1909

APPROVED BY
THE STATE BOARD OF PUBLICATION.

The Commonwealth of Massachusetts.

To the Honorable Senate and House of Representatives of the Commonwealth of Massachusetts in General Court assembled.

The undersigned commissioners, appointed under the provisions of chapter 476 of the Acts of 1893 and of chapter 474 of the Acts of 1900, herewith submit, in Part I., their seventeenth annual report, in accordance with the provisions of chapter 47 of the Revised Laws, and, in Part II., their fourth annual report relative to their supervision of telegraph and telephone companies, under the provisions of chapter 433 of the Acts of 1906; both reports being for the fiscal year ending Nov. 30, 1909.

HAROLD PARKER.
WM. D. SOHIER.
F. D. KEMP.

BOSTON, MASS., Jan. 4, 1910.

PART I.

ANNUAL REPORT OF THE MASSACHUSETTS HIGHWAY COMMISSION.

During the year ending Nov. 30, 1909, the commission laid out 36.53 miles of State roads. Of these, 30.03 miles have been completed and 6.50 miles are in process of construction. The total length of State highways at the end of the fiscal year, Nov. 30, 1909, was 784.63 miles.

Various cities, towns and individuals throughout the Commonwealth have contributed toward the building of State highways. In some cases the towns have built the highways, which have afterward been taken over by the State.

The total amount expended by the commission for the construction of State highways, including the planting of trees, etc., is \$7,157,945.96.

The number of petitions for such roads received annually grows less each year, because the main lines of thoroughfare have already been petitioned for, 826 petitions being on file, covering a total of 2,003.16 miles of road.

The sum of \$50,215.12 has been spent in so-called "small towns" for the improvement of town roads. The expenditure of this money, together with such amounts as have been contributed by the towns themselves, has resulted in the improvement of about 30 miles of town ways. These roads remain under the control of the municipalities.

The roads thus improved under the direction of the commission, and largely out of the funds of the Commonwealth,

aggregate 193.57 miles; the total amount expended (including engineering charges) being \$336,917.92.

It appears to the commission that the State highway system, indicated by the roads already built and petitioned for, has, in the main, met with public approval.

The road which has been built to avoid the hitherto almost impassable Jacob's Ladder in the town of Becket has been completed, at an expenditure within the appropriation, and, including the work done under the appropriation of 1909 in the improvement of the road between Morey Hill and East Lee, a very serviceable highway now exists all the way from Pittsfield to Chester. There still remain a few miles of road between Chester and Huntington to be improved, and then the east and west route between New York State and Boston will be in excellent condition.

Much work has been done on the road from Boston to the New Hampshire line, via Newburyport. During the past year the sections between Lynn and Salem, in Hamilton, Ipswich and Rowley, have been under construction. The sections in Hamilton, the northern part of Ipswich, the southern part of Rowley, and from Salisbury north to the New Hampshire line still remain in poor condition.

On Cape Cod in the town of Eastham there are 3 miles of road in process of construction by the sand and oil method, 2 miles of which are actually under contract. It is believed that this kind of construction will give a practical and useful road to the permanent residents of the Cape, and that the route to Provincetown will soon be one of the most pleasing tours in Massachusetts for automobiles.

A section of State road between Fitchburg and Greenfield has been completed in Erving and Montague.

The New Hampshire State road from Nashua has been united with the Massachusetts system along the Merrimac River in Tyngsborough.

The Springfield and Worcester road will be nearly completed when the bridge over the Quaboag River in Palmer, now under construction, is finished.

Some progress has been made during the year on the north-

and-south road along the Connecticut River, but many miles of inferior road still exist on this line.

The roads leading south from Boston have been improved by gradually filling in the uncompleted sections which are necessary to develop the system.

The "small town" work has progressed in a manner satisfactory to the commission. The \$25,000 allotment, made under authority of the Legislature of 1908 for small towns of less than \$1,000,000 valuation which contribute toward the cost of the improvements, has been practically exhausted. Many towns have appropriated an amount equal to the sum allotted by the commission. There appears to be no question as to the utility of this method of improving town roads. It seems to have met with public approval, especially in those towns which are remote from the main lines of traffic.

CHARACTER OF CONSTRUCTION.

The constantly increasing use of automobiles has confirmed the commission in the views that it has expressed in former reports, viz., the necessity for the adoption of a binder which will prevent the disintegration of the roads by the rubber tires of the swiftly moving motor vehicles. With this in view, the commission has continued the experiments which were begun last year, but on a very much larger scale. During the past year the commission constructed about 20 miles of plain macadam road and about $4\frac{1}{2}$ miles of macadam with an oil and sand coating; $1\frac{1}{4}$ miles of road were grouted with a tar product, and on $2\frac{3}{4}$ miles the upper course of stone was coated with tar.

The commission also built about $2\frac{3}{4}$ miles of ordinary gravel road, and let contracts for between 6 and 7 miles of road to be constructed of a mixture of asphaltic oil and sand from 3 to 4 inches in thickness. These roads are now in process of construction, one of them being practically completed.

BRIDGES AND CULVERTS.

In the construction of bridges and culverts the commission has used reinforced concrete, as has been its custom for

many years, both on account of the economy of construction and because of its durability.

Chapter 531 of the Acts of the year 1906 directed the commission to report to the Legislature when public safety and convenience required the reconstruction of the bridge across the Parker River in the town of Newbury, and on Feb. 23, 1909, the commission, in a report to the Legislature, recommended that a new bridge be constructed during the year 1909. The design of this bridge contemplated the erection of three concrete arches, one of a span of 110 feet and two of spans of 95 feet each. The waterway was also increased by this plan.

The Legislature of 1909 appropriated \$20,000 for the repair of the old bridge over Parker River in the town of Newbury, and for a study of the bridge question in general. Under the provisions of this resolve the commission, with the advice of Messrs. J. R. Worcester & Co., consulting engineers, determined upon the best way to repair the present bridge. The method adopted was to strengthen the old piers and abutments, top out the old walls with concrete so as to bring the roadway and walls to a uniform grade, and replace the old wooden trusses with steel pony trusses.

The work was advertised and let to the lowest bidder, the New England Contracting Company of Worcester, in September, 1909, and the repairs have been in progress since that time. The bridge will probably be finished during the winter, with the exception of one of the piers, which it has been found necessary to reconstruct. This will be done early in the spring.

The bridge next in importance is the bridge across the Quaboag River in the town of Palmer, which consists of three arch spans of granite, one of 49½ feet and two of 20 feet each. This bridge was advertised under two specifications, one for steel concrete and the other for granite masonry. The W. N. Flynt Granite Company of Monson was the lowest bidder under both specifications, and the difference in its bids on the two methods of construction was so small that the commission determined to use the granite in preference to the concrete.

The following is a list of other bridges built by the commission during the year:—

In Southampton, across the Manhan River, concrete beams, 2 spans, 25 feet each.

In Athol, over West Brook, concrete beam, 1 span, 19 feet.

In Salem, over Forest River, concrete slab, 1 span, 10 feet.

In Templeton, over Brigham Brook, concrete slab, 1 span, 8 feet.

In Orange, over Massachusetts Brook, concrete beam, 1 span, 16 feet.

In Becket, two concrete beam bridges, each of 1 span of 15 feet, and concrete slab, 1 span, 10 feet.

In Agawam, over Tarkhill Brook, concrete slab, 1 span, 10 feet.

In Sunderland, over Dry Brook, concrete slab, 1 span, 9 feet.

In Sturbridge, over Hobbs Brook, concrete arch, 1 span, 11 feet, extension.

MAINTENANCE.

The Legislature appropriated for maintenance purposes \$240,000 and for the improvement of the West Becket-East Lee road \$10,000. All of the \$240,000 has been expended, and, in addition, \$154,131.01 from the motor vehicle fees fund.

The estimates of the engineers, showing the money necessary to put all of the existing State roads into good condition in the year 1909, as stated in last year's report, amounted to \$684,800. Of the amount available for maintenance, \$81,730.48 has been used in the ordinary repair of State roads, which means the cleaning of gutters, the removal of weeds, the smoothing up of the road surface generally, and sanding the roadway, without resurfacing. It will be seen, therefore, that the amount of money spent by the commission this year has not nearly met the requirements for resurfacing, as reported upon by the engineers a year ago. It is, however, fair to say that, with the money spent as is detailed in this report, considerable progress has been made in restoring the roads to better condition. During the year the commission resurfaced about 42 miles of State highway, and put a surface coating of a bituminous binder and sand or screenings on about 115 miles, — a total of nearly 157 miles.

Various methods were employed in the resurfacing. About 23 miles were resurfaced with stone only. On 14 miles the upper course was grouted with a tar product, 8 miles of which had a bituminous surface coating. This surface coating was made of refined tar, tar mixed with asphalt, asphaltic oil or re-

siduum asphalt, all covered with sand and rolled. On about $4\frac{1}{2}$ miles the stones in the upper course were coated with a bituminous material before being spread upon the road. The road was then rolled, and a surface coating was applied. The materials used were refined tar, genasco and refined tar mixed with 15 per cent. of asphalt.

In Andover about 3,000 feet and in Essex 1,464 feet were resurfaced or repaired in short experimental sections, and a great variety of materials was used.

In Wayland over 2,200 feet were resurfaced with gravel mixed with asphaltic oil, or such oil enriched with asphalt in various proportions.

Of the 115 miles treated with a bituminous surface coating, nearly 104 miles were coated with asphaltic oil and over 11 miles with refined tar. In both cases the bituminous binder was covered with sharp sand or stone screening. In many cases the road so treated really needed resurfacing, and it was carefully patched with the oil or tar and sand, and in some instances broken stone was added, and afterwards the whole surface was coated. If roads so treated wear well, it may do away with the necessity for resurfacing with broken stone.

The use of sand as a protection to macadam roads has been continued wherever a bituminous surface has not been considered necessary because of excessive automobile traffic. It is undoubtedly true, and it has been still further demonstrated by this year's experience, that on an ordinary country road, where the automobile travel is not heavy, a stone road can be preserved in good condition for many years by this means, at an average cost of perhaps from $1\frac{1}{2}$ to $2\frac{1}{2}$ cents per square yard per year. This would amount to from \$140 to \$220 per mile; but wherever the automobile traffic is heavy, it is undoubtedly true that sand alone will not preserve the road.

The commission has named, in its estimate to the Auditor of the appropriations required during 1910 for the maintenance of State highways, \$250,000 in addition to the amount available from automobile fees. It has estimated that under the new automobile law a sum in excess of \$200,000 will be realized from this source, which, added to the appropriation asked

for, would put into the hands of the commission something like \$450,000 for repairs and resurfacing during the coming year.

While this sum of money will not be sufficient to put all of the State highways into perfect condition, the commission feels that it is wiser at the present time to be conservative in the use of the new method of construction and surfacing. It hopes, with the money available, to keep the existing roads in reasonable repair and without serious damage, and to gradually get them all back into better condition.

It must be realized that, even without the automobile, the roads of the State are constantly wearing out, and require resurfacing and repair, and that, as has been frequently stated in the past, the cost of repair increases in a very rapid ratio if a road is neglected.

BITUMINOUS WORK.

Uncertainty as to what methods and materials are best for obtaining roads that will withstand modern traffic has caused the commission to continue the construction of experimental sections of road, the object of these experiments being to find what treatment is the most economical, considering the cost of construction and maintenance combined, not separately.

Records are made of the minutest details of each method tried, and close observation of the results obtained will enable the commission in the near future to determine what methods or treatments can be most wisely adopted. Every bituminous binder used has been analyzed, over six hundred analyses having been made during the year.

The satisfactory results obtained by giving the roads a light surface coating of refined tar or heavy asphaltic oil has led to extensive use of this treatment; and for the more economical and effective application of the material the commission purchased in England two machines for spraying the bituminous material under pressure, by the use of which machines a very thin coating of oil or tar can be spread uniformly, using one quarter gallon or less to the square yard.

A general conclusion has been reached by the commission as a result of work done up to this time, namely, that in many instances some bituminous binder must be used in the first con-

struction of a road, and that no positive determination of the exact nature of the binder that will be the most economical in construction and maintenance can be made until more time has elapsed to demonstrate their qualities by actual use on the roads. Meantime, until such determination can be made, the commission considers it advisable to use in general only the commonly used and comparatively inexpensive surface treatment of bituminous binder, using about one-half gallon to the square yard of surface, and covering with stone screenings, fine gravel or coarse sand. This treatment preserves the road, renders resurfacing less urgent, and lays the dust. The general use of oil or other dust layer instead of water has largely increased during the year, possibly because of the law adopted last winter, as recommended by the commission, allowing cities and towns to assess upon the abutters or take from the tax levy the whole or a part of the cost of using these dust layers instead of water.

There are a few principles which the experience of the commission leads it to believe will become universal in future bituminous work. Bituminous surfaces should have less crown than the ordinary macadam road. While the customary crown on macadam roads is $\frac{3}{4}$ inch to the foot, a crown of $\frac{3}{8}$ inch or less has been found to be probably sufficient and possibly more desirable than a greater crown on bituminous surfaces. Experience has also shown that with both automobile and horse traffic on a bituminous road it is advantageous, particularly with roads made by mixing or grouting tar in the top course, to apply a surface sealing coat, preferably of asphalt, as that seems somewhat less slippery, gives a better appearance, and, at the present writing, shows indications of longer life than a surface coating of tar.

An oil or tar, to be useful on a road, must bind the materials together; it must be tenacious and adhesive, — a binder, not a lubricant. One can tell almost as soon as one begins to use a material whether it works well or not; at any rate, at the end of one or two days, when it has had time to set.

It seems evident that the failure of some of the materials to give satisfaction may be due to superheating, which causes them to lose their adhesive properties; or a material may be mixed or

STATE HIGHWAY, WAREHAM.

FOREGROUND : Sand and Asphalt Oil "A." NEXT SECTION : Same, enriched with Asphalt.

thinned or fluxed with a material which is of no value as a road binder, thus taking away the natural adhesiveness of the asphalt or tar that is fluxed with it.

The commission cannot, at this time, announce any specifications which it would feel satisfied to recommend for general adoption.

The commission, however, has had Mr. H. W. Clark, the chief chemist for the State Board of Health, at work all this season making analyses and experiments, which have proved to be of great value, and it hopes before long to adopt specifications which will insure the securing of good road material. Mr. Clark's report will be found in the appendix.

Oil and Sand Roads.

On a good many miles of road the commission has not only applied a surface coating of oil covered with sand or stone dust, but, where the road has been in need of resurfacing, it has patched the ruts or holes with the oil and sand before giving it a surface coating. In some instances, where the road was in a very bad order, it has been given two coats of oil and sand over the entire width, and in other cases two coats have been applied to the middle of the road and one for the entire width.

Roads treated in this manner have proved satisfactory, and at the present time it looks as if this use of oil and sand, if continued and repeated from time to time as necessary, might do away with the necessity of resurfacing such roads with broken stone.

A new road built entirely of asphaltic oil and sand, heated, and mixed by hand, has been built by the commission this year.

The commission has also built some road on the Cape, at Wareham and Rochester, where the same method has been employed, using sand instead of gravel. This road looks reasonably satisfactory, and if it wears well this method of treatment will prove of great benefit to the sandy sections of the State where the travel is not extremely heavy, as it is entirely probable that such a road can be built for one-third of the cost of macadam, or less.

It is expensive, of course, to heat the sand and oil and mix them by hand, but no doubt the cost of mixing can be largely diminished by the use of some mechanical mixer. Some concrete mixers have been used, with good results, on work of this character. The commission hopes, however, to be able, within a short time, to build sand and oil roads by a cheaper method, either building up in layers, or spreading the oil upon the sand in various coats, and cultivating, shaping and rolling it into shape. A road built in Eastham in this manner, which has been repaired from time to time, has now lasted five years, and, while not, of course, as good as a macadam road, it is reasonably satisfactory, and accommodates the travel in the place where it is located.

A sand and oil road, which was built by this same method in Brewster, Harwich and Orleans last year, is now in fairly satisfactory condition. It ruts somewhat, but every time it is shaped and patched it gets into better condition, and is, at any rate, a decided improvement over the sand road that existed there before.

At Wayland the commission has built a section of road entirely of oil, or oil and asphalt, mixed with various grades of gravel, heated, the whole being thoroughly mixed by hand and then spread upon the road. This has made a most excellent road. It has the appearance of an ordinary asphalt road with a true crown and grade, and so far there have been but few complaints as to its slipperiness.

Results of this Season's Work.

It is perhaps not too much to say that, while the commission has used various bituminous binders, both with tar and asphalt bases, has employed various methods of construction and resurfacing and various methods and materials in surface coating, the roads where these materials have been used have almost invariably been in very satisfactory condition at the end of a year. They are certainly in better condition than most of the roads where no such materials have been used.

In only a very few instances have the roads failed, or gone to pieces, to any great extent. Some places have had to be patched, and occasionally certain spots have required extensive patching,

but in the main, while some are much better than others, it is true that almost every one of them is reasonably satisfactory. The failures have been very few and of very slight extent.

It is because of the indications as to comparative wear, because of slipperiness, etc., that the commission has been led to adopt one material rather than another.

It can fairly say, however, as a result of this season's work, that the use of bituminous binders in road material has, in its opinion, come to stay, and will be much more prevalent in the future than it has been in the past wherever there is much automobile traffic.

The doubt that exists is not as to the use of some bituminous binder, but which binder to use, and exactly what is the best method of applying it. It will undoubtedly be found that different localities and different materials require somewhat different binders and treatment, and by experience alone can a determination be made as to what will be the best to use in any given locality with the materials that are there available.

Methods of Application.

The English spraying machines, purchased by the commission, are in very common use in England, where many hundreds of miles of road are sprayed with tar annually, and their use in that country is constantly increasing.

It has been the practice in England to spray a thin coating of tar over the road without previously preparing the road surface to any great extent. The tar is spread in a very thin coat, the first coat varying from one-third to one-quarter of a gallon, or even less, to the square yard of surface. A second coat, sometimes being only one-eighth or one-ninth of a gallon to the square yard, is then applied. The English gallon, however, is about one-sixth larger than the standard gallon of this country.

The spraying machines which the commission purchased are made to hold the tar, heat it with a steam coil by means of steam provided by a traction engine or a steam roller, and spread it upon the road in a thin and even coat. The tar is kept under pressure by pumps geared to the wheels, so that a pressure is developed by the movement of the tar-spraying machine itself.

The tar is spread hot upon the road, under pressure, through

a number of fine nipples which make a very fine spray and cause the tar to spread evenly over the road and into the depressions. The nipples are on a long tube, and have a sort of hood to prevent the tar from being blown to one side by the wind. The machines work very well in applying an even coat of about one-quarter to one-third of a gallon to the square yard. Their use has given very good results, particularly in putting on one coat of tar. The machines have been hauled behind the steam roller which provided the steam for heating the tar. This method of hauling is, of course, somewhat expensive.

Early in the year the commission used heavy asphaltic oil in the spraying machines, and the machines worked very well on this work. At the beginning of the season the commission was handicapped by the inexperience of the persons selected to operate this particular type of machine, as no similar machines had previously been used on work in this country, and the costs of the work done were necessarily high, inasmuch as proper arrangements could not be made for the continuous use of the machines. Toward the end of the season, however, the costs were very much reduced.

One coat of oil, using one-fourth gallon to the square yard, including the cost of sand, oil, labor and expenses in connection with the steam roller, can probably be applied at a cost of less than 5 cents per square yard.

While the work of applying the oil by means of a spraying machine has been more economical than coating roads with oil in any other manner, it should be borne in mind that a smaller quantity of oil is used per square yard. It seems probable that a single coat of one-quarter of a gallon to the square yard will not be sufficient except upon roads which are in good condition. One-half gallon of oil to the square yard appears to give better results on most roads.

In other oil and tar work the material has been spread in various manners. The lighter oil was, in one instance, spread from a sort of trough made of two boards with an opening at the bottom, which was mounted on wheels and which received the oil from a barrel. The American Tar Company's distributor has been used, with very good results, where the quantity of ma-

STATE HIGHWAY, LYNN.

ENGLISH TAR-SPRAYING MACHINE.

SPRAYED WITH TAR, PARTIALLY COVERED.

terial to be spread was about one-half gallon to the square yard. Oil has also been applied from an ordinary half-moon watering cart. When the heavy asphaltic oil has been used, it has always been necessary to heat and apply it hot.

The cost of the surfacing work has varied greatly in different localities, as it depends largely on the length of the haul, the cost of the sand or gravel covering, and on whether or not the oil or tar was purchased in tank car lots or barrel lots. When the heavy grade of oil has been used and applied hot, at the rate of one-half gallon to the square yard, the cost has varied from 6 to 11 cents per square yard, which cost includes the cost of material, labor, and the surface covering of sand, gravel or stone screenings. In many instances these costs included considerable patching which it was necessary to do in order to prepare the road surface for the oiling. In general, it may be stated that a fair price for such work, complete, is from 6 to 8 cents per square yard.

On account of the increased efficiency of the employees of the commission, because of the experience gained during the past season, the cost of the work done with the tar-spraying machines will probably be largely diminished.

In all cases, before applying bitumen to a road, the surface should be carefully prepared, thoroughly cleaned and compacted, all holes and depressions filled, and the roads brought to as true a crown and grade as possible. The oil or tar should then be spread as evenly as possible over the surface of the road, brooming it where necessary to secure a uniform coating, and covered with sharp sand, gravel or stone screenings.

During the first few weeks after the road has been treated, covering material should be added whenever the oil or tar appears upon the surface.

If holes or depressions are left in the road, the water which lodges there soon causes the road to become ravelled.

Roads surfaced with any bituminous binder must shed water, or they will quickly go to pieces.

Dust pockets or loose material will invariably cause the surface to peel or scale. A road should be patched as soon as any scaling appears on the surface.

All loose material should be cleaned out of depressions, or the edges made straight, before the bituminous material is applied. The depressions should be filled with heated sand, gravel or chips, thoroughly mixed with hot oil or tar, and tamped into the depressions. Another method is to sprinkle the hot oil or tar into the depressions, after it is prepared, covering the material with all the sand, gravel or chips which it will take up. The material should be tamped and the process repeated until the depression is entirely filled.

TREE PLANTING ON STATE HIGHWAYS.

At the beginning of the year all trees growing within the limits of the State highways were placed under the charge of the forester, Mr. E. W. Breed. His work during the year has consisted of the care of the trees already planted and the removal of dead and worthless trees and dead branches, cutting back the brush on corners and thinning out the worthless trees in order to secure a clear view around the corners.

Many trees were found which were being injured by the feed wires of electric railways, and the companies were required to protect their wires. This they have done, and as a result many trees which would otherwise have been destroyed have been saved.

During the past year, 730 trees have been planted, making a total of 13,666 trees planted on State highways in the last six years. In the nursery 794 trees were replaced. There are now 1,070 trees on hand in the nursery, ready for planting, and something over 4,000 smaller trees.

Trees have been planted in 58 towns. The average cost of new planting was about 74 cents each, and the cost of preparing the ground was about 49 cents, making a total of \$1.23 for each tree set out. It has been necessary to water the trees set out this year on account of the drought, but the number of trees lost has been something under 6 per cent. of those set out, mainly from causes which were not under the control of the forester.

The commission has adopted the practice of putting manure under the roots of the trees in order to reduce the number of

weeds, instead of using it as a mulch. White clover has then been planted around the trees to crowd out the weeds. This has later been made use of as a fertilizer.

STATE HIGHWAY TRAFFIC CENSUS.

This year the commission decided to have a census taken of the traffic over its 740 miles of State highway. Such a study seemed very necessary, particularly because of the advent of the automobile, in order to determine what class and character of construction would best withstand the kind of traffic which each particular highway would have to bear.

An actual count was made in August at 237 stations and in October at 240 stations on State highways, and continued for fourteen hours each day.

On certain main roads leading into Boston records were taken in August, twenty-four hours a day, so as to include vehicles carrying milk and produce into Boston and the suburbs.

In addition to the records taken by the commission, the Metropolitan Park Commission, the Boston park commission and the street commissioner of Newton caused counts to be made of the traffic over certain roads under their respective jurisdictions.

The total average daily traffic at all stations and the percentages of different vehicles were as follows:—

Average Daily Traffic, All Stations.

	August Census	October Census
Horse-drawn:—		
Light,	19,622	16,456
Heavy,	17,969	17,967
	37,591	34,423
Automobiles:—		
Runabouts,	5,922	3,995
Touring cars,	21,387	14,514
Total,	27,309	18,509
All kinds,	64,900	52,952
Per cent. horse-drawn,	58	65
Per cent. automobile,	42	35

Average Traffic per Station per Day.

	August Census.	October Census.
Horse-drawn:—		
Light,	83	69
Heavy,	76	75
Total,	159	144
Automobiles,	115	77
All kinds,	274	221

It must be remembered that these statements are merely averages, and that the different stations varied greatly, both as to the amount of travel and as to the relative number of automobiles compared to horse-drawn vehicles. In some cases the automobiles greatly outnumbered the horse-drawn vehicles and in other cases the opposite was true.

The commission is printing in Appendix K the actual traffic census as taken by the observers, and also the census taken in the metropolitan and Boston parks and in Newton, as well as the census taken at night, so that the travel in the various localities can be compared.

It is interesting to note not only the difference in the volume of travel at different points on the same main route, but the relative importance of automobiles on the different routes and in different localities.

The average taken on any particular main route should not be understood to indicate through travel, because almost invariably some one or more of the stations in the middle of the route have relatively very little travel, but the average is brought up by stations nearer some large municipality, where the local travel is heavy. Of course, even the stations in between have some local travel.

At the request of the commission, Mr. A. B. Fletcher, secretary, has made a careful study and summary of this traffic census, and his report to the commission thereon will be found in the above-mentioned appendix. It contains much interesting

information and a number of tables showing the relative travel over the most important routes, not only out of Boston, but throughout the State.

BRIDGES.

Under chapter 136 of the Resolves of 1909 the commission was directed "to investigate the subject of causeways and bridges over lakes or ponds and all bridges over streams in the commonwealth which have a span of fifty feet or more, and which are contiguous to state highways, and on routes likely to become state highways in the near future," and to report the result of its investigation to the next General Court. The commission was also directed to include in its report brief descriptions of the present bridges and the approaches thereto, estimates of costs, reasonable detail as to their condition, annual cost of maintenance, as well as the cost of rebuilding and maintaining them during a period of twenty years.

During the past season the commission has had its engineers collect the necessary data to enable it to make a reasonably comprehensive and intelligent report upon the subject. It is manifest that the estimates of cost, maintenance, etc., can only be "estimates," and must be figured upon some uniform basis, which will not be the actual cost for the rebuilding of any given bridge but merely a fair average cost for all the bridges. It would be impossible, without careful study of each particular bridge, borings, soundings, etc., to get anything like an actual estimate.

In addition to the bridges mentioned, the commission has also secured data relating to various other large bridges in the Commonwealth, as it felt that that information was really necessary in order to form any estimate of the cost of rebuilding or maintaining the important bridges in the Commonwealth.

In collecting these reports the commission has interpreted "a 50-foot span" to mean not what would technically be known as a span, but a bridge 50 feet long.

The bridges were divided into classes, to wit: —

1. Causeways and bridges within the limits of the State highways. At the present time there are on file reports of 13 bridges that would come under this class.

2. Causeways and bridges contiguous to State highways. The reports show 74 bridges under this class.

3. Causeways and bridges on routes which are likely to become State highways in the near future. Under this class there are reports already on file of 51 such causeways and bridges.

4. Causeways and bridges over the larger streams, lakes, etc., in the Commonwealth. This class was intended to include as many of the important bridges as possible. There are already on file 551 reports of such bridges.

The information in regard to these bridges is now in the office of the commission and is being tabulated, and the various other estimates required are being made as rapidly as possible.

When it is considered that the city of Boston alone has paid for over 90 bridges, the construction of which cost nearly \$8,500,000 and the yearly maintenance more than \$220,000; that some of the counties in the Commonwealth have 60 or 70 bridges of varying lengths, various characters of construction and in varying conditions of repair; that there are, in the neighborhood of Springfield, 3 bridges over the Connecticut River where the distance between banks varies from 1,135 to 1,225 feet, and the cost has varied from \$30,000 for the old toll bridge to \$170,000 for the north end bridge; and that in addition to these there are 2 bridges over the Chicopee River which are over 200 feet in length, and 2 over the Agawam River 240 and 330 feet in length, respectively, it becomes evident that, to have such a report as this commission was requested to make of any value whatever, the details must be carefully studied, the results must be tabulated and some general conclusions must be formulated.

Therefore the commission does not feel that it is wise at this time to make any further report or to give any more details in regard to the matter; but as soon as possible it will submit a supplementary report, containing all the information which it has been able to collect on the subject it has been directed to inquire into.

RECOMMENDATIONS FOR LEGISLATION.

Maintenance of State Highways.

Every year it becomes more and more evident that the problem of maintenance, not only of State highways, but of all highways, is of constantly increasing importance. It is apparent that those much used by automobiles must either be constructed with some bituminous binder, or they must be protected with some surface covering.

The expense of maintenance of State highways, including ordinary repairs, resurfacing or surface treatment, probably will be somewhere between \$300 and \$500 a mile per year. The commission thinks it might be wise for the Legislature to consider the advisability of providing a law whereby a more equitable proportion of the cost of maintenance can be assessed upon and collected from the cities and towns in which the highways are built, or from the counties, or in part from both, than under the law now in force.

Maintenance of Small Town Roads.

It is evident that when roads are once built in the small towns which are aided by the Commonwealth under the present law, the money expended on construction is largely wasted unless these roads are properly repaired every year.

Under the existing law, the commission has authority to make needed repairs to such roads in cases where they are neglected by the towns themselves, and to charge the cost to such towns up to but not exceeding \$50 per mile per year.

In many cases this amount will be insufficient. The commission has, however, no funds available for this purpose. It therefore seems to be necessary, in order to make the present law operative, that the Legislature should provide a fund which the commission could use under such conditions. The commission recommends that \$5,000 be made available for this purpose.

Main Lines and Thoroughfares.

The general tendency of this and other States seems to be toward a more central authority directing and controlling the construction and maintenance of the main lines of travel, and

the division of roads into main thoroughfares, those of secondary importance, and local roads. Such a system would gradually bring more and more roads under the supervision and direction of competent engineers, and would lead not only to better roads, but to more economical expenditures.

It is self-evident that to make any such plan effective the necessary funds for construction and maintenance must be made available, and a comprehensive scheme carefully prepared by which it can be obtained in some fair and equitable manner.

Road Material.

All road-building material is getting scarcer every year, and its value is constantly increasing. It has seemed to the commission, therefore, that it might be wise if a law were passed to authorize not only the Massachusetts Highway Commission, but cities and towns, to purchase or take land for the purpose of obtaining road material, and to take rights of way thereto, the land to be taken in fee.

Under chapter 48 of the Revised Laws, sections 105 and 106, cities and towns have authority to take land in order to obtain material; but they can merely remove the material therefrom for a period of ten years, at the expiration of which time the land reverts to the owner. It is manifest that the cost of this ten-year privilege might equal the whole value of the land, and that roads will have to be repaired for all time to come.

All agreements, contracts or takings of land by the commission should be made subject to the approval of the Governor and Council; and a reasonable amount of money could be made available each year for this purpose, either by special appropriation or by making the money available from the loan fund, the motor vehicle fees fund or some other source.

Weekly Payments.

The commission has been embarrassed frequently because of the fact that it has had no considerable sum of money easily available with which to make payments to laborers engaged upon the work of repairing the State highways. There is a provision of law which requires that all laborers engaged upon such work shall be paid weekly. In the past such weekly payments could

WASHINGTON STREET, BOSTON.

THE OLD ROAD.

THE STATE HIGHWAY.

Photographs at Same Point, before and after Improvement.

not be made unless some individual was willing to advance the money, and wait usually not less than two weeks until he could be reimbursed through the State treasury.

In the year 1909 the Legislature passed an act authorizing advances to the institutions of the Commonwealth (Acts of 1909, chapter 218), which relieved somewhat similar conditions in the institutions. The commission believes that similar legislation would be of great benefit to the Massachusetts Highway Commission.

Annual Reports.

Chapter 9 of the Revised Laws provides that 4,500 copies of the annual report of the commission shall be printed each year. Of this edition only 500 copies have been supplied to the commission for distribution, and so small a number does not begin to be enough to supply the demand.

The commission recommends, therefore, that 5,000 copies be printed each year, and that 1,000 copies be furnished to it, of which 500 copies may be bound in paper covers.

Grade Crossings.

It has seemed to the commission that it would be wise to have some legislation adopted which would in some way protect the users of the highways as well as the railroad companies, when grade crossings are abolished. This might be accomplished by providing that there shall be a clear view ahead for some minimum distance (for instance, 150 to 200 feet) through the bridge or under-pass, and that on curves there shall be a clear and unobstructed view of the roadway for some minimum distance (for instance, 150 feet). The desired result could be obtained in many other ways by providing minimum tangents or curves, etc.

Such a law should require that when a crossing was abolished the rights of the users of the highway should be considered, and that the highway should be made reasonably safe and convenient for them. In many cases, familiar to every user of the highways, when grade crossings have been abolished conditions have been made even more dangerous than before, so far as the users of the highway were concerned.

There have been many instances where the under-pass or bridge was too narrow to be safe, and the curves approaching it were so abrupt that one could not see ahead for any reasonable distance. In some cases the narrow roadway has been occupied in part by an electric car track, and the under-pass has been so narrow that a good-sized team or automobile could not go under the railroad and turn the corner to go through the under-pass without turning onto the electric car tracks, with the chance of meeting an electric car at that point, there being practically no view ahead.

Civil Service.

It seems to this commission that it might be wise to provide by law that when any person has been employed under authority of the Civil Service Commission, whether provisionally, temporarily or otherwise, and has performed his duties satisfactorily for a suitable period of time, he shall not be discharged except by order of his employer, for cause, and after a hearing.

It might be wise to provide, also, that in any promotions in any particular employment from one class or grade of service to the one above it, experience in the particular line of work which the appointee has to perform shall be given proper prominence, and that such promotions of efficient and experienced public servants may be made either with or without examination.

Many times in the past, when the commission has desired the services of rodmen, instrumentmen, etc., and has made a requisition upon the Civil Service Commissioners for a person possessing the necessary qualifications, there have been no persons upon its lists whom it could certify.

This commission has, therefore, been authorized to make a so-called "provisional appointment." It has been obliged to find a person whom it could employ to do the work.

The services of such an employee, naturally, become more and more valuable to the Commonwealth as he acquires knowledge and experience in the particular kind of work that this commission has to do.

Several times in the past the Civil Service Commissioners, undoubtedly acting in good faith, under their interpretation

of the requirements of their rules, have felt obliged to direct this commission to discharge faithful and efficient employees who had been performing their duties in a satisfactory manner for two or more seasons, and to appoint a new and untried person who was certified by them. In one instance the employee sought to be replaced has been employed for many years.

It will manifestly hamper this commission in its work if it is required to discharge faithful and efficient employees because some one else has finally got upon the civil service list and desires the position, though he often possesses no experience in that particular class of work.

The commission feels, therefore, that it might be wise, in the best interests of the Commonwealth, to make clear by a proper law exactly what the powers, rights and duties of this and other commissions and the employers of labor are, not only in their relation to the civil service, but in regard to their own employees.

The law should determine on what terms employees can be employed, for what periods of time, what class of work they can be called upon to perform from time to time, and as to whether the power to determine these various matters in relation to such employment and the duties of the employees is to be vested in the employer, whose duty it is to see that the actual work required is properly performed, or in some one else.

SURVEYS AND ENGINEERING OFFICE WORK.

During the year ending Dec. 1, 1909, surveys for preliminary studies, estimates and lay-outs were made in 29 towns, covering a total distance of 36.29 miles; and grade stakes for construction work were set in 58 towns, covering a distance of 42.8 miles, some of the stakes having been set on roads which remained unfinished at the close of the season's work in 1908.

Final surveys were made in 31 towns, covering a total distance of 28.48 miles. Surveys for "small towns" were made in 50 towns, covering a total distance of 23.5 miles, and about 5 miles of miscellaneous surveys were made of roads to be constructed by towns.

Plans, profiles and cross-sections for roads in 25 towns were plotted, representing a distance of 34.5 miles.

Lay-out plans have been made of roads in 49 towns, covering a total distance of 36.53 miles.

Plans to accompany decrees for street railway locations on State highways and for provisional locations have been made in 16 towns.

Plans and profiles have been made for roads under the small town act in 47 towns, a distance of 19.8 miles.

Preliminary estimates of the cost of work in 81 towns, representing a distance of 66.73 miles, have been made, and final estimates of the cost of work in 69 towns, representing a distance of 87.59 miles.

AUTOMOBILE DEPARTMENT.

Automobile Law.

Up to the present time the commission has heard very few criticisms as to the uniform automobile law enacted last winter. It seems to be satisfactory in the main, and it seems wise to the commission, unless some serious defect is discovered which has not heretofore come to light, that the law should be left intact, and certainly without any substantial modifications or changes. The provisions of the law are now pretty well understood, and, of course, constant changes lead to great confusion, and render it impossible for the average automobilist to know what the law is.

The provisions in regard to speed limits seem to meet with universal approbation. The fee provision has proven to be satisfactory, and has not been complained of; and the same is true of the special speed regulations.

The only criticisms offered have been of a minor nature, and one or two have been caused by the narrow interpretation put upon the law by certain judges, contrary to the interpretation placed upon it by the vast majority of courts in which automobile cases have been tried. It is believed that these minor troubles will rectify themselves in a short time, as the law becomes better understood by the judges who administer it, the police officers who are to enforce it and the automobilists who must obey it.

The uniform automobile law which was passed at the last session of the Legislature seems to be effective, so far as the four

sections which went into effect on July 1 are concerned. The authorities of cities and towns, the public and the automobilists seem, in general, to be in accord with and to approve of the provisions of that law.

The Metropolitan Park Commission has practically adopted it in its regulations affecting the use of automobiles in the metropolitan parks. The Boston park commission has done the same, leaving the speed limits provided by law applicable throughout the parks and the city of Boston in general.

So far as special regulations are concerned, the commission has been asked to approve of a very few only. In the main these have related to the exclusion of automobiles from certain narrow and dangerous roads from which they had previously been excluded, from certain portions of the parks in the city of Boston, and from certain parks in Plymouth, Haverhill and other cities, and confining them to certain roadways in Newton, the Boston parks, etc.

Only one or two towns have even attempted to make any special speed regulations affecting particular roads.

The commission, feeling that it was only fair to the public and to all users of the highways that the new law should have a fair trial, has not up to the present time approved of any special speed regulations. It seemed to the commission that before such special regulations, differing from the general law, were approved, the necessity for them should be demonstrated by an honest and earnest effort to enforce the present law. It believes that such an enforcement would accomplish all that is desired by any reasonable person in the way of regulating the danger from automobiles.

In regard to the exclusion of automobiles from particular ways and roads, it does not seem at all likely that there will be any difference of opinion between the commission and the authorities of any city or town in the Commonwealth, certainly not as to the important highways, because the law itself provides that automobiles shall not be excluded from State highways or the main highways leading from one city or town to another.

Hearings.

During the last year the commission has devoted practically one day each week (Wednesday) to the consideration of automobile cases, hearing several cases during the day. It has also been necessary to hold hearings on other days in the week from time to time. During the year it has held 155 such hearings.

Licenses revoked or suspended.

During the year 68 licenses have been revoked and 132 licenses have been suspended for various terms and for various causes.

The law requires the commission to suspend the license of any operator who is involved in an automobile accident from which death results, and the license can only be given back if, after a hearing or upon an investigation, the commission finds that the accident happened without serious fault on the part of the operator. During the year 44 licenses have been suspended because of such deaths and 9 licenses have been revoked. In 31 cases the licenses have been restored, the commission finding that the accident happened without serious fault on the part of the operator. In several cases the operator was killed, so that no action could be taken.

In most of the cases where the licenses were restored the accidents were such as resulted from the fact that the injured had stopped, run or stepped back, without looking, directly in front of the automobile; they also stepped directly out from behind other vehicles or objects, when they were so close to the automobile that no care or skill on the part of the operator could enable him to avoid hitting them. In these cases the automobiles were being operated at reasonable rates of speed, considering all the attendant circumstances.

The commission is required to revoke the license of any operator who is convicted in court of operating recklessly, or so as to endanger the safety of the public, or while under the influence of intoxicating liquor. If an operator is sentenced in the lower court and appeals, the commission is required to suspend his

license until he is acquitted, or unless it otherwise orders after an investigation or hearing.

There have been 74 licenses suspended or revoked because of court records. There have been 24 licenses suspended or revoked upon complaints and after a hearing, and 102 licenses suspended or revoked as the result of an investigation, revocations being made only after a hearing.

During the year investigations have been made in 241 cases by investigators appointed by the commission. These investigators have prosecuted 33 offenders against the automobile law in the courts, and have secured 33 convictions.

Besides this, the commission has taken action upon their investigation, and has suspended licenses as a result of the findings of the investigators and on the facts presented by them. It has been the practice of the commission to suspend licenses in the first instance, and then to notify the operators to appear and show cause why their licenses should not be revoked, when the facts presented seemed to warrant such action.

In a few cases where the commission had suspended the licenses on the reports of its investigators or upon court records, hearings have been requested, and as a result of the facts presented at such hearings the licenses have been restored in a few instances. In the majority of cases, however, even after a hearing, the operators have acquiesced in the action taken, even though the commission has seen no reason for revising its former action.

It has been the practice of the commission to write cautionary letters to all operators who were several times convicted in court of minor offenses against the automobile law. It has also been the practice of the commission to suspend the licenses of any operator who has been convicted three times within the calendar year of violating the speed law. The law which goes into effect January 1 will require that the license be revoked in such cases.

Refusing to stop after accident,	8
Convicted three times of overspeeding,	11
Operating automobile without owner's consent,	13
Sundry offenses,	10
	<hr/>
Total,	200

Automobile Accidents.

According to the reports received in the office of the commission there have been 1,130 automobile collisions during the year, 54 people have been killed and 989 injured. Of the 54 people killed, 19 were occupants of automobiles, 32 were pedestrians and 3 were bicycle riders. Of the people injured, 339 were occupants of automobiles and the balance were pedestrians, occupants of carriages and street car passengers. Of the collisions, 826 occurred in the daytime and 304 after dark; 816 on city or town streets and 314 in the open country.

Court Cases.

During the calendar year the commission received from the courts 4,271 abstracts containing the action taken in automobile cases.

These abstracts showed that 3,892 of the persons complained of were convicted, 163 were found not guilty, 482 cases were placed on file without sentence, and 264 cases were appealed.

The complaints and convictions were for various violations of law: 2,574 for overspeeding, 186 for violations of the park rules, 82 for reckless operation, 31 for operating while under the influence of intoxicating liquor, and 54 for refusing to stop when signalled to do so by an officer. The remainder of the complaints were for various offenses, like the improper display of number plates, operating without a license or without a registration certificate, or operating an unregistered vehicle.

In 229 cases persons were convicted of operating without the lights required by law, and in 60 cases for operating without having numbers on their lamps. The law which goes into effect Jan. 1, 1910, does not require numbers upon the lamps, but does require the rear number to be properly illuminated.

These abstracts show that fines aggregating \$40,721.60 were imposed.

Examinations for Licenses.

The number of examinations during the year of applicants for licenses to operate automobiles amounted to 4,629. This means that 3,473 persons were examined, 1,156 having been examined several times. The number of licenses issued thereon amounted to 3,149, 324 having been refused. In other words, 9.33 per cent. of the persons examined failed to pass, either upon examination or re-examination. Over 1,000 people failed upon their first examination, which amounts to something over 30 per cent.

More than one-half the examinations were held in Boston, the remainder being held in Brockton, Concord, Easthampton, Fall River, Fitchburg, Greenfield, Holyoke, Lawrence, Lowell, New Bedford, Pittsfield, Rockport, Salem, Springfield and Worcester.

Further details concerning the work of the automobile department will be found in Appendix J.

Automobile Fees.

The graded fee, which goes into effect Jan. 1, 1910, so far as the commission can learn, has been approved of by a vast majority, at least of the owners of high-powered cars.

During the year 1909, 23,971 automobiles and 2,394 motor cycles were registered. The amount of the fees collected from these automobiles, at \$5 each, was \$119,855; and the amount collected from the motor cycles was \$4,788, at \$2 each.

The total amount collected from registration fees, license fees, etc., was \$169,973.54. From this amount had to be paid the cost of number plates, salaries of clerks, investigators, etc., in the automobile department, as well as many other expenses, the balance being applicable to the repair of State highways.

Estimated Revenue from Automobiles in 1910.

So far as can be learned by counting the horse power of the automobiles registered, as returned by the persons registering them in 1909, the average fee to be collected in 1910 under the provision of law relating to graded fees will be \$8.84, instead of the \$5 flat fee which was collected in 1909. This small difference is accounted for by the fact that in the law enacted the Legislature retained the \$5 flat fee for all automobiles under 20 horse power.

According to the returns to the commission, it is estimated that more than one-half of all the cars registered were under 20 horse power.

Estimating the amount of revenue to be obtained from automobile fees in 1910, from automobile registrations and upon returns made in 1909, the total amount collected from automobiles in 1910 will be about \$210,000, as compared with \$119,855 collected in 1909. This estimate is based upon the assumption that the average fee is as figured, \$8.84, and also that the same number of cars will be registered in 1910 as were registered in 1909. There may be more automobiles registered, and their horse power may be found to be greater or less than the horse power stated in the applications received in 1909.

It must be remembered that all the expenses have to be paid before any of the money collected from automobile fees is available for use on the State highways.

CHANGES IN ORGANIZATION.

Since the commission was organized, in 1893, Mr. Austin B. Fletcher has acted as its secretary. In the organization of the commission and the work of its various departments his services have been of great value, continuing in office as he did from the beginning. Since 1901 Mr. Fletcher has not only served as secretary but he has been the executive officer of the Board, and, in a sense, its chief engineer, supervising the work of the division engineers and the engineering department of the Board, as well as the work of the automobile and telephone departments. His services had become extremely valuable to the Common-

wealth, and the commission has suffered a great loss in his accepting a position that was offered to him in the State of California, where he will have entire charge of the construction of many miles of highway. The commission wishes at this time to express its high appreciation of the valuable services which he so efficiently performed for so many years. He was an able, efficient and capable executive officer, of the highest personal integrity, clear sighted and of unusual ability, both in organization and construction. The resignation of Mr. Fletcher, with the constantly increasing work of the commission, has made it necessary to make changes in organization.

Mr. Frank I. Bieler, who has been acting as assistant secretary, has been promoted to the position of secretary.

Miss Mary A. Riley, who for years has had immediate charge of the records and various other official papers of the Board, under the direction of the secretary, has been appointed recording secretary.

Mr. Fred Fair, who has been in the office for many years, has been promoted to the office of assistant secretary.

On account of the increased work of the commission, it became necessary to appoint a chief engineer, to have the direction not only of the office engineering force and the force in the field making surveys, etc., but also of the resident engineers who are in charge of the construction and maintenance work in their various divisions throughout the State.

Mr. Arthur W. Dean has been chosen for this position. He has been for some years chief engineer of the State of New Hampshire, and has had charge of the construction of the State highway system in that State. He was born in Massachusetts, received his education in part at the Massachusetts Institute of Technology, was engaged in street railway work in New Hampshire and Massachusetts, and afterwards was made State engineer of New Hampshire.

EXPENDITURES.

The following is a summary of the expenditures of the Massachusetts Highway Commission from Dec. 1, 1908, to Nov. 30, 1909:—

APPENDIX D.

STATEMENT OF CLAIMS AGAINST THE COMMISSION.

[As required by section 5, chapter 18 of the Revised Laws.]

NAME.	Residence.	Nature of Claim.
Chase, Charles A., . . .	Somerset, . . .	Damages caused by drainage conditions on State highway at Somerset.
Flagg, Lucretia T., . . .	Northampton, . . .	Damages due to construction of State highway at Northampton.
Hill, Everett,	Charlton,	Damages due to construction of State highway at Charlton.
Lincoln, Benj. A.,	Taunton,	Damages due to construction of State highway at Taunton.
McLaughlin, Nancy M., . .	Dover,	Damages due to construction of State highway at Dover.
Nourse, Joseph P.,	Marlborough,	Damages due to construction of State highway at Marlborough.
Seabury, Phœbe W.,	Dartmouth,	Damages due to construction of State highway at Dartmouth.
Sullivan, Kate,	Millbury,	Damages due to construction of State highway at Millbury.
Taft, Kate P.,	Northampton,	Damages due to construction of State highway at Northampton.
Talbot, Joseph,	Taunton,	Damages due to construction of State highway at Taunton.
Warren, Alice E. M.,	Auburn,	Damages due to construction of State highway at Auburn.

APPENDIX E.

COST PER MILE OF ROAD (SECTIONS COMPLETED DURING THE
YEAR 1909).¹

APPENDIX I.

RELATING TO THE PLANTING AND CARE OF SHADE TREES.

REPORT OF MR. F. W. RANE, STATE FORESTER.

BOSTON, MASS., Dec. 31, 1909.

HON. HAROLD PARKER, *Chairman, Massachusetts Highway Commission,*
15 Ashburton Place, Boston, Mass.

DEAR SIR:— I submit herewith a brief report concerning the work done against the gypsy and brown-tail moths on State highway trees under the direction of this department during the past year.

The work has been carried on by this department as in previous years, and it has been given as much attention as possible. Also, we have endeavored to do the necessary work against the elm-leaf beetle. It has not been necessary during this year's campaign to do as much thinning on the State highways as in previous years. We have also been very fortunate in getting the federal authorities to take up some work on State highways that has helped us considerably, and has been no expense to the Commonwealth. The elm-leaf beetle problem has been a serious one the past year, and possibly has not been given as much attention as it should have had, as the infestation in some cases was new and unexpected. In the coming year we feel that it will be necessary to have larger appropriation if the elm-leaf problem is to be cared for properly, and it should be taken up at an early date, as part of the infestation occurs in cities and towns where we are doing very little spraying for the gypsy moth. The work of destroying the gypsy moth egg clusters and removing the brown-tail webs has been nearly completed at the present time, although there are a few remaining miles of road to be done in the near future.

We also wish to recommend the removal, if possible, by the State Highway Commission, of some of the trees on the highways where they are in large numbers, — more than are needed for good shade.

Work was done at a total cost of \$5,079.56 on the State highways in the following towns and cities:—

Abington.	Harwich.	Seituate.
Acton.	Haverhill.	Shrewsbury.
Amesbury.	Hudson.	Southborough.
Ashland.	Kingston.	Stonham.
Barnstable.	Lancaster.	Stoughton.
Bedford.	Leominster.	Sudbury.
Bellingham.	Lunenburg.	Swampscott.
Bourne.	Marlborough.	Taunton.
Boxborough.	Marshfield.	Tewksbury.
Bridgewater.	Melrose.	Townsend.
Brewster.	Merrimac.	Truro.
Brockton.	Methuen.	Tyngsborough.
Chatham.	Middleborough.	Walpole.

Hanover.	Rockland.	Yarmouth.
Harvard.	Salisbury.	

Yours very truly,

F. W. RANE,
State Forester.

REPORT OF FORESTER OF HIGHWAY COMMISSION.

CLINTON, MASS., Dec. 10, 1909.

To the Massachusetts Highway Commission.

GENTLEMEN:— At the beginning of the year all trees growing within the limits of the State highway were given to the forester to care for; this included many large trees that had received little or no attention for several years. Without any additional appropriation this work has been carried on.

A large number of dead and worthless trees have been removed, also many dead branches. The growth of brush on the curves has been removed or thinned back to the location line, to aid automobilists in seeing the road as far ahead as possible.

In the early part of the season trees were found that had been injured by the feed wires of the electric street railways. The companies were asked to protect their wires, which they have done, and as a result many trees have been saved an early death.

The telephone and electric light companies have done tree trimming under the direction of the forester, in the interest of the trees. Wild cherry and neglected fruit trees have been removed, as their chief value was the harboring of insect pests.

Owing to our limited appropriation, the native growth, consisting of tree seedlings and sprouts, has received but little attention. In this work there is much that ought to be done to help materially in coming years.

The young trees that have been planted have done as well as the season would allow. Owing to the extreme drought, it was necessary to water some of them, and as a result they came through in very good condition. Our loss during the year has been a little less than 6 per cent., due in most cases to conditions beyond our control.

In order to reduce the number of weeds that naturally grow about the planted trees, the dressing this year was placed under the roots of the newly planted trees, instead of over them as a mulch, as previously done. To further aid in keeping a neat appearance, an experiment was made in Chester of sowing white clover seed around the tree to crowd out the weeds; later this is to be dug into the soil for its fertilizing value.

The trees in the nursery did well during the summer. A large proportion of these are young trees that will be used for planting a few years hence.

New trees planted in 1909,	730
Total trees planted in six years,	13,666
Trees replaced in 1909,	794
Trees on hand in nursery,	1,070
Small trees on hand in nursery,	4,084
Total number of towns in which trees have been planted,	58
Number of towns in which native trees have been trimmed in 1909,	43
Number of towns in which trees have been inspected in 1909,	163

The average cost of new planting in 1909 was \$0.74 each, to which should be added the cost of preparing the ground last year, \$0.49 each, making the total cost \$1.23 each.

The cost of maintenance this year was \$0.22 per tree.

Respectfully submitted,

E. W. BREED,

Forester.

VARIETIES AND DISTRIBUTION OF SHADE TREES PLANTED IN 1909 —
Concluded.

New Planting.

In addition to the above, 119 seedling ash have been planted in 6 towns.

On hand in nursery Dec. 1, 1909: large trees: American elms, 365; Norway maples, 40; white maples, 4; American Ash, 89; red oak, 25; laurel-leaf willows, 85; American lindens, 49; black locusts, 18; Scotch elms, 52; sugar maples, 18; ash-leaf maples, 25; English ash, 173; English oak, 5; Russian willows, 85; tulip, 22; white poplars, 15; total, 1,070.

Small trees: American elms, 865; green ash, 299; pin oak, 125; American linden, 99; laurel-leaf willows, 108; white ash, 2,156; scarlet oak, 89; white maple, 282; Russian willow, 61; total, 4,084.

APPENDIX J.

RELATING TO THE WORK OF THE AUTOMOBILE DEPARTMENT.

Statement showing the Number of Registration Certificates and Licenses to operate issued during the Fiscal Year 1909, also the Fees received for the same, together with the Fees for Examinations of Professional Chauffeurs and for Copies of Certificates of Registration and Licenses, etc.

Certificates of registration:—

Automobiles,	23,971 at \$5 00	\$119,855 00
Motor cycles,	2,394 at 2 00	4,788 00
Manufacturers or dealers,	491 at 15 00	7,365 00

Licenses to operate:—

Private operators,	8,336 at 2 00	16,672 00
Professional chauffeurs,	3,289 at 2 00	6,578 00
Renewals,	6,626 at 50	3,313 00

Examinations, 4,630 at 2 00 9,260 00

Copies of certificates and licenses furnished, 1,807 at 50 903 50

Receipts from other sources, viz., interest on deposits, motor vehicle signs, and rebates on empty tar and oil barrels, 1,239 04

Total receipts for the year, \$169,973 54

REPORT OF EXAMINERS AND INVESTIGATORS.

AUSTIN B. FLETCHER, *Secretary, Massachusetts Highway Commission.*

DEAR SIR:—The examiners and investigators beg to submit the following as their third annual report, covering the period from Dec. 1, 1908, to Dec. 1, 1909. Statistical tables containing the data for this department are handed you herewith.

Examinations.

Examinations of applicants for professional licenses have been conducted during the past year in 16 different cities within the borders of the Commonwealth, and once, by request, in Pawtucket, R. I. Special examinations have been held in Concord, Easthampton, Greenfield, Holyoke, Lawrence and Rockport. Regular appointments have been made, as in the two previous years, in 9

cities of the Commonwealth besides Boston. The examinations held in Boston have been conducted by F. L. Austin and C. G. Hubbell; those in Fitchburg, Brockton, New Bedford, Fall River, Lowell and Salem by C. G. Hubbell; those in Pittsfield, Springfield and Worcester by A. F. Foote. Mr. William MacConnell has from time to time examined applicants in the several cities mentioned, as occasion demanded. The number of applicants from Springfield and vicinity have so increased that during the summer months one examiner was obliged to devote a whole day to meeting the applicants in that city, while another examiner went to Worcester.

The nature of the examinations has changed in two respects. The written part of the examination has been shortened and hence made easier than heretofore, but the road test has been more severe. About April 1 the examination paper formerly used, which consisted of twenty-five questions, was discontinued, and a paper half as long, consisting of nine questions relating to the laws and three relating to the mechanical control and proper operation of a motor vehicle, was substituted. Moreover, instead of using the same paper day after day, a series of six papers was adopted, including one for operators of steam-propelled vehicles. Each week a different paper in the series is used, so that an applicant on the second or subsequent examination seldom, if ever, has the same questions to answer. This has done away almost entirely with that learning and answering questions by rote which was so evident among a certain class of applicants last year. This change was made, furthermore, in order to bring about in the examinations what may be termed a change of emphasis. It was felt that the written part, although not very exacting, was too long, and had the effect of preventing some men from obtaining licenses, although they were thoroughly competent operators. The written part, therefore, was shortened, and the percentage and standard for the road test were raised.

The adoption by the Boston board of street commissioners, on Jan. 1, 1909, of their "Street Traffic Regulations and Rules for Driving" has tended to make the examiners more strict in observing how applicants obey those regulations, especially with reference to passing electric cars that had stopped to allow passengers to alight; also as to their consideration for other vehicles and pedestrians, and as to making crossings and turning corners properly. Whenever an applicant has failed in the road test an effort has been made to give, on the back of his examination paper, the specific reasons why he failed. This plan has worked out well in satis-

lying the minds of those who have complained because they did not pass; but, in general, it may be said that the applicants admit the justice of the examiners' decisions, and in more than one instance they have afterwards even expressed their thanks to the examiner for requiring of them more road experience.

In comparison with the figures of last year, the following special features may be noted: —

	1908.	1909.
Total number of persons examined,	2,666	3,473
Total number of examinations,	3,290	4,629
Per cent. examined in Boston,	59.30	56.58
Per cent. failed Part I. on first examination,	11.25	9.93
Per cent. failed Part II. on first examination,	16.15	21.68
Total number persons passed,	2,379	3,149
Total number persons failed to receive license,	287	324
Total per cent. failed to receive a license,	10.76	9.33
Total number failed on first examination,	730	1,098
Total per cent. failed on first examination,	27.38	31.61
Total number failures on Part II.,	559	1,044

As already stated, the written examination, or Part I., has been simplified, which accounts for the small percentage of 9.93 failing on that part in 1909, as against 11.25 per cent. in 1908; and this, as plainly shown in the sequel, accounts for the smaller total percentage of failures this year than last, — 10.76 in 1908 and 9.33 in 1909. It will be observed, however, that while only 27.38 per cent. failed on their first examination (including both Part I. and Part II.) in 1908, 31.61 per cent. failed in 1909. More striking is the higher percentage of failures in the first road test this year as compared with last, — 16.15 in 1908 and 21.68 in 1909. Still more significant is the fact that while the whole number of examinations has increased over 40 per cent., the number of failures in the

road test during 1909 has increased very nearly 87 per cent. The number of persons examined shows a 33 per cent. increase, and out of the total number of applicants, 324 gave up the attempt to become chauffeurs and failed to receive licenses. There is reason to believe that the applicants now come better prepared for the examination than they did last year, and it seems to be the general impression in automobile circles that it is now more difficult to obtain a Massachusetts license than ever before.

The condition of the vehicles in which the applicants present themselves for the road test is a subject that calls for comment. During the year the examiners have refused a number of times to accept for demonstration automobiles which were unfit to be operated and a menace to the public safety. There has been some improvement in this respect, but notwithstanding the ample notice they receive to furnish an automobile which is in good running order, and with which they are familiar, many still come with old, almost broken-down cars, lacking adequate brakes, a muffler, horn or some other essential part of their equipment. In this connection may be mentioned the case of those applicants who come with either large trucks or small pleasure vehicles propelled by electric power. The examiners favor the restriction of the licenses issued in such cases to the operation of electric vehicles only. The examiners have already recommended in some instances that this be done, and they would now recommend that this be done in future (under the authority granted in the automobile law for 1909) more than has been done in the past.

A further movement in the direction of restriction seems desirable in cases where applicants fail to pass. At present a lapse of two weeks is required between the first, the second and third road tests, and where an applicant on the third examination shows no improvement, and that he is a dangerous operator, it has been the policy of the department to refuse to give him another examination for three months. We respectfully recommend that it may be made a rule that, after a second test on the road, applicants be required to wait for at least one month before taking a third examination.

Investigations and Prosecutions.

Two hundred and forty-one cases have been investigated during 1909. In 33 cases, mostly located in the middle and western part of the State, the offenders have been prosecuted and convicted.

As to the districts covered by the several inspectors, all cases

occurring in the middle and western part of the State have been investigated by Mr. A. F. Foote. In addition, Mr. Foote has given about half of his time to conducting examinations in the same territory. All cases occurring in the eastern and southern part of the State have been investigated by Messrs. Paul H. Weinert and William MacConnell, the latter having been appointed inspector and examiner July 15, 1909.

The sources of information on which investigations have been based were chiefly three: newspaper accounts of accidents; letters of complaint received by the commission, and accounts of accidents forwarded by the Safe Roads Automobile Association. With regard to these last-mentioned cases a large majority of them had already been considered or referred to the inspectors before they were called to our attention by the association.

If the work in this branch of the department continues to increase during the coming year as it has during 1909, it will probably be necessary to secure the services of another investigator in order to give due attention to cases in the southern district. The same man might also conduct the examinations held in Brockton, New Bedford and Fall River. Throughout the year considerable of the time of the inspectors has been devoted to attending hearings held by the Board. Outside the regular work done by the inspectors, as shown in their formal reports, they have been called upon to investigate complaints of a minor nature, and to obtain information of various kinds which has been requested by the Board.

Tabulation of Accidents.

In keeping with the general increase in the demands upon the automobile department, this branch of the work has grown proportionately, involving more and more clerical labor. Clippings referring to not less than 1,130 accident cases have been received. A daily record, based on the information contained in those clippings, has been kept, showing all automobile accidents and collisions in a carefully analyzed tabulation. The greater part of the time of one clerk is required to attend to this tabulation of accidents, the filing of cards and the keeping of the court records. Besides the daily record, a monthly compilation is made. A comparison of a few of the figures for five months of 1908 with figures for the corresponding months of 1909 is given below; also figures for the full twelve months of 1909.

Deaths, Injuries, Collisions.

	1908 ¹	1909 ¹	1909 ²
Total number killed,	13	37	54
Total number injured,	486	558	989
Total number collisions,	607	619	1,130
Total number collisions in daytime,	379	453	826
Total number collisions after dark,	228	166	304
Total number collisions on country roads,	214	183	314
Total number collisions on city or town streets,	393	436	816

¹ From July 10 to December 1.

² Twelve months, January 1 to December 31.

The most marked difference to be noted in the comparison above is that relating to "collisions after dark." There has been nearly a 25 per cent. decrease in such collisions. The figures would seem to indicate that there is less "joy riding" at night than formerly.

Court Abstracts.

We have on hand upwards of 4,000 court abstracts, received since Jan. 1, 1909. A tabulation of the information contained in them, analyzed under twenty-three separate headings, is appended.

Before it is filed, each abstract requires the following clerical operations: an entry is made in a specially printed record book. The receipt of the card is acknowledged. When, as frequently happens, the address of the defendant is lacking, a letter is written requesting it. The records are searched carefully to discover what other offences, if any, against the automobile law the defendant has committed. When it is found that the defendant has been convicted three times within the calendar year, and whenever any conviction is of a more serious nature, such as reckless operation or intoxication, the abstracts are sent immediately to the secretary of the commission.

During the year many inquiries have been made in person and by telephone regarding the information contained in the abstracts. These inquiries have come for the most part from clerks of courts, police stations, operators and chauffeurs. This use of the court abstracts has steadily increased since the beginning of the year.

It may be noted that the number of abstracts is almost twice as large this year as it was last, and that considerable time is required to attend to them. Some difficulty has been experienced in obtaining abstracts from the courts, but by the persistent writing of letters to the clerks of courts, they have become accustomed to making returns. Some courts, however, still fail to make any returns whatever; hence the probability is that the number of abstracts received would have been much larger had they all been sent in promptly.

Comparing the analysis and summaries of the abstracts of last year with the same for this year, it will be seen that not only is the number of abstracts very much larger, but under every heading in the analysis the offences are much more numerous. But from the figures alone it is not to be inferred that there were more convictions, more cases of reckless operation, intoxication and so forth. The fact that the clerks of courts have apparently learned to send in the abstracts more faithfully than formerly accounts for much of the increase.

F. L. AUSTIN,
Chief Examiner.

ANALYSIS OF THE ABSTRACTS OF COURT RECORDS FOR THE YEAR 1909.

Whole number of abstracts received,	4,271
Persons convicted of unlawful automobiling,	3,892
Number of appeals taken to a higher court,	264
Persons found not guilty,	163
Complaints placed on file,	482
Complaints nol-prossed,	72
Defendants defaulted,	29
Convictions:—	
For overspeeding,	2,574
For reckless operating,	82
For operating while intoxicated,	31
For improper display or lack of register numbers,	155
For operating without carrying license,	245
For operating without carrying registration certificate,	86
For operating an unregistered motor vehicle,	69
For refusing to stop when signalled by officer,	54
For operating with unlighted lamps,	229
For operating without numbers on lamps,	60
For violations of park rules,	186
For failing to give signal when approaching an intersecting way,	344
For miscellaneous offences,	301
Persons sentenced to prison,	8

APPENDIX K.

RELATING TO STATE HIGHWAY TRAFFIC CENSUS.

REPORT OF SECRETARY.

To the Massachusetts Highway Commission.

GENTLEMEN:— Pursuant to your instructions, I have the honor to submit the following account of two records made during the year 1909 of the traffic over the Massachusetts State highways.

Introductory.

The commission, which was organized in the year 1893, began in the following year to construct the State highways, and at the end of the year 1908 740 miles of road had been completed, the roads being mostly of the macadam type of construction.

Previous to the present year, while some records of the traffic had been made in special cases and for particular purposes, no comprehensive study of the vehicular traffic over the State highways had been made. The value of such records was not unrecognized, but the labor involved and the cost of such a general study seemed to be prohibitive.

The obvious changes, however, in the nature of the vehicles using the roads, together with the apparent inadequacy of the water-bound macadam road to withstand the wear of the new self-propelled vehicles, which have multiplied in numbers and in mobility so fast since the year 1906, seemed to make necessary a comprehensive census of the vehicles and of their characteristics. It was likewise apparent that more knowledge was required concerning the present importance of the routes upon which the State highways were located, so that future work in constructing the roads may be done in locations where it is most needed.

Stated briefly, the chief needs of such records were:—

1. To determine the relative importance of the different routes of travel.
2. To secure at least a rough approximation of the relative use of such routes by motor vehicles and by horse-drawn vehicles.

Methods employed.

Since untrained observers only could be secured, the data recorded were as simple as possible, and the tally cards were prepared carefully, so as to leave little or nothing to the judgment of the observers. A reproduction of the tally card will be found in Exhibit A.

No attempt was made to secure records which would determine the volume of traffic in terms of weight, per unit of width of roadway, per unit of time. Such records would be of the greatest value to the commission in its work, but because of the expense involved such a determination would have been impossible.

The following classes of traffic only were observed: single horse (light vehicles); single horse (heavy vehicles); two or more horses (light vehicles); two or more horses (heavy vehicles); automobiles (runabouts); automobiles (touring cars).

In the instructions furnished to the observers a "light vehicle" was stated to mean "a buggy, carryall, democrat wagon or any other vehicle, other than an automobile, which is used usually for pleasure or light business purposes." A "heavy vehicle" was defined as "a farm wagon, milk wagon, tipcart, grocery or provision wagon, or any other vehicle, except an automobile, which is used for carrying heavy loads."

Two separate records were taken, the first in the month of August, beginning on Sunday, August 23, at 7 A.M., and continuing for fourteen hours each day, until 9 P.M. on the following Saturday evening.

The second census began on Sunday, October 10, at 7 A.M., and continued for the full week in precisely the same way as in August.

The August records were taken advisedly, so as to show the abnormal summer travel, particularly that in automobiles, and the October census was expected to indicate the normal traffic conditions which may fairly be considered to apply during the months of March, April, May, September, October and November. During the winter months the roads of Massachusetts are usually either frozen or are covered with snow or ice.

In August, the week chosen proved to be a period of almost perfect weather. There was no storm, and only very light showers were reported and those only in a few localities. In October, however, there were two days on which fairly heavy rains were generally reported.

For the August records 237 observers were employed, and in

October 240 observers' stations were established. Arrangements for the employment of the observers were made by the division engineers, and in most cases boys and girls in advanced grades of the public schools were selected, although in some instances the repair agents of the commission kept the records. The observers generally were interested in the work, and it is believed that the results of the census are as accurate as should be expected. Both weeks selected were normal in that there were no county fairs or other unusual events which would affect the traffic. On the other hand, the two rainy days during the week of the October census were perhaps rather more than the average week usually contains.

The census cost as follows:—

	August.	October.
Observers' pay,	\$2,217 53	\$2,159 70
Printing and postage,	159 31	57 40
Clerical work,	25 10	41 60
	\$2,401 94	\$2,258 70
Average cost per station,	\$10 14	\$9 41

The observers mailed each day to the division engineers their records for the day, so that an opportunity was had to correct quickly any obvious errors. The work moved very smoothly, and but few errors or misunderstandings occurred.

On certain of the main roads leading into Boston the records were taken during the August census for twenty-four hours each day, so as to include the vehicles which carry milk and produce into Boston and its suburbs. The results of the night traffic are shown in Exhibit D.

In addition to the records taken by the employees of the commission, the Metropolitan Park Commission, the park commissioners of the city of Boston and the street commissioner of the city of Newton caused similar counts of the traffic over the roads under their respective jurisdictions to be made, in the same manner and for the same periods. The results of these counts will be found in Exhibit D.

Tabulation of Results, etc.

After a preliminary examination by the division engineers of the observers' tally cards, they were sent to the office of the commission and there checked carefully and the data analyzed. Tables of averages were then compiled, copies of which will be found in Exhibits B and C, the former relating to the August census and the latter to that of October.

The following table shows the recapitulation of the results of both records:—

Table Showing Total Average Daily Traffic at All Stations,¹ Percentages, Averages, etc.

	August Census.	October Census.
Horse-drawn:—		
Light,	19,622	16,456
Heavy,	17,969	17,967
Total,	37,591	34,423
Automobiles:—		
Runabouts,	5,922	3,995
Touring cars,	21,387	14,514
Total,	27,309	18,509
All kinds,	64,900	52,952
Per cent. horse-drawn,	58	65
Per cent. automobile,	42	35
Averages per station: ² —		
Horse-drawn:—		
Light,	83	69
Heavy,	76	75
Automobiles,	159	144
All kinds,	115	77
All kinds,	274	221

¹ Several stations were established on the Newburyport turnpike, which has not been taken as a State highway, and the traffic count at such stations is here included. The total results are not affected appreciably by their inclusion.

² In August, 237 stations; in October, 240 stations.

It is greatly to be regretted that there are no figures available showing the traffic conditions before the advent of the automobile, with which to compare the above figures. It may be said, however, that in seven years the motor vehicle traffic has increased on the State highways from substantially nil to 42 per cent. in the summer

months and to 35 per cent. during the remainder of the year, when climatic conditions are favorable.

With the data now at hand the commission should be able to determine the character of surface which is needed for each road, and whether or not one of the bituminous products is needed as a binder to protect the road from the destructive effect of fast-moving automobiles.

Primary Routes.

The commission is now enabled to better classify the main routes of travel and to determine the relative importance of such routes. As illustrative of this point the following table shows some of the principal routes of travel in Massachusetts over which long-distance travel passes. It is not to be assumed that in all respects these routes represent the most important or most traveled sections of State highway, since an examination of the tables in Exhibits B and C will show instances where the local travel on a State highway is much in excess of the average travel on the routes marked "primary." It is fair, however, to say that the following are probably the most important of the "trunk lines," if that expression may be borrowed from the railroad nomenclature.

TABLE SHOWING AVERAGE DAILY TRAFFIC OVER THE PRIMARY ROUTES OF STATE HIGHWAYS.

Averages,		121	249	49	23	104	22

In considering the average figures shown in the foregoing tables of primary routes, it must be borne in mind, in all cases, that wherever there is a city or other thickly populated community along the route, the travel in its vicinity is greatly augmented; for example, on Route 1, extending from Lowell to Newburyport, the traffic over the road at Lawrence averaged in October 1,322 vehicles per day, while in the adjoining town of Methuen the record showed but 151 vehicles a day. There is no doubt that most of the Lawrence traffic did not go far toward Newburyport.

When the commission began its work, in 1893, there was no apparent need of through roads, such as the routes from Boston to Worcester or from Boston to Newburyport, since but few persons needed to go for such long distances in horse-drawn vehicles. With the exception of furniture-moving vans and bicycles, such routes were not used to any considerable extent for long-distance travel, and such traffic as existed was so small as to warrant no large outlay for improving the roads for that kind of use. It is true that milk and other farm produce were hauled for considerable distances, but rarely was such merchandise drawn farther than from 15 to 20 miles.

The problem which the commission had to deal with, therefore, at the beginning of its work, was that of improving the main roads from one town to another, having in mind only relatively short-haulage distances. The early State roads were built almost solely for business purposes.

It thus happened that a number of roads were built in the early years of the commission's work which do not now fall into the primary routes, although most of them would be included in what might be called secondary routes.

That the State highways which are not on the primary routes were and are of great importance to the communities in which they were built there is no doubt. Many of them show a large traffic, and in some instances, as has already been stated, such roads, even when more or less isolated from the primary routes, show a larger use than do some portions of the trunk lines.

After the year 1900, however, the use of the highways changed with the coming of the automobile. Instead of its being a rare occurrence, within a few years hundreds of automobiles were operated daily for distances of 50 miles or more over the main lines of travel, and such use is increasing very rapidly from year to year.

Since the traffic census shows that of the total road traffic in the month of August 42 per cent. was in automobiles, and that in October 35 per cent. was of the same character, it is quite evident that the through routes or trunk lines must be now seriously considered in future extensions of the Massachusetts State highways.

Such roads as have been built on other than the primary routes, while not particularly useful for automobile tours, are still as necessary, and are, without doubt, used as much for business purposes as formerly.

It is not that the use of the State roads has lessened in any instance, but rather that the use of certain main roads has increased greatly because of the new mode of locomotion.

In Exhibit E will be found a map showing the primary routes, each line of travel being numbered to correspond with the route numbers hereinbefore given. The same procedure may be easily adopted for the secondary routes.

Respectfully submitted,

A. B. FLETCHER,

Secretary.

INSTRUCTIONS TO OBSERVERS.

1. Examine carefully the card marked "Sample," sent to you with the cards upon which you are to keep your records, and be sure that you understand the method of keeping the tally.

2. Your duties begin promptly at 7 o'clock in the morning and end at 9 o'clock in the evening for the seven days shown on the cards furnished to you.

3. In recording vehicles which pass your station, make a mark in the proper column and on the proper line for every vehicle of the kinds called for on the cards, but do not record motor cycles, bicycles or pedestrians. Make an entry for every vehicle, no matter in which direction it is going or whether it has passed you previously. Entries may be made with a lead pencil.

4. "Light vehicle" means a buggy, carryall, democrat wagon or any other vehicle, other than an automobile, which is used usually for pleasure or light business purposes.

"Heavy vehicle" means a farm wagon, milk wagon, tipcart, grocery or provision wagon or any other vehicle, except an automobile, which is used for carrying heavy loads.

5. After you have recorded all of the vehicles during the period from 7 A.M. to 9 P.M., add your tally marks, and place the totals at the right of the card and at the bottom of the card in the spaces provided.

6. When you are sure the totals are added correctly, enclose the card for the day, after you have signed it, in one of the stamped addressed envelopes furnished to you and mail it at once.

7. Be sure that you use the right card each day (look at the date at the top of the card), and do not fail to record every vehicle called for by the card which passes your station.

8. If there is anything which you do not understand about the cards or these instructions, write at once to the division engineer, to whom you are to send the cards.

APPENDIX L.

RELATING TO ANALYSIS OF OILS, TARS, ETC.

REPORT OF CHEMIST.

BOSTON, MASS., Dec. 28, 1909.

To the Massachusetts Highway Commission.

GENTLEMEN:— Since August, 1908, analytical work to determine the nature and value for road work of tar and asphaltic bodies has been carried on by the commission. From time to time reports of the results of experimental laboratory work and investigations have been made by me to the secretary of the commission, and as a result of this experimental work certain specifications were elaborated early in 1909 stating certain tests which refined tars, asphaltic oils and solid asphalts must pass in order to be accepted and used in the work of the commission. Since the work was begun 688 samples of bituminous materials have been analyzed, divided as follows:—

- 298 preparations or mixtures containing tar.
- 313 samples of asphaltic oils.
- 50 asphalts.
- 27 samples of genasco, glutrin, sarco, etc.

Of the above samples, 30 were laboratory mixtures made to study certain points, information in regard to which was deemed of value.

The results of practically all these analyses are summarized in the following tables. The tables show generally the number of samples included, the average analysis and the maximum and minimum analyses.

Following are the averages of the determinations of the principal kinds of road materials during different periods. Some samples have been received, however, not properly described, being marked simply "oil," "tar," or "oil asphalt," etc., and of course could not be and are not included in the averages given.

The first two tables illustrate the variation occurring in crude tars obtained from different gas plants, and indicate the difficulties manufacturers must experience in making a uniform tar preparation.

Crude Coal Tar.

[11 samples.]

	Specific Gravity.	PER CENT. DISTILLATE. (DEGREES C.)			Per Cent. insoluble in Carbon Bisulphide.
		Below 170°.	170°-270°.	270°-360°.	
Average,	1.22	2.1	12.2	5.2	23.6
Maximum,	1.26	3.5	16.0	8.5	35.1
Minimum,	1.19	.3	8.3	3.4	17.4

Water Gas Tar.

[9 samples.]

Average,	1.09	9.0	17.4	11.9	2.4
Maximum,	1.13	46.6	37.4	18.3	8.1
Minimum,	1.06	-	6.1	7.0	-

The two following tables show the analytical results obtained by the analysis of tarvia No. 5 from the Barrett Manufacturing Company, the first table being of analyses of samples received from Sept. 1, 1908, to April 1, 1909, and the second of analyses of samples received from April 1, 1909, to Dec. 20, 1909:—

Tarvia No. 5.

[16 samples.]

	Specific Gravity.	Per Cent. distilling below 360° C.	Per Cent. insoluble in Carbon Bisulphide.
Average,	1.21	23.5	13.6
Maximum,	1.24	42.9	17.5
Minimum,	1.19	11.0	9.6

Tarvia No. 5.

[22 samples.]

	Specific Gravity.	Per Cent. distilling below 360° C.	Viscosity, 212° F.	Per Cent. insoluble in Carbon Bisulphide.	Per Cent. evaporated, 21 Hours, 100° C.
Average,	1.22	17.7	130	14.6	8.2
Maximum,	1.27	24.0	280	30.6	12.6
Minimum,	1.20	10.9	85	12.3	3.2

The two following tables give the average analyses of samples of tarvia No. 7 from the Barrett Manufacturing Company received at the laboratory, and also of samples of refined tar marked as made "according to the Massachusetts highway specifications." There has apparently been an improvement in the quality of tarvias received this year over those received during 1908.

Tarvia No. 7.

[9 samples.]

	Specific Gravity.	Per Cent. distilling below 360° C.	Viscosity, 212° F.	Per Cent. insoluble in Carbon Bisulphide.	Per Cent. evaporated, 21 Hours, 100° C.
Average,	1.23	15.1	232	18.4	5.4
Maximum,	1.24	21.9	360	23.9	7.1
Minimum,	1.21	10.0	125	13.7	3.7

Refined Tar, according to Massachusetts Highway Specifications.

[12 samples.]

Average,	1.21	16.4	138	13.0	6.9
Maximum,	1.22	23.8	170	15.3	8.3
Minimum,	1.18	14.7	120	11.0	5.1

The three following tables show average analyses of samples of tarite, so called, from the American Tar Company. The first table is of samples received from Sept. 1, 1908, to April 1, 1909; the second is of samples received from April 1 to July 27, 1909; and the third is of samples received from July 27 to Dec. 20, 1909. During July the minimum viscosity called for by the specifications was increased, and the samples of tarites received after this date showed decided improvement over those received previous to this change in the specifications.

Tarite.

[13 samples.]

	Specific Gravity.	Per Cent. distilling below 360° C.	Per Cent. insoluble in Carbon Bisulphide.
Average,	1.25	15.8	25.6
Maximum,	1.28	36.9	31.9
Minimum,	1.23	4.4	20.3

Tarite.

[13 samples.]

	Specific Gravity.	Per Cent. distilling below 360° C.	Viscosity, 212° F.	Per Cent. insoluble in Carbon Bisulphide.	Per Cent. evaporated, 21 Hours, 100° C.
Average,	1.19	19.9	136	9.6	6.1
Maximum,	1.22	30.0	310	16.8	10.9
Minimum,	1.17	12.7	55	4.4	3.4

Tarite.

[24 samples.]

	Specific Gravity.	Per Cent. distilling below 360° C.	Viscosity, 212° F.	Per Cent. insoluble in Carbon Bisulphide.	Per Cent. evaporated, 21 Hours, 100° C.
Average,	1.21	15.4	347	12.5	3.9
Maximum,	1.24	25.6	960	18.1	5.4
Minimum,	1.18	6.4	180	8.1	1.7

The following table shows the results of analyses of 17 samples of genasco, so called, from the Barber Asphalt Company. It was impossible to determine the viscosity of many of these samples of genasco because, when heated to 100° C., a portion of the sample became fluid and the rest remained pasty, this apparently being due to the natural asphalt present not being completely soluble at this temperature in the flux used. The analyses show that these samples contained a larger percentage of bodies insoluble in carbon bisulphide than any other asphalt compound examined during the year. The greater part of this insoluble residue is mineral, and is due to the natural asphalt used in this preparation.

Genasco.

[17 samples.]

	Specific Gravity.	Viscosity, 212° F.	PER CENT. INSOLUBLE IN —	
			Petroleum Ether.	Carbon Bisulphide.
Average,	1.02	-	23.5	2.6
Maximum,	1.03	-	35.2	4.3
Minimum,	1.01	1,440	12.2	0.4

The following tables show the results of the analyses of the product of the Gulf Refining Company, called fluxing oil in 1908 and asphalt oil A during 1909. The 1908 product was heavier and apparently better than much of that received during 1909 under the name of asphalt oil A. The first table shows the analyses of the fluxing oil, so called, while the second shows the analyses of the asphalt oil A, so called. Many samples of asphalt oil A frothed when heated to 100° C., while this was not observed in any of the 11 samples of fluxing oil examined during 1908.

Fluxing Oil.

[11 samples.]

	Specific Gravity.	Per Cent. insoluble in Petroleum Ether.
Average,979	5.4
Maximum,987	6.6
Minimum,969	3.0

Asphalt Oil A.

[110 samples.]

	Specific Gravity.	Viscosity, 212° F.	Per Cent. insoluble in Petroleum Ether.
Average,972	252	4.9
Maximum,980	485	9.4
Minimum,955	190	2.1

During 1908 only 2 samples of standard macadam binder, from the Standard Oil Company, were received and analyzed. These 2 samples were much thinner than those received this year, and those received late in 1909 were generally heavier and thicker than those received earlier in the season, this being due apparently to the efforts of the company to sell a product within the Highway Commission's specifications.

Standard Macadam Binder (1908).

[2 samples.]

	Specific Gravity.	Viscosity, 212° F.	Per Cent. insoluble, in Petroleum Ether.
Average,	-	-	-
Maximum,956	-	1.40
Minimum,948	-	.36

Standard Macadam Binder (1909).

[31 samples.]

Average,974	410	7.9
Maximum,983	575	11.4
Minimum,956	220	1.7

The samples of asphalt oil A received during 1909 and those of standard macadam binder received during the same year were, as far as could be judged from the chemical and physical tests made, of about the same value.

Of the solid asphalts received, the greater proportion were from the Gulf Refining Company, and the analyses of as many as could be identified from the certificates attached to the samples are shown in the following averages. The principal differences in these samples of asphalt are in their physical properties. Undoubtedly the brittle ones are the most satisfactory to use on account of the greater ease with which they can be handled on the road.

SOLID ASPHALTS.

A Asphalt.

[16 samples.]

	Specific Gravity.	Per Cent. insoluble in Petroleum Ether.
Average,	1.02	28.3
Maximum,	1.05	39.6
Minimum,	1.00	22.1

B Asphalt.

[4 samples.]

Average,	1.02	30.8
Maximum,	1.03	32.3
Minimum,	1.01	29.1

C Asphalt.

[2 samples.]

	1.03	27.4
--	------	------

No. 3 Asphalt.

[2 samples.]

	1.01	26.8
--	------	------

Summarizing all these analyses, it may be said that as far as we can judge at the present time, from analytical, physical and chemical data alone, the average values given in the tables repre-

sent the best samples of the various types of tar and asphaltic compounds so far used by the commission.

There is a great difference of opinion, however, at present in regard to methods of analysis of tars and asphaltic bodies, and the meaning or value of the different tests used in this and other laboratories. As our laboratory work and study have progressed, it has become evident to us that while our methods of analysis of tar and refined tar are fairly satisfactory, the methods used for the examination of asphaltic bodies do not give as complete information in regard to these bodies as is desirable. Many methods in use in other laboratories and those proposed by the special committee of the American Society of Civil Engineers are, in our opinion, open to the same or other criticisms. It appears from our investigations of methods that many of the tests promulgated by different persons or committees are unnecessary and valueless, and it has been our constant aim to continue throughout the year special investigating work in the hope of finally obtaining methods of analysis that should be entirely satisfactory. It has become evident, for example, that little of value is learned by one or two methods practiced by us and included in the methods of the special committee of the American Society, but knowledge of this negative character is valuable, and can, of course, be gained only by the experience we have had and by comparison of the work of different laboratories.

In the work on asphaltic oils, etc., determinations of specific gravity and viscosity are undoubtedly of value, but beyond this what is most needed is not tests for paraffine, important as this may be, or tests for the solubility of the sample in cold carbon tetra chloride, etc., but a method which will give the per cent. of asphaltic bodies, as distinguished from the fluxing bodies, of the nature of lubricating oils present in such semi-solid binders as asphalt oil A, standard macadam binder, etc. Much thought has been expended on this problem and various experiments made which we believe tended to the development of a method for determining this important point. After much work we have concluded that perhaps the most promising way as yet is an indirect method, which we are now trying to perfect. This method simply determines the amount of asphaltene that is formed, by prolonged heating of the material under examination at 250° C., the formation of this asphaltene, giving, to a certain extent, a measurement of the asphalt primarily present that can be so converted by heat. In this work it was found that certain of the semi-solid binders,

when heated in an oven at a temperature of 250° from eighteen to twenty-one hours, reached a condition in which the residue changed little, if any, in weight, and the asphaltene was increased very materially over that in the original sample.

The following table illustrates the results of the treatment in this way of samples of asphalt oil A and of standard macadam binder, etc. The asphaltene is determined in the usual way, and the increase from that primarily present shows to a certain extent, as stated, the amount of asphaltic bodies present that can be so converted.

Lawrence Number.	SAMPLE.	ORIGINAL SAMPLE.			RESULTS OBTAINED BY HEATING TO 250° C., EXTRACTING WITH PETROLEUM ETHER, HEATING EXTRACT, EXTRACTING AGAIN, ETC. (PER CENT.).		
		Specific Gravity.	Viscosity. ¹	Per Cent. Asphaltene.	Loss.	Asphaltene.	Insoluble in Carbon Bisulphide.
698	N. J. oil,982	490	9.2	21.0	72.5	6.5
700	S. O. oil,964	267	5.5	26.1	63.5	10.4
690	S. O. oil,961	239	4.5	26.8	63.5	9.7
695	Asphalt oil A, .	.972	205	3.9	42.0	56.3	1.7
696	Asphalt oil A, .	.971	334	4.8	41.4	53.5	5.1
704	Asphalt oil A, .	.972	267	5.4	35.6	63.6	.8
697	Asphalt oil A, .	.972	216	4.9	41.9	57.6	.5

¹ By Lawrence viscosimeter.

If the values in the last three columns be recalculated, leaving out the asphaltene in the sample at the start, the results are as follows:—

Lawrence Number.	SAMPLE.	Per Cent. Loss.	Per Cent. Asphaltene.	Per Cent. Insoluble in Carbon Bisulphide.
698	N. J. oil,	23.1	69.7	7.2
700	S. O. oil,	27.6	61.4	11.0
690	S. O. oil,	28.1	61.8	10.1
695	Asphalt oil A,	43.7	54.6	1.7
696	Asphalt oil A,	43.5	51.1	5.4
704	Asphalt oil A,	37.6	61.5	.9
697	Asphalt oil A,	44.1	55.4	.5

This sample of the experimental laboratory work being carried on illustrates the intricacies of the subject from an analytical point of view, but enough knowledge of improved methods has been gained during the year to make the laboratory work of the future upon asphaltic bodies of more value than that of the past year.

Respectfully submitted,

H. W. CLARK,
Chemist.

PART II.

FOURTH ANNUAL REPORT

OF THE

MASSACHUSETTS HIGHWAY COMMISSION,

FOR THE

FISCAL YEAR ENDING NOVEMBER 30, 1909,

ON

COMPANIES ENGAGED IN THE TRANSMISSION OF
INTELLIGENCE BY ELECTRICITY.

CHAPTER 433, Acts of 1906.

ANNUAL REPORT OF THE MASSACHUSETTS HIGHWAY COMMISSION CONCERNING COMPANIES ENGAGED IN THE TRANS- MISSION OF INTELLIGENCE BY ELEC- TRICITY.

During the fiscal year 1909 the commission held many conferences between certain subscribers and the officials of the New England Telephone and Telegraph Company relating either to individual complaints or to the rates established in particular places or between certain localities. While these conferences were not in the nature of formal hearings required by law, the commission deemed it best to hold such conferences, acting merely semi-officially, and it believes that much good has been accomplished thereby.

Many times a clear explanation of the facts in the case, made by representatives of the telephone company, has sufficed.

ANNUAL RETURNS.

The annual returns for the year ending June 30, 1909, which the several companies engaged in the transmission of intelligence by electricity in this State are required by law to submit to the commission, were received with more than usual promptness, and in many instances showed a marked improvement in form and make-up.

Abstracts of these annual returns are shown in Appendix B, under the same classifications as in previous years, namely, large telephone companies, nonoperating and small telephone companies, and telegraph companies.

It will be noted that in the returns submitted by the three telegraph companies of the postal telegraph system, the gross earnings and operating expenses are but fractions of the amounts shown by these companies last year; and in this connection the following correspondence between the treasurer of the companies and the secretary of the commission is given:—

NEW YORK, July 1, 1909.

Mr. A. B. FLETCHER, *Secretary, Massachusetts Highway Commission,*
15 Ashburton Place, Boston, Mass.

DEAR SIR:— Referring to the reports made by the Commercial Union Telegraph Company, the New England Telegraph Company of Massachusetts and Postal Telegraph-Cable Company of Massachusetts to the Massachusetts Highway Commission for the year ending June 30, 1908, I beg to state that these blanks were filled out and the gross earnings from operation were given in each case under the column headed "within the State." There was another column headed "whole system," but as the three companies referred to above have no property outside of the State of Massachusetts, the figures were given as stated above. These companies transfer business to other companies outside of the State of Massachusetts, and the business handed over to these other companies was included in the figures given you in the report. In this way I presume your commission thought the receipts were derived wholly from business done between points within the State, but this is not true.

We should be pleased to have you return to us the reports which we sent to you for the year ending June 30, 1908, and let us make the correction. In any future reports we will furnish you with figures separately, namely, the receipts from the business done by each of these companies between points within the State of Massachusetts and the receipts from business destined to points outside of the State, and known as inter-state business.

Yours truly,

THEODORE L. CUYLER, Jr., *Treasurer.*

JULY 9, 1909.

THEODORE L. CUYLER, Jr., *Treasurer, Postal Telegraph-Cable Company,*
253 Broadway, New York, N. Y.

DEAR SIR:— I wish to acknowledge the receipt of your letter of the 1st inst., with regard to the annual returns made by the Commercial Union Telegraph Company, the New England Telegraph Company of Massachusetts and the Postal Telegraph-Cable Company of Massachusetts for the year ending June 30, 1908.

You are correct in assuming that the commission thought the gross earnings shown in these returns represent solely the earnings of these companies; and there was nothing in the returns to indicate otherwise. It is only the gross earnings of these companies that the commission desires to know, and not earnings taken in by the companies to be handed over to companies within or without the State, and, therefore, your earnings, such as they are, should properly be shown under the columns "within the State." To make it plainer, what the commission desires is the receipts of the companies for business originating and terminating at points within the State, that proportion of the business originating within the State and terminating outside the State which ends at the State line, and that proportion of the business originating outside the State and terminating within the State which begins at the State line; that is to say, we want the exact earnings of the companies.

If, as you state, the returns have shown earnings which belong to other companies, it would seem that the expense accounts of these companies must have been enhanced to an equal degree, and these also should be corrected.

I am sending you herewith six blank forms of the return for 1908, and request that you have three of them filled out with the corrected figures and returned to this office.

It will not be possible to send back to you the annual returns which you have filed, as these have been already published in the report of the commission.

Yours truly,
A. B. FLETCHER, *Secretary.*

A comparative statement of statistical information, giving the total figures of all telephone companies for the years ending June 30, 1909 and 1908, has been drawn off and is presented herewith.

State of Massachusetts.

	1909.	1908.	Increase.	Decrease.
Number of subscribers,	218,642	199,951	18,691	-
Number of instruments,	225,628	206,466	19,162	-
Number of operators,	3,423	3,229	194	-
Number of pay stations,	6,653	6,358	295	-
Gross receipts,	\$9,999,459	\$9,467,167	\$532,292	-
Operating expenses,	\$7,366,439	\$7,175,824	\$190,615	-
Net earnings,	\$2,633,020	\$2,291,343	\$341,677	-
Per cent. of expenses to earnings,	73.7	75.8	-	2.1
Number of subscribers on party lines,	184,393	169,033	15,360	-
Number of subscribers on single lines,	34,249	30,575	3,674	-
Underground system: —				
Conduit, feet,	3,215,744	3,190,728	25,016	-
Duct, feet,	16,248,854	16,170,932	77,922	-
Cable, feet,	7,288,549	7,211,058	77,491	-
Wire, miles,	353,121	335,269	17,852	-
Submarine system: —				
Cable, feet,	56,814	65,715	-	8,901
Wire, miles,	702	925	-	223
Overhead system: —				
Pole line, miles,	9,138	10,292	-	1,154
Iron wire, miles,	40,315	66,436	-	26,121
Copper wire, miles,	132,695	140,670	-	7,975

The gross receipts represent solely the earnings (less rebates and discounts) from telephone traffic, and the total data here shown refer only to conditions within the State.

It is interesting to note that the ratio of expenses to earnings has decreased 2.1 per cent., that the underground installation has been greatly increased; and this latter fact, taken in connection with the diminished overhead installation, indicates an intent on the part of the companies to improve general conditions in the thickly populated districts.

INVESTIGATION OF THE NEW ENGLAND TELEPHONE AND TELEGRAPH COMPANY CONCERNING ITS PROPERTY, RATES FOR SERVICE, ETC.

In March of last year the commission received from the engineers employed by it, Messrs. D. C. & Wm. B. Jackson, an inventory and appraisal of the property of the New England Telephone and Telegraph Company which had been made by them under the supervision of the commission. This inventory and appraisal was made under authority of chapter 102 of the Resolves of 1908. In the report accompanying the inventory the commission's engineers stated that a further study and investigation into the amount of traffic, costs of the same, accounting, etc., was desirable. The commission thereupon forwarded the inventory, with its recommendations, to His Excellency the Governor, Hon. Eben S. Draper. The commission's letter, together with the report of its engineers, was thereupon transmitted by the Governor to the Legislature, with a special message suggesting that a sum not exceeding \$35,000 be made available for a scientific investigation and report as to the cost of operation in different localities, and the amount necessary to be set aside for repairs, etc., in order that the commission might be enabled to determine what rates were fair and reasonable in the various localities of the State, and for the various classes of service, including toll and local. The money expended under authority of this statute was to be paid in the first instance from the treasury, but was to be repaid from time to time by the telephone company, as has been done in the case of the expense of making the inventory and appraisal. The telephone company

had already agreed to pay the expenses of such an investigation if the Legislature approved of having it made.

In consequence of this special message the Legislature passed a resolve (chapter 78 of the Resolves of 1909) entitled, "A Resolve to provide for a study of the traffic and methods of accounting of the New England Telephone and Telegraph Company," and made available for that purpose a sum not exceeding \$35,000.

It was manifest that the inventory and appraisal alone did not furnish sufficient information to enable the commission to make a just determination as to what the rate should be in any given locality or for any particular class of service.

The appraisal showed the property of the New England Telephone and Telegraph Company, with the details summarized. It also showed the value of the property belonging to the telephone company within the Commonwealth of Massachusetts, which value was shown to be \$34,133,270.

At the request of the company, an inventory and appraisal were made of the property owned by the telephone company outside the Commonwealth of Massachusetts, but which was represented by its capital stock.

The value put upon this property was \$12,407,549, making the entire value of the property of the New England Telephone and Telegraph Company \$46,540,819.

The total par value of the company's outstanding stocks, bonds and notes, as given by the company's auditor for Aug. 31, 1908, was \$38,939,850.

These figures, of course, are a summary of the inventory of the property, but the inventory itself was made in the minutest detail, showing each kind of property and all collateral materials in every locality in the Commonwealth.

The value of material and apparatus, poles, fittings, cross-arms, pins and hardware set in place, etc., was collected in detail and tabulated. The relative value of the plant was divided as nearly as possible between the plant used in local service and the plant used in toll service. Where poles, buildings, etc., were used for both services the value was prorated.

The appraisal showed that the total value of the physical plant used for local service in the Commonwealth was \$22,885,082.

The total value of the local plant in metropolitan Boston was \$4,463,843.

The total value of the local plant in the suburban district surrounding the metropolitan part of Boston was \$6,446,838. The total value of the local plant in the 11 cities of the Commonwealth outside of Boston of 50,000 inhabitants or over was \$6,872,411, and the remainder of the local plant required for service in the smaller cities and rural districts was valued at \$5,979,248.

The total value of the toll plant used in affording intercommunication between subscribers connected with different central offices was \$9,641,913. This is equivalent to 42 per cent. of the total local plant.

The report of Messrs. D. C. & Wm. B. Jackson giving these details and various others, including tables of values, will be found printed hereinafter as Appendix A.

Acting under the authority of the resolve of last year, the commission proceeded at once to have the investigation made. Its engineers have been engaged during the summer, with the hearty co-operation of the officials and accountants of the telephone company, in collecting and tabulating the various items showing the amount of traffic, cost of operation, maintenance, etc., that were necessary in order to enable the commission to determine what would be a fair and equitable rate, under all circumstances, in any given locality or for any class of service. It is manifest that such a study requires an intimate knowledge of an endless amount of detail and a careful tabulation of results before any conclusions can be drawn therefrom.

A study which was made of the earnings and expenses of the Bell Telephone Companies in the United States, not including the American Telephone and Telegraph Company, showed that for each of the 5,838,000,000 exchange connections made for the year ending Dec. 31, 1907, the amount of net earnings per connection was only \$0.0056, and the amount required for interest was \$0.0012 per exchange connection and for dividends \$0.0033, leaving substantially \$0.0011 as undivided profits. This statement is included merely to show how accurate the calculations and tabulations must be, and how carefully any rates must be considered before they are adopted, when such items

as dividends, net earnings, etc., are represented by a fraction of 1 cent per exchange connection.

A careful study has been made of the metropolitan and suburban districts. Careful counts have been kept of the number of calls, the character of each call and the nature of the service given. Tabulations are being made which will show the operating cost of each exchange connection, and, so far as possible, the cost when a call goes through one or more exchanges in order to reach a connection with the station which is called for.

Several tentative schedules of rates have been considered and checked up to see how they would work in actual practice and whether or not they would result in reasonable rates, fair not only to the public but to the telephone company. The commission hopes that very soon the telephone company and the experts employed by the commission will agree upon some schedule of rates which can be adopted for trial, at least, in the metropolitan and suburban districts, establishing fair and equitable rates for each class of service and for the subscribers in each locality embraced in any given district.

The commission hopes that, by the aid of the study that has been made and the collection of all this data for the metropolitan and suburban districts, the rates adopted therein will be based upon some fair and equitable principle that will be applicable to other localities in the Commonwealth where like conditions exist as to the territory served and the number of telephones within a given area, or in some other equitable manner.

It has been the purpose of the commission and its engineers to go into this subject most carefully and thoroughly before any plan was adopted, even tentatively, so that it might be sure it was obtaining as fair a rate as possible. It has also been the purpose of the commission to attempt to ascertain as nearly as possible what the cost of service has been for each particular class of subscriber, and to differentiate in those costs between toll and local, between business and residential, between single lines and party lines, coin boxes, etc., to the end that any rates established shall be just and equitable to all classes of subscribers, and that the rates adopted, while rendering a fair return on the investment to the telephone company's stockholders,

shall be reasonable and just also to all of its subscribers in each particular locality and for each particular class.

So far as the commission has been able to learn, the reduction in the toll rate from 10 cents to 5 cents between the 16 suburban exchanges and the metropolitan exchanges, which has been in force since April 15, 1908, has given satisfactory results, both to the company and to the subscribers.

The commission understands, also, that the company has carried out, as far as possible, the commission's recommendations to discontinue "all discriminating, irregular and preferential rates which gave special privileges to particular subscribers as distinguished from terms and rates open to any one in the same locality for service of the same character."

HAROLD PARKER,
WM. D. SOHIER,
F. D. KEMP,

Massachusetts Highway Commission.

APPENDIX A.

REPORT OF MESSRS. D. C. & WM. B. JACKSON.

BOSTON, MASS., March 27, 1909.

*The Honorable Massachusetts Highway Commission, 15 Ashburton Place,
Boston, Mass.*

GENTLEMEN:— We herewith give you a summary report of the results of the inventory and appraisal of the property of the New England Telephone and Telegraph Company that has been executed for you under our supervision.

You will find at the end of this report a table marked Exhibit 1, which shows the extent of the plant of the New England Telephone and Telegraph Company within the Commonwealth of Massachusetts, according to the actual count of the inventory made last mid-summer. This table shows the plant divided into different kinds of property, and gives the extent of each. The company has 247 exchange central offices, which provide telephone service for substantially every part of the Commonwealth. Of these central offices, 46 are housed in buildings owned by the company, while the company owns 7 other buildings in the Commonwealth which are used exclusively for storage or general purposes. The number of operators' positions at exchange switchboards, which aggregate 2,367, gives a truer idea of the extent of the telephone switchboards throughout the Commonwealth than is obtained from a consideration solely of the number of central offices.

This table represents a summary of the results of the inventory of the telephone company's property, and strikingly displays the magnitude and comprehensiveness of the system in this Commonwealth and the extent of each kind of plant, but the inventory dealt with a mass of details of which the table gives only a faint idea, and which are on file for use as may be needed in further studies of the telephone situation.

It will be seen from the table that the length of telephone conductors in the Massachusetts system is sufficient to provide nine complete metallic circuits of two wires each entirely around the

equatorial circumference of the earth, and still leave a little over, and that the other quantities found by the inventory are of correspondingly great magnitude.

In Exhibit 2, appended hereto, is given the total value of property of the New England Telephone and Telegraph Company relating to its business within the Commonwealth of Massachusetts, divided to correspond with the divisions of plant shown in Exhibit 1. In Exhibit 3 is given the value of the company's property relating to its business in the adjoining States.

The value given for each kind of property in Exhibit 2 includes the values of all the collateral materials that appropriately accompany the particular main division. For example: substation equipment includes all the cost (including installation labor) of the material and apparatus in the subscribers' stations installed ready for service; poles and fittings include all the cost of the poles suitably prepared with their cross-arms, pins and hardware, set in place ready to receive the insulators; aerial cables include the cost of the cables properly spliced, together with the messenger cables and hangers for carrying the conducting cables, the pole clamps, and the terminal boxes that are a part of the aerial cable distribution, all in place ready for service; and so on throughout the entire property.

Our appraisal shows that the total value of the physical plant used for local service in the Commonwealth of Massachusetts is \$22,885,082. This is the portion of the plant that is made use of to provide local service between subscribers whose circuits emanate from the same individual exchange central office, except that the 7 central offices of metropolitan Boston are considered as the equivalent of a single exchange central office.

The foregoing total for local plant is divided in the following manner between certain important divisions of the Commonwealth:—

The total value of local plant in metropolitan Boston is \$4,463,843.

The total value of local plant in the suburban district surrounding the metropolitan part of Boston is \$6,446,838.

Of the latter total, a value aggregating \$3,983,940 lies within the inner zone, now receiving 5-cent toll service with the metropolitan district; a value aggregating \$2,462,898 lies in the outer zone, now receiving 10-cent toll service with the metropolitan district.

The total value of local plant in the 11 cities of the Common-

wealth which, besides Boston, are of substantially 50,000 inhabitants or over, is \$6,872,411. These 11 cities are: Brockton, Cambridge, Fall River, Holyoke, Lawrence, Lowell, Lynn, New Bedford, Somerville, Springfield and Worcester.

The remainder of the local plant in the Commonwealth is required for service in the smaller cities and rural districts, and its value amounts to \$5,979,248.

In these divisions of local plant, the property in Cambridge and Somerville comes into the total for the suburban district and also into the total for the 11 cities.

The total value of the toll plant for use in affording intercommunication between subscribers connected with different central offices is \$9,641,913. It will be observed that this is a sum equal to 42 per cent. of the total local plant.

The average net current assets and cash on hand which enter into the capital of the telephone company amount to \$1,560,000, as obtained from figures supplied to us by the auditor of the company. This amount represents the funds that are required in the current operations of the company, and is added to the values of physical plant in Exhibit 2.

There are (as of the period of the inventory, namely, midsummer, 1908) 42,749 telephones in use in metropolitan Boston; 34,888 in use in the inner zone of the suburban district; 19,456 in use in the outer zone of the suburban district; 56,729 in use in the 11 aforesaid cities, and 54,540 in use in the remainder of the State. These may be distributed in a different classification, as follows: 20,201 main telephones, 17,143 private branch exchange terminal telephones and 5,405 extension telephones connecting with 19,159 subscribers' circuits in the metropolitan district; 29,672 main telephones, 2,519 private branch exchange terminal telephones and 2,697 extension telephones connecting with 16,556 subscribers' circuits in the inner zone of the suburban district; 16,875 main telephones, 702 private branch exchange terminal telephones and 1,879 extension telephones connecting with 8,770 subscribers' circuits in the outer zone of the suburban district; 45,516 main telephones, 5,113 private branch exchange terminal telephones and 6,100 extension telephones connecting with 23,581 subscribers' circuits in the 11 cities; and 48,558 main telephones, 1,892 private branch exchange terminal telephones and 4,090 extension telephones connecting with 19,399 subscribers' circuits in the remainder of the Commonwealth.

We here use the term main telephone to represent any telephones

except extension telephones and private branch exchange terminal telephones. The ratio between the number of main telephones and the number of subscribers' circuits shows the average number of main telephones per subscriber's circuit, or, as it is usually thought of, the average number of subscribers per circuit. The inventory shows in detail the number of each kind of circuit and each kind of telephone for each of the 241 sections of the State, comprising the metropolitan district of Boston and 240 central office exchange districts outside of the metropolitan district.

The data gathered are in great detail, and the figures here given are a summary of the whole. The inventory and appraisal which have been made with exceptional care show how much property the company possesses within Massachusetts and outside thereof, its distribution over the Commonwealth, its value and the distribution of the value throughout the Commonwealth. It shows that for each \$100 worth of property the company has outstanding \$83.67 of par value in stocks, bonds and notes. The aggregate value of the entire property of the company, and a comparison of this value with the total outstanding securities of the company, are shown in exhibits 4 and 5, hereto appended. From this relation of the appraised value of the property to the par value of the company's securities we infer that the company has been in the habit of paying for such expenses as engineering, interest, and like expenses pertaining to new construction, out of earnings instead of out of the capital account. The appraisal shows beyond dissent that the company now has no water in its securities, and the discrepancy in the other direction, constituting 16.3 per cent. of the total value of the property, is still small enough to cause no concern. Whether the company's existing method of putting the cost of new construction on its books should be continued is a matter which your honorable body may wish to consider. To give this a full consideration we believe that suitable accountants should be associated with your engineers.

The appraisal affords information on which your honorable body can decide how much money the company should be allowed as return on its investment, and how much it should be reasonably expected to expend on the average per year for reconstruction for the purpose of maintaining the plant against the ravages of age or the obsolescence incident to inventions and other causes for improvements and changes in the art. Whether the return on investment is ultimately to be figured on the outstanding stocks and bonds of the company or on the value of the plant, the sum

that must be allowed for reconstruction is unquestionably determined by the actual existing values of the different kinds of property composing the plant, which values are shown by the appraisal.

This reconstruction is called for on account of several factors. The rotting of poles so that they must be replaced, the deterioration of conduits, cables and wires so that they must be replaced, and the other effects of the elements and of use on every part of the plant ultimately bring nearly all parts of the telephone plant to a point where their further use is impracticable without rebuilding, however well cared for and carefully kept up by current repairs they may be. The part of the plant affected must then be bodily replaced. The advances occurring through improvements in the art also make an important factor in the telephone business, which demands the remodeling or the bodily replacing of parts of the plant from time to time before their natural life is run. A third factor is introduced by the action of municipal and other public boards, which may order improvements of streets and roads, as by ordering good pole lines removed to alleys or wires placed underground. None of these factors can be cared for out of a uniform appropriation such as may cover ordinary repairs; and the cost of making good after special attacks of the elements, such as damage of pole lines from sleet storms, the effects of forest fires, etc., is still more capricious in its occurrence. Nevertheless, these expenditures must be made out of current receipts year by year or the capital of the company is bound to become impaired. For this purpose the average rate of reconstruction likely to be required over an extended period of years must be figured on the basis of experience, and a corresponding sum of money should be set aside each year, to be expended in reconstruction of operating plant as the conditions require it. Less than this amount may be used in some years and more in other years, but the amount to be taken from the gross receipts each year for this purpose should be fixed upon an average determined by the extent and value of each kind of plant in the complete system. As a result of our study of the complete plant, we have applied percentages to each kind of construction involved, giving consideration to first cost, rate of depreciation, probable effects of rate of changes in the art and the acts of municipal bodies, special misfortunes caused by the elements, and also giving consideration to any salvage that might be recovered from discarded plant. The consideration of these various factors is based on experience in telephony and electric lighting of the past and as much judgment of the future as

may be brought to bear. In this way we arrive at a figure for the average yearly reconstruction account for the property used in Massachusetts business, which is equal to 7.3 per cent. of the value of such property, exclusive of land, general supplies and working capital (net current assets and cash on hand). This makes a sum to be thus annually taken for reconstruction purposes in Massachusetts which amounts to \$2,240,000 on the existing plant. A detailed table will accompany our full report.

From the company's expenditures for current repairs and reconstruction for the whole of its system, including the plant in the adjoining States, as reported to us by the company's auditor for several years past, we are led to conclude that the company is not making charges to reconstruction at a higher rate than our estimate; and it therefore seems proved that the company is not building extensions out of annual receipts under color of the reconstruction account, and our exacting inspection of the plant leads us to say that the company is maintaining it in excellent condition.

The knowledge gained by the appraisal, added to the company's records of annual operating and repair costs, puts your honorable body in possession of standards by which to measure the reasonableness of the total sum annually collected by the company from its subscribers. This was a principal aim of the appraisal of the property and has been accomplished.

At your request we have been recently studying the company's rate schedules along with the appraisal data, and we believe that improved schedules can soon be reported to you for the Boston and suburban district. The appraisal seems to us to indicate that the rates in the metropolitan district of Boston may be examined and revised with advantage to the subscribers and without injury to the company's stability. Rates for service in the metropolitan district, however, are closely associated with suburban rates, and changes in one set cannot be safely made without a full consideration of the effect on the other.

As pointed out in our report to you of March 10, 1908, traffic data must be gathered and properly apportioned, and operating and repair cost records made before it is possible to get a comprehensive, or, in fact, a reasonably satisfactory opinion of the soundness with which the total sum annually collected by the company is apportioned amongst the various localities and kinds of communities in the Commonwealth. The company has gathered traffic data since our preceding report, especially with respect to the

Boston and suburban district, which will be of service, but we believe that fuller traffic data and apportioned cost records must be gathered and studied with extended care before recommendations in regard to this very important point (the company's relative treatment of localities and classes of customers) can be put on a firmer foundation than the foundation which has apparently been heretofore utilized, namely, business expediency and the best personal judgment of the company's officers.

The large and growing business of the company shows that the judgment used by the company in the past has worked well; but study of the service, traffic and rates shows undeniable eccentricities in the company's existing development. We believe that our progress thus far shows that careful and full study of traffic rates and costs will bring the desired end of a more satisfactory means of comparing the company's treatment of different localities in the Commonwealth.

The great importance of a full and comprehensive telephone service, and the large part which the telephone plays in the business welfare and social convenience of the Commonwealth, make us believe that the expenditure for a full study of traffic, rates and costs should be made. The company ought to co-operate in such work by adding the judgment of its best experts, but we believe that your honorable body ought to receive your advice through suitable engineers and accountants who are independent of the company.

As aforesaid, in our opinion, suitable accountants may wisely be associated with your engineers, and an early part of their joint duty should be to plan, in co-operation with the company, means of record keeping that will afford data for more effectually determining, from time to time, the effect of any changes of rates or subscribers' privileges which may be made. We look upon this as of primary importance. The company's records do not seem now to be sufficiently refined for the purpose. For instance, the company's present records do not seem to be capable of affording as full an exhibit as seems to us desirable for your information of the effects on the company's investments, gross earnings and the cost of caring for the traffic, which have resulted from the change in the rate of tolls in a portion of the Boston and suburban district which the company put in effect nearly a year ago at the recommendation of your honorable body.

Additional complexity is imported into the rate question by the relations of the toll service to the local service. In order that local

rates may be reasonably adjusted, it is desirable that they shall not be entangled with the cost of the long-distance (toll) service of the company, and the valuation of the toll plant should, therefore, be separated from the valuation of the local plant as far as practicable. This is equally necessary for a satisfactory consideration of toll rates. This principle, as indicated by the figures given earlier, has been carried out in our appraisal. The long-distance toll system probably might be expected to earn its own operating expenses, reconstruction charges and return on the investment, independently of the receipts for local service, but we are not convinced that it is now doing so. In fact, figures for gross receipts seem to indicate the contrary. In case it is not doing so, it manifestly must be carried by the subscribers in general or by some particular classes of the subscribers. This needs further study of past records of traffic, receipts and expenditures, and also study more particularly based on additional records of traffic, gross receipts and expenditures kept with a fuller separation of the records for toll service from the records of local service. Such separation has been quite incomplete in the past.

In the inventory and appraisal, wires used for toll purposes are separated from those used for local service, and the supports or conduits are apportioned to toll and local plant in proportion to the actual toll and local wires carried. The values of central office equipment and land and buildings owned by the company are also apportioned between local service and toll service on actual service requirements.

In the outlying portions of the Commonwealth the difference between what may be appropriately considered toll plant and what may be considered local plant is clearly marked, as each exchange central office provides local service to a more or less distinct community, but in the Boston and suburban district the apportionment of plant between toll and local service is much more difficult.

Owing to the closely inter-related character of the sections of metropolitan Boston, which include the central offices called Back Bay, Fort Hill, Haymarket, Main, Oxford, Richmond and Tremont, we have considered the connecting circuits between these 7 central offices as a part of local plant. We have thus considered these 7 central offices, tied together as they are by connecting trunks, as the equivalent of a single exchange central office. In the suburban district, however, we have considered as toll circuits all circuits which pass from any suburban exchange to any other exchange, following our practice in inventorying the plant in the remainder of

the Commonwealth. We believe that this is a reasonable and fair way to make the assignments. Our inventory and appraisal also show the extent and value of all circuits connecting between central offices separately from the circuits extending from subscribers to central offices, so that the appraisal gives data for correcting the apportionment in case further study should indicate a desirability of changing this part of it.

The inventory and appraisal show the distribution of the property of the company through the Commonwealth, and they also show this distribution separated, as between local plant and toll plant, thus laying the foundation for a study of local rates and of toll rates separately in each part of the State.

The only means of obtaining this separation was an inventory and appraisal, and we believe that the apportionment is satisfactory as made.

The data obtained from the inventory and appraisal do not, however, include information about the company's expenditures for operating and repairs; and these ought to be carefully studied and means devised for maintaining records which will be of an analytical character, and will lend themselves to apportionment between the local and toll service. Plans should also be developed to maintain the plant valuation on a basis of appropriate continuous records.

To carry out the additional work to which we have referred, and which we believe ought to be carried out for the purpose of putting the Highway Commission in possession of adequate grounds for recommendation of rates as required by law, an additional appropriation will be needed. The appropriation now being used was made according to an estimate of the expense attendant upon planning and supervising the inventory and appraisal. It will be substantially exhausted by that work, though we expect to have some additional results in the way of proposing an improved rate schedule for the metropolitan district to accompany or precede our final report.

Of the money expended under the appropriation for planning and supervising the inventory and appraisal of the property of the New England Telephone and Telegraph Company, \$9,600 has so far been paid to D. C. & Wm B. Jackson as professional fees. The remainder expended out of the appropriation has been used to defray the expense accompanying the making of plans, the checking of inventory figures, and reducing the data to form convenient for a report to your honorable body, and such further use as you

may desire. The aforesaid expense has been largely made up of salaries and wages of inspectors, draftsmen, checkmen, etc.

We have not yet placed in your hands the great mass of maps and figures that comprise the inventory and appraisal of the plant, as we have recently had a force engaged, in accordance with your directions, in gathering statistics and other data relating to the matter of rates, and we have consequently delayed placing in your hands the completed report until the Boston and suburban rate question is ready for your consideration.

To execute your wishes as expressed to us will require carrying out in full the various branches of investigation set forth in the foregoing. We estimate that the additional sum which should be available for expenditure by your honorable body in order that these requirements shall be met is \$35,000. This ought to cover the cost of engineering and accountants' work as outlined. We believe that provisions may be made with wisdom to extend the work over not less than one year, with the expectation of utilizing its results in the readjustment of rates from time to time as the data may warrant. We make our estimate of the expense of the work on the basis of first arranging for adequate traffic and cost data, to be followed by careful study, continuing for a satisfactory extended period, so that the traffic and cost records may be sufficient to draw reasonably reliable conclusions. It is also desirable that the effect of any changes proposed for the rates of the Boston and suburban district should be carefully studied jointly by the engineers of the company and the commission before being put into force, and thereafter as to their effect on traffic and earnings.

Respectfully submitted,

DUGALD C. JACKSON.

EXHIBIT 1. — INVENTORY OF PROPERTY OF THE NEW ENGLAND TELEPHONE AND TELEGRAPH COMPANY.

Table showing the Extent of the Plant in the Commonwealth of Massachusetts.

Number of buildings owned by company,	53
Parcels of land owned by company,	54

GENERAL REMARKS AND EXPLANATIONS.

"No exchange service given by this company in the State of Massachusetts; its business in said State consists of the furnishing of lines and facilities to enable the transmission of intelligence, through the exchanges of other telephone companies, between the subscribers and patrons of one of such companies and those of another. The traffic carried on over its lines is almost entirely interstate."

AUTOMATIC TELEPHONE COMPANY OF NEW BEDFORD.

Location of principal business office: 43 William Street, New Bedford, Mass.

Date of organization: Nov. 12, 1898.

Date of incorporation: Nov. 28, 1898.

State in which incorporated: Massachusetts.

GENERAL REMARKS AND EXPLANATIONS.

1. "Central office equipment account: we have purchased from the Automatic Electric Company our central office equipment; \$20,000 of our license account goes toward this and \$5,000 for telephones and switches purchased in this year, making a total of \$25,000 for our central office account.

"\$3,750 has been taken from license account to make that account stand \$10,000, and charged to depreciation as royalty paid.

Central office equipment:—

Taken from license and franchise account,	\$20,000
Amount of phones and switches purchased during present year,	5,000
	<hr/>

Total central office equipment, \$25,000

License and franchise account:—

Original charge,	\$33,750
Charged to central office equipment,	20,000
	<hr/>

\$13,750

Charged to depreciation account, to make license account stand \$10,000,	3,750
	<hr/>

\$10,000

2. "Interest on floating debt, \$75, is for note of \$2,500, which has since been paid."

3. "General expense incidental consists principally of directors' fees, commission on contracts and auditing of books."

4. "We have made a special endeavor during the present year to bring our exchange so as to give as perfect service as possible, necessitating extra expenditures, thereby increasing expenses over previous year although the number of stations is less."

HEATH TELEPHONE COMPANY.

GENERAL REMARKS AND EXPLANATIONS.

1. "During this fiscal year, a change in rates and territory has been made, the Deerfield Valley Telephone and Telegraph Company has been purchased and long-distance connection established.

"Under the old method of giving each subscriber his choice of towns within which he could have service without toll charges, it was practically impossible to fix the earnings or divide the expenses accurately between exchanges. These divisions are estimated as closely as possible in making up this report."

2. "Miscellaneous current liabilities is marked 'unknown' for the reason that a portion of the receipts from toll service for the months of April, May and June must be paid to the New England Telephone and Telegraph Company; the pro rata between the two companies not having been determined."

MASSACHUSETTS TELEPHONE AND TELEGRAPH COMPANY.

Location of principal business office: 185 Franklin Street, Boston, Mass.

Date of organization: about Nov. 15, 1898.

Date of incorporation: about Nov. 15, 1898.

State in which incorporated: Massachusetts.

Date of annual meeting: first Monday in November.

Date when company began to give service: 1899.

Service is given by this company over its own lines in Boston, Stoughton and Taunton.

GENERAL REMARKS AND EXPLANATIONS.

1. "The revenue within the State which is here reported is the revenue which has been collected within the State of Massachusetts. No deduction has been made for such portion of tolls as were collected within the State but transmitted partly over lines lying without the State. Neither has the separation been made of tolls originating at points outside of the territory of the New England Telephone and Telegraph Company but terminating at points within such territory.

"If such separation were made, it would probably show that a considerable sum collected within the State of Massachusetts had been earned on toll lines located outside of that State."

2. "Distribution of plant account between the various classes of exchange and toll construction is a continuation of those reported by Stone & Webster in their report of April 22, 1907, page 8, and return made last year."

3. "Rebates and discounts include charges incident to maintaining the reserve for uncollectible accounts, the regular discount of 20 per cent. on monthly tolls in excess of \$10 from a single telephone, discounts for prompt payment of sublicense rentals, and actual losses from uncollectible bills."

¹ 4. "Separation of current repair and of reconstruction between exchange and toll accounts has been made as accurately as it has been found possible to make it, but no practical way has been found to properly divide such expenses on pole

¹ Does not include underground connections.

lines which carry both toll and exchange wires, cables that carry both toll and exchange circuits, switchboards that are used for both toll and exchange connections, wires which at varying times may be used for either toll or exchange purposes, underground conduits which carry both exchange and toll cables, or other portions of the plant that serve partly for exchange and partly for toll purposes. Consequently and unavoidably, the figures here given showing separation between current repair and reconstruction must be considered inaccurate."

5. "One dividend which would have been declared in January, if the practice of previous years had been followed, was declared in December for the purpose of making the dividend year conform with the fiscal year of the company, and an amount equal to the first dividend declared in 1908 was charged against the surplus account."

6. "Reduction in general salaries and wages and increase in operating superintendence is mainly owing to different method of charging, incident to change to the so-called functional organization, which generally went into effect in August, 1908."

7. "Inventory values as determined by the Highway Commission have not yet been entered in the books."

PROVIDENCE TELEPHONE COMPANY OF MASSACHUSETTS.

Location of principal business office: 125 Milk Street, Boston, Mass.

Date of organization: Dec. 2, 1890.

Date of incorporation: Feb. 24, 1891.

State in which incorporated: Massachusetts.

Date of annual meeting: first Tuesday in December.

Date when company began to give service: April 28, 1891.

Service is given by this company over its own lines in the towns of

GENERAL REMARKS AND EXPLANATIONS.

"Last year we reported certain stations lying near boundary line between Rhode Island and this State which were operated in exchanges in Rhode Island. This year we have not included such stations, regarding them as Rhode Island stations. There are now 299 such subscribers, 304 such instruments and 2 such subscribers on single lines. These are subscribers to service of Providence Telephone Company (of Rhode Island) and not of this company."

THE SOUTHERN MASSACHUSETTS TELEPHONE COMPANY.

Location of principal business office: 101 Milk Street, Boston, Mass.

Date of organization: Feb. 17, 1880.

Date of incorporation: Feb. 17, 1880.

State in which incorporated: Massachusetts.

Date of annual meeting: second Saturday in February.

Date when company began to give service: February, 1880.

Cities and towns in Massachusetts in which service is given by the company over its own lines: —

¹ Does not include underground connections.

GENERAL REMARKS AND EXPLANATIONS.

1. "Separation of current repair and of reconstruction has been made as accurately as it has been found possible to make it, but no practical way has been found to properly divide such expenses on pole lines which carry both toll and exchange wires, cables that carry both toll and exchange circuits, switchboards that are used for both toll and exchange connections, wires which at varying times may be used for either toll or exchange purposes, underground conduits which carry both exchange and toll cables, or other portions of the plant that serve partly for exchange and partly for toll purposes. Consequently and unavoidably the figures here given showing separation between current repair and reconstruction must be considered inaccurate."

2. "One dividend, which would have been declared in January if the practice of previous year had been followed, was declared in December for the purpose of making the dividend year conform with the fiscal year of the company, and an amount equal to the first dividend declared in 1908 was charged against the surplus account."

NONOPERATING AND SMALL TELEPHONE COMPANIES.

BEECHMONT INDEPENDENT TELEPHONE COMPANY.

Location of principal business office: East Windsor, Mass.

Date of organization: January, 1906.
