15. Supplementary Notes Also published in: Transport Reviews Volume 4, Nos. 1 and 2 Taylor and Francis, Ltd. London, England					
16. Abstract This report provides an overview of approximately 50 years of urban transportation planning history. It begins with developments in highway planning in the early 1930s and ends with the shift to decentralization of decisionmaking authority in the 1980s. The key event during this period was the Federal-Aid Highway Act of 1962 which created the federal mandate for a continuing, comprehensive urban transportation planning process carried out cooperatively by states and local governments. Planning processes and procedures evolved over the years as new issues and concerns were raised and changes in attitudes and priorities occurred. Planning processes have become more complex and sophisticated but have retained many of the earlier elements and objectives. The evolution is still continuing with the objective of improving procedures and institutions that are adapted to the needs and concerns of today's planners, citizens and decisionmakers.

PREFACE

Recent evolution of the urban transportation planning function has placed greater emphasis on the role of State and local decisionmakers in the implementation of transportation system changes. In this context, it is important for these officials to understand the transportation and planning options which have been tried, and how they developed into the approaches we have today. This report describes the evolution of urban transportation planning over the last fifty years.

This report is an updated version of "Evolution of Urban Transportation Planning" which was published in 1979 as Chapter 15 in Public Transportation: Planning, Operations and Management, edited by George Gray and Lester L. Hoel. The earlier version discussed urban transportation planning to mid-1976. This version extends the historical development to mid-1983.

Trying to summarize so much history in such a short report necessarily requires difficult choices on what to include and what to omit. The efforts of many individuals and groups made important contributions to the development of urban transportation planning. Clearly, all of these contributions could not be included or cited. This report concentrates on the key events of national significance and thereby tries to capture the overall evolution of urban transportation planning. Focusing on key events also serves as a convenient point to discuss developments in a particular area.

The report is generally arranged in chronological order. Each time period is titled with the major theme pervading that period as viewed by the author. Not all key events fit precisely under a particular theme, but many do. The discussion of the background for some events or the follow-on activities for others may cover more than one time period. The discussion was placed where it seemed most relevant.

Over the years, the author has discussed these events with many persons in the profession. Often they had participated in or had first hand knowledge of the events. The author appreciates their assistance, even though they are too numerous to mention specifically.

In preparing this updated version, the author was directly aided by several individuals who provided information on specific events. Their assistance is appreciated: Elizabeth A. Parker, Barry Berlin, Sam Rea, Thomas Koslowski, Norman Paulhus, James A. Scott, Norman Cooper, Camille C. Mittelholtz, Ira Laster, John Peak and Carl Rappaport.

The author appreciates the review comments provided by: Donald Emerson, David S. Gendell, James Getzewich, Charles H. Graves, Thomas J. Hillegass, Howard S. Lapin, Alfonso B. Linhares, Gary E. Maring, Ali F. Sevin, Peter R. Stopher, Carl N. Swerdloff, and Paul L. Verchinski.

The author acknowledges the special contribution of Dr. Peter R. Stopher for his encouragement and persistence throughout this project.

This report could not have been completed without the efficient typing and editing of Joanne Kormos, who always performed her work in a cheerful manner.

Any errors of fact or interpretation are the responsibility of the author.

Section I

INTRODUCTION

More than twenty years have passed since the Federal-Aid Highway Act of 1962 mandated urban transportation planning in the U.S. That act was a major landmark in transportation planning. The legislative mandate, combined with the incentive of 90 percent Federal funding for Interstate highway projects, caused urban transportation to spread quickly throughout the U.S. It also influenced transportation planning in other parts of the world.

In some ways, the urban transportation planning process and planning techniques have changed little over the twenty years. Yet, in other ways, urban transportation has evolved over these years in response to changing issues, conditions and values, and a greater understanding of urban transportation phenomena. Current urban transportation planning practice is considerably more sophisticated, complex and costly than its highway planning precedent.

Modifications in the planning process took many years to evolve. As new concerns and issues arose, changes in planning techniques and processes were introduced. These modifications sought to make the planning process more responsive and sensitive to those areas of concern. Urban areas which had the resources and technical ability were the first to develop new concepts and techniques. These new ideas were diffused by various means throughout the nation usually with the assistance of the federal government. The rate at which the new concepts were accepted varied from area to area. Consequently, the quality and depth of planning is highly variable at any point in time.

This report reviews the historical development of the urban transportation planning process in the U.S. from its beginnings in early highway and transit planning to the most recent focus on decentralization of decision-making in the planning process.

Section 2 discusses the early beginnings of highway planning.

Section 3 covers the formative years of urban transportation planning during which many of the basic concepts were developed.

Section 4 focuses on the 1962 Federal-aid Highway Act and the sweeping changes it brought in urban transportation planning in the U.S. It also describes early federal involvement in urban public transportation.

Section 5 discusses efforts at intergovernmental coordination, a deeper federal role in urban public transportation and the evolution to "continuing" transportation planning.

Section 6 describes environmental revolution of the late 1960s and the increased involvement of citizens in the urban transportation planning process.

Section 7 addresses the events which integrated planning for urban public transportation and highways. It included major increases in federal transit programs as well as increased flexibility in the use of highway funds.

Section 8 opens with the Arab Oil Embargo which accelerated the transition from long-term system planning to short-term, smaller scale planning. It ends with federal requirements on environmental quality, cost-effectiveness, transportation for special groups, economic revitalization and energy conservation.

Section 9 describes the efforts to reverse federal intrusion into local decisions and scale back federal requirements. It discusses the growing interest in involving the private sector in the provision of transportation services.

Section 10 provides concluding remarks.

Section 2

EARLY HIGHWAY PLANNING

Need for Highway Planning

In the early years of highway construction, the automobile had been regarded as a pleasure vehicle rather than an important means of transportation. Consequently, comparatively short sections of highways were built from the cities into the countryside. During this period, urban roads were considered to be adequate, particularly in comparison to rural roads. Although the concept of a continuous national system of highways was recognized in the Federal-Aid Highway Act of 1925, there were significant gaps in many important intercity routes. In addition, highway pavements were largely inadequate to carry major traffic loads.

The need for a systematic approach to the planning of highways was recognized in the early 1930s as the rapid growth in automobile ownership and highway travel placed increasing demands on an inadequate highway system. It became clear that these growing problems necessitated the collection and analysis of information on highways and their use on a more comprehensive scale than had ever before been attempted. (Holmes and Lynch, 1957)

Federal-Aid Highway Act of 1934

Beginning with the Federal-Aid Highway Act of 1934, the Congress authorized that 1-1/2 percent of the amount apportioned to any state annually for construction could be used for surveys, plans, engineering, and economic analyses of projects for future construction. The act created the cooperative arrangement between the U.S. Bureau of Public Roads (now the U.S. Federal Highway Administration) and the state highway departments known as the statewide highway planning surveys. By 1940, all states were participating in this program. (Holmes and Lynch, 1957)

Section 3

BEGINNINGS OF URBAN TRANSPORTATION PLANNING

Early Urban Travel Surveys

Most urban areas did not begin urban travel surveys until 1944. It was during that year the Federal-Aid Highway Act authorized the expenditure of funds on urban extensions of the federal-aid primary and secondary highway systems. Until that time, there was a lack of information on urban travel which could be used for the planning of highway facilities. In fact, no comprehensive survey methods had been developed which could provide the required information. Because of the complex nature of urban street systems and the shifting of travel from route to route, traffic volumes were not a satisfactory guide to needed improvements. A study of the origins and destinations of trips and the basic factors affecting travel was needed. (Holmes and Lynch, 1957)

The method developed to meet this need was the home-interview origin-destination survey. Household members were interviewed to obtain information on the number, purpose, mode, origin, and destination of all trips made on a particular day. These urban travel surveys were used in the planning of highway facilities, particularly expressway systems, and in determining design features. The U.S. Bureau of Public Roads published the first, Manual of Procedures for Home Interview Traffic Studies, in 1944. (U.S. Dept. of Commerce, 1944) In that year the interviewing technique was used in Tulsa, Little Rock, New Orleans, Kansas City, Memphis, Savannah, Oklahoma, and Lincoln.

Other elements of the urban transportation planning process were also being developed and applied in pioneering traffic planning studies. New concepts and techniques were being generated and refined in such areas as traffic counting, highway inventories and classification, highway capacity,

pavement condition studies, cost estimating, and system planning. The first attempt to meld many of these elements into an urban transportation planning process was in the Cleveland Regional Area Traffic Study in 1927, which was sponsored by the U.S. Bureau of Public Roads. But, even in this study, traffic forecasting was a crude art using basically straight line projections. (Cron, 1975)

In the Boston Transportation Study, a rudimentary form of the gravity model was applied to forecast traffic in 1926 but the technique was not used in other areas. In fact, the 1930s saw little advancement in the techniques of urban transportation planning. It was during this period that the methodology of highway needs and financial studies was developed and expanded. (U.S. Dept. of Transportation, 1979a)

By the 1940s, it was apparent that if certain relationships between land use and travel could be measured, these relationships could be used as a means to project future travel. It remained for the development of the computer, with its ability to process large masses of data from these surveys, to permit estimation of these relationships between travel, land use, and other factors. The first major test using this approach to develop future highway plans was during the early 1950s in San Juan, Puerto Rico, and Detroit. (Silver and Stowers, 1964 and Detroit Metropolitan Area Traffic Study, 1955-6)

Early Transit Planning

During this period, transit planning was being carried out by operators as part of the regular activities of operating a transit system. Federal assistance was not available for planning or construction and little federal interest existed in transit. In some urban areas, transit authorities were created to take over and operate the transit system. The Chicago Transit Authority was created in 1945, the Metropolitan Transit Authority in Boston in 1947, and the New York City Transit Authority in 1955.

It was at this time that the San Francisco Bay area began planning for a regional rapid transit system. In 1956, the Rapid Transit Commission proposed a 123 mile system in a five-county area. As a result of this study, the Bay Area Transit District (BARTD) was formed within the five counties. BARTD completed the planning for the transit system and conducted preliminary engineering and financial studies. In November 1962, the voters approved a bond issue to build a three-county, 75-mile system, totally with local funds. (Homburger, 1967)

Dawn of Analytical Planning Techniques

In the early 1950s, new ideas and techniques were being generated rapidly for application in urban transportation planning. In 1950, the Highway Research Board published, Route Selection and Traffic Assignment (Campbell, 1950), which was a compendium of correspondence summarizing practices in identifying traffic desire lines and linking origin-destination pairs. By the mid-1950s, Thomas Fratar at the Cleveland Transportation Study developed a computer method for distributing future origin-destination travel data using growth factors. In 1956, The Eno Foundation for Highway Traffic Control published, Highway Traffic Estimation (Schmidt and Campbell, 1956), which documented the state-of-the-art and highlighted the Fratar technique.

It remained for Alan M. Voorhees in 1955 to publish the first breakthrough in travel forecasting using an analytical technique. Voorhees advanced the gravity model as the means to link land use with urban traffic flows. Research had been proceeding for a number of years on a gravity theory for human interaction. Previously, the gravity analogy had been applied by sociologists and geographers to explain population movements. Voorhees used origin-destination survey data with driving time as the measure of spatial separation and estimated the exponents for a three-trip purpose gravity model. Others conducting similar studies soon corroborated these results. (U.S. Dept. of Commerce, 1963a)

Another breakthrough soon followed in the area of traffic assignment. The primary difficulty in traffic assignment was evaluating the driver's choice of route between the origin and destination. Earl Campbell of the Highway Research Board proposed an "S" curve which related the percent usage of a particular facility to a travel-time ratio. A number of empirical studies were undertaken to evaluate the theory using diversion of traffic to new expressways from arterial streets. From these studies, the American Association of State Highway Officials published a standard traffic diversion curve in, "A Basis for Estimating Traffic Diversion to New Highways in Urban Areas," in 1952. However, traffic assignment was still largely a mechanical process requiring judgment. (U.S. Dept. of Commerce, 1964)

Then, in 1957, two papers were presented which discussed a minimum impedance algorithm for networks. One was titled, "The Shortest Path Through a Maze," by Edward F. Moore, and the second was, "The Shortest Route Problem," by George B. Danzig. With such an algorithm, travel could then be assigned to minimum time paths using newly developed computers. The staff of the Chicago Area Transportation Study under Dr. J. Douglas Carroll, Jr. finally developed and refined computer programs which allowed the assignment of traffic for the entire Chicago region. (U.S. Dept. of Commerce, 1964)

National Committee on Urban Transportation

While highway departments were placing major emphasis on arterial routes, city street congestion was steadily worsening. It was in this atmosphere that the Committee on Urban Transportation was created in 1954. Its purpose was, "to help cities do a better job of transportation planning through systematic collection of basic facts ... to afford the public the best possible transportation at the least possible cost and aid in accomplishing desirable goals of urban renewal and sound urban growth."

The committee was composed of experts in a wide range of fields, representing federal, state and city governments, transit, and other

interests. It developed a guidebook, Better Transportation for Your City (National Committee, 1958), designed to help local officials establish an orderly program of urban transportation planning. It was supplemented by a series of 17 procedure manuals describing techniques for planning highway, transit and terminal improvements. The guidebook and manuals received national recognition. Even though the guidebook was primarily intended for the attention of local officials, it stressed the need for cooperative action, full communication between professionals and decisionmakers, and the development of transportation systems in keeping with the broad objectives of community development. It provided, for the first time, fully documented procedures for systematic transportation planning.

Housing Act of 1954

An important cornerstone of the federal policy concerning urban planning was Section 701 of the Housing Act of 1954. The act demonstrated congressional concern with urban problems and recognition of the urban planning process as an appropriate approach to dealing with such problems. Section 701 authorized the provision of federal planning assistance to state planning agencies, cities, and other municipalities having a population of less than 50,000 persons, and after further amendments, to metropolitan and regional planning agencies. (Washington Center, 1970)

The intent of the act was to encourage an orderly process of urban planning to address the problems associated with urban growth and the formulation of local plans and policies. The act indicated that planning should occur on a region-wide basis within the framework of comprehensive planning.

Pioneering Urban Transportation Studies

The developments in analytical methodology began to be applied in pioneering urban transportation studies in the late 1940s and during the 1950s. Before these studies, urban transportation planning was based on existing travel demands or on travel forecasts using uniform growth factors applied on an areawide basis.

The San Juan, Puerto Rico, transportation study begun in 1948, was one of the earliest to use a trip generation approach to forecast trips. Trip generation rates were developed for a series of land use categories stratified by general location, crude intensity measures and type of activity. These rates were applied, with some modifications, to the projected land use plan. (Silver and Stowers, 1964)

The Detroit Metropolitan Area Traffic Study (DMATS) put together all the elements of an urban transportation study for the first time. It was conducted from 1953 to 1955 under Executive Director Dr. J. Douglas Carroll, Jr. The DMATS staff developed trip generation rates by land use category for each zone. Future trips were estimated from a land use forecast. The trip distribution model was a variant of the gravity model with airline distance as the factor to measure travel friction. Traffic assignment was carried out with speed and distance ratio curves. Much of the work was done by hand with the aid of tabulating machines for some of the calculations. Benefit-cost ratios were used to evaluate the major elements of the expressway network. (Detroit Metropolitan Area Traffic Study, 1955-1956, Silver and Stowers, 1964; and Creighton, 1970)

In 1955, the Chicago Area Transportation Study (CATS) began under the direction of Dr. J. Douglas Carroll, Jr. It set the standard for future urban transportation studies. The lessons learned in Detroit were applied in Chicago with greater sophistication. CATS used the basic six-step procedure pioneered in Detroit: data collection, forecasts, goal formulation, preparation of network proposals, testing proposals and evaluation of proposals. Transportation networks were developed to serve travel generated by projected land use patterns. They were tested using systems analysis considering the effect of each facility on other facilities in the network. Networks were evaluated based on economic efficiency -- the maximum amount of travel carried at the least cost. CATS used trip generation, trip distribution, modal split and traffic assignment models for travel forecasting. A simple land use forecasting procedure was employed to forecast future land use and activity patterns. The CATS staff made major advances in the use of

the computer in travel forecasting. (CATS, 1959-1962; Swerdloff and Stowers, 1966; and, Wells, et. al. 1970)

Other transportation studies followed including the Washington Area Traffic Study in 1955, Baltimore Transportation Study in 1957, the Pittsburgh Area Transportation Study (PATs) in 1958, the Hartford Area Traffic Study in 1958, and the Pennn-Jersey (Philadelphia) Transportation Study in 1959. All of these studies were transportation planning on a new scale. They were regionwide, multi-disciplinary undertakings involving large full time staffs. Urban transportation studies were carried out by ad hoc organizations with separate policy committees. They were not directly connected to any unit of government. Generally, these urban transportation studies were established for a limited time period with the objective of producing a plan and reporting on it. Such undertakings would have been impossible before the availability of computers. (Creighton, 1970)

The resulting plans were heavily oriented to regional highway networks based primarily on the criteria of economic costs and benefits. Transit was given secondary consideration. New facilities were evaluated against traffic engineering improvements. Little consideration was given to regulatory or pricing approaches, or new technologies. (Wells, et.al., 1970)

These pioneering urban transportation studies set the content and tone for future studies. They provided the basis for the federal guidelines that were issued in the following decade.

Federal-Aid Highway Act of 1956

During this early period in the development of urban transportation planning came the Federal-Aid Highway Act of 1956. The act launched the largest public works program yet undertaken; construction of the National Interstate and Defense Highway System. The act was the culmination of two decades of studies and negotiation. As a result of the Interregional Highways report, Congress had adopted a National System of Interstate Highways not to exceed

40,000 miles in the Federal-Aid Highway Act of 1944. However, money was not authorized for construction of the system. Based on the recommendations of the U.S. Bureau of Public Roads and the Department of Defense, a 37,700-mile system was adopted in 1947. This network consisted primarily of the most heavily traveled routes of the Federal-Aid Primary System. The remaining 2,300 miles were reserved for additional radials, bypass-loops, and circumferential routes in and adjacent to urban areas. Studies of urban area needs were made by the states with the cooperation and aid of city officials. The urban connections were formally designated in 1955. (U.S. Dept. of Commerce, 1957)

Funds were appropriated by then but at very low levels; \$25 million annually for 1952 and 1953 with a 50 percent federal share, and \$175 million annually for 1954 and beyond with a 60 percent federal share. To secure a significant increase in funding, a major national lobbying effort was launched in 1952 by the Highway Users Conference under the title, "Project Adequate Roads." President Eisenhower appointed a national advisory committee under General Lucius D. Clay which produced a report, A Ten-Year National Highway Program, in 1955. It recommended building a 37,000-mile Interstate System using bonds to fund the \$23 billion cost. (Kuehn, 1976)

Finally, with the Federal-Aid Highway Act of 1956, construction of the National System of Interstate and Defense Highways shifted into high gear. The act increased the authorized system extent to 41,000 miles. This system was planned to link 90 percent of the cities with populations of 50,000 or greater and many smaller cities and towns. The act also authorized the expenditure of \$24.8 billion in 13 fiscal years from 1957 to 1969 at a 90 percent federal share. The act provided construction standards and maximum sizes and weights of vehicles that could operate on the system. The system was to be completed by 1972. (Kuehn, 1976)

The companion Highway Revenue Act of 1956 increased federal taxes on gasoline and other motor fuels and excise taxes on tires and established new taxes on retreaded tires and a weight tax on heavy trucks and buses. It

created the Highway Trust Fund to receive the tax revenue which was dedicated solely for highway purposes. This provision broke with a long-standing congressional precedent not to earmark taxes for specific authorized purposes. (U.S. Dept. of Commerce, 1957)

These acts have had a profound effect on urban areas. They established an assured funding source for highways, through user charges, at a time when federal funds were not available for mass transportation. They set a 90 percent federal share which was far above the existing 50 percent share for other federal-aid highways. About 20 percent of the system mileage was designated as urban to provide alternative interstate service into, through and around urban areas. These provisions dominated urban transportation planning for decades to come and eventually caused the development of countervailing forces to balance the urban highway program.

Sagamore Conference on Highways and Urban Development

The availability of large amounts of funds from the 1956 acts brought immediate response to develop action programs. To encourage the cooperative development of highway plans and programs, a conference was held in 1958 in the Sagamore Center at Syracuse University. (Sagamore, 1958)

The conference focused on the need to conduct the planning of urban transportation, including public transportation, on a regionwide, comprehensive basis in a manner which supports the orderly development of the urban areas. The conference report recognized that urban transportation plans should be evaluated through a grand accounting of benefits and costs which included both user and nonuser impacts.

The conference recommendations were endorsed and their implementation urged, but progress was slow. The larger urban areas were carrying out pioneering urban transportation studies, the most noteworthy being the Chicago Area Transportation Study (CATS). But, few of the smaller urban areas had begun planning studies due to the lack of capable staff to perform urban transportation planning.

To encourage smaller areas to begin planning efforts, the American Municipal Association, the American Association of State Highway Officials, and the National Association of County Officials jointly launched a program in early 1962 to describe and explain how to carry out urban transportation planning. This program was initially directed at urban areas under 250,000 in population. (Holmes, 1973)

Housing Act of 1961

The first piece of federal legislation to deal explicitly with urban mass transportation was the Housing Act of 1961. This act was passed largely as a result of the growing financial difficulties with commuter rail services. The act inaugurated a small, low-interest loan program for acquisitions and capital improvements for mass transit systems and a demonstration program. (Washington Center, 1970)

The act also contained a provision for making federal planning assistance available for "preparation of comprehensive urban transportation surveys, studies, and plans to aid in solving problems of traffic congestion, facilitating the circulation of people and goods on metropolitan and other urban areas and reducing transportation needs." The act permitted federal aid to "facilitate comprehensive planning for urban development, including coordinated transportation systems, on a continuing basis." These provisions of the act amended the Section 701 planning program which was created by the Housing Act of 1954.

Section 4

URBAN TRANSPORTATION PLANNING COMES OF AGE

Joint Report on Urban Mass Transportation

In March 1962, a joint report on urban mass transportation was submitted to President Kennedy, at his request, by the Secretary of Commerce and the Housing and Home Finance Administrator. (U.S. Senate, 1962) This report integrated the objectives for highways and mass transit, which were comparatively independent up to that point but growing closer through cooperative activities.

The general thrust of this report, as it related to planning, can be summarized by the following excerpt from the transmittal letter:

"Transportation is one of the key factors in shaping our cities. As our communities increasingly undertake deliberate measures to guide their development and renewal, we must be sure that transportation planning and construction are integral parts of general development planning and programming. One of our main recommendations is that Federal aid for urban transportation should be made available only when urban communities have prepared or are actively preparing up-to-date general plans for the entire urban area which relate transportation plans to land-use and development plans.

"The major objectives of urban transportation policy are the achievement of sound land-use patterns, the assurance of transportation facilities for all segments of the population, the improvement of overall traffic flow, and the meeting of total transportation needs at minimum cost. Only a balanced transportation system can attain these goals - and in many urban areas this means an extensive mass transportation network fully integrated with the highway and street system. But mass transportation in recent years

experienced capital consumption rather than expansion. A cycle of fare increases and service cuts to offset loss of ridership followed by further declines in use points clearly to the need for a substantial contribution of public funds to support needed mass transportation improvements. We therefore recommend a new program of grants and loans for urban mass transportation." (U.S. Senate, 1962)

President Kennedy's Transportation Message

In April 1962, President Kennedy delivered his first message to Congress on the subject of transportation. Many of the ideas related to urban transportation in the message drew upon the previously mentioned joint report. The President's message recognized the close relationship between the community development and the need to properly balance the use of private automobiles and mass transportation to help shape and serve urban areas. It also recognized the need to promote economic efficiency and livability of urban areas. It also recommended continued close cooperation between the Department of Commerce and the Housing and Home Finance Administration (HHFA). (Washington Center, 1970)

This transportation message opened a new era in urban transportation and lead to passage of two landmark pieces of legislation: the Federal-Aid Highway Act of 1962 and the Urban Mass Transportation Act of 1964.

Federal-Aid Highway Act of 1962

The Federal-Aid Highway Act of 1962 provided a major stimulus to urban transportation planning. Section 9 of the act, which is now Section 134 of Title 23 states:

"It is declared to be in the national interest to encourage and promote the development of transportation systems embracing various modes of transport in a manner that will serve the states and local communities efficiently and effectively." (U.S. Dept. of Transportation, 1980a)

This statement of policy directly followed from the recommendations of the Sagamore conference and President Kennedy's Transportation Message. Moreover, the section directed the Secretary to cooperate with the states:

"...in the development of long-range highway plans and programs which are properly coordinated with plans for improvements in other affected forms of transportation and which are formulated with due consideration to their probable effect on the future development of the urban area..." (U.S. Dept. of Transportation, 1980a)

The last sentence of the section, which required that urban highway construction projects be based upon a planning process, legislated for the first time a planning requirement:

"After July 1, 1965, the Secretary shall not approve under section 105 of this title any programs for projects in any urban area of more than fifty thousand population unless he finds that such projects are based on a continuing, comprehensive transportation planning process carried out cooperatively by states and local communities in conformance with the objectives stated in this section." (U.S. Dept. of Transportation, 1980a)

The act also restricted the use of the 1-1/2 percent planning and research funds to only those purposes. If not used for planning and research, the state would lose the funds. Previously, a state could request that these funds be used instead for construction. This provision created a permanent, assured funding source for planning and research activities. In addition, the act provided that a state could spend another 1/2 percent at their option for planning and research projects.

Two features of the act are particularly significant with respect to the organizational arrangements for carrying out the planning process. First, it called for a planning process in urban areas rather than cities, which set the scale at the metropolitan or regional level. Second, it called for the process to be carried on cooperatively by the states and local communities. Because

qualified planning agencies to mount such a transportation planning process were lacking in many urban areas, the Bureau of Public Roads (BPR) required the creation of planning agencies or organizational arrangements which would be capable of carrying out the required planning process. These planning organizations quickly came into being because of the growing momentum of the highway program and the cooperative financing of the planning process by HHFA and the BPR. (Marple, 1969)

Hershey Conference on Urban Freeways

In response to the growing concern about freeway construction in urban areas, the Hershey Conference on Freeways in the Urban Setting was convened in June 1962. (Freeways, 1962) It concluded that, "Freeways cannot be planned independently of the areas through which they pass. The planning concept should extend to the entire sector of the city within the environs of the freeway." The conference recommendations reinforced the need to integrate highway planning and urban development.

The findings recognized that this planning should be done as a team effort which draws upon the skills of engineers, architects, city planners, and other specialists. Freeway planning must integrate the freeway with its surroundings. When properly planned, freeways provide an opportunity to shape and structure the urban community in a manner which meets the needs of the people who live, work, and travel in these areas. Further, the planning effort should be carried out in a manner which involves participation by the community. (Freeways, 1962)

Response to the 1962 Federal-Aid Highway Act

The Bureau of Public Roads moved quickly to implement the planning requirements of the 1962 Federal-Aid Highway Act. Instructional Memorandum 50-2-63, published in March 1963 and later superseded by Policy and Procedure Memorandum 50-9, interpreted the act's provisions related to a "continuing, comprehensive, cooperative" (3C) planning process. The

memorandum defined the basic ten elements of a 3C planning process for which inventories and analyses were required:

1. Economic factors affecting development
2. Population
3. Land use
4. Transportation facilities including those for mass transportation
5. Travel patterns
6. Terminal and transfer facilities
7. Traffic control features
8. Zoning ordinances, subdivision regulations, building codes, etc.
9. Financial resources
10. Social and community-value factors, such as preservation of open space, parks and recreational facilities; preservation of historical sites and buildings; environmental amenities; and aesthetics.

These memoranda and further refinements and expansions upon them covered all aspects for organizing and carrying out the 3C planning process.

Through its Urban Planning Division, under Garland E. Marple, the BPR carried out a broad program to develop planning procedures and computer programs, write procedural manuals and guides, teach training courses, and provide technical assistance. The effort was aimed at developing urbanized area planning organizations, standardizing, computerizing and applying procedures largely created in the late 1950s, and disseminating knowledge of such procedures. The BPR released a stream of procedural manuals that became the technical standards for many years to come: Calibrating and Testing a Gravity Model for Any Size Urban Area, in July 1963; Calibrating and Testing a Gravity Model with a Small Computer, in October 1963; Traffic Assignment Manual, in June 1964; Population Forecasting Methods, in June 1964; Population, Economic, and Land Use Studies in Urban Transportation Planning, in July 1964; The Standard Land Use Coding Manual, in January 1965; The Role of Economic Studies in Urban Transportation Planning, in August 1965; Traffic Assignment

and Distribution for Small Urban Areas, in September 1965, Modal Split-Documentation of Nine Methods for Estimating Transit Usage, in December 1966; and Guidelines for Trip Generation Analysis, in June 1967. The "Urban Transportation Planning Course" covered organizational and technical procedures of the planning process in two weeks, using the manuals as textbooks and supplementing them with lecture notes.

This effort to define the "3C planning process," to develop techniques for performing the technical activities, and to provide technical assistance completely transformed the manner in which urban transportation planning was performed. By the legislated deadline of July 1, 1965, all the 224 existing urbanized areas which fell under the 1962 act had an urban transportation planning process underway. (Holmes, 1973)

Urban Mass Transportation Act of 1964

The first real effort to provide federal assistance for urban mass transportation development was the passage of the Urban Mass Transportation Act of 1964. The objective of the act, still in the spirit of President Kennedy's Transportation Message, was "...to encourage the planning and establishment of areawide urban mass transportation systems needed for economical and desirable urban development." (U.S. Dept. of Transportation, 1979b)

The act authorized federal capital grants for up to two-thirds of the net project cost of construction, reconstruction, or acquisition of mass transportation facilities and equipment. Net project cost was defined as that portion of the total project cost that could not be financed readily from transit revenues. However, the federal share was to be held to 50 percent in those areas which had not completed their comprehensive planning process, that is, had not produced a plan. All federal funds had to be channeled through public agencies. Transit projects were to be initiated locally.

A program of research, development, and demonstrations was also authorized by the 1964 act. The objective of this program was to "...assist in the reduction of transportation needs, the improvement of mass transportation service, or the contribution of such service toward meeting total urban transportation needs at minimum cost." (U.S. Dept. of Transportation, 1979b)

Congress, however, did not authorize much money to carry out this legislation. Not more than \$150 million per year was authorized under the 1964 act and the actual appropriations fell short of even that amount. (Smerk, 1968)

Williamsburg Conference on Highways and Urban Development

By 1965, there was concern that planning processes were not adequately evaluating social and community values. Few planning studies had developed goal-based evaluation methodologies. A second conference on Highways and Urban Development was held in Williamsburg, Virginia, to discuss this problem. (Highways and Urban Development, 1965) The conference concluded that transportation must be directed toward raising urban standards and enhancing aggregate community values. Transportation values such as safety, economy, and comfort are part of the total set of community values and should be weighted appropriately.

The conference resolves highlighted the need to identify urban goals and objectives which should be used to evaluate urban transportation plans. It emphasized that many values may not be quantifiable but, nonetheless, should not be ignored. The conference also endorsed the concept of making maximum use of existing transportation facilities through traffic management and land use controls.

Section 5

IMPROVED INTERGOVERNMENTAL COORDINATION

As federal programs proliferated, intergovernmental coordination became more difficult and time-consuming. Several actions were taken to alleviate this problem. One result was to encourage broader, multifunctional planning agencies.

Housing and Urban Development Act of 1965

The Housing and Urban Development Act of 1965 created the Department of Housing and Urban Development (HUD) to better coordinate urban programs at the federal level. In addition, the act amended the Section 701 urban planning assistance program established under the Housing Act of 1954 by authorizing grants to be made to "...organizations composed of public officials whom he (the Secretary of HUD) finds to be representative of the political jurisdictions within a metropolitan area or urban region..." for the purposes of comprehensive planning. (Washington Center, 1970)

This provision encouraged the formation of regional planning organizations controlled by elected rather than appointed officials. It gave impetus to the formation of such organizations as councils of governments (COGs). It also encouraged local governments to cooperate in addressing their problems in a regional context.

Department of Transportation Act of 1966

In 1966, the Department of Transportation (DOT) was created to coordinate transportation programs and to facilitate development and improvement of coordinated transportation service utilizing private enterprise to the maximum extent feasible. The Department of Transportation Act declared that the nation required fast, safe, efficient and convenient transportation at the

lowest cost consistent with other national objectives including the conservation of natural resources. DOT was directed to provide leadership in the identification of transportation problems and solutions, stimulate new technological advances, encourage cooperation among all interested parties, and recommend national policies and programs to accomplish these objectives.

Section 4(f) of the act required the preservation of natural areas. It prohibited the use of land by a transportation project from a park, recreation area, wildlife and waterfowl refuge, or historic site unless there was no feasible and prudent alternative and the project was planned in such a manner to minimize harm to the area. This was the earliest statutory language directed to minimize the negative effects of transportation construction projects on the natural environment.

The DOT Act, however, left unclear the division of responsibility for urban transportation planning between DOT and HUD. It took more than a year for DOT and HUD to come to an agreement on their respective responsibilities. This agreement, known as Reorganization Plan No. 2, took effect in July 1968. Under it, DOT assumed responsibility for mass transportation capital grant, technical studies, and managerial training grant programs subject to HUD certification of the planning requirements for capital grant applications. Research and development was divided up. DOT assumed responsibility for improving the operation of conventional transit systems and HUD assumed responsibility for urban transportation as it related to comprehensive planning. Joint responsibility was assigned for advanced technological systems. The Reorganization Plan also created the Urban Mass Transportation Administration (UMTA). (Miller, 1972)

1966 Amendments to the Urban Mass Transportation Act of 1964

To fill several gaps in the 1964 Urban Mass Transportation Act, a number of amendments were passed in 1966. One created the technical studies program, which provided federal assistance up to a two-thirds federal matching share for planning, engineering, and designing of urban mass transportation

projects or other similar technical activities leading to application of a capital grant.

Another section authorized grants to be made for management training. A third authorized a project to study and prepare a program of research for developing new systems of urban transportation. This section resulted in a report to Congress in 1968, Tomorrow's Transportation: New Systems for the Urban Future (Cole, 1968), which recommended a long-range balanced program for research on hardware, planning, and operational improvements. It was this study that first brought to public attention many new systems such as dial-a-bus, personal rapid transit, dual mode, pallet systems, and tracked air-cushioned vehicle systems.

Demonstration Cities and Metropolitan Development Act of 1966

Section 204 of the Demonstration Cities and Metropolitan Development Act of 1966 was significant in asserting federal interest in improving the coordination of public facility construction projects to obtain maximum effectiveness of federal spending and to relate such projects to areawide development plans. It required that all applications for the planning and construction of facilities must be submitted to an areawide planning agency for review and comment. The object of this section of the act was to encourage the coordination of planning and construction of physical facilities in urban areas. Procedures to implement this act were issued by the Bureau of the Budget in Circular no. 82. In response to these review requirements, many urban areas established new planning agencies or reorganized existing agencies to include elected officials as required by the circular. (Washington Center, 1970)

Dartmouth Conference on Urban Development Models

Land use planning models developed as an adjunct to transportation planning to provide forecasts of population, employment and land use for transportation forecasting models. From the mid-1950s, there was rapid

development in the field stimulated by newly available computers and advances in operations research and systems analysis. (Putman, 1979) Developments were discussed at a seminar at the University of Pennsylvania in October 1964 which was documented in a special issue of the Journal of the American Institute of Planners. (Harris, 1965)

By 1967, the Land Use Evaluation Committee of the Highway Research Board determined that there was need for another assessment of work in the field which was progressing in a uncoordinated fashion. A conference was held in Dartmouth, New Hampshire, in June 1967 to identify the areas of research that were most needed. (Hemmens, 1968)

The conferees recommended that agencies sponsoring research on land use models, generally the federal government, expand the capabilities of their in-house staff to handle these models. They recommended steps to improve data acquisition and handling. Further research in broader models which included social goals was recommended. Conferees recommended that research on the behavioral aspects of the individual decision units be conducted. Concern was expressed about bridging the gap between modelers and decisionmakers. Professional standards for design, calibration and use of models was encouraged. (Hemmens, 1968)

The early optimism in the field faded as the land development models did not perform up to the expectations of researchers and decisionmakers, particularly at the small area level. Modelers had underestimated the task of simulating complex urban phenomena. Many of these modeling efforts were performed by planning agencies with unreasonable time deadlines. (Putman, 1979) Models had become more complex with larger data requirements as submodels were added to encompass more aspects of the urban development process. They were too costly to construct and operate, and many still did not produce usable results. By the late 1960s land use modeling activity in the U.S. entered a period of dormancy which continued until the mid-1970s.

Federal-Aid Highway Act of 1968

The Federal-Aid Highway Act of 1968 established the Traffic Operations Program to Improve Capacity and Safety (TOPICS). It authorized \$200 million each for fiscal years 1970 and 1971. The federal matching share was set at 50 percent. The program was designed to reduce traffic congestion and facilitate the flow of traffic in urban areas. Prior to the act, the Bureau of Public Roads had initiated TOPICS as an experimental program. Instructional Memorandum 21-7-67, which established guidelines for TOPICS, divided urban streets into two categories. Those on the federal-aid Primary and Secondary systems were considered Type 1. Other major streets were under Type 2. Only traffic operations improvements were allowed on Type 2 systems. (Gakenheimer and Meyer, 1977)

The TOPICS program grew out of a long history of the Bureau of Public Roads' efforts to expand the use of traffic engineering techniques. In 1959, the BPR sponsored the Wisconsin Avenue Study to demonstrate the effectiveness of various traffic management methods when applied in a coordinated fashion. (U.S. Dept. of Commerce, 1962)

TOPICS projects were to result from the 3C urban transportation planning process. By October 1969, there were 160 cities actively involved in TOPICS and another 96 cities in preliminary negotiations expected to result in active projects. Even so, the level of planning detail for TOPICS projects was not totally compatible with the regional scale of the planning process. (U.S. Dept. of Commerce, 1962)

The TOPICS program was reauthorized for fiscal years 1972 and 1973 at \$100 million per year. But, the Federal-Aid Highway Act of 1973 ended further authorizations and merged the TOPICS systems into the new federal-aid urban system. TOPICS had accomplished its objective of increasing the acceptance of traffic engineering techniques as a means of improving the efficiency of the urban transportation system. It also played an important role in encouraging the concept of traffic management. (Gakenheimer and Meyer, 1977)

In addition to launching the TOPICS program, the Federal-aid Highway Act of 1968 incorporated several provisions designed to protect the environment and reduce the negative effects of highway construction. The Act repeated the requirement in Section 4(f) of the Department of Transportation Act of 1966 on the preservation of public park and recreation lands, wildlife and waterfowl refuges, and historic sites to clarify that the provision applied to highways. Moreover, the Act required public hearings on the economic, social and environmental effects of proposed highway projects and their consistency with local urban goals and objectives. The act also established the highway beautification program. A highway relocation assistance program was authorized to provide payments to households and businesses displaced by construction projects. Additionally, a revolving fund for the advanced acquisition of right-of-way was established to minimize future dislocations due to highway construction and reduce the cost of land and clearing it. In addition, the Act authorized funds for a fringe parking demonstration program.

Many of the provisions of the Act were early responses to the concern for environmental quality and for ameliorating the negative effects of highway construction.

Intergovernmental Cooperation Act of 1968

Section 204 of the Demonstration Cities and Metropolitan Act was the forerunner of much more extensive legislation, adopted in 1968, designed to coordinate federal grant-in-aid programs at federal and state levels. The Intergovernmental Cooperation Act of 1968 required that federal agencies notify the governors or legislatures of the purpose and amounts of any grants-in-aid to their states. The purpose of this requirement was to make it possible for states to plan more effectively for their overall development. (Washington Center, 1970)

"Continuing" Urban Transportation Planning

By 1968, most urbanized area had completed or were well along in their 3C planning process. The Federal Highway Administration turned its attention to the "continuing" aspect of the planning process. In May, Instructional Memorandum (IM) 50-4-68, "Operations Plans for "Continuing" Urban Transportation Planning" was issued. The IM required the preparation of an operations plan for continuing transportation planning in these areas. The objective was to maintain the responsiveness of planning to the needs of local areas and to potential changes. (U.S. Dept. of Transportation, 1968)

The operations plans were to address the various elements for performing continuing planning, including: the organizational structure; scope of activities and the agencies that were responsible; a description of the surveillance methodology to identify changes in land development and travel demand; a description of land use and travel forecasting procedures; and work remaining on the ten basic elements of the 3C planning process. (U.S. Dept. of Transportation, 1968)

Guidelines were provided identifying the five elements considered essential for a continuing planning process. The "surveillance" element focused on monitoring changes in the area in development, socio-demographic characteristics and travel. "Reappraisal" dealt with three levels of review of the transportation forecasts and plan to determine if they are still valid. Every five years the plan and forecast were to be updated to retain a 20-year time horizon. The third element, "service," was to assist agencies in the implementation of the plan. The "procedural development" element emphasized the need to upgrade analysis techniques. Last was the publication of an "annual report" of these activities as a means of communicating with local officials and citizens. (U.S. Dept. of Transportation, 1968)

Extensive training and technical assistance was provided by the FHWA to shift urban transportation planning into a continuing mode of operation.

Bureau of the Budget's Circular No. A-95

To implement the 1968 Intergovernmental Cooperation Act, the Bureau of the Budget issued Circular No. A-95 in July 1969, which superseded Circular No. A-82. This circular required that the governor of each state designate a "clearinghouse" at the state level and for each metropolitan area. The function of these clearinghouses was to review and comment on projects proposed for federal-aid in terms of their compatibility with comprehensive plans and to coordinate among agencies having plans and programs which might be affected by the projects. These clearinghouses had to be empowered under state or local laws to perform comprehensive planning in an area. (Washington Center, 1970)

The circular established a project notification and review system (PNRS) which specified how the review and coordination process would be carried out and the amount of time for each step in the process. The PNRS contained an "early warning" feature which required that a local applicant for a federal grant or loan notify the state and local clearinghouses at the time it decided to seek assistance. The clearinghouse had 30 days to indicate further interest in the project or to arrange to provide project coordination. This regulation was designed to alleviate the problem many review agencies had of learning of an application only after it had been prepared, and thereby having little opportunity to help shape it. (Washington Center, 1970)

Circular No. A-95 provided a most definitive federal statement of the process through which planning for urban areas should be accomplished. Its emphasis was not on substance but on process and on the inter-governmental linkages required to carry out the process.

The various acts and regulations to improve intergovernmental program coordination accelerated the creation of broader multifunctional agencies. At the state level, 39 Departments of Transportation had been created by 1977. Most of the departments had multimodal planning, programming, and coordinating functions. At the local level, there was a growing trend for

transportation planning to be performed by comprehensive planning agencies, generally those designated as the A-95 clearinghouse. (Advisory Commission, 1974)

ENVIRONMENT AND CITIZEN INVOLVEMENT

By the late 1960s the growing concern for environmental quality, particularly air pollution, and the reaction to public decisions without citizen involvement had put considerable pressures on the planning process and its ability to adapt to change.

Citizen Participation and the Two-Hearing Process

Citizen reaction to highway projects usually was most vocal at public hearings. It became clear that citizens could not effectively contribute to a highway decision by the time the project had already been designed. Many of the issues related to the basic issue of whether to build the highway project at all and the consideration of alternative modes of transportation. Consequently, in early 1969, the Federal Highway Administration (FHWA) revised Policy and Procedure Memorandum (PPM) 20-8, "Public Hearings and Location Approval." It established a two-hearing process for highway projects replacing the previous single hearing which occurred late in the project development process.

The first "corridor public hearing" was to be held before the route location was made and was designed to afford citizens the opportunity to comment on the need for and location of the highway project. The second "highway design public hearing" was to focus on the specific location and design features. This PPM also required the consideration of social, economic, and environmental effects prior to submission of a project for federal-aid. (U.S. Department of Transportation, 1976b)

It was recognized that even a two-hearing process did not provide adequate opportunity for citizen involvement and, worse, provided a difficult atmosphere for dialogue. In late 1969, the basic guidelines for the 3C

planning process were amended to require citizen participation in all phases of the planning process from the setting of goals through the analysis of alternatives. Consequently, it became the responsibility of the planning agency to seek out public views.

National Environmental Policy Act of 1969

The federal government's concern for environmental issues dates back to the passage of the Air Quality Control Act of 1955 which directed the Surgeon General to conduct research to abate air pollution. Through a series of acts since that time, the federal government's involvement in environmental matters broadened and deepened.

In 1969, a singularly important piece of environmental legislation was passed, the National Environmental Policy Act of 1969 (NEPA). This act presented a significant departure from prior legislation in that it enunciated for the first time a broad national policy to prevent or eliminate damage to the environment. The act stated that it is national policy to "encourage productive and enjoyable harmony between man and his environment."

Federal agencies were required under the act to use a systematic interdisciplinary approach to the planning and decisionmaking which affected the environment. It also required that an environmental impact statement (EIS) be prepared for all legislation and major federal actions which affect the environment significantly. The EIS was to contain information on the environmental impact of the proposed action, unavoidable impacts, alternatives to the action, the relationship between short-term and long-term impacts, and irretrievable commitments of resources. The federal agency was to seek comments on the action and its impacts from affected jurisdictions and make all information public.

The act also created the Council on Environmental Quality to implement the policy and advise the President on environmental matters.

Environmental Quality Improvement Act of 1970

The Environmental Quality Improvement Act of 1970 was passed as a companion to the NEPA. It established the Office of Environmental Quality under the Council of Environmental Quality. It was charged with assisting federal agencies to evaluate present and proposed programs, and with promoting research on the environment.

These two acts dealing with the environment mark the first reversal in over a decade of the trend to decentralize decisionmaking to the state and local levels of government. It required the federal government to make the final determination on the trade-off between facility improvements and environmental quality. Further, it created a complicated and expensive process in the requirement for preparing an EIS and for seeking comments from all concerned agencies. In this manner, the acts actually created a new planning process in parallel with the urban transportation planning process.

Clean Air Act Amendments of 1970

The Clean Air Act Amendments of 1970 reinforced the central position of the federal government to make final decisions affecting the environment. This act created the Environmental Protection Agency (EPA) and empowered it to set ambient air quality standards. Required reductions in new automobile emissions were specified in the act. It authorized EPA to require states to formulate implementation plans describing how they would achieve and maintain the ambient air quality standards. In 1971, EPA promulgated national ambient air quality standards and proposed regulations on state implementation plans (SIPs) to meet these standards. (U.S. Dept. of Transportation, 1975)

The preparation, submission, and review of the SIPs occurred outside the traditional urban transportation planning process, and, in many instances, did not involve the planning agencies developing transportation plans. This problem became particularly difficult for urban areas that could not meet the

air quality standards even if new automobiles met the air pollution emission standards. In these instances, transportation control plans (TCPs) were required which contained changes in urban transportation systems and their operation to effect the reduction in emissions. Rarely were these TCPs developed jointly with those agencies developing urban transportation plans. It took several years of dialogue between these air pollution and transportation planning agencies to mediate joint plans and policy for urban transportation and air quality.

Another impact of the environmental legislation, particularly the Clean Air Act, was the increased emphasis on short-term changes in transportation systems. In that the deadline for meeting the ambient air quality standards was fairly short, EPA was primarily concerned with actions that could affect air quality in that time frame. The actions precluded major construction and generally focused on low capital and traffic management measures. Up to this time, urban transportation planning had been focused on long-range (20 years or more) planning. (U.S. Dept. of Transportation, 1975)

BEGINNINGS OF MULTIMODAL URBAN TRANSPORTATION PLANNING

By the late 1960s, the urban transportation planning process was receiving criticism on a number of issues. It was criticized for inadequate treatment of social and environmental impacts. The planning process had still not become multimodal and was not adequately evaluating a wide-range of alternatives. Planning was focused almost exclusively on long-range time horizons; and the technical procedures to carry out planning were too cumbersome, time-consuming, and rigid to adapt to new issues quickly.

During the 1970s actions were taken to address these criticisms. In some instances legislation was passed to require that something be done. Legislation that increased funds for mass transportation and placed transit on a more equal footing with highways considerably strengthened multimodal planning and implementation.

Urban Mass Transportation Assistance Act of 1970

The Urban Mass Transportation Assistance Act of 1970 was another landmark in federal financing for mass transportation. It provided the first long-term commitment of federal funds. Until the passage of this act, federal funds for mass transportation had been limited. It was difficult to plan and implement a program of mass transportation projects over several years because of the uncertainty of future funding.

The 1970 act implied a federal commitment for the expenditure of at least \$10 billion over a 12-year period to permit confident and continuing local planning and greater flexibility in program administration. The act authorized \$3.1 billion to finance urban mass transportation beginning in fiscal year 1971. It permitted the use of "contract authority" whereby the Secretary of Transportation was authorized to incur obligations on behalf of the United

States with Congress pledged to appropriate the funds required to liquidate the obligations. This provision allowed long-term commitments of funds to be made.

This act also established a strong federal policy on transportation of elderly and handicapped persons:

"...elderly and handicapped persons have the same right as other persons to utilize mass transportation facilities and services; that special efforts shall be made in the planning and design of mass transportation facilities and services so that the availability to elderly and handicapped persons to mass transportation which they can effectively utilize will be assured...." (U.S. Dept. of Transportation, 1979b)

The act authorized that 2 percent of the capital grant and 1.5 percent of the research funds might be set aside and used to finance programs to aid elderly and handicapped persons.

The act also added requirements for public hearings on the economic, social, and environmental impacts of a proposed project and on its consistency with the comprehensive plan for the area. It also required an analysis of the environmental impact of the proposed project and for the Secretary of Transportation to determine that there was no feasible or prudent alternative to any adverse impact that might result.

Federal-Aid Highway Act of 1970

The Federal-Aid Highway Act of 1970 established the federal-aid urban highway system. The system in each urban area was to be designed to serve major centers of activity and to serve local goals and objectives. Routes on the system were to be selected by local officials and state departments cooperatively. This provision significantly increased the influence of local jurisdictions in urban highway decisions. The influence of local officials in urban areas was further strengthened by an amendment to Section 134 on urban transportation planning:

"No highway project may be constructed in any urban area of 50,000 population or more unless the responsible local officials of such urban area..have been consulted and their views considered with respect to the corridor, the location and the design of the project." (U.S. Dept. of Transportation, 1980a)

Funds for the federal-aid urban system were to be allocated to the states on the basis of total urban population within the state. The act also authorized the expenditure of highway funds on exclusive or preferential bus lanes and related facilities. This could only be done if the bus project reduced the need for additional highway construction or if no other highway project could provide the person-carrying capacity of the bus project. There had to be assurances, as well, that the transit operator would utilize the facility. An additional provision of the act authorized expenditures of highway funds on fringe and corridor parking facilities adjacent to the federal-aid urban system which were designed in conjunction with public transportation services.

This act also incorporated a number of requirements related to the environment. One required the issuance of guidelines for full consideration of economic, social, and environmental impacts of highway projects. A second related to the promulgation of guidelines for assuring that highway projects were consistent with SIPs developed under the Clean Air Act.

As a result of the 1970 highway and transit acts, projects for both modes would have to meet similar criteria related to impact assessment and public hearings. The highway act also increased the federal matching share to 70 percent for all non-Interstate highways, making it comparable to the 66-2/3 percent federal share for mass transportation. In addition, the highway act legally required consistency between SIPs and urban highway plans.

Mt. Pocono Conference on Urban Transportation Planning

In recognition of the widespread awareness that urban transportation planning had not kept pace with changing conditions, a conference on Organization for Continuing Urban Transportation Planning was held at Mt. Pocono, Pennsylvania, in 1971. The focus of this conference was on multimodal transportation planning evolving from the earlier conferences which focused on highway planning and the separation between planning and implementation. (Highway Research Board, 1973a)

The conference recommended close coordination of planning efforts as a means of achieving orderly development of urban areas and relating the planning process more closely to decisionmaking processes at all levels of government. It urged that urban planning be strengthened through state enabling legislation and bolstered by equitable local representation. Further, citizen participation should occur continually throughout the planning process but should not be considered as a substitute for decisionmaking by elected officials. (Advisory Commission, 1974)

All comprehensive and functional planning, including multimodal transportation planning, should be integrated, including the environmental impact assessment process. The planning process should continually refine the long-range regional transportation plan at the sub-area scale and focus on a 5- to 15-year time frame so that planning would be more relevant to programming and project implementation. Transportation planning should consider service levels consistent with local goals, and a wide range of alternatives should be evaluated. The impact of changes in the transportation system should be monitored to improve future decisionmaking and planning efforts. (Advisory Commission, 1974)

The conference report went on to urge that this more inclusive kind of planning be supported by flexible funding from the federal level. This was to be done to avoid a preference for any mode so as to not unbalance specific urban transportation decisions contrary to local goals and priorities. The

conference also supported additional resources for planning, research, and training.

DOT Initiatives Toward Planning Unification

The U.S. Department of Transportation had been working for several years on integrating the individual modal planning programs. In 1971, DOT established a trial program of intermodal planning in the field. The overall objective of the program was to integrate the modal planning programs at the urban-area level rather than at the federal level. With the successful completion of the trial program, the DOT implemented the program on a permanent basis by establishing intermodal planning groups (IPGs) in each of the 10 DOT regions. The IPGs were charged with responsibility for obtaining and reviewing an annual unified work program for all planning activities in an urban area; for obtaining agreement on a single recipient agency for areawide transportation planning grants in each urban area; and, for obtaining a short-term (3- to 5-year) transportation capital improvement program, updated annually, from each recipient agency. (U.S. Dept. of Transportation and U.S. Dept. of Housing and Urban Development, 1974)

Also in 1971, a departmental transportation planning committee was established to promote a coordinated department-wide process for urban-area and statewide transportation planning and for unified funding of such planning. As a result of the efforts of the committee, a DOT order was issued in 1973 which required that all urbanized area submit annual unified work programs for all transportation planning activities as a condition for receiving any DOT planning funds. These work programs must include all transportation-related planning activities, identification of the agency responsible for each activity, and the proposed funding sources. The work programs are used to rationalize planning activities and joint funding under the DOT planning assistance programs. (U.S. Dept. of Transportation and U.S. Dept. of Housing and Urban Development, 1974)

Process Guidelines for Highway Projects

The Federal-aid Highway Act of 1970 required that guidelines be issued to assure that possible adverse economic, social, and environmental effects be considered in developing highway projects and that decisions on these projects be made in the best overall public interest. Initially, guidelines were developed specifying requirements and procedures for evaluating for each of the impact areas. These guidelines were presented and discussed at a Highway Research Board Workshop during July 1971 in Washington, D.C. The primary conclusion of the workshop was that full consideration of adverse impacts and of decisions in the best overall public interest could not be assured by extensive technical standards. It would depend upon the attitudes, capabilities, organization, and procedures of the highway agencies responsible for developing the projects. (U.S. Congress, 1972)

Based on the workshop recommendations and other comments, the emphasis of the guidelines was shifted to the process used in developing highway projects. In September 1972 FHWA issued PPM 90-4, "Process Guidelines (Economic, Social, and Environmental Effects of Highway Projects)." These guidelines required each state to prepare an Action Plan spelling out the organizational arrangement, the assignment of responsibilities, and the procedures to be followed in developing projects in conformance with the law. The Action Plan had to address the process for the identification of social, economic, and environmental impacts, considerations of alternative courses of action, use of a systematic interdisciplinary approach, and the involvement of other agencies and the public. Flexibility was provided to the States to develop procedures which were adjusted to their own needs and conditions.

The use of process guidelines caused an evolution in the manner in which highway projects were developed. The staffs of highway agencies were exposed to the views of other agencies and the public. Professionals with skills in the social and environmental areas were brought into the process. Gradually, the project development process became more open and embraced a broader range of criteria in reaching decisions.

Williamsburg Conference on Urban Travel Forecasting

By the latter part of the 1960s, use of the conventional urban travel forecasting procedures pioneered in the late 1950s and early 1960s was wide spread but criticism of them was growing. Critics argued that conventional procedures were time-consuming and expensive to operate and required too much data. The procedures were designed for long-range planning of major facilities and were not suitable for evaluation of the wider range of options which were of interest; such as, low-capital options, demand-responsive systems, pricing alternatives and vehicle restraint schemes. Policy issues and options had changed, but travel demand forecasting techniques had not.

These issues were addressed at a conference on Urban Travel Demand Forecasting held at Williamsburg, Virginia, in December 1972, sponsored by the Highway Research Board and the U.S. Department of Transportation. The conference concluded that there was a need for travel forecasting procedures that were sensitive to the wide range of policy issues and alternatives to be considered, quicker and less costly than conventional methods, more informative and useful to decisionmakers, and in a form that nontechnical people could understand. Further, that improvements in methodology were urgently needed. And, that significant improvements in capabilities could be achieved within three years based on the results of available research. (Brand and Manheim, 1973)

The conference recommended several simultaneous paths to improve travel forecasting capabilities. First, was to upgrade existing methodology with the results of recent research. Second, was to pilot test emerging procedures in several urban areas. Third, was research to improve the understanding of travel behavior including before-after studies, consumer theory, psychological theory and location behavior. Fourth, research was needed to transform the results of travel behavior research into practical forecasting techniques. Fifth, that a two-way dissemination program was necessary to get new methods into the field and for the results of these applications to flow back to the researchers to improve the methods. (Brand and Manheim, 1973)

The conferees were optimistic that the conversion to new improved behavioral methods was soon to be at hand. They did recognize that a substantial amount of research was going to be necessary. The Williamsburg conference did in fact launch a decade of extensive research and activity in disaggregate urban travel demand forecasting.

Federal-Aid Highway Act of 1973

The Federal-Aid Highway Act of 1973 contained two provisions which increased the flexibility in the use of highway funds for urban mass transportation in the spirit of the Mt. Pocono conference. First, federal-aid urban system funds were to be used for capital expenditures on urban mass transportation projects. This provision took effect gradually, but was unrestricted starting in FY 1976. Second, funds for interstate highway projects could be relinquished and replaced by an equivalent amount from the general fund and spent on mass transportation projects in a particular state. The relinquished funds reverted back to the highway trust fund.

This opening up of the highway trust fund for urban mass transportation was a significant breakthrough sought for many years by transit supporters. These changes provided completely new avenues of federal assistance for funding urban mass transportation.

The 1973 act had other provisions related to urban mass transportation. First, it raised the federal matching share for urban mass transportation projects from 66-2/3 percent to 80 percent, except for urban system substitutions, which remain at 70 percent. Second, it raised the level of funds under the UMTA capital grant program by \$3 billion, to \$6.1 billion. Third, it permitted expenditure of highway funds for bus-related public transportation facilities, including fringe parking on all federal-aid highway systems.

The act called for realigning all federal-aid systems based on functional usage. It authorized expenditures on the new federal-aid urban system and

modified several provisions related to it. "Urban" was defined as any area of 5,000 or more in population. Apportioned funds for the system were earmarked for urban areas of 200,000 or more population. Most important, it changed the relationship between the state and local officials in designating routes for the system. It authorized local officials in urbanized areas to choose routes with the concurrence of state highway departments. (Parker, 1977)

Two additional provisions related directly to planning. For the first time urban transportation planning was funded separately. One-half of 1 percent of all federal-aid funds were designated for this purpose and apportioned to the states on the basis of urbanized area population. These funds were to be made available to the metropolitan planning organizations (MPOs) responsible for comprehensive transportation planning in urban areas.

The 1973 Federal-Aid Highway Act took a significant step toward integrating and balancing the highway and mass transportation programs. It also increased the role of local officials in the selection of urban highway projects and broadened the scope of transportation planning by MPOs.

1972 and 1974 National Transportation Studies

Although urban transportation planning had been legislatively required for over a decade, the results had not been used in the development of national transportation policy. Beyond that, a composite national picture of these urban transportation plans did not exist even though they were the basis for capital expenditure decisions by the federal government. In the early 1970s, the Department of Transportation conducted two national transportation studies to inventory and assess the current and planned transportation system as viewed by the states and urban areas.

The two studies differed in their emphasis. The 1972 National Transportation Study obtained information on the existing transportation system as of 1970, the transportation needs for the 1970-1990 period, and short-range (1974-

1978) and long-range (1979-1990) capital improvement programs under three federal funding assumptions. (U.S. Dept. of Transportation, 1972b). The study showed that the total transportation needs of the states and urban areas exceeded the financial resources of the nation to implement them and discussed the use of low-capital alternatives to improve the productivity of the existing transportation system, particularly in urban areas.

The 1974 National Transportation Study related more closely to the ongoing urban transportation planning processes. (U.S. Dept. of Transportation, 1975) It obtained information on the 1972 inventories, long-range plans (1972-1990), and short-range programs (1972-1980) for the transportation system in a more comprehensive manner than did the 1972 study. The transportation system for all three periods was described in terms of the supply of facilities, equipment, and services, travel demand, system performance, social and environmental impacts, and capital and operating costs. Information on low-capital alternatives and new technological systems was also included. The 1972-1980 program was based on a forecast of federal funds that could reasonably be expected to be available and an estimate of state and local funds for the period. (Weiner, 1974) This study again demonstrated that the long-range plans were overly ambitious in terms of the financial resources that might be available for transportation. Further, it showed that even after the expenditure of vast amounts of money for urban transportation, urban transportation systems would differ little in character in the foreseeable future. (Weiner, 1975b)

The National Transportation Study process introduced the concept of tying state and urban transportation planning into national transportation planning and policy formulation. It stressed multimodal analysis, assessment of a wide range of measures of the transportation system, budget limitations on plans and programs, and increasing the productivity of the existing transportation system. Although these concepts were not new, it was the first time that they had been incorporated into such a vast national planning effort. (Weiner, 1976)

National Mass Transportation Assistance Act of 1974

The National Mass Transportation Assistance Act of 1974 authorized for the first time the use of federal funds for transit operating assistance. It thus continued the trend to broaden the use of federal urban transportation funds and thus provide state and local officials more flexibility. This act was the culmination of a major lobbying effort by the transit industry and urban interests to secure federal operating assistance.

The act authorized \$11.8 billion over a 6-year period. Almost \$4 billion was to be allocated to urban areas by a formula based on population and population density. The funds could be used for either capital projects or operating assistance. The funds for areas over 200,000 in population were attributable to those areas. The funds were to be distributed to "designated recipients" jointly agreed to by the governor, local elected officials and publicly-owned operators of mass transportation services. For areas under 200,000 in population, the governor was designated to allocate the funds. Of the remaining \$7.8 billion, \$7.3 billion was made available for capital assistance at the discretion of the Secretary of Transportation and the remainder was for rural mass transportation. Funds used for capital projects were to have an 80 percent federal matching share. Operating assistance was to be matched 50 percent by the federal government (U.S. Dept. of Transportation 1976)

Section 105(g) of the act required applicants for transit projects to meet the same planning statute as Section 134 of the highway act. Finally, highway and transit projects were subject to the same long-range planning requirement. Although many urbanized areas already had a joint highway/transit planning process, this section formalized the requirement for multimodal planning.

The act also required transit systems to charge elderly and handicapped persons fares which were half regular fares when they traveled in off-peak hours. This was a further condition to receiving federal funds.

The act created a new Section i5 which required the Department of Transportation to establish a data reporting system for financial and operating information and a uniform system of accounts and records. After July 1978, no grant could be made to any applicant unless they were reporting data under both systems.

TRANSITION TO SHORT-TERM PLANNING

As planning for the Interstate Highway System was being completed, attention turned to increasing the productivity and efficiency of existing facilities. In planning for new major regional transportation facilities, many urban areas had neglected maintaining and upgrading other facilities. However, environmental concerns, the difficulty of building innercity freeways, renewed interest in urban mass transit and the energy crisis gave added impetus to the focus on more immediate problems. Signs were becoming evident of the changing emphasis to shorter-term time horizons and the corridor level in transportation planning. Gradually, planning shifted to maximizing the use of the existing system with a minimum of new construction. Further, the connection was strengthened between long-term planning and the programming of projects. (Weiner, 1982)

Arab Oil Embargo

In October 1973, the Organization of Petroleum Exporting Countries (OPEC) embargoed oil shipments to the United States and in doing so, began a new era in transportation planning. The importance of oil is so paramount to the economy and, in particular, the transportation sector that oil shortages and price increases gradually became one of the major issues in transportation planning.

The immediate reaction to the oil embargo was to address the specific emergency. President Nixon signed the Emergency Petroleum Allocation Act of 1973 in November of that year which established an official government allocation plan for gasoline and home heating fuel. It regulated the distribution of refined petroleum products by freezing the supplier-purchaser relationships and specifying a set of priority users. The act also established price controls on petroleum. It gave the President authority to

set petroleum prices, not to exceed \$7.66 a barrel. This authority was to terminate on September 30, 1981.

The Emergency Highway Energy Conservation Act, signed on January 2, 1974, established a national 55 miles per hour speed limit to reduce gasoline consumption. It was extended indefinitely on January 4, 1975. (U.S. Dept. of Transportation, 1979c) It also provided that Federal-aid highway funds could be used for ridesharing demonstrating programs.

As the immediate crisis abated, the focus shifted to longer-term actions and policies to reduce the nation's dependence on oil, especially imported oil. The Energy Policy and Conservation Act of 1975 was passed by Congress to ensure that automobile gasoline consumption would be reduced to the lowest level possible and to promote energy conservation plans. As directed, the U.S. Department of Transportation through the National Highway Traffic Safety Administration (NHTSA) promulgated regulations which required the corporate average fuel economy (CAFE) to be raised from 18.0 miles per gallon in 1978 to 27.5 in 1985 and beyond. (U.S. Dept. of Transportation, 1979c)

Reaction to the energy crisis of 1973-1974 evolved slowly at the local level as information and analysis tools gradually appeared. Most local planning agencies knew little about energy consumption and conservation and needed to learn about this new issue which had been thrust upon them. It was not until the second crisis in 1979 with fuel shortages and sharply increasing prices that energy issues were thoroughly integrated into urban transportation planning.

Joint Highway-Transit Planning Regulations

UMTA and FHWA had worked for several years on joint regulations to guide urban transportation planning. Final regulations were issued to take effect in October 1975. They superseded all previous guidelines, policies, and regulations issued on urban transportation planning by UMTA and FHWA.

The regulations provided for the joint designation of MPOs to carry out planning and required agreements on the division of responsibility where the MPOs and A-95 agencies were different. A multiyear prospectus and annual unified work program had to be submitted specifying all transportation-related planning activities for an urban area as a condition for receiving federal planning funds.

The urban transportation planning process was required to produce a long-range transportation plan, which had to be reviewed annually to confirm its validity. The transportation plan had to contain a long-range element and a shorter-range "transportation systems management element" (TSME) for improving the operation of existing transportation systems without new facilities.

A multiyear "transportation improvement program" (TIP) also had to be developed consistent with the transportation plan. The TIP had to include all highway and transit projects to be implemented within the coming five years. It, thereby, became the linkage between the planning and programming of urban transportation projects. It also brought together all highway and transit projects into a single document that could be reviewed and approved by decisionmakers. The TIP had to contain an "annual element" which would be the basis for the federal funding decisions on projects for the coming year.

The regulations provided for a joint annual certification of the planning process. This certification was required as a condition for receiving federal funds for projects. The regulations incorporated previously legislated requirements related to social, economic, and environmental impact analysis, air quality planning, and the elderly and handicapped.

These joint regulations applied to all urban highway and transit programs including those for transit operating assistance. They represented the most important action up to that time to bring about multimodal urban transportation planning and programming of projects. They changed the

emphasis from long-term planning to shorter range transportation system management, and provided a stronger linkage between planning and programming. These regulations were another turning point in the evolution of urban transportation planning which set the tone for the next several years.

Office of Technology Assessment's Report on Automated Guideway Transit

By the time the report Tomorrow's Transportation: New Systems for the Urban Future (Cole, 1968) was published in 1968, UMTA barely had a research program in the area of new urban transit technologies. A small grant had been made for development of Westinghouse's Transit Expressway and several new system feasibility studies were begun in 1967. By 1970, decisions had been reached to proceed with funding of three major automated guideway transit (AGT) demonstration projects - the Transpo 72 exhibition and two other demonstrations. (U.S. Congress, 1975)

Transpo 72 was held at the Dulles International Airport near Washington, D.C. in the spring of 1972. Four companies built and operated prototype AGT systems for public demonstration. In 1971, UMTA awarded a grant to the Vought Corporation to build a group rapid transit (GRT) system, Airtrans, as the internal circulation system for the Dallas-Ft. Worth Airport. Service began in 1974. The third GRT demonstration connected three separate campuses of West Virginia University at Morgantown. Boeing Aerospace Company became the manager of the project which was largely based on a proposal by Alden Self-Transit Systems Corporation. Public service began in October 1975. The system was expanded with an UMTA grant and operations began in July 1979. (U.S. Dept. of Transportation, 1983b)

By the end of 1975, another 18 systems were in operation or under construction. They were all simple shuttle loop transit (SLT) systems at airports, amusement parks and shopping centers. All were funded with private funds. (U.S. Dept. of Transportation, 1983b)

In September 1974, the U.S. Senate Transportation Appropriations Committee directed the Congressional Office of Technology Assessment (OTA) to assess the potential for automated guideway transit systems. The report, produced in June 1975, was a comprehensive assessment of AGT systems and contained five reports from panels of specialists. Overall, the report concluded that the \$95 million spent on AGT research and development up to that time by UMTA had not produced the direct results expected in the form of fully developed systems in an urban setting. OTA went further in concluding that insufficient funding was directed at new systems research and that the program needed restructuring with a clarification of objectives. (U.S. Congress, 1975)

The OTA found that SLT systems were promising for specialized urban transportation problems. With regard to the more sophisticated GRT systems, OTA found that a number of cities had shown interest, but there were serious technical problems. As to the small vehicle personal rapid transit (PRT) systems, only preliminary studies were recommended. A major conclusion was that the program emphasized hardware development, but further research was needed on social, economic and environmental impacts. Also UMTA had not developed a mechanism for qualifying new technological systems for capital grants. (U.S. Congress, 1975)

In response to the study, UMTA launched the AGT Socio-Economic Research Program in 1976. It consisted of assessments of existing AGT installations, studies of capital and operating costs, travel market analyses, and an assessment of AGT technology compared to other alternatives in urban area application. (U.S. Dept. of Transportation, 1983b)

A review of local planning studies conducted under this program found that more than 20 cities had considered AGT systems. The conclusion reached was that there was considerable uncertainty with regard to costs, public acceptance, reliability, crime and land use impacts. (Lee et.al., 1978) Planning procedures and data were not available to adequately assess new technological systems as an alternative to conventional urban technologies.

Also in 1976, UMTA initiated the Downtown People Mover (DPM) program. It was designed to demonstrate the application of SLT type system in an urban environment. Impact studies were to be conducted to assess the systems with regard to patronage, community acceptance, reliability, maintainability, safety and economics. Four cities were selected for these demonstrations: Cleveland, Houston, Los Angeles and St. Paul. Three other cities were approved for participation using their existing commitments of Federal funds: Detroit, Miami and Baltimore. (Mabee and Zumwalt, 1977) None of these cities have constructed DPMs although Miami is still planning to do so.

Policy on Major Urban Mass Transportation Investments

The level of federal funds for urban mass transportation had increased dramatically since 1970. However, the requests for federal funds from urban areas outpaced that increase. In particular, there was a resurgence of the conviction that rail transit systems could largely solve the problems of congestion and petroleum dependence while promoting efficient development patterns. Consequently, the need to assure that these funds be used effectively and productively became apparent.

UMTA set forth its views on this issue in the document, Preliminary Guidelines and Background Analysis. It was prepared for review at a conference on Evaluation of Urban Transportation Alternatives held at Airlie House, Virginia, in February 1975. The conference was attended by a broad spectrum of persons from all levels of government, the transit industry, consultants, universities, and private citizens. The conference report indicated a number of concerns with the guidelines which were transmitted to UMTA. (Transportation Research Board, 1977)

With the assistance of the conference findings, UMTA developed a draft policy statement to guide future decisions regarding federal assistance in the funding of major mass transportation projects. This Proposed Policy on Major Urban Mass Transportation Investments was published in August 1975. It embodied a number of principles.

First, areawide transportation improvement plans should be multimodal and include regionwide and community-level transit services. Second, major mass transportation investment projects should be planned and implemented in stages to avoid premature investment in costly fixed facilities and to preserve maximum flexibility to respond to future unknowns. Third, full consideration should be given to improving the management and operation of existing transportation systems. Fourth, the analysis of alternatives should include a determination of which alternative meets the local area's social, environmental, and transportation goals in a cost effective manner. And fifth, full opportunity should be provided for involvement of the public and local officials in all phases of the planning and evaluation process. (Transportation Research Board, 1977)

UMTA stated that the level of federal funding would be based on a cost-effective alternative which meets the urban area's needs and goals in a 5- to 15-year time frame and which was consistent with the long-range transportation plan.

A second Conference on Urban Transportation Alternative Analysis was held in March/April 1976 at Hunt Valley, Maryland. This conference, too, was attended by a broad spectrum of the professional community. There was considerable discussion on several issues including the criteria to be used to measure cost-effectiveness, where the cost-effectiveness analysis fit in the overall planning process and the differences in the project development process between transit and highways. (Transportation Research Board, 1977)

Using the recommendations from the second conference, UMTA prepared and published a final policy statement in September 1976. (U.S. Dept. of Transportation, 1976b) Although changes in the proposed policy were made, the principles remained basically unchanged.

In February 1978, UMTA provided further elaboration in its Policy Toward Rail Transit. It stated that new rail transit lines or extensions would be

funded in areas where population densities, travel volumes and growth patterns indicated the need. Preference would be given to corridors serving densely populated urban centers. It reaffirmed the principles of analysis of alternatives, including TSM measures, incremental implementation and cost-effectiveness. The policy added the requirement that the local area had to commit itself to a program of supportive actions designed to improve the cost-effectiveness, patronage and prospect for economic viability of the investment. This included automobile management policies; feeder service; plans, policies and incentives to stimulate high density private development near stations; and other measures to revitalize nearby older neighborhoods and the central business district. With this policy supplement, rail transit was to become a tool for urban redevelopment.

Federal-Aid Highway Act of 1976

The Federal-Aid Highway Act of 1976 broadened the use of funds from trade-ins of non-essential Interstate routes. The process of increasing flexibility in the use of Interstate funds began with Section 103(e)(2), referred to as the Howard-Cramer Amendment, of the Federal-Aid Highway Act of 1968. It allowed withdrawal of a non-essential Interstate route and the use of the funds on another Interstate route in the state.

In the Federal-Aid Highway Act of 1973, Section 103(e)(4) allowed urbanized areas to withdraw a non-essential Interstate segment within the area upon joint request of local elected officials and the governor. An equivalent amount of funds could then be spent from general revenues for mass transportation capital projects at an 80 percent federal matching share. The 1976 act allowed the funds from the Interstate substitution to be used also for other highways and busways serving those urbanized areas. (Bloch, et. al., 1982)

The 1976 act also changed the definition of construction to allow federal funds to be expended on resurfacing, restoration and rehabilitation (3R) of highways. This was done in recognition of growing problem of highway

deterioration. The completion date for the Interstate system was extended to September 30, 1990. And, the act expanded the transferability of federal funds among different federal-aid systems thereby increasing flexibility in the use of these funds.

Urban System Study

The joint highway transit planning regulations were controversial during their preparation and after their issuance. The states contended that the federal requirement to create metropolitan planning organizations (MPOs) with the responsibility to program funds preempted the states' right of self-determination. In essence, they argued that MPOs were another level of government. Those at the local level of government were more supportive of the regulations especially the greater authority to select projects and program funds. But, there were widespread concerns that the planning and programming process had become too inflexible and cumbersome. (U.S. Dept. of Transportation, 1976a)

Consequently, the Federal-Aid Highway Act of 1976 required a study of the various factors involved in the planning, programming, and implementation of routes on the urban system. The study was conducted jointly by FHWA and UMTA and submitted to Congress in January 1977. (U.S. Dept. of Transportation, 1976a) It was a major undertaking involving a liaison group of 12 organizations representing state and local interests, site visits to 30 urbanized areas and field data on the remaining areas.

The study concluded that the planning requirements were being carried out responsibly by all participants. This was true in spite of the controversy over the responsibilities of the MPO. They also found that the flexibility in the use of urban system funds for transit was not widely used. Only 6.4 percent of the funds were being used for transit projects. It was concluded that overall the complexity of Federal requirements deterred many local governments from using their federal urban system funds. (Heanue, 1977) The study recommended that no changes should be made at that time. The

process was new and participants had not had sufficient time to adjust. Even though there was some confusion and controversy, the process was working properly. (U.S. Dept. of Transportation, 1976a)

Clean Air Act Amendments of 1977

The Clean Air Act Amendments of 1977 increased the flexibility and local responsibility in the administration of the Clean Air Act. The amendments required state and local governments to develop revisions to state implementation plans (SIPs) for all areas where the national ambient air quality standards had not been attained. The revised SIPs were to be submitted to the Environmental Protection Administration (EPA) by January 1, 1979, and approved by May 1, 1979.

The revised plans had to provide for attainment of national ambient air quality standards by 1982, or in the case of areas with severe photochemical oxidant or carbon monoxide problems, not later than 1987. In the latter case, a state must demonstrate that the standards cannot be met with all reasonable stationary and transportation control measures. The plans also must provide for incremental reductions in emissions ("reasonable further progress") between the time the plans are submitted and the attainment deadline. If a state failed to submit a SIP or if EPA disapproved the SIP and the state failed to revise in a satisfactory manner, EPA was required to promulgate regulations establishing a SIP by July 1, 1979. If, after July 1, 1979, EPA determined that a state was not fulfilling the requirements under the act, it was to impose sanctions. This would include stopping federal-aid for highways. (Cooper and Hidinger, 1980)

In many major urbanized areas, the revised SIPs required the development of transportation control plans (TCPs) which included strategies to reduce emissions from transportation-related sources by means of structural or operational changes in the transportation system. Since state and local governments implement changes in the transportation system, the act strongly encouraged the preparation of transportation elements of the SIP by

metropolitan planning organizations. These local planning organizations were responsible for developing the transportation control measure element of the SIPs. (Cooper and Hiding, 1980)

From 1978 to 1980, the Department of Transportation and the Environmental Protection Agency, after long negotiations, jointly issued several policy documents to implement the Clean Air Act's transportation requirements. One of these, signed in June 1978, was a "Memorandum of Understanding" (MOU) which established the means by which the DOT and the EPA would assure the integration of transportation and air quality planning. A second one issued also in June 1978, "Transportation Air Quality Planning Guidelines" described the acceptable planning process to satisfy the requirements. Another, in March 1980, was a notice containing guidelines for receiving air quality planning grants under section 175 of the act. (Cooper and Hiding, 1980)

In January 1981, DOT issued regulations on air quality conformance and priority procedures for use in federal highway and transit programs. The regulations required that transportation plans, programs and projects conform with the approved SIPs in areas which had not met ambient air quality standards, termed "nonattainment areas." In those areas, priority for transportation funds was to be given to "transportation control measures" (TCMs) which contributed to reducing air pollution emissions from transportation sources. Where an area's transportation plan or program was not in conformance with the TCP, "sanctions" were to be applied which prohibited the use of federal funds on major transportation projects. (U.S. Dept. of Transportation, 1981b)

The 1977 Clean Air Act Amendments certainly gave impetus to short-range planning and transportation system management strategies. It also added a new dimension to the institutional and analytical complexity of the planning process.

1978 National Urban Policy Report

In Title VII of the Housing and Urban Development Act of 1970, the Congress required preparation of biennial reports on national growth and development. Congress recognized the need to analyze the many aspects of the nation's growth in a systematic manner with the objective of formulating a national urban growth policy. The first report, transmitted to Congress in 1972, discussed the broad subject of national growth including both rural and urban areas. (Domestic Council, 1972) The 1974 report focused on the dominant role of the private sector in determining growth and the ways in which the public and private sector could influence development patterns. The 1976 report discussed the decline of older Northeastern cities, the constraints of energy, environmental resources, and the need to conserve and rehabilitate existing housing and public facilities. (Domestic Council, 1976)

The National Urban Policy and New Community Development Act of 1977 amended the 1970 act to designate the report the "National Urban Policy Report" rather than the more general "Report on Urban Growth." (Domestic Council, 1976) Less than a year later, on March 27, 1978, President Carter presented his Message to Congress on National Urban Policy. The policy was designed to build a new Partnership to Conserve America's Communities involving all levels of government, the private sector, and neighborhood and voluntary organizations. It contained a number of proposals to improve existing programs and for new initiatives with the purpose of revitalizing distressed central cities and older suburbs. (U.S. Dept. of Housing and Urban Development, 1978)

The President's Message was followed in August by the President's 1978 National Urban Policy Report. (U.S. Dept. of Housing and Urban Development, 1978) Like its predecessors, the report discussed the demographic, social and economic trends in the nation's urban areas. But, it was the first report to recommend a national urban policy. The recommendations in the Report and the President's Message were developed

by an inter-departmental committee called the Urban and Regional Policy Group. The Group worked for a year with extensive public involvement to formulate its analysis of the problems and recommendations (Urban and Regional Policy Group, 1978).

The urban policy consisted of nine objectives. The first urban policy objective was, "Encourage and support efforts to improve local planning and management capacity and the effectiveness of existing federal programs by coordinating these programs, simplifying planning requirements, reorienting resources, and reducing paperwork." Other objectives called for greater state, private sector and voluntary involvement to assist urban areas. Several objectives were for fiscal relief for distressed communities and assistance to disadvantaged persons. The last objective was for an improved physical environment and reduced urban sprawl. (U.S. Dept. of Housing and Urban Development, 1978)

A wide range of legislative and administrative actions were taken to implement the national urban policy. (U.S. Dept. of Housing and Urban Development, 1980) The Department of Transportation, FHWA and UMTA, issued guidance for evaluating the impact of major transportation projects and investments urban centers. It required an analysis of highways and transit: on the development, tax, employment, accessibility and environmental impacts on central cities; on energy conservation; on minorities and neighborhoods; so that improvements to existing facilities are considered first using TSM measures and repair and rehabilitation; and to assure that the investments are cost-effective. (U.S. Dept. of Transportation, 1979e)

The new national urban policy gave added impetus to the shift from constructing new facilities to managing, maintaining and replacing existing facilities. It was rooted in the belief that mobility could be assured despite energy, environmental and financial constraints. The key was to manage the use of the automobile in the city better. The challenge was for the urban transportation planning process to maintain and enhance mobility while meeting these other objectives. (Heanue, 1980)

Surface Transportation Assistance Act of 1978

The Surface Transportation Assistance Act of 1978 was the first act which combined highway, public transportation and highway safety authorizations in one piece of legislation. It provided \$51.4 billion for the fiscal years 1979 through 1982, with \$30.6 billion for highways, \$13.6 billion for public transportation and \$7.2 billion for highway safety. It is the first time that authorizations for the highway program were made for a four-year period. Highway Trust Fund taxes were extended five years to 1984 and the fund itself to 1985.

Title I, the Federal-Aid Highway Act of 1978, accelerated completion of the National System of Interstate and Defense Highways. It concentrated funds on projects that were ready to be constructed by changing the availability of a state's apportionment from four to two years. If the funds were not used, they could be reallocated to states with projects ready to go. The act withdrew authority to replace one Interstate route with another. It placed a deadline of September 30, 1983, on substituting public transportation or other highway projects for withdrawn Interstate routes. The federal share for both highway and transit substitute projects was increased to 85 percent. The act required that environmental impact statements for Interstate projects be submitted by September 30, 1983, and that they be under contract or construction by September 30, 1986, if sufficient federal funds were available. If the deadlines were not met, the Interstate route or substitute project was to be eliminated.

The act also raised the federal share for non-Interstate highways from 70 to 75 percent. It further increased the allowable amount of funds that can be transferred among federal-aid systems to 50 percent. The eligibility of federal funds for carpools and vanpools was made permanent. The amount of \$20 million annually for fiscal years 1979 through 1982 was authorized for bicycle projects. The act substantially increased the funding for bridge replacement and rehabilitation to \$1 billion annually.

Title III, the Federal Public Transportation Act of 1978, expanded the Section 5 Formula Grant Program. The basic program of operating and capital assistance was retained with the same population and population density formula at higher authorization levels. A "second tier" program was authorized with the same project eligibility and apportionment formula. However, the funds are initially split so that 85 percent went to urbanized areas over 750,000 in population and the remaining 15 percent to smaller areas. A third tier was established for routine purchases of buses and related facilities and equipment. A new fourth tier replaced the Section 17 and 18 commuter rail programs. The funds could be used for commuter rail or rail transit capital or operating expenses. The funds were apportioned two-thirds based on commuter rail vehicle miles and route miles and one-third on rail transit route miles.

The act changed the availability of funds for transit from two to four years. It formalized the "letter of intent" process whereby the federal government commits funds for a transit project in the Section 3 Discretionary Grant Program. Public hearings were required for all general increases in fares or substantial changes in service. A small formula grant program for non-urbanized areas (Section 18) was established for capital and operating assistance. Apportioned on non-urbanized area population, it authorized an 80 percent federal share for capital projects and 50 percent for operating assistance. The act also established an intercity bus terminal development program, intercity bus service operating subsidy program and human resources program for urban transit systems.

The urban transportation planning requirement was changed in an identical fashion in the highway and transit titles. Energy conservation was included as a new goal in the planning process and alternative transportation system management strategies were required to be evaluated. The designation of Metropolitan Planning Organizations was to be by agreement among general purpose units of local government and in cooperation the governor. For the transit program, it was further required that plans and programs encourage to the maximum extent feasible the participation of private enterprise.

Funding for transit planning grants was set at 5.5 percent of Section 3 appropriations.

A Buy American provision was included to apply to all contracts over \$500,000. The provision could be waived if: its application was inconsistent with the public interest; domestic supplies were not available or of unsatisfactory quality; or, if the use of domestic products would increase the cost over 10 percent.

National Energy Act of 1978

In 1979, Iran cut off crude oil shipments to Western nations causing shortages of oil products, especially gasoline, and price increases. Most of the regulations implemented in 1973 and 1974 were still in effect and basically unchanged. (Diesel fuel prices had been deregulated in 1976). During the intervening years, other legislation was passed to stimulate oil production and foster conservation. (Schueftan and Ellis, 1981) The Department of Energy Organization Act of 1977 brought together most Federal energy function under a single cabinet level department.

In October 1978, the Congress passed the National Energy Act which was composed of five bills. The National Energy Conservation Policy Act of 1978 extended two state energy conservation programs which required states to undertake specific conservation actions including the promotion of carpools and vanpools. The Powerplant and Industrial Fuel Use Act of 1978 required Federal agencies to conserve natural gas and petroleum in programs which they administered. (Dept. of Energy, 1978) To implement Section 403(b) of the act, President Carter signed Executive Order 12185 in December 1979 extending existing efforts to promote energy conservation through federal-aid programs.

The DOT issued final regulations in August 1980 in compliance with the Executive Order. These regulations required that all phases of transportation projects from planning to construction and operations be

conducted in a manner that conserves fuel. It incorporated energy conservation as a goal into the urban transportation planning process and required an analysis of alternative TSM improvements to reduce energy consumption. (U.S. Dept. of Transportation, 1980c)

Other actions affected urban transportation and planning. President Carter signed an Executive Order in April 1979 which began the phased decontrol of petroleum prices. By September 30, 1981, petroleum prices were to be completely set through the free market. This process was accelerated by President Reagan through an Executive Order in January 1981 which immediately terminated all price and allocation controls. (Cabot Consulting Group, 1982)

The Emergency Energy Conservation Act of 1979, which was signed in November 1979, required the President to establish national and state conservation targets. States were to submit state emergency conservation plans that would meet the targets. The act expired in July 1983 without targets being set nor plans prepared. However, many states became active in contingency planning for a potential future energy emergency. (Cabot Consulting Group, 1982)

Energy conservation had become integrated into the urban transportation planning process as a result of federal and state legislation and regulation. It gave further impetus to reducing the use of automobiles and for emphasis on transportation system management. Energy contingency planning became more widespread by planning organizations, transit authorities and highway departments.

Council on Environmental Quality's Regulations

The Council on Environmental Quality (CEQ) issued final regulations on November 29, 1978, establishing uniform procedures for implementing the procedural provisions of the National Environmental Policy Act of 1969. They applied to all federal agencies and took effect on July 30, 1979. They were

issued because the 1973 CEQ Guidelines for preparing environmental impact statements (EISs) were not viewed consistently by all agencies leading to differences in interpretations. (Council on Environmental Quality, 1978)

The regulations embodied several new concepts designed to make the EIS more useful to decisionmakers and the public, and to reduce paperwork and delays. First, the regulations created a "scoping" process to provide for the early identification of significant impacts and issues. It also provided for allocating responsibility for the EIS among the lead agency and cooperating agencies. The scoping process was to be integrated with other planning activities. (Council on Environmental Quality, 1978)

Second, the regulations permitted "tiering" of the EIS process. This provided that environmental analyses completed at a broad scale (e.g., region) need not be duplicated for site specific projects. The broader analyses could be summarized and incorporated by reference. The purpose of "tiering" was to eliminate repetition and allow discussion of issues at the appropriate level of detail. (Council on Environmental Quality, 1978)

Third, in addition to the previously required EIS which discussed the alternatives being considered, a "record of decision" document was required. It had to identify the "environmentally preferable" alternative, the other alternatives considered, and the factors used in reaching the decision. Until this document was issued, no action could be taken on an alternative which would adversely effect the environment or limit the choice of alternatives. (Council on Environmental Quality, 1978)

The regulations generally sought to reduce the paperwork in the EIS process by such techniques as limiting the length of the document to 150 pages (300 in complex situations), specifying a standard format, emphasizing that the process focus on real alternatives, allowing incorporation of material by reference and by using summaries for circulation instead of the entire EIS. Agencies were encouraged to set time limits on the process and to integrate other statutory and analysis requirement into a single process.

In October 1980, FHWA and UMTA published supplemental implementing procedures. They established a single set of environmental procedures for highway and urban transit projects. They also integrated UMTA's procedures for alternatives analysis under its major investment policy with the new EIS procedures. This permitted the preparation of a single draft EIS/alternatives analysis document. These regulations were an important step towards integrating highway and transit planning and reducing duplicative documentation. (U.S. Dept. of Transportation, 1980b)

International Conferences on Behavioral Travel Demand

The Williamsburg Urban Travel Forecasting Conference gave widespread recognition to disaggregate behavioral demand models. The momentum created by this conference caused an upsurge in research in behavioral travel demand. The research was so extensive and widespread that the need arose for better interchange of ideas and developments.

To fill this void, the Transportation Research Board Committee on Traveler Behavior and Values organized a series of four International Conferences on Behavioral Travel Demand. The conferences were held every two years: South Berwick, Maine, in 1973 (Stopher and Meyburg, 1974); Asheville, North Carolina, in 1975 (Stopher and Meyburg, 1976); Melbourne, Australia, in 1977 (Hensher and Stopher, 1979); Grainau, Germany, in 1979 (Stopher, Meyburg and Brog, 1981).

The proceedings of these conferences provide a comprehensive documentation of the progress in behavioral travel demand research and the important issues concerning the research community. Research recommendations often served as the agenda for further work in the following years. The focus of these discussions was to gain a better understanding of travel behavior and to develop travel demand models with stronger theoretical bases. Using this approach, travel forecasting would become more sensitive to relevant policy issues, require less data to estimate and be less costly and time-consuming to use.

Great strides were made in achieving these ends. But, in doing so, a class of models were produced which were substantially different than conventional forecasting techniques. As a result, progress in diffusing these techniques into practice was slow. This issue then became the major concern in the field of travel forecasting.

Urban Initiatives Program

The National Mass Transportation Assistance Act of 1974 authorized the use of federal funds for joint development purposes through the Young Amendment. The Young Amendment allowed local agencies to use federal funds to improve facilities within the zone affected by the construction and operation of mass transit improvements needed to be compatible with land use patterns. Assistance was available for establishing public or quasi-public corridor development corporations. (Gortmaker, 1980)

The Urban Initiatives program, however, was not implemented until it was authorized in Section 3(a)(1)(D) of the Surface Transportation Assistance Act of 1978. This section of the act authorized federal grants for land acquisition and the provision of utilities on land which was physically or functionally related to transit facilities for the purpose of stimulating economic development.

The Urban Initiatives program was one element of the DOT effort to implement President Carter's Urban Policy. The guidelines for the program were issued in April 1979. The program allowed expenditures for preconstruction activities (e.g., design and engineering studies, land acquisition and write down, and real estate packaging) and items which connect transportation with land developments (e.g., pedestrian connections, parking and street furniture). Preference was to be given to projects which demonstrated that they advanced Urban Policy objectives.

During the 3 years of the program, 46 projects were funded in 43 urban areas. They integrated transportation projects with economic development

activities. Many of these projects were transit malls or intermodal terminals. The program extended the traditional funding beyond direct transit projects to the related development tied to transit service. (Rice Center, 1981)

The practice of setting aside federal funds for Urban Initiatives' projects was discontinued in March 1981. However, these types of activities continued to be eligible for funding under the regular transit programs.

Section 504 Regulations on Accessibility for the Handicapped

Section 504 of the Rehabilitation Act of 1973 provided that no person who is otherwise qualified should be discriminated against due to handicap in any program or activity receiving federal financial assistance. In 1976, UMTA issued regulations which required "special efforts" in planning public mass transportation facilities that can be utilized by elderly and handicapped persons. It also required that new transit vehicles and facilities be accessible to handicapped. Handicapped groups thought the regulations were too vague and difficult to enforce. (U.S. Dept. of Transportation, 1976c)

More stringent regulations were published in May 1979. It required all existing bus and rail systems to become fully accessible to handicapped persons within three years. This included fifty percent of the buses in fixed route service to be accessible to wheelchair users. For extraordinarily expensive facilities, the time limit could be extended to 10 years for bus facilities, to 30 years for rail facilities, to 5 years for rail cars. Steady progress to achieve accessibility was required. New facilities and equipment were still required to be accessible to receive federal assistance. (U.S. Dept. of Transportation, 1979f)

Transit authorities complained that the requirements were far too costly and sued the Department of Transportation for exceeding its authority. The U.S. Court of Appeals in a decision in 1981 said that the 1979 regulations went beyond DOT's authority under Section 504. Following the decision, DOT

issued regulations on an interim basis and indicated that there would be new rulemaking leading to a final rule. The interim regulations required applicants to certify that "special efforts" were being made to provide transportation which was accessible to handicapped persons. (U.S. Dept. of Transportation, 1981a)

Section 317(c) of the Surface Transportation Assistance Act of 1982 required the Department to publish a proposed rule that would (1) include minimum criteria for the provision of transportation services to handicapped and elderly individuals, (2) a public participation mechanism, and (3) procedures for UMTA to monitor transit authorities' performance.

The Department's regulations for how transit authorities should carry out the Section 504 have long been controversial. The Department has had a difficult job accommodating both the concern of the handicapped community for adequate public transportation and the concern of transit authorities and local governments for avoiding costly or rigid requirements. This rulemaking process has been one of the most complex and protracted in urban transportation. It has engendered a fierce debate between those who felt that handicapped persons should have the right to be mainstreamed into society and those who believed that there were more cost effective means of providing transportation for those persons using paratransit-type services. This full accessibility versus equal service debate is not over. DOT's new regulations will seek to find a middle ground between the two points of view.

Aspen Conference on Future Urban Transportation

As the decade drew to a close, the assault on the automobile never seemed so widespread. Energy conservation and environmental protection were national priorities. Fiscal resources were constrained and cost-effectiveness was the major criterion in urban transportation evaluations. Reversing central city decline was emerging as a key concern. And, mobility for the transportation disadvantaged still required attention. (Hassell, 1982) What was the future for urban personal mobility in the United States? Had the dominance of the automobile in U.S. society and economy peaked?

To address these issues, the Transportation Planning Division of the American Planning Association sponsored the Aspen Conference on Future Urban Transportation in June 1979. The conference was supported and attended by representatives of both the public and private sector. The conferees could not reach a consensus on an image of the future but agreed on a range of factors which would be influential. Incremental planning was seen as the only feasible and desirable approach to the future. (Proceedings, 1979)

The conferees did conclude that there are, "...no panaceas: no substantial increases in mobility due to new techniques ... no quick or cheap energy solutions, and none without major environmental risks and costs ... no promise of breakthrough in environmental technology ... no major solutions through changes in living patterns or economic structure ... no simple mechanism for restructuring urban form so as to reduce urban travel" (Proceedings, 1979) The conferees did make certain general recommendations for approaches to energy, mobility and accessibility, environmental, social, safety and economic issues. They concluded that, at least for the balance of this century, the automobile will continue to be the principal and preferred mode of urban transportation for the majority of the American people. Public transportation will become increasingly important in supplying mobility. Both will require increased public investment from all levels of government. (Proceedings, 1979)

Section 9

DECENTRALIZATION OF DECISIONMAKING

Through the decade of the 1970s, there was a sharp increase in the range and complexity of issues required to be addressed in the urban transportation planning process. The combination of requirements and regulations had become burdensome and counter-productive. Organizations and techniques seemed unable to adapt with sufficient speed. It was becoming impossible to analyze all of the tradeoffs that were required. This problem was not confined to urban transportation but to most activities where the federal government was involved. It ushered in a new mood in the nation to decentralize control and authority, and to reduce federal intrusion into local decisionmaking. (Weiner, 1983)

President Reagan's Memorandum on Regulations

On January 29, 1981, President Reagan sent a memorandum to all major domestic agencies to postpone the implementation of all regulations that were to take effect within the coming 60 days. (Reagan, 1981b) This was to provide time for the newly appointed Task Force on Regulatory Relief to develop regulatory review procedures.

The Executive Order 12291 on Federal Regulation was issued on February 17, 1981. (Reagan, 1981a) It established procedures for reviewing existing regulations and evaluating new ones. It required that a regulation have greater benefits to society than costs and that the approach used must maximize those benefits. All regulatory actions were to be based upon a regulatory impact analysis which assessed the benefits and costs.

The order set in motion a major effort at the federal level to eliminate and simplify regulations and limit the issuance of new regulations. The impact on federal agencies was quickly felt.

Airlie House Conference on Urban Transportation Planning in the 1980s

Concern was growing in the planning community about the future of urban transportation planning. On the one hand planning requirements had become more complex, new planning techniques had not found their way into practice and future changes in social, demographic, energy, environmental and technology were unclear. On the other hand, fiscal constraints were tight and the federal government was shifting the burden of decisionmaking to state and local governments and the private sector. The future of planning was in doubt.

To address the concerns, a conference was held at Airlie House, November 9-12, 1982, on Urban Transportation Planning in the 1980s. The conference reaffirmed the need for systematic urban transportation planning especially to maximize the effectiveness of limited public funds. But, the planning process needs to be adjusted to the nature and scope of the area's problems. It need not be the same for growth and declining areas, nor for corridor and regional level problems. (Transportation Research Board, 1982)

The conferees also concluded that the federal government had been overly restrictive in its regulations making the planning process costly, time-consuming and difficult to administer. The regulations should be streamlined, specifying goals to be achieved and leaving the decisions on planning how to meet them to the states and local governments. The conferees called for a recognition of the different needs for 3C planning by urbanized areas of various sizes. Additionally, greater flexibility in the requirements for MPOs was recommended with more responsibility given to the agencies which implement transportation projects. Less frequent federal certification was recommended. (Transportation Research Board, 1982)

Increased attention to system management and fiscal issues was needed. But, long-range planning must also identify shifts in the major longer term trends that will affect the future of urban areas. This strategic planning process should be flexible to fit local concerns. (Transportation Research Board, 1982)

The conference recommendations reflected the new mood that the federal government had over regulated and was too specific in its requirements. The planning process was straining under this burden finding it difficult to plan to meet local needs. The burden had to be lifted for the planning process to be viable.

Executive Order 12372

Office of Management and Budget's Circular A-95 (which replaced Bureau of the Budget Circular A-95) had governed the consultation process on federal grant programs with state and local governments since its issuance in July 1969. Although the A-95 process had served a useful function in assuring intergovernmental cooperation on federal grant programs, there were concerns that the process had become too rigid and cumbersome and caused unnecessary paperwork. To respond to these concerns and to delegate more responsibility and authority to state and local governments, the President signed Executive Order 12372, "Intergovernmental Review of Federal Programs," on July 14, 1982. (Reagan, 1982)

The objectives of the Executive Order were to foster an intergovernmental partnership and strengthen federalism by relying on state and local processes for intergovernmental coordination and review of federal financial assistance and direct federal development. The Executive Order had several purposes. First, it allowed states, after consultation with local officials, to establish their own process for review and comment on proposed federal financial assistance and direct federal development. Second, it increased federal responsiveness to state and local officials by requiring federal agencies to "accommodate" or "explain" when considering certain state and local views. Third, it allowed states to simplify, consolidate, or substitute state plans. The order also revoked OMB Circular A-95, although regulations implementing this Circular remain in affect until September 30, 1983.

There were three major elements which comprised the process under the Executive Order. These were: establishing a state process, the single point

of contact, and the federal agency's "accommodate" or "explain" response to state and local comments submitted in the form of a recommendation. First, a state could choose which programs and activities are being included under that state process after consulting with local governments. The elements of the process were to be determined by the state. A state was not required to establish a state process, however, if no process was established, the provisions of the Executive Order did not apply. Existing consultation requirements of other statutes or regulations would continue in effect, including those of the Inter-governmental Cooperation Act of 1968 and the Demonstration Cities and Metropolitan Development Act of 1966.

Second, a single point of contact had to be designated by the state for dealing with the federal government. The single point of contact was the only official contact for state and local views to be sent to the federal government and to receive the response.

Third, when a single point of contact transmitted a state process recommendation, the federal agency receiving the recommendation had to either: (1) accept the recommendation ("accommodate"); (2) reach a mutually agreeable solution with the parties preparing the recommendation; or (3) provide the single point of contact with a written explanation for not accepting the recommendation or reaching a mutually agreeable solution. If there was nonaccommodation, the Department was generally required to wait 15 days after sending an explanation of the nonaccommodation to the single point of contact before taking final action.

The regulations implementing Executive Order 12372 for transportation programs were published on June 24, 1983 (U.S. Department, 1983a). They applied to all federal-aid highway and urban public transportation programs.

Woods Hole Conference on Future Directions of Urban Public Transportation

The transit industry was growing restless as the demands for and requirements on transit services were changing. Older cities were concerned

about rehabilitation while newer ones were focused on expansion. Future changes in the economic base, land use, energy and socio-demographic characteristics were uncertain. The transit industry was coming out of a period where federal priorities and requirements had changed too frequently. Transit deficits had risen sharply over the previous decade and the federal government had declared that it planned to phase out operating subsidies. And, many were calling for the private sector to provide an increased share of transit services because they were more efficient.

A diverse group of conferees met at the Woods Hole Study Center in Massachusetts, September 26-29, 1982, to discuss Future Directions of Urban Public Transportation. (Transportation Research Board, 1984a) The conference addressed the role of public transportation, present and future, the context within public transportation functions, and strategies for the future. Attendees included leaders of the transit industry and government, academics, researchers and consultants. There were wide differences of opinion that had not disappeared when the conference concluded.

The conferees did agree that, "Strategic planning for public transportation should be conducted at both the local and national levels." The transit industry should be more aggressive in working with developers and local governments in growing parts of metropolitan areas to capitalize on opportunities to integrate transit facilities into major new developments. The industry needs to improve its relationship with highway and public works agencies as well as state and local decisionmakers. Financing transit had become more complex and difficult but had created new opportunities. (Transportation Research Board, 1984a)

The conferees called for reductions in federal requirements and avoidance of rapid shifts in policy in the future. The federal government should have a more positive federal urban policy and UMTA should be transit's advocate within the federal government. (Transportation Research Board, 1984a)

Agreement could not be reached on the future role of urban transit. Some felt that the transit industry should only concern itself with conventional rail and bus systems. Others argued that transit agencies should broaden the range of services provided to include various forms of paratransit and ridesharing so as to attract a larger share of the travel market. Nevertheless, the conference was considered to be a first small step in a strategic planning process for the transit industry.

Easton Conference on Travel Analysis Methods for the 1980s

The Airlie House Conference on Urban Transportation Planning in the 1980s highlighted the shifts in planning that were occurring and were likely to continue. (Transportation Research Board, 1982) State and local governments would assume a greater role as the federal government disengaged, finances would be tighter, system rehabilitation would become more important and traffic growth would be slower.

A conference was held at Easton, Maryland, in November 1982 to discuss how well travel analysis methods were adapted to the issues and problems of the 1980s. This Conference on Travel Analysis Methods for the 1980s focused on defining the state-of-the-art versus the state of practice, describing how the methods have been and can be applied, and identifying gaps between art and practice that needed more dissemination of current knowledge, research or development. The conference extended the discussions of the International Travel Demand Conferences but concentrated on the application of travel analysis methods and on improving the interaction between researchers and practitioners. (Transportation Research Board, 1984b)

The conference reviewed the state-of-the-art and practice and how they applied to the various levels of planning. There were extensive discussions on how capable travel analysis procedures were in dealing with major transportation issues and why they were not being extensively applied in practice. (Transportation Research Board, 1984b)

The conferees found that in an era of scarce resources, sound analysis of alternatives would continue to be important. Travel analysis methods which were currently available were suitable for issues that could be foreseen in the 1980s. These disaggregate techniques which were developed during the 1970s had been tested in limited applications and were now ready for widescale use. Their use in the analysis of small scale projects, however, might not be justified because of their complexity. (Transportation Research Board, 1984b)

It was clear, however, that new disaggregate travel analysis techniques were not being used extensively in practice. The gap between research and practice was wider than it had ever been. The new mathematical techniques and theoretical bases from econometrics and psychometrics had been difficult for practitioners to learn. Moreover, the new techniques were not easily integrated into conventional planning practices. Neither researchers nor practitioners had made the necessary effort to bridge the gap. Researchers had been unwilling to package and disseminate the new travel analysis methods in a form usable to practitioners. Practitioners had been unwilling to undergo retraining to be able to use these new techniques. Neither group had subjected these methods to rigorous tests to determine how well they perform and for what problems they were best suited. (Transportation Research Board, 1984b)

The conferees concluded that the travel demand community should concentrate on transferring the new travel analysis methods into practice. A wide-range of technology transfer approaches were suggested. The federal government and Transportation Research Board were recommended to lead in this endeavor. (Transportation Research Board, 1984b)

Surface Transportation Assistance Act of 1982

Through the decade of the 1970s, there was mounting evidence of deterioration in the nation's highway and transit infrastructure. Money during that period had been concentrated on building new capacity and the

transition to funding rehabilitation of the infrastructure had been slow. By the time the problem was faced, the cost estimate to refurbish the highways, bridges, and transit systems had reached hundreds of billions of dollars. (Weiner, 1983)

The Surface Transportation Assistance Act of 1982, was passed to address the infrastructure problem. The act extended authorizations for the highway and transit programs by four years from 1983 to 1986. In addition, the act raised the highway user charges by five cents (in addition to the existing four cents) a gallon on fuel effective April 1, 1983. Other taxes were changed including a substantial increase in the truck user fees which were changed from a fixed rate to a graduated rate by weight. Of the revenues raised from the five-cent increase in user fees (about \$5.5 billion annually), the equivalent of a four-cent raise in fuel user charges was to increase highway programs, and the remaining one-cent was for transit programs. (Weiner, 1983)

The additional highway funds were for accelerating completion of the Interstate highway system (to be completed by 1991), an increased 4R (Interstate resurfacing, restoration, rehabilitation, and reconstruction) program, a substantially expanded bridge replacement and rehabilitation program, and greater funding for Primary, Secondary, and Interstate projects. (Weiner, 1983)

The act authorized the administration of highway planning and research (HP&R) funds as a single fund and made them available to the states for a four-year period. A standard federal matching ratio for the HP&R program was set at 85 percent. A 1-1/2 share of bridge funds was authorized for HP&R purposes. As a result of the large expansion in the construction program, the level of funding increased substantially for the HP&R program and urban transportation planning (PL) purposes.

The act restructured federal urban transit programs. No new authorizations were made for the Section 5 formula grant program. Instead, a new block

grant program was created which allowed expenditures on planning, capital and operating items. Substantial discretion was given to state and local governments in selecting projects to be funded using block grants with minimal federal interference. However, there were limitations on the use of the funds for operating expenses. The act provided for a distribution of funds into areas of different sizes by population; over one million, between one million and 200,000, under 200,000, and rural. Within these population groups, the funds were to be apportioned by several formulas using such factors as population, density, vehicle miles and route miles. (Weiner, 1983)

The revenue from the one-cent increase in highway user charges was to be placed into a mass transit account of the Highway Trust Fund. The funds could only be used for capital projects. They were to be allocated by a formula in fiscal year 1983, but were discretionary in later years. The definition of capital was changed to include associated capital maintenance items. The act also provided that a substantial number of federal requirements be self-certified by the applicants and that other requirements be consolidated to reduce paperwork. (Weiner, 1983)

A requirement was also included for a biennial report on transit performance and needs, with the first report due in January 1984. In addition, the act provided that regulations be published which set minimum criteria on transportation services for the handicapped and elderly.

The Surface Transportation Assistance Act of 1982 was passed under considerable controversy about the future federal role in transportation, particularly the Administration's position to phase out federal transit operating subsidies. Debates on later appropriations bills demonstrated that the issue remained unresolved.

Paratransit Policy

The range of public transportation services options known as "paratransit" was brought to national attention in a report by The Urban Institute with the

same title. (Kirby, et. al., 1975) Paratransit-type services had already been receiving growing interest. (Highway Research Board, 1971; 1973b; Transportation Research Board, 1974a; 1974b; Rosenbloom 1975; Scott, 1975) Paratransit was seen as a supplement to conventional transit to serve special population groups and markets which were otherwise poorly served. It was also seen as an alternative, in certain circumstances, to conventional transit. It fit well into the tenor of the times which sought low-cost alternatives to the automobile which could capture a larger share of the travel market. Paratransit could serve low density, dispersed travel patterns and thereby compete with the automobile.

The UMTA struggled for many years to develop a policy position on paratransit. The transit industry expressed concern about paratransit alternatives to conventional transit. Paratransit supporters saw it as the key option to compete against the automobile in low density markets. It was the same debate which surfaced at the Woods Hole Conference on Future Directions of Urban Public Transportation. (Transportation Research Board, 1984a)

Finally, in October 1982, UMTA published the Paratransit Policy. Paratransit was portrayed as a supplement to conventional transit services which could increase transportation capacity at low cost. It could provide service in markets that were not viable for mass transit. Paratransit could also serve specialized markets (e.g., elderly and handicapped) and be an alternative to the private automobile. Its potential in rural areas was emphasized as well. (U.S. Dept. of Transportation, 1982)

The Paratransit Policy encouraged local areas to give full consideration to paratransit options. It supported the use of paratransit provided by private operators particularly where they were not subsidized. The policy fostered reducing regulatory barriers to private operators, timely consultation with the private sector, matching services to travel needs and integration of paratransit and conventional transit services. (U.S. Dept. of Transportation, 1982)

It was stated that UMTA funds were available for planning, equipment purchase, facility acquisition, capital, administrative and research expenses. UMTA preferred unsubsidized, privately provided paratransit, but would provide financial support, where justified. (U.S. Dept. of Transportation, 1982)

Revised Urban Transportation Planning Regulations

The joint FHWA/UMTA urban transportation planning regulations had served as the key federal guidance since 1975. (U.S. Dept. of Transportation, 1975a) During 1980, there was an intensive effort to amend these regulations to ensure more citizen involvement, to increase the emphasis on urban revitalization and to integrate corridor planning into the urban transportation planning process. (Paparella, 1982) Proposed amendments were published in October 1980. Final amendments were published in January 1981 to take effect in February.

These amendments were postponed as a result of President Reagan's January 1981 memorandum to delay the effective day of all pending regulations by sixty days. During this period, the amendments were reviewed based on the criteria in the President's memorandum and Executive Order 12291. Consequently, the amendments were withdrawn and interim final regulations were issued in August 1981. These regulations included minimal changes to streamline the planning process in areas under 200,000 in population, clarify transportation system management and incorporate legislative changes. (U.S. Dept. of Transportation, 1983c)

To obtain public comment on further changes in the regulations, FHWA and UMTA published an issues and options paper in December 1981 entitled, Solicitation of Public Comment on the Appropriate Federal Role in Urban Transportation Planning. The comments clearly indicated the preference for fewer federal requirements and greater flexibility. Further indication of these views resulted from the Airlie House Conference on Urban Transportation Planning in the 1980s. (Transportation Research Board, 1982)

Based on the comments, the joint urban transportation planning regulations were rewritten to remove items that were not actually required. The changes in the regulations responded to the call for reducing the role of the federal government in urban transportation planning. The revised regulations contained new statutory requirements; and, retained the requirements for a transportation plan; a transportation improvement program (TIP) including an annual element (or biennial element); and a unified planning work program (UPWP), the latter only for areas of 200,000 or more in population. The planning process was to be self-certified by the states and MPOs that it was in conformance with all requirements when submitting the TIP. (U.S. Dept. of Transportation, 1983c)

The regulations drew a distinction between federal requirements and good planning practice. They stated the product or end which was required but left the details of the process to the state and local agencies. So, the regulations no longer contained the elements of the process nor factors to consider in conducting the process. (U.S. Dept. of Transportation, 1983c)

The urban transportation planning process was still the mutual responsibility of the MPO, state and public transit operators. But, the nature of the MPO was to be the determination of Governor and local governments without any federal prescription. Governors were also given the option of administering UMTA's planning funds for urban areas with populations under 200,000.

The revised regulations mark a major shift in the evolution of urban transportation planning. Up to that time, the response to new issues and problems was to create additional federal requirements. These regulations changed the focus of responsibility and control to the state and local governments. The federal government remained committed to urban planning by requiring that projects be based on a 3C planning process and by continuing to provide funding for planning activities. But, it would no longer specify how the process was to be performed.

Advent of Microcomputers

By the early 1980s, there was a surge of interest and use of microcomputers in urban transportation planning. The FHWA and UMTA had increasingly focused their computer related research and development activities on the application of small computers. These technical support activities were directed at gaining a better understanding of the potential and applicability of microcomputers, promoting the development and exchange of information and programs, and evaluating and testing programs. Some software development was carried out, but most software was produced commercially.

A user support structure was developed to assist state and local agencies. This included the establishment of two user support centers; one at Rensselaer Polytechnic Institute for the transit industry and, a second at the DOT's Transportation Systems Center (TSC) for transportation planning, transportation system management (TSM) and traffic engineering applications. Three user groups were formed under DOT sponsorship; transit operations, transportation planning and TSM, and traffic engineering. These groups exchanged information and software, develop and promote standards and identify research and development needs. Assistance was provided through the user support centers. A newsletter, MicroScoop, was published periodically to aid in the communication process.

FHWA and UMTA developed a one-day seminar entitled, "Microcomputers For Transportation" to acquaint users with the capabilities and uses of microcomputers. They also published reports on available software and sources of information. (U.S. Dept. of Transportation, 1983d and 1983e) As the capabilities of microcomputers have increased, they have offered the opportunity of greater analytical capacity to a larger number of organizations. As a result, their use has become more widespread.

CONCLUDING REMARKS

Urban transportation planning evolved from highway and transit planning activities in the 1930s and 1940s. These efforts were primarily intended to improve the design and operation of individual transportation facilities. The focus was on upgrading and expanding facilities.

Early urban transportation planning studies were primarily systems oriented with a twenty-year time horizon and region-wide in scope. This was largely the result of legislation for the National System of Interstate and Defense Highways which required that these major highways be designed for traffic projected twenty years in the future. As a result, the focus of the planning process through the decade of the 1960s was on this long-range time horizon and broad regional scale. Gradually, starting in the early 1970s, planning processes turned their attention to shorter term time horizons and the corridor level scale. This came about as the result of a realization that long-range planning had been dominated by concern for major regional highway and transit facilities with only minor attention to being paid to lesser facilities with the opportunity to improve the efficiency of the existing system. This shift was reinforced by the increasing difficulties and cost in constructing new facilities, growing environmental concerns and the Arab oil embargo.

Early efforts with programs such as TOPICS and express bus priorities eventually broaden into the strategy of transportation system management. TSM encompassed a whole range of techniques to increase the utilization and productivity of existing vehicles and facilities. It shifted the emphasis from facility expansion to provision of transportation service. The federal government took the lead in pressing for changes which would produce greater attention to TSM. At first, there was considerable resistance. Neither institutions nor techniques were able to immediately address TSM

options. A period of learning and adaptation was necessary to redirect planning processes so that they could perform this new type of planning. As the 1980s dawned, urban transportation planning had become primarily short-term oriented in most urbanized areas.

Through this evolutionary development, the urban transportation planning process was called upon to address a continuous stream of new issues and concerns, methodological developments, advances in technology and changing attitudes. Usually, it was the requirements from the federal government to which the planning process was responding.

Major new issues began affecting urban transportation planning in the later half of the 1960s and on through the 1970s. The list of issues included safety, citizen involvement, preservation of parkland and natural areas, equal opportunity for disadvantaged persons, environmental concerns particularly air quality, transportation for the elderly and handicapped, energy conservation and revitalization of urban centers. Most recently has been the concerns for deterioration of the highway and transit infrastructure. By 1980, the federal requirements to address all of these matters had become extensive, complex and sometimes conflicting.

During this same period, there were advocates for various transportation options as solutions to this vast array of problems and concerns. They ranged over the gamut from new highways, express buses, rail transit systems, pricing, automated guideway transit, paratransit, brokerage and dual-mode transit. It was difficult, at times, to determine whether these options were advanced as the answer to all of these problems or for just some of them. Transportation system management was an attempt to integrate the short-term, low capital options into reinforcing strategies to accomplish one or more objectives. Alternatives analysis was designed to evaluate trade-offs among various major investments options as well as transportation system management techniques.

Transportation planning techniques also evolved during this time. Procedures for specific purposes were integrated into an urban travel forecasting process in the early urban transportation studies in the 1950s. Through the 1960s, improvements in planning techniques were made primarily by practitioners and these new approaches were integrated into practice fairly easily. The FHWA and UMTA carried out extensive activities to develop and disseminate analytical techniques and computer programs for use by state and local governments. The Urban Transportation Planning System (UTPS) became the standard computer battery for urban transportation analysis by the mid-1970s.

During the 1970s, new techniques were developed for the most part by the research community largely in universities. The disaggregate approaches differed from the aggregate approaches being used in practice. Communication between researchers and practitioners was fitful. While researchers were developing more appropriate ways to analyzing this complex array of issues and options, practitioners were still wedded to the older techniques. The gap between research and practice still needs to be closed.

The 1980s bring a new challenge to urban transportation planning, the decentralization of authority and responsibility. The national mood has shifted and centralized approaches are no longer considered to be the appropriate means for dealing with national problems. The federal government is reducing its involvement and leaving the states and local governments more flexibility to respond in whatever manner they choose. The federal statutes remain in force but additional federal guidance or elaboration is being reduced and eliminated.

It is unclear what changes will occur in urban transportation planning as a result of the reduction in federal regulation and prescription. There will be expanded opportunities to fashion planning procedures and institutions to local problems and needs. More time and effort can be used to produce the information for local decisions rather than to meet federal requirements. Urban areas experiencing growth in population and employment, for example,

can focus on long-range development plans to expand their transportation systems. Other urban areas which are stable or declining can deal with redevelopment issues and infrastructure rehabilitation. There will be more flexibility in the elements of the planning process and in the division of responsibilities to perform them.

On the other hand, planning will have to be more responsive to the needs of local decisionmakers and citizens, and adjusted to the realities of long-term budget constraints in many urban areas. Procedures and institutional arrangements will have to be realigned to address local issues and needs. This may be difficult for urban transportation planning processes which have been attuned to federal requirements.

Many of the issues which have been debated over the last decade are likely to be revisited. One issue is the appropriate balance between long-range and short-term planning. A second is the level of effort devoted to system expansion, infrastructure rehabilitation, system management, and possibly even system retrenchment (e.g., removal of certain facilities or routes) to match declining population, travel demand and financial resources. The issues of changing institutional arrangements and locus of decisionmaking are likely to be raised in a number of urban areas.

Some urban areas will struggle with using transportation to foster economic development while still providing mobility. The use of innovative financing techniques such as joint development and increased participation by the private sector will probably increase to offset shortfalls in public sector funds. The matters of environmental quality, transportation for special groups and energy conservation will likely be valued differently across the spectrum of urban areas and affect planning processes in these areas in different ways.

The level of detail and complexity of planning procedures will need to be reassessed. Smaller urban areas will likely opt for a simpler planning process which is commensurate with their fewer problems and less complex planning

context. The larger areas will face many more choices in terms of problems to address, options to evaluate, organizational arrangements and procedures to use. Transportation analysis may become better integrated with land use planning at the project level scale.

The planning community will be challenged to further adapt so that procedures and techniques are tailored to local requirements. Many new approaches were developed during the decade of the 1970s. New transportation options, travel analysis methods and institutional structures were researched and applied in at least a limited fashion. The microcomputer holds the promise of providing analytical capability to many more agencies at lower cost with faster response time. All of these are now available to planners trying to reshape planning processes to the changing needs. The results should be evident within the next few years.
