County Health Officer.
- Dr. Edward von Adelung, Oakland,
Vice-President of Alameda County Society for the Study and Prevention of Tuberculosis.
- Dr. Wm. C. Voorsanger, San Francisco,
Secretary of San Francisco Association for the Study and Prevention of Tuberculosis.
- Dr. Chas. H. Whitman, Los Angeles,
Medical Director of Los Angeles County Hospital.
- Frederick S. Withington, San Francisco,
Actuary of Western States Life Insurance Company.

INTRODUCTORY.

The California legislature of 1911 enabled the State Board of Health to cause a special investigation into the tuberculosis problem of California, to "ascertain the effects of localities, employments, conditions and circumstances upon the health of those developing the disease, and to determine the best means for its eradication." To this end, a commission consisting of an executive board of five members, and an advisory board of fifty members was appointed by the State Board of Health to carry on this work.

The work was done by committees, composed of members of the advisory board, each of which was presided over by a member of the executive board. Nearly the entire work of the commission is embraced in the work of these units, which are enumerated as follows:

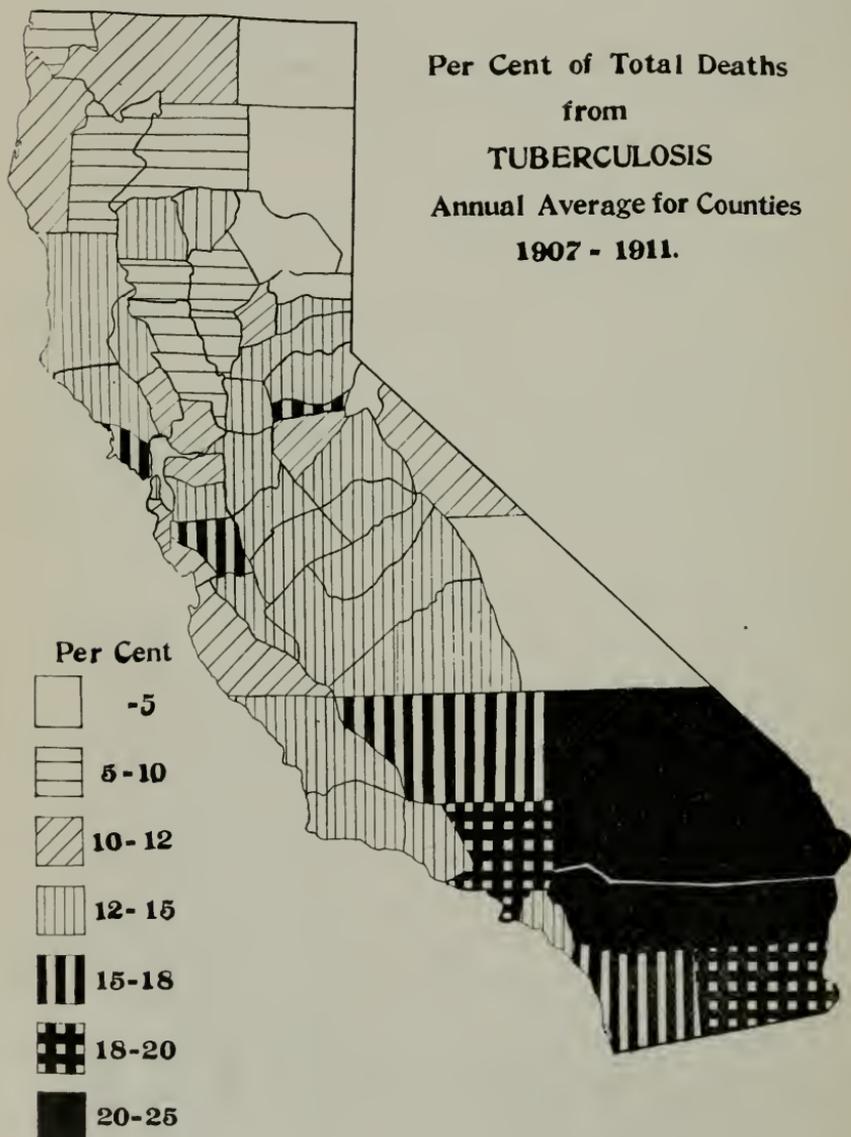

1. Institutional Activities: Administration. Dr. Browning, chairman.
2. Institutional Activities: Construction. Dr. Browning, chairman.
The construction and administration of sanatoria, hospitals, dispensaries, camps, etc., are included in the work of these committees, as well as home treatment and general prophylaxis.
3. School Construction and Health Administration of Schools. Miss Felton, chairman.
4. Housing Conditions. Miss Felton, chairman.
The work of these committees refers to open air and outdoor schools, medical inspection of school children; also, general housing conditions—in homes, tenements, factories, hotels, and lodging houses.
5. Sociologic and Economic Conditions. Dr. Kress, chairman.
6. Legal Procedure. Dr. Kress, chairman.
Special attention will be given by these committees to statistical work, showing the relation of tuberculosis to daily life, and economic and sociologic conditions. The gathering of legal information and the advising of the executive board regarding proposed legislation, based upon the experience of other commonwealths and upon present conditions in this state, will be a duty of these committees.
7. Scientific Problems. Dr. Brodrick, chairman.
8. Educational Measures. Dr. Brodrick, chairman.
The study of scientific data relative to human and bovine tuberculosis, their prophylaxis, etiology and methods of transmission; and the education of the public by means of literature, press reports, sermons, exhibitions, demonstrations and the like, will be undertaken by these committees.
9. Industrial and Commercial Problems. Mr. Bonnheim, chairman.
10. Registration and Disinfection. Mr. Bonnheim, chairman.
These committees will take up an occupational investigation of tuberculosis and will study the problems dealing with transportation, fumigation, reporting of cases and deaths, proper disinfection, etc.

The personnel of the ten committees is as follows:

In addition to these administrative boards, constituting the officially appointed commission, many persons have undertaken special work in connection with the investigation. To these volunteer workers, most of whom are members of women's clubs, medical societies, labor organizations, etc., the State Board of Health and the California Tuberculosis Commission are indebted.

In addition, several experts in welfare work have given freely of their time in special work undertaken by the several committees. To all of these persons, sincere thanks is extended.

STATISTICAL AND SOCIOLOGICAL ASPECTS OF THE CALIFORNIA TUBERCULOSIS PROBLEM.

Some Condensed Facts and Working Figures.

Some of the facts and estimates upon which the Tuberculosis Commission has built its recommendations for action are as follows:

1. *Approximately five thousand deaths in California each year are caused by tuberculosis.* This means that as an annual average one person out of every five hundred of our population is sacrificed to this disease: or stated in another way (since approximately one seventh of all deaths are due to tuberculosis) the chances of these five thousand Californians living to a ripe old age would be improved 14 per cent if we could eliminate this disease.

2. *Thirty per cent of these five thousand deaths are among native Californians, and a large percentage among persons who have lived in California more than ten years.* The state as a whole shows an average of 8 per cent of the tuberculosis deaths to be among residents of less than one year, while southern California shows 20 per cent of its tuberculous deaths to be among residents of less than one year.

3. *The percentage of deaths is slightly higher for cities than for rural population.*

The great majority of deaths occur between 25 to 44 years of age.

More deaths occur in February than in any other month, the smallest number occurring in October.

Single men and married women show specially high percentages among the deaths.

Occupations undoubtedly are an important and confusing factor, the percentage of deaths being specially high among the poorer paid wage-earning pursuits.

4. *Among those victims of the disease who are married, approximately 25 per cent of the men die between the ages of 25 to 35 years, and 25 per cent more between 35 to 45 years, and similarly 37 per cent of the married women die between 25 to 35 years, and 25 per cent between 35 to 45 years.* The financial and household problem suddenly placed upon the surviving members of these patients' families is most serious and is a matter of public concern as well.

5. The average duration of the fatal cases of tuberculosis from the beginning of the definite illness to death is variously estimated, but may be conservatively stated to be four years. During these years the patient can not earn even partial wages much beyond the first year. It is estimated that for every person developing tuberculosis at least one other person is infected under present social and civic conditions. *These figures mean that California must have constantly at least 20,000 persons with tuberculosis which will terminate fatally.* In addition to this there is an unknown number of persons who ultimately recover or die after many years with some other disease given as the cause of death.

6. A preliminary study of 3,350 California patients, under present hospital treatment, shows the following:

Patients in county hospitals (at public expense) -----	1,700
Patients in state hospitals (at public expense) -----	200
Patients in government hospitals (at public expense) -----	200
Patients in benevolent hospitals (not over \$1.00 a day charged, balance subscribed by public) -----	250
Patients in sanitariums (not over \$15.00 per week, balance subscribed by public) -----	350
Patients in sanitariums (\$100.00 per month up paid by patients or relatives) ---	350
Patients in sanitariums (private rates not quoted) -----	300

During the years 1907 to 1911, inclusive, out of approximately 10,000 patients tabulated by the commission as treated in institutions, over 50 per cent were cared for entirely at public expense. This number is incomplete and is in addition to an unknown percentage for those afforded private charity.

7. The economic values upon which the tuberculosis problem depends vary greatly, according to the locality under consideration, but the following figures represent a fair average:

(a) Probably 90 per cent of the families and unmarried persons in California are living upon less than \$1,500.00 per year incomes.

(b) The wage earners receive from \$500.00 to \$1,500.00 per year, with a general possible average of \$800.00 in California.

(c) The minimum cost of maintaining a family (man, wife, four children or less) is generally recognized to be \$650.00 to \$750.00 per year.

(d) The question of wage earners living in the country, or in an uncongested part of the city, is limited as a rule to the range of a five-cent fare and one hour of travel each way.

(e) The cost of properly caring for a child from birth to 20 years of age varies from \$3,000.00 to \$4,000.00, with a probable minimum average of \$100.00 per year for the period of time during which the child is dependent on others for support.

(f) The commercial value of human lives has been variously estimated. All employers of men and women know the value of a good workman, and express this commercially in the salaries paid. These salaries, translated into capitalized values, indicate that the average adult workman is worth in gross valuation from \$12,000.00 to \$20,000.00, but when the cost of his maintenance, unemployment, etc., is deducted, he is not worth to his family more than \$3,000.00 to \$10,000.00 in money equivalent. The United States national vitality report, after correcting such figures as these, for age distribution of deaths and the percentages of preventability, estimates the average economic loss on all lives so sacrificed to be \$1,700.00 each.

(g) The majority of statistics bearing upon sources of income to a family other than through the efforts of the father show that the mother may bring in $1\frac{1}{2}$ to 2 per cent through miscellaneous light labor, mostly piecework, and 6 to 8 per cent through taking in boarders. The minor children may collectively bring in 8 to 10 per cent more. A possible 20 per cent therefore of the minimum necessary income for a family may be supplied by a mother and her children without sacrificing her home or the schooling of the children.

(h) The average cost of maintenance of a tuberculosis sanitarium can probably not be reduced below \$2.00 per day per patient. Practi-

cally no charitable institution, even those limiting their patients to selected cases, can cover expenses for less than \$40.00 per month. Proper home care will probably mean as much in equivalent values.

(i) Various estimates by careful students of the tuberculosis problem in the United States indicate that a total number of tuberculosis patients at any given time, one half are totally incapacitated as wage earners, while the other half are reduced 50 per cent in their wage earning capacity. It is also estimated that 60 per cent of this loss on a consumptive is his personal and family loss, the remaining 40 per cent being lost to the state.

(j) The cost of caring for orphans of parents who have died of tuberculosis is a factor. The State of California pays \$100.00 per year for the maintenance of a full orphan and \$75.00 per year for a half orphan. For foundlings the state pays \$12.50 per month.

(k) Since the medium age for deaths due to tuberculosis is thirty-three years, with an expectancy of thirty-three years more of life, the majority of victims of the disease die before the public has an opportunity to know their potential value. A list of one hundred world-famous men and women who have died during the past five years, after having profoundly influenced every human interest—financial, governmental, literary, religious, journalistic, military, dramatic—shows an average age of 36 years to have been attained before public recognition was achieved. The average age of death from this group was 69 years. One way of graphically illustrating the potential loss from tuberculosis to any community is to determine the number of persons who have died of tuberculosis under the age of 33 years, and then estimate the value to the community of a similar number of persons who did not die at that age, but lived on to become successful and influential members of the community. The wealth and increased measure of life generally, resulting from the activities of these members, fairly represent the potential loss suffered through the tuberculosis ravages.

(l) The "colonist rate" tragedy and many other economic phases of the problem should be included in any complete synopsis of basic data for estimating the cost of tuberculosis.

8. The social and economic issues involved in the relations of tuberculosis to poverty, crime, and despondency are of tremendous importance, but are too indefinite to be set down in generalized percentages and totals.

9. And, finally, the one great fact which overshadows all else is the needless amount of suffering, sorrow, and human heartache endured by those who are daily dropping out of their successful careers and happy homes amongst us, to drift a while, before the victory of the bacillus is complete.

Some Speculations on the Importance of the Problem.

With the data roughly outlined above, one may make many interesting estimates of the cost of tuberculosis in California, and in special localities within the state. The following trial balance is made up by starting with the one definite fact in our possession, i. e., that we have approximately five thousand deaths each year from tuberculosis. If the average duration of the serious illness of each of these victims is four years, it is obvious that there must be at least twenty thousand patients constantly in the state. That there are more than this number

is certain, but the case mortality in tuberculosis is such a variable percentage that no figures are worth much except those based upon actual morbidity reports for special areas. If we take only twenty thousand as a basis, and use the lowest reasonable figures for expense items, our trial balance would read something like this:

A net loss of \$15,000,000.00 per year is worth investigating carefully. Estimating 60 per cent of this loss to be the personal loss of the patient and his family, there is left \$6,000,000.00 as the annual loss to the state on account of the uncontrolled spread of tuberculosis. Sir Ronald Ross stated in a series of "Sanitary Axioms" that "for economic reasons alone governments are justified in spending for the prevention of such diseases (endemic diseases) a sum of money equal to the loss which the disease inflicts upon the people." The United States Conservation Commission estimated that 85 per cent of all tuberculosis was preventable. This would mean that \$12,750,000.00 of this annual loss is preventable. From any basis of estimating the economic value of increased population it would seem conservative to say that if the Tuberculosis Commission can prove that effective measures will reduce the amount of tuberculosis by even 10 per cent, the state would make money by investing any sum necessary up to \$1,500,000.00 per year in the project. A saving of 10 per cent of the five thousand deaths per year would mean the equivalent to the state of five hundred new settlers each year at the medium age of 33 years with an expectancy of 33 years more of life. This is but one of many estimates which any one can make for the state or his locality, if he desires to work out the value of health conservation to the nation.

The Wage Loss from Tuberculosis Deaths in California for 1911.

The actual loss in wages, for a single year, to those engaged in wage-earning occupations who died from tuberculosis in California during 1911, amounted to almost \$3,000,000.00; \$844,000.00 of this loss, almost one third of the total, fell upon those engaged in manufacturing and mechanical industries, the skilled trades—carpenters, engineers, machinists, painters, plumbers, tailors, etc. Over half a million, almost one fifth of the total, fell upon those engaged in agriculture, transportation and other outdoor pursuits. The loss was almost as great to the class engaged in other than agricultural pursuits, laborers and servants, among whom there are more deaths in actual numbers than in any other class, but who do not share so great a financial loss because of the lower wage received. Over a quarter of a million dollars was lost to those engaged in clerical and office work, and almost as much to merchants and traders. The loss to those engaged in the professions amounted to \$208,000.00, and for women workers it was \$138,000.00.

The average age of death for those dying of tuberculosis in California is 36 years, while the average age of life in the state is 48 years. If these workers had lived the twelve years to which they were entitled, as average human beings, had they not died of this preventable disease, they would have earned no less than \$39,618,000.00, which is lost not only to themselves, but to their families and to the state. This is but a fraction of the aggregate loss, when the cost for care, medical attendance, support of dependent families, etc., is considered. This is one of the things that makes the cost of living higher, for it is safe to say that each death from tuberculosis raises the rate of taxation, not alone

through the public expense for care of dependent families, but also for the care of the living afflicted. There are few lodges and fraternal organizations that do not have members drawing benefits for illness from tuberculosis, and there are 1,500 tuberculosis cases being cared for constantly by the state, the number increasing every year.

In the tabulation which follows it will be noted that of the 1,565 women over 15 years of age who died of tuberculosis, no occupation was recorded for 1,380. Most of these were housewives, whose loss to the family cannot be estimated in dollars nor in influence, but which no doubt has in many cases a far reaching effect in furthering juvenile delinquency, resulting in expense to the state.

The wage estimate used in this tabulation is based upon the report of the State Bureau of Labor and may be considered as conservative. The actual loss is probably greater than represented.

TABLE NO. 1.

	Total deaths from tuberculosis, 15 years and over	Total number fully employed at time of death	Number without occupation	Occupational group	Number of deaths	Loss in wages one year
Male	3,074	2,745	329	Mechanical and manufacturing	577	\$844,224 00
				Agriculture, transportation and other outdoor pursuits	690	517,500 00
				Laboring and servant	773	463,800 00
				Clerical and official	197	256,100 00
				Mercantile and trading	189	236,250 00
				Professional	139	208,500 00
				Personal service, police, etc.	90	90,000 00
				Public entertainment, hotel, etc.	66	82,500 00
				Other occupations	24	18,720 00
Female	1,565	185	1,380	All occupations	185	138,750 00
Total	4,639	2,930	1,709		2,930	\$2,856,344 00

Tuberculosis in Relation to Marriage and Occupation.

Tuberculosis is especially a problem of the industrious poor—poor in the sense that the earning capacity of the breadwinners is limited to very low wages; industrious as evidenced by a large proportion of its victims having married and begun the making of homes and rearing of families. Much of the tragedy of tuberculosis lies in its selection of these young married persons—a young husband cut off from providing for his young wife and helpless children, or a young wife required to leave her children to the chance bringing up of her unprepared husband, or both husband and wife within a few years compelled to leave their children to the care of relatives or the state; these are the things which touch our sympathy and rouse us to the fighting point, when we come into direct touch with them.

Economically this problem may be stated this way: A young man, earning \$1,000 per year decides to marry. He is strong, the young wife is a successful manager of the home, and together they plan their future—a cottage on the installment plan, a bank account for the education of their children, etc.—so the years pass quickly and joyously. The man has reached the age of thirty-two or three and the children

have entered school, when something happens—the “white plague” has put its stamp on this family. In a year or two this young husband has been taken to the cemetery, the young mother has given up the home to the building and loan society and is desperately trying to earn enough money to feed and clothe her children. The law of general averages should have given this man until the age of forty-eight to live, whereas tuberculosis killed him at the age of thirty-six. His wife faces the loss of the \$12,000 he would have earned during that time. Manifestly poverty counts tuberculosis an important ally.

The Commission estimates that 75 per cent of the 5,000 deaths annually occurring in California are among persons on an income of \$1,000 or less. Forty-seven per cent of these 5,000 victims were married. The Commission has not yet completed its investigation of the number of these patients who left children, or the number of second and third visitations of the disease to the same families, but the economic significance of the following figures must be apparent to all.

Tuberculosis has registered 23,831 deaths in California in the past five years. Of this number, approximately 11,000 were married. It is believed that at least 10,000 separate families are represented in this number. This averages 2,000 per year for the five year period. At the present time we are talking much about mothers' pensions. The figures of the Commission would indicate that it is the husband who dies first in nearly 60 per cent of these two thousand families. This means 900 families (75 per cent of 1,200) cut off annually from the \$1,000 income of the wage earner. If the state were to provide this \$1,000 annually for ten years in order to permit these mothers to bring up and educate their children, it would cost \$900,000 per year; and the adoption of a permanent policy of this kind would require \$90,000,000.

No one will deny that a mother needs \$1,000 a year to properly clothe, house, nourish and educate her children, and that she should devote her whole time to the task. If this is true, what happens now in these families that have the breadwinner cut off? Who provides the \$1,000? If it is not provided, what becomes of the family? Is the argument just outlined financially unsound? If not, is it not apparent that tuberculosis does cost California and California citizens many millions of dollars annually? And if this be true, is not the argument sound that the state should take charge of this problem and properly solve it, even if it does require the expenditure of very large sums of money from the various agencies that should contribute?

Of course it may be argued that the family of a man on \$1,000 per year receives not more than \$700, but as against this it might be argued that the \$300 balance should be set aside as an endowment to care for the mother after her work of bringing up her family is done. Unless she is so provided for, she becomes a handicap on the children when they should be free to marry and begin developing their own homes. No reference is made to the loss suffered by the death of the mother of a family, as the wage earner is left and can at least provide the necessities of life, if not the inestimable training and home influences which only a mother can provide. Also no reference is made to the plight of the mother left by the husband whose salary was many times \$1,000.

Often such men have made no provision for their families and their wives are more helpless than those whose husbands were receiving \$1,000 or less.

A similar argument might be developed for those unfortunate men and women of marriageable age who do not marry because they know their condition and the fate which will ultimately be theirs.

Especially Significant Facts.

The especially significant facts in connection with the figures which have been collected may be said to include the following:

1. The State of California has one of if not the highest mortality rate from tuberculosis of any state in the union.

2. In 1911 it is shown that a total of 5,114 citizens died from tuberculosis in California; and on the basis of at least two to three living advanced cases of the disease for every person dying therefrom, this would mean a total of from 10,000 to 15,000 residents afflicted with advanced tuberculosis who are constantly in our midst. It is not improbable that there are constantly about fifty thousand residents in our midst who have the disease in what may be considered an active though not dangerously infective stage.

These figures instead of growing less are furthermore constantly growing larger.

The special importance of the presence of so many tuberculous persons being in our midst lies in the fact that wherever one of these open stage of tuberculosis persons is living, there is the possibility, unless proper sanitary precautions are observed, of other citizens of our state becoming infected with the disease, and so going down to preventable and unnecessary sickness and death.

It is a pertinent question to ask, whether it is not a fundamental obligation of the state to institute those sanitary and preventive measures which would prevent all such unnecessary loss of civic usefulness and life.

3. Another significant fact is this: that the burden of this disease falls heaviest upon the citizens who are engaged in occupations necessitating the severest physical labor or labor under adverse sanitary conditions. This means that the burden falls heaviest upon the families of the poorer citizens of our state; means further that the state is often made to finally expend more money in the care of dependent children than would have been necessary to have given the father or mother a decent chance for recovery and life, leaving out of all account the value of one additional and useful civic unit to the state, or the sorrow and grief and privation that fell on each such dependent family.

4. It is true that the California tuberculosis problem is not in a sense indigenous to the state; that is, the majority of the residents who are afflicted with the disease did not contract their disease within the state.

It is impossible to work out any legal or practical plan whereby those who contract tuberculosis in other states can be prevented from entering California. To hold up all trains at the border and examine all passengers for tuberculosis is impossible, even were it desirable, and it is not desirable.

It is, of course, absolutely unfair on the part of tuberculous residents of other states, and the friends of such persons, to send them to Cali-

fornia with hardly more than their transportation expenses, so that they almost immediately become a tax upon the private and public charities of California. It must be remembered, however, that the great majority of such tuberculous persons come here in the honest and sincere desire and hope that the California climate may in some way enable them to nurse themselves back to health and civic usefulness. And many of our citizens have been able to accomplish this very thing. It would seem only just, therefore, that we should permit the tuberculous sick to come to us, just as have come so many hundreds and thousands of families, one of whose members has been suffering from some other disease perhaps.

California can not prevent the influx of tuberculous citizens of other states, and it is wrong in every way for other states to escape their responsibilities in the care of their own tuberculous sick by sending them to California, but it is likewise wrong for California to evade its responsibilities to its thousands of non-tuberculous citizens, when it permits these tuberculous residents of other states to come and settle themselves in our California communities, without having done those things which can reduce the danger of infection from the presence of some tuberculous persons to the lowest possible amount.

If California continues to neglect its responsibilities in the tuberculosis problem as it actually exists, a larger and larger number of healthy citizens will each year become infected with this disease, and each such infection will mean sickness and perhaps death, with all its immediate economic loss and sorrow to the family of each such person, with all its direct economic loss to the state in taking from it, temporarily or permanently, a useful citizen, and with all the indirect economic and social loss that falls on the state, when one of its families becomes so poverty stricken and dependent that the family group is broken up and relegated to a lower social level, the children being sent to institutions maintained in whole or in part by the state when the state ultimately pays out more than would have given the wage-earning father a decent opportunity to save his life.

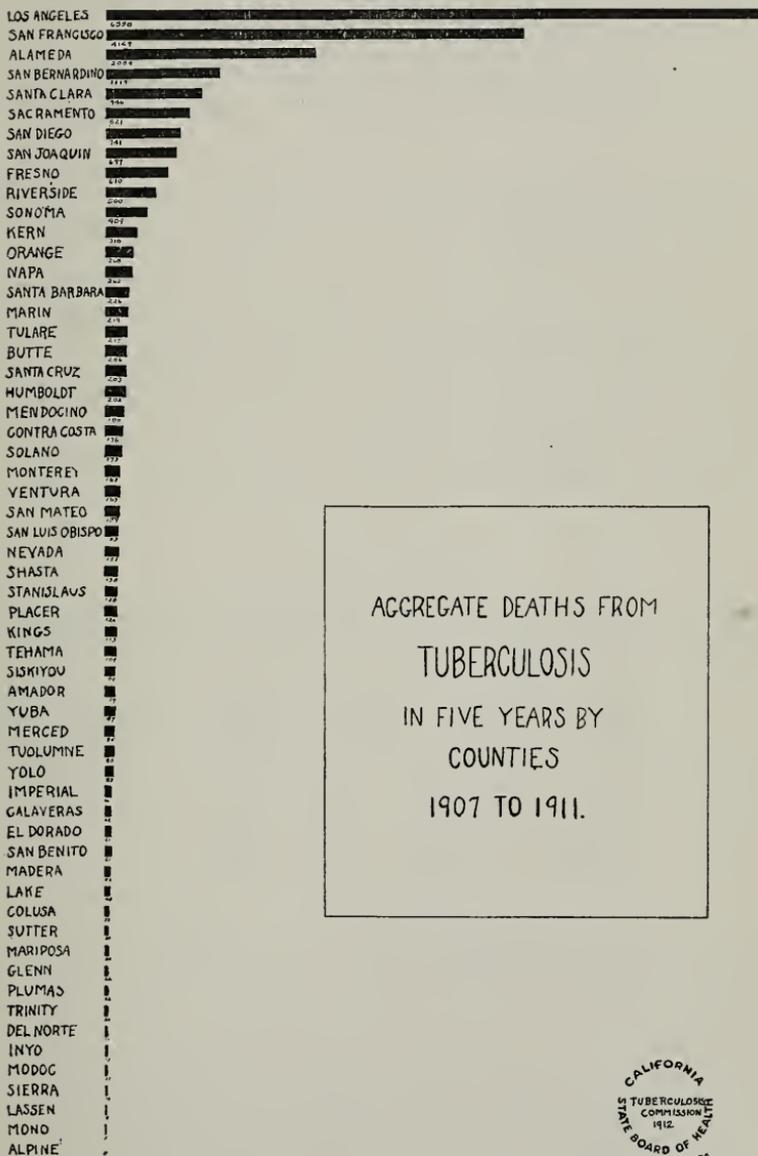

5. A striking feature of the statistics which have been collected is that which shows that in California, even more than elsewhere, that the viable age period of 19 to 44, during which period we deal with citizens on whom the state and county has spent its money for education and protection, and with citizens who have reached the age during which they take upon themselves the care of homes and families, that the mortality is especially high for this period. Why rob the state of these persons, who in health by their occupation and activity add to its wealth and prosperity?

Ethically considered, is it not as much a function of the state to conserve life from the effects of disease as much as it now construes it to be one of its duties to protect citizens from other causes of death, like knives and bullets and dynamite?

Thousands and thousands of dollars are expended annually to protect citizens and the material interests of citizens from criminals and other transgressors of the laws.

Would it not be only fair, and must we not ultimately institute those measures, even though they necessitate the annual expenditure of much less amount of money, which go to protection of health, life and the prevention of unnecessary death from preventable diseases?

California.

AGGREGATE DEATHS FROM
TUBERCULOSIS
IN FIVE YEARS BY
COUNTIES
1907 TO 1911.

6. The data collected shows that all sections of our state meet this tuberculosis problem, but that the burden of the care of these consumptives from the east falls with special force on the counties of southern California, some of the not thickly populated counties like San Bernardino and Riverside being called on to bear altogether disproportionate burdens. So also in some of the smaller cities, like Sierra Madre, with 1,300 population, in the foothills of Los Angeles, the residents of that city were called upon to help care for some seventy-five indigent consumptives who were living in their midst. Surely conditions such as these suggest need of a more equitable distribution of this burden.

7. Not the least among the facts brought out are those which show that more than sixty per cent of all persons receiving institutional treatment for tuberculosis are in institutions which are absolutely free, *i. e.*, receive treatment largely in county hospitals. At the same time, the efforts to obtain accurate data from the county hospitals of the state show that many of these institutions provide little more than a place to die for the indigent consumptives of their respective communities.

County sanatoria and hospitals where residents sick with tuberculosis might really have a fair opportunity for restoration of health and usefulness are still in the incipient stage.

The above are some of the facts which should be of special interest to the people and officials of the State of California.

GENERAL TABLES.

TABLE NO. 2.

Estimated Midyear Population, Number and Per Cent of Total Deaths from Tuberculosis, and Death Rates for Total Deaths and for Tuberculosis, for California, 1907 to 1911.

Year	Estimated midyear population	Total deaths (all causes)	Deaths from tuberculosis (all forms)	Per cent of total deaths from tuberculosis	Death rate (all causes) per 1,000 population	Death rate for tuberculosis per 100,000 population
1911 -----	2,488,256	34,012	5,114	15.0	13.7	205.5
1910 -----	2,396,639	32,398	4,872	15.0	13.5	203.3
1909 -----	2,396,001	30,985	4,673	15.1	13.4	202.6
1908 -----	2,215,615	31,287	4,565	14.6	14.1	206.0
1907 -----	2,125,240	31,095	4,607	14.8	14.6	216.8

TABLE No. 3.

Number and Per Cent of Total Deaths from Tuberculosis, for Individual Cities and Rest of State: 1907 to 1911.

City	Number of deaths from tuberculosis					Per cent of total deaths from tuberculosis					
	1911	1910	1909	1908	1907	Annual average 1907 to 1911	1911	1910	1909	1908	1907

*Per cent for single year, 1911. ¹Average for three years, 1909 to 1911.

This table shows that there are more deaths from tuberculosis in most cities of southern California than in northern and central California cities. The per cent runs high during certain years, however, in northern California cities. This is due, no doubt, to circumstances, and also to local conditions. Cities maintaining good housing conditions, as a rule, have a low death rate from tuberculosis. Large numbers of imported cases, however, alter the death rate, when the best of housing conditions are maintained.

In some of the small cities of the state tuberculosis is a real menace to citizens. Many of the smaller cities of southern California are called upon to care for an immense number of late cases. In Monrovia, for a single year, the rate in relation to all causes was 59 per cent; in Ontario it was 22 per cent; in Redlands 32 per cent; in San Bernardino 31 per cent; Riverside 32 per cent; Pasadena 22 per cent and Colton 25 per cent. Some of the smaller cities in Northern California for the same year had rates that were equally high; for example, Los Gatos 23 per cent; Colusa 22 per cent; Pleasanton 22 per cent. While these high rates do not prevail year in and year out, it becomes very evident that tuberculosis is not only a menace to the health in large cities but it is a problem in the smaller cities and in rural districts.

TABLE No. 4.
Per Cent of Total Deaths from Tuberculosis, for Geographic Divisions: 1907 to 1911.

Geographic division	Per cent of total deaths from tuberculosis					
	Annual average 1907 to 1911	1911	1910	1909	1908	1907
The State -----	14.9	15.0	15.0	15.1	14.6	14.8
Northern California -----	11.0	11.7	11.0	11.5	9.6	11.0
Coast counties -----	11.7	12.7	11.8	11.1	10.4	12.4
Interior counties -----	10.3	10.7	10.2	11.8	9.0	9.8
Central California -----	13.2	13.1	13.5	13.4	13.1	13.0
San Francisco -----	13.1	12.3	13.9	13.4	13.5	12.2
Other bay counties -----	12.6	12.6	12.1	13.0	12.2	13.0
Coast counties -----	14.1	14.4	14.6	14.3	14.0	13.1
Interior counties -----	13.6	13.8	13.7	13.4	13.1	13.9
Southern California -----	19.7	19.4	19.2	19.8	19.8	20.1
Los Angeles -----	19.7	19.9	18.7	19.8	19.6	20.3
Other counties -----	19.7	18.4	20.2	19.8	20.2	19.8
Northern and Central California -----	12.8	12.8	13.1	13.0	12.5	12.6
Coast counties -----	12.9	12.7	13.2	13.1	12.8	12.6
Interior counties -----	12.7	13.0	12.8	12.9	11.9	12.7
Metropolitan area -----	12.9	12.4	13.2	13.2	13.0	12.5
Rural counties -----	12.8	13.2	13.0	12.9	12.0	12.7

This table emphasizes the importance of the tuberculosis problem in the different geographic divisions of California. The marked prevalence of the disease in southern California is shown by comparison with the figures for that section with those for other geographic divisions. It will be noted that the variation from year to year in each group is very slight. The figures for each group, in relation to each other, remain very constant. The low rate in northern California should be noted. Of course, the out of door life enjoyed by most residents of this division and the absence of large cities and consequent problems conducive to the disease, have much to do with the low rate.

TABLE NO. 5.

Number and Per Cent of Tuberculosis Cases in Incorporated Cities and Towns Arranged According to Population, for 1910.

Town	County	Popula- tion	Total number deaths	Deaths from tubercu- losis	Per cent

TABLES PERTAINING TO OCCUPATION.

TABLE NO. 7.

Deaths of Males 15 Years and Over Engaged in Gainful Occupations, Classified by Kind of Occupation, with Number and Per Cent from Tuberculosis, for California, 1911.

Kind of occupation	Total deaths	Tuberculosis	
		Number	Per cent
All occupations	15,409	2,745	17.8
Professional	763	139	18.2
Clerical and official.....	1,062	197	18.2
Mercantile and trading.....	1,112	189	17.0
Public entertainment	345	66	19.1
Personal service, police and military.....	498	90	18.1
Laboring and servant.....	3,385	773	22.8
Manufacturing and mechanical industries.....	3,182	577	18.1
Agricultural, transportation and other outdoor.....	4,936	690	14.0
All other occupations.....	126	24	19.0

This table shows the actual number of deaths (male) from tuberculosis for different occupations in California during 1911.

The number of deaths from tuberculosis of those engaged in general labor (not farm labor) by far exceeds the number in any other occupation, 658 in this division having died from the disease during the year. Next in number comes farm laborers, 243 of whom died of tuberculosis. Next in order come miners, clerks, servants, carpenters and merchants, 85 deaths in each of the last two occupations having been recorded.

Local conditions are responsible for a large number of deaths in certain occupations; in the deep gold mines for instance, a large number of miners are victims of the disease every year, especially in Amador and Nevada counties.

Teamsters in California cities, seem to be under certain conditions which make them particularly susceptible to tuberculosis. Breathing irritating street dust, working long hours with low wages, subject to exposure and cold, also the disipation which these things tend to encourage, cause a great many of them to fall victims of the disease.

TABLE NO. 8.

Deaths 15 Years and Over from Tuberculosis and Other Causes Classified by Sex and Occupation, with Per Cent by Sex, for California, 1911.

	Deaths			Per cent male	Per cent female
	Total	Male	Female		
All causes	28,137	17,903	10,234	63.6	36.4
Occupation reported	16,363	15,409	954	94.2	5.8
No gainful occupation.....	11,774	2,494	9,280	21.2	78.8
Tuberculosis	4,639	3,074	1,565	66.3	33.7
Occupation reported	2,930	2,745	185	93.7	6.3
No gainful occupation.....	1,709	329	1,380	19.3	80.7
All other causes.....	23,498	14,829	8,669	63.1	36.9
Occupation reported	13,433	12,644	789	94.3	5.7
No gainful occupation.....	10,065	2,165	7,900	21.5	78.5

This table deals only with deaths of males engaged in gainful occupations in California in 1911. By far the greatest number of deaths from tuberculosis occur in the laboring and servant occupational division. The percentage being 22.8 as against 14 per cent for agricultural, transportation and out door occupations. For the public entertainment classification, the percentage is 19.1. This includes hotel keepers, saloon keepers and many others who work under conditions favorable to the contraction of the disease.

Scattered in between come the professional, clerical and official, police and military, machinery and mechanical industry classifications, the percentage for all of which is about 18 per cent.

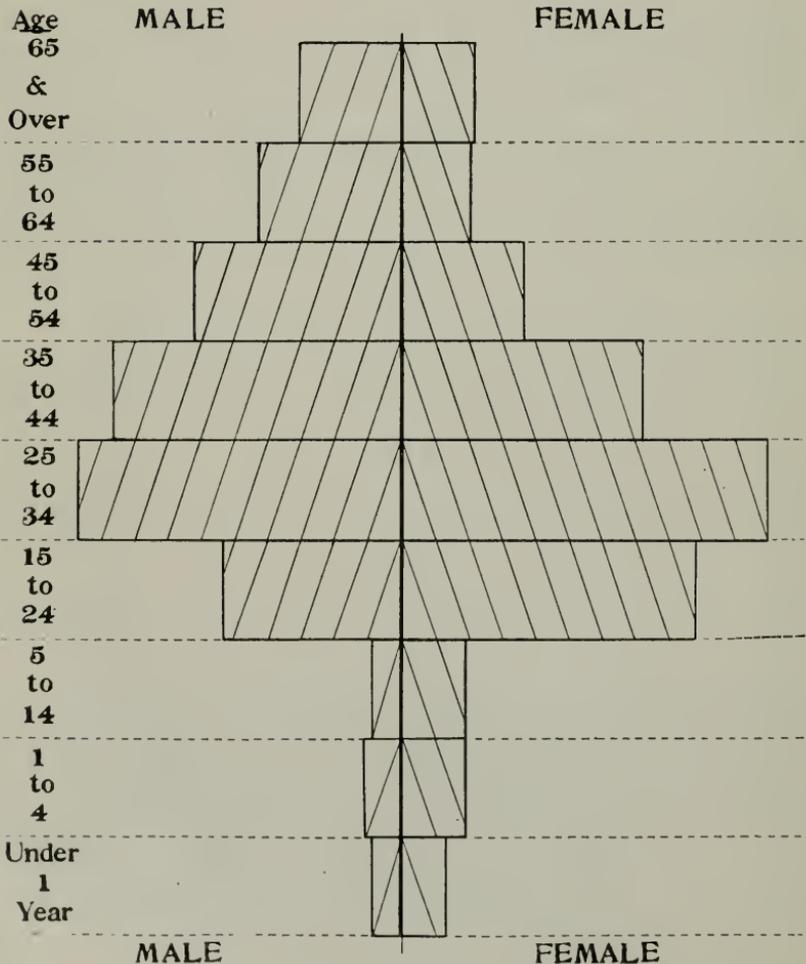

The table on page 25 shows the percentage of deaths from tuberculosis in relation to all other causes in specified occupations. *The percentage is highest among barbers and hairdressers, 29.2 per cent. For bookkeepers, clerks and copyists, it is 24.8 and 24.4 per cent, respectively. For engineers and surveyors, 22.5 per cent. Saloon keepers 23 per cent, tailors 26 per cent, and servants 27.1 per cent.*

The lowest percentage is for bankers, brokers and officials of companies, 6.2 per cent; policemen, 7.5 per cent; soldiers and sailors, 7 per cent.

It can be seen from these figures that *deaths from tuberculosis in California, among certain occupations, occur mostly in those occupations which pay low wages or are of a confining nature, in which work is performed under unfavorable sanitary conditions, with long working hours and in which the tendency toward dissipation is strong.*

On the other hand, there are comparatively few deaths in those occupations which pay well, in which the hours of labor are short, in outdoor occupations and those occupations which provide care, good food and sufficient hours for recreation, as for instance, among soldiers and sailors, who are examined for health and who live under good sanitary conditions.

**Average Annual Per Cent Distribution, by Age Periods, of
Deaths from Tuberculosis, Classified by Sex,
1907-1911.**

TABLES PERTAINING TO AGE PERIODS.

TABLE NO. 10.

Per Cent. by Age Periods of Deaths from Tuberculosis, for California, 1907 to 1911.

Age period	Per cent of deaths from tuberculosis					
	Annual average 1907-1911	1911	1910	1909	1908	1907
California	100.0	100.0	100.0	100.0	100.0	100.0
Under 1 year.....	2.6	2.6	3.0	2.8	2.3	2.1
1 to 4 years.....	3.5	3.6	3.8	3.8	3.2	3.2
5 to 14 years.....	3.1	3.1	2.9	3.1	3.3	3.2
15 to 24 years.....	16.4	16.6	15.1	16.2	16.6	17.3
25 to 34 years.....	25.3	24.8	25.2	26.1	26.1	24.5
35 to 44 years.....	20.3	21.4	20.7	19.1	19.7	20.4
45 to 54 years.....	13.2	12.1	14.3	13.2	13.1	13.4
55 to 64 years.....	8.8	9.1	8.4	8.8	8.9	8.6
65 years and over.....	6.8	6.7	6.6	6.9	6.8	7.3

Most of the deaths from tuberculosis during the five year period, 1907 to 1911, occurred among those who were from 25 to 34 years of age, the percentage being 25.3 per cent, practically one fourth. One fifth, or 20.3 per cent of those dying from the disease were from 35 to 44 years of age. Only 2.6 per cent were under one year of age; 3.5 per cent one to four years; 3.1 per cent were from five to fourteen years of age.

TABLE NO. 11.

Per Cent Distribution, by Age Periods, of Deaths from Tuberculosis Classified by Sex, for California, 1907 to 1911.

Sex or age period	Per cent of deaths from tuberculosis					
	Annual average 1907-1911	1911	1910	1909	1908	1907

25 to 34 years.....	24.2	23.9	24.0	25.5	24.1	23.3
35 to 44 years.....	21.5	23.0	22.3	20.3	20.5	21.4
45 to 54 years.....	15.5	14.2	16.9	14.8	15.4	16.3
55 to 64 years.....	10.7	11.0	9.9	11.1	11.0	10.5
65 years and over.....	7.6	7.2	7.6	7.8	7.7	8.0
Female	100.0	100.0	100.0	100.0	100.0	100.0
Under 1 year.....	3.3	3.4	3.7	4.0	2.8	2.5
1 to 4 years.....	4.8	5.0	5.4	5.5	4.4	3.9
5 to 14 years.....	4.8	4.6	4.9	4.6	4.7	5.0
15 to 24 years.....	22.0	22.5	21.4	21.5	21.0	23.4
25 to 34 years.....	27.4	26.6	27.4	27.1	29.5	26.4
35 to 44 years.....	18.0	18.6	17.4	16.9	18.2	18.7
45 to 54 years.....	9.1	8.1	9.6	10.4	9.1	8.5
55 to 64 years.....	5.2	5.4	5.4	4.7	4.9	5.5
65 years and over.....	5.4	5.8	4.8	5.3	5.4	6.0

During the age period of 25 to 34 years, more women die of tuberculosis than men in California. The same is true for the period of from 15 to 24 years of age. On the other hand, for the period from 35 to 44 years, the percentage is higher among men than among women. The same is true for the age period of 45 to 54 years and for the period of 55 to 65 years and over. Thus, more young women died from tuberculosis in California during the years 1907 to 1911 than young men, and more men died from tuberculosis during the same years than old women. Or, to be more explicit, more women under 35 years of age died of tuberculosis than men under 35 years of age, but, more men over 35 years of age died of the disease than women over 35 years of age.

TABLE NO. 12.

Per Cent Distribution, by Marital Condition, of Deaths from Tuberculosis 15 Years and Over, Classified by Sex, for California, 1907 to 1911.

Sex or marital condition	Per cent of deaths from tuberculosis 15 years and over

Divorced -----	1.2	1.5	1.0	1.2	1.0	1.1
Unknown -----	1.1	1.3	1.4	0.3	0.8	1.5

Most of the women dying from tuberculosis in California from 1907 to 1911, were married and most of the men dying from tuberculosis in the same years were single—the percentages being 56.7 per cent and 51.2 per cent, respectively—while the percentage for married men is 36.2 per cent and for single women 29.4 per cent. More widowed women died of the disease during these years than widowed men, the percentages being 11.6 per cent and 6.1 per cent, respectively. For divorced persons, the percentage is the same for both sexes, 1.2 per cent.

TABLE NO. 13.

Per Cent Distribution, by Age Periods of Deaths from Tuberculosis Among the Married, Classified by Sex, for California, 1907 to 1911.

Sex or age period	Per cent of deaths from tuberculosis—married					
	Annual average 1907-1911	1911	1910	1909	1908	1907
Male -----	100.0	100.0	100.0	100.0	100.0	100.0
15 to 24 years -----	2.7	2.6	2.2	2.9	2.9	3.1
25 to 34 years -----	23.4	22.2	23.5	23.4	25.2	22.7
35 to 44 years -----	28.9	31.1	29.4	26.5	26.9	30.4
45 to 54 years -----	21.4	20.1	22.8	21.5	21.1	21.6
55 to 64 years -----	14.8	15.7	13.6	15.9	15.2	13.5
65 years and over -----	8.8	8.3	8.5	9.8	8.7	8.7
Female -----	100.0	100.0	100.0	100.0	100.0	100.0
15 to 24 years -----	15.9	16.4	13.9	16.9	14.5	13.0

35 to 44 years -----	25.9	28.0	25.4	23.9	25.4	26.7
45 to 54 years -----	11.8	10.0	14.1	13.1	11.4	10.5
55 to 64 years -----	5.5	5.5	5.0	5.8	5.3	5.9
65 years and over -----	3.6	3.7	4.1	3.8	3.4	3.0

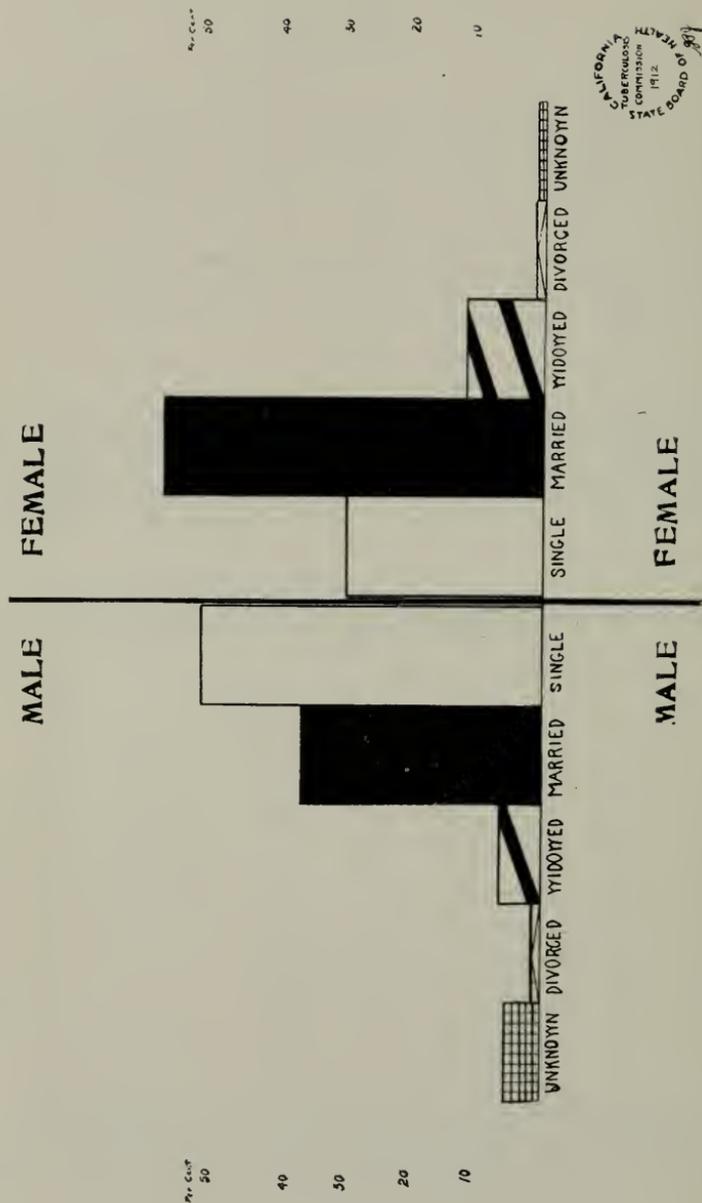

It will be observed from this table that among the married males most deaths from tuberculosis occur during the age period 35 to 44 years, while among married females most deaths occur from 25 to 34 years. It will also be observed that more married males die of tuberculosis during the age of 45 to 54 than married females during the same age period.

TABLE NO. 14.
Per Cent of Deaths from Tuberculosis Among Males 15 Years and Over.

Marital condition or age period	Per cent of deaths from tuberculosis among males 15 years and over					
	Annual average 1907-1911	1911	1910	1909	1908	1907

65 years and over.....	9.8	10.4	7.3	9.6	9.9	11.7

Among the unmarried, the tuberculosis death rate is very high among females in the age group 15 to 24 years, and among males in the age group 25 to 34 years. Home infection undoubtedly has much to do with the high rate among the females in this group and dissipation has much to do with the high rate among males in the group mentioned.

TABLES PERTAINING TO LENGTH OF RESIDENCE.

TABLE NO. 17.

Unknown	10.0	9.7	7.2	8.4	14.2	10.4

The most striking feature of tuberculosis conditions in California arises from the migration of cases from other states to the southern part of California. During the five year period, 1907 to 1911, 17 per cent of deaths from tuberculosis in southern California were of those who resided in the state for a period of less than one year, 5.5 per cent six to eleven months, 4.9 per cent from three to five months, 4.7 per cent from one to two months, and 1.9 per cent for less than one month. On the other hand, in northern and central California, only 3.5 per cent have lived in the state for less than one year.

Thus, during the years 1907 to 1911, more people dying from tuberculosis in southern California lived there for less than two months than died in northern California with a residence of less than one year; 37.9 per cent of those dying in southern California, lived there from one to nine years, against 13.2 per cent in northern and central California for the same group; 28.7 per cent of those dying in northern and central California have lived there for ten years and over as against 18.9 per cent for the same classification in southern California.

Comparatively few of those dying of tuberculosis in southern California, have lived there all their lives—only 16.2 per cent as against 38.4 per cent, more than double the number, for northern and central California.

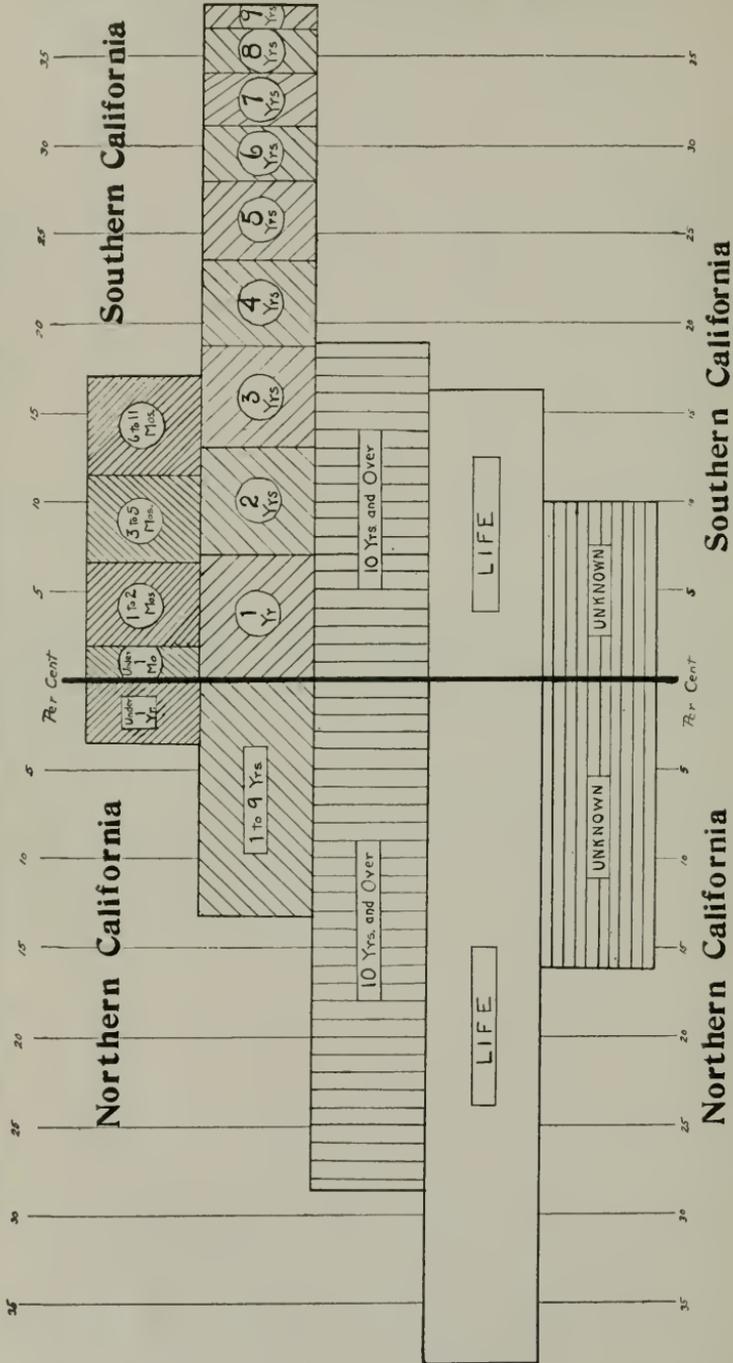

TABLE NO. 18.

Per Cent Distribution, by Length of Residence in California (in months) of Deaths from Tuberculosis, for Southern California, 1907 to 1911.

6 to 11 months.....	5.1	6.1	4.1	4.1	5.0	6.2

The migration of advanced cases to southern California, seems to be quite evenly distributed over the counties in that section of the state, as 1.9 per cent of those dying from tuberculosis in Los Angeles County in the years 1907, to 1911, were there less than one month. The percentage for the other counties of southern California for the same division, is 2.1 per cent. This table shows that the distribution of deaths by length of residence in southern California is remarkably even in each classification.

Annual Average Per Cent Distribution by Length of Residence of Deaths from Tuberculosis, Northern & Southern California . 1907 - 1911.

TUBERCULOSIS IN CALIFORNIA HOSPITALS, SANITARIUMS AND INSTITUTIONS.

Three hundred and fifty circular letters, asking for information in regard to number of patients cared for in California institutions during the past five years, terms, stages at which taken, facilities, etc., were sent to as many hospitals, state, county and institutional. Replies were received from 200, most of which were lacking in records for years previous to 1911. The figures quoted for last year, however, may be taken as approximately correct for the institutions replying. One hundred and twenty-seven institutions replied that they take no tubercular cases, 71 stated that they take such cases in the first and second stages for the most part (incipient cases preferred), but nearly all intimated that they would receive patients suffering from the disease in any and all stages. Of these 71 institutions 25 are county hospitals, 4 are government institutions, 10 are state hospitals, and the remaining 32 are private.

While the records in the county hospitals are, in most cases, wholly lacking and in most private institutions are not available except for three years past, the returns from the institutions would indicate that an average number of about 3,500 tuberculosis cases are cared for by them every year, 1,700 of these in county hospitals, 200 in government institutions, 200 in state hospitals and the remaining 1,600 in private sanitariums.

Four of these sanitariums, charging not more than one dollar per day, treated 237 patients during 1911. Five of them, charging fifteen to twenty-five dollars per week, accommodated 342 patients. Five, whose rates average \$100 per month and over, treated about 350 cases. The other sanitariums, treating 285 patients, did not state their terms. These figures would seem to substantiate the statement that facilities are lacking for treating "middle" class tuberculosis cases in the state:

County hospitals, free-----	1,700
Government hospitals -----	200
State institutions -----	200
Sanitariums, not more than \$1.00 per day-----	250
Sanitariums, \$15.00 per week-----	350
Sanitariums, \$100.00 per month and up-----	350
Sanitariums, rates not quoted-----	300
	3,350

In reply to the question, "Have you special wards or special facilities for this class of cases?" all replies were in the affirmative, some stating that they use outside sleeping porches, special wards, tents or cabins.

There were not many responses to requests for special data bearing on (a) the source of infection, (b) place of infection, (c) epidemiology, and (d) financial problems. Dr. Philip King Brown, of the Arequipa Sanitarium for Working Women at Fairfax, writes in answer to this group of questions:

(a) More than half are cases in families where the disease has existed in another member.

(b) Question not plain. If you mean whence it comes, I should say the home.

(c) Conditions in shirt and overall factories have repeatedly attracted our attention.

(d) A consumptive can not find employment if it be known that he has the disease, therefore, if he is past the first stage, and most cases are when they apply at clinics, he should go to a free hospital, since the one half to two years' time it takes to do

anything really worth while for him places a prohibitive tax on him. The state should take care of advanced cases near all large cities and in addition to such care as is taken of such cases by the municipalities. The reason is that such cases flock to large towns and the burden of their care should not fall on the town. Finally when adequate provision is made for *advanced* cases, it is time for state and city to establish places for early cases.

Doctor Pottenger, of the Pottenger Sanatorium, answers this group of questions as follows:

First, the source of infection. I believe that the chief source of infection in tuberculosis is the human being who has tuberculosis. I believe, however, that a certain percentage of cases also come through infected milk. The time of infection, I think, is largely in childhood. My conception of infection in tuberculosis is as follows: Practically from the time the child is born he begins to come in contact with bacilli. If they are in small amounts they are warded off and no infection occurs, but a certain amount of immunity is established. If the bacilli are in large numbers, however, infection occurs. If the infection is small it may heal and leave little evidence of its existence. After such an infection a child would have considerable tolerance to heal out entirely, but remain quiescent until later in life when, through lowered resistance or for some other reason, the bacilli become active and the disease breaks down again. My idea is that the chief place of infection is the home. My reason for believing is that of hospital children, fully 90 per cent are infected with tuberculosis before their fifteenth year, and, of course, up to this time the children, as a rule, are in the home and not getting out to the work shops and other sources of danger.

Regarding infection, Doctor Robert A. Peers, of the Colfax School for Tuberculous, says:

Most of my cases have been infected in this state, and I think that the source of infection in a large percentage has been from other members of the family. As you well know, my opinion is that the family circle is a great source of infection in these cases. Regarding your request for data bearing on the financial problem presented, I can probably give you very little information. Prices charged at our institution make it possible for a patient to live here under treatment at a total cost of less than ninety dollars per month. All those who come to me are able to pay this amount or receive sufficient assistance from relatives to pay. There are others undoubtedly who do not come because unable to pay our charges, and there are a great many who find it impossible to stay longer than two or three months when they should stay six or eight months or a year. Occasionally a patient comes who is without means, but this is rare at present.

Regarding the prevalence of tuberculosis in our section of the state I will say that we are practically entirely free from this disease among our own inhabitants. There has only been one death from tuberculosis in Colfax among our own inhabitants in the twelve years I have lived here. I not infrequently, though, see patients, or see them in consultation, in Grass Valley or Nevada City. These patients are mostly underground miners.

Regarding tuberculosis among underground miners, Dr. P. S. Goodman of Sutter Creek, Amador County, suggests:

Predisposing factors:

Poorly ventilated mines.

Deep mines.

Hot mines.

Crowded, unsanitary boarding houses.

Direct infection from miners to their families and associates.

Another factor:

Introduction of infectious cases into the community, without adequate financial resources.

Several sanitarium superintendents emphasized the importance of segregation, most of them advocating the establishment of a state institution for the care of the tuberculous, attendance to be forced upon those so afflicted. Superintendents connected with county hospitals, dealing with indigents entirely, of course, shifted the responsibility to the state, saying that it is not a county problem, but a state problem. It is a noticeable fact that in most of the county hospitals no records are kept—not even of the diseases from which patients are suffering.

To sum up, the hospital returns received so far would indicate that 63 per cent of the tuberculous under institutional care in California are in places where treatment is given free of all charges. Seven per cent pay not more than \$1.00 per day, 10 per cent pay \$15.00 per week, 10 per cent pay \$100.00 per month and more, and 10 per cent are in sanitariums, the rates of which are not quoted.

NOTE.—Y indicates "Yes"; N indicates "No."

Sixty-three per cent of all cases of tuberculosis under institutional care in California during 1911, received treatment free of all charges. Most of these cases were in county hospitals, of which there were 38 in the state. By far the greatest number of cases treated in a single institution were in the Los Angeles County Hospital where during 1911, 783 cases were treated. During the same year, 511 were cared for in the San Francisco County Hospital. Alameda County cared for 130, Sacramento County cared for 134 and San Joaquin County had 104 cases under treatment.

In most of these institutions, the records are incomplete. Few of them are conducted properly and it is doubtful if the county hospitals with a few exceptions, are at this time properly conducted as regards the treatment of tuberculosis. Most of them simply provide a place for advanced cases to die. Those who are admitted into these places, are indigents, most of them with no fixed place of residence, floaters, wanderers on the face of the earth and charges from other commonwealths. Some of the counties have wards and separate buildings, specially designed for the treatment of tuberculosis, but in the majority of these places, there are absolutely no facilities either for treating the patients or for protecting those suffering from other diseases.

NOTE.—Y indicates "Yes"; N indicates "No."

Of the 37 per cent of tuberculosis cases of California under institutional care in 1911, only 7 per cent were in those semi-charitable institutions, charging not more than \$1.00 per day, 10 per cent paying \$15.00 per week, 10 per cent paying \$100 per month or more and the remaining 10 per cent being in sanitariums, the rates of which were not given.

According to the records, which are incomplete, nearly 10,000 people have received treatment for tuberculosis in California institutions. Probably the actual number is twice that given, as in most county hospitals inadequate or no records at all are kept. Comparatively few cases of tuberculosis are treated in state and government hospitals in California. The rate is high in state prisons and in state hospitals. Tolson prison has cared for 104 cases of tuberculosis in the past five years and San Quentin has cared for 73. At the Stockton State Hospital 198 have been cared for during the past five years and at the Southern California Hospital in 1911, 61 received treatment.

Report of Investigation Into Tuberculosis Records at Los Angeles County Hospital, 1912.

During the first eleven months of 1912 there were 845 cases of tuberculosis discharged from the Los Angeles County Hospital, including deaths. Of this number 699 were males and 146 females. There were 17 negroes, 13 Japanese, 8 Chinese, 1 Hindu and 1 Indian, the remainder, 805, being of the Caucasian race; 353 of the patients were born in foreign countries, 259 were born in other states of the union than California, while but 27 were natives. It was impossible to secure information regarding nativity from 210, out of the total 845. This was due to inability to speak the English language, death before history could be obtained, and to irrationality of the patients concerned: 482 patients were discharged as improved, 327 died and 31 left without showing any improvement. The average age for the men is 39.3 years; the average age for the women being 35 years, and the average age for all patients being 38.8 years.

Of those born in the United States more came from New York than any other state, there being 37; California is next with 27. Illinois third, with 25; then Missouri with 18, Indiana 15, Ohio 14, Pennsylvania 13, and Massachusetts, Iowa and Georgia each with 10.

Following is a tabulation showing nativity by states:

New York	37	North Carolina	4
California	27	Connecticut	3
Illinois	25	Rhode Island	3
Missouri	18	Oregon	3
Indiana	15	Colorado	3
Ohio	14	Arizona	2
Pennsylvania	13	Vermont	2
Massachusetts	10	Utah	2
Iowa	10	Maine	2
Georgia	10	Mississippi	2
Virginia	8	Maryland	2
Kentucky	8	Nevada	1
Wisconsin	8	South Carolina	1
Michigan	7	Washington	1
Tennessee	6	Alabama	1
Arkansas	5	Florida	1
Nebraska	5	District of Columbia	1
New Jersey	5	New Hampshire	1
Louisiana	5	West Virginia	1
Kansas	5	Minnesota	1
Texas	4	Oklahoma	1

Of the foreign born, most of them were from Mexico, the exact number being 74; 44 were born in Ireland, 37 in Russia, 29 in Germany, 24 in Sweden, 23 in England, 18 in Canada, 15 in Austria-Hungary, 13 in Italy, 12 in Japan, and 11 in Norway.

Following is a tabulation of nativity by foreign countries:

Mexico	74	Poland	4
Ireland	44	Denmark	3
Russia	37	France	3
Germany	29	Spain	2
Sweden	24	Turkey	2
England	23	Roumania	2
Canada	18	South America	1
Austria-Hungary	15	Syria	1
Italy	13	Belgium	1
Japan	13	West Indies	1
Norway	11	India	1
China	8	Armenia	1
Finland	8	Korea	1
Scotland	7	Australia	1
Greece	6		

The detailed histories were available for 350 patients who were discharged during the latter part of 1912. Their histories probably represent the average for the entire year. The percentages as given are believed to be accurate enough that they may be taken as typical of the Los Angeles County Hospital.

Of the 353 cases considered, 196 were single, 120 married, 27 widowed, and 10 divorced. Of the single, most of them were men, and the percentage of the married was higher among the women than among the men.

It is a significant fact that there were 63 dependent children recorded in the histories as given by patients.

Ninety patients stated that they lived in California for less than one year, 23 of them had been in Los Angeles for only a few days, some for a few weeks and more for a few months.

One hundred and eleven, almost half, gave records of tuberculosis in their families. Of these, more stated that their mothers had been infected than their fathers. In nine families, two or more cases had the disease, and in three families two or more sisters, but the most startling statement in regard to the source of infection relates to the histories as given regarding infected friends and fellow workmen. Fifty-six patients stated that their friends were infected, and fifty-seven stated that fellow workmen had been infected. On the other hand, only fourteen men stated that their wives had tuberculosis, and three women stated that their husbands were sufferers. Nine children of patients had tuberculosis, according to histories given, and six of them stated that their grandparents were infected.

In regard to personal habits, 164 patients used alcohol, and only 41 stated that they used tobacco. One hundred and ten gave histories of venereal diseases. Of these 110, 75 stated that they had gonorrhoea, and 35 reported syphilis. Some few gave history of using morphine. The majority of patients stated that they had suffered from excessive physical work, more than half, 181 in actual numbers, while on the other hand, only 24 stated that they had suffered from excessive mental work. Thirty-three were sufferers from worry incidental to finances.

In regard to diseases which formed predisposing factors, some interesting information is given. Two hundred and eleven out of 353 patients stated that they took cold easily and 157 stated that they had suffered from gripe. A total of 224 cases of diseases of the lungs was recorded, 149 of these being cases of pleurisy, and 75 pneumonia. Some of the patients had suffered from these diseases several times. One hundred and thirty-four had severe cases of measles, and 108 severe whooping-cough, and 58 had had typhoid fever.

In regard to occupations, the tabulation conforms closely to the tabulation for the state for 1911, the majority of the patients being laborers and housewives. Out of the 350 there were 75 common labor-

ers, 42 housewives, 18 farmers, 15 miners and 15 waiters. Twenty-three gave no occupation. Following is the tabulation:

Laborers -----	75	Florists and gardeners -----	6
Housewives -----	42	Engineers -----	5
No occupation -----	23	Machinists -----	5
Farmers -----	18	Dressmakers -----	4
Miners -----	15	Sailors -----	4
Waiters -----	15	Barbers -----	4
Clerks, bookkeepers, stenographers -----	12	Bakers -----	4
Painters -----	12	Blacksmiths -----	4
Cooks -----	11	Teamsters -----	4
Tailors -----	9	Cement workers -----	4
Peddlers and solicitors -----	9	Stone cutters -----	3
Railroad men -----	7	Laundrymen -----	3
Carpenters -----	6	Electricians -----	3
Printers -----	6		

An Investigation of 218 Cases of Tuberculosis at the Tuberculosis Division of the San Francisco County Hospital, Twenty-second Street and San Bruno Avenue.

During the first half of 1912 there were about 250 cases of tuberculosis received at the San Francisco County Hospital, tuberculosis division. Most of these were males; out of the 218 cases there being 29 females and 119 males. Out of the total number, 98 died, 93 were discharged and ran away, the remaining 27 being still in the hospital. Forty-two of the patients were born in California, 154 were born outside of this state, and 22 gave no history as to birthplace.

Exactly one half of the patients were single, 48 were married, 10 widowed and one divorced, there being no records regarding the marital condition of fifty of them. Only fifteen gave histories of tuberculosis having existed in their families.

There were 90 who admitted the use of alcohol, 70 saying that they had used it to excess. Seventy-eight of them used tobacco, 45 using it to excess and 33 in moderation. Sixty-three gave histories of venereal disease, 44 having had gonorrhoea and 21 syphilis.

The average age of patients is thirty-nine years, and the average length of stay is $2\frac{1}{2}$ months.

During most of the time there are from 160 to 180 patients in the hospital. During the first eight months of 1912 there was an average of eighteen deaths each month, February, with its heavy rain storms, claiming the greatest number, 24, and July and August each 15 for each month.

A large percentage of the tuberculosis patients admitted here come from the cheap lodging houses. Out of these 189 men, 7 were from the Glendale House, the only lodging house that provides single rooms for a rental of ten cents.

The New York House, which is the largest of the cheap lodging houses, containing 600 rooms, the cheapest of which is 15 cents per night, sent the next greatest number.

The Portland House at 611 Harvard street sent 3 or 4. Few of these men from the cheap lodging houses live long after reaching a hospital. Some of them are brought there in so advanced a stage that they are not able to give any information concerning themselves.

The names of the seven men who were from the Glendale House are as follows: John Comerford, who died a few weeks after being admitted; Dan Higgins, who lived only a few months at the hospital; Albert Hoffman, who lived only a few hours after admission; Louis Sutter, William Gillen, Clement Lloyd, and Thomas McLeod. Of the last four, two of them ran away and two were discharged as improved. The first three mentioned occupied room 384 at the Glendale House. While this room may not have been the source of their infection, it no doubt was a factor in bringing about their indisposition. In looking over the addresses of the last place of residence of the patients, it is strikingly brought out that most of these people came from the poorer districts of the city where housing conditions are at their worst. The cheap lodging houses sent patients to this hospital every month. Sometimes several come in the same day.

Occasionally a migratory case is taken. There are records of a man who spent several months in a private sanatorium, and who, upon his return to San Francisco in an improved condition, ran out of funds, following which the disease made its appearance in a renewed form. He spent several months in the County Hospital; as well as the case from Placer County Hospital, who came from that place hoping that the climate near the bay would be more beneficial. The reverse proved to be the case, however. In this hospital now most of the patients received are in an advanced stage, and it is too late to do very much for them except to provide simple comforts until such time as they shall die. There is no law to compel an advanced case to remain, consequently a very large percentage of the men who have been accustomed to dissipation and upon whom the dull monotony of hospital life is galling decide to run away.

THE CALIFORNIA TUBERCULOSIS PROBLEM IN ITS RELATION TO LEGISLATIVE NEEDS.

California most urgently needs legislation on tuberculosis. The careful tables, charts and statistics, based on figures and information on file in the office of the State Board of Health, collected for this survey and printed in part on other pages of this report, are but an index of what might have been elaborated, had the funds been at hand for the work of making a more extensive investigation.

What This Investigation Has Demonstrated.

Enough has been elaborated to definitely prove, beyond any possibility of doubt, the following things:

1. That a real tuberculosis problem or menace does exist in this State of California.
2. That this problem will each year become more grave, and the menace increase, as long as the state refrains from taking more active efforts to control this situation than are now permitted or provided for in our state law.
3. That the longer time action is delayed on much needed laws bearing on the prevention of tuberculosis, just so much more will it ultimately cost to grapple with and solve this problem, and just that many more lives will have been needlessly sacrificed in the mean time, to a policy of neutral or inaction.

This particular portion of the California Tuberculosis Commission's report to the legislature of the state (as provided for in the statute passed by the California legislature in 1911) is supposed to deal only with the outlining of a scheme of legislative procedure. Those who would wish to have the detailed premises or facts dealing with the nature of tuberculosis, its causes, prevention, treatment, and so on, are referred to the reports printed elsewhere in this volume, and to the data collected in this investigation, and which has been placed on file in the offices of the State Board of Health.

Certain Fundamental Facts Which Must Be Accepted.

It is taken as accepted:

- A. That tuberculosis is especially spread among human beings when a large number of persons are already afflicted with the disease; and
- B. That California has almost if not the highest sickness and death rate from tuberculosis of any state in the union; and
- C. That tuberculosis is a preventable disease.

This is simply the report of a sub-committee on legislation. The recommendations to the legislature, as given by the Commission as a whole, are printed at the beginning of this report.

It necessarily follows, then, that some definite kind of legislative program must be decided upon, by means of which this unnecessary and preventable loss of life in California from tuberculosis may be stopped, and the economic waste resulting from the sickness and mortality from this disease likewise prevented.

Reasons Why Our Legislature Must Act.

Action by the legislature to help solve this problem is urgently demanded for several reasons:

1. That our humanitarian instincts demand that human life be at all times conserved.
2. That the economic loss to the state from preventable tuberculosis morbidity and mortality demands, for financial reasons alone, that a policy be pursued whereby, in the future, as much of this economic loss as possible may be prevented.

Why Tuberculosis Is Difficult to Eradicate.

The difficulty of outlining a system of laws intended to aid in the prevention of tuberculosis lies in the fact that the disease with which we have to deal is distinctly not only an infectious disease (that is, due to a form of germ life), but also, above all others, what might be termed a "social" disease; that is, one which owes much of its spread and distribution to social defects or faults of our civilization. The complete extirpation of tuberculosis would virtually mean the ushering in of a physical and social millennium, which is, of course, out of the question. The more radical defects of our environments, however, can and should be remedied. The legislation herein recommended is intended to work for the correction of certain of these defects.

SCHEME I. CAUSATIVE SCHEME OF ANTI-TUBERCULOSIS MEASURES.

The eradication of any evil comes back always to a consideration of the eradication of the causes of the evil, and if we were to group from the standpoint of causation, preventive and curative measures (these two are so closely intermingled in tuberculosis that it is often impossible to consider the one without the other), we would have a scheme which might be said to embrace among others, the following factors:

A. Grouping of Anti-Tuberculosis Measures from the Standpoint of the Germ Cause of the Disease.

In the consideration of methods of prevention as applied to the exciting or germ cause, we will briefly indicate prevention measures under the following sub-heads:

1. Compulsory registration of all consumptives.
One must always know where an enemy is located, if an intelligent attack is to be made.
2. Compulsory disinfection.
 - (a) Of the homes of consumptives.
 - (b) Of railways and common carriers.
3. Free examination of sputum by city and state health officials.
4. The proper care of advanced cases in county hospitals.
5. The proper care of incipient cases in state sanatoria, state farms, and semi-charitable sanatoria.
6. The proper care of ambulant patients in dispensaries.
7. The forcible removal of ignorant and willful consumptives in advanced stages to county hospitals.
8. Preventatoria for children. These institutions to be at seaside or in foothills for children of tuberculosis families or with incipient or quiescent tuberculosis.
9. Anti-spitting ordinances.

B. Grouping of Anti-Tuberculosis Measures from the Standpoint of the Pre-disposing or Accessory Causes of the Disease.

- (a) Protection of food supplies.
 - 1. Milk.
 - 2. Meat.
 - 3. Bakestuffs.
 - 4. Pavement stores.
- (b) Disposition of garbage.
- (c) Proper housing.
 - 1. Tenements.
 - 2. Factories.
 - 3. Hotels and lodging houses.
- (d) School improvements.
 - 1. Medical inspection of school children.
 - 2. Open air schools.
- (e) Provision of public playgrounds and recreation centers.
- (f) Proper hours of labor for adults, with especial restriction as regards hours of labor for women and children.
- (g) General publicity campaign under supervision of the State Board of Health.

A brief survey of the above items indicates at once how comprehensive a problem the eradication of tuberculosis, and how difficult and expensive it will be to eradicate this preventable disease.

Scheme I, as outlined above, may be clear enough to medical practitioners, because they can supply from their own knowledge the collateral information whereby each of the items is justified as being worthy of consideration in a discussion of a broad campaign of prevention of tuberculosis in California.

It may be better, however, to present these preventive measures from another and perhaps more practical viewpoint, namely, that of dealing, on the one hand, with the tuberculosis patient from the day he is discovered until the day his disease is healed or until he dies; and on the other hand, with all the other miscellaneous preventive measures which have to do with the construction of physical environments in California in which the danger of infection from tuberculosis would be reduced to a minimum.

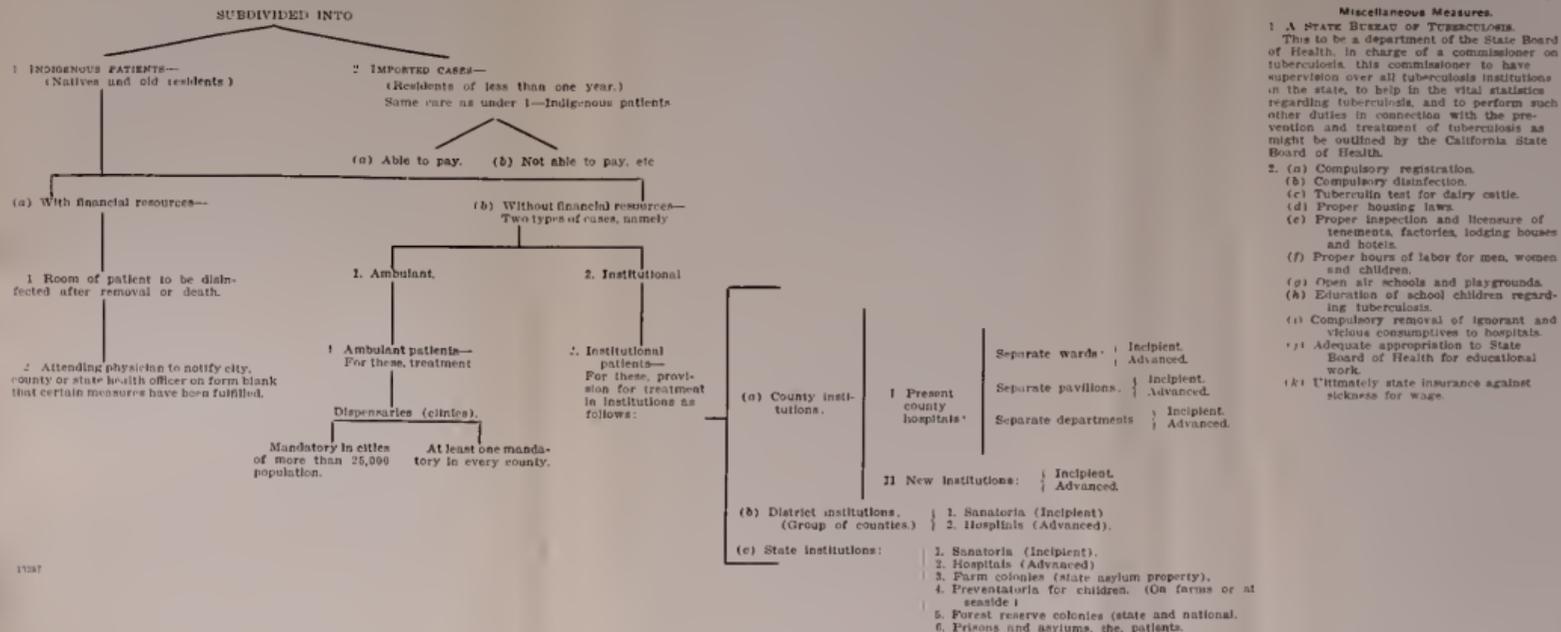

To that end, measures dealing with tuberculosis in California will be briefly considered as indicated in the accompanying diagram labeled "Scheme II, Anti-Tuberculosis Measures, Tuberculosis in California."

Scheme II. Anti-Tuberculosis Measures, Tuberculosis in California.

A. TREATMENT OF TUBERCULOUS CITIZENS AND RESIDENTS.

SUBDIVIDED INTO

B. GENERAL AND MISCELLANEOUS PREVENTIVE MEASURES

A reference to Scheme II, as presented in the diagram under that legend, shows that the committee has there divided the tuberculosis problem of California into two major portions: A. That dealing with citizens or residents already infected; and, B. That dealing with all those general and miscellaneous measures which would be important aids in the fight to prevent tuberculosis.

REGARDING CITIZENS AND RESIDENTS ALREADY INFECTED.

Regarding the first major group, which has to do with preventive and curative measures in relation to citizens or residents already infected, it has been found that such infected persons fall naturally into two groups, namely I—Indigenous Cases of Citizens (native born or residents for a number of years) who have become infected in California, and II—Imported Cases, or residents of less than one year's standing, who were infected in other states and who have come to California in the hope of regaining their health.

The method of procedure with both types of patients would be the same. Both classes naturally divide themselves into the two subgroups of (*a*) those who have means sufficient to obtain medical advice, and (*b*) those who are penniless, or virtually so, so that in a short time they must depend upon free clinics, charity or county institutions for their cure.

Procedure with the Tuberculous Patient Having Financial Resources.

As regards the patient who has means sufficient to call in an attending physician, all that would be demanded would be that the physician fill in a blank form in which he would state that he had instructed the patient in certain sanitary procedures regarding disposal of sputa, etc., and that if the patient removed to some other house, or died while under his care, he would notify the health officer, so that the room or rooms of the said patient might be properly disinfected. This system, by such mandatory report, virtually embraces the system of compulsory registration. The system of compulsory registration is here meant to imply that the health officers of the city, county or state shall be notified of the location of a tuberculous person at such and such place, and that sanitary precautions have been taken. No publicity is given and no further surveillance is made, except in cases where patients are ignorant or vicious, or too poor to observe necessary sanitary precautions. In such cases the state, county or city officials would step in and give aid in these matters.

Procedure with the Tuberculous Patient Who is Virtually Penniless.

As regards the tuberculous patient who has little or no means, a different method of procedure is necessary. This patient, if left alone, soon sinks into the most crowded and poverty stricken portion of our communities, precisely where there are the largest proportion of underfed or debilitated persons who are predisposed to the disease. Being poverty stricken, this class of patients usually neglect sanitary precautions, and thus become a double menace, not only to those with whom they come into immediate contact but to the community at large as well. For a considerable and varying time period, this class of patients avoid going to our county hospitals as they now exist, because

the provisions for tuberculous patients are so far from what they ought to be in those institutions.

Dispensaries.

For this class of up and about ambulant consumptives we should have clinics or dispensaries or helping stations, which ever term is preferred. It should be mandatory for every city of more than twenty-five thousand population to maintain such a tuberculosis clinic, where indigent residents could have opportunity to go for advice and treatment at specified times, at least twice weekly. It should also be mandatory for every county in the state to provide at least one such clinic for county residents.

Institutional Care of Our Dependent Consumptives.

The care of tuberculous citizens and residents in institutions opens up a big problem. We believe that the tuberculosis problem is not only a state but a community problem, and that, therefore, while the state as a whole should do its part in setting a standard and showing how to proceed, in using the facilities already existing, laws should be passed in addition, making it mandatory on counties having a certain population (or groups of counties called districts) to provide certain needed facilities for the care of the consumptive poor of their respective communities.

County Hospitals for Tuberculous Patients.

In the county hospitals already existing, it should be mandatory that consumptive patients be kept in separate rooms or wards or pavilions. It should also be permitted for county boards of supervisors to establish branches or departments exclusively devoted to tuberculous patients on sites more or less distant from the location of the county hospital proper. Such branches or departments should be parts of the county hospitals proper and under the existing general county hospital management. It would be advisable also to permit such counties as desire to do so, to establish absolutely separate tuberculosis institutions. Where a county finds it necessary to care for a large number of tuberculous sick, it would be justice to both the other patients and the consumptives to have the latter segregated, and the expense of administration need not be any higher than for the county hospital proper.

District Hospitals for Tuberculous Patients.

Some of the smaller counties might find it difficult to care for their consumptives in separate pavilions or institutions. A law modeled after the Ohio statute, which has worked out admirably, would permit several of such counties to form a "district" and so unite their resources for the erection and maintenance of a hospital or sanatorium for consumptives.

State Hospitals for Tuberculous Patients.

As regards the state's work in institutional activity for the care of consumptives, it would seem that the heavy financial demands at this time upon the state at large by institutions like those already existing, would make it impracticable, for the present, for the state to initiate the construction of a state tuberculosis hospital or sanatoriums of sufficient bed capacity to have any material influence on the alleviation of the tuberculosis menace in California. While we believe that the state should assume, as soon as its resources permit, its proper share of

responsibility in this direction, we do not strongly advocate at this time an appropriation for such a sanatorium or tuberculosis hospital, for it is our belief that more far reaching results could be attained by the other enabling acts and appropriation legislation advocated herein. Moreover, the money expended by the counties in construction would in no sense be lost, should the state ever assume the entire control of the tuberculosis problem.

Use of State Lands as Sites for Sanatoriums or Convalescent Farms.

The state could, however, easily permit the use of portions of the state insane asylum farm lands as sites on which county or district (a group of counties) could construct and maintain at their own expense sanatorium pavilions, under supervision of the State Board of Health.

Or better still, the state itself, without much expense, erect "shack pavilions" at small cost, where "convalescent farms" could be maintained. Here patients with incipient tuberculosis or comparatively quiescent tuberculosis could have an opportunity to gain health and so continue to be useful citizens of the commonwealth.

Use of Forest Reserves as Sites for Sanatoriums or Colonies.

A similar legal permission should be granted for tuberculosis farms or colonies, on some of the state forest reserves, as per the Pennsylvania plan—such lands as would be designated and used for such purpose, and the institutions thereon to be under the supervision and control of the State Board of Health. Permission for similar use should also be sought of the national government for the use of certain portions of the national forest reserves, under sanitary control of the State Board of Health.

The Consumptives Who are in Our Asylums and Prisons.

A law is also needed making it mandatory to care for the consumptives in our insane asylums and prisons, so that the lives of their fellow inmates be not unjustly and flagrantly jeopardized.

GENERAL AND MISCELLANEOUS PREVENTIVE MEASURES.

(Applies especially to citizens not yet infected.)

This brings the report to a consideration of the second great group of anti-tuberculosis effort, namely, that dealing with general and subdivisions, one portion having to do with a Bureau of Tuberculosis and the other with miscellaneous measures.

Miscellaneous Measures.

These miscellaneous measures indicated under the second subhead of this phase of legislative procedure have been taken up in the reports of other committees, so that it will not be necessary here to explain in any detail the need of these several measures. The data on file in the Sacramento offices of the California State Board of Health also covers these points. The State Board of Health will be glad to give full information on all these points.

Bureau of Tuberculosis.

The Bureau of Tuberculosis, which should be a subdepartment of the California State Board of Health, in charge of a commissioner of tuberculosis appointed by that board, and the function of which bureau

would be to exercise general supervision over all tuberculosis institutions and activities in the state, and to follow up the statistical and educational work on this disease, as much as possible, could be made to be a tremendous factor in the solution of the tuberculosis problem in California and is urgently advocated.

Appendix of Proposed Types of Laws, as Advocated in this Report.

Attached to this report on legislative procedure are a number of laws, so drafted as to present the ideas of the committee as indicated in the scheme attached to this report, and as explained somewhat in the preceding paragraphs.

These various laws are labeled "Exhibit A," "Exhibit B," etc., for convenience of reference.

APPENDIX.

EXHIBIT A.

An act to provide for the establishment and maintenance of a department of tuberculosis under the direction of the state board of health; defining its powers and duties; and making an appropriation therefor.

The people of the State of California do enact as follows:

Section 1. The state board of health shall maintain a department of tuberculosis for the complete and proper registration of all tuberculous persons within the state; for supervision over all hospitals, dispensaries, sanatoria, farm-colonies and other institutions for tuberculosis; for advising officers of the penal and charitable institutions regarding the proper care of tuberculous inmates; and for the performance of such other duties as may be assigned by the said board.

Sec. 2. The state board of health shall appoint a director of the department whose salary shall be fixed by the board in an amount not to exceed three thousand dollars per annum, and such other employees as may be deemed necessary, and shall fix their compensation. The director shall be a duly licensed physician, shall be appointed an assistant secretary of the state board of health, and shall devote his entire time to the duties assigned to him. In addition to the administration of the department, it shall be the duty of the director, and he is hereby invested with full power, to inspect and investigate, and have access to all records and departments of all institutions, both public and private, where tuberculous patients are treated. He shall prepare annually for each institution a report of its rating on sanitary construction, enforcement of sanitary measures, adequate provision for medical and nursing attendance, provision for proper food, and such other matters of administration as may be designated. The director and other employees of the department shall be allowed their actual and necessary traveling expenses incurred in the performance of their duties.

Sec. 3. There shall be an advisory board of four members appointed by the governor for a term of four years; provided, that the first appointees shall be designated respectively for one, two, three, and four years. These members shall be selected for their recognized ability and interest in the control and eradication of tuberculosis. The advisory board may meet at least quarterly for conference with the state board of health. All recommendations for appointments, promotions, dismissals, increases of salaries, special expenditures, rules and regulations to be issued by the department and other important matters of policy must be submitted to the advisory board before final action, and its written opinions must be recorded with each action; provided, that a majority vote by mail ballot may be recognized as complying with the provisions of this section. In all matters of action in which the approval of the advisory board is withheld, the state board of health must file a report with the governor, stating the reasons for action and attaching thereto a copy of the adverse opinion. The advisory board may make at any time such recommendations regarding the policy of the department, as it may decide by vote to be expedient, but no recommendations for appointments, promotions, or dismissals may originate with it. The advisory board shall elect from its members a chairman who shall serve for one year, and until his successor shall be elected. In addition to the quarterly conferences with the state board of health, the said board may, upon its own volition, meet annually in the offices of the department, and special meetings may be held at any time or place subject to the call or approval of the state board of health, or its secretary. The director of the department shall serve as secretary for the advisory board. The members shall receive no salary, but may receive their actual and necessary traveling expenses while in the service of the department.

Sec. 4. The sum of \$7,500 is hereby appropriated out of any moneys in the state treasury not otherwise appropriated to be expended by the state board of health in carrying out the provisions of this act. All claims against this appropriation shall be audited by the state board of control. The controller is hereby directed to draw his warrants for sums aggregating this amount and the state treasurer is directed to pay the same.

EXHIBIT B.

An act to provide for the medical treatment of residents afflicted with tuberculosis; to create a fund therefor; to prescribe the duties of the state board of health, its agents and other public officials with relation thereto; and making an appropriation for the purposes of this act.

The people of the State of California do enact as follows:

Section 1. The state board of health through the department of tuberculosis is hereby authorized and empowered to enter into appropriate contracts with the board of managers, or other executive head, of any institution, public or private, which is

now or may hereafter be established and maintained in this state for the express purpose of affording approved medical treatment to patients having tuberculosis, wherein there shall be made provision for the treatment at public expense of indigent residents of this state afflicted with such disease. In making such contracts, the board shall be guided by general considerations of public health and safety, together with the approved teachings of medical science, touching upon the location, altitude and climatic conditions of the institutions offering to enter into such contracts. The board of managers, or other executive head, of each institution desiring to enter into such contracts and receive and treat patients, under the provisions of this act, must, in writing apply to the secretary of the state board of health for an inspection and examination of such institution, and must give all such information concerning the location, climatic surroundings, methods of treatment, class of patients received and other details of management, and terms of admission, as the board may require. Such information shall be given upon forms prepared for the purpose by the board of health, and shall be signed by the medical superintendent of such institution. In the event such institution, its management and methods of treatment be approved by the board of health, the board of managers, or other executive head thereof, shall, within ten days after receipt of notice of such approval, forward to the secretary of the board, a written offer in behalf of such institution to receive patients under the terms of this act: provided, however, that the charge shall in no case exceed ten dollars per week for each of such patients; and further agreeing in behalf of said institution to furnish to the secretary of the board, on forms prepared by him, all receipt of such offer, the board may, if it so elects, proceed to enter into a contract with such institution for the maintenance and treatment therein of indigent patients, the form of which shall be approved by the attorney general prior to execution. Upon the execution of the contract, the secretary of the state board of health shall certify to the clerk of the board of supervisors of each county in this state the name and location of such institution and such other details concerning the same as he may deem appropriate.

Sec. 2. Each county of this state is hereby given the privilege of maintaining in said institutions, at the expense of such county, such number of indigent patients as the institution may have accommodations for: provided, however, that the total number of such patients shall not exceed the aggregate capacity of the institutions making such contracts; and provided, that no county shall be required to pay more than ten dollars per week per patient for all medical and other services rendered such patient; and that the board of supervisors may withdraw their patients at any time; and provided, further, that the proper authorities of each institution shall file an affidavit that no payments are being received for care of such patients from any other source.

Sec. 3. Indigent persons who are afflicted with tuberculosis and who have been residents of this state for not less than one year prior to making application therefor, may be admitted to any such institution selected as in section one hereof provided, and receive treatment therein at the expense of the county in which he or she resides, in the manner and upon the terms and conditions hereinafter prescribed. Any person desiring to receive such treatment must make written application therefor to the board of supervisors of the county in which he or she resides, stating the name, age, sex, place of residence, and such other data concerning the applicant as the state board of health may, from time to time, prescribe. Such application must be verified by the oath or affirmation of the applicant. If, after investigation, the board be satisfied that the applicant properly comes under the provisions of this act then the board may thereupon order that the applicant be maintained as a patient in one of the institutions named by the state board of health which is most closely located to the indigent to be admitted, until cured, or until discharged as hereinafter provided, or for such period of time as the board may provide. The necessary expense of transporting such patient to the institution selected shall be advanced and paid by the county.

Sec. 4. The sum of two thousand dollars is hereby appropriated out of any money in the state treasury, not otherwise appropriated, to provide and maintain a permanent revolving fund to be used under the direction of the state board of health for the payment by the state, in the first instance, of the expense of maintaining such patients at such institutions, and no part of said sum shall be used for any other purpose. All sums advanced out of said fund shall be repaid to the state by the respective counties thereof, as hereinafter provided, and shall be paid into the state treasury to the credit of said fund.

Sec. 5. The medical superintendent of each institution in which there are maintained any patients under the provisions of this act shall, monthly, render to the secretary of the state board of health, an itemized bill, duly verified, showing the number of patients so maintained in such institution during the month last preceding, or any part thereof, the name and county of residence of each patient, and the amount due such institution. All such bills shall be audited as provided by law, and shall be paid out of the fund provided by section four hereof.

Sec. 6. The secretary of the state board of health shall, quarterly, furnish to the clerk of the board of supervisors of each county from which any patient shall have been sent to any such institution, an itemized claim showing the names of the patients so sent from such county, the name of the institution in which each is maintained, and the amount advanced by the state for the support of such patient during the

preceding quarter, or any part thereof. Each of such claims shall be verified in the manner provided by law. It shall be the duty of the board of supervisors to audit and allow such claim in the manner provided by law, and to order a warrant drawn for the amount thereof in favor of the secretary of the state board of health. It shall be the duty of the county auditor to draw such warrant, and of the county treasurer to pay the same. Upon receipt of the money, the secretary of the state board of health shall deposit the same in the state treasury to the credit of the fund established by section four hereof.

Sec. 7. If, in the judgment of the medical superintendent of any institution mentioned in this act, any patient has reached a stage of arrestment or cure of his disease, he shall upon approval of the director of the department of tuberculosis, discharge such patient and shall furnish him with transportation to the county seat of the county whence he came. The amount advanced for such transportation shall be included in the next monthly bill and shall be audited and paid as are the other items thereof. Or, if for misconduct, medical or other good reasons it be desirable to discharge any patient, the superintendent shall report such fact to the director of the department of tuberculosis with reasons for such action, and shall, subject to the approval of the director, discharge said patient and return him to the county whence he came, as hereinabove provided. In the event of the death of any such patient in said institutions, the superintendent shall deliver the body at the place of the death to the legal representative of the deceased. In case no legal representative or friend shall claim the body of a patient who is a proper charge to another county, the body may be interred by the county in which death occurs and become a charge to the county from which he comes and paid as hereinbefore provided for claims.

Sec. 8. Pulmonary tuberculosis is hereby declared to be an infectious and communicable disease, dangerous to the public health, and all proper expenditures which may be made by any county of this state, pursuant to the provisions of this act, are hereby declared to be necessary for the preservation of the public health of the county, within the meaning of section four thousand two hundred and twenty-five of the Political Code.

EXHIBIT C.

An act to provide for the establishment, maintenance and control of sanatoria for the treatment of tuberculosis and making appropriation therefor, and authorizing cities and counties within the state to send patients to said sanatoria and to pay the running expenses and maintenance of said sanatoria and of patients therein, and to levy taxes therefor.

The people of the State of California do enact as follows:

Section 1. The governor of the state is hereby authorized and directed to appoint five citizens of the state, who shall constitute the commissioners of the tuberculosis commission of the State of California. The term of office of the said commissioners shall be five years, except that the members of the first commission shall be appointed for the following terms:

- One member for the period of one year.
- One member for the period of two years.
- One member for the period of three years.
- One member for the period of four years.
- One member for the period of five years.

Vacancies in said commission, caused by death, resignation or in any other manner, shall be filled for the unexpired term in the manner provided for original appointments. Three commissioners shall constitute a quorum.

The commission shall within sixty days from the passage of this act, at the call of the governor, qualify by taking the official oath, and meet for organization. It shall have authority to make all contracts and employ all agents necessary to carry into effect the provisions of this act; provided, however, that no contract shall be made by the commission for a longer term than one year, or involving an expenditure of more than one thousand dollars, without the approval of the state board of control; and provided, further, that nothing herein contained shall be deemed to in any manner abridge the powers and jurisdiction of the state board of control, under the laws of the state, as to any contracts or expenditures made by said commissioners. The commission shall adopt such rules and by-laws as may be deemed necessary to carry on the work hereby delegated to it. It shall have authority to make such rules and regulations pertaining to the admission of patients as it deems proper, subject to the provisions of this act.

Sec. 2. There shall be established, upon sites to be selected as hereinafter provided, state sanatoria for the treatment of tuberculosis, to be designated by the name of "state sanatoria for tuberculosis."

Sec. 3. The commission shall select a site or sites for the sanatoria to be erected under this act and in the selection of such site or sites shall decide solely upon and be governed by advantages for health, suitability of location, adaptability for the purpose of the institution and convenience of management.

Sec. 4. The commission shall, after selecting the proposed site or sites, report the same from time to time as the selections are made to the state board of control,

and, as soon as by it approved, may purchase, lease, acquire by gift, or otherwise acquire and hold the same for and on behalf of the state. As soon as practicable after the selection of the site or sites, the commission shall procure and adopt plans and specifications for the construction of suitable buildings, with the necessary appurtenances thereto, and accommodation for the necessary officers, employees and attendants. Upon the adoption of suitable plans and specifications for said sanatorium or sanatoria, the commission shall proceed with the construction of the necessary buildings in accordance with law.

Sec. 5. The commission shall cause to be kept a full and correct record of all proceedings, which shall be open at all reasonable times to the inspection of any citizen desiring to examine the same. It shall make an annual report to the governor, concerning the work done, and such other matters as he may require.

Sec. 6. The commission shall appoint and employ a medical superintendent or superintendents, and such other employees as it deems desirable; and, subject to the approval of the state board of control, shall fix their compensation. The commission shall have power to remove any person appointed or employed by it pursuant to the provisions of this act.

Each medical superintendent shall be a legally licensed physician in good standing as a member of such profession, and shall reside at the sanatorium and shall give all his time to the management of the sanatorium.

Sec. 7. Each medical superintendent shall have charge of the sanatorium under his direction with the buildings and grounds, furniture, fixtures and equipments, and shall be held responsible for its workings, and shall appoint the necessary employees, subject to the approval of the commission, and shall personally supervise the treatment of all patients and shall discharge the same from the institution when, in his judgment, they have gained full benefits from the treatment, or when they are deemed to be unsuitable cases.

Sec. 8. Any county or city and county of the state may send to the sanatoria any patient or patients, provided that patients shall be admitted to the sanatoria only upon presentation of a certificate from the county or city and county wherein the patient resides, which certificate shall be signed by a majority of the supervisors of said county or city and county or by a committee or other agent duly authorized by such board of supervisors, and shall request the admission and certify the admissibility of such patient to said sanatoria. No patient shall be admitted to said sanatoria except upon certificate from a county or city and county within the state, and unless found, upon examination by a medical superintendent, to be suffering from tuberculosis.

Sec. 9. Each county and city and county in the state shall pay to the state annually, and before the fifteenth day of May of each year, the cost of maintenance of the patients theretofore sent or certified, in the manner herein provided, by said county or city and county to said sanatoria, and there maintained during the previous state fiscal year, or part thereof.

Sec. 10. The board of supervisors of each county or city and county in the state is hereby authorized and empowered annually, and at the time and in the manner of levying other county or city and county taxes, to levy and cause to be collected a tax to be known as the "sanatorium tax," the amount of which shall not be less than a sum equal to the cost of maintenance of the patients sent and certified by such county or city and county to the state sanatoria, and there maintained during the previous state fiscal year, or part thereof. The amount of the cost of maintenance shall be determined as follows:

The said commission shall annually, and before the first day of March of each year, fix the rate per month per patient which shall be paid by each county or city and county for each patient sent by said county or city and county to said sanatoria, and there maintained during the fiscal year ending on the following thirteenth day of June. The rate of cost of maintenance fixed by the commission for each patient shall, as nearly as possible, provide the amount of funds necessary for the expenses and maintenance of said sanatoria and of the patients therein during the current fiscal year ending on the thirteenth day of June following the date on which said rate is fixed by the commission.

Sec. 11. The amount of the cost of maintenance of patients sent to said sanatoria by any county or city and county, at the rate fixed as herein provided, shall be a debt collectable by the state from said county or city and county. Upon the failure of any county or city and county to pay the cost of maintenance of any patient or patients in the manner herein provided, the commission may return said patient or patients to the said county or city and county from which the said patient or patients were sent.

Sec. 12. The members of the commission shall receive no compensation for their services, but shall be allowed their actual traveling and other expenses occasioned by the duties of their office.

Sec. 13. For the purchase of the site or sites and erection of the sanatoria herein provided for, and the equipment and furnishings, and towards the maintenance of the same, and for other necessary expenses of the commission in connection with the proper exercise of their powers and performance of their duties, two hundred thousand dollars is hereby appropriated, one half of which shall be available July 1, 1915, and one half July 1, 1916.

Sec. 14. For the support of said sanatoria during the period corresponding to the state fiscal year, or portion thereof, ensuing upon the completion of said sanatoria or any of them, each county shall pay for each patient sent from such county, the sum of thirty-five dollars for each month that such patient is maintained at said sanatoria or any of them, during said period.

Sec. 15. The commission shall have power to investigate the spread and prevention of the spread of tuberculosis, and shall prepare and render such reports of its investigations as it deems proper, and may receive and expend donations in aid of such investigation, subject, however, to the approval of the state board of control, as hereinbefore provided.

EXHIBIT D.

An act to provide for the establishment, maintenance and control of sanatoria, farm colonies and other institutions for the treatment of tuberculosis and making an appropriation therefor, and authorizing cities and counties within the state to send patients to said institutions and to pay the running expenses and maintenance of the same and of patients therein, and to levy taxes therefor, and providing for other sources of revenue.

The people of the State of California do enact as follows:

Section 1. The state board of health, through the state department of tuberculosis, may establish upon sites to be selected as hereinafter provided, institutions for the treatment of tuberculosis, to be designated by the name of "state sanatoria for tuberculosis," "farm colonies," "settlements," or other appropriate names.

Sec. 2. The department may select a site or sites for the institutions to be erected under this act and in the selection of such site or sites shall decide solely upon and be governed by advantages for health, suitability of location, adaptability for the purpose of the institution and convenience of management.

Sec. 3. The department shall after selecting the proposed site or sites, report the same from time to time as the selections are made to the state board of control, and, as soon as by it approved, may purchase, lease, acquire by gift, or otherwise acquire and hold the same for and on behalf of the state. As soon as practicable after the selection of the site or sites, the department shall procure and adopt plans and specifications for the construction of suitable buildings, providing such do not already exist, with the necessary appurtenances thereto, and accommodations for the necessary officers, employees and attendants. Upon the adoption of suitable plans and specifications for said institution or institutions, the department shall proceed with the construction of the necessary buildings in accordance with law.

Sec. 4. The department shall appoint and employ a medical superintendent or superintendents, and such other employees as it deems desirable; and shall fix their compensation. The department shall have power to remove any person appointed or employed by it pursuant to the provisions of this act. Each medical superintendent shall be a legally licensed physician in good standing as a member of such profession, and shall reside at the institution and shall give all his time to the management of the institution.

Sec. 5. Each medical superintendent shall have charge of the institution under his direction with the building and grounds, furniture, fixtures and equipment, and shall be held responsible for its workings, and shall appoint the necessary employees, subject to the approval of the department, and shall personally supervise the treatment of all patients and shall discharge the same, or transfer them to another type of institution, when, in his judgment, they have gained full benefits from the treatment, or when they are deemed to be unsuitable cases.

Sec. 6. Any county or city and county of the state may send to the institution any indigent patient or patients of the class or character for which such institution is equipped; provided, that such indigent patients shall be admitted to the institution only upon presentation of a certificate from the county or city and county wherein the patient resides, which certificate shall be signed by a majority of the supervisors of said county or city and county or by a committee or other agent duly authorized by such board of supervisors, and shall request the admission and certify the admissibility of such indigent patient to said institution. No such indigent patient shall be admitted to said institution except upon certificate from a county or city and county within the state, and no patient shall be received unless found, upon examination by a medical superintendent, to be suffering from tuberculosis. Patients who are not indigent may be received into said institutions upon such terms as may be agreed upon by the department. All sums received for this service shall be paid into the department for deposit with the state controller, to the credit of the state board of health fund for maintenance of the department of tuberculosis. The state board of health may also receive, for promotion of the work of this department, gift of lands, endowments and bequests for construction, maintenance, equipment, scientific research or any other support in connection with the management of such institutions.

Sec. 7. Each county and city and county in the state shall pay to the state annually, and before the fifteenth day of May of each year, the cost of maintenance of the patients theretofore sent or certified, in the manner herein provided, by said county or city and county in said institutions, and there maintained during the previous state fiscal year, or part thereof.

Sec. 8. The board of supervisors of each county or city and county in the state is hereby authorized and empowered annually, and at the time and in the manner of levying other county or city and county taxes, to levy and cause to be collected a tax to be known as the "sanatorium tax," the amount of which shall not be less than a sum equal to the cost of maintenance of the patients sent and certified by such county or city and county to the state institutions, and there maintained during the previous state fiscal year, or part thereof. The amount of the cost of maintenance shall be determined as follows: the state department shall annually, and before the first day of March of each year, fix the rate per month per patient which shall be paid by each county or city and county for each patient sent by said county or city and county to said institutions, and there maintained during the fiscal year ending on the following thirteenth day of June. The rate of cost of maintenance fixed by the department for each patient shall, as nearly as possible, provide the amount of funds necessary for the expenses and maintenance of said institutions and of the patients therein during the current fiscal year ending on the thirteenth day of June following the date on which said rate is fixed by the department.

Sec. 9. The amount of the cost of maintenance of patients sent to said institutions by any county or city and county, at the rate fixed as herein provided, shall be a debt collectable by the state from said county or city and county. Upon the failure of any county or city and county to pay the cost of maintenance of any patient or patients in the manner herein provided, the department may return said patient or patients to the said county or city and county from which the said patient or patients were sent.

Sec. 10. The medical superintendents of institutions shall be allowed their actual traveling and other expenses occasioned by the duties of their office.

Sec. 11. For the purchase of the site or sites and erection of the institutions herein provided for, and the equipment and furnishings, and towards the maintenance of the same, and for other necessary expenses of the institutions herein provided for, the sum of five thousand dollars is hereby appropriated. In addition to this amount, only such sums as may be received from gifts, endowments, and bequests will be available until otherwise provided.

Sec. 12. For the support of said institutions during the period corresponding to the state fiscal year, or portion thereof, ensuing upon the completion of said institutions or any of them, each county shall pay for each patient sent from such county, the sum of thirty-five dollars for each month that such patient is maintained at said institutions or any one of them, during said period.

EXHIBIT E.

An act to provide for the medical treatment of indigent residents afflicted with incipient pulmonary tuberculosis; to create a fund therefor; to prescribe the duties of the state board of health and other public officials with relation thereto; and making an appropriation for the purposes of this act.

The people of the State of California do enact as follows:

Section 1. Until such time as there shall be established by law in this state a state hospital for the medical treatment of persons afflicted with incipient pulmonary tuberculosis, the state board of health is hereby authorized and empowered to enter into appropriate contracts with the board of managers, or other executive head, of any institution which is now or may hereafter be established and maintained in this state for the express purpose of affording approved medical treatment to patients having incipient pulmonary tuberculosis, wherein there shall be made provision for the treatment at public expense of indigent residents of this state afflicted with such disease. In making such contracts, the board shall be guided by general considerations of public health and safety, together with the approved teachings of medical science, touching upon the location, altitude and climatic conditions of the institutions offering to enter into such contracts. The board of managers, or other executive head, of each institution desiring to enter into such contracts and receive and treat patients, under the provisions of this act, must, in writing, apply to the secretary of the state board of health for an inspection and examination of such institution, and must give all such information concerning the location, climatic surroundings, methods of treatment, or other details of management, as the board may require. Such information shall be given upon forms prepared for the purpose by the board of health, and shall be signed by the medical superintendent of such institution. In the event such institution, its management and methods of treatment be approved by the board of health, the board of managers, or other executive head thereof, shall, within ten days after receipt of notice of such approval, forward to the secretary of the board, a written offer in behalf of such institution to receive, medically treat, and otherwise care for, such patients as might be sent there under the provisions of this act, not exceeding a stated number in all, at a uniform charge, which shall in no case exceed one dollar per day for each of such patients; further agreeing in behalf of said institution to furnish to the secretary of the board, on forms prepared by him, all such reports as the state board of health may, from time to time, require, together with full and complete information concerning any new or important discoveries made in the methods of treating, checking, preventing, or curing said disease.

and such recommendations regarding the same as may be deemed beneficial to the interests of the public. Upon receipt of such offer, the board may, if it so elects, proceed to enter into a contract with such institution for the maintenance and treatment therein of state patients, the form of which shall be approved by the attorney general prior to execution. Every institution entering into such a contract shall be required to give bonds in the sum of five thousand dollars, conditioned for the faithful performance of the obligations by it assumed in such contract. Upon the execution of the contract and the filing of the bond, the secretary of the state board of health shall certify to the clerk of the board of supervisors of each county in this state the name and location of such institution and such other details concerning the same as he may deem appropriate.

Sec. 2. Each county of this state is hereby given the privilege of maintaining in said institutions, at the expense of such county, such number of indigent patients as its board of supervisors may determine; provided, however, that the total number of such patients shall not exceed the aggregate capacity of the institutions making such contracts; and provided, further, that no county shall be required to pay more than one dollar per day per patient for all medical and other services rendered such patient.

Sec. 3. Indigent persons who are afflicted with incipient pulmonary tuberculosis, and who have been residents of this state for not less than one year prior to making application therefor, may be admitted to any such institution selected as in section one hereof provided, and receive treatment therein at the expense of the county in which he or she resides, in the manner and upon the terms and conditions hereinafter prescribed. Any person desiring to receive such treatment must make written application therefor to the board of supervisors of the county in which he or she resides, stating the name, age, sex, place of residence, and such other data concerning the applicant as the state board of health may, from time to time, prescribe. Such application must be verified by the oath or affirmation of the applicant. If the board be satisfied as to the truth of such declarations, and if there be then a vacancy in the number of indigent patients to be supported by such county, the board shall require the applicant to submit to a proper bacteriological and clinical examination by the superintendent of the county hospital, or, if there be none, by the county health officer, for the purpose of ascertaining whether or not the condition of the applicant is such as to afford a reasonable hope of cure by a course of treatment in one of such institutions. If, in the judgment of the medical officer making such examination, the applicant is afflicted with incipient pulmonary tuberculosis and there is a reasonable hope that such person may be cured, he shall so certify to the board, and the board may thereupon order that the applicant be maintained as a patient in one of the institutions named by the state board of health until cured, or until discharged as hereinafter provided. The necessary expense of transporting such patient to the institution selected shall be advanced and paid by the county.

Sec. 4. The sum of fifteen thousand dollars is hereby appropriated out of any money in the state treasury, not otherwise appropriated, to provide and maintain a permanent revolving fund to be used under the direction of the state board of health for the payment by the state, in the first instance, of the expense of maintaining such patients at such institutions, and no part of said sum shall be used for any other purpose. All sums advanced out of said fund shall be repaid to the state by the respective counties thereof, as hereinafter provided, and shall be paid into the state treasury to the credit of said fund.

Sec. 5. The medical superintendent of each institution in which there are maintained any patients under the provisions of this act shall, monthly, render to the secretary of the state board of health, an itemized bill, duly verified, showing the number of patients so maintained in such institution during the month last preceding, or any part thereof, the name and county of residence of each patient, and the amount due such institution. All such bills shall be audited as provided by law, and shall be paid out of the fund provided by section four hereof.

Sec. 6. The secretary of the state board of health shall, quarterly, furnish to the clerk of the board of supervisors of each county from which any patient shall have been sent to any such institution, an itemized claim showing the names of the patients so sent from such county, the name of the institution in which each is maintained, and the amount advanced by the state for the support of such patient during the preceding quarter, or any part thereof. Each of such claims shall be verified in the manner provided by law. It shall be the duty of the board of supervisors to audit and allow such claim in the manner provided by law, and to order a warrant drawn for the amount thereof in favor of the secretary of the state board of health. It shall be the duty of the county auditor to draw such warrant, and of the county treasurer to pay the same. Upon receipt of the money, the secretary of the state board of health shall deposit the same in the state treasury to the credit of the fund established by section four hereof.

Sec. 7. If, in the judgment of the medical superintendent of any institution mentioned in this act, any patient has become cured of his disease, he shall discharge such patient and shall furnish him with transportation to the county seat of the county whence he came. The amount advanced for such transportation shall be included in the next monthly bill and shall be audited and paid as are the other items thereof. Or, if any patient be deemed hopelessly incurable, the superintendent shall report such fact to the secretary of the state board of health, and shall, subject

to the approval of the secretary, discharge such patient and return him to the county whence he came, as hereinabove provided.

Sec. 8. Pulmonary tuberculosis is hereby declared to be an infectious and communicable disease, dangerous to the public health, and all proper expenditures which may be made by any county of this state, pursuant to the provisions of this act, are hereby declared to be necessary for the preservation of the public health of the county, within the meaning of section 4225 of the Political Code.

EXHIBIT F.

An act providing for the dissemination of knowledge among the people of California as to the best means of preventing the spread of tuberculosis, and for investigation of its prevalence and making an appropriation therefor.

The people of the State of California do enact as follows:

Section 1. It shall be the duty of the state board of health to cause special investigation of the prevalence of tuberculosis in California and the effects of localities, employments, conditions and circumstances on the health of those developing the disease, and to determine the best means for its eradication.

Sec. 2. For the purpose of this act, in addition to the provisions of section 1, the state board of health is authorized and empowered to establish through the department of tuberculosis, dispensaries for providing examination of and furnishing advice to tuberculous persons, and for the detection, prevention and alleviation of suffering from tuberculosis. The number of these dispensaries shall be determined by the state board of health after due investigation through the department of tuberculosis, and dispensaries shall be located at such places in the state as may be deemed necessary. The state board of health is also authorized and empowered through said department of tuberculosis, to enter into appropriate contracts with the board of managers or other executive head of any dispensary or other institution which is now or may hereafter be established and maintained with adequate equipment for the dispensary service included within the meaning of this act. No dispensary may be established or contract entered into under the provisions of this act until a careful report has been prepared and filed with the state board of control showing the necessity for such action and for the location chosen, together with a careful estimate of the expense involved. The approval of the estimate by the state board of control shall be necessary before any dispensary may be established or contract concluded.

Sec. 3. The state board of health shall publish, or procure and distribute free to the people of the State of California, printed matter, charts, pictures or models, or demonstrate to them in any practical way the prevalence of tuberculosis, the danger of infection therefrom and the means of prevention and cure.

Sec. 4. The sum of five thousand dollars is hereby appropriated out of any moneys in the general fund in the state treasury, not otherwise appropriated, for the purpose of this act, and the state controller is hereby directed to draw his warrant in favor of the state board of health for sums aggregating that amount, these claims having been audited by the state board of control, and the state treasurer is directed to pay the same.

EXHIBIT G.

An act defining the powers and duties of physicians, local health officers and boards of health in the matter of protection of the people of the State of California from the disease known as tuberculosis.

The people of the State of California do enact as follows:

Section 1. Tuberculosis is hereby declared to be an infectious and communicable disease, dangerous to the public health. It shall be the duty of every physician practicing in this state, and every chief officer in charge of any hospital, dispensing asylum or other private or public institutions in said state to report in writing to the health officer of the city, town or village, in which said tubercular person resides, the name, age, sex, color, occupation, address and place where last employed, of every person having tuberculosis who comes under his care or observation. Said reports shall be made in writing on a form furnished as hereinafter provided and shall be forwarded to said health officer within twenty-four hours after knowledge of the case comes to said physician or chief officer.

Sec. 2. It shall be the duty of every health officer of a city, town or village, where so requested by any physician, or by authorities of any hospital or dispensary, to make or cause to be made a microscopical examination of the sputum sent him as that of a person having symptoms of tuberculosis, accompanied by a blank giving the name, age, sex, color, occupation, place where last employed, if known, and address of the person whose sputum it is. It shall be the duty of said health officer promptly to make a report of the results of such examination, free of charge, to the physician or person upon whose application the same is made.

Sec. 3. It shall be the duty of every health officer of a city, town or village, to cause all reports, and all results of examinations, showing the presence of the bacilli of tuberculosis, made in accordance with the provisions of sections 1 and 2

respectively of this act, to be recorded in a register, of which he shall be the custodian. Such register shall not be open to inspection by any person other than the health authorities of the state and of the said city, town or village, and said health authorities shall not permit any such report or record to be divulged so as to disclose the identity of the person to whom it relates, except as may be necessary to carry into effect the provisions of this act.

Sec. 4. In case of the vacation of any apartment or premises by the death or removal therefrom of a person having tuberculosis, it shall be the duty of the attending physician, or if there be no such physician, or if such physician be absent, of the owner, lessee, occupant or other person having charge of the said apartments or premises, to notify the health officer of said city, town or village, of said death or removal within twenty-four hours thereafter, and such apartments or premises so vacated shall not be occupied until duly disinfected, cleansed or renovated as hereinafter provided.

Sec. 5. When notified of the vacation of any apartments or premises as provided in section 4 hereof, the local health officer or one of his assistants or deputies, shall within twenty-four hours thereafter visit said apartments or premises and shall order and direct that, except for purposes of cleansing or disinfection, no infected article shall be removed therefrom until properly and suitably cleaned or disinfected, and said health officer shall determine the manner in which such apartments or premises shall be disinfected, cleansed or renovated in order that they may be rendered safe and suitable for occupancy. If the health authorities determine that disinfection is sufficient to render them safe and suitable for occupancy, such apartments or premises together with all infected articles therein, shall immediately be disinfected by the health authorities at the public expense, or if the owner prefers, by the owner at his expense, to the satisfaction of the health authorities. Should the health authorities determine that such apartments or premises are in need of thorough cleansing or renovation, a notice in writing to this effect shall be served upon the owner or agent of said apartments or premises, and said owner or agent shall thereupon proceed to the cleansing or renovating of such apartments or premises in accordance with the instructions of the health authorities, and such cleansing and renovation shall be done at the expense of the said owner or agent.

Sec. 6. In case the orders or directions of the local health officer requiring the disinfection, cleansing or renovation of any apartments or premises or any articles therein as hereinbefore provided, shall not be complied with within forty-eight hours after such orders or directions shall be given, the health officer may cause a placard in words and form substantially as follows to be placed upon the door of the infected apartments or premises:

"Tuberculosis is a communicable disease. These apartments have been occupied by a consumptive and may be infected. They must not be occupied, until the order of the health officer directing their disinfection or renovation has been complied with. This notice must not be removed under penalty of the law except by the health officer or other duly authorized official."

Sec. 7. Any person having tuberculosis who shall dispose of his sputum, saliva or other bodily secretion or other excretions so as to cause offense or danger to any person or persons occupying the same room or apartment, house or part of a house, shall on complaint of any person or persons subjected to such offense or danger, be deemed guilty of a nuisance and any persons subjected to such nuisance may make complaint in person or in writing to the health officer of any city, town or village where the nuisance complained of is committed. And it shall be the duty of the local health officer receiving such complaint to investigate and if it appears that the nuisance complained of is such as to cause offense or danger to any person occupying the same room, apartment, house or part of a house, he shall serve a notice upon the person so complained of, reciting the alleged cause of offense or danger and requiring him to dispose of his sputum, saliva or other bodily secretion or excretion in such a manner as to remove all reasonable cause of offense or danger. Any person failing or refusing to comply with orders or regulations of the local health officer of any city, town or village, requiring him to cease to commit such nuisance, shall be deemed guilty of a misdemeanor and on conviction thereof shall be fined not more than ten (\$10.00) dollars.

Sec. 8. It shall be the duty of a physician attending a patient having tuberculosis to take all proper precautions and to give proper instructions to provide for the safety of all individuals occupying the same house or apartment, and if no physician be attending such patient this duty shall devolve upon the local health officer and all duties imposed upon physicians by any sections of this act shall be performed by the local health officer in all cases of tuberculosis not attended by a physician, or when the physician fails to perform the duties herein specified, and shall so report: provided, however, that nothing herein shall be construed to give to said health officer or inspector the right to remove such patient, or to provide for or compel the use of the services of any medical or other practitioner of medicine or method of healing, other than that selected by the patient.

Sec. 9. It shall be the duty of the local health officer to transmit to a physician reporting a case of tuberculosis as provided in section 1 of this act, a printed statement and report, in a form approved by the state board of health, naming such procedure and precautions as in the opinion of the said board are necessary or

desirable to be taken on the premises of a tuberculosis patient. It shall be the duty of the state board of health to print and keep on hand an ample supply of such statements and reports and to furnish the same in sufficient numbers to all local health authorities. Upon receipt of such statement and report the physician shall either carry into effect all such procedures and precautions as are therein prescribed, and shall thereupon sign and date the same and return it to the local health officer without delay, or, if such attending physician be unwilling or unable to carry into effect the procedures and precautions specified, he shall so state upon this report and immediately return the same to the local health officer, and the duties therein prescribed shall thereupon devolve upon said local officer. Upon receipt of this statement and report the local health officer shall carefully examine the same, and satisfy himself that the attending physician has taken all necessary and desirable precautions to insure the safety of all persons living in the apartments or premises occupied by the person having tuberculosis. If the precautions taken or instructions given by the attending physician are, in the opinion of the local health officer, not such as will remove all reasonable danger or probability of danger to the persons occupying the said house or apartments or premises, the local health officer shall return to the attending physician the report with a letter specifying the additional precautions or instructions which the health officer shall require him to take or give; and the said attending physician shall immediately take the additional precautions and give the additional instructions specified and shall report and return the same on the original report to the local health officer. It shall further be the duty of the local health officer to transmit to the physician reporting any case of tuberculosis a printed requisition, in a form furnished by the state board of health, and issued in sufficient number to supply local physicians. Upon this requisition blank shall be named the materials kept on hand by the local health officer for the prevention of the spread of tuberculosis and it shall be the duty of the local health officer to supply such materials as may be specified in such requisitions. Any physician may return a duly signed requisition to the local health officer for such of the specified materials and in such amount as he may deem necessary to aid him in preventing the spread of the disease, and all local health officers shall honor, as far as possible, a requisition signed by the attending physician in such case. It shall be the duty of every local health officer to transmit to every physician reporting any case of tuberculosis, or to the person reported as suffering from this disease, provided the latter has no attending physician, a circular of information approved by the state board of health and which shall be provided in sufficient quantity by the best local authorities. This circular of information shall inform the consumptive of the best methods of treatment of his disease and of the precautions necessary to avoid transmitting the disease to others.

Sec. 10. Any physician or person practicing as a physician who shall knowingly report as affected with tuberculosis any person who is not affected, or who shall wilfully make any false statement concerning the name, sex, color, occupation, place where last employed if known, or address of any person reported as affected with tuberculosis, or who shall certify falsely as to any of the precautions taken to prevent the spread or infection, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be subject to a fine of not more than one hundred dollars.

Sec. 11. Upon the recovery of any person having tuberculosis, it shall be the duty of the attending physician to make a report of this fact to the local health officer, who shall record the same in the records of his office, and shall relieve said person from further liability to any requirements imposed by this act.

Sec. 12. Any person violating any of the provisions of this act shall be deemed guilty of a misdemeanor and upon conviction thereof shall be punished except as herein otherwise provided, by a fine of not less than fifty dollars nor more than five hundred dollars.

Sec. 13. There is hereby appropriated, out of any funds in the state treasury, not otherwise appropriated, the sum of two thousand five hundred dollars to be expended by the state board of health for the purpose of printing and circulating the required blanks to make the law effective.

Sec. 14. All acts and parts of acts contrary to or inconsistent with the provisions of this act are hereby repealed.

This act shall take effect immediately.

THE CONTROL AND PREVENTION OF BAD HOUSING CONDITIONS AS PART OF A PROGRAM TO CHECK THE SPREAD OF TUBERCULOSIS.

Your committee has studied the housing conditions in the larger cities of California in order to determine what measures are necessary to prevent the development of overcrowded and congested districts. The time and money available has been so limited as of necessity to prevent any elaborate or detailed investigation.

During the two months from March 7th to May 7th of 1912, the committee was able to secure the service of Mrs. Johanna von Wagner, a woman who has had wide experience as a tenement house inspector in the East, and who was at the time employed as an inspector for the Housing Commission of Los Angeles. Mrs. von Wagner made a rapid survey of housing conditions in the principal cities of California, visiting in all fourteen cities and towns and inspecting tenements and lodging houses. Two conclusions stand out prominently as a result of this investigation:

First—That, with the exception of San Francisco, the poorer people of California are not, in any considerable numbers, housed in tenements. The tenement houses are, as a rule, apartment houses that were built for the fairly well to do, where the apartments are rented for a substantial sum. These cities can easily prevent congestion and the development of a tenement house district if a public sentiment can be created on the subject within the next few years. The tenement house law of 1911 is, in itself, a protection against the worst evils, but as this was copied from the New York law, and allows 90 per cent of corner lots and 75 per cent of inner lots to be built upon, it is not adapted to meet the conditions in the smaller cities and towns of California. If local ordinances could be passed in these cities and towns, requiring larger yard spaces and courts, the development would be along more normal lines and people would be forced out in the suburbs instead of being crowded into certain districts in the city.

Second—Mrs. von Wagner's report shows that in the unregulated lodging houses, that exist in great numbers in all our towns and cities, there is already a real menace to health that demands immediate regulation. The following extracts are quoted from the report in order to show how bad the conditions are in lodging houses. Three lodging houses are described—one in Sacramento, one in Stockton, and one in San Francisco:

SACRAMENTO.

May 7, 1912. Three story brick building; 2 fire escapes, 1 front, 1 rear; 54 rooms on three floors. Beds, 25 cents to \$1.00 each per night; 24 inside rooms, dark, insufficiently ventilated. Air can not be changed in these rooms, as the only way of admitting air is through a transom over the door. The hall skylight can not be raised. Does not ventilate halls, therefore, no fresh air can enter rooms. One of these inside rooms, 13 feet by 14 feet by 14 feet is occupied by three men. Adequate cubic air space, but no air; 4 toilets, 2 baths, 1 sink; 2 stairways. Most lodgers are transient; both sexes. Colored, Japanese and Hindus, not admitted.

STOCKTON.

May 21, 1912. Two story brick building; age, 50 years, rent, \$100.00 per month. Number of rooms, 75, dormitories, 1. Beds, 25 cents to 75 cents each per night. Inside rooms, 60. Ventilation fair; transoms and skylights all open. Stairs, 2. Plumbing fixtures—2 toilets, 2 sinks, 1 urinal. *No baths*. Nationalities—all except

Japanese, Chinese, Hindus and negroes. No sick people admitted. Occupations, field workers. Lighting done with oil lanterns. First floor being cleaned and white-washed. Bedding and furniture show lots of vermin.

SAN FRANCISCO.

March 24, 1912. Building of temporary shack construction. Conditions so bad that building should be destroyed. Seventy-five men sleep in basement, which can not be properly ventilated. Windows only on one side of building. Beds filthy; 1 toilet; 2 bath tubs which can not be used.

Apart from this investigation of Mrs. von Wagner's, the committee has confined its attention largely to San Francisco as this is the only city that has a well defined congested district and a tenement house problem for its poorer people, and has collected only general information in regard to one or two of the other large cities. Before turning to consider the results of the San Francisco investigation, the following brief statements are given in regard to Los Angeles and Oakland:

LOS ANGELES.

The following information in regard to Los Angeles was obtained from the executive secretary of the housing commission and the health administration.

Since January, 1912, about 250 tenements have been built in Los Angeles. Almost all of these are apartment houses built for fairly well to do people where rents are high. A few tenements have been built for poorer families and these have been closely inspected by the building department. The board of health has appointed one inspector to inspect existing tenement houses and two inspectors for lodging houses. This force is considered inadequate. The inspection of house courts, where most of the foreign poor live, is in charge of a housing commission, with aid inspectors. Los Angeles has a housing ordinance which is more stringent than the state tenement house law and which both the health department and the housing commission believe to be strictly enforced.

OAKLAND.

In Oakland, like Los Angeles, the tenements are practically all apartment houses for the well to do. The tenement house law is believed to be well enforced. The health department has not undertaken to carry out any of the provisions of houses. A rapid survey of housing conditions indicates that, as yet, Oakland has no serious housing problem, and that only in flats built in the business districts over stores, is there any tendency to build over too large a percentage of the lots. Lodging houses, both for single men and transients, need careful supervision.

SAN FRANCISCO.

Before the fire, Telegraph Hill, which is now the congested area, was a district of small houses, much of the land being owned by comparatively poor people. Had it not been for the fire, the small owners of property would never have had the money to build tenement houses. As the district became more congested, therefore, and multiple dwellings were required to house the population, the small owners would have been forced to sell and more substantial houses would have been built on larger lot areas. This change would have taken place gradually and had the first houses occupied the entire lot space, they would probably have attracted considerable attention and a law would have been passed to prevent further houses of the same sort being built. The fire, how-

ever, not only destroyed all the small homes in this district, but the insurance money paid the small owners of land made it possible for them to rebuild on their own lots, while the urgent demand for housing room tempted them to make the most of every inch of space. Immediately following the fire, every one was too concerned with his own affairs to think about the matter of safeguarding the public, and in the great need for the building of houses there was little desire to make any restrictions that might limit their number. Under these conditions, the owners of property on Telegraph Hill built as they pleased and with absolutely no restrictions. In many cases, the owners built their own houses without employing the services of an architect, so that the district is filled with crudely designed shacks that occupy the whole 100 per cent of the lot.

The first tenement house ordinance was passed in San Francisco through the urgent effort of the Telegraph Hill Neighborhood Association in June, 1907, but, unfortunately, before the passage of this law, the Telegraph Hill district had already been largely built up with shack tenement houses, many of which were absolutely unfit for human habitation, as they had dark, unventilated rooms, opening on to inner courts not more than four to six feet in area. In order to determine what proportion of the houses in the more congested district were built before the ordinance of 1907, and what proportion after that date, the dates of building permits were looked up in the case of 179 tenement houses in this district. Of this number, 158 had been built before the ordinance of 1907 and only 21 since that date. This shows conclusively that so far as the Telegraph Hill district is concerned, the problem which San Francisco must face is how to alter or to get rid of existing tenements that were not in violation of law when they were built, because there was no law in force, but are absolutely unfit for human habitation. As this is the Latin quarter of the city, Spaniards and Porta Ricans coming from the Hawaiian Islands will prefer to settle here, no matter what the living conditions are, because they will be among their own people and will be able to buy from markets that cater to their taste. As long as the owners are permitted to make an undue profit by renting dark, unventilated rooms, and by using 100 per cent of their lot, there will be no inducement to them to sell to others who could afford to build proper houses, covering larger areas.

The housing association of San Francisco has made a house to house investigation in this district and a most careful study of four blocks. A plan of one of these blocks is given in the appendix of this report, in order to show how great the congestion has become.

The San Francisco center of the California Civic League appointed a housing committee in order to assist in this investigation, and, in co-operation with the housing association of San Francisco, a reinvestigation was made of housing conditions in certain blocks of the Telegraph Hill district. This investigation, in addition to showing the need of forcing alterations in existing tenements, shows very conclusively the immediate need of inspection by the health department in order to enforce sanitary conditions. The following extract from this report will show how great this need is:

No. 402 Green street. The lighting and ventilation of this place are a disgrace. At 11.15 a. m. the rooms were pitch dark in the rear apartment. One 8 foot by 6

foot bedroom had a 2 foot by 5 foot window, which opened on to a triangular court 2 feet by 2 feet by 2 feet. The court was formed by the walls of the adjoining houses and was in no way ventilated. An air intake from the outer air might ventilate the court, and thus ventilate the rooms, but there is no possible way of lighting them.

Most serious are the violation of the plumbing laws and sections 63 and 45, requiring owners of tenements to keep them in repair and free from accumulations of dirt and garbage.

Nos. 152, 154, 156, and 158 Varennes street. Here are four flats of five rooms each. The rear is in a very filthy condition, garbage cans overflowing, piles of dirty rags everywhere, especially in the lower north end flat, where every room needed fumigation, etc. One of the dirtiest, filthiest places in the block and no necessity for it. Landlord should be forced to clean, paint and whitewash. Toilets in very bad condition.

In order to obtain a general idea of housing conditions in certain thickly populated districts other than Telegraph Hill, a list of vacant tenements and flats, renting below \$20.00 a month, was obtained from various real estate agents, and a group of students from the University of California undertook to visit and report upon them. One table that was prepared in the course of this investigation is of special interest and is given in another part of this report. It shows an investigation made in the Mission district, between Fifteenth and Twenty-fourth streets and Florida and Sanchez streets, and relates to 78 separate apartments contained in 27 separate houses, all of which are tenements under the law of 1911. Most of them, however, are "Romeo" flats and were not considered tenement houses under the law of 1909, although the stairs leading to the separate apartments are in all cases closed in. Of these 78 apartments, 46, or 60 per cent of the total, were in buildings which occupied at least 85 per cent of the lot, while 32 occupied as much as 90 per cent of the lot. This, in spite of the fact that the building house law of 1909 provides that no dwelling house occupied by three or more families shall occupy more than 80 per cent of the lot, so that all of these houses that were built before 1909 violate the building house law, even if they are not to be considered as tenements. Many of these houses consist of six four-room apartments, the front room, in every case, being light and well ventilated. In the lower apartments, however, the dining-room and bedroom are comparatively dark, as they open upon long, narrow courts, while the kitchen is also a dark room because of the overhanging porch of the upper flat, which takes up the space which should have been reserved for a yard. The use of enclosed porches to fill up yard spaces is common in San Francisco and is accountable for a great many of the dark and ill ventilated rooms and apartments.

As no effort at selection was made, the houses investigated may be taken fairly typical of the flats and tenements renting for less than \$20.00 in the Mission district. The dates when building permits were issued for these houses is not known and therefore we can not say whether they were built in violation of the building law of 1909, which provides that no dwelling house occupied by three or more families shall occupy more than 80 per cent of the lot.

A similar investigation of 46 two-story flats in the same district in the Mission shows that 34 per cent of them are in buildings which occupy more than 85 per cent of the lot, while 12 of the 46 are in buildings which have no yard at all. This certainly suggests the advisability of a law which shall limit the percentage of the lot which can be occupied by two as well as by three family dwellings.

The investigations in the Telegraph Hill and the Mission districts both show conclusively that San Francisco has many tenement houses that occupy altogether too great a proportion of the lot and that provide only dark and unsanitary rooms for their tenants. These tenements were all built before the tenement house law of 1911. Those on Telegraph Hill were most of them built before July, 1907, and therefore before the passage of any law regulating housing conditions. Many of those that were built in the Mission are "Romeo" flats and were not considered tenements under the tenement house ordinance of 1907 or the tenement house law of 1909, and if they were built before the passage of the building law in December, 1909, they were not considered to violate any building laws.

From these investigations it is evident that San Francisco has many tenement houses that are unfit to be lived in, but that did not violate the law when they were built. Housing conditions in these districts can not be improved unless these houses are altered or torn down. San Francisco, then, if it would improve the conditions in these districts, needs to have the authority to force alterations and to condemn houses that are not fit for habitation. Your committee has therefore attempted to find out just what authority is given under the existing tenement house laws and ordinances. The tenement house law of 1911 repeals, in its title, the tenement house law of 1909, but does not repeal the tenement house ordinance of 1907 in any case where the provisions of the latter are more stringent than the provisions of the law of 1911, in regard to tenements built before that date. Unfortunately, however, the only penalty attached to the violation of the ordinance of 1907, or the building house law of 1909, is a fine and imprisonment for misdemeanor. There is no provision in either act to permit houses built in violation of these laws to be vacated. The tenement house law of 1911 makes a sharp distinction between existing tenements and tenements which shall be built thereafter. In the case of existing tenements, it gives no authority to require alterations in structure except in section 77. This section is here quoted to show how absolutely unsatisfactory it is:

No room in a tenement house erected prior to the passage of this act shall be occupied for living purposes unless it shall have a window opening directly upon a street or upon a yard not less than ten feet deep or above the roof of an adjoining building or upon a court not less than twenty square feet in area * * *. Any room which does not comply with the above provisions, shall be provided with a small window. * * *.

This section permits a series of dark rooms, provided that they are finally connected with a light room. Under the law, the worst possible evils would be permitted in the absence of stricter local ordinances.

From these considerations, it is evident that under the law of 1911, and its own local ordinances, San Francisco is without clearly defined power to condemn or to compel alterations in tenement houses built before 1911. The board of health may have authority to do these things under its general health powers, but to rely on these is probably to take the risk of endless litigation. Therefore your committee believes that it is of immediate necessity to amend the tenement house law in such a way as to give local boards of health clear and definite authority to condemn existing tenements that are unfit for habitation and to compel alterations and repairs in such buildings.

In the conclusion of this report, certain amendments to the tenement house law have been suggested. These have been approved by the Housing Association of San Francisco and will be embodied in a law by this association, to be presented at the coming legislature.

CONCLUSIONS.

In conclusion, your committee respectfully makes the following recommendations:

1. That the immigration commission, which is planning to submit a bill to the coming legislature for the appointment of a permanent immigration commission, be urged to ask that this commission be made a commission of immigration and housing, and given authority to supervise the enforcement, by local authorities, of the tenement house and building laws. Such a commission would do much to influence public opinion. Through its efforts, civic organizations in each city could be interested in housing conditions and a public sentiment created which would prevent the development of congested districts. Through these civic organizations, ordinances suited to the needs of the smaller cities and towns of the state could be passed.

2. The passing of a law with a provision similar to the Minneapolis lodging house ordinance, providing for the regular inspection by boards of health of all lodging houses in incorporated cities and towns. Local ordinances may provide, as they do in San Francisco, for the licensing of lodging houses and the payment by them of a regular fee. If this is done, funds will be provided to meet the entire cost of inspection, so that no additional burden will fall upon the general taxpayers through the enactment of this law.

3. That the tenement house law of 1911 be amended so as to give the boards of health more definite powers in forcing the alteration and condemnation of tenement houses that were built prior to the law of 1911. In this connection it is suggested that section 77 be stricken out and that there shall be substituted the following:

No room in a tenement house erected prior to the passage of this act shall hereafter be occupied for living purposes unless it shall have a window opening directly upon a street, or upon a yard not less than ten feet deep, or upon an inner court not less than six feet wide or one hundred square feet in area, or an outer or lot line court not less than four feet in width, for any building of four stories or under, and not less than six feet for any building over four stories.

4. That provisions be added to the tenement house law in line with the following provisions of the Massachusetts law, definitely defining its power to condemn unfit buildings and to compel the alteration or the destruction of unsanitary and ill ventilated buildings:

Whenever, in the opinion of the board of health, any tenement house or part thereof, constructed before the passage of the tenement house law of 1911, is in its present state, unfit for human habitation on account of age, infection with contagious disease, or defects in drainage, plumbing or ventilation, or because it makes other buildings in said vicinity unfit for human habitation, and whenever such tenement house can be made fit for human habitation by certain alterations and repairs, then the board of health shall have the power to order such repairs and alterations to be made, and to order the tenement house, or part thereof, to be vacated, in case such repairs and alterations are not made within a certain length of time.

Whenever, in the opinion of the board of health, any tenement house or part thereof, constructed before the passage of the tenement house law of 1911, is, in its present state, unfit for human habitation on account of age, infection with contagious disease, or defects in drainage, plumbing or ventilation, or because it makes other buildings in said vicinity unfit for human habitation or dangerous or injurious to health, or because it prevents proper measures from being carried into effect for

remedying any nuisance injurious to health or other sanitary evils in respect of such other buildings, so unfit for human habitation that the evils in or caused by said building can not be remedied by repairs or alterations, or in any other way except by the destruction of said tenement house or of any portion of the same, said board of health may order the same or any part thereof to be removed; and if said tenement house is not removed in accordance with said order, said board of health shall remove the same at the expense of the city in which the tenement house is located.

The city in which the tenement house is located shall pay the damages sustained by the owner of the tenement house by the destruction of the same or part thereof, as determined on agreement between said board of health and said owner, and if they can not agree the same shall be determined by a jury of the superior court for the county, on petition of said owner or board within one _____ after said destruction, in the same manner as damages are determined for the taking of land in laying out streets and highways.

HOUSING CONDITIONS IN CALIFORNIA CITIES.

SACRAMENTO.

Sacramento, like many other cities of California, has a large single man problem, transients which come and go. Seasonal workers who work intermittently and spend their earnings and idle time in cities. The lack of home life and ties and the deplorable condition of lodging houses, make the saloon and other vicious places of amusement very attractive and most of the earnings are spent in these resorts. The least of it is spent on lodgings, food and laundry. The unskilled, seasonal laborer prefers a 10 cent bed, ignorant of the danger to his health through infection.

When we consider that there are between 200 and 300 lodging houses, having between 50 and 300 beds each, all cheap and overcrowded during the winter season, we realize the importance of dealing with this neglected phase of housing.

The facts of the investigation prove that cheap lodging houses are needed and that the investment pays, even when conducted on sanitary and moral lines. Religious institutions which solicit contributions from the public should not be exempt from supervision, but compelled to maintain the same standard of cleanliness required of private lodging houses.

Second hand furniture, which is one of the many evils in our large cities, unless strictly supervised by the board of health, compelling fumigation and cleaning before selling, will always be bought by the keepers of these cheap lodging houses.

The man who carries his blanket wherever he goes is very often obliged to leave it to pay for his night's lodging. In one cheap house most of the blankets on the beds were secured in this manner.

Another serious condition is that in all but one place inspected, Negroes, Japanese, Chinese and Hindus are not admitted. What becomes of these? We find them living under the most unfavorable conditions because they have to colonize and take buildings which no one else will occupy. Hindus are even barred from these and must rent cellars. It does seem that if allowed to live in this country, we should treat them as we would wish to be treated if we decided to live in their country.

We know from experience that the housing conditions among many foreign nationalities is not what it ought to be and much work needs to be done to teach and enforce a high standard of living.

Another factor which undermines the health of the people is the cheap restaurant, always found near the cheap lodging house. As rents are high and meals very cheap, the quality, keeping and handling of food is of the worst kind and necessarily injurious. When speaking to the owners of these eating places about the lack of cleanliness and the tainted food, I was told that because of high rent and the competition of the free lunch in saloons, it was impossible to pay for better service. Only when serving 400 and 500 meals a day is the investment profitable.

As saloons are light, clean, and in winter, warm places, the men prefer to stay there and enjoy the social life until closing time, instead of going to the airless, dark, filthy cells or basement beds which are offered to them for 10 or 15 cents. "We would stay all night if it were not for the cop" was the statement of many men.

Night inspections made of these cheap lodging houses showed all beds taken and all late comers accommodated somewhere, in halls, on floors, etc. No one is turned away and overcrowding during this time of the year is seen almost everywhere.

Employees in cheap lodging houses and restaurants are mostly disabled and sick, willing to work for almost nothing beside their room and board, so as not to be sent to charitable institutions.

Sacramento County Hospital.

May 9, 1912. Found 25 male patients in tuberculosis ward. Interviewed all of them.

Marital condition:	
Single	24
Widower	1
Nationalities:	
American and Irish-American	17
German	3
Chinese	3
Austrian	1
Unknown	1
Total	25
Occupations:	
Cooks	4
Laundry workers	2
Teamster	1
Railroad men	4
Miner	1
Bookkeeper	1
Carpenter	1
Laborers	11
Total	25

Last place of residence in Sacramento of all except Chinese and German as follows:

Arcade Lodging House	3
Denver Lodging House	3
Haney Lodging House	6
International Lodging House	1
St. George Hotel	3
Salvation Army	1
City mission	3
Heavy drinkers	20

Following are some of the remarks made to me by tuberculosis patients at county hospital:

"I was born a Catholic, but do not believe in religion any more. Religion is a thing to be put in a closet with Sunday clothes."

"Life is all a graft."

"Lady, can't you do something to help us? Get rid of the religious lodging houses and the charities. Let the city help us."

"I suppose I am getting all I deserve, spent all my money foolishly, drinking a lot. But may be I could not help it, inherited it."

"If I could only get one more chance, I would go out and work and do what is right."

"Lady, do not lay it all to the liquor. We had to take it to keep up. Hard work and long hours and taking our pleasures quick, did it." It was a very young man, almost a boy, that said this—hopeless, waiting for the end, his friends far away, no one to help him over his last hour.

"I was born in San Francisco. Did odd jobs, then became sailor and long-shoreman. Went East, spent all I earned in drink. Worked my way back West. Started in Buffalo, Chicago and Wyoming. Came to Sacramento. Lived at Haney's as long as I could pay, then worked in the Salvation Army and the Mission woodyard at 10 cents per hour. There never were any worse places than religious ones. Why do the cities allow it? Why don't they have city lodging houses? Why didn't anybody know this here trouble, tuberculosis, we all got, before? It is only a year ago I heard about it. I have known consumption all my life, but this here is something new."

All of those people had a mortal fear of the county hospital and stayed at the cheaper lodging houses until they were driven out.

OROVILLE.

Oroville has, as yet, no tenements, but because of its large floating population, mostly seasonal laborers, who come in town during the slack seasons, it has many rooming and lodging houses which need better regulations and supervision to maintain cleanliness and prevent overcrowding.

According to police records, crime and drunkenness has considerably decreased during the past years, credit for which belongs to the efficiency of this department.

CHICO.

Town has neither building laws nor building inspector. Only a few apartment houses, but none built within the last two years. Inspected the new hotel built lately and found it sanitary in every respect. A large number of rooming and lodging houses would be benefited by systematic inspection.

Visited with county health officer, district where the first outbreak of smallpox occurred. The first case of it was in a family which lived in a one room shack, in the most primitive manner. There was one bed for all members of the family, the father, a grown up daughter and four smaller children. A shallow well within 25 feet of sewage polluted ground. Family had lived there over a year, never taking the trouble to dig a vault. A piece of burlap about 3 feet in height screened from the view of the public, a patch of ground that was covered with human excrement deposited on surface, during the past year. The danger of flies and impure water through soil pollution is evident. The disease spread to other families in the neighborhood, both children and adults.

The family which caused this outbreak is a tramp family, going from state to state, traveling by wagon. Kind people in Idaho, their home state, tiring of supporting this family, started them off in this manner. Father and daughter plainly show signs of mental deficiency, smaller

children not so much, as yet. Wherever they go they will be a danger to the community.

MARYSVILLE.

Inhabitants of Marysville live mostly in their own homes. Those who live in rooming houses are only there because there are no cottages for rent. There is great need of laying out new tracts for homes for working people. The few old buildings which have been changed into apartments are unsafe for occupancy, cover all of lot and are not suitable for family domiciles.

Seepage from river is to be confined to one lake, keeping it fresh by pipe connection from river, and filling in all low places to prevent stagnant pools: in the meantime treating them with crude oil to prevent breeding mosquitoes.

The health officer, who also is city engineer, is to be commended for his untiring and active services in behalf of the health and cleanliness of the city.

STOCKTON.

Stockton is situated in the upper half of the San Joaquin Valley, east of San Joaquin River. Connected with the river by Stockton Channel. Generally level, slightly sloping towards the river. The North Street Canal is the north boundary. Running through the center of the city is the Miner Channel emptying into Stockton Channel. The south part of the city is traversed by Mormon Slough, formerly outlet of river.

The house boats on McLeod's Lake, called arks, about 40, are occupied by Irish and Spanish fishermen. Many criminals are found among them, but little sickness.

The Weber engine house, occupied by the fire department, is unfit for occupancy. It is a two story frame house, very old and unsanitary. It has wooden floors even in the horses' stalls and is overrun with rats. The yard is full of manure several feet deep. It is never removed.

A junk shop, fish store and second hand store, west of the engine house, throw garbage and rubbish in rear of their premises to save cost of removal. The people of the engine house who would like to be clean, and an adjoining creamery, which ought to be kept clean, suffer in consequence.

The city has no building laws or building inspector. The city clerk issues the permits but does not control construction. The new tenement house law was not known. Two temporary sanitary inspectors at \$50 each per month, one plumbing inspector and an underpaid health officer, are supposed to maintain and protect the public health and safety. Garbage and rubbish nuisances found everywhere because citizens have to pay for removal. The garbage incinerator being located at a great distance is responsible for the existence of many dumps, the contractor finding it cheaper to dispose of refuse here instead of hauling it to the proper place.

There are 300 rooming, lodging houses and hotels, which house a large transient population, mostly seasonal workers. Their habits and racial characteristics make close supervision by competent officials necessary, thereby preventing disease and vice.

BAKERSFIELD.

Arrived at Bakersfield Sunday night. Went out on street to see celebration of carnival. When I arrived on the scene heard several shots. A Mexican had been killed. Little attention was given to the matter. A few people gathered around the dead body, others kept on in pursuit of their pleasures, the band played, and when I asked some questions about the cause of the killing was told, "Never mind, it's only a Mexican."

At the same time in another part of the city, another man was killed. Such was the greeting of Bakersfield to the newcomer.

The carnival presented to the public all that is vulgar and shocking. Any cheap fake show to make money. One feels sorry for the children and young people who frequent, with or without their parents, such places.

Little painted girls who looked not more than twelve years old already soliciting. Many drunken people everywhere.

One can only wonder at the indifference of authorities and an enlightened public, to suffer such moral degradation. Again I asked myself, where are the mothers who ought to know and interfere?

The next day I went to see the different officials, city marshal, city clerk, city and county health officer and plumbing inspector.

The city of Bakersfield is suffering from a lack of proper health supervision. It needs both a building and sanitary inspector. The plumbing inspector can not possibly do all this work, his own office takes all his time, therefore, we find dirty streets and alleys, no restaurants or hotels fit to eat or live in, no enforcement of building or sanitary regulations.

The fact that one half of the causes of death are due to violence, would indicate insufficient police control.

MARICOPA.

The town of Maricopa is three years old. Was incorporated July, 1911. The inhabitants, while living in temporary shacks on leased ground, are permanent as long as the oil industry continues.

There is very little tramp element here, only skilled workers being needed and the cost of living too high. Wages paid per day from \$4 to \$8, these skilled workers, who live here with their families, form a community of unusually fine citizens.

The health of the people is good. Found neither tuberculosis nor typhoid fever.

Hotels and rooming houses are new and clean. All of frame construction. Have plenty of light and air. Restaurants clean.

No more dance halls, no cribs, thanks to the single-handed efforts of the minister, Mr. Watts. All that trade is carried on outside the city limits in the canyon. It is a sad fact that it remains there undisturbed.

The bad feature of Maricopa is the condition of the outhouses and back yard. Privies are open, not screened or disinfected. Manure and garbage thrown on ground. The danger to health would be greater if flies could live here during the summer season.

It seems strange that in this hot climate and with danger of fire through oil industry, houses are not constructed of material to protect against both. At present, all are frame buildings.

The health officer is much interested in public welfare work and would do much to improve conditions if his services were paid. At present he depends upon his private practice for an income.

SAN BERNARDINO.

There is no ordinance for compulsory report of tuberculosis, no fumigation of premises after death, or removal of patient.

No contagious disease hospital. No city physician, school physician, or city nurse for the poor.

The county hospital has only a one room cottage for tuberculosis patients. No provision is made for women and children afflicted with this disease.

Considering that San Bernardino is a railroad center and an industrial city, these facts prove a sad lack of civic spirit, unjustly neglecting public welfare work.

REDLANDS.

Better wages, educational and social work among Mexicans would help to better their conditions. Tuberculosis, death rate of infants and number of crimes would be reduced, especially those caused by drunkenness.

No work for social betterment is carried on among these ignorant people. When speaking to the nearest American neighbors about their condition, little interest was expressed. Prejudice and self-interest prevent any efforts in their behalf. Municipal supervision has not, as yet, been established, and these people have been left to work out their own salvation. Bishop Conaty of Los Angeles, of late, has sent a priest to work among them for their spiritual uplifting.

SAN DIEGO.

Building inspector is strictly enforcing new state tenement house law. When plans are rejected because they do not conform to the law, builders and property owners petition the common council for special privileges and permits are granted in defiance of the law. During my interview with the building inspector, plans were refused because of lack of fire escapes, the applicant saying, "Very well, I will get the council to pass them."

LOS ANGELES.

What has been said of the other cities applies equally to Los Angeles. Much good work has been done and much remains to be done.

Over 3,000 lodging houses would furnish a large field for useful activities. At present two inspectors have charge over these, who can not begin to cover one half in a year's time. Bakeries, delicatessen and grocery stores all have food exposed to flies and dirt.

The health department need a much larger force, as also the housing commission, for their respective sanitary and educational inspection.

The large foreign population lives in overcrowded tenements or house courts, ignorant of city laws and American customs. They need all the help toward right living that can be given. Their young people must be fortified against the lure of saloon, poolroom and dance hall. Their children must be kept at school and prevented from entering child labor industries.

The Austrians are the janitors of the city. Combined wages per month of husband and wife, \$70. Women clean 30 offices per day at $3\frac{1}{2}$ cents per office. Men clean 40 offices per day at $3\frac{1}{2}$ cents per office. Hours from 4.30 to 8.30 a. m. and from 5.30 to 9.30 p. m.

Dry sweeping, enforced by head janitor, to save carpets, etc., and bad living conditions must account for so much tuberculosis among Austrians.

In order to be near their work, they have to live in whatever habitation they can find. A four-room flat is often occupied by three families, using the kitchen in common. The women die young and children grow up sickly. They do not know that dust and overcrowding are responsible for ill health and are apt to blame the air here.

The Mexicans live mostly in house courts in a one or two-room shack, often sharing their habitation with friends and relatives. Tuberculosis is prevalent among them. Overcrowding, unsanitary living and the spread of disease from one member of the family to another, are responsible for so much sickness.

In one family where parents and five children occupied a one-room shack, all but two died of tuberculosis in quick succession, the mother developing the disease first. The father escaped because he worked on a ranch and came home but once a month. A sad fact is that most of our tuberculosis patients, still able to be up, work on the fruit ranches, in canneries and laundries instead of living in sanatoria, where their health might be restored and other people's health—saved.

Eternal vigilance on the part of health officials is the only safeguard for the nation.

SAN FRANCISCO.

In order to get a comprehensive idea of existing housing conditions in San Francisco, I made a general survey in the most congested districts during these first months of my stay, so as to be able to do the work in detail and intelligently, if time permits, as so many separate phases of laws of construction have to be considered. Inspections were made in the following districts: Telegraph Hill, North Beach, Nob Hill, the Mission and Potrero; also lodging houses south of Market street.

The Telegraph Hill district was the most densely populated part of the city. Blocks are almost covered with buildings, with little breathing space between houses, and houses occupied by large families. The following conditions I found typical in houses built soon after the fire.

Most of the lot area covered by building, with too small a percentage left free to allow sufficient light and ventilation for inside rooms. As these houses are mostly owned by working people it will be a hardship to change existing conditions. Some apartments have only one light room in front of the house; all other rooms are deprived of the sunshine and ventilation. A small light well ventilates both bedrooms and toilets, not even one tenth of the required size. Rooms in basement and on first floor are so dark that during the day artificial light is needed. If there is a projecting bay window on back porch, basement rooms underneath are in complete darkness, even with a ten foot yard in rear. If one tenement house covers all of the lot, having windows on lot line, the owner of the adjoining tenement house, having left the

lot line court, will put up a board fence to cover up these windows because the neighbor steals his light.

Sometimes a court 10 feet by 10 feet is surrounded by four tenement houses, three or four stories in height. The sun can never reach the lower apartments, neither can there be a current of air. Therefore, we find darkness and dampness, all inducing tuberculosis.

Another bad phase of construction is when bay windows are projected into lot line courts, both front and rear. If this happens on two adjoining lots the projecting walls touch, and the tenants, in order to have privacy, keep windows closed and shades down, thus depriving themselves of needed ventilation.

The children's playground under these conditions is the street, and the mothers' recreation the front windows. The absence of yards is a hardship to tenants, as there is no possibility of clothes lines, thus making it necessary to carry all laundry to the roof. All garbage and rubbish has to be kept on the back stairs, close to windows. The only way of cleaning clothes, carpets, bedding, etc., is by way of windows or back stairs, thus distributing all dust and dirt to the neighbors surrounding. A careless housekeeper will, therefore, allow the dust and dirt to accumulate in her home year after year.

In the Mission district, where former comfortable residences have been turned into rooming houses, conditions are just as bad as in these dark tenement houses. Thin partitions have divided large rooms into several small ones, without making provision for necessary light and ventilation. Sometimes the transom over the door leading into the hallway will be the only avenue for ventilation and light. On the upper floors, where some of the rooms have skylights, there is light, but no way of opening those skylights to give ventilation.

Houses are often furnished from the second-hand stores, are badly kept, and plumbing old and defective, for the reason that rents are so high and returns in the way of rents too small to permit the landlord to maintain the premises in a sanitary condition.

These furnished rooms are, to a great extent, occupied by families, with or without children, of a shiftless nature, who crowd into one room, in some instances the parents and three children sharing one bed, with one of the parents suffering from tuberculosis.

A great many houses in all districts of the city are built without chimneys. Apartments are only heated with gas, which causes the plastering in these houses to become damp, as the moisture from gas heat condenses on walls and woodwork, being both detrimental to health and home furnishings.

A great many new buildings on Nob Hill I visited with the building inspector and alone. In the essential parts of construction they comply with the new tenement house law, except that in many instances the air intakes do not measure ten feet square. In some instances boilers have been placed too close to the walls and the walls have not been protected against danger from fire.

In most of the new apartment houses servants' rooms have been placed in the basements, in a great many of which the windows are not of sufficient size. In this respect the present state law should be amended to prohibit basement inhabitation.

An interesting fact is noticed on Nob Hill, as well as in other districts of the city. Houses which were built immediately after the fire, at the present time are being rented at almost half the former rentals in order to keep tenants. In some instances owners of large apartment houses are losing up to \$200 a month on their investment, for the reason that the tenants prefer to move into houses built under the new law, to secure more light and air. In houses erected under the old law the lower floors are mostly vacant, prospective tenants calling at the rate of ten and twelve a day (according to the janitor's statement) but refusing to take them. Houses built two or three years ago have more light but no sunshine for the bedrooms, while as yet having a better class of tenants, still have to reduce rents to induce their tenants to remain and keep them from moving into the newer and more up-to-date houses.

The owners of new buildings tell me they have no difficulty in renting their flats. Even before being finished they are often rented.

As the ratio of the workingman's income is out of all proportion to the rental he must pay, he is compelled to sublet most of his rooms. Among many Italian, Slavonian and Mexican families, as well as American, all rooms, except kitchens, are bedrooms, occupied by boarders. This condition is deadly to family life, health and morals.

Houses built in the potrero section soon after the fire are even here too close and cover too much of the lot. Many buildings are of the shack type and some built of second-hand lumber. Many basements are used for living purposes. But neither Russians nor Italians live as crowded here as do people on Telegraph Hill. The smaller houses have gardens and are owned by people living there. Many streets have no sewers, which cause a very unsanitary condition in the rear of houses. All waste water is discharged over the ground, stagnating in filthy pools. Privy vaults are offensive because neither cleaned nor kept clean. People living there do not know the danger of such conditions or how to prevent the same. Therefore, educational inspection is needed to protect the people until the city provides the streets with sewers. The Italians and Mexicans living here keep animals too close to living rooms and sometimes in cellars, such as chickens, goats, cows and horses. Several dogs to each family are usually kept under the beds. Regular inspection will prevent such conditions.

I found little tuberculosis among Russians and Italians, but much skin disease among children, especially where women do not realize the importance of cleanliness.

The North Beach district, Beach street and North Point street, probably show the worst sanitary conditions in the city. Houses were built after the fire and are of shack construction, with no sewer in the streets. All water and garbage lies on ground in rear of houses and overflows on adjoining lots. Privy vaults are overflowing. In some places a raised board walk had to be laid over the ground in order to enter the houses, as sewerage had stagnated in deep pools. The owners of this property have sixty to ninety days' notice to vacate, as land is to be used as Exposition park. But the houses should be vacated immediately as conditions are dangerous to health.

Rooming and lodging houses south of Market street present a serious problem. The cheaper class with ten to twenty-five cent beds, are not

only breeding places for various diseases, but also centers of infection, especially tuberculosis. We know from past history that plague, cholera and smallpox originated in cheap lodging houses. Therefore, they should be eliminated. They are all unfit for human habitation. Structurally they are fire traps, with insufficient light and ventilation. I find either dormitories, or floor space divided into little cells, 5 feet by 6 feet, with twice as many beds as the law allows. No current of air is possible inside those cells, neither a ray of light. But plenty of vermin. The doors to roofs, or the exits to fire escapes on first floors are usually kept locked, in direct violation of the law.

No baths and insufficient toilets; one towel for all; one drinking cup and one wash basin. The inmates of these places are human wrecks, old and young, diseased or habitual drunkards; others who have failed in the struggle for existence, and those who from the beginning were never able mentally or physically to compete with their fellow men, their condition making it all the more urgent that they be compelled to live in a more sanitary environment.

An ordinance regulating construction and maintenance of hotels and lodging houses is essential to the progress and welfare of any city. Minneapolis, perhaps, presents the best example of an ordinance of this kind.

All these conditions go to prove that strict supervision and house to house inspection must be maintained by inspectors of the Board of Health, which, of course, necessitates a larger force than at present.

Men and women are needed for this work with sufficient training and experience to enable them to work intelligently and promote the health and welfare of the community. Men can do the mechanical part of the work, such as passing on building plans and following up the construction of buildings. Women must do the educational inspection among our large foreign population; teach and enforce cleanliness and other laws of health, and so help to prevent disease and bad living conditions, to save this city from slums and their evil results. While others in authority, and an awakened public, will work for the realization of better living conditions in the cities of the future which will know no tenement, but have their people live in homes where children are welcome and well cared for, so that the best human development may be possible, sickness prevented and poverty abolished.

GENERAL CONCLUSIONS.

This, my report, which might be called a chapter of dirt, seen and felt in every community, doing its deadly work by day and by night, among rich and poor, is sent on its mission to plead for prevention of disease and its sequels, poverty and vice, through the enforcement of the first and greatest sanitary law, "removal of all dirt."

If this were done, the second great law, "isolation of all preventable diseases," would become before long a dead letter.

First in the list of preventable diseases is *tuberculosis*, the cause of which we must seek in that great enemy of mankind, *dirt*. Whether it is found in foul air, through overcrowding, lack of ventilation or dampness through faulty construction of habitations, or dirt in food articles, especially milk and meat, in factories or from sweepings of streets and homes, search as we may, calling it by whatever scientific

name we choose, dirt seems to be the primary factor in causing this great and terrible plague.

Without present day scientific knowledge and practical experience, it seems criminal that any nation allows conditions to exist that are not only conducive to this disease, but actually causes them to become centers of infection.

Until we hear the curses of the sick and dying that were stricken before their time, pleading "For God's sake, lady, do something," not for their sake, they knew their end was near, but to save others from a like fate, do we realize the sin of neglect. They did not know the dangers of bad living as concerns personal habits, housing, food, health undermining trades; no one had taught them and the price for ignorance and sin was paid with their lives. The end was terrible to witness. I promised to do all I could to bring the facts to those in high places who have the power to legislate against dirt and stamp out the largest and deadliest plague ever known, *tuberculosis*.

My experiences in every town and city bring out the following facts, first, that the health of the public is dependent upon just sanitary laws and their honest enforcement, and second, upon the education of the general public in matters pertaining to sanitary legislation, to secure intelligent cooperation.

Next in importance would be trained officials to carry out this important branch of public service, to supplant the old system of providing jobs for political purposes, or worse yet to provide work for those incompetent to earn a living because they need an income.

Men and women should be chosen with an education that would make them true teachers of the masses, whose motive for public service would be the public good.

The obedience to the two great laws of sanitation, namely, the removal of all dirt and isolation of all diseases, would bring about a new era.

People living a normal life, that is, a healthy life, dying from old age, and with preventable diseases such as tuberculosis and all other contagious diseases, washed away with sanitary science practically applied in our city housekeeping, is the end for which this work is undertaken.

Why are present laws so little enforced? When one hears statements like these made by public officials in public speeches, "We cannot enforce our ordinances, our private practice would be ruined," or "we would lose every friend in town, others must do it," we realize that the system is wrong.

Not only did many private citizens thank me for coming, but public officials interested in public health were glad for the visit and wished it might be prolonged. Hotel and rooming-house keepers, in many instances, told me when leaving, "Go and thank the state for sending an inspector; we wish they might do it oftener."

As the time was short and the field unlimited, only a hasty investigation here and there could be made. Not all information desired could be obtained, nor could all information obtained be recorded. Not alone because this report would be too voluminous, but because some of the conditions prevailing are not to be described.

What has been said has lifted the veil enough from apparently fair

exteriors to reveal hitherto unknown depths of filth and disease, which it would be criminal to allow to continue. It needs a strong hand to expose to the light and air of public opinion the full situation, to be dealt with firmly and justly and so make impossible a remark made by a decent, quiet young working man, living in one of the rooming houses described, which voiced the sentiment of thousands of others similarly situated. "G—d d——n California! my wife and I came here hearing so much of the climate, thinking our health would improve. We have been cooped up in a stuffy room ever since we came, paying as high as \$16 a month to get *some* outside air to breathe. When we want to talk privately we have to go on the street. Every word is heard by others in rooms on either side. The smells from all the different cooking stays in the house and rooms, gets into our clothing, makes us sick. We can not live outside of the city. We both have to be near our work. Time and money counts."

It was a miserable existence they were leading. At night, tired out from work, unable to sleep because of some drunken spree in the next room, pianos and various musical instruments in others, or the disputes of the landlady addicted to opium, late street car service and other inevitable street noises, they found rest impossible. My suggestion to change was inopportune. They walked many Sundays to find a better place. Houses seen were either too dirty, too expensive, or too far away. So stay they must.

Thousands who want to live right suffer like this.

The congestion of population in our cities, the herding of families in barracks, the basement and cellar habitations, workshops and bakeries, the cheap eating places, the dance halls and brothels, the street vendors of ice cream, candy and tamales, mostly afflicted with incurable diseases, keeping and making their wares in dirty hovels, are all deteriorating factors in our Nation's health and should be speedily studied and remedied.

Privacy and cleanliness in homes, decent amusements in healthy places, sanitary workshops, more attention paid to proper ventilation and maintenance of all public buildings; public baths and comfort stations for the needy, making personal hygiene possible to those who can not afford to pay the price, are the necessary means the law makers must consider and wisely provide, to realize the godliness which is the lost chord even in the twentieth century of a Christian civilization.

Who knows but it may be found only in overcoming the conditions which constitute this chapter on dirt, through the one remedy—cleanliness, *public, domestic and personal*, to bring about the vision of the apostle, the healthy, that is, the holy city.

This report is submitted with thanks for the privilege of proving the great need for such investigation.

NOTE.

The general recommendations of the Commission were first printed in December of 1912, in a preliminary abstract of the final report. Since these recommendations are substantially the same, the original abstract is attached to this report and may be regarded as the final word of the Commission with regard to suggestions for the control of tuberculosis in California. It follows herewith.

Sixth Biennial Report

OF THE

California

State Commissioner of Horticulture

TO THE

Legislature of California

1913-1914

CALIFORNIA
STATE PRINTING OFFICE
1914

LETTER OF TRANSMITTAL.

To the Honorable Members of the Senate and Assembly of the Legislature of California.

GENTLEMEN :

Pursuant to the requirements of section 2319 of the Political Code of the State of California, under "An Act Relating to the State Commissioner of Horticulture," approved April 25, 1911, I herewith submit for your consideration a financial statement covering the sixty-fourth and sixty-fifth fiscal years, a report of the horticultural condition of the state, of the service and status of the county horticultural commissioners for the past two years and the work of the several divisions of this Commission, together with a brief statement of the needs and requirements for the sixty-seventh and sixty-eighth fiscal years, with recommendations.

A. J. COOK,
State Commissioner of Horticulture.

E. J. VOSLER,
Secretary, State Commission of Horticulture.

SIXTH BIENNIAL REPORT OF THE STATE COMMISSIONER OF HORTICULTURE.

STATEMENT OF EXPENDITURES.

Sixty-fourth Fiscal Year.

Main Office.

Commissioner, deputy commissioner, secretary, clerk, stenographer and janitor.

Salary	\$1,494 08	
Supplies and equipment.....	1,630 43	
Traveling	1,664 14	
		\$4,788 65

Insectary Division.

Superintendent, assistant superintendent, field deputy, stenographer and janitor.

Salary	\$1,480 00	
Supplies and equipment.....	881 46	
Traveling	707 15	
Extra help	62 50	
		\$3,131 11

Quarantine Division.

Chief deputy quarantine officer, deputy quarantine officer, 7 inspectors and clerk.

Salary	\$10,339 17	
Supplies and equipment.....	451 12	
Traveling	1,197 26	
Office rent	360 00	
Reporting vessels	162 05	
Extra help	27 75	
		\$12,537 35

Pathological Division.

Plant pathologist.

Salary	\$2,425 00	
Supplies and equipment.....	255 28	
Traveling	334 18	
Extra help	124 93	
		\$3,139 39

General Expenses.

Telephone and telegraph.....		\$475 28
Express, freight and cartage.....		494 68
Revolving fund increased (amount raised from \$250 to \$500).....		250 00
Revolving fund (postage).....		1,471 00
Library (new books).....		189 36
Mediterranean fruit fly campaign (Hawaii).....		1,416 82
White fly campaign (Marysville).....		426 59
Painting State Insectary.....		105 00
Services state quarantine guardians.....		47 50
Oil burner equipment and boiler for State Insectary.....		479 75
Miscellaneous		277 95
Special trips:		
Portland, Nurserymen's Convention (commissioner).....		56 50
Utah, alfalfa weevil investigation (chief deputy).....		112 15
Spokane, Northwest Inspectors' Association (secretary).....		98 15
Washington, D. C., Mexican orange maggot investigation (commissioner)		200 30
Total expenditures		\$29,697 53
Amount appropriated for sixty-fourth fiscal year.....		\$27,500 00
Balance unexpended for sixty-third fiscal year.....		3,273 21
Amounts returned to appropriation:		
1912, January 23d, postage.....		56 53
April 15th, express.....		30 00
Amount on hand for sixty-fourth fiscal year.....		\$30,859 74
Expenditures for sixty-fourth fiscal year.....		29,697 53

Balance for sixty-fourth fiscal year..... \$1,162 21

Amounts returned to general fund from sixty-fourth fiscal year appropriation:

1912, October 8th, scrip book rebate.....	\$11 35
1913, June 25th, scrip book rebate.....	4 03
June 30th, postage refund.....	43 63
July 23d, revolving fund.....	500 00
October 21st, refund on claim.....	5 57
Balance sixty-fourth fiscal year.....	1,162 21

Total returned to general fund..... \$1,726 79

Sixty-fifth Fiscal Year.

Main Office.

Commissioner, deputy commissioner, secretary, assistant secretary, clerk, stenographer and janitor.

Salary	\$2,530 00
Supplies and equipment.....	1,018 66
Traveling	1,535 62
	<hr/>
	\$5,084 28

Insectary Division.

Superintendent, assistant superintendent, field deputy, stenographer and janitor.

(a) Sacramento office:

Salary	\$1,124 00
Supplies and equipment.....	684 28
Traveling	707 53
	<hr/>
	\$2,515 81

(b) Insect collecting, Mediterranean region, work commencing March, 1914, Mr. Henry L. Viereck in charge:

Salary	\$666 64
Traveling	417 76
Miscellaneous expenses	188 85
	<hr/>
	\$1,273 25

Quarantine Division.

Chief deputy quarantine officer, deputy quarantine officer, 8 inspectors and clerk.

Salary	\$10,800 00
Supplies and equipment.....	154 50
Traveling	1,040 86
Office rent	360 00
Reporting vessels	156 00
Extra service	19 00
	<hr/>
	\$12,530 36

Pathological Division.

Plant pathologist and assistant, work discontinued August 31, 1913.

Salary	\$500 00
Supplies and equipment.....	62 14
Traveling	126 89
	<hr/>
	\$689 03

General Expenses.

Telephone and telegraph	\$347 24
Express, freight and cartage.....	428 66
Library (new books).....	44 82
Revolving fund created.....	500 00
Revolving fund (postage).....	854 00
Services State Quarantine Guardian.....	200 05
Forty-fourth State Fruit Growers' Convention (Davis).....	22 71
Insect collections in Orient (superintendent insectary).....	1,008 99
Miscellaneous expenses	109 37

Total expenditures

\$25,608 57

OFFICERS OF THE CALIFORNIA STATE COMMISSION OF HORTICULTURE, DECEMBER, 1914.

EXECUTIVE OFFICE.

Capitol Building, Sacramento.

A. J. Cook.....	Commissioner
G. P. Weldon.....	Chief Deputy Commissioner
E. J. Vosler.....	Secretary
Miss Maude Hiatt.....	Clerk
Mrs. N. Mitchell.....	Stenographer
O. W. Newman.....	Office Assistant

INSECTARY DIVISION.

Capitol Park, Sacramento.

Harry S. Smith.....	Superintendent
Henry L. Viereck.....	Assistant Superintendent
E. J. Branigan.....	Field Deputy
Mrs. E. Stephens.....	Stenographer

QUARANTINE DIVISION.

San Francisco Office: Room 11, Ferry Building.

Frederick Maskew.....	Chief Deputy Quarantine Officer
George Compere.....	Chief Quarantine Inspector
B. B. Whitney.....	Quarantine Inspector
L. A. Whitney.....	Quarantine Inspector
Archie Chatterley.....	Quarantine Inspector
Stewart Chatterley.....	Quarantine Inspector
Miss Clare Dutton.....	Stenographer and Clerk

QUARANTINE DIVISION.

Los Angeles Office: Floor 9, Hall of Records.

A. S. Hoyt.....	Deputy Quarantine Officer
C. H. Vary.....	Quarantine Inspector
L. A. Strong.....	Quarantine Inspector

QUARANTINE DIVISION.

San Diego Office: Courthouse.

H. V. M. Hall.....	Quarantine Inspector
--------------------	----------------------

A succinct tabulated statement of the principal activities of the several divisions of the Commission:

MAIN OFFICE.

1. Publication of The Monthly Bulletin.
2. Crop reports and orchard statistics.
3. Work of chief deputy.
4. White fly campaign.
5. Alfalfa weevil inspection.
6. Correspondence.
7. Lectures.
8. Insect control.
9. State Fruit Growers' conventions.
10. Emergency convention—mealy bug.
11. Emergency convention—potato.
12. Melanose quarantine.
13. Special monographs.
14. Mails—parcel post.

HORTICULTURAL STATUS OF CALIFORNIA.

The year 1913 closed a period of prolonged drought, and as a result the grain and hay crops and also the fruit production in unirrigated areas were considerably below the average, but the high prices often more than made up for the deficient crops. Last year alfalfa sold for \$12 per ton, whereas this year it is difficult to secure \$7.

The frost in early January, 1913, was a serious blow to the citrus industry. Not only was much fruit destroyed, but also the trees were often greatly damaged or killed outright. In some sections where no destructive freeze had ever occurred before, heavy loss was sustained. Strange to say, these sections were often in the very southern limits of the state; indeed, the north suffered less by far than did the south. Many of the growers had provided equipment to fight the frost and thus saved both fruit and trees, and the high prices of fruit consequent upon the diminished supply secured to these provident fruit growers large returns for their output. The superior marketing system of the south and the high prices received for the fruit did much to compensate for the great loss caused by the freeze.

The lessons of the freeze are many and are not likely to be forgotten: *First*, "There are no frostless areas in California"; *second*, oil pots or other equipment are a *sine qua non* in California citrus culture; *third*, a good heating system with sufficient oil and help available upon call will certainly protect against the lowest temperature ever yet known in the citrus belt; *fourth*, the loss from severe cold is in inverse proportion to the amount wisely spent in securing heating apparatus, and lastly, the man who has the proper equipment to resist the frost damage may find the cold a very substantial friend.

The almonds also suffered severely by cold weather in spring. In some places one half or more of the crop was lost.

The ample rains of the winter 1913-1914 produced very large crops this present season. Except for prunes, I think this was generally true. Of course, low prices have resulted, although doubtless on the whole the past season may be considered a favorable one for the ranchers of the state.

By studying the orchard statistics in The Monthly Bulletin published by this Commission it will be seen that the annual plantings are enormous. This fact leads some of our people to wonder how we shall be able to market our greatly increased production in the distant future. The same wail was heard years ago when we marketed less than twenty thousand carloads of citrus fruit. The cry was raised: "We have reached the utmost possibilities of the market." We now ship more than double the amount sent from our orchards at that time, yet there were far more "red ink returns" then than now. With our improved methods, better knowledge and keener attention to marketing, the wide-

awake rancher need fear no bar to success. The worst possible result will be the elimination of the heedless, slip-shod farmer, which certainly would be no loss to the great fruit industry.

It is worthy of note that large citrus orchards are now being planted as far north as Tehama County, while avocados, rice, cotton and date production are claiming more and more attention and bid fair to be important in the future agriculture of the state.

More and more our farmers are acting on the belief that insect control must not be neglected; that to combat fungi with the best sprays and spray outfits is to court success; that deep, ample cultivation pays enormous profits; that wise and timely use of water pushes failure to the wall; that stable fertilizer and cover crops in large full measure insure a large full bank account, and that nitrogen—especially organic nitrogen—like dried blood and tankage, gives big orchard and field returns, although as yet the use of potash and the phosphates gives no certain proof of value.

COUNTY COMMISSIONERS OF HORTICULTURE.

Our state was first to organize fully to give advice and exercise the function of general quarantine and insect and fungus control. In 1911 the old law providing for a board consisting of three horticultural commissioners in each county gave way to the far better system of a single commissioner. The several commissioners, having served each four years, have for the most part qualified anew by taking a more rigid examination and have generally been reappointed. A few have been promoted and so are lost to the service. Perhaps some have been weeded out as unfit. I think politics has had little to do with any changes which have occurred. For the most part the services of these officials are appreciated, as they well may be. Many of the inspectors serving under the commissioners have taken the examination and have usually passed with a high rank. In one county all of the inspectors, five in number, qualified as eligibles for the commissionership.

These county horticultural commissioners are faithful, earnest, capable men; they have become skillful in the use of control measures, apt in quarantine and by hard study are exceptionally well prepared to advise. This education has been gained at the expense of the several counties, and added to the natural adaptation has become a valuable asset, not only to the counties, but also to the state as well. Thus we must felicitate the various counties on the fact that these men have been so generally reappointed.

It is to be regretted that every county producing fruit or dealing in fruit or plants and trees has not a county horticultural commissioner. The counties of San Francisco, Marin, San Mateo and San Luis Obispo are at present without county horticultural commissioners. This lack is a real menace to the counties themselves and a danger point which

threatens the safety of the entire state. San Francisco, because of its large shipments of fruit and nursery stock, is in special need of such an official. The present law provides that upon the reception of a petition from certain specified citizens the board of supervisors shall immediately call for an examination of candidates for the position of county horticultural commissioner. Those who pass this examination are eligible for the position. These are reported to the supervisors, who shall within thirty days appoint a county horticultural commissioner. The supervisors of San Francisco, San Mateo and San Luis Obispo counties have each and all received such a petition. San Francisco and San Luis Obispo counties have refused to act at all in the matter, while San Mateo asked for an examination, but made no appointment from the list of eligibles submitted. The attorney general informs me that it is neither my duty nor is it his to compel action. The nurserymen, fruit vendors and others interested, not wishing to excite the ill-will of the supervisors, hesitate to bring action, and the welfare and safety of each county in the state are placed in jeopardy. Could not the law be so changed that the attorney general shall be compelled to take action where the law is unheeded?

Six other counties, Plumas, Mono, Amador, Calaveras, Tuolumne and Mariposa, are without supervision. Each one of these is commencing to plant orchards, and there is good promise of success. Their limited size results in inaction, and so each county is a danger point in the state. Each one of these counties might be united with its nearest neighboring county, thus forming a district with a single commissioner for the two. Thus Mono could be combined with Inyo, Amador with Sacramento, Plumas with Lassen, Calaveras with San Joaquin, etc. There is every reason why this legislation should be hastened. Local and state safety pleads for it.

At present each commissioner is a county officer, appointed by the supervisors, so politics may be influential in the selection of this official, and besides the supervisors are not competent in many cases to select wisely. The state commissioner of horticulture should be the party to perform this service, which would remove both of the above objections. Then all appointments would be under civil service rules, and the commissioners would be state officials, paid by the state. There is much to recommend this, and as state expenses are not met by direct taxation there seems little objection to the change.

Again, each county board of supervisors can at the suggestion of the county horticultural commissioner pass an ordinance, which is in effect a law as binding as any law, in case it does not conflict with a state law. As we have forty-three county horticultural commissioners, we may have as many county ordinances regarding the shipment of a single plant or tree; indeed, there are several such laws affecting intercounty shipments

of grape vines. Such diverse laws are a serious handicap upon trade, and of course are not only embarrassing but a great hardship upon all of our nurserymen and upon the would-be orchardist as well. Uniform horticultural laws throughout the state are imperative to successful business. These changes in the law are greatly needed, but should not displace our present able corps of county horticultural commissioners.

THE MONTHLY BULLETIN.

One of the activities of the Commission is the publication of The Monthly Bulletin, edited by the secretary. If expressions of approval from very many of its readers are to be trusted, this publication fills a real want. It is only sent out upon personal application, yet its rapid increase in circulation is startling. The aim of the bulletin is to give information that is virile, fresh and severely practical. Nearly all of the State Fruit Growers' conventions have given hearty and unanimous approval to this publication, and have urged its continuance. At the recent convention in Los Angeles, where over thirteen hundred persons registered, it was unanimously voted that the publication of The Monthly Bulletin be continued and financed by the state, even though this result in the cessation of the publication of the convention reports by the state.

CROP REPORTS AND ORCHARD STATISTICS.

Not only The Monthly Bulletin but also the monthly crop reports and annual orchard statistics, published regularly in The Monthly Bulletin, are new features of the work of the State Commission of Horticulture. Statistics to be valuable must be accurate. If inaccurate, they are misleading and do serious harm. We have at our command hundreds of trained, able men daily in the fields and orchards. These county horticultural commissioners, their deputies and inspectors form a corps of census collectors unequaled anywhere. We are not only equipped to do this work exceptionally well, but we are doing it in a way to command the respect of the public. Our statistics are much sought after. Would it not be wise to include field and truck crops in these reports, as this could be easily done? The convention recently held at Los Angeles thought so, as in speaking of statistics it passed the following resolution unanimously:

WHEREAS, The State Commission of Horticulture is in position, through cooperation with the County Horticultural Commissioners, to gather this data more accurately and cheaply than any other organization,

Be it resolved, That we recommend to the California state legislature that the work of the state statistician be placed under the State Commission of Horticulture, and that the appropriation now granted for the compilation of data as mentioned above be attached to the Commission's office for this purpose.

This gathering of statistics is in charge of the Chief Deputy Commissioner of Horticulture, whose ability, training and experience fit him so well for the work that the statistics are becoming increasingly valuable.

WORK OF CHIEF DEPUTY.

I wish to call your attention to the work of the Chief Deputy. This officer might well be called "Field Deputy." The position is important, but although a statutory office, it was never filled until the present administration took up the work. It is the duty of the Chief Deputy to visit as adviser the several county horticultural commissioners and to cooperate with them in perfecting the quarantine and control work. He also gives field demonstrations and lectures. The present Chief Deputy has written a valuable treatise on the apple. He was appointed from Colorado, where he had gained a wide reputation for his excellent work of kindred nature in that state. His admirable service here has secured to him general recognition. He has had thorough training as well as extended practical experience in entomology, plant pathology and general horticulture, and is a real acquisition to the Commission.

WHITE FLY CAMPAIGN.

The white fly menace at Marysville still continues. We hope to eradicate the pest, but as yet we have only been able to hold it in control. We shall continue the fight, hoping to exterminate this dreaded destroyer. If this hope prove vain, we shall work in conjunction with the county horticultural commissioner of Yuba County with all diligence and energy that the evil spread no further. This white fly fight was ably prosecuted by my predecessors at an expense of about \$10,000. We have spent about \$600, and as indicated above, the end is not yet. It is significant that this pest probably came to our state through the mails.

ALFALFA WEEVIL.

This destructive insect enemy of our great forage crop which has done such frightful damage in Utah and which has gained entrance into Idaho and Wyoming, where it is spreading, has not yet invaded our state, as by our strict quarantine and close attention we have kept it at bay thus far. We are more than ever hopeful that we will continue to do so. We sweep the alfalfa fields contiguous to the transcontinental railroads extending from Utah to California with a hand net each season. By this precaution we hope and expect to discover its first appearance should it reach our state, when by very drastic and strenuous measures we shall endeavor to extirpate the insects before they are widely dispersed, in which case it would be quite impossible to do so. In that event the damage would be great and continuous, and the loss to the state would be alarmingly large. Our motto is "extreme vigilance," for this alone will insure safety.

CORRESPONDENCE.

The correspondence of the several divisions of the Commission is large, often over fifty letters a day being received. By far the largest portion

of these relates to insects and fungi and their control. With our present able corps of assistants and our equipment we are almost always able to identify these enemies and give advice at once. Very rarely does a letter go over night unanswered.

LECTURES.

Reference has already been made to the lectures given by the Chief Deputy. The Commissioner is very often called upon to lecture as are other members of the staff. The former has lectured in all more than one hundred times and in nearly all the fruit-growing counties of the state. Inyo and Humboldt are the only counties omitted. Several invitations to these counties could not be accepted because of distance and lack of time. In some of the larger counties the number of lectures has reached as high as seven or eight. The Chief Deputy has advised with the county horticultural commissioners in every county; in several counties two or three times, and he has lectured altogether more than a score of times. This service seems to be appreciated, and we believe it is valuable.

INSECT COLLECTION.

Our insect collection is of signal value. It enables us to give quick and certain identification of almost any insect received. This collection is accurately named, and now numbers thousands of species. It has all been collected and arranged in the three years of this administration and is an invaluable adjunct to our work.

STATE FRUIT GROWERS CONVENTION.

In the last two years we have held three regular State Fruit Growers conventions, one at San Jose, another at Davis at the University Farm and the last at Los Angeles. If we may judge by the attendance and evident interest, these conventions are greatly appreciated. At the Davis convention over eight hundred registered, and without doubt many in attendance failed to register. At the Los Angeles convention over thirteen hundred registered.

These annual and semi-annual meetings have been conducted with no little enthusiasm since 1881, and the lectures and discussions have been published with but two exceptions by the state for free distribution until the San Jose convention, held in December, 1913. We had no funds to publish the proceedings of that convention nor yet of the Davis and Los Angeles conventions and keep up the publication of *The Monthly Bulletin* and issue a second edition of the work on "Injurious and Beneficial Insects," which was loudly called for. Of course we decided to omit the publication of the convention reports, but we have, however, arranged to issue the report of the Los Angeles convention with no expense to the state. As the more important papers read at the conventions appear in *The Monthly Bulletin* from time to time and in the vari-

ous agricultural and horticultural papers, this failure to publish by the state is not so great a loss as would at first appear. We found that to issue a report of the Davis meeting alone would cost the state more than \$3000. In the estimate handed to the State Board of Control for funds for the support of this Commission during the sixty-seventh and sixty-eighth fiscal years no provision was made for the publication of the convention reports. If it is thought that these reports should be issued as in the past, the appropriation for printing must be increased accordingly.

EMERGENCY CONVENTIONS.

During the present year there have been held two emergency conventions, one on the mealy bug at Ontario and the other on the potato at Stockton. The first was called because of an invasion by the mealy bug in several orchards at Upland, causing serious losses. The citrus growers were anxious, not to say alarmed. The convention gave information that largely quieted fears and in a sense solved the problem. It was voted at this convention that this Commission prepare and publish a comprehensive report on the subject, which appeared in *The Monthly Bulletin* of March, 1914. The potato convention came as a result of quarantine action taken by Idaho and British Columbia against California potatoes because of the presence in our state of the tuber moth, an insect destructive to the potato. This quarantine was extended practically by Oregon and Washington, where whole carloads of California potatoes were destroyed. This convention was attended by experts from Europe and the United States Department of Agriculture. It developed that the potato industry was suffering severely from insect and fungoid attack, which could be successfully resisted. The information gained at this meeting was very assuring. Action was taken towards the formation of the West Coast Potato Association, including California, Nevada, Utah, Idaho, Oregon, Washington and British Columbia. Later the association was fully organized, and it is believed that in creating a better interstate understanding and securing better cultural methods great good will accrue to our state.

MELANOSE QUARANTINE.

Owing to the severe freeze in January, 1913, pomeloes were shipped into California from Florida in large quantities. They were all rigidly inspected by our quarantine staff, and we at once became aware of a serious fungous disease affecting this fruit. This disease is known as "melanose," or "stem-end rot," and once established in the groves of California would be a serious handicap to our great citrus industry. We at once placed an absolute quarantine on citrus fruit from Florida and the Island of Porto Rico on account of melanose. Of late there has developed another virulent fungous disease affecting the citrus in the gulf states known as "citrus canker." Happily the quarantine regu-

lations already established against these states will protect us against this new enemy of the citrus growers.

SPECIAL MONOGRAPHS.

When I assumed the duties of this office I found very few treatises on the care and culture of the many fruits grown in California. Almost every mail brought requests for such information. We have secured and published reliable up-to-date treatises prepared by successful growers on alfalfa, the almond, apricot, date, peach, pear, plum, prune, walnut, avocado and citrus fruits, and have now in the press a treatise on the apple. Our correspondence convinces us that this part of our work is appreciated.

In February, 1913, we issued an unusually large edition of "Injurious and Beneficial Insects of California," prepared by our then secretary, as we expected that there would be a great demand for the publication. Our expectation was greatly exceeded. In a few months the supply was exhausted. Some of the leading authorities in entomology congratulated us on the preparation of "the best work of the kind ever published." Scores of requests have been received and placed on file awaiting the issue of a second improved edition nearly ready for distribution.

BACTERIA AND FUNGI.

Before I ever thought of accepting the position I now hold I felt the crying need of more knowledge regarding these unspeakable enemies of the orchardists, destructive bacteria and fungi. The loss from these pernicious foes is alarming. Though funds were scant, the State Board of Control consented to the employment of a mycologist. I knew of the excellent work of Prof. H. S. Fawcett in the citrus groves of Florida and hastened to secure his services. He accepted the position and was stationed at Whittier, commencing his research work at Chula Vista, Santa Paula and Whittier. He was given every assistance at each place and soon discovered, actually demonstrating, the cause and cure of lemon gummosis, which is decidedly the most destructive disease of the lemon known to our citrus growers. This disease has robbed our orchardists of hundreds of thousands of dollars. In The Monthly Bulletin of August, 1913, Professor Fawcett explained the cause and cure of this disease in an illustrated article. We did not have funds to retain the services of a mycologist if we carried on the parasitic work, as I felt we must do, and I also believed that such research work could be more economically performed at the State University and that it properly belonged there. I therefore proffered the services of Professor Fawcett to the university authorities on the condition that he be retained exclusively in the field of investigation for which he had proved himself so admirably fitted. It hardly need be said that the proffer was immediately accepted.

THE STATE INSECTARY.

California is almost unique among the states in the way she wages war on insects injurious to agriculture. We are not satisfied with spraying and fumigation alone; we recognize their value (without them the citrus industry would now be impossible), but we believe that we should take advantage of every possible opportunity which might give aid in reducing the cost of growing and marketing our fruits. It now costs us more than \$1,000,000 annually to control our insect foes. For these reasons we have the State Insectary, an institution for studying the natural control of insects and the putting to practical use the knowledge thus gained. The work is of an extremely technical nature and requires both training and practical experience by those engaged in its prosecution. An intimate knowledge of the habits and relationships of parasitic and predaceous insects as well as familiarity with the literature treating of the subject is indispensable. There are very few scientists in the world qualified to perform this important service. This fact led us to a very thorough investigation, and we believe we have succeeded in securing a person of exceptional ability in this field of service.

During the past year until the outbreak of the war in Europe an expert entomologist of proved ability was kept in the Mediterranean region searching for promising beneficial insects. Another laboratory was and is maintained in Japan for the same purpose, arrangements having been made with Doctor Kuwana, official entomologist of the Japanese government and a scientist of international repute, to supervise the work. Relations have been established with the government of the union of South Africa, from our standpoint an unexplored region, whereby we have been able through the kindness of Prof. C. P. Lounsbury and of Prof. C. W. Mally to obtain regular sendings of black scale parasites of great promise. California has the benefit of the experience of the three scientists, Messrs. Lounsbury, Mally and Kuwana, absolutely without expense, and the state owes these gentlemen a vote of thanks for the interest they have taken in our welfare.

The promise of securing these beneficial insects from South Africa is so great that we are now placing an assistant in that field. We are also securing the services of a gentleman born in China but educated in our own state, a trained entomologist, who is now a teacher in China, to collect and ship parasites from that great country where citrus fruits have been long grown. We expect much from this section, as Mr. George Compere, who has had such extended observations, feels that China is a very hopeful field for research in this line of work. We are also arranging to exploit the Philippine Islands, where we can secure valuable assistance under the supervision of expert entomologists at a very slight expense. It goes without saying that this work could hardly be carried out without the kindly help of Doctor L. O. Howard, chief of

the Bureau of Entomology, United States Department of Agriculture, Washington, D. C.

The number of species of insects imported during the past two years is considerable, the more promising of which are as follows: Several enemies of the citrus mealy bug from Europe, the best of which seems to be a tiny chalcid, or parasitic fly, called *Leptomastix*. From all reports this parasite is of considerable importance in the control of the mealy bug in Sicily. One colony has been liberated in Southern California, and we are now engaged in breeding additional colonies in the insectary. There occur in Europe two ladybirds, *Chilocorus* and *Exochomus*, which are said to be of considerable value in controlling the black scale. We were unable to obtain a sufficient number for colonizing, but an effort will be made next year to get them introduced. They should thrive in California.

In Japan the mealy bug is greatly checked by natural enemies. We have received a large number of species of parasites from this locality, but for some strange reason they do not thrive on our California mealy bug. Apparently the insect in Japan is a different species from our own, but we are now engaged in trying out the parasites on the Baker and the long-tailed mealy bugs in the hope that we may find these hosts adapted to their habits.

In South Africa we have occupied ourselves entirely with the parasites of the black scale. Messrs. Lounsbury and Mally have sent us so far about a dozen species. Naturally most of them will not prove of great value, but out of the lot we hope to get a few good ones, and our laboratory investigations so far certainly justify our hopes. One of the new species, a small chalcid fly, known to entomologists as *Coccophagus orientalis*, has done wonderful work in the insectary. What gives us great promise from this species is the fact that, unlike *Scutellista*, it breeds upon and destroys the young of the black scale before the latter has an opportunity to lay its eggs. As we have no parasites of importance in California which breed upon this stage of the black scale, it will readily be seen that the introduction of *Coccophagus* will fill an important gap in the natural control of this most damaging of our citrus pests. We have already placed in the field several colonies of this parasite and have found it breeding during the summer. It ought certainly to thrive here, and our efforts will be continued until it becomes thoroughly established. Professor Lounsbury has had the black scale under observation in South Africa for many years and he is responsible for the statement that it is effectually controlled in that country by parasites, except in those restricted localities where the Argentine ant has interfered, so we have reason to feel encouraged over the outlook.

The superintendent of the State Insectary made a hurried trip to the Orient during the latter part of the summer of 1913. Several species of valuable predaceous and parasitic insects were obtained and many important observations made upon the natural control of insects in that region. The most promising species brought to California is a tiny ladybird, *Scymnus bipunctatus*, which feeds upon the mealy bug. It has been introduced into California and is at present breeding in astonishing numbers upon the citrus mealy bug at Alhambra.

We feel that we have been making very satisfactory progress with the work of introducing predaceous and parasitic insects, but the war in Europe has very greatly interfered with its prosecution. In fact, it is necessary to discontinue much of the foreign work on account of delay caused by the chaotic condition of shipping. Delay in the shipment of such insects is fatal.

We have now progressed to a point in our scientific investigations where we feel justified in stating that a great deal of expense can be saved to the California fruit growers by a wise introduction of beneficial insects. The work from now on should be prosecuted with more vigor than ever before. **THERE IS NO REASON WHY THE WORK SHOULD BE DELAYED AND EVERY REASON WHY IT SHOULD BE PUSHED.**

We have made great improvements in the insectary. In fact, it is now one of the best equipped entomological laboratories in the world. We are carrying on the work with as little publicity as possible, as it is necessary to avoid the danger of causing the growers to neglect such matters of control as fumigation and spraying. The plans for the next biennium should include besides the purely research work carried on at the insectary with regard to natural control of insects in general the collection and shipment of material from south Europe, Japan, south-east China, south Africa and possibly from northern South America. These are the regions of greatest promise, and with the large amount of material which we may expect to receive we are bound to obtain results of greatest value to the fruit growers of California.

The fact that we have received several shipments from Europe since the outbreak of the war makes us hopeful that we may continue the work with less certainty, of course, and with somewhat of loss, yet the encouragement which we have received from our success in the last year convinces us we would not be warranted in any cessation of these importations, even though under somewhat trying circumstances.

QUARANTINE DIVISION.

The quarantine division is the most expensive and certainly a very important part of the service rendered by the Commission. The work has increased to an enormous degree, as will be seen by the reports in

The Monthly Bulletin. Except for the thorough organization under the present able Chief Deputy Quarantine Officer, it would be impossible to transact the tremendous volume of inspection required. The long experience and devotion to the work of the entire quarantine force give an efficiency which warrants the compliment extended to it by the chairman of the Federal Horticultural Board, "Well-nigh perfect, the best in the world."

At the suggestion of the writer the entire membership of this corps were made collaborators of the Federal Horticultural Board, which, while this in no way detracts from their usefulness, does give added prestige to their work and greater efficiency to the service.

During the present administration the numerical strength of the force employed in the quarantine division has been practically doubled, and the logical result of this action has been the complete enforcement of the provisions set forth in the state quarantine law as passed by the legislature on January 2, 1912. In support of the foregoing statement the following simple statistics are submitted:

Parcels of horticultural material intercepted, inspected and disposed of at the San Francisco station.

1910.

Fumigated	Refused	Total	Ships Inspected
6,992	750	48,441	253

1913.

29,183	3,150	1,016,807	481
--------	-------	-----------	-----

The records of the Los Angeles and San Diego stations show a like increase in the volume of work, and at these stations, as at San Francisco, an itemized record is kept of each of these transactions and is on file in the several quarantine stations and also at the main office in Sacramento and is available at any time.

The policies of the quarantine division during the period under consideration have been vigorously pursued and have resulted in much permanent benefit. The prime object sought is to eliminate the infestations which constitute the basis for rejection of shipments of plant material at the source of origin. In this effort many avenues have been made use of—publicity in The Monthly Bulletin, conferences with resident consuls, correspondence with inspection officials in foreign countries and the enlistment of the capable cooperation of the active agents employed by the common carriers, both afloat and ashore. The results so far have justified the means made use of, and the material is arriving in cleaner, better condition than ever before.

A perfect working understanding exists between the directors of the Panama-Pacific International Exposition, the prospective exhibitors of horticultural material and the quarantine officers, and the work of installing such exhibits is proceeding with safety to California and satisfaction to the numerous exhibitors.

The counties of San Mateo, San Francisco, Marin and San Luis Obispo, not maintaining county horticultural commissioners, have necessitated in the enforcement of a quarantine the assumption by this division of a large volume of inspection work that properly belongs to the duties of these counties.

The Mediterranean fruit fly, the melon fly, the Mexican orange fly, the alfalfa weevil and the canker and melanose of citrus trees and fruit have been kept from becoming established in the State of California, and all quarantine regulations have been rigorously maintained.

The horticultural laws ought certainly to be so amended that all counties which grow fruit or engage in its sale to any extent should have county horticultural commissioners. There is further reason for this in that the safety of the entire state is jeopardized by the absence of such officers.

MENACE FROM THE PARCEL POST.

There is great danger of our receiving very destructive insect and fungoid pests through the mails, especially since the establishment of the parcel post. An order from the United States Postmaster General requires that all nursery stock, plants and fruit shipped by mail shall bear certificates either from state or government officials declaring that they have been inspected and are free from insect pests and disease. This is largely inoperative, as in most cases there are no persons qualified for this duty and often none at all. Later the order was supplemented by another specifying that any postmaster upon request by an inspection officer might report the fact of any such shipments which had arrived and to whom addressed, yet the law specifically states that any such package must be delivered at once upon its arrival. Of course this requirement makes inspection quite impossible. To search out the numerous packages sent far and wide over the state would require an army of inspectors. What we urgently need and must secure at the very earliest possible date is an order from the Postmaster General, or better, an enactment by Congress requiring that all nursery stock, trees, plants and fruit be sent to one, two or three postoffices in any state requesting such action and that is equipped to make inspection. At these central stations the shipments shall be inspected immediately and forwarded to the addressee if clean and safe, and treated or destroyed in case of infestation, as the condition requires. Such a law has been introduced in Congress and is now awaiting action in the House of Representatives. It certainly should be rushed to speedy passage.

It is thought that the introduction of the white fly at Marysville, Oroville, Sacramento and Bakersfield was through the mails. It has now cost the state nearly \$11,000 in an attempt to eradicate the pest, and it still lingers at Marysville. With the parcel post and its wide patronage the danger is greatly increased. We have intercepted egg masses and even larvæ of the gipsy moth, larvæ and adults of the white flies and many other dangerous insect enemies in the mails. We are gaining very frequent evidence that our mails are a serious menace. "The strength of a chain is its weakest link." The unguarded mailed parcel is the weak link in our otherwise admirable quarantine system. Indeed, may we not look forward hopefully to the time when thorough, efficient inspection may make quarantine no longer necessary? Any legislation that will quicken the pulse of Congress to the effect that it shall require and enforce efficient mail inspection of all nursery stock, trees, plants and fruit is greatly to be desired.

LEGISLATION.

Our horticultural laws are for the most part very excellent. Without doubt they are unsurpassed in efficiency throughout the world, but certain amendments are greatly needed. Every county where fruit is grown or sold in any considerable quantity should have a horticultural commissioner. Ten counties now lack this protection. Again, these officials are county officers appointed by the boards of supervisors. They should be state officials appointed by the State Commissioner of Horticulture under civil service regulations. This would largely eliminate political influence in making appointments and would certainly tend to secure more able county horticultural commissioners. This should, however, not remove the present incumbents as they are picked men who have passed a rigid examination and have been trained in the school of experience at the expense of the several counties and are a valuable asset to the state. These county horticultural commissioners are in the supervision of all intercounty shipments of nursery stock, etc., independent of each other and of the State Commissioner of Horticulture. Thus there is a lack of unity, embarrassment to trade and consequent loss to the state.

The boards of supervisors at the suggestion of the county horticultural commissioners can each frame ordinances which, in case they do not conflict with any state law, become as binding as does a law enacted by the legislature. This makes it possible to have forty-four different laws regarding the same plant, tree or fruit. Indeed, there are now diverse laws in force regarding the same plant. This is a grievous handicap on nurserymen and a serious impediment to trade. The nurserymen have reason to complain, as they do loudly. The growers are injured hardly less than the nurserymen. In case this change in

our laws is made, then the State Commissioner of Horticulture should be permitted to divide the state into districts, each with a commissioner to guard its interests. If this district system is adopted, then the combining of the unprotected counties of limited population with a promising future in fruit growing with those counties already having county horticultural commissioners as referred to under the discussion of "County Horticultural Commissioners" could be effected. This would greatly lessen expense, and all counties, even the less populous, would be protected to their own advantage and to the safety of the entire state.

AN AGRICULTURAL DEPARTMENT.

Since assuming the duties of the office of State Commissioner of Horticulture I have felt that economy and efficiency would be served by consolidating all the departments of the state that have to do with agriculture. At the San Jose State Fruit Growers Convention a committee was appointed to consider and recommend desirable legislation. This committee met later and was unanimous in the opinion that consolidation is desirable. At the Davis convention a tentative measure was reported and favored. This was further considered at the recent convention held in Los Angeles, where over thirteen hundred persons registered, and was again endorsed. This committee will present a bill to be considered by your honorable body. I believe that this contemplated action will unify, harmonize and would, as stated above, work for economy and efficiency.

STATE SMELTER WASTE COMMISSION.

At the fortieth session of the California State Legislature a commission was appointed to investigate the problem of smelter waste to determine its effect on vegetation and consequent injury, if injury there be, on agriculture. As one of the three members of this State Smelter Waste Commission no little time has been given by myself and the Chief Deputy State Commissioner of Horticulture to the prosecution of this inquiry. A report of our findings has been submitted to the Governor as directed by the statute providing for the investigation.

REPORT OF THE INDUSTRIAL ACCIDENT COMMISSION.

From January 1, 1913, to June 30, 1914.

HON. HIRAM W. JOHNSON,
Governor of California.

DEAR SIR: In obedience to the requirements of section 88 of the Workmen's Compensation, Insurance and Safety Act, we herewith report the results of the operations of chapter 399 of the laws of 1911, commonly known as the Roseberry Act, for the calendar year 1913, and the results of the operations of the Workmen's Compensation, Insurance and Safety Act from the first of January, 1914, up to and including the 30th day of June, 1914, to which report there have been added such information and conclusions as in the judgment of this Commission will prove of interest to you as Governor of California and to the legislature of California.

On the first day of January, 1913, the then Industrial Accident Board consisted of A. J. Pillsbury, chairman, Will J. French and Willis I. Morrison, members. Up to that time there had been filed with this Commission 504 acceptances of the compensation provisions of chapter 399. During the year 1913, 656 additional acceptances were filed. This probably brought under the protection of the Roseberry Act 75,000 employees.

During the calendar year 1913, 69 applications were filed for adjustment of controversies between injured employees and their employers or insurance carriers, and 56 cases were decided, leaving adjudicated 13 cases. From the first of January, 1914, up to and including the 30th of June, 1914, 32 cases under the Roseberry Act were filed, and 39 cases had been determined by the latter date, the remaining ones being yet under consideration. There will doubtless continue to be additional cases under this act until the full year has expired from the time that the Roseberry Act was superseded by the Workmen's Compensation, Insurance and Safety Act, viz. until January 1, 1915.

It is needless at this time to narrate the reasons which prompted the legislature to abrogate the so-called Roseberry Act and substitute therefor the Workmen's Compensation, Insurance and Safety Act. It is sufficient to say that the Roseberry Act, while a good beginning and while it served a most useful purpose in acquainting the people of the state with the idea of compensation for industrial injuries, was crude and tentative only and needed to give place to a more comprehensive law. It served its purpose well, but that purpose was mainly formative and educational.

The Workmen's Compensation, Insurance and Safety Act.

The half year of experience under this act is too short a time for the complete determination of the value and correctness of all of the provisions of the act, but suffices to show by experience that, in practice, it is workable and sound in principle.

During the first six months of the operation of the act there were 26,958 persons under its protection who sustained injuries of greater or less degree. All of these were compensable, at least to the extent of receiving medical and surgical treatment to cure and relieve them from the effects of their injuries, but, of this total number, only 3,438 were entitled to disability indemnity in addition to their medical and surgical treatment. A significant fact is that of these 3,438 persons entitled to indemnity, there were only 323 instances in which controversies arose. In other words, over 3,000 cases were settled between employer and employee, or the employer's insurance carrier, without dispute. The number of controversies referred to the Commission was a little more than 10 per cent of the compensable injuries. This is a very high average and no doubt constitutes double the percentage of controverted cases that will be encountered when employers and employees have come thoroughly to know their rights and obligations under the act. Any law that is 90 per cent self-operative may be regarded as a good law and as accepted in good part by those whom it affects as directly as this law affects the employers and employees of California. This Commission hopes within the next two years to reduce the percentage of controversies to 2 per cent of the compensable cases, but to reach this goal will require a thorough familiarization on the part of employer and employees with the terms of the act.

Organization of Commission.

The Industrial Accident Commission, as successor to the Industrial Accident Board under the Roseberry Act, was organized on the first day of January, 1914, with A. J. Pillsbury (chairman), Will J. French (vice-chairman), and Harris Weinstock, members; Ira B. Cross, secretary; H. L. White, assistant secretary; Chris. M. Bradley, attorney; Dr. Morton R. Gibbons, medical director; C. W. Fellows, manager of the State Compensation Insurance Fund; John R. Brownell, superintendent of safety; T. Norman Dean, statistician.

Quarters had previously been obtained in the Underwood Building, 525 Market street, San Francisco, and the general work of putting the new Workmen's Compensation, Insurance and Safety Act into operation was undertaken with enthusiasm on the part of the entire force. Offices were also opened in the Hollingsworth Building in Los Angeles, in charge of H. H. Kinney, secretary of the Southern California District. Many addresses were delivered throughout the state by members of the Commission and by other officers, in order to acquaint the

public with the purposes of the new act. At first a great deal of opposition from employers was encountered, but this arose mainly from a dread of the unknown and because of misinformation persistently disseminated, but this condition cleared up as soon as people came to understand what the provisions of the act really were and what the policy of the Commission would be with reference to the enforcement of its provisions. Those who had operated under the Roseberry Act were quite content with the new measure, and almost universally exercised their influence in its favor. By the expiration of the first six months of operation under the new act, practically all opposition had ceased.

A great amount of administrative work has been accomplished through personal interviews. The entire time of one person has been taken up both at San Francisco and Los Angeles in meeting persons claiming rights under the Workmen's Compensation, Insurance and Safety Act or owing obligations under said act, in order that they may have explained to them their rights and their obligations and how to effect adjustments of controversies without requiring formal hearings before the Commission. This service has been very satisfactorily performed, with the result that probably not more than half as many cases have gone to the Commission for adjustment as would have gone to it had it not been for the personal interviews thus held with prospective litigants.

There has also been a very heavy volume of correspondence with employers and employees as to their obligations and rights under the act where personal interviews could not be had. This has been less satisfactory than where the representatives of the Commission could meet these parties face to face, mainly for the reason that what is stated in a letter is not as fully comprehended as when stated by word of mouth and further opportunity given for questions and answers; nevertheless, our correspondence department has been very serviceable in adjusting differences that otherwise would doubtless have culminated in controversies before the Commission.

Attitude of Insurance Carriers.

There was, during the session of the legislature of 1913, a determined opposition on the part of the insurance companies doing business in this state against the Workmen's Compensation, Insurance and Safety Act, and particularly against the establishment of the State Compensation Insurance Fund. Nevertheless, in most cases, these insurance carriers readily cooperated with the Industrial Accident Commission in trying to carry out the provisions of the new act, and, as a rule, this Commission has enjoyed the loyal cooperation of insurance carriers in the execution of the law. A stubborn resistance on their part would

have made the successful operation of the act difficult. There were instances where insurance carriers were dilatory in reaching adjustments with the injured employees, but a part of this may be attributed to the newness of the system and the lack of complete organization of the adjustment departments of such companies. In recent months, there has been less reason to complain of such delays on the part of insurance carriers. Instances still remain where criticism may justly be made of the treatment of injured persons by insurance carriers, but these constitute the exception and not the rule, and this Commission looks forward with confidence to a continuation of the cooperative spirit on the part of insurance carriers generally.

One Crucial Issue.

There remains one subject of controversy that is fundamentally important to the successful operation of the Workmen's Compensation, Insurance and Safety Act. There are members of the bar of this state who are unable to reconcile themselves to a procedure wholly different from that which characterizes trials in courts. They feel that unless they are permitted to conduct a case before this Commission exactly as they would conduct it before a court, they and their clients are unjustly and tyrannically treated. If cases before this Commission are to be conducted as they are conducted in trial courts, such conduct of such cases will be tantamount to a denial of justice in a large percentage of the controversies that come before the Commission for determination. It is better for the state and for the people of the state that what may be termed "average justice" shall be speedily and inexpensively administered than that exact justice shall be striven for at a cost that, in many cases, would consume the entire amount involved and leave the applicant indebted for costs and expenses besides.

This Commission holds that it is not a court and that hearings before it are not trials, but are what the term implies, "hearings," or inquiries in which the dispatch of business is best facilitated by permitting the Commissioner, or referee holding the hearing, to do most of the inquiring, leaving to attorneys opportunity to bring out any material fact which the Commissioner or referee may not have elicited from the witnesses. Perhaps in 75 per cent of the cases there is no requirement that any attorney be present on either side. All that the Commission requires in order to reach a just determination of the issue is to have the parties and the witnesses present, and in most cases the only service necessary to be rendered by an attorney is to advise the parties what facts need to be established and what witnesses should be in attendance in order that such facts may be established. The Commissioner holding the hearing will ordinarily do the rest and do it expeditiously and inexpensively. In short, it is the purpose of the Commission to afford

an object lesson as to how to determine issues of minor consequence with reasonable certainty and without delay or burdensome expenditure.

But there are cases which involve issues of great importance in which the advice of attorneys is gladly welcomed by the Commission.

A Question of Evidence.

The statute particularly provides that the Commission shall not be bound by the technical rules of evidence in conducting its hearings, but notwithstanding this provision, attorneys have protested vigorously against the admission of evidence for the consideration of the Commission which would be ruled out by a judge if an issue were to be tried before a jury.

Frankly, the Commission does permit itself to hear evidence that no court would permit a jury to hear, but the Commission has faith in its own ability to value such evidence, whether hearsay or what it may be, at its true worth, whereas a jury might give a higher value to evidence of a lower grade than would a court or would this Commission. It frequently happens that, in admitting hearsay evidence, the Commissioner holding the hearing gets a clew to further testimony material in determining the issue and then such Commissioner takes steps to have such other testimony brought before the Commission in order that it may judge rightly when the case is closed.

In a word, the Commission does not propose to make up its mind in relation to controverted issues in accordance with any particular rules laid down in the civil law of this state, but the Commissioners expect to keep their minds open until convinced by such evidence as, in the common and practical affairs of every day life, would produce conviction in the minds of reasonable men. This is the standard that the Commission has set for determining all issues brought before it, and if the courts and the legislature will permit the Commission to continue as it has begun and work out its salvation along this line, it has no doubt that it will reach substantial justice in practically all cases and do it with a minimum cost in time and money on the part of the state, employer and employee. The Commission feels that the success or failure of the whole semi-judicial department of its work depends almost entirely upon its being free to follow the policy above outlined.

Judicial Interpretation.

It is to be expected that, in an act as comprehensive as the Workmen's Compensation, Insurance and Safety Act, there will be provisions which, in the course of administration, must be submitted to courts of competent jurisdiction to determine precisely what force and effect must be given to such provisions. This is welcomed by the Commission with full confidence that the higher courts of the state will be found in sympathy with the purposes of the act.

Hearings.

Up to January 1, 1913, the date of the last report of the Industrial Accident Board, there were filed for adjudication by the Board 14 claims. These represented the accidents suffered by the employees of the 504 employers who had accepted and agreed to be bound by the provisions of the Roseberry Act.

In 1913, 656 additional employers enrolled under the act. As more employers accepted and more employees were affected, the number of claims increased, 32 being filed from January 1, 1913, to June 30, 1913, and 37 in the following six months. Of the 83 cases filed before January 1, 1914, the Board had, at the latter date, heard and disposed of all but 13.

On January 1, 1914, the Workmen's Compensation, Insurance and Safety Act, went into effect. It naturally took some time for employees to realize what their rights were under the act, so that, notwithstanding the enormous number of employees affected, only 3 cases were filed during the first month and a half. From that time on, claims came in faster and faster until, on June 30, 1914, a total of 291 had been filed under the new law, and 32 under the old law.

Cases Filed January 1, 1914, to June 30, 1914.

	Law of 1911	Law of 1913	Total
January -----	7	3	10
February -----	7	9	16
March -----	6	55	61
April -----	9	83	92
May -----	3	85	88
June -----	---	56	56
Total cases filed -----	32	291	323
Cases pending January 1, 1914 -----			13
Total cases before Commission to June 30, 1914 -----			336

The clerical work required by such a large number of cases was necessarily great. One clerk was employed in January and a second in May. With the assistance of this force and the necessary stenographers and typists, together with the expert advice of the medical department and appointed referees, the Commission was able to hear and decide 218 cases, leaving 118 cases pending on July 1, 1914.

The average time for settlement of a case from the filing of the claim to mailing the decision was 45 days.

Of the cases decided, there were 34 death cases in which the dependents received a total award of \$78,767.54. The compensation given for disabilities was \$18,371.42, making the total benefits received in decided

cases before the Commission \$97,138.96. Not included in this amount were 13 cases in which continuing awards were made, the award to be paid until the recovery of the employee.

PERMANENT DISABILITY RATING DEPARTMENT.

The Permanent Disability Rating Department was organized in July of last year for the purpose of putting into practical application a plan for rating permanent disability. This plan involved the creation of a series of tables from which the amount of compensation in any case might be determined in accordance with the provisions of the Workmen's Compensation, Insurance and Safety Act.

It was essential in the beginning carefully to outline and define the work of the department. The Workmen's Compensation, Insurance and Safety Act defines total permanent disability, and provides that in all cases of permanent partial disability, the percentage of such disability to total disability must be determined by taking into account the nature of the physical injury or disfigurement, the occupation of the injured employee, and his age at the time of the injury.

The successful application of a schedule to this problem necessitated a complete investigation of the degrees of disability occasioned by the various injuries as related to a certain occupation and age which would act as a standard by which all other ages and occupations might be judged. This standard occupation was taken as that of the ordinary unskilled laborer and the age as 39. The occupation was taken because of the simple nature of the physical requirements placed upon the different parts of the body by reason of the work required to be performed. There is no skill here, no special training of any one part of the body to make it more valuable for bread-winning purposes than any other part. It is a comparatively easy problem to discuss the effect of injuries on the earning capacity of this standard individual. Age 39 was taken because statistical records show this age to be the approximate average age of persons injured in California.

The discussion involved principally a study of functional loss and loss in competing ability. A list of some three hundred permanent injuries was drawn up and submitted to the various state commissions and to prominent medical men in California, with the request that estimates of the effect of these injuries on the earning capacity of the standard man be given. A considerable number of replies were received. In addition the permanent disability schedules of all of the compensation laws available were studied for the relationship between the various enumerated injuries. Many foreign works on the subject, principally by French and German authors, were carefully considered. With all of this material at hand a standard rating was created.

It became necessary next to discuss the relationship between this standard occupation and all of the other occupations to be included in the scheme. It was necessary to study the degree of physical require-

ments in each occupation as compared with the similar requirement in the standard case. In this work five investigators were employed. The plan of investigation involved a visit to the plant where the occupation was being performed, several plants being visited in each case to make sure that conditions were the same everywhere, as well as a discussion with the employer and employee in which the relationship existing between the occupation in question and the standard occupation was thoroughly discussed. In this manner a complete industrial dictionary was compiled, referring particularly to the physical requirements imposed upon the body of the worker in each occupation by the particular work his occupation demanded. The result of each discussion with an employer, an employee, or groups of employers and employees, was carefully noted. The investigator was assigned a certain field for his own particular efforts. He was required to make himself an expert in the occupations involved in the industries in this field and to give a comprehensive report on the result of his research work. In this way the occupational factor was taken into consideration.

It remained to include provision for variations in age from the standard age. This was done by means of an empirical formula well tested by practical application to a series of special problems.

The schedule was completed and ready for use on January 1, 1914. Today, when a permanent injury is sustained, it is possible to obtain a rating by consulting the schedule after determining three items: (1) the exact nature of the physical injury or disfigurement, (2) the occupation, and (3) the age of the worker at the time of the injury. The schedule is easy to apply and has solved the problem of making settlements without the formality of hearings for the adjustment of claims before the Industrial Accident Commission. It is equitable, and has met with the most general appreciation and approval. For a scientific work it has found a wonderful popularity among the parties interested. There are not more than two pages of explanation, and it has been found possible to instruct almost any person in its use in a few moments. Considering the fact that the schedule will answer 1,080,000,000 questions, the simplicity of its operation is remarkable. The schedule better meets the needs of the problem than the ordinary permanent disability schedule which takes into consideration the one item of physical loss and omits all others from the discussion. Instead of placing a fixed dollars-and-cents valuation on the different members of the body, the schedule actually considers the effect of the loss on the earning capacity of the individual by including in the method of determination a discussion of all of the vital factors which are capable of measurement, namely, the items of physical loss, occupation and age. The schedule fits the ins and outs of the problem where others only hit the high places.

The department, today, exists for the twofold purpose: (1) of collecting and distributing further information concerning permanent disability, and (2) of approving permanent disability ratings which are made by the parties concerned and submitted to the Commission for approval. In the line of its work to extend the usefulness of the schedule, the department has investigated further classifications of injury groups and some 800 new occupations, which information is now available and can be had upon request. In its other line of work the department is keeping a close record of the ratings in actual cases in order to collect sufficient data with which to check the correctness of the schedule.

MEDICAL DEPARTMENT.

The Medical Department was organized at the time that the Workmen's Compensation, Insurance and Safety Act went into effect. There was no information except that contained in the new law to look to for guidance. The laws and conduct of medical departments in other states did not present points of similarity sufficient to assist in devising a new organization.

The Industrial Accident Commission asked that whatever duties, connected with its activities, related to medical subjects, be assumed by the Medical Department.

A department has accordingly been developed partly to conduct the medical business of the Commission and partly to contribute to the smooth operation of the act, by assisting organizations and individuals outside of the Commission in medical matters pertaining to the law.

Personnel.

The Medical Department is composed of the medical director, the assistant medical director, a clerk having custody of all records pertaining to the Medical Department and assistant to the medical director and a clerk assistant to the assistant medical director.

(1) Duties of the Medical Department for the Commission.

To advise the Commission on medical subjects. To appoint medical referees and receive and transmit reports of medical referees with interpolations, interpretation, and comment for use of the Commission in forming conclusions regarding cases upon which hearings are held.

To make ratings of disability in consultation with the "Permanent Disability Rating Department."

To adjust bills in cases of award by the Commission and to advise regarding proper expenses in cases before the Commission.

As medical adviser of the Commission, the medical director is called in consultation on cases involving medical points not clear to the Commission. He is called on to interpret testimony and to advise regarding further information and its production.

The services of the best physicians in this state are available for the Commission in this work. From among the teachers and other leaders of the profession we have derived our most valuable assistance. From the colleges we have voluntary offers of investigation and scientific research, which is most gratifying. Our medical referees are appointed with reference to special fitness in the case involved, so that the best information in the given case may be before the Commission. It is the object of the Medical Department to make information placed before the Commission as nearly incontrovertible as possible.

The matter of permanent disability rating is an important function of the Medical Department. While the Commission has adopted a comprehensive "schedule of disabilities" it is practically impossible to make any schedule complete since the various combinations of disability approach infinity. It is necessary in a large proportion of cases to have special consultation regarding the disability and to rate each case upon its own merits. Reports of such ratings are kept with the object of establishing precedent for use in subsequent cases of approximately like character.

The question of bill adjustment is another important function of the Commission. The Medical Department is called upon to approve all accounts forming a portion of the awards of the Commission. The fees approved in such cases correspond to a fee schedule adopted by the Industrial Accident Commission which will be discussed later under the affairs of the State Compensation Insurance Fund.

(2) *For the State Compensation Insurance Fund.*

To supervise the medical affairs of the fund. To follow the more serious cases and supervise or advise treatment. All the more serious cases are followed and supervised from the beginning.

To adjust bills incurred in connection with treatment of the injured individuals cared for by the Fund. To arrange for care of cases in hospitals, etc.

To determine disability.

The Industrial Accident Commission, in its administration of the State Compensation Insurance Fund, has deemed it expedient to accept the services of any licensed practitioner of medicine and surgery unless his services are known to be without value. The Commission does not believe that the Fund, as a state organization, may exact the services of any certain group of doctors for general accident work.

Physicians and surgeons are allowed great latitude in the treatment and care of "Fund Cases," and are requested to deal with such cases as they would their private patients, deferring, however, in any serious matters to the direction of the Medical Department.

A fee schedule has been adopted by the Industrial Accident Commission which is designed to compensate physicians caring for industrial accidents in a manner commensurate with the value of the service.

The Commission believes that charges should be such as would be made to an injured workingman if he were to be charged and to pay the bill himself. The average individual is assumed by the Commission to earn \$1,000 per annum. To bear out this statement, the statistics for 1914 up to this time show the average income of all those injured in industrial accidents in the state to be \$900 per annum.

In the past the surgeon who has attended the injured workingman for any serious or protracted condition has received, it is estimated, not more than 40 per cent of his fee. Under the act all medical fees are provided for, all hospital expense is provided for and the fees are assured. Accordingly, the Commission has approved a fee schedule which is considerably lower than the average fees *charged* for similar work in private practice. This at first met with very considerable opposition on the part of the profession through misunderstanding. However, the matter was taken up before the Medical Society of the State of California in April, 1914, and by vote of the house of delegates of that organization, the fee schedule of the Commission was adopted. Since that time, the Commission, meeting with the medical society of southern California, has secured an understanding of the situation by that body and the great majority of the county medical society units have subscribed to the arrangement approved by the Commission.

At this time there is a very satisfactory understanding between the medical profession generally, and the Industrial Accident Commission. We are frequently in receipt of voluntary expressions of approval of the present arrangements, and the cooperation of the medical profession promises a most happy development in the operation of workmen's compensation.

Reverting to the question of fees for medical service, the Commission in designing the fee schedule provided for great elasticity so that cases of different severity answering the same description would involve compensation for medical service in accordance with the work done.

(3) *For the Private Casualty Companies.*

In somewhat the same manner as medical referees are selected for cases coming before the Commission, referees are selected to act on cases submitted to the medical director by casualty companies. In many cases of misunderstanding between the injured person and his employer, or the casualty company, representing the employer, the assistance of a medical referee will avoid necessity of application for formal hearing. In such instances the injured workingman is sent to a medical referee appointed by the medical director for examination and report. Such reports are commented upon and a decision is reached by the medical director. The report and finding then is submitted to the insurance company for its use and the information becomes the property of the Industrial Accident Commission for future reference, if required. Such information is elicited at the expense of the insurance company, the employer, or employee, or whoever requested it. This manner of investigating cases saves the Commission a very considerable number of applications for decisions, as is shown by the fact

that some 400 cases in the past ten months have been acted upon by the Medical Department. In many of these cases there was a large amount of discussion and correspondence.

(4) *For the State Board of Control.*

At the request of the State Board of Control, the approval of all bills pertaining to medical care of injured employees of the state is in the hands of the medical director. This entails correspondence sometimes with the injured person, or the state department in which he is employed, and generally with the doctor who cared for him.

The medical department has been in a formative stage practically up to the present time, a vast amount of the detail regarding the various phases of the work of the Commission, where it relates to medical subjects, has passed through this department. Much of the work does not show on the surface. There are no evidences for a large and important part of it unless cooperation and approval of the medical profession and the better understanding of the value of the law and the sincerity of its administrators are considered.

INSURANCE.

Cost of Liability Insurance Compared with Cost of Compensation Insurance and Justification for the Disparity.

Employers' liability insurance, which might be aptly termed "Damage Suit Insurance," is a form designed to protect employers against damage awards by courts of law in favor of injured employees and their dependents. In practice, it long ago became expedient for insurance carriers selling such indemnifying contracts to settle out of court most of the claims arising. This practice became more general as juries showed a growing tendency to return verdicts for extremely large amounts. Trained adjusters were employed by the insurance companies for the purpose of disposing of these claims at the lowest possible cost, and a very large number of attorneys and "ambulance chasers," so-called, reaped a harvest through compromising or pressing such claims on behalf of the injured, the result being that far less than one half of the amount paid by employers for liability insurance reached the needy injured or their dependents.

Manifestly, under such a system, it was impossible for the insurance companies to establish rates upon any basis of statistical data which might be considered scientific from an actuarial point of view. The abuses resulting from this system are described elsewhere in these pages. The social progress of the world has demanded a more equitable basis for compensating injured industrial workers, and, in case of death, their dependents.

The published rates for compensation insurance in California are roughly estimated at two and one half times the former rates for employers' liability insurance, but in this comparison it must be remembered that the rates for the latter form were based upon standard limits of \$5,000 for injury or death of one person, and \$10,000 for any one accident involving injuries or death of two or more persons, while the rates for compensation insurance provide covering for the unlimited liability of the employer. Under employers' liability, it became common for juries to award damages in excess of the policy limits, often necessitating a liberal contribution by the employer. Furthermore, many employers volunteered to furnish injured workers with medical and surgical attention, and often paid large amounts to relieve the suffering of the workers when the insurance carrier refused on the ground that the accident did not result from the employer's negligence, and that, therefore, no liability existed. In addition, an unfriendly feeling on the part of the workers toward their employers was engendered by this system when both the employer and the insurance carrier refused to pay.

In estimating the real difference in the cost of liability and compensation insurance, account should be taken of all economies under com-

penensation, such as increase in efficiency, saving of time and attorneys' fees, and the employers' proportion of expensive litigation. When all advantages under compensation, which it is impossible to measure in dollars, are considered, the Commission doubts whether there is any material difference in the ultimate and actual cost to the employer. To further bear out this statement, it is found that in other states where the principal common law defenses of employers have been removed by statute, as under the Roseberry Act in California, the insurance carriers have increased their rates for employers' liability insurance to equal the rates for compensation insurance. In this state farm labor is exempt from compensation, unless the employer files a written acceptance of the compensation provisions of the law, and if he does not file such acceptance, the rate charged for employers' liability insurance is the same as for compensation insurance. The Commission also believes that the present rates for compensation insurance will eventually be reduced materially and that at present these rates are loaded more heavily for expense than is warranted.

State Compensation Insurance Fund.

Industrial insurance in any form is essentially a public utility and as such must be regulated intelligently and judiciously by the state, not only for the best interests of employers and employees, but for the protection of the insurance carriers as well. Keen competition with poor management and the expensive practices attendant has often resulted in financial ruin of insurance carriers.

Many different plans have been adopted by the various states, some providing for the establishing of a fund with complete control and monopoly of the compensation insurance business by the state; others for state supervised companies; and in several states, as in California, a state insurance fund to compete with other licensed insurance carriers. This latter plan was adopted in this state with the idea that corporate insurance carriers, when properly regulated, might perform a useful social service. The State Compensation Insurance Fund was created for the purpose of assisting in this regulation by the injection of a competition which would tend to make necessary a reduction in operating cost by other insurance carriers with the natural reduction in rates which must ultimately follow. The Commission believes that a healthy competition is as good for the state as for its competitors, a monopoly by either being likely to result in an assurance which might tend to the furnishing of only fair service at high rates.

The State Compensation Insurance Fund operates under the jurisdiction of the Industrial Accident Commission as a governing body, but conducts its business in a similar manner to other insurance carriers. The personnel of the organization is made up of capable and experienced insurance men, who were chosen entirely upon personal merit and

without regard to political faith. The "Fund" began business on January 1, 1914, with an appropriation by the legislature of \$100,000. An additional sum of about \$68,000 was appropriated for the use of the Industrial Accident Commission in defraying the initial expenses of the State Compensation Insurance Fund should it be unable to write a sufficient volume of business to consistently pay this expense out of premiums received. It has not been necessary for the "Fund" to make use of any portion of these appropriations, its premium writings being far in excess of the expected business.

When the Workmen's Compensation, Insurance and Safety Act was being considered by the legislature, it was freely predicted by the representatives of corporate insurance companies that if the measure became a law the compensation rates would, of necessity, be materially increased. The establishing of a competing state "Fund" resulted, however, in the standard compensation rates published for use under the Roseberry law being reduced to an extent averaging 25 per cent. The Commission, therefore, feels justified in stating that this is the first advantage accruing to California employers through the intervention of state insurance.

In the absence of statistics to indicate the result of compensation in California, it was decided, in order to be on the side of safety, that the State Compensation Insurance Fund should, at the outset, adopt the California rates published by the Workmen's Compensation Service Bureau of New York and followed by the companies holding membership in that "bureau." But as the law provides that the State Compensation Insurance Fund shall be ultimately no more or less than self-supporting, and that the rates shall be only sufficient to carry out the specific purposes stated in the act, the policy form issued by the "Fund" provides for return to policyholders of any excess premium collected. This makes of the "Fund" a purely mutual insurance institution for employers, which, through competition, is expected finally to force compensation insurance rates charged by all insurance carriers to a minimum.

Despite the heavy organization expense borne, the "Fund" has been able to conduct its affairs at a cost in ratio to premiums written of only a fraction of the expense of corporate insurance companies, several items of wasteful expense common to the companies being eliminated in the administration of the "Fund."

American and Foreign Experience in Relation to Compensation Insurance Rates.

In fairness to the insurance companies doing business in California, it should be stated that the Workmen's Compensation Service Bureau, maintained in New York by the larger companies, is now engaged in a scientific study of American and European experience for the purpose of revising compensation rates for various states. The pure premium

cost under the Massachusetts law has been used as a basis, accident frequency in other states and abroad being also taken into consideration. Through this means, it is expected that a universal manual of classifications can be drafted and a system of differentials derived to provide the rates for various American states. This work is in charge of most able actuaries and statisticians, and the Commission finds a disposition on the part of the "Bureau" to court publicity in its work and to realize that its members are engaged in an enterprise which may be considered as constituting them public service corporations. It is believed that these companies would be content with little or nothing more than the banking profit on premiums, and if the "Bureau" will undertake to institute such reforms as will materially reduce the operating cost, thereby lessening the present excessive expense load upon rates, it will have accomplished still more to merit the approbation of supervising bodies and the general public.

The insurance departments of several states, as well as the Industrial Accident Commission of California, are also engaged in a careful study of American and foreign experience, in order that the operations of insurance carriers may properly and fairly be regulated and that state insurance funds may adopt rates for each classification which more nearly represent the true hazard of the industry.

Cost of Compensation.

The cost of compensation in California can not fairly be indicated by the experience of the State Compensation Insurance Fund during so short a period as six months, as it is a well established fact that the cost rises each year during several years after a compensation law becomes effective. This is due to several natural causes, principally that the workers do not have a general understanding of the law at the outset, but as their rights become more widely known more claims for compensation are filed. It is also true that the accident frequency will fluctuate extensively, and experience covering a wide distribution of hazard over a considerable period is necessary to arrive at a true average. The cost to date under policies of the State Compensation Insurance Fund is indicated in the financial statement by the amount expended for compensation and for medical and surgical attention and by the estimated cost of cases on which payments are still to be made. Liberal provision is made in these estimates for probable cost of accidents reported, in connection with which complete data is not at hand. It will be noted that a considerable portion of the cost is represented by estimates, but this is largely due to the fact that under the Workmen's Compensation, Insurance and Safety Act payments to injured workers and to their dependents must be made in installments, these payments often extending over a considerable period. The Com-

mission discourages the commutation of indemnity to lump sums in order to avoid the defeat of the purpose for which compensation is intended and to prevent the dissipation of the indemnity, or the loss of it through the manipulations of designing persons.

Cost of Medical Aid.

The Commission is informed that in the compilation of California compensation rates, the theoretical pure premium cost is loaded about 30 per cent for medical aid. This can hardly be considered a fair method of measuring medical cost, and the charge could be more equitably based upon accident frequency than upon pay roll, the cost of treating a worker earning \$5 per week being the same on the average as for furnishing such attention to an employee earning \$20 per week. This suggested method is not followed at the present time, but to date it appears that the 30 per cent load on pure premiums was a fair guess as to the comparative cost of compensation indemnity and medical aid. General experience in California indicates that the actual cost of medical, surgical, hospital and similar service provided for under the act is, roughly, 50 per cent of the cost of compensation or 33 per cent of the total cost. This follows closely the experience in the state of Wisconsin, where medical aid is furnished for a period of ninety days as in California.

General Report of State Compensation Insurance Fund.

During the first six months, ending June 30, 1914, 4,417 applications for compensation insurance from employers were registered by the State Compensation Insurance Fund, and during the same period 1,417 accident cases were handled under its policies. In only seven of these cases was it necessary for the Commission to hold hearings to adjust claims under policies of the "Fund." In three of these cases the hearings were necessary to establish the extent of dependency, to designate the persons dependent, or to settle a question as to the extent of a partial permanent disability. Another case proved to be an attempt to collect indemnity for a hernia alleged to have been suffered from a recent accident, but was found to have been existing before the claimant entered the employ of the insured.

In addition to the work of the Safety Department of the Commission, the State Compensation Insurance Fund has made systematic inspections of risks covered by state insurance. In a majority of the cases of risks examined for merit classification, it was found on inspection that a reduction in rate could be allowed by application of the merit rating schedule and the insured employers were given the benefit of such reduction. In addition, many recommendations for improvement to promote safety were made.

The financial statements of the "Fund" follow:

State Compensation Insurance Fund. Statement of Admitted Assets and Liabilities
June 30, 1914.

ADMITTED ASSETS.

Cash—		
State treasury	\$120,932 08	
Bank	3,666 30	
Office	75 00	
		\$124,673 38
Bonds		294,425 00
Accrued interest		4,996 55
Premiums in course of collection		8,971 32
Total admitted assets		\$433,066 25

LIABILITIES.

Estimated cost of compensation and statutory medical payments for accidents reported (see footnote).....	\$45,494 50
Unearned premiums	193,959 22
Bills unpaid	1,008 27
Return premiums unpaid	74 69
Total liabilities	\$240,536 68
Surplus of admitted assets over liabilities	\$192,529 57
Appropriation, chapter 180, statutes 1913	\$100,000 00
Accumulated surplus for six months ending June 30, 1914 (see footnote)	92,529 57
Total surplus	\$192,529 57

NOTE.—If the statutory reserve (required for an annual report) of 72 per cent of earned premiums is used, the legal reserve would be increased to \$104,130.63. This would reduce the accumulated surplus for the six months to \$33,893.44 and the total net surplus, including appropriation, to \$133,893.44.

The preliminary expenses of organization incurred prior to January 1, 1914 (amounting to about \$4,000), have been paid by the Industrial Accident Board, out of a special appropriation.

SAFETY DEPARTMENT.

Summary of the Law.

Sections 51 to 72, inclusive, of the Workmen's Compensation, Insurance and Safety Act, give the Industrial Accident Commission power to make and enforce safety orders, rules and regulations, to prescribe safety devices, to fix safety standards and to order the reporting of accidents. They also provide for the review of the safety orders of the Commission by the courts and for the establishment of museums of safety.

An obligation is placed on the employer to provide a safe place of employment for his employees. The "place of employment" is defined in the law, and likewise "employment," "employer" and "employee." Emphasis is laid on the providing of reasonably safe surroundings for employees. The law prohibits disturbing any safety device or safeguard furnished and provided for use in any employment or place of employment, and further calls on employees to do "every other thing reasonably necessary to protect the life and safety" of other employees.

Public hearings on safety orders must be held before such orders become binding, in order that any opposition or criticism may be presented in time for due consideration.

Industrial accidents have to be reported to the Industrial Accident Commission under such rules and regulations as the Commission may from time to time make.

Failure to comply with the orders, rules or regulations issued by the Industrial Accident Commission places the onus on employers of proving that their places of employment are safe.

Organization of Safety Department.

The members of the Industrial Accident Commission, realizing the importance of the Safety Department, decided that the best men obtainable should be procured as safety engineers, to be under the direct charge of a superintendent of safety.

California had, before the Workmen's Compensation, Insurance and Safety Act was passed, practically no legislation on its statute books providing for industrial safety. This meant an open field in which to work, and the need of pioneering in such a manner as to secure the best results and efficiently to surround employees with safe conditions of employment.

Only within the last four or five years has there been a demand for competent mechanical engineers who can supervise safety work in all industries. This demand is the result of the recent adoption of workmen's compensation laws in the different states. In California there are many competent men, in given industries, who could perform the

duties that pertain to safety engineering in their respective occupations. It was necessary to have a man of wider experience.

John R. Brownell, who was the safety expert for the Pennsylvania Steel Company's plant at Steelton, Pa., was offered the position of superintendent of safety. He was highly recommended by the National Safety Council, he had about 7,000 men under his jurisdiction in the plants of the Pennsylvania Steel Company, had studied at the Massachusetts Institute of Technology, and had experience in constructing buildings as well as in the field of mechanical engineering. Mr. Brownell accepted the offer made to him by the Industrial Accident Commission, and came to California in the middle of January, 1914. He was given full charge of his department, so far as the technical end of his work is concerned, with authority to choose his safety engineers exclusively on the merit plan. He selected three expert safety engineers in the northern field and one in the south. A caretaker was appointed for the Safety Museum, who is well acquainted with mechanical devices and has the ability to install them and explain their operation to visitors.

As a result of the policy outlined, the work of the Safety Department has proceeded with energy and without friction of any kind, with the sole purpose of rendering that aid to employers and employees that will benefit both groups of citizens, as well as the people of California.

California Takes a New Lead in Safety Work.

In December, 1913, Dr. J. A. Holmes of the United States Bureau of Mines was asked if the Bureau would cooperate with the State of California in providing safe conditions of employment in the mining industry. This proposal was immediately accepted. Dr. Holmes stated that it was the first time one of the states had approached his department on a cooperative plan. The Secretary of the Interior, Franklin K. Lane, immediately approved the agreement, and since January 1, 1914, the United States Government and the State of California have been working harmoniously in this important field. Dr. Holmes and his able assistant, Van H. Manning, have aided in every possible way in furthering the cause of industrial safety, so that both mine operators and miners are pleased with the outcome.

The agreement called for the United States Bureau of Mines selecting a competent mining engineer to take charge of the work. This plan completely took out of politics the selection of the mining engineer. In many states this position has resulted in inefficient work because of the changes that come politically. Half of the salary and half of the traveling expenses of the mining engineer are paid by the United States Government and the other half of the salary and expenses by

the State of California. This gives the mining engineer the support of both federal and state governments.

H. M. Wolflin, a Californian, was assigned to this state. He had the advantage of having worked in the mines and of studying in and graduating from the mining departments of the University of Arizona and Columbia University, and also of having had experience for several years as one of the United States Bureau of Mines' best mining engineers.

During the period January 1, 1914, to June 30, 1914, 48 mines were visited by Mr. Wolflin and 282 safety suggestions made. These suggestions affected the safety of approximately 3,601 employees (2,495 underground and 1,106 surface). This first series of inspections was made as rapidly as possible in order that the Industrial Accident Commission might have available, at the earliest possible date, first-hand information about mining conditions in California. Almost without exception, the mine managements expressed their intention of complying with all suggestions made, and in most instances expressed their appreciation of the help which was given and their desire to cooperate in the "Safety First" movement.

A. A. Krogdahl, another United States Bureau of Mines official, was assigned to the California field on a cooperative plan similar to that governing Mr. Wolflin's employment. Mr. Krogdahl's specialty is first-aid work. He has been engaged in visiting the mining districts of the state and instructing the miners how to prevent deaths or injuries by giving that immediate care which oft times means the difference between life and death, especially when men are hundreds or thousands of feet underground. Mr. Krogdahl started his work in California during June, and up to June 30, 1914, had visited 8 mines and given 10 hours first-aid training to each of 75 miners.

The "Safety First" Campaign.

By means of lectures and newspaper publicity, and the laying of emphasis on the virtue of preventing those deaths and accidents that constitute a grave indictment of our industrial methods in the United States, there came an immediate response from employers and employees, and the public generally. The Safety Department of the Industrial Accident Commission appreciates to the fullest extent this valuable assistance. It has meant more than can be told in words. We found that employers are just as anxious as employees to make their places of employment safe. The thousands of suggestions that have been made by our safety engineers and by our mining engineer have been cheerfully followed. There was needed in California an organized effort to direct this important work. It came on January 1, 1914, when the new law became effective.

The most emphasis has been placed on the humanitarian aspect of "Safety First." It has been stated that the value of a human life can not be estimated in dollars and cents, and this is true. Each preventable accident that takes place represents an entry on the wrong side of the ledger of social efficiency. An appeal can be made to men and women whenever a man or woman is in danger of injury or of death. The second important factor is that the cost of the compensation system will be materially reduced when the death and serious accident lists show a saving to the commonwealth. From every point of view the Safety Department has merited its existence; in fact, it is to be regretted that no attention was paid to accident prevention many years ago.

The average amount of compensation paid in death cases was \$2,700. The average amount of compensation paid in cases of temporary injury was approximately \$37. The amount of money paid in the case of one death would provide for compensation in the cases of 73 temporary injuries.

There were in the files of the Industrial Accident Commission, before the present law became operative, many requests from employers to assist them in guarding their establishments. These were all carefully complied with just as soon as organization was completed. This phase of the work has been growing in volume and has met with the cordial approval of those concerned.

Employees have frequently drawn attention to wrong conditions and in each instance immediate attention has been given to the complaint. There is a provision in the law which prohibits divulging the name of an informant, so that employees are protected if they decide to ask the Safety Department for an investigation of alleged unsafe working conditions.

The National Safety Council estimates that in the United States a worker is killed every fifteen minutes, day and night, and a worker is injured every sixteen seconds. It is likely that the number of industrial accidents reported to the Industrial Accident Commission will total 60,000 for the year 1914. This number is altogether too large. It is thought that not only should there be a reduction on this total number, but that the number of deaths and serious disabilities should be reduced from one third to one half.

SOME OF THE EFFECTS OF INDUSTRIAL ACCIDENTS.

W. F. Burns: Load on wagon shifted, causing wagon to overturn. Burns jumped from wagon, catching his foot under the wheel. Left leg so crushed that amputation was necessary.

Manuel Medeiros: Loss of two middle fingers of right hand and permanent curvature of middle fingers and thumb of left hand, due to catching hold of two 2300-volt wires.

D. B. Blake: Eye put out by scale from boiler plate which was thrown on the ground. Scale flew into the eye, cutting the cornea through the vitreous humor.

Jack Navocich: Metal well casing while being raised struck high tension wires, causing electric burns necessitating amputation of left arm and lower right leg, and burns to hand and face.

Opening of a Safety Museum.

More than one hundred exhibits are on display in the first Safety Museum in this part of the country. Probably no other state has a safety museum as large as that at 525 Market street in San Francisco. Manufacturers of safety appliances have eagerly availed themselves of the opportunity to show their devices. Many California inventors have accepted invitations to exhibit. It is contemplated in the near future to give a full measure of publicity to this opportunity of seeing what inventive genius can do to make employments and places of employment safe. Employers and the representatives of insurance companies

have, in large numbers, visited the Safety Museum, and all people interested are cordially invited to view the displays. Preparations are being made to establish in Los Angeles a safety museum similar to the one in San Francisco.

Illustrated Lectures.

During the year many lectures have been given at which pictures were shown of safety methods and devices for preventing industrial accidents. More than one hundred slides are available that deal exclusively with conditions in California shops and factories, and other places of employment. The same way of installing guards at a minimum cost is clearly shown by these pictures.

Three Important Essentials.

1. Home-made safeguards, constructed and installed cheaply in the shop, are advocated by California's Safety Department.
2. No safeguard is required which the safety engineers can not show how to install.
3. All safeguards required, or suggested, must be practical in character.

Employers soon found that these three essentials rendered the work of safeguarding comparatively inexpensive, and the Industrial Accident Commission has hundreds of letters from employers stating that their employees have turned out more work and better work in a shorter time since the safety devices have been installed. By removing the risk heretofore attending the work, men are able to give their attention solely to their business without exercising particular care to avoid the risks that come from industrial danger.

"BEFORE AND AFTER" THE INSTALLATION OF SAFEGUARDS.

Guarded knuckle mechanism on can closing machine.

A Few Safety Details.

The work of the Safety Department of the Industrial Accident Commission consists essentially of three parts:

I.

The inspection of plants with a view of discovering dangerous places and practices, in order that these may be called to the attention of the plant managers, so that proper safeguards may, wherever possible, be installed to minimize or eliminate the hazard of operation.

II.

Arousing the interest of plant owners and manufacturers in accident-prevention work in order to gain their cooperation, not only in safeguarding conditions of employment, but in initiating a system of safety committees chosen from the working force, who are given authority to bring all matters of safety and welfare before the management.

III.

The establishment of a Safety Museum in San Francisco, to be followed later by one in Los Angeles, in which museums all manner of safety devices are shown and maintained free of cost to exhibitors.

The result of this work has been the inspection of 255 industrial plants, distributed as follows:

No. of plants		No. of employees affected
68	Metals and machinery -----	3,824
64	Foodstuffs -----	9,969
44	Lumber and its products -----	8,392
13	Paper, printing -----	675
7	Construction -----	505
7	Textiles, cotton mills, etc. -----	600
7	Power and light -----	2,611
6	Quarries -----	243
6	Brick, tile, pottery, etc. -----	716
5	Painting, papering, kalsomining, acids -----	280
4	Laundries -----	2,593
4	Mercantile -----	685
3	Intrastate railroads -----	140
2	Public corporations, municipal power, etc. -----	
2	Tanneries -----	235
1	Oil industry, asphalt paving, etc. -----	
12	Miscellaneous, accidents, etc. -----	
255	Total -----	31,468

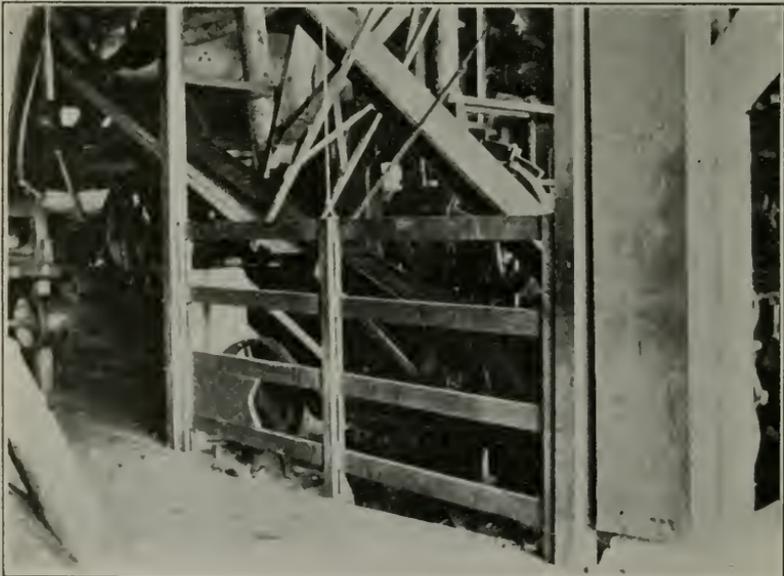

One instance of economy was noted in one of the large manufacturing plants of the state, where the installation of overhead walks for the use of the men detailed to oil shaft bearings, combined with a proper grouping of tubes from various oil cups, which tubes were segregated

for convenience in oiling, not only saved a large quantity of oil, but reduced the actual cost of operation of the company by \$50 per day. In another instance, the placing of a very small guard increased the output of the machine 20 per cent.

"BEFORE AND AFTER" THE INSTALLATION OF SAFEGUARDS.

Unguarded belts on large sticker.

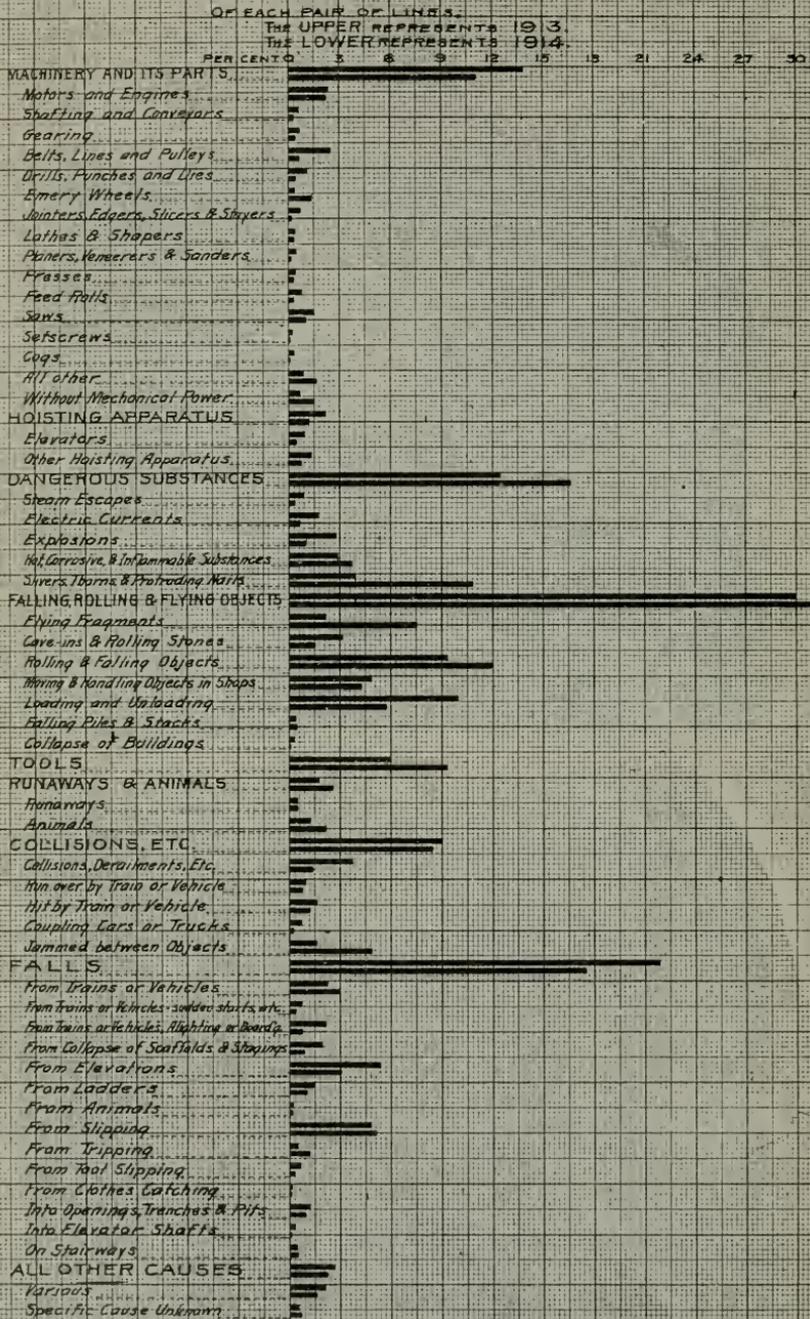

Guarded belts on large sticker.

The attitude of the Safety Department toward employers and employees is not one of compulsion, but of cooperation. It is expected that compulsion will have to be resorted to in rare cases only. The letters on file show that the keenest interest is evinced by manufacturers who express in highest terms their appreciation of the practical suggestions offered by the safety engineers.

The Safety Department affiliated with the National Safety Council early in the year. As a result, the department is securing weekly bulletins of service and has the assistance of nation-wide cooperation in meeting the intricate problems that arise.

A local council of the National Safety Council was formed on May 28th in San Francisco. The Safety Department is represented in this local council, and its president is John R. Brownell, California's superintendent of safety.

COMPARISON OF CAUSES OF ACCIDENTS IN 1913 AND 1914.

INDUSTRIAL ACCIDENT COMMISSION
STATE OF CALIFORNIA

Fig. 1.

A STATISTICAL RESUME—1913 AND 1914.

1913.

In making comparisons of accident statistics collected during the years 1913 and 1914, it must be borne in mind that accidents which did not cause disability to last more than seven days, were not reported during 1913, while since January 1, 1914, every accident which disables throughout the day of injury or requires medical attention, is reported to this Commission.

Since the publication of the annual bulletin of the Statistical Department for 1913, later advices show that the 10,721 accidents tabulated in that bulletin has been increased to 12,031.

The following distributions by character of disability show that of the 12,031 accidents where the injury lasted longer than one week, 890 were accidents which resulted in permanent injury and that 555 of the 12,031 terminated fatally.

This subsequent information increased the totals of indemnity paid in 1913, from \$613,862.31 to \$724,282.61, distributed as follows: Indemnity for temporary injuries, \$395,824.83; indemnity for permanent injuries, \$144,911.63, and indemnity for fatal injuries, \$183,546.15.

The total amount of expenditures for medical aid was \$147,700.99 for all accidents.

The total number of dependents for 1913 was 554, distributed as follows:

(A) <i>Total Dependents.</i>		
Wives -----		296
Children -----		149
Parents -----		28
Sisters -----		10
Brother -----		1
Nephew -----		1
Common-law wives -----		2
(B) <i>Partial Dependents.</i>		
Parents -----		51
Sisters -----		12
Brothers -----		3
Illegitimate children -----		1

1914.

The 1914 experience covers only a period of six months, beginning January 1 and ending June 30, 1914. During this time reports of industrial accidents to the number of 26,958 were reported to this department; distributed by character of disability, 25,991 were cases of temporary injury, 698 were cases of permanent injury and 269 were cases which terminated fatally.

During this six months, employers and insurance companies have paid in indemnity for non-fatal accidents, \$151,075.64, and for fatal accidents, \$36,107.89. They have also paid for medical attention, \$155,157.87.

The foregoing lines are intended to focus attention upon the data included in this report.

Copies of the statistical report for 1913 can be obtained from the Industrial Accident Commission, 525 Market street, San Francisco, California.

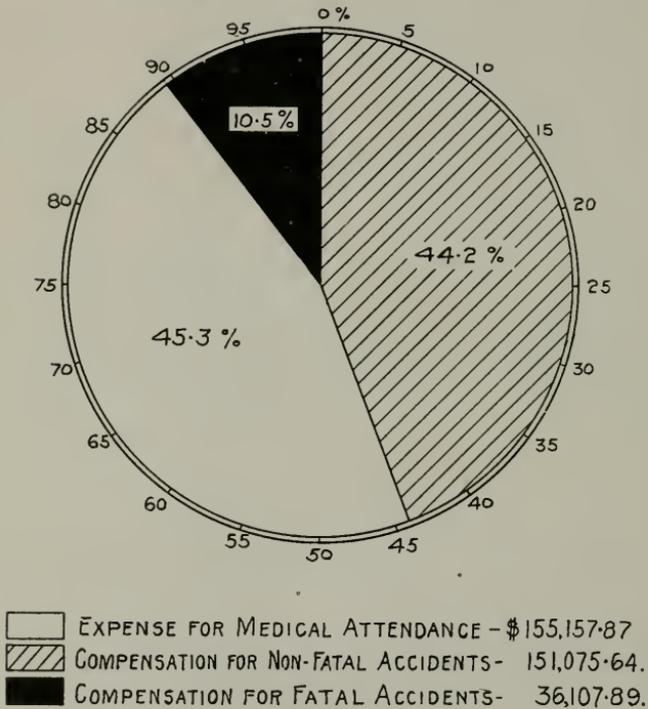

Fig. II.

STATISTICAL REPORT FOR THE HALF-YEAR.

January 1 to June 30, 1914.

Introduction.

This semi-annual report of the Statistical Department of the Industrial Accident Commission of the State of California is compiled from the data which has been collected concerning accidents to employees in California industries during the six-months' period, January 1 to June 30, 1914. There are many limitations to the work which will be pointed out later, but these need not destroy its value as an earnest of what the work will be after sufficient time has elapsed to gather enough experience to publish trustworthy data. Even this brief report may serve many purposes, but the chief end for which it is designed is to set forth as clearly as possible, from the available information, the magnitude of the problem arising out of accidents to workingmen.

New Regulations Regarding Reports.

The Industrial Accident Board during the year 1913 did not receive reports of accidents to employees engaged in horticulture, viticulture, farming and neighboring pursuits; nor did they receive reports of accidents to employees who as a result therefrom were disabled for less than seven days. The Industrial Accident Commission, beginning January 1, 1914, superseded the Industrial Accident Board, and, accordingly, changed its rules and regulations relative to making reports of accidents. The field of experience to be covered this year has been vastly widened by requiring reports of accidents from every employer of labor in this state, including domestic, farm and casual labor. Furthermore, every accident that disables the man through the day of injury or that requires the attention of a physician, must be reported by the employer to this Commission within seven days from the date of accident; and within ten days and fourteen days from the date of accident, the physician in attendance and the insurance company carrying the risk must make reports, respectively. A supplemental or final report of accident is required from the employer and the insurance company, but not from the physician, unless the injury terminates in permanent disability or death, in which case it is necessary for the physician to report to the Commission at once. The first supplemental is due to be filed by the employer within thirty days after the accident, and every sixty days thereafter until disability ends, at which time a final report is required from the insurance company.

The Nature of the Material Contained in This Report.

From the foregoing paragraph, which sets forth the methods of reporting accidents, it is clear that a supplemental or final report of a serious accident that happens in the latter part of May or in June can not reach this office in time to close the history of the accident and render it useful in tabulations which are made before the end of the year. Approximately one third of the reports of accidents which are included in the following tables are without sufficient data to close the history of the case and are therefore tabulated and designated as "Open Cases." It is this element of incompleteness that operates against the trustworthiness of any conclusions that might be drawn from calculations based on these tables.

It is, however, the intention of the Industrial Accident Commission to have all data collected that relates to these open cases and at the next tabulation have the totals revised. In which case, it will appear that many of the accidents that were thought at first to be temporary injuries have resulted in permanent incapacity, and many of those that were determined as permanent, will have resulted in death. With such changes in the status of many of the cases, it is apparent that the only safe figures are those that have been gathered over a period of five or ten years and which include only cases where a satisfactory determination of disability and cost has been obtained.

A Brief Study of the Accidents Occurring for the Six Months' Period from January 1 to June 30, 1914.

Twenty-six thousand nine hundred and fifty-eight (26,958) accidents were reported to the Industrial Accident Commission during the six months' period, from January 1 to June 30, 1914, for which employers and casualty companies have paid in compensation and medical benefits the sum of \$342,341.40, or an average cost of \$12.73 per case reported. Two hundred and ninety-one of the reported cases were fatalities, of which two hundred and sixty-nine form the basis for the calculations of the total wage-loss and averages of this report. Twenty-two of the fatal cases are withheld from the calculation of averages, as the data on hand is not sufficient to determine them as industrial.

Six hundred and ninety-eight men have received injuries during the first half of this year that will incapacitate them to some extent for life.

Six men each lost a foot.

Nine other men each lost a leg.

Six men each lost a forearm.

One man lost an arm.

Six men each lost a hand.

Twelve men each suffered impairment of vision in one eye.

Five men each are totally blinded in one eye, while

Fourteen men each suffered the organic removal of an eye.

Three hundred and ninety-four men, boys and girls have suffered all forms of mangled fingers and thumbs.

Of all those who recovered from their injuries, one man required twenty-five weeks, while three required twenty-four weeks.

The question naturally arises, what are the causes of these accidents and what industries are most responsible? For convenient comparison of the causes of accidents for this year and for the year 1913, Chart No. II will be of service. Inasmuch as the figures for 1913 include only accidents causing disability for more than seven days, the calculations are on a percentage basis to facilitate comparison.

It is obvious that the classification of causes that will fluctuate the most will be that of machinery and its parts. Roughly speaking, the causes of accidents fall under two heads: Those accidents that are caused by some mechanical device that is driven by man or horsepower; the other large class is that caused by some form or condition of hand labor. The former class of accidents can be reduced in a large measure by protective devices; the latter by a campaign of education that will teach the employees that it is bad to lose money and time, but it is worse to suffer pain and mutilation of the body.

The second part of the question provoked in the above paragraph regarding the kind of industry that is most responsible for accidents, is not answerable because of the lack of accurate information concerning the number of men who are employed in the various industries. However, in a large way, an idea of the frequency of accidents in any specific industry can be gained by a study of the chart No. III on the opposite page. A reference to the table which classifies the fatal accidents by industries in which they happened, will disclose the striking change that has taken place in some of the industries compared with last year's classification of industries by their inherent hazards. For example, the manufacturing of metals and machinery is responsible for 30 deaths, while for the half-year of 1914, it is responsible for 8 only. On the other hand, general construction, which is largely hand labor, likewise lumbering, mining and smelting, and agriculture press close for the lead. General construction is responsible for 48 deaths; steam railways, for 38; lumbering, for 33; mining and smelting, for 29; and agriculture for 27.

Attention is called to the fact that figures covering fatal accidents can not successfully be used as a basis for trustworthy calculations, as the most serious accidents rarely occur twice under exactly the same circumstances. One year labor may test the whole gamut of hazards and suffer but a few deaths, while in one day ten will die from one blast in the manner of an accident that occurred on April 23, 1913, at 5 p.m. Notwithstanding the fact that in the above lines responsibility for

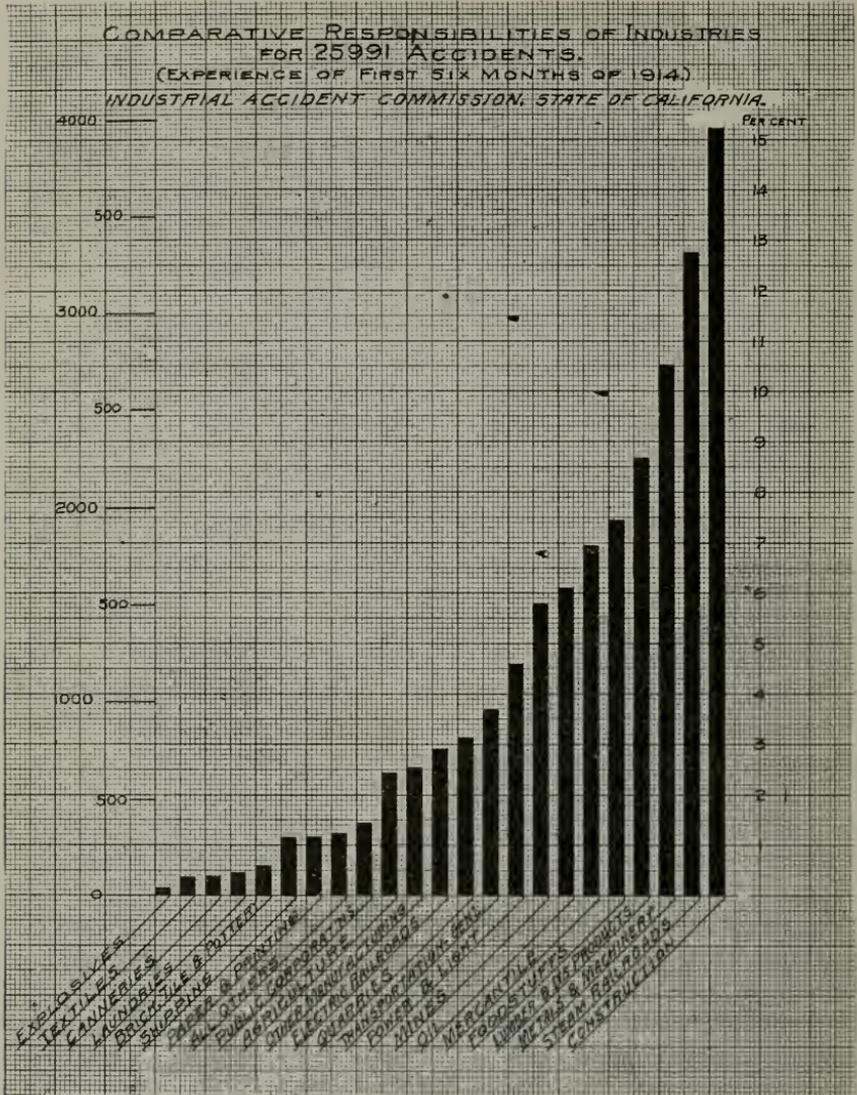

Fig. III.

frequency of accidents by industries was attached by reference to the table of deaths, more satisfactory judgments can be made from the chart classifying industries by non-fatal accidents.

TABLE No. 12.

Fatal Accidents Grouped by Industries in Which They Occurred.

Industry	Number
General construction -----	48
Steam railways -----	38
Lumber -----	33
Mining and smelting -----	29

Total -----	291

A Study of the Fatalities for the Half-Year.

The reader will probably be confused with the many totals for the death cases. An explanation at the outset will not be amiss. The difficulty of getting complete information concerning the cases has already been mentioned. This condition obtains with regard to twenty-two of the death cases. In some cases the age and wage are given so that they can be included in computing the average age and wage, while the absence of other data excludes them from certain other tables and calculations. For all calculations concerning cost, the 269 cases where all information has been received and is final, are used only. The following tables of ages and wages of those fatally injured, grouped by convenient periods, are submitted for ready reference, while for a more detailed study, attention is invited to Table No. 15, in the subsequent pages of this report:

Ages of Persons Fatally Injured.

16 to 21 -----	22
22 to 29 -----	58
30 to 39 -----	96
40 to 49 -----	49
50 to 59 -----	36
60 to 69 -----	19
70 to 79 -----	5
85 -----	1
Total -----	286

Comparison of wage loss, maximum compensation due, and indemnity paid on account of 269 fatal accidents. (Experience of first six months of 1914.)

Large black circle—Wage loss.
White circle—Maximum compensation due.
Small black circle—Compensation paid.

Fig. IV.

Weekly Wages of Persons Fatally Injured.

\$3 00 to \$9 00	23
10 00 to 19 00	172
20 00 to 29 00	63
30 00 to 39 00	18
40 00 to 49 00	8
63 00	1
85 00	1
Total	286

The average age of those killed this year was 39 years, and the average wage was \$18.78 per week. Assuming that the average man of those killed could have hoped for twenty-five years in which to earn a livelihood, his income for that time at an average annual wage of \$900, would amount to \$22,500. For 269 men, this totals a loss of \$6,052,500 to the families of workingmen and to society.

Compensation to the amount of \$36,107.89 has already been paid in 19 cases. Should the maximum compensation be paid in the 116 cases where total dependents were left, it would approximate \$313,200. Com-

pare this with the total wage-loss of all those killed and the amount of indemnity which is asked from industry in return, and you have the appalling large circle No. IV which represents what employees lost through accidents that might have been prevented, and the small circle which represents the indemnity industry pays for owning such hazardous machinery which refuses to run a single year without exacting a toll in human lives.

Dependents in Death Cases.

Nephews and nieces.....	3	
Total	47	
Number of death cases where dependency is unknown.....		80
Number of death cases where no dependency existed.....		66
Total number of death cases.....		291

Medical and Burial Expenses.

The information concerning the payments of claims, medical and burial expenses, is not available in the majority of death cases, and for that reason average medical and compensation costs should be deferred until the end of the year. In 76 cases, \$11,527.55 has been paid for medical and burial expenses. This figure will be considerably raised within the year.

Dependency.

Two hundred and ninety mothers, fathers, wives and children have been left dependent. Forty-seven mothers, fathers, sisters, brothers, nephews and nieces were partially dependent for support upon those killed. This information is very difficult to obtain and there is a strong likelihood that the number of both partial and total dependents is greater than herein given.

Comparison of the Average Expenditures for Compensation and Medical Aid in 1913 and 1914.

It is of interest in this connection to compare the average amount of indemnity paid to dependents last year with that paid this year. On page 8 of the bulletin for the first half-year period of 1913, it is stated the average indemnity in death cases was \$322.25, while this year, under compensation, the family of a workman who was killed received an average of \$1,900.41, plus the medical and burial expenses, which this

year have averaged \$151.67 per case for 76 cases, compared with \$25.83 expended on an average case in the first six months of 1913. This average will be effectively enlarged by the end of the year when the majority of all claims will be adjusted and reported to this office.

While the burden of accidents has been more evenly distributed among the employers by the provisions of the compensation act, and while the averages per case have been materially enlarged, there is a consoling thought to all, that long and expensive suits have been made unnecessary and no opportunity has been given for a rupture of relations between employer and employee. Furthermore, a material saving in attorney's fees, etc., in the settlement of suits is seen by a study of the average cost of suits over a period of five years. Exclusive of the costs of court procedure, etc., the average suit that was settled between and including the years 1905 and 1911, cost the employer or his insurance carrier approximately \$8,000.

Causes of Fatal Accidents.

In the following table of Causes of Fatal Accidents, there seems to be a lack of correlation between the number of accidents resulting in death that were caused by machinery and its parts and the table of Frequency of Fatal Accidents by Industries, wherein it attaches the responsibility of only eight deaths to the manufacture of machinery, against eleven deaths due to machinery enumerated in the table of causes. This can be explained by calling attention to the fact that machinery is used so extensively on ranches and in dairying and kindred pursuits that it is not infrequent that a man on the farm is seriously mangled by a mowing or pumping machine. One farm laborer was electrocuted by a 220-volt current this year and several died from explosives ignorantly handled.

Under the head of Dangerous Substances, it will be noted that two employees died from infection due to nail wounds. This is not uncommon, and it seems that in some cases infection is avoidable. By carefully looking over the list of causes, it will be apparent that in many cases a slight bit of insulation or a box over a switch in the pumping plant, a loose wire tightened, a covering over a gear, would have spared the lives of many strong workingmen, and though such precaution is inexpensive, it would save thousands of dollars, to say nothing of the human element which is certainly worth as much consideration.

Frequency of Fatal Accidents by Months.

This table is scarcely of more value than to indicate with what consistent regularity the work of killing men goes on from month to month. No data concerning the frequency of fatal accidents by hours of the day is available, but such experience as was collected last year relative to this feature, parallels other experience very closely, especially in the

frequency of non-fatal accidents. It is general information that the greatest number of accidents per day happen around 10 o'clock in the forenoon, and around 3 o'clock in the afternoon. This scarcely means more than that the highest point of fatigue, carelessness, and indifference has been reached at these hours.

A Study of Those Permanently Injured.

It has been the experience in some countries where safety appliances were introduced to prevent accident, that the total number of permanent injuries increased with a corresponding decrease in the deaths. This is natural, for it is not altogether unlikely that safety appliances may be improved as time goes on, but the chief interest of this observation is that from a financial standpoint it is cheaper to employ only the best of safety devices and exercise precaution. The obvious reason for this is that a permanent injury can cause not only more affliction, but can be far more expensive than a death. When a man receives a 100 per cent impairment of his earning capacity by losing both of his eyes, it is not unthinkable to suggest death under some circumstances to be far more preferable. If an isolated case of this character were rare, it would not be so cogent an argument for compensation, but in six months, 31 men and boys have suffered all the stages of blindness, from the impairment of vision in one or both eyes, to total blindness in one eye or the removal of the eye from its socket.

During the first half of the year 1913, only three hundred and five cases of permanent disability were reported to the Commission, while on the same basis of comparison for the half-year periods in 1913 and 1914, the number of cases of permanent injuries reported to this office has increased over 125 per cent. A partial explanation for this increase is that the conditions for reporting accidents have been improved, the people are becoming more interested in the workings of the law, and can see a larger benefit to all to be derived from compliance with its provisions.

Nature of Specific Injuries in Detail.

Twelve men each suffered a permanent impairment of vision in one or both eyes; while in five cases injury resulted in total blindness in one eye.

As the result of injury, five men lost the right eye and nine lost the left eye.

Two men each lost an ear, one losing his right ear and another the left. Information regarding any impairment of hearing is lacking in both cases. One man suffered the loss of hearing in his left ear.

In one case, a man fell from a ladder or poor staging, alighting on his head, causing weakening of the brain. In this case an award of \$1,050 plus the medical bill of \$930 was made.

One hundred and seventeen men suffered more or less serious rupture from over lifting. A careful inspection of all these cases was made and all cases of old rupture have been excluded.

Three men suffered paralysis as the result of heavy strains or falls.

Nineteen men lost twenty-three toes.

Six men lost a foot.

Nine men lost ten legs at the knee joint.

Two men suffered the shortening of a leg.

Six men lost a forearm, and another lost his entire arm.

Six other men are each minus a hand.

In ten cases men suffered crushes and mashes of fourteen fingers that destroyed their usefulness and left the members sticking stiffly in all directions and constantly in the path of the rolls and lathes that menaced them before. While they did not suffer loss of the members, their capacity to do accurate work has been greatly reduced with a corresponding reduction in efficiency.

For convenience, the study of finger injuries is divided into three parts: Amputation of the end of a finger or including the first joint; amputation at any point below the first joint, but not including the knuckle; amputation at knuckle.

In six months' time, unprotected gears, rolls, etc., nipped and mangled two hundred and seventy-eight fingers at or above the first joint from the end of the finger. In every case the bone was disfigured and required skilled attention.

Records of losses of finger nails, mashes and crushes with no permanent loss are included in the list of temporary injuries.

The loss of the ends of these two hundred and seventy-eight fingers was distributed among two hundred and thirty-nine men.

In addition to these, there were fifty other men who fared worse at their employment by losing, at or below the second joint, seventy-four or nearly one and one half fingers per man.

Ninety-five men lost enough fingers to supply thirty-eight and one-half hands, or 154 fingers.

A permanent injury is measured by a loss of earning capacity, a loss of physical function and the power of accommodation, plus the lessening of ability to compete in the labor market. Obviously, a satisfactory determination of the extent of incapacity must take into consideration the injured's age, his average weekly wage, his occupation, the part of the body injured, the extent of the injury, etc. By using a standard method of rating permanent injuries, it is not necessary in calculations to consider the loss of time due to temporary disability, as compensation for such injuries does not consider temporary loss in time, but a permanent impairment.

If, however, a permanent injury does not operate to reduce the earning capacity of a man, such injuries become compensable on the basis of time lost in the same manner as temporary injuries. It has been determined that this condition exists in 381 of the 698 cases of permanent injuries that have been reported. This total may be enlarged as further inquiries are made and more detailed information received.

For all calculations of wage-loss to those permanently injured this year, the 317 cases only will be used. Before considering the costs of permanent injury this year and the wage-loss, it will be of interest to note the following table that distributes the 381 cases of specific injury by the periods of temporary disability due to the malignancy of the wound:

Those Who Recovered in		
3 weeks	-----	152
5 weeks	-----	96
7 weeks	-----	62
9 weeks	-----	36
11 weeks	-----	14
13 weeks	-----	10
15 weeks	-----	5
17 weeks	-----	2
23 weeks	-----	3
41 weeks	-----	1
Total	-----	381

An average of forty days' time per case.

The loss in earning capacity due to permanent injury has been determined to be approximately 25 per cent for the average case. That is to say that the average man who is permanently injured can hope to earn only 75 per cent as much as he did prior to his injury.

Statistics show that the average age of the employee who is permanently injured is 34 years, and that the average annual wage is \$900. Assuming that the industrial life expectancy of a man thirty-four years of age, is twenty-five years, the total loss in earnings for 317 of those who received injuries that are permanent, is \$1,783,125. That is, each man loses in earning power \$5,625, excluding from these figures any payments of compensation that might be made.

Settlements have only been made as yet in 240 cases of permanent injury, the amount of which is \$40,564.39, or an average of \$169 per case. The average settlement in cases of permanent injury for 1913 was \$126.84. This average is taken from the figures covering the entire year.

An impairment of earning capacity that is permanent, and that is rated at 25 per cent, is worth to the workingman under the compensation law, 65 per cent of his average weekly wages for a period of 100 weeks, or approximately, \$1,125. If it should be necessary to settle the 317 cases of permanent injury on this basis, it would cost industry \$356,625, or exactly 20 per cent of the wage-loss of those permanently injured.

Medical expense amounting to \$15,357.77 was incurred in 258 cases of permanent injury, averaging per case, \$59.52.

Causes of Accidents That Resulted in Permanent Injury.

The following table of causes of accidents that resulted in permanent injury has been abbreviated to accommodate the text. A more detailed statement of causes is found in the appended table, No. 16.

Power-driven machines	250
Shopwork, handling heavy objects, flying fragments, and falling bodies..	251
Collisions, falls from ladders and on stairs, jammed in doors.....	86
Tools	62
Elevators, derricks, winches.....	39
Animals	9
Unknown	1
Total	698

It is easily seen from the foregoing table that power-driven machinery is responsible for a large share of the accidents, while shopwork and flying fragments lead by one. The classification, "Power-driven machines," includes the following: Rollers of printing presses, paper-cutting machines, metal stamping machines, dies, planers, shapers, lathes, etc. The accidents that happen in the shop from handling and lifting could be reduced by reasonable care. The nature of a wound or injury nearly always forces its cause classification. The correlation of

cause and nature of injury is automatic. For instance, in reading a table of causes, it is possible in a general way to determine the resultant injury, as an open gear would not cause a sprain, nor would lifting a heavy object result in a burn. The nature of the injury in the majority of the cases under the heading, "Shopwork," etc., is a crush or a fracture resulting in amputation, but a very frequent injury is that to the eyes. By referring to the table of general classification of causes, it will be noted that accidents to the eyes rank fourth. It is safe to say that three fourths of these accidents could be avoided by very simple and inexpensive means. The most frequent causes of injury to eyes are flying metal fragments, chips of emery, slivers, acids, hot babbit, asphalt, etc., usually preventable by the use of goggles.

In the following table, the nature of the injury has been correlated with the industry in which it happened:

Nature of Specific Injuries.

A—Paralysis.

B—Loss of 1 or more toes.

C—Loss of 1 foot.

D—Loss of leg.

E—Shortening of leg.

F—Loss of arm or forearm.

G—Loss of hand.

H—Mangled thumbs and fingers.

I—Impaired vision in 1 eye.

J—Loss of sight in 1 eye.

K—Organic loss of 1 eye.

L—Loss of ear, 1 case impaired hearing.

M—Partial dementia.

N—Ruptures.

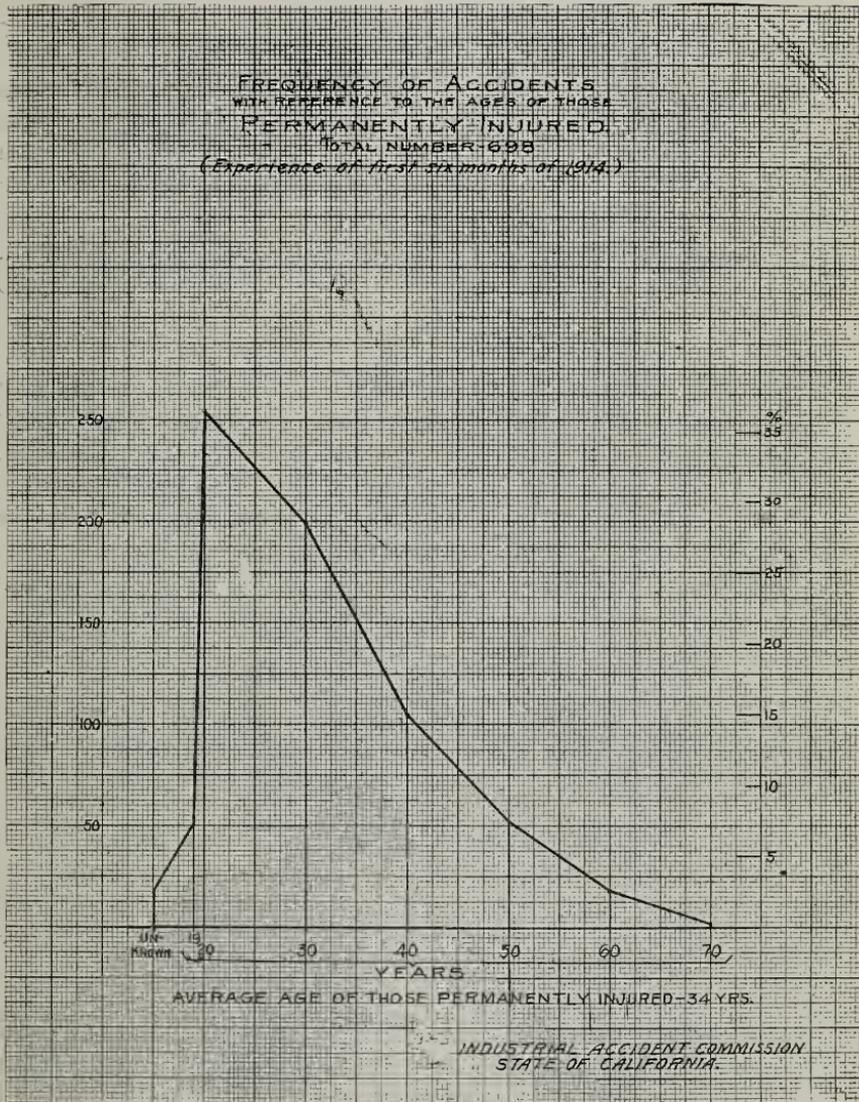

Fig. V.

Attention is called to the graph No. V, and to the following tables, which are self-explanatory. If figures were available, it would be interesting to know the number of young men of the ages of nineteen and twenty, compared with the number of workers above thirty or forty who were employed in the industries responsible for the 698 permanent injuries. If such were the case, it would be an easy matter to discover if, per one hundred men, as many young men or more of the age of nineteen or twenty were injured than men of more maturity and judgment. Such data would scarcely be of monetary value, but it would throw an interesting sidelight on the matter of providing appliances that are needed to safeguard the quasi-matured youth.

This situation possesses more gravity than is revealed on the instant. It does not mean so much to the individual or to society or industry to chop off the hand, foot or finger of a man forty-five or fifty years old, compared with inflicting a like injury on one not yet in his prime. There is scarcely a devisable method to calculate the loss to a young man nineteen or twenty years old who loses a hand or an eye before he has mastered his trade. He has never yet had the advantage of having earned a very large wage to help provide against disaster, but, on the contrary, he is handicapped in the beginning by a permanent loss in earning power and ability to compete with his fellow workers.

It is generally thought that the major part of those killed and permanently injured are men who are old and clumsy, or have grown careless with years. The contrary is true. Industry, like war, crushes the flower of its army. According to graph No. V, 254, or approximately 36 per cent of those who received permanent injuries, were twenty years of age. No distinction of sex is recognized. Twelve girls and women are numbered among those who were crippled by machinery.

The average wage of those permanently injured was \$18 per week.

HERNIA.

The problem of traumatic hernia is being raised at very frequent intervals. In the absence of concrete and authoritative proof that hernia is not induced by accident, but simply occasioned thereby, a solution to the problem is still pending. The presence of reports of 219 cases in six months is sufficient material both to demand attention and investigation. It is the spirit of compensation to pay back to a man in part that which he lost in the interest of one who realized a profit from his labor. Nor is there a disposition to charge industry with that for which it is not and can not be responsible.

It is outside the province of these pages to provoke controversy, but in view of the wide interest aroused because of the frequency of hernia, it was thought not beside the point to cite a few rulings of this Commission regarding hernia, also a few passages from a recent article bearing on this subject:

Recent Rulings of the Industrial Accident Commission of the State of California Regarding Hernia.

(No. 77. May 29, 1914. Chap. 176, Laws 1913.)

United States Fidelity and Guaranty Co., Applicant vs. Max Rosenbach, Defendant.

Application by the insurance carrier of Marks Bros., Inc., to have adjusted the amount of compensation due defendant Rosenbach for disability caused by a hernia received while working in the course of his employment for said Marks Bros., Inc. The evidence showed that defendant was ruptured while lifting and moving a heavy table in his employer's place of business, and that he was operated upon at a San Francisco hospital and incurred the following expenses in relieving himself from the consequences of the injury:

General doctor's bill.....	\$3 00
Doctor's fee for operation.....	170 00
Hospital charges.....	111 00
Cost of private nurse.....	120 00
Bandage.....	6 00

The Commission awarded the defendant the sum of \$61.61 compensation for temporary total disability and the reasonable value of medical and surgical services rendered or to be rendered defendant, not to exceed the sum of one hundred seventy-one dollars (\$171.00), including nursing and hospital expenses. Expenses incurred in addition to this sum by defendant to the extent of \$239.00 were pronounced unreasonable and not a proper charge against the employer or his insurance carrier.

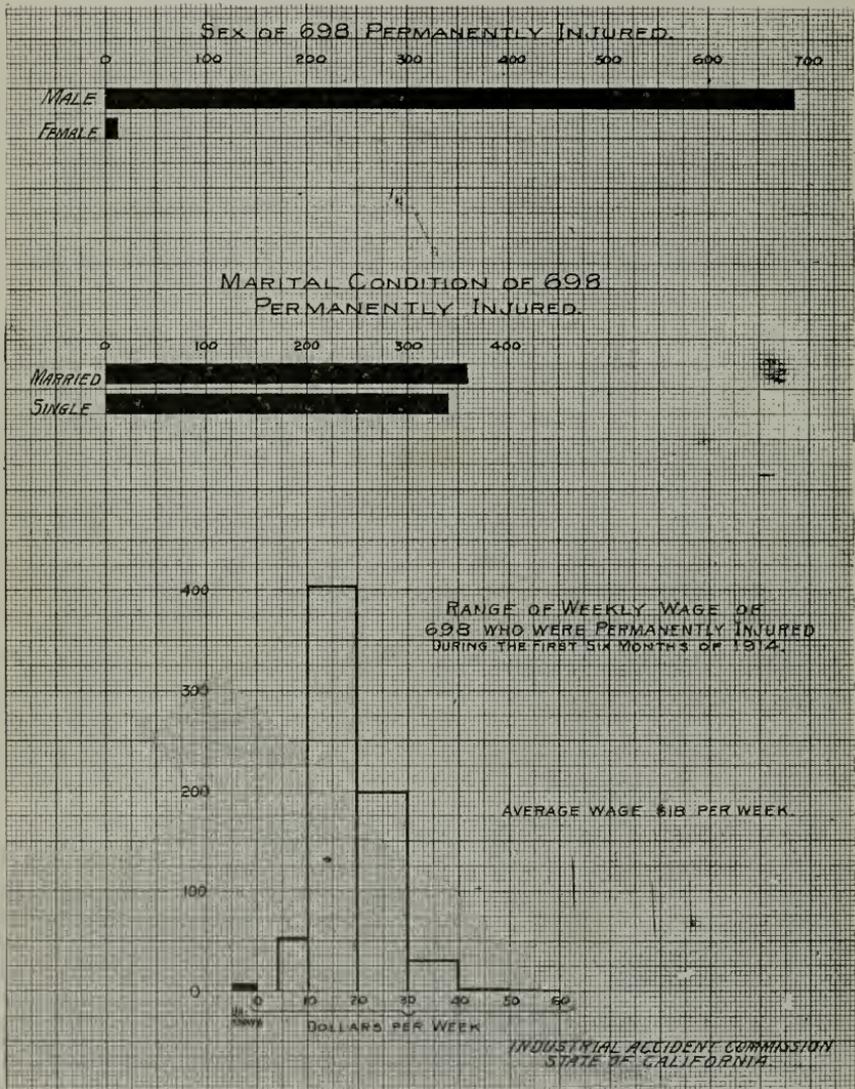

Fig. VI.

(No. 102. June 3, 1914.)

Frank Bertolli, Applicant vs. *Selby Smelting and Lead Company*, Defendant.

This is an application for compensation for hernia claimed to have been caused by a strain while carrying a bar of lead at defendant's smelter at Crockett, March 7, 1914. Applicant was awarded fifty-six dollars and twenty-nine cents (\$56.29) for five and three sevenths weeks temporary total disability, and also the payment of the reasonable value of the medical services rendered by his physician in performing an operation to cure the hernia.

(No. 73. May 4, 1914.)

United States Fidelity and Guaranty Company, Applicant, vs. *Peter Silk*, Defendant.

The defendant suffered a right inguinal hernia, also a "T" fracture of the tibia, as a result of being kicked by a horse on January 10, 1914, while he was employed by the Club Stables of San Diego. The insurance carrier for the employer made the application in order to have the amount of compensation determined. At the time of the hearing an operation had not been performed for the hernia, and the leg was not yet well. The defendant was allowed compensation of \$9.75 per week up to the time of the hearing, amounting to \$112.82 and \$9.75 per week thereafter during the disability resulting from the injury to the leg; also the cost of surgical and hospital treatment necessary for an operation to cure the hernia, together with a temporary total disability indemnity while disabled by reason of said operation, the applicant to submit to the operation within a reasonable time.

(No. 40. May 5, 1914.)

Charles H. Grauss, Applicant vs. *Frankfort General Insurance Company and L. D. McLean Company*, Defendants.

This was an application for indemnity for a temporary total disability resulting from an indirect right inguinal hernia. An operation was performed. The Commission found that the hernia was proximately caused by an industrial accident, and allowed applicant \$25.71 for three and three sevenths weeks of temporary total disability; also payment for hospital and surgical services rendered.

(No. 157. June 8, 1914.)

B. H. Cieck, Applicant, vs. *Standard Oil Company, a corporation*, Defendant.

PROXIMATE CAUSE—INGUINAL HERNIA.—Inguinal hernia is often a matter of slow growth and prenatal tendencies, although it may be caused by a strain or other injury. As it rarely develops in the absence of a prenatal tendency, strong proof is always to be required to establish an industrial accident as its cause. Where applicant can not remember any occasion of strain or injury at the time his hernia was developing, *held*, evidence is insufficient to establish an injury in the course of his employment as the cause thereof.

The applicant in this case was driving a tank wagon for the defendant corporation. On or about the 14th of February, 1914, he felt an ache or pain in the vicinity of the groin on the right side, and, after enduring it two or three days, consulted a physician and was informed that he had a right inguinal hernia.

It occurred to him that this condition might have resulted from a little incident, rather than accident, which took place some days before, when, in taking down from the side rack of the wagon a ten gallon can of oil, his foot slipped and the can came down against him, but he actually felt no injury at that time or at any other time that he can remember prior to the development of the hernia.

It is well known that inguinal hernias often develop without the accompaniment of any strain or other injury and because of prenatal tendency to hernia, and that it is rarely the case that hernia is developed by accident in the absence of such prenatal tendency. Therefore, in nearly all cases where an allowance is made for a hernia as the result of a definitely known accident happening at a certain time and place, the Commission is stretching the statute to the extreme limit in finding that such hernias were produced by accident at all. The Commission certainly would not be warranted in finding that any particular hernia was proximately caused by accident when the

claimant can not remember that any accident happened or noted that any pain was suffered at any particular time and place. There must be something more in the testimony than mere conjecture or surmise to support such claim, and, we may remark in passing, that if applicant had not been a thoroughly honest man and had not "sworn to his own hurt and changed not," this deficiency in the testimony would scarcely have been lacking. Hence we venture the hope that the defendant corporation may, notwithstanding, see its way clear to offer applicant the needed surgical operation.

(No. 79. June 9, 1914.)

United State Fidelity and Guaranty Co., Applicant, vs. *Emil Kurschner*, Defendant.

This is an application by the insurance carrier to have adjusted the right of defendant Emil Kurschner to compensation for disability caused by accidental injury while in the employ of applicant's assured, Johnson & Smith. Defendant was employed as a porter in the hotel of the insured, and while lifting a trunk received a strain causing a left inguinal hernia. After hearing the evidence the Commission made its award in favor of the defendant in the sum of thirty-eight dollars and eighty-nine cents (\$38.89) for temporary total disability and the reasonable value of medical and surgical services rendered to him, the same to be paid to the persons entitled to receive the same.

In many hernia cases, compensation was disallowed because of inability to prove that the injuries resulted from the employment.

The following extracts are from an article in "The National Compensation Journal" by Dr. J. W. Mowell, Chief Medical Adviser, Industrial Insurance Commission of Washington:

Kingdon, in his statistics on hernia, states that out of each 100 cases, 84 are inguinal herniæ, 10 are femoral and five are umbilical, leaving one for miscellaneous; and, taking people as a class, 34 per cent have an hereditary tendency to hernia.

Graser, in his treatise on hernia, says: "One in twenty to thirty individuals have rupture; one in fourteen males, and one in forty-four females. This proportion increases up to the age of 65."

Berger found that, "Upon examination of 7,542 cases, 2,179 were positive in this respect, the proportion being one to 3.6; right side much more common than left, especially in males. Several herniæ may be present at the same time. Upon examination of 6,221 cases of hernia, 1,042 of these were single, 4,526 were bilateral."

The form of hernia that concerns us most is the oblique inguinal hernia. This follows the same course that the testicle took to reach the scrotum. The route is pointed out by the course of the round ligament and the hernia enters the tunica vaginalis communis which surrounds it and guides its course downward. For this reason the vast majority of oblique herniæ sooner or later enter the scrotum. An oblique inguinal hernia enters the internal inguinal ring through the funnel-shaped fascia passing obliquely through the canal and appears through the external inguinal canal. Now a fresh hernia of this class always has an oblique course and is covered by peritoneum, cremaster fibers and connective tissue fibers from the inter-columnar fascia, superficial fascia, the tunica dartos, and finally the skin. As the hernia increases, the relations change somewhat. The rings become enlarged and the canal shortened so that finally the external ring lies almost over the internal ring. When this condition exists, the term "oblique" no longer applies.

Statistics show in children at the age of ten that 25 per cent have a patulous inguinal canal and that about 16 per cent more have a partially open canal. Taking this in connection with Kingdon's statistics that 34 per cent of all people have a tendency to hernia, gives us at once an idea as to how susceptible to hernia the average individual is.

We examine a great many men where it is easy to pass the finger through the external ring into the canal, and on having them cough, receive a decided impulse on end of finger. The individual in this condition is liable to have hernia at any

time, as all that is necessary is for a fold of intestine or omentum or fat to enter the internal ring through the funnel-shaped fascia, and this will begin a dilation of the already open canal. It may slip out and re-enter the conical pouch of the peritoneum and may continue to slip out and get caught again for some time, but a hernia proper develops soon after some abdominal organ remains permanently within the sac, a condition that may appear suddenly, due to exertion, or may be a gradual process not accompanied by pain.

Graser states, "that in ten operations for inguinal herniæ, nine were congenital and one acquired."

As far as the hernia is concerned, it may be congenital, because of defective development. Hernia occurs also in the inguinal region because of insufficient obliteration of the vaginal process. In most of the so-called congenital inguinal herniæ, only the sac itself is congenital. The degree of obliteration may vary considerably, but it is uncommon to have a free communication into the vaginal cavity later in life. It is more apt to close at the scrotal end, and may remain patent in the region of the cord even as far as the internal abdomen ring.

The inguinal canal is the weakest spot in the abdominal wall in any individual. The wider it is and the straighter its course, the more readily will a hernia develop. The external ring, instead of being a slit in the fascia bounded by two firm pillars, may be a round opening.

The acquired predisposition to hernia is the result of physical weakness. In after life if a man loses in weight, the fat disappears from the meshes of the cellular tissues, which become lax and movable, so that the so-called hernial openings are insufficiently plugged. The effect is greater if the patient has previously been obese. The greater acquired predisposition is found in advanced years.

There is considerable discussion as to whether a hernia can appear suddenly in all its component parts. The large majority of authorities believe that this is very extremely rare. The vast majority of acquired herniæ develops very gradually, and are not accidents or fortuitous events. Only a very small percentage of herniæ are the immediate result of an accident. Graser says, "I have never been able to trace a case of hernia in which there were signs of acute trauma, such as oedema and ecchymosis."

A Study of the 25,991 Accidents That Occasioned Temporary Disability.

It must constantly be borne in mind that one of the important functions of accident statistics is to indicate the field where accidents happen most frequently, and where reliable testimony is wanted as to which causes are most common and which industries are chargeable with the larger hazards, it is apparent that the testimony of 25,000 cases is more trustworthy than that of one-fiftieth of that number.

The 291 death cases bear witness to the fact that the unusual or the extremely simple cause is the rule rather than the exception. For instance, death rarely occurs in the common field of injuries, such as bruises, contusions and abrasions resulting from petty machine accidents or simple conditions of hand labor, that number 6,753. Death happens in places where the hazard is common knowledge, and everyone who accepts the conditions realizes the chance taken in coupling cars, switching, scaling beams 300 feet in mid air, sitting in mines with faulty timbers that prop loose slate, or smoking a cigarette over a box of dynamite caps. That these causes of serious accidents are simple and sure is patent to everyone, and there is little to be gained from their study. The frequency of such accidents only serves to accentuate the

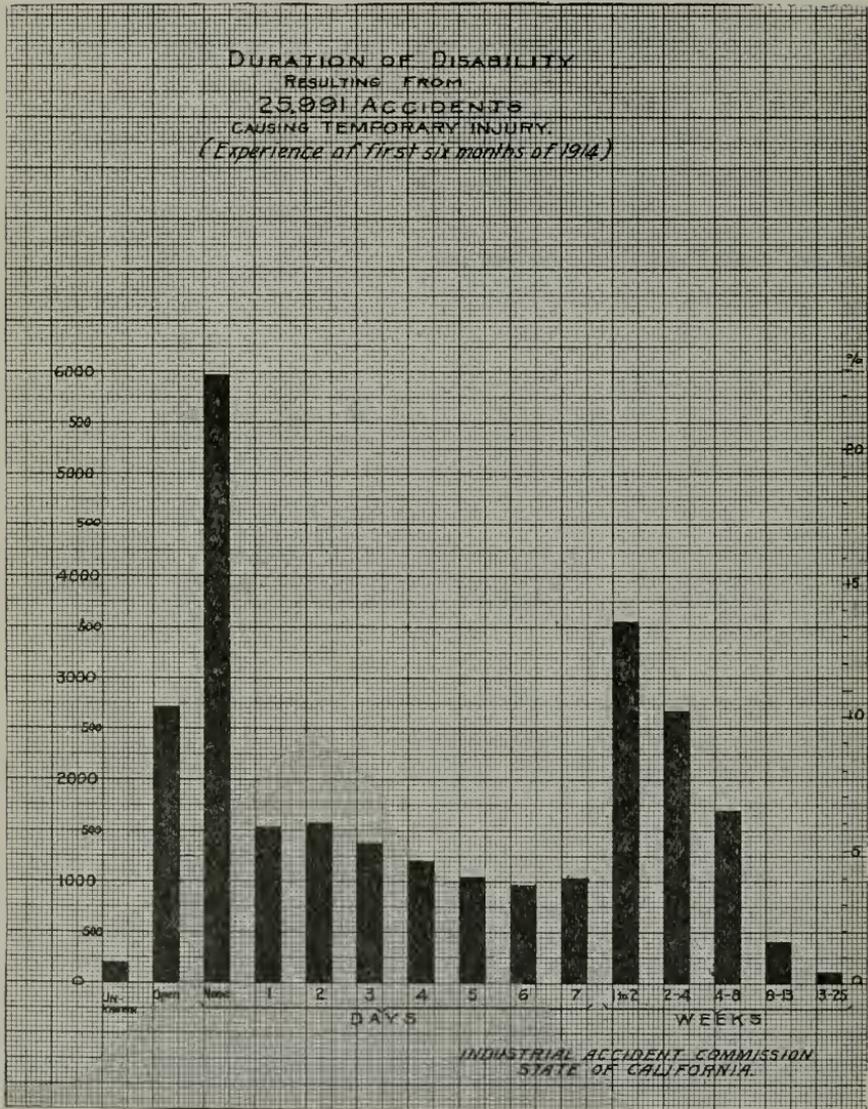

Fig. VII.

need for the exercise of ordinary judgment and care on the part of all concerned; but the consistent recurrence of accidents in similar industries under similar circumstances that cause 25,000 men to lose in a half-year period the equivalent of 784 years for one man, or 784 men for one year's time, furnishes vast opportunity for industry to square itself with a rational economy. Therefore, it is of value to know that 7,572 or 29.13 per cent of the 25,000 injured men received their injuries while at some form of hand labor, and that 1,330 or 5.11 per cent were injured while working at power-driven machinery. A comparison of the causes of fatalities reveals a similar but not altogether reliable condition, where hand labor is responsible for approximately 23 per cent of the deaths, while machinery is responsible for 3.7 per cent. These figures suggest the use that can be made of the chart of Causes of Accidents.

The same study applied to the chart showing the distribution of accidents by the industries in which they occurred indicates in a large way what industries are most responsible and affords a guide to the employer and to the safety engineer in developing necessary measures for accident prevention. Responsibility for the greatest number of accidents by industries is determined by their order.

General construction is responsible for 3,959, or 15.8 per cent. The common hazard of general construction is poor staging quickly constructed. a one or two-plank scaffold with no guards, lax rules governing the disposition of refuse lumber, bricks, etc., new stairways and openings left unprotected.

The construction and operation of steam railways in this state, which possess identically the same hazards in their construction as in ordinary general construction, has afforded occasion for 3,312 injuries to employees in six months. Loading ties, hand cars, etc., rolling rocks from embankments, poor scaffolding on trestles, snow sheds, bad signaling, are not all the remediable conditions of railroading that keep a corps of doctors, nurses and several hospitals busy caring for a small army of injured workmen.

The manufacture of metals and machinery is next in order and is responsible for 2,733 injuries. Lumber is credited with 2,253 and mines with 1,503.

These are simply totals of accidents by industries where they happened, and they indicate very little concerning the hazard native to any specific industry with its special machinery and peculiar conditions. That is to say, the mining of metals may be a far less hazardous occupation than agriculture, considering the number of employees engaged in both industries and the number of injured in a unit of time. It is the measurement of the hazard in each industry that is so essential to

any calculation of rates to justify the assumption of a particular risk. This can only be accomplished by an approximate determination of the number of men who are employed in our different industries and are therefore exposed to their hazards. With these figures obtained and compared with the intelligence of accidents already on file in this office, it would be possible to lay down an accurate estimate "weighted" with a safety factor, of just what accidents would cost industry in compensation and medical aid from year to year.

Totals	18,027	7,964	25,991

Time and Money Loss Through 25,991 Temporary Injuries.

Of these 25,991 cases of temporary injuries, only 3,438, or 13.25 per cent, are cases in which the disability extends beyond the fourteen day therefore exposed to their hazards. With these figures obtained and limit and which are considered compensable. Compensation amounting to \$110,511.25 has been paid in 2,991 of the 3,438 cases, an average of \$36.92 per case, against \$23.70, the average settlement last year. Attention is called to the fact that last year a large per cent of the cases were never compensated, and although at the time of publication of this report compensation has not been paid in all the cases where due, it is not anticipated that there will be any difficulty in settlement.

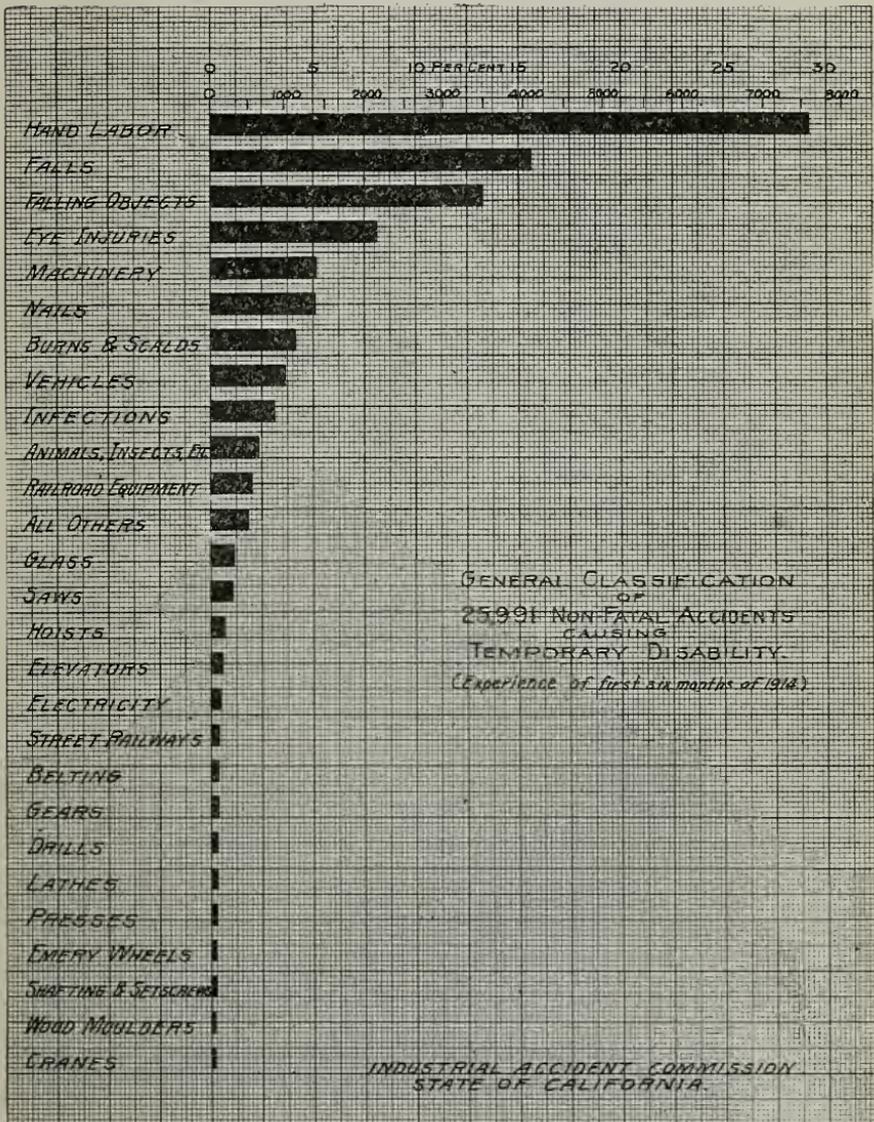

Fig. VIII.

Wage Loss of Those Who Were Temporarily Disabled.

The serious aspects of the question of wage-loss due to temporary injuries have been overlooked. The probable reason for this is that the loss of time and money has been distributed over too large an area to be sorely felt in any particular quarter. It is these small but numerous contributions from 25,000 or more men that eat a \$2,145,816 hole in the annual wages of the 25,991 men, women and boys who are injured for a day or more every year.

A little comparative study of the wage-loss of those temporarily disabled, those permanently disabled, and those who were killed, will indicate the gravity of these small and numerous accidents. For instance, the wage loss of those permanently injured is estimated to be \$1,783,125, and that of those killed to be \$6,052,500, with \$1,072,908 as the wage-loss for those temporarily disabled. The wage-losses of those permanently disabled and of those killed require twenty-five years to elapse for maturity, and are an estimated aggregate based on a twenty-five year life expectancy. The present annual loss of those permanently injured would be one twenty-fifth of \$1,783,125, or \$71,326, compared with \$1,072,908 which is lost in six months by those who receive only temporary injuries. A similar comparison can be made with the cases of death.

An idea of the comparative expense in medical attention of the three classes of accidents can be gained from the following figures covering the cost of medical aid in six months.

For the temporary injuries, industry paid \$128,272.55.

For medical attention to those permanently injured, it paid \$15,357.77.

For medical and burial expenses, it paid \$11,527.55. This means that industry expends more than a quarter of a million dollars per year on injuries that occasion temporary disablement. This item of medical expense to industry does not include the loss due to the equivalent of 784 men absent from the factories and shops for each year.

Statement of Medical Benefits to Employees Who Suffered Temporary Injury.

During the first six months of the year, \$128,272.55 was paid for medicine and the service of physicians. This amount excludes the 7,135 cases that were cared for by physicians under contract or at hospitals owned by the employer.

In 1,863 cases where disability lasted through one day or more, no medical expense was incurred by either casualty company or employer.

By comparing the number of cases where specific charges for medical services were made, and those that were cared for by contract doctors or at company hospitals, it will be noted that about 44 per cent of all cases requiring medical attention were cared for under some form of contract or association plan.

It is next to impossible to obtain accurately the average cost of medical attention per case. As has already been pointed out, 44 per cent of the cases are cared for under contract, which leaves a little more than half of the total number of cases from which to obtain an

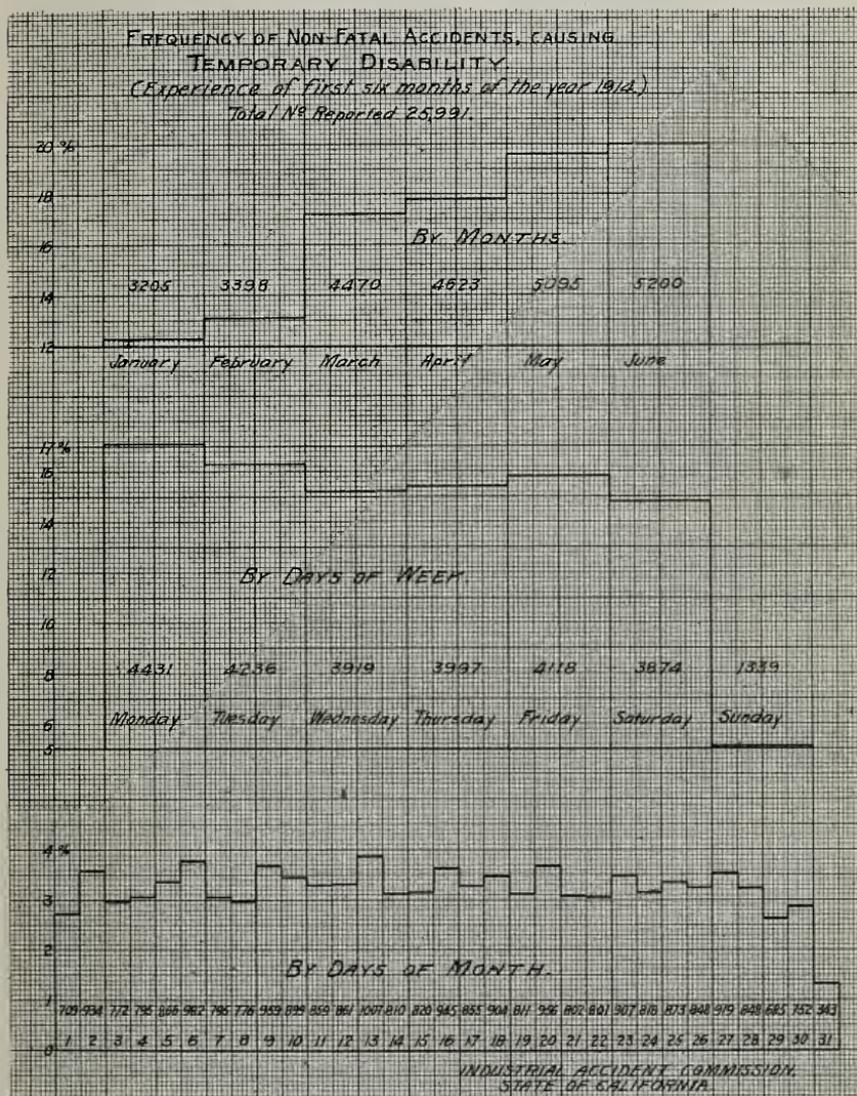

Fig. IX.

average. The necessity of deriving an average cost of medical attention from half the number of cases accounts for this disparity of experiences, and the average cost of \$14.25 is out of all proportion compared with other experience.

However, if the average be derived from the total number of accidents that disable for one day or more it would be found to be considerably less.

For example, the total number of accidents that caused employees to remain off duty for one day or more is 17,131, and the total medical costs \$128,272.55, determining an average of \$7.50 per case treated.

By combining the totals of amounts expended for compensation and medical benefits to employees temporarily disabled, and dividing by the total number of accidents that occasioned disability for one day or more, we find that the average cost to employers and insurance companies is \$9.18 per accident reported.

It is not the province of this bulletin to theorize as to the quality of the medical services rendered, but a glance at the list of infections would indicate that either the employee is negligent or else does not receive proper care.

Several amputations have been made because of improper care and they have always proven more expensive in the long run than if the very best service had been secured in the beginning. There are two cases on record where men died as the result of a sliver wound resulting in infection.

Payments of Compensation and Medical Benefits in Cases of Temporary Disability.

Voluntary Acceptance of the Compensation Act.

Since January 1, 1914, 3,019 farmers, 484 employers of domestic labor and 344 employers of casual labor have voluntarily accepted the provisions of the Workmen's Compensation, Insurance and Safety Act. This widespread interest among those who were exempted from the operations of the act is not simply an indication of discovered interest to those accepting the act's protection, but it means that the vital interests of approximately 30,000 casual, domestic and farm laborers have received attention and that they have the assurance that in case of serious injury they will have medicine and shelter while disabled. This can scarcely be considered unfair, for when the relation of master and servant exists and the servant must labor near a machine that is poorly protected, or go into a corral with a maddened

bull and is thereby injured, there should be, in all soberness, adequate compensation for such a risk. At any rate, it is a safe conclusion that men and business would take particular pains to prevent precious metals from running such risks of destruction, and yet a farm laborer not more than five months ago accepted a wage of \$7.50 per week to care for a farmer's ox and while engaged in some performance of duty, was overpowered by the animal and killed.

Under similar and simpler conditions of labor on the farm, in the last six months, 27 men have lost their lives.

In the case of death cited above, the earnings amounted to approximately \$480 per year. If this amount is considered as a fee in payment of the risk the man assumed in working around dangerous animals and machines, it still would be a bad business deal. Statistics show that the average man is actually worth \$300 a year to society, and the average man expects to live and earn for 25 years. Hence, aside from the value the man may place on his own life, the loss to society was not one life alone, but \$7,500 paid out on a bad risk, the annual premium of which was a man and his "found."

Reporting of Accidents to Employees by Exempted Industries.

Farmers and employers of casual and domestic labor have construed their exemption from the operations of the compensation act as meaning that they were exempted from the reporting of accidents happening to their employees. This misunderstanding has led to endless confusion and has resulted in a great loss of intelligence regarding accidents to such classes of employees.

Assuming that the frequency of non-fatal accidents in farming and allied pursuits bears a similar relation to the number of fatalities as is found to be true in other fields of industry, approximately 2,500 non-fatal accidents to farm laborers alone have not been reported. On the basis of California disability frequency, this would indicate that three cases of death have not been reported and 70 cases of permanent injuries. If these accidents were compensable, farm employees would have received approximately \$170,100, plus medical attention.

The following Table No. X is appended for a comparative study of the hazards in German industries and agriculture with those of California.

The tables appended herewith are self-explanatory and are submitted with the hope that they may prove of value to those interested in the social and economic welfare of this state.

LETTER OF TRANSMITTAL.

SAN FRANCISCO, CALIFORNIA.

June 30, 1914.

Honorable HIRAM W. JOHNSON,
Governor State of California,
Sacramento.

SIR: In accordance with law, we submit for your consideration a statement of the transactions and disbursements of the board for the biennial term July 1, 1912, to June 30, 1914.

The report, we feel, covers fully the many operations of the board for the biennial period treated of, but there are certain features of it to which we desire to call your particular attention.

As the division reports show, much authority previously held by the head office has been delegated to the branch offices, in charge of individual commissioners and division chiefs. This new system has not only relieved the head office of a great many routine matters, but has given the several parts of the state local supervision of affairs, and some one in authority, always quickly and easily reached, to give information and settle disputed questions. The system also permits of a more satisfactory management of the patrol service, which consideration alone, in our opinion, more than justifies its added cost. The work of the various divisions has been not only highly satisfactory but has in fact shown a steadily increasing improvement. Consequently we feel justified in stating that there has been and is now a better management of the board's business than was ever possible under the old system of centering the control of affairs in a head office in charge of a chief deputy.

During the past two years the board has had at all times the services of an attorney, the wisdom of which plan is proven by the greater effectiveness of the patrol service and the more satisfactory handling of prosecutions. As this report shows, the board prosecuted during the two years just past 1993 cases involving violations of the fish and game laws, and out of this number obtained convictions in 1653 cases. The percentage of convictions obtained, 83 per cent, is, so far as we know, the highest ever obtained in the country by any fish or game board. During the period covered by this report, the board has been involved in some of the most important litigation in its history. The satisfactory termination of all this litigation should be sufficient evidence of the effectiveness of the legal department.

As stated by the Superintendent of Hatcheries in his report, it has been the purpose of the board to build up this department to the highest degree of efficiency. No effort or expense has been spared to

give the entire state the best possible distribution of food and game fishes. The board believes also that more fish screens and fish ladders have been installed or authorized than during the previous history of the commission. In the opinion of the board, the work of the hatchery department during the past two years has been the most successful in its history. The Superintendent of Hatcheries can not be too highly commended for the splendid services given by him to the state during this time.

The board's operations in the field of game propagation and distribution have been less extensive during the past two years than for the preceding biennial term. The work of this department has been curtailed, primarily, because the purposes for which it had been created had been served and also because it has seemed desirable to reduce expenditures in this particular direction. The board's operations at the Hayward game farm have disclosed the fact that practically all of the foreign game birds hitherto imported into the state are unsuited to our conditions. A possible exception is the ringneck pheasant, which seems to be adapted to certain humid valleys along the coast. The board has hopes that the pheasant may establish itself in the state and prove a desirable addition to the stock of native birds.

The board has continued its policy of obtaining required data as to stream and water conditions, as is well set forth in the report of the Engineer-Draftsman. An effort has been made, also, to carry on a systematic inquiry as to fishery methods and conditions. A great deal of data has been collected and compiled by special assistants of the board and will be available for such use as the coming legislature may care to make of it. It is planned to give publicity to the fishery investigations through the medium of free bulletins, several of which are now in course of preparation.

One of the deputies has very kindly prepared an interesting paper dealing with the southern Sierras and the desert region, parts of the state of great interest to the fisherman and hunter, but which are not generally known and appreciated at the present time.

We desire to commend for your careful consideration certain contributed articles, the first dealing with "Arid California and Its Animal Life," written by Mr. Frank Stephens, a naturalist of note; the second, "California Fishing Industry from a Commercial Point of View," written by Mr. F. E. Booth, one of the principal commercial fishermen of the state; the last, "National Forests in California," which has been prepared at the board's request by Mr. W. C. Hodge, forest examiner of the United States Forest Service.

We are including in this report a roster of the board's employees as on June 30, 1914. On August 10, 1913, the board's employees and assistants were included in the classified list of state employees under civil service. Nothing that has happened in the forty-three years of the board's history has been fraught with such possibilities of good as this going under civil service. Every employee is now assured that the permanence of his position and the certainty of promotion are matters that rest entirely with him and not with some political power.

As will be noted, the board's revenues have been entirely derived from the sales of licenses, from fines paid into the state treasury for violations of the fish and game laws and from certain miscellaneous and unimportant sources. As a matter of fact, no appropriation of whatever nature or amount has been made for the board's maintenance since the legislative session of 1909. This policy has been based on the theory that fish and game conservation in California should be made self-sustaining, and that the burden of carrying on such work should be placed upon those who profit directly from a supply of fish and game in the state. Under this programme, the four thousand market fishermen, the one hundred and sixty thousand hunters and the eighty odd thousand anglers pay for their profit and pleasure, while the general public, which is only indirectly interested, is relieved of all expense.

Within the past two years the Board of Control has installed a very comprehensive and satisfactory system of records and accounts for the board. Through the use of this system the board is now able to publish each month a statement of disbursements covering every item of expense. It is believed that the hunters and fishermen, and the public as well, will appreciate this much needed provision for a monthly accounting.

Your attention is respectfully called to a comparative statement of the arrests made by this board for a period of twelve years, beginning with 1902. This statement shows that practically one fourth of the total of all arrests for the twelve years have been made during the last biennial term, and further, that almost one half of all arrests made in the said twelve years have been made during your term of office.

As the period covered by this report ends, the commission is reestablishing what in its opinion will become one of the most important branches of the service. The board has been fortunate in securing, as the head of the department, Dr. H. C. Bryant of the University of California, whose work will be the study of game life histories, the working out of methods of conservation and the instruction of the public as to the purposes of the work of his department. In his work Dr. Bryant will have the cooperation of university attaches and of the leading wild life conservationists the country over.

Very few recommendations as to new legislation are included in this report, the board preferring to collect all possible data as to conditions and to hold the same until called upon by the legislature for suggestions.

The board wishes at this time to express its appreciation of the splendid assistance received from state officers, boards and commissions, the universities, the United States Forest Service, and from the large transportation companies and many private citizens. The successful conduct of the board's business has always been and is now largely due to such cooperation.

In conclusion, we desire to state that the board has been actuated in its labors solely with the idea of conducting the affairs entrusted to it in such manner as to benefit all the people of the state, without regard to class or location. The laws have been enforced strictly but justly upon preserve member and unattached hunter alike, as the records will show. It can not be claimed with any degree of truth whatever that the commission has been subservient to any special class or interest, nor do we believe that the general public any longer looks upon the commission as being a class institution.

Respectfully submitted.

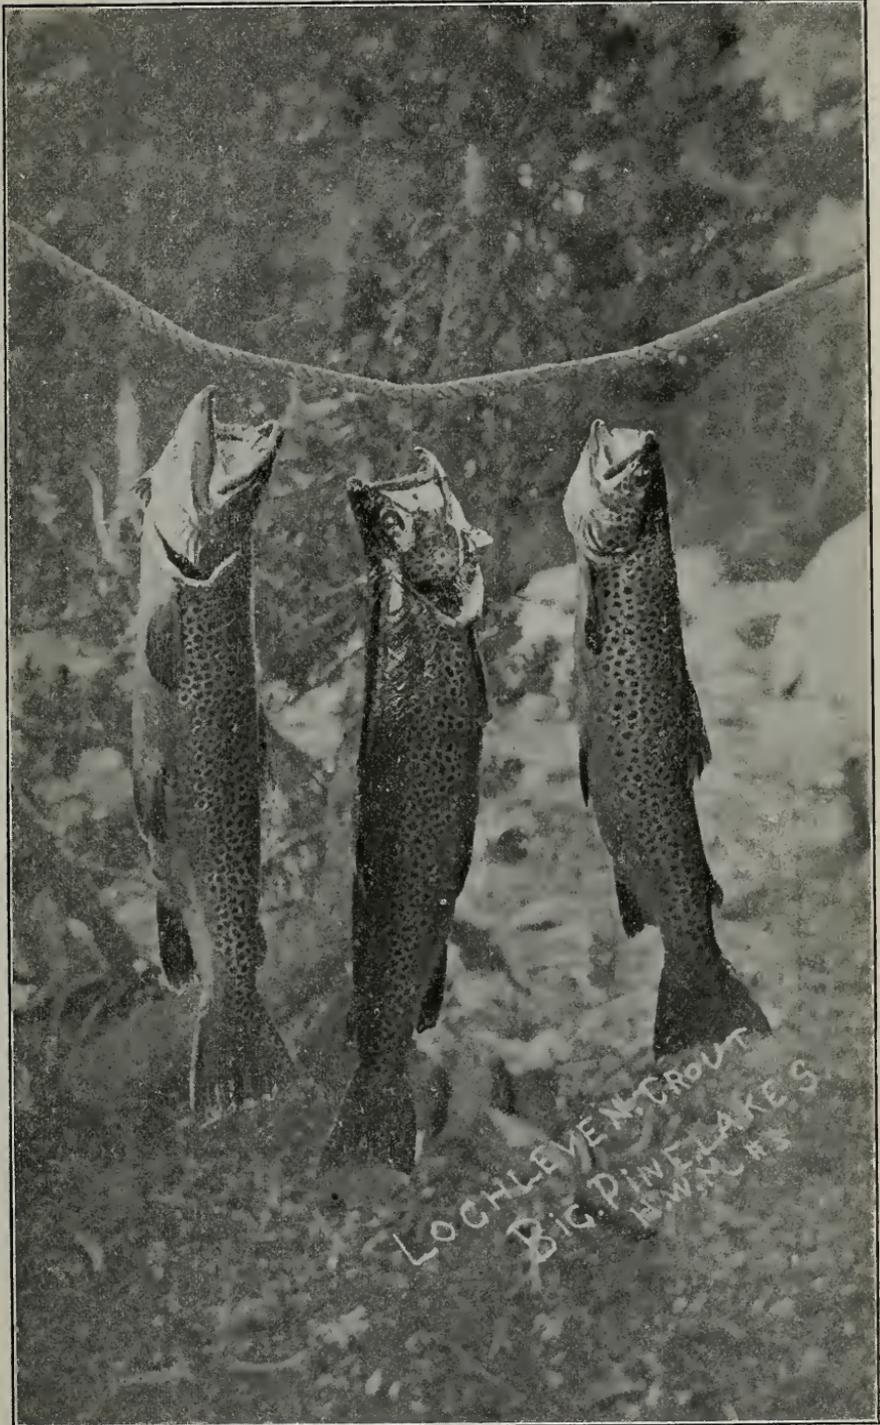

F. M. NEWBERT, *President,*

DIVISION REPORTS.

SAN FRANCISCO DISTRICT.

By J. S. HUNTER, Assistant Secretary.

Game Conditions.

During the past two years, the game situation in the San Francisco division has been very satisfactory. There is yet an abundance of all native varieties of game and with some slight changes in the laws now in force a very considerable increase should be noted in all sections.

Deer.

In many sections the deer are far more abundant than they were a few years ago, but in other sections there has been a very appreciable decline each year. On another page is listed the kill of deer throughout the state. This list is based for the most part on the records obtained by our deputies. It is probable that the actual number killed would be double that given. From these figures it can be easily understood how essential it is that better protection be given if we are to retain one of the most valuable natural assets that we have in our state.

A suggestion has been made that the law prohibit the killing of spike bucks. If such a law were in force, it would decrease the number killed by at least one third. It would also reduce the number of does that are frequently killed by mistake, as it often happens that a doe is mistaken for a spike buck.

The present open season for the coast section is much too early. There is no place where deer should be killed as early as July first. The horns are in the velvet, very soft, and do not make attractive trophies. The season should be arranged between the time the horns become hard and the rutting season, as during the rut the flesh is strong and distasteful in flavor.

There has been no severe epidemic among the deer, such as occurred in Trinity and the adjoining counties during the summer and fall of 1911. It was reported, however, in the fore part of 1914 that the deer were dying in considerable numbers in the northern part of Sonoma and Southern Mendocino counties. It was impossible to carry on an extensive investigation, as reports were not received until after the worst of the trouble was over, but from the information gathered it would seem that approximately four hundred deer died. Some of those examined were infested by a small intestinal parasite, possibly that known as *Nematodirus flicollis*. This parasite occurs commonly in nearly all deer, and in this particular instance apparently developed in abnormal

numbers, resulting in the death of the animals. It is not believed that this abnormal development was caused by any scarcity of food for the deer, nor to any severe climatic conditions, as the winter in that section was practically normal. It is interesting, also, to note that there was a severe loss in the same section by various sheep ranchers. One rancher lost over three hundred yearling sheep of apparently the same trouble. All of the deer that died were yearlings, except a few bucks and does on one of the larger ranches.

The small remnant of the Roosevelt elk, which are now found in the northern part of Humboldt County and in Del Norte County, seem to be increasing, if the reports received can be relied upon. We have no reason to suspect that any of these animals have been killed during the past two years. The people in the section where they range are in entire accord in giving them absolute protection. With this protection, there should be a rapid increase in their numbers as the territory over which they range is limitless in extent.

Valley and Mountain Quail.

Quail in the greater parts of the coast district are barely holding their own. The season for the taking of valley quail and the bag limit is greater than the supply of birds will warrant. It must be remembered that the best quail sections in Monterey and other counties were thoroughly combed over by the market hunters in recent years, and that the birds have not had an opportunity to increase on account of the great number of hunters who kill off every season so many of the breeding stock. The year of 1913 was a poor one for both species of quail, and in many sections they did not pair off, probably on account of the scarcity of rain. The present year, however, will probably be a record breaker, as young quail can now be seen everywhere.

Ducks.

In the bay region, the season of 1912-1913 was far more satisfactory than that of 1913-1914. Probably only one half the number of birds were killed during the latter year that were taken in the season of 1912-1913. It is impossible for us to determine the cause. There were in the season of 1913-1914 a greater number of canvasback. In fact, it is said that in the San Pablo Bay region canvasback have not been so abundant for years. Limits of this excellent duck were the rule rather than the exception in that part of the country for a number of weeks. The closing of the season at the beginning of February by the new federal law has been exceedingly beneficial, as greater numbers of ducks have been noted as breeding. Young mallards were seen in the Alviso Marsh in the early part of March, showing that the parents must have paired off not later than the month of January.

It should be mentioned that the first arrests for the violation of the federal game law in the United States were made by our deputies in the San Francisco Bay region. There was no difficulty in securing convictions in every one of the cases brought before the court, and it would seem that the sportsmen are in accord with the provisions of this new law.

Other species of game, rabbits, squirrels, doves, etc., can be found in abundance in practically every county of the district; even in counties that are adjacent to the great population of the bay region there are many places where good shooting can be had.

Ringneck Pheasants.

Very encouraging reports have been received from the plants of pheasants which have been made in various parts of the state. The area that is adapted to the peculiar requirements of these birds is limited, consequently they probably never will range throughout the state. After they have established themselves in the well watered valleys where insect life is abundant, they may extend their range into the rougher foothills, but it is impossible to start them successfully upon the brush covered hills.

During the past several years, over four thousand pheasants have been liberated. This number, together with those raised this year, will be sufficient to show whether the species will find conditions adapted to a prolific increase.

The Work of Deputies.

The deputies throughout the San Francisco District have without an exception, been doing excellent work. Particular mention should be made of the work in Humboldt County, where, on account of the conscientious manner in which the deputies have worked, they have moulded public opinion so that convictions are the rule, rather than the exception, as they were in former years. Some of the largest fines in the history of the commission for the possession of deer meat during the closed season have been imposed in this county. This change of public opinion has not been confined entirely to Humboldt County. In Mendocino County a hotel proprietor, who was charged with having deer meat in his possession during the closed season, demanded a jury trial, was convicted by a jury of his fellow townsmen, and was fined a substantial sum by the justice, also a fellow townsman.

Great credit should be given to Mr. Frank C. Clarke in this case, as it was based entirely on work that had been done by him. Through this work it is now possible for us to positively identify a piece of venison, no matter how cooked or treated.

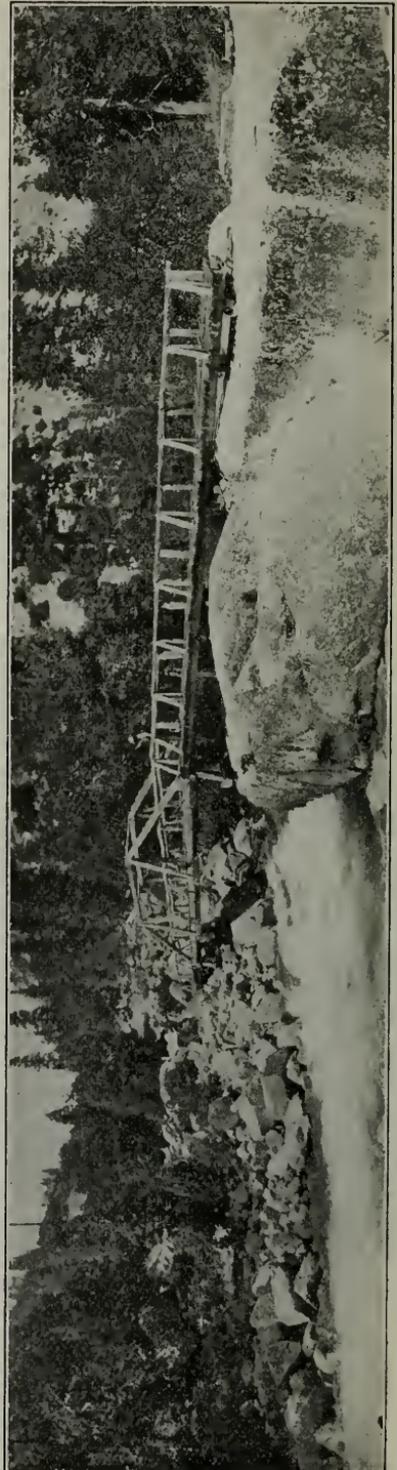

The work of the deputies in San Francisco has also been particularly gratifying. This has been brought about by the heartier cooperation of the courts. During the season three years ago there were fully 250,000 wild ducks brought into the San Francisco market for sale. Previous to that time, there had been organized, to get around the bag limit law, a system of "game transfer companies." It was impossible for the commission to break up these companies until the fall of 1913, when a decision rendered by one of the superior judges showed that they were organized merely to evade the law and recognized the power of the commission to confiscate all ducks that were shipped to them. The total receipt of ducks in San Francisco during the season of 1913, including those shipped in by the market hunters and those shipped by resident sportsmen, was scarcely one third of those shipped in when the game transfer companies were running without hindrance. This can not be attributed entirely to the scarcity of ducks; but credit should be given to the superior judge who made it possible to break up the game transfer companies.

A RESUME OF WILD GAME AND THE CONDITIONS PERTINENT THERETO IN NORTHERN CALIFORNIA.

By GEORGE NEALE, Deputy in Charge, Sacramento District.

The Sacramento Administrative District of the Fish and Game Commission is composed of the following counties of the First Fish and Game District: Siskiyou, Modoc, Shasta, Lassen, Trinity and Tehama; the following counties of the Second Fish and Game District: Glenn, Colusa and Yolo; the following counties of the Third: Plumas, Butte, Sierra, Sutter, Yuba, Nevada, Placer, El Dorado, Alpine, Amador and Sacramento; also San Joaquin County in the Fourth Fish and Game District.

Thus this administrative district comprises twenty-one counties covering an area of 44,174 square miles, or approximately one third the total area of the state. The district is under the supervision of the President of the Commission, Mr. F. M. Newbert.

Feed Conditions and What They Make For.

The abundance of fish, game, birds or animals in a wild state is determined largely by the quantity and character of food that nature provides. The counties of the Sacramento District are particularly favored in this respect, furnishing an abundance of the foods necessary for fish, animals and birds. The skilled deer hunter goes to the range or mountain hillside where the browsing is abundant, for there he knows the deer will surely be, especially in the early morning feeding time and during the dark of the moon. Likewise, the duck hunter who is experienced will prospect the lakes and ponds before the arrival of the ducks, geese, etc., from the far North for indications as to the supply of the rich grasses, seeds, roots and bulbs most sought by water fowl, well knowing that upon these depend the appearance and stay of birds in this locality. The higher altitudes of this district furnish a great supply of wild fruits, berries, seeds, bugs, grasshoppers, etc., of which sage hens, grouse and mountain quail are very fond. That portion of the Sacramento and San Joaquin delta before the era of reclamation was a veritable paradise for wild fowl, and to a great extent still furnishes a food supply for a large number of ducks, geese, swan, sandhill cranes, and other water fowl. All the reeds, seeds, bulbs, and succulent water grasses, except wild rice, known to the Eastern and Middle States and classified by the Department of Agriculture grow in the greatest luxuriance. Many varieties of roots and grasses which I am unable to identify are also much in evidence. The most important of these duck foods are the two varieties of what is known locally as "tule potatoes,"

or bulbs and classified as *Sagittaria latifolia* and *Sagittaria arifolia*. The next in importance perhaps is the wild celery seed or bean, *Vallisneria spiralis*. The writer once killed a canvasback with forty-one of these beans in its gullet. Ducks arriving in poor condition on these feeding grounds will get quite fat in a few days. The most plentiful is the tuber, known as the "wapata." These tubers grow in such quantities in the Sacramento delta that many tons are annually dug by Chinese and shipped to San Francisco for the Japanese and Chinese, by whom they are highly prized for food. There is the wild millet, the sago weed, what is known locally as gray duck food, perch grass weed, what is known as the yellow lily pad (*Nymphae flavo*) seed, which is very abundant in some localities and furnishes a great amount of food, especially favored by wood ducks, and many other seed bearing grasses, too numerous to mention.

The variety of food on which wild ducks feed depends entirely on the depth of water. All the deep water or sea ducks are able to procure their food at from one to ten feet of water, while the waders, mallard, sprig, teal, etc., feed on what can be obtained in shallow water, at from a few inches to two feet, or on what remains on the surface after being pulled loose by the diving ducks. Wild celery has been introduced in several parts of California, but so far with little success, owing, no doubt, to a lack of knowledge of the conditions necessary to insure its successful growth. Circular No. 81 issued by the Bureau of Biological Survey, U. S. Department of Agriculture, gives valuable information as to planting of this seed. Some objection has been raised to the introduction of this seed into California owing to the fact that carp are very partial to it, but there are many varieties of native seeds and grasses which may be successfully planted that carp can not destroy, as is shown by the large crops of duck feed found where carp are abundant. Many of these seeds, roots, etc., may be obtained in the fall of the year, especially from the territory bounded by Cache and Miner sloughs and the Sacramento River. The amount of reclamation being done in overflowed lands will necessitate the planting of this wild feed in waters barren of such seed. Wild ducks demand other feed besides grain as fed by some gun clubs. Of the cultivated grains, mallard and sprig show a preference for cultivated rice.

Fish and Game of the Sacramento Administrative District.

In describing the varieties of game to be found in this district it is not my intention to undertake an analysis or classification of species, etc. I will describe only those which have come under my observation in thirty years' experience in much of the territory under consideration, as well as under the observation of the old hunters and deputies of the Fish and Game Commission.

The classification of the different varieties of deer, bear, etc. is as yet incomplete and largely matters of personal opinion not yet settled. I have seen a female black bear with a black and brown cub and a brown bear with two black cubs. What should concern us most is that a bear, deer or other animal of any kind is a valuable asset to California. I care nothing for the resemblance of one species of deer to another species as long as it is a deer and a good deer. All deer are beautiful and, unfortunately for them, are considered desirable game and good for food.

Large Game Animals.

Numerous varieties of game animals are peculiar to this portion of California. In some counties their numbers are increasing, on account of the wise legislation protecting these animals, and the vigorous prosecution of violators by the Fish and Game Commission, with the cooperation of the prosecuting officers of the several counties. Public spirited citizens have realized what a great asset the fish and game are to the state. It is a magnet which draws the people to the mountains with gun, rod or camera, and is an incentive for outdoor life and health. Remove the fish and game and that incentive will no longer exist.

Deer are to be found in all the twenty-one counties of the Sacramento District; the counties containing the greatest number are doubtless in the eastern and northern part of the state. Along the northern line may be found the large mule and black tail deer, while in the eastern portion may be found the black tail and, occasionally, the large white tail. It is claimed there are other species of small deer, known locally as chemise and chaparral—deer which do not attain a large size are to be found in Nevada, Placer, El Dorado, Amador, Glenn, and Colusa, or at an elevation generally at from eight hundred to thirty-five hundred feet.

Space will not permit giving the various localities where fish and game most abound. There are many booklets issued by the several railroads and various promotion bodies that may be had for the asking. All are reliable and written by authorities who know the game by experience.

From reliable information it seems that the remnant of the antelope in Siskiyou County are increasing in number. There are about three hundred in several bunches, seventy-six being counted recently by one of the commission's deputies in that county.

The elk liberated in Shasta County are increasing; a number of calves having been seen recently. These two last named animals are protected by stringent laws, as are does and spotted fawns of all our deer.

Black and brown bear are numerous in portions of Siskiyou, Modoc, Lassen, Trinity, Tehama and Shasta counties. From reports a few grizzlies still remain in Trinity and Siskiyou counties, together with a large number of smaller mammals, some of them highly predatory.

Upland Game Birds.

Among the feathered and furred game of the upland or mountain are to be found the blue grouse, sage hen, and mountain quail. At a still lower altitude, from sea level up to three thousand feet, may be found anywhere the valley blue quail, possibly the grandest game bird in the world. He will put to the test the nose of the trained pointer or setter

Marble Mountain in western Siskiyou. A great game country.

and the eye and nerve of the hunter as no other game bird can—a game bird in all that the word implies—and always capable of caring for himself under any and all conditions.

The wild or band-tail pigeon is yet in evidence at some seasons. This bird is now protected by federal law.

Rabbits of several varieties, as the jack rabbit, the red hare, cottontail, bush rabbit, and the gray squirrel are numerous in many sections.

Group of Waterfowl.

Of the migratory game and waterfowl, classed as such under the federal regulations, although many are habitant to California, are the mallard, sprig, gray duck or gadwall, widgeon or ballie, spoonbill, blue wing, green wing and cinnamon teal, wood duck, canvasback, redhead, blue bill, black jack, ruddy duck or wire tail, and many other small varieties, coot or mudhen, etc. Of geese, there are the honker or Canada goose, the big brant or Mexican, one of the smaller size and the lesser brant or yelper, two white or snow geese, the large and small, the speckled breast or gambel goose, also a large gray goose resembling the gambel goose, but much larger, weighing as much as ten pounds or

more; local name tule goose. This goose is devoid of the large black feathers seen in the breast of the gambel at any age. It has a different call or cry, and is easily decoyed by call. This goose and one of the brant are not described or identified by any one, as far as I can ascertain.

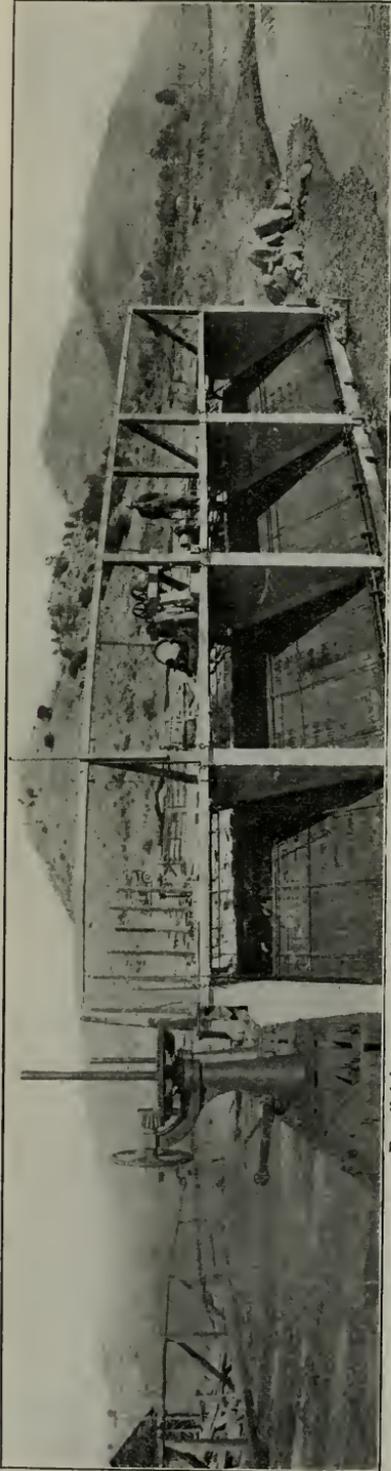

There is the white swan, the sandhill and other cranes, nearly all the shore birds, the king of all, the Wilson or English snipe, which, with the yellowleg and robin snipe, are most abundant of all. There are golden, black-breasted, ringneck, bullhead and other varieties of plover, snipe, sandpipers, ibis, curlew, stilt, avocet, herons, bittern, mergansers, terns, loons, divers, grebes, pelicans, cormorants, etc.

Waterways and Fishes.

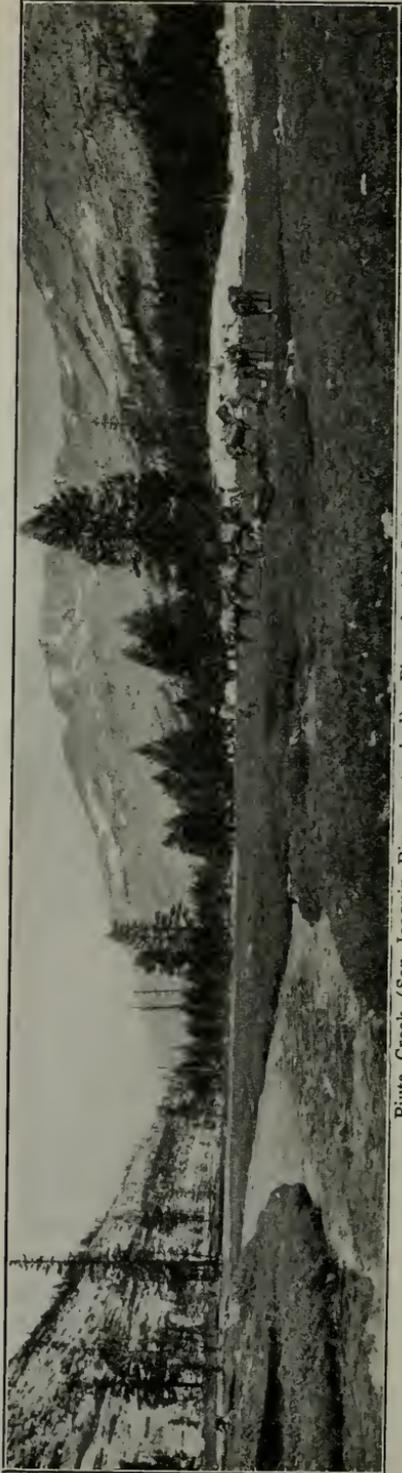

The Sacramento District possibly furnishes a greater mileage of streams and a larger acreage of lakes capable of sustaining fish life than any other like territory. In this district there are said to be 14,500 miles of streams, besides 400,000 acres of lakes, nearly all the habitat of some varieties of fish. The higher regions are the homes of the black spotted, rainbow, Loch Leven, eastern brook, dolly varden, mackinaw and other trout. Many of the upper lakes have been stocked with the gamey large and small mouth black bass. The rivers, lakes and creeks at a lower altitude also furnish the angler with the finest of black and striped bass fishing.

The Sacramento River, being the highway of the quinnat salmon between the Pacific Ocean and the spawning grounds on the numerous cold streams of the tributaries of the Sacramento, is, during the running season, filled with the choicest of salmon, shad, striped and black bass. The introduction of foreign fish into our waters about two decades ago has proved a grand success. These are the shad, striped bass, two varieties of catfish or bullheads, crappie, blue gill, yellow or ring perch, black bass, both of the large and small mouth varieties, besides the large variety of fish native to our rivers. The sloughs tributary to the lower Sacramento and San Joaquin rivers, in Yolo, Solano, San Joaquin and Sacramento counties, afford striped and black bass fishing unsurpassed anywhere. Striped bass are frequently taken with rod and line weighing as high as forty pounds, while black bass of nine pounds are common. The striped and black bass have both penetrated the upper tributaries of the Sacramento River. They are now found two hundred miles up stream from Sacramento city, being especially abundant in season in the American, Feather and Yuba rivers and smaller tributaries. Fortunately, their zone ends where the trout waters commence.

Altogether, the twenty-one counties of the Sacramento District afford the rarest opportunity to the naturalist, the ornithologist and ichthyologist. Should this territory not satisfy him, then he is hard to please indeed.

Piute Creek (San Joaquin River watershed). Planted with Golden trout in 1914.

FRESNO DIVISION.

General Conditions and some Important Problems.

By A. D. FERGUSON, Assistant Commissioner.

Fish in the Valley Streams.

The fishing conditions in the valley section of the Fresno Division are at once important and peculiar. Important, for the reason that many thousands of people in all walks of life, coming from grain ranches, farms, hamlets, and the larger cities, find throughout the fishing season pleasure and recreation along the banks of the two great rivers of the valley. Peculiar in that, due to the diversion of the waters for irrigation purposes, both the San Joaquin and Kings rivers are dry throughout a portion, at least, of their lower courses, almost every fall.

In addition to this natural hazard, two fruitful causes have militated against the existence of fish life in these rivers, to wit, the operations of market fishermen and the absence of screens across the inlets of the various irrigating canals. It would seem hopeless to expect good fishing at any time under such conditions as prevail in these two rivers, and it speaks volumes for the prolificness of these waters that a reasonable supply of fish life has been maintained from year to year. The first of these two chief causes for the destruction of whatever fish life can exist under the natural conditions, has been partially overcome by the action of boards of supervisors in some of the valley counties in forbidding, by ordinance, the use of seines or nets in the taking of fish. The screening problem is now in process of adjustment, through the activities of the Fish and Game Commission.

Effects of Market Fishing.

The Fourth Fish and Game District embraces all of the waters of the valley section south of the San Joaquin County line. The interest of the people in fishing conditions in the local waters is almost universal, and to them the fish are an important and valuable natural resource, not as affording opportunity for a commercial industry, but as an object of pleasurable pursuit and offering an incentive to many outings. Certainly, the waters of the Fourth Fish and Game District are not of sufficient magnitude to maintain a commercial industry of any importance, and if left to their own devices, the market fishermen, while their number is comparatively limited, can, by reason of the fact that the fish during the low water period are congregated in a comparatively few holes and pools, easily capture all of the fish life in these waters. Nor is the damage confined alone to the low water season. The drawing of seines for the purpose of taking even the less valuable fishes, such as

carp, works destruction to the future black bass supply by disturbing or destroying the nests of the bass. Hence no form of commercial fishing can be indulged in in these waters without working injury to the general fish supply. Up to the time when some of the valley counties undertook to conserve the fish supply by passing ordinances forbidding the use of seines and nets in the taking of fish, all of the indigenous fishes were in imminent danger of speedy extermination. The counties of Kings, Tulare, Fresno, Merced and Stanislaus have passed anti-seining ordinances, and the effect has worked great good in those counties whose ordinances have been longest in existence. But since the validity of county ordinances for the better protection of fish and game has been seriously questioned, there should, by all means, be a state law enacted forbidding the taking of any variety of fish at any time by means of seines, nets or traps of any description. The passage of such a law would not displace an industry of any commercial importance. As a matter of fact, the total revenue derived by the state from the sale of commercial fishing licenses in the whole Fourth Fish and Game District is less than \$400. On the other hand, while working incalculable benefit to the people of the Fourth District, the cessation of commercial fishing would permit of many salmon reaching the spawning waters of the upper rivers and thus much good eventually be done the general commercial fishing industry of the state.

Screens.

The destruction of fish life in the many irrigating canals has been a serious drain upon the general supply. In the spring of the year the fish descend these canals in large numbers, probably in search of food, and when the canals are turned dry in the fall the annual destruction of fish life is appalling. Until the year 1913, no demand had been made by the Fish and Game Commission for the installation of screens across the inlets of the canals for the reason that no adequate screen had been devised which would effectively exclude fish from the canals without seriously interfering with the flow of water. Recognizing the prime importance of the horticultural interests, the commission was loath to take any action which might possibly stop the flow of water in the canals, since not only the material prosperity but the very existence of the population of the valley depends upon the irrigating water. It should not be understood, however, that the matter had, in the interim, received no attention by the commission. Many experiments were tried looking to the securing of an adequate screening device, particularly in the Fresno Division. Mr. W. H. Shebley, Superintendent of Hatcheries, and members of his staff, have succeeded in perfecting a parallel bar device with an automatic cleaning attachment which is thoroughly adapted to the purposes for which it was intended. The important

departure, and the successful feature, of the new device, is the dropping of the mesh screen and the substitution of parallel bars of $\frac{1}{16}$ inch by 1 inch galvanized iron, bound together in sections by means of stay rods, and the proper opening between bars secured by the use of burrs between the bars. The space between the bars is usually one fourth of an inch. It has been proven that this type not only offers less resistance to the flow of water but also has no tendency to choke up with trash and slickens as is the case with square mesh screens. This device has the further advantage of being easily cleaned, in contradistinction to a mesh screen, for the cleaning of which no adequate device has ever been found. An automatic cleaning device has been perfected by Mr. R. W. Requa of the hatchery force. This device involves the use of angle iron rakers attached to sprocket chains which are driven at slow speed by sprocket wheels set on shafts top and bottom at both ends of the screen. The mechanism can be driven either by a small electric motor or by a waterwheel set in the canal itself. The angle irons drag over the face of the screen and carry off any trash which may have collected thereon. The total displacement of water by this type of screen is about 8 per cent; hence, in order to permit the passage of water through the screen without increasing the pressure, it is necessary only to place the screening device in such position as to occupy 8 per cent more of the river channel. In practice, canal companies usually allow a somewhat greater percentage for displacement. This type of screen is being rapidly installed throughout the division, and the ultimate effect upon the fish supply will be highly beneficial; for although the lower waters of these rivers may go dry, yet above the point of last diversion of water there will always be sufficient living water in the river channel to carry a sufficient number of fish to perpetuate the supply.

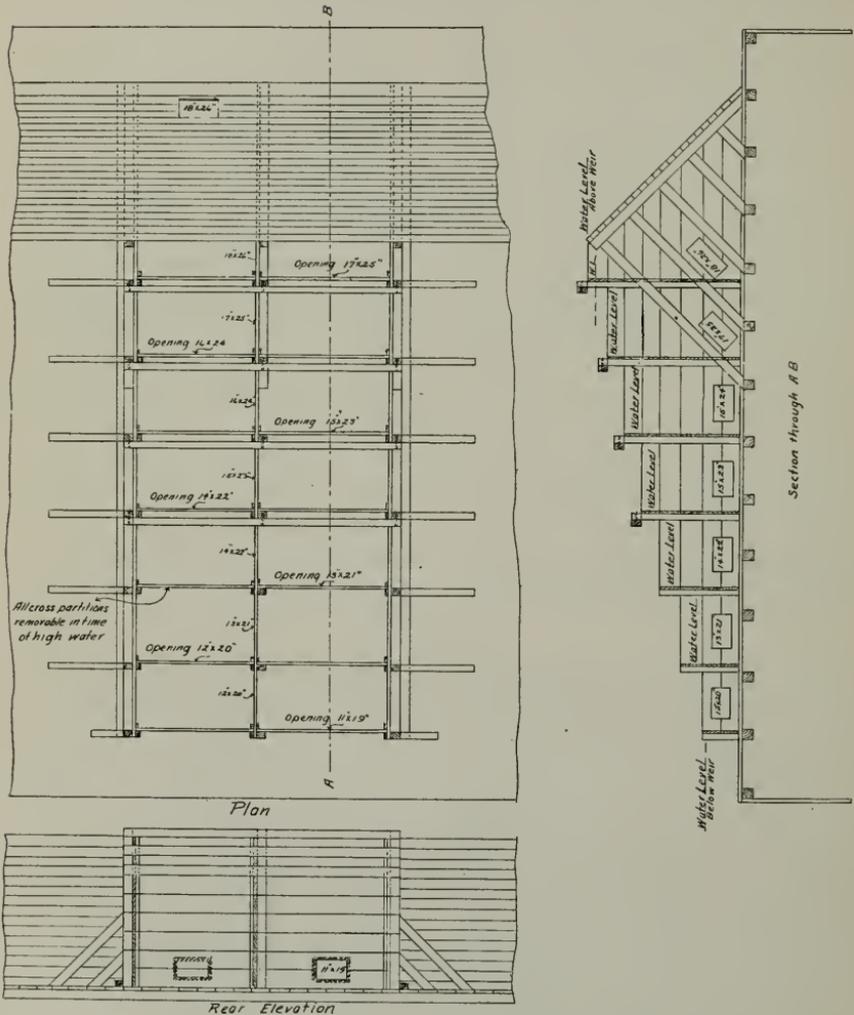

Fishways.

The problem of providing fishways upon the diverting dams and weirs of these rivers was also unique. Although artificial fishways have been in use for three hundred years, all of the various types of fishways heretofore used have had to do with dams having a permanent level, such as concrete and masonry dams. But in the rivers of the San Joaquin Valley the prevailing type of weir provides for a varying height. The canal inlets are usually constructed to receive water at what may be called a mean high water level. The water level at the inlet of the canal is maintained by raising or lowering the height of the diverting weir. To accomplish this, removable boards called "flash boards" are inserted or removed in the face of the weir. Thus it may happen that the actual height of these weir boards may vary several feet in a day. No type of fishway heretofore invented could be made to conform to this condition of varying levels. To meet the situation, an entirely new type of fishway was evolved, after many experiments, by

Messrs. Ernest Schaeffle, executive secretary of the commission, and Deputies E. W. Smalley and A. D. Ferguson of the Fresno Division. The construction of this fishway, now called by the Fish and Game Commission the "Kings River fishway," is shown by the following drawing.

Plan of
Kings River Type
FISHWAY

Showing typical installation in a weir
eight feet from floor to crest
Scale 1/4 inch = 1 foot.

The principle involved is, that the pressure in any of the openings in the bottom of the fishway between compartments is equal only to the hydrostatic pressure of a column of water whose height is the difference

between the water level in one compartment and the water level in the next compartment above; the same being true of the last compartment and the river level itself. This permits ascending fish to pass through the dam on the bottom level of the stream instead of passing *over* the dam as in other fishways. This regular procession of increased water levels in each succeeding compartment is secured by reducing the dimensions of each outlet opening. The evolution of the Kings River type of fishway is somewhat interesting. Starting with the theory that if a succession of single compartment pools, each one foot lower than the other, were constructed in such manner that if a small volume of water were permitted to overflow from the river into the first and thence into the succeeding pools, and if an opening were cut in each of the pools flush with the bottom of the river, then, so long as there was an overpour from one pool to the next, the pressure in the bottom openings would be equal only to the hydrostatic pressure between pools—in other words, a column of water one foot high. By experiments it was demonstrated that if each pool were divided by a lateral partition into two pools, and an opening of the same size as the other bottom openings were cut through this partition, the pressure in the openings could be further diminished. This led to the further experiment of decreasing the size of the outlet bottom openings one inch in each dimension in a regular ratio between each set of double compartment pools, leaving the opening in the lateral compartment the same size as the inlet opening next above. The result proved that the desired difference of water levels between the compartment pools could be maintained without any overpour from the river, and without increasing the pressure in any of the fishway openings. The velocity of the water in passing through the openings in the pools in this type of fishway does not exceed four feet per second, and this permits of the passage of even the most sluggish of fish through any weir, no matter what its height. There is practically no limit to the possibilities of this type of fishway. On extremely high dams, it would become only a matter of expense. On board weirs, up to a height of twenty feet, the expense is comparatively trifling.

Tulare Lake.

Tulare Lake has always been an important factor in the conditions affecting fish life in Kings River waters. To a lesser degree this is also true of the Kaweah and Tule rivers. After a succession of wet years, this large, shallow lake, approximating twenty by forty miles in area, has afforded a haven for vast numbers of Sacramento perch, catfish, black bass, Sacramento "pike," and many fishes of minor value. With the advent of the spring freshets the fish of the lake have annually migrated to their spawning grounds in the streams which feed the lake. Nowhere else in the state have Sacramento perch and catfish been found

in such numbers and of the size of these Tulare Lake fish. Unfortunately, the dry seasons of 1912 and 1913 were accountable for the almost total disappearance of what had once been a lake of large proportions. With the drying up of the waters of the lake, hundreds of tons of valuable food and game fishes were destroyed. In this year, 1914, a large volume of water has been poured into the lake, which will make it again a sea of water of considerable size and importance. But its future existence depends upon two factors; *first*, a succession of wet seasons; and, *second*, whether or not the flood waters of the feeder rivers, particularly Kings River, shall be diverted from the lake and thrown into the San Joaquin River in order that the lake bed may be reclaimed for agricultural purposes. Very naturally, since the bed of the lake, when dry, is agricultural land of wonderful possibilities, it is but a question of time when all or practically all of the lake bed will be reclaimed by the agriculturists. Already, a great drainage channel is being constructed which, while primarily intended to reclaim other lands, will have a tendency to divert the flood waters of Kings River from the lake to the San Joaquin River. While the effect of this will preclude the return of the old-time favorable conditions for fish life at the same time it will not be without its compensations. The setting up of a well defined current from Kings River into the San Joaquin will undoubtedly attract a run of salmon, striped bass and possibly shad, into Kings River. It is worthy of being recorded that this reclamation work is already responsible for a noticeable run of salmon from the San Joaquin into Kings River. Prior to the year 1911, salmon did not enter Kings River, due to the fact that although the two streams were directly connected, there was no perceptible current for many miles throughout the swamp and overflowed section lying between the San Joaquin River at the mouth of Fresno slough and Summit Lake, which was once the dividing line where part of the waters of Kings River discharged toward the San Joaquin, while the rest of the Kings River waters flowed into Tulare Lake. In the spring of the year 1911, due partly to the partial confinement of these Kings River flood waters into one channel, and partly to the fact that the Miller & Lux dam checked the current of the San Joaquin River for a considerable distance above the dam, a few salmon, confused, no doubt, by so much still water, found their way into the connecting channel of Kings River and thence into Kings River as far up as the town of Laton. The following year, for the first time, a very considerable run of salmon actually entered Kings River and ascended the stream to a point at least as high up the river as Trimmer Springs, being some 125 miles from the point where Kings River enters the San Joaquin channel. In 1913, due to the dry

season, no Kings River water entered the San Joaquin River, but in June of this year a very considerable run of salmon again appeared in upper Kings River.

Food Value of the Fish.

While the value of the fish life in the rivers of the Fourth Fish and Game District is chiefly in the opportunities for sport and pleasure offered the population, at the same time the food value of these fishes is not inconsiderable. In the favorable fishing season of 1911, the waters of lower Kings River were literally alive with catfish, Sacramento perch and black bass. Hundreds of people from points within a radius of fifty miles of the river, taking advantage of the presence of such large numbers of fish, took, with hook and line, not only enough fish for their own immediate needs, but often fish in quantities for distribution to their neighbors. At the weir of the Empire Land and Water Company near Tulare Lake, a daily average of 400 to 500 persons fished from the banks of the river for a period of two months. Whole families were camped there from Friday evening until Monday morning and every one apparently was able to take, with hook and line, all of the fish which they could carry away with them. While black bass and Sacramento perch were plentiful, catfish largely predominated. These catfish so caught were from two to twelve pounds weight, and it was estimated by deputies of the Fish and Game Commission, who were constantly stationed at that point, that in two months from one half mile of the river waters, 150 tons of catfish alone were taken with hook and line.

The Future Prospect.

Although the unusually favorable condition last described probably never again will obtain, at the same time it is possible, by the stoppage of commercial fishing, the screening of the canals and the establishment of practical fishways, to restore and maintain, for a great many years, a high degree of excellence of fishing conditions throughout all of the lower waters of the rivers of the Fourth District. A new factor must, within a few years, enter into the general situation. It is more than probable that great storage reservoirs will be constructed to impound the flood waters of the more important rivers. The trend of public opinion seems to be that while impounding the flood waters of these rivers for the purpose of providing a regular and sufficient flow of water for the irrigating canals, the navigation interests shall also be considered. No doubt the flood waters can be so conserved and distributed that a regular flow can be maintained sufficient not only to provide water for all of the irrigating canals, but to provide a perpetual flow throughout the whole length of the river channels. The beneficial effect on fish life of such a system, should it ever be inaugurated, is apparent.

Water Diversion for Power Purposes.

Whatever may be said of the necessary sacrifice of fish life in the streams of the valley section by reason of the diversion of water for irrigation purposes, the situation is different in control and in principle with regard to the streams of the Sierra Nevada Mountains. In the valley section, the water diverted from the streams by means of irrigation canals is spread upon the land and does not return to the streams, but the water thus diverted is necessary to the very existence of the population. In the mountains, water is usually diverted for the purpose of developing electric power, and returns eventually to the natural channels. Here, since the water is not lost but diverted and returned to the channels, the problem of conserving the fish life in the streams is simple in principle, but even more important than the similar problem in the valley section, because, with proper regulations, the fish life can be forever perpetuated; while it is conceivable that the time may come when all of the lower waters may be used for irrigation. Nor does the principle of the greatest good to the greatest number apply alike to the use of water by irrigationists and power companies. In the first instance it amounts practically to a public use of a public resource. Irrigating canals in the San Joaquin Valley are operated under legally organized irrigation districts, cooperative companies of horticulturists or by public service corporations selling water, usually, to holders of water rights whose money actually dug the canals. Thus, in any event, the ownership of the land and the use of the water are intimately related; while in the second instance the enterprise is wholly commercial. The capital invested bears a different relation so far as the public is concerned, and while power companies are public service corporations, the electric power developed by the diversion of the stream does not necessarily make for the benefit of the people who live adjacent to its banks. As a matter of fact, the biggest power projects in the Sierra Nevadas were inaugurated for the purpose of developing electricity to be carried on wires, entirely away from the San Joaquin Valley.

The problem, then, of water diversion for power purposes with relation to its effect on fish life, may be safely treated as separate and distinct from the diversion and use of the same water after it reaches the valley section.

The effect of water diversion for power purposes, presents many complications. For instance, and, illustrating from actual conditions, if a comparatively small percentage of the minimum flow of a natural trout stream is diverted, no harm results. If a storage reservoir is constructed across the head of a precipitous, rocky gorge, which naturally presents a series of falls impassable by fish and after being used to generate electric power, the water is returned to the channel at a point more favorable for the existence of fish, great good has been

done to the fish interests. For while the fishing waters destroyed by the diversion of the water from the section of the stream where conditions for the existence of fish life are not good, is negligible, the lower section of the channel is not affected, and the storage reservoir, if large, will support infinitely more fish life than could have existed in many miles of the stream under natural conditions. Again, if all of the minimum flow of a minor stream is diverted at a point which practically marks the limit of the downward migration of trout, and which is above the limit of the upward migration of the fishes of the lower river, no great amount of harm has been done. But throughout the mountains there are trout waters of such importance that the public interests will be irreparably damaged if a considerable portion of the channels of such streams were to be dried up because of the diversion of water for power purposes. And such streams, by reason of the fact that they occupy the bottoms of deep canyons where erosion has reduced the fall of the stream to comparatively slight proportions, if diverted for power purposes, will not be returned to the original channel for many miles. The development of power by falling water in our mountains is simply a question of contours. If water is diverted from a stream at the head of a succession of falls or rapids, and carried in conduits nearly on a contour level, it need not be taken a very considerable distance until it shall have attained a level a thousand feet or more above the bed of the stream. Naturally the largest streams occupy the deepest canyons where the grade is the slightest; hence, the water diverted from such streams must be carried a great distance before it will have attained a height above the canyon floor sufficient for the purposes of developing a large amount of hydroelectric power. And naturally, too, those who would develop hydroelectric power are attracted to the streams carrying a large volume of water; and therein is the menace to the people's interests, since such streams carry the greatest amount of fish life. Typical instances of this, the most important condition, are found in Kern River from Kernville upward; in Kings River from Redhill upward, and including its main branches; and in the San Joaquin River from the town of Friant, almost to the sources of the main branches of the said stream. These rivers and their main feeders teem with fish life, and are among the most important trout waters of the state. The fish which abound in these waters are not only a resource of great immediate importance to the people of California, but are of potential importance impossible to measure in figures of dollars and cents. In all reason, this fish life must be conserved.

That the fear that the waters of such typical streams may be diverted to the detriment of the fish interests is well grounded, is evidenced by the fact that on Kern River above Kernville, preliminary construction

work has already been started to divert, by a large ditch, Kern River water for power purposes. Apparently no storage reservoir is provided for, and if the interested power company is permitted to divert all of the minimum flow of the river, the fish life in sixteen miles of what is now one of the finest trout streams in the state will be destroyed. Although the maximum flow of Kern River at the point of this proposed diversion is several thousand second feet, yet the minimum flow recorded on the government gauge in 1913 was 334 feet for a period of about ten days. It is quite conceivable that a hydroelectric plant would require all of this minimum flow if a full degree of efficiency were

Kern River near Fairview.

to be maintained. Furthermore, it is generally understood that engineers have, at the behest of a power company, made surveys which contemplate the diversion of Kern River water still thirty miles above the intake of the proposed diverting ditch last named. If this were the only important trout stream threatened, the situation would be serious enough, but unfortunately it is more than possible that in the race for hydroelectric power development throughout the Sierra Nevada mountains, similar projects will be undertaken on other equally important streams and on a scale of such magnitude as to make difficult the obtaining of sufficient water for the power plants without taking all of the minimum flow of the streams.

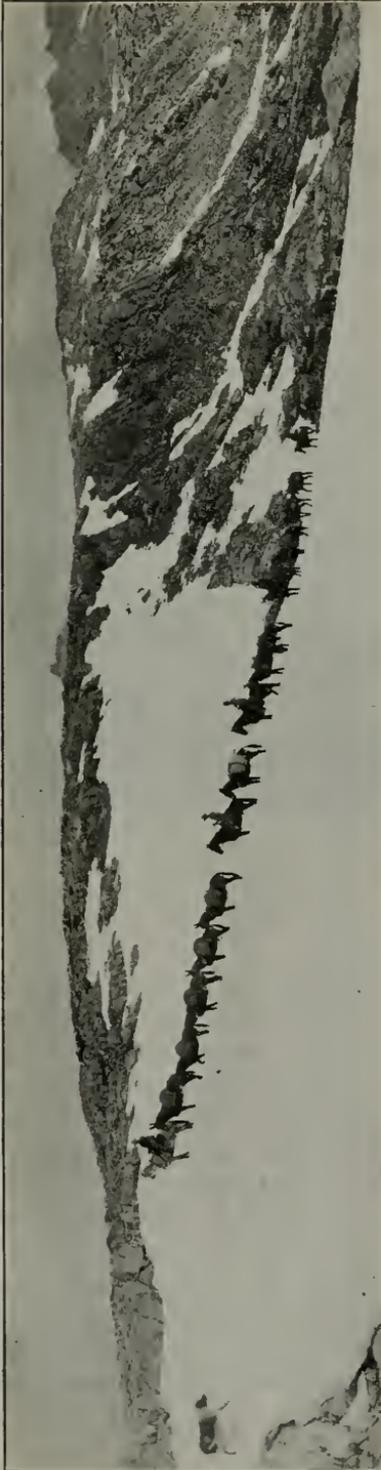

To meet the situation, the Fish and Game Commission will insist upon the strict observance, in spirit as well as in letter, of the law compelling the installation of fishways upon all dams. The law requires that the owners or occupants of all dams or artificial obstructions in all rivers of this state, naturally frequented by migratory fish, must construct and

maintain durable and efficient fishways in accordance with the plans and specifications as determined by the Fish and Game Commission, and such fishways must be kept open to the free passage of fish at all times. Ten per centum of the minimum flow of a mountain stream passing through a fishway might be sufficient to permit the free passage of fish throughout the stream channel below the point of water diversion, and thence over the obstruction. The matter is so important that the right of the people to insist upon the preservation of the fish life in our mountain streams, must be jealously guarded, and if necessary, more firmly established by further legislative acts. The principle should be fixed by law, that there must at all times, in all trout streams, be a sufficient minimum flow of water passing any diverting dam or intake canal to insure the perpetuation of the fish life from the point of diversion to the point where the diverted water is returned to the natural channel.

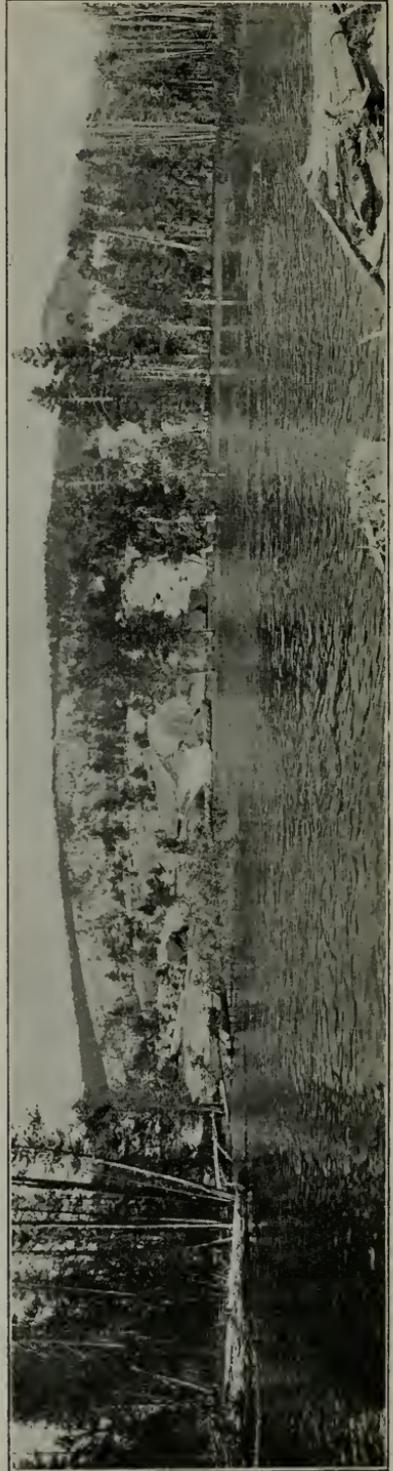

It must not be taken for granted that a law to provide for the absolute protection of the fish life will prevent or seriously interfere with hydroelectric power development in the state. When the percentage of the minimum flow of any stream which must be permitted to remain in the channel is fixed by law, engineers, in figuring on the development of a certain amount of hydroelectric power, will plan either to store by reservoirs a sufficient amount of the flood waters of such stream to provide a constant minimum flow, or will plan a succession of power house sites at descending levels along the course of the stream the waters of which are to be used. It will then become a question of expense. But the people's rights are supreme in all instances and such expense should be taken into consideration by the projectors of future hydroelectric enterprises.

Trout Planting.

The work of reaching and planting, with desirable varieties of trout, the barren waters of the higher mountains, progress in which has been set forth in previous biennial reports, has been consistently carried forward. It would require a study of a topographic map of the mountain region to obtain any adequate idea of the magnitude and importance of these operations. As stated in previous reports, only those few main channels which occupy the beds of deep canyons in the Sierra Nevada Mountains, where no impassable fall exists between the point where the trout are found and the ocean, naturally contained any fish life. The feeder waters of this vast watershed, coming into the main channels over high and impassable falls, were naturally devoid of fish life of any kind. To reach and plant with desirable varieties of trout, these barren waters, has been the fixed policy of the Fish and Game

Fish and Game Commission's 20-mule pack-train crossing Piute Pass. Elevation 11,400 feet. Train carrying Golden trout.

A pool below Jackass Falls on South Fork San Joaquin River.

Commission since the organization of the Fresno Division. Since there are no wagon roads in existence, the transportation of trout involves packhorse distribution. With surprising celerity the public has discovered the fishing thus established in previously little known streams, and many thousands of people from the adjacent valleys now annually visit, in pursuit of pleasure, streams which, until placed there by the commission's deputies, contained no fish life. Nor are the streams alone important. In the higher mountains of the Fresno Division there are over 1,000 lakes and lakelets, most of which are adapted to the existence of fish life. A great many of the more accessible of these lakes have already been reached and planted with rainbow, Loch Leven and Eastern brook trout. In the watersheds of the Kern and Kings rivers a great many lakes, too, have been reached and planted with adult golden trout. Following the original plan, other lakes of the summit region are now being reached as fast as possible and stocked with none but golden trout. The close of the season 1914 will mark the extension of the range of the golden trout northward from their original habitat in the Mount Whitney region more than 100 miles. Cut off by high falls from the lower waters where other varieties of trout have been planted, the golden trout now being established in the summit region will remain true to their type, since no opportunity will be afforded for interbreeding with other varieties. For future reference, it is here recorded that in these golden trout operations only the golden trout of Volcano Creek, *Salmo roosevelti* (Evermann) are being used as stock fish. Two other varieties of golden trout, to wit, the *Salmo agua bonita* (Jordan) and *Salmo whitei* (Evermann) are recognized by the authorities, but lest confusion should arise in identifying these transplanted fish in future years, only the Volcano Creek fish are used in the commission's operations.

The details of the fish planting operations of the Fresno office during the season 1913, are set forth in the following copy of a report filed at the close of the season. This report deals only with the planting of barren waters by the Fresno office of the Fish and Game Commission. Several hundred thousand trout fry were distributed to public spirited applicants throughout the Fresno Division, to be used in replenishing the supply of trout in the more accessible, and consequently over fished streams.

Fish Planting Report, 1913.

FISH AND GAME COMMISSION,
San Francisco, California.

GENTLEMEN: I have the honor to report the season's fish planting operations of this division, as follows:

In the month of August (16th to 29th), Deputy W. G. Scott of Tuolumne County, assisted by William Guinn, with seven pack animals, undertook, and carried on to a successful conclusion the stocking of some important lakes in the mountains of

Tuolumne County. Adult stock fish of the rainbow trout variety were used in Deputy Scott's operations. Deputy Scott was compelled to take his supply of stock fish with hook and line. Fishing with "flies," the deputy and his assistant first took 250 rainbow trout ranging from eight to twelve inches in length, from the stream at Lord's Meadow near the Yosemite National Park line, and thereafter planted them in Deer Lake and in Big Lake above Piute Meadows. These lakes, which are about fifteen miles from Strawberry station, are of large size and excellent spawning water is afforded by a stream which flows through both lakes.

In accordance with a mutual understanding between Major William T. Littebrant, Acting Superintendent of Yosemite National Park, and this office, whereby, at Major Littebrant's request, we agreed to do some trout planting in the back waters of Yosemite National Park, Deputy Scott next transferred his operations to the vicinity of Wilmer Lake within the park boundary. Major Littebrant showed the party many courtesies, which are hereby acknowledged. Taking adult rainbow trout for stock fish, as before, Deputy Scott stocked Dorothy Lake at the head of Jack Main's Canyon, and Mary Lake, some five miles above Tilden Lake, stocked last season; both within the park boundary. Dorothy Lake and the stream in Jack Main's Canyon promise to be some of the best fishing waters within a large section of the Sierra Nevada Mountains. Deputy Scott was greatly hampered in his operations by reason of many severe electric storms. The deputy was himself, once shocked into unconsciousness by lightning which struck a tree near where he was working while taking up fish. He was alone at the time, and has no idea of the length of time he was unconscious, but believes it was for a considerable period, since all of the fish in a can which he was carrying were dead when he recovered consciousness. Added to the fish planting work previously reported in former years, the Tuolumne County section of the mountains will soon afford splendid fishing opportunities for the constantly increasing number of people who seek that section as an "outing" ground. There remains to be stocked, some back waters, both lakes and streams, which waters we have reserved to be planted with golden trout, in accordance with the established policy of this division.

* * *

Our packhorse distribution fish work having been confined, in 1912, to stocking the barren waters of the mountains of Madera and Tuolumne counties, and the work of distributing rainbow, Lock Leven and Eastern brook trout being well advanced throughout the division, the major effort in fish planting work this year was devoted to transplanting golden trout to suitable waters in the mountains of Tulare and Fresno counties. Accordingly, on July 30th, Deputies S. L. N. Ellis and E. W. Smalley left Big Meadows in the mountains of northern Tulare County, with a splendidly equipped pack train, to carry forward the programmed transplanting operations in the watershed of the upper Kern River. En route, they stocked Moose Lake with Lock Leven and Eastern brook trout taken from Weaver and Jennie Ellis lakes, which lakes were stocked by this office with Lock Leven and Eastern brook fry in 1911. Both varieties have thrived in the two lakes mentioned to such a degree that a supply of stock fish was readily secured by the use of "flies." The Lock Leven trout used for planting Moose Lake were about eight inches in length while the Eastern brook trout ran about thirteen inches in length. Moose Lake is locally famous as the largest sheet of water in the Kaweah watershed. It lies an easy day's travel from Giant Forest, at an elevation of some 11,500 feet, and has heretofore, like most other lakes in these mountains, been barren of any fish life.

Proceeding to the upper Kern watershed, the deputies took up adult stock fish from available sources and made thirty-four distinct plants of golden trout in barren waters; principally lakes. Since most of these lakes, and the smaller streams, are as yet unnamed, the waters planted can best be described in general terms, as that section of the Kern River watershed lying west of the Whitney Divide and drained by the North Fork of Volcano Creek, Whitney Creek, Crabtree Creek and the two branches of the East Fork of Kern River.

Deputy Ellis reports that he investigated those waters in the Kern River region which were planted with golden trout by him in 1909 and 1910, and that with two exceptions he invariably found that these plants have been completely successful. These transplanted golden trout have lost none of their original color and markings, and like other varieties of transplanted trout, average larger in size than the original stock.

The transplanted fish seem, in every instance, to have sought out the comparatively quiet waters of open gentle riffles, and are not found in large numbers in extremely rough water or in deep pools below falls and cataracts.

In giving the golden trout this wide distribution, we are but barely anticipating the drain which will be put upon the supply of these incomparable fish by reason of the constantly growing influx of campers and tourists who will annually visit the upper Kern River region. Kern River and the whole Mt. Whitney region, for many years past the summer "outing" grounds for large numbers of people from the San Joaquin Valley, is fast becoming the goal of an army of pleasure seekers from south of Tehachapi. Many automobile parties from southern California reach the region via Kernville and thence by pack train to the various favorable objective points. Many people, too, find their way into the region via Lone Pine and Independence, which are easily accessible by railroad from southern California. From Lone Pine or Independence it is but a short trip with a pack train into the upper Kern River Basin.

On September 1st the deputies left Whitney Meadows with 821 golden trout (*Salmo roosevelti*) with which to stock some selected waters in the Roaring River watershed tributary to the South Fork of Kings River. These stock fish were from three to eight inches in length, and were secured principally by turning a stream, at Whitney Meadows and taking them up in the manner described in previous reports. The expedition had been constantly hampered by terrific storms which prevailed throughout the Sierra Nevada Mountains during all of last summer. Heavy rains spelled muddy, swollen streams and constant difficulty in securing supplies of stock fish. On the return journey the expedition was compelled to travel by a circuitous route because of washed out trails. As an example of the possibilities of packhorse fish distribution in the high mountains, I would state that to reach Roaring River from Whitney Meadows involved descending into the Kern River Canyon, crossing the Kern-Kaweah Divide, thence to Mineral King and on through Timber Gap to the Kaweah Canyon; thence over the Kaweah-Kings Divide and on to Roaring River, a matter of some six days steady travel. Of this lot of 821 golden trout, some fish, when planted, had been in the cans for fourteen days. The total loss from the time of the start from Whitney Meadows until the last fish was planted, amounted to five fish.

On September 4th, Deputy F. A. Bullard relieved Deputy Smalley and thereafter assisted in the distribution of the Roaring River consignment. Thirty-one plants of golden trout were made in barren streams and lakes tributary to Roaring River. A survey of the region enables me to confidently predict that these waters will prove thoroughly adaptable to the golden trout, and that they will become well established throughout the section.

While on the subject of golden trout, I have to report that in July of this year I personally investigated a small plant made by Deputy Bullard in 1911, in the waters of a small creek at Traweeks some six miles east of Dunlap, in Fresno County. This stream lies at an elevation of about 3,500 feet. Its waters, because of the comparatively low elevation, become quite warm during the summer months, reaching a temperature of about seventy-five degrees. On account of the small volume of water and high temperatures, I had never planted trout of any variety therein, believing the stream to be incapable of supporting trout life. Certainly the conditions present a severe test of the adaptability of golden trout to waters in regions other than their native habitat. I found golden trout of various sizes in considerable numbers in this creek. A specimen some twelve inches in length, I judged to be one of the original plant. I found that while the fish were not so brilliantly colored as the fish of Volcano Creek, they were nevertheless very pronouncedly golden trout. I attribute

their somewhat duller coloring to the fact that they are now found in shady pools and in water frequently discolored by decaying leaves and from vegetation. Incidentally I would state that Deputy Ellis reports a peculiar phenomenon in connection with these particular fish. In taking them up for transplanting, a few were accidentally killed. Immediately after their death, and for several minutes, these specimens suddenly glowed with all the brilliancy and peculiarities of color of the original Volcano Creek golden trout. As a further experiment, Deputies Ellis and Bullard, at my direction, took up a number of the golden trout from Traweek Creek and carried them back to a branch of Sugarloaf Creek in the Roaring River watershed and absolutely beyond any possibility of other fish ever becoming mixed with them. The waters selected, while far remote from the Whitney region, are like, by reason of altitude and temperatures, other waters wherein we have successfully established transplanted golden trout. Should these twice transplanted fish regain their original brilliant coloring, it would go far toward confirming the belief of those who hold that golden trout are a distinct species.

After completing their golden trout work, the deputies took up six cans of two year old Eastern brook trout from Jennie Ellis Lake at the head of Boulder Creek, and carried them, a three days' journey, to a large barren lake in Granite Basin, on the divide between Middle and South forks of Kings River.

The time consumed in the various activities of this expedition was sixty days, exclusive of the time required to go and come from the mountains.

* * *

In addition to the packhorse distribution work, several hundred cans of trout fry from the Sisson hatchery were distributed to public waters throughout this division. Since such plants are a part of the hatchery department records, they will not be specified in this report. Two enterprises, however, are worthy of particular note. In the month of September, 40,000 Loch Leven fry were planted in Lake Huntington. This body of water, some five miles long by one half mile wide, is a new reservoir at the head of the Pacific Light and Power Company's pipe line in eastern Fresno County. Accessible by the San Joaquin and Eastern Railroad, this lake must, in the future, be heavily drawn upon by many people in search of fishing.

At Shaver Lake, also in Fresno County, a departure was made this season from the usual policy of stocking mountain waters with no fish but trout, when we planted therein some 300 adult black bass. The stock fish were secured in the course of our bass rescue operations in Kings County, and were of various sizes, from one half pound to four pounds in weight. Shaver Lake, while fairly well adapted to trout life, will no doubt prove to be most excellent bass waters; and since Big Creek Lake and the nearby streams will be kept strictly trout water, Shaver Lake will eventually offer a pleasing variety in the sport to be enjoyed in that section of the mountains. The popularity of lake fishing for bass is attested by the number of people who annually visit the Crane Valley reservoir on the north side of the San Joaquin River.

The fish planting operations of the Fresno office during the season 1914 will be on a much larger scale than ever before undertaken by this office. It having been demonstrated that more fish could be carried in tin cans than in galvanized ones, tin was substituted for galvanized iron in the construction of pack horse fish cans some three years ago. Experiments in the mean time having demonstrated that canvas containers offer added advantage over tin in the carrying of trout, a new pack horse fish "can" has been evolved by deputies of the Fresno office, which apparently is the acme of perfection in fish carrying receptacles in regions where ice is unavailable and where aeration must be obtained without the aid of artificial methods. The size and shape (oblong) of the usual packhorse can has been retained. The tops and bottoms of the new

Crane Valley reservoir (Madera Co.). Stocked with trout and black bass.

Cascade in Bear Creek (Fresno Co.). Stream stocked with Golden trout in 1914.

containers are of pine five eighths of an inch thick; a throat of tin is inserted in the top, provided with a removable screen as in former cans. A strip of canvas of special design, eighteen inches wide, the ends lapped and sewed in such manner as to make an open envelope, is fitted to the wooden top and bottom and secured thereto by means of clothes-line wire drawn in such manner as to press the canvas tightly into grooves which encircle the boards. To give rigidity to this container, a galvanized iron shield is provided with hangers which, when bolted top and bottom to the "can," makes it to all intents and purposes as rigid as though the whole container were of metal. This shield does not completely encircle the can, covering only the back and ends, and to it are attached straps for hanging the container to the packsaddle. For packhorse work the new device has many advantages. First, just enough water exudes through the canvas to keep down the temperature within the container by evaporation; second, aeration of the water is infinitely better; third, the fish are not liable to injury by striking against canvas; fourth, the cans may be carried "knocked down," and set up at any time without the use of tools; one packhorse can carry a dozen or more of these "knocked down" containers, leaving the rest of the packtrain free to carry barley and other necessary supplies for the expedition. A few extra canvas envelopes, which occupy little space, can be carried for emergency repairs, and in event of an accident to a can on the trail a new canvas form substituted for the injured one. To avoid infection, the canvas envelope may, at any time, be removed and placed in boiling water. The cost of this new type of packhorse can is 50 per cent less than for a well constructed tin can. The details of the new fish carrying device were worked out and 14 pairs of the "cans" were constructed by Deputy D. H. Hoen of the Fresno Division.

Game Conditions in the Fresno Division.

WATERFOWL.

The seasons 1912 and 1913 witnessed a noticeable decrease in the numbers of ducks, geese and shore birds throughout the whole length of the former feeding grounds of these waterfowl. Unquestionably, the inroads of the market hunters are fast depleting the supply of these valuable game birds in a region where, in former years, their numbers seemed to be inexhaustible. Eliminating those sections of the valley where the increase of human population has driven the wildfowl from their former haunts, there remains a natural feeding ground in the Fresno Division, extending from the Stanislaus County line through the trough of the valley to Buena Vista Lake in Kern County, a strip of country from 3 to 10 miles wide and 120 miles long. The numbers of waterfowl which twenty years ago annually visited this region and

remained during the winter months is simply inconceivable and although the supply of ducks and geese has been diminished by fully 80 per cent, this region still continues to be the source of supply of the major portion of the waterfowl which reach the markets of the big cities. Once the supply of any kind of wild game shows signs of decreasing, the annual decrease in numbers seems like an arithmetical progression. The diminution in numbers of waterfowl in the Fresno Division during the past five years has been far greater than in the preceding twenty years.

While the general situation is alarming, a new and hopeful element has been introduced in the cutting down of spring shooting through the federal migratory bird law. With the stoppage of shooting after January 31st, large numbers of ducks, being unmolested during the month of February, remained and nested in the swamp lands of the trough of the valley. Most gratifying reports of nesting ducks come from many points throughout the overflowed section of the valley. The wisdom of stopping the shooting of ducks through the month of February has been demonstrated beyond the possibility of doubt. Nor will the loss of February shooting to the sportsmen be without its compensation, for these homebred birds will afford fall shooting, which in late years has been a negligible factor in the season's sporting possibilities.

QUAIL.

In the Fresno Division as a whole the supply of valley quail has materially decreased during the past two years. The chief untoward factor which has brought about this condition was the two successive dry seasons, 1912 and 1913. It is a well recognized fact that quail do not breed to any considerable extent in dry seasons. There being no perceptible increase in the fall over the number of quail left at the close of the preceding spring, very naturally the coveys of what should be stock birds suffered materially at the hands of the gunners. The hatch of quail in the early summer of 1914 has, however, been most gratifying, and it is possible that by rigid regulations the general supply of quail may be restored in a few years. Speaking particularly of that section from Coalinga southward, and in the hills and valleys of the Coast Range Mountains, which are the western boundary of the San Joaquin Valley, the old-time conditions can never be fully restored. Up to the time of the discovery of oil, these hills were an isolated and seldom visited region. Quail in vast numbers were found in every canyon and valley. In the Cuyama Valley, in Kern County, five years ago the ground was literally covered with them. The development of the oil industry caused many towns of considerable size to spring up in what had formerly been a desert region, and right at the edge of the quail country. The presence of such vast numbers of quail was a direct

invitation to hundreds of gunners and the unsophisticated birds fell easy prey even to tyros. The resulting condition throughout this section is now about on par with that of other parts of the division, and here, as elsewhere, it is apparent that the open season should be shortened and the daily bag limit reduced. There should also be a weekly as well as daily limit of birds which one person may take.

DOVES.

Except in the counties of Tuolumne and Mariposa, the general supply of doves throughout the Fresno Division apparently is well maintained. In spite of the fact that doves are the most generally sought of all the game birds in the Fresno Division, the restriction of dove shooting except during September and October seems to have proven adequate to insure the presence of large numbers of doves for many years. Although the general game law for many years permitted the shooting of doves after July first, several counties of the valley section prohibited, by county ordinances, the shooting of doves until September first. The effect was to add to the general supply a second brood of young doves. The legislature in 1911, in response to a general demand, forbade by law the shooting of doves in the Fourth Fish and Game District until September first. The wisdom of this action is evidenced by the fact that doves may now be found throughout the whole Fourth District in probably as great numbers as at any time during the past ten years. While the ethics of shooting doves under any circumstances may be debatable, the fact remains that throughout the Fourth District dove shooting is the most nearly universal sport of the gunners, and that the supply has been maintained by wise restrictive laws, the number of doves annually killed must be enormous. In the season of 1913, it is estimated that in Fresno County 4,000 gunners were out for doves on the opening day, September first; and it is a tribute to the existing game laws that few if any of these people were disappointed in the day's bag. After the opening date doves could not be so readily secured. Apparently the surviving birds took refuge in the Sierra hills and in isolated sections of the sparsely inhabited west side of the valley. The spring of 1914, however, disclosed the presence of doves in their old breeding grounds in most satisfactory numbers.

MOUNTAIN QUAIL AND GROUSE.

The annual supply of mountain quail and grouse in the mountains of the Fresno Division apparently depends principally upon weather conditions during the nesting season. Except in the counties of Tuolumne and Mariposa, very few mountain quail and grouse, comparatively speaking, are killed by hunters. Except in the counties named, there is

sparse population in the sections where mountain quail are ordinarily found. The range of the grouse is at even higher altitudes. Most people, when in the higher mountains, carry rifles only; hence, their opportunity for killing mountain quail and grouse is a comparatively negligible factor in the situation. Should the opening of the deer season in the Fourth District be made to conform to the season in the Third District, the number of shotguns which would be found in the possession of "outing" parties in the mountains during September would be small indeed, and since weather conditions close the higher mountains to "outing" parties after October, the only mountain quail which would be killed thereafter would be the few which annually migrate down to the hills along the edge of the snowline. Up to this time, the chief source of destruction of mountain quail is undoubtedly bobcats and other natural enemies of the quail.

DEER.

Taken as a whole, the supply of deer in the Fresno Division is about normal. In some sections in both the Sierra Nevadas and the Coast Range Mountains the deer have actually increased, while in other sections there is a noticeable decrease. In Tuolumne and Mariposa counties the situation is satisfactory. In the mountains of Madera County the deer appear to be more than holding their own. In Kern County the situation is satisfactory. There is, however, a decrease in the supply in the mountains of Fresno County, and this condition is very noticeable in some sections of the mountains of Tulare County. The legal season for killing deer in the Fourth District is calculated to benefit neither the deer nor the shooters, and should be changed. The open months for the shooting of deer are now July and August, and while it is an undoubted fact that bucks are not in good condition for human consumption during these months, particularly during July, yet, at this time, they are more easily found and killed. As the law now stands, it is a crime to kill bucks during September and October in the Sierra Nevada Mountains of the Fourth District when, as a matter of fact, they are then in prime condition and infinitely better able to protect themselves from slaughter than during July and August. It may be safely stated that the universal opinion of those who are best informed is that by all means the open season for deer in the Sierra Nevadas should include the months of September and October instead of July and August as at present. There is no good reason why the Sierra Nevada Mountains of the Fourth District should have an earlier deer season than prevails in the mountains of the Third District, since conditions are practically the same throughout the Sierra Nevadas. If there is a difference, from a biological standpoint, it is in favor of a later deer season in the Sierra Nevada Mountains of the Fourth District than that of the third. From

the standpoint of game conservation there is everything in favor of a late open season for deer shooting in the Sierra Nevadas. In September and October they would be successfully killed principally by hunters of some experience, and thus few, if any, immature males and practically no does would be killed through excitement on the part of the hunter. The people who live in the mountains and who now resent the workings of a law which permits the shooting of deer at a time when they are not in prime condition, would be inclined to take personal interest in the protection of deer during the closed season. Aside from all this, it is an economic waste to kill game of any kind when it is not in prime condition.

By an act of the legislature of 1913, that portion of the Coast Range Mountains which was formerly included in the Fourth District, was placed in the Fifth Fish and Game District in order to permit of an earlier open deer season than that which was to be provided for the Fourth District. While there is no question but the deer of the Coast Range hills mature earlier than the deer of the Sierra Nevadas, at the same time July first is too early to shoot deer on the eastern slope of the Coast Range. Considering the comparative accessibility of the Coast Range Mountains, which makes for the easy destruction of deer during the open season, the open season is now too long in those mountains. A single open month, August, would probably be a more rational deer season in the Coast Range. An open season from July fifteenth to September first would be an improvement over present conditions. The development of the oil fields in Fresno and Kern counties, along the edge of the Coast Range hills, has had a decided effect in depleting the deer supply of the Coast Range in those counties. Climatic conditions, however, in the Coast Range, are very favorable to the existence of deer, and with proper conservation a reasonable supply can be maintained for many years.

BEAR, ELK, ANTELOPE, AND MOUNTAIN SHEEP.

Of late years there has been a very noticeable decrease in the number of bear found in the Sierra Nevada Mountains. Once classed as "varmints," whose destruction was the hope of all mountaineers, bear have come to be an object of solicitude on the part of many thoughtful people who live in and near the mountains, and who formerly could see no good in them. As an object of pleasurable pursuit, many people would see the remaining supply conserved; and many people, too, regret the disappearance of any form of wild life. Most of the bear which are now killed are taken during the summer months, principally by means of traps and setguns, at a time when the meat and hide is absolutely worthless. There is a growing sentiment in favor of protecting, by law, the bear of the Fresno Division during the summer months.

Few people know that there are still to be found, in the so-called west side region of Fresno and Kern counties, a few scattering bands of antelope. While their number can never increase to the point where they may be classed as available game animals, yet the few remaining bands are holding their own in numbers, and since their range is in a section where the population must be sparse for a great many years, there need be no immediate alarm over their possible extinction. In time, steps must be taken to impound, in some suitable locality, the remnant of the vast herds of these very interesting animals which once roamed at will the whole San Joaquin Valley, lest one more species of wild life be lost to the world.

In Kern County is to be found the last remnant of the formerly vast numbers of dwarf or tule elk which once inhabited the San Joaquin Valley. These elk are a distinct species, and were never found naturally in the higher mountains. At certain seasons they did inhabit the Coast Range hills, but there is no evidence of elk ever being seen at considerable altitudes in the Sierra Nevadas. It has been recorded in a previous biennial report that the elk of the valley at one time had been reduced to a single pair, which Mr. Henry Miller, of the Miller & Lux corporation, took under his immediate protection on the Button Willow ranch in Kern County, and from this pair the number has increased to about 500 specimens. They now range on the ranches of the Miller & Lux corporation and the Kern County Land Company, all in Kern County. A serious and aggravating problem is now presented as to how to conserve and perpetuate these remaining elk. Roaming at will over the Miller & Lux properties, the elk cause great destruction of grain crops, estimated by Mr. Miller at \$5,000 per year. It is a tribute to Mr. Miller that he has borne patiently their depredations these many years, but the time has come when something must be done to impound the elk at public cost. Various schemes for splitting the elk herd into small bunches and removing them to other localities have been advanced, but here arises another complication, best illustrated by an instance where such a plan has already been tried. A number of years ago some twenty-six elk were taken to Sequoia National Park in the mountains of Tulare County. The enterprise was accomplished only after great exertion on the part of those having the matter in charge, and with considerable suffering and mortality among the elk. The federal government fenced a large enclosure within the park, in which to hold the elk, and for a period of years the scheme seemed to work satisfactorily. At the present time, according to the estimate of Mr. Walter Fry, Acting Superintendent of Sequoia National Park, the original twenty-six head which survived transportation have increased to about fifty. Some of

these elk of late years have refused to stay within the enclosure provided for them, and because of the rugged nature of the park, it is apparently impossible to so construct a fence as to prevent their escape. Considerable damage has already been done by wandering elk, to fences and young orchards in the Three Rivers section. It is easily conceivable that if the Kern County herd of elk should be divided and released in small bunches in other sections of the state, much cause for complaint of depredations by escaping elk might arise in those other sections. As suggested by Dr. Grinnell of the University of California, apparently the most satisfactory and feasible solution of the situation would be for the state to secure a section or two of land in the territory which is now the natural range of the elk, and there impound and care for all of the present herd or at least a sufficient number to perpetuate the species. Such a plan would involve considerable expense for the purchasing of land, since it would not suffice to place the elk upon arid lands where feed conditions are uncertain. To provide the best natural condition for the elk would involve the securing of 500 to 1,000 acres of good land out of the Miller ranches along Bull Slough in such location as to permit of enclosing also a large body of government land in the Elk hills which adjoin the tract. Under natural conditions the females of the species sought out the dry arroyos of these hills during the gestation period, and while these lands would not afford sufficient feed to maintain the herds throughout the year, it would be wise to include them in the general scheme of providing a park for the elk. The acreage of good land could be planted to alfalfa, and being already well watered, would provide ample food at all times of the year for the elk. On these lands there would be no difficulty in constructing a fence sufficient to impound the herd.

There still remains a few mountain sheep in the high mountains of the division. A bunch of over twenty was seen last summer near the head of Silver Creek in the summit region of eastern Fresno County. A small band probably still ranges in the inaccessible mountains about the Palisades at the head of the Middle Fork of Kings River. There is no record and no rumors of any unlawful killing of mountain sheep in the division during the past two years.

PRIVATE PRESERVES AND THE GAME LAWS.

By ERNEST SCHAEFFLE.

Dissatisfaction over the control and use of wild game is probably as widespread in the United States as it ever was in Europe, where we point whenever we want to show a horrible example of selfishness and injustice to the masses.

And, misunderstanding, as to the real trouble, is apparently as widespread as the dissatisfaction. No two people seem able to agree as to the cause of the universal complaint, the blame being usually placed upon the "game laws." Was ever an institution or programme so generally misunderstood as those compromise statutes, usually ineffective, intended to preserve the country's wild life!

The writer of this article makes no claim to wisdom; but a peculiarly intimate acquaintance of many years with game and fish, "game laws," so-called "poachers" and the general public has given him some knowledge of natural conditions and those unnatural conditions brought about by advancing civilization, and he feels capable of explaining and clearing up some of the existing dissatisfaction and misunderstanding.

We must recognize the fact that in the United States, and in most foreign countries, land is subject to private ownership. Of course in every country large areas are collectively owned, or owned by the "government," the "crown" or by free cities and by states; but, with the possible exception of Russia, the private holding system obtains and is pretty generally regarded as being just and wise. We have the system in this country as an inheritance from our British predecessors in occupancy, who, in turn, had it from the Romans.

Along with the private land ownership system, however, has gone a somewhat conflicting system of public ownership in wild game and fish. That conflict should arise as a result of the dual system was inevitable; but that much of the present day discontent comes from it may not have occurred even to careful students. Let us state the case concretely, and see if it does not immediately become clearer and more convincing.

About ten per cent (more or less) of the population owns the land that is not publicly owned. The remaining ninety per cent owns no land and has no rights to or upon any "land" except public waters and highways, public parks, reservations, etc.

The wild life belongs to the "people," by which we always mean the hundred per cent, whether they own land or not.

Now, the ninety per cent, being people—the same as the ten per cent—like to ramble about on holidays and Sundays and to hunt and fish.

But—and right here the trouble begins—the minority owns the farms and the streams and lake beds and borders, and quite naturally objects to trespassing and keeps or puts the invaders out.

All the while, mind you, the game and fish belongs to the general public, and the general public knows it and curses a system of laws that keeps it away from them and in the practical possession of the landholder.

The fact that a tract of land is used by a “gun club” or “preserve,” whether by virtue of ownership or mere lease, is invariably sufficient to irritate the local public. For some reason the prejudice against a farmer who closes his place against public hunting is nothing compared

In the marsh at the head of Newport Bay.

to the ill feeling entertained for a club (or even an individual) who keeps a place as a “preserve.” It seems also that, mingled with resentment at being denied a privilege, is to be found a rapidly growing belief that the public has a right to go on private land so long as the purpose is the pursuit and taking of “community property,” and so long as no actual damage is done to the landholder’s own possessions.

It is, of course, outside the purpose of this article to discuss the questions of land ownership and trespass; but no argument over the ownership of game and the public rights in it can be engaged in without going smash against those questions. And, what is more disquieting, it seems certain that the present trouble between the hunters and fishermen

and those who control the game and fish will continue and increase. What the outcome will be no one can foresee; but it is hard to even imagine that a people wedded to the idea of private ownership in land and in the unrestricted use of it, as well as to the idea of a divine right to protection in such ownership and use, would stand for the general "trespass" that would be needed to bring about the end desired by the public.

That private ownership means careful and often complete protection to wild species is not always accepted by the public as sufficient excuse for the system. Too often sentiment seems to favor utter extinction of what can not be freely and universally enjoyed. This sentiment is, possibly, weak and hysterical, besides being a menace to animals that have the same right to existence and comfort that man himself claims.

The future may prove the viciousness of such feeling by developing some different scheme of holding land, under which every one will have real ownership in such wild life as may be spared by the present ruthless generation. I say present generation advisedly, for it is evident that another twenty-five years will see the practical extermination of every desirable wild species in North America, unless the present slaughter is checked. Some doubting Thomas may say, "That can't be true, for in Great Britain, with her forty-five millions of people, they have been slaughtering for centuries, and still there's plenty of game." Another doubter will say, "Why, just establish public game preserves, like those they have in Oklahoma, and everybody can have game." And even another will say, "All they (note the they) need to do is to start farms everywhere and raise pheasants and wild ducks and deer, etc." Just for fun I am going to show the fallacy of all three arguments—partly because they're all fallacious and dangerous, but largely because they have been given wide circulation by irresponsible and dishonest agencies and are accepted, more or less, by the public.

The first argument is advanced by superficial thinkers. It is true that there is still wild game in Great Britain; but it exists because millions and millions of pounds are spent each year by sportsmen and landholders in fencing and draining, building of roads, trails and telephone lines; in the wholesale poisoning and trapping of predatory birds and animals; in the rearing, liberating and "training" of millions of birds; in the feeding, watering, sheltering and even doctoring of wild deer, grouse and partridges, and in the continuous patrol against "poachers" by a body of "keepers" nearly as large as the regular army of the United States.

Further than this, the kill of game in Great Britain is not to be gauged by either area or population, for out of forty-five millions of people, less than sixty-eight thousand do all the hunting, and the number is decreasing. There are now over one hundred and sixty thousand hunters in California and the number is increasing by leaps and bounds.

As to argument number two—that about public preserves. We have them—have had them for years—and will have more and larger ones. But if the entire state were one preserve it would not raise the game that the public wants. Furthermore, not all varieties would breed in the state; most species of wildfowl breed only in more northern latitudes. What we must realize is that game must be treated like any other crop, saving each year enough seed for the next season's planting, with something over as a safeguard against bad weather, epidemics, etc.

And now we come to the last argument, which, of the three, sounds the best to many enthusiasts. The answer is that the game farms and preserves cost money, even in England, where families have owned the same tract of land until its value has been forgotten or is no longer appreciated, and where labor is dirt cheap. I have been told (by one of them) that capable gamekeepers work in England for \$6.00 a month "and found." The same man would demand from \$40.00 to \$60.00 a month here and would refuse to work as hard or as long. But the great trouble is that successful game preserves and farms are almost an impossibility because of the public's determination to pursue and kill "wild" game, even on private holdings. It is true that every hunter does not "poach" and it is also true that some preserve owners are able to protect their property; but a great many hunters will hunt wherever the shooting is good, and the average farmer or preserve owner gets laughed out of court whenever he attempts the prosecution of a trespasser. Some preserve owners have given up the courts and rely upon the shotgun, which is a favorite plan in Europe. Obviously the plan fails here, and what is worse, carries the whole scheme of things into increasing disrepute.

And now, lest the reader quit with the feeling that the situation is utterly hopeless, I will venture—a prophecy, shall we call it? It is my strong belief, based upon the knowledge gained through experience and investigation, that the American public at last realizes the value of wild life and the terrible necessity of protecting the pitiful remnant left. I believe also, that we will, if we find that the tinkering of the past and of the present has resulted in nothing but a sense of false security, and if compromise measures are not soon found, close down on all killing, whether for commerce or for sport.

DEPARTMENT REPORTS.

REPORT OF LEGAL DEPARTMENT.

By R. D. DUKE.

Fish and Game Commission of the State of California:

GENTLEMEN: I herewith transmit to you a report of the work of the legal department of the commission, for the two years ending June 30, 1914.

Among the more important cases tried by this department for this commission are the following:

In 1909, the board leased about forty-one acres of land near Hayward, in Alameda County, as a game farm, for a period of one year, at \$37.50 per month, with option to renew the lease for nine years provided written notice of intention to accept said option were served upon the lessors. During the first year, improvements amounting to about \$12,000 had been placed on the land by the Fish and Game Commission; but no written notice as stipulated in the lease was served on the lessors. At the expiration of the term of lease, the lessors began an action for the possession of the property and \$2,000 a year rent from and after the expiration of the first year's lease. The court decided that the lessors had waived written notice and instructed them to enter into a lease with the commission for the full term of nine years, upon payment of the original rental stipulated in the lease, which was accordingly done.

For a number of years prior to 1913, there was an organized effort on the part of certain commission merchants in San Francisco to evade the limit law on ducks and to that end transfer companies were formed, which, while endeavoring to act as such, were, in fact, subterfuges of the several commission houses; for the reason that a transfer company is allowed to have in its possession more than the limit of ducks in one day, for the purpose of transportation only. When the commission discovered this fact, all the ducks in the possession of the so-called transfer companies were seized. Thereafter, an action was brought in the superior court to restrain the commission from seizing the ducks, so shipped, and for \$5,000 damages. Judgment was rendered in favor of the commission and against the plaintiff, for costs. Since the rendering of this decree, these so-called transfer companies have entirely gone out of business and it has reduced the unlawful distribution of ducks to less than one half.

On March 10, 1913, Special Deputy John W. Galloway placed under arrest Herbert Le Cornee, George Le Cornee and J. W. McNamara, for having in possession steelhead trout, which had been taken with an unlawful net. Galloway turned to speak to McNamara, and while his back was turned to the Le Cornee brothers he was shot through the head by Herbert Le Cornee, and the Le Cornee brothers immediately fled. Deputy Galloway drew his revolver and shot both the Le Cornee brothers. Deputy Galloway and Herbert Le Cornee recovered, but George Le Cornee died as a result of his injury. Herbert Le Cornee was brought to trial for assault to murder and the jury disagreed. After a second trial, verdict "not guilty" was rendered.

On April 26, 1913, Regular Deputy Frank P. Cady and Special Deputy Joseph Nelligan arrested ten Indians for spearing spawning trout on streams running into Tule Lake, Lassen County. Three of the Indians, Wilson Duke, John Hendricks and John Pede, resisted arrest, disarmed Deputy Cady and shot Deputy Nelligan three times and then shot Deputy Cady, severely injuring both. Deputy Nelligan then shot Wilson Duke through the chest. The Indians fled with Wilson Duke and left Cady and Nelligan, believing they were dead. Later, on the same day, Cady and Nelligan were found in a shed near the scene of the shooting. Pede and Hendricks were subsequently placed under arrest and tried on a charge of assault to murder, and the jury found them guilty as charged. Wilson Duke was found guilty of assault with a deadly weapon and pleaded guilty to a second charge of assault with a deadly weapon on Deputy Nelligan, and was sentenced to four years in the state prison at San Quentin, and Pede and Hendricks were each sentenced to three years.

On February 2, 1913, Special Deputy Bert Blanchard was murdered by being shot by two men believed to be Italians, in Contra Costa County. The murderers have never been apprehended.

On the 16th day of April, 1913, near San Quentin Point, Marin County, Deputy M. S. Clark and Special Deputy Ernest Raynaud placed Antone Balesteri and Salvatore Balesteri under arrest for catching striped bass with an unlawful net. Carlo Balesteri requested to be taken into the boat, as an interpreter. After Balesteri had spoken a few words in Italian to the men under arrest, a desperate struggle ensued, during which both Deputy Raynaud and Salvatore Balesteri were killed. Deputy Clark was struck and thrown overboard and an attempt made to run him down, but he was rescued by a Joseph Swack. Antone Balesteri escaped and has never been apprehended. Carlo Balesteri was tried and convicted of murder in the first degree, and sentenced to San Quentin Prison for life.

The conduct of all these deputies, under such trying circumstances, in offering and giving up their lives, in the discharge of their duties, can not be too highly commended.

On March 14, 1914, one A. Parra was arrested for fishing without first obtaining a license therefor. This arrest was made for the purpose of testing the validity of the Market Fisherman's License Act, passed in 1913. A writ of habeas corpus was applied for in the District Court of Appeals of the State of California, in and for the Third District, and a writ was denied. Another writ was later taken to the Supreme Court, which, by also denying the writ, has affirmed the decision of the District Court of Appeals. This determined the constitutionality of the Market Fisherman's License Act.

Besides the above cases, this department, during the period beginning July 1, 1912, to and including June 30, 1914, has tried 225 cases throughout the State of California.

In addition to the above cases, this department has been called upon to give many opinions respecting the laws for the protection of fish and game, to various citizens throughout the State of California, and the several departments of this commission; also many hundred letters answering inquiries for information have been written respecting the fish and game laws.

During the legislature of 1913, this department continually engaged in assisting the legislators in drawing the necessary laws and in making amendments with respect to fish and game legislation.

It has been necessary to visit a great many of the power and irrigating companies of this state with reference to the screening of ditches and the placing of fishways in order to prevent the enormous destruction of fish. This work is far advanced and has been accomplished with but few prosecutions.

San Francisco, June 30, 1914.

REPORT OF SUPERINTENDENT OF HATCHERIES.

By W. H. SHEBLEY.

To the Honorable Board of Fish and Game Commissioners of the State of California.

GENTLEMEN: I herewith present my report for the year 1913, and so much of the work as has been accomplished and under way for the first six months of 1914. The report of the hatchery department for 1913 shows the number of fish distributed by the commission, from which hatchery or hatching station, the number of fish distributed in each stream and the names of the applicants.

The work of distribution for 1914 is now under way, but will not be completed until late in the fall, therefore it will be impossible to give more than the number of trout at the different stations that are now ready for distribution. The salmon work for 1913 and 1914 is given in full, as the eggs taken during the fall of 1912 were distributed in 1913 and the eggs collected during the fall of 1913 were distributed during the spring of 1914.

This department has been busily engaged in the surveys necessary to screen the ditches and canals throughout the state and to plan efficient fishways or ladders over the dams that obstruct the free passage of fish in our streams. Mr. A. E. Doney, as ladder surveyor, and Mr. A. E. Culver, in charge of the screen investigation and surveys, have rendered valuable services in this work.

The preliminary studies of the screens most suitable for the conditions that exist in the different parts of the state were begun in 1912. It was found on examination of the conditions that the parallel bar screen with the automatic cleaning device for the large ditches and canals, and the rotary screen devised by R. W. Requa for the smaller ones, are all that is necessary to save the fish, if properly installed and cared for.

Surveys and plans have been made in nearly every county in the state that required screens and ladders for the preservation of the fish. While there is a great deal more to be done, we have, in our limited time, covered as much of the ground as possible. This work necessarily caused a great deal of correspondence. After the plans were made for fish ladders and screens and the legal notices served on the owners of the ditches, canals, and dams to have the work done, in nearly every instance the owners asked for instructions regarding the detail of the work, and in many cases delays were caused by storms, and the inability to get material to complete the work in the specified time. Extensions were granted in all cases where we were satisfied the persons applying for the same were honestly endeavoring to comply with the plans and carry out the instructions given them.

During 1913 and up to date, July 20th, over four hundred and twenty notices were served on the owners of ditches and canals, and plans furnished. Owing to the limited number of men engaged in the investigation, we have not as yet received full reports on the number of screens installed. To date we have a record of two hundred and thirty-five screens that are in place and working satisfactorily. The work of installing the screens was necessarily slow as the surveyor had to make a great many long trips to inspect the ditches, plan the screens particularly adapted for each ditch, as well as to find the owners of the ditches and serve the legal notice on them, to comply with the law.

The large screens in the canals of the Sacramento and San Joaquin valleys were expensive and required considerable skill and judgment in planning them. The parallel bar type with the self-cleaning attachment is the one that we have planned for all of the larger canals. Among the larger screens installed so far are the screens in the canals of the Sacramento Valley West Side Canal Company, near Hamilton City, Glenn County; the East Side Canal Company, Merced County; Pacific Light and Power Company, Kern County; Mt. Whitney Light and Power Company, Tulare County; Peoples Ditch Company, Kings County; Lower Kings River Canal Company, Kings County; Lemoore Canal and Irrigation Company, Kings County; Empire Water Company, Kings County; and the Sutter-Butte Canal Company, Butte County. The screen of the Sacramento Valley West Side Canal Company was our first attempt at a large parallel bar screen. Quite a number of smaller ones of this type had been installed in other parts of the state, but no attempt had been made to construct one of the proportions necessary to efficiently screen a canal of this size. The canal at the place selected for the screen is seventy feet wide and sixteen feet deep. I called on the president of the company, Mr. W. F. Fowler, in February, 1913, and stated that the Commission desired him to screen the canal, as we had demonstrated to our satisfaction that all the ditches and canals in the state could be screened without working a hardship on the owners, if the proper type of screens were used, according to the location and the amount and kind of debris in the water. He willingly agreed to do so if I could suggest a plan that would meet with the approval of the company's engineer, Mr. H. Cauthard. I suggested the parallel bar type with the self-cleaning attachment. Mr. Cauthard immediately took the matter up with an iron manufacturing company and soon had the material for the screen in place. The automatic cleaner is operated with a small motor and the expense of keeping the screen clean is very small. One month last season the expense did not exceed fifty cents for the electric current to run the motor. The motor is operated at such times as is necessary to clean the screen. On page — of this report is a photograph of this screen.

The fishway or "fish ladder" work, as it is commonly called, has been making good progress, when the time for the making of surveys, plans and blue prints are taken into consideration. Delays were caused by owners in asking for extensions of time, necessary to get the materials to construct the fishways, and the time often asked for the surveyor to return and give the builders further instructions regarding the work of construction. During 1913 and 1914 we have made 118 surveys for ladders over dams. Forty-four fishways have been constructed, repaired and are being built. In addition to the fishways constructed, nine obstructions and dams have been blown out by the owners and the commission, to give an unobstructed passage for the fish in different

Screen of Sacramento Valley West Side Canal Co., in Stony Creek, Glenn County.
Seventy feet long and sixteen feet deep.

streams. The more important dams have been looked after first. We have made it our constant care to see that all the ladders that have been built and repaired were kept open for the free passage of fish. We have 41 surveys from which blue prints will be made this summer, and it is our earnest endeavor to get as many of these fishways completed by fall as possible.

One important matter relative to fishways should be taken up by the next legislature, and an act passed to compel the owners of fish ladders to allow sufficient water to pass through their fishways at all times to allow the fish a free passage through the ladders as well as to support

the fish life below the dams during the minimum flow of water. It is useless to construct fishways if there is not to be sufficient water in the streams below the dams to keep the fish alive during the minimum flow in the summer and fall. I have studied these conditions for a number of years, and I would recommend that 10 per cent of the amount of water in each stream, river or creek, measured half way between the watershed and the mouth of the stream, be allowed to pass over or through every fishway, dam or obstruction that diverts the water from the main channel, to the mouth of the stream. This act should apply to all streams that do not sink or get so low that they do not flow at their mouths in the dry season. We find considerable difficulty in getting the owners of dams and fishways to allow sufficient water to pass their dams and fishways during the period of low water. If 10 per cent of the water, measured, as stated before, half way between the watershed and the mouth of the stream during the minimum flow, be allowed to flow continuously in the bed of the stream there would be sufficient for the fish, and the loss to the power plants and irrigationists would be very small, as nearly all the persons owning or managing such dams can plan to allow this amount of water to flow over the dams or through the fishways without damaging their interests. Where there are several dams on a stream, each one could give up an amount of water proportionate to the amount used at their respective dams. Thus, for instance, a stream running 3,000 inches of water at the time of the minimum flow had five dams on it; the largest one using or diverting 1,000 inches of water could give up 100 inches, or ten per cent, without material damage, and the others in like proportion according to the amount they had appropriated. This would not be necessary on many streams, for in most places there is sufficient water to support the fish, if it is properly regulated and the fish ladders kept open.

In cooperation with the Nevada Fish Commission a survey was made for an efficient fishway over the Derby dam in the state of Nevada. The Derby dam is the property of the United States Reclamation Service and diverts the water from the Truckee River about thirty miles below Reno, Nevada, for a large irrigation project in that state. We made several trips to this dam to study the conditions existing there. Complaints had reached the California Fish and Game Commission that the large trout from Pyramid Lake could not pass this dam when attempting to ascend the Truckee River into California on their annual migrations to their spawning grounds. We found that the Reclamation Service had installed a fishway, but that it was not properly arranged for the passage of large fish. The small trout in limited numbers would ascend the fishway above the dam, but the large spawners would not pass into it, or through it. With the assistance of Hon. Geo. T.

Mills, President of the Nevada Fish Commission, we gathered the necessary information to establish the fact that the large lake trout from Pyramid Lake could not pass the Derby dam. The matter was taken up with the United States Reclamation Service through Congressman J. E. Raker, who used his influence to further our efforts in having a proper fishway installed. The Reclamation Service desired to make changes on the fishway that had been installed, but in the judgment of the California and Nevada Fish Commissions, it would not meet the requirements. In November, 1913, a survey was made by

Fish-way over Clough Dam in Mill Creek, Tehama County.

our department assisted by the members of the Nevada Fish Commission, for a new fishway over the Derby dam, which in our judgment will allow the large lake trout to pass up the river, if all the details of the plan are properly carried out. As soon as the plans were approved by the Nevada and California Fish Commissions, they were forwarded to Congressman Raker, who presented them to the Secretary of the Interior and the officers of the Reclamation Service, and we have been assured the fishway will be constructed according to the plan that we prepared, this coming fall. Congressman Raker deserves the thanks of the state for his keen interest and untiring efforts in getting the Reclamation Service to construct the fishway over Derby dam.

Following is a list of surveys which have been made for fish ladders to be installed over dams in California up to July 1, 1914:

Owner	County	Stream	Action
Spring Valley Water Co.	Alameda	Arroyo Bayou Creek	Ladder installed.
Spring Valley Water Co.	Alameda	Alameda Creek	Ladder installed.
Harold Meek	Alameda	San Lorenzo Creek	Ladder installed.
Curtz Cons. Mining Co.	Alpine	Carson River	Plans being made.
Nevada-Hercules Mining Co.	Alpine	Carson River	Plans being made.
Sutter-Butte Canal Co.	Butte	Feather River	Ladder installed.
K. Johnson	El Dorado	Trout Creek	Plans being made.
Western States Gas and Electric Co.	El Dorado	South Fork American River	Ladder installed.
K. Johnson	El Dorado	Cold Creek	Plans being made.
Fresno Canal and Irrigation Co.	Fresno	North Fork Kings River	Ladder installed.
U. S. Government	Glenn	Stony Creek	Ladder under construction.
Redwood Mill and Lumber Co.	Humboldt	Little River	Ladder installed.
Elk River Lumber Co.	Humboldt	Elk River	Ladder installed.
Nevada-California Power Co.	Inyo	Bishop Creek	Ladder installed.
Nevada-California Power Co.	Inyo	Bishop Creek	Ladder installed.
Mono Power Co.	Inyo	Owens River	Ladder installed.
Empire Water Co.	Kings	Kings River	Ladder installed.
Empire Water Co.	Kings	Kings River	Ladder installed.
Crescent Canal Co.	Kings	Kings River	Legal notice served.
Riverdale Ditch Co.	Kings	Murphy Slough	Legal notice served.
Riverdale Ditch Co.	Kings	Murphy Slough	Legal notice served.
Lemoore Canal and Irrigation Co.	Kings	Kings River	Legal notice served.
Riverdale Ditch Co.	Kings	Murphy Slough	Legal notice served.
Lassen Townsite Co.	Lassen	Susan River	Ladder installed.
A. Bantley	Lassen	Susan River	Ladder installed.
Robert Elledge	Lassen	Susan River	Ladder installed.
Lassen Townsite Co.	Lassen	Susan River	Plans being made.
Red River Lumber Co.	Lassen	Robbers Creek	Plans being made.
Red River Lumber Co.	Lassen	Feather River	Plans being made.
Honey Lake Land and Livestock Co.	Lassen	Susan River	Plans being made.
Lassen Electric Co.	Lassen	Susan River	Plans being made.
Isaac Hinkle	Placer	North Fork American River	Ladder installed.
Mariposa Commercial Mining Co.	Mariposa	Merced River	Plans being made.
Nameless Mining Co.	Mariposa	Merced River	Plans being made.
Exchequer Mining Co.	Mariposa	Merced River	Plans made, but dam washed out.
San Joaquin Light and Power Co.	Mariposa	Merced River	Plans being made.
Union Mill and Lumber Co.	Mendocino	Pudding Creek	Ladder installed.
Crocker-Huffman Co.	Merced	Merced River	Plans being made.
Alturas Electric Power Co.	Modoc	Pine Creek	Plans being made.
Lakeview Development Co.	Modoc	Lawson Creek	Ladder installed.
Natural falls	Modoc	Lawson Creek	Falls blown out.
Melone Co.	Napa	Dry Creek	Ladder installed.
County of Napa	Napa	Redwood Creek	Legal notice served.
County of Napa	Napa	Redwood Creek	Legal notice served.
Elks Club	Napa	Redwood Creek	Legal notice served.
City Water Co.	Napa	Napa River	Ladder installed.
W. B. Lees	Napa	Redwood Creek	Legal notice served.
State Reformatory	Napa	Rector Creek	Legal notice served.
Pacific Gas and Electric Co.	Nevada	South Fork Yuba River	Ladder installed.
Excelsior Mining Co.	Nevada	Deer Creek	Ladder installed.
Excelsior Mining Co.	Nevada	Deer Creek	Ladder installed.
Pacific Gas and Electric Co.	Nevada	Little Deer Creek	Ladder installed.
Francis Newland	Nevada	Donner Creek	Legal notice served.
Pacific Fruit Express Co.	Nevada	Donner Creek	Ladder under construction.

The pollution of the streams has been given as much attention as our time has allowed. We have had several aggravated nuisances abated and have others pending. The Shasta River, which has been polluted with sawdust for years past, from old sawdust dumps as well as some from recent operations, is now free from pollution. Dams, ditches and restraining walls have been constructed according to plans furnished by this department and there will be no further trouble from that source.

One of the important cases that I desire to call to your attention, is the pollution of the Truckee River by the Crown-Columbia Paper Company. The commission in past years has endeavored to find a way to have the sulphite liquor from the factory deposited where it would not pollute the water of the Truckee River. Several attempts had been made by the company acting under the direction of the commission to have this liquor piped into a settling basin near the plant where it was supposed that it would be absorbed or evaporated, but owing to the loose formation of the rock, it found its way back into the river and caused a serious damage to the eggs deposited by the spawning fish, as was fully demonstrated by the experiments carried out by this department during the fall of 1912, when F. A. Shebley and N. B. Scofield made practical and scientific tests to determine the deleterious action of the sulphite liquor on fish eggs and embryo fish below the paper mill. Last winter the writer and Professor Dinsmore of the University of Nevada were appointed a committee, by your honorable board, to confer with Mr. Louis Bloch, the manager of the paper company, to determine on the best method to prevent the sulphite liquor from polluting the Truckee River. The company had agreed to make any changes that could be suggested along practical lines, either to evaporate the liquor, or to pipe it to some basin where it could be absorbed in the earth and not reach the river. Professor Dinsmore has made a couple of trips to other states where similar plants are located, in an effort to find a practical solution of the problem, and we are at this date awaiting his

return, before taking action. If an evaporator can not be constructed that will be a positive success, I respectfully recommend that a pipe line be constructed that will carry the liquor from the mill to some distant point where it can not do any damage. If this can not be done, I would recommend that the company be restrained by an injunction from further operations until at such time they can find a way of disposing of the sulphite liquor from their mill. I believe that an evaporator can be installed that will evaporate the chemically charged liquor at an expense that will not be prohibitive to the company, and I earnestly hope that this may be accomplished this summer.

SISSON HATCHERY.

Sisson hatchery has been conducted on the same general plan as in the past, as far as the rearing of stock fish and the distribution of trout fry are concerned.

The policy adopted of holding and feeding all of the salmon fry before releasing them, and then only when the flood season is over in the spring, will unquestionably give good results. In my opinion it was the holding and feeding of the salmon fry in the early history of the Sisson hatchery that increased the run of salmon in the Sacramento River, and the present run is largely due to the efforts along those lines in the days when the commission established the Sisson hatchery in an attempt to restore the salmon in the Sacramento River.

Following is a short history of the work at Sisson hatchery during the first years of its operation, which gives my ideas of the results of holding and feeding salmon fry:

The first salmon fry fed in California was after the establishing of the Sisson hatchery in 1888. The United States Commission, in 1883, quit operations at Baird hatchery on the McCloud River. Only 1,000,000 eggs had been taken that season. The salmon had greatly decreased in the Sacramento River, owing to the operations of the mines on the tributary rivers, destroying the spawning beds and the unrestricted fishing on the lower reaches of the river, as well as the wholesale slaughter of the breeding fish by miners, Indians and others during the period that they were entering the tributary streams to spawn.

In 1883, the United States Commission collected approximately 1,000,000 of eggs at the Baird hatchery during the entire season, this being the smallest take in the history of the work on the McCloud River, since the preliminary work of establishing the station in 1872, when the first attempt at the propagation of the Pacific salmon was made by Dr. Livingston Stone. The salmon, though greatly depleted in numbers in the Sacramento River, had ascended as far as Baird in numbers

sufficient to give from 2,000,000 to 14,000,000 eggs each season from 1872 to 1883. This year the salmon in the Sacramento River seemed doomed to extinction. The failing of this year was due largely to the heavy blasting and other operations on the line of the Southern Pacific Railroad, which was then being constructed from Redding northward along the banks of the Sacramento River to the mouth of the Pit River, into which the McCloud River flows. The salmon were undoubtedly frightened so that they did not ascend the Sacramento River, besides a great many were taken and destroyed by the grading gangs and used in the camps for food. Thousands of trout and salmon were destroyed by powder used by the Chinese and white laborers, of whom there were 9,000 camped along the river; and while a great many were used as food, there was wanton destruction in the way they were killed. The same condition existed in 1884, and Superintendent Stone of the Baird hatchery recommended that the station be not operated that season. It remained closed from that date until 1888, the year that the Sisson hatchery was established by the California Fish Commission, in an attempt to restore the salmon run in the Sacramento River.

In 1885 the California Commission decided to establish a hatchery for the propagation of salmon, as the federal government had not again resumed operations at Baird. It was decided to establish a hatchery and an egg collecting station on Hat Creek, a large tributary of the Pit River, where salmon formerly abounded by the thousands during the spawning season. This station was operated for two seasons. The writer was in charge of the work during the last season this station was operated. The work of collecting the eggs was begun early in August and continued until November. Less than 500,000 eggs were collected as the result of the season's work. The spawning beds in Pit River and Hat Creek, that a few years before had been covered with salmon, were now deserted. In the spring of 1888 recommendations were made to the Board of Fish Commissioners and to the Governor of the state to abandon the hatchery or close it down for a number of years, and that a station be established lower down the Pit River or on the main Sacramento River to endeavor to collect the eggs from the few remaining salmon that ascended the Sacramento to the spawning grounds. It was demonstrated beyond any doubt during the two seasons that the Hat Creek hatchery was operated that the spawning salmon that remained did not reach Hat Creek nor the Pit River near its confluence with Hat Creek in numbers sufficient to justify further operations. It was evident to the writer and others who made a study of conditions regarding the spawning salmon, that owing to the greatly diminished number of fish that ascended the Sacramento River, that ample spawning beds were found by the fish lower down and that only a few strag-

glers ascended Pit River and its tributaries. Acting under the recommendation of the writer, the Board of Fish Commissioners ordered the Hat Creek station closed, and began to look for another site.

After a thorough examination and study of the different streams by J. G. Woodbury, the newly appointed Superintendent of Hatcheries, it was decided to locate a salmon hatchery on Spring Creek in Siskiyou County, near the town of Sisson. In the mean time arrangements had been made with the United States Commission to open up the Baird hatchery, collect the eggs at that station and ship them to Sisson, where they could be hatched and the fry reared and fed until they were large enough to liberate in the tributaries of the upper reaches of the Sacramento River. This location and plan of hatching and distributing the salmon fry was concurred in by Mr. Woodbury, representing the California Fish Commission, and Dr. Livingston Stone, Superintendent of Baird hatchery, and the first fish culturist to attempt the propagation of the Pacific salmon. Mr. Woodbury had been Dr. Stone's assistant at Baird during the time of the establishment of the Baird station, and no better authorities on salmon culture could be found, and to this day no marked improvement over their ideas and work has ever been advanced. The writer had personal knowledge of their plans and consulted and worked with both gentlemen.

The Sisson hatchery was completed and ready for operations in September, 1888. The floods did not interfere with the work, and Dr. Stone operated until late in November. Eight hundred thousand eggs were collected from the early fall run and 2,200,000 from the October and November, or late fall run. These eggs were hatched and the fry fed until they were large enough to care for themselves and then carefully distributed in the upper reaches of the Sacramento River and its tributaries. The work of feeding the fry was continued until 1895, when the feeding of the fry was discontinued by the Board of Fish Commissioners, as a matter of economy and a wrong idea that had been advanced by those who were dictating the policy of the fish cultural operations in California, that the salmon fry were better off if distributed as soon as the umbilical sac was absorbed. The benefit of feeding the fry was plainly demonstrated by the great increase of the salmon in the Sacramento River in the years that followed the return of the output of fry from 1888 to 1896. In 1896, 27,000,000 eggs were collected at Battle Creek station, a few miles below the mouth of the McCloud River, and 7,000,000 at Baird station from the McCloud River. During these years a better and more efficient patrol of the bays and rivers was made during the close season than formerly. The laws regarding the legal size of nets used in fishing were enforced, and the Saturday-Sunday non-fishing law was enforced strictly. This

insured a larger number of breeding salmon for the egg collecting stations. These regulations and the feeding of the salmon fry during the period from 1888 to 1896 were, in my opinion, the principal agents in restoring the salmon in the Sacramento River.

After the appointment of the present Board of Fish and Game Commissioners during the summer of 1911, and the reorganization of the department of hatcheries, it was decided to again hold and feed the salmon fry until they were large enough to care for themselves when they were distributed, as well as to hold a large number of them in the ponds at the Sisson hatchery until fall, and then release them in the upper reaches of the Sacramento River during the early fall, before the winter floods. This method of handling the salmon fry will give them a chance to reach the ocean at an age when they can protect themselves from the predaceous spiny rayed fishes that inhabit the lower reaches of the Sacramento River and Suisun, San Pablo and San Francisco bays, through which they must pass before they reach the ocean. During the season of 1913 three quarters of a million salmon fry were held in the ponds at the Sisson hatchery and released during October. This season 21,000,000 salmon fry were held in the troughs, nurseries and ponds and fed until late in the spring. Of this number 2,000,000 were distributed by the California Fish and Game Commission's distributing car in the lower reaches of the Sacramento River near Walnut Grove and Benicia. Four million were placed in the large ponds at the Sisson hatchery in perfect condition, where they are fed daily and looked after by a skilled fish culturist. The remainder were distributed in the tributary streams of the upper Sacramento River. Those placed in the ponds will be released during the early fall, so that they can descend the river slowly and reach the lower reaches of the river and the bays at a time when the spiny rayed fishes are not so active as they are during the summer months. After the temperature of the river falls the bass and other predaceous fishes are not so active in the pursuit of food, and the salmon fry will reach the ocean with less loss than if they are released in the spring or summer.

The Fish and Game Commission of the State of California is now preparing one of the largest and best pond systems for the rearing of salmon fry in the country. Plans are being made to construct enough ponds to hold 10,000,000 of salmon fry next season.

The fry at the Sisson hatchery are first held and fed in the troughs about two months before they are removed to the ponds. Then they are taken out in small lots and fed until all are accustomed to the new surroundings. The pondkeeper distributes the food slowly at the different feeding stations in the ponds, until he is satisfied that all the fry have received their share of food. By this method the fry all make the same

development and growth and there is not any danger of developing a lot of precocious fry to exercise their cannibalistic instincts on the others. During the first cold weather in the fall the fry are ready to be liberated. They are then in readiness for their trip to the ocean at a time when there is not any danger of their being carried into the overflow basins, when many of the predaceous fishes have lost their activity, and when the salmon fry are large enough and conditions of weather and water are such that they will not linger long in the lower reaches of the Sacramento River and bays, but will descend to the ocean with less loss and in better condition than if handled in any other way.

The large island district in the lower Sacramento River, and the bays through which it flows before reaching the ocean, makes the propagation of the salmon a different problem than in any other stream on the Pacific coast. If it were not for the conditions above mentioned, the fry could be hatched and distributed nearer the ocean, but on account of the large bodies of water inhabited by predaceous fishes at the mouth of the Sacramento River it is necessary to hold the fish as long as possible near the upper reaches of the river, and release them at a time when they will make the journey to the ocean in the shortest time possible, if the best results are to be obtained.

During the past year three new ponds have been constructed for the rearing of brood fish, making in all a total of fifty-one ponds and nurseries. With the increasing demand for fish to stock our streams it is necessary to increase our pond system, to enable us to raise stock fish enough to supply the eggs. The loss to our rainbow stock has not been made up as yet. The unwise policy of releasing the stock of rainbow on hand in the beginning of 1911 has caused a shortage in our distribution this season of this variety of fish. The streams in which the wild eggs can be collected can not be depended on. We must depend on our stock fish in the ponds, if we desire a regular supply of eggs each season. This season the tremendous snows of last winter, that kept the tributary streams of the Klamath River high, roily and cold during the spawning season, caused the run of rainbow trout into the tributary streams to be very small, and as our stock of young rainbow trout are not old enough to breed, our take of eggs was limited, as will be shown by the table of distribution. We hope to have sufficient stock fish in our ponds within the next fifteen months, with a few collected from the streams, to meet the demands of the public for fish to stock the waters throughout the state. On the following pages is a list of the streams stocked in 1913.

We have for distribution during the season of 1914, 7,832,000 fry, consisting of the following varieties: Loch Leven, Eastern brook, rainbow, steelhead, black spotted and large lake trout.

The total number of fish on hand in the ponds at Sisson hatchery July 1, 1914, is as follows:

Rainbow trout:		
Adults -----	2,600	
Two years old -----	5,000	
One year old -----	12,000	
Fry -----	30,000	49,600
Loch Leven trout:		
Adults -----	9,000	
Two years old -----	1,200	
One year old -----	13,000	
Fry -----	25,000	48,200
Eastern brook trout:		
Adults -----	5,500	
Two years old -----	1,200	
One year old -----	32,000	
Fry -----	25,000	63,700
Miscellaneous:		
Land-locked salmon, yearling -----		1,100
Golden-rainbow, adult -----		45
Grayling, two years old -----		180
Grayling, one year old -----		1,400
Total -----		164,225

TAHOE HATCHERIES.

The Tahoe hatcheries consist of three stations, Tahoe, Tallac, and Glen Alpine. These hatcheries have been under the supervision of E. W. Hunt for the past twenty years, and the results of his management are excellent. The Tahoe and Tallac hatcheries are the property of the state. Glen Alpine is a substation operated in connection with the Tallac hatchery. It is only a small building, the property of the Glen Alpine Hotel Company. It is used by the commission to hatch out a few hundred thousand eggs to save the cost of transportation of the fry. The fry from this station are distributed in the high lakes in the vicinity of Glen Alpine Springs. The principal lakes stocked from this station are Lily Lake, Grass Lake, Susie Lake, Heather Lake, Gilmore Lake, Lucille Lake, Half Moon Lake, Lake of the Woods and Glen Alpine Lake. These small mountain lakes afford excellent fishing for those who desire to make the trip in this region. Glen Alpine hatchery was not operated during the season of 1913 as the run was late and the number of eggs collected did not justify the expense of operating this station.

Tahoe and Tallac hatcheries were operated as usual. The fry hatched out in good condition and were distributed, in the places as shown by the statistical report of the distribution from the Tahoe and Tallac hatcheries for 1913.

This season (1914), Superintendent Hunt was given instructions to get on the ground as early as possible with his crew, as it was the desire of the commission to collect as many of the eggs of the black spotted trout as possible. Mr. Hunt began operations at the mouth of Taylor Creek with his seining crew on April first and collected 5,548,000 eggs. After placing as many eggs as could be safely handled in the Tallac, Tahoe and Glen Alpine stations, the remainder were shipped to Wawona and Sisson hatcheries. The work of the artificial propagation of the black spotted trout at the Tahoe hatcheries has been productive of good results, and the large number of fish taken from the waters of Lake Tahoe and other lakes in that region speak well for the system of work carried on at these hatcheries. The increasing number of fishermen that visit this region each year, owing to the easy trip to the lake by railroad and automobile, causes a demand for a larger output of fry into Lake Tahoe and the lakes of the Tahoe Basin.

I respectfully recommend that the Tahoe hatchery be improved, and enlarged to twice the present capacity. The water supply is limited at the Tahoe hatchery, but I believe that it can be arranged under a different system than the one now in use to double the capacity of this station. If this can not be done, I would suggest that another location be selected for a new hatchery with a capacity of at least 3,000,000 eggs and that arrangements be made for holding the fry until later in the fall before making the distribution. The large lake trout (*Salmo tahoensis*) should be propagated in as large numbers as possible. A well constructed trap should be placed in the Little Truckee River this fall, so that when the run begins next spring no time would be lost and as many eggs collected from this stream as possible. Nearly all the large lake trout spawn in Blackwood Creek and the Little Truckee River. A few enter some of the other creeks, but their numbers are not great enough to justify the expense of trying to collect their eggs. The smaller variety (*Salmo henshawi*) can always be taken in sufficient numbers at the mouth of Taylor Creek to supply all the eggs necessary for stocking the waters of the Tahoe Basin.

BROOKDALE HATCHERY.

Brookdale hatchery was operated during 1913 by the Fish and Game Commission under a lease from Santa Cruz County. Mr. F. A. Shebley has been in charge of this station since it was established in 1905. It is not necessary to mention the efficiency of his management regarding the steelhead work in Santa Cruz County. The increased number of fish in the streams stocked from the Brookdale hatchery since its institution are all the evidence necessary of the valuable work of this station. In the statistical tables will be found the result of the operations of this station for 1913.

This season the commission entered into a contract to purchase the eggs from Santa Cruz County, and gave up the lease. The price agreed on was that the Fish and Game Commission was to pay one dollar and fifty cents per thousand for the eyed steelhead eggs, up to the number of two million, and one dollar per thousand for all eggs that the county of Santa Cruz could furnish up to 3,000,000, provided that the eggs were collected and eyed by a skilled fish culturist and would pass inspection before they were accepted. F. A. Shebley was placed in charge of the work.

The Commission owned property jointly with the county, that was purchased several years ago, to the value of \$796.65. This the county of Santa Cruz accepted in part payment of eggs furnished the state.

PRICE CREEK HATCHERY.

Price Creek hatchery has been under the supervision of Mr. W. O. Fassett, who has successfully operated this station for the past fourteen years. We are pleased to note that the salmon are yet plentiful in Eel River, and do not show any signs of a decrease, although the fishing has been as heavy as in past years. This hatchery was established in 1898 at a time when the average number of salmon shipped did not exceed 500,000 pounds. Five years after the artificial propagation of the salmon the number had increased to over 1,500,000 pounds annually. The salmon eggs that restored the run of salmon in Eel River were the surplus eggs shipped from the Sacramento River stations.

In the fall of 1912 we made arrangements to collect the salmon eggs for the Price Creek hatchery by purchasing the mature fish from the fishermen at a nominal cost, but we were not successful. The fishermen did not respond as readily as we expected. They were too anxious to get their fish to the market to assist us by furnishing us the mature fish to supply the eggs so that we could keep up the supply of salmon in the river without a decrease in numbers. During the fall of 1913 we made arrangements to collect the eggs with our own crews. Accordingly Superintendent Fassett was instructed to construct the necessary live cars to hold the fish, and plan to seine the pools for mature fish. A skilled egg collector was sent to assist him in the work. The work started off auspiciously, but just as the run was at its best an unusual storm set in that caused the river to rise and allowed the spawning salmon to leave the pools in the lower reaches of the river, where they congregate before ascending the river to spawn. Before the freshet caused the river to rise a number of mature fish were taken and 472,250 eggs were collected; these, with 3,611,000 eggs shipped from Mill Creek station, were successfully hatched and the fry liberated in Mad River, Elk River, Jacoby Creek, Freshwater Creek and Eel River and Price Creek, as will be shown by the table of salmon fry distribution.

I would recommend that if the funds are available, a well built restraining rack be constructed across Eel River to hold the salmon, and another attempt made this fall to collect the eggs of the salmon from this river. Eel River is one of the most difficult rivers on the coast to construct racks in, as it rises suddenly, and the bed of the river is formed of such a deep deposit of loose gravel and sand that is always shifting whenever there is a rise in the river, which makes it a very expensive piece of work to construct racks that will hold the salmon. The best that can be expected would be a rack that would stand a rise of two or three feet at the most. To attempt to construct a larger rack would be very expensive and one that would require heavy piers sunk deep in the gravel with the bed of the river floored with brush and rock. It would not be practical to construct anything but low racks to withstand a rise of two or three feet. During normal seasons the river would not rise enough to damage the low racks until the salmon run was practically over. If the funds are available, I would recommend the construction of a rack as described above, and preparations made to collect the salmon eggs from Eel River this fall to supply the Price Creek hatchery.

UKIAH HATCHERY.

Ukiah hatchery is located one mile from the town of Ukiah, Mendocino County. It is the property of the city of Ukiah. The state is given permission to use this hatchery through the courtesy of the city of Ukiah. It has been in operation for a number of years under the supervision of Mr. A. V. LaMotte, one of the oldest fish culturists in the state. Mr. LaMotte is particularly successful in the propagation of the steelhead trout.

The Ukiah hatchery was not operated during the season of 1913. Owing to the extremely low water in the streams it was not considered necessary to operate this station, as a sufficient supply of eggs could be collected from Scott Creek to stock all the streams. The streams contiguous to the Eel River and Russian River basins, as well as the streams of Marin County, were stocked with steelhead fry hatched at Sisson hatchery from eggs shipped from Scott Creek station.

As the season of 1914 appeared to be propitious for the collection, propagation and distribution of trout fry, owing to the streams being again filled with an abundance of water after the heavy storms of last winter, it was decided by the commission to operate all the hatching stations to their fullest capacity, if sufficient eggs could be collected. The Board of Fish and Game Commissioners, early in the year, received permission from the Snow Mountain Water and Power Company, to collect eggs at their dam in Eel River and use the old eyeing station for the purpose of preparing the eggs for shipment to Ukiah hatchery.

After the necessary repairs had been made, the crew began work on February 10th and collected 1,713,000 eggs. Eight hundred eighty-one thousand eggs were shipped to Sisson where they were hatched and are now being distributed in the streams throughout the coast counties. The Ukiah hatchery was filled to its normal capacity with eggs (550,000), which hatched in good condition and the fry will be distributed in the streams of Sonoma and Mendocino counties.

The Snow Mountain egg collecting station on Eel River is a very important station and should be owned by the state. It will, if the Eel River is kept well stocked, furnish several million steelhead eggs each season.

I respectfully recommend that the Fish and Game Commission take the necessary steps to establish a permanent egg collecting station at, or near, the Snow Mountain dam, for the purpose of collecting the eggs to stock Eel River as well as the streams tributary to the Russian River and throughout Sonoma and Marin counties.

I would respectfully call the attention of the commission and the legislature to the fact that all of our steelhead stations are held by leases and that the commission is only operating through the courtesy of the owners of the different stations. I would recommend that one or two streams be selected for permanent steelhead trout egg collecting stations, and that the legislature pass an act setting these streams aside as permanent egg collecting streams, and that no fishing be allowed at any time on the streams selected for this work. In my judgment, if these egg collecting reserves be set aside and properly cared for, enough eggs can be collected from the steelhead trout to stock all the coastal streams of California from Little River, Humboldt County, to the Ventura River in Ventura County. If this work is carried out systematically and the coastal streams properly stocked each year, an open season of two months or two months and a half during the winter months could be declared for catching the large steelhead trout when they first leave the ocean to enter the coastal streams. I make this recommendation with this reservation—that the season for taking the large fish be not opened to any but the anglers taking the fish with hook and line, and then only when these egg collecting stations are established and all preparations made for collecting enough eggs to stock the streams in all the coast counties from Humboldt County to the Ventura River.

WAWONA HATCHERY.

The Wawona hatchery was erected by the Washburn brothers in 1895 under an agreement with the commission that it should be operated each season to stock the inaccessible regions above the Yosemite Valley.

The writer had made several trips with fish in that region previous to that time, and successfully stocked a number of lakes and streams

above the Yosemite Valley, but the work was hard and expensive. The hatchery was constructed in the spring of 1895 and the first black spotted trout hatched during June of that year. Since that time the hatchery has been operated each season for a period of about three months, and the excellent fishing in the lakes and streams of that region speak well of the work from this station. Mr. M. L. Cross has been very successful in handling the station. He has had charge of the work at this station for the past ten years, except the season of 1912. He is an experienced and capable man for this work, and when the conditions of the water are considered during the warm summer weather, the excellent condition of the fish distributed from this hatchery speak well of the skill and good judgment used by Mr. Cross in rearing the fry.

The Wawona hatchery was operated during 1913 and also this season, and 220,000 fry were distributed in 1913, a list of which will be found in the table of distribution. This season 242,000 eggs of the black spotted trout were hatched in good order and the fry are now (July 1st) ready for distribution.

The Wawona hatchery is old and dilapidated and should be replaced by a more modern building. A better site should be selected where an abundance of cold water can be had. The supply of water at Wawona station is too warm to hold the fry as long as desired, and I respectfully recommend to your honorable board that a new site be selected near Wawona, on one of the streams tributary to the Merced River where the water is colder, and where the fry can be held longer before they are liberated. The state should get a lease or permit, if a site should be selected in the Yosemite National Park, and erect the hatchery. The Washburn brothers have been fully repaid for their kindness in erecting the hatchery that has done so much good work in the last nineteen years, and the state should now construct a building on their own property, and endeavor to keep this region well stocked by a larger and more up to date hatchery.

THE SACRAMENTO EXPERIMENTAL STATION.

During the fall of 1912 and the winter of 1912-13, the experimental work of attempting to hatch the salmon eggs with the water pumped from wells in the vicinity of the city of Sacramento were continued. The results of the previous winter were not satisfactory. Although a fair percentage of the eggs hatched the embryos were soon affected by the minerals in solution in the water and the lack of well oxygenated water. The water did not have the life sustaining qualities of mountain stream water, although a well arranged system of aeration was used.

During the winter of 1912-13, the well on the Sherburn tract was again pumped. This well appeared to contain less mineral than the other wells in this section that had been tried out. We arranged the troughs in a

barn that had been rented, for the purpose of using it for a hatchery, and conveyed the water in a flume from the well on the Sherburn tract that gave the best results the season before, hoping that a better aeration and longer pumping of the well would improve the condition of the water; but we were disappointed. After heavy pumping of the well for a few days, the eggs were placed in the troughs and the development closely watched. The eggs were carefully tested and examined on arrival and found to be in perfect condition. A few hours after they were in the water they began to change from their natural color to a reddish brown. The embryos soon showed signs of distress by a quick, spasmodic motion in the shell, plainly exhibiting the distress they were in from the action of the mineralized water. A few days later they hatched prematurely, and began dying in great numbers shortly after hatching. The shells by the time the embryos first began hatching were stained to a dark brown color. The troughs, flume, baskets, and other hatching apparatus were all covered with a coating of a reddish brown substance, consisting of iron, barium, etc. The effect of the water from this well was worse on the eggs and embryos this season than in any of the previous experiments. The action of the water was so deleterious that it was only a question of a few days when the embryos would have all been destroyed, so I instructed the employees to deposit the remaining embryo salmon in the Sacramento River and to close the station. The troughs and other apparatus were shipped to Sisson hatchery.

In my opinion there is not any well water in the Sacramento Valley in which the salmon eggs will hatch successfully. I would not recommend any more experiments along these lines as I feel positive that the well water all through the valley contains too much mineral to hatch salmon eggs without destroying, or injuring them so badly that they will not thrive, if they should hatch out. All eggs of the *Salmonidæ* of any species require pure cold spring or mountain stream water in which to hatch. The eggs are very absorbent, and any mineral substance in the water, no matter how small in amount, is gradually absorbed in the economy of the egg, and the embryos will be affected or destroyed from its action.

RECOMMENDATIONS.

With the rapidly increasing population of California, a proportionate increase of hatchery work should be carried on, if the streams and lakes of this state are to be kept in condition to meet the demands of the population. All the hatchery stations should be enlarged and improved, and new stations established within the next two or three years.

In my report for 1912 I recommended the erection of a hatchery in southern California, and if suitable conditions are yet to be found, I would recommend the construction of a hatchery of about 1,500,000

capacity. One million five hundred thousand fry properly reared and distributed will keep the streams that are in condition to support trout well stocked. This does not include the streams and lakes in the Seventh District. The streams and lakes of the Seventh District can be supplied from Sisson hatchery. If a suitable site with sufficient water can not be found in the counties lying contiguous to Los Angeles and farther south, I would recommend that a hatchery be established in the Seventh District large enough to supply all the fry necessary for southern California.

Before erecting a large plant in southern California, it is necessary to rear enough stock fish at Sisson or at some other station to furnish the

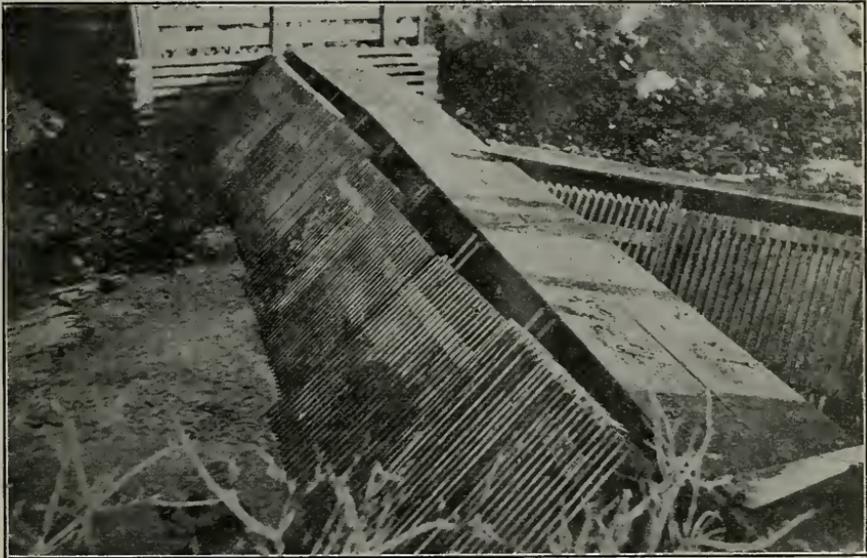

The Mantelpiece—on upper Bear Creek, San Bernardino County.

eggs necessary to supply this region. The steelhead eggs can be collected on our northern coast if arrangements are made to do so. The rainbow eggs can be supplied from our northern stations. The Loch Leven can be supplied from Sisson hatchery. They will thrive in the streams of the higher regions. The black spotted trout will do well in Bear Valley Lake and in some of the higher lakes and reservoirs. The region in which the Eastern brook trout will thrive in southern California is limited, and only a very few will be required to stock all the streams in which they will thrive in southern California.

Owing to the failure of the rainbow trout to enter the tributary streams to the Klamath River in numbers great enough to give us our usual supply of eggs, I would respectfully recommend that egg collect-

ing stations be operated on the tributaries of the Pit River. Mr. E. W. Hunt and myself have just returned from an inspection of the streams that enter Pit River in Shasta County, and believe that the chances are good to collect a large number of eggs in Burney Creek, Clark Creek and Hat Creek. There appears to be as many trout in that region as there were twenty-five years ago when we operated the Hat Creek hatchery. The eggs could be collected and conveyed by team to the old Hat Creek hatchery, where they could be held until they are advanced enough to stand shipping to Sisson or some of the other stations. The Hat Creek hatchery was closed down by the commission in the spring of 1888. The

Fish racks on Camp Creek.

writer was in charge at the time. It was our impression that the state only held a lease on the land on which the hatchery was located. Mr. E. W. Hunt, superintendent of the Tahoe stations, was my assistant at the time.

The board recommended that the station be closed for a number of years as there were not salmon enough at that time in the Pit River to justify the expense of operating the station. Since then no attempt has been made to carry on fish cultural work in that part of the state. Two years ago we were informed that the commission owned the land, and that the land that we supposed was held under a lease had been deeded to the state. A short time ago we had the records searched in Redding, Shasta County, and found an instrument on record that purports to deed to the State of California about three and one-half acres of land on the banks of Hat Creek, on which was built the Hat Creek hatchery

and the mess house. The same buildings are there in a good state of preservation today. The only questionable thing regarding the deed is that of the description of the boundary lines. They are not well defined, but when Mr. Hunt and myself visited the station on Hat Creek on July 14th we found the fences and buildings located as they were in 1888. I believe that we can establish the boundary lines as they were then recognized by all the interested parties. One of the signers to the instrument or deed declares that he only signed a lease and claims the land. The other party, who owns another portion of the land, is living, and we will endeavor to get him to assist us in clearing the title to the property. At the time the transactions were made, Mr. Hunt and myself were employed in the hatcheries and did not have any knowledge of the affairs of the commission, as they were then carried on at the head office. The deed on record in Redding was executed April 20, 1885, and in my opinion was drawn up by Judge A. B. Dibble, who was at that time President of the Board of Fish Commissioners. The original copy was probably lost during the fire in San Francisco in April, 1906. When I visited the Hat Creek station I placed Mr. Tucker in charge of the buildings and grounds until we could have the legality of the deed passed on and the boundary lines defined. If we can establish the right of the commission to this property it will make a fine hatching station in a few years, and can be used this winter for the purpose of eyeing the eggs preparatory to shipping them.

If the funds are available, I am of the opinion that better results can be obtained in distributing the fry by one of the messengers from the car accompanying each shipment and supervising the distribution, particularly so where the applicants are not familiar with the handling of the fry. I do not believe in the policy of hatching a large number of fish and having them handled by skilled fish culturists up to the time they are taken from the distribution car, and then turned over to some person who may lose a portion or all of them. A great many applicants have been receiving and distributing fish for years, and they are familiar with all the conditions to properly plant the fry, but we often receive applications from persons who have never handled any fish and they are apt to ignore the instructions on the printed sheet that is given to each applicant.

I again recommend that your honorable board call the attention of the legislature to the danger of allowing any one to introduce any more predaceous or spiny rayed fishes into the waters of this state. I would recommend the passage of an act making it a misdemeanor for any one to introduce any fish or fish eggs into the State of California without first obtaining permission from the Board of Fish and Game Commissioners, so that no one will ever be allowed to introduce any specie of

fish that would be injurious to and probably exterminate our valuable food and game fishes. I would also recommend that every possible means be used to discourage the planting of black bass or any of the spiny rayed fishes in waters where trout will thrive. There is in this state sufficient water for all of these species of fishes without encroaching on the mountain lakes where trout will thrive and where the other varieties will live only to destroy the trout, but not to increase or thrive well enough to take their place.

I urge the recommendation made previously in this report that the 10 per cent water flow regulation be passed. This is a vital subject when the preservation of the trout and salmon are taken into consideration.

Bills were introduced during the last session of the legislature covering nearly all of the above mentioned subjects, but owing to the vicious onslaughts that we received from several demagogues who believed they were making themselves popular by attacking the Fish and Game Commission, our efforts failed and the measures that were introduced for the benefit of the people were left to die in the committees. It is to be hoped that the next legislature will act on these recommendations and pass them, for it is earnestly urged that these measures be passed for the conservation of the fish of the state.

I earnestly recommend the increasing of the hatchery work to meet the demands of the rapidly increasing population of the state. This must be done by increasing the capacities of our hatcheries, and the most important thing of all in my opinion is the increase of the number of ponds for rearing brood fish, and the setting aside of several good coast streams for steelhead trout preserves where enough steelhead trout can be taken each season to supply all the coast streams. If this is done, an open season during the winter months can be had.

This concludes my report. A great many things of importance have been carried on concerning the conservation of the fish through our efforts to install screens in the ditches and canals and fishways over the dams. We have the work well in hand at present, but it will take us at least a year or two longer, with our present crew, to complete this important work. I wish to express my gratitude to the Board of Fish and Game Commissioners for the support they have given me and those associated with me in this work. The earnest and hearty support of my superiors and the untiring efforts of my assistants have made the last two seasons' work among the most successful in the history of the commission.

Respectfully submitted,

W. H. SHEBLEY,
Superintendent of Hatcheries.

Sisson, California, June 30, 1914.

REPORT OF SUPERINTENDENT OF GAME FARM.

By W. N. DIRKS.

The scarcity of wild game, and the demand that there is from the non-hunting public for something to take the place of the game that was formerly commonly served at all hotels and resorts throughout our state, has opened up a new field for the pheasant breeder. The ringneck pheasant is not only one of the best of game birds, but also takes very kindly to domestication and can be reared by careful breeders with scarcely more difficulty than ordinary poultry. The prices that are obtained for young pheasants has made the breeding of pheasants very attractive to many people throughout the state, and in time should be an important addition to its industries. In the hope that the experience we have gained at the state game farm during the past several years may be of benefit to the public, we offer a few suggestions for the handling of pheasants and other game birds in confinement.

Since the inception of the game farm, approximately five thousand pheasants have been raised. Most of these have been liberated in the various parts of the state climatically adapted to them. It has not been the intention of the commission to enter into competition with private breeders and practically no birds have been sold.

Selecting of Breeding Stock.

It has been our practice to hold the largest and most vigorous birds from the early hatch for breeders the following year. These birds seem to be stronger in every way than those from hatches later in the season. It is well to exchange birds with other parties having a different strain of stock to prevent any evil effects that might arise from inbreeding.

Breeding Pens.

As the breeding birds will be held for approximately five months during the laying season, it is essential that they be placed in pens that can be easily moved to new ground. Very satisfactory pens can be built of equal size panels covered with inch mesh wire and secured at the corners with butterfly bolts. A baseboard at least a foot high on each panel will add strength and durability to the pens. In the corner of one panel a door large enough to admit the entrance of the attendant should be constructed. Panels can be placed across the top, or poultry wire can be stretched and fastened temporarily. A pen of six birds should have a ground space of at least 144 square feet. The takedown pens have the additional advantage that they can be segregated should there be any need of keeping the birds apart on account of disease. They can also be easily cleaned and disinfected.

Feed for Breeding Stock.

Any standard brand of poultry scratch feed, together with plenty of greens, grit and dust will be found satisfactory. Over feeding is to be guarded against, and the pens should never be littered with stale food. An abundance of fresh water should be available at all times.

Breeding Season.

The breeding stock should be placed in their allotted pens by the first of February, or as soon as they show any inclination to mate. In our experience, we have found that the best results can be obtained from confining not to exceed five hens with each male bird, although good results can sometimes be obtained by using a greater number of hens; but under average conditions this is not advisable. Eggs may be expected by the middle of March. Between this time and the middle of July, each hen should lay approximately sixty eggs. These eggs should be gathered twice a day and placed in a cool, well ventilated room on shelves covered with a half inch of sand to prevent them from rolling about. In order to avoid the confusion of having several small hatches coming off every few days, we make a practice of setting every ten or twelve days. This permits us to give our entire attention to one lot of young birds during the most critical period, namely, the first ten days. We have found that holding the eggs for this length of time is not detrimental in any way. It should be remembered that in the wild state the hen pheasant will lay an egg a day over a period of from two to three weeks. She does not commence to set until the last egg is laid, and almost invariably every egg will hatch.

Setting.

Our experience with the incubator has proven to our satisfaction that the domestic chicken or turkey is preferable. We have had excellent results from combining both. Eggs have been placed under hens for the first half of the period of incubation and then tested for fertility and the fertile eggs transferred to the incubator. As the eggs are taken from the hens, they are placed in a basket and the hens are then reset on fresh eggs. The number of eggs given each hen is governed by the ability of the hen to cover them satisfactorily. When setters are scarce, we ordinarily place as many as twenty-five under each hen. Bantams will cover only fifteen and a hen turkey will cover satisfactorily as many as thirty-five.

Eight hens are placed in one compartment, the nests being on the ground and separated by a four-inch board. By this arrangement only one drinking fountain is necessary. There is also a reduction in the number of feed pans, dust boxes, etc., and the extra work in attending to them. It is necessary, however, for the attendant to keep careful

watch to see that the setting hens do not "double up," thereby leaving a setting of eggs uncovered, so that they become chilled.

Great care should be taken in the selection of the brooding hens. No birds should be selected that can not be handled. Nervous, easily frightened birds will fly off the nest at the approach of the attendant and will destroy more eggs than the hen is worth. Before setting, the hen should be free of all vermin, and only healthy fowls should be selected.

Incubation.

Pheasant eggs are tested for fertility in the same manner as the ordinary hen egg. The fertile eggs are placed in the incubator for the

Two bird-killers—house cat and weasel.

remaining period of incubation, and the infertile ones can be set aside to be used later for food for the young chicks. The incubating period varies between twenty-three to twenty-four days. We have used California made incubators equipped with moisture pans kept partially full of water during the entire season. The bulb of the thermometer is placed even with the top of the eggs, the temperature registering from 101 to 103 degrees Fahrenheit. We have found that the temperature can vary to a considerable extent without any serious results in the hatch. Eggs should be allowed to cool in the morning and evening up to the time of hatch. While most lots of eggs are moved or scrambled about at each cooling, we have had the same percentage of hatches from

lots that have not been turned at all during the period of time while in the incubators.

Brooding.

During the season of 1912-13, all birds, with the exception of a few small lots whose numbers did not warrant the expense of operating artificial brooders, were brooded in brooders of various makes. The fireless brooder equipped with feather dusters gave excellent satisfaction with small lots, but scores of birds were confined together and a large number were lost through piling up. One of the chief objections to this style of brooder is the fact that the chicks must be forced in, there being no artificial heat to attract them. When there are many birds to be taken care of, it has been found more satisfactory to use a brooder with artificial heat. There are various makes of oil heaters on the market, all of which should give good results.

During the season of 1914, owing to uncertainty as to whether the game farm would be permanently maintained, we have only a very small breeding stock and are using hens exclusively for brooders. When this is done, it is absolutely essential that they be cleaned of all vermin, as nothing is more fatal to the pheasant chicks than vermin. Large, clumsy hens are to be condemned, as they kill many chicks by stepping on them.

As soon as the chicks are thoroughly dry, they are placed in baskets and given to the hens that are to take care of them. A close watch is kept to see that they are adopted, after which each family is transferred to its individual brooding coop. Some hens will show a positive dislike towards caring for the chicks. Such hens should be reset and not given the young birds until they will take care of them.

The brooding coops are constructed of twelve-inch redwood boards, with a shed roof on one end to afford shelter at night. The open portion should be covered with poultry wire of small enough mesh so that the young birds can not get out. The brooding pens are open at the bottom and are transferred to fresh ground from day to day. If confined to the same place for any length of time, the birds will quickly become weakened and not be able to withstand disease. Water is an essential requirement and a clean supply should be available at all times. Several makes of excellent chick fountains can be purchased. When the coops are set on grass plots, it is not necessary to feed other greens, otherwise lettuce, kale, or Swiss chard or some other greens should be given every day. We feed a standard variety of chick food, mixed with ground hard boiled eggs, in the proportion of twelve eggs to one gallon of food. This preparation is given for about two weeks, and then gradually cut down until the birds are eating straight feed at three weeks of age. In

addition to this, we feed dried house flies freely. They are trapped in wire fly traps and roasted and put in the sun to dry.

Maggots make an ideal, economical food that is readily taken by the young birds and is highly recommended by all pheasant breeders. Maggots can be reared without any great amount of trouble, by placing meat in a box, one end of which has been replaced by inch mesh wire. The box should be raised a foot from the ground and underneath the wire should be placed a bucket or tub, the bottom of which is covered with an inch of dry bran. The meat will quickly become "fly blown" and thoroughly infested with maggots. As they reach maturity, they will drop from the open end of the box into the bran of the bucket, where they dry off and can be fed to the young birds. A number of these maggot "factories" can be started at intervals, so as to maintain a constant supply of food.

A small box of sand or dust is kept in each coop, in which the chicks may dust themselves, thus keeping down any vermin that may not have been destroyed. The chicks should be confined in these coops until they are at least three weeks old. When moved to a larger pen, if the hen shows any tendency to neglect the chicks, they should be put back in the smaller pen until large enough to get along without her care. From the brooding pens, we have found it wise to put the flock in pens similar to those in which the breeding stock has been confined.

Shelter should be arranged so that the birds may during the stormy weather in the winter, if they desire, get under cover. A strip of roofing paper or oil canvas stretched over part of the top and along the upper part of the back of a series of pens will make an ideal shelter. Underneath this, perches or roosts can be constructed. The growing birds can be fed the regular poultry scratch food alternated with whole corn.

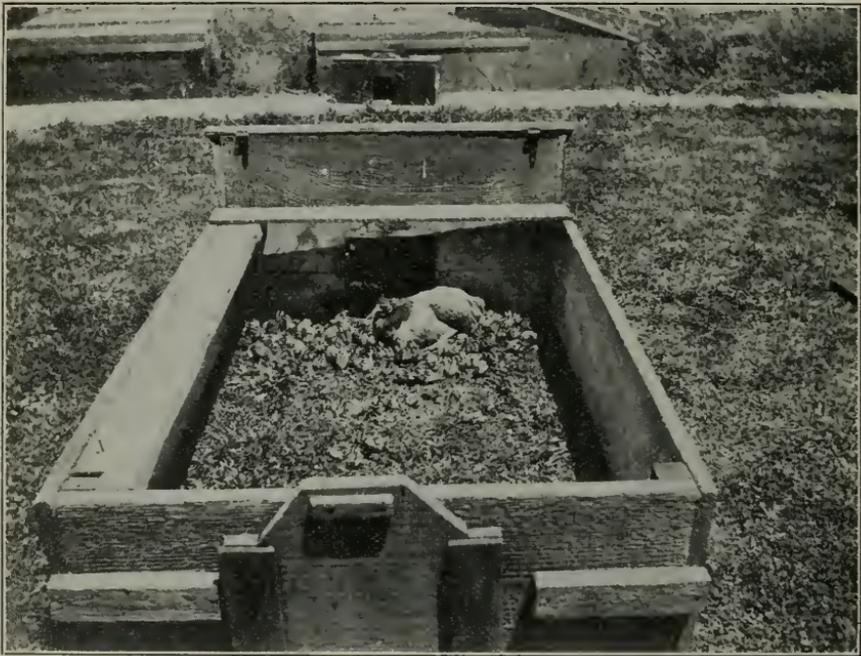

Valley Quail.

We have carried on during the past two years a number of experiments in the breeding of valley quail. During the season of 1913, part of our breeding stock was confined in pens similar to the pheasant pens, five females with one male. The others were held in a large enclosure. While the number of eggs secured was practically the same per bird in both lots, the fertility was somewhat better in those taken from the larger pen.

During the season of 1914, all of the quail have been confined in one cage, the eggs gathered day by day and held in the same manner as the pheasant eggs; in fact, with the exception of the incubation, the eggs and young quail are handled in exactly the same manner as the pheasants.

The period of incubation varies between twenty-three to twenty-four days. The water pan is kept full during the entire period, thus maintaining an equal amount of humidity during the entire period. The temperature may vary a number of degrees, some incubators registering at times as high as 105 degrees.

Quiet, bantam hens make excellent setters and brooders and where the number of eggs does not warrant the use of an incubator, they can be depended upon to hatch every fertile egg. On the twenty-second day of incubation, the hen should be confined in such a way that it will be absolutely impossible for the young birds to stray more than a few

Hen with brood of young valley quail at State Game Farm.

inches from the nest; otherwise they will go so far that they will not be able to find their way back, not understanding the cluck of the hen. At this time they need the heat that they secure from the mother hen and quickly die if chilled. Care should be taken that all holes are closed, as the young quail can make their way through an exceedingly small opening. After the young quail are thoroughly dry, they may be moved with the hen to the brooding coop, as illustrated in an accompanying cut. We have not found an artificial brooder that can compare in results secured with the ordinary hen.

The chicks should remain with the hen until fully grown, but should be moved at about six weeks of age to larger pens.

In a small way, good results can be obtained by allowing the female quail to select her own nest and hatch the eggs. If left to herself, practically every chick will be raised, but if molested or interfered with, she will neglect the little ones and they will quickly suffer.

Sometimes a male quail will take it upon himself to incubate the eggs and take care of the chicks. In one instance, a male confined with five females sat for the entire period, without any assistance from the females, and hatched eight eggs, leaving fifteen eggs still in the nest. These were put in an incubator and hatched at intervals until all the chicks had come out. This was due, we believe, to the fact that the different hens had laid in the nest while the male was setting. In another instance, a male bird hatched eleven young from a nest in a large cage where over fifty pair of quail were confined.

In the rearing of quail, one of the most important lessons to be learned is the fact that quail can not be confined on ground to which chickens, turkeys or pheasants have previously had access. Quail are particularly susceptible to the poultry diseases, and these diseases are very fatal to them.

Ducks.

We have at the game farm a number of wild ducks—spoonbill, sprig and mallards. Of these, the only species that has shown any inclination to breed in confinement is the mallard. The mallards will incubate their own eggs, or the eggs can be hatched in incubators. The other varieties named show no desire to mate. Young mallards can be given the same treatment as domestic ducks. They are strong and healthy and require comparatively little attention. If they are confined in open pens, the ducklings must be pinioned at an early age, or they are apt to take wing and fly away as soon as the migrating season is on.

REPORTS OF SPECIAL ASSISTANTS.

STREAM SURVEYS AND MAP WORK.

By CHAS. L. GILMORE, Engineer-Draftsman.

Importance of Accurate Knowledge of Streams.

To the State Fish and Game Commission, the importance of a thorough knowledge of the various watersheds of California, their location, runoff, impounding areas, etc., is most essential to the proper conduct of fish and game protection, preservation and propagation.

The whole of the present and future of the fish life of the state depends upon our water resources. Without this natural element of fish life they would entirely disappear from the face of nature; for no artificial method of sustaining fish without water has yet been discovered.

Water Supply and Its Relation to Game.

In the matter of the distribution of game there is a proposition analogous to that of fish. The abundant wildfowl in California that breed within the confines of this state nest in our lake and swamp regions. Their feeding places are in our valleys in our swamp areas, that have, in many instances, indeterminate areas. Our game is most abundant in those portions where streams and lakes are most plentiful and this water results directly in the heavy stand of timber that acts as a natural shelter to the game. Those areas classed as arid and semi-arid and devoid of a natural supply of water are as nothing in importance to the human family in the matter of game when compared with the well watered, heavily timbered mountains or the fertile valleys with their adjacent swamp areas.

Accurate Stream Records Essential.

Knowing and realizing the importance of a knowledge of the water resources of the state to the intelligent despatch of fish and game protective and preservation methods, the present Fish and Game Commission set about obtaining complete and accurate information on this subject.

Since there is but one method of surveying in vogue in the United States, it follows that accurate and authentic maps are the best methods of recording data of the character desired. Further, maps drawn to scale accord with the United States system of land surveys are easily understood, easily used as reference records and may be constructed as complete as may be desired. There is no better or more adequate method of recording the streams, lakes, ditches, canals, reservoirs, etc., together with volume of diversions, than by means of maps.

Data Collected and Recorded.

In 1912, this Fish and Game Commission initiated the task of gathering all available data relative to streams, etc., and preparing accurate and authentic maps whereon all this data, together with all fish distribution in its proper position with reference to the locality of the actual plant. In June, 1912, I had the honor to be appointed to conduct this very important work.

The base maps for the commission are drawn in conformity with the United States land surveys. The data has been obtained from all available authentic sources, such as United States land and geological surveys, private surveys conducted by power, irrigation and railroad companies, county surveys and a few original surveys carried on by myself in person.

Acting under instructions of the commission I began work with the Truckee River system, the outlet of Lake Tahoe. This river basin is one of the best patronized trout localities in the state.

A base map of the basin was first prepared whereon was placed all streams, lakes, etc., and this was followed by the addition of all dams that could possibly be classed as stream obstructions whether they were provided with fish ladders or not. Likewise I obtained from the records of the assessors of the several counties through which the river and its tributaries flowed, the names of all owners of land bordering or adjacent to the streams and placed this data upon the map.

Getting a Corner on Fishing Streams.

This Truckee River map brought to light a peculiar condition of affairs. An enterprising company, owning all the land on both banks of the Truckee River from a point near Lake Tahoe to the town of Truckee, divided the 15-mile strip into lots of approximately two acres each and having a frontage of practically 200 feet on the river. These lots were put on the market with the understanding that each purchaser of one or more lots would own, in fee simple, the all and exclusive right to fish in that portion of the river immediately fronting his lot or lots. The publicity given section 4085½ of the Political Code, which authorizes the county boards of supervisors to condemn a public highway along certain streams for the exclusive use of fishing, had the effect of causing this company to withdraw its fishing promises.

After completing the Truckee River, I platted the McCloud River Basin. Here was found a like condition. One club and two or three individuals own or control practically thirty miles of the best fishing on the river. Even deputies of the commission have been refused permission to enter the sacred precincts of these fishing barons, and it required no little diplomacy and exchange of hard words to change their attitude. However, with the educational propoganda of the com-

mission, these people have modified their regulations very considerably in most instances. The McCloud River is widely known as the home of the rainbow trout, and its even flow throughout the driest of summer periods makes it one of the best trout streams in the state. It has a mean daily flow of 2,509 second feet of water.

After the completion of the Truckee and McCloud systems, I mapped the Sacramento River, showing the ownership of the lands adjacent and adjoining as in the case of the prior maps.

I then turned my attention toward obtaining accurate information relative to the mileage of streams and acreage of lakes, together with the mean daily flow of the streams and the approximate volume of the lakes, reservoirs, etc. Also I collected data relative to the rainfall of the state, temperature and general topographic features. California is the cellar and roof of the United States in that we have Mt. Whitney, the highest mountain in the United States proper, being 14,502 feet above the sea, and Death Valley, the lowest point on the whole American continent, being 427 feet below mean tide. Our climatic changes vary from 30 degrees below zero to 128 degrees above, Fahrenheit.

At divers times I continued the actual map drafting and have the bases completed for the Klamath, Pit, Feather (in part), Yuba, Bear, American and Smith River systems and the Lake Tahoe drainage basin. Have prepared a map showing the approximate locations of all proposed by-passes and cuts in the Sacramento Valley, together with existing and proposed reclamation districts.

Stream Mileage and Lake Acreage.

As I have already reported, the mileage of all streams in the state not intermittent in character and capable of sustaining fish life at all seasons of the year, I have set at 26,212. I have set the acreage of freshwater lakes at 862,133. This lake area would be increased were it possible to carry on an exhaustive resurvey of certain of our mountain lake regions. The earlier surveys executed by and under the authority of the United States government, are, in many instances, merely office surveys and the land purported to be surveyed never beheld a surveyor's transit. Numerous lakes are positively known to exist in localities when the official surveys show dry land. This commission has stocked with trout hundreds of these lakes and many of them exceed 160 acres in extent. This further shows the importance of having accurate data to refer to and maps whereon to record work of this character.

From the reports of the United States Geological Survey and from power and irrigation companies I have gathered considerable data relative to the flow of the streams. With respect to the volume of water carried by our streams it is pertinent to take into consideration the geologic formation peculiar to the mountain regions of northern and

south central California. The higher elevations are almost wholly lavic in character, and capable, through its porous character and possible underlying beds of tuff or tufa, of absorbing immense quantities of water. The gradual melting snows supply the millions of springs adjacent to this area with a perennial flow of water and distributes the runoff through and over a period of months. However, our "nature sponges," as this formation might well be called, can not care for and control the downpour of heavy rains such as we have in the later winter months. At that period the "sponges" are filled almost to their greatest capacity and the runoff is swelled to an enormous volume—attended by the annual floods in the lower valleys. The Sacramento River is a fair example of the river systems having a maximum flow in winter and a minimum in summer. During the flood period of January, 1907, this river was carrying under the Southern Pacific bridge at Sacramento City, 650,000 second feet of water.

In closing, I wish to say that when the proposed maps are completed the California Fish and Game Commission will have in their possession the most unique, and, at the same time, the most complete set of records covering every activity of this and former commissions on streams and stream life in use by any commission in the United States. These maps will show, in addition to natural and artificial stream data, the elevations at different points, temperatures, rain and snow fall and, in fact, many items necessary to the proper and intelligent conduct of affairs of the Fish and Game Commission.

Sacramento, California, June 30, 1914.

THE TUNA CANNING INDUSTRY OF SOUTHERN CALIFORNIA.

By N. B. SCOFIELD, Fishery Expert.

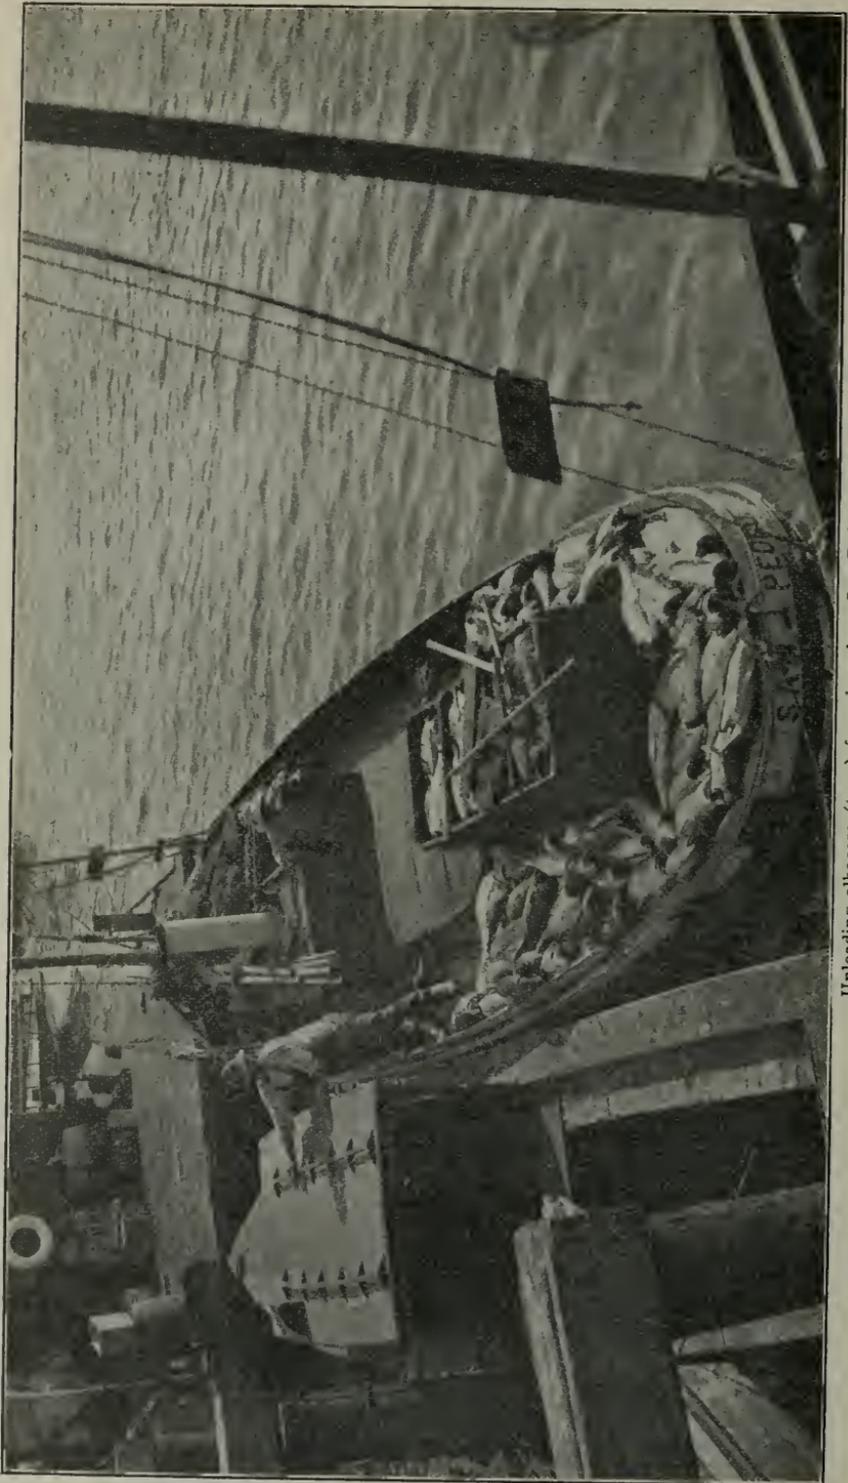

The long-finned tuna or albacore (Thunnus alalunga).

General Description, Habits and Food.

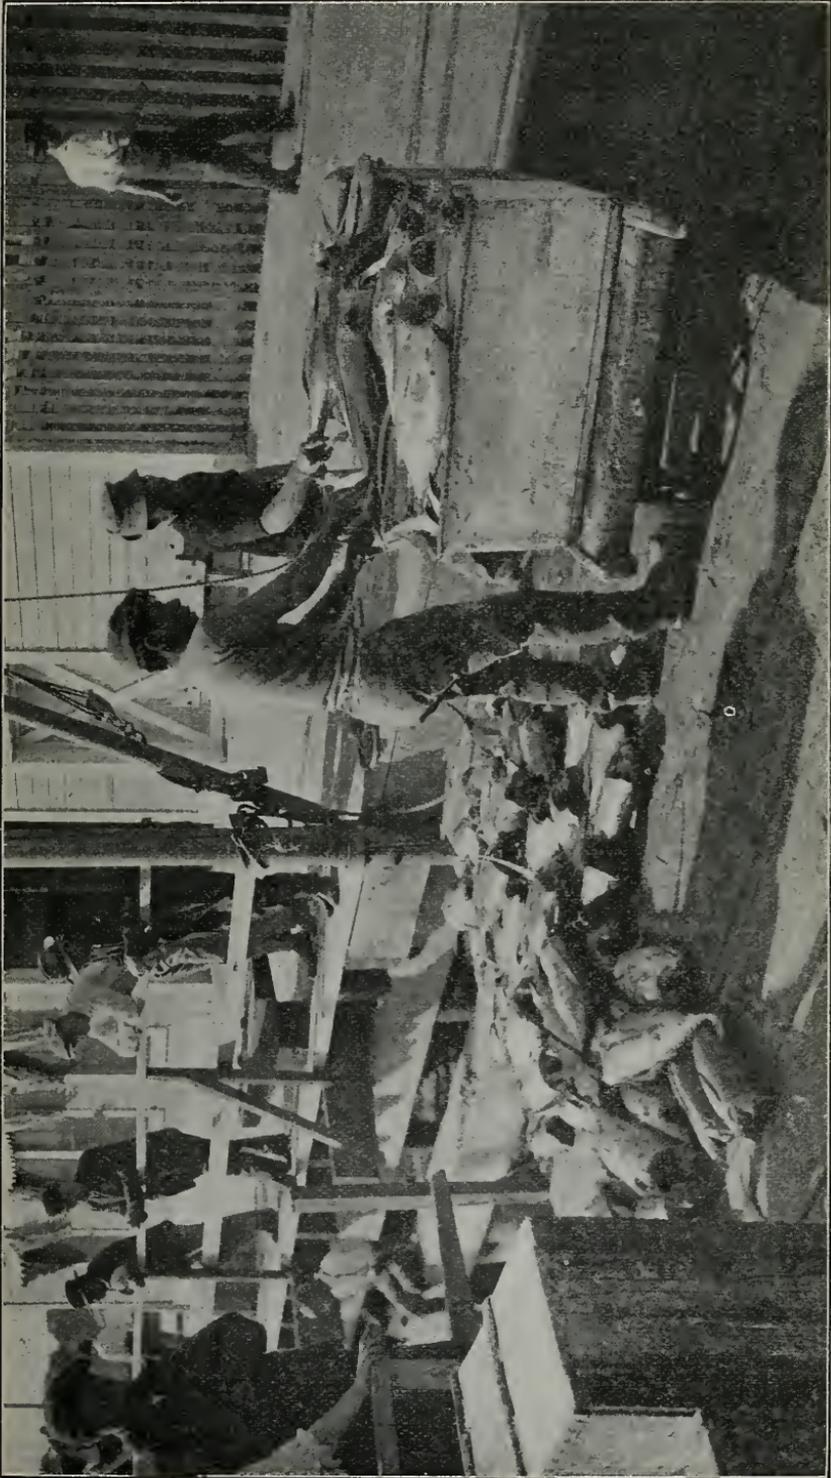

There are several species of tuna in southern California waters, all of which may be styled game fish, but the one we have to deal with is commonly known by the name of albacore, less frequently called the long-finned tuna.

It is a thickest fish, as wide as it is deep and averages about twenty pounds in weight. In contour it has the lines of a submarine torpedo. It is built for speed and quickness in the water. Deep steel blue above and silvery beneath, with long sabre-like pectoral fins two fifths the entire length of the fish. The albacore is pelagic, a fish of the high seas and of very wide distribution in the warm seas of the world. It is found in deep clear water and rarely nearer than a mile or two of shore, or in shallower water than seventy fathoms. It is found in the Mediterranean and is abundant off the coast of Lower and southern California and in Japan. It is usually found in schools the individuals of which are not in compact masses but well scattered. It swims rather deep in the water, but will quickly dart to the surface for sardines, anchovies, smelt or squid, which constitute its principal food. Its stomach often contains small devil fish, sculpins and rockfish, indicating that it also feeds near the bottom. The albacore which were being taken off Santa Monica Bay, California, during July, were gorged with small two-inch anchovies.

The albacore's season in southern California is, roughly, from May to December, although they may be found in small numbers during the other months of the year. When stormy weather sets in the fish almost entirely disappear, and it is the general belief that they move southward. Very little is known about the migrations or spawning habits of the albacore. The most reliable information I have obtained on the subject was given me by Mr. M. Kondo, formerly professor in the Imperial Fisheries Institute at Tokyo, and by Mr. S. F. Takasaki, an assistant from the same institution. These gentlemen have made investigations in Lower California during the last two years. On March 7, 1912, while trying for albacore near Magdalena Bay, they took twenty fish by trolling. The fish were mature and ready to spawn. The roe of the females was about the same size as codfish roe, and was a light brownish red color. Toward the end of March, this year, they again took albacore with mature roe off San Batrome (?) Bay, Lower California, and at that time observed large patches of floating eggs, which they were satisfied were

Unloading albacore (tuna) from launch at San Pedro.

Japanese unloading albacore (tuna).

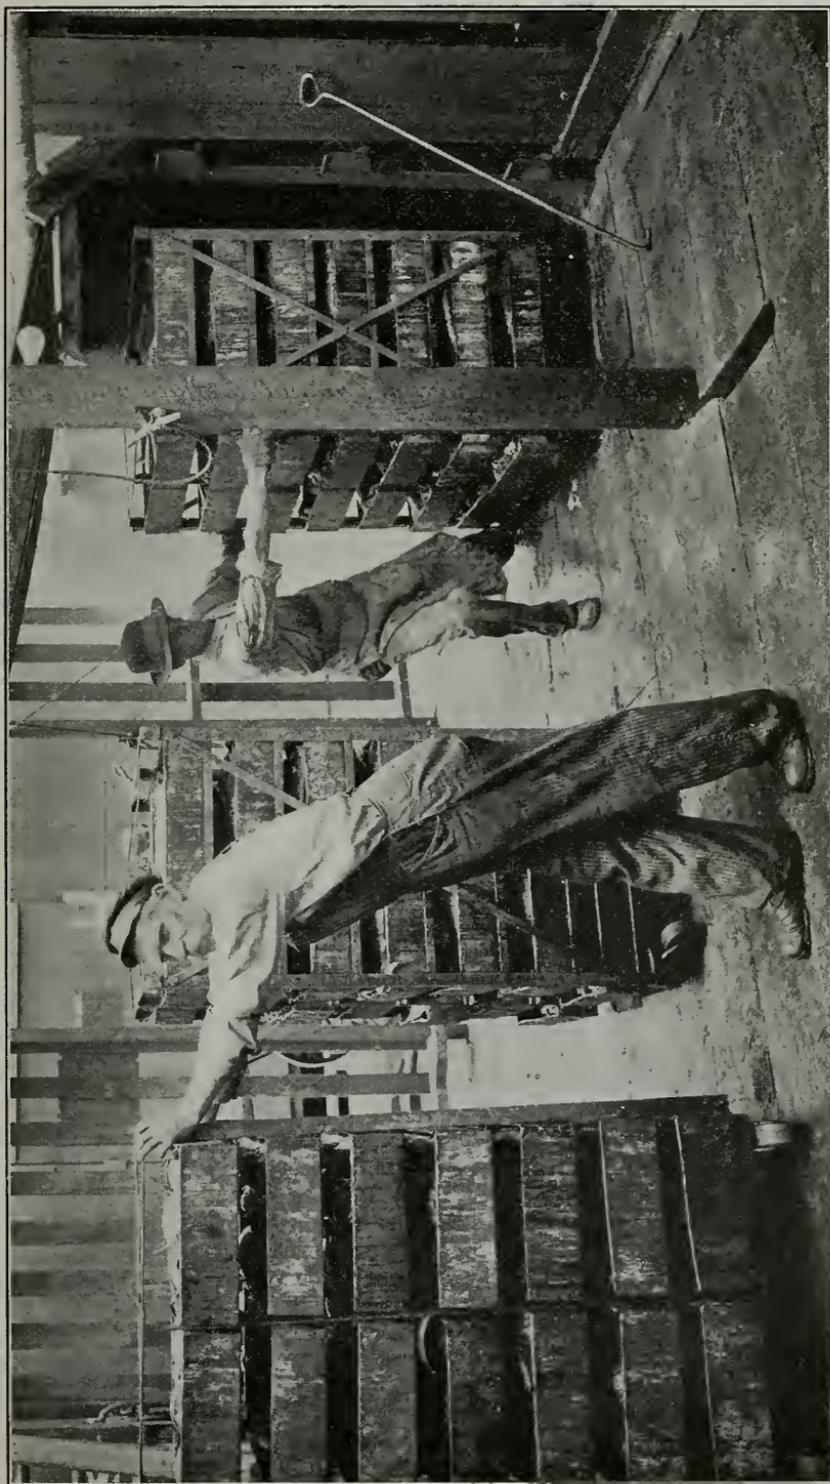

either the eggs of the albacore or of the bonito. They could not be sure which they were for they also took bonito with mature roe. In both of these instances the albacore were found well off shore in deep water. At San Lucas they found albacore plentiful in January. On visiting San Lucas again in August they found them still plentiful. At this time all had spawned. Mr. Kondo believes albacore are plentiful at San Lucas the year round. They appear off Magdalena Bay in numbers in April and usually enter the bay itself in August.

It seems reasonably certain from this evidence that the albacore begins spawning in March near the latitude of San Lucas, Lower California, in deep water off shore. The eggs are buoyant and float at the surface of the water. The albacore moves northward, in the late spring, in search of food. The fish taken during the early part of the run in southern California are considerably smaller than those taken later. A reasonable explanation of this would be that the larger mature fish are occupied with the business of spawning and do not move northward as early as the immature fish. It is not likely that the albacore spawns near the Santa Barbara Islands, as some have thought, for fish with mature roe are not taken there. When the fish arrive in May or June they have very immature roe or have already spawned. Fish under eight pounds are not common, and one as small as two pounds is a rarity. The albacore's appearance here coincides with the appearance in abundance of sardines. The fishermen believe the albacore follow the sardines and other food and that there is a general movement up the coast in the spring of the year. As far as we know the albacore does not run in numbers north of the Santa Barbara Islands. Occasional individuals are taken far north of that point. One is recorded 250 miles north of San Francisco, taken on a "jig" made of a hook and seagull feathers, late in the fall of the year, by returning Alaska salmon fishermen.

The Albacore in the Mediterranean Sea.

In the countries bordering the Mediterranean on the north, the albacore is valued very highly as a food fish. It is evidently not nearly so plentiful there as here, and the fishermen fish for it with large gill nets three hundred fathoms long. They are held in such esteem there that the fishermen themselves usually can not afford to eat them, but sell them for a good price and for themselves use less expensive fish.

Those who have eaten the Mediterranean albacore consider the fish taken here its equal if not superior in quality and flavor, but until within recent years the albacore here has not played an important part in the food supply. Small quantities were salted and dried for the Portuguese and Japanese trade, but not until enterprising packers began canning it and advertising it did the people appreciate it.

Albacore (tuna) ready for the cooker.

Origin and Growth of the Tuna Canning Industry.

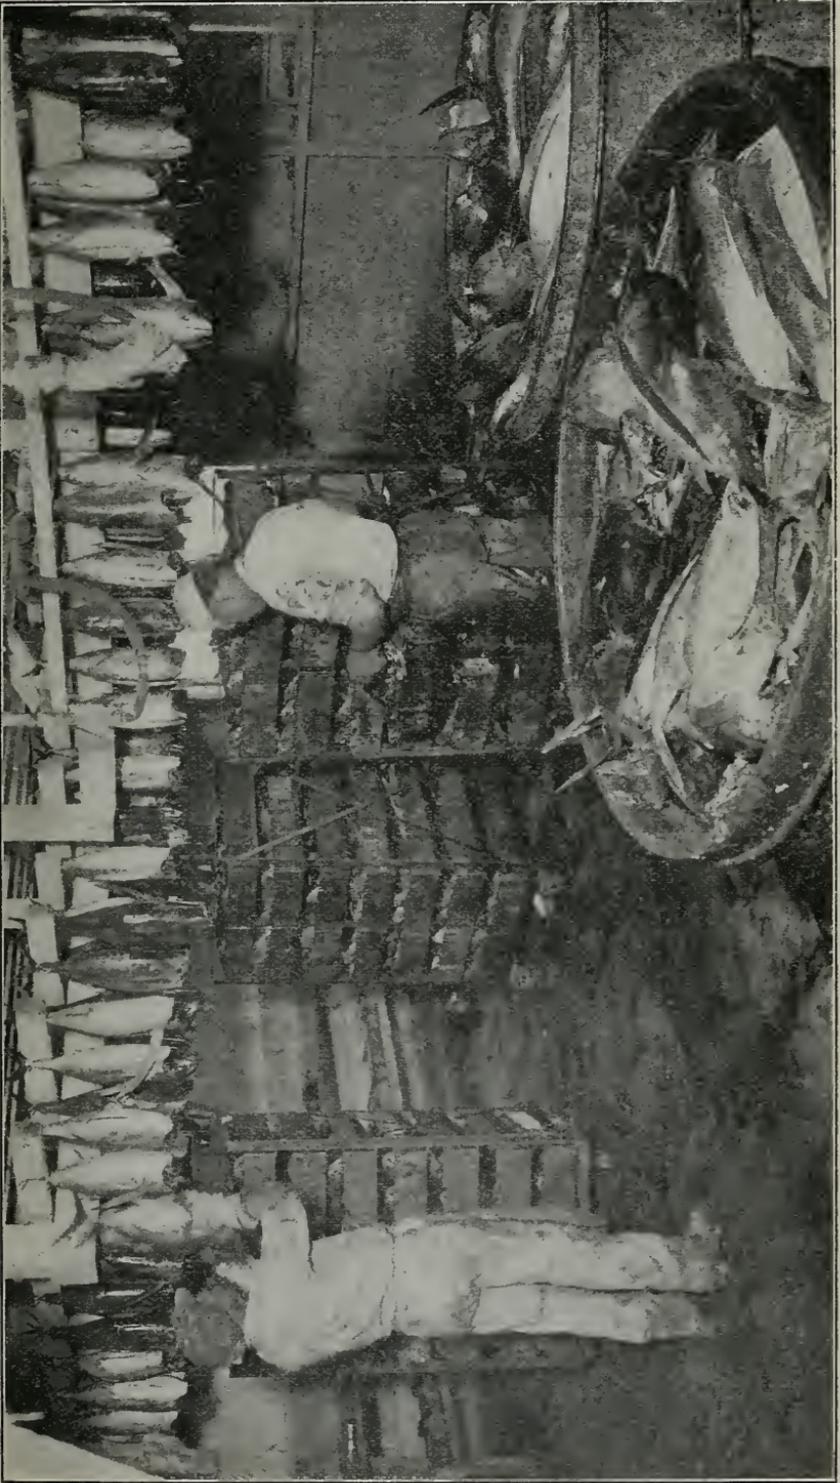

About six years ago the Southern California Fish Company of East San Pedro packed a few cases of albacore as an experiment. The first important pack was in 1911, when the above cannery and the Pacific Tuna Canning Company of San Diego together put up about 20,000 cases. From that time on the industry has grown enormously. In 1912 there were five tuna canneries in southern California which put up 80,000 cases. In 1913, there were nine canneries which put out 128,000 cases, or roughly 6,400,000 pounds. In canning, but little more than 50 per cent of the whole fish is used; so that the weight of the fish as they were taken from the sea was about 12,000,000 lbs. At this time, July, 1914, there are eleven canneries located in southern California, and at least one more in Lower California at Magdalena Bay. The canneries of southern California up to July 18th had taken 90,000 cases or, roughly, 9,000,000 pounds of the whole fish as they come from the ocean. The season so far is considered poor. The fish have not been as plentiful as it was hoped they would be. Preparations had been made to put up a large pack, for the demand for canned tuna has been great. The combined canning plants expected to put up 300,000 cases. The season is probably not half over, however, and they may yet put up very nearly this expected amount, which at the ruling prices would bring, at wholesale, over \$1,500,000.

Other Uses of the Tuna.

Besides the tuna that are canned, large quantities are used in the fresh markets, and the demand for this fish in a fresh condition is very rapidly growing. It is estimated 200 tons of fresh albacore will be handled through San Diego and Los Angeles markets this year. It was reported at San Diego that an eastern order had been placed there for 300 tons of albacore to be shipped frozen. At least three companies are putting up salted and smoked albacore or tuna. One of these firms, the Redondo Fish Company, will put up 350 tons this year if they can get the fish.

Method of Taking the Albacore in Southern California.

Boats.—The boats engaged in taking albacore are good seaworthy boats of about five tons and driven by 15 to 25 horsepower gasoline engines. They are decked in and have a cabin that accommodates the three men of the crew. The average cost of these boats is \$2,500. Placed on the deck and near the stern of each boat is a square tank for holding and keeping the sardines, anchovies and smelt used for bait. A pump connected with the boat's engine keeps fresh sea water constantly circulating through it to keep the bait alive. Each boat also has its own small meshed net for catching this bait. Before daylight the boats start out and run to wherever they can get sardines, which are considered the

Hanging albacore (tuna) by tails to drain.

best bait that can be used. After they have secured sufficient bait, which is very often not easy to get, they start out into the open sea for the fishing grounds, trolling behind them a couple of "jigs" or lures, which are made of bone and so fashioned that they resemble a small fish as they are drawn through the water. These "jigs" are usually homemade affairs, each boat having its own particular pattern. When an albacore seizes or "strikes" one of these lures, the boat is quickly brought to a stop, the men at the same time throwing out live bait to draw the fish around the boat. Soon they can be seen "breaking" at many places about the boat as they come to the surface after the sardines thrown out. Hand lines are then thrown over baited with the sardines, each man operating one line. If the albacore are biting well, a ton or more are caught in a very few minutes. When they cease to bite, the boat moves on, with the lures out as before, until another school is struck.

Another method of catching the albacore is by pole and line. This method was introduced by the Japanese and is called the "Jap pole" method. A short, unyielding bamboo pole is employed with a line slightly longer than the pole itself. A live sardine is hooked through the back and so held with this pole and line that it swims about on the surface of the water. The pole is supported by one hand with its butt against the body. With the other they scatter splashing drops of water around the swimming bait, with a cup shaped bamboo paddle tied at the end of a short springy piece of bamboo. This is supposed to make the one sardine look like a whole school. If the fisherman is alert he will check the albacore as soon as it seizes the bait and before it gets started down with it, and lifting it bodily from the water, swings it into the boat in one mighty heave. When the albacore are coming fast this is the favorite method of fishing, for it is much faster. With the hand lines a gaff has to be used to lift the fish into the boat.

The albacore are cleaned or dressed at sea by the fishermen. The head and entrails are removed, in which process the fish loses about 18 per cent of its weight. For the dressed fish they receive from the canneries $1\frac{1}{2}$ cents per pound. Anything less than a ton of fish is considered a poor catch and catches of four to six tons are common.

The Capture of Bait.—In fishing for albacore the most difficult part is obtaining the bait. Very often the sardines or anchovies are hard to find or the fishermen may have to go a long distance out of their way to get them. Frequently some of the boats are not able to obtain bait at all. Small meshed nets of two types are used for capturing this bait. Practically all boats carry a small net known locally as the "blanket net." It was introduced by the Japanese. A few of the boats now carry circle or lampara nets, the largest of which are 350 feet long and about 40 feet deep.

Removing skin and bones from albacore (tuna).

It is necessary to use the larger nets when the sardines and anchovies are scarce. The "blanket net," I think, is a harmless net and does little or no damage. The circle net is usually cast where a school of sardines or anchovies is observed at the surface of the water, and the nets take little else. The only serious damage they could do would be when they are used in too shallow water and the lead line drags the bottom. I understand they seldom use it where the water is shallow.

No legislation should be contemplated which would hinder these nets in the taking of fish for bait, as it would seriously cripple the tuna industry. Due to the scarcity of bait at times, I think it would be to the best interest of the people as a whole in the southern part of the state to allow the restricted taking of bait within fish preserves.

The Canning of the Tuna.

Only the long-finned tuna or albacore is used in canning. The dressed fish are brought in by the boats in the afternoon or evening to the cannery wharf, where they are unloaded and hung by the tails to drain over night. The next day they are packed in wire baskets and cooked with steam in large retorts. They are rolled on trucks from the retorts to the cooling room, where they remain until cooled. They are then carried to the tables, where women and girls remove the skin, bones and dark meat. Only the white meat goes into the cans. The rest of the process is very similar to the canning of salmon or other fish. The latest canning machinery and equipment is the rule in the tuna canneries. The plants are new and most of them have started out with the best.

There are now eleven of these canneries in southern California, located at San Pedro, Wilmington, Long Beach and San Diego. They have approximately \$300,000 invested in buildings and their equipment. Besides this there are the boats, about 125 of them, worth at least \$300,000 more.

Following is a list of the canneries with their estimated capacity:

Van Camp Sea Food Company, San Pedro.

Formerly the California Tunny Canning Company. They can handle 35 tons of dressed fish daily: put up the "Van Camp's" Brand.

White Star Canning Company, East San Pedro.

Capacity, 15 tons daily; put up the "White Star" Brand.

Southern California Fish Company, East San Pedro.

Capacity, 15 tons daily; put up the "Blue Sea" Brand.

United States Fish Packing Company, Wilmington.

Capacity, 5 tons daily.

United Tuna Company, Wilmington.

Capacity, 25 tons.

Monarch Canning Company, Wilmington.

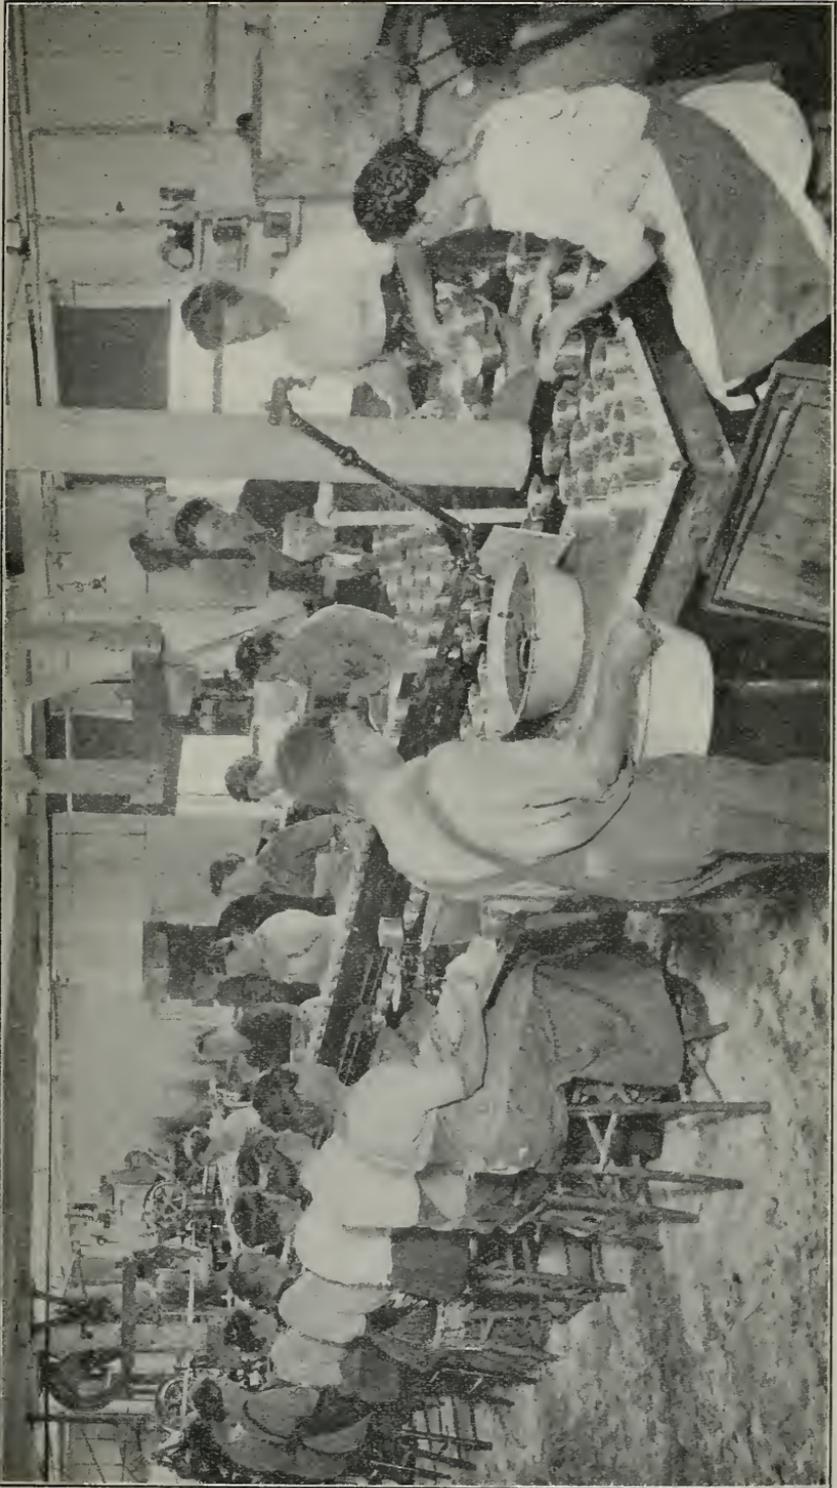

Capacity 8 tons daily; put up the "De Lux" Brand.

Los Angeles Tuna Canning Company, Long Beach.

Capacity, 15 tons; put up the "Panama" Brand.

South Coast Canning Company, Long Beach.

Capacity, 35 tons; put up the "Avalon" Brand.

Canning albacore (tuna) at San Pedro.

Lower California Canning Company, San Diego.

Occupies the site of the former Roberts-Hume Fisheries Company; capacity, 20 tons.

Pacific Tuna Canning Company, San Diego.

Capacity, 20 tons; put up the "Catalina" Brand.

Premier Packing Company, San Diego.

Capacity, 15 tons; put up the "Premium" Brand.

Of these canneries the Southern California Fish Company has canned sardines for several years. At least three others, the Lower California Canning Company, San Diego, the South Coast Canning Company, Long Beach, and the Van Camp Sea Food Company, San Pedro, will can sardines this winter. The rest of the canneries are likely to soon be canning other varieties of fish, rather than allow their plants to be idle the five or six months between tuna runs. These canneries will greatly expand the fishing industry of southern California. Improved methods of fishing will undoubtedly be introduced. The taking of albacore with hook and line is rather a primitive method, but still very effective while the fish are numerous. Occasionally, though, the fish do not bite, although they may be there in large numbers. So far, no net has been successfully used in these waters for the taking of albacore.

As to the probable effect of intensive fishing for albacore, it is not likely that intensive albacore fishing in California waters will ever greatly reduce the numbers of these fish. The spawning fish are not taken in California, neither are the young; nor is it at all likely that all the albacore migrate into California waters between spawning seasons. Any laws looking toward the preservation of these fish would have to apply to Mexican waters, where the fish spawn and the young are to be found. Intensive fishing near San Lucas, where they spawn and are found throughout the year, would undoubtedly affect the California fisheries seriously.

The Utilization of Fish Waste.

When the albacore are caught at sea, they are at once cleaned, and 18 per cent of the fish is thrown away and is a total loss. The dressed fish, before it is in the cans, loses a third or more of its weight. This one third of the cooked fish is at the present time turned over to "fertilizer" plants which pay from 75 cents to \$1 a ton for it. They convert it into chicken feed and sell it for about \$50 a ton. Some of the canneries expect to put in plants of their own to take care of this waste. The Lower California Canning Company will put in a plant to convert this waste into chicken feed. They expect to make a well balanced chicken food of it by the addition of ground red abalone shells. Other canneries expect to can their cooked "scraps" for chicken feed. It probably will not be long until they will be using the heads and entrails, now thrown away at sea, for fertilizer. It is proposed to use kelp fertilizer, which is rich in potash, with fish waste, which is rich in phosphoric acid and nitrates, thus making a well balanced fertilizer.

FISH AND GAME CONDITIONS IN THE "LAND OF LITTLE RAIN."

By E. H. OBER, Assistant Commissioner.

Inyo County has an area of 10,294 square miles; its boundaries are, north, Mono County; east, the Nevada state line; south, Kern and San Bernardino counties; west, Fresno and Tulare counties; its surface is largely mountainous, interspersed with large valleys, of which the Owens Valley is the largest, being over one hundred miles long and about seventeen miles wide at Bishop City, and varying in width as one goes south from four to ten miles. The Sierras here being impassable by wagon, the valley is reached from the north or south only, from California points, with the exception of four fair packtrails which lead across the Sierras.

The altitude of Owens Valley ranges from 3,620 feet at Keeler, the southern point, to 4,148 feet at Bishop, in the north; Mount Whitney, the highest peak in the United States, is within Inyo's borders, and many slightly less high neighboring summits afford scenic views scarcely less grand. We also have Death Valley, one of the lowest depressions in the world, at one point 430 feet below sea level. On each side of this wonderful Death Valley mountains rise to an altitude of from 8,000 to 10,000 feet, and within its bleak wastes desolation reigns supreme; a temperature of 120 degrees, and even higher, is not rare here. Naturally, in view of the foregoing facts, there is a tremendous amount of misunderstanding concerning this region, people generally accepting the sole functions of the valley as that of Creation's morgue; but it may be truthfully said that almost in its very heart springs of pure cold water are to be found, small tracts of land are now under cultivation, and more are sure to become so in the years to come. Similar conditions exist in the desolate valleys of Pannamint, Saline, Cow Horn and Eureka, these being continuations of Death Valley, lying to the north and west, and all being located in Inyo County.

Writers of note have frequently referred to Inyo County as a "sportsman's paradise," and that the Sierra Nevadas, particularly their frontage west of the Owens Valley, are, from a scenic standpoint, unsurpassed by any portion of the globe.

Mountain sheep are very plentiful in Inyo County, especially in the southeastern portion where the Nelson or desert sheep makes his home; their increase within the past five years has been truly wonderful, due to the fact that each year has brought forth an abundance of rain, with its consequence of plenteous feed in the particular habitat where these sheep abound, and to the further fact that very little if any mineral prospecting has been done, which certainly acts as a disturbance and cause of much loss of life to the sheep.

That which is, perhaps, the largest herd of mountain sheep in Inyo County, may be found around and near Homestake Canyon, on the eastern slope of the White Mountains about twenty miles east of Independence. This herd numbers upward of one hundred and fifty head, but they have been observed, however, in separate bunches, eventually reuniting. Homestake Canyon is their watering place during the summer months.

East of Homestake Canyon, and across Saline Valley twenty miles to Hot Springs, and around Sand Springs and Last Chance Mountain, mountain sheep may be found everywhere; also on Ubehebe Mountain,

Mount Tom in Inyo County. The home of 100 "bighorns". (mountain sheep).

lying east of Saline Valley, mountain sheep are very abundant, and south of Ubehebe Mountain for one hundred miles; all through the Funeral, Argus, Pannamint and Slate ranges of mountains, they abound. They are most numerous, however, in Inyo County, in the above named mountains, and in and around "Windgate Pass" and the Sheep Mountain country, and on the western slope of Tin Mountain northeast of Ubehebe Mountain.

Directly east of Big Pine, about thirty miles, there is a very beautiful herd, the writer, on several occasions having seen as many as sixty at one time, and thirty-eight and forty at others; very reliable reports reach me concerning their splendid increase each year.

The Nelson or desert sheep vary in color at different seasons, ranging from a pale gray in summer to a pale blue in winter. Desert sheep frequent the most remote and precipitous and barren mountains imaginable, using for their shade and resting place the faces of perpen-

dicular cliffs. Their food consists chiefly of the tender shoots of growing brush and their favorite dessert is the most delicate ferns and flowers.

In the Sierras running through Inyo County there are three herds of mountain sheep, and these are a distinct and much larger variety than the desert sheep. People generally are not aware of the existence of these sheep from the fact that tourists seldom see them, as they are found high up in cloudland and above the localities frequented by man. The largest herd known in the Sierras can be found northeast of Independence and about ten miles away; the writer has observed this herd upon many occasions, and their number is in the near neighborhood of eighty-five to ninety, sixty-five having been counted at one time this last winter at the base of the mountains touching the valley, and within a stone's throw of an automobile road, thus refuting the popular notion that mountain sheep do not change their altitude, regardless of weather conditions.

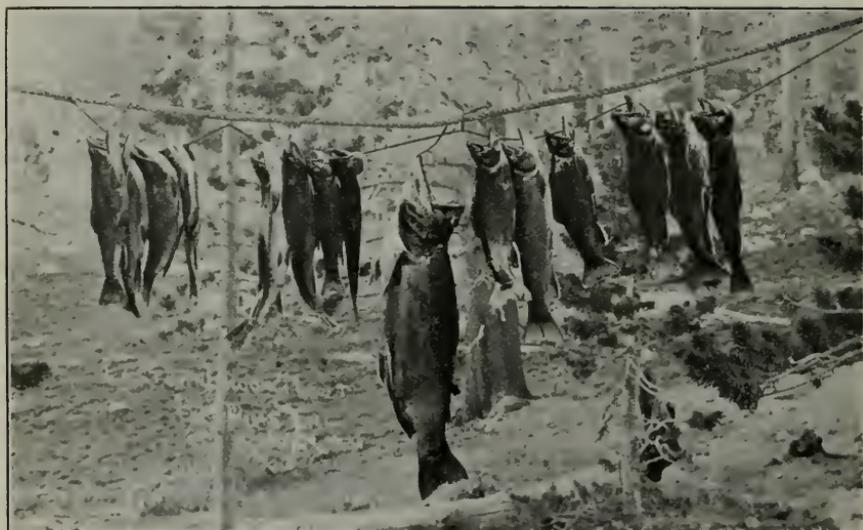

The herd next in size may be found about twenty-five miles west of Bishop City, on Mount Tom, and numbers about forty or fifty head: they follow the snow line in winter, and, as a matter of fact come very close to the little farming community of Round Valley.

The next largest herd make their home in the neighborhood of the South Fork of Big Pine Creek, and from there on over to the rough Birch Creek and Mount Credo country; this herd consisted of about thirty head when last seen by the writer.

Of all the game animals in California the mountain sheep stand in a class by themselves; nature has provided for their welfare in many ways, having provided them with a telescopic vision and a telephonic hearing. While bold and seemingly reckless in their rock and cliff climbing, they are quick to calculate, always on the alert, and their judgment is free from error; they are very robust and strong limbed, yet very active withal, and are capable of feats of great endurance and in many ways most astonishing. Notwithstanding what many people have written and said, a mountain sheep can not and never did leap from any great height and alight upon its horns. The fact that the desert sheep are rarely found with unbroken horns is due to their using them in seasons of drouth, for prying amid the rocks and boulders in search of a certain succulent and watery bulb, called by the Indians "Sequaya," and which serves the sheep as a thirst-quencher until the springs are replenished and flow again; while in the Sierras, on the other hand, where water is plentiful, the horns are nearly always perfect to the very tips. When sheep are once pursued or fired upon, however, they can dash down an appalling declivity, touching a crevice here and there, and land in perfect safety and condition, where to the observer it would seem certain to be killed. For one to fully and really appreciate mountain sheep,

they should be seen in their native home amid the grandeur of the treeless slopes, far above timber line, in the Inyo section of the grand old Sierra Nevadas.

The people of this county are duly grateful and appreciative of the splendid results achieved for them through the efforts of the State Fish and Game Commission. There is not a living stream within its borders today that does not teem with either rainbow, Eastern brook, cutthroat, Loch Leven or golden trout; at least fifty mountain lakes, previously barren of life, now hold countless millions of large Loch Leven and Eastern brook trout, and the bagging of a five-pounder of either of

Eastern brook trout from Big Pine Creek, Inyo County. Introduced in 1909 by Fish and Game Commission.

these high class table varieties has long since ceased to be rare enough to cause a comment, and is commonplace. The commission has well stocked seven streams in this county with trout, streams to which the fin of a fish was previously unknown, and has added to this section an asset in the way of an attraction to outside people, and in actual food value, beyond the possibility of computation or of estimation. The Chinese or ringneck pheasant, introduced into this section by the commission, has also adapted himself to his new environment and is thriving and multiplying rapidly. Inyo County doffs its hat to the California State Board of Fish and Game Commissioners!

CONTRIBUTED ARTICLES.

ARID CALIFORNIA AND ITS ANIMAL LIFE.

By FRANK STEPHENS.

Perhaps it may seem a little severe to term southeastern California arid, but the most distinctive character of the region I wish to indicate by this heading is its dryness as compared with the region west of the mountains. I am writing of that part of southern California east of the Sierra Nevadas and the mountains south to the state line. While a large part of this region is arid, there are localities of greater or less extent scattered through it that are less arid, either from the presence of streams or springs that furnish water for irrigation, or from a higher altitude causing a moister mountain climate. Animal life is more abundant and of greater variety in these less arid localities, but there is some life in all parts of this region. A greater proportion of it is nocturnal than in the western part of the state, and animals of nocturnal habits are more likely to be overlooked than those that are abroad in the daytime. This is the principal reason why so many people think that there is almost no animal life on the deserts. Really one does not see much life in traveling through this region, yet there is a far greater amount and variety there than a casual observer would think possible.

In a general way the southern part of this region is known as the Colorado Desert. It is the lowest in altitude, the warmest, and averages the driest; but it also contains the largest body of cultivated land, principally under the Imperial Canal.

North of the Colorado Desert is the Mohave Desert, a plain of higher altitude interspersed with low mountains, usually isolated or standing in small irregular groups. Some of the northernmost of these mountains rise to a considerable height and carry small coniferous forests. A more or less connected range of low barren mountains divides the Mojave Desert from the Colorado Desert.

In the strict sense of being a land without animal or vegetable life, these are not deserts, as there is everywhere some animal life, and shrubs and cactuses occur, albeit sparsely in places. But in the sense used by us "old desert rats" (as the prospectors, cattlemen, frontiersmen and naturalists frequenting this region are often called) a "desert" means a land where springs and water holes are many miles apart and grass or other horse feed is very scanty or altogether lacking.

All animal life is dependent on vegetable life, hence when plants are few animal life is correspondingly scanty. But the plants of this region sprout their seeds quickly, grow rapidly and mature early when showers

do come, and showers are quite likely to be heavy though brief. Then many annuals quickly appear that soon ripen a quantity of seeds that furnish food for many small mammals and some birds. If the rains happen to come at short intervals and extend over several weeks, the "desert" becomes a brilliant flower garden. Then the desert is a paradise for botanists, entomologists and other naturalists. Plants and insects of many species appear, live a brief life and disappear, for years perhaps. This fullness of bloom happens but rarely, however. I have seen it at its best but twice in many years.

MAMMALS.

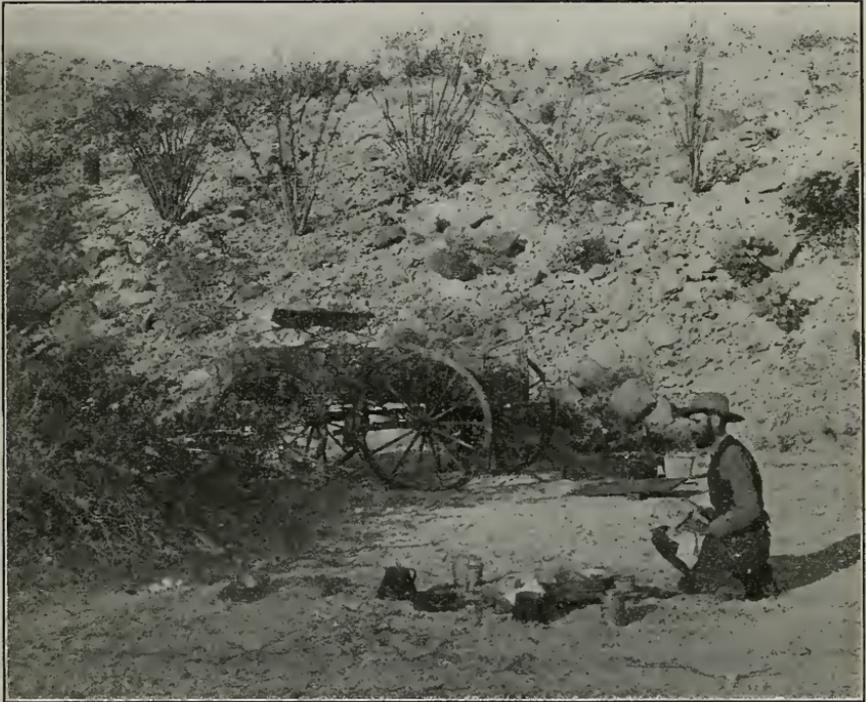

Deer are found only near the border of arid California, the deserts being unsuited to their wants. Formerly some burro deer lived along the Colorado River, but the settlers and prospectors have practically exterminated them there. A few California mule deer range down the eastern slopes of the mountains bordering the western side of the deserts.

I do not think that antelope were ever plentiful in this region, but I once saw four antelope where Carrizo Creek opens out to the Colorado Desert, and I have seen fresh tracks of antelope many times in the southern part of this desert. As near as I can learn no antelope has been seen in that part of the Colorado Desert north of the Mexican boundary for seven or eight years. I am told that a few still survive near Lake Maquata in northeastern Lower California, and an occasional individual might wander north as far as the boundary. A small band of antelope still live in Antelope Valley, which is the western end of the Mojave Desert. This band is carefully protected, and is the only one I know of in southern California.

Bighorns (mountain sheep) still live in eastern California. The subspecies of the desert mountains is the Nelson bighorn, *Ovis canadensis nelsoni*. Recently (1912) Dr. Joseph Grinnell described a new race from the Sierra Nevadas as the Sierra Nevada bighorn, *Ovis canadensis sierræ*. It is probable that the few bighorns living in the San Gabriel and San Bernardino Mountains belong to the latter race, as Nelson bighorns prefer a warmer climate, being seldom found as high as 4,000 feet above sea level, while the Sierra Nevada bighorns live mostly above 8,000 feet altitude.

Among the rough and almost inaccessible canyons and spurs of the eastern slope of the coast range of mountains in San Diego and Riverside counties, and in the desert hills and low mountains of eastern Riverside, San Bernardino, Inyo and Imperial counties, Nelson bighorns occur in small bands or singly. There are few large bands left. Those remaining maintain a precarious existence by constant watchfulness. Their natural enemies aside from man are few. Cougars (mountain

lions), that are so destructive to bighorn lambs in the Rocky Mountains, do not occur at all in most of this region, and are very rare along the Colorado River and on the eastern slope of the coast range. Nor do golden eagles do much harm to the lambs. Coyotes kill an occasional lamb or an isolated wounded adult, but adult bighorns, especially if in a small band, are able to fight coyotes away. But bighorns can not cope with man. Sportsmen do not now kill many bighorns, but prospectors, ranchmen and Indians do kill many, in season and out of season, male

A "desert rat." (Photo by courtesy of Mr. Frank Stevens.)

and female. Most prospectors contend that they have the moral right to kill game for food whenever they have the opportunity. Travelers and outlying ranchmen pick them off occasionally; Mojave and other Indians kill some. Among them they make life exceedingly hazardous for bighorns. The frontier people particularly resent entire restriction of hunting. I believe that if a brief open season was allowed the closed season would be better respected, no more bighorns would be killed than now, and it would be much easier to educate the people to respect the closed season. With all this destruction, I believe that bighorns are nearly holding their own, and if poaching was stopped their numbers would begin to increase slowly. There is a large area of rough hills

and low mountains in southeastern California that is well adapted to the wants of bighorns, that can never be utilized for agricultural purposes for lack of water. Its principal value at present is as a prospecting ground for minerals. By thorough protection the number of bighorns in this region could be steadily increased, and ultimately this could be made a fine hunting ground.

The food of bighorns is of a coarse nature, mostly the leaves and twigs of shrubs, or a very coarse kind of desert grass called *gietta*. Bighorns go to water nearly every day in warm weather; but if disturbed at the springs, or if they become suspicious of the presence of men at the springs they may go without water for several days. At such times they eat the large cactuses that grow in this region. The Indians tell me that they sometimes get in the habit of eating these cactuses and then go without drinking for a long time in cool weather.

Six species of squirrels live in arid California, all being ground squirrels or chipmunks. Some of these squirrels are troublesome to farmers through depredations on crops. No tree squirrels or flying squirrels live in this region as there are no extensive forests.

Formerly beavers were common along the Colorado River, but they have been trapped so relentlessly that they have become quite scarce. If they were thoroughly protected a few years they would again become common. Notwithstanding the warm climate in which they live the fur of these beavers is fairly good because the water of the river remains cool most of the year.

Muskrats occur here and there along the Colorado River, but are not common. I am told that they have followed down the Imperial Canal and have become quite troublesome by causing breaks in the canal. They are likely to always be troublesome in such canals as it is not practicable to entirely exterminate them. Their fur is poor.

Mice and rats, of many species, are the most abundant mammals of arid California. A locality must be barren indeed if mice are unable to find food in it, and the mice of this region are hardy. In favorable places they become very abundant, particularly pocket mice and pocket rats, which have developed the habit of storing food in the season when it is most abundant. The list of species of these two groups foots up thirty for arid California. Of course no one locality has half of them.

Desert jack rabbits are widely distributed, though sparsely in the more barren parts. Arizona cottontails are common in the Colorado River bottoms, and in various places where brush is plentiful enough to make sufficient cover. They are lacking in wide areas of the more barren parts of the region.

Desert wildcats (lynx, bobcats) are found along the Colorado River and along the old channels running from it into Salton Lake, and less commonly in brushy localities in the foothills and low mountains. They prey on rats, mice, cottontails, etc., and once in a while on poultry.

Yuma cougars (puma, mountain lion) are rare inhabitants of the Colorado River bottoms, not occurring west, according to our present knowledge of their distribution. The Pacific cougar occurs in the foothills bordering the deserts on the west, but is becoming quite rare. They prey on squirrels, rats, mice, rabbits, and occasionally on hogs, fawns and bighorn lambs.

Coyotes are common everywhere in arid California. They prey on cottontails, jack rabbits, ground squirrels, rats and mice, and such insect life as grasshoppers and beetles. They catch a small amount of poultry at isolated ranches and the borders of settlements, but on the whole they do the farmer more good than harm, as they help keep in check harmful insects, ground squirrels, gophers, etc. Certainly no bounty should be paid for the destruction of coyotes.

Foxes of two species live in this region. The desert kit fox is a yellowish colored animal inhabiting the open desert. Its prey is almost entirely rats and mice. The Arizona gray fox is common in the timbered bottom lands along the Colorado River. They are easily trapped.

Raccoons are abundant along the Colorado River and the old overflow channels in Imperial Valley. They eat fish, frogs, rats, mice, fruits and seeds. Their fur is moderately good in winter.

A very few badgers are scattered through arid California.

Sonora otters are rare along the Colorado River. Trappers look closely for their signs and occasionally get an otter there.

Arizona skunks are common along the Colorado River and the old channels. A few spotted skunks live in the same region.

Bats are more or less common in their season in arid California, and are abundant at times around water.

Altogether about sixty-five kinds of mammals are native to arid California.

BIRDS.

About two hundred species and sub-species of birds are known to be found in arid California at some season of the year. About thirty-five of these are practically resident all the year. Most of the water birds are present only in winter. Over a large part of this area water birds are necessarily lacking, yet even small ponds and springs are visited by migrating ducks at times. The muddy waters of the Colorado River are not inviting to water birds, but the sloughs and ponds

of the flood channels of the lower river afford clearer water, and are visited by great numbers of water birds in winter, more particularly those in Lower California, where the birds are not harassed by hunters so much.

Sea birds of course do not visit this part of California, and loons, grebes and gulls are not common. White pelicans sometimes appear in large numbers in winter. I have seen flocks covering several acres standing thickly on sand bars a few miles south of the boundary. A dozen species of edible ducks occur. They are most common south of the boundary, but a considerable number are to be found along the overflow channels and on the main river in California. Geese are of irregular occurrence in this region and are seldom abundant.

Wood ibises come up the Colorado River in summer after their breeding season along the Gulf of California is over. I have seen large flocks in August a hundred miles above Yuma. These large birds are not used as food. I do not know that they do any harm, unless possibly by eating the young of edible fishes. They appear to glean their food entirely from the water. Herons of several species are found, but rarely away from the big river or its overflow channels. Shore birds are comparatively few, for lack of suitable feeding grounds.

Three species of quail are found in arid California. California valley quail are limited to the foothills along the western border of the deserts, and the partly timbered mountains of the northern Mojave Desert. In some of these mountains nice coveys used to be found at some of the springs. Mountain quail also occur at many of the same places in smaller numbers. I have even found mountain quail in thin growths of juniper. They seem more independent of water than valley quail. Gambel quail are often abundant along the Colorado River and about the overflow channels, though their numbers are now being greatly lessened around the settlements by steady hunting. The ranges of these three species meet at the western end of the Colorado Desert. I have shot hybrids between valley and Gambel quail there, and I have seen hybrids between mountain and Gambel quail that were shot on the northeast slope of the San Bernardino Mountains.

Mourning doves are found occasionally in summer at springs and water holes, and more commonly along the Colorado River.

Hawks are usually scarce throughout this region, as are owls, though great horned owls are somewhat more common where they can find shelter in crevices in cliffs.

Woodpeckers are scarce away from the mountains and the timbered river bottoms, and are not very plentiful even there.

In certain places hummingbirds are common when flowers are in bloom. Four or five species occur, though two are only migrants.

Flycatchers are not common, for lack of insect food. The male of one species, the vermilion flycatcher, is conspicuous from its bright red colors.

Ravens are widely distributed in arid California. They are usually seen in pairs, and probably remain paired permanently. When it is time for travelers to break camp in the morning and move on, a pair of ravens are likely to appear and perch on some shrub near, to wait patiently until the travelers have gone, when they thoroughly glean any scraps of food or grain that the party may have left around the recent camp. Jays are unknown in most of this region.

Blackbirds, orioles and meadow larks are ordinarily found only along the river bottoms and around the irrigated land.

About twenty-five kinds of sparrows are found in this region, mostly as migrants or winter visitors. Swallows are common in but few places. The smaller insectivorous birds are mostly only transient migrants.

Wrens are few, the cactus wren being the most conspicuous species. Crissal thrashers are common in the thickets of the river bottoms, and the rare LeConte thrasher is sometimes seen out in the desert, where it is a permanent resident.

On the whole, birds are not plentiful, as might be expected in so barren a country.

FISH.

Fish of course are scarce in a region so deficient in streams as this is. As a matter of fact no edible fish are found in arid California except in the Colorado River and in the sloughs and ponds supplied by it. Even in the Colorado River native fish are not abundant, as the water is so muddy as to make it unfit to support most kinds of fish. There are some carp and catfish, the descendants of introduced fish. There are very small fish, like small minnows, in many of the permanent springs of arid California, particularly in the warm springs. These little fish are of several species, and sometimes two or three species live in the same spring. It is a problem how these little fish became so widely disseminated in isolated springs.

SNAKES.

Snakes are not abundant in arid California. Perhaps rattlesnakes are the most common species, though they are not nearly as common as when I first knew the desert, nearly forty years ago. Every one kills rattlesnakes wherever found, and this steady destruction has decidedly lessened their number. The small rattlesnake known as the "sidewinder" is peculiar in its mode of locomotion. It moves side-

wise or diagonally to the direction which it faces. It is dreaded by the "desert rats" because it gives so little warning; its rattle is small and is little used, while the larger species sound their rattle on slight provocation. Several other species of snakes live in this region.

LIZARDS.

Lizards are comparatively abundant, both in species and in individuals. Several prospectors and cattlemen have told me that they had seen the big lizard known as the "Gila monster" in southeastern

The border of the desert. (Photo by courtesy of Mr. Frank Stevens.)

California. A little questioning usually convinced me that the lizard really seen was the "chuckwalla," another large lizard that is rather common in rocky places in the Mojave Desert, and is occasionally found in the foothills bordering the Colorado Desert. I know of no reliable record of the occurrence of the Gila monster anywhere in California. It is the only poisonous lizard found in the United States. The desert Indians formerly ate chuckwallas and other large lizards, and to some extent do so yet. White men laughed at them for eating lizards and rats, and now they do not like to be seen eating such things, although they are really as clean and wholesome as squirrels and rabbits.

TORTOISES.

Agassiz tortoises inhabit arid California. They are found most often on the mesas west of the Colorado River, but I have never seen them plentiful even there, and farther west they are rare. The Indians eat them, and so do the white settlers sometimes. I have seen teeth marks of coyotes on their shells, but the shells generally prove too hard for the coyotes. These tortoises are exclusively vegetarian. They are able to become dormant for weeks at a time when green food is scarce, and in cold weather. They are principally nocturnal, in hot weather at least.

THE CALIFORNIA FISH INDUSTRY FROM A COMMERCIAL POINT OF VIEW.

By F. E. BOOTH, Secretary, Sacramento River Packers' Association and President, Monterey Packing Company.

Much has been said in the press of the state about a so-called "fish trust," which has, it is stated, arbitrarily raised the price of fish to the housewives, until fish is a higher priced article of food than the choicest beef cut.

Thousands of our good citizens have really believed this, and some are even satisfied that this charge has been fully proven. They recall the time when shrimps and cracked crabs were served free, as an appetizer, at many of the old-time restaurants; when a whole cooked crab could be bought for 10 cents; when salmon were so plentiful on the Sacramento River that the steamboats refused to haul them from river receiving points to San Francisco, unless the freight charges were prepaid. They can remember visiting the beach at old Harbor View and watching the always picturesque fishermen, hauling in their beach seines, and usually with a mass of all kinds of good food fish, including many dozens of crabs, at each haul. Fish were so plentiful then that any one could help himself, without objection from the fishermen.

Now all this is changed, and the old-timers, without trying to find the real cause, accept without question, or the slightest investigation, the first explanation that any irresponsible person may make. Hence, the cry of "fish trust" was taken up and believed, and is, unfortunately, still believed by many to be the cause of high prices.

The purpose of this article is to put the commercial fishing business right up to the reader, and let him draw his own conclusions.

Any person, after a moment's thought, will admit the following to be true, almost from his personal knowledge of the situation. First, that if he eats fish at all, it is almost always on Friday, and at no other time; second, that he eats fish not so much for its food value as for a change in diet, or because of church edicts.

Statistics show that 80 per cent of the fish business is done on Friday, and 15 per cent on Wednesday (both days being observed by certain religious denominations, as fish days), the remaining 5 per cent being scattered over the other four business days in the week.

It requires no great knowledge of arithmetic to figure out a tremendous additional increase in the cost of fish from this very fact. A retail fish dealer must, therefore, get practically all his week's expenses and profits from his Friday sales. This necessarily means 50 to 100 per cent added to his cost.

Another thing, which is altogether wrong, is that most of the retail fish business is carried on by persons selling practically nothing but fish, and it is imperative that they get these higher prices to make even ordinary wages. The economical course would be for butchers or grocers to be the distributors of fish, for their expenses would be no greater than when handling meats or groceries. Some butchers do sell fish, and they could *afford* to sell, for at least one half of their asking price. But why should they, they argue? Their neighbor (the exclusive fish store) gets from 20 cents to 25 cents per pound for fish, so why shouldn't the butcher? Not a bad argument, and one you would probably use.

Once more they argue, a woman will only buy 50 cents to 60 cents worth of fish per week, anyway, and she doesn't care what it costs per pound. Still once again, the housewife phones her fishman, and nine times out of ten wants that variety of fish which she can prepare with the least trouble and which has the least waste in bone or skin. So she orders halibut or salmon, or striped bass.

A thoughtful reader will see right here one of the reasons for advanced prices to the retailer.

The population of the cities throughout the state has doubled and quadrupled within a comparatively few years. This has directly increased the demand for fish, and certain kinds, notably salmon, have not increased with the population. In fact, as population has increased and encroached on the spawning grounds of the salmon, it has automatically lessened the natural increase of the salmon. Had it not been for the artificial propagation of salmon in all these last twenty-five years, it is reasonable to suppose there would not now be a single salmon left in the Sacramento River. As it is, the supply is tremendously bigger than most people think, for the increased consumption in the fresh fish market requires an enormous supply of salmon. The fall run of salmon is probably as big now as it used to be, although it is not so apparent owing to the enormous demand.

Striped Bass.

One of the most popular of all the river fish, the striped bass, was originally introduced by the Fish and Game Commission from the waters of the eastern part of the United States. Evidently it liked the new surroundings, for its increase has been marked. The present laws regarding the catching and sale of this fine fish seem most wise and effective. This fish is usually high priced, as it is a fine shipping fish, firm and a good carrier, and justly popular. It matures in salt water, returning each year to fresh water for spawning purposes, after which it again returns to salt water.

Shad.

This is another transplanted eastern fish, which, like the striped bass, has increased rapidly in the Pacific waters. But there the comparison ends, for the fish has not met with popular favor. It is esteemed most highly in the eastern markets, the wholesale price running from 8 to 10 cents per pound. It is admitted that the Pacific fish is in every way as fine as the Atlantic variety, but people here will not eat it, even at a retail price of 5 cents per pound, cleaned and delivered to the house. Their principal use now is to strip them of the roe and salt the rest of the fish. It is hard work to sell them salted at $1\frac{1}{2}$ cents per pound, dressed, dried weight, boxed and delivered, f. o. b. to the China steamers. The Chinese exporters are practically the only ones handling the salt fish.

Catfish.

Here, again, is an example of what success the Fish and Game Commission has made of an imported fish. The catfish is entirely a fresh water fish, and has found a home to its liking in the California waters. For several years it was a despised little fish, too plentiful to be considered good for anything, and neglected accordingly. Gradually, however, its worth became known and it came into its own. Over fishing necessitated special laws regarding size to be taken, kind of nets to be used, etc.

Crabs.

This dainty sea food has before been mentioned in this article. Twenty-five years ago, these fish were sold for from 40 cents to 50 cents per dozen. Now they command from \$2 to \$2.50 and even \$3 per dozen. This advance is occasioned by two factors: *First*, an extraordinary demand owing to a large population; *second*, to a combination among the crab fishermen's union, which imposes a limit on the number of crabs that can be taken in one day, and the price they must be sold for.

Shrimps.

The bay is said to be as full of shrimps now as it ever was, yet comparatively few are being caught. Here is the reason: There is only one "best" way of catching shrimps, at least only one "best" *known* way, and that is with a Chinese shrimp or bag net. This is so constructed that it not only catches shrimps of all sizes, but everything else that is alive that comes its way. It is an accepted theory that the young and immature fish of most every variety of salt water fish live right in among the shrimps. This is most unfortunate, for the taking of shrimps is very desirable. The destruction of countless millions of baby food fish is, however, not to be tolerated. After years of fighting the Chinese shrimp

interests, the Fish and Game Commission finally got a law passed prohibiting the use of the Chinese shrimp net, and this has automatically stopped shrimp fishing, since no one seems to have found out how to take shrimps with any other kind of net. This will be discovered some day, however.

As a matter of fact, not over 5 per cent of the shrimps formerly caught were used in the local market, the balance being dried and shipped out of the country. A careful account kept of one week's catch of the baby fish showed 100 tons to have been wasted by the destruction of these fish in the shrimp nets, equal, perhaps to 1,000 tons at maturity. The Fish and Game Commission never did a better thing in its career than to get the present law passed. Of course, great effort will be made to have this law repealed.

Crawfish or California Lobster.

Many people think this fish fully as fine as the eastern lobster. Certainly it is worth preserving, and it has taken endless patience and tact to have the present laws passed. The people do not care to eat the large sized crawfish, and as this is the real breeder, it was made illegal to take them over 13½ inches long. This is as it should be. A 14 inch female lobster produces about ten times as many eggs as a 7 inch female. The present law permits the importation into California of the Mexican lobster, under the supervision of the Fish and Game Commission. This is as it should be, for it not only gives our people the privilege of having lobster, but it also protects California's supply. It is true that some of the California lobster fishermen are trying hard to have the law changed so as to exclude the Mexican fish, claiming that if no Mexican or Lower California lobsters came in the price of the California lobsters would double.

Soles, Sand-dabs, and Flounders.

These are the principal supply of fish in the San Francisco and Bay cities markets. They are caught almost entirely by trawlers, fishing outside the Heads, and frequently twenty-five miles off shore. They are the freshest of all fish sold on the market, for the trawl boats go out every day except Saturday, returning the same night. Furthermore, they are, with two exceptions, shad and carp, the cheapest of all the fish sold in San Francisco. They seldom bring more than 3 to 4 cents per pound; so when the retailer sells you this variety of fish at from 20 to 25 cents per pound, you may know he seldom paid more than 4 cents for it.

The Italian name of the net used in this trawl fishing is *paranzella*. It sounds pretty forbidding, but is nothing more nor less than a drag net, weighted to go nearly to the bottom and in very deep water, and is dragged usually between two power boats. This kind of fishing has been going on here for over forty years, with no apparent diminution of fish.

Halibut.

A large flat fish like a sole or flounder, but frequently weighing over 100 pounds. It is caught principally in Alaska, where it is cleaned and iced and shipped to San Francisco, where it finally finds a market from two to four weeks after it is caught. It has no particular merit, except an absence of bones, and is therefore easily served and popular with the "hurry up" housekeeper.

Chicken Halibut.

A small size edition of the halibut of Alaska, but caught in southern California waters. It is sold the day after it is caught. In Los Angeles they prefer the chicken to the genuine halibut, which is where they show good judgment.

Barracuda, Sea Bass, Spanish Mackerel, Yellow Tail.

All these fish are, more properly speaking, southern California fish, although some of the varieties frequently get as far north as San Francisco Bay. At certain seasons, Monterey Bay gives up good catches of these fish. They are a popular table fish, and usually not very high in price.

Albacore.

A species of tuna, caught in southern California waters, and during the season very abundant. They are not at all popular as a table fish, but are principally used for canning. This industry has grown beyond belief and promises to tax the fish supply. The merit of the canned fish is unquestioned and the demand is constantly expanding.

Compulsory salting of stock on U. S. National Forest. Salting done at definite places, which become salt licks for deer. (Photo by courtesy of U. S. Forest Service.)

THE NATIONAL FORESTS IN CALIFORNIA.

By W. C. HODGE, Forest Examiner, U. S. Forest Service.

From the earliest times forestry has been associated with the protection of game. In the year 1598 the Englishman, Manwood, in his treatise on the "Laws of the Forest," defines a forest as "a certain territory of woody grounds, fruitful pastures, privileged for wild beasts and fowls of forest, chase, and warren to nest and abide in, in the safe protection of the king." Since Manwood's time the functions of the forest have greatly increased, so that instead of being solely valuable as a pleasure ground they are now chiefly valuable for the production of wood and the conservation of water. But their usefulness for recreation purposes is still extremely great, and although the production of timber and the maintenance of the water supply will henceforth outrank in importance the game production feature, this last will always continue to be a valuable resource.

As a forest was formerly a game preserve, so a forester was formerly a gamekeeper. With the shifting of the functions of the forest came about a change in the duties of the forester. Nowadays, although the function of game protection is still important, it is subordinate to the work of forest administration and forest protection.

National forests are set apart to insure a perpetual supply of timber for the use and necessities of the people of the United States, and to prevent destruction of the forest cover which regulates the flow of streams. They "are open to all persons for all lawful purposes. The timber, water, pasture, and other resources are for the use of the people, and the minerals are open to exploitation just as on unreserved public land. * * * Twenty-five per cent of all receipts from national forests are given to the counties in which they lie, to be used for schools and roads. An additional ten per cent is expended by the Secretary of Agriculture upon roads and trails constructed primarily for the benefit of settlers within the forests."*

Between July 1, 1913, and June 30, 1914, receipts from the national forests in California amounted to \$261,415.44. This revenue is derived from the sale or lease of the resources contained in the forests, the administration and protection of which constitutes the principal work of the service.

In California there are eighteen national forests. Their average size is one and one half million acres, and they include the roughest and most mountainous portions of the state. The areas selected for national

*The Use Book: A Manual for users of the National Forests. July 1, 1913. Copies may be obtained free of charge on application to the District Forester, 114 Sansome street, San Francisco.

forests are of two kinds: those actually or potentially valuable for the production of timber, and those whose cover is valuable chiefly for its effect on stream regulation. In southern California water conservation is the principal function; in northern California timber production is the most important; but all of the national forests serve both purposes to some extent.

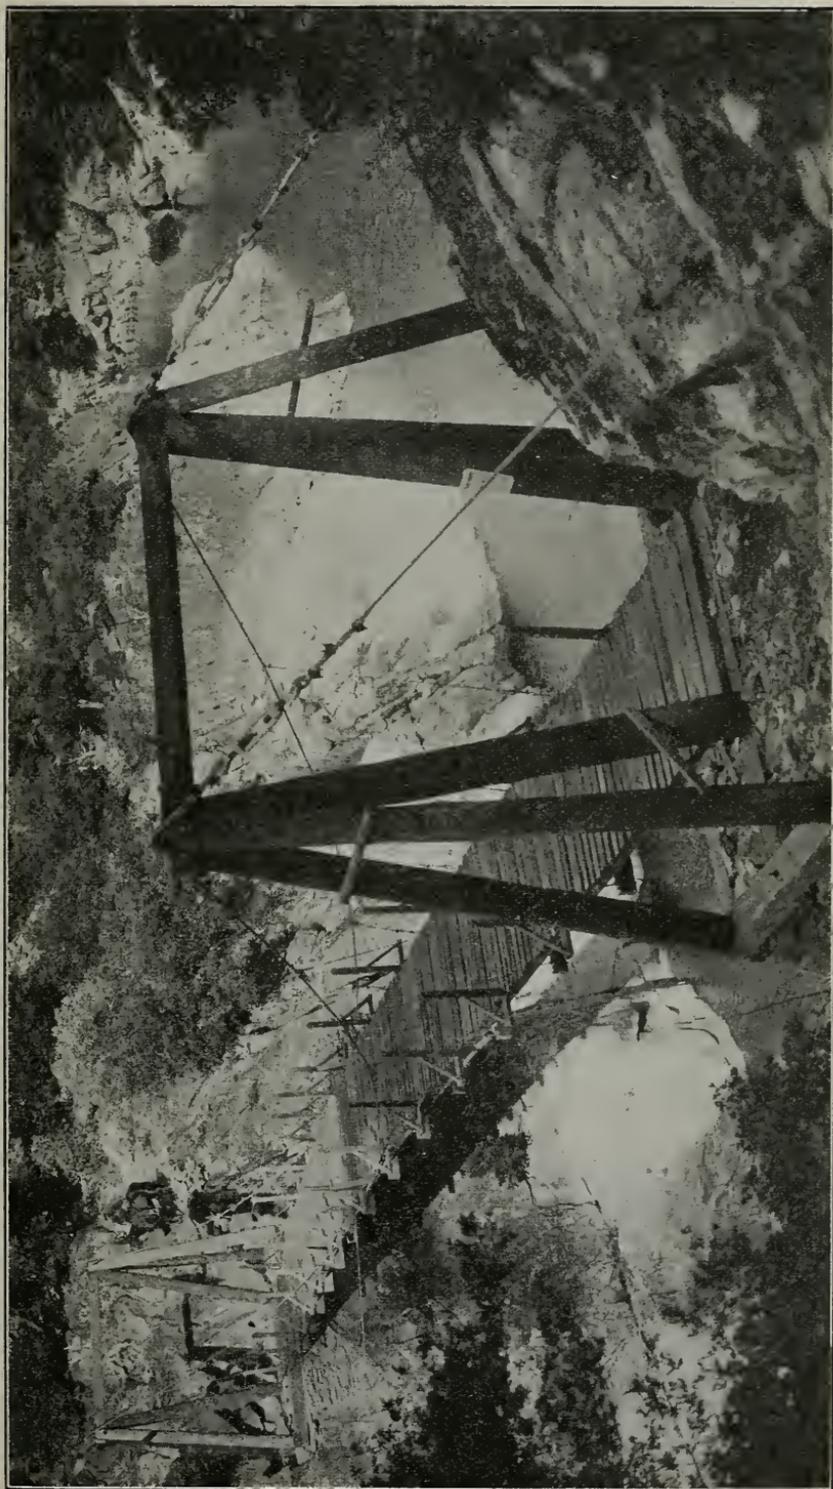

Originally the national forests were called "forest reserves." The name was changed in order to bring out more clearly the point that the resources of the forests are to be used. The national forests are "reserved" in the sense that certain of the land laws which apply to the public domain are not effective on the forests; but none of the resources are reserved from use except in occasional cases where one use is incompatible with another.

All mature timber in the national forests which may be cut with benefit in accordance with the principles of forestry is for sale and will be offered as demand arises. Only stumpage is sold, the title to the land remaining with the government. Timber may be sold in amounts ranging from a few thousand feet up to whatever amount may be necessary to warrant the investment required for constructing a railroad or other means of transportation into comparatively inaccessible regions. Forage resources are sold under regulations whose leading objects are the protection and conservative use of all national forest land adapted for grazing; the permanent good of the live stock industry through proper care and improvement of grazing lands; and the protection of the settler and home builder against unfair competition in the use of the range.

Claims can be initiated upon lands within national forests only under the mining laws, the coal land laws, and the forest homestead act. Prospecting is not interfered with in any way. Free use of timber is granted to bona fide miners and prospectors who may not reasonably be required to purchase and who have not on their own claims a sufficient or practically accessible supply.

The use and occupancy of the agricultural lands in the forests is desired from every standpoint. Every added home helps in the upbuilding of the country. The forests are to serve the people in a permanent development of homes and industries. In addition, the settler is a great help—practically a necessity—in the protection and development of the forest itself. Every cultivated field is a fire-break; every ranch is a vantage point to prevent and fight fires; every settler may become a forest protector.

The national forests contain waterpowers of great value, the aggregate capacity of which is estimated at 12,000,000 horsepower. Permits for the development and use of these water powers are granted under

U. S. Forest Service bridge over American River, El Dorado National Forest. (Photograph by courtesy U. S. Forest Service.)

regulations which seek to prevent the appropriation of power sites for speculative purposes; to secure prompt and full development; to prevent monopoly; and to secure a reasonable compensation to the government for the use of the land occupied and the beneficial protection given to the watershed.

The administration of these various resources and the protection of the forests especially from fire constitute the principal work of the forest officers.

The national forests contain the principal habitats of all the important game animals of the west. No charge is made for hunting, fishing, or ordinary camping upon government land within the national forests and their use as recreation grounds is encouraged. No permits are issued for game preserves or any use of land which would result in preventing or restricting lawful hunting or fishing. Since game in general is regarded as under state control, the federal forest officers derive their authority in game protection from the state. They are not game wardens *ex officio* but only after appointment as such by the proper state authorities. National forest officers are, however, active in game protection, the policy of the government in this respect being expressed in the following regulation of the Secretary of Agriculture:

All forest officers will cooperate with state or territorial officials, so far as they can without undue interference with their regular forest work, to enforce local laws for the protection of birds, fish, and game. When properly authorized to do so they will act *without additional pay* as deputy game wardens with full power to enforce local laws, but *may not accept any fees or rewards or parts of fines* on account of the enforcement of the state game laws. Forest officers and employees may, however accept any bounties voluntarily offered by any state or county or any association or individual for the destruction of predatory wild animals.

This is supplemented by the following instructions:

Wild game adds materially to the enjoyment of the national forests by the public, and the preservation of game animals, birds, and fish is a public duty. This duty, however, rests primarily with the state. It is incumbent upon the forest service, under the act of May 23, 1908, to render all reasonable assistance in the protection of game within the national forests, but the service must be governed in its enforcement of the game laws by the attitude of the state officials. Furthermore, such assistance must be subordinated to the regular protective and administrative work of the forest service.

Acting under these instructions and in cooperation with the State Fish and Game Commission, the forest officers on 27,000,000 acres of national forest lands are fulfilling the duties of game wardens in California.

The administration of the national forests and the conduct of all matters relating to forestry which have been placed upon the Department of Agriculture by congress are under the direction of the Secretary of Agriculture, in charge of the Forester, who is chief of the Forest Service. The office of the Forester is in Washington, D. C.

For the better administration of the national forests, six districts have been established, each of which is in charge of a district forester who is aided by several assistant district foresters and specialists in various branches of the work.

District 5, which includes California and western Nevada, has its headquarters at 114 Sansome street, San Francisco, California.

Each national forest is in charge of a supervisor who plans the work on his forest under the instructions of the district forester and supervises its execution. His headquarters is located in a town conveniently situated with regard to his forest. Routine work involved in the supervision of timber sales, grazing, free use of timber, special use, and other contracts and permits, the carrying out of the protection and improvement plans, and other administrative activities, is performed by rangers. Each forest is divided into ranger districts of such size that, under ordinary conditions, all the regular work can be handled effectively by one fully equipped ranger with the necessary temporary assistants. The average ranger district has about 60,000 acres, but where means of travel and communication are good, or where there is only a small volume of business or the fire hazard is low, very much larger districts may be established.

From the sportsman's point of view, the most important activity of the forest service outside of the enforcement of the game laws is the protection of the forests from fire. The fire risk in California is excessive. The long dry season, the inflammable nature of the cover, and the habit, natural to California, of camping out during the summer, tend to produce severe fire conditions. The matter of camping is mentioned for the reason that most fires are of human origin. The seasoned camper is by no means a source of fire danger; he is, rather, a safety factor since he knows what precautions must be taken and helps to instruct those who are less experienced. But until a camper has had at least a season's experience in the forests he is apt to take unwarranted chances with camp fires, matches, burning tobacco, etc; and, speaking generally, the more people there are in the forests the greater the risk.

The fire organization on the national forests includes measures designed to prevent, detect, and suppress fires. Absolute prevention is, of course, impossible; lightning causes a certain percentage of fires each year, and a few fires start in other ways that may be fairly called unpreventable. Among these are the breaking of transmission lines, the accidental burning of houses in the forest, etc. There is also a theory very popular in California that broken bottles, by focusing the sun's rays upon inflammable material, are a frequent source of fires, but the theory has never been verified. During seven years in which

accurate fire records have been kept in California, not a single case of this sort has come to light.

Preventable fires can be prevented only by educating the public. This the service attempts to accomplish by various devices but especially by giving currency to the following Six Rules:

1. **Matches.** Be sure your match is out. Break it in two before you throw it away.

2. **Tobacco.** Throw pipe ashes and cigar or cigarette stumps in the dust of the road and stamp or pinch out the fire before leaving them. Don't throw them into brush, leaves, or needles.

3. **Making Camp.** Build a small campfire. Build it in the open, not against a tree or log or near brush. Scrape away the trash from all around it.

4. **Leaving Camp.** Never leave a campfire, even for a short time, without quenching it with water and then covering it with earth.

5. **Bonfires.** Never build bonfires in windy weather or where there is the slightest danger of their escaping from control. Don't make them larger than you need.

6. **Fighting Fires.** If you find a fire, try to put it out. If you can't, get word of it to the nearest U. S. Forest Ranger or State Firewarden at once. Keep in touch with the rangers.

The work of detecting and suppressing forest fires has been greatly systematized in recent years. Nowadays fires are reported mainly by lookouts whose function is not to fight fires but merely to discover and report them. The lookouts are located on commanding peaks, and remain on duty continuously. They are equipped with the necessary instruments and housed in cabins from the interior of which the entire area under protection can be kept in view. Each forest has several lookouts. Where the same area is under observation from two or more, the location of a fire can be determined very accurately even at a distance of many miles from either.

The lookout is in communication with the ranger either by telephone or by heliograph. Telephone service is the most certain and satisfactory but heliographs are used in situations where other facilities are lacking or are too costly. On receiving a report from a lookout, the ranger in whose district the fire is located takes immediate steps to put it out. His assistants are stationed at various strategic points each connected by telephone, and they remain within hearing distance of the bell. In fighting a forest fire it is as necessary to be prompt as it is in saving a burning house. For this reason the forest firemen are kept at their stations in constant readiness. This system has proved to be very economical. Instead of having large fires to fight, the majority of fires are kept to an area under one quarter of an acre and are handled by one or two men at the most.

Where large fires occur, due to exceptional circumstances, large bodies of fire fighters may be required. These are as far as possible organized in advance so that no time may be lost. They are recruited from near-by

ranchers, stockmen, lumbermen, and even from the settlements outside. Transportation facilities both for the men and for their subordinates are also arranged beforehand, and tools and nonperishable food supplies are cached in places where a demand for them is likely to arise.

In the more thickly settled portions of some forests, especially where there are numerous occasional visitors from near-by towns, moving patrolmen are employed. These, by calling the attention of campers to the necessity for taking proper precautions, and even by their very

Junction of phone and heliograph systems on national forests.
(Photo by courtesy U. S. Forest Service.)

presence, keep a great many fires from starting. They also attend to the extinguishing of such fires as occur, and in the case of large fires take charge of the fire fighting until their superiors relieve them.

The system thus briefly described handled 1,628 fires on the national forests of California during the season of 1913. This was an exceptional year for electric storms, lightning having caused 804 fires or nearly half the total. Thirteen per cent of the fires were caused by campers. The total area of forest burned was a trifle less than 90,000 acres, 10,418 acres being timber land and the remainder brush or grass land. Only 275 fires attained an area of 10 acres or larger and 912 were caught and put out before they had covered a space 100 feet square.

One additional phase of fire protection work should be mentioned, namely, the safeguarding of dangerous areas either by reducing their inflammability or by constructing fire lines around them. Obviously the simplest way of cleaning up considerable areas that are in dangerous condition is by the careful use of fire. The debris resulting from the

cutting of timber under the timber sale regulations would form a serious menace to the young growth from which the future forest will be derived unless it were disposed of somehow. The usual practice is to require that the purchaser of government timber pile the brush, tops, limbs, and other debris in piles of suitable size which are fired at the proper season by the rangers.

A few years ago the opinion was very prevalent in California that the entire forest area should be burned over periodically in order to effect a general clean-up. This theory is now very largely discarded, and properly so. There are certain arguments in favor of it but it is chiefly based upon conceptions that are fundamentally wrong.

In the first place, although it appears to cost nothing, it is in reality an extremely expensive measure when performed effectively. Advocates of this theory—the so-called “light burning” theory—assume that it is

“Making trail” in the U. S. National Forest. (Photo by courtesy of U. S. Forest Service.)

only necessary to touch off a piece of forest at the proper season and that the fire will do its work without further attention. This is by no means the case. It is obvious that there are many areas that fire should be kept out of at all hazards, or, if they are to be burned at all, should be burned with extreme care. This means, then, that the fire must be kept under control, which would entail prohibitive expense as compared with the cost of keeping fires out entirely. One large tract in the northern Sierras was cleaned up in this fashion at a cost of 50 cents per acre. At the same rate, the expense of light burning the whole of the yellow pine belt in California would amount to at least \$5,000,000.

But besides the prohibitive cost there are two other objections to this practice. One is that the young growth is inevitably destroyed; in fact, since thickets of young growth are specially inflammable, it is one of the objects of light burning to consume them. But the forests of the future can not be created all at once when they are needed. They require a development period of at least one hundred years before they produce material fit to cut into lumber. Any system which protects the mature timber at the expense of the young growth which is to replace it violates the principles of forestry, and, unless the sacrifice is absolutely unavoidable, of common sense as well. It was formerly argued that the sacrifice was necessary; that unless the debris which collected on the floor of the forest year after year was burned, unless the thickets of young growth were kept down, the final result would be a conflagration that nothing could control. This argument upon examination, is found not to hold. The record of the forest service in California during the last year proved that very severe fire conditions could be handled without any considerable loss of timber.

But, what is still more important, it is found by experiment that burning decreases the amount of litter not for a period of years but at most for an interval of a few months. The litter upon the ground at the time of the burning is consumed, but is replaced with more than normal rapidity by the debris shed from the trees scorched by the fire.

In short, light burning, in order to make the forest safe against future fires, must not be "light" but must be a fire of exactly the sort that it is the object of the practice to prevent. Fortunately the light burning method is no longer advocated to any great extent.

THE AMERICAN ARMY OF HUNTERS.

By ERNEST SCHAEFFLE.

Do we not sometimes overlook the fact that America has a "standing army" of over 5,000,000 hunters, trained in the use of firearms, accustomed to the most strenuous exercise, and recruited from the most active, courageous part of the population?

And singularly enough this splendid "army" costs the government not a cent in appropriation nor a moment's anxiety or directorship, but pays its own bills and administers its own affairs. Furthermore, the "army" about which we are speaking takes no man from useful industry during times of peace, but rather increases the productive capacity of its members and in many ways makes of them healthier, happier and more useful members of society. Of what other "army" can this much be said?

We are inspired to write of this "army" at this particular moment, knowing that the thoughts of most Americans are clustered around the central ideas of war, armies and the safety of the nation. At a time like this many of us are likely to regret the fact that our regular army is so small and to rather condemn our peace time determination to get along with less than a hundred thousand soldiers. We are also likely to give attention to the militarist with his "I told you so" impudence and suggestion of an European system.

Just at this point it is well for us to take a long breath and collect our scattered wits, for have we not as a nation always met every emergency that called for an intelligent, courageous army of men who could and would shoot? And after reviewing certain conditions in our national life how can we doubt our ability to meet future emergencies as they may arise? The American people have always been a nation of hunters. We have lived in a land blessed by nature with an abundance of game and have always had the privilege of hunting such game in a degree enjoyed by few other peoples in modern times. Given the supply and the opportunity, quite naturally the game has been hunted, universally and hard, for man is still a hunter and full of the desire to kill. In the country's infancy game was taken for food, while in later years it has been regarded more and more as the object and reward of sport; but always it has been hunted, from one ocean to the other and by millions of our heartiest, most "American" men.

With the wonderful advance that has been made in our country in the mechanical trades and businesses has come wonderful improvement and cheapening in firearms and ammunition, so that today the "poor man" with an outlay of \$25 is the practical equal in the field of his English brother with an outfit running into the hundreds of dollars.

Which all brings us back to our theme:

The country has now (and has had since its beginning), an "army" of hunters, confined to the game fields in times of peace, but ready for defense of the nation in time of peril. This "army" would never have existed and would not exist now had we not recognized the injustice of conditions in older countries and guarded our inherent right to bear arms and to hunt. But where would our army be if the land had no game, and where will it be in future if the game we have saved is to be exterminated, as seems to be the real purpose of even many who call themselves "game protectors" and what not?

The best guarantee of American freedom from foreign invasion and more dangerous aggression and demoralization at home would seem to be a rifle in every household, with the young men trained in its use by experience in the hunting field after game.

CALIFORNIA FISH AND GAME COMMISSION ADMINISTRATIVE DISTRICTS.

San Francisco District.

Office: 734 Mills Building, San Francisco, California.

SEIZURES OF FISH, GAME AND ILLEGALLY USED FISHING APPARATUS.

July 1, 1912, to June 30, 1914.

Illegally used fishing apparatus (nets and lines).....	*223	
Salmon	11,410	pounds
Striped bass	7,826	pounds
Steelhead	781	pounds
Black bass	20	pounds
Catfish	1,842	pounds
Trout	241	pounds
Crabs	5,775	
Abalones	304	
Crawfish	898	
Clams	1,976	
Miscellaneous fish	1,153	pounds
Crawfish traps	64	
Ducks	6,656	
Quail	273	
Shore birds	36	
Doves	96	
Non-game birds	892	
Deer meat	2,190	pounds
Hides	60	
Rabbits (cottontail and bush).....	1,318	
Squirrels	11	
Golden eagle (mounted).....	2	

Illegally used fishing apparatus, after condemnation in superior courts, is destroyed by the board; all wholesome fish and game is donated to public and charitable institutions, from whom many grateful letters of acknowledgment have been received.

During the period from July 1, 1912, to June 30, 1914, there were 1,191 searches and inspections of markets, restaurants, private individuals, conveyances, etc., for illegal fish and game, made by deputies. Of this number, 975 were made in San Francisco.

*The 223 nets and lines seized represent 12,305 fathoms, or 73,834 feet.

HUNTING LICENSE SALES.
