SEA BATTLE BETWEEN THE ENGLISH AND THE DUTCH, JUNE, 1666

An encounter at North Foreland which lasted four days. The Dutch fleet was under the command of De Ruyter and Van Tromp, the English under Monk and Prince Rupert. Both fleets were badly shattered.

(After painting by Willem Van de Velde, in the Ryks Museum, Amsterdam)

LIST OF MAPS IN VOLUME VII

1. EMPIRE OF ALEXANDER THE GREAT, 323 B.C.; DIVISION OF THE EMPIRE, 301 B.C.; THE EASTERN WORLD, 190 B.C.; THE EASTERN WORLD, 88 B.C. (colored) See MACEDONIA

[EDITOR'S NOTE: These four colored maps show the political evolution of the Near East, from the death of Alexander the Great in 323 B.C. to the establishment of Roman supremacy in the first century before Christ. The first map of the series reveals the empire of Alexander at its greatest extent, while the three succeeding maps indicate the progressive break-up of that territory until the decisive intervention of Rome at the time of Sulla and Pompey.]

2. MEXICAN WAR, 1846-1848 See MEXICO: 1847

3. MEXICO (colored) See MEXICO

4. MONGOLIAN EMPIRES, CENTRAL ASIA, 1330 (colored) See MONGOLIA

[EDITOR'S NOTE: This map portrays the disintegration of the vast empire of Jenghiz and Kublai Khan about one generation after the visit of Marco Polo. It will be noted that nearly all of eastern Europe and a large part of India were still ruled by the descendants of the Mongol conquerors. The inset map gives a clear view of southwestern Asia on the eve of the career of Timur or Tamerlane.]

5. NETHERLANDS AND BELGIUM (colored) See NETHERLANDS

[EDITOR'S NOTE: This modern political map of the Low Countries includes not only kingdoms of the Netherlands and Belgium, but also the grand duchy of Luxemburg. The two small districts around Malmedy and Eupen, which Belgium secured from Germany at the end of the World War, can be seen east of Liège and south of Aachen.]

THE NEW LARNED HISTORY

FOR READY REFERENCE, READING AND RESEARCH

VOLUME VII

LYLY, Lilly, or Lylic, John (1553-1606), English writer. See **DRAMA: 1558-1592**; **ENGLISH LITERATURE: 1530-1660**.

LYMAN M. LAW, American vessel. It was sunk by a German submarine, 1917. See **U. S. A.: 1917** (February-April).

LYMNE. See **PORTUS LEMANIS**.

LYMPHATIC CIRCULATION OF THE BLOOD. See **MEDICAL SCIENCE: Modern: 17th century: Discovery of the lymphatic circulation**.

LYNCH, Thomas (1749-1779), American patriot. See **U. S. A.: 1765: Stamp Act Congress; 1776** (July); **Text of Declaration of Independence**.

LYNCH LAW: Origin in the United States.—Change in the meaning of the term.—Record of lynching to 1914.—"It is generally supposed that the custom or practice of lynching in this country had its origin in the method of punishment used by a Virginian farmer named Lynch, who during the Revolutionary War sought in this way to maintain order in his community or section,—hence, Lynch's Law, and Lynch law, from which comes the word 'lynching.' In the beginning, however, the term seldom, if ever, conveyed the meaning 'to put to death'; nor does it appear that Negroes were lynched even so often as whites. The methods of punishment in the majority of cases consisted of riding the victim on a rail, beating or whipping him, and often of giving him a coat of tar and feathers. Moreover, it does not appear that lynching in any form was very common in the early history of the country. Indeed, in 1830 a writer in the *Southern Literary Messenger* began a brief article on the subject with the following: 'Forty years ago the practice of wreaking private vengeance or of inflicting summary or illegal punishment for crime actual or pretended which has been glossed over by the name of Lynch law was hardly known except in sparse, frontier settlements beyond the reach of courts and legal proceedings.' Newspapers, periodicals, and other literature of the time show,—as the years pass,—an interesting change in the meaning of the term Lynch law. As the practice of lynching increased, the methods of the executors of this law became more severe, and it grew more often to mean 'a putting to death.' Possibly the change in meaning was partly due to the fact that lynching came to be a favorite means of punishment for abolitionists, their Negro dupes, and for both Negroes and whites who might be found guilty of unusual or shocking crimes. The change from the mild to the severer meaning of the term was gradual. From 1830 to 1840 it seldom meant 'to put to death'; from 1850 to 1860 it very often had that meaning, and by 1870, or 1875,—this became the most exclusive interpretation of 'lynching.' . . . Beginning in 1885, *The Chicago Daily Tribune* has kept a record of lynchings to the present time. . . . The following statistics which are based upon the records of the

Chicago Daily Tribune are compiled by periods; excepting the last which is for four years, these periods were taken almost indiscriminately for two years together, beginning with 1885 and 1886. In the United States there were 314: 150 whites, 140 Negroes, and 6 Chinamen; 62 in the North, 252 in the South. Of those lynched in the South, 144 were Negroes. . . . [In 1892 and 1893] the whole number [of lynchings] for the country was 436: 309 Negroes, 110 whites, 5 Mexicans, and 8 Indians; 53 lynchings in the North, 287 Negroes in the South."—W. H. Collins, *Truth about lynching, and the negro in the south*, pp. 9-11, 48-50.—Statistics, compiled by the *Chicago Tribune*, of the cases of mob-murder, called "lynchings," which were reported in the newspapers as having occurred in the United States during the year 1890, showed a total of 107, being 20 less than a similar record for 1898 had shown. Of the reported cases, 3 were in Kansas, 1 in Pennsylvania, and 103 in Southern States. Georgia led in the latter list, being credited with 20 executions under lynch law. Mississippi followed with 14, Louisiana with 13, Arkansas with 11, and other States of the South with lesser numbers. Of the victims (mostly colored) 44 were accused of murder; 11 of complicity in murder; 11 with rape or attempted rape; 1 with rape and murder. The *Political Science Quarterly*, in its Record of Political Events between November 11, 1897, and May 10, 1898, cites 31 incidents of lynching, exclusive of a mob-murder committed at Lake City, South Carolina, where a negro postmaster and one of his children were killed, his wife and three other children wounded, and their house burned down. Of these incidents, 23 were reported from the south, the victims in every case being black; 8 were from northwestern states, the victims being white. For 1897, the *Buffalo Express* compiled statistics of reported lynchings from its news columns, which showed 38 between January 1 and June 8, and 77 during the remainder of the year, making a total of 115. In 1901 and 1902 "lynchings for the country were 231: 29, North, 202, South; 194 Negroes, 35 whites, 2 Indians, 1 Chinaman; 185 Negroes lynched in the South . . . [In] 1906 and 1907, for the United States, 132: 3, North, 129, South; Negroes lynched in the South, 129. . . . During the four years [1911-1914] there were 235 lynchings in the United States: 11, North; 224, South. In the North, 5 Negroes and 6 whites were lynched; in the South, 215 Negroes, 8 whites, and 1 Mexican."—*Ibid.*, pp. 50-52.

ALSO IN: *Negro Year Book*, 1912, pp. 33, 148-149.

Georgia case. See **GEORGIA: 1914-1915**.

National aspects.—Record in 1919 and 1920.—"If anyone is disposed to deny that lynching is national rather than regional, the riots in East St. Louis, Illinois, in 1917, resulting in the death of over two hundred Negroes, and the horrible

lynching at Coatesville, Pennsylvania, in 1911, should be sufficient to show that the burden of guilt does not rest on the South alone.' A second significant and usually unnoticed fact is that comparatively few of the persons lynched are even charged with assault or attempt assault—in 1918, 16 out of 62. This disposes of the idea that the motive of the mob is a chivalrous determination to protect the honor of white women. A third fact to be observed is that lynchings commonly occur in neighborhoods where education is backward and community standards are low. If Georgia, Louisiana, Texas, and other Southern states have won a bad eminence in their record of lynchings, the reason may largely be found in the unenlightened conditions under which too many of their people, white and black, have been allowed to live."—J. E. Gregg, *Lynching*, pp. 3-4.—"During the year 1919 there occurred in the United States 84 lynchings. Of the victims 78 were negroes, 4 were whites, and 2 were Mexicans. They were distributed among the states as follows: Alabama, 8; Arkansas, 10; Colorado, 2 (both Mexicans); Florida, 5; Georgia, 21; Kansas, 1 (white); Louisiana, 8; Mississippi, 13; Missouri, 2 (1 white); Nebraska, 1; North Carolina, 4; South Carolina, 2; Tennessee, 1; Texas, 3; Washington, 1 (white); and West Virginia, 2. During the first six months of 1920 the number of known lynchings fell to 12, of which one was a white person. The distribution of the twelve was as follows: Alabama, 2; Arkansas, 2 (1 white); Florida, 1; Kansas, 1; Kentucky, 1; Minnesota, 3; South Carolina, 1; and Texas, 1."—E. D. Graper and H. J. Carman, *Municipal affairs (Political Science Quarterly, Supplement, Sept., 1920, p. 76)*.—" [A] bill which passed the House. It which thus far has failed to be approved by the Senate, is the Dyer Bill making lynching a federal crime. The vote in the House on January 26 was 230 for and 119 against. Seventeen Republicans voted with the Democrats against the measure while eight Democrats voted with the Republicans for it. The chief argument against the bill was that it constituted an unconstitutional invasion of the police powers of the states. . . . "During the year 1921 there were 64 lynchings in the United States. They were distributed among the states as follows: Alabama, 2 (1 white); Arkansas, 6; Florida, 5 (1 white); Georgia, 14 (1 woman); Kentucky, 1; Louisiana, 5 (1 white); Mississippi, 13 (1 white); Missouri, 1; North Carolina, 4; South Carolina, 5; Tennessee, 1 (white); Texas, 6 (1 white); Virginia, 1. In 18 cases the alleged offense was murder, and in 19, assault on white women. The other offenses were of a miscellaneous character. In 32 cases, just one-half of the total number of lynchings, the victims were taken from peace officers and jails. During the first half of the year 1922 there occurred in the United States 30 lynchings. Twelve occurred in Texas; 7 in Mississippi; 4 in Georgia; 2 in Arkansas; and one in each of the following states: Alabama, Florida, Louisiana, Oklahoma and South Carolina."—*Political Science Quarterly, Supplement, Sept., 1922, pp. 37, 47*.

LYNE, Sir William John (1844-1913), Australian statesman. Minister for home affairs, 1901-1903; for trade and customs, 1903-1904; 1905-

1907; treasurer of the commonwealth, 1907-1908. See AUSTRALIA: 1902.

LYNES, Hubert (1874-), British naval officer. See WORLD WAR: 1918: IX. Naval operations: a, 2.

LYON, John, leader of White Hoods in Ghent. See FLANDERS: 1379-1381.

LYON, Mary (1797-1849), American educator, founder (in 1837) of Mount Holyoke Female Seminary, and pioneer advocate for higher education of women in America. See WOMAN'S RIGHTS: 1644-1852.

LYON, Nathaniel (1818-1861), American soldier. See U.S.A.: 1861 (July-September: Missouri); MISSOURI: 1861.

LYON, name of ship which brought relief to American colonists. See RHODE ISLAND: 1631-1636.

LYONS, city in eastern France, at the confluence of the Rhône and Saône rivers. In 1921, the city had a population of about 561,592.

Under the Romans.—Minutius Plancus, Roman governor of Gallia Comata, or the Gaul of Cæsar's conquest, founded, 43 B.C., a city called Lugdunum, at the confluence of the Rhone and the Saône. A few years later, under Augustus, it was made the capital of a province to which it gave its name—Lugdunensis—and which comprised the whole of central Gaul, between the Loire and the Seine with the Armorican peninsula. In time the name Lugdunum became softened and shorn to Lyons. "Lyons, which stood on the west side of the Rhone, not so near the confluence of the Saône as now, appears to have been settled by fugitive Romans driven out of Vienne by another party. It grew with as marvelous a rapidity as some of our western cities, for in fifteen years it swelled from a simple colony into a metropolis of considerable splendor. . . . Lugdun appears to have been a Celtic designation, and, as the 'g' in that speech took the sound of 'y' and 'd' was silent, we can easily see how the name became Lyon."—P. Godwin, *History of France: Ancient Gaul, bk. 2, ch. 5, with foot-note*.—"Not having originated out of a Celtic canton, and hence always with a territory of narrow limits, but from the outset composed of Italians and in possession of the full Roman franchise, it [Lyons] stood forth unique in its kind among the communities of the three Gauls—as respects its legal relations, in some measure resembling Washington in the North American federation. . . . Only the governor of the middle or Lugdunensis province had his seat there; but when emperors or princes stayed in Gaul they as a rule resided in Lyons. [See GERMANY: B.C. 8-A.D. 11.] Lyons was, alongside of Carthage, the only city of the Latin half of the empire which obtained a standing garrison, after the model of that of the capital. The only mint for imperial money which we can point to with certainty, for the earlier period of the empire, is that of Lyons. Here was the headquarters of the transit-dues which embraced all Gaul; and to this as a centre the Gallic network of roads converged. . . . Thus Lugdunum rapidly rose into prosperity. . . . In the later period of the empire, no doubt, it fell behind Trèves."—T. Mommsen, *History of Rome, bk. 8, ch. 3*.

500.—Under the Burgundians. See BURGUNDY: 500.

10th century.—In the kingdom of Arles. See BURGUNDY: 843-933.

12th century.—"Poor Men of Lyons." See WALDENSES.

1685-1698.—Loss in silk weaving industry by Huguenot exodus. See FRANCE: 1681-1698.

1793-1794.—Revolt against revolutionary gov-

ernment at Paris.—Siege and capture by Terrorists. See FRANCE: 1793 (June); (July-December): Progress of war of coalition; also Civil war; 1793-1794 (October-April).

1795.—Reaction against Reign of Terror.—White Terror. See FRANCE: 1794-1795 (July-April).

19th century.—Austrian occupation.—Industrial crises.—Floods.—Lyons was occupied by the Austrian forces in 1814 and 1815. There was a labor insurrection in 1831, a socialist movement in 1871 that was inspired by the Paris commune, and industrial crises in 1849 and 1882. In 1840 and 1856 Lyons suffered from serious floods.

20th century.—Manufacturing, commercial and military centre.—Modern Lyons is ranked next to Paris as a French manufacturing, commercial and military center. The silk industry of France centers at Lyons (see EDUCATION, ART: Modern: France), and general industrial life in that city was augmented during the World War by many manufacturing establishments being transferred from the war zone.

LYONS, Peace of (1601). See SAVOY AND PIEDMONT: 1580-1713.

LYRE. See INVENTIONS: Ancient and medieval: Stringed instruments.

LYS, river of northeastern France flowing through Belgium. It empties into the Scheldt at Ghent. The Lys valley was a scene of fighting

during the World War. See WORLD WAR: 1914: I. Western front: t; 1918: II. Western front: a, 2; d, 5; d, 19; k, 5.

MCANENY, George (1860-), American civic administrator. President of the borough of Manhattan, 1910-1913; member of the New York board of aldermen, 1914-1917. See NEW YORK CITY: 1900.

MACAO, peninsular town and free port in China, near the western entrance of the Canton river. (See CHINA: Map.) The peninsula (area 4 square miles) has been a Portuguese settlement since 1557 when as a reward for aid against pirates, some merchants, engaged in the Chinese trade, were allowed to build warehouses there. (See also COMMERCE: Era of geographic expansion: 15th-

17th centuries: Leadership of the Portuguese). The settlement grew into a town, which in the eighteenth century was a great center for the Eastern trade. China, however, for long did not recognize it as a Portuguese territory. Although a governor was regularly sent out from Portugal, China succeeded in maintaining supervision of the government, until the nineteenth century. In 1849, however, the rental which had been exacted ceased to be paid, and the Portuguese governor succeeded in destroying the authority of the Mandarin. In 1887 a treaty was made between the two countries, by which the settlement was recognized as Portuguese territory with the proviso that it should not be alienated without the consent of China. A large trade is still done, but is chiefly transit trade in Chinese hands and is hampered by the shallowness of the inner harbor. The population in 1910 was 74,866 of whom 2,171 were Portuguese, 71,021 Chinese, and 244 of various nationalities.

MCARTHUR, Arthur, governor of Wisconsin, 1856. See WISCONSIN: 1856-1893.

MACARTHUR, John (1767-1834), English colonist. Introduced the sheep-raising industry in New South Wales. See AUSTRALIA: 1787-1840.

MACAULAY, Thomas Babington, Baron (1800-1859), English historian and essayist. Member of the House of Commons, 1830-1834, 1839-1847; member of the supreme council in India, 1834-1838. See HISTORY: 8; 28; 31.

MACDONALD, Sir John Alexander (1815-1891), Canadian statesman, one of the "Fathers of the Confederation." Premier of Canada, 1857-1862; 1867-1872; 1878-1891; chiefly instrumental in carrying the confederation of the dominion to a conclusion; responsible for institution of the tariff system known as "National Policy" for the protection of home industries; after his return to power in 1878, vigorously pushed the Canadian Pacific railway to completion; one of the British commissioners at Washington on settlement of the Alabama claims, 1870; opposed trade reciprocity with the United States.

MACDONALD, Sir William Christopher (1831-1917), Canadian capitalist. See EDUCATION: Modern developments; 20th century: General: Canada; EDUCATION, AGRICULTURAL: Canada; GIFTS AND BEQUESTS.

MACDONNELL, Antony Patrick, 1st Baron of Swinford (1844-), British administrator. In Indian civil service, 1865-1902; under-secretary of state in Ireland, 1902-1908; member of the Irish convention, 1917-1918. See IRELAND: 1903.

MACDONNELL, Sir Richard, governor of South Australia, 1855-1862. See SOUTH AUSTRALIA: 1840-1862.

MACDONOUGH, Thomas (1783-1825), American naval officer. Served in the War of 1812, in command of naval forces on Lake Champlain; defeated a British fleet under Downie in Plattsburg harbor, 1814. See U. S. A.: 1814 (September).

MACDOUGALL, William (1822-1905), Canadian statesman. Member of Canadian parliament, 1858-1882; member of executive council and commissioner of crown lands, 1862-1864; provincial secretary, 1864-1867; chairman of West Indian trade commission, 1865-1866; member of confederation conferences, 1864-1867; minister of public works, 1867; commissioner to London, for acquisition of North-West Territory, 1868. See CANADA: 1860-1873.

MACDOWELL, Edward Alexander (1861-1908), American composer. Studied in Paris, Wiesbaden, Frankfurt, and Weimar, where he was chiefly influenced by Joachim, Raff, and Liszt; returned to America, 1888; was professor of music, Columbia university, 1896-1904; elaborated a

highly personal harmony and method of musical speech which gives him his position as one of America's most original thinkers. See MUSIC: Modern: 1774-1908.

MCDOWELL, Ephraim (1771-1830), American surgeon. See MEDICAL SCIENCE: 19th century: Antiseptic surgery and obstetrics.

MCDOWELL, Irvin (1818-1885), American general. Served in the Mexican and Civil wars. In command of the Army of the Potomac, 1861; of the Army of Rappahannock in Virginia, 1862; engaged in the battles of Bull Run, Cedar Mountain, and Rappahannock Station, 1861-1862. See U. S. A.: 1861 (July: Virginia); 1862 (May-June: Virginia).

MACE: Symbol of authority.—"The club or mace, formed originally of hard wood, and the latter, subsequently either wholly or in part of metal, would naturally be adopted as one of the earliest weapons of primitive man, but it soon came to be regarded as a symbol of authority. . . . In the Middle Ages the mace was a common weapon with ecclesiastics, who in consequence of their tenures, frequently took the field, but were, by a canon of the Church, forbidden to wield the sword. It strikes me as not improbable that in this custom we have the origin of the use of the mace as a symbol of authority by our cathedral and other ancient religious bodies. . . . In all probability its use by lay corporations may be traced to the corps of sergeants-at-mace, instituted as a body-guard both by Philip Augustus of France and our own Richard I., whilst with the Crusaders in Palestine. We learn that when the former monarch was in the Holy Land he found it necessary to secure his person from the emissaries of a sheik, called 'the Old Man of the Mountain,' [q.v.] who bound themselves to assassinate whomsoever he assigned. 'When the king,' says an ancient chronicler, 'heard of this he began to reflect seriously, and took counsel how he might best guard his person. He therefore instituted a guard of sergeants-à-maces who night and day were to be about his person in order to protect him.' These sergens-à-maces were 'afterwards called sergeants-at-arms, for Jean Bouteiller, . . . who lived in the time of Charles VI., that is, at the conclusion of the fourteenth century tells us. "The sergens d'armes are the macebearers that the king has to perform his duty, and who carry maces before the king; these are called sergeants-at-arms, because they are sergeants for the king's body." We learn further that Richard I. of England soon imitated the conduct of the French king, but he seems to have given his corps of sergeants-at-arms a more extensive power. Not only were they to watch round the king's tent in complete armour, with a mace, a sword, a bow and arrows, but were occasionally to arrest traitors and other offenders about the court, for which the mace was deemed a sufficient authority. . . . Hence, in all probability, was derived the custom of the chief magistrate of a municipality, who, as such, is the representative of the sovereign, being attended by his mace-bearer, as a symbol of the royal authority thus delegated to him."—W. Kelly, *Great mace* (*Royal Historical Society Transactions*, v. 3).

MACEDONIA: Geographical description.—Character of population.—Macedonia is a territory on the northwestern coast of the Ægean sea, with a population of 1,194,000, 1920. The mixture of races has made it a storm center of the Balkans and its boundaries have been uncertain. "It is only within recent years that Dr. J. Cojic, Professor of Geography at the University of Belgrade,

has, as the result of many years travelling in Macedonia and exhaustive study of all the literary records in the country, established beyond all doubt that the central part of Macedonia extends to the middle (below Skoplje) and lower reaches of the Vardar; that her territory extends westward to the great lakes of Ochrida and Prespa, and eastward to the River Struma and, in places, to the River Mesta. Consequently the territorial unit of Macedonia would include the regions around Ochrida, Bitolj, Voden, Salonica, Dojran, Strumica, Seres and Kayala. All else to the north of this is not Macedonia."—T. R. Georgevitch, *Macedonia*, p. 2.—Generally speaking the district to which the name is given may be described as the valley of the Vardar with the coastal strip which is dominated by Salonika. "Macedonia comprises principally the central and lower valley of the Vardar, the country around great lakes in the west and up to Struma, and on some points up to Mesta in the East. During the Serbian and Bulgarian conquests, the name . . . [was] almost entirely lost. But towards the end of the XVth and during the XVIIth century many Balkan countries . . . were marked as Macedonia . . . as a reminiscence on the classical world and classical nomenclature."—*Macedonia and Macedonian problems* (*Pamphlet*), p. 12.—Under the Turks it was divided into vilayets and included those of Kossovo, Uskub and Salonika. It is inhabited by "a considerable population of Albanians, Serbs, Bulgars, and Greeks, by a few thousand Circassians, Turks, and Tatars, and by scattered shepherd-tribes of Latin extraction, the Kutzo-Wallachs, claimed by the Rumanians to be of Rumanian, and by Greeks to be of Greek origin, while the town of Salonika contained a population of 80,000 Spanish Jews, of strong Turcophile sympathies."—W. E. D. Allen, *Turks in Europe*, pp. 194, 195.

Early inhabitants.—"The race that in the early age of Greece inhabited Macedonia was probably related to the Thracians and the Phrygians. It was of Aryan stock (as the remains of the language prove), but not Hellenic—that is, neither Achæan nor Doric. Later the coast region and the more fertile inland plains were overrun by Hellenes from the south, who drove the natives to the hills. These Greeks, or semi-Greeks, of the lowlands regarded themselves as 'companions' of the king. They composed the royal bodyguard and, like the Norman nobility, formed a distinct class. It was long before the wild Macedonian hill tribes, as well as the Pæonians, Thracians, and Illyrians, were sufficiently subjugated and civilized to coalesce with their conquerors and to form a powerful nation. The Macedonian kings . . . claimed to be of Hellenic descent—a fact that Demosthenes fiercely denied, calling Philip II a 'pestilential Macedonian . . . and in no way related to the Greeks.'"—H. B. Cotterill, *Ancient Greece*, p. 425.—"The Macedonians of the fourth century B. C. acquired, from the ability and enterprise of two successive kings, a great perfection in Greek military organization, without any of the loftier Hellenic qualities. Their career in Greece is purely destructive, extinguishing the free movement of the separate cities, and disarming the citizen-soldier to make room for the foreign mercenary whose sword was unhalloved by any feelings of patriotism—yet totally incompetent to substitute any good system of central or pacific administration. But the Macedonians of the seventh and sixth centuries B. C. are an aggregate only of rude inland tribes, subdivided into distinct petty principalities, and separated from the Greeks by a wider ethical

difference even than the Epirots; since Herodotus, who considers the Epirotic Molossians and Thesprotians as children of Hellen, decidedly thinks the contrary respecting the Macedonians. In the main, however, they seem at this early period analogous to the Epirots in character and civilization. They had some few towns, but they were chiefly village residents, extremely brave and pugnacious. . . . The original seats of the Macedonians were in the regions east of the chain of Skardus (the northerly continuation of Pindus)—north of the chain called the Cambunian mountains, which connects Olympus with Pindus, and which forms the northwestern boundary of Thessaly; but they did not reach so far eastward as the Thermaic Gulf. . . . The Macedonian language was different from Illyrian, from Thracian, and seemingly also from Pæonian. It was also different from Greek, yet apparently not more widely distinct than that of the Epirots; so that the acquisition of Greek was comparatively easy to the chiefs and people. . . . The large and comparatively productive region covered by the various sections of Macedonians, helps to explain that increase of ascendancy which they successively acquired over all their neighbours. It was not, however, until a late period that they became united under one government. At first, each section—how many we do not know—had its own prince or chief. The Elymiots, or inhabitants of Elymeia, the southernmost portion of Macedonia, were thus originally distinct and independent; also the Orestæ, in mountain-seats somewhat north-west of the Elymiots. . . . The section of the Macedonian name who afterwards swallowed up all the rest and became known as 'The Macedonians' had their original centre at Ægæ or Edessa—the lofty, commanding and picturesque site of the modern Vodhena."—G. Grote, *History of Greece, v. 3, pt. 2, ch. 25.*

B. C. 700-359.—First Macedonian dynasty.—"Perdiccas . . . founded the dynasty of the Macedonian kings [about 700 B. C.]. The fifth of these, Amyntas I, about whose assassination of some Persian envoys Herodotus tells a weird story, was obliged to side with the barbarians during the Persian invasion, and was sent by them as ambassador to Athens; but he is said to have been secretly in favour of the Greeks and to have clandestinely imparted to them at Plataea the plans of the Persians. He competed at the Olympian Games . . . and set up a golden statue at Delphi. Perdiccas II lived during the Peloponnesian War and changed sides more than once. Then came Archelaus, who was a great admirer of Greek civilization and art, and entertained at his court many Greek notabilities, such as Euripides, Thucydides, Agathon, and Zeuxis. The relationships of the succeeding Macedonian monarchs will be best explained as follows:

the nobles, put aside his young nephew Amyntas (to whom he afterwards married one of his daughters) and assumed the crown."—H. B. Cotterill, *Ancient Greece, pp. 424, 425.*

B. C. 367-356.—Philip in Thebes.—Development of army.—Gold resources.—Birth of Alexander.—Philip's foreign problems and methods.—"Philip's education in Thebes had given him a deep insight into Greek character and Greek politics. He possessed great intellectual gifts and a genius for diplomacy. Under a frank and attractive personality he concealed a subtle cunning and an ambition that was as unscrupulous as it was boundless. Conscious that the last appeal was to force, he gave the greatest attention to the formation and training of a powerful standing army, the efficiency of which was much increased by the use of newly invented engines of war (catapults, &c.), and also by the introduction of a new formation—that of the famous Macedonian phalanx, the idea of which Philip probably took from the deep wedge-like column invented by Epameinondas and used with such effect at Leuctra. [See MILITARY ORGANIZATION: 6]. . . . But Philip did not trust only to his army. By the acquisition of Thracian mines and by getting Thasian miners to work the gold in the neighbourhood of his town, Philippi, newly founded on the site of the ancient Crenides, he obtained large revenues, and it was by gold that he gained many of his successes. Philippi and its gold-mines brought Philip and the Athenians into collision. Amphipolis, at the mouth of the Strymon, cut him off from the sea and commanded the access to the goldbearing range of Mount Pangæus. This city, a colony of Athens, had been more or less independent ever since the time of Brasidas, and the Chalcidian Confederacy of Greek towns, headed by Olynthus, had tried in vain to gain it as an ally. By cunningly playing off Olynthus against Athens Philip duped both of them and captured Amphipolis, and soon afterwards Pydna and Potidaea fell into his hands. This happened in 356—the year in which his son Alexander was born; and, as Plutarch remarks, the year brought Philip a third gift of fortune, namely, an Olympic victory."—H. B. Cotterill, *Ancient Greece, pp. 423-426.*—"The problem of foreign relations was solved with . . . efficiency. Measures were taken to secure friends and prevent a coalition of Greeks against him. Gold was disbursed freely among the venal to obtain support. For some, the flattery of friendship suf-

Amyntas II (393-369)

"When Perdiccas III fell fighting against the Illyrians his brother Philip [born 382] was probably acting as his gerent. After crushing the Illyrians, Philip, probably by the invitation of

ficed. Others were gained by promises of support in local politics or petty wars. Exhibitions of his power won the fearful. Before the final conflict began there was a strong Macedonian party in

every city of Greece and some cities had declared themselves his friends. Philip was entirely without scruple. The old rules of warfare did not bind him. Treaties and truces he broke whenever his purposes required. Frequently he avowed friendship for a city and promised support and alliance. Once a foothold was secured in this way, he forgot his promises and the city fell. Captured, it might expect no mercy. The surrounding country was devastated, the city destroyed, its men killed or sold into slavery, while its women, too often, suffered a worse fate. In the neighborhood a colony of Macedonians was settled to secure the region. Spies in Philip's employ were everywhere. One Athenian was executed for accepting his bribe to burn an arsenal in Athens. Two things were needed to establish his place in the sun of the Ægean world: recognition by the Greek states as a leading power in order that he might dominate their councils, and the stretch of seacoast reaching from Saloniki to Byzantium—modern Constantinople—to secure for him the rich gold mines of Thrace, but above all to give him a vantage point from which he might outrive and crush the commercial and naval power of Athens. Conquest of Thessaly and the Theban invitation to take part in the Sacred War secured him the first of these. Success made him head of the Amphictyonic Council, the great religious body of Greece, with tremendous prestige. All his resources and all his ability were directed towards gaining the coastland. Clever trickery and quick action won him important gains in the very beginning. Success attended him nearly to the end."—W. E. Caldwell, *Hellenic conceptions of peace*, pp. 119-121.—See also GREECE: B. C. 350-358.

B. C. 353-336.—Philip's conquest of Thessaly.—Intervention in Sacred War.—Victory at Chæbronea.—Mastery of Greece. See GREECE: B. C. 357-336; ATHENS: B. C. 359-338.

B. C. 351-348.—War with Olynthian confederacy.—Destruction of Olynthus. See GREECE: B. C. 351-348.

B. C. 345-336.—Philip's ambition.—Treaty of Philocrates.—Devastation of Phocis.—Sparta and Athens.—Treatment of foes.—Preparations for invasion of Persia.—Assassination.—Importance of Philip.—"Never did Philip hold better cards than at Pella in May, 346 [B. C.], and never better did he play his game. Encamped about him in the plain of the Vardar was such an army as united Greece could not excel; and embassies from Athens, from Thebes, from the Phocians, from the Thessalian synod, from Aetolia, were bidding for his favour, each interpreting in their own sense the purpose which alone he knew. His whole soul was set on one great end—unconditional supremacy over the Hellenes—and he had the most definite plan of action. First, he must secure the command of the land route into central Greece; second, he looked to obtain a recognized position in the inner communion of the Hellenes; and third, he proposed to reduce the Greek states to an innocuous equality. In effect, he would seize and hold Thermopylae; he would assume the double role of champion of the Delphian Apollo and patron of Athens; and he would crush the Phocian 'Grand Company,' Sparta, and eventually Thebes. . . . Philip swore a solemn oath to observe peace with the Athenians, and with their children's children, and put forward representatives of all his 'allied' cities, from Epirus to Cardia in the Chersonese, to do the like. The final terms [of this agreement, known as the Peace of Philocrates, 346 B. C.] implied the abandonment of

Amphipolis to Philip; the recognition that Cardia was his ally; the relinquishing of the great eastern islands, Rhodes, Chios, and Cos, to the satrap of Caria; and the acknowledgment of the right of the Byzantines to levy their own tolls in the Bosphorus. In effect, Athens accepted the fact that she was no longer imperial. Nevertheless, the ten Athenians received Philip's oaths and accepted a safe conduct, and, not a little relieved, took ship to Euboea, and came again to Athens early in June. . . . [Later in the year] Philip was within the gates of Greece. What would he do? For whom, against whom, would he be? All Greece waited, hoping somewhat, fearing more, Athens especially looking to her walls, and calling in her country folk, though it was near the season of the rural feast of Heracles. With masterly duplicity, Philip held out the hand of frank fellowship to Thebes, who had been on the right side in the Sacred War when Lacedaemon and Athens had been on the wrong. The Boeotian cities, Orchomenus, Coronea, and Corsiae, whilom allies of the Phocians, were handed over to Theban mercies, and Philip marched into the mountains to avenge Apollo. Fire and sword went through Phocis, as

PHILIP OF MACEDON

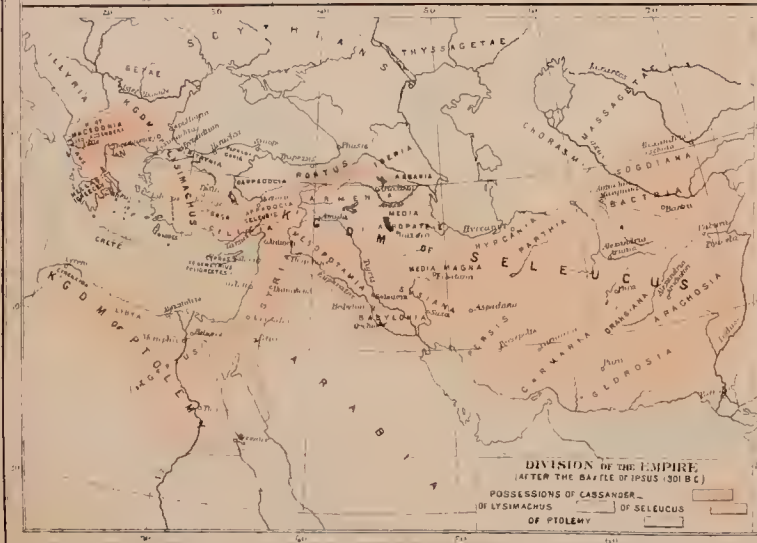

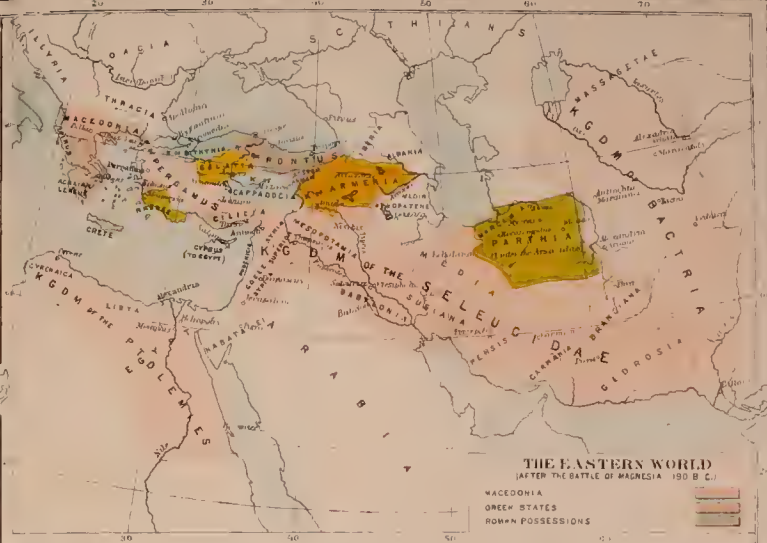

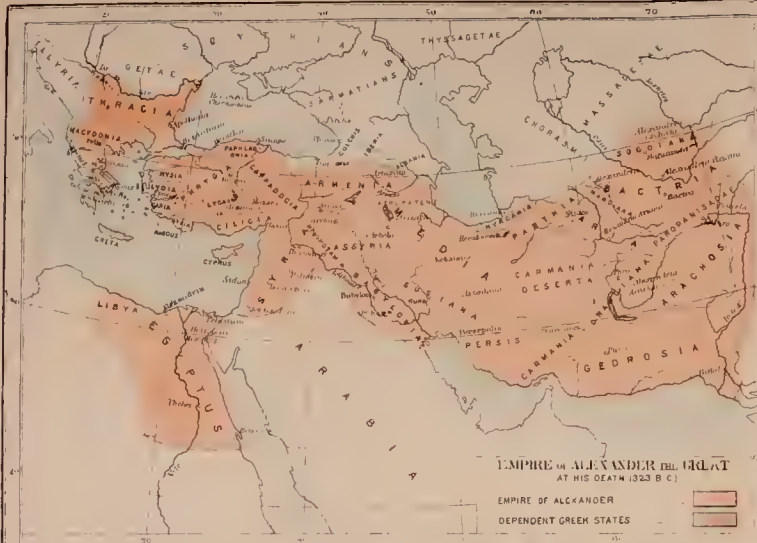

through no Greek state since Epaminondas had raided Laconia. Twenty-three cities were dismantled, and broken up into open villages, a device learned from the great Theban, and after ten years the Delphians were led back to their Delphi, and put in possession of its spoiled and violated shrine. . . . In 345 [B. C.], however, the most part of Philip's intrigue and coercion was exercised within the Isthmus to the breaking-up of the traditional supremacy of Sparta, against whom he could allege that she had ranged herself in Thermopylae with the violators of Delphi. But, although compelled now by superior force to swallow peace with Argos, and to see Arcadia set up again, and to resign Messene, Sparta never submitted herself altogether, but in years to come alone of all the Greeks refused to serve under Philip's banner against Persia, and broke out against his son, so soon as he was gone into Asia. . . . Athens herself, however, Philip did not touch. Determined as he was to end her claims to imperial dominion on the coasts which he conceived to be his own, he respected nevertheless the soil of Attica more than if it had been holy ground. And not only so, but by letter after letter, and envoy after envoy, he tried to soothe the fears of the city and heal

her wounded feelings. . . . Certainly . . . he comforted himself towards one part of his beaten foes with a forbearing and, as it were, an apologetic temper that is all the more conspicuous by contrast with the measure that he meted out to Thebes. That city, into which the Macedonians presently marched, was made to feel all the bitterness of defeat. Her headship of the Boeotian towns was stripped from her for ever, and Orchomenus and Plataea were encouraged to rise again on the north and the south. And not only this, but her own civic autonomy was destroyed, her leaders being proscribed or banished, and their lands seized for the king; and, while a Macedonian garrison was installed in the Cadmeia, a body of three hundred men, formerly exiled for adherence to Macedonian interests, was put in office in the lower city to work their will on the lives and goods of the citizens. Thus did Philip remove the last obstacle to his sway in northern Hellas, paying the city which had taught him war and cost him most the rude compliment of a treatment more brutal than any great state of Greece had experienced since the Persian War. . . . [See also GREECE: B. C. 340.] His ambition was satisfied formally about a twelve-month after Chaeronea. Delegates from all the states, except Sparta, came to meet him at the Isthmus. . . . From one motive or another the delegates were content to acclaim Philip Captain General, and to promise the spearmen, cavalry, and ships which he asked each state to provide, that his venture might assume a panhellenic character. If their fellow citizens grumbled privately, the returned delegates reminded them that they could hardly have done less for the master of so many legions. To Philip it mattered little if the panhellenic movement was factitious now; a successful campaign in Asia would go far to give it reality, and common danger and common triumph would unite his Macedonians and their Greek allies. In 337 he had probably no such Asiatic Empire in view, as that which later his son conceived; he was possessed rather with an idea of nation-making at home, to which end the mere warring with a common enemy would conduce more than the sack of the latter's towns, or the loot of his camps. The word given for a twelvemonth from that time, Philip left Greece, well pleased to gather up his forces for the great adventure which should crown all previous successes, and set the seal on his nation and his fame. He had a great army to equip and supply, and all that winter the arsenal of Pella must have rung to the sound of his arming. By the spring of 336 his host was ready, and making two divisions, he despatched the lesser in advance under Parmenio, with Amyntas and Atalys for lieutenant-generals, to hold the passage of the Dardanelles, and secure the Greek cities on the farther shore against his own coming with the second division and the allied army of Greeks. . . . Philip put off his own march, to the autumn, for he had his house to set in order. [But during the summer of 336 he was assassinated, at the instigation of Olympias, his former wife and the mother of Alexander.] . . . It was remarked long ago that the modern world has taken no political institution consciously or directly from Athens, that is to say, in letters and in art the Athenian is not our immediate fore-father. For if it is true that all the roads of civilization lead back to Greece, equally it is true that they run for vastly the greater part of their course not through Greece. But none the less all along those roads, down to the gate of modern times, the Greek is

conducting us always, himself the spirit of progression. Had no Philip nor such rude giant driver him forth from the frontiers of his little state, our present debt to Hellas had been little greater than can be contracted by conscious archaists in political science, in letters, and in art. But Philip it was that forced the Hellenic into the open sea, and therefore, if it be that 'nothing moves in the world which is not Greek in origin,' it is owed to no man more than the Macedonian. And surely if the great dead still may note the course of progress, in which once they played a part, a reconciliation must have been sealed long ago in the Elysian Fields between Demosthenes and his 'barbarian of Pella.'—D. G. Hogarth, *Philip and Alexander of Macedon*, pp. 93-94, 96, 99, 131, 135-137, 157.—See also GREECE: B. C. 357-336; ATHENS: B. C. 359-338.

B. C. 336-335.—Alexander's campaigns in the north.—Revolt and destruction of Thebes. See GREECE: B. C. 336-335.

B. C. 334-330.—Invasion and conquest of Persian empire by Alexander the Great.—Philip of Macedon was succeeded by his son, Alexander, who applied himself first, with significant energy, to the chastisement of the troublesome barbarians on his northern frontier, and to the crushing of revolt in Greece (see GREECE: B. C. 336-335; ATHENS: B. C. 336-322). He had not yet been a year on the throne "when he stood forth a greater and more powerful sovereign than his father, with his empire united in the bonds of fear and admiration, and ready to carry out the long premeditated attack of the Greeks on the dominion of [Darius the Great]. . . . He had indeed a splendid army of all branches, heavy infantry, light infantry, slingers and archers, artillery such as the ancients could produce without gunpowder, and cavalry, both Thessalian and Macedonian, fit for both skirmishing and the shock of battle. If its numbers were not above 40,000, this moderate force was surely as much as any commander could handle in a rapid campaign with long marches through a hostile country. [See also MILITARY ORGANIZATION: 6.] . . . After a Homeric landing on the coast near Ilium, and sacrifices to the Ilian goddess at her ancient shrine, with feasts and games, the king started East to meet the Persian satraps, who had collected their cavalry and Greek mercenary infantry on the plain of Zeleia, behind the river Granicus (B. C. 334). Here he fought his first great battle, and showed the nature of his tactics, . . . and after a very severe struggle in crossing the river, and climbing its rugged banks, he completely broke the enemy's line. . . . He did not strike straight into Asia, for this would have left it possible for Mentor and Memnon, the able Rhodians who commanded on the coast for Darius, either to have raised all Asia Minor against him, or to have transferred the war back to Macedon. . . . So then he seized Sardis, the key of all the highroads eastwards; he laid siege to Halicarnassus, which made a very long and stubborn resistance, and did not advance till he had his rear safe from attack. Even with all these precautions, the Persian fleet, under Memnon, was producing serious difficulties, and had not that able general died at the critical moment (B. C. 333), the Spartan revolt, which was put down the following year in Greece, would have assumed serious proportions. Alexander now saw that he could press on, and strike at the headquarters of the enemies' power—Phœnicia and the Great king himself. He crossed the difficult range of the Taurus, the southern bulwark of the Persian Empire, and occupied Cilicia. Even

the sea was supposed to have retreated to allow his army to pass along a narrow strand under precipitous cliffs. The Great king was awaiting him with a vast army—grossly exaggerated, moreover, in our Greek accounts—in the plain of Syria, near Damascus. Foolish advisers persuaded him, owing to some delay in Alexander's advance, to leave his favourable position, where the advantage of his hosts of cavalry was clear. He therefore actually crossed Alexander, who had passed on the sea side of Mount Amanus, southward, and occupied Issus on his rear. The Macedonian army was thus cut off from home, and a victory necessary to its very existence. The great battle of Issus was fought on such narrow ground, between the sea and the mountains, that neither side had room for outflanking its opponents, except by occupying the high ground on the inland side of the plain (B. C. 333). This was done by the Persians, and the banks of a little river (the Pinarus) crossing their front were fortified as at the Granicus. Alexander was obliged to advance with a large reserve to protect his right flank. As usual he attacked with his right centre, and as soon as he had shaken the troops opposed to him, wheeled to the left, and made straight for the king himself, who occupied the centre in his chariot. Had Darius withstood him bravely and for some time, the defeat of the Macedonians' left wing would probably have been complete, for the Persian cavalry on the coast, attacking the Thessalians on Alexander's left wing, were decidedly superior, and the Greek infantry was at this time a match for the phalanx. But the flight of Darius, and the panic which ensued about him, left Alexander leisure to turn to the assistance of his hard-pressed left wing, and recover the victory. . . . The greatness of this victory completely paralyzed all the revolt prepared in his rear by the Persian fleet. Alexander was now strong enough to go on without any base of operation, and he boldly (in the manifesto he addressed to Darius after the battle) proclaimed himself King of Persia by right of conquest, who would brook no equal. Nevertheless, he delayed many months (which the siege of Tyre cost him. . . . [See TYRE: B. C. 332]), and then, passing through Jerusalem, and showing consideration for the Jews [see JEWS: B. C. 332-167], he again paused at the siege of Gaza [see GAZA: B. C. 332], merely, we may suppose, to prove that he was invincible, and to settle once for all the question of the world's mastery. He delayed again for a short while in Egypt [see EGYPT: B. C. 332], when he regulated the country as a province under his sway, with kindness towards the inhabitants, and respect for their religion, and founded Alexandria [see also AFRICA: Ancient and medieval civilization: Development of Egyptian civilization; ALEXANDRIA: B. C. 332]; nay, he even here made his first essay in claiming divinity; and then, at last, set out to conquer the Eastern provinces of Darius' empire. The great decisive battle in the plains of Mesopotamia (B. C. 331)—it is called either Arbela or Gaugamela—was spoken of as a trial of strength, and the enormous number of the Persian cavalry, acting on open ground, gave timid people room to fear; but Alexander had long since found out, what the British have found in their many Eastern wars, that even a valiant cavalry is helpless, if undisciplined, against an army of regulars under a competent commander. . . . The Macedonian had again, however, failed to capture his opponent, for which he blamed Parmenio. . . . So then, though the issue of the war was not doubtful, there was still a real and legitimate rival to the

throne, commanding the sympathies of most of his subjects. For the present, however, Alexander turned his attention to occupying the great capitals of the Persian empire—capitals of older kingdoms, embodied in the empire. . . . These great cities, Babylon in Mesopotamia, Susa (Shushan) in Elam, Persepolis in Persia proper, and Ecbatana in Media, were all full of ancient wealth and splendour, adorned with great palaces, and famed for monstrous treasures. The actual amount of gold and silver seized in these hoards (not less than £30,000,000 of English money, and perhaps a great deal more) had a far larger effect on the world than the discovery of gold and silver mines in recent times. Every adventurer in the army became suddenly rich; all the means and materials for luxury which the long civilization of the East had discovered and employed, were suddenly thrown into the hands of comparatively rude and even barbarous soldiers. It was a prey such as the Spaniards found in Mexico and Peru,

ALEXANDER THE GREAT

(After the statue in the Glyptothek, Munich)

but had a far stronger civilization, which must react upon the conquerors. And already Alexander showed clear signs that he regarded himself as no mere Macedonian or Greek king, but as the Emperor of the East, and successor in every sense of the unfortunate Darius. He made superhuman efforts to overtake Darius in his retreat from Ecbatana through the Parthian passes to the northern provinces—Balkh and Samarcand. The narrative of this famous pursuit is as wonderful as anything in Alexander's campaign. He only reached the fleeing Persian as he was dying of the wounds dealt him by the traitor Bessus, his satrap in Bactria, who had aspired to the crown (B. C. 330). Alexander signally executed the regicide, and himself married the daughter of Darius—who had no son—thus assuming, as far as possible, the character of Darius' legitimate successor."—J. P. Mahaffy, *Story of Alexander's empire*, ch. 2-3.

B. C. 330-323.—Alexander's conquest of Afghanistan, Bactria and Sogdiana.—Invasion of India.—Death at Babylon.—Character and aims.—“After reducing the country at the south of the Caspian, Alexander marched east and south, through what is now Persia and Afghanistan. On his way he founded the colony of Alexandria Arion, now Herat, an important military position on the western border of Afghanistan. At Prophthasia (Furrah), a little further south, he stayed two months. . . . Thence he went on eastwards and founded a city, said to be the modern Candahar, and then turned north and crossed the Hindu Koosh mountains, founding another colony near what is now Cabul. Bessus had intended to resist Alexander in Bactria (Balkh), but he fled northwards, and was taken and put to death. Alexander kept on marching northwards, and took Mara Kanda, now Samarcand, the capital of Bokhara (B. C. 329). He crossed the river Jaxartes (Sir), running into the sea of Aral, and defeated the Scythians beyond it, but did not penetrate their country. He intended the Jaxartes to be the northern frontier of his empire. . . . The conquest of Sogdiana (Bokhara) gave Alexander some trouble, and occupied him till the year B. C. 327. In B. C. 327 Alexander set out from Bactria to conquer India [see INDIA: B. C. 327-312]. . . . Alexander was as eager for discovery as for conquest; and from the mouth of the Indus he sent his fleet, under the admiral Nearchus, to make their way along the coast to the mouth of the Euphrates. He himself marched westwards with the army through the deserts of Beloochistan [see BALUCHISTAN: B. C. 325], and brought them after terrible sufferings, through thirst, disease, and fatigue, again to Persepolis (B. C. 324). From this he went to Susa, where he stayed some months, investigating the conduct of his satraps, and punishing some of them severely. Since the battle of Arbela, Alexander had become more and more like a Persian king in his way of living, although he did not allow it to interfere with his activity. He dressed in the Persian manner, and took up the ceremonies of the Persian court. The soldiers were displeased at his giving up the habits of Macedonia, and at Susa he provoked them still more by making eighty of his chief officers marry Persian wives. The object of Alexander was to break down distinctions of race and country in his empire, and to abolish the great gulf that there had hitherto been between the Greeks and the Asiatics. He also enrolled many Persians in the regiments which had hitherto contained none but Macedonians, and levied 30,000 troops from the most warlike districts of Asia, whom he armed in the Macedonian manner. Since the voyage of Nearchus, Alexander had determined on an expedition against Arabia by sea, and had given orders for ships to be built in Phœnicia, and then taken to pieces and carried by land to Thapsakus on the Euphrates. At Thapsakus they were to be put together again, and so make their way to Babylon, from which the expedition was to start. In the spring of B. C. 323, Alexander set out from Susa for Babylon. On his journey he was met by embassies from nearly all the States of the known world. At Babylon he found the ships ready: fresh troops had arrived, both Greek and Asiatic; and the expedition was on the point of starting, when Alexander was seized with fever and died (June, B. C. 323). He was only thirty-two years old.”—C. A. Fyffe, *History of Greece (Primer)*, ch. 7.—“Three great

battles and several great sieges made Alexander master of the Persian empire. And it is worth remark that the immediate results of the three battles, Granikos, Issos, and Gaugamela, coincide with lasting results in the history of the world. The victory of the Granikos made Alexander master of Asia Minor, of a region which in the course of a few centuries was thoroughly hellenized, and which remained Greek, Christian, and Orthodox, down to the Turkish invasions of the 11th century. The territory which Alexander thus won, the lands from the Danube to Mount Tauros, answered very nearly to the extent of the Byzantine Empire for several centuries, and it might very possibly have been ruled by him, as it was in Byzantine times, from an European centre. The field of Issos gave him Syria and Egypt, lands which the Macedonian and the Roman kept for nearly a thousand years, and which for ages contained, in Alexandria and Antioch, the two greatest of Grecian cities. But Syria and Egypt themselves never became Greek; when they became Christian, they failed to become Orthodox, and they fell away at the first touch of the victorious Saracen. Their government called for an Asiatic or Egyptian capital, but their ruler might himself still have remained European and Hellenic. His third triumph at Gaugamela gave him the possession of the whole East; but it was but a momentary possession; he had now pressed onward into lands where neither Grecian culture, Roman dominion, nor Christian theology proved in the end able to strike any lasting root. . . . We believe then that policy, passion, and genuine superstition were all joined together in the demand which Alexander made for divine, or at least for unusual, honours. He had taken the place of the Great King, and he demanded the homage which was held to be due to him who held that place. Such homage his barbarian subjects were perfectly ready to pay; they would most likely have had but little respect for a king who forgot to call for it. But the homage which to a Persian seemed only the natural expression of respect for the royal dignity, seemed to Greeks and Macedonians an invasion of the honour due only to the immortal Gods. . . . He not only sent round to all the cities of Greece to demand divine honours, which were perhaps not worth refusing, but he ordered each city to bring back its political exiles. This last was an interference with the internal government of the cities which certainly was not warranted by Alexander's position as head of the Greek Confederacy. And, in other respects also, from this unhappy time all the worst failings of Alexander become more strongly developed.”—E. A. Freeman, *Alexander (Historical essays, series 2)*.—See also ASIA: B. C. 334-A. D. 1408.

B. C. 323-316.—Partition of empire of Alexander.—First period of the wars of the Diadochi or successors of Alexander.—Alexander “left his wife Roxana pregnant, who at the end of three months brought into the world the rightful heir to the sceptre, Alexander; he left likewise an illegitimate son, Hercules; a bastard half-brother, Arrhidæus; his mother, the haughty and cruel Olympias, and a sister, Cleopatra, both widows; the artful Eurydice, (daughter to Cyane, one of Philip's sisters,) subsequently married to the king, Arrhidæus; and Thessalonica, Philip's daughter, afterwards united to Cassander of Mace-

donia. The weak Arrhidæus, under the name of Philip, and the infant Alexander, were at last proclaimed kings, the regency being placed in the hands of Perdiccas, Leonnatus, and Meleager; the last of whom was quickly cut off at the instigation of Perdiccas. [The provinces of the empire which Alexander had conquered were now divided between the generals of his army, who are known in history as the Diadochi, that is, the Successors. The division was as follows]: Ptolmey son of Lagus received Egypt [see also EGYPT: B. C. 323-30]; Leonnatus, Mysia, Antigonus, Phrygia, Lycia, and Pamphylia; Lysymachus, Macedonian Thrace; Antipater and Craterus remained in possession of Macedonia. . . . The remaining provinces either did not come under the new division [see SELEUCIDÆ], or else their governors are unworthy of notice."—A. H. L. Heeren, *Manual of ancient history*, p. 222.—Meantime, "the body of Alexander lay unburied and neglected, and it was not until two years after his death that his remains were consigned to the tomb. But his followers still shewed their respect for his memory by retaining the feeble Arrhidæus on the throne, and preventing the marriage of Perdiccas with Cleopatra, the daughter of Philip; a union which manifestly was projected to open a way to the throne. But while the project of marriage occupied the attention of the regent, a league had secretly been formed for his destruction; and the storm burst forth from a quarter whence it was least expected. . . . The barbarous tribes of the Cappadocians and Paphlagonians . . . asserted their independence after the death of Alexander, and chose Ariarathes for their leader. Perdiccas sent against them Eumenes, who had hitherto fulfilled the peaceful duties of a secretary; and sent orders to Antigonus and Leonatus, the governors of Western Asia, to join the expedition with all their forces. These commands were disobeyed; and Perdiccas was forced to march with the royal army against the insurgents. He easily defeated these undisciplined troops, but sullied his victory by unnecessary cruelty. On his return he summoned the satraps of Western Asia to appear before his tribunal, and answer for their disobedience. Antigonus, seeing his danger, entered into a league with Ptolemy the satrap of Egypt, Antipater the governor of Macedon, and several other noblemen, to crush the regency. Perdiccas, on the other hand, leaving Eumenes to guard Lower Asia, marched with the choicest divisions of the royal army against Ptolemy, whose craft and ability he dreaded even more than his power. Antipater and Craterus were early in the field; they crossed the Hellespont with the army that had been left for the defence of Macedon. . . . Seduced by . . . false information, they divided their forces; Antipater hastening through Phrygia in pursuit of Perdiccas, while Craterus and Neoptolemus marched against Eumenes. They encountered him in the Trojan plain, and were completely defeated. . . . Eumenes sent intelligence of his success to Perdiccas; but two days before the messenger reached the royal camp the regent was no more. His army, wearied by the long siege of Pelusium, became dissatisfied; their mutinous dispositions were secretly encouraged by the emissaries of Ptolemy . . . and Perdiccas was murdered in his tent (B. C. 321). . . . In the meantime a brief struggle for independence had taken place in Greece, which is commonly called the Lamian war [see GREECE: 323-322]. . . . As soon as Ptolemy had been informed of the murder of Perdiccas, he came to the royal army with a large supply of wine and provisions. His kindness and courteous manners so won upon

these turbulent soldiers, that they unanimously offered him the regency; but he had the prudence to decline so dangerous an office. On his refusal, the feeble Arrhidæus and the traitor Python were appointed to the regency, just as the news arrived of the recent victory of Eumenes. This intelligence filled the royal army with indignation. . . . They hastily passed a vote proclaiming Eumenes and his adherents public enemies. . . . The advance of an army to give effect to these decrees was delayed by a new revolution. Eurydice, the wife of Arrhidæus, a woman of great ambition and considerable talent for intrigue, wrested the regency from her feeble husband and Python, but was stripped of power on the arrival of Antipater, who reproached the Macedonians for submitting to the government of a woman; and, being ably supported by Antigonus and Seleucus, obtained for himself the office of regent. No sooner had Antipater been invested with supreme power than he sent Arrhidæus and Eurydice prisoners to Pella, and entrusted the conduct of the war against Eumenes to the crafty and ambitious Antigonus. . . . Eumenes was unable to cope with the forces sent against him; having been defeated in the open field, he took shelter in Nora, a Cappadocian city, and maintained a vigorous defence, rejecting the many tempting offers by which Antigonus endeavoured to win him to the support of his designs (B. C. 318). The death of Antipater produced a new revolution in the empire; and Eumenes in the meantime escaped from Nora, accompanied by his principal friends. . . . Antipater, at his death, bequeathed the regency to Polysperchon, excluding his son Cassander from power on account of his criminal intrigues with the wicked and ambitious Eurydice. Though a brave general, Polysperchon had not the qualifications of a statesman; he provoked the powerful resentment of Antigonus by entering into a close alliance with Eumenes; and he permitted Cassander to strengthen himself in southern Greece, where he seized the strong fortress of Munychia. . . . Polysperchon, unable to drive Cassander from Attica, entered the Peloponnesus to punish the Arcadians, and engaged in a fruitless siege of Megalopolis. In the meantime Olympias, to whom he had confided the government of Macedon, seized Arrhidæus and Eurydice, whom she had murdered in prison. Cassander hastened, at the head of all his forces, to avenge the death of his mistress: Olympias, unable to meet him in the field, fled to Pydna; but the city was forced to surrender after a brief defence, and Olympias was immediately put to death. . . . In Asia, Eumenes maintained the royal cause against Antigonus, though deserted by all the satraps, and harassed by the mutinous dispositions of his troops, especially the Argyraspides, a body of guards that Alexander had raised to attend his own person, and presented with the silver shields from which they derived their name. After a long struggle, both armies joined in a decisive engagement; the Argyraspides broke the hostile infantry, but learning that their baggage had in the meantime been captured by the light troops of the enemy, they mutinied in the very moment of victory, and delivered their leader, bound with his own sash, into the hands of his merciless enemy (B. C. 315). The faithful Eumenes was put to death by the traitorous Antigonus; but he punished the Argyraspides for their treachery."—W. C. Taylor, *Student's manual of ancient history*, ch. 11, sect. 3.—See also GREECE: B. C. 321-312.

B. C. 315-310.—First league and war against Antigonus.—Extermination of the heirs of Alexander.—“Antigonus was now unquestionably the most powerful of the successors of Alexander the Great. As master of Asia, he ruled over those vast and rich lands that extended from India to the Mediterranean Sea. . . . Although nearly seventy years old, and blind in one eye, he still preserved the vigor of his forces. . . . He was fortunate in being assisted by a son, the famous Demetrius, who, though possessed of a very passionate nature, yet from early youth displayed wonderful military ability. Above all, the prominent representatives of the royal family had disappeared, and there remained only the youthful Alexander, Herakles, the illegitimate son of Alexander the Great, who had no lawful claim whatever to the sovereignty, and two daughters of Philip, Kleopatra, who lived at Sardis, and Thessalonike, whom Kassander had recently married—none of whom were sufficiently strong to assert their rights to the throne. Thus Antigonus seemed indeed destined to become vicar and master of the entire Alexandrian kingdom, and to restore the unity of the empire. But not only was this union not realized, but even the great realm which Antigonus had established in Asia was doomed to inevitable destruction. The generals who possessed the various satrapies of the empire could not bear his supremacy, and accordingly entered into a convention, which gradually ripened into an active alliance against him. The principal organ of this movement was Seleukus, who, having escaped to Ptolemy of Egypt, first of all persuaded the latter to form an alliance—which Kassander of Macedonia and Lysimachus of Thrace readily joined—against the formidable power of Antigonus. The war lasted for four years, and was carried on in Asia, Europe, and Africa. [See also INDIA: B. C. 312.] Its fortunes were various [the most noteworthy event being a bloody defeat inflicted upon Demetrius the son of Antigonus, by Ptolemy, at Gaza, in 312], but the result was not decisive. . . . In 311 B. C. a compact was made between Antigonus on one side, and Kassander, Ptolemy, and Lysimachus on the other, whereby ‘the supreme command in Europe was guaranteed to Kassander, until the maturity of Alexander, son of Roxana; Thrace being at the same time assured to Lysimachus, Egypt to Ptolemy, and the whole of Asia to Antigonus. It was at the same time covenanted by all that the Hellenic cities should be free.’ Evidently this peace contained the seeds of new disputes and increasing jealousies. The first act of Kassander was to cause the death of Roxana and her child in the fortress of Amphipolis, where they had been confined; and thus disappeared forever the only link which apparently maintained the union of the empire, and a ready career now lay open to the ambition of the successors. Again, the name of Selenkus was not even mentioned in the peace, while it was well known at the time it was concluded that he had firmly established his rule over the eastern satrapies of Asia. . . . The troops also of Antigonus, notwithstanding the treaty, still remained in Hellas, under command of his nephew Ptolemy. Ptolemy of Egypt, therefore, accusing Antigonus of having contravened the treaty by garri-soning various Hellenic cities, renewed the war and the triple alliance against him.” A series of assassinations soon followed, which put out of the way the young prince Herakles, bastard son of Alexander the Great, and Kleopatra, the sister of Alexander, who was preparing to wed Ptolemy of Egypt when Antigonus brought about her murder, to prevent the marriage. Another victim of the

jealousies that were rife among the Diadochi was Antigonus’ nephew Ptolemy, who had deserted his uncle’s side, but who was killed by the Egyptian Ptolemy. “For more than ten years . . . Antigonus, Ptolemy, Lysimachus, and Kassander successively promised to leave the Greeks independent, free, and unguarded; but the latter never ceased to be guarded, taxed, and ruled by Macedonian despots. We may, indeed, say that the cities of Hellas never before had suffered so much as during the time when such great promises were made about their liberty. The Ætolians alone still possessed their independence. Rough, courageous, warlike, and fond of freedom, they continued fighting against the Macedonian rule.”—T. T. Timayenis, *History of Greece*, v. 2, pt. 9, ch. 5.

B. C. 310-301.—Demetrius Poliorcetes at Athens.—His siege of Rhodes.—Last combination against Antigonus.—His defeat and death at Ipsus.—Partition of his dominions.—After the war which was renewed in 310 B. C. had lasted three years, “Antigonus resolved to make a vigorous effort to wrest Greece from the hands of Cassander and Ptolemy, who held all the principal towns in it. Accordingly, in the summer of 307 B. C., he despatched his son Demetrius from Ephesus to Athens, with a fleet of 250 sail, and 5,000 talents in money. Demetrius, who afterwards obtained the surname of ‘Poliorcetes,’ or ‘Besieger of Cities,’ was a young man of ardent temperament and great abilities. Upon arriving at the Piræus, he immediately proclaimed the object of his expedition to be the liberation of Athens and the expulsion of the Macedonian garrison. Supported by the Macedonians, Demetrius the Phalerean had now ruled Athens for a period of more than ten years. . . . During the first period of his administration he appears to have governed wisely and equitably, to have improved the Athenian laws, and to have adorned the city with useful buildings. But in spite of his pretensions to philosophy, the possession of uncontrolled power soon altered his character for the worse, and he became remarkable for luxury, ostentation, and sensuality. Hence he gradually lost the popularity which he had once enjoyed. . . . The Athenians heard with pleasure the proclamations of the son of Antigonus; his namesake, the Phalerean, was obliged to surrender the city to him, and to close his political career by retiring to Thebes. . . . Demetrius Poliorcetes then formally announced to the Athenian assembly the restoration of their ancient constitution, and promised them a large donative of corn and ship-timber. This munificence was repaid by the Athenians with the basest and most abject flattery [see GREECE: B. C. 307-197]. . . . Demetrius Poliorcetes did not remain long at Athens. Early in 306 B. C. he was recalled by his father, and, sailing to Cyprus, undertook the siege of Salamis. Ptolemy hastened to its relief with 140 vessels and 10,000 troops. The battle that ensued was one of the most memorable in the annals of ancient naval warfare, more particularly on account of the vast size of the vessels engaged. Ptolemy was completely defeated; and so important was the victory deemed by Antigonus, that on the strength of it he assumed the title of king, which he also conferred upon his son. This example was followed by Ptolemy, Selenus, and Lysimachus. Encouraged by their success at Cyprus, Antigonus and Demetrius made a vain attempt upon Egypt, which, however, proved a disastrous failure. By way of revenge, Demetrius

undertook an expedition against Rhodes, which had refused its aid in the attack upon Ptolemy. It was from the memorable siege of Rhodes that Demetrius obtained his name of Poliorketes. . . . After a year spent in the vain attempt to take the town, Demetrius was forced to retire and grant the Rhodians peace [see RHODES, ISLAND OF; B. C. 304]. Whilst Demetrius was thus employed, Cassander had made great progress in reducing Greece. He had taken Corinth, and was besieging Athens, when Demetrius entered the Euripus. Cassander immediately raised the siege, and was subsequently defeated in an action near Thermopylae. When Demetrius entered Athens he was received as before with the most extravagant flatteries. He remained two or three years in Greece, during which his superiority over Cassander was decided, though no great battle was fought. In the spring of 301 B. C. he was recalled by his father Antigonus, who stood in need of his assistance against Lysimachus and Seleucus. In the course of the same year the struggle between Antigonus and his rivals was brought to a close by the battle of Ipsus in Phrygia, in which Antigonus was killed, and his army completely defeated. Antigonus had attained the age of 81 at the time of his death. Demetrius retreated with the remnant of the army to Ephesus, whence he sailed to Cyprus, and afterwards proposed to go to Athens; but the Athenians, alienated by his ill-fortune at Ipsus, refused to receive him."—W. Smith, *History of Greece*, ch. 45.—"After the battle [of Ipsus] it remained for the conquerors to divide the spoil. The dominions of Antigonus were actually in the hands of Seleucus and Lysimachus, and they alone had achieved the victory. It does not appear that they consulted either of their allies on the partition, though it seems that they obtained the assent of Cassander. They agreed to share all that Antigonus had possessed between themselves. It is not clear on what principle the line of demarcation was drawn, nor is it possible to trace it. But the greater part of Asia Minor was given to Lysimachus. The portion of Seleucus included not only the whole country between the coast of Syria and the Euphrates, but also, it seems, a part of Phrygia and of Cappadocia. Cilicia was assigned to Cassander's brother Pleistarchus. With regard to Syria however a difficulty remained. The greater part of it had . . . been conquered by Ptolemy: Tyre and Sidon alone were still occupied by the garrisons of Antigonus. Ptolemy had at least as good a right as his ally to all that he possessed. . . . Seleucus however began to take possession of it, and when Ptolemy pressed his claims returned an answer, mild in sound, but threatening in its import . . . and it appears that Ptolemy was induced to withdraw his opposition. There were, however, also some native princes [Ardoates in Armenia, and Mithradates, son of Ariobarzanes, in Pontus], who had taken advantage of the contests between the Macedonian chiefs to establish their authority over extensive territories in the west of Asia. . . . So far as regards Asia, the battle of Ipsus must be considered as a disastrous event. Not because it transferred the power of Antigonus into different hands, nor because it would have been more desirable that he should have triumphed over Seleucus. But the new distribution of territory led to calamitous consequences, which might perhaps otherwise have been averted. If the empire of Seleucus had remained confined between the Indus and the Euphrates, it might have subsisted much longer, at least, as a barrier against the inroads of the barbarians, who at last obliterated all the traces of European civi-

lisation left there by Alexander and his successors. But shortly after his victory, Seleucus founded his new capital on the Orontes, called, after his father, Antiochia, peopling it with the inhabitants of Antigoniana. It became the residence of his dynasty, and grew, while their vast empire dwindled into the Syrian monarchy. For the prospects of Greece, on the other hand, the fall of Antigonus must clearly be accounted an advantage, so far as the effect was to dismember his territory, and to distribute it so that the most powerful of his successors was at the greatest distance. It was a gain that Macedonia was left an independent kingdom, within its ancient limits, and bounded on the north by a state of superior strength. It does not appear that any compact was made between Cassander and his allies as to the possession of Greece. It was probably understood that he should keep whatever he might acquire there."—C. Thirlwall, *History of Greece*, v. 7, ch. 59.

B. C. 297-280.—Death of Cassander.—Intrigues of Ptolemy Keraunos.—Overthrow and death of Lysimachus.—Abdication and death of Ptolemy.—Murder of Seleucus.—Seizure of Macedonian crown by Keraunos.—"Cassander died of disease (a rare end among this seed of dragon's teeth) in 297 B. C., and so the Greeks were left to assert their liberty, and Demetrius to machinate and effect his establishment on the throne of Macedonia, as well as to keep the world in fear and suspense by his naval forces, and his preparations to reconquer his father's position. Lysimachus, Seleucus, and Ptolemy were watching one another, and alternating in alliance and in war. . . . Pyrrhus was now a very rising and ambitious prince; if not in alliance with Demetrius, he was striving to extend his kingdom of Epirus into Macedonia, and would doubtless have succeeded, but for the superior power of Lysimachus. This Thracian monarch, in spite of serious reverses against the barbarians of the North, who took both him and his son prisoners, and released them very chivalrously, about this time possessed a solid and secure kingdom, and moreover an able and righteous son, Agathocles, so that his dynasty might have been established. but for the poisonous influence of Arsinoe, the daughter of Ptolemy, whom he, an old man, had married in token of an alliance after the battle of Ipsus. . . . The family quarrel which upset the world arose in this wise. To seal the alliance after Ipsus, old king Ptolemy sent his daughter Arsinoe to marry his rival and friend Lysimachus, who, on his side, had sent his daughter, another Arsinoe, in marriage to the younger Ptolemy (Philadelphus). This was the second son of the great Ptolemy, who had chosen him for the throne in preference to his eldest son, Keraunos, a man of violent and reckless character, who accordingly left the country, and went to seek his fortune at foreign courts. Meanwhile the old Ptolemy, for safety's sake, installed his second son as king of Egypt during his own life, and abdicated at the age of 83 [B. C. 283], full of honours, nor did he leave the court, where he appeared as a subject before his son as king. Keraunos naturally visited, in the first instance, the Thracian court, where he not only had a half-sister (Arsinoe) queen, but where his full sister, Ly-sandra, was married to the crown prince, the gallant and popular Agathocles; but Keraunos and the queen conspired against this prince; they persuaded old Lysimachus that he was a traitor, and

so Keraunos was directed to put him to death. This crime caused unusual excitement and odium all through the country, and the relations and party of the murdered prince called on Seleucus to avenge him. He did so, and advanced with an army against Lysimachus, whom he defeated and slew in a great battle, somewhere not far from the field of Ipsus. It was called the plain of Coron (B. C. 281). Thus died the last but one of Alexander's Companions, at the age of 80, he, too, in battle. Ptolemy was already laid in his peaceful grave (B. C. 283). There remained the last and greatest, the king of Asia, Seleucus. He, however, gave up all his Asiatic possessions from the Hellespont to the Indus to his son Antiochus, and meant to spend his last years in the home of his fathers, Macedonia; but as he was entering that kingdom he was murdered by Keraunos, whom he brought with him in his train. This bloodthirsty adventurer was thus left with an army which had no leader, in a kingdom which had no king; for Demetrius' son, Antigonus, the strongest claimant, had not yet made good his position. All the other kings, whose heads were full with their newly acquired sovereignties, viz., Antiochus in Asia and Ptolemy II. in Egypt, joined with Keraunos in buying off the dangerous Pyrrhus [king of Epirus (see *ROME: Republic: B. C. 281-272*)], by bribes of men, money and elephants, to make his expedition to Italy, and leave them to settle their affairs. The Greek cities, as usual, when there was a change of sovran in Macedonia, rose and asserted what they were pleased to call their liberty, so preventing Antigonus from recovering his father's dominions. Meanwhile Keraunos established himself in Macedonia; he even, . . . induced the queen, his step-sister, his old accomplice against Agathocles, to marry him! but it was only to murder her children by Lysimachus, the only dangerous claimants to the Thracian provinces. The wretched queen fled to Samothrace, and thence to Egypt, where she ended her guilty and chequered career as queen of her full brother Ptolemy II. (Philadelphus), and was deified during her life! Such then was the state of Alexander's Empire in B. C. 280. All the first Diadochi were dead, and so were even the sons of two of them, Demetrius and Agathocles. The son of the former was a claimant for the throne of Macedonia, which he acquired after long and doubtful struggles. Antiochus, who had long been regent of the Eastern provinces beyond Mesopotamia, had come suddenly, by his father's murder, into possession of so vast a kingdom, that he could not control the coast of Asia Minor, where sundry free cities and dynasts sought to establish themselves. Ptolemy II. was already king of Egypt, including the suzerainty of Cyrene, and had claims on Palestine and Syria. Ptolemy Keraunos, the double-dyed villain and murderer, was in possession of the throne of Macedonia, but at war with the claimant Antigonus. Pyrrhus of Epirus was gone to conquer a new kingdom in the West. Such was the state of things when a terrible new scourge [the invasion of the Gauls] broke over the world."—J. P. Mahaffy, *Story of Alexander's empire*, ch. 7.

B. C. 280-279.—Invasion by the Gauls.—Death of Ptolemy Keraunos. See *GAUL: B. C. 280-279*.

B. C. 277-244.—Strife for the throne.—Failures of Pyrrhus.—Success of Antigonus Gonatus.—His subjugation of Athens and Corinth.—"On the retirement of the Gauls, Antipater, the nephew of Cassander, came forward for the second time, and was accepted as king by a portion, at any rate,

of the Macedonians. But a new pretender soon appeared upon the scene. Antigonus Gonatus, the son of Demetrius Poliorcetes, who had maintained himself since that monarch's captivity as an independent prince in Central or Southern Hellas, claimed the throne once filled by his father, and, having taken into his service a body of Gallic mercenaries, defeated Antipater and made himself master of Macedonia. His pretensions being disputed by Antiochus Soter, the son of Seleucus, who had succeeded to the throne of Syria, he engaged in war with that prince, crossing into Asia and uniting his forces with those of Nicomedes, the Bithynian king, whom Antiochus was endeavouring to conquer. To this combination Antiochus was forced to yield; relinquishing his claims, he gave his sister, Phila, in marriage to Antigonus, and recognised him as king of Macedonia. Antigonus upon this fully established his power, repulsing a fresh attack of the Gauls. . . . But he was not long left in repose. In B. C. 274, Pyrrhus finally quitted Italy, having failed in all his schemes, but having made himself a great reputation. Landing in Epirus with a scanty force, he found the condition of Macedonia and of Greece favourable to his ambition. Antigonus had no hold on the affections of his subjects, whose recollections of his father, Demetrius, were unpleasing. The Greek cities were, some of them, under tyrants, others occupied against their will by Macedonian garrisons. Above all, Greece and Macedonia were full of military adventurers, ready to flock to any standard which offered them a fair prospect of plunder. Pyrrhus, therefore, having taken a body of Celts into his pay, declared war against Antigonus, B. C. 273, and suddenly invaded Macedonia. Antigonus gave him battle, but was worsted, owing to the disaffection of his soldiers, and being twice defeated became a fugitive and a wanderer. The victories of Pyrrhus, and his son Ptolemy, placed the Macedonian crown upon the brow of the former. . . . But the arts and employments of peace had no charm for the Epirotic knight-errant. Hardly was he settled in his seat when, upon the invitation of Cleonymus of Sparta, he led an expedition into the Peloponnese, and attempted the conquest of that rough and difficult region. Repulsed from Sparta, which he had hoped to surprise, he sought to cover his disappointment by the capture of Argos; but here he was still more unsuccessful. Antigonus, now once more at the head of an army, watched the city, prepared to dispute its occupation, while the lately threatened Spartans hung upon the invader's rear. In a desperate attempt to seize the place by night, the adventurous Epirote was first wounded by a soldier and then slain by the blow of a tile, thrown from a housetop by an Argive woman, B. C. 271. On the death of Pyrrhus the Macedonian throne was recovered by Antigonus, who commenced his second reign by establishing his influence over most of the Peloponnese, after which he was engaged in a long war with the Athenians (B. C. 268 to 263), who were supported by Sparta and by Egypt [see *ATHENS: B. C. 288-263*]. These allies rendered, however, but little help; and Athens must have soon succumbed, had not Antigonus been called away to Macedonia by the invasion of Alexander, son of Pyrrhus. This enterprising prince carried, at first, all before him, and was even acknowledged as Macedonian king; but ere long Demetrius, the son of Antigonus, having defeated Alexander near Derdia, re-established his father's dominion over Macedon, and, invading Epirus, succeeded in driving the Epirotic monarch out of his paternal kingdom. The Epi-

rots soon restored him; but from this time he remained at peace with Antigonos, who was able once more to devote his undivided attention to the subjugation of the Greeks. In B. C. 263 he took Athens, and rendered himself complete master of Attica; and, in B. C. 244, . . . he contrived by a treacherous stratagem to obtain possession of Corinth. But at this point his successes ceased. A power had been quietly growing up in a corner of the Peloponnese [the Achæan League (see GREECE: B. C. 280-146)] which was to become a counterpoise to Macedonia, and to give to the closing scenes of Grecian history an interest little inferior to that which had belonged to its earlier pages."—G. Rawlinson, *Manual of ancient history*, pp. 261-263.—See also ÆTOLIA.

9th-10th centuries.—Bulgarian occupation.—Revolts.—Independent Macedonian state.—Retaken by Bulgaria.—“For the first 150 years of their history on the Balkan Peninsula the Bulgarians never left their original frontiers. They used to make incursions in the neighbouring Greek provinces, with the object of plundering, but they regularly returned in their country. It is only under Krum that they begin their new migration westwards and that they conquer in 809, Sophia (Sredatz). Under Boris I. (852-888) they conquer the eastern parts of Macedonia and reach the Vardar. During Vladimir’s reign there are no new conquests . . . but under the Tzar Simeun (893-927) the Bulgarians conquer the whole of Macedonia, nearly the whole Balkan Peninsula and half of to-day’s Roumania and Hungary—in these times Bulgaria was at the zenith of her power.”—S. Tomitch, *Who are the Macedonian Slavs? (Macedonia and the Macedonians [pamphlet] pp. 81, 82)*—“Coming in this manner under the sway of the Bulgars, the Macedonian Slavs maintained the same relations towards them which they had hitherto observed towards Byzantium. The Slav tribes, under the rule of their native princes or chieftains, retained their independent domestic organization, only their allegiance was transferred to their new masters. The change of allegiance did not, therefore, interfere with the domestic life of the Macedonian Slavs. Likewise it exercised no influence on the ethnical evolution of the Macedonians either. The Bulgars did not come as settlers, but as conquerors. . . . The lot of the Macedonian Slavs represented not only two social classes one of which was the ruling and the other the ruled, but also two nations, two religions, and two civilizations. It is true that the Bulgars had already approximated themselves considerably to the conquered Slavs in Bulgarian territory, but to all intents and purposes they were in the main Bulgars. Although they were nominally converted, they were far from being really Christians.”—T. R. Georgevitch, *Macedonia*, p. 23.—“But already under Simeun’s son Peter (927-966) Bulgaria begins to decay and during the reign of the latter’s successor Boris II. (966-969) the sons of the Mace-

donian prince Nikolitz rise against the Bulgarians, turn them out of the country and found an independent Macedonian State. In 971 the Greek Emperor John Tzimiski conquers Bulgaria and in 973 he subdues also the new Macedonian State. In 976 the Macedonian Slavs rise again, this time against the Byzantines, liberate themselves and one of their leaders, Samuilo (970-1014) takes all the power in his hands and proclaims himself Emperor. Samuilo’s young and powerful State, with Prespa as capital liberates the whole of Macedonia, unites itself with all Serbian tribes up to Trebinjë and, in 986, conquers from the Byzantines the whole of Bulgaria. Fourteen years later (1000) the Byzantines retake Bulgaria from Samuilo and his State begins to decay also.”—S. Tomitch, *Who are the Macedonian Slavs? (Macedonia and the Macedonians [pamphlet], p. 82)*.

9th-10th centuries.—Origin of Cyrillic alphabet. See SLAVS: 9th-10th centuries.

11th-15th centuries.—Macedonia as a Serbian state.—Taken by Greeks.—Conquered by Asen II.—Re-conquered by Serbians.—Conquered by Turks.—“Samuel’s vast Macedonian Empire was not of long duration. Already under his immediate successors it began to decay, until finally in 1018 it fell completely under the domination of Byzantium. . . . Abortive insurrections in 1040 in the county of Vardar in Macedonia, which aimed at liberation from Byzantium, proved unsuccessful. [About 1186] the Bulgars revolted against the Byzantine supremacy. With the help of the Kumans (Russian *Polovci*) from the steppes of Pontus, they succeeded in freeing themselves and in once more establishing their State. . . . This Bulgarian domination in Macedonia did not last long, only until the death of Kalojan in 1207. . . . Part of Macedonia came to be ruled by a relative of Kalojan, Strez by name, but under Serbian suzerainty. Strez died in 1215; part of his lands was taken by the Latins of Salonica, and part by the Greeks of Epirus. . . . In 1223 Macedonia was ruled by Theodore Komnenus, Despot of Epirus, who presently proclaimed himself Emperor. . . . Theodore ruled over Macedonia for seven years in all. In 1230 he was suddenly attacked, defeated, and made prisoner by the Bulgarian Tsar Asen II, near the village of Klokotnica (now Semisdze). . . . In gratitude for his success over Theodore Komnenus, Asen II built the Church of the Forty Martyrs in his capital of Trnovo. In an inscription in this church he gives a brief account of his war with Theodore. There he describes how he captured Theodore with all his nobles and subdued all the lands from Adrianople even to Durazzo: the Greek, then the Albanian and the Serbian. . . . In 1246, Michael, the son of Asen II, ascended the Bulgarian throne. That same year the Greek Emperor John Vatatzes succeeded in retaking from the Bulgars all the Macedonian provinces from Adrianople to the Vardar. Michael II, Despot of Epirus, on his part occupied the Macedonian districts lying west of the Vardar, with the towns of Veles, Prilep, and Ochrida. In 1252 John Vatatzes overcame Michael II, and all Macedonia as far as the frontiers of the Serbian contemporary State became a Greek province. There was one more Bulgarian invasion of Eastern Macedonia as far as the Vardar, which lasted from the end of 1254 until 1256, and was also ‘carried out without difficulty.’ . . . In 1258 King Uros of Serbia took Skoplje, Prilep, and Kicevo from Byzantium, but lost them again shortly afterwards in 1261. . . . In 1283 King Milutin [of Serbia] . . . conquered the entire territory as far as Ser (the Seres of to-day), Morunac

(Krestopolje, or Kavala of to-day), and the neighbourhood of Mount Athos, and afterwards added Porec, Kicevo, and Debar in Macedonia to these conquests. . . . [Milutin's son Stephen defeated the Bulgarians at the battle of Velbuzo in 1330. His son, Stephan Dusan soon succeeded and commenced the reign which marked the apotheosis of Serbian history, and an epoch in the history of Macedonia more brilliant and prosperous than any she had hitherto passed through. By 1345 he had taken the remaining Macedonian towns including Salonika and thus the whole of Macedonia became a Serbian province. (See also SERBIA: 1341-1356.) Dusan was succeeded in 1355 by his son the feeble Stephan Uros, under whom the Serbian kingdom] was divided into several parts. . . . [Before this time the Turks had begun to overrun the Balkan peninsula, and after the defeat of the Serbs on the Marion in 1371 Macedonia was conquered by them. After this battle it is said that Serbian princes ruled as vassals of the Turks. The last Serbian ruler was Bogdan who can be traced up to the year 1413.]—T. R. Georgevitch, *Macedonia*, pp. 30-32, 34, 45.—See also TURKEY: 1300-1380.

1870-1912.—Macedonian problem.—Influence of Bulgaria.—"Macedonia is the microcosm of the Balkan problem. In Macedonia we can see simultaneously, and in compact and concentrated form, all the different elements which, on a larger scale and in successive phases, have combined to make up the Eastern Question. . . . The presence of the Turk is, however, the least perplexing of the problems which confront us in Macedonia. The country with its ill-defined boundaries and its kaleidoscopic medley of races is in itself a problem. And the problem has been intensified by the demarcation of the Balkan nations in the last half-century. For Macedonia is a 'no man's land'; or rather it is an all men's land. It is the residuum of the Balkans. Moslems, Jews, Albanians, Bulgars, Serbs, Kutzo-Vlachs, Greeks—all are to be found here cheek by jowl; only the roughest territorial discrimination is possible. The Greeks have always desired to see Macedonia 'Hellenized,' and an Hellenized Macedonia is plainly an indispensable preliminary to the realization of the dream of a revived Hellenic Empire with Constantinople as its capital. Yet to Macedonia itself the Greeks have, on ethnographic grounds, no overpowering claim. Greeks are numerous on the coast and in most of the towns; they form a preponderant element in the south-western part of the vilayet of Monastir and in the south of that of Salonica, but they are outnumbered by the Spanish Jews in the city of Salonica, and in the aggregate they are far inferior to the Slavs. . . . 'Hellenism,' writes a close observer, 'claims these (Macedonian) peoples, because they were civilized by the "Greek Orthodox" Church.' . . . This purely ecclesiastical claim is buttressed by a 'spiritual' claim. . . . Down to 1870 all the Bulgarians in Macedonia, as elsewhere, were, according to the official nomenclature of the Ottoman Empire, Greeks. Creed being the only differentia acknowledged by the Turk, all members of the Orthodox Church were in the same category. The establishment of an independent Bulgarian exarchate was the first blow to the Greek monopoly in Macedonia. But although Bul-

garia came into existence as an ecclesiastical entity in 1870, it was not until 1878 that its existence was acknowledged in a political sense. The conclusion of the Treaty of San Stefano appeared to deal a death-blow to Hellenic ambitions in Macedonia. Lord Beaconsfield's intervention was a godsend to the Greeks. But the success of the Philippopolis revolution in 1875 and the subsequent union of Eastern Roumelia and Bulgaria again rendered acute the Macedonian situation. The events of 1885 seemed once more to bring within the sphere of practical politics the realization of the dream of the Greater Bulgaria actually defined at San Stefano. For some years after 1885 the Bulgarians entertained the hope that it might be realized. . . . Ethnographically also [the] . . . claims [of Bulgaria] are strong. It is perhaps rather too much to say, with a distinguished American authority, that 'the great bulk of the population of Macedonia is Bulgarian,' but it is undeniable that Macedonia has, 'by the educational efforts of the Bulgar people, been to a very large extent Bulgarized in its sympathies' in recent years. The people have 'for a quarter of a century been educated as Bulgars; have fought as Bulgars in 1895, 1903, and 1912; were annexed to Bulgaria by the Russians in 1878, and by the Serbs in 1912; were assigned to the Bulgar Church by the Turks in 1872 and 1897; and are to-day, many of them, perhaps most of them, protesting against being treated other than as Bulgars.' The policy of Bulgaria in regard to Macedonia has passed through two phases and into a third during the last thirty years. For some years, as was said, it aimed at the realization of the Greater Bulgaria, mapped out at San Stefano. Gradually abandoning this idea as outside the domain of practical politics the Bulgarians devoted their energies to the emancipation of Macedonia. Their avowed hope was that, as an autonomous principality under a Christian governor, Macedonia, possibly enlarged by the addition of the vilayet of Adrianople, might become a powerful independent State and the nucleus of a Balkan Federation. . . . [The Serbians, however,] have their own claims to substantiate. Ethnographically those claims are incontestable in northern Macedonia; historically they extend much further. It was from Serbians, not from Greeks or Bulgars, that the greater part of Macedonia was originally conquered by the Ottoman Turks. The historical self-consciousness of the Serbs is not less intense than that of the Greeks. . . . But Macedonia is not only the residuum of Balkan races; . . . the cockpit of competing Balkan nationalities; it has been for years the favourite arena for the international rivalries of the great European Powers. . . . If Russia had been permitted to carry out her plans in 1878 the Macedonian question would have been settled in favour of Bulgaria. At that time Europe was quite unconscious of the existence of a Macedonian problem. . . . Meanwhile, the condition of the Macedonian peoples, to whatever race they might belong, was nothing short of deplorable. For five hundred years the Ottomans had been undisputed lords of Macedonia. They began to plant colonies in Macedonia, even before they attempted the conquest of the Balkan Peninsula. They have been systematically colonizing it afresh since the shrinkage of their empire in Europe. But at no time have Turkish Moslems formed a majority of the population in Macedonia. There, as elsewhere, many of the upper classes apostatized to Mohammedanism, and were rewarded in the usual fashion. Those who refused to do so shared the common lot of the subject Chris-

tian populations in other parts of the peninsula. . . . For some years after the conclusion of the Treaty of Berlin these things were patiently endured in the hope that the Powers would fulfil the promises of reforms contained in that document. But from 1893 to 1903 there were sporadic insurrections in various parts of Macedonia, organized by the secret revolutionary committees which quickly came into existence as the hope of reform faded. In 1895 Bulgaria stood forth as the avowed champion of the oppressed peasantry of Macedonia. In that year the 'supreme Macedo-Adrianopolitan Committee' was formed at Sofia, and armed hands poured over the Bulgarian frontiers. Bulgarian intervention effected little good, though it served to stimulate a movement in Macedonia itself which had for its object the creation of an autonomous province under Turkish suzerainty. The outbreak of the 'Three Weeks' War' between Turkey and Greece in 1897 naturally aroused considerable enthusiasm in Macedonia. But the hopes it raised were destined to disappointment, for, in 1898, Austria and Russia concluded an agreement to maintain the *status quo*. In 1899, however, the Macedonian Committee, which was attempting from Sofia to organize a reform movement, addressed a memorial to the Powers in favour of an 'autonomous Macedonia.' . . . Nothing came of it, and from 1900 to 1903 Macedonia was in a state of chronic insurrection, which culminated in the autumn of 1903 in general risings in the Monastir district and in Thrace."—J. A. R. Marriott, *Eastern question*, pp. 361-367.—See also TURKEY: 1902-1903.

1878.—Treaty of San Stefano. See BALKAN STATES: 1878.

20th century.—Turkish administration in town and country.—Misrule of Young Turk government.—"There is in Turkish administration a singular but quite intelligible contrast between the country and the larger cities. The cities are emphatically over-governed. The administration pries into every detail of the daily life of the people. The streets swarm with spies, and it is as difficult to avoid them as it is to escape stumbling over the dogs. . . . The country, on the other hand, is exempt from any systematic government. It is inhabited in Macedonia mainly by Bulgarians, and the Turk does not see why he should trouble himself to provide them with the machinery of order and security. Macedonia is a land of villages. Hardly anywhere outside Albania proper does one find little hamlets or scattered houses. To build an isolated cottage or a lonely farm-house would imply too much trust in one's fellow-men. Nothing would be easier than to police Macedonia by establishing one or two resident gendarmes of good character in all the larger villages. But that is a precaution which the Turks have never adopted. They leave the villages to their own devices, and, if trouble threatens, suddenly quarter troops upon them, not to protect, but to terrorise them."—H. N. Brailsford, *Macedonia*, pp. 32-33.—"Abdul Hamid pursued the time-honoured Imperial policy of *divide et impera*, for he considered that to increase the confusion among the heterogeneous population of Macedonia, was the means best calculated to maintain the Ottoman authority. Following that policy which in 1871 had created the Bulgarian Exarchate as a counterforce to the Greek Patriarchate, he alternately conceded to and withdrew privileges from the Serbian, Bulgarian, and Greek 'nationalist' clergy in Macedonia. Of the three rival races, the Bulgarians carried on the most active propaganda. Many Macedonians had

risen to high positions in the Bulgarian Government and army, and thousands of refugees from the affected regions formed a restless element in the south-western districts of Bulgaria."—W. E. D. Allen, *Turks in Europe*, p. 195.—See also TURKEY: 1903-1908.—In 1910-1912 "the situation in Macedonia was . . . as bad, if not worse, than that existing prior to the [Turkish] Constitution. Instead of the promised equality for all nationalities, the non-Turkish elements of the population had, so to speak, been placed beyond the pale of common justice. Christians were expelled from their farms in order to be replaced by Mouhaggirs (Moslem emigrants) from Bosnia and Bulgaria. A systematic and organised campaign for the murder of a large number of Bulgarians was instituted. In short, the Constitution had been reduced to nothing but a name. Moreover, whereas under the Old Régime the people enjoyed a certain protection from Europe under various schemes of reform sanctioned and undertaken by the Great Powers, and whereas their religious chiefs were then treated with a certain deference by the Constantinople Government, two years after the establishment of the Constitution these advantages had been done away with and instead no amelioration in the actual system of government had been introduced. Upon this point the feeling of the population seems to have been well expressed in a memorandum, drawn up by the Committee of the Bulgarian Internal Organisation, and handed to the Consuls of Great Britain, Russia, Austria-Hungary, and France, on October 31, 1911. After discussing various aspects of the situation in Macedonia, this document declared that: 'Comparing the present state of things to that which existed during the last four years of the reign of Abdul Hamid, when there was in Macedonia a European Control, and when the country enjoyed a certain financial autonomy, the people find the present situation much more abominable and much more insupportable.'—H. C. Woods, *Cradle of the war*, pp. 17-18.

1903-1908.—Mürzsteg reforms.—Turkish obstruction.—"At last in February, 1903, the Austrian and Russian governments attempted a limited intervention, and drew up a scheme of reform, suggesting the appointment of an Inspector-general for a fixed number of years, the reorganisation of the gendarmerie under the superintendence of foreign officers, and certain financial arrangements."—W. 1901.—Assassination.—President McKinley, with Mrs. McKinley, had arrived in Buffalo on the 4th of September for a long planned visit to the exposition, and had accepted the hospitality of its president, John G. Milburn. On the afternoon of the 6th he held a public reception in the temple of music, on the exposition grounds, and it was there that the brutal assassin found his opportunity for the deed. The one fatal bullet of the two that were fired was found to have passed through both walls of the stomach, and its further progress was not traced. For a week there seemed good ground for believing that the sound constitution of the president would defeat the assassin's attempt; but on Friday the 13th the symptoms underwent a rapid change, and at fifteen minutes past two o'clock of the morning of Saturday he breathed his last. The assassin, who called himself Nieman at first, was identified as Leon Czolgosz, a Pole, having reputable parents at Cleveland, Ohio. He had come under anarchist influences and been taught to believe that all heads of government were enemies of the people and ought to be slain. There was no other motive discoverable for his crime. He was arraigned in the county court, before Justice Emory, on September 17th. On the 26th he was sentenced to be executed, in the state

prison at Auburn, within the week beginning October 28.

"The circumstances of this, the third assassination of an American President, have a peculiarly sinister significance. Both President Lincoln and President Garfield were killed by assassins of types unfortunately not uncommon in history; President Lincoln falling a victim to the terrible passions aroused by four years of civil war, and President Garfield to the revengeful vanity of a disappointed office-seeker. President McKinley was killed by an utterly depraved criminal belonging to that body of criminals who object to all governments, good and bad alike, who are against any form of popular liberty if it is guaranteed by even the most just and liberal laws, and who are as hostile to the upright exponent of a free people's sober will as to the tyrannical and irresponsible despot. It is not too much to say that at the time of President McKinley's death he was the most widely loved man in all the United States; while we have never had any public man of his position who has been so wholly free from the bitter animosities incident to public life. . . . The blow was aimed not at this President, but at all Presidents; at every symbol of government. President McKinley was as emphatically the embodiment of the popular will of the Nation expressed through the forms of law as a New England town meeting is in similar fashion the embodiment of the law-abiding purpose and practice of the people of the town. On no conceivable theory could the murder of the President be accepted as due to protest against 'inequalities in the social order,' save as the murder of all the freemen engaged in a town meeting could be accepted as a protest against that social inequality which puts a malefactor in jail."—*Message of President Roosevelt to Congress, Dec. 3, 1901.*

McKINLEY, Mount, or **Denali**, the highest mountain (20,000 feet) in North America, first mentioned by George Vancouver in 1794; seen in 1878 by two Alaska traders, Alfred Mayo and Arthur Harper and in 1889 by Frank Densmore, a prospector, from whose description it was known for years to the Yukon settlers as "Densmore's mountain." Visited by W. A. Dickey in 1896, who guessed its height accurately and named the peak for William McKinley, the news of whose nomination was received on this expedition. Although viewed by George Eldridge and Robert Muldrow of the U. S. Geological Survey in 1898 and by Lieut. Herron in 1899 who named the lesser peak Mount Foraker for the Ohio senator, Alfred Brooks and D. L. Raeburn were the first white men to set foot on Mount McKinley. The first attempt to climb the mountain was made by James Wickersham with four men in 1903. The same year Dr. F. A. Cook tried the ascent and in 1906 organized a second expedition on which he was accompanied by Belmore Browne and Herschel Parker. The first ascent of the difficult North Peak was made by a party of miners and prospectors in 1910. In this year Parker and Browne organized another party, as well as C. E. Rust of Portland, Oregon. Parker and Browne again undertook the ascent in 1912. The summit was reached by Hudson Stuck and Harry Karstens, June 7, 1913, after two months' work.

MACLEAN, Sir Harry Aubrey (1848-1920), British soldier. Instructor in Moroccan army, 1876-1906; held captive by the bandit Raisuli, 1907, his release being secured through a ransom paid by the British government. See MOROCCO: 1904-1909.

McLEMORE RESOLUTION.—"During the month of February the administration was engaged in admittedly delicate negotiations growing out of the armed merchantman-submarine controversy between Great Britain and Germany. . . . [William McLemore, representative from Texas introduced a resolution] which requested the president to warn all American citizens to refrain from traveling upon a merchantman of any belligerent even though armed only for defense, and specifically stating that 'in case American citizens do travel on such armed belligerent ships they do so at their own risk.' . . . [As this resolution tended to infringe upon the presidential powers, the president called into conference several of the majority leaders of the House. The conference gave rise to a rumor that the president was not in agreement with the leaders in the House. This rumor was transmitted to Germany, and] the German newspapers, and through them the German public were promptly advised that the President and his leaders in Congress were hopelessly out of accord. . . . Utterances like these tended to strengthen, and did strengthen, the position of Germany in its negotiations with the United States on this matter and . . . tended to embarrass, and did embarrass, the President of the United States in his dealings with Germany. . . . [Agitation which arose in Congress was] over the McLemore resolution and over nothing else. It arose, therefore, not over a mere 'warning' resolution but over a resolution than an American, in effect, lost his citizenship when he walked up the gangplank of a merchantman bound for Europe and carrying even a single gun. . . . Had this resolution been presented in time of world peace, or even at the beginning of the . . . session . . . the issue would have been very simple and it might have easily been disposed of. . . . [But in the situation then present the matter had a wider significance. Some weeks earlier German Government had given] notice that beginning March 1 it would sink armed enemy vessels without warning, whether such vessels were armed for defense only or not."—*Congressional Record*, Mar. 8, 1916, pp. 4327, 4332.—At the request of the president, the resolution was defeated.

MAD PARLIAMENT. See PARLIAMENT, ENGLISH: 1258.

MADAGASCAR: Area. — Population. — Resources. — Racial characteristics.—"Madagascar [a colonial possession of France] is the third largest island in the world, being 1,000 miles long, by 375 at its widest part, with an average breadth of about 250 miles. It has thus an area of about 230,000 square miles."—T. T. Matthews, *Thirty years in Madagascar*, p. 13.—See also AFRICA: Map.—"Although lying almost wholly within the tropics, it resembles South Africa in being mainly of an elevated character. . . . The eastern and northern coast plains and mountain slopes are very wet and are clothed with tropical forests, while on the highlands there are grasslands. . . . The population is largely found on the highlands, where Antonanarivo stands, connected by rail with the port of Tamatave. Here the abundance of natural pasture makes cattle-rearing the leading industry, there being over 7 million head of horned cattle in the country. Hence there is a large surplus of hides, and a meat-packing industry is established on a small scale in the leading towns and ports. . . . About 3 million acres are under cultivation, 12 per cent. of this total being worked by Europeans. . . . Much rice is grown, and with *manioc* and *butter beans* makes up an important total of food-stuffs exported. Of forest products, wild rubber, tanning barks, and raphia palm fibre . . . are all (especially the last named) exports of considerable value, while very important timber resources await development."—E. G. R. Taylor, *Business man's geography*, p. 326.—"Madagascar is often conveniently spoken of as the Great African Island. . . . It is, geographically speaking, an African island, as it lies near to the great continent, and may, indeed, in very remote ages have been part of it. But its people are not on the whole an African people; and much in its flora and fauna indicates a very long separation from the neighbouring continent. Particularly noticeable is the fact that Madagascar has no lions, elephants, deer, or antelopes, which are abundant in Africa. . . . The people of Madagascar, usually spoken of as the Malagasy, are doubtless of mixed origin. That a large African element exists among them cannot be doubted, but speaking generally they are not Africans, but belong to the same family as the Malays and Malayo-Polynesians. Substantially the same language exists throughout the entire island; and there is not more difference between the dialects than such as exists . . . between the talk of a countryman from Lancashire and another from Somersetshire. . . . The chief tribes in the island are the Hova, the Betsileo, the Bara, the Tankay, the Sihanaka, the Betsimisaraka, the Taimofo, the Taisaka, the Taifasy, the Tanosy, the Sakalava, the Tankarama. To these might be added many other tribal names of less importance, if we intended to make our list complete. The Hova are the inhabitants of the central province of Imerina."—W. E. Cousins, *Madagascar of to-day*.—"The element of Sanscrit in Malagasy proves that the immigrations from the mother source—from Sumatra—took place after the epoch of the Indianising of the Malay language through the Indian invasions of the Malay Peninsula, Java, and Sumatra, which began about 500 B. C. It has therefore been generally agreed to call the Malagasy Indonesians in respect of their race-affinity. . . . The study of comparative phonetics has proved that the Malagasy language is a perfect unity, and that it has developed as a Malayan dialect. . . . The existence of the light-skinned Hova-type of very pure Malayan origin (about 500,000 individuals), especially in the noble caste, could only be explained by the endogamic marriage customs

strongly maintained."—E. Birkeli, *Bantu in Madagascar (Journal of the African Society, July, 1920)*.—See MALAY, MALAYSIAN, OR BROWN, RACE; PHILIOLOGY: 27.

Early history.—"About the seventh century, the Arabs of Mecca took possession of the Comoro Islands, lying to the north-west of Madagascar, and extended their commerce all over the coasts of that great island; and it was to a marked extent their language, civilization, and religion which for centuries dominated the north-west of the island. The great Arab geographer Edresi, who lived in A. D. 1090, has left among his writings a description of Madagascar, which he calls Zaledi. The same author refers to the emigration of Chinese and Malays, who settled in Madagascar at an epoch which unfortunately cannot now be precisely determined. . . . Madagascar was first made known to modern Europe by the celebrated Venetian traveller Marco Polo, in the thirteenth century. He, however, had never seen or visited the island, but had heard during his travels in Asia various accounts of it under the name of Magaster, or Madagascar. . . . It was not until the beginning of the sixteenth century that any European set foot on Madagascar. . . . In A. D. 1505, King Manoel of Portugal sent out a fleet to the Indies under the command of Don Francisco de Almeida. . . . On their way they discovered, on February 1, A. D. 1506, the east coast of Madagascar. Joas Gomez d'Abreu discovered the west coast of the island in the same year, on August 10, St. Laurence's Day, from which circumstance it was called the Island of St. Laurence, a name which it retained for more than a hundred years. During the early times of French intercourse with Madagascar, in the reign of Henry IV, it was known as the Île Dauphiné; this name was never accepted by other nations. There is, however, every reason for believing that the name Madagascar is not a native name, but one given to the island by foreigners."—T. T. Matthews, *Thirty Years in Madagascar*, pp. 16-17.—The Hova were the ruling tribe; but their rule was oppressive and they were hated and feared by the subject tribes. They are, however, a progressive people and after their acceptance of Christianity began to assimilate ideas which fitted them to lead.

1810-1894.—Native rule.—French treaty.—Protectorate.—As far back as tradition will carry us there existed in Madagascar a kind of feudalism. Villages were usually built on the hill tops, and each hill top had its own chieftain, and these petty feudal chiefs were constantly waging war with one another. The people living on these feudal estates paid taxes and rendered certain services to their feudal lords. Each chief enjoyed a semi-independence, for no strong overlord existed. Attempts were made from time to time to unite these petty chieftaincies into one kingdom, but no one tribe succeeded in making itself supreme till the days of Radama I. [1810-1828]. . . . By allying himself closely with England, Radama obtained arms and military instructors, and carried war into distant provinces. He ultimately succeeded in conquering many of the tribes, and his reign marks the beginning of a new era in Madagascar. Indeed, only from his days could Madagascar in any sense be regarded as a political unit. . . . For three reigns, i.e. from the accession of Rasoherina in 1803, the 'Mpanjaka' [(sovereign) was a woman and the wife of the prime minister. The arrangement, however, was quite a recent one]. In the 17th century the French occupied Fort Dauphine, at the south-east extremity of the island, and also formed

establishments at Foule Point and other places on the east coast. The lives of many Frenchmen were sacrificed in the attempt to maintain these positions, and finally they were all but abandoned. In the Napoleonic wars, when Great Britain seized Mauritius and Bourbon, she also acquired whatever possessions and rights France possessed in Madagascar. And although, when peace was reestablished after the battle of Waterloo, Bourbon was restored to France, all French rights and possessions in Madagascar were retained by Great Britain. Later on, in the time of Radama I. (1810-1828), when a treaty of friendship was entered into between him and Governor Farquhar in 1817, all these claims were finally renounced, and Radama was acknowledged King of Madagascar. The French, however, never altogether abandoned the idea that Madagascar in some sense belonged to them. A work was published in 1859 entitled 'Madagascar; a French Possession from the year 1642,' showing how there still lingered in the minds of many the idea that, as a result of these early establishments, France still possessed some claims on the island. Later on France acquired by treaty with local chiefs the islands of St. Mary (1821), near the eastern coast, and Nosihè (1841) on the north-west. . . . From the accession of Radama II. there [were] . . . constant difficulties between the French and Malagasy governments. . . . In the year 1868 a treaty of friendship was entered into by the two governments, and Queen Rasoberina was recognized as Queen of Madagascar. This seemed to be the final abandonment of all French claims. It did not, however, end the difficulties. . . . In 1883, because the Malagasy would not yield to certain demands made by the French, war broke out. . . . In 1886 a treaty of peace was concluded, which, while reserving to the Hova the control of all domestic affairs, gave to the French a privileged position in regard to foreign affairs. . . . The large bay of Diego Suarez, on the north-east of Madagascar (sometimes known as British Sound) was also ceded to France."—W. E. Cousins, *Madagascar of to-day*.—"Difficulties and disputes arose from time to time, however, on various points directly bearing on the treaty, and notably on the two following: the validity of the appendix which was added to the agreement, and the rights of the native government to issue exequaturs to the foreign consuls. As time wore on the tension between the two parties became more and more strained, until at last the French government, feeling the situation to be intolerable, determined to make one final and serious effort to bring the Malagasy government to submission by peaceful means, and, with this end in view, sent out in October, 1894, a plenipotentiary in the person of M. Le Myre de Vilers, who, a short time previously, had been resident-general of the island. But, as the queen and prime minister were unwilling to yield to his demands, his mission proved abortive, and he returned to France."—T. T. Matthews, *Thirty years in Madagascar*, pp. 291, 292.

1890.—French sphere of influence recognized by Great Britain. See AFRICA: Modern European occupation: 1884-1890.

1894-1899.—Subjugation of island by the French.—Anti-foreign and anti-Christian risings.—Revival of idolatry.—Final possession of the island by France proclaimed.—Submissive declaration of the queen.—In 1894 the French government took decisive measures looking toward the subjugation of the island, and, early in 1895, a strong expedition under General Duchesne was

landed on the coast. The Malagasy were much divided among themselves, and they were poorly prepared for war. They made feeble resistance to the invaders; but the latter had a difficult and costly campaign, notwithstanding, on account of the nature of the country and the absence of roads, which they were obliged to construct as they advanced. They are said to have lost only twenty men killed in action, but 6,000 by disease. They reached Antananarivo, the Hova capital, at the end of September. "Immediately on the arrival of General Duchesne a treaty was signed by the Malagasy authorities, by which the whole power of the country was ceded to the French. The queen remained in her place, and the Hova Prime Minister was also allowed to be nominally at the head of affairs. Part of this arrangement was found impracticable after a short time; the Prime Minister had enjoyed unlimited power for too long a period to accept a subordinate position, and General Duchesne was forced to remove him. Accordingly, he was taken to a house of his own at a short distance from the capital, where he was kept under surveillance for two or three months, but as he was still supposed to be plotting he was deported to Algiers, in which country he died after a very short exile. It seemed at first as if the change of masters in the island was to be accomplished without any serious disturbance. . . . In the early part of November (1895), however, this satisfactory state of affairs was rudely interrupted. A paltry quarrel between two clans about a piece of ground, which each claimed, gradually developed into a serious rising. The two parties came to an understanding by agreeing to make an attack upon the Europeans. As soon as General Duchesne was informed of what had been happening to the south-west of the capital, he sent a column . . . with orders to punish the insurgents and to pacify the district. . . . The resistance on the part of the natives was vigorous, and for a time well sustained. . . . Discipline and Lebel rifles, however, were more than a match for all their efforts, and after a loss of about 150 men they desisted. . . . One distressing feature in the insurrection was the revival of idolatry, which was thought to be extinct in Imerina, but which evidently has been scotched and not killed. Almost the first move on the part of the rebels had been to reinstate a local idol called Ravololona, and the performance of certain acts of worship in the presence of the idol was considered the mark of a good patriot. Naturally under these circumstances the teachers and the more prominent Christians in the various churches and chapels were objects of dislike and hatred, and in the disaffected district these men with their wives and families had to fly for their lives. It is useless to shut one's eyes to facts; a considerable number of those who were held in esteem by the missionaries failed to stand the test of persecution, and if not guilty of actually worshipping idols were actively in league with those who did so. . . . After the suppression of this first outbreak matters remained quiet in Imerina for some months. . . . The next serious event in the island was an outbreak of a different character. With the exception of the Hova, few if any of the tribes were thought to be opposed to French rule. . . . The Hova were as much hated as they were feared, and, from whatever quarter it might come, release from their rule would be welcome. The arrival of the French was the long-wished-for moment; but news spreads slowly in Madagascar, and though the Hova power came to an end at the beginning of October, it was not realised on the coast until the new year [1896].

When, however, it was known that the French were masters of the country the explosion came. The two large tribes of the Betsimisaraka and the Taimoro on the east rose against the Hova, and ruthlessly killed them wherever they could catch them. . . . The buildings used as churches and schools were also burnt, for, as the greater part of the teachers came from Imerina, religion and education were associated with the Hova. In one or two instances Europeans were murdered, but only when they were mixed up with the Hova."—F. A. Gregory, *French in Madagascar (Nineteenth Century, Jan., 1897)*.

Formal possession of the island was now proclaimed, and, on January 18th, 1896, the submissive queen signed the following "Declaration":

Her Majesty the Queen of Madagascar, having been made acquainted with the Proclamation taking possession of the Island of Madagascar by the French Government, declares her acceptance of the following conditions:—

Article I. The Government of the French Republic shall be represented at the Court of Her Majesty the Queen of Madagascar by a Resident-General.

Art. II. The Government of the French Republic shall represent Madagascar in all relations with foreign Powers. The Resident-General shall be intrusted with the conduct of relations with the Agents of foreign Powers; and all questions affecting foreigners in Madagascar shall be dealt with through him. The French Diplomatic and Consular Agents abroad shall be charged with the protection of Malagasy subjects and interests.

Art. III. The Government of the French Republic reserve to themselves the right of maintaining in Madagascar the armed forces necessary for the exercise of their authority.

Art. IV. The Resident-General shall control the internal administration of the island. Her Majesty the Queen of Madagascar undertakes to introduce such reforms as the French Government shall deem expedient for the economic development of the island, and for the advancement of civilization.

Art. V. The Government of Her Majesty the Queen of Madagascar undertake to contract no loan without the authorization of the Government of the French Republic. (Signed) RANAVALOMANJAKA, *Mpanjakan'ny Madagascar*.

On February 11th the following "Notification" was officially communicated to all the Powers: "In consequence of difficulties which have arisen in Madagascar, the Government of the Republic, in the exercise of their Protectorate, have been obliged to intervene by force of arms in order to make their rights respected, and to obtain guarantees for the future. They have thus been obliged to occupy the island with their troops, and to take final possession thereof."—Great Britain, *Parliamentary Publications (Papers by Command: Africa, no. 8, 1897)*. About this time, "M. Laroche, the first Resident-General, arrived at the capital and began to organise the government of the country. A new Prime Minister was appointed, in whose name laws might be issued, for it had been settled that the administration should be indirect, that is to say conducted through the medium of the natives. A considerable number of regulations were promulgated, affecting the development of the industries of the country, the granting of concessions, and the education of the natives. Most of these were much too elaborate to be useful, and up to the present time nearly all of them have remained a dead letter. Some

may be useful when the insurrection has been quelled, when the country is such as to invite capitalists, and when schools have been re-established. In March there were again signs of trouble, though at first these were faint and perhaps too far off to attract the serious attention of the authorities. . . . A petty disturbance in the beginning, fomented for private purposes and fostered by an appeal to patriotic feeling, has developed into a formidable insurrection. I say formidable, but I do not mean to give the idea that the insurrection is formidable from a military point of view. . . . But from industrial, educational, and religious points of view, the rebellion has been a complete success, and however soon it may be suppressed, the progress of the country in some parts has been thrown back for years, a large tract reduced to desolation, and the inhabitants to little better than savages. This destruction has been effected in five months, for, beginning in May, it has spread over the whole of Avaradrano, Vonizongo, part of Imarovatana, and Vakin'Ankaratra, four out of the six divisions of Imerina. . . . To mark the anti-European character of the rising, the churches were burnt without distinction, and in some places leper hospitals were destroyed, and their unhappy inmates rendered houseless. The English and Norwegian missions have suffered the most severely. It is impossible to estimate correctly the number of churches and chapels that have been burnt, but at the lowest computation it must amount to 600. . . . As in the West, idol-worship was practised, the idol in this case being Ramahavaly, the war-god or goddess; the pillaging of houses and property became almost universal, and soon it came to pass that no one was safe unless he either joined the insurgents or paid them to leave him unmolested. . . .

"The greatest move in the organisation of the country is the abolition of slavery throughout the island. This was proclaimed in the official gazette issued on the 27th of September [1896] by decree of the Resident-General. It was wholly unexpected at the time, though there had been rumours two or three months previously to the effect that the step was contemplated, but would be effected gradually. Naturally, it fell upon the Hova like a clap of thunder, and, as the law was published on a Sunday, some worthy folk found themselves, on their return from service, without a slave to cook the dinner. . . . It would have been better to have proceeded more slowly to the desired end; to have made all children born after a fixed day free; and to have made the redemption of the rest, either by themselves or by others, cheap and easy. However, it has been decided otherwise, and certainly the state of the country is such as to justify any measure, for, when everything is in a state of upheaval the exact amount of pressure is of small importance. In addition to this it must be remembered that in consequence of the outbreak Madagascar has been declared a French colony, and that this carries with it the abolition of the status of slavery. While, then, the greater number of Europeans who know Madagascar would have preferred that slavery should have been abolished by degrees, few would be prepared to say that it was altogether a mistake."—F. A. Gregory, *French in Madagascar (Nineteenth Century, Jan., 1897)*.—An Act for the annexation of Madagascar was passed by the French chamber and senate in the early summer of 1896, with a declaration for the immediate abolition of slavery. In the following year Queen

Ranavalomanjaka was banished to the French island of Réunion, and in 1899 she was removed to a more distant exile in Algiers.

1900-1916.—Development of island as French colony.—“The French went to Tananarive in the same year that Jameson went to Johannesburg; and Queen Ranavalona was exiled to Algiers in the same year that President Kruger made his desperate personal appeal to Europe. . . . The results in Madagascar, just as the results in South Africa, have proved distinctly beneficial to the people of the country. . . . Madagascar is a credit to France. There was much initial suffering to native races, and a great amount of injustice in the early years. This is proved by the appeal of the Native Races Protection Committee, issued in Paris in 1900, which declared that the forced labor of the Malagasy was a crying scandal; that they were in a condition of slavery worse than that which the French Government had abolished by proclamation four years before they conquered the island; and that the taxes amounted to exploitation. It was asserted that forced labor on roads was reducing the robust male population on the island; that natives were arrested and imprisoned without trial, and then compelled to work, because they were prisoners, without pay. . . . Madagascar to-day has over two million acres under cultivation. Although rubber is the principal product, sugar, coffee, cloves, cotton, vanilla, and vegetables are raised in considerable quantity. Scientific development of forest products, government initiative in cattle breeding, and the introduction of silk-worms have done much for the prosperity of the natives. Mines are being opened up. There are nearly nine thousand miles of telegraph and telephone lines. Railway construction has advanced slowly. But there are many good roads, and motor lorries are in use extensively. The revolution in motor transport through the invention and development of the automobile has changed remarkably the problem of transport on islands. Where plantations are large and the haul to the port is not more than two hundred kilometers, it is a question whether the public interest is not better served by good roads than by railways. The planter can load the automobile truck in the field, and unload directly at the steamer. The haul is down to sea-level. . . . France was beginning to find a return in Madagascar when the Great War broke out. There was trade with France to the amount of seventy-five million francs in 1913. Of the ten thousand ships that entered Madagascar ports during that year, nearly seven thousand carried the French flag. . . . Most important of all things is the fact that the French, in spite of their bad start, have succeeded in winning the natives. Second only to the Senegalese have been the Malagasy in their zeal to serve France in this war.”—H. A. Gibbons, *New map of Africa (1900-1916)*, pp. 40-42.

MADEIRA ISLANDS, small group of islands, belonging to Portugal, 360 miles from the coast of Morocco, consisting of Madeira island—capital Funchal—Porto Santo, Desertas and the Selvagens. In the year 1419, Joham Gonçalvez Zarco and Tristam Vaz, “seeing from Porto Santo something that seemed like a cloud, but yet different (the origin of so much discovery, noting the difference in the likeness), built two boats, and, making for this cloud, soon found themselves alongside a beautiful island, abounding in many things, but most of all in trees, on which account they gave it the name of Madeira (wood).”—A. Helps,

Spanish conquest, bk. 1, ch. 1.—See also AMERICA: Map showing voyages of discovery.—Madeira island, from which the group takes its name has an area of about 300 square miles, and is composed of volcanic mountains, interspersed with valleys, which are capable of cultivation only if irrigated. The water courses, which have been constructed with infinite pains are therefore of great importance. To increase the area of cultivable land terraces have been built up the sides of the hills. Wine and sugar are exported; but the island is not capable of producing enough food for the population. Madeira is popular in Europe as a health resort for tuberculosis patients.

MADISON, capital of the state of Wisconsin, between Lakes Mendota and Monona, eighty-two miles west of Milwaukee. The population was 38,378 in 1920. It is the seat of the University of Wisconsin. See WISCONSIN: 1836-1844.

MADRAS, presidency in British India, of which the city of Madras is the capital. (See INDIA: Map.) The city is the third largest in India. In 1921 the population of the presidency was 42,322,270; of the city 522,951. “The area of the Madras presidency . . . has grown gradually by successive increments to the 6 square miles bought by Francis Day for the East India Company in 1640 [when the city of Madras was founded. (See INDIA: 1600-1702.)] The first important accession of territory was the Jagir, now the Chingleput district, granted in perpetuity by the Nawab of the Carnatic in 1763, as confirmed by the Mogul Emperor two years later. The ‘Northern Circars’ (properly, Sarkars or districts) . . . and Gantur, were acquired by treaties made in 1765 and 1766, but the southernmost district, Gantur, did not come under British administration until 1788. The dominions of the Nawab of the Carnatic were annexed in 1801, and the rest of the presidency was acquired for the most part as the result of the third and fourth Mysore wars, which ended respectively in 1792 and 1799; but Kurnool (Karnul) was not annexed until 1830. The result of those annexations and many minor

changes is that the presidency now consists of 24 districts. . . . All administered in the ordinary 'regulation' manner by executive and judicial officers of standing similar to those employed in other settled provinces. A board of revenue controls the revenue staff, and the chartered high court of Madras is the supreme judicial authority. The land is mostly 'settled' on the *rayatwari* system with individual peasants, as in Bombay. . . . [The chief industries, aside from agriculture are chrome tanning, cotton weaving and spinning dyed and printed cotton goods.]—V. A. Smith, *Political geography, government, and administration (Oxford Survey of the British Empire, v. 2—Asia, pp. 280, 281)*.—See also INDIA: 1021.

MADRID, capital of Spain, built along the Manzanares river, on a high, barren, wind-blown plateau, with the one advantage of being almost in the center of the country. The population in 1018 was 608,703. The site of the city was in the tenth century a citadel of the Moors, from whom it was taken by Alfonso VI. The Cortes first met there in 1320; but it was not made the permanent capital until 1560, in the reign of Philip II. (See SPAIN: 1550-1563.) During the War of the Spanish Succession, the capital was entered by the Austrians in 1706 (see SPAIN: 1706; 1707-1710), and again in 1710 Philip V and his court were put to flight by the victorious Austrians. During the Peninsular Wars the city was a pawn in the military game played with the country. In April, 1808, it was occupied by a French army under Murat. In July, Joseph Bonaparte made his entrance into his new capital, only to fly on August 1, at the threat of the Spanish advance. At the close of the year, however, the city surrendered to Napoleon, Joseph was reinstated, and the French remained in occupation until August, 1812. (See SPAIN: 1807-1808; 1808 [May-September]; 1808 [September-December]; 1812 [June-August].) Once more in March, 1823, the French occupied Madrid, when they intervened to replace Ferdinand on the throne. (See SPAIN: 1814-1827.) It is the seat of a well-known university and is the railway center of the country.—See also SPAIN: 1012.

MAGHREB EL-AKSA. See MOROCCO: Geographic description.

MAGIANS, **MAGI**, the priesthood of the ancient Iranian religion—the religion of the Avesta and of Zarathustra, or Zoroaster—as it existed among the Medes and Persians. In Eastern Iran the priests were called Athravas. In Western Iran “they are not called Athravas, but Magush. This name is first found in the inscription which Darius caused to be cut on the rock-wall of Behistun; afterwards it was consistently used by Western writers, from Herodotus to Agathias, for the priests of Iran.”—M. Duncker, *History of antiquity*, v. 5, bk. 7, ch. 8.—“The priests of the Zoroastrians, from a time not long subsequent to Darius Hystaspis, were the Magi. This tribe, or caste, originally perhaps external to Zoroastrianism, had come to be recognised as a true priestly order; and was entrusted by the Sassanian princes with the whole control and direction of the religion of the state. Its chief was a personage holding a rank but very little inferior to the king. He bore the title of ‘Tenpet,’ ‘Head of the Religion,’ or ‘Movpetan Movpet,’ ‘Head of the Chief Magi.’”—G. Rawlinson, *Seventh great oriental monarchy*, ch. 28.—“To the whole ancient world Zoroaster’s lore was best known by the name of the doctrine of the Magi, which denomination was commonly applied to the priests of India, Persia, and Babylonia. The earliest mention of them is made by the prophet Jeremiah (xxxix. 3), who enumerated among the retinue of King Nebuchadnezzar at his entry into Jerusalem, the ‘Chief of the Magi’ (‘rab mag’ in Hebrew), from which statement we may distinctly gather that the Magi exercised a great influence at the court of Babylonia 600 years B. C. They were, however, foreigners, and are not to be confounded with the indigenous priests. . . . The name Magi occurs even in the New Testament. In the Gospel according to St. Matthew (ii. 1), the Magi (Greek ‘magoi,’ translated in the English Bible by ‘wise men’) came from the East to Jerusalem, to worship the new-born child Jesus at Bethlehem. That these Magi were priests of the Zoroastrian religion, we know from Greek writers.”—M. Haug, *Essays on the religion of the Parsis*, I.—See also ZOROASTRIANS.

Usurpation of Persian government. See PERSIA: B. C. 549-521.

MAGIC: Origin of word. See CHALDEA: Wise men of the East.

Ancient magi.—“Black” and “white” magic.—**Association with science**.—“Magic might be called the science of superstition, or the ‘philosophy of the unknown.’ . . . The Magi, a hereditary caste of Persian priests, first practised it in any systematic form. [See MAGIANS.] In the Bible we find soothsaying and sorcery denounced as magic; and the foretelling of the birth of Christ by the Wise Men of the East is a foremost illustration. Now-a-days we find the necromancy of the Greeks—the consultation of ghosts for prophecy—and the Chinese practice of receiving oracles from mediums and from the ‘descending pencil’ imitated by the Spiritualists. . . . At first, the priests were the magicians, and the researches of Tylor, as contained

in his ‘Primitive Culture,’ tend to prove the association of ideas, which accounts for the development of magic, as Fontenelle declares myth developed, in the lowest state of race’s history. When magic became separated from religion, we find the distinction of ‘Black’ and ‘White.’ The former was a belief in supernatural powers, such as are now called ‘odid,’ ‘psychic,’ or ‘occult,’ and the latter a sort of tentative forerunner of the truths of science. Egypt, Babylonia, and Assyria brought magic into its pseudo-scientific stage, and extended it to the philosophic and theurgic forms, which are features in the science of the classics and the Jewish theology. . . . Some of the best deceptions of the sorcerers of old were furnished by the science of acoustics. The imitation of thunder in the subterranean temples indicated the presence of a supernatural agent. . . . The principles of hydrostatics were equally available in the work of deception. . . . The weeping statues and perpetual lamps—these were all obvious effects of the equilibrium and pressure of fluids. And the skill of the philosophers of antiquity in mechanics is unaccountably demonstrated by the Egyptian obelisks and the huge masses of transported stone raised to great heights in the erection of the temples, which are standing marvels till to-day. The powers they employed and the mechanism by which they operated have been studiously concealed. Mechanical arrangements seemed to have formed a large part of their religious impostures. . . . But, of all sciences, perhaps optics has been the most fertile in marvellous expedients. . . . The ancients, indeed, were not acquainted with those combinations of lenses and mirrors which constitute the telescope and the microscope; but they must have been familiar with the properties of glass to form erect and inverted images and objects. There is reason to think that they employed them to effect apparitions of their gods; and in some of the descriptions of the optical displays which hallowed their ancient temples we recognise all the transformations of the modern phantasmagoria.”—A. Thompson, *Magic and mystery*, pp. 7-9.—See also RELIGION: Universal elements; MEDICAL SCIENCE: Ancient: Egyptian; Ancient Finnish; Ancient: Babylonian.

MAGIC CALDRON. See LIA-FAIL.

MAGNA CARTA.—“Coming when he did, King John is to be counted among the most notable of the many gifts of good fortune to the English people. Everything in his character and every circumstance of his reign . . . combined to unite his subjects against him and to strip him of the power to resist their demands. Hence the signing [June 15, 1215.] at Runnymede of the Great Charter which underlies, in its principles and its exemplary influence, all that has been most successful in the enfranchisement of peoples. . . . That the English could win the Magna Charta when they did was due largely . . . to singularly favoring chains of circumstances; that they preserved it is their stronger claim to the grateful admiration of the world. Throughout the next two centuries they were seldom neglectful of opportunities to secure confirmation of the charter from successive kings, and repeatedly from many of them, by attaching that condition to their fiscal grants; and thus, before the end of the Middle Ages, it stood confirmed no less than thirty-eight times. Two-thirds of a century later than Magna Charta the cities of Aragon, already represented in the cortes of that small kingdom, obtained their ‘Great Privilege,’ so called, which went even beyond Magna Charta in its affirmation of popular rights, and it was often confirmed to them; but the want . . . of a broadly nationalized, land-owning Third Es-

tate, to support the burghers of the free towns, exposed them [later] to an easy suppression of their political rights."—J. N. Larned, *English leadership*, pp. 70-71.—"It is my belief that a clear understanding of what the Great Charter was thought to mean in the year 1215 by those who framed it and of its relation to earlier law and institutions, is indispensable to anyone who wishes to comprehend either how the English Constitution originated or what the influence of the charter was on later history. There is, I think, no institution and no set of facts bearing upon the establishment of constitutional government whose correct interpretation, as understood by contemporaries, is so vitally necessary as this. Such an opinion should go almost without saying because the Charter is a great generic or comprehensive document, gathering into itself in result almost all legal institutional history since the Conquest whatever may have been its influence upon the future."—G. B. Adams, *Origin of the English constitution*, pp. 207-208.—"If the results of Magna Carta were to be so creative in our history, at the instant it seemed to demand but little change. Unless we look to a future still distant, we can call it change only by insisting on its character as reaction. And in spirit, in method, and in principle, from the narrower point of view of 1215, it was reaction. If we regard the political necessities of the time, or the principle on which must rest the royal right to carry out the innovations which had been made, in the light of any political science which had up to that time been formulated, we must admit that the king was right and the barons wrong. Nor is the cause of the barons made better by any foresight, or any guess at wider applications of this principle. Their interest was wholly personal, selfish, and temporary. If instead of regarding principle we look to the side of forms, the only change we can find is also reaction. The law which the Great Charter asserts is old law. The things which are new in it, apart from those which are wrong and quickly abandoned, are unessential details or methods of enforcing rights. What was new at the time were the royal innovations, as in the judicial system and taxation, and if we judge them by what increasing business and the needs of government called for, or by the rapid social transformation which was taking place in the community, we must call them advance and the baronial demands reactionary. It is the unintended result which followed in course of time, which gives to the rebellion of 1215 its right to be regarded as the first step in the formation of the English Constitution. It is, therefore, not in details of form and law that the permanent influence of the Great Charter is to be sought. These almost wholly disappeared, or where they became permanent features of Anglo-Saxon public law, it is in a meaning greatly broadened by later experience. To repeat what has been already said, the controlling and moulding power of the Charter in English history is to be found in two things: First of all in the principle upon which it rests that there is a definite body of law by which the king's action is bound, and, second, that, if he insists upon violating it, he may be compelled by force to desist. It is not asserted that the barons of 1215 were conscious of this as an abstract principle, or that they could have formulated it in precise terms. They did not attempt any theoretical justification of their action; they could not even feel the need of it in the stage of political development in which they stood. In any case their ideas seem all to have been concrete and practical, and in their remedies they went no further than the correction of the

specific abuses from which they suffered, and the difficulty, also specific, of securing the king's observance of his promises. But it seems clear that the Charter and the whole movement of which it formed a part proceeded on the supposition that the existing law already bound the king, that many acts of his had been illegal, such as he was bound not to commit, and that the existing law also gave to the barons full right to insist, to the point of armed rebellion if necessary, that these acts should cease and that for the future the king should observe the law and in such an understanding of their rights under the law as it existed, the barons were undoubtedly correct. . . . It was this principle which gave the Charter its influence in the period immediately following, and ultimately its great place in English history. In the slowly developing crises of Henry III.'s reign, what men saw in the charter in its bearing on their differences with the king was not a body of specific law, but that the king's action was bound and limited, and that the community possessed the right to coerce him."—W. A. Dunning, *British empire and the United States*, pp. 249-251.—See also ENGLAND: 1215; COMMON LAW: 1215; LAND TITLES: 1215.—The following is the text of Magna Carta:

"John, by the Grace of God, King of England, Lord of Ireland, Duke of Normandy, Aquitaine, and Count of Anjou, to his Archbishops, Bishops, Abbots, Earls, Barons, Justiciaries, Foresters, Sheriffs, Governors, Officers, and to all Bailiffs, and his faithful subjects, greeting. Know ye, that we, in the presence of God, and for the salvation of our soul, and the souls of all our ancestors and heirs, and unto the honour of God and the advancement of Holy Church, and amendment of our Realm, by advice of our venerable Fathers, Stephen, Archbishop of Canterbury, Primate of all England and Cardinal of the Holy Roman Church; Henry, Archbishop of Dublin; William, of London; Peter, of Winchester; Jocelin, of Bath and Glastonbury; Hugh, of Lincoln; Walter, of Worcester; William, of Coventry; Benedict, of Rochester—Bishops; of Master Pandulph, Sub-Deacon and Familiar of our Lord the Pope; Brother Aymeric, Master of the Knights-Templars in England; and of the noble Persons, William Marescall, Earl of Pembroke; William, Earl of Salisbury; William, Earl of Warren; William, Earl of Arundel; Alan de Galloway, Constable of Scotland; Warin FitzGerald, Peter FitzHerbert, and Hubert de Burgh, Seneschal of Poitou; Hugh de Neville, Matthew FitzHerbert, Thomas Basset, Alan Basset, Philip of Albiney, Robert de Roppell, John Mareschal, John Fitz-Hugh, and others, our liegemen, have, in the first place, granted to God, and by this our present Charter confirmed, for us and our heirs forever:—

1. That the Church of England shall be free, and have her whole rights, and her liberties inviolable; and we will have them so observed, that it may appear thence that the freedom of elections, which is reckoned chief and indispensable to the English Church, and which we granted and confirmed by our Charter, and obtained the confirmation of the same from our Lord the Pope Innocent III, before the discord between us and our barons, was granted of mere free will; which Charter we shall observe, and we do will it be faithfully observed by our heirs for ever.
2. We also have granted to all the freedom of our kingdom, for us and for our heirs for ever, all the underwritten liberties, to be had and holden by them and their heirs, of us and our heirs for ever: If any of our earls, or barons, or others, who hold of us in chief by military service, shall die, and at the time of his death his heir shall be of full age, and owe a relief, he shall

have his inheritance by the ancient relief—that is to say, the heir or heirs of an earl, for a whole earldom, by a hundred pounds; the heir or heirs of a baron, for a whole barony, by a hundred pounds; the heir or heirs of a knight, for a whole knight's fee, by a hundred shillings at most; and whoever oweth less shall give less, according to the ancient custom of fees. 3. But if the heir of any such shall be under age, and shall be in ward, when he comes of age he shall have his inheritance without relief and without fine. 4. The keeper of the land of such an heir being under age, shall take of the land of the heir none but reasonable issues, reasonable customs, and reasonable services, and that without destruction and waste of his men and his goods; and if we commit the custody of any such lands to the sheriff, or any other who is answerable to us for the issues of the land, and he shall make destruction and waste of the lands which he hath in custody, we will take of him amends, and the land shall be committed to two lawful and discreet men of that fee, who shall answer for the issues to us, or to him to whom we shall assign them; and if we sell or give to any one the custody of any such lands, and he therein make destruction or waste, he shall lose the same custody, which shall be committed to two lawful and discreet men of that fee, who shall in like manner answer to us as aforesaid. 5. But the keeper, so long as he shall have the custody of the land, shall keep up the houses, parks, warrens, ponds, mills, and other things pertaining to the land, out of the issues of the same land; and shall deliver to the heir, when he comes of full age, his whole land, stocked with ploughs and carriages, according as the time of wainage shall require, and the issues of the land can reasonably bear. 6. Heirs shall be married without disparagement, and so that before matrimony shall be contracted, those who are near in blood to the heir shall have notice. 7. A widow, after the death of her husband, shall forthwith and without difficulty have her marriage and inheritance; nor shall she give anything for her dower, or her marriage, or her inheritance, which her husband and she held at the day of his death; and she may remain in the mansion house of her husband forty days after his death, within which time her dower shall be assigned. 8. No widow shall be distrained to marry herself, so long as she has a mind to live without a husband; but yet she shall give security that she will not marry without our assent, if she hold of us; or without the consent of the lord of whom she holds, if she hold of another. 9. Neither we nor our bailiffs shall seize any land or rent for any debt so long as the chattels of the debtor are sufficient to pay the debt; nor shall the sureties of the debtor be distrained so long as the principal debtor has sufficient to pay the debt; and if the principal debtor shall fail in the payment of the debt, not having wherewithal to pay it, then the sureties shall answer the debt; and if they will they shall have the lands and rents of the debtor, until they shall be satisfied for the debt which they paid for him, unless the principal debtor can show himself acquitted thereof against the said sureties. 10. If any one have borrowed anything of the Jews, more or less, and die before the debt be satisfied, there shall be no interest paid for that debt, so long as the heir is under age, of whomsoever he may hold; and if the debt falls into our hands, we will only take the chattel mentioned in the deed. 11. And if any one shall die indebted to the Jews, his wife shall have her dower and pay nothing of that debt; and if the deceased left children under age, they shall have necessaries pro-

vided for them, according to the tenement of the deceased; and out of the residue the debt shall be paid, saving, however, the service due to the lords, and in like manner shall it be done touching debts due to others than the Jews. 12. No scutage or aid shall be imposed in our kingdom, unless by the general council of our kingdom; except for ransoming our person, making our eldest son a knight, and once for marrying our eldest daughter; and for these there shall be paid no more than a reasonable aid. In like manner it shall be concerning the aids of the City of London. 13. And the City of London shall have all its ancient liberties and free customs, as well by land as by water; furthermore, we will and grant that all other cities and boroughs, and towns and ports, shall have all their liberties and free customs. 14. And for holding the general council of the kingdom concerning the assessment of aids, except in the three cases aforesaid, and for the assessing of scutages, we shall cause to be summoned the archbishops, bishops, abbots, earls, and greater barons of the realm, singly by our letters. And furthermore, we shall cause to be summoned generally, by our sheriffs and bailiffs, all others who hold of us in chief, for a certain day, that is to say, forty days before their meeting at least, and to a certain place; and in all letters of such summons we will declare the cause of such summons. And summons being thus made, the business shall proceed on the day appointed, according to the advice of such as shall be present, although all that were summoned come not. 15. We will not for the future grant to any one that he may take aid of his own free tenants, unless to ransom his body, and to make his eldest son a knight, and once to marry his eldest daughter; and for this there shall be only paid a reasonable aid. 16. No man shall be distrained to perform more service for a knight's fee, or other free tenement, than is due from thence. 17. Common pleas shall not follow our court, but shall be holden in some place certain. 18. Trials upon the Writs of Novel Disseisin, and of Mort d'ancestor, and of Darrein Presentment, shall not be taken but in their proper counties, and after this manner: We, or if we should be out of the realm, our chief justiciary, will send two justiciaries through every county four times a year, who, with four knights of each county, chosen by the county, shall hold the said assizes in the county, on the day, and at the place appointed. 19. And if any matters cannot be determined on the day appointed for holding the assizes in each county, so many of the knights and freeholders as have been at the assizes aforesaid shall stay to decide them as is necessary, according as there is more or less business. 20. A freeman shall not be amerced for a small offence, but only according to the degree of the offence; and for a great crime according to the heinousness of it, saving to him his contentment; and after the same manner a merchant, saving to him his merchandise. And a villein shall be amerced after the same manner, saving to him his wainage, if he falls under our mercy; and none of the aforesaid ameracements shall be assessed but by the oath of honest men in the neighbourhood. 21. Earls and barons shall not be amerced but by their peers, and after the degree of the offence. 22. No ecclesiastical person shall be amerced for his lay tenement, but according to the proportion of the others aforesaid, and not according to the value of his ecclesiastical benefice. 23. Neither a town nor any tenant shall be distrained to make bridges or embankments, unless that anciently and of right they are bound to do it. 24. No sheriff, constable, coroner, or other

Facsimile of the Latin text of the Magna Carta, arranged in a central column between two vertical borders of various heraldic shields.

FACSIMILE OF THE MAGNA CARTA
(Original parchment, with seal attached, is in the British Museum)

our bailiffs, shall hold "Pleas of the Crown." 25. All counties, hundreds, wapentakes, and trethings, shall stand at the old rents, without any increase, except in our demesne manors. 26. If any one holding of us a lay fee die, and the sheriff, or our bailiffs, show our letters patent of summons for debt which the dead man did owe to us, it shall be lawful for the sheriff or our bailiff to attach and register the chattels of the dead, found upon his lay fee, to the amount of the debt, by the view of lawful men, so as nothing be removed until our whole clear debt be paid; and the rest shall be left to the executors to fulfil the testament of the dead; and if there be nothing due from him to us, all the chattels shall go to the use of the dead, saving to his wife and children their reasonable shares. 27. If any freeman shall die intestate, his chattels shall be distributed by the hands of his nearest relations and friends, by view of the Church, saving to every one his debts which the deceased owed to him. 28. No constable or bailiff of ours shall take corn or other chattels of any man unless he presently give him money for it, or hath respite of payment by the good-will of the seller. 29. No constable shall distrain any knight to give money for castle-guard, if he himself will do it in his person, or by another able man, in case he cannot do it through any reasonable cause. And if we have carried or sent him into the army, he shall be free from such guard for the time he shall be in the army by our command. 30. No sheriff or bailiff of ours, or any other, shall take horses or carts of any freeman for carriage, without the assent of the said freeman. 31. Neither shall we nor our bailiffs take any man's timber for our castles or other uses, unless by the consent of the owner of the timber. 32. We will retain the lands of those convicted of felony only one year and a day, and then they shall be delivered to the lord of the fee. 33. All kydells (wears) for the time to come shall be put down in the rivers of Thames and Medway, and throughout all England, except upon the seacoast. 34. The writ which is called *præcipe*, for the future, shall not be made out to any one, of any tenement, whereby a freeman may lose his court. 35. There shall be one measure of wine and one of ale through our whole realm; and one measure of corn, that is to say, the London quarter; and one breadth of dyed cloth, and russets, and haberjeets, that is to say, two ells within the lists; and it shall be of weights as it is of measures. 36. Nothing from henceforth shall be given or taken for a writ of inquisition of life or limb, but it shall be granted freely, and not denied. 37. If any do hold of us by fee-farm, or by socage, or by burgage, and he hold also lands of any other by knight's service, we will not have the custody of the heir or land, which is holden of another man's fee by reason of that fee-farm, socage, or burgage; neither will we have the custody of the fee-farm, or socage, or burgage, unless knight's service was due to us out of the same fee-farm. We will not have the custody of an heir, nor of any land which he holds of another by knight's service, by reason of any petty serjeanty by which he holds of us, by the service of paying a knife, an arrow, or the like. 38. No bailiff from henceforth shall put any man to his law upon his own bare saying, without credible witnesses to prove it. 39. No freeman shall be taken or imprisoned, or disseised, or outlawed, or banished, or any ways destroyed, nor will we pass upon him, nor will we send upon him, unless by the lawful judgment of his peers, or by the law of the land. 40. We will sell to no man, we will not deny to any man, either justice or right. 41. All merchants

shall have safe and secure conduct, to go out of, and to come into England, and to stay there and to pass as well by land as by water, for buying and selling by the ancient and allowed customs, without any unjust tolls; except in time of war, or when they are of any nation at war with us. And if there be found any such in our land, in the beginning of the war, they shall be attached, without damage to their bodies or goods, until it be known unto us, or our chief justiciary, how our merchants be treated in the nation at war with us; and if ours be safe there, the others shall be safe in our dominions. 42. It shall be lawful, for the time to come, for any one to go out of our kingdom, and return safely and securely by land or by water, saving his allegiance to us; unless in time of war, by some short space, for the common benefit of the realm, except prisoners and outlaws, according to the law of the land, and people in war with us, and merchants who shall be treated as is above mentioned. 43. If any man hold of any escheat, as of the honour of Wallingford, Nottingham, Boulogne, Lancaster, or of other escheats which be in our hands, and are baronies, and die, his heir shall give no other relief, and perform no other service to us than he would to the baron, if it were in the baron's hand; and we will hold it after the same manner as the baron held it. 44. Those men who dwell without the forest from henceforth shall not come before our justiciaries of the forest, upon common summons, but such as are impleaded, or are sureties for any that are attached for something concerning the forest. 45. We will not make any justices, constables, sheriffs, or bailiffs, but of such as know the law of the realm and mean duly to observe it. 46. All barons who have founded abbeys, which they hold by charter from the kings of England, or by ancient tenure, shall have the keeping of them, when vacant, as they ought to have. 47. All forests that have been made forests in our time shall forthwith be disforested; and the same shall be done with the water-banks that have been fenced in by us in our time. 48. All evil customs concerning forests, warrens, foresters, and warreners, sheriffs and their officers, water-banks and their keepers, shall forthwith be inquired into in each county, by twelve sworn knights of the same county, chosen by credible persons of the same county; and within forty days after the said inquest be utterly abolished, so as never to be restored; so as we are first acquainted therewith, or our justiciary, if we should not be in England. 49. We will immediately give up all hostages and charters delivered unto us by our English subjects, as securities for their keeping the peace, and yielding us faithful service. 50. We will entirely remove from their bailiwicks the relations of Gerard de Atheyes, so that for the future they shall have no bailiwick in England; we will also remove Engelard de Cygony, Andrew, Peter, and Gyon, from the Chancery; Gyon de Cygony, Geoffrey de Martyn, and his brothers; Philip Mark, and his brothers, and his nephew, Geoffrey, and their whole retinue. 51. As soon as peace is restored, we will send out of the kingdom all foreign knights, crossbowmen, and stipendiaries, who are come with horses and arms to the molestation of our people. 52. If any one has been dispossessed or deprived by us, without the lawful judgment of his peers, of his lands, castles, liberties, or right, we will forthwith restore them to him; and if any dispute arise upon this head, let the matter be decided by the five-and-twenty barons hereafter mentioned, for the preservation of the peace. And for all those things of which any person has, without the lawful

judgment of his peers, been dispossessed or deprived, either by our father King Henry, or our brother King Richard, and which we have in our hands, or are possessed by others, and we are bound to warrant and make good, we shall have a respite till the term usually allowed the crusaders; excepting those things about which there is a plea depending, or whereof an inquest hath been made, by our order before we undertook the crusade; but as soon as we return from our expedition, or if perchance we tarry at home and do not make our expedition, we will immediately cause full justice to be administered therein. 53. The same respite we shall have, and in the same manner, about administering justice, disafforesting or letting continue the forests, which Henry our father, and our brother Richard, have afforested; and the same concerning the wardship of the lands which are in another's fee, but the wardship of which we have hitherto had, by reason of a fee held of us by knight's service; and for the abbeys founded in any other fee than our own, in which the lord of the fee says he has a right; and when we return from our expedition, or if we tarry at home, and do not make our expedition, we will immediately do full justice to all the complainants in this behalf. 54. No man shall be taken or imprisoned upon the appeal of a woman, for the death of any other than her husband. 55. All unjust and illegal fines made by us, and all amercedments imposed unjustly and contrary to the law of the land, shall be entirely given up, or else be left to the decision of the five-and-twenty barons hereafter mentioned for the preservation of the peace, or of the major part of them, together with the aforesaid Stephen, Archbishop of Canterbury, if he can be present, and others whom he shall think fit to invite; and if he cannot be present, the business shall notwithstanding go on without him; but so that if one or more of the aforesaid five-and-twenty barons be plaintiffs in the same cause, they shall be set aside as to what concerns this particular affair, and others be chosen in their room, out of the said five-and-twenty, and sworn by the rest to decide the matter. 56. If we have disseised or dispossessed the Welsh of any lands, liberties, or other things, without the legal judgment of their peers, either in England or in Wales, they shall be immediately restored to them; and if any dispute arise upon this head, the matter shall be determined in the Marches by the judgment of their peers; for tenements in England according to the law of England, for tenements in Wales according to the law of Wales, for tenements of the Marches according to the law of the Marches: the same shall the Welsh do to us and our subjects. 57. As for all those things of which a Welshman hath, without the lawful judgment of his peers, been disseised or deprived of by King Henry our father, or our brother King Richard, and which we either have in our hands or others are possessed of, and we are obliged to warrant it, we shall have a respite till the time generally allowed the crusaders; excepting those things about which a suit is depending, or whereof an inquest has been made by our order, before we undertook the crusade: but when we return, or if we stay at home without performing our expedition, we will immediately do them full justice, according to the laws of the Welsh and of the parts before mentioned. 58. We will without delay dismiss the son of Llewelin, and all the Welsh hostages, and release them from the engagements they have entered into with us for the preservation of the peace. 59. We will treat with Alexander, King of

Scots, concerning the restoring his sisters and hostages, and his right and liberties, in the same form and manner as we shall do to the rest of our barons of England; unless by the charters which we have from his father, William, late King of Scots, it ought to be otherwise; and this shall be left to the determination of his peers in our court. 60. All the aforesaid customs and liberties, which we have granted to be holden in our kingdom, as much as it belongs to us, all people of our kingdom, as well clergy as laity, shall observe, as far as they are concerned, towards their dependents. 61. And whereas, for the honour of God and the amendment of our kingdom, and for the better quieting the discord that has arisen between us and our barons, we have granted all these things aforesaid; willing to render them firm and lasting, we do give and grant our subjects the underwritten security, namely that the barons may choose five-and-twenty barons of the kingdom, whom they think convenient; who shall take care, with all their might, to hold and observe, and cause to be observed, the peace and liberties we have granted them, and by this our present Charter confirmed in this manner; that is to say, that if we, our justiciary, our bailiffs, or any of our officers, shall in any circumstance have failed in the performance of them towards any person, or shall have broken through any of these articles of peace and security, and the offence be notified to four barons chosen out of the five-and-twenty before mentioned, the said four barons shall repair to us, or our justiciary, if we are out of the realm, and, laying open the grievance, shall petition to have it redressed without delay: and if it be not redressed by us, or if we should chance to be out of the realm, if it should not be redressed by our justiciary within forty days, reckoning from the time it has been notified to us, or to our justiciary (if we should be out of the realm), the four barons aforesaid shall lay the cause before the rest of the five-and-twenty barons; and the said five-and-twenty barons, together with the community of the whole kingdom, shall distrain and distress us in all the ways in which they shall be able, by seizing our castles, lands, possessions, and in any other manner they can, till the grievance is redressed, according to their pleasure; saving harmless our own person, and the persons of our Queen and children; and when it is redressed, they shall behave to us as before. And any person whatsoever in the kingdom may swear that he will obey the orders of the five-and-twenty barons aforesaid in the execution of the premises, and will distress us, jointly with them, to the utmost of his power; and we give public and free liberty to any one that shall please to swear to this, and never will hinder any person from taking the same oath. 62. As for all those of our subjects who will not, of their own accord, swear to join the five-and-twenty barons in distraining and distressing us, we will issue orders to make them take the same oath as aforesaid. And if any one of the five-and-twenty barons dies, or goes out of the kingdom, or is hindered any other way from carrying the things aforesaid into execution, the rest of the said five-and-twenty barons may choose another in his room, at their discretion, who shall be sworn in like manner as the rest. In all things that are committed to the execution of these five-and-twenty barons, if, when they are all assembled together, they should happen to disagree about any matter, and some of them, when summoned, will not or cannot come, whatever is agreed upon, or enjoined, by the major part of those that are

present shall be reputed as firm and valid as if all the five-and-twenty had given their consent; and the aforesaid five-and-twenty shall swear that all the premises they shall faithfully observe, and cause with all their power to be observed. And we will procure nothing from any one, by ourselves nor by another, whereby any of these concessions and liberties may be revoked or lessened; and if any such thing shall have been obtained, let it be null and void; neither will we ever make use of it either by ourselves or any other. And all the ill-will, indignations, and rancours that have arisen between us and our subjects, of the clergy and laity, from the first breaking out of the dissensions between us, we do fully remit and forgive; moreover, all trespasses occasioned by the said dissensions, from Easter in the sixteenth year of our reign till the restoration of peace and tranquillity, we hereby entirely remit to all, both clergy and laity, and as far as in us lies do fully forgive. We have, moreover, caused to be made for them the letters patent testimonial of Stephen, Lord Archbishop of Canterbury, Henry, Lord Archbishop of Dublin, and the bishops aforesaid, as also of Master Pandulph, for the security and concessions aforesaid. 63. Wherefore we will and firmly enjoin, that the Church of England be free, and that all men in our kingdom have and hold all the aforesaid liberties, rights, and concessions, truly and peaceably, freely and quietly, fully and wholly to themselves and their heirs, of us and our heirs, in all things and places, for ever, as is aforesaid. It is also sworn, as well on our part as on the part of the barons, that all the things aforesaid shall be observed in good faith, and without evil subtilty. Given under our hand, in the presence of the witnesses above named, and many others, in the meadow called Runingmede, between Windsor and Staines, the 15th day of June, in the 17th year of our reign.

MAGNA GRÆCIA.—"It was during the height of their prosperity, seemingly, in the sixth century B. C., that the Italic Greeks [in southern Italy] either acquired for, or bestowed upon, their territory the appellation of Magna Græcia, which at that time it well deserved; for not only were Sybaris and Kroton then the greatest Grecian cities situated near together, but the whole peninsula of Calabria may be considered as attached to the Grecian cities on the coast. The native Ænotrians and Sikels occupying the interior had become hellenised, or semi-hellenised, with a mixture of Greeks among them—common subjects of these great cities."—G. Grote, *History of Greece*, pt. 2, ch. 22.—See also ACILEAN CITIES, LEAGUE OF.

MAHDI.—"The literal meaning of the word Mahdi is not, as the newspapers generally assert, 'He who leads,' a meaning more in consonance with European ideas, but 'He who is led.' . . . If he leads his fellow-men it is because he alone is the 'well-guided one,' led by God—the Mahdi. [See also MOROCCO: 1003-1004.] The word Mahdi is only an epithet which may be applied to any prophet, or even to any ordinary person; but used as a proper name it indicates him who is 'well-guided' beyond all others, the Mahdi 'par excel-

lence,' who is to end the drama of the world, and of whom Jesus shall only be the vicar. . . . The Koran does not speak of the Mahdi, but it seems certain that Mahomet must have announced him. . . . The idea of the Mahdi once formed, it circulated throughout the Mussulman world . . . among the Persians, the Turks, the Egyptians, and the Arabs of the Soudan."—J. Darmesteter, *Mahdi, past and present*, ch. 1-2.—"A work written at Mecca in 1883 by a Sherif of that place, entitled *The Conquests of Islam*, contains what may be considered as an authorised version of the conditions which the true Mahdi must fulfil. 'The greatest of the signs,' it is said, 'shall be that he shall be of the line of Fatma (i. e. a Sherif, or descendant of the Prophet); that he shall be proclaimed Mahdi against his will, not seeking such proclamation for himself, and not causing strife amongst the Faithful to obtain it, nor even yielding to it till threatened with death by them. He shall be proclaimed in the Mosque of Mecca, not elsewhere; he shall not appear save when there is strife after the death of a Khalifa; he shall neither come nor be proclaimed until such time as there is no Khalifa over the Moslems. His advent shall coincide with that of Anti-Christ, after whom Jesus will descend and join himself to the Mahdi. These are the great signs of his coming. The others are imaginary or disputed, and whosoever shall, of his own will, declare himself to be Mahdi and try to assert himself by force, is a pretender, such as have already appeared many times.' In August 1881, a man named Mohammed Ahmed proclaimed himself to be the Mahdi in the Soudan. He was born in 1843 in the Province of Dongola. As a young man he was apprenticed to his uncle, a boatbuilder in Sennar, but the tendency which, from his earliest childhood, he had shown towards religious studies, led him to abandon trade, and to enter a religious school at Khartoum. His mission, as explained in his various Proclamations, was to gain over the Soudan to his cause, then to march on Egypt, overthrow the heretical Turks, and convert the whole world. All who opposed his mission were to be destroyed, whether Christians, Mohammedans, or Pagans. Mohammed Ahmed was at once branded by orthodox Mohammedans in Egypt and elsewhere as a False Mahdi (Mutemahdi). Neither, in spite of the credulity and ignorance of the population of the Soudan, is it probable that he would have met with any success even in that province, had not the prevailing discontent predisposed the inhabitants against the Egyptian Government."—Lörd Cromer, *Modern Egypt*, v. 1, pp. 351-353.—See also EGYPT: 1870-1883; 1884-1885; 1885-1896; SENUSSIA; SUDAN: 1003.

MAHDIA, Mehdiya, or Mahdiya, town on the coast of Tunisia, about forty-seven miles southeast of Susa, between the gulfs of Hammamet and Gabes. MAINE: Geographic description.—Area.—Population.—Resources.—"The State of Maine forms the northeastern part of the United States. It is about 300 miles long and 285 miles wide. Maine lies between 43° 6' and 47° 27' 33" N. latitude; between 66° 56' 48" and 71° 6' 41" W. longitude. The 45th. parallel crosses the state within thirty miles of its geographical center. The boundaries are as follows:—The southern boundary, the Atlantic Ocean, is 226 miles, 3640 feet long; the eastern boundary follows the St. Croix river to its source, thence due north to the St. John

river, a distance of 195 miles. The northern boundary extends from the St. John Grand Falls along the river to Crown Monument, a distance of 300 miles, 3950 feet; the western boundary extends from Crown Monument to the sea at the mouth of Piscataqua River near Kittery Point, a distance of 163 miles, 3760 feet. The tenth census places the area at 33,845 square miles, a total land surface of 29,895 square miles. Maine is as large as New Hampshire, Vermont, Rhode Island, Connecticut and Delaware combined."—H. E. Dunning, *Maine book*, p. 37.—"No State has so broken, rugged, and picturesque a coast-line, the actual length of the coast being not far from 2500 miles. Along the coast, and for the most part at no great distance from it, are numerous islands, that of Mt. Desert being the largest. The surface of the State, in general rugged and broken, presents two well-defined slopes or drainage areas. The northern slope, drained by the river St. John and its tributaries, includes about one-third of the area of the State. The southern slope is drained by the rivers which flow southeastward into the Atlantic. The coast rises toward the east. Mt. Katahdin and the northeastern peaks of the White Mountain range are the only considerable mountains. The State is numerously dotted with lakes, large and small, Mooshead and Rangeley lakes being the largest. A noticeable characteristic of the lakes is their high altitude above the sea. The principal rivers . . . are navigable only a short distance from the sea, but they afford excellent and abundant water power, which has long been utilized for manufacturing purposes. [The population of Maine on January 1, 1920, was 768,014, an increase over the census of 1910 of 15,673. The summer population, however, is much larger.] The soil of Maine save in the Aroostook valley and along the rivers, is not fertile. . . . Fortunately, however, Maine does not need to depend upon agriculture alone for its wealth. Its extensive forests of hard and soft wood, its large deposits of granite, slate, and limestone, its fisheries, and its ice afford employment to thousands of persons, and yield, where properly developed, large and increasing returns; while the excellent hunting and fishing, which the State carefully fosters, and the reputation of Maine as the summer resort *par excellence* of eastern North America, form unique and important sources of revenue."—W. MacDonald, *Government of Maine*, pp. 1-3.—Maine is essentially a manufacturing state, and her manufactures had a beginning very early in her history. The first woolen mill of which there is any record was built in Lisbon in 1808, and was still in use as a cotton mill in 1910. In 1870, the state had ninety-three woolen mills, but after that date the era of consolidation was commenced and in 1914 fifty-seven establishments only were reported. Cotton weaving began in Windsor in 1800. Its history followed practically the same course as that of woolen making, and in 1914 the number of persons employed in the manufacture was 13,070. Paper making, which was begun in 1880 is one of the most important of the state's industries. In 1914 it employed 10,606 people. Boot and shoe making began in 1844, and in 1914 employed 0,371 people in fifty plants. Brick-making began before 1760, and in 1880 had reached its highest point, with 118 plants. These rapidly diminished, however, and in 1914 thirty-seven only were quoted. The paper and lumber industries hold the first place, so far as capital invested is concerned among the industries of the state. The lumber industry, however, has changed in its char-

acter since the early times. The use of wood pulp for paper now causes the timber cut to be consumed more in that way than in any other. The large capitalized companies, also are engaged in the development of water power to such an extent that lumbering is almost a by-product. For example the Great Northern Paper Company has constructed dams and reservoirs in various places that have a capacity of forty billion cubic feet. The picturesque industry of ice-cutting, which was formerly a source of considerable profit, decayed to nothing at the beginning of the century. The formation of the ice trust in 1899 brought about a doubling of the price to the people of New York, Philadelphia, Washington and Baltimore where its control was established. This led to failure, reorganization and development of local sources of supply. A more important cause was the introduction of artificial ice which is now made in nearly every state in the Union.—See also U. S. A.: Economic map.

Name.—Sullivan in 'Hist. of Maine,' and others, say that the territory was called the Province of Maine, in compliment to Queen Henrietta, who had that province in France for dowry. But Folsom, 'Discourse on Maine' (Maine Hist. Coll., vol. ii., p. 38), says that that province in France did not belong to Henrietta. Maine, like all the rest of the coast, was known as the 'Maine,' the mainland, and it is not unlikely that the word so much used by the early fishers on the coast, may thus have been permanently given to this part of it."—W. C. Bryant and S. H. Gay, *History of the United States*, v. 1, p. 337, foot-note.

1524-1600.—Verrazano's voyage along the coast.—Thevet's visit.—John Walker's expedition.—In May 1524 Giovanni da Verrazano, in command of an expedition sent out by Francis I of France is believed to have entered the gulf of Maine. About a year after Estevan Gomez, sent out by Charles V to search for a passage to the Indies, named the territory of which Maine is a part, "the country of Gomez." "We have very vague accounts of an English expedition to the coast of Maine in a ship 'The Mary of Guilford,' commanded by John Rat. This was in the year 1567. It is said that he frequently landed, with parties of his men, to explore the interior. The account which we have of this enterprise is meagre in the extreme. This was the second English expedition after that of Sebastian Cabot. . . . In the year 1556, a French gentleman by the name of André Thevet, a scholar and a writer of much repute, desiring to see the New World, took passage in a vessel which sailed along the entire east coast of both South and North America. Thevet visited the coast of Maine, and gives . . . [a] description of the Penobscot River."—J. C. S. Abbott, *History of Maine*, pp. 28-30.—In 1580, John Walker, in command of an expedition sent out by Sir Humphrey Gilbert, also reached the coast of Maine.

1602-1605.—English and French voyages in early seventeenth century.—"In the year 1602 an English navigator, Bartholomew Gosnold, crossed the Atlantic; and it is said by some, while it is disputed by others, that he touched the coast of Maine near Mount Desert. The next year (1603) Martin Pring, with two vessels, 'The Speedwell' and 'The Discover,' sailed from Milford Haven. . . . On the 7th of June, Pring entered Penobscot

Bay. He gives a glowing account of the almost unrivalled scenery there presented. They found excellent anchorage, and fishing-ground never surpassed. The majestic forests deeply impressed them. . . . Sailing along the coast in a south-easterly direction, they passed by the beautiful islands which stud Casco Bay, and entered a river which was probably the Saco. This they ascended about six miles. It seems probable that they also entered the Kennebec and York Rivers. . . . [In 1604 de Monts entered Passamaquoddy bay] now the extreme eastern border of the State of Maine. He explored this bay, and ascended the St. Croix and Schoodic Rivers. . . . It being late in fall, De Monts decided to pass the winter there. Selecting a spot easy of defence, in the midst of a grand forest which afforded shelter from the piercing northern winds, he built several log-cabins for his men. . . . [In May 1605 he took possession of the country round the Kennebec in the name of the king of France, traversed Casco Bay, and sailed south to Cape Cod; but returned to Port Royal. Rumors of these French activities having reached England an expedition was fitted out with the intention of frustrating them.] A thoroughly-built, well-furnished ship, 'The Archangel,' sailed from the Downs on the 31st of March, 1605. Capt. George Weymouth was in command. On the 12th of May the white sands of Cape Cod hove in sight. He directed his course northerly toward the coast of Maine. On the 17th he came to an island about six miles from the shore, and about noon cast anchor upon its north side. . . . After a tarry here of two days, taking in wood and water, on Sunday the 10th Weymouth again spread his sails, and, passing several other islands, reached the mainland at the distance of about nine miles. . . . Wild currants were found, and luxuriant vines which promised an abundance of grapes. They found the soil to be very rich. . . . [and there planted a garden] the first attempt made by Europeans to cultivate the soil of Maine. . . . [Weymouth appears to have made a survey of that region of Penobscot bay and river up to the Kennebec. He sailed for home on June 16, taking with him five captives, who had been seized from among the trading Indians while the ship lay at anchor.]—J. S. C. Abbott, *History of Maine*, pp. 31-34.

ALSO IN: W. D. Williamson, *History of the state of Maine*, pp. 183-195.

1607-1608.—Popham colony on the Kennebec.—Fruitless undertaking of Plymouth Company.—The company chartered in England by King James, in 1606 (see AMERICA: Map of King James's grants), for the colonization of the indefinite region called Virginia, was divided into two branches. To one, commonly spoken of as the London Company, but sometimes as the Virginia Company, was assigned a domain in the south, from 34° to 41° N. L. To the other, less familiarly known as the Plymouth Company, or the North Virginia Company, was granted a range of territory from 38° to 45° N. L. (See VIRGINIA: 1606-1607.) The first named company founded a state; the Plymouth branch was less fortunate. "Of the Plymouth Company, George Popham, brother of the Chief Justice, and Raleigh Gilbert, son of the earlier navigator and nephew of Sir Walter Raleigh, were original associates. A vessel despatched from Bristol by Sir John Popham made a further survey of the coast of New England, and returned with accounts which infused vigorous life into the undertaking; and it was now prosecuted with eagerness and liberality. But in little more than

a year 'all its former hopes were frozen to death.' Three ships [some say two] sailed from Plymouth with 100 settlers, amply furnished, and taking two of Gorges's Indians [kidnapped on the voyage of Captain Weymouth in 1605] as interpreters and guides. After a prosperous voyage they reached the mouth of the river called Sagadahoc, or Kennebec, in Maine, and on a projecting point proceeded to organize their community. After prayers and a sermon, they listened to a reading of the patent and of the ordinances under which it had been decreed by the authorities at home that they should live. George Popham had been constituted their President, Raleigh Gilbert was Admiral. . . . The adventurers dug wells, and built huts. More than half of the number became discouraged, and returned with the ships to England. Forty-five remained through the winter, which proved to be very long and severe. . . . When the President sickened and died, and, presently after, a vessel despatched to them with supplies brought intelligence of the death of Sir John Popham, and of Sir John Gilbert,—the latter event calling for the presence of the Admiral, Gilbert's brother and heir, in England,—they were ready to avail themselves of the excuses thus afforded for retreating from the distasteful enterprise. All yielded to their homesickness, and embarked on board of the returning ship, taking with them a small vessel which they had built, and some furs and other products of the country. Statesmen, merchants, and soldiers had not learned the conditions of a settlement in New England. 'The country was branded by the return of the plantation as being over cold, and in respect of that not habitable by Englishmen.' Still the son of the Chief Justice, 'Sir Francis Popham, could not so give it over, but continued to send thither several years after, in hope of better fortunes, but found it fruitless, and was necessitated at last to sit down with the loss he had already undergone.' Sir Francis Popham's enterprises were merely commercial. Gorges alone [Sir Ferdinando Gorges, who had been among the most active of the original promoters of the company], 'not doubting but God would effect that which man despaired of,' persevered in cherishing the project of a colony.—J. G. Palfrey, *History of New England*, v. 1, ch. 2.—See also U.S.A.: 1607-1752.

ALSO IN: W. C. Bryant and S. H. Gay, *Popular history of the United States*, v. 1, ch. 12.—R. K. Sewall, *Ancient dominions of Maine*, ch. 3.—E. Ballard, *Geographical names on the coast of Maine*.—C. H. Pope, *Pioneers of Maine and New Hampshire*.

1608-1613.—French Jesuit settlement on Mount Desert.—Two Jesuits, Biard and Masse, who had sailed from France with Poutrincourt to convert the natives to Christianity, after an altercation with his son, travelled westward from Port Royal to Mount Desert, where they settled and worked for five years. "Among the visitants to these Northern coasts, at this period, one was *Samuel Argal*, subsequently governor of South-Virginia. Driven by a violent storm, he bore away for Sagadahoc; and coming in sight of a small rocky island out of Penobscot bay, in latitude 43°44', he approached it as the winds abated, and on the 28th of July [1608] landed upon it. . . . Since the Charter was obtained, Gorges had been viewing the American coast between Piscataqua and Passamaquoddy with peculiar intensity and predilection; and continually drawing from voyagers, from the natives, and in particular, from Richard Vines, a great variety of facts about its situation, its inhabitants, and its resources. . . . Meanwhile,

an opportune transaction gave fresh vigour to the enterprizes of the French in this region. Madame de Guercheville, a Catholic lady of France, zealous for the conversion of the American natives, after procuring of de Monts a surrender of his patent, had it all confirmed to her by a Charter from the King, excepting Port-Royal, previously granted to Poutrincourt. She appointed one Suassaye, her agent, who set up at Port le Hive, in Acadia, . . . the arms of his mistress, in token of possession taken; and at Port-Royal, he made a visit, where he found only five persons, of whom two were Jesuit missionaries. Suassaye, producing his pious credentials, took both monks into the service of the mission, and sailed for Mount Desert. Here 25 colonists were landed on the south side of the river; a small fort was built; the ship's crew of 35 men helped fit up the habitations; and here they set up a cross, celebrated mass, and called the place *St. Saviour*. . . . But scarcely had these emigrants provided themselves with some few accommodations, when they had to encounter new, and unexpected troubles from the English. Capt. Argal, of Virginia, in a fishing trip to these waters, being cast ashore at Pentagoet, or Penobscot bay, was there fully informed by the natives what the French were doing at St. Saviour, sometimes called Mount Mansel. This intelligence he immediately communicated to the Virginia magistrates, and they at once determined to expel these Catholic Frenchmen, as obtruders within the limits of the first Charter granted to the patentees of North and South Virginia. Eleven fishing vessels were speedily equipped [1613] carrying 60 soldiers and 14 pieces of cannon;—and of this little armament, Argal was appointed the commodore. His first approach completely surprized the French; yet having a ship and a barque in the harbour, and 'a small entrenchment' on shore, they made a show of resistance. This was all they were able to do, for the cannon were not in a situation to be used; and the men were mostly absent from the fort, engaged in their respective employments. Argal, in his attack upon the vessels, found the capture of them to be no difficult task, even with musketry. Gilbert du Thet, one of the Jesuits, was killed by a musket ball, while in the act of levelling a ship's gun against the assailants; others were wounded; and those on board, except 4 or 5, were taken prisoners. Argal then landed and summoned the fort. The commander requested time for a consultation; but through fear of his being reinforced, his request was not granted. The garrison then abandoning the fort, through a private passage, escaped to the woods. After breaking in pieces the cross which the Jesuits had erected, Argal reared another inscribed with the name of his king and in this way, took formal possession of the place. The people came in the next day and surrendered themselves, their patent, and their stores. Argal treated them with kindness, and gave them their choice, either to return home in such French vessels, as might perchance resort to the coast, or to go with him to Virginia."—W. D. Williamson, *History of the state of Maine*, v. 1, pp. 207-210.

1623-1631.—Gorges' and Mason's grant and division of it.—First colonies planted. See NEW ENGLAND: A. D. 1621-1631.

1629-1631.—Ligonía, or Plow Patent, and other grants.—"The coast from the Piscataqua to the Kennebec was covered by six . . . patents, issued in the course of three years by the Council for New England, with the consent, doubtless, of Gorges, who was anxious to interest as many per-

sons as possible in the projects of colonization to which he was himself so much devoted. Several of these grants were for small tracts; the most important embraced an extent of 40 miles square, bordering on Casco Bay, and named Ligonía. The establishments hitherto attempted on the eastern coast had been principally for fishing and fur-trading; this was to be an agricultural colony, and became familiarly known as the 'Plow patent.' A company was formed, and some settlers sent out; but they did not like the situation, and removed to Massachusetts. Another of these grants was the Pemaquid patent, a narrow tract on both sides of Pemaquid Point, where already were some settlers. Pemaquid remained an independent community for the next forty years."—R. Hildreth, *History of the United States*, v. 1, ch. 7.—The Plow Patent "first came into notoriety in a territorial dispute in 1643. The main facts of the case are told shortly but clearly by Winthrop. According to him, in July, 1631, ten husbandmen came from England, in a ship named the Plough, with a patent for land at Sagadahock. But as the place did not please them they settled in Massachusetts, and were seemingly dispersed in the religious troubles of 1636. . . . At a later day the rights of the patentees were bought up, and were made a ground for ousting Gorges from a part of his territory."—J. A. Doyle, *English in America: Puritan colonies*, v. 1, ch. 7.—See also AMERICA: Map of early colonial grants.

1639.—Palatine principality.—Royal charter to Sir Ferdinando Gorges.—"In April 1639 a charter was granted by the King constituting Gorges Lord Proprietor of Maine. [In this charter the name "Province of Maine" was used.] The territory was bounded by the Sagadahock or Kennebec on the north and the Piscataqua on the south, and was to extend 120 miles inland. The political privileges of the Proprietor were to be identical with those enjoyed by the Bishop of Durham as Count Palatine. He was to legislate in conjunction with the freeholders of the province, and with the usual reservation in favour of the laws of England. His political rights were to be subject to the control of the Commissioners for Plantations, but his territorial rights were to be independent and complete in themselves. He was also to enjoy a monopoly of the trade of the colony. The only other points specially worth notice were a declaration that the religion of the colony was to be that of the Church of England, a reservation on behalf of all English subjects of the right of fishing with its necessary incidents, and the grant to the Proprietor of authority to create manors and manorial courts. There is something painful in the spectacle of the once vigorous and enterprising soldier amusing his old age by playing at kingship. In no little German court of the last century could the forms of government and the realities of life have been more at variance. To conduct the business of two fishing villages Gorges called into existence a staff of officials which might have sufficed for the affairs of the Byzantine Empire. He even outdid the absurdities which the Proprietors of Carolina perpetrated thirty years later. They at least saw that their elaborate machinery of caciques and landgraves was unfit for practical purposes, and they waived it in favour of a simple system which had sprung up in obedience to natural wants. But Gorges tells complacently and with a deliberate care, which contrasts with his usually hurried and slovenly style, how he parcelled out his territory and nominated his officials. . . . The task of putting this cumbrous

machinery into motion was entrusted by the Proprietor to his son, Thomas Gorges, as Deputy-Governor."—J. A. Doyle, *English in America: Puritan colonies*, v. 1, ch. 7.—"The Province was divided into two counties, of one of which Agamenticus, or York, was the principal settlement; of the other, Saco. . . . The greatness of York made it arrogant; and it sent a deputation of aldermen and burgesses to the General Court at Saco, to save its metropolitan rights by a solemn protest. The Proprietary was its friend, and before long exalted it still more by a city charter, authorizing it and its suburbs, constituting a territory of 21 square miles, to be governed, under the name of 'Gorgeana,' by a Mayor, twelve Aldermen, a Common Council of 24 members, and a Recorder, all to be annually chosen by the citizens. Probably as many as two thirds of the adult males were in places of authority. The forms of proceeding in the Recorder's Court were to be copied from those of the British chancery. This grave foolery was acted more than ten years."—J. G. Palfrey, *History of New England*, v. 1, ch. 13.—"Nothing like it [the charter], before or since, is to be found in all the history of the American nation. By it Gorges became the feudal lord of the soil of Maine, and Maine was a fief. The new Lord of Maine established his government and set up his general court at what is now York, which he named Gorgeana, and which was . . . the first incorporated city in America. This court was established in the year 1640."—H. E. Holmes, *Makers of Maine*, pp. 154-155.

1643-1677.—Territorial jurisdiction in dispute.—Claims of Massachusetts made good.—"In 1643, the troubles in England between the King and Commons grew violent, and in that year Alexander Rigby bought the old grant called Lygonia or 'Plow Patent,' and appointed George Cleaves his deputy-president. Governor Thomas Gorges about that time returned to England, and left Vines in his place. Between Cleaves and Vines there was of course a conflict of jurisdiction, and Cleaves appealed for aid to Massachusetts; and both parties agreed to leave their claims (1645) to the decision of the Massachusetts Magistrates, who decided—that they could not decide the matter. But the next year the Commissioners for American plantations in England decided in favor of Rigby; and Vines left the country. In 1647, at last, at the age of 74, Sir Ferdinando Gorges died, and with him died all his plans for kingdoms and power in Maine. In 1651, Massachusetts, finding that her patent, which included lands lying three miles north of the head waters of the Merimack, took in all the lower part of Maine, began to extend her jurisdiction, and as most of the settlers favored her authority, it was pretty well established till the time of the Restoration (1660). Upon the Restoration of Charles II., the heir of Gorges claimed his rights to Maine. His agent in the province was Edward Godfrey. Those claims were confirmed by the Committee of Parliament, and in 1664 he obtained an order from the King to the Governor of Massachusetts to restore him his province. In 1664 the King's Commissioners came over, and proceeded through the Colonies, and among the rest to Maine; where they appointed various officers without the concurrence of Massachusetts; so that for some years Maine was distracted with parties, and was in confusion. In 1668, Massachusetts sent four Commissioners to York, who resumed and re-established the juris-

dition of Massachusetts, with which the majority of the people were best pleased; and in 1669 the Deputies from Maine again took their seats in the Massachusetts Court. Her jurisdiction was, however, disputed by the heirs of Mason and Gorges, and it was not finally set at rest till the year 1677, by the purchase of their claims from them, by Massachusetts for £1,250."—C. W. Elliott, *New England history*, v. 1, ch. 26.

1675-1783.—Indian warfare.—Maine in Revolutionary War.—"For almost a century the northern American colonies experienced all the horrors of savage warfare incident to the desperate struggle for supremacy between France and England. 'The brunt fell upon Maine, the vast frontier and flying buttress of New England,—her soil the battle ground and her sons the vanguard.' Within her boundaries at the conclusion of King Philip's War [1675-1676] were only five settlements and such was the drain upon her during the succeeding wars that there was not left at home one man to a family. The fleet which took Port Royal was chiefly manned in Maine and commanded by her distinguished son, Sir William Phipps. The famous siege of Louisburg [1745] was commanded by William Pepperell of Kittery, . . . and at least a third of the entire besieging force was recruited from the Province of Maine. Maine gave to the struggle for independence six thousand men. And when it was over, one thousand of her sons had sacrificed their lives, and the burden of the debt that fell upon her was greater in proportion to her wealth and population than her share in the cost of the Civil War. The news of the Battle of Lexington reached York on the evening of the same day. The next morning a company of sixty men, fully equipped with arms, ammunition and food, were marching to Boston. The first company was followed in a few days by men from the entire province, even as far east as Machias. Falmouth, now Portland, was bombarded and utterly destroyed by a British fleet, October 18, 1775, and the territory from the Kennebec to the eastern boundary was frequently invaded and suffered numerous attacks at different points. A Maine regiment was present at Bunker Hill. On June 12, 1775, the patriots of Machias fought the 'Lexington of the seas,' when the British flag was struck for the first time on the ocean to Americans. Eleven hundred men from Maine were with Washington at Valley Forge, a tenth of the entire force. At the siege of Boston practically every able-bodied man in Western Maine was present."—H. E. Dunnack, *Maine book*, pp. 3, 4.

1779-1814.—Plans of the English to separate Maine from Massachusetts during the revolution.—"The design of the British government during the Revolution, of severing a portion of Maine from Massachusetts, and of erecting it into a

province to be colonized by Loyalists, under the name of New Ireland, had received little attention from historians. The earliest published account of it appeared in the seventh volume of our Proceedings, and it has since been briefly noticed by Bancroft, in the closing volume of his history of the United States. . . . I have obtained copies of several documents which illustrate the origin and progress of the project. These were found in the private collections of the Marquis of Lansdowne, . . . [who was] Secretary of State for war [1805-1800], and of Earl Dartmouth [sixth earl], whose ancestor was Secretary for American Affairs during the Revolution. . . . The project had received attention from the Government during the preceding year [1779], and was communicated to Governor Hutchinson, then in England. His diary, under date of September 3, 1778, recounts an interview with Mr. Knox, an official of the War department, who stated that the Penobscot district was, 'to be erected into a new province, and to be given to the refugees, . . . as a recompense for their sufferings, and to ease Government of the expense it is now at for their support.' . . . After slumbering for nearly two years after the royal approval, the plan was revived by memorials from Dr. John Calef, agent for the Loyalists on the Penobscot and others. . . . In Knox's Extra Official State Papers, it is stated that the proposed colony received its death-blow from an opinion rendered by the Attorney General of England, afterwards Lord Loughborough, who entertained scruples about violating the sacredness of the chartered rights of the Province of the Massachusetts Bay, arguing that the rights extended its limits to the river St. Croix, and that the eastern boundaries were not terminated at either the Saco, the Kennebec or the Penobscot. Up to this time Dr. Calef, who had remained in England two years, had been hopeful of success, but one morning, entering the office of Lord North, these hopes were ended by his Lordship's saying, 'Doctor, we cannot make the Penobscot the boundary; the pressure is too strong.' Yet long afterwards the British claimed that Massachusetts had no title west of that river, and in 1814 took possession of all the land between it and the St. Croix, not as conquered territory, but as rightfully belonging to the crown."—J. Williamson, *Proposed province of New Ireland (Maine Historical Society Collections, v. 1, pp. 147, 157)*.—See also U. S. A.: 1813-1814.

1783.—Abolition of slavery in the state.—"As there had been for more than half a century, a considerable number of colored people in this eastern country, as well as in other parts of the State, who were *slaves*;—the very name after the revolutionary struggle became doubly odious. It was thought to be base hypocrisy and crime in a *free* people to tolerate slavery; and consequently, it was declared in the Bill of Rights, a constituent part of the State constitution, that 'all men are born free and equal.' Aided by this clause, the Supreme Judicial Court at Worcester, in 1783, imposed a small fine upon a man for correcting his negro servant, though he pleaded his privilege in justification. The public were satisfied; and every slave felt the relief for which he had long sighed. But this was not sufficiently effectual, for there had been lately an attempt by a sea-captain to seize three blacks in Boston harbor, for the purpose of carrying them to the West-Indies; and therefore, the Legislature, March 26, [1788] passed an act, highly penal against both kidnapping and the slave trade."—W. D. Williamson, *History of the state of Maine, v. 2, pp. 536-537*.

1783-1812.—Growth of desire for separation from Massachusetts.—First newspaper.—Separation convention.—Petition and vote.—Embargoes.—Hartford convention.—Declaration of war.—"Immediately after the close of the Revolution, the question of the separation of Maine from Massachusetts and the erection of the District into an independent State was freely discussed among all classes of society. In 1784 the *Falmouth Gazette*, the first newspaper in Maine, was established, for the purpose, according to Williamson, of advocating separation. . . . After the discussion had continued for months, it was felt that some action ought to be taken to secure a decision of the question. . . . The District had neither a legislature nor executive of its own, and in that modest age 'individuals were averse to any active step lest they should be considered officious.' At last some gentlemen summoned courage to procure the insertion of the following notice in the *Falmouth Gazette* of September 17 and October 1, 1785: 'Agreeably to a request made and signed by a large and respectable number of persons to the printer of this *Gazette*, the inhabitants of the three Counties of York, Cumberland and Lincoln are hereby notified that so many of them as are inclined or can conveniently attend, are requested to meet at the Meeting House of the Revd. Messrs. Smith and Deane in Falmouth, on Wednesday, the fifth day of October next, to join in a conference then and there to be held on the proposal of having the said counties erected into a separate government; and, if it should be thought best, to form some plan for collecting the sentiments of the people on the subject and pursue some orderly and regular method of carrying the same into effect.' Thirty-three gentlemen, residents in about equal proportion of the three Maine counties of York, Cumberland and Lincoln, answered the call. . . . A committee of seven, of which General Wadsworth was chairman, was appointed . . . [to call a convention of delegates from all the Maine towns and plantations] to be held at Falmouth on the first Wednesday of January, 1786. . . . Whether a separation was wise or not, the measures taken to obtain it were certainly moderate, peaceable and lawful, but the authorities in Massachusetts seem to have regarded them as almost treasonable. Governor Bowdoin . . . described it as 'a design against the Commonwealth of very evil tendency.' . . . [While the convention was held, nothing of importance was done. Separation feeling grew, however. Convention meetings were again held in September 1786; a petition for separation was sent to the legislature, and an address issued to the people of Maine.] The petition was a moderate and respectful document, stating that the people of Maine were loyal and law-abiding citizens of Massachusetts, but that owing to their separation therefrom by another State and their great distance from the seat of government, they labored under difficulties which they believed could be removed only by their erection into a separate State. . . . The movement for separation was originally a moderate and conservative one. . . . It was the time of Shay's rebellion in Massachusetts proper. The people were burdened with taxes and with debts, many of which had fallen into the hands of speculators and were being pressed for collection in a very harsh manner. . . . The convention having issued the address and requested that a vote on separation be taken, and returns made to them, adjourned to the last Wednesday of January. It then appeared that

only 970 of the citizens of the District had taken the trouble to vote at all; 618 of the votes were in favor of separation, and 352 against it. So small a vote was an almost fatal blow to the project, and the adoption of the United States Constitution of 1787 gave a new turn to the people's thoughts. The convention, which had adjourned until September 5, 1787, resolved to obtain another vote of the people but nothing was done. . . . In 1792 a vote of the District on separation was taken by order of the Legislature. The number of votes in favor was 2084, opposed 2438. . . .

"Maine was commonly called the District of Maine, or, more briefly, the District, until its separation from Massachusetts. . . . In 1788 Maine was invited to express, indirectly, her views on the adoption of a Federal Constitution. In the General Convention at Philadelphia, which drew up the constitution, Maine was not represented, the four delegates from Massachusetts being all from Massachusetts proper. The ablest of them, however, Rufus King, was a native of Maine. . . . [Maine had forty-six delegates in the Massachusetts constitutional convention, only seven of whom, however, favored it.] Maine was Federalist until 1805. By that time the party had greatly decreased in numbers. Even Massachusetts, a Federalist stronghold, had been carried by Jefferson in the preceding year, though the Federalists elected their candidate for Governor. But in Maine there was great discontent with the land policy of Massachusetts. Men who sought homes had settled without leave on land which had been sold or granted in large tracts to wealthy individuals and companies. In some cases the settlers were expelled, losing their improvements; sometimes the owners would neither sell nor lease; in other cases the ownership of the land was in dispute and there was no one who could give a clear title. It was felt in Maine that the Legislature at Boston favored the absentee landlords and wrongfully refused to resume land which they had forfeited by non-compliance with the conditions of the grant. These local causes and the general Democratic movement gave the District of Maine to the Republicans in 1805, and nearly gave them the State in the following year. . . . The public feeling in Massachusetts, as in the nation, was setting strongly toward the Republicans, but it was checked by the passage in 1807 of an embargo law forbidding commercial intercourse between the United States and foreign countries. It was hoped that this would compel both England and France to cease their interference with American commerce, but the stoppage of trade caused the greatest distress in the United States and provoked furious opposition to the law which caused it. Various towns in Maine joined in the chorus of remonstrance. Nor did the opposition stop with mere words. All kinds of tricks were resorted to in order to evade the law. . . . In June, 1812, the United States declared war against Great Britain. Opinion in Maine was much divided. There was a strong anti-war sentiment. . . . When the Legislature voted to call a convention at Hartford to consider means for redressing the grievances of New England, the vote in opposition from Maine was much larger proportionately than that from Massachusetts proper, and the most vigorous speech against the call was made by John Holmes, of New York."—L. C. Hatch, ed., *Maine*, v. 1, pp. 107-112, 67, 70-73.

1794.—Founding of Bowdoin college. See UNIVERSITIES AND COLLEGES: 1794.

1812-1814.—Maine in War of 1812-1814.—"At first the war of 1812 bore lightly on Maine except for the interference with trade and the increase of taxations. It was more than a year after the outbreak of hostilities before there was any fighting of importance on her soil or near her waters. . . . In 1814 the pressure of the war was felt more severely by Maine. The attempt to win New England to make a separate peace with Great Britain had failed, and on April 25, 1814, a blockade of her ports, as well as those of the rest of the United States, was proclaimed. . . . A more serious invasion followed. Maine, according to the American interpretation of the treaty of 1783, thrust itself deep into the British provinces, and the Cabinet at London desired an acquisition of territory which would make the direct route from Halifax to Quebec undeniably British."—L. C. Hatch, ed., *Maine*, v. 1, pp. 73-75.—"In the war of 1812, although it was unpopular with the people, Maine shirked no responsibility. It is said that more soldiers were enlisted in the District of Maine, in proportion to its population, than in any of the states. The whole number of the militia, ever ready to march, amounted to twenty-one thousand one hundred and twenty-one men. During the first two years of the war Maine was not actually invaded, though often menaced. During the summer of 1814, however, the towns of Eastport, Castine, Belfast, Bangor and Hampden were captured and plundered by a strong British force. The region between Pasamaquoddy Bay and the Penobscot River passed under the control of the British. Castine was made the port of entry, and a custom house was opened at Hampden. A naval engagement off the coast near Portland on September 5, 1814, in which the American brig the 'Enterprise' captured the British brig the 'Boxer' is probably the most noteworthy battle in which Maine participated."—H. E. Dunnack, *Maine book*, p. 4.

1814-1819.—Resumption of agitation for separation.—Separation Bill of 1815.—Arguments for statehood.—Elections of 1819.—Passage of Separation Act.—Constitutional convention.—"The War of 1812 and the Hartford Convention proved a stimulus to the separation movement. Though the Massachusetts delegation included two residents of the district, 'in no other part of the Union, perhaps, did that famous convention call forth more exasperation than it did in Maine.' A convention of towns in Oxford county declared it expedient for Maine to be a part of Massachusetts only so long as Massachusetts gave support to the Union, and that a convention ought to be called to take action in this sense. . . . In the same year, 1814, the Massachusetts House appointed a committee to consider the expediency of taking the opinion of the people of the State (not as formerly, of the District of Maine, only) on the question of a separation. The committee advised that the matter be referred to the next Legislature. Meanwhile . . . petitions for separation were sent to the Legislature, and its supporters found the Federalists apparently ready to give the request 'benevolent consideration.' . . . On February 26, 1815, a resolution for separation was introduced by Senator Albion K. Parris, of Oxford. On February 26, [1815] the Senate by a party vote of 17 to 10 accepted the report of a committee that 'it was not expedient to pass these resolves.' . . . The refusal of Massachusetts to allow the people of Maine to express their opinion on the question of separation roused its advocates to greater activity. When the Legislature met in the following winter, petitions poured in from Maine in favor of Statehood. The

action of the previous year was reversed and a bill was passed allowing the people of Maine, on the 20th of the following May, to express by a vote their wishes in the matter of separation. . . . The contest in the District was fiercely waged, but when the ballots were counted it was found that less than half of the voters had gone to the polls. The vote stood, in favor of separation, 10,584, opposed, 6,941. . . . The Legislature met shortly after the vote in Maine and promptly referred the subject of separation to a joint committee . . . [which reported that the vote in May did not clearly express the wishes of the people, hoped that separation would not take place, and in order to learn the opinion of Maine] presented a bill providing for the election by the people of Maine of a convention to meet at Brunswick on August 26. . . . The failure of Massachusetts to defend the District during the late war had caused the bitterest feeling in Maine. In 1786 the citizens of Machias had voted against separation, one of the reasons being that Maine needed the protection of Massachusetts against Great Britain. Now . . . it was claimed that if Maine had been a separate State she would not have tamely submitted to the occupation of Castine, but would have won honor by her courage as did Kentucky. Massachusetts was accused of partiality in education matters. . . . It was urged that the population of Maine was equal, and more than equal, to that of Rhode Island, Delaware and Louisiana taken together. The point was also made that the new State would be entitled to two Senators, and that this might 'quiet the alarms of some of our good folks over Southern influence.' . . . Election day came, the separationists carried the convention, and from the early returns it appeared that they had the necessary five to four majority of the popular vote on the question of separation. But when the ballots were counted it was found that they had polled 11,969 votes, and their opponents 10,347. . . . [Agitation continued, however, and bitter feeling began to show itself.] Fortunately wiser counsels prevailed, and the official action of the representatives of Massachusetts and Maine was marked by courtesy and moderation. . . . On April 19, 1819, 'a committee of the Maine members of the Legislature issued an address to the people of the District, urging them, in the selection of representatives, to choose none but supporters of separation. . . . At the annual election party differences were extinguished, and the sole issue was separation. Every Senator elected from the District was in favor of separation, and of 127 representatives chosen by eighty-nine towns, 114 were in favor of separation. Both these numbers were subsequently increased by later returns. . . . So overwhelming a majority rendered it practically impossible for Massachusetts to refuse separation. . . . A joint committee on which Maine was well represented . . . reported a bill providing that there should be a vote of the District on separation, . . . that the returns should be made to the Governor and Council, . . . [and that a majority of 1500 in its favor should be regarded as assent to separation. This bill passed by a vote of 193 to 59.] Every county in the District voted for separation, although the majority in Hancock was only sixty-three. The total vote was, for separation 17,001, opposed 7,132. Proclamation of the result was duly made by Governor Brooks, and Maine turned to the election of the constitutional convention. The fight over separation once decided, both parties forgot old disputes, and joined in a friendly and patriotic effort to choose the best men in the State to draw

up her fundamental law. . . . [On October 17 the constitutional convention met at the court house in Portland. The constitution was framed and passed and the new state at once made application for admission to the Union, December, 1819.]—L. C. Hatch, *Maine*, v. 1, pp. 123, 125-127, 136, 139-141.

1819.—Adoption of Connecticut plan for amending state constitutions. See AMENDMENTS TO CONSTITUTIONS: United States: Other methods.

1820.—Recognition as distinct commonwealth.—Admission into Union.—First meeting of legislature.—"The memorial of Maine asking for admission was referred to a select committee, and on December 31 they reported a bill for that purpose. Here was an opportunity for the opponents of the prohibition of slavery in Missouri. The vote on the latter question would be very close, it was possible that the seven Representatives from Maine might consent to waive their objections to the reception of another slave State into the Union if the sacrifice were necessary to secure the admission of Maine, and their votes might turn the nicely balanced scale. The temptation would be the stronger because the consent of Massachusetts to the separation of Maine was given on condition that the bill admitting her be passed before the fourth of March, 1820, and should Congress fail to act, the vote of the District in favor of Statehood, and the ratification of the constitution presented by the Portland convention would become of no effect."—L. C. Hatch, *Maine*, v. 1, pp. 161.—"In the division of the property all the real estate in Massachusetts was to be forever hers; all that in Maine to be equally divided between the two, share and share alike. . . . Several days the subject was debated, and sent from one branch to the other in Congress, till the 1st of March, when, to our joy, they were divorced; and on the 3d of the month [March, 1820] an act was passed by which Maine was declared to be, from and after the 15th of that month, one of the United States."—W. D. Williamson, *History of Maine*, v. 2, ch. 27.—William King, the governor pro-tempore was re-elected, a legislature was chosen, and its first meeting was held on May 31, 1820.

1821-1840.—Early Democratic governors.—Effort by National Republicans in 1829 to gain control.—Question of internal improvements.—For the first thirty years of its existence as a State, Maine consistently elected National Democrats to office. William King, the first governor of Maine, resigned in 1821 to become United States commissioner on the adjustment of the Spanish claims in Florida. He was followed by W. D. Williamson, president of the senate, who acted as governor until the election of Albion Keith Parris six months later. Governor Parris held office from 1821 to 1826, the period in which successful arrangements were made in connection with property held jointly with Massachusetts. He was succeeded in 1827 by Enoch Lincoln, also a lawyer, who died in 1829. During his administration the federal tariff bill of 1828 known as the "tariff of abominations" created very adverse criticism in Maine, especially among the opponents of President Jackson. "Among the 'abominations' was one doubling the duty on molasses, and thus striking a heavy blow at the West India trade. Maine lumber, Maine ships, and all the industries dependent on them, were seriously affected. When the news that the bill had passed reached Portland, the town went into mourning. Stores were hung with crepe, bells were tolled, and the vessels in the harbor half-masted their flags. . . . [Election for the national legislature had a

strong reflex influence on the elections of 1829.] In Maine the Adams men had carried the Legislature, and they proceeded to make their power felt. They elected a new Council composed solely of National Republicans. The Treasurer and Secretary of State were Jacksonians. Supporters of Adams were put in their places. Sheriffs and other county officers were at that time appointed by the Governor and Council. Governor Lincoln renominated most of the incumbents, but the Council refused to confirm the Jackson men. . . . The Democrats of the Legislature held the usual gubernatorial caucus and renominated Governor Lincoln, but he declined the honor. They then determined to leave the choice of a candidate to a convention specially called for the purpose. . . . But, alas, the convention chose a man who was reported to have voted for Adams, Samuel E. Smith, chief justice of the Court of Common Pleas. . . . The National Republicans in the Legislature held a caucus and nominated Jonathan G. Hunton, of Readfield. . . . [After an exciting election campaign Hunton was elected by a narrow majority, which on re-count gave him a majority of 39.] Hardly had the excitement over the election a little subsided, when the people of the State were shocked by the sudden death of Governor Lincoln. . . . [His death at this particular moment was followed by a period of confusion.] Eight Senators were National Republicans, eight Democrats, and there were four vacancies. . . . The first duty of a Senate is to officially declare what vacancies exist and to go into a joint convention with the House to fill them. Before the election of a president, the National Republicans had repeatedly proposed that . . . [the Senate should officially declare what vacancies existed, and go into joint convention with the House to fill them], but the Democrats refused, on the ground that until an organization was effected there was no Senate. . . . On February 1 the House passed an order to go into a convention with the Senate on the following day. On February 2 the National Republican leader in the Senate, Mr. Kingsberry, moved to adjourn for the purpose of going into a convention, but the motion was lost by a vote of 8 to 8. A National Republican senator then read a protest against the right of Mr. Hall to vote, as he was now legally acting governor. Mr. Kingsberry stated that, since Mr. Hall had no right to vote, he considered the Senate adjourned, and the National Republican senators proceeded to the House. On their arrival, Speaker Goodenow declared that as the House had voted to go into convention at this time, no further vote was necessary, and that by the arrival of the senators a convention was *ipso facto* formed. The Democrats submitted a written protest and withdrew from the hall, and the vacancies reported by the Governor and Council were filled. . . . The National Republicans met, elected a president *pro tem*, and called on the secretary of the Senate, Mr. Kavanagh, to surrender the journal, which he refused to do. The National Republicans, however, did not attempt to form a separate organization, but they maintained that four new senators had been lawfully elected. . . . There had been a question as to who had the legal right to act as Governor. At Governor Lincoln's death, the president of the Senate, Nathan Cutler, of Farmington, had, as all admitted, become acting governor by virtue of his office. But the Senate of which he was president ceased to exist on the day before the first Wednesday in January. He was no longer president of the Senate, could he then remain acting governor? Mr. Cutler swore in the members of the Legis-

lature, a duty which the constitution devolved on the governor. For this there was both precedent and reason. It must at times happen that the governor would have served a year before the first Wednesday of the calendar year. The constitution required the governor to swear in the Legislature before they could act, and the Legislature to declare the election of Governor for the current year. Hence, if the provision that the governor serve a year were to be strictly construed, all government must stop. . . . Two of the three judges, Chief Justice Mellen and Judge Parris, stated that it was the duty of the president of the existing Senate to act as governor, the other member of the court, Judge Weston, believed that Mr. Cutler was acting governor until a governor should be regularly elected. Mr. Cutler, in deference to the opinion of the majority of the court, and wishing to remove all doubts on the subject, resigned his office of acting governor; and President Hall assumed it. . . . The Senate accepted the majority report of the joint committee on the votes for governor, . . . and appointed a committee to notify Mr. Hunton of his election. . . . [At the end of his term Governor Hunton was renominated but failed of reelection. Samuel Emerson Smith, the Democratic candidate, was chosen governor.] The Democrats also carried the Legislature, and to the great wrath of the Whigs insisted on passing an act validating the laws of the previous year. . . . [Governor Smith stayed in office until 1834, the period during which the state capital at Augusta was completed. Public opinion in the state during this time was more or less divided over the nullification movement in South Carolina. On the whole President Jackson was upheld but the dislike of the existing tariff laws was more or less general.] . . . Governor Parris served five years, and then declined a renomination; Governor Lincoln served three years and also declined a renomination. Governor Smith had served for the same period and party usage demanded his renomination without a contest. . . . The Democrats of the Legislature refused to make any nomination, but directed the State committee to provide for the holding of a convention twice as large as the House of Representatives, to nominate a candidate for Governor. The convention was duly held and nominated Robert G. Dunlap. . . . [Dunlap was elected and served as governor from 1834 through 1837.]

"In 1835 the question of internal improvement became an issue of importance. [The great need of the country for better means of transportation and the enormous benefit which New York had obtained from the Erie canal had resulted in a mania for turnpikes, canals and railroads. . . . Maine had, on the whole, been free from the excitement, but some of the leading business men believed that the government should assist in the development of the State. . . . Unfortunately Maine was a poor, large and thinly settled State, and the improvements which would most hasten its development would be very costly and would at first directly benefit only a few of its citizens. . . . Internal improvement was not, however, the only issue of the campaign. Both parties had much to say on the subject of banks. . . . The election of a Governor was not the only political battle of the year 1837 [when Edward Kent, the Whig candidate, was elected]; there was also a sharp contest over the disposition of Maine's share of the 'surplus revenue.' . . . In Maine there was a sharp dispute over the use to be made of her part of the 'loan.' The Whigs urged that it be used for some public purpose, the Democrats de-

manded that it be divided among the people. . . . The Legislature voted that the money be divided among the towns and plantations, according to population, care being taken that residents in unorganized territory should receive their share. The towns and plantations were permitted to use the money for any purpose for which money raised by taxation might be used or to loan it on ample and safe security. . . . Various towns voted to distribute the money, but their right to do so was denied. . . . [On a test case the Supreme Court decided] that the money raised by taxation could not be divided among the inhabitants. . . . But the people were determined not to lose their gratuity, and in the following winter the Legislature released the towns from any obligation of returning the 'deposit,' and permitted them to divide it among the inhabitants."—L. C. Hatch, ed., *Maine*, v. 1, pp. 193-194, 195-197, 200-202, 206, 213-214, 219, 220, 229-230.

1838-1839.—Border war in disputed territory between New Brunswick and Maine. See AROOSTOOK WAR.

1840-1841.—Gubernatorial contest.—Governor Kent (Whig) defeated by ex-Governor Fairfield (Democrat).—First appearance of Liberty (Anti-Slavery) party.—"The Maine Whigs went into the gubernatorial campaign in the fall [of 1840] weakened by the internal quarrel of their party. The Maine Democrats also were not entirely harmonious. . . . Governor Kent had again removed many Democrats from office and these martyrs felt that their suffering should be compensated by immediate re-appointment if the Democrats won. But others who perhaps had not belonged to the office-holding faction practiced by the 'Federalists' demanded a rigid adherence to the principle of rotation in office, and that the future appointing power 'should be unshackled by the past condition of things,' and under no obligation to reappoint men who had been removed. Both Fairfield and Kent were nominated by their respective parties, with substantial unanimity. . . . An amendment to the constitution had just been passed limiting the terms of judges to seven years. This vacated the seats of Chief Justice Weston and Associate Justice Nicholas Emery, and the Whigs put men of their own party in their places. The Democrats loudly protested against the alleged introduction of partisanship into judicial appointments. Governor Kent himself had wished to reappoint Chief Justice Weston, but the Council refused its assent. The Liberty [Anti-Slavery] party appeared in Maine this year for the first time, and nominated for Governor, Jeremiah Curtis, of Calais. . . . Fairfield was elected, leading Kent by over 10,000 votes. The official returns gave Fairfield 47,354 votes, Kent 36,700, Curtis 1,662; there were 347 scattering. It was a great triumph for the Democrats."—L. C. Hatch, ed., *Maine*, v. 2, pp. 311-312.—"In 1841 an amendment to the constitution of Maine forbade the Legislature to loan the credit of the State directly or indirectly in any case, 'or to increase the State debt beyond the sum of \$300,000 except to suppress insurrection, repel invasion or for purposes of war.' Many came to feel that this limitation was a serious obstacle to the development of Maine, but no change was made until 1912."—L. C. Hatch, ed., *Maine*, v. 3, p. 720.

1841-1842.—Settlement of northeastern boundary.—Webster-Ashburton Treaty.—Unpopularity of Webster.—When Webster became secretary of state, the time seemed to have arrived for the settlement of the boundary question with

Great Britain. In the summer of 1841 he informed Fox that he was ready to enter into negotiations, and on the British side Lord Ashburton was sent out as a special minister with power to settle the dispute. "While awaiting the arrival of Lord Ashburton, Webster began in serious earnest to make ready for the negotiation. His first act, the grand stroke, as he called it, was to seek the consent of Maine and Massachusetts to a conventional line. Reuel Williams, then a Senator from Maine, was asked to sound the Governor and leading men of the State as to the willingness of the legislature to send commissioners to Washington fully empowered to agree to such a line with the understanding that it should not be adopted without their assent. Williams replied that from such information as he could gather, it seemed quite likely that the Governor and Legislature would accept a conventional line, provided that privileges of navigation and other benefits were given in lieu of any territory that might be ceded. As it was not known, however, that Lord Ashburton would have authority to agree to a conventional line, nothing could be done before he arrived. Should Maine appoint commissioners and then find that his lordship could not discuss such a line, she would be placed where no true American could wish to see her. At this stage of the correspondence Webster received from Jared Sparks a letter and a copy of a map which greatly helped his negotiations. . . . Webster determined to use . . . [this map] to force Maine to modify her demands and accept a conventional line, and despatched Sparks to Augusta to show it to the Governor of Maine. The Governor at once declared for a conventional line, and by his influence the legislature was induced to appoint four commissioners. Two were Whigs and two were Democrats, and to them were given no instructions and unlimited power. Massachusetts, which had likewise been invited to send agents, soon after appointed hers, and in June, Webster, and Lord Ashburton took up the question of the northeastern boundary. The commissioners from Maine fought sturdily for their State, but in the end were forced to accept a line which gave Great Britain eight hundred and ninety-three square miles more territory than had been awarded her by the decision of the King of the Netherlands. They had seen the red-line map and, it is probable, feared that if no treaty were made another arbitration might follow, that the map might be laid before the arbitrator, and that the second award might be worse than the first. . . . In Maine the treaty found no friends among the Democrats. Great Britain, said one journal, gains on all sides of our State. She gets an easy and ready communication between Halifax and Quebec on the North. She gets good military positions on the four-mile strip ceded to her on the east, and still others along the whole chain of highlands given to her on the northwest. On the east side, said another, a large strip is yielded to Great Britain. Instead of running the line due north from the monument at the source of the St. Croix, as the old treaty provides, the line bends westward to Mars Hill, which is four miles west of the true meridian. This greatly strengthens the British military road in that quarter. Maine, said a third, will lose about three million acres, or one million more than she would had the Dutch award been accepted. In return she is to have the free navigation of the St. John River, one hundred and fifty thousand dollars and the posse account of two hundred thousand more. Rouse's Point is retained, and New York, New Hampshire, and Vermont have

their boundary lines established as they wish. If the St. John runs through our territory we have a right to navigate it. Can the free navigation of it be considered the equivalent for territory? Can benefits received by other States be looked on as an equivalent for territory lost to Maine? For the time being Webster was an unpopular man in both Maine and Massachusetts. Even his friends now cried out that the time had come for him to leave the Cabinet. On the other hand, strangers wrote to him from all parts of the country, urging him not to quit the Department of State. When, however, the Massachusetts Whigs met to nominate candidates for State offices, they declared that the misdeeds of Tyler 'left no alternative to the Whigs of Massachusetts but to declare, as they do now declare, their full and final separation from him,' and then presented Henry Clay to the Whigs of Massachusetts as justly entitled to their suffrages 'for the first office in the gift of the American people.'—J. B. McMaster, *History of the people of the United States*, v. 3, pp. 273-277, 283-288.—See also AROOSTOOK WAR; U. S. A.: 1842; Ashburton treaty with England.

ALSO IN: M. Macdonald, *Government of Maine*.
1851-1858.—Prohibition legislation.—In 1851 a prohibitory law was passed. "The act granted extensive powers of search and many felt that private rights were invaded. A cry was also raised that the law as enforced was hurting business. But far more injurious to the Republicans was a liquor riot in Portland in which the militia were called out, the mob fired on; several persons injured and one killed. Liquor had been bought for the city agency and it was claimed that technically Mayor Dow was the owner and had violated his own prohibitory law. . . . The opponents of the Maine law were much excited. They considered it a most outrageous and inquisitorial statute which established arbitrary and unreasonable presumptions of guilt and that it had been enforced by Mr. Dow in a very severe manner. The report that he had been caught in his own trap and might be publicly proclaimed and punished as a violator of his own law was received with the greatest joy. . . . [In 1855] an extremely arduous piece of business for the Democrats was the preparation of a new liquor law. Here, like their opponents in 1855, they were embarrassed by all the difficulties of a coalition. There were Democrats who wished free rum; there were others who honestly desired an effective prohibitory law, but who believed that the act in force was unduly stringent and gave great opportunities for espionage and tyranny. . . . After long delay, and changes from the original plan, an act was passed [1858] allowing the sale of liquor by a limited number of persons varying according to the population of the city or town where the license to sell was granted. Liquor thus sold was not to be drunk on the premises and must be unadulterated. Liquor might also be sold by innholders to strangers who were travellers or lodgers. No liquor could be sold to a minor without the written direction of his master, parent or guardian, to any Indian, soldier in the army, drunkard or intoxicated person of whose intemperate habits the seller had been notified by his relatives or the public authorities. Notice by the relatives should be presumptive evidence and by the public authorities conclusive evidence of such habits."—L. C. Hatch, *Maine*, v. 2, pp. 383-384, 396-397.

1853.—Purchase of public lands from Massachusetts.—"Massachusetts held title to her one-half of the public lands until 1853 when the

Maine legislature passed the following resolve: 'Resolved: That the land agent proceed without delay to Boston, for the purpose of ascertaining from the authorities of Massachusetts, the terms on which that state will sell or surrender to Maine, all her interests in the lands in this state. Also upon what terms Massachusetts will sell to Maine her interest in the lands known and denominated as settling lands, independently of the timber lands, and report to the legislature as soon as may be.' By a further resolve the Legislature was directed to choose by ballot three commissioners to make negotiations with Massachusetts for the purchase of these lands. The commissioners for Maine were Reuel Williams, William P. Fessenden and Elijah L. Hamlin, and on the part of the Commonwealth were E. M. Wright, Jacob H. Loud and David Wilder. An extra session of the Legislature was held September 20, 1853, at which time the report of the joint commission was received and accepted and their acts ratified and confirmed by a resolve approved September 28, 1853.—H. E. Dunnack, *Maine book*, p. 61.

1854-1867.—Attitude towards slavery question.—Work of William Pitt Fessenden during reconstruction period.—Before 1856 Maine had always been Democratic but from 1856 to 1920 it has been largely Republican. The change took place over the slavery question and in 1854 Maine sent William Pitt Fessenden to the United States Senate. His brilliant oratory brought him to the front as one of the leaders of the anti-slavery camp. "The report of the [reconstruction] committee, which was made [in 1867] after a thorough and careful examination into the condition of the Southern states, was anxiously awaited in the belief that it would shed light upon the darkness, and would point out the true path leading to a reunited nation. The report was written by Mr. Fessenden, and it has been said of it that with the possible exception of the Proclamation of Emancipation it is the ablest state paper of the period. With perhaps the same exception it is the most important. Clear and lucid in its style, admirable in its composition, faultless in its logic, convincing in its argument, thorough and complete in its treatment of the subject, and wise in its recommendations, it is a document upon which Mr. Fessenden may well rest his reputation for broad, intelligent, patriotic and wise statesmanship. The influence of the report was immense. It became the creed of the Republican Party, and the settlement of the question therein proposed was considered throughout the country as reasonable, practicable and just. Mr. Fessenden, although he had from his earliest days been an opponent of slavery, and had always been a true friend to the colored race, was not in favor of negro suffrage as a condition of reconstruction. When the proposed Fourteenth Amendment was before the Senate it was most forcibly attacked by Mr. Sumner because it did not grant universal suffrage, and Mr. Fessenden in his reply contended that it was in all respects better to leave the question of suffrage wholly to the states, holding out to them, however, the prospect of increased representation whenever they should make suffrage universal. Negro suffrage might thereby appear as for the interest of the South, and the negroes would in time be enfranchised by act of the states themselves. Had the negro received the right from the state, he would have been much more likely to have been protected in its exercise."—R. Webb, *William Pitt Fessenden* (*Maine Historical Society Collections*, p. 252).

1861-1865.—Part taken in the Civil War.—

"The outbreak of the Civil War found Maine like most of the Northern States totally unprepared. The old musters had been abandoned as burdensome, useless, and furnishing occasions for drunkenness and dissipation. . . . But the country's need was pressing; Maine was asked to furnish a regiment under the President's call for 75,000 men, and Governor Washburn requested ten of the volunteer companies to enlist in the United States service. Eight did so, the others declined or failed to act promptly, and two new companies were raised. The Governor, however, felt that he had not the legal powers which the occasion demanded, and the day after the President's proclamation he called the Legislature to meet in extra session on April 22. That body promptly passed an act for raising ten regiments of volunteers to serve for two years, and for the borrowing of \$10,000,000. Maine responded readily and enthusiastically, but after six regiments had been sent forward recruiting was suspended, the Governor being unofficially informed that no more regiments would be accepted from Maine. The means of the national government for arming and caring for troops were limited and the expense and difficulty of assembling them at Washington was greatest in the case of the most remote States. Some of the Maine regiments suffered heavy losses in battle, others never saw an enemy. Lieutenant-Colonel William F. Fox . . . says that the First Maine Heavy Artillery had more men killed and mortally wounded than any other regiment in the Union army, and a greater percentage killed than any regiment but one, the Seventh Wisconsin. . . . The First Maine Heavy also had the greatest number of killed in any one action."—L. C. Hatch, *Maine*, v. 2, p. 473.—"The years following . . . [the Civil War] were trying ones for Maine. Business declined, manufacturing decreased, and many citizens, attracted by the inducements held out by land owners in Ohio, emigrated to what was then known as the Far West. Nearly 15,000 of Maine's citizens left their homes to settle on lands west of the Alleghany Mountains, and this draft upon the population for a time checked her prosperity and growth. But after a few years, the tide turned, business revived, and the growth of Maine, while slow, has been steady since that time."—W. W. Stetson, *History and civil government of Maine (State Government Series)*, p. 67.

1875-1909.—Compulsory Education Bill.—Educational qualification.—Australian ballot.—Initiative and referendum.—Following on the "Maine Law," or prohibition act, the most important legislative enactment was the Compulsory Education Bill, passed in 1875. "In 1870 the terms of the Governors, Senators, and Representatives were made two years, instead of one, and the regular sessions of the Legislature became biennial. The requirement of a majority in the elections of Representatives, Senators and Governor was changed to that of a plurality in 1847, 1875 and 1880 respectively."—L. C. Hatch, ed., *Maine*, v. 3, p. 720.—In 1884 the prohibition law was made a constitutional amendment. This was followed in 1892 by a constitutional amendment, which provides an educational qualification for voters. In 1891 the Australian ballot system had been introduced, and in 1908 the direct initiative and optional referendum were adopted. "Maine has the distinction of being the first of the eastern states to enact an initiative and referendum law, which was put into effect in 1909. The history of this movement in Maine covers a period of five years. There has long been a feeling of unrest among

important elements of the electorate regarding certain questions of local importance. Maine has vast tracts of unorganized and unsettled lands, some ten million acres in extent, [the 'wild lands'] which are owned by a comparatively small number of individuals and corporations, an area which is covered with valuable timber, and has an assessed valuation of fifty million dollars, and, indeed, is probably worth several times that amount. . . . So liberal has been the policy of the state in the past in disposing of its wild lands, including the earlier grants, in 1836 and subsequent years, to settlers, which were justifiable, and the large grants to railroads and sales at nominal costs to individuals that were made in the period from 1862 to 1875, which were questionable; that almost the entire area, some fourteen thousand square miles in extent, or the equivalent of one-half of the total area of the state, is in private hands, and the state now retains but a paltry fifty thousand acres of its former vast public domain. Because of their low valuation these lands contribute through taxation less than one-ninth of the state's revenues from direct taxation. The influence of a powerful lobby at the state house has been successful in heading off efforts to increase the tax on wild lands; and the owners of these lands are strongly fortified by a decision of the Supreme Court of Maine, which prohibits the taxing of wild lands at a higher rate than the state tax imposes upon the settled areas. There seems to be no other way to meet this situation save through the passage of a constitutional amendment, subjecting these lands to a separate classification and independent treatment, but such a proposal has thus far failed to produce results. To be sure the preservation of the forest is necessary to the preservation of the rivers and upon these the people are dependent for water power, a source of energy with which nature has abundantly endowed the state. The forests are also necessary to the maintenance of the game preserves, which attract thousands of hunters and fishermen to the state every year, and thereby bring large sums into the coffers of the merchants and the railroads—an argument which has constantly served as a defense of low state taxes. The gains from this source, however, are not a sufficient offset for the losses incident to the failure to pursue a policy that would force the development of new agricultural lands, open up the state to larger settlement, and attract immigrants to promote latent industries and increase the wealth of . . . [the] state. Maine has also been liberal in the grant of valuable franchises for little or no return, and through her lax corporation laws has become the mother of numerous corporations, many of which should never have been authorized, and whose only justification seemed to be the fees which they yielded. . . . The state has also been liberal in the past in rebating the taxes of her railroads, and in granting other privileges and exemptions which have cost her revenue. These are some of the reasons why Maine has been unable to meet the growing demand for better roads, . . . and for the improvement of her schools and other state institutions. Maine's remarkable water power facilities have not been developed beyond a fraction of their possibilities; the Maine farmer has been more conservative and less progressive than his western rival, except in certain industries in which he has shown some specialization, like the cultivation of potatoes in Aroostook County. There has been too much protection and too little reciprocity in both commodity and labor to give Maine the benefit of the rich iron and coal deposits of her neighbor to the north and east,

which might well have been turned to the advantage of the state for the employment of her natural resources of stream and forest, and in the saving of a great industry, shipbuilding, in which Maine had such an early and promising start."—J. W. Black, *Initiative and referendum in Maine (Annals of American Academy of Political and Social Science, Sept., 1912)*.—"In Maine initiative bills may propose any measure, including bills to amend or repeal emergency legislation, but not to amend the state constitution. The petition must set forth the full text of the measure proposed and be signed by not less than 12,000 electors, and be filed by the secretary of state, or presented to either branch of the Legislature at least 30 days before the close of its session. . . . The veto power of the governor does not extend to any measure approved by vote of the people, and if he vetoes any measure initiated by the people and passed by the Legislature without change, and his veto is sustained by the legislature, the measure is referred to the people at the next election. . . . The Legislature may enact measures expressly conditioned upon the people's ratification of referendum vote. Petitions for a reference of any act, or any part or parts thereof, passed by the Legislature must be signed by not less than 10,000 electors, and be filed within ninety days after the recess of the Legislature. . . . The governor may order a special election upon an initiative or referendum measure, or if so requested in the petition shall order a special election held upon the act to be referred or the act initiated but not enacted by the Legislature."—H. E. Dunnack, *Maine book*, pp. 71-72.—See also INITIATIVE AND REFERENDUM: Development in the United States.

1883-1896.—Republicans in power.—Prohibition legislation of 1883.—Opposition to McKinley tariff.—"The inauguration of Governor Robie [1883] was the beginning of a Republican supremacy which lasted for nearly thirty years. For much of the period there is comparatively little that is interesting in the political history of the State, except the great part played by Maine men at Washington. In 1883, however, the Legislature took an important step in the development of the prohibitory policy by submitting a constitutional amendment forbidding the manufacture of intoxicating liquors, except cider, and the sale or keeping for sale of intoxicating liquors. But the Legislature was given authority to permit the sale of cider, and of liquors to be used for medicinal and mechanical purposes and in the arts. . . . In 1884 the amendment was submitted to the people and ratified by a large majority, the vote standing: yeas, 70,783; nays, 23,811. . . . [Governor Robie] served through 1886. Joseph R. Bodwell was elected in the election of that year but died in December, 1887, and Sebastian S. Marble, president of the Senate, served for the balance of the term. In 1890 when Edwin C. Burleigh, who had followed Governor Marble in office, was re-elected, elections were notable because of the fact that for the first time the labor party was strong enough in Maine to nominate a candidate, who received 1,296 votes. In 1892 when Henry B. Cleaves became governor the People's Prohibitionist and Union Labor Party were both represented and received votes aggregating about 8,500. The Democratic convention expressed itself in opposition to the McKinley tariff, but the party was not sufficiently strong to force the Republicans out of office."—L. C. Hatch, ed., *Maine*, v. 3, p. 633.

1896-1918.—Maine elections.—Thomas B. Reed's contest with William McKinley for the

presidential nomination.—Governor Fernald's defeat.—Frederick W. Plaisted's term.—1912 elections.—1916 election and the war governor.—September elections.—"In 1896, Maine again presented a candidate for the Republican nomination for President, not Mr. Blaine, who had died early in 1893, but Thomas B. Reed. . . . It was believed that the tariff would be the chief issue of the campaign, and Reed was a protectionist through and through, and had done most valiant and effective service against the Democratic Mills and Wilson bills for reducing the tariff. On the currency question he had an untarnished record of open, undeviating support of 'sound money.' His daring and resolution in counting a quorum had saved the Republican legislative program in 1890. Yet he was overwhelmingly defeated by the man he himself had beaten for the speakership, McKinley of Ohio. . . . 'It is true of Reed as . . . of many another public man that his strength was his weakness. His power as a leader whether of majority or minority enabled him to thwart, and his integrity and the loftiness of his principles compelled him to thwart many dubious schemes and thus he made enemies. His impatience with whatever was pretentious and superficial led him into needlessly uttered expressions of contempt that rankled in the minds of the little men at whom they were aimed. He was ambitious but as a politician he was not tactful and would not budge from a position once taken with deliberation, though his inflexibility might, and he was aware of it, imperil his political life. . . . Many of those who admired him and were not his enemies doubted the wisdom of placing at the head of affairs one who had such undoubted confidence in his own judgment or opinion, and who was so capable of making his opinions effective.' Moreover, McKinley had the great advantage of having Mark Hanna for his manager."—L. C. Hatch, ed., *Maine*, v. 3, pp. 650-651.—After a long and useful service Mr. Reed retired shortly after the Spanish-American War. He did all he could to prevent this war and was disappointed at the result. An address published in the Maine Historical Society Publications commenting on the retirement says: "After the ratification of the treaty of peace in February of 1899, he clearly foresaw the new policy upon which his own party was to embark and the impossibility of his longer continuing in public life in harmony therewith." (See also CONGRESS OF THE UNITED STATES: House of Representatives: Speaker.) In 1896 Llewellyn Powers was elected governor. The democratic convention in this election "repudiated the platform its party was to adopt in national convention, declaring by a vote of 193 to 101 that it was opposed to the free coinage of silver unless by international agreement. . . . [E. B. Winslow, the democratic candidate, refused the nomination, and a second convention nominated W. P. Frank and declared for free silver, and the Republican majority for both state and federal election was very large, Governor Powers was re-elected in 1898. He was followed in 1900 by John F. Hill who in 1904 was succeeded by William T. Cobb. In 1906 Governor Cobb's majority was reduced to 8,000.] The principal cause of the change was the 'Sturgis law' and Governor Cobb's attitude on prohibition. A bill fathered by Senator Sturgis of Cumberland had been passed providing for the appointment of a special commission to enforce the prohibitory law, with authority to appoint deputy commissioners. Governor Cobb in his first address to the Legislature had called for the enforcement of prohibition

and he made his actions square with his words. . . . [In 1908 Bert M. Fernald was elected.] The circumstances of Governor Fernald's administration [1909-1911] gave opportunity for grave charges of extravagance. He had also offended the radical prohibitionists by vetoing a bill which made imprisonment the sole punishment for certain violations of the liquor laws, and the Democrats felt that with care and energy on their part they would win at the next election. The leaders selected for their standard bearer Frederick W. Plaisted of Augusta, a son of Harris M. Plaisted, and a man of pleasing personality. . . . Plaisted was nominated on the first ballot by a vote of 575 to 311 for Gardiner. Mr. Gardiner promptly pledged his full support to the nominee, and took the stump in his behalf. The vote of the preceding election was reversed and Plaisted led Fernald by between eight and nine thousand votes. The Democrats also carried the Legislature which gave them a United States Senator, as Senator Hale's term expired in March, 1911. The Legislature elected Charles F. Johnson. . . . William P. Frye died in the summer of 1911, and Governor Plaisted appointed Obadiah Gardiner to fill the vacancy. The Democratic Legislature submitted a constitutional amendment annulling the prohibitory amendment of 1884, but after a sharp contest it was defeated by a small majority. It is a significant fact that seventeen of the eighteen cities of the State voted against prohibition. In 1912 the Democrats went into the campaign with the advantage of the split in the Republican ranks which followed the renomination of President Taft. But the Maine Republicans avoided a break as far as the State campaign was concerned, Progressives and Regulars agreeing to work together in September and then fall apart and fight in the presidential election. A law had been passed providing for primary nominations, but the candidates were the same as would have been 'slated' under the old system. The Republicans nominated William T. Haines, the leading, unsuccessful candidate of four years before. The Democrats renominated Governor Plaisted. Haines fell just short of a majority but led Plaisted by 3,229 votes. The Republicans also carried the Legislature. In the presidential election the Democrats were successful, Wilson receiving 51,113 votes to 48,495 for Roosevelt and 26,545 for Taft. The Legislature of 1913 had the duty of electing a Senator to succeed Mr. Gardiner and the choice fell on ex-Governor Burleigh, who had been a Representative in Congress since 1897. In the gubernatorial election of 1914 the straight Republicans and the Progressives were unable to unite. The Republicans renominated Governor Haines, the Progressives nominated Halbert P. Gardiner of Patten, and the result was that the Democratic candidate, Oakley C. Curtis, of Portland, obtained the prize. In 1916, the political wheel made another revolution, the Progressives came back to the Republican fold and the Republican candidate, Carl P. Milliken, of Island Falls, a young man with Progressive ideas, was nominated and elected. In the presidential election too, Maine once more took her place in the Republican ranks. The following year she was again obliged to choose two United States Senators. Senator Burleigh had died in 1916 and Senator Johnson's term expired in the following March. The amendment to the national Constitution giving the election of Senators to the people was now in force and the people chose Frederick Hale for the long term and ex-Governor Fernald for the unexpired term of Mr. Burleigh. . . . Governor Milliken's administration was marked by a

special effort to enforce neglected laws. In 1914 he compelled the amusement concessionaires at Old Orchard Beach to cease operation on Sunday and with the consent of his Council he removed Sheriff White of Penobscot for failing to enforce the prohibitory law. The World War greatly added to the Governor's burdens but he assumed them courageously and showed much activity and energy in the execution of his office. In 1918 he received the customary renomination, as did Senator Fernald, whose term expired in March, 1919. . . . The election resulted in a great victory for the Republicans. They defeated Mr. White, who had been renominated for sheriff of Penobscot county by the Democrats, they secured an overwhelming majority in both Houses of the Legislature, and they re-elected Mr. Fernald by a handsome majority. They also re-elected Governor Milliken but by a majority much less than the one that he had received in 1916. . . . He is the first Governor of the State to be re-elected since 1906 and . . . he has secured his place in the history of Maine as her World War and Centennial Governor."—L. C. Hatch, ed., *Maine*, v. 3, pp. 652, 655-658.—Maine still holds her state elections in September and these elections attract national attention. If the Republican pluralities are larger than usual, they are thought to be the forerunner of national Republican victory. If, on the other hand, these pluralities are small, or if the Democrats elect their state ticket, the Democrats are hopeful for national success in November. On this account both parties send speakers of national prominence to participate in the early state campaign.

1904-1905.—*Historical celebrations.*—Two notable celebrations took place within a year of each other. One was the tercentennial of the landing of de Monts and his fellow colonists on St. Croix island. The other was the tercentennial of the landing of Weymouth. Both of these events were appropriately celebrated and a granite cross was unveiled on Allen island in commemoration of Weymouth's landing. One feature of the celebration was an imitation of the landing.

1909.—*Industrial arbitration board created.* See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1886-1920.

1911-1919.—*Notable legislation.*—In 1911 Maine passed a corrupt practices act, a primary election law, an act to protect forests, an act to exempt mortgages from taxation, and ratified the sixteenth federal amendment (income tax). In 1911 Augusta was declared the seat of government by constitutional amendment, and the same year an attempt to repeal the prohibitory law was defeated. "This decision, rendered [in 1911] by the Governor and Council, was not reached until almost two months after the voters had registered their will. The delay in announcing the result of the vote is easily explained. The votes were cast on September 11. At first the report was that the Constitutional provision for prohibition had been repealed. Out of nearly 121,000 votes cast, however, there appeared on the afternoon after election day to be a majority for repeal of only 168. By that same evening the returns indicated that repeal had been defeated and that prohibition had been retained. So close, however, was the vote that it was impossible for even the officials of the State to tell definitely on which side the majority really was. After all the returns were officially made, it appeared evident that the final result would depend upon a decision with regard to certain errors in the records. This decision rested with the Governor and Council. In his report to the Council

Governor Plaisted explains the nature of their duty. He points out that they had no authority to examine or recount the ballots, but simply 'to tabulate the returns and describe the result as it 'appears.' The vote as it thus 'appeared' is 60,095 for the repeal of prohibition and 60,853 for the retention of prohibition. Thus the majority for the retention of constitutional prohibition in Maine is less than sixty-three hundreds of one per cent of the total vote."—(*Outlook*, Nov. 25, 1911, p. 694.)—In 1916 C. E. Miliken, the successful candidate, declared himself in favor of the enforcement of the anti-liquor laws, and received the solid support of the anti-liquor element.

In 1912 an act of the legislature provided for the appointment of a chemist to inspect food. Another act provided that women should not be compelled to work more than sixty hours in certain employments. A constitutional amendment to authorize the issue of highway bonds, to the amount of \$2,000,000 was adopted the same year. "Maine first undertook road improvement through state aid in 1901 by providing for the payment of half the cost of permanently improving a section of the main thoroughfare in any town which should be designated by the county commissioners as the state aid road. [The limit of aid was first one hundred dollars, raised at intervals until it reached three hundred dollars.] In 1907 the legislature . . . created a State Highway Department. . . . [At this time state aid appropriation was fixed at one-third of a mill on the valuation of the state. This was raised in 1909 to three-fourths of a mill, and in 1911 the mill tax was abolished, and an appropriation of \$250,000 a year made to carry on the work. In 1913 the appropriation was raised to \$300,000 a year.] The legislature of 1913 passed a new state highway law reorganizing the state highway department under a commission of three members. This law directed the highway commission to lay out a system of state highways which should be the principal thoroughfares of the state and a system of state aid highways which should be feeders to the state highway system. The law also placed in the hands of the commission the maintenance of all state and state aid highways. . . . This law provided for the issue of \$2,000,000 bonds to be applied to the construction of state highways and made an appropriation of \$300,000 annually for the state aid construction. . . . In order to provide funds to meet the Federal aid offered by the government, the legislature in 1919 proposed an \$8,000,000 bond issue for state highway construction. This was approved by the voters at a special election in September . . . and in November the legislature in special session authorized the issue of \$2,000,000 of these bonds for state highway construction work in 1920. . . . The Maine Public Utilities Commission was created in 1913. . . . This Act was referred to the people in 1914 and accepted by a large majority. . . . The Public Utilities Commission consists of three commissioners appointed for a term of seven years. This Commission has regulatory powers over all steam railroads, electric railroads, gas, water, electric, telephone, telegraph, steamboat and express companies, also warehousemen and wharfingers operating in the State of Maine. . . . The Commission has the power to fix the rates charged for the different classes of service rendered by the different utilities. . . . It has jurisdiction over all issues of stocks, bonds, and notes. This requires public hearings and careful scrutiny of the purpose and legality of the issues. . . . The Commission requires full and complete financial statements from each company,

authorizes all sales, leases, or mergers, the necessity and cost of which must be approved."—H. E. Dunnack, *Maine book*, pp. 245-246, 251.—"In 1913 the seventeenth federal amendment was ratified (direct election of senators). In 1914 a public utility commission was created that followed in general the Wisconsin law. In 1915 the legislature passed an act which provided a nine hour day for women and minors under sixteen. The Maine voters, by a referendum ballot at this election [1916] ratified, despite strong corporation hostility, the fifty-four hour bill passed by the Legislature in 1915. This act reduces the working week of women and minors from fifty-eight to fifty-four hours. Maine is, we believe, the fifteenth State to adopt a measure of this kind."—*Maine elections (Outlook, Sept. 20, 1916)*.—"The Workman's Compensation Act of Maine was passed by the legislature of 1915, and became operative for organization purposes upon the first day of October, 1915. . . . Administration of the law is supervised by a commission consisting of four members; a chairman and associate legal member who are appointed by the governor, the commissioner of labor and industry and the commissioner of insurance. . . . The system provided for is elective, except as to state, counties, cities, water districts and other quasi municipal corporations. All other employers have the right to elect whether or not to adopt the compensation features of the act."—H. E. Dunnack, *Maine book*, p. 305.—In 1917 a compensation act which applied to state employees, and a mother's pension act were passed. In the same year a moratorium was voted for the men in the service (the state furnished 22,000 soldiers). In 1919, the eighteenth federal amendment (prohibition) and the nineteenth federal amendment (woman suffrage) were ratified.

1916-1920.—**Historical celebrations.**—In June, 1916, the 200th anniversary of the permanent settlement of Portland was observed by the city and the Chamber of Commerce. "The 100th anniversary of Maine's entrance into the Union was celebrated at Portland, the opening day being Saturday, June 26th, 1920. The Historical Day was Sunday, June 27th, when at 3 P.M. official historical exercises were held at the First Parish Church, Congress Street, near Monument Square."—*Maine centennial, June 26-July 5, 1920 (Sprague's Journal of Maine History, Dec., 1920)*.

1917-1918.—**Part taken in World War.**—For its resources, Maine contributed largely in men and money toward the success of the World War. Quite aside from liberty loans and other war savings, the people of the state contributed above \$2,367,500 to assist the various war activities. The state furnished 24,252 men, or .65 per cent of the whole force who were engaged in the various branches of the army and navy services.

1919-1921.—**State budget.**—"Under the provisions of . . . the Public Laws of 1919, the governor becomes the head of the budget committee. He with the state auditor, state treasurer, chairman of the committee on appropriations and financial affairs on the part of the Senate and chairman on the part of the House of the Maine Legislature make up this budget committee. An informal budget was inaugurated in 1917. This was continued in 1919, and the Legislature of 1921 . . . [saw] the first legal budget."—H. E. Dunnack, *Maine book*, p. 180.

MAJESTAS, Law of.—“The law of Majestas or Treason . . . under the [Roman] empire . . . was the legal protection thrown round the person of the chief of the state: any attempt against the dignity or safety of the community became an attack on its glorified representative. Nevertheless, it is remarkable that the first legal enactment which received this title, half a century before the foundation of the empire, was actually devised for the protection, not of the state itself, but of a personage dear to the state, namely, the tribune of the people. Treason to the State indeed had long before been known, and defined as *Perduellio*, the levying of war against the commonwealth. . . . But the crime of majesty was first specified by the demagogue Apuleius, in an enactment of the year 654 [100 B.C.], for the purpose of guarding or exalting the dignity of the champion of the plebs. . . . The law of Apuleius was followed by that of another tribune, Varius, conceived in a similar spirit. . . . [After the constitution of Sulla] the distinction between Majestas and *Perduellio* henceforth vanishes: the crime of Treason is specifically extended from acts of violence to measures calculated to bring the State into contempt.”—C. Merivale, *History of the Romans*, ch. 44.

MAJORCA, largest of the Balearic islands, off the east coast of Spain.

1229.—Conquest by King James of Aragon. See SPAIN: 1212-1238; ARAGON.

1708.—Captured by the English in War of Spanish Succession. See SPAIN: 1707-1710.

MALATESTA FAMILY.—“No one with any tincture of literary knowledge is ignorant of the fame at least of the great Malatesta family—the house of the *Wrongheads*, as they were rightly called by some prevision of their future part in Lombard history. . . . The story of Francesca da Polenta, who was wedded to the hunchback Giovanni Malatesta and murdered by him with her lover Paolo, is known not merely to students of Dante, but to readers of Byron and Leigh Hunt, to admirers of Flaxman, Ary Scheffer, Doré—to all, in fact, who have of art and letters any love. The history of these Malatesti, from their first establishment under Otho III. [900-1002] as lieutenants for the Empire in the Marches of Ancona, down to their final subjugation by the Papacy in the age of the Renaissance, is made up of all the vicissitudes which could befall a mediæval Italian despotism.

Acquiring an unlawful right over the towns of Rimini, Cesena, Sogliano, Ghiacciuolo, they ruled their petty principalities like tyrants by the help of the Guelph and Ghibelline factions, inclining to the one or the other as it suited their humour or their interest, wrangling among themselves, transmitting the succession of their dynasty through bastards and by deeds of force, quarrelling with their neighbours the Counts of Urbino, alternately defying and submitting to the Papal legates in Romagna, serving as condottieri in the wars of the Visconti and the state of Venice, and by their restlessness and genius for military intrigues contributing in no slight measure to the general disturbance of Italy. The Malatesti were a race of strongly marked character; more, perhaps, than any other house of Italian tyrants, they combined for generations those qualities of the fox and the lion which Machiavelli thought indispensable to a successful despot. . . . So far as Rimini is concerned, the house of Malatesta culminated in Sigismondo Pandolfo, son of Gian Galeazzo Visconti's general, the perfidious Pandolfo. . . . Having begun by defying the Holy See, he was impeached at Rome for heresy, parricide, incest, adultery, rape, and sacrilege, burned in effigy by Pope Pius II., and finally restored to the bosom of the Church, after suffering the despoliation of almost all his territories, in 1463. The occasion on which this fierce and turbulent despiser of laws human and divine was forced to kneel as a penitent before the Papal legate in the gorgeous temple dedicated to his own pride, in order that the ban of excommunication might be removed from Rimini, was one of those petty triumphs, interesting chiefly for their picturesqueness, by which the Popes confirmed their questionable rights over the cities of Romagna. Sigismondo, shorn of his sovereignty, took the command of the Venetian troops against the Turks in the Morea, and returned in 1465, crowned with laurels, to die at Rimini."—J. A. Symonds, *Sketches in Italy and Greece*, pp. 217-220.

ALSO IN: A. M. F. Robinson, *End of the Middle Ages*, pp. 274-209.

MALAY, MALAYSIAN, or BROWN, RACE.—"The Malay race may be defined as that grand division of mankind which is distinguished by its brown color and which is native to the Malay Archipelago and Peninsula and the Island of Madagascar, with perhaps a few related remnants of tribes in Indo-China. The Malay Archipelago includes the Philippines, but not New Guinea on the east. . . . All the languages spoken by the Malay race belong to the great Malayo-Polynesian family of languages. . . . While linguistically the Malays are radically distinct from the Mongolians, physically they approach them more nearly than any other great race. The lighter brown color found in some sections approaches the yellow of the Chinese, and the slanting eye, or 'Mongol fold' of the upper lid is frequently found where no intermixture can be assumed. . . . In temperament, and native civilization, however, the Malay is quite distinct. He has primitive cruel instincts more like those of the American Indian. He has nowhere accepted the Mongolian type of civilization so much as the Caucasian."—D. Folkmar, *Dictionary of races and peoples*, p. 94.—"In the Oceanic domain, which for ethnical purposes begins at the neck of the Malay peninsula, the Mongol peoples range from Madagascar eastwards to Formosa and Micronesia, but are found in compact masses chiefly on the mainland, in the Sunda Islands (Sumatra, Java, Lombok, Borneo, Celebes), and in the Philippines. Even here they have mingled in many places with other populations, forming fresh eth-

nical groups, in which the Mongol element is not always conspicuous. Such fusions have taken place with the negrito aborigines in the Malay peninsula and the Philippines; with Papuans in Micronesia, Flores, and other islands east of Lombok; with . . . dolichocephalic Indonesians in Sumatra, Borneo, Celebes, Halmahera, parts of the Philippines, and perhaps also Timor and Ceram; and with African negroes (Bantu) in Madagascar. To unravel some of these racial entanglements is a . . . most difficult task. . . . The problem has been greatly . . . complicated by the indiscriminate extension of the term 'Malay' to all these and even to other mixed Oceanic populations farther east. . . . The essential point to remember is that the true Malays—who call themselves Orang-Malayu, speak the standard, but quite modern Malay language, and are all Mohammedans—are a historical people who appear on the scene in relatively recent times, ages after the insular world had been occupied by the Mongol peoples to whom their name has been extended, but who never call themselves Malays. The Orang-Malayu, who have acquired such an astonishing predominance in the Eastern Archipelago, were originally an obscure tribe in . . . Sumatra, . . . whose migrations date only from about the year 1160 A.D. . . . Sumatra . . . became the true centre for the later diffusion of the cultured Malays, their language, usages, and religion, throughout the Peninsula and the archipelago. . . . Beyond Sumatra . . . the Orang-Malayu are . . . in fact intruders on the other Malayan populations, with whom they collectively constitute the Oceanic branch of the Mongol division."—A. H. Keane, *Man past and present*, pp. 221, 222.—"The first inhabitants [of the Malay peninsula and the archipelago] were probably a black woolly-haired race, of which the pigmy representatives (Negritos) are the Andamanese, the Semang of the Malay Peninsula, the Aeta of the Philippines, and the pygmies of New Guinea; the taller varieties are the recently extinct Tasmanians, the Papuans proper, and the ground stock of the Melanesians. The Malay peninsula was first occupied in the twelfth century by the true Malays, Orang-Malayu, who crossed over from Sumatra; thence at the close of the thirteenth century they spread over the East Indian archipelago. . . . A mixture of proto-Malayans with Indonesians whom we may call Proto-Polynesians, drifted into the west Pacific, and gave to the black woolly-haired natives their language and some elements of higher culture, the resultant mixed peoples being the Melanesians. Later migrations fared further into the Pacific."—A. C. Haddon, *Wanderings of peoples*, pp. 33-36.

In the Philippines.—"The data at hand would seem to indicate that the bulk of the population of the Philippine Islands may be included in three racial types each of which presents certain distinctive characteristics. . . . These are I. Malay: affinities distinctly Mongoloid, . . . [Malayans proper, the dominant peoples, found in the coastal districts of all the Malayan islands and the peninsula]. II. Indonesian: affinities less Mongoloid than the Malay type, . . . [found in the interior of all Malay islands and the Malay peninsula]. III. Negrito: [affinities negroid, found in the hill regions of the Malay peninsula, the Philippine and the Andaman Islands]. The Philippine problem is a part of the much larger Malay problem. All through Malaysia we find an apparent stratification of the population. In the interior of the various islands, we find tribes variously called 'wild,' 'pagan' or 'head hunters.' Surrounding these on all sides are the more civilized tribes designated as

'civilized' or 'Christian.' These people for the most part live near the coast of the islands. Mingling with these peoples, we have the Mahomedan peoples known as 'historic Malays' or 'Moros.' This stratification is further complicated in some instances, notably the Philippine Islands, by the presence of a fourth element, the pygmy Negrito, who usually occupy the mountain wilds. . . . The Negrito were probably the first inhabitants of the islands. We had, in turn, two prehistoric Malay invasions. The first Malay invasion, probably from Borneo, drove the Negrito inland and the newcomers inhabited the coast. The second invasion, also prehistoric, drove the people of the first invasion inland."—L. R. Sullivan, *Anthropological Papers of the Museum of Natural History*, 1918, pp. 10-11.

MALAY ARCHIPELAGO: Land.—The Malay archipelago is a group of islands which are botanically, zoologically, and ethnologically related to each other, and to the Malay peninsula. The larger islands are connected with each other by smaller islands, and the similarity of plants, animals, and human inhabitants throughout the archipelago makes of it a geographical unit. The islands lie almost uniformly in tropical waters and stretch from the Malay peninsula to the Philippines on the north, the Nicobar islands on the west, and the Solomon islands, beyond New Guinea, on the east. "The Malay Archipelago extends for more than 4,000 miles in length from east to west, and is about 1,300 in breadth from north to south. It would stretch over an expanse equal to that of all Europe from the extreme west far into Central Asia, or would cover the widest parts of South America, and extend far beyond the land into the Pacific and Atlantic oceans. It includes three islands larger than Great Britain; and in one of them, Borneo, the whole of the British Isles might be set down, and would be surrounded by a sea of forests. New Guinea, though less compact in shape, is probably larger than Borneo. Sumatra is about equal in extent to Great Britain; Java, Luzon, and Celebes are each about the size of Ireland. Eighteen more islands are, on the average, as large as Jamaica; more than a hundred are as large as the Isle of Wight; while the isles and islets of smaller size are innumerable. The absolute extent of land in the Archipelago is not greater than that contained by Western Europe from Hungary to Spain; but, owing to the manner in which the land is broken up and divided, the variety of its productions is rather in proportion to the immense surface over which the islands are spread, than to the quantity of land which they contain."—A. R. Wallace, *Malay archipelago*, pp. 4-5.—See also ASIA: Map; BRITISH EMPIRE: Extent.

People.—The inhabitants of the Malay archipelago consist chiefly of the Malays. (See MALAY, MALAYSIAN, OR BROWN, RACE.) But in New Guinea and the eastern islands there are also the Papuans, a stalwart, black race, much superior to the Malays in physical strength, and, in some respects, superior also in character and intelligence. . . . "The Malays proper inhabit the Malay peninsula, and almost all the coast regions of Borneo and

Sumatra. They all speak the Malay language, or dialects of it; they write in the Arabic character, and are Mahometans in religion. The Javanese inhabit Java, part of Sumatra, Madura, Bali, and part of Lombok. They speak the Javanese and Kawi languages, which they write in a native character. They are now Mahometans in Java, but Brahmans in Bali and Lombok. The Bugis are the inhabitants of the greater parts of Celebes, and there seems to be an allied people in Sumbawa. They speak the Bugis and Macassar languages, with dialects, and have two different native characters in which they write these. They are all Mahometans. The fourth great race is that of the Tagalas in the Philippine Islands. . . . Many of them are now Christians, and speak Spanish as well as their native tongue, the Tagala. The Moluccan-Malays, who inhabit chiefly Ternate, Tidore, Batchian, and Amboyna, may be held to form a fifth division of semi-civilized Malays. They are all Mahometans, but they speak a variety of curious languages, which seem compounded of Bugis and Javanese, with the languages of the savage tribes of the Moluccas. The savage Malays are the Dyaks of Borneo; the Battaks and other wild tribes of Sumatra; the Jakuns of the Malay Peninsula; the aborigines of Northern Celebes, of the Sula island, and of part of Bouru."—A. R. Wallace, *Malay archipelago*, v. 2, p. 441.—"The different peoples making up the [Malay] race differ markedly from one another in culture. . . . Fourteen or fifteen hundred years ago Hinduism spread over Burma, Siam, and Java. Great cities were erected with splendid temples and huge idols, the ruins of which still remain, though their magnificence has gone and they are covered to-day with the growth of the jungles."—D. P. Barrows, *History of the Philippines*, p. 37.

Before sixteenth century.—Origin and early history previous to discovery by Europeans.—Influence of Hinduism and Mohammedanism.—Native race previous to European contact.—Origin.—"It is thought that the Malayan race originated in southeastern Asia. From the mainland it spread down into the peninsula and so scattered southward and eastward over the rich neighboring islands. Probably these early Malaysians found the little Negritos in possession and slowly drove them backward, destroying them from many islands until they no longer exist except in the places we have already named. With the beginning of this migratory movement which carried them from one island to another of the great East Indian Archipelago, these early Malaysians must have invented the boats or praus for which they are famed and have become skillful sailors living much upon the sea. . . . Life for many generations, upon these islands, so warm, tropical, and fruitful, gradually modified these emigrants from Asia, until they became in mind and body quite a different race from the Mongol inhabitants of the mainland. Previous to their discovery by Europeans they seem to have come in contact, in varying degrees, both with Hinduism and Mohammedanism. The powerful civilization of the Hindus, established . . . in Malaysia, greatly affected the Malayan people on these islands, as well as those who came to the Philippines. Many words in the Tagalog have been shown to have a Sanskrit origin, and the systems of writing which the Spaniards found in use among several of the Filipino peoples had certainly been developed from the alphabet then in use among these Hindu peoples of Java. . . . Not only did Mohammedanism move westward over Africa and Europe, it was carried eastward as well. Animated by their faith, the

Arabs became the greatest sailors, explorers, merchants, and geographers of the age. They sailed from the Red Sea down the coast of Africa as far as Madagascar, and eastward to India, where they had settlements on both the Malabar and Coromandel coasts. Thence Arab missionaries brought their faith to Malaysia. At that time the true Malays, the tribe from which the common term 'Malayan' has been derived, were a small people of Sumatra. At least as early as 1250 they were converted to Mohammedanism, brought to them by these Arabian missionaries, and under the impulse of this mighty faith they broke from their obscurity and commenced that great conquest and expansion that has diffused their power, language, and religion throughout the East Indies. A powerful Mohammedan Malay settlement was established on the western coasts of Borneo probably as early as 1400. The more primitive inhabitants, like the Dyaks, who were a tribe of the primitive Malays, were defeated, and the possession of parts of the coast taken from them. From this coast of Borneo came many of the adventurers who were traversing the seas of the Philippines when the Spaniards arrived."—D. P. Barrows, *History of the Philippines*, pp. 31, 32, 38, 40.

1500.—Characteristics of the Malay archipelago at the beginning of the sixteenth century.—"If now we look at the Malay Islands, we find . . . that changes had been effected there. Hinduism had first elevated and civilized at least a portion of the race, and Mohammedanism and the daring seamanship of the Malay had united these islands under a common language and religion. There was, however, no political union. The Malay peninsula was divided. Java formed a central Malay power. Eastward among the beautiful Celebes and Moluccas, the true Spice Islands, were a multitude of small native rulers, rajas or datos, who surrounded themselves with retainers, kept rude courts, and gathered wealthy tributaries of cinnamon, nutmegs, and cloves. The sultans of Ternate, Tidor, and Amboina were especially powerful, and the islands they ruled the most rich and productive. Between all these islands there was a busy commerce. The Malay is an intrepid sailor, and an eager trader. Fleets of praus, laden with goods, passed with the changing monsoons from part to part, risking the perils of piracy, which have always troubled this archipelago. Borneo, while the largest of all these islands, was the least developed, and down to the present day has been hardly explored. The Philippines were also outside of most of this busy intercourse and had at that date few products to offer for trade. Their main connection with the rest of the Malay race was through the Mohammedan Malays of Jolo and Borneo. The fame of the Spice Islands had long filled Europe, but the existence of the Philippines was unknown."—D. P. Barrows, *History of the Philippines*, pp. 50-60.—Since there never was any real political union in the Malay archipelago, and since several of the islands, while retaining the same original characteristics, developed in highly individual ways, the history of the Malay archipelago becomes the history of its individual units.

MALAY PENINSULA, or Malacca.—"The term 'Malay Peninsula' covers that portion of Asia which forms a prolongation of the narrow neck of land, known as the Isthmus of Kra, where Burmese territory abuts on Lower Siam.

. . . Except for a small piece of Siamese territory on the east coast, this area is under British rule or influence, and covers with adjacent islands approximately 52,500 square miles. It is bounded on the west by the Straits of Malacca, on the east by the South China Sea, and on the south by the shallow waters in which are set the green islands of the Riau-Lingga Archipelago. Politically that part of the Malay Peninsula under British rule or protection is divided into: 1. The Crown Colony of the Straits Settlements, comprising the island of Singapore, the island of Penang with Province Wellesley and the Dindings, and the Settlement of Malacca. 2. The Federated Malay States: Perak, Selangor, Negri Sembilan and Pahang. 3. The Unfederated Malay States: Johore, Kedah, Perlis, Kelantan and Trengganu."—R. O. Winstedt, *Malaya*, p. 2.—See also ASIA: Map; STRAITS SETTLEMENTS.

Valletta, with a population of 25,000. Malta lies about halfway between Gibraltar and Port Said, [see AFRICA: Map] and 50 miles south of Sicily, in latitude 36° n. [The island is strongly fortified, and is the chief station of the British Mediterranean fleet.] It commands the great trade-route between Western Europe, India and the East. The total trade is valued at about . . . [£5,000,000], of which over . . . [£4,000,000] represents imports. This is due to the fact that supplies for the garrison and for civil servants are imported, while many Maltese are engaged about the harbours and docks, or as merchant sailors, since Malta is an important calling and bunkering station for ships. . . . Bunkering coal is imported and exported to the value of about half a million sterling, while wheat and flour, cattle food, petroleum and textiles are other heavy items on the import list. There is a considerable trade in luxury articles. About 43,000 acres of land are under cultivation, wheat being the chief crop, although the harvest is quite inadequate to local needs. Potatoes, onions, tomatoes and other

vegetables, besides citrons and other fruit are grown for export. . . . The chief domestic animals are sheep and goats. There is a small manufacture of lace and cigarettes. The islands are over populated, and there is considerable emigration to the continent, the United States, and North Africa, the destination of the emigrants varying according to the state of the labour market."—E. G. R. Taylor, *Business man's geography*, p. 332.—In the later Stone Age, Malta was inhabited by a people who may have belonged to the stock from which the Basques and Iberians have sprung. Remains of remarkable megalithic temples and monuments erected by these people are found in various parts of the island. "By reason of its secure anchorage and its position between the African and European seaboard, . . . Malta has been, even from early classical times, the coveted prize of those nations who sought to extend their commerce and increase their possession by maritime power. It has been, in consequence, the meeting-place and the battleground of such various protagonists as the Carthaginians, Romans, Arabs, and Normans, to name only a few of the races which have directed the destinies of the island. The Maltese are a homogeneous race, distinct from their African or European neighbours in language and character, and with national customs of which they are tenacious and proud. They are descended from the Phœnicians, who colonized the island a thousand years before Christ. From this stock they inherit their native tongue, which is neither English nor Italian, but a patois [a mixture of the old Phœnician (or Semitic) Arabic, Latin and Italian]. . . . Many races have ruled Malta since the coming of the Phœnician, but few have sent settlers to the island in sufficient numbers to crush out the primitive inhabitants, and so down to this day the Phœnician strain predominates. Some ancient families, indeed, especially among the nobility, are of foreign extraction, bearing Italian, French, Spanish, or other surnames; they came to the island long ago, intermarried with the natives, and are now more Maltese than the Maltese themselves. Environment has, no doubt, in part done this, as well as the use from infancy of the Maltese tongue, universal as the language of domestic life by both high and low in the island; hence, the Maltese present a study in national development in many ways unique. A people, so small in numbers, with a territory so valuable, could not, however, live their life entirely uninfluenced by the rest of the world, and Malta has, in consequence, been drawn into most great movements. It is no exaggeration to say, with a native writer, that in local records may be read in microcosm the history of Europe; while in the archaeological remains found, the island presents a complete picture of the various stages of Western civilization. Here Hamilcar surrendered to Titus Sempronius Gracchus, when Carthage ceded her command of the Great Sea to Rome. Saint Paul the Apostle, shipwrecked upon the island, preached Christianity to the Maltese. Feudalism came early into Malta, and stayed, under the régime of the Knights, an interesting anachronism, until the eighteenth century. In the wars of the Crescent and the Cross, Malta became, under the Knights, the bulwark of Christian Europe; in later days Napoleon saw its importance as a naval and military base when he declared to the British Ambassador in Paris: 'Peace or war depends upon Malta. . . . I would rather put you in possession of the heights of Montmartre than of Malta.' . . . When Garibaldi entered Rome, the Vatican considered the possibility of transferring the Holy See to Malta, always loyal to the

Papal connection. These are but a few cases in which the island has been a factor in European events, and as we come to know local history better, we find the Maltese people themselves have played, within the narrow compass of their island, a part not ignoble. Hence, the problems of race, language, and religion which confront the Government of Malta to-day, . . . have sprung from seed long sown in a field long prepared."—F. W. Ryan, *Malta*, pp. 2-5.

B. C. 500-A. D. 870.—Phœnician and Roman domination.—Saint Paul's shipwreck.—There are still left a few remains of houses and cisterns from the time of the Phœnician period. (See also PHœNICIANS: Origin.) Carthaginian settlements date from the sixth century B. C. There are a number of references by Roman writers in regard to the history and monuments of this period and there are also found tomb caves in the hill-sides which contain urns full of human bones, and beautiful vessels of iridescent glass. The capital of Malta during Carthaginian and Roman days was the present city of Notabile. Here, during the first century A. D., and after, a Roman governor was apparently stationed. About 60 A. D., St. Paul was shipwrecked on Malta and the inhabitants are described in the Acts of the Apostles as "barbarous" people, Lind and superstitious. In 395, Malta was transferred to the Eastern empire and was governed from Constantinople.

870-1530.—From Arab to Norman domination.—In 870 the island was conquered by the Arabs. The fortress of St. Angelo, at the entrance to the Grand Harbor was built by them on a site formerly occupied by the Roman temple to Juno; and numbers of Arab graves with Semitic inscriptions have been excavated among the ruins of the Roman villa at Notabile. "The Maltese Islands flourished considerably under the Arabs. It even seems likely that they found an independent state, with a fleet of their own. But difference of religion . . . proved an insuperable barrier between the two races. . . . In A. D. 1090, Roger the Norman completed his conquest of Sicily by landing on our shores . . . [He] marched in bloodless triumph through the gates of our old capital, and was acclaimed lord of the island. . . . [The Arabs succeeded in recapturing the island in 1127, but were soon dislodged.] From that time Malta became a part of the Kingdom of Sicily, and for four and a half centuries underwent the same changes of rulers and dynasties and practically the same fate as the larger island. During that long period Malta, by reason of its position, was called upon to assume the rôle of policing the Mediterranean, . . . first against the pirates and the Barbary corsairs, and then against the Ottomans."—A. Bartolo, *Malta and sea power (United Empire, Royal Colonial Institute Journal, Dec., 1920)*.—At the end of the twelfth century Malta became a fief of the grand admiral of Sicily. Late in the thirteenth century, the island came into possession of Peter of Aragon, and through him descended to Charles V.

1530-1798.—Possession by the Knights of St. John.—After the Knights of St. John had been driven from the island of Rhodes by the Turks, the Emperor Charles ceded Malta to them as a refuge for the order. The knights fortified themselves strongly in the peninsula which is overlooked by the Castle of San Angelo, in prevision of a Mohammedan attack. It came in 1565 when the island was besieged from May to September. La Valette, the grand hospitaller of the order, conducted the defence with energy and wisdom, and the Mohammedan force was defeated in September

with great loss. The story of the siege is almost the same from day to day: efforts to take the city by storm, constantly repulsed; mines and counter mines; fights in the water between Turkish swimmers armed with axes, endeavoring to cut the chain at the mouth of the creek, and Maltese swimmers with daggers defending it. "It became evident however, that succour could not be long delayed. When even Protestant England put up public prayers in her churches for the deliverance of Malta, the saturnine Philip must have felt shamed into action. The superhuman exertions of the defenders, continued so unintermittingly under the tropical heat of a Malta summer, could not endure for ever. La Valette himself had moved his quarters to a small house near the chief point of attack, where his arms are this day visible, carved in the wall: this movement was probably made in consequence of a suggestion which had been brought forward, in anticipation of another grand attack, of which they had been forewarned, on the 23rd August, that they should abandon the towns, and defend themselves in the castle of St. Angelo. The assault was repulsed, and so was another on the 1st of September, when the besiegers actually were forced to the charge by blows from the swords of their own officers. Yet when the Viceroy of Sicily called a council, a speaker urged that considering the expressed intention of the Turks to abandon Malta after destroying the Order, it would be better to allow them to do so, and reoccupy it. Happily this prudent counsellor stood alone. At length a horseman brought news to Mustapha, just as he was assembling his hordes for one more effort to storm the defences, that an army had landed from Sicily: at once a retreat was commenced, and all the war material hurried to the ships, which was scarcely effected ere the garrison occupied the deserted posts, and the Turkish commanders learned that less than 9,000 men had landed from the Christian fleet. Hurriedly determining to try the fortune of war once more, Mustapha landed about an equal number of soldiers at St. Paul's Bay, and began a march towards the capital. An irregular skirmish with the advanced guard led to a general engagement, in which the Mahometan force was driven to the ships with heavy loss. So ended this famous siege; about 40,000 men had been engaged in the attack, of whom barely 15,000 survived to return to Constantinople. The number of those engaged in the defence was originally under 9,000, and about 700 were added in the course of the struggle; of those only 600 were left unwounded at the close. It was a world-renowned effort of heroic endurance."—W. K. R. Bedford, *Malta and the knights hospitallers*, pp. 25-26.—"The full effects of the crushing defeat inflicted by the little rock of Malta on the flower of the Ottoman Army was the first staggering blow dealt at the power of the Turks, and its effects, though perhaps not fully realised at the time, were not considerably underrated. . . . Viewing the events of three and a half centuries ago in the light of modern principles, it is easy to explain their importance by the simple reflection that, in the hands of the Turks, Malta would have proved an invaluable naval base, such as would have rendered them masters of the Mediterranean."—A. Bartolo, *Malta and sea power (United Empire, Royal Colonial Institute Journal, Dec., 1920)*.—See also HOSPITALLERS OF ST. JOHN OF JERUSALEM: 1522; 1530-1565; BARBARY STATES: 1543-1560.

1798-1799.—French seizure and surrender.—The rule of the Knights of Saint John lasted until

June 1798, when Napoleon, on his way to Egypt, took possession of the island, and expelled the order. The French were, however, compelled to surrender to the allies in the following year.—See also FRANCE: 1798 (May-August); 1801-1802.

1814.—Ceded to England.—"By the terms of the Treaty [of Amiens, 1802] Malta was to remain in English hands until the guarantees laid down in the same Treaty were given; but as these guarantees did not appear to be forthcoming, England refused to evacuate Malta. [See FRANCE: 1802-1804.] Napoleon was furious at what he regarded as a breach of faith. . . . His anxiety and his threats . . . betrayed his plans, which were soon to be completely unmasked. 'Peace or war depends upon Malta,' he said to the British Ambassador in Paris. . . . Although the Treaty of Paris, which recognised the British sovereignty over Malta, was not signed till 1814, . . . Malta had definitely passed to England long before that time—by the victory of Trafalgar."—A. Bartolo, *Malta and sea power (United Empire, Royal Colonial Institute Journal, Dec., 1920)*.—See also FRANCE: 1814 (April-June).

1814-1901.—Government under British rule.—Friction.—Strickland-Mizzi constitution.—In a speech made in the British House of Commons on January 28, 1901, Chamberlain gave a brief resumé of the history of the island, under British rule down to that date. "We did not conquer the Maltese, we were fighting side by side with them, but never against them. It was not a conquest, it was a cession by the representative authorities of the Maltese. . . . The Constitution, if indeed it can be called a Constitution, which existed at the time of the cession and for a great many years afterwards, was a purely autocratic Constitution. The Governor was judge and jury in every case in which Imperial interests were concerned; he was the Grand Elector, he was the representative authority; all laws were made by him. Sir Thomas Maitland, who was Governor from 1813 to 1824, was the best type of a beneficent despot; but from 1803 to 1838, that is, for thirty-five years, the Constitution of Malta was absolutely autocratic; there was no representation of any kind. In 1838 a representative element was introduced for the first time, but it was not an elective one. The Council of Government then consisted of the Governor and six persons, all of whom were nominated by the Governor. Three of them were official members, and three of them unofficial. These were the gentlemen who, up to 1840, made the laws of Malta. In that year, for the first time, . . . elected members were introduced. The Council of Government then consisted of the Governor, with nine nominated and eight elected members. But, under this constitution, as under the previous one, the Governor, in the last resort—representing the Imperial authority, the security of the fortress, and the interests of the Empire—was supreme. The elected gentlemen were called in to advise and assist him, but the will of the Imperial Government prevailed. . . . [But in 1887] in deference to the wishes expressed by the representatives of a section of the Maltese population, for the first time [by what is known as the Strickland-Mizzi constitution] a majority of the Council of Government was given to the elected members. The Council consisted . . . of the Governor and six officials, with fourteen elected members. The consequence is that the control of the finances . . . [has been transferred to] the elected members. . . . They could refuse every penny for every service in the island; and, in those circumstances, the position of

the Government in the maintenance of this fortress would be one of the greatest difficulty. . . . Legislation by Order in Council [however] was expressly reserved . . . and, if the powers of the elected members are abused in any way, the Imperial Government has it always in its power to legislate over their heads by means of this order in Council. Friction, however, continued. The language question has been brought into the foreground, and made the dominant one. . . . Since our Government will not grant the demands of this party, the elected majority in the Council has refused to vote money for new schools, and for teachers' salaries. It has blocked our Government proposals for drainage-works, water-works, hospitals, asylums, street-improvements, harbours and jetties, etc., etc. . . . This local Council in the island, refusing to act in the way in which our Governor, Sir Francis Grenfell, and our Chief Secretary, Sir Gerald Strickland desire—as instructed by the Government at home—the Cabinet . . . issued an "Order in Council," to meet the difficulty by taxation. . . . Now the Government, having considered the state of things, decided that when purely local interests were concerned, we must—so long as there are elected members—allow them to play ducks and drakes with the interests of their constituents; but wherever Imperial interests are concerned—or where there are interests that so considerably affect the welfare of the population that they become Imperial interests—we must interfere."—W. Knight, *Malta (Fortnightly Review, Apr., 1903)*.

1903.—**Repeal of constitution.**—Antagonism between the political forces in the island and the imperial government was not allayed by the action taken under the order in council. The elected members refused to vote supplies, or even to attend the meetings of the council. The marriage laws, and education, were burning questions; but the chief opposition centered around the question of the official language which the official authorities desired should be English, and the majority of the elected members, with equal persistency insisted should be Italian. In 1903, therefore, the constitution was repealed, and an executive government of thirteen official members instituted by letters patent.

1903-1920.—**Administration.**—In 1909 the constitution of 1903 was modified by the admission of two elected members of the legislative council to the executive council. No further change was made, and the government continued to consist of a governor, an executive council of eleven official, and two unofficial members, and a legislative council of ten official and eight elected members besides the president and vice-president. The governor was president of both councils. Revenue was raised entirely by indirect taxation.

1921.—**Constitution providing self-government.**—"In 1921 the island of Malta received a new constitution which has placed it in a position above any of the Crown Colonies. It was granted responsible self-government, such as exists in the Dominions, for purely local affairs, while matters of imperial concern were retained under the control of the Governor, assisted by an Executive Council. In 1919 there was a very evident desire in Malta for a constitution granting responsible government. The National Assembly proposed a draft constitution, which was made the basis of a second draft constitution prepared by the Colonial Office. This, in turn, received wide discussion; the completed document was formally put into effect in May, 1921. The Maltese constitution makes

provision for two concurrent systems of government, one for matters of imperial concern and one for purely local affairs. The two are united in the person of the chief Crown appointee, who is known as the Governor and Commander-in-Chief of Malta; from one aspect he is the mouthpiece of the Imperial Government, from another aspect the head of a self-governing community. The constitution provides for a legislature of two houses. There is a Ministry responsible to the legislature, as in the Dominions. English and Italian are recognized as the official languages; speeches in the legislature may be in Maltese as well. Matters of imperial concern which are without the jurisdiction of the constitution are such as affect the general defense of the Empire and the position of Malta as an imperial fortress, dockyard, and maritime center. This novel constitutional experiment has been made in order to grant a colony of great imperial importance, with a population largely non-British, a measure of self-government; this diarchical system seemingly answers the objection that one might about as well grant a constitution to a battleship as give one to Malta."—H. Robinson, *Development of the British empire, pp. 439-440*.

MALTHUS, Thomas Robert (1766-1834), English political economist. See MALTHUSIAN DOCTRINE; STATISTICS: Laws of growth of population; CHARITIES: England: 1782-1834.

MALTHUSIAN DOCTRINE, the name commonly associated with a theory of population enunciated by Thomas Robert Malthus toward the end of the eighteenth century. Malthus did not originate the idea that population tends to increase excessively. In his first essay, 1798, he was indebted to the works of Wallace, Hume, Smith and Price, and he later acknowledged what had been done by Montesquieu, Franklin, Stewart, Young and Townsend. Malthus was acquainted with Rousseau and Hume, and the latter must have exercised some influence over him. The immediate cause of his "Essay on Population" was furnished by the writings of William Godwin, who in 1793 had published a work entitled "Inquiry concerning political justice and its influence on morals and happiness." In it Godwin held that government, which he described as a necessary evil, is to blame for the unhappiness and misfortunes of man. This book was much discussed, and excited much controversy. It was in reply to an essay of Godwin's on avarice and prodigality (1797) that Malthus in 1798 published his "Essay on the principle of population." He endeavored to prove that abolition of government could not restore an Eden on earth, because the cause of unhappiness and misfortune is to be found in our weak and imperfect natures. Malthus held that human institutions, far from increasing, had tended to mitigate misery, though they could never remove it altogether. He assumed two premises: (1) Food is necessary to the existence of man; (2) Passion between the sexes is necessary and will remain nearly in the present state. His complete doctrine finally was: History shows that population has a constant tendency to increase beyond the means of subsistence and is kept to its necessary level by various positive and negative checks, including moral restraint. This conclusion rests upon the natural operation of three factors: (1) Natural rate of increase of population; (2) Rate of increase of means of subsistence; (3) External checks

on increase of population. Despite the criticism and derogatory estimate of his contemporaries and followers, Malthus's claim to importance as an original thinker is supported by many of the best present day thinkers. Perhaps the most vitriolic attack within the memory of men now living was made by Henry George in "Progress and poverty." Taking his most careful statement of the three factors in his problem separately, and considering them only as tendencies in the sense that they would be true if not interfered with, they may be accepted; but Malthus sometimes states them so that their character as mere potential tendencies is forgotten. He has also been criticised for lack of foresight in his view of the possibilities of increased subsistence through improvements in agricultural science and transportation. He did not seem to appreciate fully the possible effects of an increase of population in increasing the rate of increase of subsistence. However, he was the first to devote a treatise to the principle of population, and he deserves great credit for calling attention to economic significance of an hitherto neglected subject. It is important to note that the Malthusian doctrine was partly instrumental in leading Darwin to his doctrine of natural selection. In addition, Malthus also collected a mass of valuable facts illustrative of his doctrine—on emigration, poor laws and various customs. These influenced legislation considerably and gave him a place among the founders of historical economics. Darwin himself said that his theory of the struggle for existence was only "the doctrine of Malthus applied with manifold force to the whole animal kingdom." The Malthusian theory is essential to an understanding of the problems of social reform even in our day. John Stuart Mill was prevented from unreservedly advocating governmental interference with wages, of a highly socialistic character, only by his belief in the theory of population of Malthus. The economist cannot go far without recognizing the tendencies with which Malthus dealt. Attempts to solve modern social problems without taking into consideration the principle of population, are foredoomed to failure.—See also STATISTICS: Laws of growth of population; ECONOMICS: 18th-19th centuries.

MANCHURIA: Geographic description.—**Area.**—**Population.**—**Administration.**—"Manchuria comprises what are known as the three eastern provinces [Tung-san-shêng] of the Chinese Empire, known locally as Feng-tuen [Liao-tung] in the south, with an area of about 60,000 square miles; Kirin, to the north of Feng-t'ien, with an area of about 120,000 square miles; and Hei-lung-chiang, to the north and west of Kirin and north of Mongolia, containing an area of about 200,000 square miles, this being a total area of about 380,000 square miles for the whole of Manchuria, which practically embraces the territory from the southernmost point of the Liaoyang Peninsula (Port Arthur) to the Great Amur River on the north, being bounded on the east by the Bay of Corea,

while additional importance has been lent to the latter term by its finding place in the treaties recently concluded between Japan and China."—*Economic history of Manchuria* (*Bank of Chosen*) p. 12.—"The population is apparently greatest in the southern province of Feng-t'ien, which seems to be well developed, this being doubtless due to its closer proximity to the seaboard and commercial ports of China proper, such as Tientsin, Chefoo, Shanghai, and trade routes to all other Oriental ports. . . . The climate of Manchuria is varied. In summer, the temperature of the northern portion reaches about 90 degrees, while in the winter months it falls as low as 49 degrees below zero. In the extreme south, the temperatures range from about 96 degrees in summer to about 17 below zero in the winter. . . . From the end of November to about the 1st of April, the whole country to the north of the southernmost part of the Liaoyang Peninsula is practically ice-bound and frozen. . . . [and] the biting cold of the Manchurian winters far surpasses anything in other

parts of the world for similar latitudes. . . . The rich agricultural land . . . extends in a northerly direction to about 150 miles north of Harbin, the junction of the Manchurian and Siberian railways. The soil is certainly very rich. For miles and miles one travels through rich loamy soil, which alternates with rich chocolate soil. . . . If Manchuria were devoted to wheat-growing, then all other wheat-growing countries would have a formidable competitor."—J. B. Suttor, *Report on Manchuria, 1907* (*New South Wales Intelligence Department Bulletin no. 20, pp. 4, 5*).—"The great grain and bean producing area in the three provinces is contained in a strip of country, extending from the Treaty Port of Newchwang to 30 miles north of Pei-tuan-lin-tzu. To the west of this belt of arable land are the Mongolian steppes, all in grass, but fading away into sand as they merge in the great desert of Gobi; to the east is a hilly or mountainous region, in which the only large cultivated area is that watered by the River Hwei-fa, an affluent of the Upper Sungari; elsewhere the cultivated areas are small, such as those at Mergen, Tsi-tsi-har, the Valley of the Yen, and at Sansing, Ninguta, Hun-chun, and Omoso. . . . The Manchus are nearly all concentrated in towns; there are Manchu villages, but they are small, possibly their numbers amount to between 2,000,000 and 3,000,000, or about 20 per cent. of the population. The chief appointments in Manchuria are, without exception, held by Manchus, the descendants of the conquerors of China. In four centuries of ease and sloth they have lost the wild courage, the spirit of adventure that inspired them to overrun China, and the hardihood and skill at arms that brought success to their venture. But if they have lost the warlike instincts of their savage ancestors, they have retained all their pride, their ignorance, their cruelty, and their superstition. All these qualities a Manchu possesses far in excess of the liberal share that nature has bestowed on the Chinese. . . . Formerly the Manchus did not intermarry with Chinese women, but at the present time this custom is frequently broken through, though of course no Chinese would be permitted to marry a Manchu woman. . . . As regards the Chinese, few of the rich merchants make Manchuria their home. They come to the country for a definite number of years, and the same applies to their agents, managers, and staff generally, who leave their families in China. The settlers, on the contrary, have made the country their home. They are a fine, healthy, and vigorous race. Driven from China by poverty or famine, they regard Manchuria as a land flowing with milk and honey. . . . Whether it be the rigour of the climate which softens their manners, or the absence of the Chinese Mandarin, or living under the sway of an alien race which humbles their pride, or a combination of all these elements, it is difficult to say, but the people are far less hostile to the foreigner than those in China proper."—Great Britain, *Parliamentary Publications (Papers by Command: China, no. 1, 1890, pp. 34-37)*.—"Of the 17,000,000 inhabitants of the three provinces of Manchuria [in 1910] probably not more than ten per cent. are Manchus, and by Manchus I mean not merely the descendants of the various tribes which were welded into one kingdom by Nurhachu, but also the descendants of the inhabitants of the Northern province of Hei-lung-chiang, which was not brought completely under the sway of the present dynasty until 1671, as well as the descendants, called Han-Chün, of the northern Chinese, who

assisted the Manchus in the conquest of China. All these—Manchus, Han-Chün, as well as the descendants of Mongols, who also lent their aid—are known by the generic name of Ch'i Jên, or Bannermen. When the Manchus conquered the Chinese the great mass of the conquerors remained in China, where they were required to garrison their newly-acquired territory. . . . The descendants of those who stayed at home are scattered over Manchuria from the Yellow Sea to the Amur; but the vast majority are to be found in the two provinces of Hei-lung-chiang and Kirin. There are, however, certain places in Fêng-t'ien . . . where Bannermen predominate, and in the chief Government centres, especially the capitals of the three provinces—Mukden, Kirin, and Tsitsihar (Pu-k'uei)—they are comparatively numerous. Mongols are sparsely scattered about in the south-west of Hei-lung-chiang and in the north-west of Kirin, but ninety per cent. of the seventeen millions of Manchuria are composed of the descendants of Chinese who had already settled in Southern Manchuria during the Ming Dynasty, and of immigrants from the northern provinces of China, who are annually on the increase. . . . Intellectually, . . . the Manchu is no match for the Chinese. The former lacks the intelligence and capacity which are characteristic of the latter. . . . As merchant or farmer, too, the Manchu lacks the business qualities and industry of the Chinese. This intellectual inferiority is due, in the main, to the grant by the State [during the empire] to the majority of Manchus of mature age of a monthly subsidy which, while keeping them from actual want, . . . [precluded] that stimulus to earn a livelihood and better their condition which goes to make men and nations. In return for this subsidy the Government . . . [exact] a certain amount of military training from the recipients and their enrolment as reservists; but the system . . . [did] serious harm, for it . . . [prevented] the pensioner from leaving the neighbourhood of the pension office . . . unless, indeed, he . . . [chose] the army as a profession. . . . There . . . [were] for example, many Bannermen in the employ of foreigners at Peking; but, . . . [they were] as a rule, unwilling to take service elsewhere even at considerably enhanced pay. The Manchu language, unlike the Chinese, has no antiquity to boast of, and, at the present time, it is to all intents and purposes a thing of the past. . . . The administration of Manchuria was originally conducted on a purely military basis; but the southern province of to-day resembles in its form of government the provincial administration of China. There is a difference, however, and it is this. At Peking there are six Boards for the transaction, each in its own department, of all public business referred to them. They are: (1) Board of Civil Office, (2) Board of Revenue, (3) Board of Ceremonies, (4) Board of War, (5) Board of Punishments, and (6) Board of Works. With the exception of the first, the Board of Civil Office, these Boards have their counterparts of Mukden, and each of the five Boards, established in 1631, is presided over by a vice-president, who, in his own special department, is a colleague of the head of the province, the Governor-General."—A. Hosie, *Manchuria, v. 14, pp. 7, 22-28*.—There is also in Manchuria a Forestry Office at Harbin and a Mining Inspector's Office at Changchun. Presumably under the direction of Peking, these offices, however, are controlled by the Governor General of Manchuria, and all important negotiations regarding the affairs directed

by these offices are carried on at the Governor General's Yamen in Mukden."—T. F. Logan, *Manchuria, land of opportunities*, p. 8.

Early history.—"Unlike the Mongols, who have 'moved about after grass and water,' [the Manchus] have always been a settled people, who in ancient times dwelt during the cold season in holes excavated in the sides of dry banks, or in pits in the earth, and during summer in huts formed of young trees and covered with bark or with long wild grass. They have, unlike the Mon-

Suhmo Mo-hos, that member of the confederation whose territory lay immediately on the north of Corea and north-east of Liau East, established themselves as rulers over the whole of Manchuria Proper, over Liau East, and over a large portion of Corea. In 712, the then Whang-ti, or Emperor of China, conferred the title of Prince of Po-hae on the head of the family; but the immediate successors of this prince shook off even the form of vassalage, and by their conquest of Northern Corea and Liau East, assumed a position of hos-

MANCHUS

© Underwood & Underwood

gols, from the earliest periods been somewhat of agriculturists; like them they have always reared domestic animals. . . . In the 11th century before Christ this nation appeared at the court of the Chow dynasty as Sub-chin, and presented tribute, a portion of which consisted of stone-headed arrows. In the 3d century after Christ they reappeared as Yih-low. . . . In the 5th, 6th, and 7th centuries after Christ we find them under the names of Wuh-keih, and Mo-hos, still described as rude barbarians, but politically organized as a confederation of seven large tribes or seven groups of tribes. At length, in the beginning of the 8th century, a family named Ta, belonging to the

tility to the Whang-ti. Po-hae, the name adopted by the new rulers, became the name of the Manchu Nation; which under it for the first time takes a place in history, as constituting a civilized State with a centralized administration. . . . It was overthrown by the Ketans, . . . [either a Manchu or a Mongol tribe, who] took their rise in the valleys of the Hu-lan, a small northern branch of the Soongari. . . . The Ketans had possessed themselves of Eastern Mongolia, and been engaged in successful war on China before they, in 926, attacked the Po-hae state, which they speedily overthrew, incorporating into their own dominions all Manchuria Proper and the East of the Liau. Be-

fore the middle of the 10th century, they had conquered nearly all Mongolia and Northern China. . . . They assumed for their dynasty the name of Liau, that of the river which flows past this port. Under the eighth of the line, their power had sunk so much that it fell easily before the attacks of A-kuh-ta, the chief of a purely Manchu tribe or commune, the Neu-chins, whose original seat was the country between the Upper Soongari and the Hurka. The Neu-chins rebelled against the Ketans or Liaus in 1113. Within 15 years, they had possessed themselves of the whole of Manchuria, Mongolia, and Northern China, driving the Chinese Whang-ti to the south of the Great River, and themselves establishing a rival line under the name of Kin, or Golden; adopted because their own country Manchuria 'was a gold-producing one.' The Neu-chins or Kins were in their turn overthrown by the Mongols, under Ghenghis Khan and his immediate successors. Manchuria came under their power about 1217, Northern China, about 1233, and Southern China, about 1280, when they established—it was the first time the thing had happened—a line of non-Chinese Whang-tis in undisputed possession of that dignity. . . . The Mongol dynasty maintained itself in China for about 90 years, when (in 1368) the last Whang-ti of the line was driven to the north of the Great Wall by the forces of a Chinese rebel, who established himself at Nanking as the first Whang-ti of the Ming dynasty."—T. T. Meadows (quoted in A. Williamson's "Journeys in north China," v. 2, ch. 4).—Manchuria "is an agglomeration of petty Tartar or Manchu principalities, which were conquered one after another and welded into one kingdom during the sixteenth and seventeenth centuries by a Manchu chieftain named Nurhachu and his successors, who, pushing south and west from their ultimate capital, Mukden (lat. 41° 46' N. and long. 123° 37' E.), overthrew the great Ming dynasty and seated themselves on the throne of China at Peking in the year 1644, under the name of Ta Ching Ch'ao (The Great Pure Dynasty)."—A. Hosie, *Manchuria*, v. 14, p. 3.—See also CHINA: 1204-1736.

1689-1860.—Russian encroachments.—"When the Manchus were struggling with China the Russians were settling on the banks of the Upper Amur and in the neighbouring regions, which then constituted part of Northern Manchuria. This encroachment, which was naturally resented, gave rise to a conflict, which resulted in the Treaty of Nerchinsk in 1680, wherein the boundaries of the two Empires are laid down. . . . Notwithstanding the various discrepancies which occur in the texts of this Treaty, it may be assumed that the boundary of Russia and Northern Manchuria was intended to be the Argun and Gorbitza Rivers and the Yablonoi Mountains from the source of the latter rivers to the sea. . . . [The French text of] the Treaty of Aigun (Ai-h'un), concluded in May, 1858 . . . gives the Amur from the Argun River to the sea as the northern boundary of Manchuria. . . . By this Treaty, therefore, the whole of the country between the Yablonoi Mountains and the Amur fell to Russia, and the territory between the Ussuri and the sea was placed under the jurisdiction of both countries, pending, according to the French text, a delimitation of the frontier. . . . In November, 1860, and in accordance with Article IX. of the Treaty concluded at Tientsin on the 13th of June, 1858, a Supplementary Treaty was made at Peking and ratified at

St. Petersburg in December of the same year. . . . In virtue of this Treaty the boundaries of Russia and Manchuria were, in 1860, the Erguné (Argun) River on the west, the Amur to the Ussuri on the north, and a line from the mouth of the Ussuri to the mouth of the Tumén on the east. By Article I. of the Treaty of Aigun (Ai-h'un) the Amur, the Sungari, and the Ussuri Rivers were declared open to the navigation of Russian and Chinese vessels only—to the exclusion of the vessels of other foreign countries. . . . But since 1680 the whole coast line of Northern and Central Manchuria has bit by bit fallen into the hands of Russia, and the only seaboard now remaining to the whole of Manchuria lies between the Ya-lu River (*i.e.*, Korea) and the Chinese province of Chihli."—A. Hosie, *Manchuria*, v. 14, pp. 4-6.

1891-1899.—Trans-Siberian railway.—Russo-Chinese Treaty. See RAILROADS: 1876-1921; TRANS-SIBERIAN RAILWAY; CHINA: 1895.

1896.—Russian and Japanese occupation and influence.—"The treaty of St. Petersburg, December 26, 1896, gave the Eastern Chinese Railroad Company, whose stock could be held only by Russians and Chinese, the right to construct a line through Manchuria, to develop mines, to promote all other commercial enterprises, and to station troops in Manchuria 'to protect the railroad.' This virtually made Manchuria a Russian province."—A. J. Brown, *Mastery of the Far East*, p. 129.

1900-1901.—Chinese Boxer attack on Christians.—Russian retaliation.—Russian occupation of Niu-Chwang.—Russo-Chinese negotiations.—Distrust of Russian designs.—The Boxer outbreak in and around Peking in the early summer of 1900 (see CHINA: 1900) had its counterpart in Manchuria. On June 10, 1900, the Boxers began to drill in Mukden; on the 17th orders were given that two camps of imperial troops were to drill as Boxers. The families of the missionaries were sent away just in time for, on the last day of the month the burning of the mission buildings was begun. "The Lieutenant-Governor, Commander of the army, threw himself with zeal into the task of exterminating all trace of foreign existence. The soldiers were employed to help the Boxers, who, however, remained a separate organization, their numbers being swelled by all who were eager for loot. The Russians were completely taken by surprise. Many of the railway men were killed. A party of engineers fought their way north from Tieling, generously escorting a number of Catholics and a Protestant missionary. All the northern missionaries were helped to escape by the Russians. Parties of soldiers and Boxers were dispatched to city after city, town after town, and even to villages and glens. One after another every church, hospital, school, and foreign house was burned, and many Christians were killed. . . . After looting and confiscating all available Christian property, the Boxers had soon begun to seek new sources of gain. They blackmailed the merchants and wealthy men of city and country, levied taxes, interfered with trade, and took up an arrogant attitude to all. When the Governor-General's equipage met on the street some of their leaders with their mounted escort, he had to draw aside humbly to make room for them. Their claims for power and money grew till all Moukden trembled before them, and the country sighed for the old days of comparative prosperity and security. At the beginning of August, their ally the Lieutenant-Governor, went south with part of the army. . . . The Boxer power had now

lasted forty-one days in Moukden, and the Governor-General decided that this was long enough. A strong proclamation denouncing them was issued, which was received with relief by the people; and at the same time, on 11 August, the soldiers were commanded to turn on them, and kill every Boxer they could find. A good many were killed, many more fled from Moukden, and the rest were absorbed in the ordinary population. The Boxer Madness was at an end in Manchuria. . . .

"In August the Russians began slowly but steadily to move northwards, meeting with vigorous opposition from the Lieutenant-General and his troops. . . . At the same time another Russian force was moving down from the north. . . . In September Dr. A. Macdonald Westwater, [a missionary] of Liaoyang, accompanied the Russian army on its forward march, as a Red Cross surgeon. Knowing the country and people well, and having some previous acquaintance with the Russians, he was able to be of great use as an intermediary. When the army was encamped south of Liaoyang, he went forward . . . [and persuaded the authorities to] let the Russians enter quietly. Thus the city was saved. Moukden was unfortunately occupied by those same soldiers whose passions had been roused by helping the Boxers to kill and loot. Many of them had at the command of their officers turned their weapons on their quondam allies and looted and killed them in their turn; others had returned angry and rebellious after being defeated by the Russians. There was open conflict between the Governor-General and the Lieutenant-General, who was very indignant at the massacre of his friends the Boxers. Fearing for his life, Tseng Chi fled on 29 September, followed by most of the officials, when the Russians were within a few miles of the city. The consequences to Moukden were dire. The soldiers threw off all restraint, and all that night and all next day they pillaged and terrorized the defenceless merchants and people. . . . On the second evening they began to set fire to the shops they had looted; then hearing that the Russians were at the south gate, they fled precipitately by the north gates, leaving the most busy and prosperous streets of the city in flames, which were rapidly spreading. An advance party of three hundred Cossacks rode up to the south gate to reconnoitre, and finding it undefended, they entered and took possession of Moukden, their first work being to help to control and extinguish the fires. Had their arrival been delayed until morning, the soldiers would have continued their ruthless destruction, and half Moukden might have been burned. . . . The Russian Commander . . . set himself to restore order. Some days later the Russian armies from the north joined forces with those from the south, and through Manchuria there ran a line of Russian rule from Siberia to the sea."—D. Christie, *Thirty years in Moukden*, pp. 142-143, 140-153.—The retaliation of the Russians appears to have been simply ferocious. Professor G. Frederick Wright, who was travelling in Manchuria at the time, gives a sickening account of what he saw on the Amur, above Blagovestchensk, in a letter written, August 6, from Stretensk, Siberia, to the *Nation*, of New York. The Chinese fort at Aygun, on the Manchurian side of the Amur, began, without warning, on July 14, he writes, "to fire upon passing steamboats, and, on the 15th, fire was opened upon Blagovestchensk, and some Russian villages were burned opposite the fort. The actual injury inflicted by the Chinese was slight; but the terror caused by it was

indescribable, and it drove the Cossacks into a frenzy of rage. The peaceable Chinese, to the number of 3,000 or 4,000, in the city were expelled in great haste, and, being forced upon rafts entirely inadequate, were most of them drowned in attempting to cross the river. The stream was fairly black with their bodies. Three days after, we counted hundreds of them in the water. In our ride through the country to reach the city on Thursday, the 19th, we saw as many as thirty villages and hamlets of the Chinese in flames. One of them was a city of 8,000 or 10,000 inhabitants. We estimated that we saw the dwellings of 20,000 peaceable Chinese in flames that awful day, while parties of Cossacks were scouring the fields to find Chinese, and shooting them down at sight. What became of the women and children no one knew; but there was apparently no way for them to escape to a place of safety. On our way up the river for 500 miles above the city, every Chinese hamlet was a charred mass of ruins. The large village of Motcha was still smoking, and we were told that 4,000 Chinese had been killed. We do not mention these facts to excite prejudice against the Russian authorities or against the Cossacks. This work of devastation has not been ordered by those high in authority. It is rather the result of mob violence. . . . The wholesale destruction, both of property and of life, was thought to be a military necessity. The wives and children of the Cossacks were in terror."

Russian troops were poured into Manchuria in vast numbers, and however much or little there may have been of the Boxer movement, it was crushed with merciless rigor. A letter from the Manchurian treaty port of Niu-chwang, on the Liao-tung gulf, written August 13, to the *London Times* describes the Russian occupation of that town and region, in the previous week. After some 1,500 or 2,000 Chinese soldiers and civilians, in flight from the town, had been intercepted and killed, "the Russian general," says the writer, "was about to order a general assault on the town when the foreign residents interceded, as there were no longer any soldiers or 'Boxers' left. He declared his intention was to kill all, as it was impossible to distinguish between soldiers, 'Boxers,' and civilians. Some foreigners then went down into the city and brought up the principal merchants, who were given until 10 a.m. to deliver up all the guns in the town. This, of course, they could not and did not do, so some foreign residents offered to enter the city with the Russian soldiers, and guaranteed peaceful occupation. This offer was accepted, and the town was spared enormous loss of life, though there was a certain amount of looting, and a few people were bayoneted in the outlying houses. Outside the walls men, women, and children were killed, and from all sides came reliable reports of violation of women. There is no possible doubt about the truth of these reports. The Russians are carrying out a policy of destruction of property and extermination of the people. Kai-chau, the district city, 24 miles south of this port, and nearly all the villages have been burnt and the inhabitants killed. The soldiers, both infantry and Cossacks, have been allowed to do what they like for some days." The same correspondent goes on to say: "The Russians hoisted their naval flag over the Custom-house at 7.30 p.m. on August 4. Neither in the attack and bombardment of the town nor in hoisting their flag did they consult any of the foreign Consuls or the commanders of the two Japanese gunboats in port. Admiral Alexieff arrived on the 5th and

issued a circular announcing the occupation of the treaty port by Russian military forces." . . . The "one flag" seems to have been still waving over Niu-chwang as late as February 15, 1901, since a member in the British House of Commons, on that day, arraigning his government for want of vigor in China, said that "though British people traded with Niu-chwang to the extent of three millions sterling a year, the port was now under the civil and military administration of Russia alone. He should like to know what undertaking his Majesty's Government had obtained that Russia would speedily evacuate Niu-chwang, and that the administration of the port would revert to the hands of the Chinese Government."

A few days later, the under secretary of state for foreign affairs, Viscount Cranborne, said in reply to this statement: "We made proper inquiry from our representative, and he assured us that any agreement which exists between Russia and China in respect to Manchuria is in the nature of a 'modus vivendi, consisting merely in the simultaneous presence of the Russian and Chinese forces in Manchuria, and in order to prevent disturbances on their frontier. He assured us that the occupation of the railway is of a purely temporary character, and that, although a guarantee is expected by the Russian Government that upon their withdrawal the disturbances shall not break out again, yet that guarantee will not take the form of an acquisition of territory or of a virtual or actual protectorate in Manchuria. . . . In respect to Niu-chwang we have received assurances at least equal to those which have been given us in respect to the province of South Manchuria. We understand the Russians are prepared to restore Niu-chwang at the end of their occupation precisely to its former condition."

For the time being, however, the Russians seemed to have established in practice a very real protectorate over the province of Fêng-tien, in southern Manchuria, by an agreement between the Russian governor of the territory leased from China in the Liao-tung peninsula and the Chinese Tatar general of Fêng-tien, signed on November 11, 1900. The general terms of this agreement were reported late in December, and excited much uneasiness as to Russian designs. The full text was communicated to the London *Times*, in the February following, by its Peking correspondent, with the information that the Tatar general who signed it, in transmitting a copy to Li Hung-chang, "states that grief pierces his very soul, but what alternative has he?" The agreement required the Tatar general to disband his troops and disarm them, on account of the rebellions which had occurred among them; to deliver up all munitions of war and dismantle all forts and defenses, and to give full information of all important measures taken by him to a Russian resident who should be stationed at Mukden, with "general powers of control." Late in February, 1901, it was ascertained that the Russian minister at Peking, M. de Giers, was negotiating a more definite and binding convention relative to Manchuria with the Chinese imperial government, as represented by Li Hung-chang; and, on March 7, the Peking correspondent of the London *Times* telegraphed to that journal what claimed to be a translation of the full text of the treaty, as follows:

I. The Emperor of Russia, being desirous to manifest his friendly feelings, agrees to restore Manchuria completely to China without keeping in mind the fact of the recent warfare in that

province. The Chinese administration shall be restored in all respects to the "status quo ante."

II. China granted to the railway company, as stipulated in Article VI. of the Eastern China Railway Concession, the right of guarding the line with troops, but the country being still in disorder and the number of troops being insufficient, it has been found necessary to station a body of troops in the province, which will be withdrawn as soon as peace and order are restored and the provisions of the last four articles of the present convention are carried out.

III. In case of emergency, the Russian troops stationed in the province shall render all possible assistance to China to suppress any disturbances.

IV. The recent attacks against Russia having been conducted principally by regular troops, China agrees not to organize any army before the completion of the railway and the opening thereof for traffic. When China subsequently organizes her military forces, the number of troops shall be fixed in consultation with Russia. The importation of arms and ammunition into Manchuria is prohibited.

V. In order to safeguard the province, China shall immediately dismiss such Governors-General and high local officials as have committed improper acts in connexion with foreign relations against which Russia would protest. China can organize infantry and cavalry in Manchuria for police purposes, but the number shall be fixed in consultation with Russia. Artillery should be excluded, and arms given to no subjects of any other Power employed in connexion with the exercise of functions.

VI. China, as previously agreed, shall not employ the subjects of any other Power for training her naval and military forces in the northern provinces.

VII. In order to maintain peace and order, the local authorities, residing in the vicinity of the neutral zone provided for by the fifth article of the convention relating to the lease of the territory of Leao-tong, shall establish special regulations suitable to the circumstances, and shall relinquish the administrative autonomy of Kinchau, which is reserved to China by Article IV. of the special convention.

VIII. China shall not grant, without the consent of Russia, to any other Power or their subjects advantages relative to mines, railways, or other matters in the Russo-Chinese Frontier provinces—namely, Manchuria, Mongolia, Kashgar, Yarkand, Khotan, and Turkestan; neither shall she construct her own railways in those provinces without the consent of Russia. Leases of land outside Niu-chwang shall not be granted to the subjects of any other Power.

IX. China being under obligations to pay the war expenses of Russia and the claims of the various other Powers, the amount of Russia's indemnity, and the terms of payment and the security for it, shall be adjusted conjointly with the other Powers.

X. Indemnities shall be paid and compensation granted for the destruction of railway property and to the employés of the company. Losses accruing from delay in the work shall be adjusted between China and the railway company.

XI. When the indemnities for the various damages shall have been agreed upon between China and the company the whole or part of the amount of such indemnities should be met by advantages other than pecuniary compensation—that is, either by revision of the existing agreement relating to the railway or by the grant of new advantages.

XII. China shall, as previously agreed, grant to Russia a concession for the construction of a railway from the main or branch line of the Manchuria Railway towards Peking and to the Great Wall.

Notwithstanding the very positive agreement contained in the first article of this treaty, that the emperor of Russia will "restore Manchuria completely to China," the publication of its terms excited new and greater distrust of the designs and the action of the Muscovite power. It was seen that Chinese authority, for the time being, would be pushed out of Manchuria so completely, and that of Russia would be established so firmly, that any future restoration of the former was improbable, to say the least. Moreover, the entire exclusion of all people except Russians from any share in the development of Manchurian resources was exceedingly offensive to the money-making desires with which the whole western world is looking toward the great decaying empire of the East. That such an exclusion should extend beyond Manchuria, even to Mongolia, Kashgar, Yarkand, Khotan and Turkestan, as set forth in the above report of the pending treaty, was an idea at which capitalistic circles in Europe and America stood aghast. Very soon there was denial that the exclusiveness asked for by the modest Russian went farther than the bounds of Manchuria; but, even as thus limited, it roused strenuous protest from the press of the western world, if not from the governments.

1900-1910.—Russian occupation to the Russo-Japanese War.—Japanese occupation compared with Russian.—"The confusion caused by the Boxer uprising of 1900 afforded Russia a pretext for further aggressions. Asserting, and with reason, that foreign interests in Manchuria were imperilled, Russia sent troops into New-chwang and virtually assumed the government of all Manchuria. In a treaty with China, signed April 8, 1902, Russia solemnly agreed to evacuate Manchuria, except the leased Liao-tung peninsula, by October 8, 1903. [See also CHINA: 1901-1902; JAPAN: 1902-1905.] . . . The intermingling of the Chinese and the Manchus appears much more complete in Manchuria than in other parts of China, and the result is a virile type, physically vigorous and mentally alert. . . . In recent years the people of Manchuria have been overawed by the aggressive power first of the Russians, and later of the Japanese. Manchuria was helpless before the military strength of the Russian occupation prior to the Russia-Japan War. The common people cared little who their rulers were, knowing that they would get scanty consideration in any event, while the ruffled dignity of officials was smoothed by Russian gold. The Russians had greater tact in getting along with the Chinese than any other foreign people showed, and difficulties were seldom serious. When Japan drove Russia out of Port Arthur and southern Manchuria, the people simply exchanged one master for another. Many of their fields and villages were destroyed; but it was not the policy of either the Japanese or the Russians to molest the Manchurians unnecessarily, and as the contending armies required enormous food-supplies and tens of thousands of carts and laborers, the thrifty inhabitants took shrewd advantage of their opportunity and reaped rich profits from both sides with true Chinese impartiality."—A. J. Brown, *Mastery of the Far East*, pp. 131-132, 210.—"There is this thing to be said in

favour of the Russian occupation (of Manchuria); before the Russians came it was little more than a sterile waste; now [1910] money is poured into the country, and another ten years will probably reveal wonders.' When an Englishman or a Japanese of those days spoke well of the Russians, what he said was always true. The wonders revealed themselves before the ten years had passed. A marvellous development was soon in evidence all along the railway and especially a round Harbin. Lands hitherto lying waste were taken up and cultivated, and production increased by leaps and bounds."—*Economic history of Manchuria (Bank of Chosen, p. 37)*.

1905-1907.—Administration of Chao-Er-Sun.—Abolition of opium-smoking.—Educational reforms.—"The Russo-Japanese war seems to have awakened the Central Government somewhat tardily to the importance of Manchuria. For the first time a Governor-General of outstanding merit was appointed, not a Manchu, as always before, but a Chinese Bannerman, *Chao Er Sun*, one of the ablest men available and a notable financier. . . . *Chao Er Sun's* watchword might have been expressed as 'Progress, Efficiency, and Economy.' Scores of paid officials had little or no work to do; these he dismissed, and sought to gather round him men like himself, eager for good hard work. . . . One of his most striking reforms was the abolition of opium smoking. This vice had never been so common in Manchuria as in some parts of China, still there were a large number of smokers. . . . The cultivation of the poppy was illegal, but very lucrative. During the years since 1900 it had rapidly increased, some of those officials whose duty it was to prevent it receiving a share of the gains. . . . [But, owing to the vigorous action of the governor, cultivation of the poppy ceased and] Manchuria was one of the first provinces closed to Indian opium. . . . Education also received the new Governor-General's earnest care. Till now there had been no such thing as a Government school. . . . Several large boys' schools and one for girls were opened, professing all the modern subjects, tuition, books, and stationery being free."—D. Christie, *Thirty years in Moukden, 1883-1913*, pp. 197-200.

1905-1908.—Japanese occupation.—Treaty between Japan and China.—"Although it had several times previously been announced that Japan was fulfilling her treaty obligation, and had restored the part of Manchuria then occupied by Japanese armies to the exclusive administration of China, it was not until December, 1906, that Japanese troops were withdrawn from Moukden, Newchwang and other important places, and Chinese autonomy outwardly resumed. At that time Japanese had occupied southern Manchuria over two years, and the military authorities had used this period to establish Japanese in possession of all property formerly owned, occupied or claimed by the Russians; to occupy themselves much Chinese property to which the Russians never had asserted claim; to establish thousands of Japanese immigrants in the country by according to them more favorable treatment in comparison with Chinese or other foreigners; and to lay, by arbitrary

seizure, foundations for subsequent claims to valuable mines and concessions. This so-called evacuation was not made, however, until Japan had used her military control of the country to put pressure upon China with a view to firmly establishing Japanese interests there. The Komura-Yuan agreement was negotiated while Japan was in full control, which put China in the real attitude of bargaining to regain possession of her own territory. In scrutinizing this agreement it appears that in some important matters it is intentionally ambiguous. Japan probably did not then desire to appear to press China too severely, but refused to relax her hold until foundation for further negotiation was laid. This agreement was signed late in 1905, and by its terms Japan specifically agreed to begin evacuation of Manchuria immediately, and not to wait upon full expiration of the time limit (March, 1907) fixed by the Portsmouth treaty. [See also CHINA: 1905 (December).] But for another year after it was signed Japan retained her tight grip. The reason is obvious. During this period supplementary negotiations were progressing at Peking, and Japan was making the fulfillment of her promise a condition of China's yielding in other matters which Japan was pressing upon her. Late in 1906 the Peking Government sent Prince Tsai-chen to Manchuria to investigate conditions and report upon a plan to reorganize Chinese administration of the three provinces and consolidate Chinese power to resist Russian and Japanese aggression. In attempting to pursue this policy, Chao Ehr-sun, then Tartar General at Moukden, soon developed friction with the Japanese authorities. H. E. Chao seems to have been intensely anti-Japanese, and in dealing with the Japanese authorities was alternately swayed by dislike, which inclined him to be over-aggressive, and timidity, which made him too yielding. Upon representation of Japan at Peking, H. E. Chao was transferred to another post and Hsu Shih-chang was appointed. About the same time Tang Shao-yi [an enlightened official, who had studied at Columbia University] was appointed Governor of Feng-tien province . . . and from the time he arrived [1907] at Moukden he virtually had charge of relations between the Chinese and Japanese authorities. . . . [By 1908] outward evidences of Japanese occupation were less conspicuous. Japanese troops in the country had been reduced. . . . Moukden was the last important place evacuated, the troops being withdrawn from the city in April, 1907."—T. F. Millard, *America and the Far Eastern question*, p. 262.—See also U. S. A.: 1907-1917.

1905-1914.—Colonization by Koreans.—South Manchuria Railway Company.—“Along with these developments, Japanese officialdom, from its base in the Leased Territory and through the consulates and the Railway Company, went on effectively consolidating and extending its influence. The result is that the Japanese authority has become practically absolute, not alone in the Leased Territory and along the Railway Zone, but, indirectly, throughout all of Southeastern Manchuria; for, while the Chinese administration still functions, the Chinese officials submit to the exercise of a veto power by the Japanese which renders Japan for practical purposes the final authority in determining issues of importance. . . . Japanese colonization of Manchuria has not proceeded as rapidly as the Japanese government had hoped. The vast, wind-swept plains, fertile though they are, do not seem to attract the Japanese farmer. From the indications of ten years' experience, it

would seem that if Manchuria passes into the possession of Japan it will serve the purposes of an exploitation rather than of a settlement colony. When, however, we turn to the question of Korean immigration, we find a difference. We discover that, simultaneously with a considerable influx of Japanese into Korea, there is occurring a considerable exodus of Koreans, who, selling their property to the Japanese, leave their native land, cross the Yalu, and settle in South Manchuria. The Japanese government is officially encouraging this movement. At the same time, whereas it was formerly a common practice among the Korean immigrants in Manchuria to become naturalized as Chinese subjects, the Japanese authorities are now putting all possible obstacles in the way of their doing this. Naturally, the Japanese policy in this matter is based upon two principles: that Manchuria shall be colonized by Japanese subjects, and that Japan shall retain the allegiance of these emigrating and colonizing subjects. It might be added, also, that the idea is to be encouraged that South Manchuria is a projection of Japanese territory. These Korean farmers become real settlement colonists and contribute materially to the consolidation of the Japanese political hold upon the regions in which they establish themselves; at the same time their extraterritorial status as Japanese nations has contributed to the complication of the political situation. Thanks to their presence to the number of about 250,000, Japan can point out that she has the interests of some 350,000 of her subjects resident in Manchuria to look after. While strategically and politically Manchuria presents problems for each of the three countries whose territories converge on its borders, when considered as a field for colonization its importance commands more specifically the attention of China and Japan. Told, as we have been over and over, that Japan must have an outlet for her excess population and that Manchuria is the natural outlet, it is well to bear in mind that China also has a crowded population and that in the new condition in which the awakening Chinese people find themselves a movement toward the relief of the present congested conditions is bound to manifest itself in an attempt at redistribution. This will mean pressure outward. Manchuria is a natural outlet for the excess of China's population more truly than for that of Japan; and, as far as rights to this open field are concerned, China has the better claim. . . . Though Japan takes South Manchuria, and whether she leaves it open to Chinese immigration or whether she closes it, her occupation will not settle the question of population pressure; nor will it settle finally the question of political domination. Still less will it insure the peace of the Far East. . . .

“No account of Japanese activity in South Manchuria would be complete or do justice which failed to describe and pay tribute to the material successes which the conquerors have achieved—through an efficient administration—in the fields of industrial and commercial development. When Russia began her forward move in Manchuria, she leased the Liaotung Peninsula for a period of twenty-five years. The lease which passed to Japan would, therefore, expire in 1923, but it was subject to renewal. The railway agreements provided that China should have the right to buy the lines at the end of thirty-six years from 1903—which would be in 1939—or to secure the reversion, without payment, at the end of eighty years—or in 1983. The administration of the Leased Territory and the Zone is subject to the

Ministry of Foreign Affairs at Tokyo and is in the hands of a Governor-General with official headquarters at Port Arthur. The railway, which is now a government enterprise, is controlled by the Ministry of Communications in Tokyo. The Governor-General must be an officer of the Imperial army, and he has powers which not only include the administration of civil affairs and control of the railway guards but extend into the diplomatic sphere for purposes of negotiation with the Chinese authorities. . . . The most conspicuous evidences of Japanese constructive efficiency in Manchuria are to be found in the improving of the railways, the building of cities, and the developing of mining and commercial enterprises. First of all come the railways. Japan inherited from Russia about five hundred miles of track and equipment, including the main line from Changchung to Dairen and branch lines to Port Arthur, to the Fushun Mines, and to Newchwang. She has subsequently built the line from Antung—on the Yalu River—to Mukden, thus linking the Korean frontier with central Manchuria and establishing a direct line of communication between Japan and Europe. She has also participated in building the branch line from Changchun to Kirin, which she expects to extend to Hoiryong on the North Korean coast. The Japanese government controls the lines, though the actual administration is in the hands of the South Manchuria Railway Company. When the Company was organized it was authorized to engage in railway business, mining, marine transportation, sale on consignment goods shipped, warehousing, administration of land and construction on lands belonging to the railway, and supplementary enterprises; to make necessary provisions for education, health, and engineering works within the Railway Zone; and to collect fees (that is, taxes) from residents in the Zone. In short, the Railway Company has been, except in military affairs, the government of the Railway Zone, and it has in addition been the greatest factor in the economic life and development of the Leased Territory. The South Manchuria Railway Company has done a truly remarkable work. The railway is one of the best managed, to outward appearance at least, and best equipped in the Far East. Projecting Japan's political authority along a narrow line from a triangular base up into the center of Manchuria, the company has acted in most of the capacities of a colonial administration. It owns harbors and mines; it has built cities, towns, and settlements, and has installed in them various public works—even to parks and summer resorts; it has installed factories, gas, electric light and waterworks, telegraph, telephone, and tramway systems. It superintends immigration, builds hotels, hospitals, schools, and laboratories; it conducts a loan business—in connection with which it has made several loans to the Chinese for joint railway enterprises. Money has been lavished on the equipment. One of the criticisms of the railway has been that the equipment is above the standard for which the traffic calls, the implication being that Japan planned deliberately to make the valuation of her holdings so high that China could not, when the time should come, afford to buy out these interests. The direct result of the investment is that the railway furnishes excellent facilities for both freight and passenger traffic. The various enterprises of the company have contributed wonderfully to the prosperity of South Manchuria, have improved the export trade in the great Manchurian staple—beans—and have facilitated the building up of a

huge import trade, from all of which the profits have accrued especially to Japan. The Antung-Mukden line, one hundred and seventy miles long, is a beautiful piece of construction, representing great expense. Both as to roadbed and equipment it is far superior to the lines in Japan. Its completion brought Mukden within 1,582 miles, or less than three days' travel, of Tokyo. As soon as it had been finished the Japanese secured a reduction in the Chinese tariff rates in favor of goods imported by rail from south of the Yalu. This line, while affording a great convenience for passenger traffic, has appeared, so far, more valuable as a strategic than as an economic instrument. Its commercial value is, however, increasing. Persons who have occasion to use both the Chinese and the Japanese railways in South Manchuria regularly give praise and preference to the latter. Goods are said to be safer and to be handled more expeditiously, and *likin* and 'squeezes' are avoided on the Japanese lines. The tariffs are more dependable, and payments are made in gold yen or equivalents regularly listed at the stations.

"The Fushun Mines, which the Russians had developed to some extent and of which the Japanese took control after some controversy with the Chinese, are a very valuable adjunct to the railway and other enterprises. Here there exists a single vein of coal varying in thickness from 80 to 175 feet, about ten miles long and estimated to contain 800,000,000 tons of coal. The Japanese have installed the most up-to-date machinery and methods of mining and have brought the output up to over 3,000,000 tons per annum, which exceeds that of the best collieries of Japan. The coal is used throughout Manchuria, to some extent in Siberia, and is exported to Chinese ports, the Philippines, and even as far as Singapore and India. The mines employ a great number of Japanese-skilled and Chinese unskilled laborers. About the pit mouths the Railway Company has built a model city. At Pensihiu, nearer the Yalu, both coal and iron mines are being developed: In co-operation with the Yokohama Specie Bank and the Mitsui Bussan Kaisha, which have established banking houses and a ramification of trading facilities throughout the region, the Railway Company has become the mainspring of the economic awakening of South Manchuria."—S. K. Hornbeck, *Contemporary politics in the Far East*, pp. 269-276.—See also CHINA: 1005-1009.—"As the Japanese military grip was relaxed, Chinese administrative processes gradually resumed their functions, and now perform ordinary governmental duties throughout the country with some limitations and exceptions. But these limitations and exceptions, when examined, reveal that Manchuria still [1914] is far from being restored to the exclusive administration of China. Japanese garrisons remain at Antung; at the Fu-Shun, Pen-shui-hu and other mines; and in Chien-tao. Japanese troops (railway guards) are garrisoned along the railways and at all railway stations and settlements. Japan also has covered the country with a web of consulates. In the Japanese sphere, there is a consulate-general at Moukden, consulates at Kirin, Newchwang and Antung; consular agencies at Liao-yang, Tsinmintun, Fakumen, Tieling, Kwang-chengtze, Feng-wang-cheng and Kaiping. In the Russian sphere, Japan has a consulate-general at Harbin, and consular agencies at Tsitsihar and Manchuli. At most places where Japan has established a consular representative also is a consular guard, which means that small garrisons thus are distributed over the country. There is

no actual need for these troops. They are not considered necessary by British, American, German and other foreign governments which have consulates in Manchuria."—T. F. Millard, *America and the Far Eastern question*, pp. 259-263.

1907-1922.—Changes in administration.—"The administrative system of China in Manchuria has undergone frequent changes in recent years. In 1864 a system was instituted by which Mukden, Kirin, and Amur each had a military governor vested with complete authority, both civil and military. In 1897 the three provinces were placed under a governor-general with a civil governor attached to each."—*Economic history of Manchuria (Bank of Chosen, p. 11)*.—"In 1907 another change was made, and for the first time in the history of the 'Three Eastern Provinces' a single Viceroy was appointed with authority over the three Governors, chiefs of the provincial organizations. An effort was made with satisfactory results to remodel the old administrative machinery. The first Viceroy and the Governor of Fengtien province, who were responsible for this endeavor, were, however, greatly hampered by the lack of well-trained and progressive men. There was, undoubtedly, speculation and waste, even under their administration, and a close investigation would probably reveal numerous instances of corruption and incompetence. An honest and sincere effort, however, is now being made to overcome these defects and it is safe to say that Manchuria to-day is more efficiently governed than any other portion of the Chinese Empire. The last Tartar General of Fengtien, predecessor at Mukden of the first Viceroy, gave his Province probably the first two years of fairly honest government in the history of Manchuria."—G. H. Blakeslee, *China and Far East*, pp. 139-140.—"Since 1916 [written in 1922] the three provinces have been separately governed, each having a *Tuchun* (Military Governor) and a *Shengchang* (Civil Governor). At present, however, these two offices are vested in one person for Mukden and Amur Provinces."—*Economic history of Manchuria (Bank of Chosen, p. 11)*.

1910.—Russo-Japanese convention. See JAPAN: 1905-1914.

1910-1911.—Plague.—"During the winter of 1910-11 Manchuria was swept by an epidemic of pneumonic plague, of such a virulent and deadly type that it recalled the traditions of the Middle Ages, the Black Death which decimated Europe, the Great Plague of London. . . . This was not bubonic plague, and its spread had no connection with rats and fleas. . . . This was the first time for centuries that there had been in the world a serious outbreak of pneumonic plague, independent of the bubonic variety. Its specially marked feature was its unvarying fatality: 43,042 cases are recorded, and 43,042 deaths. There was no authenticated case of recovery."—D. Christie, *Thirty years in Moukden*, pp. 234, 235.

1918.—Japanese troops in Manchuria.—Allied operations against Bolsheviki in Siberia. See WORLD WAR: 1918: III. Russia: e, 1; SIBERIA: 1917-1919.

1919-1923.—Extent of Japanese jurisdiction.—Foreign trade.—Railway mileage.—Status of Chinese eastern railroad.—"The Japanese jurisdiction in Manchuria is limited to 1,300 square miles, known as the Leased Territory in the Kwantung Peninsula, and the South Manchuria Railway Zone of 100 square miles. This Japanese juris-

isdiction is confined to civil administration in the Leased Territory, and to railway guard, police and postal service in the Zone. . . . The Leased Territory is divided for local government purposes into three civil administration districts with headquarters at Dairen, Port Arthur and Chinchow. Port Arthur and Dairen are partly self-governed, having been raised to municipalities electing their mayors and counsellors, among whom, at Dairen, there are many prominent Chinese. The Leased Territory is a 'free zone' and consequently no duty is levied on goods imported for consumption within it; but articles passing the frontier into Manchuria are subject to the Chinese tariffs. The entire system for the administration of the customs is in the hands of the Chinese. . . . With the development of the port of Dairen, the gateway to Manchuria, the foreign trade of the country has grown apace. Three years after the Russo-Japanese War, when Dairen and Antung were opened to commerce, the total trade reached \$40,000,000. In the first year after the close of the European War it had risen to nearly \$500,000,000. . . . More than 2200 miles of railway are now in operation in Manchuria. These lines are as follows: South Manchuria Railway—686 Miles; . . . Chinese Government Railways—522 Miles; . . . Railways Under Russo-Chinese Management—1,078 Miles. . . . For the purpose of providing long-term capital to develop the country, there have been organized the Oriental Developing Company, the Eastern Enterprise Company and the Manchurian Enterprise Company. These financial institutions make loans against lands and buildings."—T. F. Logan, *Manchuria, land of opportunities*, pp. 9, 55, 61, 67.—"Since the Russia-Japan War an anomalous condition has prevailed. Theoretically, Manchuria remains [written in 1919] a part of China. Its officials are appointed by the government of China, and are supposed to be amenable to it. Practically, the Viceroy and his subordinates are in a very embarrassing position. They are expected by the Peking government to rule the country; but north of Chang-chun the Russians, until the chaos which followed the revolution of 1917 weakened their hold, were in possession of the railway and all the leading cities en route. . . . Both Russians and Japanese do as they please in their respective territories, with little regard for the wishes of the Chinese officials. It is true that their jurisdiction is technically limited to a narrow strip on each side of the railway, but as that railway is the one thoroughfare of the country along which all streams of trade and travel flow, and in which practically all the activities of Manchuria center, the limitation is more nominal than real, and a Chinese magistrate who acted on any other assumption would quickly find himself in hot water."—A. J. Brown, *Mastery of the Far East*, pp. 213-214.—See also JAPAN: 1921.

"According to news from Moscow, the Bolshevik Government is about to recover control of the Chinese Eastern Railroad, built by the Czar's Government a quarter of a century ago. If the Moscow version is accurate, this is probably the most satisfactory possible solution of one of the minor complications of Far Eastern economic politics. Under a treaty made with China in 1896, Russia built the railroad; China supplied the right of way, and received her reward in the enormous economic development of Manchuria; Russia paid for the building of the road, and for twenty years paid operating deficits due to the fact that it was used as an instrument of political expansion and not as a business enterprise. But the money was lent by France; and when various Siberian

Governments followed the Imperial Government into collapse, it was the French interests in control of the Russo-Asiatic Bank, holding company for the railroad, which virtually directed its policy. At the Washington conference last Winter [1922] the Chinese came forward with a proposal that they be allowed to buy the road with a new bond issue. This provoked no enthusiasm at all among the men whose money was in it, and who were at last beginning to see a chance of getting some of it back under the competent management of Basil Ostroumoff. Chinese troops had taken over the work of 'guarding' the railroad through most of its length; and they were the soldiers of Chang Tso-lin. His influence compelled the addition of a considerable number of Chinese to the administrative staff. . . . A technical committee appointed by the conference recommended the creation of an international committee of finance which should hire guards and have general control of the railroad. This plan was ruined by Chinese opposition, . . . and the interallied committee which had given the road some protection since 1919 was dissolved last Autumn. Accordingly, the Russo-Asiatic Bank interests seem to have decided to come to terms with Moscow, and the arrangement now concluded virtually restores the conditions existing before the revolution. That is to say, the Russian Government controls the road, and the French are apparently to get interest on their money. China has a minority interest on the Board of Directors, which is as much as China can expect. . . . The road is more important as the shortest outlet for inner Siberia than as the main line of Manchuria. In any case, China has the treaty right to buy it back, if she can, in 1933, and will acquire the title automatically in 1977."—*New York Times*, March 12, 1923.

MANETHO, List of.—"Of all the Greek writers who have treated of the history of the Pharaohs, there is only one whose testimony has, since the deciphering of the hieroglyphics, preserved any great value—a value which increases the more it is compared with the original monuments; we speak of Manetho. Once he was treated with contempt; his veracity was disputed, the long series of dynasties he unfolds to our view was regarded as fabulous. Now, all that remains of his work is the first of all authorities for the reconstruction of the ancient history of Egypt. Manetho, a priest of the town of Sebennytus, in the Delta, wrote in Greek, in the reign of Ptolemy Philadelphus, a history of Egypt, founded on the official archives preserved in the temples. Like many other books of antiquity, this history has been lost; we possess now a few fragments only, with the list of all the kings placed by Manetho at the end of his work—a list happily preserved in the writings of some chronologers of the Christian epoch. This list divides into dynasties, or royal families, all the kings who reigned successively in Egypt down to the time of Alexander."—F. Lenormant, *Manual of ancient history of the East*, v. 1, bk. 3, ch. 1, sect. 2.—See also **EGYPT**: Historical antiquity; **HISTORY**: 14.

MANHATTAN BRIDGE. See **NEW YORK CITY**: 1867-1915.

MANHATTAN ISLAND, island at the head of New York bay, forming the borough of Manhattan of Greater New York. It has a length of thirteen and one half miles, a maximum width of two and one quarter miles, and an area of twenty-two square miles. Its population, in 1922, was 2,271,892.

Aboriginal people and name.—"The earliest notice we have of the island which is now adorned by a beautiful and opulent city is to be found in Hudson's journal. 'Mana-hata' is therein mentioned, in reference to the hostile people whom he encountered on his return from his exploring of the river, and who resided on this island. De Laet . . . calls those wicked people Manathans, and names the river Manhattes. . . . Hartger calls the Indians and the island Mahattan. . . . In some of the early

transactions of the colony, it is spelled Monhattoes, Munhatos, and Manhattoes. Professor Ebeling says, that at the mouth of the river lived the Manhattans or Manathanes (or as the Englishmen commonly called it, Manhados), who kept up violent animosities with their neighbours, and were at first most hostile towards the Dutch, but suffered themselves to be persuaded afterwards to sell them the island, or at least that part of it where New York now stands. Manhattan is now the name, and it was, when correctly adopted, so given by the Dutch, and by them it not only distinguished the Indians, the island and the river, but it was a general name of their plantations. . . . Mr. Hecke-welder observes that hitherto all his labours had been fruitless in inquiring about a nation or tribe of Indians called the 'Manhattos' or 'Manathones'; Indians both of the Mahicanni and Delaware nations assured him that they never had heard of any Indian tribe by that name. He says he is convinced that it was the Delawares or Munseys (which last was a branch of the Delawares) who inhabited that part of the country where New York now is. York Island is called by the Delawares to this day [1824] Manahattani or Manahachtanink. The Delaware word for 'Island' is 'Manatey'; the Munsey word for the same is 'Manächtey.' . . . Dr. Barton also has given as his belief that the Manhatta were a branch of the Munsis."—J. V. N. Yates and J. W. Moulton, *History of the State of New York*, v. 1, pp. 223-224.

MANI, or Manes (c. 216-c. 277), Persian religious philosopher. Claimed divine inspiration and founded the sect of the Manicheans; crucified by order of the Persian king. See MANICHEANS.

MANICHEANS.—"A certain Mani (or Manes, as the ecclesiastical writers call him) . . . grew to manhood under Sapor, exposed to . . . various religious influences. . . . With a mind free from prejudice and open to conviction, he studied the various systems of belief which he found established in Western Asia—the Cabalism of the Babylonian Jews, the Dualism of the Magi, the mysterious doctrines of Christians, and even the Buddhism of India. At first he inclined to Christianity, and is said to have been admitted to priest's orders and to have ministered to a congregation; but after a time he thought that he saw his way to the formation of a new creed, which should combine all that was best in the religious systems which he was acquainted with, and omit what was superfluous or objectionable. He adopted the Dualism of the Zoroastrians, the metempsychosis of India, the angelism and demonism of the Talmud and Trinitarianism of the Gospel of Christ. Christ himself he identified with Mithra, and gave Him his dwelling in the sun. He assumed to be the Paraclete promised by Christ, who should guide men into all truth, and claimed that his 'Ertang,' a sacred book illustrated by pictures of his own painting, should supersede the New Testament. Such pretensions were not likely to be tolerated by the Christian community; and Manes had not put them forward very long when he was expelled from the church and forced to carry his teaching elsewhere. Under these circumstances he is said to have addressed himself to Sapor [the Persian

king], who was at first inclined to show him some favour; but when he found out what the doctrines of the new teacher actually were, his feelings underwent a change, and Manes, proscribed, or at any rate threatened with penalties, had to retire into a foreign country. . . . Though the morality of the Manichees was pure, and though their religion is regarded by some as a sort of Christianity, there were but few points in which it was an improvement on Zoroastrianism."—G. Rawinson, *Seventh great oriental monarchy*, ch. 4.—First in Persia and, afterwards, throughout Christendom, the Manicheans were subjected to a merciless persecution; but they spread their doctrines, notwithstanding, in the West and in the East, and it was not until several centuries had passed that the heresy became extinct.—Based on J. L. Mosheim, *Christianity during the first 325 years, third century*, lect. 39-55.—See also PAULICIANS; ALBIGENSES; PRISCILLIANISM.

MANIFESTATION, Aragonese process of severity for national liberty. See CORTES: Early Spanish.

MANIKALAND, a region in the southeastern part of Africa, part of the territory being in Rhodesia and part in the section claimed by the Portuguese.

MANILA, capital and principal port of the Philippine islands, on the east shore of Manila bay, on the island of Luzon. (See PHILIPPINE ISLANDS: Map.) The population was 283,013 in 1918. The Pasig river divides the city into two parts, the old walled city and the suburbs. Manila was originally founded by Legaspi in 1571. A year later it was attacked and nearly conquered by Chinese pirates. An era of prosperity set in early in the seventeenth century when Manila was considered the commercial metropolis of the Far East. Before the close of the century, however, running parallel with the decline of Spanish power and the growth of Dutch commerce, this prosperity gradually waned and did not pick up again under Spanish rule. Especially disastrous too, were the earthquakes of 1645 and 1863. The city was captured by the English in 1762, but was, however, returned to Spain by the Treaty of Paris (1763). Late in the nineteenth century Manila became the center of revolutionary agitation against Spanish sovereignty.—See also PHILIPPINE ISLANDS: 1564-1572; 1574; 1600; 1600-1663; 1700-1800.

MANIOTO, or Mayno, South American Indian tribe. See ANDESIANS.

MANIPULI, name of Roman company of soldiers. See LEGION, ROMAN.

MANITOBA: Geographical description.—"The original area of the Province of Manitoba was 13,000 square miles. There have been two extensions since. In 1881 the western boundary of the province was carried from the 100th meridian of west longitude to its present position [the eastern boundary of Saskatchewan], and in 1912 a large part of the Territory of Keewatin was added,

the boundaries of Manitoba being then carried north to the 60th parallel, and northeast to where the 89th meridian meets the southern coast-line of Hudson Bay. The present area of the province is 251,832 square miles. [While Manitoba is best known for its hard wheat and other grains, stock raising and dairying, lumbering, mining and fishing and the fur trade are all industrially important.]—*Manitoba, the keystone province of the Canadian confederation*, pp. 15, 20.—See also NORTHWEST TERRITORY; CANADA: Agriculture; U.S.A.: Economic map.

1811-1835.—Origin of province.—Troubles of early settlers.—In the beginning of the nineteenth century, James Douglas, Earl of Selkirk, a philanthropist, who believed that emigration was the best remedy for the economic ills from which the Old World was suffering, conceived the idea of planting a colony on the Red river. He was associated with the Hudson's Bay Company, and from its agents had learned of the great fertility of the region in which he proposed to make his great experiment. In pursuance of his project "Lord Selkirk proceeded to purchase a large quantity of the stock of the Hudson's Bay Company. Up to May, 1811, he or his relatives had acquired some £35,000 out of a total capital variously stated as from £105,000 to £180,000. Having finally and legally purchased so large a portion of the stock, a general court of proprietors was called to consider his proposition to settle, within a limited time, a large colony—assuming the expense of transport, of outlay for the settlers, of Government, of protection, and of quieting the Indian title. . . . The district thus disposed of was called Assiniboia. . . . It is variously estimated to have been from 75,000 to 116,000 square miles in extent. It included the valleys of the Red River and Assiniboine."—G. Bryce, *Manitoba, its infancy, growth and present position*, pp. 149-151.—Part of this great tract is now in the United States, the rest forms part of the present province of Manitoba. In 1811, 1813 and 1815, Scottish and Irish colonists were sent out to settle the land, and from the first faced discouragements which would have dismayed any less hardy pioneers. They were brought into the country by way of James bay, which they reached in the early autumn, and each contingent was compelled to winter on the Nelson river, and make its way across the country to the Red river in the following autumn. The first three winters were spent at Pembina, seventy miles south of the proposed settlement, partly at the insistence of the North-West Company's employees. Quarrels between the fur companies obstructed the growth of the colony, and it was not until 1820, that even a semblance of prosperity began to give hope to the settlers. In 1821 a party of Swiss arrived; but they were unsuited for pioneer life and a few years later moved away to the United States. In 1821, when the fur companies amalgamated, the population of the settlement was "about five hundred. . . . A number of enterprises were undertaken, in order to provide employment for the colonists. . . . [They were unsuccessful, and] these dismal failures placed an undesired stigma upon the character of the soil, climate and resources of Assiniboine. It took more than fifty years of subsequent effort to remove this impression, [an impression which was sedulously cultivated by the Hudson's Bay Company]."—G. Bryce, *Lord Selkirk's colonists*, pp. 167, 176.—The control of the colony was in the hands of the founder and his executors until 1823, when the government was transferred to the Hudson's Bay Company, which repurchased the land in 1835.

1835-1871.—Government by Hudson's Bay Company.—"For more than twenty years the colony had existed almost without laws, rulers, or protectors; but . . . [in 1835] the Hudson's Bay Company thought it time to adopt some system whereby law and order could be more effectually maintained. Its first step towards this end was to appoint a new Council of Assiniboia in which the people of the colony would have a larger representation and to empower this council to make a simple code of laws, to establish courts of justice, and to appoint a constabulary force for the maintenance of order. . . . Accordingly new councillors . . . were nominated and commissioned by the company's executive committee in London; and these, with the councillors chosen from the company's officials, were to constitute the council of the governor-in-chief. It was a legislative body, having power to make laws in criminal as well as civil matters; and it was also a judicial body, inasmuch as it might sit as a court of appeal from decisions made in the magistrates' courts. The new council met for the first time on February 12, 1835. . . . In spite of defections and drawbacks of various kinds, the population of the colony increased. The census of 1840 showed the total population to be 4,704, the number of Protestant families being 257 and the number of Catholic families 488. . . . The census of 1849 shows that there were 745 dwelling houses in the colony, 7 churches, 12 schools, 2 watermills, and 12 windmills. The settlers . . . [were fairly well supplied with stock] and they had 6,320 acres of land under cultivation."—G. Bryce, *Lord Selkirk's colonies*, p. 167.—"There was a bad flood in the spring of 1852 . . . [which lasted from May 7 to June 12]. About 3,500 people had to leave their homes and flee to the open country, and [wheat could not be planted]. In 1861 there was another flood, although it was not so destructive as that which devastated the settlement nine years earlier. . . . [In 1865 an epidemic of typhus came in the wake of immigrants by way of James bay; in 1865 grasshoppers appeared and worked havoc until 1867 when they disappeared, and all these hardships did not help to make the colonists more satisfied with the rule of the Company. In spite of obstacles new settlers appeared from time to time, from Canada and the United States, and dissatisfaction showed itself more strongly among these newcomers] who had been accustomed to self-government, than among the old settlers, who had passed most of their lives in the colony."—F. H. Schofield, *Story of Manitoba*, pp. 197-198.—"In 1867 Canadian patriots established the Dominion of Canada, and at once a cry was raised for . . . [Canadian] rights in the west. A determined stand was now made, and most extraordinary stories were told in England before a Committee of the House of Commons, showing that the country was little better than an iceberg. In 1868 Bishop Taché published his sketch of the North-West, and he, too, like the Hudson's Bay Company, looked upon the country as scarcely suited for civilized man. Its rivers were unsuited for navigation, and its climate hyperborean. Not one section [of the land which Lord Selkirk had said was capable of supporting 30,000] is spoken of as being suited to a farming community."—J. Macoun, *Manitoba and the great North-West*, p. 453.

1869-1870.—Purchase by Canadian government.—First Riel rebellion.—Creation of province of Manitoba. See CANADA: 1869-1873.

1871-1883.—Organization of government.—Development of communications.—Land "boom."—

"Close in the wake of Wolsey's Expedition, there arrived on the 2nd of September, Adams G. Archibald [of Nova Scotia], the newly-appointed Governor of the new Province of Manitoba. The organization of his government began at once. . . . The Legislative Council . . . of seven members, was appointed, and electoral divisions for the election of members to the Legislative Assembly were made to the number of twenty-four—twelve French and twelve English. The time for the opening of Parliament was the spring of 1871. . . . During the first session certain elementary legislation was passed including a short school act. There was yet no division of parties, and a sufficient cabinet was chosen by the Governor. Thus . . . Manitoba—the successor of our Red River Settlement—had conceded to it the right of local self-government. [The legislative council was abolished in 1876.]—G. Bryce, *Lord Selkirk's colonists*, pp. 307-308.—"When the West became part of the Dominion of Canada, the Indians had to be dealt with justly, the Indian and the half-breed titles to land had to be provided for, the prairies had to be surveyed, roads had to be made, and law and order had to be maintained. First of all, communications had to be established. In 1871 a tri-weekly stage line under contract with the government began running between Abercrombie, Minn., and Winnipeg. In 1877 it became a daily service. In 1871 a telegraph line from Pembina to Winnipeg was opened; thereafter the little outpost at the junction of the Red and the Assiniboine was daily in touch with Ottawa and with the rest of the world. In 1872 the . . . [steamer "Selkirk," appeared on the river, and] meanwhile the Dawson route, . . . from Thunder Bay, . . . to Winnipeg, was opened up. By 1875 a considerable number of home-steaders from Eastern Canada had come to Manitoba. . . . The Mennonites, who came in 1875, were the first foreign settlers. In the following year came the vanguard of the Icelandic settlers. The first train over the first railway to be operated in Manitoba, which was called the Pembina branch, reached St. Boniface, across the river from Winnipeg, on December 7, 1878; it had made the run from Emerson"—*Manitoba, the keystone province of the Canadian confederation*, pp. 17-10.—"The growth from straggling settlements with 12,000 inhabitants to a province of more than 60,000 had taken place in scarcely a decade, despite an isolation unbroken except by the 'prairie schooner' or the river steamboat. . . . [By 1878 settlement had spread westward even as far as Edmonton.] 'At the close of 1870,' says Begg, 'farm houses and cultivated fields were in sight all along the main road for 250 miles west of Winnipeg.'"—C. Martin, *Political history of Manitoba* (A. Shortt and A. G. Doughty, ed., *Canada and its provinces*, v. 19, p. 110).—"The rapid increase in the population . . . and the consequent increase in . . . capital and the amount of business transacted throughout the country resulted in prosperity . . . [which led to speculation; and] culminated in 'the boom' of 1882. A mania for buying and selling real estate seized the people. The prices of lots in the city of Winnipeg [and the smaller towns] were forced up to many times their real value. . . . Lots were sold in towns which never existed save on paper. A similar unwarranted inflation pervaded all departments of business. It could not last, and after a few months the crash came . . . [and many] woke to find themselves ruined. During 1883 and a few of the succeeding years business in Manitoba was at low ebb, and it was a long time before the country recovered from the disastrous effects

of 'the boom.'"—F. H. Schofield, *Story of Manitoba*, v. 1, p. 384.

1871-1912.—Disputes with Dominion government.—Settlement of boundaries.—"Almost from the organization of the Province, the relations of Manitoba with the Dominion government were complicated by problems relating to railways, the public schools, finances and boundaries. In the case of the railways, the complication was caused by the federal policy that 'no charter for a line exclusively within the Province of Manitoba should be granted by its Legislature' without the previous assent of the Dominion government. . . . When the incorporation of the Manitoba South-Eastern Railway by the provincial legislature was actually disallowed in 1882 by the governor-general in council because it contravened existing federal contracts . . . [energetic protests were made]. 'The monopoly clause' . . . in the Canadian Pacific Railway contract of 1880, precluding for twenty years competition except by 'such line as shall run south-west or to the westward of south-west'—together with the 'land-lock' occasioned by the granting to that company of alternate sections for twenty-four miles on either side of the railway, . . . [had already become topics of heated discussion]. 'Railway Policy' became a party issue, and parties began to conform more rigidly to the exigencies of federal politics. . . . [In 1888, however, 'Disallowance' of railways] was abolished by the surrender of the offensive 'monopoly clause' by the Canadian Pacific Railway Company. . . . [The public school question came to the front, when] an agitation for non-sectarian public schools and a government department of Education to replace the cumbersome dual board of 1871 . . . [was] organized in 1876 under inspiration from Ontario. . . . [The summary readjustment of the board of education averted conflict, and the system] of public schools in Winnipeg, controlled by a board of elected trustees and supported by extensive powers of taxation, appointment, and inspection, proved sufficiently satisfactory to keep the 'school question,' for twelve years, from the arena of provincial politics. . . . [Immigration from Ontario brought reinforcements for the agitation against separate schools. In 1890 they were abolished by the Public Schools Act, and in 1896 the whole matter had become a federal question, and the chief issue in Dominion politics. (See CANADA: 1890-1896.) The Public Schools Act was followed by the abolition of the use of French as an official language. The financial problem known as 'better terms,' arose from the fact that the Dominion had actually bought the territory of which Manitoba formed part. When the Province was created, her public lands were withheld, and in lieu thereof she received certain annual sums to be applied on the budget. The Province had little or no revenue from other sources, for the crown lands within its borders, the minerals, the timber, and the fisheries were all controlled by the Dominion.] From the organization of the Province the agitation for 'better terms' was almost continuous. . . . As early as 1873 it was contended that Manitoba 'should possess a seaport on Hudson Bay and a lake port on Lake Superior.' . . . [Various increases were made in the annual subsidy, and in 1881] the original boundaries, comprising less than 13,500 square miles were extended more than 100 miles to the westward, eastward to the undefined boundary of Ontario, and northward by more than 150 miles, the new boundaries comprising in all an area estimated at more than 150,000 square miles. It was found, however, that the final settlement of the eastern boundary with

Ontario left Manitoba with less than half that area. . . . [In 1883 the two Provinces came into collision over some of the disputed area, but the matter was submitted to the Privy Council, and was decided in favor of Ontario. Agitation continued, however, until 1912 when the boundary was extended to Hudson bay. (See CANADA: 1912.)] In right of this grant Manitoba extended full legislative authority over a new district estimated at 106,304,000 acres, extending from the northern boundary of the old province to the 60th parallel of north latitude, and from the eastern boundary of Saskatchewan to Hudson Bay and a line drawn from the coast at the 89th meridian of west longitude to the eastern extremity of Island Lake and the north-eastern extremity of the old province. There was a littoral on Hudson Bay of five hundred miles."—C. Martin, *Political history of Manitoba* (A. Shortt and A. G. Doughty, ed., *Canada and its provinces*, v. 19, pp. 110, 112, 124-125, 133-134, 137).

1876-1912.—Growth of grain and cattle trade.—The beginning of the great grain trade of Manitoba was made in 1876, when in spite of the ravages made by grasshoppers a small shipment was made to Toronto. In 1877, the first shipment of Manitoba wheat was made to Great Britain, and the following year 35,000 bushels were exported. "As early as 1881 grain commission houses had been established in Winnipeg. In 1883 an attempt was made to organize the trade; but this was not successful, and it was not until the crop of 1887 was ready for market, that a grain exchange was successfully organized. . . . From 1887 onward, there was a steady increase in the export trade. . . . At the end of 1888 there was a well established inspection department, a grain exchange, . . . elevators at all important points in the Province, and a steadily growing activity. . . . [In 1887, the whole crop of the year was under 13,000,000 bushels.] In 1912 about 400,000,000 bushels were traded in options through the grain exchange clearing house, and the cash grain exchange business was the largest on the continent of America. . . . The cattle trade has formed one of the great enterprises of Manitoba. When the second Riel rebellion broke out in 1885, cattle were so scarce in Manitoba that it was necessary to bring in supplies from eastern Canada and the United States to supply the troops with necessary meat. Between the years 1885 and 1908, the export trade in cattle of western Canada reached its maximum, namely 90,000 head."—F. H. Schofield, *Story of Manitoba*, v. 1, pp. 399-401.

MANORS.—"The name manor is of Norman origin, but the estate to which it was given existed, in its essential character, long before the Conquest; it received a new name as the shire also did, but neither the one nor the other was created by this change. The local jurisdictions of the thegns who had grants of sac and soc, or who exercised judicial functions amongst their free neighbours, were identical with the manorial jurisdictions of the new owners. . . . The manor itself was, as Ordericus tells us, nothing more nor less than the ancient township, now held by a lord who possessed certain judicial rights varying according to the terms of the grant by which he was infeoffed. Every manor had a court baron, the ancient gemot of the township, in which by-laws were made and other local business transacted, and a court customary in which the business of the villenage was despatched. Those manors whose lords had under the Anglo-Saxon laws possessed sac and soc, or who since the Conquest had had grants in which those terms were used, had also a court-leet, or criminal jurisdiction, cut out as it were from the criminal jurisdiction of the hundred, and excusing the suitors who attended it from going to the court-leet of the hundred."—W. Stubbs, *Constitutional history of England*, v. 1, ch. 9, sect. 98; ch. 11, sect. 129.—"From the Conquest to the 14th century we find the same agricultural conditions prevailing over the greater part of England. Small gatherings of houses and cots appear as oases in the moorland and forest, more or less frequent according to the early or late settlement of the district, and its freedom from, or exposure to the ravages of war and the punishment

of rebellion. These oases, townships or vills if of some extent, hamlets if of but a few houses, gather round one or more mansions of superior size and importance, the Manor houses, or abodes of the Lords of the respective Manors. Round each township stretch the great ploughed fields, usually three in number, open and uninclosed. Each field is divided into a series of parallel strips a furlong in length, a rod wide, four of which would make an acre, the strips being separated by ridges of turf called balks, while along the head of each series of strips runs a broad band of turf known as a headland, on which the plough is turned, when it does not by custom turn on some fellow-tenant's land, and which serves as a road to the various strips in the fields. These strips are allotted in rotation to a certain number of the dwellers in the township, a very common holding being that known as a virgate or yardland, consisting of about 30 acres. . . . Mr. Seebohm's exhaustive researches have conclusively connected this system of open fields and rotation of strips with the system of common ploughing, each holder of land providing so many oxen for the common plough, two being the contribution of the holder of a virgate, and eight the normal number drawing the plough, though this would vary with the character of the soil. . . . At the date of Domesday (1086), the holders of land in the common fields comprise the Lord; the free tenants, socmanni or liberi homines, when there are any; the villani or saxon geburs, the holders of virgates or half virgates; and the bordarii or cotarii, holders of small plots of 5 acres or so, who have fewer rights and fewer duties. Besides ploughing the common-fields, the villani as part of their tenure have to supply the labour necessary to cultivate the arable land that the Lord of the Manor keeps in his own hands as his domain, dominicum, or demesne."—T. E. Scrutton, *Commons and common fields*, ch. I.—"The usual 'fief' or 'manor' consisted of a village with several hundred acres of arable land surrounding it. The cultivators of the soil lived in this village rather than in isolated farm houses, as do the agricultural folk in America to-day. Beyond the fields, there were stretches of pasture and waste land and of woodland, where the pigs might forage for food. The arable area was divided up into two portions. A considerable part was kept in the hands of the lord, and cultivated under his direction, or that of his representative, for his own personal benefit. This was known as the 'demesne.' The rest was parcelled out among the tenants. Now the holdings of the several tenants or villeins, as they frequently were called, were not compact fields but a number of acre or half-acre strips scattered over the whole of the tillable area. Each man had several separate strips in each of the three fields, which were not separated by fences or hedges, but simply by 'balks' of unplowed turf. The significant thing about the intermixed holdings in the open fields was that each man was bound to cultivate his strips in accordance with the rotation of crops observed by his neighbors. There were also other forms of common action and co-operation. The cattle of all the tenants were turned out to graze over the stubble after the grain was cut, as well as over the one great field whose turn it was to lie fallow in that particular year. They turned their cattle out upon the common pasture or waste, sometimes in proportion to the size of their holdings, and sometimes 'without stint.' They seem in many cases to have employed a village herdsman, shepherd or swincherd. Thus the whole land of the manor seems to have been cultivated on an elaborate system of joint labor, and even the raising

of stock seems to have been generally a co-operative enterprise. These common activities bound the people together in a manner far more effective than anything we know in the modern world. Everyone's work was so bound up with that of the entire community that he had exceedingly little opportunity for individuality or to use any initiative, and custom ruled supreme. But not only was the economic life a community rather than an individual affair; the same thing was true of the legal, religious and the general social life. As a usual thing, each manor had its own law courts for the maintenance of order. At frequent intervals court was held at the manor house or the castle, attended by all the villagers for the punishment of petty offences and the transfer of holdings. All the villagers attended the same church. Very often so large a portion of the tithes was taken by the bishop or other high ecclesiastical official that the priest had to be content with the altar dues, and was glad enough to get a few acres of land, and add to his income by joining in the common agriculture."—S. A. Queen, *Social work in the light of history* (E. C. Hayes, ed., *Lippincott's Sociological Series*, pp. 273-274).—See also AGRICULTURE: Medieval: Manorial system.—Relative to the origin of the manor and the development of the community from which it rose there are divergent views much discussed at the present day. "The interpretation, current fifteen years ago, was the natural outcome of the Mark theory and was somewhat as follows: The community was a voluntary association, a simple unit within which there were households or families of various degrees of wealth, rank and authority, but in point of status each was the equal of the other. Each was subject only to the customs and usages of the community and to the court of the Mark. The Mark was therefore a judicial and political as well as an agricultural unit, though cultivation of the soil was the primary bond of union. All offices were filled by election, but the incumbent in due time sank back into the general body of 'markgenossen.' He who was afterwards to be the lord of the manor was originally only 'the first Marksman,' who attained to this pre-eminence in part by the prestige of election to a position of headship, in part by usurpation, and in part by the prerogatives which protection and assistance to weaker Marksmen brought. Thus the first Marksman became the lord and held the others in a kind of subjection to himself, and received from them, though free, dues and services which grew increasingly more severe. [See also FEUDALISM: Organization.] The main difficulty here seems to be in the premise, and it is the evident artificiality of the voluntary association of freemen which has led to such adverse criticism upon the whole theory. . . . While the free village community was under fire at home as well as abroad, Mr. Seebohm presented a new view of an exactly opposite character, with the formula of the community in villeinage under a lord. Although this view has . . . divided thinkers on the subject, it has proved no more satisfactory than the other; for while it does explain the origin of the lord of the manor, it leaves wholly untouched the body of free Saxons whom Earle calls the rank and file of the invading army. Other theories have sought to supply the omissions in this vague non-documentary field, all erected with learning and skill, but unfortunately not in harmony with one another. Coote and Finlason have given to the manor an unqualified Roman origin. Lewis holds to a solid British foundation, the Teutonists would make it wholly Saxon, while Gomme is inclined to see an Aryo-British community under Saxon overlordship. Thus

there is a wide range from which to select; all cannot be true; no one is an explanation of all conditions, yet most of them have considerable sound evidence to support them. It is this lack of harmony which drives the student to discover some theory which shall be in touch with known tribal conditions and a natural consequence of their development, and which at the same time shall be sufficiently elastic to conform to the facts which confront us in the early historical period. An attempt has been made [in the work here quoted from] to lay down two premises, the first of which is the composite character of the tribal and village community, and the second the diverse ethnological conditions of Britain after the Conquest, conditions which would allow for different results. . . . Kemble in his chapter on Personal Rank has a remark which is ill in keeping with his peaceful Mark theory. He says: 'There can be no doubt that some kind of military organization preceded the peaceful settlement, and in many respects determined its mode and character.' To this statement Earle has added another equally pregnant: 'Of all principles of military regiment there is none so necessary or so elementary as this, that all men must be under a captain, and such a captain as is able to command prompt and willing obedience. Upon this military principle I conceive the English settlements were originally founded, that each several settlement was under a military leader, and that this military leader was the ancestor of the lord of the manor.' Professor Earle then continues in the endeavor to apply the suggestion contained in the above quotation. He shows that the 'hundreds' represent the first permanent encampment of the invading host, and that the military occupation preceded the civil organization, the latter falling into the mould which the former had prepared. According to this the manorial organization was based upon a composite military foundation, the rank and file composing the one element, the village community; the captain or military leader composing the other, settled with suitable provision by the side of his company; the lord by the side of free owners. In this attempt to give the manor a composite origin, as the only rational means whereby the chief difficulty can be removed, and in the attempt to carry the seigniorial element to the very beginning we believe him to be wholly right. But an objection must be raised to the way in which Professor Earle makes up his composite element. It is too artificial, too exclusively military; the occupiers of the village are the members of the 'company,' the occupier of the adjacent seat is the 'captain,' afterwards to become the lord. . . . We feel certain that the local community, the village, was simply the kindred, the sub-clan group, which had become a local habitation, yet when we attempt to test its presence in Anglo-Saxon Britain we meet with many difficulties."—C. McL. Andrews, *Old English manor*, pp. 7-51.

B. C. 222.—Change of name.—In the war between Cleomenes of Sparta and the Achaean league, the city of Mantinea was, first, surprised by Aratus, the chief of the league, 226 B. C., and occupied by an Achaean garrison; then recaptured by Cleomenes and his partisans, 224 B. C., and finally, 222 B. C., stormed by Antigonus, king of Macedonia, acting in the name of the League, and given up to pillage. Its citizens were sold into slavery. "The dispeopled city was placed by the conqueror at the disposal of Argos, which decreed that a colony should be sent to take possession of it under the auspices of Aratus. The occasion enabled him to pay another courtly compliment to the king of Macedonia. On his proposal, the name of the 'lovely Mantinea'—as it was described in the Homeric catalogue—was exchanged for that of Antigonea, a symbol of its ruin and of the humiliation of Greece."—C. Thirlwall, *History of Greece*, v. 8, ch. 62.

B. C. 207.—Defeat of Lacedaemonians.—In the wars of the Achaean League, the Lacedaemonians were defeated under the walls of Mantinea with great slaughter, by the forces of the League, ably marshalled by Philopæmen, and the Lacedaemonian king Machanidas was slain. "It was the third great battle fought on the same, or nearly the same, ground. Here, in the interval between the two parts of the Peloponnesian War, had Agis restored the glory of Sparta after her humiliation at Sphacteria; here Epameinondas had fallen in the moment of victory; here now [207 B. C.] was to be fought the last great battle of independent Greece."—E. A.

Freeman, *History of federal government*, ch. 8, sect. 2.

MANTUA, fortified city of Lombardy, Italy, twenty-five miles southwest of Verona. In 1915 it had a population of 34,507. It was originally an Etruscan city, becoming a Roman municipium just before the time of Virgil, who was born near the city. The Lombards found Mantua a walled city, in 568. Recovered by the exarch of Ravenna in 590, it was again captured by Agilulf in 601. In the ninth century the city was in the hands of the church and in the eleventh century formed part of the vast possessions of Boniface, marquis of Canossa.

1814-1866.—Austrian possession.—The Austrians retained Mantua until their final withdrawal from the peninsula in 1866, when it was absorbed in the new kingdom of Italy.

MANU, Laws of.—"The Indians [of Hindustan] possess a series of books of law, which, like that called after Manu, bear the name of a saint or seer of antiquity, or of a god. One is named after Gautama, another after Vasishtha, a third after Apastamba, a fourth after Yajnavalkya; others after Bandhayana and Vishnu. According to the tradition of the Indians the law of Manu is the oldest and most honourable. . . . The conclusion is . . . inevitable that the decisive precepts which we find in the collection must have been put together and written down about the year 600 [B. C.]."—M. Duncker, *History of antiquity*, bk. 5, ch. 6.—"The name, 'Laws of Manu,' somewhat resembles a 'pious fraud,' for the 'Laws' are merely the laws or customs of a school or association of Hindus, called the Manavas, who lived in the country rendered holy by the Divine river Saraswati. In this district the Hindus first felt themselves a settled people, and in their neighbourhood they established colleges and hermitages, or 'asramas,' from some of which we may suppose Brahmanas, Upanishads, and other religious compositions may have issued; and under such influences we may imagine the Code of Manu to have been composed."—Mrs. Manning, *Ancient and mediæval India*, v. 1, p. 276.—See also HINDU LITERATURE: Legal writings.

MANX KINGDOM.—The Isle of Man in the Irish sea gets its English name, Man, by an abbreviation of the native name, Mannin, the origin of which is unknown. The language, called Manx (now little used), and the inhabitants, called Manxmen, are both of Gaelic, or Irish derivation. From the sixth to the tenth century the island was successively ruled by the Scots (Irish), the Welsh and the Norwegians, finally becoming a separate petty kingdom, with Norwegian claims upon it. In the thirteenth century the little kingdom was annexed to Scotland. Subsequently, after various vicissitudes, it passed under English control and was granted by Henry IV to Sir John Stanley. The Stanleys, after some generations, found a dignity which they esteemed higher, in the earldom of Derby, and relinquished the title of king of Man. This was done by the second Earl of Derby, 1505. In 1765 the sovereignty and revenues of the island were purchased by the British government; but its independent form of government has undergone little change. It enjoys "home rule" to perfection. It has its own legislature, called the Court of Tynwald, consisting of a council, or upper chamber, and a representative body called the House of Keys. Acts of the imperial parliament do not apply to the Isle of Man unless it is specifically named in them. It has its own courts, with judges called deemsters (who are the successors of the ancient Druidical priests), and its own governor, appointed by the crown. The divisions of the island, corresponding to English counties, are called sheadings.—Based on S. Walpole, *Land of home rule*. MAORI, branch of the Polynesian race in New Zealand. See NEW ZEALAND: 1375-1642; 1815-1840; 1818-1838; 1843-1850; 1853-1870; EDUCATION: Modern developments: 20th century: General education: New Zealand.

MAQUAHUITL.—This was a weapon in use among the Mexicans when the Spaniards found them. It "was a stout stick, three feet and a half long, and about four inches broad, armed on each side with a sort of razors of the stone itztlil (obsidian), extraordinarily sharp, fixed and firmly fastened to the stick with gum lack. . . . The first stroke only was to be feared, for the razors became soon blunt."—F. S. Clavigero, *History of Mexico*, bk. 7.

MARBURG CONFERENCE (1529). See SWITZERLAND: 1528-1531.

MARCEAU-DESGRAVIERS, François Severin (1760-1796), French general. Served in the French revolutionary wars as a brigade and division commander, often in association with his friend Kleber; helped to win many important battles, including Fleurus, 1794, and Coblenz, 1794.

MARCEL, Etienne (d. 1358), provost of the merchants of Paris. See FRANCE: 1356-1358.

MARCELLUS I (d. 309), pope, 308-309.

Marcellus II (1501-1555), pope, 1555.

MARCH, MARK, frontier or boundary of a territory; a border. Hence came the title of Marquis, which was originally that of an officer charged with the guarding of some March or border district of a kingdom. In Great Britain this title ranks second in the five orders of nobility, only the title of duke being superior to it. The old English kingdom of Mercia was formed by the Angles who were first called the "Men of the March," having settled on the Welsh border, and that was the origin of its name. The kingdom of

Prussia grew out of the "Mark of Brandenburg," which was originally a military border district formed on the skirts of the German empire to resist the Wends. Various other European states had the same origin.—See also MARGRAVE.

MARCOING, town in northeastern France, four miles southwest of Cambrai. The British captured and held it for a short time in 1917. See WORLD WAR: 1917: II. Western front: g, 4; 1918: II. Western front: o, 1; o, 2.

MARCOMANNI AND QUADI.—"The Marcomanni [an ancient German people who dwelt, first, on the Rhine, but afterwards occupied southern Bohemia] stand first in strength and renown, and their very territory, from which the Boii were driven in a former age, was won by valour. Nor are the Narisci [settled in the region of modern Ratisbon] and Quadi [who probably occupied Moravia] inferior to them. This I may call the frontier of Germany, so far as it is completed by the Danube. The Marcomanni and Quadi have, up to our time, been ruled by kings of their own nation, descended from the noble stock of Maroboduus and Tudrus. They now submit even to foreigners; but the strength and power of the monarch depend on Roman influence."—Tacitus, *Germany* (tr. by Church and Brodribb), ch. 42.—"The Marcomanni cannot be demonstrated as a distinct people before Marbod. It is very possible that the word up to that point indicates nothing but what it etymologically signifies—the land or frontier guard."—T. Mommsen, *History of Rome*, bk. 5, ch. 7, foot-note.—See also AGRI DECUMATES.

MARGIANA, ancient name of the valley of the Murghab or Moorghab (called the Margos). It is represented at the present day by the oasis now called Merv, formerly Bactrian Mouru.

MARGRAVE, Marquis.—"When Charles deposed the Duke of Bavaria [788], he did away with the last of the old tribal leaders of the other Germanic peoples absorbed by the Franks, and native dukes were left only in Celtic Brittany and among the Basques. He appointed a few new dukes, but they were exceptional; his regular local officer was the count. The Frankish territories were divided into counties, and in each the count was the royal representative, attending especially to judicial and military matters. Charles appointed whom he pleased, but the term of the office was for life, a dangerous feature liable to result in the office becoming hereditary. Charles also depended a great deal upon the bishops in the localities, and instructed his counts to co-operate with them. Newly conquered territory or districts needing to be kept in a state of military preparation for frontier defence were organized as marks under margraves, or counts of the marks. Sometimes a mark included more than one county and was placed under a duke. The chief marks at this time were the Breton, Spanish, Friulian, Avarian, Sorbian, and Saxon."—L. Thorndike, *Medieval Europe*, pp. 194-195.—"The title derived from the old imperial office of markgrave [margrave], 'comes marchensis,' or count of the marches, had belonged to several foreigners who were brought into relation with England in the twelfth century; . . . but in France the title was not commonly used until the seventeenth century, and it is possible that it came to England direct from Germany."—W. Stubbs, *Constitutional history of England*, ch. 20, sect. 751.—See **MARCH**; **GRAF**.

MARIANNE, or **LADRONE ISLANDS**, group of fifteen islands in the western Pacific, north of the Caroline islands and 1,500 miles east of the Philippines, disposed in a row almost due north and south, with a united area of approximately 250 square miles, and an estimated population, 1918, of over 15,000. The islands were discovered by Magellan in 1521, whose sailors name them the "Thieves" (Ladrones) islands; in 1668 they received the name of Mariana, or Marianne islands from the queen of Spain, Marianne of Austria, at whose expense Jesuit missionaries were sent over in 1667. By the treaty of February 12, 1899, the islands, excepting Guam (which was ceded by Spain to the United States in 1898), passed from Spanish into German possession, October 1, 1899, and were included in the German New Guinea Protectorate (see **CAROLINE ISLANDS**: 1899-1920). Early in the World War, 1914, the islands were captured by the Japanese. Under the provisions of the Treaty of Versailles, 1919, Japan was appointed mandatory to the former German possessions lying north of the equator.—See also **MICRONESIA**; **GUAM**; **PHILIPPINE ISLANDS**: 1901; **PACIFIC OCEAN**: 1919-1921.

MARINE, Secretary of. See **NAVY DEPARTMENT OF UNITED STATES**: Origin.

MARINE CORPS.—"Soldiers enlisted for service either on shore or on board ships of war are known by the distinctive name of 'marines.' In nearly all maritime countries claiming to be war powers they constitute a separate military body trained either to fight as infantrymen or artillerymen, and especially for participation in naval engagements. . . . The first authentic record of marines in America bears the date of 1740. Early in that year three additional regiments were raised when the royal standard was displayed at New York as a port to which any volunteer marine was to repair. . . . The field officers were appointed by the Crown; the company officers were nominated by the American provinces. On the 8th of June, 1775, the Continental Congress resolved 'that the compact between the Crown and Massachusetts Bay is dissolved,' and on the 10th of November, before a single vessel of the navy was sent to sea, the corps was organized by the following resolution: 'Resolved, That two battalions of marines be raised, consisting of one colonel, two lieutenant-colonels, two majors, and other officers as usual in other regiments; that they consist of an equal number of privates with other battalions; that particular care be taken that no person be appointed to officers or enlisted in said battalions but such as are good seamen or so acquainted with maritime affairs as to be able to serve to advantage by sea when required; . . . that they be distinguished by the name of the "first and second battalions of American marines."' . . . On the 13th of December, 1776, Congress directed 13 ships of war to be built. On the 22d of the same month Congress passed a resolution declaring Essex Hopkins commander in chief, and appointed officers for all the vessels then in service. This is the first step toward the creation of the Naval Establishment which has won imperishable fame for the United States, and upon which is based the claim of the Marine Corps to be 'the oldest in the service.'"—J. C. Burrows, *Marine Corps (Senate Document, no. 719, Feb. 15, 1909)*.

MARIPOSA FAMILY.—"Derivation: A Spanish word meaning 'butterfly,' applied to a county in California and subsequently taken for the family name. Latham mentions the remnants of three distinct bands of the Coconoon, each with its own language, in the north of Mariposa County. These are classed together under the above name. More recently the tribes speaking languages allied to the Coconūn have been treated of under the family name Yokut. As, however, the stock was established by Latham on a sound basis, his name is here restored."—J. W. Powell, *Seventh Annual Report, Bureau of Ethnology*, p. 90.

MARK, border, boundary or frontier. See GAU; MARCH.

MARK.—"The theory of the Mark, or as it is more generally called in its later form, the free village community, has been an accepted hypothesis for the historical and economic world for more than half a century. . . . The history of the hypothesis forms an interesting chapter in the relation between modern thought and the interpretation of past history, and shows that in the formation of an opinion both writer and reader are unconsciously dependent upon the spirit of the age in which they live. The free village community, as it is commonly understood, standing at the dawn of English and German history is discoverable in no historical documents, and for that reason it has

been accepted by prudent scholars with caution. But the causes which have made it a widely acceptable hypothesis and have served to entrench it firmly in the mind of scholar and reader alike, have easily supplied what was wanting in the way of exact material, and have led to conclusions which are now recognized as often too hazy, historically inaccurate, though agreeable to the thought tendencies of the age. . . . The Mark as defined by Kemble, who felt in this interpretation the influence of the German writers, . . . was a district large or small with a well-defined boundary, containing certain proportions of heath, forest, fen and pasture. Upon this tract of land were communities of families or households, originally bound by kindred or tribal ties, but who had early lost this blood relationship and were composed of freemen, voluntarily associated for mutual support and tillage of the soil, with commonable rights in the land within the Mark. The Marks were entirely independent, having nothing to do with each other, self-supporting and isolated, until by continual expansion they either federated or coalesced into larger communities. Such communities varying in size covered England, internally differing only in minor details, in all other respects similar. This view of the Mark had been taken already more or less independently by v. Maurer in Germany, and five years after the appearance of Kemble's work, there was published the first of the series of volumes which have rendered Maurer's name famous as the establisher of the theory. As his method was more exact, his results were built upon a more stable foundation than were those of Kemble, but in general the two writers did not greatly differ."—C. McL. Andrews, *Old English manor*, pp. 1-6.—See also MANORS.

MARQUESAS ISLANDS.—The Marquesas or Mendaña islands in the South Pacific, belong to the Polynesian group and consist of eleven islands, six of which are inhabited. The islands are mountainous and the valleys are filled with luxurious vegetation. The people of these islands are of pure Polynesian type with a language closely related to the dialects spoken on the Hawaiian islands. The culture and traditions of the Marquesans point to Samoa as the colonizing center from which they came. (See also MYTHOLOGY: Polynesian.) The Marquesas islands were first discovered in 1595 by Alvaro Mendaña, a Spanish explorer. Two centuries later Captain James Cook followed the same course and coming to the Marquesas islands in 1774 discovered the northern islands which Mendaña had not visited. The Marquesas islands have the distinction of being the first piece of noncontiguous territory claimed for the United States. Commodore David Porter came to the islands in 1813, but since he failed to plant a colony and because the claim was never acted upon at Washington, the right to the island was lost to France when in May, 1842, Rear-Admiral Dupetit-Thouars took

formal possession of the islands. There were many native rebellions and after much bloodshed the French lost interest in the islands and since 1870, the control has been nominal. There is a French civil governor whose residence is on the island of Nukahiva. The rapid decline of the native population has led the French to take steps to exclude the most immediate causes of native degeneracy. In 1894 the use of opium by the Marquesans was prohibited. In 1895, the sale and possession of alcohol was made a criminal offense. In 1896, attendance at school was made obligatory. But, in 1900, as a result of the passing of the Associations law in France, disbanding all schools maintained by the Catholic religious orders, the education of the natives was taken out of the hands of the Catholics who had been their first teachers, and whose schools were the oldest in the islands.—See also PACIFIC OCEAN: B. C. 2500-A. D. 1500.

MARQUETTE, Jacques (1637-1675), French missionary and explorer in Canada. See CANADA: 1634-1673; MICHIGAN: 1640-1671.

1902.—Projected canal.—In 1902 an appropriation was made by the Chamber of Commerce for a canal to the mouth of the Rhône, and one was projected between the Rhône and the Loire in order to bring Marseilles into connection with northern France.

MARSHAL, title given in several countries to various officers, usually of high military rank. In the Middle Ages, the marshal was second to the constable, but became a powerful military subordinate of the king. In England the office was for a time hereditary. In America a marshal is a law-court officer and in some places a local sheriff. In the modern English and German armies, a field-marshal ranks above a general, and commands a group of armies. The most distinguished application of the term has been made in France. Napoleon I and Napoleon III each created a number of marshals, who were of higher rank than ordinary generals. The kings of France created an increasing number of "marshals of France." After being in abeyance at various periods, it remained for the Third Republic, during the World War, to revive the famous title of "marshal of France." During the conflict the title was granted to Joffre, Foch and Pétain and since to other distinguished generals.—See also CONSTABLE.

MARSHALL, James Wilson (1810-1885), American wheelwright; discovered gold in California, 1848. See CALIFORNIA: 1848-1849.

MARSHALL, John (1755-1835), American jurist, served in the Revolutionary War; member of Virginia legislature, 1782-1791; member of Virginia Constitutional Ratifying Convention, 1788; envoy to France, 1797; member of the House of Representatives, 1799-1800; secretary of state, 1800-1801; chief justice of the United States Supreme Court, 1801-1835.

MARTINIQUE, French island colony in the Lesser Antilles, discovered by Columbus about 1502. It has been a French possession since 1635 when d'Esnabuc erected a fort. It was three times captured by the British and was held by them for a number of years during the wars with Napoleon. A decree of April 27, 1848, abolished slavery. St. Pierre, until then the chief town of the island was utterly destroyed and the surrounding district devastated by an eruption of Mont Pelée, in 1902. About one third of Martinique is under cultivation, sugar cane being the principal crop.

MARY OF GUISE, or of Lorraine (1515-1560), queen of Scotland, 1538-1560. Wife of James V of Scotland and mother of Mary Queen of Scots. See SCOTLAND: 1558-1560.

MARY QUEEN OF SCOTS (Mary Stuart) (1542-1587), queen of Scotland, 1543-1567. Daughter of King James V; married the dauphin, Francis II, 1558; laid claim to the English throne on the death of Mary Tudor, 1558; Francis died, 1660; married Lord Darnley, 1665; labored to restore the Catholic faith in the kingdom; became estranged from Darnley and consented to his murder, 1567; married Bothwell, his murderer, 1567; imprisoned and forced to abdicate, 1567; escaped and fled to England, 1568; confined in various castles until her trial on a charge of conspiracy against the life of Elizabeth, 1587; beheaded at Fotheringay, 1587. See SCOTLAND: 1544-1548; 1558-1560; 1561-1568; ENGLAND: 1585-1587.

MARYLAND (nicknamed *Old Line*, or *Cockade*), one of the thirteen original states of the American union occupying a middle position on the Atlantic coast. It is bounded on the north by Pennsylvania and Delaware; on the east by Delaware and the Atlantic ocean; on the south by Virginia and West Virginia from which it is separated by the Potomac river; and on the west by West Virginia. The irregular southern boundary gives the state a varying breadth from north to south that ranges from two miles to one hundred and twenty-eight. The irregularity of Maryland's outline is further emphasized by Chesapeake bay that almost divides the eastern part of the state into two parts. The state has a total area of 12,327 square miles of which 2,386 are water, Chesapeake bay alone occupying 1,203 square miles. The population in 1920 was 1,449,661.

Resources.—Maryland is largely an agricultural state and of the total land surface of the state

about eighty-two per cent of the area is in farms, given over to the production of wheat, maize, hay, potatoes, tobacco, tomatoes, fruit, and vegetables. Of the live stock industry the state had a total of 1,143,000 head in 1920. The oyster fisheries of the state have a yield greater than any other state in the Union. Coal is the principal mineral product of the state and represents over one-half of the total mineral value produced in the United States.—See also U. S. A.: Economic map.

1608.—Explorations of Captain Smith around Baltimore. See BALTIMORE: 1608-1707.

1632.—Charter granted to Lord Baltimore.—**American palatinate.**—Powers of proprietary.—“Among those who had become interested in the London or Virginia Company, under its second charter, in 1609, was Sir George Calvert, afterwards the founder of Maryland. . . . Upon the dissolution of the Virginia Company . . . he was named by the king one of the royal commissioners to whom the government of that colony was confided. Hitherto he had been a Protestant, but in 1624, having become unsettled in his religious convictions, he renounced the church of England, in which he had been bred, and embraced the faith of the Catholic church. Moved by conscientious scruples, he determined no longer to hold the office of secretary of state [conferred on him in 1619], which would make him, in a manner, the instrument of persecution against those whose faith he had adopted, and tendered his resignation to the king. . . . The king, . . . while he accepted his resignation, continued him as a member of his privy council for life, and soon after created him Lord Baltimore, of Baltimore, in Ireland [1625. This was seven years before the grant of the Maryland charter and some years before the arrival of the first colonists. The title became extinct, 1771.] The spirit of intolerance at that time pervaded England. . . . The laws against the Catholics in England were particularly severe and cruel, and rendered it impossible for any man to practice his religion in quiet and safety. Sir George Calvert felt this, and although he was assured of protection from the gratitude and affection of the king, he determined to seek another land and to found a new state, where conscience should be free and every man might worship God according to his own heart, in peace and perfect security. . . . At first he fixed his eyes on New-found-land, in the settlement of which he had been interested before his conversion. . . . Having purchased a ship, he sailed with his family to that island, in which, a few years before, he had obtained a grant of a province under the name of Avalon. [The charter was liberal in its terms and in the powers conferred upon the proprietary. The province was erected into a county palatine, held of the Crown by strictly feudal tenure *in capite* by knights service.] Here he only resided two years [see NEWFOUNDLAND: 1610-1651], when he found the climate and soil unsuited for the establishment of a flourishing community, and determined to seek a more genial country in the south. Accordingly, in 1628, he sailed to Virginia, with the intention of settling in the limits of that colony, or more probably to explore the uninhabited country on its borders, in order to secure a grant of it from the king. Upon his arrival within the jurisdiction

of the colony, the authorities tendered him the oaths of allegiance and supremacy, to which, as then framed, no Catholic could subscribe. Lord Baltimore refused to take them, but prepared a form of an oath of allegiance which he and all his followers were willing to accept. His proposal was rejected, and being compelled to leave their waters, he explored the Chesapeake above the settlements. He was pleased with the beautiful and well wooded country, which surrounded the noble inlets and indentations of the great bay, and determined there to found his principality. . . . He returned to England to obtain a grant from Charles I, who had succeeded his father, James I, upon the throne. Remembering his services to his father, and perhaps moved by the intercessions of Henrietta Maria, his Catholic queen, who desired to secure an asylum abroad for the persecuted members of her church in England, Charles directed the patent to be issued. It was prepared by Lord Baltimore himself; but before it was finally executed that truly great and good man died, and the patent was delivered to his son

GEORGE CALVERT, FIRST LORD BALTIMORE.

Cecilus, [second Lord Baltimore] who succeeded as well to his noble designs as to his titles and estates [and who thus at the age of twenty-six, became the First Lord Proprietary of Maryland]. The charter was issued on the 20th of June, 1632, and the new province, in honor of Queen Henrietta Maria, was named 'Terra Mariae'—Maryland."—J. McSherry, *History of Maryland, introduction.*—"The boundaries of Maryland, unlike those of the other colonies, were precisely defined. Its limits were: on the north, the fortieth parallel of north latitude; on the west and southwest, a line running south from this parallel to the farthest source of the Potomac, and thence by the farther or western bank of that river to Chesapeake Bay; on the south by a line running across the bay and peninsula to the Atlantic; and on the east by the ocean and the Delaware Bay and River. It included, therefore, all the present State of Delaware, a large tract of land now forming part of Pennsylvania, and another now occupied and claimed by West Virginia. The charter of Maryland [modelled after that of Avalon] contained the most ample rights and privileges ever conferred by a sovereign of England. It erected Maryland into a palatinate, equivalent to a principality, reserving only the feudal supremacy of the

crown. The Proprietary was made absolute lord of the land and water within his boundaries, could erect towns, cities, and ports, make war or peace, call the whole fighting population to arms, and declare martial law, levy tolls and duties, establish courts of justice, appoint judges, magistrates, and other civil officers, execute the laws, and pardon offenders. He could erect manors with courts-baron and courts-leet, and confer titles and dignities, so that they differed from those of England. He could make laws with the assent of the freemen of the province, and, in cases of emergency, ordinances not impairing life, limb, or property, without their assent. He could found churches and chapels, have them consecrated according to the ecclesiastical laws of England, and appoint the incumbents. All this territory, with these royal rights, 'jura regalia,' was to be held of the crown in free socage [which differs from *in capite* by knights service, in that uncertain military service required by the latter is commuted for a fixed tribute], by the delivery of two Indian arrows yearly at the palace of Windsor, and the fifth of all gold or silver mined. The colonists and their descendants were to remain English subjects. . . . The King furthermore bound himself and his successors to lay no taxes, customs, subsidies, or contributions whatever upon the people of the province. . . . This charter, by which Maryland was virtually an independent and self-governed community, placed the destinies of the colonists in their own hands. . . . Though often attacked, and at times held in abeyance, the charter was never revoked."—W. H. Browne, *Maryland*, ch. 2.—The intention to create a palatine principality in Maryland is distinctly expressed in the fourth section of the charter, which grants to Lord Baltimore, his heirs and assigns, "as ample rights, jurisdictions, privileges, prerogatives, royalties, liberties, immunities, and royal rights . . . as any bishop of Durham, within the bishoprick or county palatine of Durham, in our kingdom of England, ever heretofore hath had, held, used, or enjoyed, or of right could, or ought to have, hold, use, or enjoy."—J. L. Bozman, *History of Maryland*, v. 2, p. 11.

1633-1637.—Planting of the colony at St. Mary's.—Leonard Calvert appointed governor.—"Cecil, Lord Baltimore, after receiving his charter for Maryland, in June, 1632, prepared to carry out his father's plans. Terms of settlement were issued to attract colonists, and a body of emigrants was soon collected to begin the foundation of the new province. The leading gentlemen who were induced to take part in the project were Catholics; those whom they took out to till the soil, or ply various trades, were not all or, indeed, mainly Catholics, but they could not have been very strongly Protestant to embark in a venture so absolutely under Catholic control. At Avalon Sir George Calvert, anxious for the religious life of his colonists, had taken over both Catholic and Protestant clergymen, and was ill repaid for his liberal conduct. To avoid a similar ground of reproach, Baron Cecil left each part of his colonists free to take their own clergymen. It is a significant fact that the Protestant portion were so indifferent that they neither took over any minister of religion, nor for several years after Maryland settlements began made any attempt to procure one. On behalf of the Catholic settlers, Lord Baltimore applied to Father Richard Blount, at that

time provincial of the Jesuits in England, and wrote to the General of the Society, at Rome, to excite their zeal in behalf of the English Catholics who were about to proceed to Maryland. He could offer the clergy no support. . . . The Jesuits did not shrink from a mission field where they were to look for no support from the proprietary or their flock, and were to live amid dangers. It was decided that two Fathers were to go as gentlemen adventurers, taking artisans with them, and acquiring lands like others, from which they were to draw their support. . . . The Maryland pilgrims under Leonard Calvert, brother of the lord proprietary, consisted of his brother George, some 20 other gentlemen, and 200 laboring men well provided. To convey these to the land of Mary, Lord Baltimore had his own pinnace, the Dove, of 50 tons, commanded by Robert Winter, and the Ark, a chartered vessel of 350 tons burthen, Richard Lowe being captain. Leonard Calvert was appointed governor, Jerome Hawley and Thomas Cornwaleys being joined in the commission. . . . [After many hindrances and delays, the two vessels sailed from Cowes, November 22, 1633, and made their voyage in safety, though encountering heavy storms. They came to anchor in Chesapeake bay, near one of the Heron Islands, which they named St. Clement; and on that island they raised a cross and celebrated mass.] Catholicity thus planted her cross and her altar in the heart of the English colonies in America, March 25, 1634. The land was consecrated, and then preparations were made to select a spot for the settlement. Leaving Father White at St. Clement's, the governor, with Father Altham, ran up the river in a pinnace, and at Potomac on the southern shore met Archihau, regent of the powerful tribe that held sway over that part of the land. . . . [Having won the goodwill of the savages], Leonard Calvert sailed back to Saint Clement's. Then the pilgrims entered the Saint Mary's, a bold, broad stream, emptying into the Potomac about 12 miles from its mouth. For the first settlement of the new province, Leonard Calvert, who had landed, selected a spot a short distance above about a mile from the eastern shore of the river. Here stood an Indian town, whose inhabitants, harassed by the Susquehannas, had already begun to emigrate to the westward. To observe strict justice with the Indian tribes, Calvert purchased from the werowance, or king, Yaocomoco, 30 miles of territory. The Indians gradually gave up some of their houses to the colonists, agreeing to leave the rest also after they had gathered in their harvest. . . . The new settlement began with Catholic and Protestant dwelling together in harmony, neither attempting to interfere with the religious rights of the other, and religious liberty obtained a home, its only home in the wide world, at the humble village which bore the name of St. Mary's' [Bancroft, i, 247]. . . . The settlers were soon at work. Houses for their use were erected, crops were planted, activity and industry prevailed. St. Mary's chapel was dedicated to the worship of Almighty God, and near it a fort stood, ready to protect the settlers. It was required by the fact that Clayborne [a trading adventurer and a member of the Virginia Council, who refused to render allegiance to Lord Baltimore, or to accept title to land from him], the fanatical enemy of Lord Baltimore and his Catholic projects, who had already settled on Kent Island, was exciting the Indians against the colonists of Maryland. The little community gave the priests a field too limited for their zeal. . . . The Indian tribes were

to be reached. . . . Another priest, with a lay brother, came to share their labors before the close of the year 1635; and the next year four priests were reported as the number assigned to the Maryland mission. Of their early labors no record is preserved. . . . Sickness prevailed in the colony, and the missionaries did not escape. Within two months after his arrival Father Knolles, a talented young priest of much hope, sank a victim to the climate, and Brother Gervase, one of the original band of settlers, also died. . . . Lord Baltimore's scheme embraced not only religious but legislative freedom, and his charter provided for a colonial assembly. . . . In less than three years an assembly of the freemen of the little colony was convened and opened its sessions on the 25-26th of January, 1637. All who had taken up lands were summoned to attend in person. . . . [Some of the resulting legislation was disapproved by the missionaries, and] the variance of opinion was most unfortunate in its results to the colony, as impairing the harmony which had hitherto prevailed."—J. G. Shea, *Catholic church in colonial days*, ch. 2.—"The Acts of this session [1637], Baltimore refused to approve; because, as he claimed, the right to originate laws resided, under the charter, exclusively in himself; the power of the Assembly being limited to assent and dissent to such as he propounded. The freemen of Maryland, convinced that they possessed equal and co-ordinate rights, in matters of legislation, with the Proprietary, with the courage of their conviction, vindicated their position, by rejecting, at the next session of the Assembly, the whole body of bills drafted and submitted by him for their adoption, and enacted in their stead, a code which emanated from themselves, though substantially the same as the one that he had propounded. After this, the right of the Assembly to initiate legislation was not contested, and the right of the Proprietary was, in practice, limited to his veto. This right he always retained the privilege of exercising personally, and, while the Governor of the Province was invested with the power of assenting to or rejecting laws passed by the Assembly, his assent only gave them efficacy until the Proprietary's dissent was declared. The freemen, successful in their opposition to what they deemed an encroachment upon their charter rights, thus planted in Maryland, at the session of 1637, that germ of liberty which underlies the right of free self-government."—J. W. Thomas, *Chronicles of colonial Maryland*, pp. 55-56.

1634.—Embraced in palatine grant of New Albion. See NEW ALBION.

1635-1638.—Troubles with Clayborne of Virginia.—William Clayborne "was the person most aggrieved by the Maryland charter. Under a general license from Charles I. to trade, he had established a lucrative post on Kent Island. The King, as he had unquestioned right to do under the theory of English law, granted to Lord Baltimore a certain tract of wild land, including Kent Island. Clayborne had no legal right there except as the subject of Baltimore; but, since his real injuries coincided with the fancied ones of the Virginians generally, his claim assumed importance. . . . There was . . . so strong a feeling in favor of Clayborne in Virginia that he was soon able to send an armed pinnace up the Chesapeake to defend his invaded rights at Kent Island, but the

expedition was unfortunate. Governor [Leonard] Calvert, after a sharp encounter, captured Clayborne's pinnace, and proclaimed its owner a rebel. Calvert then demanded that the author of this trouble should be given up by Virginia; but Harvey [the governor of Virginia], who had been in difficulties himself on account of his lukewarmness toward Clayborne, refused to comply. Clayborne, however, solved the problem in his own way, by going at once to England to attack his enemies in their stronghold. . . . On his arrival in England he . . . presented a petition to the King, and by adroitly working on the cupidity of Charles, not only came near recovering Kent Island, but almost obtained a large grant besides. After involving Lord Baltimore in a good deal of litigation, Clayborne was obliged, by an adverse decision of the Lords Commissioners of Plantations, to abandon all hopes in England, and therefore withdrew to Virginia to wait for better times."—H. C. Lodge, *Short history of the English colonies in America*, ch. 3.—See also VIRGINIA: 1630-1652.

ALSO IN: J. L. Bozman, *History of Maryland*, v. 2, ch. 1.

1639-1692.—Composition of legislature.—Changes in basis of representation.—"The Legislature consisted at first of one branch, and until 1639, was composed of the Council and all the freemen in the Province, either in person or by proxy, convened by proclamation and summons, with the Governor as its President. In 1639, burgesses were elected from every hundred, who with the Governor and Council, composed the House of Assembly. With this change from a primary to a representative Assembly, two curious anomalies still existed—the one conceding to the Governor the right of every freeman who failed to vote for the burgess elected, to claim representation in person. In 1650, the organization of an Upper and a Lower House of Assembly was established; the Governor, Council, and those summoned by special writ, constituting the Upper House, and the burgesses elected, the Lower House. The number of delegates to be elected was within the Governor's discretion, and was regulated by the proclamation for the election, usually from two to four from each hundred [subsequently, each county], until 1681, when the number was uniformly fixed, and reduced to two, which continued until 1692, when it was, for the first time, regulated by Act of Assembly, and when the number was increased to four from every county—a basis of representation which continued until the Revolution. It should here be said that the legislation enacted at the little Capital of Saint Mary's, during the sixty-one years in which it was the seat of Government, forms, to a great extent, the foundation and outlines of the present legal, civil, and social structures of Maryland, and of some of its most cherished institutions."—J. W. Thomas, *Chronicles of colonial Maryland*, pp. 56-57.

1643-1649.—Colonial disturbances from English Civil War.—Lord Baltimore and the Puritans.—The struggle of parties incident to the overthrow of the monarchy and the civil war, in England, was attended in Maryland "with a degree of violence disproportionate to its substantial results. It is difficult to fasten the blame of the first attack definitely on either party. In 1643 or 1644 the King gave letters of marque to [Governor Leonard Calvert commissioning him to seize upon all ships belonging to the Parliament. It would seem, however, as if the other side had begun to be active, since only three months later

we find the Governor issuing a proclamation for the arrest of Richard Ingle, a sea-captain, apparently a Puritan and an ally of Clayborne. [Ingle had been arrested by the authorities on the charge of using violent and treasonable language concerning the king. He] . . . landed at St. Mary's [1645], while Clayborne at the same time made a fresh attempt upon Kent Island. Later events showed that under a resolute leader the Maryland Royalists were capable of a determined resistance, but now either no such leader was forthcoming, or the party was taken by surprise. Cornwallis, who seems to have been the most energetic man in the colony, was absent in England, and Leonard Calvert fled into Virginia, apparently without an effort to maintain his authority. Ingle and his followers landed and seized upon St. Mary's, took possession of the government, and plundered Cornwallis's house and goods to the value of £300. Their success was short-lived. Calvert returned, rallied his party, and ejected Clayborne and Ingle. The Parliament made no attempt to back the proceedings of its supporters, and the matter dwindled into a petty dispute between Ingle and Cornwallis, in which the latter obtained at least some redress for his losses. The Isle of Kent held out somewhat longer, but in the course of the next year it was brought back to its allegiance. [The authority of the Proprietary, was thus restored.] This event was followed in less than a twelvemonth by the death of . . . Governor [Calvert, on June 9, 1647, who before his death had named Thomas Greene as his successor. Lord] Baltimore now began to see that in the existing position of parties he must choose between his fidelity to a fallen cause and his position as the Proprietor of Maryland. As early as 1642 we find him warning the Roman Catholic priests in his colony that they must expect no privileges beyond those which they would enjoy in England. He now showed his anxiety to propitiate the rising powers by his choice of a successor to his brother. The new Governor, William Stone [who served from 1649 to 1654] was a Protestant. The Council was also reconstituted and only two Papists appeared among its members. . . . Furthermore he [Lord Baltimore] exacted from Stone an oath that he would not molest any persons on the ground of their religion, provided they accepted the fundamental dogmas of Christianity. The Roman Catholics were singled out as the special objects of this protection, though we may reasonably suppose that it was also intended to check religious dissensions. So far Baltimore only acted like a prudent, unenthusiastic man, who was willing to make the best of a defeat and save what he could out of it by a seemingly free sacrifice of what was already lost. . . . The internal condition of the colony had now been substantially changed since the failure of Ingle and Clayborne. The Puritan party there had received an important addition. . . . A number of Nonconformists had made an attempt to establish themselves on the shores of the Chesapeake Bay. . . . The toleration which was denied them by the rigid and narrow-minded Anglicanism of Virginia was conceded by the liberality or the indifference of Baltimore. The precise date and manner of their immigration cannot be discovered, but we know that by 1650 their settlement was important enough to be made into a separate county under the name of Ann Arundel, and by 1653 they formed two distinct communities, numbering between them close upon 140 householders. All that was required of them was an oath of fidelity to the Proprietor, and it seems

doubtful whether even that was exacted at the outset. They seem, in the unsettled and anarchical condition of the colony, to have been allowed to form a separate and well-nigh independent body, holding political views openly at variance with those of the Proprietor. To what extent the settlers on the Isle of Kent were avowedly hostile to Baltimore's government is doubtful. But it is clear that discontent was rife among them, and that in conjunction with the new-comers they made up a formidable body, prepared to oppose the Proprietor and support the Parliament. Symptoms of internal disaffection were seen in the proceedings of the Assembly of 1649."—J. A. Doyle, *English in America: Virginia, Maryland, etc.*, ch. 10.

ALSO IN: G. P. Fisher, *Colonial era*, ch. 5.

1649.—Act of Toleration.—"Religious liberty was a vital part of the earliest common-law of the province. At the date of the charter, Toleration existed in the heart of the proprietary. And it appeared in the earliest administration of the affairs of the province. But an oath was soon prepared by him, including a pledge from the governor and the privy counsellors 'directly or indirectly' to 'trouble, molest, or discountenance' no 'person whatever,' in the province, 'professing to believe in Jesus Christ.' Its date is still an open question—some writers supposing it was imposed in 1637; and others, in 1648. I am inclined to think the oath of the latter was but 'an augmented edition' of the one in the former year. The grant of the charter marks the era of a special Toleration. But the earliest practice of the government presents the first, the official oath the second, the action of the Assembly in 1649 the third, and to advocates of a republican government the most important phasis, in the history of the general Toleration. . . . To the legislators of 1649 was it given . . . to take their own rank among the foremost spirits of the age. Near the close of the session, . . . by a solemn act [the 'Act Concerning Religion'], they endorsed that policy which ever since has shed the brightest lustre upon the legislative annals of the province. . . . The design was five-fold:—to guard by an express penalty 'the most sacred things of God'; to inculcate the principle of religious decency and order; to establish, upon a firmer basis, the harmony already existing between the colonists; to secure, in the fullest sense, freedom as well as protection to all believers in Christianity; and to protect quiet disbelievers against every sort of reproach or ignominy."—G. L. Davis, *Daystar of American freedom*, ch. 4-7.—"In the wording of this act we see evident marks of a compromise between the differing sentiments in the Assembly. . . . It was as good a compromise as could be made at the time, and an immense advance upon the principles and practice of the age. In reality, it simply formulated in a statute what had been Baltimore's policy from the first. . . . From the foundation of the colony no man was molested under Baltimore's rule on account of religion. Whenever the Proprietary's power was overthrown, religious persecution began, and was checked so soon as he was reinstated."—W. H. Browne, *Maryland*, ch. 4.

1650-1675.—Uncertainty of Lord Baltimore's tenure under Puritan commonwealth.—Commissioners of the English parliament.—Repeal of the Act of Toleration and final restoration.—"To whatever causes . . . toleration was due, it

worked well in populating Maryland. There was an influx of immigration [1650], composed in part of the Puritans driven from Virginia by Berkeley. These people, although refusing the oath of fidelity, settled at Providence, near the site of Annapolis. Not merely the Protestant but the Puritan interest was now predominant in Maryland, and in the next Assembly the Puritan faction had control. They elected one of their leaders Speaker, and expelled a Catholic who refused to take an oath requiring secrecy on the part of the Burgesses. . . . Yet they passed stringent laws against Clayborne, and an act reciting their affection for Lord Baltimore, who had so vivid an idea of their power that he deemed it best to assent to sumptuary laws of a typically Puritan character. The Assembly appears to have acknowledged the supremacy of Parliament, while their proprietary went so far in the same direction that his loyalty was doubted, and Charles II. afterward appointed Sir William Davenant in his place to govern Maryland. This discreet conduct on the part of Lord Baltimore served, however, as a protection neither to the colonists nor to the proprietary rights. To the next Assembly, the Puritans of Providence refused to send delegates, evidently expecting a dissolution of the proprietary government, and the consequent supremacy of their faction. Nor were they deceived. Such had been the prudence of the Assembly and of Lord Baltimore that Maryland was not expressly named in the Parliamentary commission for the 'reducement' of the colonies, but, unfortunately, Clayborne was the ruling spirit among the Parliamentary commissioners, and he was not the man to let any informality of wording in a document stand between him and his revenge."—H. C. Lodge, *Short history of English colonies*, ch. 3.—"In 1652, the Commissioners of the English Parliament, arrived at Saint Mary's, deposed Governor William Stone, who had been appointed Governor of the Province in 1648, and named a Board of Councilors, for the government of Maryland, of whom Robert Brooke, of De La Brooke, was President, and, as such, acting Governor of the Province. On the dissolution of Parliament, however, Stone, in 1654, proclaimed Cromwell 'Lord Protector,' and reorganized the Proprietary government. This excited the violent opposition of the Puritan element in Maryland, who, with all available forces, invaded Saint Mary's, and finding Governor Stone without the means of effectual resistance, removed the records to Mr. Richard Preston's, near Saint Leonard's, on the Patuxent River, appointed from their own party, officials for the government of the Province, and passed laws ignoring Lord Baltimore's territorial rights, disfranchising Roman Catholics, and repealing the Toleration Act, of 1640, enacting in place of the latter, an Act concerning religion in obedience to the inspiration of their own philosophy. Governor Stone succeeded in capturing the records and restored them to the Provincial Capital, as well, also, the magazine and arms designed for the defense of Saint Leonard's, but in his effort, through the memorable battle at Providence [1655]—the first land engagement in Maryland—to reduce the insurgents to subjection, he was overwhelmingly defeated, and they continued to hold the reins of government until 1657, when, through an agreement, induced by the turn of affairs in England against Puritans, it was formerly surrendered and re-instated at Saint Mary's."—J. W. Thomas, *Chronicles of colonial Maryland*, pp. 63-64.—The proprietary government was re-established 1658, and Josias Fendall, whom Balti-

more had appointed Governor in place of Stone, was recognized. "The results of all this turbulence were the right to carry arms, the practical assertion of the right to make laws and lay taxes, relief from the oath of fealty with the obnoxious clauses, and the breakdown of the Catholic interest in Maryland politics. Toleration was wisely restored. The solid advantages were gained by the Puritan minority at the expense of the lord proprietary. In the interregnum which ensued on the abdication of Richard Cromwell, the Assembly met and claimed supreme authority in the province, and denied their responsibility to any one but the sovereign in England. Fendall, a weak man of the agitator species, acceded to the claims of the Assembly; but Baltimore removed Fendall, and kept the power which the Assembly had attempted to take away."—H. C. Lodge, *Short history of the English colonies*, ch. 3.—"When in 1658, the government of the Province was restored to the Lord Proprietary, the Acts which had been passed by the Assembly since the overthrow of his authority, and to none of which his assent had been given, were treated as nullities; and so the old law of 1649 revived. And eighteen years later, at an Assembly held in 1676, the first one after the death of Cecilius, in order to clear up the records and give certainty as to what laws were in force in the Province, an Act was passed enumerating all previous laws which had been repealed, as well as all laws which remained in force. Among the latter is found the Act of 1649 concerning Religion. The Act of 1654 is not mentioned in either category. It was recognized only during the sway of the commissioners of Parliament."—C. C. Hall, *Lords Baltimore and the Maryland palatinate*, pp. 94-95.—"Maryland did not suffer by the Restoration, as was the case with her sister colonies, but gained many solid advantages. The factious strife of years was at last allayed, and order, peace, and stability of government supervened. Philip Calvert, an illegitimate son of the first proprietary, was governor for nearly two years, and was then succeeded [1661] by his nephew, Charles, the oldest son of Lord Baltimore, whose administration lasted for fourteen. It would have been difficult to find at that time better governors than these Calverts proved themselves. Moderate and just, they administered the affairs of Maryland sensibly and well. Population increased, and the immigration of Quakers and foreigners, and of the oppressed of all nations, was greatly stimulated by a renewal of the old policy of religious toleration. The prosperity of the colony was marked."—H. C. Lodge, *Short history of the English colonies*, ch. 3.—"Upon the death of Cecilius, Lord Baltimore, in 1675, Charles succeeded to his title and estates and as third Lord Baltimore resided in the province and assumed authority in person.

1660-1776.—Colonial trade and agriculture.—Tobacco as staple product.—Attempts to encourage production of naval stores.—Supremacy of tobacco industry.—"Tobacco was almost the only product [of Maryland] grown for profit, and . . . the inhabitants were exclusively occupied in its production. While the royal governors were in Maryland the amount grown for export averaged about 25,320 hogsheads annually. The price

of tobacco in England was low and the province was far from prosperous. Toward the end of the period of royal government, however, the price in the colony rose from one and three fourths pence per pound in 1710 to two and one fourth pence in 1711,—a fact which argued hopefully for the colonists. Almost all the tobacco raised in Maryland was apparently shipped directly to England, and the large revenue, nearly 100,000 pounds annually received from colonial tobacco by the duties on its import gave rise to the greatest care in the protection of the industry and eventually in 1713 to the law easing the conditions of import into England. The slight rise in price, combined with this improvement in the arrangements made for collecting the duties on tobacco in England, while not altering conditions during the twenty-five years of royal government, certainly would seem to foreshadow prosperity for the future. It was thus in line with England's general colonial policy that Maryland should devote herself exclusively to the production of tobacco, and should neglect to exploit her natural resources of fur and fish or to raise food-stuffs for exportation. There was, however, one important respect in which this attitude of the government was qualified, to wit, in regard to naval stores, to the production of which the English statesmen at the end of the century were more than willing to give definite encouragement. Indeed, from the beginnings of English colonization it had been considered desirable that the colonies should furnish naval stores in order that the English navy might not be dependent for its existence on imports from foreign and possibly hostile countries. At first in the southern colonies the production of such stores was encouraged even at the expense of tobacco as being more directly profitable to England. Maryland promoters from the beginning reported that the soil of the province was suitable for the growth of hemp and flax, and that pitch and tar could be easily obtained from the neighboring woods. . . . In 1664, when the price of tobacco had fallen very low and the colonists were greatly in debt, the English government directed that hemp, pitch, and tar be brought into the kingdom customs free for five years, for the purpose, as the Lords Committee of Trade of the Privy Council put it of encouraging 'the planters to apply themselves to the planting of other commodities which may be of more benefit than tobacco.' In Maryland the colonial legislature supported the effort to grow hemp and flax by the passage of a number of laws, in 1671, 1683, and 1688. Unfortunately this legislation had but little effect, and the amount of hemp and flax raised in the province during the proprietary period was inconsiderable. By the end of the century the point of view of England concerning tobacco had radically changed, but the question of securing naval stores for her fleet continued to be a vital consideration. She was at war with France, and the trade for naval stores with the Baltic was in a most unsatisfactory condition. All the colonies, whatever their chief occupation, must be encouraged to produce naval stores also. The commissions sent to America by the Board of Trade in 1698 confined its attention to the investigation of the conditions for the production of such stores in the northern colonies, and at first no emphasis was laid on producing them in Maryland. The importance assigned to the whole question in England, however, did influence the resident royal officials in Maryland to emphasize strongly in their letters to the home government the suitability of

that province for the production of naval stores as well as of tobacco. . . . The conclusions . . . on the staple products of Maryland may be broadly stated. The colonial authorities never succeeded in inducing the inhabitants to turn their attention to exporting furs or fish or food-stuffs, and the royal governors at the end of the century not only acquiesced in the natural line of economic development in the colony, but did everything in their power to foster the growth of tobacco. This was to an even greater extent the aim of the English government which the colonial governors represented, but on account of the necessities of the English fleet the home authorities were forced to make one exception to their policy in the encouragement of the production of naval stores in Maryland as well as in the other colonies,—an effort that proved to be futile. The staple commodity of Maryland was, and continued to be, tobacco, and with a few minor exceptions it was tobacco only that was produced in sufficiently large quantities to be exported to England or to the English colonies."—M. S. Morris, *Colonial trade of Maryland*, pp. 51-53.—See also AGRICULTURE: Modern; United States: Beginnings.

1664-1682.—Claims to Delaware disputed by duke of York.—Grant of Delaware by the duke to William Penn. See PENNSYLVANIA: 1682.

1675-1691.—Charles, third Lord Baltimore and second proprietary.—Codification of laws.—Indian troubles.—Friction with revenue collectors.—Protestant associators.—"Charles, the third Lord Baltimore and second Proprietary of Maryland, succeeded to the title upon the death of his father, in November, 1675. . . . In 1676, the year after his accession, he convened the Assembly for the purpose of revising the laws of the Province, and at this session an Act was passed which was practically a codification of the existing laws, as it enumerated all previous laws which remained in force. . . . In 1675, the Susquehannough Indians, whose hunting grounds were to the north of Maryland, and who had by treaties been taken to a certain extent under the protection of the Province, had become greatly reduced in power, and their numbers diminished, by the ravages of small-pox. At this time a fierce descent was made upon them by their ancient enemies, the warlike Senecas, and the Susquehannoughs fled in dismay across Maryland to the old camping grounds of the Piscataways. . . . Shortly after, several murders were committed by Indians on both sides of the Potomac. Of these the Susquehannoughs were accused, and a number of them were killed in reprisals in Virginia. A force was raised,—of Virginians, commanded by Colonel John Washington, and of Marylanders, commanded by Major Thomas Truman, who was a member of the Council. A party of Indians was besieged in a blockhouse near the Potomac, in which they had taken refuge. They insisted that they were innocent of the murders, and five of their chiefs came to a parley. . . . Their protestations failed to convince Colonel Washington, and it came about that these five men, who, though savages, had come as envoys on an errand of peace, were put to death with the consent and by the authority of Major Truman. For this act of treachery he was impeached by the Maryland Assembly, but escaped punishment by that body on account of a disagreement between the two houses as to the character of his crime. . . . It was unfortunate for Lord Baltimore that at a time when his presence was urgently required in England, it was no less needed in Maryland.

Upon his departure,—his eldest son, Cecilius, having died a few years before,—he appointed his infant son, Benedict Leonard, Governor, with a board of Deputy Governors, of which George Talbot, an Irishman and a kinsman of Lord Baltimore's cousin, Sir William Talbot, was named as first, or President. . . . Much friction had been caused by the behavior of the collectors of the royal revenues from customs, and charges and countercharges of misconduct were made. . . . Disputes and antagonisms naturally arose, and upon the representations of the collectors, Lord Baltimore was required to pay a fine of £2500 for losses to the royal revenues alleged to have resulted from his negligence in suppressing smuggling and failing to render assistance to the collectors. . . . Upon the accession of William and Mary, Lord Baltimore at once despatched a special messenger from England with an order to the Council to proclaim the new Sovereigns. The messenger died on the voyage and the order was not delivered. Consequently, William and Mary were proclaimed in Virginia and New England while Maryland remained silent. . . . The malcontents seized upon it as evidence of Lord Baltimore's adherence to the cause of the dethroned monarch. . . . In addition to the charges brought against him in relation to the customs revenues, Lord Baltimore had been accused of treating the Protestants unfairly; and now the time to strike was ripe. A rumor was started that the Roman Catholics had entered into a conspiracy with the Indians to murder all the Protestants in the Province, and that large bodies of the savages were actually moving on the settlements. . . . John Coode, who had been associated with Fendall in sedition and an attempted insurrection ten years before, was the chief instigator. Coode had been a Roman Catholic and then a Protestant. . . . He gathered an armed force, and with his associates put forth a declaration replete with the well-worn cries of 'popery' and 'Jesuit,' and in which the tyrannical character of the popish government of Lord Baltimore was duly dilated upon. . . . The force led by Coode besieged the members of the Council in a fort at Mattapony, in which they had taken refuge, and obtained their surrender [August, 1689]. These insurgents then organized themselves under the title of Associators, and for a while carried things with a high hand, imprisoning not only Roman Catholics, but also any Protestants who resisted their lawless proceedings."—C. C. Hall, *Lords Baltimore and the Maryland palatinate*, pp. 101-103, 118-123.—"With the power in their own hands, Coode and his associates, issued the famous 'Declaration of the Protestant Associators,' selected a Council for the government of the Province, of which Nehemiah Blackiston, of 'Longworth Point,' was President, and sent an address to William and Mary, in which they detailed the results of the revolution, assigned the 'defense of the Protestant religion' as the reason for it, and asked that the Province be placed under the protection of the English Government."—J. W. Thomas, *Chronicles of colonial Maryland*, pp. 60-70.

1681-1685.—Boundary dispute with William Penn, in its first stages. See PENNSYLVANIA: 1685.

1688-1757.—Lord Baltimore deprived of the government.—Change of faith and restoration of his son.—Intolerance revived.—Lord Baltimore, "though guilty of no maladministration in his government, though a zealous Roman catholic, and firmly attached to the cause, of king James II., could not prevent his charter from being questioned in that arbitrary reign, and a suit from

being commenced to deprive him of the property and jurisdiction of a province granted by the royal favour, and peopled at such a vast expense of his own. But it was the error of that weak and unfortunate reign, neither to know its friends, nor its enemies; but by a blind precipitate conduct to hurry on everything of whatever consequence with almost equal heat, and to imagine that the sound of the royal authority was sufficient to justify every sort of conduct to every sort of people. But these injuries could not shake the honour and constancy of lord Baltimore, nor tempt him to desert the cause of his master. Upon the revolution [1688] he had no reason to expect any favour; yet he met with more than king James had intended him; he was deprived indeed of all his jurisdiction [1691], but he was left the profits of his province, which were by no means inconsiderable."—W. H. Browne, *Maryland*, ch. 11.—"From this time, that is from 1602, until 1715, a period of twenty-three years, the administration of the Province was in the hands of governors appointed by the Crown. The authority of the Lords Baltimore was in abeyance. They were no longer Absolute Lords as prescribed in the charter of Maryland, but they remained Proprietaries, in the sense that they were lords of the soil. They were deprived of the right of government, but their territorial rights were not infringed. . . . King William decided to assume control of the Province for the Crown, and appointed as Governor, Sir Lionel Copley, the first royal governor of Maryland. Upon arriving in the colony, Sir Lionel immediately terminated the provisional government . . . and convened an Assembly. . . . The first Act of the Assembly was naturally one of recognition of the authority of William and Mary. . . . The second law passed was one for the establishment of the Church of England, and the imposition of a tax of forty pounds of tobacco per poll for the support of the clergy of that Church. . . . [This act was amended in 1695 and in 1696 an entirely new act was passed by which the acts of 1602 and 1605 were repealed, but with their principal provisions re-enacted in greater detail.] While the government of the Lord Proprietary had been overthrown, the Crown respected his rights as Proprietor. . . . The Maryland Assembly undertook to dispute these rights, and to harass Lord Baltimore's agents in their attempts to collect his private revenues. He had again to appeal to the King, who specially instructed Sir Lionel Copley to take care that the agents of Lord Baltimore should be permitted to live peaceably and quietly, and to act as formerly in receiving his Lordship's dues and revenues in the Province. . . . The City of St. Mary's . . . was situated at a remote corner of the Province and was inconvenient of access to settlers established along the upper portion of the bay, and at the heads of the rivers. A more central location, near the old Puritan settlement on the banks of the Severn, was selected as the future seat of the government and thither it was removed in 1604. To this place was given the name of Anne Arundel Town, afterwards changed to Annapolis. . . . Sir Lionel Copley died in 1603, and Francis Nicholson, who had been commissioned Lieutenant-Governor, was absent in England. Sir Edmund Andros, who was then serving as Governor of Virginia, thereupon assumed the Governorship of Maryland. . . . The Assembly, however, objected, . . . and Sir Edmund retired, leaving the government to be administered by the President of the Council until Nicholson's arrival. . . . [Governor Nicholson] secured the foundation of William and Mary College

in Virginia, and his efforts in Maryland resulted, in 1696, in the establishment of King William School at Annapolis, to the support of which he was himself a generous contributor. He was succeeded in 1698 by Nathaniel Blackstone, who retired in 1701, on account of enfeebled health. It is an indication of the esteem in which he was held in the colony that, upon his departure for England, he was requested by the Assembly to act as its agent, to look after the interests of the Province with Crown and Parliament. The next royal governor was John Seymour, who was appointed in 1704, the office having been, meanwhile, administered by Thomas Tench, President of the Council. . . . In 1709, Governor Seymour died, and the Governorship then devolved upon Edward Lloyd, President of the Council, and so remained until the appointment of John Hart, the last of the royal governors, in 1714, one year before the restoration of the Proprietary government. The period of the royal governors witnessed a marked change in the constitutional character of the government of the Province. The lower house of the Assembly acquired larger powers as a coordinate branch of the legislative body, and sought continually to extend those powers. It called in question the powers of the governors, as in the case of Governor Seymour's attempt to grant a charter to Annapolis, and held them to the letter of their commissions."—C. C. Hall, *Lords Baltimore and the Maryland palatinate*, pp. 125, 128-135.—"One of the last acts of the royal government was also one of the best. The laws of the province, many of which had been enacted for limited times, while alterations and amendments had frequently taken place, had fallen into great confusion. By the Assembly of 1715 a complete revision was made. . . . So well was this work done that it laid the foundations of legislation that has lasted almost to the present day."—J. M. Gambrill, *Leading events of Maryland history*, p. 71.—"Upon the death of Charles, third Baron, which occurred on February 20th, 1714/5, his son, Benedict Leonard, succeeded to the title, which he held, however, for a few weeks only, as his own death followed on April 5th, of the same year (1715). Benedict Leonard had, in 1713, publicly renounced the Roman Catholic faith and attached himself to the Church of England. . . . Charles, the fifth Baron, succeeded to the title. . . . He was then sixteen years of age, and his guardian, Lord Guilford, lost no time in representing to the King, George I., the fact that his ward was a Protestant, and that therefore no political reason existed for delaying the restoration to him of the government of the Maryland Province. The King was equally prompt to act, and in May, 1715, the palatinate authority was restored to the infant Lord Baltimore under the terms of the original charter granted eighty-three years before."—C. C. Hall, *Lords Baltimore and the Maryland palatinate*, pp. 135, 140.—"When his descendants had conformed to the church of England, they were restored [1741] to all their rights as fully as the legislature had thought fit that any proprietor should enjoy them. When upon the revolution power changed hands in that province, the new men made but an indifferent requital for the liberties and indulgences they had enjoyed under the old administration. They not only deprived the Roman Catholics of all share in the government, but of all the rights of freemen; they have even adopted the whole body of the penal laws of England against them; they are at this day [1757] meditating new laws in the same spirit, and they would undoubtedly go to the greatest lengths in

this respect, if the moderation and good sense of the government in England did not set some bounds to their bigotry."—E. Burke, *Account of the European settlements in America*, v. 2, p. 7, ch. 18.—"We may now place side by side the three tolerations of Maryland. The toleration of the Proprietaries lasted fifty years, and under it all believers in Christ were equal before the law, and all support to churches or ministers was voluntary; the Puritan toleration lasted six years, and included all but Papists, Prelatists, and those who held objectionable doctrines; the Anglican toleration lasted eighty years, and had glebes and churches for the Establishment, connivance for Dissenters, the penal laws for Catholics."—W. H. Browne, *Maryland*, ch. 11.

1690.—First Colonial Congress.—King William's War. See U.S.A.: 1690.

1715-1751.—Rule of fourth proprietary.—"The rule [1715-1751] of the fourth proprietary [Charles] was, on the whole, mild and just. The royal governor, Hart, was continued in office for a time. He was succeeded in turn by Charles Calvert, probably a relative of the proprietary, and Benedict Leonard Calvert, brother of the proprietary. The latter was succeeded, on his resignation in 1731, by Samuel Ogle. Lord Baltimore was present and governed personally from December, 1732, to June, 1733. The period was one of peace and prosperity, but was marked by struggles between the two houses of Assembly, the lower house jealously guarding the rights and liberties of the people. Highly significant was the determined stand made by the people and their representatives in Maryland for all the rights and privileges of the people of England, in particular their contention that Maryland was entitled to the benefit of the common and statute law of England. This was undoubtedly one of the far-off beginnings of the American Revolution."—J. M. Gambrill, *Leading events of Maryland history*, p. 72.—"During the lifetime of Charles, Lord Baltimore, the requisitions of the Crown upon the American colonies for troops and money were frequent, and the lower house of the Assembly in Maryland persisted in finding means for withholding the supplies, by coupling to the appropriation bills conditions which the upper house would not accept. They were generally framed so that the duties levied for the use of the Proprietary should be reduced by an amount sufficient to offset the levy made for the Crown."—C. C. Hall, *Lords Baltimore and the Maryland palatinate*, p. 160.

1718-1776.—Suffrage qualifications. See SUFFRAGE, MANHOOD: United States: 1621-1776.

1729-1730.—Founding of Baltimore.—"Maryland had never taken kindly to towns, and though in Queen Anne's reign, in conformity with the royal wish, a number were founded, the reluctant Assembly 'erecting' them by batches—42 at once in 1706—scarcely any passed beyond the embryonic stage. . . . St. Mary's and Annapolis, the one waning as the other waxed, remained the only real towns of the colony for the first 90 years of its existence. Joppa, on the Gunpowder, was the next, and had a fair share of prosperity for 50 years and more, until her young and more vigorous rival, Baltimore, drew off her trade, and she gradually dwindled, peaked, and pined away to a solitary house and a grass-grown grave-yard, wherein slumber the mortal remains of her ancient citizens. Baltimore on the Patapsco was not the first to bear that appellation. At least two Baltimores had a name, if not a local habitation, and perished, if they can be said ever to have rightly existed, before

their younger sister saw the light. . . . In 1729, the planters near the Patapsco, feeling the need of a convenient port, made application to the Assembly, and an act was passed authorising the purchase of the necessary land, whereupon 60 acres bounding on the northwest branch of the river, at the part of the harbor now called the Basin, were bought of Daniel and Charles Carroll at 40 shillings the acre. The streets and lots were laid off in the following January, and purchasers invited. The water-fronts were immediately taken up."—W. H. Browne, *Maryland*, ch. 12.

Also in: J. M. Gambrill, *Leading events of Maryland history*, pp. 74-76.

1751-1775.—All vestige of power gradually lost to proprietary government.—"Upon the death of Charles, Lord Baltimore, on April 24th, 1751 . . . the title and estates devolved upon his son Frederick, who was then a minor. . . . History records little, if anything, concerning Frederick that is to his credit. . . . In 1768, Frederick was tried at the Kingston Assizes for an infamous crime. . . . He was acquitted. . . . The news of the charge against him, and of the trial, extinguished in the Maryland Province whatever vestige of regard or loyalty remained for the Proprietary, whom the people had never seen, and whose exactions had been long resented. His death occurred in Naples, September 14th, 1771. . . . Frederick, Lord Baltimore, left no legitimate offspring. . . . [By his will] Frederick devised the Province to his natural son, Henry Harford . . . [and the executors] secured his recognition by the Assembly of Maryland."—C. C. Hall, *Lords Baltimore and the Maryland palatinate*, pp. 158, 162, 168-169.—"The proprietary government gradually lost power, and ceased to rule except in name, as the people assumed control of their own affairs. A temporary government was formed. The supreme authority was in the hands of a Convention, composed of delegates from all the counties; the executive power was vested in a Council of Safety; and county affairs were controlled by Committees of Observation. In July, 1775, the Convention formally assumed the control of affairs. A declaration was drawn up in which the wrongs committed by the British government were recited, and it was declared that the choice now lay between 'base submission or manly opposition to uncontrollable tyranny,' and that the framers were 'firmly persuaded that it is necessary and justifiable to repel force by force.' The authority of the Convention was supreme, yet its exercise was always characterized by moderation and a respect for the forms of law. Its management of affairs was just and admirable."—J. M. Gambrill, *Leading events of Maryland history*, pp. 80-90.

1763-1776.—Proprietary tax dispute.—Resistance to "Stamp Act."—Burning of the Peggy Stewart.—Proclamation of Freeman.—Declaration of Independence adopted.—"During the French and Indian War there were many sharp disputes between the governor [Horatio Sharpe] and the lower house of Assembly. The lower house

resisted the demands of the king and insisted that the proprietary should pay a share of the expenses for the defense of the province by paying taxes on his estates. This was of course resisted by the governor, who was bound to protect the interests of the proprietary, but after a severe struggle he was obliged to yield. . . . When the time came for the Stamp Act to go into operation, the court of Frederick county boldly declared that its business should be carried on without stamped paper, and other courts followed the example. . . . Governor Sharpe was succeeded in June, 1769, by Sir Robert Eden, the last proprietary governor of Maryland. . . . The new governor was scarcely seated before he met with opposition. There was a heated dispute between the houses of Assembly in 1770, as a result of which the session ended without the renewal of the acts fixing the fees of officers of the government and imposing the tax for the support of the Episcopal church, these acts having expired in that year. The Governor thereupon revived the old acts by proclamation, which the people regarded as an invasion of their rights, and resisted accordingly."—J. M. Gambrill, *Leading events of Maryland history*, pp. 82, 84-86.—"It has been said that Maryland was slow in voting for independence, but her emphatic resistance of all attempts toward an infringement of her rights and liberties are direct contradictions to any suggestion of a want of patriotism. In open day her Sons of Liberty had burned [Oct. 14, 1774] the Peggy Stewart and put the tax collector to flight more than two years before the Declaration of Independence. . . . A year before the final break the Convention of Maryland subscribed to the Declaration of the Association of Freeman, and public meetings were held in the counties and resolutions adopted and representative citizens named as committees of correspondence and observation to carry the resolutions of the convention into effect. The Proclamation of the Freeman of Maryland, which was signed July 26, 1775, reads [in part] as follows: . . . 'Resolved, That the said colonies be put into a state of defense, and now support, at the point of expense, an army to restrain the further violence and repel the future attacks of a disappointed and exasperated enemy. We, therefore, inhabitants of the Province of Maryland, firmly persuaded that it is necessary and justifiable to repel force by force, do approve of the opposition by arms to the British troops employed to enforce obedience to the late acts and statutes of the British Parliament for raising revenue in America, and altering and changing the Charter and Constitution of Massachusetts Bay, and for destroying the essential securities for the lives, liberties and properties of the subjects in the United Colonies. And we do unite and associate as one land, and firmly and solemnly engage and pledge ourselves to each other and to America that we will to the utmost of our power promote and support the present opposition, carrying on as well by arms as by the Continental Association restraining our commerce.' . . . Maryland proposed the Continental Congress, selected Philadelphia as its place of meeting, fixed the time as September (1774) and chose the first delegates. . . . John Rogers and Thomas Stone cast the vote of Maryland on the momentous Fourth of July, 1776, when the Declaration of Independence was formally adopted."—H. D. Richardson, *Side-lights on Maryland history, with sketches of early Maryland families*, pp. 374-372, 375-376.

1776.—End of proprietary and royal government.—Formation and adoption of state constitution.—"In Maryland the . . . political power

was vested in a Convention which created the Council of Safety and provided for the common defence. This was, however, so much under the control of the proprietary party and timid Whigs that, on the 21st of May [1776], it renewed its former instructions against independence. . . . The popular leaders determined 'to take the sense of the people.' . . . Meetings were called in the counties," which promptly declared for independence, with so much effect that on the 23d of June "the British man-of-war, Fowey, with a flag of truce at her top-gallant mast, anchored before Annapolis; the next day, Governor Eden was on board; and so closed the series of royal governors on Maryland soil."—R. Frothingham, *Rise of the republic*, pp. 525-527.—"Elections were held throughout the state on the 1st day of August, 1776, for delegates to a new convention to form a constitution and state government. . . . On the 14th of August this new body assembled. . . . On the 3d of November the bill of rights was adopted. On the 8th of the same month the constitution of the State was finally agreed to, and elections ordered to carry it into effect."—J. McSherry, *History of Maryland*, ch. 10.—See also U.S.A.: 1776-1779.

1776-1783.—War of Independence, to Peace with Great Britain. See U.S.A.: 1776, to 1783 (June).

1776-1783.—Formation of state government.—Reforms inaugurated.—Annapolis temporary capital of the United States.—The bill of rights "set forth in a general way the rights of the people, such as freedom of worship, the right to make their own laws, and to alter the form of their own government; . . . [the constitution] replaced the charter, fixing the form of government. There were three departments of the government: the legislative, or lawmaking; the executive, or law-enforcing; and the judicial which explains the laws and by applying them directly to men's actions dispenses justice. The legislative power was vested in a General Assembly, composed of two branches, the senate and the house of delegates. The chief executive power was vested in a governor. The judicial power was vested in the judges of the various courts. The delegates were elected by the people, while the senators were elected by a college of electors who were chosen by the people, nine senators to be chosen from the Western Shore and six from the Eastern. The governor was elected annually by the legislature, and had no veto power; he had an executive council to assist him, and he could not serve for more than three years at a time. The judges were appointed by the governor with the advice of the senate. A man must be worth a certain amount in order to vote, in order to be a delegate he must be worth more, in order to be a senator he must be worth still more, while to be a governor he must be yet richer. These restrictions have long since been removed. Under this Constitution Thomas Johnson was elected first governor of Maryland. He was proclaimed as such at Annapolis on March 21, 1777, amid the rejoicings of the people."—J. M. Gambrell, *Leading events of Maryland history*, pp. 94-95.—"The firmness and energy of Thomas Johnson, the first governor, proved fully equal to the task of organization, and of enforcing the measures adopted by the Assembly. The administration of his successor, Thomas Sim Lee, was also efficient. The reforms introduced in the judiciary carried out the programme of separating the three departments of the government. The right of justices of the peace to hear petty cases with an appeal to the county court, the ordinary *nisi prius* tribunal, was not disturbed. The Provincial Court was merged into a

General Court, which had formerly been held by one of the Provincial Court justices. A new official, the chancellor, was provided to preside over the Chancery Court in place of the governor. Instead of the governor and council the constitution established a court of appeals to hear cases from the General Courts, from the Admiralty Court, and from the Court of Chancery. The Assembly completed the judicial reorganization by substituting for the old probate system of a commissary general and his deputies an orphans' court in each county to be held by justices of the peace. The constitution had already ordered the appointment of a registrar of wills for every county. Nominations were made by the Assembly April 3, 1777, for a chancellor, for judges of the General and Admiralty Courts, or registrars of wills and for justices of the peace. The governor and council appointed the justices to serve in the orphans' courts, June 4, 1777. There is no record of a choice for the five judges of the Court of Appeals before December 12, 1778. . . . The reestablishment of judicial procedure constituted a very necessary measure. The suspension of all suits by order of the convention had greatly confused judicial business. The Assembly decreed that after July 1, 1777, suits might be begun, and that all civil actions pending July 26, 1775, should be reinstated in their former conditions. Legal procedure under the Provincial government was declared valid under the new administration. The county courts were to meet as under former laws. The first sitting of the General Court was fixed, for the Eastern Shore at Talbot courthouse the second Tuesday in September, for the Western Shore at Annapolis the second Tuesday in October. Two annual sittings on each shore were provided. Although the Assembly appointed the first Tuesday in October, 1777, for the initial session of the Court of Appeals, as has already been shown, the justices of this court were not named until late in 1778. Two annual sessions of the Court of Appeals were held. . . . Needed reforms in judicial procedure were not altogether neglected. A proposal of the House of Delegates to revise completely the criminal law failed, although the Senate proposed a joint recess committee to consider this undertaking. As the records of the Assembly for this period show no further action, this revision was probably overshadowed by the many important matters for the consideration of the Assembly."—B. W. Bond, *State Government in Maryland (Johns Hopkins University Studies in Historical and Political Science, March-April, 1905)*.—The legislature elected William Paca as successor to Governor Lee on November 22, 1782. "By invitation of the state, Annapolis became temporarily the capital of the United States. There, in the Senate Chamber of the State House, December 23, 1783, George Washington surrendered his commission to Congress."—J. M. Gambrell, *Leading events of Maryland history*, p. 95.

1776-1784.—Influence of Maryland in founding Western domain.—"The immense importance of the region northwest of the Ohio as a source of national revenue, when the tide of emigration should set in, was recognized as early as 1776. Silas Deane, the agent whom the Continental Congress had sent to France, addressed a communication to the Committee of Secret Correspondence, calling the attention of Congress to that triangular region described in general, by the Ohio, the Mississippi, and the parallel of Fort Detroit. 'These three lines,' he says, 'of near one thousand miles each, include an immense territory, in a fine climate, well watered, and, by accounts, exceed-

ingly fertile. To this I ask your attention, as a resource amply adequate, under proper regulations, for defraying the whole expense of the war.' The first move that was ever made in Congress towards the assertion of national sovereignty over this western country, was made by Maryland. On the 15th of October, 1777, exactly one month before the Articles of Confederation were proposed to the Legislature for ratification, it was moved 'that the United States in Congress assembled, shall have the sole and exclusive right and power to ascertain and fix the western boundary of such States as claim to the Mississippi or South Sea, and lay out the land beyond the boundary, so ascertained, into separate and independent States, from time to time, as the numbers and circumstances of the people may require.' Only Maryland voted in the affirmative. But in this motion was suggested that idea of political expansion under the sovereign control of Congress, which ultimately prevailed and constituted, upon grounds of necessity, a truly National Republic. Not only the suggestion of a firm and lasting union upon the basis of a territorial commonwealth, but the chief influence in founding such a union, must be ascribed to Maryland. . . . The original proposition that Congress should exercise sovereign power over the western country was a pioneer thought. . . . We have discovered by a careful examination of the Journals of the Old Congress, that Maryland was not only the first, but for a long time the only State, to advocate national jurisdiction over the western lands. The opposition to the establishment of a public domain, under the sovereign control of Congress was so great, at the outset, that the States possessing land claims succeeded, a few days after Maryland's motion, in adding a clause to the Ninth Article of the Confederation, to the effect that no State should be deprived of territory for the benefit of the United States. . . . What these States desired was either a share in the revenues arising from the western country, or, that the funds accruing from the sale of western lands should be applied towards defraying the expenses of the war. But of the western lands as the basis of republican expansion under the national jurisdiction of Congress, these States seemed to have no conception whatever. Rhode Island, in a proposed amendment to the Articles of Confederation, expressly declared that all lands within those States, the property of which before the war was vested in the Crown of Great Britain, should be disposed of for the benefit of the whole confederacy, 'reserving, however, to the States within whose limits such Crown lands may be, the entire and complete jurisdiction thereof.' New Jersey, in her remonstrance to the Ninth Article, while demanding that the Crown lands should be sold by Congress for defraying the expenses of the war, admits that, 'The jurisdiction ought, in every instance, to belong to the respective States within the charter or determined limits of which such lands may be seated.' Delaware also had a keen sense of the common interest of all the States in the sale of the unoccupied western lands, but of that interest as the basis of a truly national commonwealth, she seems to have had no appreciation whatever. The credit of suggesting and successfully urging in Congress, that policy which has made this country a great national commonwealth, composed of 'free, convenient, and independent governments,' bound together by ties of permanent territorial interests, the credit of originating this policy belongs to Maryland, and to her alone. Absolutely nothing had been effected by Rhode Island, New Jersey, and Delaware, before they ratified the Articles,

towards breaking down the selfish claims of the larger States and placing the Confederation upon a national basis. Delaware, the last of all the States, except Maryland, to ratify the Articles, acceded to the latter, February 22, 1779, under a mild protest, which Congress allowed to be placed on file, 'provided,' as was said, 'it should never be considered as admitting any claim.' Maryland was left to fight out the battle alone. . . . The 'Instructions' of Maryland to her delegates, which were read in Congress, May 21, 1779, after the accession of Delaware, as above stated, forbidding them to ratify the Articles of Confederation before the land-claims had been placed upon a different basis, must be regarded as one of the most important documents in our early constitutional history, for it marks the point of departure for those congressional enactments of the 6th of September and 10th of October, 1780, which were followed by such vital results for the constitutional as well as the material development of this country. From the effect of these instructions upon the acts and policy of Congress, we shall be able to trace out, from documentary evidence, that line of events which led to the great land-cessions of Virginia and New York, and to the Ordinance of 1784 for the government of the ceded territory, which Ordinance was termed 'a charter of compact,' the articles of which should stand as 'fundamental constitutions' between the thirteen original States and each of the new States therein described. The following brief citations from the original document will suffice to convey its tenor and spirit, and to indicate the attitude of Maryland towards the Confederation: 'Although the pressure of immediate calamities, the dread of their continuance from the appearance of disunion, and some other peculiar circumstances, may have induced some States to accede to the present confederation, contrary to their own interests and judgments, it requires no great share of foresight to predict that when those causes cease to operate, the States which have thus acceded to the confederation will consider it no longer binding, and will eagerly embrace the first occasion of asserting their just rights and securing their independence. Is it possible that those States, who are ambitiously grasping at territories, to which, in our judgment, they have not the least shadow of exclusive right, will use with greater moderation the increase of wealth and power derived from those territories, when acquired, than what they have displayed in their endeavors to acquire them? We think not. . . . Suppose, for instance, Virginia, indisputably possessed of the extensive and fertile country to which she has set up a claim, what would be the probably consequences to Maryland? . . . Virginia, by selling on the most moderate terms, a small proportion of the lands in question, would draw into her treasury vast sums of money and . . . would be enabled to lessen her taxes: lands comparatively cheap and taxes comparatively low, with the lands and taxes of an adjacent State, would quickly drain the State thus disadvantageously circumstanced, of its most useful inhabitants, its wealth; and its consequence, in the scale of the confederated States, would sink of course. A claim so injurious to more than one-half, if not the whole of the United States, ought to be supported by the clearest evidence of the right. Yet what evidences of that right have been produced? . . . We are convinced, policy and justice require that a country unsettled at the commencement of this war, claimed by the British crown, and ceded to it by the treaty of Paris, if wrested from the common enemy by the blood and treasure of the thirteen States, should be con-

sidered as a common property, subject to be parcelled out by Congress into free, convenient and independent governments, in such manner and at such times as the wisdom of that assembly shall hereafter direct. . . . We have spoken with freedom, as becomes freemen, and we sincerely wish that these our representations may make such an impression on that assembly [Congress] as to induce them to make such addition to the articles of confederation as may bring about a permanent union."—H. B. Adams, *Maryland's influence in founding a national commonwealth*, pp. 27-33.—See also U.S.A.: 1781-1786; also Historical geography.

1776-1787.—Suffrage qualifications. See SUFFRAGE, MANHOOD: United States: 1776-1787.

1777-1781.—State aid to Continental army.—"The aid to the Continental army during the period 1777 to 1781 forms probably the most important phase of the support which Maryland accorded Congress. Situated between the northern and southern campaigns, the abundant resources of Maryland were not exhausted by much actual conflict, or by the presence of large bodies of troops. . . . The exhaustion of the resources of many States by the trying winter of 1780 to 1781 induced a request on June 2, 1780, for a large monthly supply from Maryland. . . . Large quantities of wheat, flour, and other provisions were sent to the New England States, to Virginia, to the Bermudas, and to the French fleet."—B. W. Bond, *State government in Maryland (Johns Hopkins University Studies in Historical and Political Science, Mar.-Apr., 1905)*.

1787-1788.—Opposition to slave trade at constitutional convention.—At the time of the constitutional convention, Maryland made an effort to stop the traffic in African slaves. "The slave trade was then actively carried on by the North, and to check it, Maryland, through Luther Martin, her representative in the convention, appealed to that body to stop this pernicious traffic. . . . This was the first word said in the convention of 1787 against the above proposition to permit the indefinite continuance of the slave trade to all the States in the Union. Maryland, . . . acting in her own sovereign capacity, had in fact as early as 1783, prohibited the African slave trade, and her representative now wished the Federal Union to have the power to imitate her example."—J. T. Scharf, *History of Maryland*, v. 3, pp. 295-296.

1787-1788.—Adoption and ratification of Federal constitution. See U.S.A.: 1787; 1787-1780.

1788.—Cedes land for District of Columbia. See DISTRICT OF COLUMBIA: Location.

1800-1864.—Manhood suffrage qualifications. See SUFFRAGE, MANHOOD: United States: 1800-1864.

1812-1814.—War of 1812.—Coast of Chesapeake bay harried by British.—Movement of British fleet against Baltimore.—In a series of disputes with England which brought on the war of 1812, Maryland took an active part. Upon Maryland, the New England states laid the blame of the conflict, and against Maryland the British offensive was especially directed. (See also U.S.A.: 1812 [June-October].) "In the spring of 1813, the enemy's naval force left their anchorage at Lynn Haven, and moved up the Chesapeake Bay. [See U.S.A.: 1812-1813: Indifference to the Navy.] A general alarm was excited amongst the inhabitants of its shores; and unused as they were to a state of war, the first demonstrations of outrage and the system of plunder and destruction

which Cockburn began, were of a nature to terrify a people who had so long enjoyed tranquillity and peace. . . . About the first of April, the enemy moving up the bay, and as he advanced, sending his tenders and barges into most of the navigable inlets, the case of invasion or threatened invasion occurred at almost every point; and parties of militia were hastily formed to repel it, and disbanded when the danger seemed past. . . . On the 16th of April, the fleet threatened the city of Baltimore, which was 'pointed out for military execution in papers published by citizens of the United States,' and the jealousies and animosities of other cities scarcely concealed their joy of her impending ruin. . . . Maryland had already been notified by the secretary of war that she was to expect little, if any help from the Federal Government. Nothing was then left her to depend on but her local militia. . . . [In 1814] General Ross openly boasted, that though the heavens 'rained militia,' he would make his winter quarters in Baltimore. . . . About two o'clock on Tuesday morning, September 13th, the enemy opened fire [on Fort McHenry] from his five bomb vessels at the distance of about two miles; and the whole of Tuesday and Tuesday night was employed in an effort to subdue the passive resistance of the fort by an incessant shower of shell. [See U.S.A.: 1814 (August-September).]—J. T. Scharf, *History of Maryland*, v. 3, pp. 37-38, 99, 116.

1820-1860.—Movement toward extinction of slavery.—Objection to Abolition movement.—Interests at stake in attempt to preserve union.—Between 1820 and 1860 the chief item of general historical interest in Maryland was the development of the feeling of the state on the subject of the slavery issue which was agitating the Union. Though Maryland, from the first, had been permeated with anti-slavery sentiments, she was separated from the Northern states by a variety of commercial, economic, and social jealousies, which had been obvious enough during the War of 1812, and which did not tend to decrease. Consequently she was quite prepared to look upon the growth of the abolition movement in New England and the rest of the North as unwarranted meddling on the part of her ancient enemies. At the same time the lot of the negro slave in Maryland steadily improved. "Before 1840, all persons of color were slaves. In 1790, not quite one out of every fourteen was free. In thirty years from that period (1820) the number of free had increased to 44,730, and here the proportion of considerably more than one-fourth of the total number of their race in the State. During the same period the entire increase of the slaves was but 3,968, being less than four per cent. In 1830, more than one-third of the colored people of the State were free, and in 1840, the proportion of free colored to the slaves was as 64 to 69—or more than two-fifths of the whole. It will also be seen that for thirty years, from 1810, the number of slaves diminished 21,796. . . . Slaves in Maryland had become very uncertain and uncomfortable property. In fact, public sentiment was in favor of the gradual extinction of slavery in the State; but in consequence of the violent denunciation and improper interference of Northern abolitionists, a reaction had taken place, not in public sentiment, but in public policy. . . . [This excitement] compelled the passage of the most stringent laws against slaves at the very moment when they were rapidly acquiring public sympathy, and when the Legislature was making

the most liberal appropriations for the comfort of the colored race. . . . Maryland, as an exposed and frontier slaveholding State, had a larger practical interest in the maintenance of the guarantees of the Constitution in regard to slavery than South Carolina, Georgia, Alabama, and Mississippi put together. From her geographical position, she had a heavier stake, proportionately, in the preservation of the Union, so far as her material prosperity was concerned, than any of her sister commonwealths. This was clearly demonstrated by a consideration of the sources of her wealth, the nature and direction of her industry and of her commerce, external and internal."—J. T. Scharf, *History of Maryland*, v. 3, pp. 319-320, 331-332, 361.

1824-1847.—Interest in project of Liberia. See LIBERIA: 1824-1847.

1837-1851.—Constitutional changes.—Agitation over repudiation of state bonds.—Payments resumed.—"The Constitution, in 1837, was revised. Representation was more fairly apportioned; the counties sent delegates according to population. Annapolis lost her delegates, and Baltimore sent the same number as the largest counties. The electoral college was abolished, and the election of the senators given to the people. The governor's council was abolished, and the governor elected by the people. In 1802 the property qualification for voting was abolished, and that for holding office followed in 1810; in 1825 Jews, who before this time were not allowed to hold any public office, were placed on the same footing with Christians; and in 1846 the sessions of the General Assembly were made biennial. The old Constitution having become 'a thing of shreds and patches,' a new one was adopted by the people in 1851. The term of the governor and of senators was made four years, and it was provided that the judges and many other officers should be elected by the people. Imprisonment for debt was abolished. It is apparent that the general tendency of all these reform movements was to place the control of affairs more directly in the hands of the people."—J. M. Gambrill, *Leading events of Maryland history*, pp. 162-163.—"In 1842 Maryland was forced to suspend payment on its bonds, and this gave rise to a somewhat marked agitation for repudiation. Although neither [Governors] Grason nor Thomas can be regarded as other than the most pronounced enemies of repudiation, it was not until the administration of Governor Pratt—the whig successor of Mr. Thomas—that the idea of repudiation was finally disposed of. . . . Governor Thomas retired from the executive mansion on January 6, 1845. . . . [Governor Pratt] was inaugurated . . . on January 6, 1845, and his term expired on January 3, 1848. During these three years he was untiring in his endeavors to have Maryland resume her interest payments, which had been passed continuously since 1842, and within a few days of his retirement from the gubernatorial office the state did resume these payments."—H. E. Buchholz, *Governors of Maryland from the revolution to the year 1908*, pp. 141, 144, 147.

1850.—Attitude on slavery question. See U. S. A.: 1850 (June).

1860-1864.—Part played in Civil War.—Throughout the war Maryland occupied a curious position. Though she never joined the seceding states, her loyalty to the union was from the first exceedingly suspicious, and the federal government at Washington never dared allow her full popular rights. This action was felt to be the more necessary because the safety of the federal capital depended on keeping Maryland out of the control of

the South. Moreover the normal path of the federal armies en route to Washington lay through Maryland. "While four-fifths of the people of Maryland at this time regarded the course which had been adopted by the cotton States as rash, hasty, unadvised and uncalled for, yet there was one point upon which we believe the people of this State were almost unanimous, and that was against the idea of coercing the Southern States by the physical power of the Federal government or the northern people."—J. T. Scharf, *History of Maryland*, v. 3, p. 363.—Accordingly, there was trouble when the first federal troops passed through Baltimore in April, 1861, en route to Washington. "Neither of these men [Governor Hicks nor Mayor Brown of Baltimore] . . . failed in loyal sentiment to the Union, but both felt the peculiar environment of Southern interests, and bent before a tempest that nearly swept the State from its safe moorings. [See also U. S. A.: 1861 (April): President Lincoln's call to arms.] For Baltimore was the one populous community of this genial and hospitable State, and in its society surged all the crests of opposition to Lincoln's policy of coercion, from dislike to the maddest avowal of secession and Southern sympathies. Allowance should be made for an executive under such conditions; and of all governors in the border slave States, except Delaware, at this crisis, Hicks was the only one tractable and true, and his record, on the whole, in time of trial, did him lasting honor. President Lincoln, who appreciated his good intentions, and humored his moods yielded far enough, upon General Scott's advice, to march troops around Baltimore for a time, instead of through it, on their way to the capital. . . . The New York 7th reached Washington on Friday, April 26th, and the 8th Massachusetts with other troops followed the next day. Washington, in the meanwhile, cut off for nearly a week from the outer world after the Baltimore riot, felt all the anxieties of isolation. . . . National officials and the inhabitants prepared for a siege. . . . With the Massachusetts quota, Governor Andrew had despatched, as brigadier commander, General Benjamin F. Butler of the State militia. . . . Having directed at Annapolis with the 8th Massachusetts, Butler was now detailed to guard the railroad connections which flanked Baltimore, and gradually to reopen a free highway. Governor Hicks, while in a yielding frame of mind, had been persuaded to call an extra session of the legislature, and that session meant mischief. President Lincoln watched the movement and prepared to counteract disloyal designs by military stress. Construing the Federal Constitution in favor of his executive discretion in the existing emergency, he authorized General Scott and his deputies to suspend the writ of *habeas corpus*. On the 4th of May, Butler advanced with his military force to Relay House, nine miles south of Baltimore, menacing the city and controlling the railway approaches. The Maryland legislature convened at Frederick, April 26th, and remained in session until May 14th; disunion projects were broached, but no decisive step was taken. Late on the evening of the 13th, Butler made a sudden entry into Baltimore, which was unopposed. Proceeding next to make vindictive civil arrests, he was promptly displaced by General Scott, who deputed this 'high and delicate trust' of suspending *habeas corpus* to Cadwalader of Pennsylvania, another militia general. In vain did Chief Justice Taney record his protest against such suspension, when the mandate he issued on his circuit was disregarded at Fort McHenry in a test case. Nathaniel P. Banks, who took command still later, commissioned a major-

general, pursued by orders from Washington the same stern military course. . . . He prevented the State legislature from meeting once more in September by boldly arresting its disunion members and preventing a quorum. But the secession spirit of Maryland waned speedily. . . . By midsummer, transit from the North was restored. . . . Hicks in the autumn was reelected governor by a very large majority, and when in December a newly chosen legislature, loyal in its composition, convened at Annapolis, this executive, no longer wavering, announced with emphasis that Maryland had no sympathy with rebellion, but desired to do her full share in the duty of suppressing it."—J. Schouler, *History of the United States, under the constitution*, v. 6, pp. 45-48—See also U. S. A.: 1861 (April): Activity of rebellion; 1861 (April-May: Maryland); BORDER STATES.

1862.—Lee's first invasion.—His message to people of Maryland.—In 1862 the invasion of Maryland by Lee's army threw the federal district into terror (See U. S. A.: 1862 [September: Maryland]: Lee's first invasion). Lee had counted upon the sympathies of the Marylanders themselves and had expected his troops to be re-enforced by the secret devotion of the people. In anticipation of this he addressed to the citizens of Maryland the following letter: "The people of the Confederate States have long watched with the deepest sympathy the wrongs and outrages that have been inflicted upon the citizens of a Commonwealth allied to the States of the South by the strongest social, political and commercial ties. They have seen with profound indignation their sister State deprived of every right, and reduced to the condition of a conquered province. Under the pretence of supporting the Constitution, but in violation of its most valuable provisions, your citizens have been arrested and imprisoned upon no charge, and contrary to all forms of law; the faithful and manly protest against this outrage, made by the venerable and illustrious Marylander to whom in better days no citizen appealed for right in vain, was treated with scorn and contempt; the Government of your chief city has been usurped by armed strangers; your Legislature has been dissolved by the unlawful arrest of its members; freedom of the press and of speech has been suppressed; words have been declared offences by an arbitrary decree of the Federal Executive, and citizens ordered to be tried by a military commission for what they may dare to speak.—R. E. Lee, *General Commanding*."—J. T. Scharf, *History of Maryland*, v. 3, p. 408.

1863.—Lee's second invasion.—Gettysburg. See U. S. A.: 1863 (June-July: Pennsylvania).

1864.—Early's invasion. See U. S. A.: 1864 (July: Virginia-Maryland).

1864-1867. — Reconstruction. — Abolition of slavery and declaration of loyalty.—Disfranchisement of citizens.—New constitution and declaration of rights.—In 1864 the wavering loyalty of Maryland was brought to some apparent stability by the adoption of a new constitution. "The Declaration of Rights and Constitution adopted by the Convention of 1864, made radical changes in the organic law of the State. Of these, the most important were the articles abolishing slavery, and declaring 'paramount allegiance' to be due to the Constitution and Government of the United States."—J. T. Scharf, *History of Maryland*, v. 3, p. 582.—"The close of the war brought cessation of armed hostilities, but it was far from bringing political peace. Of some 95,000 persons entitled to vote about 60,000 were disfranchised under one pretext or another, and of the 35,000 qualified voters it was estimated that 15,000 were

of the opposition, so that the State was ruled by little more than one-fifth of its voters. This state of things of course could not continue after the rule of law had replaced the rule of force, and although the beneficiaries of the existing state of things made desperate efforts to perpetuate their power by registration laws framed to exclude all but their partisans, and even by beseeching the Federal government to restore military law, that they might rule their fellow-citizens by the bayonet, if they could not by the ballot, their efforts were in vain. However, it was only the radical portion of the 'Union' party that urged such measures; many of the fairer-minded men of that party (who took the title of Conservatives) approved the movement for the repeal of the iniquitous registration law, and the officers of registration, seeing that the tide was turning, became very lenient in its application. In May, 1867, a constitutional convention duly elected, assembled in Annapolis and drew up a new Declaration of Rights announcing 'That the provisions of the Constitution of the United States and of this State apply as well in time of war as of peace; and any departure therefrom or violation thereof under the plea of necessity or any other plea is subversive of good government and tends to anarchy and despotism.' The Constitution conferred the franchise upon every male citizen of the United States of lawful age, who had been a resident of the State for one year, and imposed no other test or qualification beyond the exclusion of convicts and lunatics. Persons elected to office were required to swear to support the Constitution of the United States, and bear true allegiance to the State of Maryland."—W. H. Browne, *Maryland, the history of a palatinate*, pp. 360-362.—"The Constitution is composed of two parts. The first, called the Declaration of Rights, consists of forty-five articles. It is a statement of the general rights which the people of the state consider of special importance to their freedom. . . . The second part of the Constitution is the Form of Government. The legislative power is vested in a General Assembly, composed of two Houses, the Senate and the House of Delegates. In the former each county is represented by one member, and the city of Baltimore by four; in the latter each county is represented according to its population, Baltimore sending four times as many delegates as the most populous county. The Assembly meets biennially on the first Wednesday of January. If he deems it necessary, the governor may call the legislature together in special session. The chief executive power is vested in a governor; he is elected by the people for four years. . . . To the governor is given the appointment of many important officials, and he has the power to appoint all officials whose appointment is not otherwise provided for in the Constitution or by law. In most cases the appointments are made by and with the advice and consent of the Senate. . . . For the administration of justice the state is divided into eight districts called circuits. Baltimore, which composes the eighth circuit, has a separate system of courts. In each of the other circuits three judges are elected, —a chief and two associates. The chief judges of these circuits, together with a special judge from Baltimore city, form the Court of Appeals, the highest court of the state."—J. M. Gambrill, *Leading events of Maryland history*, pp. 182-184.

1865-1868. — Establishment of comprehensive school system.—Centralization of school administration.—Provisions of school law.—Decentralization of system.—"It was not until 1865 however that the state secured a comprehensive

school system. The system then adopted was strongly centralized. Instead of the school funds being divided among the several counties and administered according to different systems there was created a state Board of Education. This was to consist of the governor, lieutenant-governor, speaker of the House of Delegates, and a state superintendent, an appointee of the governor. This formidable assemblage of dignitaries was given supervision of all colleges and schools receiving state donations. They had the selection of the school equipment, prepared a code of regulations for the government of the county school boards, appointed such school commissioners for each county as the state superintendent might direct and had the power of removal of any commissioners found guilty of failing to act in harmony with the superintendent. 'All property, estate, and effects, all money, all funds, all claims, all state donations, now vested by law in any county or school district, any board of school commissioners, any board of inspectors of primary schools, any trustee or trustees of primary schools, or any other body of persons whatsoever, for the use and benefit of public, primary, free, or high schools in the county,' was transferred to the board of school commissioners of the county. The counties were divided into school districts with one commissioner in control of each, who had the appropriate duties of such an office, the appointing of teachers from persons having proper certificates, the supervision of certificates and the hearing of charges affecting the morals or competency of teachers. The law provided for the establishment of a high school in each county, and St. John's College, Washington College, the Agricultural College, the Faculty of Arts and Sciences, and the Law School were brought together to constitute the University of Maryland. It was designed that the courses of instruction in the county high schools should prepare students for matriculation in some one of the schools comprising that University. The school law of 1865 further provided that the state appropriations to the counties for the maintenance of the academies and schools should constitute 'together with such other donations as from time to time may be made and annually appropriated by the county board,' a high school fund. In its operation it was soon found that the Act of 1865 had carried centralization too far and a new school law was passed in 1868 which restored the right of local self-government in school matters and left the endowed schools as they had been before 1865."

—J. McSherry, *History of Maryland*, pp. 405-406.
1867-1914.—Era of general progress.—Founding of Johns Hopkins University.—Baltimore and Ohio railroad strike.—Disfranchising of negroes.—Legislation.—As Maryland began to recover from the depression of the Civil War and to restore full self-government, her history becomes an almost indistinguishable part of the general stream of American development. Here and there some special achievement stands out amidst the quiet course of the state life. The founding of Johns Hopkins in 1867 (see UNIVERSITIES AND COLLEGES: 1867) established in Maryland one of the greatest of the American universities and an important center of medical science. In 1877 the greatest railroad strike the country had known centered in Maryland. "In July, 1877, the Baltimore and Ohio Railroad lowered the wages of its employees for the fourth time in seven years, and thus precipitated the greatest strike the country had yet known. The strike began at Martinsburg, West Virginia (July 16, 1877), and spread rapidly to other States and other lines. Transportation

and industry were speedily paralyzed. Bloody clashes between the strikers and the police and militia took place at Baltimore, Pittsburgh, and other towns; at Pittsburgh the mob completely controlled the city, pillaged property at will, and destroyed 100 locomotives and 2,000 cars. In many instances the police and even the militia proved powerless to preserve the peace; in a dozen States a situation developed resembling civil war. . . . In some places determined citizens formed committees of safety and organized special forces to save the country from anarchy, while the governors of several States called on the President for federal troops, and in most instances he complied. Owing to the hard times, many railroads were in the hands of federal receivers, and in several cases federal judges enjoined the strikers from interfering with the operation of such roads."—P. L. Haworth, *United States in our own times*, pp. 146-147.—"In 1890 the state adopted a plan known as the Australian ballot, by which voting might be entirely secret, and in 1896 a law was passed to throw additional safeguards about voting. . . . In March, 1901, the General Assembly, being in special session, passed a new election law, which has since been amended from time to time, especially in 1912 and 1914. The voter is not permitted to use any ballot except the one prepared by the state officers, on which the names of all candidates must be printed in alphabetical order under the head of the respective offices. The ballot shows the party of each candidate by printing the party name in plain type, but no symbol or emblem of any kind is allowed."—J. M. Gambrill, *Leading events in Maryland history*, pp. 185-186.—In 1901 Maryland joined the southern states in the disenfranchisement of the negro. A new election law for the purpose of disfranchising the majority of colored citizens, was passed by both houses on the 20th of March, 1901. It is said to be "considerably more fair than the North Carolina and similar laws in States farther south. It disfranchises by means of regulations which practically make it necessary for a voter to be able to read his ballot. The illiterate are denied any assistance when they go into the booths, and all emblems are omitted from the ticket. The color line is not drawn. It is believed that there are about 32,000 negroes and 16,000 whites who will not be able to vote under this law. Practically all of the negroes are supposed to be Republicans, while it is estimated that the whites are divided about evenly between the parties. In 1902 the General Assembly passed a compulsory education act, applying only to Baltimore city and Allegany county, but its provisions were gradually improved and extended throughout the state. . . . At the session of 1914 the General Assembly created the Maryland State University. This was not a new institution of learning, but a new body of officials with power to bring about a closer association between existing colleges and professional schools. . . . In 1908 a Public-Service Commission, consisting of three members appointed by the governor, was created. Its duty is to exercise supervision over the corporations that perform some important service for the general public, such as furnishing transportation (as do the railroads, electric lines, and steamboats), telephone service, gas, electricity, etc. . . . A stringent Corrupt Practices Act was passed in 1908 and extended in 1912, imposing severe penalties for bribery and other dishonest acts committed in connection with elections. In 1914 a law was passed authorizing the use of voting machines whenever the election supervisors of Baltimore city or of the respective counties so desire. . . . In 1914 a Workmen's Compensation

Law went into effect."—J. M. Gambrill, *Leading events of Maryland history*, pp. 186, 196, 199, 203.—In 1908 a special senatorial primary-election law was enacted; this law was amended, 1914, to conform with the provisions of the Seventeenth Amendment of the Federal constitution. In 1909-1910, efforts were made to disfranchise the negro vote. In 1911, all state officers were nominated at direct primaries. In 1912 a measure was passed providing for the election of presidential electors. In 1913, six amendments to the state constitution were ratified.

1871-1915.—Negro population.—Baltimore segregation ordinance. See BALTIMORE: 1871-1915.

1902.—Coöperative accident insurance. See SOCIAL INSURANCE; Details for various countries: United States: 1893-1918.

1915-1916.—Home rule for cities and referendum adopted.—Revision of school code.—Welfare laws.—"In 1915 two amendments of special importance were added [to the constitution]: one is a 'home rule' law giving the people of Baltimore city or of a county a large amount of freedom in deciding upon the form of their local government and in the making of local laws, the other establishes the 'referendum.'"—J. M. Gambrill, *Leading events in Maryland history*, p. 184.—"A State Board of Agriculture, consisting of nine members appointed by the governor, was created in 1916. Besides serving as trustees of the State College of Agriculture, the board performs a number of duties to promote the prosperity of farmers and protect the food supply of the people. . . . In 1914 an act of the legislature provided for a commission to conduct a 'school survey,' that is, a careful study by experts of the entire educational work of the state. The result was a series of recommendations for improvements that were adopted by the legislature of 1916 in a completely revised code of school laws that is one of the best in the United States. Under the present organization there is a State Board of Education composed of seven members appointed by the governor. This board elects the state superintendent of schools, who serves as secretary, treasurer, and chief executive of the board and has large powers in the general direction and supervision of public education. For each county the governor appoints a County Board of Education, which elects a county superintendent of schools, who serves the county board as secretary, treasurer, and chief executive officer, advises them regarding the appointment of teachers and adoption of textbooks, and has general supervision of education in the county."—J. M. Gambrill, *Leading events in Maryland history*, pp. 196-197.—"The . . . child labor law was amended, in the face of influential opposition, so as to forbid work permits to children who cannot read and write; employment of children under 14 in all industries except canning; employment of children under 16 for more than 8 hours a day, 48 hours a week, or between 7 P. M. and 7 A. M.; also on the stage, in theaters or motion picture establishments, or on any machine operated by any power other than foot or hand, or in tobacco factories. The age of newsboys is raised from 10 to 12 years. . . . Adult children who are financially able to do so are now compelled to support their dependent parents, instead of being permitted to shift responsibility upon the community. Adults, whether parents, guardians, employers or others, who contribute to the delinquency of children, may be haled into court by any interested or responsible party. Circuit court judges are empowered to designate one of their number to sit in juvenile cases, thereby making

possible the extension of the juvenile court system to all the counties. . . . The boards of directors of the Maryland House of Correction and the penitentiary are abolished, and the management of both prisons is placed under a new Board of Prison Control which is to devise a plan for doing away with contract labor and is authorized to work prisoners on roads. It is also to recommend a plan by which the state may secure a penal farm. . . . A mothers' pension bill was passed at the last moment. It appropriates \$5,000 to be distributed among the commissioners of the counties for cost of administration of pension funds, and \$10,000 to a Board of Mothers' Relief for like purpose in Baltimore. Baltimore, however, may elect to have the funds administered by the supervisors of city charities. The Board of State Aid and Charities was reorganized with the governor made a member and the other members so classified that half of them retire every two years. The most important provision of this bill—and of the session, for that matter—was the substitution of per capita appropriations to institutions in place of the present lump sums. This was a change for which leading social agencies have been agitating for years. The rates, under the new plan, are to be fixed by the State Board of Public Affairs."—*Survey*, May 13, 1916, p. 175.

1916-1918.—Establishment of executive budget.—Faults of old fiscal system of state.—Executive budget amendment.—Absence of lobbying.—Difficulties.—Advantages.—"The Executive Budget was established in Maryland by an amendment to our state constitution. The legislature of Maryland at its regular session of 1916 passed a bill amending the constitution of the state so as to provide for an Executive Budget for Maryland, and as acquired under our constitution, this amendment was submitted to the people of our state for their approval or rejection. At the general election of 1916 it was approved by the people by an overwhelming majority, and therefore all appropriations thereafter had to be made in accordance with the Budget Amendment. The manner of passing appropriations, leading as it did to appropriations by the legislature of 1914, for the fiscal years intervening from one legislature to another, of over \$1,500,000 in excess of the revenues for the same time, at a time when the governor was of one political faith and the legislature of another, had caused both political parties to make the fiscal condition of the state the leading issue, and thereby both of the two great political parties declared in favor of an Executive Budget. The result was that the passage of the amendment by the legislature and its ratification by the people was proposed and carried most opportunely. Our legislatures meet every two years, so that the real test or try-out occurred at the last legislature, the legislature of 1918. . . . Our Budget Amendment was drawn after the most careful consideration by a Budget Committee . . . [appointed by Governor Harrington], with President Goodnow, of Johns Hopkins University, as chairman. . . . The [chief] points of this amendment are:

"Section 52. The general assembly shall not appropriate any money out of the Treasury except with the following provisions: *Sub-Section A*: Every Appropriation Bill shall be either a Budget Bill, or a Supplementary Appropriation Bill, as hereinafter mentioned. *Sub-Section B*: Within twenty days after the convening of the general assembly (except in the case of a newly elected governor) and then within thirty days after his inauguration (unless such time shall be extended by the general assembly for the session at which

the Budget is to be submitted), the governor shall submit to the general assembly two budgets, one for each of the ensuing fiscal years. Each budget shall contain a complete plan of proposed expenditures and estimated revenues for the particular fiscal year to which it relates; and shall show the estimated surplus or deficit of revenue at the end of such year. Accompanying each budget shall be a statement showing: (1) the revenues and expenditures for each of the two fiscal years next preceding; (2) the current assets, liabilities, reserves and surplus or deficit of the state; (3) the debts and funds of the state; (4) an estimate of the state's financial condition as of the beginning and end of each of the fiscal years covered by the two budgets above provided; (5) any explanation the governor may desire to make as to the important features of any budget and any suggestion as to methods for the reduction or increase of the state's revenue. *Second.*—Each budget shall be divided into two parts, and the first part shall be designated 'governmental appropriations' and shall embrace an itemized estimate of the appropriations; (1) for the general assembly as certified to the governor in the manner hereinafter provided (2) for the executive department; (3) for the judiciary department as provided by law, certified to the governor by the comptroller; (4) to pay and discharge the principal and interest of the debt of the state of Maryland in conformity with Section 34 of Article III of the constitution, and all laws enacted in pursuance thereof; (5) for the salaries payable by the state under the constitution and laws of the state; (6) for the establishment and maintenance throughout the state of a thorough and efficient system of public schools in conformity with Article VIII of the constitution and with the laws of the state; (7) for such other purposes as are set forth in the constitution of the state. *Third.*—The second part shall be designated 'general appropriations,' and shall include all other estimates of appropriations. The governor shall deliver to the presiding officer of each house the budgets and a bill for all the proposed appropriations of the budgets clearly itemized and classified; and the presiding officer of each house shall promptly cause said bill to be introduced therein, and such bill shall be known as the 'Budget Bill.' The governor may, before final action thereon by the general assembly, amend or supplement either of said budgets to correct an oversight or in case of an emergency, with the consent of the general assembly, by delivering such an amendment or supplement to the presiding officers of both houses; and such amendment or supplement shall thereby become a part of said budget bill as an addition to the items of said bill or as a modification of or a substitute for any item of said bill such amendment or supplement may affect. The general assembly shall not amend the budget bill so as to affect either the obligations of the state under Section 34 of Article III of the constitution, or the provision made by the laws of the state for the establishment and maintenance of a system of public schools, or the payment of any salaries required to be paid by the state of Maryland by the constitution thereof. The general assembly may increase or diminish the items relating to the general assembly and may increase, but not decrease, the items therein relating to the judiciary. In all other respects the legislature cannot increase any items of appropriation, but may strike out or decrease, with one exception, that is, it cannot decrease the salary of a public official during his legal tenure of office. The budget bill as then passed by both houses becomes a law without the governor's signature. The gov-

ernor or any one of the department heads designated by the governor has the right to appear and be heard in respect to any budget bills while they are being considered, and still further it is made his duty to do so if requested by either house of the legislature, to answer inquiries relating thereto. *Sub-Section C; Supplementary Appropriation Bills:* Neither house shall consider other appropriations until the Budget Bill has been finally acted upon by both houses, and no such other appropriation shall be valid except in accordance with the provisions following: (1) Every such appropriation shall be embodied in a separate bill limited to some single work, object or purpose therein stated and called herein a supplementary appropriation bill; (2) Each supplementary appropriation bill shall provide the revenue necessary to pay the appropriation thereby made by a tax, direct or indirect, to be laid and collected as shall be decided in said Bill.

"A majority in each house of the whole number elected is required to pass a supplementary bill and the yeas and nays must be recorded. The requirement for the revenue to be provided in the bill places the responsibility, whether the tax be a direct or an indirect one. Moreover, all supplementary bills are to be presented to the governor and are subject to his veto under the same conditions as now apply. Nothing, however, shall be construed to prevent the legislature, under the same conditions and qualifications as now, from passing any bill to pay for any obligation of the state of Maryland under the provisions of section 10 of article 1 of the Constitution of the United States. Should the budget bill not be finally acted upon within three days before the expiration of the regular session, the governor can by proclamation extend the term, but no other matter save the budget bill shall be considered except as to its cost. Likewise, the governor is given full power to require all departments and heads to report to him and all institutions applying for or receiving state aid to give such itemized estimates and information as, and in such form as he may desire. The governor has the power to provide for public hearings and to compel attendance of all necessary parties. The legislature may enact such laws as may be found necessary from time to time to carry out the provisions of this constitutional amendment. In the case of any inconsistency between any provisions of this amendment and any other of the constitution, the provision of this amendment shall prevail. Nothing in the amendment, however, shall affect any obligations as to the public debt as provided for in section 34 of article 10 of our Constitution; and the governor may as heretofore call an extra session of the legislature for the same purposes as now provided, and in such a case the legislature can consider any emergency appropriation or appropriations. In our budget system, the items of the budget can be reduced or eliminated, but not increased by the legislature. This limitation is fundamental in my opinion for any sound budget system. It will be noticed that the governor has to include the salaries provided for by law for the public officials, also the salaries and expenses of the judiciary have to be included as certified to him by the comptroller as fixed by statute, and third, that the legislature has control of its own running expenses, the governor having to put into the budget what the presiding officers of the legislature estimate as the proper expenditures for the succeeding legislature. The idea was that the governor should not have the power to reduce salaries fixed by the constitu-

tion or by law, and that the independence of the judiciary and the legislature as to their own expenses should be maintained. The Budget Bill provides: "That the items and amounts which hereinafter follow the sums appropriated, and which are, respectively, entitled "Schedule," do not constitute appropriations, but represent the initial plan of distribution and apportionment of the appropriations to which they, respectively, refer. Each appropriation shall be paid out only in accordance with the schedule therefor, if any, unless such schedule be amended in the following manner: any department, board, commission or officer may at any time submit in writing to the governor an amended schedule for the distribution and apportionment of the appropriations made to it or him, or any unexpended balance thereof, different from the manner set forth in the schedule contained in this act. The governor may himself make such an amended schedule, if the same be necessary, with respect to the appropriations for the Executive Department. If the governor shall make such an amended schedule with respect to the appropriations for the Executive Department or if he shall approve an amended schedule when submitted to him as aforesaid, then he shall transmit the same with his certificate of approval to the comptroller, and thereafter the appropriation, or the unexpended balance thereof, shall be paid out in accordance with such amended schedule. Any amended schedule, so submitted to the governor may be withdrawn and amended to meet any objections of the governor, and then resubmitted. Any such amended schedule may be again amended, at any time, in like manner and with like effect. All amendments and schedules thus made or approved by the governor shall be reported by him to the next session of the general assembly." The legislature of 1918 kept its own expenditures down to estimated expenditures and well within the appropriation of 1916, and no extra bills for the fiscal years 1919 and 1920 were passed. There was a total absence of lobbying in the interest of appropriations or of personal solicitations by departments or institutions upon the members of the legislature. The state institutions and departments and the state-aided or benevolent institutions accepted the allowances of the governor without any protest. The chief difficulty . . . in making up a budget in Maryland was that some of our departments, such as the Insurance Department, the State Accident Commission, the Conservation Commission and the Automobile Commission, were accustomed to collect their own revenues and pay their own expenses and turn over balances to the treasurer. There could not be an effective budget unless all of the revenues were paid into the general treasury and all expenditures made therefrom, so it became necessary for legislation to be passed turning all the receipts into the general treasury, which was done. Another embarrassment, equally great to one kind of a budget as to another, is that some of our institutions, such as our insane asylums, not only get an appropriation from the state, but a proportional per patient appropriation from Baltimore city and from the different counties. In our budget in such cases we have fixed the salaries and expenses in detail to be allowed, and with their statement of the revenues from the counties and from other sources, such as their farms, the state has appropriated the difference between such total and the total of the expenditures allowed for salaries and expenses. For the first time in our state the budget gives us a con-

crete statement of our fiscal condition and a concrete statement of all our revenues and expenditures in every detail."—E. C. Harrington, *First state executive budget* (*Proceedings, American Academy of Political Science, July, 1918*).

1918-1920.—Legislation.—Part played in World War.—In 1918, the legislative enactments included the regulation of hours of labor for women and children, and the ratification of the Federal Prohibition Amendment. In 1920, a commission was created to revise and prepare industrial and welfare laws; a merit system for state employes was put in operation; and Albert C. Ritchie was elected governor. During the World War the state furnished 47,054 men, or 1.25 per cent of the whole force. Several military establishments were located in the state, the most important ones being Camp Meade, Camp Holabird, the Edgewood Arsenal, and the Aberdeen Proving Grounds.

MASONIC SOCIETIES: Definitions of status and objects.—"Freemasonry is an order whose leading star is philanthropy, and whose principles inculcate an unceasing devotion to the cause of virtue and morality."—Marquis De Lafayette, quoted by *Masonic Standard*, Nov. 27, 1920.—"Freemasonry is an establishment founded on the benevolent intention of extending and conferring mutual happiness upon the best and truest principles of moral life and social virtue."—Calcott, quoted *Ibid.*—"Freemasonry is in no sense a club. It was never intended to supply amusement and entertainment for the members. Its field of endeavor is in the moral and intellectual sphere of mankind."—*Masonic Journal of South Africa*, Sept., 1920.—"Where devotion to the well-being to the community is asked of the Freemason he will feel it to be his duty to afford support and cooperation to those of like mind who are already

at work in his field. In other words it is the duty of the Freemason to accord his support to social work wherever possible."—*Ibid.*, Feb., 1920.—"Masonry is the activity of closely-united men, who employing symbolical forms borrowed principally from the Mason's trade and from architecture, work for the welfare of mankind, striving morally to ennoble themselves and others; and thereby to bring about a universal league of mankind, which they aspire to exhibit even now on a small scale."—*Freemason (Toronto) Mar.*, 1920.—"The Right Reverend Henry C. Potter, bishop of New York in the Episcopal Church, in 1901 wrote a letter in which he said: 'Freemasonry, however, is in my view of it, a great deal more than a mutual benefit association. In one sense, wild and extravagant as the words may sound, it is the most remarkable and altogether unique institution on earth. Will you tell me of any other that girdles the world with its fellowship and gathers all races and the most ancient religions, as well as our own, into its brotherhood? Will you tell me of any other that is as old or older; more brilliant in its history; more picturesque in its traditions? Today it lies in the hand of the modern man, largely an unused tool, capable of great achievements for God, for country, for mankind, but doing very little.'"—W. G. Sibley, *Story of Freemasonry*, pp. 49-50.

Legend and fact in Masonic history.—Problem of origin.—Alleged connection with Knights Templars.—Early kindred societies.—Legendary documents and "Constitutions."—Revelations of modern historical research.—Foundation traced to England.—"Who the early Freemasons really were, and whence they came, may afford a tempting theme for inquiry to the speculative antiquary. But it is enveloped in obscurity, and lies far outside the domain of authentic history. In proceeding retrogressively, and attempting to trace the origin of the Society, when we reach the fourteenth century the genealogical proofs are exhausted. Still, from the documentary evidence which has carried us thus far, we shall at least be justified in assuming that the Masonry practised in the Lodges of that period was of no recent institution. Beyond this conclusion, nothing further can be confidently laid down with regard to the more remote past of the sodality. . . . Freemasonry has exercised a remarkable influence over all other oath-bound societies for a long period. What that period is cannot be absolutely, though it may be approximately, determined. The second quarter of the eighteenth century constitutes a sort of zone that will illustrate my meaning. About the year 1725 Freemasonry was beginning to be widely known, and about the year 1750 it had become thoroughly so. If, therefore, we can trace the customs of any other oath-bound societies as they existed, let us say before 1725, there is strong probability, amounting almost to certainty, that such were in no way influenced or affected by Freemasonry. . . . Evidence of customs now existing by no means proves that they are of very old standing. If the ceremonial of the Craft to a certain extent finds a parallel in the present observances of the Druses and the Ansariyeh—that is to say, if the writers, by whom we are so informed, have not been misled by resemblances more or less fanciful and imaginary—then I believe that these secretaries of Mount Lebanon adopted some of the practices of the Freemasons. The same may be said with respect to the rites of many other secret societies of current date—for example, the Begtaschi of Turkey, and the Yesidis of Armenia and Asia Minor. Though I must not

pass over in silence an alternative supposition, namely, what has been called 'the doctrine of chance coincidences,' which may possibly be held to apply in some of the cases I have already cited, and certainly appears to myself to fully account for the great bulk of stories that are related of so-called 'Masonic signs' having been exchanged by travellers with Arabs, Abyssinians, Dervishes, North American Indians, Australian natives, and the various tribes of Africa. Examples of older types of such associations may be found in the Soofees [Sufi] of Persia; in the Komosô of Japan (now extinct), who challenged one another by signs; and very possibly in the leading secret societies of China, which claim to have existed for several centuries, and admit their members with ceremonies approximating more or less closely to our own."—R. F. Gould, *Concise history of Freemasonry*, pp. 1-3.—"For years writers and speakers have been projecting all sorts of theories concerning the beginnings of Freemasonry until the Masonic world is flooded with fantastic tales and the great men from time immemorial charged with having been identified with the fraternity and contributing to its ritual and philosophy. Adam has been referred to as the first Mason, probably for no other reason than that he wore an apron made of fig leaves. Noah has been declared a member of the Craft and given credit for having organized the first lodge in the ark. Moses has been frequently acknowledged as a Mason because the Ten Commandments shadow forth Masonic principles and of course the Masonic enthusiast can think of no one but a Freemason as having conceived them. So much reference is made to King Solomon and his Temple in Masonic Ritualism that many Masons honestly place the origin of the fraternity at the building of this great monument of architecture, and readily accept the Son of David as the first Grand Master. Some Masonic enthusiasts have even been bold enough to assert that Jesus Christ was a Mason, and received His instruction in a society of philosophers similar to the present system of Freemasonry and that in many of His sayings are thinly veiled the doctrines of the mystic art.

"It is a matter of sincere regret and not at all to the credit of Freemasonry that there are many Masons who seem to prefer to have the fraternity draped in tradition and mysticism rather than to have the truth elicited and understood. It is inconsistent that Freemasonry, the embodiment of veracity, should allow allegory and symbolism, which are its methods of illustration and instruction, to be confounded with the history and doctrines of the fraternity. To understand Freemasonry, the ideal must be separated from the real. . . . And when one listens to the many exorbitant statements so often made concerning Freemasonry, he is led to exclaim that the fraternity must have wonderful capacity for adaptability. A Masonic tradition is simply a parable and makes no more claim to historical accuracy than does the parable."—D. D. Darrah, *Evolution of Freemasonry*, pp. 20-22.—"The fall of the Knights Templars has been connected with the origin of the Freemasons, and the idea has prevailed that the only secret purpose of the latter was the re-establishment of the suppressed order. Jacques de Molai, while a prisoner in Paris, is said to have created four new lodges, and the day after his execution, eight knights, disguised as masons, are said to have gone to gather up the ashes of their late Grand Master. To conceal their designs, the new Templars assumed the symbols of the trade, but took, it is said, the name of Francs 'Maçons' to distinguish

themselves from ordinary craftsmen, and also in memory of the general appellation given to them in Palestine. Even the allegories of Freemasonry, and the ceremonies of its initiations, have been explained by a reference to the history of the persecutions of the Templars. The Abbé Barruel says, that 'every thing—the signs, the language, the names of grand master, of knight, of temple—all, in a word, betray the Freemasons as descendants of the proscribed knights.' Lessing, in Germany, gave some authority to this opinion, by asserting positively that 'the lodges of the Templars were in the very highest repute in the twelfth and thirteenth centuries, and that out of such a lodge, which had been constantly kept up in London, was established the society of Freemasons, in the seventeenth century, by Sir Christopher Wren.' Lessing is of opinion that the name Mason has nothing to do with the English meaning of the word, but comes from Massonney, a 'lodge' of the Knights Templars. This idea may have caused the Freemasons to amalgamate the external ritual of the Templars with their own, and to found the higher French degrees which have given colour to the very hypothesis which gave rise to their introduction. But the whole story appears to be most improbable, and only rests upon the slight foundation of fancied or accidental analogies. Attempts have also been made to show that the Freemasons are only a continuation of the fraternities of architects which are supposed to have originated at the time of the building of Solomon's Temple. The Egyptian priests are supposed to have taught those who were initiated a secret and sacred system of architecture; this is said to have been transmitted to the Dionysiac architects, of whom the first historical traces are to be found in Asia Minor, where they were organized into a secret fraternity. . . . It is, however, a mere matter of speculation whether the Jewish and Dionysiac architects were closely connected, but there is some analogy between the latter and the Roman guilds, which Numa is said to have first introduced, and which were probably the prototypes of the later associations of masons which flourished until the end of the Roman Empire. The hordes of barbarians which then ruthlessly swept away whatever bore the semblance of luxury and elegance, did not spare the noblest specimens of art, and it was only when they became converted to Christianity, that the guilds were re-established. During the Lombard rule they became numerous in Italy. . . . As their numbers increased, Lombardy no longer sufficed for the exercise of their art, and they travelled into all the countries where Christianity, only recently established, required religious buildings. . . . These associations, however, became nearly crushed by the power of the monastic institutions, so that in the early part of the Middle Ages the words artist and priest became nearly synonymous; but in the twelfth century they emancipated themselves, and sprang into new life. The names of the authors of the great architectural creations of this period are almost all unknown; for these were not the work of individuals, but of fraternities. . . . In England guilds of masons are said to have existed in the year 926, but this tradition is not supported by history; in Scotland similar associations were established towards the end of the fifteenth century. The Abbé Grandidier regards Freemasonry as nothing more than a servile imitation of the ancient and useful fraternity of true masons established during the building of the Cathedral of Strasburg, one of the masterpieces of Gothic architecture, and which caused the

fame of its builders to spread throughout Europe. In many towns similar fraternities were established. . . . The origin of the Freemasons of the present day is not to be attributed to these fraternities, but to the Rosicrucians [see ROSICRUCIANS] who first appeared at the beginning of the seventeenth century."—A. P. Matras, *Secret fraternities of the Middle Ages*, ch. 7-8.—"Although manuscripts containing the legendary history of the Masonic body have come down to us in great profusion and variety, neither the testimony of history nor the voice of legend can be relied upon as affording any distinct clue to the *incunabula* of the Craft mythology. These ancient writings are described in various ways: e. g., as the Manuscript (or Masonic) Constitutions, the Constitution of the Craft, the History of Freemasonry, the Story of the Guild, and the Legend of the Craft. . . . Besides these compilations, of which the majority now extant are in roll or scroll form, there are two manuscripts—the Regius and Cooke—of higher antiquity, possessing many characteristics of the Masonic 'Constitutions.' . . . [These] must be classified rather as histories of, or disquisitions upon, Geometry (or Masonry) than as 'Constitutions' of the Craft or Society. Of the ordinary versions of the Masonic Constitutions, the oldest dated form is the 'Grand Lodge' MS. No. 1 of the year 1583. The readings or texts, however, of these documents, as distinguished from the forms or writings in which they have been preserved, exhibit many discrepancies, whereby some confusion and much disputation have arisen. . . . Leaving the old 'Constitutions' (properly so-called), and passing to the next group of documents in the ascending scale, we come in the first instance to the Cooke MS., and, a little higher, reach the Masonic Poem, or Regius MS., after which the genealogical proofs are exhausted. These two manuscripts, however, afford conclusive evidence of their having been—at the time from which they speak—pre-existing 'histories' of Geometry (or Masonry) of much earlier date."—R. F. Gould, *Concise history of Freemasonry*, pp. 125, 127.

"In the nineteenth century, a new class of historians came into prominence who refused to accept the legendary history of the fraternity as fact, but who demanded documentary evidence in order to prove any given claim concerning the remote antiquity of the society. Among this class of writers may be mentioned Mackey, Gould, Hughan, Speth, Crawley, Robbins, and others. These men have perhaps rendered the Craft a greater service than any known writers for they dispelled much of the doubt concerning the origin and early history of the Society and destroyed many false notions which have been held by Masons concerning the institution. . . . It is strange but nevertheless true that many Masons, in the absence of authentic data concerning the early history of the society, have seized upon the obscure origin of the fraternity as an excuse for their exorbitant claims. They have assumed the same right to set up the Solomonic theory as has the critical student to place its beginnings with the formation of the Grand Lodge of England in the year 1717. . . . Of the many books and articles which have been written concerning Freemasonry, there are but few which will stand the cold test of modern criticism."—D. D. Darrah, *Evolution of Freemasonry*, pp. 30-31.—"The Freemasonry of the present day, organized as we now have it with its associations of Lodges (as the various units are called) grouped territorially under what are known as 'Grand Lodges' with their

hierarchies of 'Grand officers' took its rise from very humble beginnings in London in the year 1717, when the famous 'Four Old Lodges' combined in order to establish the first 'Grand Lodge' of the world. Until that time there had been isolated Lodges of Masons working for the most part independently of each other, so far as is now known, in different parts of Great Britain. . . . This 'Revival' in 1717 forms the starting point from which continuous Masonic history dates. The founders of the premier Grand Lodge were quickly able to get 'a Noble Brother at their Head,' for in 1721 the Duke of Montague was their Grand Master, and from that time onward an unbroken succession of noblemen or members of the Royal Family have presided over the Craft in England. . . . In 1751 a rival Grand Lodge was established in London by some Irish Masons, who claimed that they alone preserved the ancient tenets and practices of Masonry, and that the regular Lodge had made innovations; so they called themselves 'Ancient' Masons, and styled the members of the 1717 Grand Lodge 'Moderns'; the two bodies continued in rivalry until 1813, when the 'United Grand Lodge of Ancient Free and Accepted Masons of England' was formed, and this body has continued ever since."—E. L. Hawkins, *Freemasonry* (J. Hastings, ed., *Encyclopaedia of religion and ethics*, v. 6, pp. 118, 120).—C. W. Moore, Grand Secretary of the Grand Lodge of Massachusetts, in an address in Boston, December 29, 1856, said: "At the reorganization of the Craft and the establishment of the present Grand Lodge of England in 1717, we laid aside our operative character, and with it all pretensions to extraordinary skill and architectural science. We then became a purely moral and benevolent association, whose great aim was the development and cultivation of the moral sentiment, the social principal, and the benevolent affections, a higher reverence for God, and a warmer love for man. New laws and regulations, adapted to the changed condition of the Institution, were then made,—an entire revolution in its governmental policy took place, order and system obtained where neither had previously existed, and England became the great central point of Masonry for the whole world. From this source have Lodges, Grand and Subordinate, at various times, been established, and still exist and flourish."

Symbolism.—Primitive simplicity.—Sources of later elaboration.—"The Masonic student needs but to consider the primitive condition of Masonry as it was given to the world in 1717 to understand how the early writers took everything for granted and cared little for authentic proofs. The first Masonic ceremonies consisted of one very simple rite, that of initiation, and it was not until the second decade of the Eighteenth Century that what, in a modern sense, are called degrees were known. Fellowcraft and Master were simply honorary distinctions which existed for quite a period in the early years of the fraternity, and were in no sense degrees but distinguishing titles which were accorded to certain members of the craft and when conferred involved no additional secrets, no ceremonies, and no retirement from the lodge of even the youngest entered apprentice. It cannot be doubted that as the fraternity grew older and gained in prestige that its ritual, however simple it may have been in the beginning, commenced to receive the attention of those who sought to elaborate upon it. In order to do so these ritual builders drew upon old world societies, mysteries and traditions. If there is in Freemasonry any similarity between

any of its customs and those of the practices of several thousand years ago, it does not mean that Freemasonry had any connection whatsoever with those rites but that they were woven into the fraternity in modern times with a view to enhancing the ritual and investing the fraternity with an atmosphere of antiquity."—D. D. Darrah, *Evolution of Freemasonry*, pp. 35-36.—"By the Jew, the [acacia] tree from whose wood the sanctuary of the tabernacle and the holy arc had been constructed would ever be viewed as more sacred than ordinary trees. The early Masons, therefore, very naturally appropriated this hallowed plant to the equally sacred purpose of a symbol, which was to teach an important divine truth in all ages to come. . . . The acacia in the mystic system of Freemasonry is pre-eminently the symbol of the immortality of the Soul—that important doctrine

ROSE CROIX REGALIA

which it is the great design of the Institution to teach."—A. G. Mackey, *Encyclopædia of Freemasonry*, v. 2, p. 7.—"The speculative successors to the ancient English operative Freemasons added to their symbolism, drawn from the workingmen's guilds of the middle ages, many of the characteristics of the older religious and mystical societies. Thus, there may be found in modern Freemasonry traces of the Egyptian, Eleusinian, Mithraic, Adonic, Cabiric, and Druidic Mysteries, all of which, when undefiled, taught purity, immortality, and the existence of an ever-living and true God. Their ceremonials were divided into degrees in which were conferred secret means of recognition, and each had a legend which, by dramatic representation, impressed upon the novice the lesson that the way to life is by death. Masonic symbolism and ceremonials show also the influence of the teachings of the Gnostics, the Kabbalists, Pythagoreans, Druses, Manicheans, and the earlier Rosicrucians."—A. C. Stevens, ed., *Cyclopædia of fraternities*, p. xvi.—"In Freemasonry,

all the instructions in its mysteries are communicated in the form of symbols. Founded, as a speculative science, on an operative art, it has taken the working-tools of the profession which it spiritualizes, the terms of architecture, the Temple of Solomon, and everything that is connected with its traditional history, and adopting them as symbols, it teaches its great moral and philosophical lessons by this system of symbolism. But its symbols are not confined to material objects as were the hieroglyphics of the Egyptians. Its myths and legend, unauthenticated by history, distorted by anachronisms, and possibly absurd in its pretensions if viewed historically or as a narrative of actual occurrences, when interpreted as a symbol, is found to impress the mind with some great spiritual and philosophical truth. The legends of Masonry are parables, and a parable is only a spoken symbol. . . . The first three degrees of Freemasonry, namely, those of Entered Apprentice, Fellow-Craft, and Master Mason are known, by way of distinction, as the 'symbolic degrees.'"—A. C. Mackey, *Encyclopædia of Freemasonry*, v. 2, p. 752.—"It was between 1723 and 1740 that the parent modern secret society spread from England throughout Europe and into the British colonies. After the American War of the Revolution it became, with one or two political secret societies founded by Freemasons, the direct or indirect source of all secret societies founded in America since that time. With a few exceptions, the like is true concerning secret societies in Europe formed since 1740."—A. C. Stevens, ed., *Cyclopædia of fraternities*, p. xvi.

Masonic bodies.—Ancient Arabic Order of the Mystic Shrine.—Secret Monitor.—Cryptic Councils.—Order of the Scarlet Cord.—Friendly societies, Masonic offspring.—From the parent society a considerable number of kindred organizations have grown up. Fundamentally masonic, these regular bodies accept only Freemasons as members and are, in a sense, extraneous adjuncts to the craft. The essence of Masonry is contained in the three degrees of the so-called "Blue Lodge," while other degrees beyond these are optional and may voluntarily be taken by a Master Mason, i. e., one who has passed through the original three degrees, which alone are obligatory. Among the greater divisions are the American Rite, the Scottish Rite, the York Rite; Concordant Orders are the Royal Order of Scotland, Knights of the Red Cross of Constantine; non-masonic bodies to which only Freemasons are eligible are the Modern Society of Rosicrucians, Sovereign College of Allied Masonic Degrees, Ancient Arabic Order of Nobles of the Mystic Shrine, the Mystic Order, the Veiled Prophets of the Enchanted Realm, Independent, International Order of Owls, and the "side degree," Tall Cedars of Lebanon. The dead or dormant bodies include the Rite of Memphis, Oriental Rite of Memphis and Misraim, Rite of Swedenborg, Order of Martinists. Among the "irregular or spurious" Masonic bodies are accounted the American and "Scottish Rite" bodies among Negroes and the Cerneau and Seymour-Cerneau "Scottish Rite" bodies.—Based on A. C. Stevens, ed., *Cyclopædia of Fraternities*, p. xvi.—The Ancient Arabic Order of Nobles of the Mystic Shrine is "a social and benevolent society with a ritual and history linked to Arabic traditions, in which Oriental mysticism, names, legends, and titles are freely employed. It has also a secret purpose, made known only to those who encircle the Mystic Shrine. None except Masonic Knights Templars or those who have attained the Scottish Rite of Freemasonry, are eligible to membership. It is

not a Masonic Order and forms no part of Freemasonry, is independent in origin and government, and is associated with the Craft only because it was established by eminent Freemasons and because none but Freemasons of high degree may become acquainted with its mysteries. [There is also the Ancient Arabic Order of Nobles of the Mystic Shrine of North and South America.] This is a social and fraternal organization of negroes, which seeks to parallel the Ancient Arabic Order of Nobles of the Mystic Shrine. As the A. A. O. N. M. S. admits only Freemasons who are Knights Templars or have received the thirty-second degree, Ancient and Accepted Scottish Rite, so the A. A. O. N. M. S. of North and South America receives only those who have taken the higher degrees conferred in negro Masonic bodies. The

following year in the West Indies, in 1848 in Jerusalem, and in 1865 it became known to English Freemasons. It was not until April, 1887, however, that a definite attempt was made to organize the order in England, by the *Bon Accord* Lodge of Mark Master Masons. In July 1887 a Grand Council was formed, and in the same year four Conclaves (or 'Lodges') came into being. . . . Seven other Conclaves were established in the following year, and there are now forty-two Conclaves under the jurisdiction of the Grand Conclave of the United Kingdom. Conclaves of the Order now exist in many of the larger cities throughout the British Empire."—Masonic Correspondent, *Evening Standard* (London), June 19, 1913.—In the Cryptic Councils "the Cryptic Degrees are an important branch of Masonry, and

Grand Council of the A. A. O. N. M. S. of North and South America was instituted at Chicago, June 10, 1893, by John G. Jones and others. It is declared that it was conferred upon him by 'several members of the Grand Council of Arabia' who were in Chicago 'in attendance at the World's Fair.' It is likely that Jones and associate negro Nobles received their Shrine ritual in the same manner as the negro Knights Templars obtained theirs."—*Ibid.*, p. 6.—The Order of the Secret Monitor developed from the Brotherhood of David and Jonathan, which, it is claimed, "is as old as Freemasonry itself. The earliest existing records of an organized system of the Brotherhood was found in Holland, where it is said to have been founded in 1773. It was carried by Dutch emigrants to America, where it spread rapidly throughout the Republic. In 1845 the Order was established in Malta, in the fol-

lowing year in the West Indies, in 1848 in Jerusalem, and in 1865 it became known to English Freemasons. The degrees were first conferred in Albany, N. Y., in 1766, and there is absolute proof of their conferment in Charleston, S. C., in 1783. Formerly, Councils of the Cryptic Rite were working in Toronto, Barrie, St. Thomas and other Masonic centers in this Province, but are now dormant. Montreal has an active Council, and there is a Grand Council of the Rite for Eastern Canada."—*Freemason (Toronto)*, Feb., 1920.

"An order very little known either in or outside Masonry [is] that of the Order of the Scarlet Cord. . . . This prosperous body, founded on records in the archives of Amsterdam dated 1760, was reestablished in this country in 1900 and has made healthy progress. The members consist of those

who have shown the greatest interest in the benevolent fund of the Order of the Secret Monitor, and the possession of a badge of the order in the button-hole is a necessary preliminary to admission."—*Christian Science Monitor*, Aug. 12, 1921.—"The earlier offspring of the Masonic Fraternity included the Odd Fellows (England), 1739; Druids, 1761; and the Foresters, 1780, 'friendly' societies, with Masonic thumbmarks on their rituals and in their ceremonials, but differing in that their primary purposes were to pay to members specified sick, disability, funeral, and other benefits. They are conspicuous among hundreds of other English friendly societies, and are the forerunners of the American insurance or secret beneficiary societies, of which there are more than one hundred and fifty."—A. C. Stevens, ed., *Cyclopædia of fraternities*, pp. xx.

Anti-Masonic agitations.—Publications against the craft.—Forms of organized opposition.—Roman Catholic bulls.—Persecution in Holland.—Presbyterian antagonism.—Pennsylvania Christian Reform Convention.—"The hundred years preceding 1793 were prolific in amusing publications that profess to be exposures of Freemasonry, written by French and English romancers. No less than forty-five of these productions are to be found in Masonic libraries, where they are preserved as curiosities: They bear such titles as 'An Account of the Freemasons,' 'The Grand Mystery of Freemasons Discovered,' 'The Secrets of Masonry Made Known,' 'Masonry Dissected,' 'A Master Key to Freemasonry,' 'The Three Distinct Knocks,' 'Freemasonry of the Ladies,' and 'The Veil Withdrawn.'"—W. G. Sibley, *Story of Freemasonry*, pp. 17-18.—"Organized opposition to Freemasonry has shown itself in three forms since the revival in 1717, when the four London Lodges united to form a Grand Lodge. The first came and still emanates from the Roman Catholic Church; the second, from one or more offshoots of the Scotch Presbyterian Church [and several other Protestant sects or communities] and the third was conspicuous in the United States for a decade after the disappearance of William Morgan of Batavia, N. Y., who, it was said, was about to disclose the secrets of the Fraternity. [See below: United States: Abduction of William Morgan, 1826.] Almost all political antagonism to Freemasonry in Europe may be traced to the influence of the Roman Catholic Church. During the seven years from 1717 to 1724 the Fraternity attracted the attention of many Englishmen of learning and title, when, on September 3, 1724, the London 'Daily Post' announced the appearance in that city of a secret society described as the Ancient and Noble, or, the August and Noble Order of Gormogons. It was declared to be of Chinese origin, founded 'thousands of years' prior to Adam, and the printed account set forth that a Chapter would be held at Castle Tavern, Fleet Street, where 'no Mason' would be received as a member 'till he had renounced' his 'novel Order' and been 'properly degraded.' Six weeks later the same paper stated that 'many eminent Freemasons' had 'degraded' themselves (renounced their Fraternity and burned their gloves and aprons) and joined the Gormogons. Several theories have been advanced to account for the existence of the Gormogons. The first, that it was a creation of the Chevalier Ramsey, an ardent Freemason and a Roman Catholic, and another, that it was the beginning of what took shape as the schismatic branch of English Freemasonry about the middle of the last century, are both regarded as un-

worthy of consideration. The third theory, that it was a 'Jesuistic,' that is, Roman Catholic, invention, designed to offset the growing popularity of Freemasonry, was, and still is, believed to be the true explanation, particularly as the Society of Gormogons disappeared in 1738, the year in which Pope Clement XII. issued his famous bull against Freemasonry. It was on April 28, 1738, that Pope Clement XII. published his bull, entitled *In Eminenti Apostolatus Specula*, containing the following words: 'For which reason the temporal and spiritual communities are enjoined, in the name of holy obedience, neither to enter the society of Freemasons, to disseminate its principles, to defend it, nor to admit nor conceal it within their houses or palaces or elsewhere, under pain of excommunication *ipso facto* for all acting in contradiction of this, and from which only the Pope can absolve the dying.' On January 14, 1739, a still more stringent edict was issued for the Papal States, death and confiscation of property, without hope of mercy, being the penalty. De Cormenin, in his 'History of the Popes,' refers to the 'pleiad of philosophers' which had ranged itself around Voltaire, 'battling in the breach against the civil and religious authority of popes, bishops and priests,' Montesquieu, Rousseau, Diderot, d'Alembert, and others compelling 'the third estate, the nobility, and even a great part of the French clergy to march in their progressive route to the conquest of a new order of things.' The political movement, he declared, 'though less apparent than the religious, was not the less real. Secret associations were everywhere organized to labor for the overthrow of kings and priests,' and 'Rome was so moved' by this revolutionary tendency that 'Clement XII. declared war on secret societies and fulminated a terrible bull against the Freemasons who had established Lodges in England, Scotland, France, Germany, and Italy.' These statements indicate that Clement was unable to distinguish between a secret, pacific, non-political, benevolent brotherhood and secret political associations. De Cormenin relates that Pope Clement's bull against Freemasonry prohibited 'his subjects' from affiliating with or being present at Masonic assemblies, from inducing anyone to join the Fraternity, and from 'rendering aid, succor, counsel, or a retreat' to a Freemason 'under penalty of death:' which, in part, refers, probably, to the supplementary bull of 1739, applying to the Papal States. 'These proscriptions,' De Cormenin says, gave Freemasonry an 'extraordinary lustre, and Europe was soon covered by a prodigious number of Lodges.' The reasons for issuing this, the first of a long list of bulls against Freemasonry, are thus set forth in the document itself:

"We have learned, and public rumor does not permit us to doubt the truth of the report, that a certain society has been formed under the name of Freemasons into which persons of all religions and all sects are indiscriminately admitted, and whose members have established certain laws which bind themselves to each other, and which, in particular, compel their members, under the severest penalties, by virtue of an oath taken on the Holy Scriptures, to preserve an inviolable secrecy in relation to everything that passes in their meetings.' The bull further declares that these societies had become suspected of being hurtful to the tranquillity of the state and to the safety of the soul; that if the actions of Freemasons were irreproachable they would not so carefully conceal them from the light; and all bishops, superiors, and ordinaries were enjoined to punish the Free-

masons 'with the penalties which they deserve, as people greatly suspected of heresy, having recourse, if necessary, to the secular arm.' . . . Although Clement's bull did not meet with a favorable reception in France, in Italy many suspected of being Freemasons were arrested and placed in dungeons, as well as some accused of having furnished an asylum to Masonic Lodges. Like measures to crush the Fraternity were resorted to in Spain and in Portugal, and in 1745 Masonic assemblies were prohibited throughout Switzerland under the severest penalties. In 1748 a Masonic Lodge at Constantinople was demolished and its members were arrested, but ultimately discharged through the interposition of the British Minister. . . . The Papal bull of 1738 was confirmed and renewed by Benedict XIV. in 1751, and by Pius VII. in 1821. Leo XII., in his Apostolic Edict, *Quo Graviora*, 1826, included the acts and decrees of the earlier popes on this subject, and ordered them to be ratified forever. As noted by Gould, in his 'History of Freemasonry,' Pius VIII. spoke to the same effect in 1820, Gregory XVI. in 1832, and Pius IX. in 1846, 1864, and at other dates; Leo XIII. again confirmed these decrees of his predecessors in 1884, and extended the opposition of the Roman Church to the Odd Fellows, the Knights of Pythias, and the Sons of Temperance."—A. C. Stevens, ed., *Cyclopædia of fraternities*, pp. 8-10.—"One of the first persecutions to which Masonry, in its present organization, was subjected, occurred in the year 1735, in Holland. On the 16th of October of that year, a crowd of ignorant fanatics, whose zeal had been enkindled by the denunciations of some of the clergy, broke into a house in Amsterdam, where a Lodge was accustomed to be held and destroyed all the furniture and ornaments of the Lodge. The States General yielding to the popular excitement, or rather desirous of giving no occasion for its action prohibited the future meetings of the Lodges. One, however, continuing, regardless of the edict, to meet at a private house, the members were arrested and brought before the Court of Justice. Here, in the presence of the whole city, the Masters and Wardens defended themselves with great dexterity; and while acknowledging their inability to prove the innocence of their Institution by a public exposure of their secret doctrines, they freely offered to receive and initiate any person in the confidence of the magistrates, and who could then give them information upon which they might depend, relative to the true designs of the Institution. The proposal was acceded to, and the town clerk was chosen. He was immediately initiated, and his report so pleased his superior, that all the magistrates and principal persons of the city became members and zealous patrons of the Order."—A. G. Mackey, *Encyclopædia of Freemasonry*, v. 2, pp. 556-557.—"In Scotland, in 1757, the Synod of Stirling debarred all adhering Freemasons from the ordinances of religion, whence, possibly, may be found the origin of some of the opposition to the Fraternity in one or more branches of the Scotch Church."—A. C. Stevens, ed., *Cyclopædia of fraternities*, p. 10.—"The Pennsylvania Christian Reform Convention, opposed to secret societies, held at the First United Presbyterian Church, Philadelphia, February, 1894, declared Freemasonry, so-called, the Society of Jesuits, and all societies which impose an oath on members to obey unknown laws, unscriptural, un-Christian and un-American, and membership in them degrading, and implored the State and Nation to declare members of all such societies outlaws. . . . Organized opposition to Freemasonry among Protestant religious bodies

has not been of sufficient importance to attract public attention during the past fifty years, being largely confined to a few of the minor schismatic sects."—A. C. Stevens, ed., *Cyclopædia of fraternities*, p. 12.

Africa: North and South.—Proposed Masonic colony on Lake Nyasa.—"In the North of the 'Dark Continent' we find at Alexandria a Grand Orient of Egypt, with a membership of about 100; and at Cairo a Grand National Lodge, with a following of 68 Lodges. Several European Masonic powers, including England, Scotland, Italy, and France, are also represented in the valley of the Nile, England having a Provincial Grand Lodge for Egypt and the Soudan, with 14 Lodges. In Algeria and Morocco, Masonry may be said to fall exclusively within the French sphere of influence, and in Tunis mainly so, though in this Regency an independent Grand Lodge was established in 1881. On the West Coast of Africa there are several Lodges under England and one under Ireland. Others exist in Senegal, the Azores, and St. Helena, holding French, Portuguese, and English warrants respectively. In the Negro Republic of Liberia there is a Grand Lodge—constituted in 1867—with 8 daughter Lodges, and a membership of 250."—R. F. Gould, *Concise history of Freemasonry*, pp. 324-325.—"The first of a long series of Dutch Lodges was established at Cape Town in 1772, and since the final cession of the Cape Settlement to Great Britain in 1814, the Freemasons owning fealty to the Grand Orient of the Netherlands have always acted in perfect harmony with those working under warrants from the Grand Lodges of the British Isles. At the present time, in Cape Colony, Natal, the Transvaal, the Orange River Colony, Rhodesia, Nigeria, Mashonaland, etc., there are 185 English, 35 Scottish, 23 Dutch, and 4 others—more or less clandestine—which are not recognized by the dominant Masonic Powers. In the South African Islands, there are French Lodges at Réunion (or Bourbon) and Madagascar. A Portuguese Lodge exists at Mozambique. At the Mauritius there are (or were) three Lodges holding French charters, and until quite lately an equal number under the Grand Lodges of the British Isles, but one of these, Independent, No. 236 on the roll of the Grand Lodge of Ireland, has, at the present time of writing [1904], disappeared from the list."—R. F. Gould, *Concise history of Freemasonry*, pp. 325-326.—"Most, though not all, coöperative colonies have failed. Perhaps the cement of brotherly love has been lacking in such undertakings. It will be supplied in an experiment about to be tried on the border of Lake Nyasa in the country that was formerly German East Africa. None but Freemasons are to be admitted to the colony, which is to be governed Masonically. Masons from New Zealand are the prime movers in the enterprise. It is proposed that every settler shall acquire 5,000 acres or more of plantation land at less than one shilling an acre. Tobacco, rice, cotton, tea, coffee, wheat, tropical and subtropical fruits, can be raised abundantly in the allotted territory; labor is cheap there, and strikes are unknown. It will not take long in that rich soil to put nature through the 32°."—*New York Globe*, quoted in *Masonic Standard*, Mar. 27, 1920.—"Bro. Captain Willis, M.C., a native of . . . New Zealand, . . . experienced in tobacco planting in South and East Africa, has been appointed commandant of a portion of the conquered [former German] territory in East Africa, and is also supervising a scheme for the establishment of a Masonic coöperative settlement there. The territory he pro-

poses the settlement should occupy is the hilly country contiguous to the north end of Lake Nyasa, a 'pool' 360 miles long, between thirty and sixty miles wide, and the second deepest lake in the world."—*Freemason (London)*, Aug. 21, 1920.

Asia: Persia and India.—"Askeri Khan, a Prince of Persia, ambassador of the Shah at Paris, was admitted a member of the Craft in that city in 1808. A similar experience befell the Mirza Abul Hassam Khan—also a Persian Ambassador—who was made a Mason by the Earl of Moira, in London, in 1810. During the same year Sir Gore Ouseley, English Ambassador at the Court of the Shah, was appointed Provincial Grand Master for Persia, but there is no evidence to show that any Lodges were ever established in that country by any external authority. [Light in Iram is the name of a Lodge working in Shiraz, Persia.]—*Freemason (Toronto)*, May, 1920.] The earliest stationary Lodges in India, which must all have partaken more or less of a military character, were established at Calcutta in 1730, at Madras in 1752, and at Bombay in 1758. The rivalry between the two Grand Lodges of England was reflected in the Indian Lodges, but the 'Brethren' of Madras anticipated in a very happy manner the complete 'Union' of 1813, by the 'Atholl' or 'Ancient' Masons, and the Regular Masons or titular 'Moderns,' who amalgamated under General Horne, in 1786. In the senior Presidency, however, the animosities between the Regular Masons and the Schismatics lingered until 1813, when, under the benignant sway of the Earl of Moira, Acting Grand Master of India, Masonry in Bengal took firm root in the land, and flourished as it had never done before. In Bombay, the most brilliant era of the Craft is inseparably connected with the memory of Dr. James Burnes, by whom, in order to throw open the portals of Freemasonry to native gentlemen, a Lodge—Rising Star of Western India—was established in December, 1843. . . . In the three Presidencies—with Aden and Burma—there are at the present time 130 Lodges under the English, and 44 under the Scottish jurisdiction."—R. F. Gould, *Concise history of Freemasonry*, pp. 317-318.

Asia: East Indies.—Far East.—"Lodges holding charters from European jurisdictions exist at Ceylon, Sumatra, Java, Celebes, and Borneo. In the Philippines there were, until the recent political changes, four Spanish Lodges at Manila, the capital, but the activity of the Craft is gradually being resumed under charters from the American Grand Lodges. [See PHILIPPINE ISLANDS: 1837-1806.] A system of corrupted Freemasonry is practised in these islands by the members of the Katapunan Society. This was originally a revolutionary association formed by the leaders of the people during their revolt against Spanish rule. . . . Lodges constituted from Great Britain or Ireland exist in the Straits Settlements, Siam, China, and Japan, and at the most important treaty-port in the Chinese Empire—namely, Shanghai—there are two Lodges under other foreign jurisdictions, which hold German and American warrants respectively. In China, moreover, there exists what by many persons is regarded as a kind of indigenous Masonry, which has likewise penetrated into some of the Colonies and dependencies of certain European powers, for example, Sumatra, Java, the Straits Settlements, and Burma."—R. F. Gould, *Concise history of Freemasonry*, p. 320.

Australasia.—Oceania.—"The 'Mother City' of Australasian Masonry, as might naturally be ex-

pected, is Sydney, the capital of the parent colony. Regimental, in the first instance, paved the way for Stationary Lodges, and the earliest of the latter—Australian Social—was established by warrant of the Grand Lodge of Ireland, in 1820. Many Lodges were afterwards formed in all parts of Australasia by the three jurisdictions of the British Isles, and after some hasty declarations of independence by unruly minorities, Grand Lodges have now been established, in strict accordance with Masonic usage, in all of the Colonies. . . . In Queensland there is a Grand Lodge, but there are English, Scottish, and Irish District (or Provincial) Grand Lodges, with a following of 54, 58, and 23 Lodges respectively, forming a total of 135. Probably all will soon unite. Western Australia is also the seat of a Scottish Masonic Province, with 34 Lodges, and there is a solitary representative (in each case) of the English and Irish jurisdictions, making an aggregate of 36 in addition to those on the roll of the Grand Lodge. Apart from the above, England still retains control over two Lodges—one in New South Wales and the other in Victoria—and Ireland over one, in South Australia. Tasmania has no Lodges under the authority of other Masonic powers, working side by side with those on the roll of its own Grand Lodge. In New Zealand the English, Scottish, and Irish Lodges have united, and formed a Grand Lodge, which flourishes with 267 Lodges and 15,000 members. There are four Lodges holding British warrants in the Fiji Archipelago; two, one English and the other French, in New Caledonia; and one Scottish and two (or more) American Lodges in the Sandwich or Hawaiian Islands."—R. F. Gould, *Concise history of Freemasonry*, pp. 348-349.

Austria-Hungary: Creation of Grand Lodges.—Suppression and revival of the craft.—Abolition in Hungarian republic.—"A Lodge—The Three Stars—is said to have been established at Prague by Count F. A. Sporck, afterwards Governor of Bohemia, on returning from his travels in 1726, or at all events prior to 1729. Other Lodges were subsequently constituted from Prague, in Galicia, Hungary, Luxembourg, Styria, and Moravia. The first Vienna Lodge—The Three Firing Glasses—was established in 1742, but closed, by order of Maria Theresa, in the following year. The members, however, among whom was her husband, Francis of Lorraine (afterwards Emperor) continued to meet in secret. A second Lodge—The Three Hearts—was formed at the Austrian capital, in 1754; and a third, Royal Militaire, in 1761. Maria Theresa regarded Freemasonry with disfavour, but the influence of her Consort was sufficiently potent to procure for it a certain measure of toleration, though powerless to protect it from occasional outbursts of persecution. Other Lodges were founded at Vienna, in the Tyrol, Lombardy, and Illyria, but Freemasonry in Austria had passed under the yoke of the Strict Observance when the Empress Maria Theresa died, in 1780. The territory of St. Stephen in the eighteenth century comprised the Kingdom of Hungary, or 'Mother Country,' the Principality of Transylvania, and the Kingdoms of Croatia and Slavonia. The first Lodge in the 'Mother Country'—*Taciturnitas*—at Pressburg, is known to have existed in 1766, and eight other Hungarian Lodges were established between 1769 and 1771. Four Lodges were also formed in Transylvania, the first in 1750 and the last (of which the name has been preserved) in 1769. One

of these, bearing the curious title of St. Andrew of the Three Sea-Leaves, gave birth to some daughter Lodges. The Three Dragons was established at Varasd (Croatia) in 1774. In Southern Hungary, under the influence of the two Counts, John Draskovitch and Stephen Niczky, Lodges were founded at Glina (1764-69) and Agram (1771), and (also in Croatia) a 'Free Carpenters' Lodge' was established at Varasd (1772), which was soon afterwards transformed into a Masonic one, under the name of Perfect Union. Lodges were likewise formed at Eszek, the capital of Slavonia, and at Kreutz (a country centre). These Lodges, in 1775, created a National Masonic Rite, under the name of Masonry of Freedom, or Province (*i. e.*, *Grand Lodge*) of Liberty, but it was commonly known as 'The Draskovitch Observance, or Rite.' The new power was short lived, but did much good during its brief span of life. Under the Emperor Joseph II—1780-83—four Lodges were instituted at Vienna, and nine in other Austrian States. During the same period two Lodges each were constituted in Bohemia and Moravia, three in Galicia, eleven in Hungary, and one in Transylvania. A Grand Lodge—ruling over forty-five Lodges—for Austria and its dependencies was established in 1784. An Imperial Edict in the following year ordered that not more than three Lodges should exist in any single town, while those that were at work in any place which was not a 'Seat of Government' were summarily suppressed. The consequences may be supposed. The newly-formed Austrian Grand Lodge, together with its Provincial Grand Lodges, passed off the scene, and the general discontent of the Craft betokened the beginning of the end. Then came the French Revolution. The Freemasons were regarded with suspicion. The Austrian Lodges voluntarily closed in 1792, and those in Bohemia during the following year.

"Masonry in Hungary had a slightly longer life, but by an Edict of 1795 all Secret Societies in the Austrian dominions were ordered to dissolve. There was a short Masonic revival at Vienna during the French occupation of 1805, and again in 1800-12. In 1867, after the Civil War, Masonry revived in Hungary, though in Austria it continued to be forbidden. In 1918, after the Great War, a Grand Lodge of Vienna was formed with 14 Lodges and 1,010 members. . . . A Lodge, Unity in the Mother Land, was founded at Budapest in 1868, and this, with six daughter Lodges, formed, on January 30th, 1870, the St. John's Grand Lodge of Hungary. The three Craft degrees only were recognized or tolerated by this governing body. In 1869, however, a Lodge, Matthias Corvinus, established under the auspices of the so-called 'Ancient and Accepted *Scottish Rite*' (after a vain application to the Grand Lodge of *Scotland*) obtained a warrant from the Grand Orient of France. This likewise warranted daughter Lodges, and the united body, in November, 1871, founded the Grand Orient of Hungary. Ultimately the Grand Lodge and the Grand Orient amalgamated under the title of the Symbolic Grand Lodge of Hungary, on March 23rd, 1886. 'Freedom of Conscience' is acclaimed by this Grand Lodge, and the preamble of its Statutes follows rather closely that of the Grand Orient of France. There are 82 Lodges, with a total membership of 6,134."—R. F. Gould, *Concise history of Freemasonry*, pp. 296-299.—"The renewal of the Hungarian Constitution in 1868, sanctioning the statutes of Freemasonry, produced a new splendor for it. The aim of the statutes was defined as the development of public morals,

of popular instruction, of love of neighbor, and practice of charity. During the war the lodges organized hospitals at Budapest; they rebuilt one of the villages which had been destroyed by the Russians; they procured situations for demobilized officers; they assisted soldiers who returned from the front; and after the armistice, did all they could to obtain just and kindly treatment for their unhappy country. In addition Hungarian Masonry created a large number of social and beneficent societies which occupied themselves with the protection and succour of men, women and children, as well as with education, but these societies were not connected with the craft nor was its name advertised in connection therewith. . . . But about three years ago Hungarian Masonry ended violently and abruptly. Communists occupied their buildings and during the Rumanian occupation the military authorities prohibited all meetings. Ultimately, on May 14, 1921, the order was dissolved by the command of the Ministry of the Interior. Since that date Hungarian Masonry acted officially on only one occasion, viz., when, by permission of the National Assembly, the last administrators of the Grand Lodge addressed a request to the foreign Masonic bodies to assist in the sending home of their countrymen who were imprisoned in Russia. Thus Freemasonry no longer exists in Hungary."—D. Wright, *News of Freemasonry (Christian Science Monitor, Feb. 6, 1922)*.

Canada and Newfoundland.—"Tradition marks the year 1738 as the date of the constitution of the first Masonic Lodge, in what is now the Dominion of Canada. This Lodge was warranted at Annapolis Royal, in Nova Scotia, by Erasmus J. Phillips, Fort Major of the pioneer fortress, under the authority of Henry Price, the Prov. G. M. of St. John's Grand Lodge at Boston, Massachusetts. Phillips was initiated in 'the first Lodge in Boston' in 1737, while on a visit to that town. On his return to Annapolis, he opened the Lodge, thus sowing the first seeds of Craft fellowship in the Maritime Provinces. The position given him by Price was that of Deputy Grand Master—but within a short period he became Provincial G. M.—and by his authority the first Lodge at Halifax was warranted in 1740-50, with Brigadier-General Edward Cornwallis as Master. A Grand Lodge was formed by a minority of the Lodges, in 1866, but it was shortly afterwards merged in the existing Grand Lodge of Nova Scotia, which was regularly organized in 1860. The first Province west of the Maritime Provinces to constitute Lodges was Quebec, in 1750-60. These Lodges were military and civil—military for a short time after the conquest, and civil from 1761-2. They were governed by a Provincial Grand Lodge (*Moderns*'). This body had an active existence until 1791, when the 'Ancients' warranted a Provincial Grand Lodge under Prince Edward, afterwards Duke of Kent, who was in command of the forces at Quebec. Both these organizations did good work, but that of the Moderns was not an active factor after 1800. In 1813, when the rival Grand Lodges of England joined hands, a Provincial Grand Lodge, under the present United Grand Lodge of England, took charge of the jurisdiction of Quebec. In 1701 the Province of Canada (Quebec) had been divided into Upper and Lower Canada, under William Jarvis and Prince Edward, as Provincial Grand Masters respectively. Both these appointments were made by the Ancients. In 1822-3 the Provincial Grand Lodge of Lower Canada was divided for Masonic purposes into two districts, one—Quebec and Three Rivers, the other—Montreal and William Henry. The

two Provinces had separate Legislatures until 1841, when for civil purposes they were united, Lower Canada being afterwards known as Canada East, and Upper Canada as Canada West. The dividing line between these Provinces from 1791 was the Ottawa River, and no change was made when they were united in 1841. In 1855 a secession took place from the Provincial Grand Lodge of Upper Canada, and an independent Grand Lodge was established. Two years later, the Provincial Grand Lodge (dating from 1792), formed 'The Ancient Grand Lodge of Canada.' In 1858 these two bodies united under the title of the Grand Lodge of Canada, by which organization Lodges were formed, not only in Canada West, but also in Canada East. The Grand Lodge of Quebec was formed in 1869, and exercises Masonic jurisdiction over the Province of Quebec, formerly Canada East. But three of the Lodges in Montreal still retain their English warrants, and have hitherto declined to affiliate with the Colonial Grand Lodge. At a later period, in recognition of the position attained by the Grand Lodge of Quebec (Canada East), the words 'In the Province of Ontario' (Canada West) were added by the Grand Lodge of Canada to its title. The Grand Lodge of Alberta was formed in 1905, and that of Saskatchewan in 1906.—R. F. Gould, *Concise history of Freemasonry*, pp. 346-347.—"There are ten English and two Scottish Lodges in this island [Newfoundland]."—*Ibid.*, p. 348.

Central and South America.—"In 1804 the Comte de Grasse introduced a new system or Rite of thirty-three degrees into France, under the title of the Ancient and Accepted Scottish Rite. Its success in France was instantaneous and phenomenal, and it speedily became a favourite with the Latin races. The Rite penetrated and made its ground secure in Spain, Portugal, Mexico [see MEXICO: 1822-1828] and South America, while, to come to our own day (with the exceptions that will be presently noticed), what Lodges there are in the Republics of Central and South America are governed either by Supreme Councils or by Grand Orient, of which Supreme Councils form part. Supreme Councils and Sovereign Grand Inspectors General, 33°, were each supposed by members of the Rite to possess, on the whole, powers greatly in excess of those appertaining to Grand Lodges and Grand Masters. Supreme Councils could confer at pleasure the 33rd degree, and the persons so honoured could not only create Supreme Councils where none existed, and add to the number of their own degree (S.G.I.G.), but it was extensively believed that, like the Scots Masters—whose assumed powers were afterwards, in some shape or form, successively exercised by the Chapter of Clermont, the Knights of the East, the Emperors of the East and West, and the Strict Observance—they could, at any time or place, personally impart, either with or without a ceremony, the secrets of the three Craft degrees. The Grand Orient system was a French invention, and has since been adopted by other Latin nations. *In theory*, a Grand Orient is an organization consisting of several sections, usually a Supreme Council, Grand Chapter, and Grand Lodge, each with exclusive power over its own degrees. *In practice*, the Supreme Council is always the predominant partner, and its Grand Commander is the Grand Master of the united body. In Mexico, besides a Supreme Council, there are several distinct Grand Lodges. A circular, issued—June 14th, 1901—by one of the latter, declares:—"That the Bible, the

Great Light of Masonry, is to be formed on its altars; and that no women are admitted into the Lodges;—from which an opinion may be formed of the so-called 'Masonry' of the Republic, as practised under the ægis of the Gran Dieta Simbolica, now happily defunct. The most important, founded 1865, has 15 Lodges, with over 1,000 members. A Grand Orient for Central America—comprising the Republics of Costa Rica, Guatemala, Honduras, and San Salvador, was established in Guatemala, in 1887. Under it are 18 Lodges, exclusive of 7 which are ruled by the Grand Lodge of Costa Rica—formed in 1899—and 3, holding British charters, in Nicaragua. A Grand Lodge of Guatemala has 12 Lodges; that of Salvador has 5; that of Panama 6 Lodges; and that of Yucatan has 9.

"In South America, there is in Brazil the Grand Orient of Brazil at the capital, and of the Rio Grande Do Sul, at Porto Alegre, with a following of 390 and 39 Lodges respectively. Single Grand Orient exist in Argentina (115), Chili (40), Colombia (5), Paraguay (9), Paraná (13), Uruguay (18), and Venezuela (9). The figures within parentheses denote the number of Lodges in the several jurisdictions, so far as I have been able to discover them. There is a Grand Lodge of Peru—reorganized in 1852—with a following of 6 Lodges. Besides the national organizations, Lodges under various European jurisdictions exist in many of the Republics, and in all of the larger capitals. England is represented by 22 Lodges in South America, and America by 3—under charters granted from Massachusetts—in the 'District of Chili.' In Guiana, Lodges have been, from time to time, constituted by Holland and France within their respective spheres of influence, and British Guiana, at the present moment, besides having a Scottish Lodge at Demerara, is itself the seat of an English Province, with a roll of 6 Lodges, one of which, however, is at work in Chili (*Valparaiso*) and another in Uruguay (*Montevideo*)."—R. F. Gould, *Concise history of Freemasonry*, pp. 329-331.—"A Masonic school has been founded in Bahia, Brazil, to promote and supervise farms, libraries, workshops and schools."—*New Masonic Advocate*, Nov., 1920.—"As a result of the report of Charles A. Adams, past grand master, to the seventy-second annual convention of the California Masonic Grand Lodge, in session here [San Francisco], the York Rite Grand Lodge of Mexico will be recognized, and the York Rite Lodge of the Valley of Mexico urged to amalgamate with the Grand Lodge of the Valley of Mexico, thus bringing harmony out of the differences which have existed between the two Mexican lodges for some years."—*Christian Science Monitor*, Oct. 13, 1921.

China: Ancient forms of Masonry.—**Ceremonial in the Temple of Heaven.**—"The late Sir Chaloner Alabaster, who was not only one of our most respected sinologues, but also an indefatigable student of Freemasonry, tells us:—"Going then to the records we possess of the earliest historic times in China, I find clear evidence of the existence of a mystic faith expressed in allegorical form, and illustrated, as with us, by symbols. The secrets of this faith were orally transmitted, the chiefs alone pretending to have full knowledge of them. I find, moreover, that in these earliest ages this faith took a Masonic form, the secrets being recorded in symbol buildings like the Tabernacle Moses put up in the desert, and the Temple his successor, Solomon, built in Jerusalem; that the various offices of the hierarchy

of this religion were distinguished by the symbolic jewels held by them during their term of office, and that, as with us, at the rites of their religion they wore leather aprons, such as have come down to us, marked with the insignia of their rank. I find in the earliest works that have come down to us . . . the compasses and the square used as the symbol of right conduct, the man who had the compasses and square, and regulated his life thereby, being then, as now, considered to possess the secrets and to carry out the principles of true propriety. Finally, I find one of the most ancient names by which the Deity is spoken of in China is that of the First Builder, or, as Masons say, the 'Great Architect of the Universe.' According to the same authority, 'the Mysteries of this ancient Faith have now become lost, or at best obscured, though attempts at a revival may be traced in the proceedings of existing brotherhoods, whose various rituals and signs are supposed to be in some measure founded on ancient rites and symbols which have been handed down from the earliest ages.'—R. F. Gould, *Concise history of Freemasonry*, pp. 3-4.—"Walter Curner, who has just been on a journey to the East, gives an interesting description of Chinese lodges in the following words: 'A form of Freemasonry has been in vogue among the Chinese for thousands of years. The philosopher Mencius, 300 years before the Christian era, wrote: "A master mason makes use of the compasses and square, and ye who are engaged in the pursuit of wisdom must also make use of the compasses and square." In "Chinese Proverbial Philosophy" we read: "The Honly Doctrine (Confucianism) in its education of mankind uses the compasses and the square." The Triad Society have working tools, and among them the 12-inch gauge. They have a worshipful master, a great brother and a second brother, corresponding to our senior and junior wardens, a first point and a second point, corresponding to our senior and junior deacons, and also an inner and outer guard. They recognize three degrees—affiliated younger brother, affiliated elder brother, and obligated uncle, or the E. A., F. C., and M. M. degrees. They have a book of constitutions, issue certificates, and give badges to each member in the form of a medal to carry about with him. At initiations the candidate is purified by ablution. The obligation consists of 36 articles. A white cock is sacrificed, the bird being an emblem of vigilance. The candidate performs eight salutations—to heaven, the earth, the sun, the moon, to the five founders of the society, to Wan Yun Lung, a former grand master, to the brethren present and absent, and to the glorious representatives of the order. In Shanghai the English, Scottish, Irish, and American constitutions in Freemasonry are all working together amicably, and they have among their members Parsees and Chinese.'"—*Christian Science Monitor*, Aug. 11, 1921.

Denmark.—The first Danish Lodge, St. Martin, was established in Copenhagen in 1743; seceders from this lodge founded the second, Zerubbabel, in 1744. Both received English charters and subsequently amalgamated. Most of the kings and princes of Denmark have been and still are members or patrons of the craft. Frederick VII became Grand Master on his accession in 1848, when he remodeled Danish Masonry on the Swedish system. There are about 6,000 members in the fraternity.—Based on R. F. Gould, *Concise history of Freemasonry*, p. 304.

England: Origins of Freemasonry.—Establishment of first Grand Lodge. See above: Legend and fact in Masonic history.

England: Recent events.—Declaration of principles.—Policy of Grand Lodge.—English, Scottish and Irish Grand Lodges: Closer relations.—In 1920 a public statement clarifying the principles guiding the policy of the Grand Lodge was made by the Grand Secretary: "As a great deal of misapprehension appears to be entertained in some quarters concerning the aims and relationships of the United Grand Lodge of Antient, Free and Accepted Masons of England, I have been desired by the Grand Master [the Duke of Connaught] to make the following statement regarding them. The Grand Lodge of England, of which H.R.H. the Duke of Connaught has been for twenty years Grand Master, in succession to the late King Edward VII.—himself Grand Master as Prince of Wales from 1875 to 1901—has held strictly aloof throughout its history, which dates from 1717, from participation in public or political affairs, either national or international, considering itself precluded from taking any share in discussions on State policy. While thus standing aside from party divisions, it has always inculcated patriotism in the citizen and loyalty in the individual. It had not long been established when it publicly gave assurance of this to one of His Majesty's Principal Secretaries of State. The assurance thus given in the reign of George I. is emphasised in a special degree in that of George V. Everyone who comes into Freemasonry is strictly enjoined at the outset not to countenance any act which may have a tendency to subvert the peace and good order of society, to pay due obedience to the law of any State in which he resides, and never to be remiss in the allegiance due to his Sovereign. No secret is attached to these duties, which are of the essence of Masonry as practised under the Jurisdiction of the United Grand Lodge of England, as well as by the Sister Grand Lodges of Ireland, Scotland, Canada, Australia, and New Zealand, and, I have reason to believe, of the remainder of the English-speaking world. Every English Lodge at his consecration is dedicated to God and to His Service; no one can become a Mason until he has declared faith in the Supreme Being. As a consequence, men of every shade of political opinion and ministers of all religious denominations are members of and office-bearers in our Organisation, and Masonry thus provides a platform on which men of all conditions, classes, and creeds can work together for the common welfare. In Masonic Lodges all discussions on topics of a political or theological nature are strictly forbidden. Because of its determination to preserve the position it has upheld for over two centuries, the Grand Lodge of England never takes part in any Masonic or quasi-Masonic gathering in which the fundamental Antient Landmarks of Freemasonry—which have been indicated above—are allowed to be regarded as open questions.—Yours faithfully and fraternally, P. Colville Smith, Grand Secretary. 5th August, 1920."—*Freemason (London)*, Aug., 1920.—"The Grand Lodges of England, Scotland, and Ireland are arranging the details of their new and closer relationship, and there seems no question that the greatest harmony will prevail from now on. The working agreement . . . provides: The Grand Lodges of England, Scotland, and Ireland will in future not recognize or enter into relation with any Masonic body or society which claims to be Masonic without previous consultation and agreement. They will confer together before deciding any question affecting the Landmarks of the order which may arise within any or either of these Grand Lodges. In order to maintain this co-operation there shall be a regular annual conference

among five leading representatives of each of the three Grand Lodges at London, Dublin and Edinburgh in rotation. General fraternization shall, if possible, be arranged at the period of these conferences. The first conference shall be held in London in 1920."—*Masonic Standard*, Feb. 28, 1920.

England: Ideals of universal Freemasonry.—Bicentenary of English Masonry.—In a speech delivered at Birmingham, England, in March, 1913, the Pro-Grand Master of the Grand Lodge of England, Lord Amptill, declared: "Every one of us has from time to time asked himself whether Freemasonry has done all it could, all it ought, and all it pretends to do, and I feel certain that many of us must agree that it has not. . . . We live in a time when ancient institutions are being attacked and exposed to the searchlight of criticism, and it is only right to expect that our own ancient Institution will come under that searchlight. Has Freemasonry justified its position? We have done very good benevolent work, but what we have to remember always is that, if we were first and foremost a benevolent institution, all the pomp and ceremonial associated with Masonry would be out of place; we could do without it. Our Association claims to be, first of all, a philosophical Society—a body of thinking men—and, I ask, is this sufficiently expressed in the Craft, and impressed upon the Initiates? Before we can advance we must put our own house in order. We must see that every one admitted to Freemasonry is not only a good fellow, but that those who come into the Craft are prepared to give more than they receive. The Master of a Lodge should be one who is capable of influencing the higher mental attitude of the whole of the members of his Lodge, and inspiring them with the true and real spirit of Freemasonry, so that every Mason should become a power in the world. I may be a dreamer, but I consider that there is great scope in Freemasonry for improving the relationship among nations." In response to this appeal there was formed in London during June, 1913, an international society with the objects of cultivating every form of Masonic knowledge and forwarding the universal application of Masonic principles. The "constitution" of the society is in part as follows: "1. The motto of this Society will be *Altiora Peto*—I seek higher things. 2. The title suggested for the Society is The International Masonic, Rendezvous, and Polyglot Lodge of Improvement. 3. The place selected for its home is the Hampden Club, St. Pancras, [which] . . . contains, in addition to the ordinary appointments of a well-conducted Club, a Masonic Temple. . . . 4. The work of the Society, as a Lodge of Improvement, will include the enhancement of ceremonial effectiveness by proper attention to Lodge æsthetics and deportment, and the practice of ritual in English, French, German and Italian to such an extent as may be found needful and helpful to the members. 5. Masonic history, English, American, and Continental, will be the subject of special study, so that the Brethren may become familiarized with the original aims of Freemasonry, and be enabled to profit by the examples of the past in all that is worthy of emulation, and to avoid the errors of omission and commission which experience has condemned. 6. Research, in so far as it is of practical value, will receive due attention, but no time will be wasted on studies which involve Freemasonry in esoteric entanglements, or which begin and end in turning over rubbish heaps of speculative theory and unbased assertion. . . . 7. To carry out the aims of the Society it will be necessary to organize a correspondence section, so that co-operation may in

time be secured throughout Greater Britain, Europe, and America. . . . 8. It may also be found desirable to arrange international tours, serving the double purpose of providing pleasure and education for Brethren on holiday, and of assisting the objects of the Society by personal inter-communication. 9. It is the intention of the Committee to follow the example of the early English Masons in the matter of moderate fees and expenses. . . . [The prospectus concluded thus]: The organisers of this movement . . . while they keep before their eyes, as their supreme ambition, the accomplishment of some part in the grand scheme of welding the Freemasons of the world into an associated body moved by a single impulse, they may hope, as an indispensable first step in that direction, to attract many spirited helpers to the work of 'setting our own house in order,' by a determined endeavour to redeem Freemasonry in England from the reproach of intellectual sluggishness."

France: Introduction of Freemasonry.—Grand Orient Lodge.—Freemasonry was introduced into France in 1725 by Lord Derwentwater. The first French Masonic authority was founded in 1736 and took the name of 'Grand Lodge of France.' In 1772 the Grand Lodge split into two groups, and for a time each group bore the title of 'Grand Lodge.' Then, in 1773, the more important of the two factions adopted the name of 'Grand Orient, Grande Loge Nationale de France.'—*Annuaire général de la France et de l'étranger*, 1920-1921, p. 209.—"In 1877 the Grand Orient of France removed the Bible from its altar and erased from its ritual all reference to Deity; and for so doing it was disfellowshipped by nearly every Grand Lodge in the world. . . . It was felt [according to apologists for this action] that France needed the aid of every man who was an enemy of Latin ecclesiasticism in order to bring about a separation of Church and State; hence the attitude of the Grand Orient."—J. F. Newton, *Builders*, p. 261, note.—As a result, a storm of criticism broke from all sides, accusing the French organization not only of irreligion but of political activity and of pursuing subversive aims. "All Masonic lodges throughout the world except the Grand Orient do homage to a Divine Being, symbolized as Horani, the Great Architect of the Universe, and in the beginning the French lodge also recognized the designer of the Temple. But forty years ago the Grand Orient formally repudiated the Great Architect of the Universe, and the first condition of initiation is Atheism. The 'Frères Trois Points,' as they are commonly called in France, the Brothers of the Three Dots (···), are credited with all the revolutions of modern times in France, Italy, Portugal, Turkey, Persia, and China. . . . The 'serious' objects of the Grand Orient, symbolised by the Three Dots, were the triple liberation of humanity from religious, political, and social points of view. And here came the crux, for Freemasonry is a 'bourgeois' affair, and social liberation it abhors. The Grand Orient, with its lodges, had grown enormously wealthy, and did not want to grow poor again. The Confédération Générale du Travail, the great Socialist machine, rose up against it, and latterly all the better feeling of France revolts against its tyranny."—*Standard* (London), Jan. 27, 1913.

France: American criticism of French Masonry.—Defense of Grand Orient by its president.—French Lodges re-opened in Alsace-Lorraine.—American relations with Grand Lodge of France.—Charges against the Grand Orient of France stigmatizing it as a political and irreligious institution have in recent years been raised in the United States as in England. The following criti-

cism is by a past District Deputy Grand-Master of the Grand Lodge of the State of New York: "For a great part of the time since 1870, the real centre of power has been, not in the Palace of the Elysian Fields [Champs-Élysées, Paris], the official residence of the President of the Republic; not in the Bourbon Palace, the meeting-place of the Chamber of Deputies, but in the Rue Cadet, the headquarters of the 'Grand Orient'—the life centre of 'Latin Freemasonry' in France. And in this Temple of Mystery in the Rue Cadet, Joseph Caillaux has been one of the Chief Priests. In its policies, this great secret society has had three watchwords, as enunciated by its own leaders: 'Anticlericalism, Antimilitarism, Socialism.' In following out the first, it has tried to impose upon France, not genuine religious liberty, as we understand it in America, but a despotism of atheism and materialism, for a striking characteristic of this 'Latin Freemasonry,' which markedly distinguishes it from the reverent and religious brotherhood of England and the United States, is the deliberate elimination from its ritual and teaching of every allusion to 'the Grand Architect of the Universe.' . . . At the present moment, it is estimated that 300 Deputies (out of 580) and 180 Senators (out of 300) are Freemasons. Freemasonry thus disposes of an absolute majority in both legislative assemblies. As for the Ministries, for the last twenty-five years they have constantly contained a majority of Freemasons."—C. Johnston, *Caillaux's secret power through French Masonry* (*New York Times Magazine*, Feb. 24, 1918).—The above charges were refuted in a long letter defending the principles and policies of the Grand Orient of France by its President, M. Corneau, which appeared in the *New York Times* of May 14, 1918. Herein it was stated that M. Caillaux was not a Freemason at all; that "atheism," so-called by the Grand Orient's critics, was apparently confounded with the "absolute liberty of conscience" recommended by the society's constitution; that the Grand Orient, so far from serving one political party, represented all factions of republican opinion "in order to work together for the emancipation of human intelligence, for the independence of peoples, and for the social happiness of humanity"; and that allegations representing the French Masons as unpatriotic in the World War were unjustified. He pointed out that Marshal Joffre was a member. Documentary evidence showing the consistently patriotic attitude of the Grand Orient during the war was included in the letter and made public. "There are, in France, as in Italy, two bodies, each claiming to be the genuine representative of Freemasonry. There is, on the one hand, the body affiliated with the Ancient and Accepted Scottish Rite, which was established in Paris, I believe, in 1804. This is so distinctly a religious body that many lodges will accept only professing Christians as members. . . . [It is] . . . doubtless correct [to say] that Caillaux does not belong to it. But there is, besides, an older body, . . . the body which, on Sept. 13, 1877, erased from its rules the paragraph declaring that the existence of God and the immortality of the soul were the basis of Freemasonry; which, on Sept. 10, 1878, expunged from its ritual the symbols of the Grand Architect of the Universe. This is the body which I described as irreligious."—C. Johnston, *French Masons and their critics* (*New York Times*, May 12, 1918).—"The return of Alsace and Lorraine to France, has caused the dissolution of the German Masonic Lodges. The Grand Orient of France has re-opened the French Lodges which were closed in 1871, when these provinces were annexed to the German Em-

pire."—*Freemason* (*Toronto*), May, 1920.—As distinct from the Grand Orient of France, the other authoritative body, the Grand Lodge of France, received favorable consideration from American Masonry, as the following paragraph from *The Trestle Board* of July, 1920, would indicate: "The Knights Templar of the United States having made a special investigation of Masonic conditions in France have decided to maintain fraternal communications with the Grand Lodge of France and have appointed Edward P. Denny, the Grand Secretary of the Grand Lodge of France, to represent and advise the American Knights Templar."

Germany: Introduction of Masonry.—**Fredrick the Great a member.—Formation of Grand Lodges.**—"The first mention of Freemasonry in connection with Germany is the appointment of *Fredericus du Thom* as Provincial G. M. for the circle of Lower Saxony, by the Duke of Norfolk in 1729-30, but this appears to have been a sort of honorary appointment, as Du Thom is a person entirely unknown in German Masonic history. Next, the Earl of Strathmore, 1733, is stated to have granted to 'eleven German Masons, good brothers,' a deputation to open a Lodge at Hamburg; but the deputation was evidently not acted upon, as no trace of a Lodge between 1733-1737 can be found. The first German Lodge was established at Hamburg on December 6th, 1737, under Charles Sarry. It consisted of 7 members then, and no mention is made of any English Warrant. In point of fact, the W. M., Luttmann, only had it registered in England in October, 1740, and he was a few days later appointed Prov. G. Master. On his return to Hamburg, the Lodge—in July, 1741—took the name of Absalom. The first German Lodge had the honour of initiating at Brunswick, on the 14th of August, 1738, the Crown Prince of Prussia (later Frederick the Great), who thereupon opened a private Lodge of his own at his castle of Rheinsberg. This is the starting point of Freemasonry in Prussia. The King's Lodge ceased when Frederick left for the first Silesian War, but with the King's permission another was then—September 13th, 1740—formed at Berlin. Out of this Lodge originated the oldest of the Prussian Grand Lodges: The Grand National Mother Lodge of the Three Globes, in Berlin. . . . This was originally formed at Berlin, as a private Lodge, on September 13th, 1740, under the name of 'Aux Trois Globes.' It soon erected Lodges itself at Meiningen, Frankfort-on-the-Maine, Breslau, and Halle, after the fashion of those times, and thereupon styled itself, from June 24th, 1744, the Grand Royal Mother Lodge. It also founded two Lodges at Berlin: Eintracht, which is the oldest of the *Berlin* daughter Lodges (1754), and Aux Trois Colombes (1760). The latter is now the Grand Lodge Royal York (No. III). After this time there was a great confusion of Masonic systems at Berlin, and in August, 1766, the Rite of the Strict Observance was adopted. In 1772 the title was altered to Grand National Mother Lodge, when Prince Frederick August, of Brunswick, was appointed Grand Master, who remained in that position till 1790. In 1772 the Prince's uncle, Duke Ferdinand of Brunswick, was appointed Grand Master of the Strict Observance, and there can be no doubt that when the Convent of Wilhelmsbad was held, in 1782, the Three Globes expected the centre of gravity to be shifted to Berlin. But the Convent decided otherwise, Ferdinand remained as nominal Grand Master of the Strict Observance, and the Three Globes formally declared themselves independent of that Order in 1783. In 1707 a new system of 7 degrees was adopted, which, with a few

alterations, is still in force, and forms the basis of the present Masonic edifice; it was revised in 1883. In 1798 a Royal Edict was issued granting certain privileges to the three Prussian Grand Lodges. In 1799 the present Masonic Hall was bought. In 1839 the Grand Lodge joined the 'Prussian Grand Master's Union,' and in 1873, together with the two other Prussian Grand Lodges, the 'Grand Lodge League of Germany.' Under this Grand Lodge are 156 St. John's (*i.e.*, Craft) Lodges, 69 Scottish Lodges, 354 Benevolent Institutions, and 16,346 active members; 116 of the St. John's Lodges are domiciled in Prussia proper, 16 in other German States, 1 in the Brazils, and 1 in China."—R. F. Gould, *Concise history of Freemasonry*, pp. 282-284.

Germany: Grand National Lodge of German Freemasons in Berlin.—Allied Masons sever communication with German Masonry.—"This Grand Lodge was founded by J. W. von Zinnendorf, one of the most remarkable Masons that ever existed, on December 27th, 1770. Zinnendorf was instrumental in bringing about the connection between the Three Globes and the Strict Observance. He was Grand Master of the former, and a warm supporter of the latter, but in 1766 he renounced the Strict Observance, and in the following year retired altogether from the Three Globes. Zinnendorf had obtained from C. F. von Eckleff (1765) the Swedish Ritual, and also a warrant of constitution, on the strength of which he founded—commencing in 1768—about twelve Lodges. These, in 1770, formed a new Grand Lodge. A compact with the Grand Lodge of England, by which (Frankfort alone dissenting) all Germany was virtually handed over to the Zinnendorf body, was concluded in 1773, and the new Grand Lodge obtained the protection of Frederick the Great in 1774. It also benefited by the Royal Edict of 1798, already mentioned. Disputes with the Grand Lodge of Sweden arose, but were eventually settled, and a formal treaty between the two Masonic powers was concluded in 1819. A revision of the Ritual took place about 1840, but only so far as words and expressions were concerned—nothing else was altered. Since then the assertion that the Society of Freemasons is directly descended from the Order of the Knights Templar has been dropped, and a spiritual succession is now only maintained. In 1840 Prince William of Prussia (later Emperor Wilhelm I) was initiated, and in 1853 his son (later Emperor Frederic III) joined the Society. The latter, as 'Master of the Order,' presided over the Grand Lodge from 1860 until 1874. In 1889 Prince Frederick Leopold of Prussia was initiated, in 1894 he was appointed Protector of the three Prussian Grand Lodges, and in 1895 'Master of the Order' (or Grand Master). In this jurisdiction there are 7 chapters, 28 St. Andrew's Lodges, 151 St. John's Lodges, 148 Benevolent Institutions, and 15,300 active members; 84 of the Craft Lodges are in Prussia proper, and the others in the different German States."—R. F. Gould, *Concise history of Freemasonry*, pp. 284-285.—"Owing to the Great War, and the attitude adopted by the German Lodges, no intercourse between them and the Allies is allowed at present (1920), nor is this likely to be quickly altered."—*Ibid.*, p. 283, note.—Relations had not been resumed at the close of 1922.

Greece.—"Lodges were founded by the Grand Orient of France at Corfu, in 1809 and 1810, and by the Grand Lodge of England—Pythagoras, still existing—in 1837. A Grand Lodge of Greece—of which all traces have vanished—is supposed to have been formed at the same island about 1840. On

the mainland there were, in 1867, eight (Italian) Lodges, which met and constituted themselves into an independent Grand Lodge. Irregular Masonic centres were subsequently established, but in 1898 the Grand Lodge of 1867, by a combination with its only surviving rival, became the sole governing body of the jurisdiction, with the title of the Grand Orient and Supreme Council 33° for Greece. It rules over eighteen Lodges, with a membership of about 1,000."—R. F. Gould, *Concise history of Freemasonry*, p. 315.

India. See above: Asia.

Ireland: Early traces of Freemasonry.—Grand Lodge of Ireland in 1725.—Decrees and regulations.—Schism of 1805 and Grand Lodge of Ulster.—Recent statistics.—"A Masonic medallion, bearing date 1516 . . . discovered in Ireland some years ago, was unknown to the Masonic authorities until recently. . . . The members of the Dublin Masonic Lodge of Research believe that it is one of the oldest Masonic emblems in Ireland, and the date it bears is 101 years prior to the establishment of the Grand Lodge of England, the mother Grand Lodge of the world, in 1717."—*Christian Science Monitor*, May 25, 1821.—"The recent research of Dr. Chetwode Crawley has clearly established, that in Irish academical circles Freemasonry was well known before the landing of William of Orange at Carrickfergus in 1690. . . . Of the Freemasonry existing in Ireland before the era of Grand Lodges, merely a passing glance is afforded, and the glimpse we obtain of it is supplied by Dr. Chetwode Crawley in an introductory chapter to a recent Masonic work [Chetwode Crawley MS. in Grand Lodge Library, Dublin, published 1904]. He tells us that a custom prevailed during the seventeenth century in certain Universities of allowing a representative of the undergraduates to make a satirical speech, called a *Tripes*, at the annual meeting for conferring degrees. At Trinity College, Dublin, the '*Tripes*' (or speech) delivered, July 11th, 1688, amounts, in fact, to an attack on the authorities of the University, by the use of illustrations drawn from the Freemasonry of the day. For example: 'It was lately ordered that for the honour and dignity of the University there should be introduced a Society of Freemasons, consisting of gentlemen, mechanics, porters, parsons, tinkers, freshmen [and others], who shall bind themselves by an oath never to discover their mighty no-secret; and to relieve . . . distressed brethren they meet with, after the example of the Fraternity of Freemasons in and about Trinity College, by whom a collection was lately made for a reduced Brother, who received [among other gifts], from Sir Warren, for being Freemasonized the new way, five shillings. . . .' According to Dr. Chetwode Crawley, with whom I am wholly in accord, and whose words I reproduce: 'All Freemasonry in existence to-day can be traced, through one channel or another, to the Grand Lodge of England. This general statement is particularly true of Ireland. The Freemasonry of Ireland in the days immediately succeeding the erection of the Grand Lodge for London and Westminster seems rather a part than a counterpart of the new system. In less than eight years from the foundation of the Premier Grand Lodge, the Sister Grand Lodge of Ireland stands forth as the compeer of the Grand Lodge of England, to which alone it owes precedence.' To the research of the same talented writer we are indebted for the fact that in 1725 the Grand Lodge of Ireland was in existence in Dublin. . . . There is no list of the Officers of the Grand Lodge of Ireland for the years 1726-29, but the Earl of Rosse, who was

Grand Master in 1725, filled the same position in 1730. In the latter year John Pennell, Grand Secretary, published *The Constitutions of the [Irish] Free Masons*. This work is almost an exact counterpart of the English original, and the slight differences which exist are mainly due to the compilation of John Pennell being intermediate in point of date between Dr. Anderson's 'Constitutions' of 1723 and 1738. In 1731 the Grand Lodge of Munster passed under the sway of James, fourth Lord Kingston (who had been Grand Master of England in 1729), and during the same year (1731) this nobleman was elected to the chair of the Grand Lodge of Ireland, in connection with what appears to have been a re-organization of the latter body. The Grand Lodge of Munster is heard of no more, and from 1731 to the present date the succession of the Grand Officers of the Grand Lodge of Ireland is plain and distinct. The first Warrant of Constitution ever issued by a Grand Lodge was granted to the First Lodge of Ireland in 1731. . . . In 1740, under the Grand Lodge of Ireland, as the Masons of that country still showed a want of alacrity in applying for what may be termed 'Charters of Confirmation,' the decree of 1732 [that 'true and perfect Warrants should be taken out by all the Irish Lodges'] was re-enacted, but in more peremptory terms: 'Such Lodges as have not already taken out Warrants are ordered to apply for them to John Baldwin, Esq., Secretary to Grand Lodge, or they will be proceeded against as Rebel Masons.' The next event of importance was the promulgation of the Irish Regulations of 1741, which are a virtual reproduction of Dr. Anderson's second *Book of Constitutions*, published in 1738. . . .

"New regulations for the better government of the Freemasons in Ireland were published in 1768. These ordain that 'Every Master and Warden at his first Entrance [into the Grand Lodge] shall stand such Examination as the Grand Master . . . shall appoint' (IX); That, 'Any Person who has been made a Mason in a Clandestine Manner, contrary to the Rules of the Grand Lodge, shall not . . . sit in any Regular Lodge, until such Lodge . . . shall have him first entered and passed over the usual Courses over again, as if the same had never been performed before' (XXV); That, 'No Army Lodge on the Registry of this Kingdom, shall be charged with . . . annual Contributions, except for the Time they remain on *Dublin Duty*' (XXVI); And, that 'No Army Lodge shall for the future make any Townsman a Mason, where there is a registered Lodge held in any Town where such Lodge do meet; and No Town's Lodge shall make any Man in the Army a Mason, where there is a warranted Lodge held in the Regiment, Troop, or Company, or in the Quarters to which such Man belongs' (XXVII). These Regulations eventually gave place to *The Constitution of FREE-MASONRY, or AHIMAN REZON*, published in 1807. . . . The Laws passed in the interval between the two publications are given in the later one, from which I extract the following: Oct. 1, 1780.—'That no Masonic transaction be inserted in a newspaper by a brother, without permission from the Grand Lodge.' In 1805, a schism blazed forth in the Grand Lodge of Ireland. It had smouldered since 1800, when Alexander Seton, an unscrupulous barrister, had been appointed Deputy Grand Secretary, but without the additional emoluments of Deputy Grand Treasurer, which he had expected. Seton fomented local jealousies, seized the Grand Lodge archives, and retained adverse possession of the Grand Lodge premises. Many of the Lodges in the North of Ireland followed his standard, and were

joined by others misled by his specious circulars. Driven from Dublin in 1807, after a struggle, conducted with unseemly virulence on his part, he organized at Dungannon a schismatic body, which he called the Grand Lodge of Ulster. Worsted in a law suit, in which he sought to recover damages from the Grand Lodge of Ireland for his expulsion, his influence rapidly waned, and the Grand Officers whom he had attracted by misrepresentations, repudiated the short-lived Masonic power. The final blow was dealt in 1814, when it was agreed between the Grand Lodges of England and Ireland that no countenance should be shown to Seton's adherents. The disaffected Lodges speedily returned to their obedience, and the Grand Lodge of Ireland received their submission with wisdom and toleration. The roll of Irish Lodges probably reached its highest figure about the year 1797, when scarcely a village in the Kingdom was without its 'Masonic Assembly.' Afterwards, however, a period of dormancy set in. . . . At the present time of writing [1920] there are 530 Irish Lodges, of which 59 are in Dublin, 43 abroad, and six in Military Corps. There are about 28,000 members under the Irish Constitution. Of a grand total of at least 409 Ambulatory Lodges, which are *known* to have been constituted by the Grand Lodges of the British Isles, it may be remarked in conclusion, a much larger number were warranted by the Irish than by any other Grand Lodge."—R. F. Gould, *Concise history of Freemasonry*, pp. 124, 187, 192, 198, 266-268.

Italy: Introduction of Masonry.—Clerical opposition.—Temporary extinction.—Its contribution to national unity.—"In the uncertain period of Italian Freemasonry, a Lodge is said to have been founded at Florence by Lord George Sackville, in 1733, and others are also traditionally reported to have existed at Milan, Verona, Padua, Vicenza, Venice, and Naples, in 1735. But the minutes are still preserved of the Roman Lodge, in the States of the Church, from the year 1735 down to the time of its final closure—when the Earl of Winton was 'Grand Master'—in 1737. Shortly afterwards (1738) the thunders of the Vatican were launched against the Freemasons, and the series of Bulls issued against the Society by successive Pontiffs have been carefully enumerated by the present Pope [Leo XIII], from whose *Encyclical Letter* of April 20th, 1884, I transcribe the following:—'The first warning of danger was given by Clement XII in 1738, and his Edict was confirmed and renewed by Benedict XIV (1751). Pius VII followed in their steps (1821); and Leo XIII, in his Apostolic Edict '*Quo Graviora*' (1825), embraced the acts and decrees of the earlier Popes on this subject, and ordered them to be ratified forever. To the same effect, Gregory XVI (1832), and very often Pius IX (1846, 1865, etc.), have spoken.' (*De Secta Massonum*.) In the opening years of the second half of the eighteenth century, Lodges under England were established in the Two Sicilies, Tuscany, Venetia, Genoa, and Sardinia. The Strict Observance swept over Italy in 1777, and a little later there was a general cessation of Masonic work. Then came the French domination, and with it a system of Grand Orientals. After the fall of Napoleon, edicts of suppression were issued by the various States, and from 1821 to 1856 not a Lodge existed in any part of what is now the Kingdom of Italy. In 1850 some Masons congregated in a Lodge at Turin, and the example was followed at Genoa, Milan, Pisa, Florence, Lehorn, and Rome. On the 1st of January, 1862, twenty-two Lodges being represented, the Grand Orient of Italy was proclaimed at Turin. This body has been

several times reconstructed, and absorbed the Supreme Council, 33°, at Palermo, in 1873. There are 204 Lodges in the jurisdiction, of which 38 are in foreign countries (Roumania, Servia, Egypt, Barbary, North Africa, South America, and China). A new Grand Orient of Italy—at Milan—with a following of 42 Lodges, is mentioned in a circular of the Swiss Grand Lodge Alpina (1901). At present the Grand Orient is at Rome, and has 482 Lodges with 20,000 members.—R. F. Gould, *Concise history of Freemasonry*, pp. 311-313.—“Freemasonry, owing to the part it had played in the unification of Italy, was incorporated in the history and therefore in the public life of the nation. But from the day on which Freemasonry ceased to be regarded by the Italian people as one of the instruments of unity it was bound to lose its *raison d'être* and a great part of its prestige. However, it was no easy task to divorce the masonic ideal from the national ideal. If there was in Italy one historic memory which counted for something, one sentimental force which conspired to favour the anticlerical democracy, it was Garibaldiism. It took more than one campaign to outwear this tradition, and in these campaigns the Nationalists were the leaders. They succeeded in proving to their contemporaries that as far as Italian interests were concerned the masonic idea was an anachronism, and, as such, dangerous, and therefore to be eliminated. Revelations as to the influence of masonic elements in the Army produced a tremendous sensation, and were followed by a tremendous protest. Wounded to the heart, the Italian Grand Orient had to emerge from its secrecy and appeal to the public; we saw, in the summer of 1913, on all the walls of Italy, the manifesto by which it recalled the services which it had rendered to the nation. It had assumed a posture of defence, which enabled one to prophesy retreat, and the defeat which the elections ratified. . . . One might devote a whole chapter to the greatness and the decadence of Italian Freemasonry. Of late years numerous incidents have given evidence of a reaction against masonic influence. We need only recall the case of Signor Camera, a deputy, and some of his colleagues, whose indictment was demanded by the lodges of the Scottish rite, because they voted in favour of religious instruction in the schools. Signor Giolitti was then accused of having designedly caused dissension and discussion in the ranks of Freemasonry, by supporting moderates like Signor Fera against the more advanced section led by Dr. Ballori, then assistant to the Radical Mayor of Rome, Dr. Nathan [a Freemason]. The fall of Dr. Nathan's municipal government and of the Roman bloc was, by the way, one of the most notable episodes of this conflict.”—J. Bainville, *Italy and the war*, pp. 142-144.

Jugo-Slavia.—“Private Lodges, under foreign warrants, were established at Belgrade and elsewhere, and in 1910 the Grand Lodge of Serbia, Croatia, and Jugo-Slavia was formed, with seven Lodges and 270 members.”—R. F. Gould, *Concise history of Freemasonry*, p. 316.—“On June 3, 1910, a Grand Masonic Lodge for Serbs, Croats and Slovenes, ‘Jugo-slavia’ was formed. The Supreme Council transferred the symbolic lodges to the new Grand Lodge, but reserving to itself jurisdiction over all degrees from the 4th to the 32nd.”—*Freemason* (Toronto), Jan., 1920.

Malta.—“After early persecutions, caused by the Papal Bull of 1738, the Lodge of Secrecy and Harmony was formed on the island, and in 1789 reconstituted from England, as No. 539. All the officers were Knights of Malta. If we may credit

Besuchet, Napoleon Buonaparte was initiated at Valetta in 1798. (Précis histoire de la Franc-Maçonnerie.) Since 1815 the island has been the seat of an English Provincial (or, as now termed, a District) Grand Lodge. Tunis was incorporated with the Malta district in 1869.”—R. F. Gould, *Concise history of Freemasonry*, p. 316.—See also above: Africa.

Mexico. See above: Central and South America.

Norway.—The first Lodge, St. Olaus, was constituted about 1745. In 1814, on separation from Denmark, the Norwegian Lodges came under the jurisdiction of the Grand Lodge of Sweden. In 1905, when Norway became an independent kingdom, the Norwegian Grand Lodge also regained its freedom. There are 16 Lodges with a membership of about 6,000.—Based on R. F. Gould, *Concise history of Freemasonry*, p. 305.

Persia. See above: Asia: Persia and India.

Poland.—“It is contemplated to establish a Masonic Lodge in Warsaw, Poland, by Poles belonging to lodges of other nationalities, and eventually to have a Grand Orient in that country.”—*Freemason* (Toronto), May, 1920.

Portugal: Introduction of Masonry.—Schisms and reconstruction.—“An English Lodge was established at Lisbon in 1735, and the progress of the Craft was uninterrupted, until suddenly arrested by a royal edict in 1743. On the banishment of the Jesuits in 1761 Masonry revived, but again declined on the death of Joseph II in 1777. Lodges, however, continued to exist at Lisbon, Coimbra, and Oporto, also in the shipping. The Lodge Regeneration was constituted on board the frigate Phoenix in 1797, and shortly afterwards created five other Lodges. The superior authority was then confided to a committee (*commissao do expediente*), consisting of six delegates, under whose benign rule Masonry penetrated into every part of the Kingdom. A Grand Lodge of Portugal was established in 1800 (or 1805). During the French invasions the Craft languished, and there were successive revivals, followed by intermittent and savage persecutions, in 1810, 1821, and 1834. In 1848 there were three Grand Lodges, a Grand Orient, and an Irish Provincial Grand Lodge. All the National organizations coalesced in 1860 and formed the United Grand Orient of Lusitania. This was joined by the four Irish Lodges in 1872, who thereupon laid down their *Provincial* title, and resolved themselves into a Single Lodge, Regeneração Irlandeza (*Irish Regeneration*). Eleven years later (1883) there was a schism, and a new Grand Lodge was established. Still more recently (1892) the Lodges Regeneração Irlandeza and Obreiros Do Trabalho seceded from the United Grand Orient (on the ground of its having departed from the fundamental principles of Freemasonry), and formed the Grande Loja De Portugal. The calendars, however, of current date, only mention the United Grand Orient of Lusitania, which has an apparent following of 70 Lodges, 34 Triangles, and 2,748 members.”—R. F. Gould, *Concise history of Freemasonry*, pp. 314-315.

Rumania.—“Twenty Lodges (of foreign origin) united in forming the National Grand Lodge of Roumania in 1880. The next year two Supreme Councils were established, one of the Rite of Memphis 95°, the other of the Ancient and Accepted Scottish Rite 33°. In 1882, a Grand Chapter of the Royal Arch was added; and in 1883, a Grand Lodge and Temple of the Swedenborgian Rite. The Grand Master of all these bodies is (or was) one and the same person. Statistics fail me with respect to the majority of these associations, but

the 'National Grand Lodge of Freemasons' had a following of twenty-seven Lodges before the war; no recent statistics are at present available."—R. F. Gould, *Concise history of Freemasonry*, p. 316.

Russia: Introduction of Masonry.—Imperial patronage.—Persecution and extermination.—"The Order penetrated into Russia about 1731; there existed a Lodge in St. Petersburg [Petrograd] in 1740; another appeared at Riga in 1750, and from these the Order spread. The Tsar Peter III in 1762 extended special benevolence to the fraternity. Chapters of the High Grades were formed in 1765 and received with great enthusiasm. Masonry rose in splendor. . . . Prince Kurakin in 1777 constituted the Grand Lodge of the Russian Empire and Prince Gagarin became Grand Master. . . . Towards the end of the (18th) century, in consequence of events in France, the Empress Katherine II turned her animosity against the institution and the Lodges closed up. As soon as Paul I ascended the throne, he convoked an assembly of Freemasons at Moscow, at which he assisted in person, to discuss the advisability of re-opening the Lodges. After long debate the opinion of Bro. W. de Ungern-Sternberg prevailed, and the Tsar (accordingly) ordained that the Lodges remain closed until circumstances should be more favorable to permit of their being re-opened. The Tsar added, 'Write to me then without compliments and as to a brother.' He next embraced each of the officers and fraternally shook hands with all."—U. Bacci, *Il libro del Massone Italiano*, v. 2, pp. 31-32.—"It was during the reign of the stern, reactionary Czar Nicholas I. (1825-55) that Masonry began to occupy itself with strictly religious and political questions. After the mutiny in 1825 of the officers of the Guards, known as the Decembrists, in which many prominent Masons took an active part, the lodges of the latter were declared to be political, guilty of political sedition and intrigue against the Czar, and were put under the ban. Hundreds of Masons were sent to Siberia, most of them dying there in the convict mines. After this Masonry existed in Russia as an 'underground,' or secret organisation, in frank rebellion with the secret police. In the 'sixties it succumbed, from lack of fresh recruits to keep the movement going. Since that time no evidence has been obtainable that the organisation has come to life again anywhere in Russia, although the Government officials have often announced that lodges have been discovered. The party of the Extreme Right in the Duma, however, recently [in 1913] announced that Masonry had broken out in the Empire again, and should be ruthlessly exterminated."—*Masonic Correspondent*, *Evening Standard* (London), May 1, 1913.—See also RUSSIAN LITERATURE: 1752-1816.

Scotland: Antiquity of the craft.—Famous Kilwinning Lodge.—Curious records of the sixteenth and seventeenth centuries.—"The most complete picture we possess of the early Masonry of Scotland is afforded by the Schaw Statutes of 1508 and 1509. These are Codes of Laws signed and promulgated by William Schaw, Master of the King's Work and General Warden of the Masons, the one directed to the craft in general, the other to the Lodge of Kilwinning. From these two codes we learn very little with regard to the entry of Apprentices—simply that in each case it was booked—but on other points they are more communicative. Thus a Master (or Fellow Craft, which was a term importing the same meaning) was to be received or admitted in the presence of six Masters and two Entered Apprentices: his name and mark were also to be booked, together with the names of those by whom he was admitted, and

of his Intenders (or instructors). No one was to be admitted, according to the earlier Code, without an Essay and sufficient trial of his skill and worthiness in his vocation and craft; or, according to the latter one, without a sufficient Essay and proof of memory and art of craft. A further regulation requires an annual trial of the art of memory and science thereof, of every Fellow Craft and Apprentice, according to their vocations, under a penalty if any of them shall have lost one point thereof. Some of the Lodges held a controlling or directing power over other Lodges in their districts. . . . Patrick Coipland, the Laird of Udaucht, was granted, in 1590, by James VI, the office of Warden and Justice over the Art and Craft of Masonry within the counties of Aberdeen, Banff, and Kincardine. This appointment, however, was clearly made for purposes of a purely local character, and, without a doubt, the powers granted to Coipland were entirely subordinate to the paramount authority of the Warden General. A more prominent holder of a similar office to that held by the Laird of Udaucht, was Sir William St. Clair of Roslin, with regard to whose family and its alleged hereditary connection with the ancient Masonry of Scotland, much disputation and not a little confusion have arisen. There are two 'St. Clair' Charters, neither of which are dated, but the earlier document has been assigned on the best authority to the year 1601, and the later one to 1628. . . . In a letter dated February 27th, 1635, Charles I instructed the Commissioners of the Exchequer to call before them Sir William St. Clair of Roslin and examine him as to his pretending 'anc heritable charge over the Maissons of our said Kingdome.' They were also to order 'that the Maissons be examined by the Magistrates of every town, and the Sheriffs of every schyre.' . . . Two of the Lodges mentioned in the Schaw Statutes (1509), those of Edinburgh and Kilwinning, and with fair probability that of Stirling—the 'third ludge of Scotland'—are in existence at this day. Several Lodges also, who figure in documents of only slightly later date—for example, the St. Clair Charters of 1601 and 1628—after undergoing vicissitudes of good and bad fortune, still live on, and are surrounded by a halo of antiquity, for which a parallel will be vainly sought in any other region of the globe. With the exception of the Lodge of Edinburgh, however, the minutes of which body extend back to July, 1599, none of the existing records of the old Scottish Lodges are of earlier date than the seventeenth century. But the documentary evidence of that period is fairly abundant. . . . It is most probable that, down to the close of the sixteenth century, there was only a single Lodge in each town or city which, as a matter of course, possessed all the rights and privileges belonging to the mason's trade. 'Not the slightest vestige of authentic evidence, however,' as we are well reminded by Mr. Lyon, 'has ever been adduced in support of the legends in regard to the time and place of the institution of the first Scottish Masonic Lodge.' To which may be added, that, while the entire group of really ancient Lodges in the Northern Kingdom are without any documents at all approximating to the dates of their foundation, several of them have occasion to deplore, not only the loss of their oldest records, but also the loss (in a historical sense) of any old records whatever. . . . The Lodge of Dundee asserts a traditional antiquity of more than a thousand years. It also claims as one of its former Masters, David, Earl of Huntington—afterwards King of Scotland. . . . Apart, however, from these genealogical *extravaganzas*, 'our lady'—i.e., St. Mary's—'ludge of

Dundee,' referred to in an indenture of 1583, is almost certainly represented by one of the two old Lodges, Nos. 47 or 49, which (claiming the same traditional antiquity) are working side by side in the mercantile capital of Forfarshire at this day. To the Lodge of Glasgow St. John, for a long time, was conceded (in certain districts) a singular pre-eminence, by virtue of a Charter alleged to have been granted by Malcolm III, King of Scots, so far back as the year 1057. But the earliest authentic record of the Lodge occurs in a document bearing the date of 1620, which refers to its existence in 1613. 'Ancient Stirling' claims a venerable antiquity, as representing the body of Masons who were engaged in the construction of Cambuskenneth Abbey, founded by David I, 1147. But . . . it is probably identified with the 'third lodge in Scotland,' referred to in the Schaw Statutes of 1599, and also with 'the Lodge of Stirling,' one of the parties to the St. Clair Charter of 1628. 'The masowns of the lodge'—of whose successors in an unbroken line we possibly read in the existing 'Lodge' minutes of 1670—are mentioned, under the year 1483, in the Burgh Records of Aberdeen. . . . There was a Masonic Convention at St. Andrews, in January, 1600, summoned by order of the Warden General. Of its proceedings no record has been preserved, but from a minute of the Lodge of Edinburgh, dated November 27th, 1590, we learn that the Lodge of St. Andrews was charged to attend, 'and that the Maisters of Dindie and Perth be alswa warnit to convene.' . . . No other Lodge, as we are rightly told, has such traditions as the Lodge of Kilwinning, and not the least splendid of the series, according to the Rev. W. Lee Ker, is the tradition, 'believed in so far back as 1658, in which the Lodge of Perth declares that the Kilwinning temple of Free Masons was the temple which was first instituted in Scotland, and that its foundation was laid about the year 1100.' . . . The same writer assures us—"that Kilwinning Lodge is the true Mother Lodge of Scotland is not a mere legend. On the contrary, a fair reading of Schaw's Statutes shows it to be a solemn truth." . . . It is quite possible, of course, that Kilwinning may have been the seat of the first Scottish Lodge, without that old court of Operative Masonry being the supreme Lodge in Scotland. . . . The customs of the old Scottish Lodges are of interest, as being in many instances, down to a comparatively recent period, survivals of usages pre-dating the era of Grand Lodges. . . . According to a diarist of the seventeenth century, at the sitting of the Assembly (or Synod) in 1649, 'Ther was something spoken aenat the meason word, which was recommended to the severall presbytries for tryall thereof' (*Chronicle of Fife*, 9). . . . What the old Scottish Mason Word was, however, remains a mystery, and . . . the historians of the Craft are silent on this subject."—R. F. Gould, *Concise history of Freemasonry*, pp. 173-180, 182-183.

Spain: Introduction of Masonry.—Death penalty for Masons.—Decay of the craft.—"The first Lodge in Spain was founded in 1728 by the Duke of Wharton at Madrid, and the second was constituted later in the same year by the Grand Lodge of England at Gibraltar. In 1740 Philip V issued an edict against the Craft, and a further decree of Ferdinand VII, in 1751, condemned the Freemasons to death without the formality of a trial. Brighter times came, and in 1767 a Grand Lodge was formed, which in 1780 became a Grand Orient. In 1811 there were four governing Masonic bodies, two Grand Orients, and two Supreme Councils 33°. Another persecution took place in 1814, then came the popular movement under the

patriot Riego (1820), the Jesuits were expelled, the Inquisition abolished, and the old liberal constitution re-granted. For four years the Craft flourished, but a new insurrection broke out, and Ferdinand VII was charged by the populace with being a Freemason himself, because he had not re-established the Inquisition. By the aid of French troops the old prerogatives of the King were restored, and the Fraternity suppressed. Riego was shot, and in 1825, a Lodge at Granada having been forcibly entered, the seven Master Masons present were hanged, and an apprentice who had just been initiated was sent for five years to the galleys. The next period of Spanish Masonry extends to the year 1868, when Queen Isabella was deposed, and throughout the whole of it there is darkness and uncertainty. In 1869 the Craft once more emerged into the light of day, and in 1887 the names are mentioned of the Grand Orient of Spain, the Grand National Orient, and the Symbolical Grand Lodge, with a following of 247,220 and 28 Lodges respectively. These members, if, indeed, even approximately correct, have since declined, and at the present time there exists in Madrid a Grand Orient (or Grand Lodge), with 100 subordinate Lodges and 5,920 members. Grand Lodges were also mentioned as having their seats at Seville and Barcelona, the former with twenty-six, and the latter with fifteen daughter Lodges. These are not now known; but there is a Symbolic Regional Grand Lodge of Catalana-Balcar at Barcelona with 8 Lodges and 200 members, and a Supreme Council at Madrid."—R. F. Gould, *Concise history of Freemasonry*, pp. 313-314.—"In Gibraltar there are eight English warranted Lodges, four Scottish, and one Irish. Three R. A. Chapters, one Preceptory, and the Scottish Rite are also working on the Rock."—*Freemason (Toronto)*, May, 1920.

Sweden.—"Masonry in Sweden is a very peculiar product and is an evolution of the Strict Observance or Templar System. It requires a belief in Christianity, and its teachings are a mixture of the Freemasonry of England, of Templarism and the mystic doctrines of Swedenborg."—*Freemason (Toronto)*, Nov., 1920.—"About the middle of the eighteenth century Swedish Masons found the English system of ritual too simple; they desired more pompous ceremonial and an elaboration of the "secrets." King Gustavus III took a hand in working out a new Swedish system, a compound of the materials noted above, plus some elements of "Rosicrucianism" and of a system introduced by the Comte de Clermont, French Grand Master.

Turkey.—"There were Lodges at Smyrna and Aleppo in 1738, and from about ten years later till the present time others have been constituted at irregular intervals by many of the European Grand Lodges or Grand Orients."—R. F. Gould, *Concise history of Freemasonry*, p. 315.

United States: Introduction of Freemasonry.—"Symbolic Masonry was introduced into America by the British, and during the colonial period . . . was under English authority. After the Declaration of Independence in 1776 the question of allegiance became a serious one to American Masons, but they concluded that Masonic must be in accord with civil government, and in 1777 chose their own Grand Master to take the place of the British official. In 1776 a charter was granted to a military lodge in 'the Connecticut line,' called American Union Lodge, erected in Roxbury or wherever its body might remove on the continent of America. At the close of the Revolutionary War the master and a number of the members of this

lodge, of which George Washington was a member, settled at Marietta, Ohio. They had the charter, and reorganized the lodge there in 1790, two years after the settlement of that historic city. In 1816, the original charter having been lost by fire, the lodge was granted a new one by the Grand Lodge of Ohio, under the name of American Union Lodge No. 1, their new charter showing it to be a revival of the old lodge, undoubtedly the first one established under American authority."—W. G. Sibley, *Story of Freemasonry*, pp. 61-62.

United States: Abduction of William Morgan, 1826.—"The history of Freemasonry in the United States would have been uneventful and, for the most part, marked by harmonious development extending over a long period of years had it not been for something which transpired in Batavia, N. Y., in 1826. . . . The disappearance of William Morgan [a disaffected Mason] created a great furore and in due time knowledge of the circumstances was carried to all sections of the United

were the conditions of society and the feelings of men from 1825 to 1830. Middle New York was the storm center but the excitement extended eastward to Vermont and quite extensively through all the New England States. It reached as far west as Northeastern Ohio, and in some portions of that state, lodge halls were destroyed by mobs, jewels and records carried away, members ostracized, their business injured, and families slandered and abused. . . . It was not long until the excitement invaded politics and a political party was organized by individuals who were seeking to place themselves in the limelight and who seized upon the opposition to Freemasonry as the opportunity of accomplishing their purposes. The newly formed party held several conventions and endeavored to enlist the support of prominent statesmen. Desiring a candidate for president they wrote Henry Clay, the great commoner, asking if he was a Mason, and what his views were concerning the institution. His reply was that when a young man,

States."—D. Darrah, *Evolution of Freemasonry*, pp. 235, 237.

United States: Aftermath of Morgan abduction.—Anti-Masonic party.—"As a result of the Morgan episode, hatred and opposition to the fraternity spread throughout the country and became almost uncontrollable. In order to arouse the people, and lead them to believe that the Anti-Masonic movement was one of very wide scope, numerous Anti-Masonic papers were published. Four of them were issued from a printing office in Boston under the names of *The Anti-Freemason*, the *Anti-Masonic Christian Herald*, the *Free Press* and the *Anti-Masonic Baptist Herald*. . . . The excitement ran so high that Anti-Masonic spelling books and readers were introduced into the schools and almanacs into the family. . . . So intense did the Anti-Masonic feeling grow that it rocked political parties, sundered churches and religious organizations and was carried into the social life of many communities. Even little children at school took it up and boys were sometimes beaten and abused because they were children of Freemasons. Such

he had become a Freemason but had given the Fraternity no attention for so long a time that he did not think he could gain admission to a lodge. . . . In 1831, the Anti-Masonic party nominated William Wirt and Amos Ellmaker as its candidates for President and Vice President of the United States. At the election each of these men received but seven votes, being the entire electoral vote of Vermont, the only state in the Union that voted for them. So overwhelming was the defeat that the party immediately disbanded and from 1833 was never heard of more. The Anti-Masonic party was purely a political move and however strong it may have become it simply used its vindictive spirit against Freemasonry as a means to an end regardless of the innocence or guilt of the Freemasons themselves. This is the only instance in the whole history of Freemasonry where opposition to the society assumed the form of a political agency."—D. D. Darrah, *Evolution of Freemasonry*, pp. 248-249, 253, 254.—See also NEW YORK: 1826-1832.

United States: Ten presidents, Freemasons.—Polyglot Masonry in New York City.—"It is a

lamentable fact that the early records of many of the Lodges existing in the American colonies previous to the Revolutionary War are lost to history. In the Royal forces at Louisburg, Crown Point, and Lake George were Lodges in which many of the King's soldiers (who were Americans) were initiated. Previous to the formation of several of the Grand Lodges there were no returns made as to many of the names of initiates, and military Lodges rarely ever made any such returns. This is a lamentable thing in Masonic history."—G. P. Brown, *Old American Masons (Freemason, London, July 10, 1913)*.—Darrah, in his "Evolution of Freemasonry" (Chicago, 1922), states that the authentic record to date gives ten presidents of the United States as members of the Masonic fraternity: George Washington, Andrew Jackson, James K. Polk, James Buchanan, Andrew Johnson, James A. Garfield, William McKinley, Theodore Roosevelt, William H. Taft, and Warren G. Harding.

West Indies: British and French.—"In the large group of islands lying east of Central and north of South America, there are 45 British Lodges, and a solitary Irish one. The districts where Masonry flourishes with the greatest luxuriance are Jamaica, Barbadoes, Bermuda, and Trinidad. Lodges holding French charters are (or were) existing at Martinique and Guadeloupe. A Grand Lodge of Cuba was established in the early part of the last century, and after a most chequered career was once more revived and reorganized in 1899. During its latest dormancy, however, a Gran Oriente Nacional sprang into temporary existence. The Grand Lodge had, in 1901, a following of 102 subordinates, with a total membership of 6,000. In Porto Rico, the other island in what was formerly the *Spanish West Indies*, a Grand Lodge was formed at Mayaguez in 1885. After a slumber of three years, this body met in 1899, and transferred its seat to San Juan. The Gran Logia Soberana De Puerto Rico has 15 Lodges within its jurisdiction, and a membership of 396. This is now under the U. S. A. Hispaniola, Hayti, or San Domingo, formerly included in the *French West Indies*, is now divided into two Negro Republics, one of which—in the west—has taken the name of Hayti, and the other—in the east—that of San [Santo] Domingo. In the former there are two Grand Orientes, the older of which (1836), at Port-au-Prince, has 75 Lodges on its roll; of the junior body (1886) no particulars are forthcoming. In the district now called San Domingo there is a Grand Orient (1866) with 13, and a Grand Lodge (1891) with 13 Lodges. If we go back, however, to the second half of the eighteenth century, it will be found that what is now one of the most popular and widely diffused of the vast array of Rites which claim to be Masonic, was cradled in what was then indifferently known as the island of Hispaniola, Hayti or San Domingo. Among the French colonists were four men, Stephen Morin, Germain Hacquet, the Comte Alexander F. A. de Grasse Tilly, and Jean Baptiste Marie de la Hogue. . . . In 1761 Stephen Morin received a patent from the Grand Council of the Emperors of the East and West, and the Grand Lodge of France, then temporarily united, power being given him to establish a symbolic Lodge, also to confer the higher degrees and the rank of Inspector. The 'Emperors of the East and West' controlled a Rite consisting of twenty-five degrees, which has ordinarily been known as the Rite of Perfection, or of Heredom. In 1763 Morin went from Paris to San Domingo, which he made his headquarters, or Grand Orient, for the 'High De-

grees' in the New World. He also created a Council of Princes of the Royal Secret (25°) at Kingston, Jamaica, in 1770, and appointed numerous Deputy Inspectors General for the purpose of propagating the Rite, granting them roving commissions with powers very similar to his own. Of the filiation of these powers there is no complete record, but the first Deputy Inspector appointed by Morin was Henry A. Francken, of Kingston, Jamaica, who afterwards went to New York, and established a Lodge of Perfection at Albany, in that State. At the outbreak of the revolution at San Domingo in 1791 (after which nothing further is heard of Stephen Morin), the French settlers were obliged to flee, and many of them sought refuge in America. The Comte de Grasse Tilly and his father-in-law, J. B. M. de la Hogue, were created Deputy Inspectors General at Charleston, in 1796, and a similar rank was conferred upon Germain Hacquet at Philadelphia in 1798. Down to the year 1801, the highest degree known either in the West Indies or America was that of Prince of the Royal Secret, the twenty-fifth and last of the Rite of Perfection. But on the 31st of May, 1801, there was organized a new governing body of a new Rite, into which the Rite of Perfection had been transformed. It was named the Supreme Council of Sovereign Grand Inspectors General of the Thirty-Third Degree for the United States of America. It recognized the 'Constitutions' of 1762, the 'Secret Constitutions,' and the 'Constitutions of 1786.' The last named are the supreme law of the Rite, and purport to have been sanctioned by Frederick the Great, as its Governor and head. Whether, indeed, the 'Grand Constitutions of 1786' more properly belong to the authentic, or to the legendary, history of this Rite is a question that has been fiercely debated. . . . De Grasse Tilly, as his patent informs us, was a member of the Supreme Council at Charleston, and Grand Commander for life of the *French West Indies*, in 1802, at the close of which year he returned with de la Hogue to San Domingo, and founded a Supreme Council at Port-au-Prince. Both men were then *Sovereign Grand Inspectors General* (S. G. I. G.)—*i.e.*, members of the 33rd degree: In 1803 the Negroes again attained the upper hand, and the Whites were once more driven out of San Domingo. Hacquet arrived in Paris early in 1804, and was adroit enough to induce the Grand Orient of France to accept the twenty-five degrees of the Rite of Perfection. . . . In September, 1804, De Grasse Tilly, aided by de la Hogue and three other S. G. I. G., who had also come from San Domingo, organized and established a Supreme Council for France at Paris; and in the following month a Grand Scots Lodge. The Grand Orient of France thought it advisable to make a Union with these bodies, and by a concordat the Grand Scots Lodge was merged in the Grand Orient, and the Supreme Council became a co-ordinate branch of it. But this arrangement came to an end in 1805. All the Supreme Councils of the so-called Ancient and Accepted Scottish Rite in the world trace their descent from Charleston, De Grasse, the Supreme Council, or the Grand Orient of France."—R. F. Gould, *Concise history of Freemasonry*, pp. 326-320.—See also ROSICRUCIANS.

MASORETES, or Massorettes.—When the Hebrew language had ceased to be a living language the "so-called Masorettes, or Jewish scribes, in the sixth century after the Christian era, invented a system of symbols which should represent the pronunciation of the Hebrew of the Old Testament as read, or rather chanted, at the time in the great synagogue of Tiberias in Palestine. It

is in accordance with this Masoretic mode of pronunciation that Hebrew is now taught."—A. H. Sayce, *Fresh light from the ancient monuments*, ch. 3.—"Massora denotes, in general, tradition . . . but more especially it denotes the tradition concerning the text of the Bible. Hence those who made this special tradition their object of study were called Massoretes. . . . As there was an eastern and western, or Babylonian and Palestinian Talmud, so likewise there developed itself a two-fold Massora,—a Babylonian, or eastern, and a Palestinian, or western: the more important is the former. At Tiberias the study of the Massora had been in a flourishing condition for a long time. Here lived the famous Massorete, Aaron ben-Moses ben-Asher, commonly called Ben-Asher, in the beginning of the tenth century, who finally fixed the so-called Massoretic text."—*Schaff-Herzog encyclopedia of religious knowledge*.

MASS: In Roman Catholic church.—Mass is the ceremony used in celebrating the sacrament of the Eucharist.

6th-7th centuries.—Definite formation of doctrine by Gregory the Great.—"In the sixth century and in the early part of the seventh, doctrines were clearly enunciated which had been abundantly foreshadowed by earlier writers, but had not been fitted into an intelligible and practical system. These were especially the doctrine of purgatory and the sacrifice of the mass. . . . By the sacrifice of the mass the advantages of Christ's death were constantly applied, not merely to the sin of the world in general, but to specified objects; the believer was brought into closest contact with the great act of redemption and a center was placed around which the life of the individual and the authority of the hierarchy could be brought into relation." In the words of Gregory the Great who late in the sixth century formulated the canon of the mass as it is known today: "It should be considered that it is safer to do to men while one is living, the good which one hopes will be done by others after one's death. It is more blessed to depart free than to seek liberty after chains. We ought with our whole mind, despite the present world, especially since we see it already passing away. We ought to immolate to God the daily sacrifice of our tears, the daily offerings of His flesh and blood. For this offering peculiarly preserves the soul from eternal death, and it renews to us in a mystery the death of the Only Begotten, who although being risen from the dead, dieth no more, and death hath no more dominion over Him (Rom. 6:0); yet while in Himself He liveth immortal and incorruptible, for us He is immolated again in this mystery of the sacred oblation. For it is His body that is there given, His flesh that is divided for the salvation of the people, His blood that is poured, no longer into the hands of unbelievers, but into the mouths of the faithful. For this let us ever estimate what this sacrifice is for us, which for our absolution ever imitates the passion of the only begotten Son. For what one of the faithful can have any doubt that at the very hour of the offering (*immolatio*), at the word of the priest, the heavens are opened, the choirs of angels are present at the mystery of Jesus Christ, the lowest things are united to the highest, earthly things with heavenly, and from the invisible and the visible there is made one?" (Gregory the Great, *Dialogorum libri IV, de Vita et Miraculis*

Patrum Italicorum, IV, 56)."—J. C. Ayer, *Source book for ancient church history*, pp. 621-622.

7th-14th centuries.—Development of plenary missal.—Relation of doctrine of mass to medieval Christian thought.—"Indelible character" of priesthood essential.—Miracle of "transubstantiation."—Chantry priests.—Prowess of clergy and new philosophy.—Denial by heretical sects.—"The pre-eminence of the Roman See led to the substitution of the Roman rite for the Hispano-Gallican, the other great Liturgy of the West, which now survives only in Salamanca and Toledo under the name of Mozarabic where it was installed by Cardinal Ximenes. The Gallican rite ceased to exist in the ninth century, although it continued to leave a very definite impress on the medieval rituals of England, France and Germany, which were nominally Roman with Hispano-Gallic details. In the East, the political supremacy of Constantinople, and its doctrinal orthodoxy at the time of the great heresies, of which the mystery of the Incarnation was so long the storm-center, gave it also a liturgical ascendancy which established its ritual as the standard, according to which all Liturgies of the Orthodox church were constructed. Some of these in their very primitive form may still be found among the Nestorians and Monophysites. . . . The ancient books containing the rubrics and prayers to be observed and recited in the Mass . . . were combined into one volume in the ninth century. . . . The corporate volume was called a plenary Missal, because it contained, in full, all the prayers and lessons and rubrics necessary for a low Mass."—J. Walsh, *Mass and vestments of the Catholic church*, pp. 54-56.—"The theory of spiritual substances was very welcome to the Christian thinkers of the Middle Ages, since it confirmed their belief in a human soul separate from the mortal body and in a host of dreams and angels. That substance was something distinct from external appearance and particular qualities was also an attractive thought to them. It enabled them to explain that in the sacrament of the mass, while the bread and wine might retain their outward qualities such as are apparent to the senses of sight, taste, and touch, yet their inner nature had been 'transubstantiated' into the body and blood of Christ. This illustrates what important bearings logic or dialectic might have upon theology. . . . While the medieval Church recognized the great importance of having well-educated men of pure life and attractive personality in its priesthood, it regarded neither preaching ability nor executive capacity nor moral conduct as the essential thing for one entrusted with the care of souls. The essential was divine grace and power, and this the priest was believed to receive when he was ordained by the bishop. Henceforth, regardless of his natural capacity or incapacity, he possessed 'an indelible character' and could perform the sacraments upon which the obtaining of divine grace by his parishioners depended. The Church held that man could not save his soul by his own efforts; that he must also receive divine grace through partaking of the sacraments. In the *Sentences* of Peter Lombard, written in the twelfth century, we find the number of sacraments stated as seven, itself a sacred number. Two could be performed only by the bishop; namely, the ordination of priests, already mentioned, and the confirmation of children in their membership in the Church when they become old enough to distinguish good and evil. Of the five which an ordinary priest could perform, three, like the two already described, applied to some important epoch in life and would normally be received but once by a

given person; namely, baptism into the Church as soon as feasible after birth, the marriage ceremony which in the Middle Ages could be performed only by the clergy, and extreme unction just before death. The two remaining sacraments of the mass and penance were often repeated—indeed, the oftener the better. The mass was the central feature of the church service. Often the only preaching was done by the bishop when he paid a visit. By the saying of mass the priest was believed to perform a great miracle known as 'transubstantiation,' by which the bread and wine were changed into the body and blood of Christ and his memorable sacrifice of himself on the cross for sinful humanity was renewed and perpetuated for the benefit of those present and partaking of the host or consecrated bread. It became the custom for the clergy alone to drink the wine for fear lest some drops of the precious blood might be spilled in passing the cup about among the rude laity. It was explained to them that the bread or body contained full virtue. Indeed, the mere celebration of the sacrifice of the mass by the priest was beneficial and the people only occasionally actually received the communion. Moreover, masses might be said for the soul of an absent or dead person. In fact there was so great a demand and so much money left for the repetition of masses for such purposes that some priests had no parishes under their care, but devoted their entire time to chanting private masses and so were called 'chantry priests.' . . . These seven sacraments meant everything to medieval men. Most of them never questioned but that water could be made holy, that there were sacred places which it did one good to visit as a pilgrim, that bones of dead saints had wondrous virtues, and that living priests could perform such miracles as the mass. In their control of these sacraments the clergy had a tremendous weapon to use against the laity. By excommunication they cut off an individual from receiving the sacraments, besides, perhaps, launching additional curses and anathemas against him. By an interdict the clergy were ordered to cease the celebration of some or all of the sacraments in a given locality. . . . Such measures were effective so long as the people believed in the sacramental power of the priesthood. But what could be done if an entire region lost faith in the Church, its clergy, and its ceremonies? Such was threatening to become the situation in southern France when Innocent became pope. With the rise of towns, travel, and trade, and the reception of new ideas in science and philosophy, there had come in also through the eleventh and twelfth centuries strange religious doctrines and practices. Often they spread by the same routes as trade. The leading heresy of this period—that of the Cathari or Patarins or Albigensians, as they finally came to be called from the town of Albi in southern France where they were especially prominent—spread from the East across the Balkans to the Adriatic, and then across Lombardy to Provence and Languedoc. Here they flourished most, but they were also frequently heard of here and there in Germany, Flanders, Brittany, and other parts of northern France. . . . Another prominent heretical sect in southern France were the Waldensians, some of whom still survive. They were followers of Peter Waldo . . . [who] was not an ordained priest. When his disciples began to criticize the lives of the bishops and priests who did not adopt the life of poverty, and to say that laymen and women could preach, and that a prayer to God made in a barn was as likely to be heard as one made in a cathedral, and that the masses said for the dead did them no

good, and when they began to refuse to pay tithes, the Church began to condemn them as heretics. . . . Wyclif . . . proclaimed 'the universal priesthood of believers' and denied the special sacramental power of the clergy. Some of the seven sacraments, like confirmation and extreme unction, he rejected entirely, and he even dared to attack the theory of transubstantiation in the mass. He denied any material change in the bread and wine or any priestly miracle, and taught that in the sacrament one does not actually partake of the body of Christ, but sees Him through faith and communes with Him in spirit. . . . In 1381 his denial of transubstantiation lost him the favor of John of Gaunt and his position at Oxford."—L. Thorndike, *History of medieval Europe*, pp. 380, 438, 404.

16th-19th centuries.—Development of missal. —Influence of Reformation on doctrine of Church of England.—Position of Oxford School, nineteenth century.—"The Roman Missal . . . [had been] published and substituted for other missals because, with the exception of the Canon of the Mass, which had remained unchanged from the time of Pope Gregory the Great, the older missals had introduced into the Mass many unauthorized changes and additions which were departures from the purity and simplicity of the Gregorian Liturgy. . . . [Therefore] the Council of Trent (Session XVIII) February 16, 1562, entrusted the correction of the Missal to a special committee, and after its adjournment, to the reigning Pope, Pius V. This Pope assigned the duty to certain learned scholars, who, after a studious research and comparison of the various liturgical manuscripts in the Vatican library, and consultation with the experts in sacred Liturgy, submitted their report to the Pope. The report became a Roman Missal, and was published with a Papal Bull, July 14, 1570. . . . [The Pope] forbade any priest, subject to the Roman rite, to say or sing Mass otherwise than according to the formula of the Roman Missal, and he ordered that all other Missals be rejected and their use discontinued. . . . Those Missals . . . [might], but not necessarily, be retained, which remained in uninterrupted use for two hundred years, from the time of their approval by the Holy See to the adoption of the new Missal in 1570. Under this exception the Carthusians and Dominicans use their own Missal. Others, like the Franciscans, have a special mass-book called the Roman-Seraphic Missal, because whilst conforming to the Roman Missal in the manner of saying Mass they are allowed special Masses for the saints of their own Order and also special Prefaces. . . . As the Vulgate version of the New Testament did not appear till 1590-1592, Pius V. followed in his Missal the reading of the version called Itala. Afterwards, without consulting the Holy See, certain publishers issued new missals adapted to the Vulgate. The Pope interdicted these missals, and restored the Roman Missal to its former integrity and gave copious comments on its rubrics. Urban VIII. (1634) adapted the Roman Missal to the Vulgate. Leo XIII. (1884) issued a Missal which he called typical of all other editions. It contains the following: the text of the rubrics according to the changes made in 1882; the Masses for the Universal church; the votive Masses conceded in 1883; the Diocesan and Provincial Masses allowed by the Holy See in their proper place; the chant to which all other Missals must conform; a new revision of the rubrics in harmony with recent decrees as late as 1807."—J. Walsh, *Mass and vestments of the Catholic church*, pp. 57-59.

—"It was because the reformers held the doctrine known as 'the sacrifice of the Mass' to be neither 'primitive' nor 'protestant' that they ended by evicting the word 'mass' from the Liturgy of the Church of England and from the lips of her people."—J. H. Round, *Sacrifice of the mass (Nineteenth Century, May, 1897)*.—In the nineteenth century "a certain sacrificial character is attributed by the Oxford School to the Eucharist. . . . The Bishop of Brechin argues that, as the Same Body, which is naturally in heaven, is 'supra-locally and mystically' taken and received, its 'faculty of impetration'—that is, its intercessory appeal—continues, while yet there is no repetition of the sacrifice of the Cross. The twenty-first of the Articles affirms that masses for 'the remission of pain or guilt' are 'blasphemous fables and dangerous conceits.' Pusey, in a letter to Bishop Bloomfield, states that he had termed the Eucharist a proprietary sacrifice, but in the sense that the Church in this act pleads the efficacy of the one sacrifice. As to the adoration of the Lord in the Eucharist, he cites with approval a saying of Andrews that wherever Christ is present, He is 'truly to be adored.' . . . It is evident, not only from his writings, but from his practise . . . that he made such an approach to the Roman Catholic system, doctrinal and practical, as is certainly not compatible with the principles and spirit of the Reformers."—G. P. Fisher, *History of Christian doctrine*, pp. 465-466.

MASSACHUSET INDIANS. See ALGONQUIAN FAMILY; INDIANS, AMERICAN: Cultural areas in North America: Eastern woodlands area.

MASSACHUSETTS: Geographic description.—Area.—Population.—Massachusetts, belonging to the New England group of the United States, presents an irregular eastern coast line to the Atlantic ocean. To the north of the state lie Vermont and New Hampshire, to the west, New York, and on the south, Connecticut, Rhode Island and the Atlantic ocean. About one-half of the coast line, which is nearly 300 miles in length, belongs to Cape Cod, the "great right arm" of Massachusetts. Inland, the surface of the country is hilly and rocky except along the water courses, and in the west, the elevations are mountainous, the loftiest being Greylock mountain in northern Berkshire, 3,500 feet above sea-level. The climate of the state is generally called "severe" although on the southeastern coast and islands it is modified by the gulf stream. The total area is about 8,266 square miles of which 227 square miles are water surface. The population in 1920 was 3,852,356, an increase of 14.4 per cent since 1910 as against 20 per cent in the previous ten years.

Resources.—The state is one of the wealthiest in the union and has developed its resources chiefly along the line of manufacturing, although most of the raw material required is imported. The earlier history of Massachusetts was associated with a renown for maritime commerce which has become much less important since the Civil War, due partly to the general paralysis of American foreign trade at that time and partly to the unusual facilities for industrial growth in the state. Important industries are textiles, boots and shoes, and writing paper. Agriculture is secondary to manufacturing, the soil being little adapted to specialized efforts in its cultivation. A few valleys of limited area, however, can boast very rich

soil. Granite and stone are the chief mineral products. The fishing industry is important, Boston and Gloucester forming the main centers. Education has always been considered one of Massachusetts' unusual assets.—See also U.S.A.: Economic map.

Name.—The name Massachusetts, so far as I have observed, is first mentioned by Captain Smith in his 'Description of New England,' 1616. He spells the word variously, but he appears to use the term Massachusetts and Massachewset to denote the country, while he adds a final 's' when he is speaking of the inhabitants. He speaks of Massachusetts Mount and Massachusetts River, using the word also in its possessive form; while in another place he calls the former 'the high mountain of Massachusit.' To this mountain, on his map, he gives the English name, of 'Chevyot Hills.' Hutchinson (i. 460) supposes the Blue Hills of Milton to be intended. He says that a small hill near Squantum, the former seat of a great Indian sachem, was called Massachusetts Hill, or Mount Massachusetts, down to his time. Cotton, in his Indian vocabulary, says the word means 'a hill in the form of an arrow's head.' See, also, Neal's 'New England,' ii. 215, 216. In the Massachusetts charter the name is spelled in three or four different ways, to make sure of a description of the territory."—C. Deane, *New England (Narrative and critical history of America, v. 3, p. 342, footnote)*.

1620.—Pilgrim Fathers.—Whence and why they came to New England. See INDEPENDENTS OR SEPARATISTS; CONGREGATIONAL CHURCH: Origin and early growth.

1620.—Voyage of the Mayflower.—Landing of the Pilgrims.—Founding of Plymouth colony.—The congregation of John Robinson, at Leyden, having, after long efforts, procured from the London Company for Virginia a patent or grant of land which proved useless to them, and having closed a hard bargain with certain merchants of London who supplied to some limited extent the means necessary for their emigration and settlement (see INDEPENDENTS OR SEPARATISTS: 1617-1620), were prepared, in the summer of 1620, to send forth the first pilgrims from their community, across the ocean, seeking freedom in the worship of God. "The means at command provided only for sending a portion of the company; and 'those that stayed, being the greater number, required the pastor to stay with them,' while Elder Brewster accompanied, in the pastor's stead, the almost as numerous minority who were to constitute a church by themselves; and in every church, by Robinson's theories, the 'governing elder,' next in rank to the pastor and the teacher, must be 'apt to teach.' A small ship,—the 'Speedwell,'—of some 60 tons burden, was bought and fitted out in Holland, and early in July those who were ready for the formidable voyage, being 'the youngest and strongest part,' left Leyden for embarkation at Delt-Haven, nearly 20 miles to the southward,—sad at the parting, 'but,' says Bradford, 'they knew that they were pilgrims.' About the middle of the second week of the month the vessel sailed for Southampton, England. On the arrival there they found the 'Mayflower,' a ship of about 180 tons burden, which had been hired in London,

awaiting them with their fellow passengers,—partly laborers employed by the merchants, partly Englishmen like-minded with themselves, who were disposed to join the colony. Mr. Weston, also, was there, to represent the merchants; but, when discussion arose about the terms of the contract, he went off in anger, leaving the contract unsigned, and the arrangements so incomplete that the Pilgrims were forced to dispose of sixty pounds' worth of their not abundant stock of provisions to meet absolutely necessary charges. The ships, with perhaps 120 passengers, put to sea about August 5/15, with hopes of the colony being well settled before winter; but the 'Speedwell' was soon pronounced too leaky to proceed without being overhauled, and so both ships put in at Dartmouth, after eight days' sail. Repairs were made, and before the end of another week they started again; but when about a hundred leagues beyond Land's End, Reynolds, the master of the 'Speedwell,' declared her in imminent danger of sinking, so that both ships again put about. On reaching Plymouth Harbor it was decided to abandon the smaller vessel, and thus to send back those of the company whom such a succession of mishaps had disheartened. . . . It was not known till later that the alarm over the 'Speedwell's' condition was owing to deception practised by the master and crew. . . . At length, on Wednesday, September 6/16, the Mayflower left Plymouth, and nine weeks from the following day, on November 9/19, sighted the eastern coast of the flat, but at that time well-wooded shores of Cape Cod. She took from Plymouth 102 passengers, besides the master and crew; on the voyage one man-servant died and one child was born, making 102 (73 males and 29 females) who reached their destination. Of these, the colony proper consisted of 34 adult males, 18 of them accompanied by their wives and 14 by minor children (20 boys and 8 girls); besides these, there were 3 maid-servants and 19 men-servants, sailors, and craftsmen,—5 of them only half-grown boys,—who were hired for temporary service. Of the 34 men who were the nucleus of the colony, more than half are known to have come from Leyden; in fact, but 4 of the 34 are certainly known to be of the Southampton accessions. . . . And whither were they bound? As we have seen, a patent was secured in 1609 in Mr. Wincob's name; but 'God so disposed as he never went nor they ever made use of this patent,' says Bradford,—not however making it clear when the intention of colonizing under this instrument was abandoned. The 'merchant adventurers' while negotiating at Leyden seem to have taken out another patent from the Virginia Company, in February, 1620, in the names of John Peirce and of his associates; and this was more probably the authority under which the Mayflower voyage was undertaken. As the Pilgrims had known before leaving Holland of an intended grant of the northern parts of Virginia to a new company,—the Council of New England,—when they found themselves off Cape Cod, 'the patent they had being for Virginia and not for New England, which belonged to another Government, with which the Virginia Company had nothing to do,' they changed the ship's course, with intent, says Bradford, 'to find some place about Hudson's River for their habitation,' and so fulfil the conditions of their patent; but difficulties of navigation and opposition from the master and crew caused the exiles, after half a day's voyage, to retrace their course and seek a resting-place on the nearest shore. . . . Their radical change of destination ex-

posed the colonists to a new danger. As soon as it was known, some of the hired laborers threatened to break loose (upon landing) from their engagements, and to enjoy full license, as a result of the loss of the authority delegated in the Virginia Company's patent. The necessity of some mode of civil government had been enjoined on the Pilgrims in the farewell letter from their pastor, and was now availed of to restrain these insurgents and to unite visibly the well-affected. A compact, which has often been eulogized as the first written constitution in the world, was drawn up. . . . Of the 41 signers to this compact, 34 were the adults called above the nucleus of the colony, and seven were servants or hired workmen; the seven remaining adult males of the latter sort were perhaps too ill to sign with the rest (all of them soon died), or the list of signers may be imperfect. This needful preliminary step was taken on Saturday, November 11/21, by which time the Mayflower had rounded the Cape and found shelter in the quiet harbor on which now lies the village of Provincetown; and probably on the same day they 'chose, or rather confirmed,' as Bradford has it, . . . Mr. John Carver governor for the ensuing year. On the same day an armed delegation visited the neighboring shore, finding no inhabitants. There were no attractions, however, for a permanent settlement, nor even accommodations for a comfortable encampment while such a place was being sought." Some days were spent in exploring Cape Cod Bay, and the harbor since known as Plymouth Bay was chosen for the settlement of the colony. The exploring party landed, as is believed, at the famous Rock, on Monday December 11/21. "Through an unfortunate mistake, originating in the last century, the 22d has been commonly adopted as the true date. . . . Tradition divides the honor of being the first to step on Plymouth Rock between John Alden and Mary Chilton, but the date of their landing must have been subsequent to December 11 [N. S. 21]." It was not till the end of the week, December 16/26, that the Mayflower was anchored in the chosen haven. "The selection of a site and the preparation of materials, in uncertain weather, delayed till Monday, the 25th [Jan. 4, N. S.] the beginning of 'the first house for common use, to receive them and their goods.' Before the new year, house-lots were assigned to families, and by the middle of January most of the company had left the ship for a home on land."—F. B. Dexter, *Pilgrim church and Plymouth colony (Narrative and Critical history of America, v. 3, ch. 8, with footnotes)*.—"Before the Pilgrims landed, they by a solemn instrument founded the Puritan republic. The tone of this instrument and the success of its authors may afford a lesson to revolutionists who sever the present from the past with the guillotine, fling the illustrious dead out of their tombs, and begin history again with the year one. These men had been wronged as much as the Jacobins. 'In the name of God. Amen. We whose names are underwritten, the loyal subjects of our dread Sovereign Lord King James, by the grace of God of Great Britain and Ireland, defender of the faith, etc., having undertaken, for the glory of God and advancement of the Christian faith, and honour of our king and country, a voyage to plant the first colony in the northern parts of Virginia, do by these presents solemnly and mutually, in the presence of God and of one another, covenant and combine ourselves together into a civil body politic for our better ordering and preservation, and for the furtherance of the ends aforesaid; and by virtue hereof to exact, constitute, and frame such

just and equal laws, ordinances and acts, constitutions and offices, from time to time, as shall be thought most meet for the general good of the colony, unto which we promise all due submission and obedience.' And then follows the roll of plebeian names, to which the Roll of Battle Abbey is a poor record of nobility. There are points in history at which the spirit which moves the whole shows itself more clearly through the outward frame. This is one of them. Here we are passing from the feudal age of privilege and force to the age of due submission and obedience, to just and equal offices and laws, for our better ordering and preservation. In this political covenant of the Pilgrim fathers lies the American Declaration of Independence. From the American Declaration of Independence was borrowed the French Declaration of the Rights of Man. France, rushing ill-prepared, though with overweening confidence, on the great problems of the eighteenth century, shattered not her own hopes alone, but nearly at the same moment the Puritan Republic, breaking the last slight link that bound it to feudal Europe, and placing modern society firmly and tranquilly on its new foundation. To the free States of America we owe our best assurance that the oldest, the most famous, the most cherished of human institutions are not the life, nor would their fall be the death, of social man; that all which comes of Charlemagne, and all which comes of Constantine, might go to the tombs of Charlemagne and Constantine, and yet social duty and affection, religion and worship, free obedience to good government, free reverence for just laws, continue as before. They who have achieved this have little need to talk of Bunker's Hill."—G. Smith, *On the foundation of the American colonies (Lectures on the study of history)*.—See also U. S. A.: 1607-1620.

1621.—First year of the Plymouth colony and its sufferings.—Pierce patent.—Naming of Plymouth.—"The labor of providing habitations had scarcely begun, when sickness set in, the consequence of exposure and bad food. Within four months it carried off nearly half their number. Six died in December, eight in January, seventeen in February, and thirteen in March. At one time during the winter, only six or seven had strength enough left to nurse the dying and bury the dead. Destitute of every provision, which the weakness and the daintiness of the invalid require, the sick lay crowded in the unwholesome vessel, or in half-built cabins heaped around with snow-drifts. The rude sailors refused them even a share of those coarse sea-stores which would have given a little variety to their diet, till disease spread among the crew, and the kind ministrations of those whom they had neglected and affronted brought them to a better temper. The dead were interred in a bluff by the water-side, the marks of burial being carefully effaced, lest the natives should discover how the colony had been weakened. . . . Meantime, courage and fidelity never gave out. The well carried out the dead through the cold and snow, and then hastened back from the burial to wait on the sick; and as the sick began to recover, they took the places of those whose strength had been exhausted." In March, the

first intercourse of the colonists with the few natives of the region was opened, through Samoset, a friendly Indian, who had learned from fishermen on the more eastern coast to speak a little English. Soon afterwards, they made a treaty of friendship and alliance with Massasoit, the chief of the nearest tribe, which treaty remained in force for fifty-four years. On April fifth the Mayflower set sail on her homeward voyage, "with scarcely more than half the crew which had navigated her to America, the rest having fallen victims to the epidemic of the winter. . . . She carried back not one of the emigrants, dispiriting as were the hardships which they had endured, and those they had still in prospect." Soon after the departure of the Mayflower, Carver, the Governor,

© A. S. Burbank

WILLIAM BRADFORD

died. "Bradford was chosen to the vacant office, with Isaac Allerton, at his request, for his Assistant. Forty-six of the colonists of the Mayflower were now dead,—28 out of the 48 adult men. Before the arrival of the second party of emigrants in the autumn, the dead reached the number of 51, and only an equal number survived the first miseries of the enterprise. . . . Before the winter set in, tidings from England had come, to relieve the long year's lonesomeness; and a welcome addition was made to the sadly diminished number. The Fortune, a vessel of 55 tons' burden, reached Plymouth after a passage of four months, with Cushman and some 30 other emigrants. The men who now arrived outnumbered those of their predecessors who were still living. . . . Some were old friends of the colonists, at Leyden. Others were persons who added to the moral as well as to the numerical strength of the settlement. But there were not wanting such

as became subjects for anxiety and coercion." The Fortune also brought to the colonists a patent from the Council for New England, as it was commonly known—the corporation into which the old Plymouth Company, or North Virginia branch of the Virginia Company, had been transformed. (See NEW ENGLAND: 1620-1623.) "Upon lands of this corporation Bradford and his companions had sat down without leave, and were of course liable to be summarily expelled. Informed of their position by the return of the Mayflower to England in the spring, their friends obtained from the Council a patent which was brought by the Fortune. It was taken out in the name of 'John Pierce, citizen and cloth-worker of London, and his associates,' with the understanding that it should be held in trust for the Adventurers, of whom Pierce was one. It allowed 100 acres of land to every colonist gone and to go to New England, at a yearly rent of two shillings an acre after seven years. It granted 1,500 acres for public uses, and liberty to 'hawk, fish, and fowl'; to 'truck, trade, and traffic with the savages'; to 'establish such laws and ordinances as are for their better government, and the same, by such officer or officers as they shall by most voices elect and choose, to put in execution'; and 'to encounter, expulse, repel, and resist by force of arms' all intruders. . . . The instrument was signed for the Council by the Duke of Hamilton, the Duke of Lenox, the Earl of Warwick, Lord Sheffield, and Sir Ferdinando Gorges. . . . The precise time of the adoption of the name which the settlement has borne since its first year is not known. Plymouth is the name recorded on Smith's map as having been given to the spot by Prince Charles. It seems very likely that the emigrants had with them this map, which had been much circulated. . . . Morton (Memorial, 56) assigns as a reason for adopting it that 'Plymouth in Old England was the last town they left in their native country, and they received many kindnesses from some Christians there.' In Mourt, 'Plymouth' and 'the now well-defended town of New Plymouth' are used as equivalent. Later, the name Plymouth came to be appropriated to the town, and New Plymouth to the Colony."—J. G. Palfrey, *History of New England*, v. 1, ch. 5, and footnote.

1622-1628.—Weston at Wessagusset, Morton at Merrymount, and other settlements.—"During the years immediately following the voyage of the Mayflower, several attempts at settlement were made about the shores of Massachusetts bay. One of the merchant adventurers, Thomas Weston, took it into his head in 1622 to separate from his partners and send out a colony of seventy men on his own account. These men made a settlement at Wessagusset, some twenty-five miles north of Plymouth. They were a disorderly, thriftless rabble, picked up from the London streets, and soon got into trouble with the Indians; after a year they were glad to get back to England as best they could, and in this the Plymouth settlers willingly aided them. In June of that same year 1622 there arrived on the scene a picturesque but ill understood personage, Thomas Morton, 'of Clifford's Inn, Gent.,' as he tells on the title-page of his quaint and delightful book, the 'New English Canaan.' Bradford disparagingly

says that he 'had been a kind of petiefogger of Furniell's Inn'; but the churchman Samuel Maverick declares that he was a 'gentleman of good qualitie.' He was an agent of Sir Ferdinando Gorges, and came with some thirty followers to make the beginnings of a royalist and Episcopal settlement in the Massachusetts bay. He was naturally regarded with ill favour by the Pilgrims as well as by the later Puritan settlers, and their accounts of him will probably bear taking with a grain or two of salt. In 1625 there came one Captain Wollaston, with a gang of indented white servants, and established himself on the site of the present town of Quincy. Finding this system of industry ill suited to northern agriculture, he carried most of his men off to Virginia, where he sold them. Morton took possession of the site of the settlement, which he called Merrymount. There, according to Bradford, he set up a 'schoole of athisme,' and his men did quaff strong waters and comport themselves 'as if they had anew revived and celebrated the feasts of ye Roman Goddes Flora, or the beastly practices of ye madd Bachanaliens.' Charges of atheism have been freely hurled about in all ages. In Morton's case the accusation seems to have been based upon the fact that he used the Book of Common Prayer. His men so far maintained the ancient customs of merry England as to plant a Maypole eighty feet high, about which they frolicked with the redskins, while furthermore they taught them the use of firearms and sold them muskets and rum. This was positively dangerous, and in the summer of 1628 the settlers at Merrymount were dispersed by Miles Standish. Morton was sent to England, but returned the next year, and presently again repaired to Merrymount. By this time other settlements were dotted about the coast. There were a few scattered cottages or cabins at Nantasket and at the mouth of the Piscataqua, while Samuel Maverick had fortified himself on Noddle's Island, and William Blackstone already lived upon the Shawmut peninsula, since called Boston. These two gentlemen were no friends to the Puritans; they were churchmen and representatives of Sir Ferdinando Gorges."—J. Fiske, *Beginnings of New England*, ch. 3.

1623-1629.—Plymouth colony.—Land allotments.—Buying freedom from adventurers at London.—New patent.—"In 1623 the Ann and Little James, the former of 140 tons, and the latter of 44 tons, arrived with 60 persons to be added to the colony, and a number of others who had come at their own charge and on their own account. . . . The passengers in the Ann and Little James completed the list of those who are usually called the first-comers. The Ann returned to England in September, carrying Mr. Winslow to negotiate with the merchants for needful supplies, and the Little James remained at Plymouth in the service of the company. . . . Up to that time the company had worked together on the company lands, and, each sharing in the fruits of another's labors, felt little of that personal responsibility which was necessary to secure the largest returns. . . . 'At length, after much debate of things, the Governor (with the advise of the cheefest amongst them) gave way that they should set corne every man for his owne perticuler, and in that regard

trust to themselves; in all other things to go on in the generall way as before. And so assigned to every family a parcell of land, according to the proportion of their number for that end. . . . This had very good success; for it made all hands very industrious.' . . . Such is the language of Bradford concerning a measure which was adopted from motives of necessity, but which was, to a certain extent, an infringement of the provisions of the contract with the adventurers. Before the planting season of the next year a more emphatic violation of the contract was committed. 'They (the colony) begane now highly to prize corne as more pretious then silver, and those that had some to spare begane to trade one with another for smale things, by the quart, potle, & peck &C.: for money they had none, and if any had, corne was prefered before it. That they might therefore increase their tillage to better advantage,

gence, Capt. Standish was sent to England, followed next year by Mr. Allerton, "to make a composition with the adventurers," and obtain, if possible, a release from the seven years contract under which the colonists were bound. Allerton returned in 1627, having concluded an agreement with the adventurers at London for the purchase of all their rights and interests in the plantation, for the sum of £1,800. The agreement was approved by the colony, and Bradford, Standish, Allerton, Winslow, Brewster, Howland, Alden, and others, assumed the debt of £1,800, the trading privileges of the colony being assigned to them for their security. "In accordance with this agreement these gentlemen at once entered vigorously into the enterprise, and by the use of wampum, as a circulating medium, carried on so extensive a trade with the natives, in the purchase of furs and other articles for export to England

GOVERNOR BRADFORD'S HOUSE AT PLYMOUTH

© A. S. Burbank

they made suite to the Governor to have some portion of land given them for continuance, and not by yearly lotte. . . . Which being well considered, their request was granted. And to every person was given only one acre of land, to them and theirs, as nere the towne as might be, and they had no more till the 7 years were expired.' This experience gradually led the colony in the right track, and the growing necessity for some other circulating medium than silver secured abundant harvests." Winslow returned from England in 1624, "bringing, besides a good supply, '3 heifers & a bull the first beginning of any cattle of that kind in the land.' At that time there were 180 persons in the colony, 'some cattle and goats, but many swine and poultry and thirty-two dwelling houses.' In the latter part of the year Winslow sailed again for England in the Little James and returned in 1625. The news he brought was discouraging to the colonists. The debt due to the adventurers was £1,400, and the creditors had lost confidence in their enterprise." On this intelli-

as within the prescribed period [six years] to pay off the entire debt and leave the colony in the undisputed possession of their lands. No legal-tender scheme, in these later days, has been bolder in its conception, or more successful in its career, than that of the Pilgrim Fathers, which, with the shells of the shore, relieved their community from debt, and established on a permanent basis the wealth and prosperity of New England. . . . After the negotiations with the adventurers had been completed, the colonists were anxious to obtain another patent from the New England Company conferring larger powers and defining their territorial limits. After three visits to England, Allerton was sent a fourth time, in 1620, and secured a patent dated January 13, 1620 (old style), and signed by the Earl of Warwick on behalf of the Council of New England, enlarging the original grant, and establishing the boundaries of what has been since known as the Old Colony. It granted to William Bradford and his associates 'all that part of New England in America, the tract

and tracts of land that lie within or between a certain rivolet or rundlett, then commonly called Coahasset alias Conahasset, towards the north, and the river commonly called Naraganset river towards the south, and the great Western ocean towards the east, and between two lines described as extending, severally, from the mouth of the Naraganset and the mouth of the Coahasset, 'up into the mainland westward,' 'to the utmost limits and bounds of a country or place in New England called Pokernacutt, alias Puckenackick, alias Sawaamset.'"—W. T. Davis, *Ancient landmarks of Plymouth*, ch. 2.

1623-1629.—Dorchester Company and royal charter to the governor and Company of Massachusetts Bay.—"While the people of Plymouth were struggling to establish their colony, some of the English Puritans, restless under the growing despotism of Charles, began to turn their eyes to New England. Under the lead of the Rev. John White, the Dorchester Company was formed for trading and fishing, and a station was established at Cape Ann [1623]; but the enterprise did not prosper, the colonists were disorderly, and the Company made an arrangement for Roger Conant and others, driven from Plymouth by the rigid principles of the Separatists, to come to Cape Ann. Still matters did not improve and the Company was dissolved; but White held to his purpose, and Conant and a few others moved to Naumkeag, and determined to settle there. Conant induced his companions to persevere, and matters in England led to a fresh attempt; for discontent grew rapidly as Charles proceeded in his policy. A second Dorchester Company, not this time a small affair for fishing and trading, was formed, and a large grant of lands [from three miles north of the Merrimac to three miles south of the Charles, and to extend from the Atlantic to the Western ocean] was made by the Council for New England to Sir Henry Roswell and five others [March, 1628]. One of the six patentees, John Endicott, went out during the following summer with a small company, assumed the government at Naumkeag, which was now called Salem, and sent out exploring parties. The company thus formed in England was merely a voluntary partnership, but it paved the way for another and much larger scheme. Disaffection had become wide-spread. The Puritans began to fear that religious and political liberty alike were not only in danger but were doomed to destruction, and a large portion of the party resolved to combine for the preservation of all that was dearest to them by removal to the New World. The Dorchester Company was enlarged, and a royal charter was obtained incorporating the Governor and Company of Massachusetts Bay," March 4, 1620.—H. C. Lodge, *Short history of the English colonies in America*, ch. 18.—"This [the royal charter named above] is the instrument under which the Colony of Massachusetts continued to conduct its affairs for 55 years. The patentees named in it were Roswell and his five associates, with 20 other persons, of whom White was not one. It gave power forever to the freemen of the Company to elect annually, from their own number, a Governor, Deputy-Governor, and 18 Assistants, on the last Wednesday of Easter term, and to make laws and ordinances not repugnant to the laws of England, for their own benefit and the government of persons inhabiting their territory. Four meetings of the Company were to be held in a year, and others might be convened in a manner prescribed. Meetings of the Governor, Deputy-Gov-

ernor, and Assistants, were to be held once a month or oftener. The Governor, Deputy-Governor, and any two Assistants, were authorized, but not required, to administer to freemen the oaths of supremacy and allegiance. The Company might transport settlers not 'restrained by special name.' They had authority to admit new associates, and establish the terms of their admission, and elect and constitute such officers as they should see fit for the ordering and managing of their affairs. They were empowered to 'encounter, repulse, repel, and resist by force of arms . . . all such person and persons as should at any time thereafter attempt or enterprise the destruction, invasion, detriment, or annoyance to the said plantation or inhabitants.' Nothing was said of religious liberty. The government may have relied upon its power to restrain it, and the emigrants from their distance and obscurity to protect it."—J. G. Palfrey, *History of New England*, v. 1, ch. 8.—"In anticipation of a future want the grantees resisted the insertion of any condition which should fix the government of the Company in England. Winthrop explicitly states that the advisers of the Crown had originally imposed such a condition, but that the patentees succeeded, not without difficulty, in freeing themselves from it. That fact is a full answer to those who held that in transferring the government to America the patentees broke faith with the Crown."—J. A. Doyle, *English in America: The Puritan colonies*, v. 1, ch. 3.

ALSO IN: N. B. Shurtleff, ed., *Records of the Government and County of Massachusetts Bay*, v. 1 (containing the charter).—S. F. Haven, *Origin of the company* (*Archæologia Americana*, v. 3).

1629-1630.—Immigration of the governor and Company of Massachusetts Bay, with their royal charter.—"Several persons, of considerable importance in the English nation, were now enlisted among the adventurers, who, for the unmolested enjoyment of their religion, were resolved to remove into Massachusetts. Foreseeing, however, and dreading the inconvenience of being governed by laws made for them without their own consent, they judged it more reasonable that the colony should be ruled by men residing in the plantation, than by those dwelling at a distance of three thousand miles, and over whom they should have no control. At a meeting of the company on the 28th of July [1629], Matthew Cradock, the governor, proposed that the charter should be transferred to those of the freemen who should become inhabitants of the colony, and the powers conferred by it be executed for the future in New England. An agreement was accordingly made at Cambridge, in England, on the 26th of August, between Sir Richard Saltonstall, Thomas Dudley, Isaac Johnson, John Winthrop, and a few others, that, on those conditions, they would be ready the ensuing March, with their persons and families, to embark for New England, for the purpose of settling in the country. The governor and company, entirely disposed to promote the measure, called a general court [at which, after a serious debate, adjourned from one day to the next,] . . . it was decreed that the government and the patent of the plantation should be transferred from London to Massachusetts Bay. An order was drawn up for that purpose, in pursuance of which a court was holden on the 20th of October for a new election of officers, who would be willing to remove with their families; and 'the court having received extraordinary great commendation of Mr. John Winthrop, both for his integrity and sufficiency, as being one very well fitted for the place, with a

full consent chose him governor for the year ensuing.' . . . Preparations were now made for the removal of a large number of colonists, and in the spring of 1630 a fleet of 14 sail was got ready. Mr. Winthrop having by the consent of all been chosen for their leader, immediately set about making preparations for his departure. He converted a fine estate of £600 or £700 per annum into money and in March embarked on board the *Arbella*, one of the principal ships. Before leaving Yarmouth, an address to their fathers and brethren remaining in England was drawn up, and subscribed on the 7th of April by Governor Winthrop and others, breathing an affectionate farewell to the Church of England and their native land. . . . In the same ship with Governor Winthrop came Thomas Dudley, who had been chosen deputy governor after the embarkation, and several other gentlemen of wealth and quality; the fleet containing about 840 passengers, of various occupations, some of whom were from the west of England, but most from the neighborhood of London. The fleet sailed early in April; and the *Arbella* arrived off Cape Ann on Friday, the 11th of June, and on the following day entered the harbor of Salem. A few days after their arrival, the governor, and several of the principal persons of the colony, made an excursion some 20 miles along the bay, for the purpose of selecting a convenient site for a town. They finally pitched down on the north side of Charles river (Charlestown), and took lodgings in the great house built there the preceding year; the rest of the company erected cottages, booths, and tents, for present accommodation, about the town hill. Their place of assembling for divine service was under a spreading tree. On the 8th of July, a day of thanksgiving was kept for the safe arrival of the fleet. On the 30th of the same month, after a day of solemn prayer and fasting, the foundation of a church was laid at Charlestown, afterwards the first church of Boston, and Governor Winthrop, Deputy Governor Dudley, and the Rev. Mr. Wilson, entered into church covenant. The first court of assistants was held at Charlestown, on the 23d of August, and the first question proposed was a suitable provision for the support of the gospel. Towards the close of autumn, Governor Winthrop and most of the assistants removed to the peninsula of Shawmut (Boston), and lived there the first winter, intending in the spring to build a fortified town, but undetermined as to its situation. On the 6th of December they resolved to fortify the isthmus of that peninsula; but, changing their minds before the month expired, they agreed upon a place about three miles above Charlestown, which they called first Newtown, and afterwards Cambridge, where they engaged to build houses the ensuing spring. The rest of the winter they suffered much by the severity of the season, and were obliged to live upon acorns, groundnuts, and shell-fish. . . . They had appointed the 6th of February for a fast, in consequence of their alarm for the safety of a ship which had been sent to Ireland for provisions; but fortunately the vessel arrived on the 5th, and they ordered a public thanksgiving instead thereof."—J. B. Moore, *Lives of the governors of New Plymouth and Massachusetts bay*, pt. 2: Winthrop.

1630.—Founding of Boston.—"The English people who came with Governor Winthrop first located upon the peninsula of Mishawum, which they

called Charlestown. . . . They found here a single white man named Thomas Walford, living very peaceably and contentedly among the Indians. They also discovered that the peninsula of Shawmut had one solitary white inhabitant whose name was William Blackstone. They could see every day the smoke curling above this man's lonely cabin. He, too, was a Puritan clergyman, like many of those who had now come to make a home in the New World, free from the tyranny of the English bishops. Still another Englishman, Samuel Maverick by name, had built a house, and with the help of David Thompson, a fort which mounted four small cannon, truly called 'murderers,' and was living very comfortably on the island that is now East Boston. And again, by looking across the bay, to the south, the smoke of an English cottage, on Thompson's Island, was probably seen stealing upward to the sky. So that we certainly know these people were the first settlers of Boston. But scarcity of water, and sickness, which soon broke out among them, made the settlers at Charlestown very discontented. They began to scatter. Indeed this peninsula was too small properly to accommodate all of them with their cattle. Therefore good William Blackstone, with true hospitality, came in their distress to tell them there was a fine spring of pure water at Shawmut, and to invite them there. Probably his account induced quite a number to remove at once; while others, wishing to make farms, looked out homes along the shores of the mainland, at Medford, Newtown (Cambridge), Watertown and Roxbury. A separate company of colonists also settled at Mattapan, or Dorchester. The dissatisfaction with Charlestown was so general that at last only a few of the original settlers remained there. . . . While those in chief authority were still undecided, Isaac Johnson, one of the most influential and honored men among the colonists, began, with others, in earnest, the settlement of Boston. He chose for himself the square of land now enclosed by Tremont, Court, Washington and School Streets. Unfortunately this gentleman, who was much beloved, died before the removal to Boston became general. . . . Although the chief men of the colony continued for some time yet to favor the plan of a fortified town farther inland, Boston had now become too firmly rooted, and the people too unwilling, to make a second change of location practicable, or even desirable. So this project was abandoned, though not before high words passed between Winthrop and Dudley about it. The governor then removed the frame of his new house from Cambridge, or Newtown, to Boston, setting it up on the land between Milk Street, Spring Lane, and Washington Street. One of the finest springs being upon his lot, the name Spring Lane is easily traced. The people first located themselves within the space now comprised between Milk, Bromfield, Tremont, and Hanover Streets, and the water, or, in general terms, upon the southeasterly slope of Beacon Hill. Pemberton Hill soon became a favorite locality. The North End, including that portion of the town north of Union Street, was soon built up by the new emigrants coming in, or by removals from the South End, as all the town south of this district was called. In time a third district on the north side of Beacon Hill grew up, and was called the West End. And in the old city these general divisions continue to-day. Shawmut, we remember, was the first name Boston had. Now the settlers at Charlestown, seeing always before them a high hill topped with three little peaks, had already, and very aptly too, we think, named

Shawmut Trimountain [the origin of the name Tremont in Boston]. But when they began to remove there they called it Boston, after a place of that name in England, and because they had determined beforehand to give to their chief town this name. So says the second highest person among them, Deputy Governor Thomas Dudley. The settlers built their first church on the ground now covered by Brazer's Building, in State Street. . . . Directly in front of the meeting-house was the town market-place. Where Quincy Market is was the principal landing-place. The Common was set apart as a pasture-ground and training-field. . . . A beacon was set up on the summit of Trimountain and a fort upon the southernmost hill of the town. From this time these hills took the names of Windmill, Beacon, and Fort Hills."—S. A. Drake, *Around the Hub*, ch. 2.—"The order of the Court of Assistants,—Governor Winthrop presiding,—'That Trimontaine shall be called Boston,' was passed on the 7th of September, old style, or, as we now count it, the 17th of September, 1630. The name of Boston was specially dear to the Massachusetts colonists, from its association with the old St. Botolphs' town, or Boston, of Lincolnshire, England, from which the Lady Arbella Johnson and her husband had come, and where John Cotton was still preaching in its noble parish church. But the precise date of the removal of the Governor and Company to the peninsula is nowhere given."—R. C. Winthrop, *Boston founded* (J. Winsor, ed., *Memorial History of Boston*, v. 1, pp. 116-117).

1631-1636.—Puritan theocracy and its intolerance.—"The charter of the Massachusetts Company had prescribed no condition of investment with its franchise,—or with what under the circumstances which had arisen was the same thing, the prerogatives of citizenship in the plantation,—except the will and vote of those who were already freemen. At the first Cisatlantic General Court for election, 'to the end the body of the commons may be preserved of honest and good men,' it was 'ordered and agreed, that, for the time to come, no man shall be admitted to the freedom of this body politic, but such as are members of some of the churches within the limits of the same.' The men who laid this singular foundation for the commonwealth which they were instituting, had been accustomed to feel responsibility, and to act upon well-considered reasons. By charter from the English crown, the land was theirs as against all other civilized people, and they had a right to choose according to their own rules the associates who should help them to occupy and govern it. Exercising this right, they determined that magistracy and citizenship should belong only to Christian men, ascertained to be such by the best test which they knew how to apply. They established a kind of aristocracy hitherto unknown."—J. G. Palfrey, *History of New England*, v. 1, ch. 9.—"The aim of Winthrop and his friends in coming to Massachusetts was the construction of a theocratic state which should be to Christians, under the New Testament dispensation, all that the theocracy of Moses and Joshua and Samuel had been to the Jews in Old Testament days. They should be to all intents and purposes freed from the jurisdiction of the Stuart king, and so far as possible the text of the Holy Scriptures should be their guide both in weighty matters of general legislation and in the shaping of the smallest details of daily life. In

such a scheme there was no room for religious liberty as we understand it."—J. Fiske, *Beginnings of New England*, ch. 4.—"The projected religious commonwealth was to be founded and administered by the Bible, the whole Bible, not by the New Testament alone. . . . They revered and used and treated the Holy Book as one whole. A single sentence from any part of it was an oracle to them: it was as a slice or crumb from any part of a loaf of bread, all of the same consistency. God, as King, had been the Lawgiver of Israel: he should be their Lawgiver too. . . . The Church should fashion the State and be identical with it. Only experienced and covenanted Christian believers, pledged by their profession to accordance of opinion and purpose with the original proprietors and exiles, should be admitted as freemen, or full citizens of the commonwealth. They would restrain and limit their own liberty of conscience, as well as their own freedom of action, within Bible rules. In fact,—in spirit even more than in the letter,—they did adopt all of the Jewish code which was in any way practicable for them. The leading minister of the colony was formally appointed by the General Court to adapt the Jewish law to their case [1636]; and it was enacted that, till that work was really done, 'Moses, his Judicials,' should be in full force. Mr. Cotton in due time presented the results of his labor in a code of laws illustrated by Scripture texts. This code was not formally adopted by the Court; but the spirit of it, soon rewrought into another body, had full sway. . . . That frankly avowed and practically applied purpose of the Fathers, of establishing here a Bible Commonwealth, 'under a due form of government, both civil and ecclesiastical,' furnishes the key to, the explanation of, all dark things and all the bright things in their early history. The young people educated among us ought to read our history by that simple, plain interpretation. The consciences of our Fathers were not free in our sense of that word. They were held under rigid subjection to what they regarded as God's Holy Word, through and through in every sentence of it, just as the consciences of their Fathers were held, under the sway of the Pope and the Roman Church. The Bible was to them supreme. Their church was based on it, modelled by it, governed by it; and they intended their State should be also."—G. E. Ellis, *Lowell Institute Lectures on the early history of Massachusetts*, pp. 50-55.—"Though communicants were not necessarily voters, no one could be a voter who was not a communicant; therefore the town-meeting was nothing but the church meeting, possibly somewhat attenuated, and called by a different name. By this insidious statute the clergy seized the temporal power, which they held till the charter fell. The minister stood at the head of the congregation and moulded it to suit his purposes and to do his will. . . . Common men could not have kept this hold upon the inhabitants of New England, but the clergy were learned, resolute, and able, and their strong but narrow minds hurned with fanaticism and love of power; with their beliefs and under their temptations persecution seemed to them not only their most potent weapon, but a duty they owed to Christ—and that duty they unflinchingly performed."—B. Adams, *Emancipation of Massachusetts*, ch. 1.

1634-1637.—Threatening movements in England.—Charter demanded.—“That the government of Charles I. should view with a hostile eye the growth of a Puritan state in New England is not at all surprising. The only fit ground for wonder would seem to be that Charles should have been willing at the outset to grant a charter to the able and influential Puritans who organized the Company of Massachusetts Bay. Probably, however, the king thought at first it would relieve him at home if a few dozen of the Puritan leaders could be allowed to concentrate their minds upon a project of colonization in America. It might divert attention for a moment from his own despotic schemes. Very likely the scheme would prove a failure and the Massachusetts colony incur a fate like that of Roanoke Island; and at all events the wealth of the Puritans might better be sunk in a remote and perilous enterprise than employed at home in organizing resistance to the crown. Such, very likely, may have been the king's motive in granting the Massachusetts charter two days after turning his Parliament out of doors. But the events of the last half-dozen years had come to present the case in a new light. The young colony was not languishing. It was full of sturdy life; it had wrought mischief to the schemes of Gorges; and what was more, it had begun to take unheard-of liberties with things ecclesiastical and political. Its example was getting to be a dangerous one. It was evidently worth while to put a strong curb upon Massachusetts. Any promise made to his subjects Charles regarded as a promise made under duress which he was quite justified in breaking whenever it suited his purpose to do so. Enemies of Massachusetts were busy in England. Schismatics from Salem and revellers from Merrymount were ready with their tales of woe, and now Gorges and Mason were vigorously pressing their territorial claims.”—J. Fiske, *Beginnings of New England*, ch. 3.—In April, 1634, “the superintendence of the colonies was . . . removed from the privy council to an arbitrary special commission, of which William Laud, archbishop of Canterbury, and the archbishop of York, were the chiefs. These, with ten of the highest officers of State, were invested with full power to make laws and orders . . . to appoint judges and magistrates and establish courts for civil and ecclesiastical affairs . . . to revoke all charters and patents which had been surreptitiously obtained, or which conceded liberties prejudicial to the royal prerogative. Cradock, who had been governor of the corporation in England before the transfer of the charter of Massachusetts, was strictly charged to deliver it up; and he wrote to the governor and council to send it home. Upon receipt of his letter, they resolved ‘not to return any answer or excuse at that time.’ In September, a copy of the commission to Archbishop Laud and his associates was brought to Boston; and it was at the same time rumored that the colonists were to be compelled by force to accept a new governor, the discipline of the church of England, and the laws of the commissioners. The intelligence awakened ‘the magistrates and deputies to discover their minds each to other, and to hasten their fortifications,’ towards which, poor as was the colony, £600 were raised. In January, 1635, all the ministers assembled at Boston; and they unanimously de-

clared against the reception of a general governor, saying: ‘We ought to defend our lawful possessions, if we are able; if not, to avoid and protract.’ In the month before this declaration, it is not strange that Laud and his associates should have esteemed the inhabitants of Massachusetts to be men of refractory humors. . . . Restraints were placed upon emigration; no one above the rank of a serving man might remove to the colony without the special leave of Laud and his associates. . . . Willingly as these acts were enforced by religious bigotry, they were promoted by another cause. A change had come over the character of the great Plymouth council for the colonization of New England,” which now schemed and bargained with the English court to surrender its general charter, on the condition that the vast territory which it had already ceded to the Massachusetts Company and others should be reclaimed by the king and granted anew, in severalty, to its members. (See NEW ENGLAND: 1635). “At the Trinity term of the court of king's bench, a quo warranto was brought against the Company of the Massachusetts bay. At the ensuing Michaelmas, several of its members who resided in England made their appearance, and judgment was pronounced against them individually; the rest of the patentees stood outlawed, but no judgment was entered against them. The unexpected death of Mason, the proprietary of New Hampshire, in December, 1635, removed the chief instigator of these aggressions. In July, 1637, the king, professing ‘to redress the mischiefs that had arisen out of the many different humours,’ took the government of New England into his own hands, and appointed over it Sir Ferdinando Gorges as governor-general. . . . But the measure was feeble and ineffectual. [Gorges] . . . never left England, and was hardly heard of except by petitions to its government.” Troubles had thickened about king Charles and his creature Laud until they no longer had time or disposition to bestow more of their thoughts on Massachusetts. A long-suffering nation was making ready to put an end to their malignant activities, and the Puritans of New England and Old England were alike delivered.”—G. Bancroft, *History of the United States*, v. 1, pt. 1, ch. 17.

1636.—Banishment of Roger Williams.—“The intolerance of England had established the New England colonies. The time was at hand when those colonies should in their turn alienate from them their own children, and be the unwilling parents of a fresh state. In 1631, there arrived at Boston a young minister, Roger Williams, ‘godly and zealous, having precious gifts.’ . . . His theological doctrines seem to have been those generally received among the Puritans, but in questions of church discipline he went far beyond most of his sect. He was a rigid separatist, and carried the doctrine of toleration, or, as perhaps it might be more properly called, state indifference, to its fullest length. Accordingly it was impossible to employ him as a minister at Boston. He went to Salem, which was then without a preacher, and was appointed to the vacant office. But a message

from Winthrop and the assistants compelled the church of Salem to retract its choice, and the young enthusiast withdrew to Plymouth," where he remained two years, until August, 1633, when he returned to Salem. "In 1634, he incurred the displeasure of some of his congregation by putting forward the doctrine that no tenure of land could be valid which had not the sanction of the natives. His doctrine was censured by the court at Boston, but on his satisfying the court of his 'loyalty,' the matter passed over. But before long he put forward doctrines, in the opinion of the government, yet more dangerous. He advocated complete separation from the Church of England, and denounced compulsory worship and a compulsory church establishment. Carrying the doctrine of individual liberty to its fullest extent, he asserted that the magistrate was only the agent of the people, and had no right to protect the people against itself; that his power extends only as far as such cases as disturb the public peace. . . . On the 8th of August, 1635, Williams was summoned before the general court; his opinions were denounced as 'erroneous and very dangerous,' and notice was given to the church at Salem that, unless it could explain the matter to the satisfaction of the court, Williams must be dismissed. In October, Williams was again brought before the court, and after a 'disputation' with Mr. Hooker, which failed to reduce him from any of his errors, he was sentenced to depart out of the jurisdiction of Massachusetts in six weeks. The church of Salem acquiesced in the condemnation of their pastor. Their own experience might have taught the fathers of New England that the best way to strengthen heresy is to oppose it. The natural result followed: the people were 'much taken with the apprehension of Williams' godliness,' and a large congregation, including 'many devout women,' gathered round him. Since they had failed to check the evil, the Massachusetts government resolved to exterminate it and to ship Williams for England. The crew of a pinnace was sent to arrest him, but, fortunately for the future of New England, he had escaped. . . . He had set out [January, 1636] for the territory of Narragansett, and there founded the village of Providence."—J. A. Doyle, *American colonies*, ch. 2.—"His [Roger Williams'] own statement is, it was 'only for the holy truth of Christ Jesus that he was denied the common air to breathe in, and a civil cohabitation upon the same common earth.' But the facts of the case seem to show that it was because his opinions differed from the opinions of those among whom he lived, and were considered by them as dangerous and seditious, tending to the utter destruction of their community, that he was a sacrifice to honest convictions of truth and duty. . . . The sentence of banishment, however, was not passed without reluctance. Governor Winthrop remained his friend to the day of his death, and even proposed, in view of his services in the Pequot war, that his sentence should be revoked. Governor Haynes, of Connecticut, who pronounced his sentence, afterwards regretted it. Governor Winslow, of Plymouth, who had no hand in his expulsion, 'put a piece of gold in the hands of his wife,' to relieve his necessities, and though Mr. Cotton hardly clears himself from the charge of having procured his sentence, there was no private feud between them. Cotton Mather concedes that 'many judicious persons judged him to have had the root of the matter in him.' Later writers declare him, 'from the whole course and tenor of his life and conduct, to have been one of the most

disinterested men that ever lived, a most pious and heavenly-minded soul.' And the magnanimous exile himself says, 'I did ever from my soul honor and love them, even when their judgment led them to afflict me.'"—J. S. Barry, *History of Massachusetts*, v. 1, ch. 9.—See also RHODE ISLAND: 1631-1636; 1636.

ALSO IN: J. D. Knowles, *Memoir of Roger Williams*, ch. 3-5.—G. E. Ellis, *Puritan age and rule*, ch. 8.

1636-1638.—Mrs. Anne Hutchinson and the Antinomian troubles.—"The agitation and strife connected with the Antinomian controversy, opened by Mrs. Anne Hutchinson, came dangerously near to bringing the fortunes of the young Massachusetts colony to a most disastrous ruin. . . . The peril overhung at a time when the proprietary colonists had the most reasonable and fearful forebodings of the loss of their charter by the interference of a Privy Council Commission. . . . Ominously enough, too, Mrs. Hutchinson arrived here, Sept. 18, 1634, in the vessel which brought the copy of that commission. Winthrop describes her as a woman of a 'ready wit and bold spirit.' Strongly gifted herself, she had a gentle and weak husband, who was guided by her. She had at home enjoyed no ministrations so much as those of Cotton, and her brother-in-law, Mr. Wheelwright. She came here to put herself again under the preaching of the former. . . . She had been here for two years, known as a ready, kindly, and most servicable woman, especially to her own sex in their straits and sicknesses. But she anticipated the introduction of 'the woman question' among the colonists in a more troublesome form than it has yet assumed for us. Joined by her brother-in-law, who was also admitted to the church, after those two quiet years she soon made her influence felt for trouble, as he did likewise. . . . The male members of the Boston Church had a weekly meeting, in which they discussed the ministrations of Cotton and Wilson. Mrs. Hutchinson organized and presided over one, held soon twice in a week, for her own sex, attended by nearly a hundred of the principal women on the peninsula and in the neighborhood. It was easy to foresee what would come of it, through one so able and earnest as herself, even if she had no novel or disjointed or disproportioned doctrine to inculcate; which, however, it proved that she had. Antinomian means a denying, or, at least, a weakening, of the obligation to observe the moral law, and to comply with the external duties; to do the works associated with the idea of internal, spiritual righteousness. It was a false or disproportioned construction of Saint Paul's great doctrine of justification by faith, without the works of the law. . . . Mrs. Hutchinson was understood to teach, that one who was graciously justified by a spiritual assurance, need not be greatly concerned for outward sanctification by works. She judged and approved, or censured and discredited, the preachers whom she heard, according as they favored or repudiated that view. Her admirers accepted her opinions. . . . Word soon went forth that Mrs. Hutchinson had pronounced in her meetings, that Mr. Cotton and her brother-in-law Wheelwright, alone of all the ministers in the colony, were under 'a covenant of grace,' the rest being 'legalists,' or under 'a covenant of works.' These reports, which soon became more than opinions, were blazing brands that it would be impossible to keep from reaching inflammable material. . . . As the contention extended it involved all the principal persons of the colony. Cotton and all but five members of the

Boston Church—though one of these five was Winthrop, and another was Wilson—proved to be sympathizers with Mrs. Hutchinson; while the ministers and leading people outside in the other hamlets were strongly opposed to her. She had a partisan, moreover, of transcending influence in the young Governor, Sir Henry Vane," who had come over from England the year before, and who had been chosen at the next election for Governor, with Winthrop as deputy. "Though pure and devout, and ardent in zeal, he had not then the practical wisdom for which Milton afterwards praised him in his noble sonnet:—'Vane, young in years, but in sage counsels old.' . . . With his strong support, and that of two other prominent magistrates, and of so overwhelming a majority of the Boston Church, Mrs. Hutchinson naturally felt emboldened." But in the end her Church and party were overcome by the ministers and their supporters in the other parts of the colony; she was excommunicated and banished (November, 1637, and March, 1638), going forth to perish six years later at the hands of the Indians, while living on the shore of Long Island Sound, at a place now known as Pelham Neck, near New Rochelle. "As the summing up of the strife, 76 persons were disarmed; two were disfranchised and fined; 2 more were fined; 8 more were disfranchised; 3 were banished; and 11 who had asked permission to remove had leave, in the form of a limitation of time within which they must do it. The more estimable and considerable of them apologized and were received back."—G. E. Ellis, *Lowell Institute Lectures on the early history of Massachusetts*, pp. 95-100.

1637.—Pequot War. See NEW ENGLAND: 1637.

1637.—First synod of the churches and its dealings with heresy.—The election of Sir Harry Vane to be governor of the colony, in place of John Winthrop, "took place in the open air upon what is now Cambridge Common on the 27th day of May [1637]. Four months later it was followed by the gathering of the first Synod of Massachusetts churches; which again, meeting here in Cambridge, doubtless held its sessions in the original meeting-house standing on what is now called Mount Auburn Street. The Synod sat through twenty-four days, during which it busied itself unearthing heterodox opinions and making the situation uncomfortable for those suspected of heresy. . . . It broke up amid general congratulations 'that matters had been carried on so peaceably, and concluded so comfortably in all love.' . . . As the twig is bent, the tree inclines. The Massachusetts twig was here and then bent; and, as it was bent, it during hard upon two centuries inclined. [During this period the clergy had a strong influence on the policies of the government, and suffrage was denied to all who could not pass certain strict religious tests.] The question of Religious Toleration was, so far as Massachusetts could decide it, decided in 1637 in the negative. . . . The turning point in the history of early Massachusetts was the Cambridge Synod of September, 1637, . . . which succeeded in spreading on its record, as then prevailing in the infant settlement, eighty-two 'opinions, some blasphemous, others erroneous and all unsafe,' be-

sides 'nine unwholesome expressions,' the whole mighty mass of which was then incontinently dismissed, in the language of one of the leading divines who figured in that Assembly, 'to the devil of hell, from whence they came.' The mere enumeration of this long list of heresies as then somewhere prevailing is strong evidence of intellectual activity in early Massachusetts,—an activity which found ready expression through such men as Roger Williams, John Cotton, John Wheelwright and Sir Henry Vane, to say nothing of Mrs. Hutchinson, while the receptive condition of the mental soil is likewise seen in the hold the new opinions took. It was plainly a period of intellectual quickening,—a dawn of promise. Of this there can no doubt exist. It was freely acknowledged at the time; it has been stated as one of the conditions of that period by all writers on it since. The body of those who listened to him stood by Roger Williams; and the magistrates drove him away for that reason. Anne Hutchinson so held the ear of the whole Boston community that she had 'some of all sorts and quality, in all places to defend and patronize' her opinions; 'some of the magistrates, some gentlemen, some scholars and men of learning, some Burgesses of our General Court, some of our captains and soldiers, some chief men in towns, and some men eminent for religion, parts and wit.' These words of a leader of the clerical faction,—one of those most active in the work of repression,—describe to the life an active-minded, intelligent community quick to receive and ready to assimilate that which is new. Then came the Synod. It was a premonition. It was as if the fresh new sap,—the young budding leaves,—the possible, incipient flowers, had felt the chill of an approaching glacier. And that was exactly what it was;—a theological glacier then slowly settled down upon Massachusetts,—a glacier lasting through a period of nearly one hundred and fifty years."—C. F. Adams, *Massachusetts: Its historians and its history*, pp. 10-50.

1646-1651.—Presbyterian Cabal and Cambridge platform.—"There had now come to be many persons in Massachusetts who disapproved of the provision which restricted the suffrage to members of the Independent or Congregational churches of New England, and in 1646 the views of these people were presented in a petition to the General Court. . . . The leading signers of this menacing petition were William Vassall, Samuel Maverick, and Dr. Robert Child. . . . Their request would seem at first sight reasonable enough. At a superficial glance it seemed conceived in a modern spirit of liberalism. In reality it was

nothing of the sort. In England it was just the critical moment of the struggle between Presbyterians and Independents which had come in to complicate the issues of the great civil war. Vassall, Child, and Maverick seem to have been the leading spirits in a cabal for the establishment of Presbyterianism in New England, and in their petition they simply took advantage of the discontent of the disfranchised citizens in Massachusetts in order to put in an entering wedge. This was thoroughly understood by the legislature of Massachusetts, and accordingly the petition was dismissed and the petitioners were roundly fined. Just as Child was about to start for England with his grievances, the magistrates overhauled his papers and discovered a petition to the parliamentary Board of Commissioners, suggesting that Presbyterianism should be established in New England, and that a viceroy or governor-general should be appointed to rule there. To the men of Massachusetts this last suggestion was a crowning horror. It seemed scarcely less than treason. The signers of this petition were the same who had signed the petition to the General Court. They were now fined still more heavily and imprisoned for six months. By and by they found their way, one after another, to London, while the colonists sent Edward Winslow, of Plymouth, as an advocate to thwart their schemes. . . . The cabal accomplished nothing because of the decisive defeat of Presbyterianism in England. 'Pride's Purge' settled all that. The petition of Vassall and his friends was the occasion for the meeting of a synod of churches at Cambridge, in order to complete the organization of Congregationalism. In 1648 the work of the synod was embodied in the famous Cambridge Platform, which adopted the Westminster Confession as its creed, carefully defined the powers of the clergy, and declared it to be the duty of magistrates to suppress heresy. In 1649 the General Court laid this platform before the congregations; in 1651 it was adopted; and this event may be regarded as completing the theocratic organization of the Puritan commonwealth in Massachusetts. It was immediately preceded and followed by the deaths of the two foremost men in that commonwealth. John Winthrop died in 1649 and John Cotton in 1652."—J. Fiske, *Beginnings of New England*, ch. 4.

1649-1651.—Under Cromwell and the Commonwealth of England.—"Massachusetts had, from the outset, sympathized with Parliament in its contest with the king, and had blended her fortunes with the fortunes of the reformers. She had expressed her willingness to 'rise and fall with them,' and 'sent over useful men, others going voluntarily, to their aid, who were of good use, and did acceptable service to the army.' Her loyalty, therefore, procured for her the protection of Parliament. Yet the execution of Charles, which royalists have ever regarded with the utmost abhorrence, was not openly approved here. 'I find,' says Hutchinson, 'scarce any marks of approbation of the tragical scene of which this year they received intelligence.' The few allusions we have discovered are none of them couched in terms of exultation. Virginia pursued a different course, and openly resisted Parliament, refused to submit to its decrees, and adhered to the cause of royalty. . . . Yet the legislation of the commonwealth was not wholly favorable even to Massachusetts. The proclamation relative to Virginia asserted, in general terms, the power of appointing

governors and commissioners to be placed in all the English colonies, without exception; and by Mr. Winslow, their agent in England, they were informed that it was the pleasure of Parliament the patent of Massachusetts should be returned, and a new one taken out, under which courts were to be held and warrants issued. With this request the people were indisposed to comply; and, too wary to hazard the liberties so dearly purchased, a petition was drawn up, pleading the cause of the colony with great force, setting forth its allegiance, and expressing the hope that, under the new government, things might not go worse with them than under that of the king, and that their charter might not be recalled, as they desired no better. This remonstrance was successful; the measure was dropped, and the charter of Charles continued in force. Parliament was not 'foiled' by the colony. Its request was deemed reasonable; and there was no disposition to invade forcibly its liberties. We have evidence of this in the course of Cromwell. After his success in the 'Emerald Isle,' conceiving the project of introducing Puritanism into Ireland, an invitation was extended to the people of Massachusetts to remove thither and settle. But they were too strongly attached to the land of their adoption, and to its government, 'the happiest and wisest this day in the world,' readily to desert it. Hence the politic proposal of the lord protector was respectfully declined."—J. S. Barry, *History of Massachusetts*, v. 1, ch. 12.

1651-1660.—Absorption of Maine. See MAINE: 1643-1677.

1656-1661.—Persecution of Quakers.—"In July, 1656, Mary Fisher and Ann Austin came to Boston from Barbadoes; and shortly after, nine others, men and women, arrived in the ship Speedwell from London. It was at once known, for they did not wish to conceal it, that they were 'Friends,' vulgarly called 'Quakers'; and the Magistrates at once took them in hand, determined that no people holding (as they considered them) such damnable opinions, should come into the Colony. A great crowd collected to hear them questioned, and Boston was stirred up by a few illiterate enthusiasts. They stood up before the Court with their hats on, apparently without fear, and had no hesitation in calling governor Endicott plain 'John.' . . . The replies which these men and women made were direct and bold, and were considered rude and contemptuous. . . . They . . . were committed to prison for their 'Rudeness and Insolence'; there being no law then under which they could be punished for being Quakers. [Before the year closed, this defect of law was remedied by severe enactments] . . . laying a penalty of £100 for bringing any Quaker into the Colony: forty shillings for entertaining them for an hour; Quaker men who came against these prohibitions were, upon first conviction, to lose one ear, upon the second, the other ear; and women were to be whipped. Upon the third conviction, their tongues were to be bored with a hot iron. But these things seemed useless, for the Quakers, knowing their fate, swarmed into Massachusetts; and the Magistrates were fast getting more business than they could attend to. It was then determined to try greater severity, and in October, 1658, a law was passed in Massachusetts (resisted by the Deputies, urged by the Magistrates), punishing Quakers, who had been banished, with death." The first to challenge the dread penalty were a woman, Mary Dyer, and two men, William Robinson and Marmaduke Stevenson, who,

after being banished (September, 1659), came defiantly back the next month. "Governor Endicott pronounced sentence of death against them. . . . On the 27th of October, in the afternoon, a guard of 200 men, attended with a drummer, conducted them to the gallows. [Stevenson and Robinson were hanged; but Mary Dyer was reprieved]. . . . Her mind was made up for death, and her reprieve brought her no joy. She was taken away by her son. . . . Mary Dyer was a 'comely and valiant woman,' and in the next Spring she returned. What was now to be done? The law said she must be hung, and Endicott again pronounced sentence, and she was led out to die a felon's death. Some scoffed and jeered her, but the most pitied; she died bravely, fearing nothing. . . . There seemed no end; for Quaker after Quaker came; they were tried, they were whipped, and the prison was full. . . . William Ledra [banished in 1657] came back (September, 1660), and was subject to death. They offered him his life, if he would go away and promise not to return; he said: 'I came here to bear my testimony, and to tell the truth of the Lord, in the ears of this people. I refuse to go.' So he was hanged in the succeeding March (14th). Wenlock Christopherson, or Christison, came, and was tried and condemned to die. . . . The death of Ledra, and the return of Wenlock Christison, brought confusion among the Magistrates, and some said 'Where will this end?' and declared it was time to stop. Governor Endicott found it difficult to get a Court to agree to sentence Christison to death; but he halted not, and pronounced the sentence. . . . But a few days afterward the jailor opened the prison doors, and Wenlock (with 27 others) was set at liberty, much to his and their surprise." The friends of the Quakers in England had prevailed upon King Charles II., then lately restored, "to order the persecutions to cease in New England (Sept. 1661). Samuel Shattock, a banished Quaker, was sent from England by Charles, with a letter to Governor Endicott [the subject of Whittier's poem, 'The King's Missive'], commanding that no more Quakers should be hanged or imprisoned in New England, but should be sent to England for trial. This ended the persecutions; for, on the 9th of December, 1661, the Court ordered all Quakers to be set at liberty."—C. W. Elliott, *New England history*, v. 1, ch. 36.—"Some of our writers, alike in prose and in poetry, have assumed, and have written on the assumption, that the deliverance of the Quakers was effected by the interposition in their behalf of King Charles II. . . . The royal letter . . . had . . . been substantially anticipated as to its principal demand by the action of the Court [in Massachusetts]. The general jail delivery of 31 Quakers, including the three under the death sentence who had voluntarily agreed to go off, was ordered by the Court in October, 1660. The King's letter was dated at Whitehall a year afterward. Let us claim whatever of relief we can find in reminding ourselves that it was the stern opposition and protest of the majority of the people of the Puritan Colony, and not the King's command, that had opened the gates of mercy."—G. E. Ellis, *Puritan age and rule*, pp. 477-479.—While the Quakers first arrested at Boston were lying in jail, "the Federal Commissioners, then in session at Plymouth, recommended that laws be forthwith enacted to keep these dreaded heretics out of the land. Next year they stooped so far as to seek the aid of Rhode Island, the colony which they had refused to admit into their confederacy. . . . Roger Williams was then president of Rhode Island, and in full accord with his noble spirit was the reply of the assembly.

'We have no law amongst us whereby to punish any for only declaring by words their minds and understandings concerning the things and ways of God as to salvation and our eternal condition.' As for these Quakers, we find that where they are 'most of all suffered to declare themselves freely and only opposed by arguments in discourse, there they least of all desire to come.' Any breach of the civil law shall be punished, but the 'freedom of different consciences shall be respected.' This reply enraged the confederated colonies, and Massachusetts, as the strongest and most overbearing, threatened to cut off the trade of Rhode Island, which forthwith appealed to Cromwell for protection. . . . In thus protecting the Quakers, Williams never for a moment concealed his antipathy to their doctrines. . . . The four confederated colonies all proceeded to pass laws banishing Quakers. . . . Those of Connecticut . . . were the mildest."—J. Fiske, *Beginnings of New England*, ch. 4.

1660-1665.—Under restored monarchy.—First collision with the crown.—"In May, 1660, Charles II. mounted the throne of his ancestors. . . . In December of this year, intelligence of the accession of a new king had reached Massachusetts; the General Court convened and prepared addresses to his majesty. . . . In the following May a reply, signed by Mr. Secretary Morrice, together with a mandate for the arrest of Goffe and Whalley, the regicides who had escaped to Massachusetts, was received in Boston. The king's response contained a general expression of good will, which, however, did not quiet the apprehensions of the colonists. The air was filled with rumors, and something seemed to forebode an early collision with the crown. At a special session of the court, held in June, 'a declaration of natural and chartered rights' was approved and published. In this document the people affirmed their right 'to choose their own governor, deputy governor, and representatives; to admit freemen on terms to be prescribed at their own pleasure; to set up all sorts of officers, superior and inferior, and point out their power and places; to exercise, by their annually elected magistrates and deputies, all power and authority, legislative, executive, and judicial; to defend themselves by force of arms against every aggression; and to reject, as an infringement of their rights, any parliamentary or royal imposition, prejudicial to the country, and contrary to any just act of colonial legislation.' More than a year elapsed from the restoration of Charles II. to his public recognition at Boston. . . . Even the drinking of his health was forbidden, and the event was celebrated only amid the coldest formalities. Meanwhile the colonists not only declared, but openly assumed, their rights; and in consequence complaints were almost daily instituted by those who were hostile to the government. Political opinion was diversified; and while 'a majority were for sustaining, with the charter, an independent government in undiminished force, a minority were willing to make some concessions.' In the midst of the discussions, John Norton, 'a friend to moderate counsels,' and Simon Bradstreet were induced to go to England as agents of the colony. Having been instructed to convince the king of the loyalty of the people of Massachusetts, and to 'engage to nothing prejudicial to their present standing according to their patent, and to endeavor the establishment of the rights and privileges then enjoyed,' the commissioners sailed

from Boston on the 10th of February, 1662. In England they were courteously received by King Charles, and from him obtained, in a letter dated June 28, a confirmation of their charter, and an amnesty for all past offences. At the same time the king rebuked them for the irregularities which had been complained of in the government; directed 'a repeal of all laws derogatory to his authority'; the taking of the oath of allegiance; the administration of justice in his name; a concession of the elective franchise to all freeholders of competent estate; and as 'the principle of the charter was the freedom of the liberty of conscience,' the allowance of that freedom to those who desired to use 'the booke of common prayer, and perform their devotion in the manner established in England.' These requisitions of the king proved anything but acceptable to the people of Massachusetts. With them the question of obedience became a question of freedom, and gave rise to the parties which continued to divide the colony until the establishment of actual independence. It was not thought best to comply immediately with his majesty's demands; on the other hand, no refusal to do so was promulgated. [Presently a rumor reached America] . . . that royal commissioners were to be appointed to regulate the affairs of New England. Precautionary measures were now taken. The patent and a duplicate of the same were delivered to a committee of four, with instructions to hold them in safe keeping. Captain Davenport, at Castle Fort, was ordered to give early announcement of the arrival of his majesty's ships. Officers and soldiers were forbidden to land from ships, except in small parties. . . . On the 23d of July, 1664, 'about five or six of the clock at night,' the 'Guinea,' followed by three other ships of the line, arrived in Boston harbor. They were well manned and equipped for the reduction of the Dutch settlements on the Hudson, and brought commissioners hostile to colonial freedom, and who were charged by the king to determine 'all complaints and appeals in all causes and matters, as well military as criminal and civil,' and to 'proceed in all things for the providing for and settling the peace and security of the country, according to their good and sound discretions.' Colonel Richard Nichols and Colonel George Cartwright were the chief members of the commission. At the earliest possible moment they produced their legal warrant, the king's letter of April 23, and requested the assistance of the colonies in the reduction of the Dutch. Shortly afterwards the fleet set out for New Netherlands. On the 3d of August the General Court convened, and the state of affairs was discussed." As the result of the discussion it was agreed that a force of 200 men should be raised to serve against the Dutch, and that the old law of citizenship should be so far modified as to provide "that all English subjects, being freeholders, and of a competent estate, and certified by the ministers of the place to be orthodox in faith, and not vicious in their lives, should be made freemen, although not members of the church." Before the session closed, Massachusetts published an order forbidding the making of complaints to the commissioners," and adopted a spirited address to the king. When, in February, 1665, three of the commissioners returned to Boston, they soon found that they were not to be permitted to take any proceedings which would call in question "the privilege of government within themselves" which the colony claimed. Attempting in May to hold a court for the hearing of charges against a Boston merchant, they were interrupted by a herald from the governor who sounded his trumpet and forbade, in the name of the king, any abetting of their

proceedings. On this they wrathfully departed for the north, after sending reports of the contumacy of Massachusetts to the king. The latter now summoned governor Bellingham to England, but the summons was not obeyed. "We have already furnished our views in writing [said the General Court], so that the ablest persons among us could not declare our case more fully." . . . The defiance of Massachusetts was followed by no immediate danger. For a season the contest with the crown ceased. The king himself was too much engaged with his women to bestow his attention upon matters of state; and thus, while England was lamenting the want of a good government, the colonies, true to themselves, their country, and their God, flourished in purity and peace."—G. L. Austin, *History of Massachusetts*, ch. 4.—*Records of the Government and Colony of Massachusetts Bay*, v. 4, pt. 2.—See also NEW YORK: 1664.

1671-1686.—*Struggle for the charter and its overthrow.*—"Although the colonists were alarmed at their own success, there was nothing to fear. At no time before or since could England have been so safely defied. . . . The discord between the crown and Parliament paralyzed the nation, and the wastefulness of Charles kept him always poor. By the treaty of Dover in 1670 he became a pensioner of Louis XIV. The Cabal followed, probably the worst ministry England ever saw; and in 1672, at Clifford's suggestion, the exchequer was closed and the debt repudiated to provide funds for the second Dutch war. In March fighting began, and the tremendous battles with De Ruyter kept the navy in the Channel. At length, in 1673, the Cabal fell, and Danby became prime minister. Although during these years of disaster and disgrace Massachusetts was not molested by Great Britain, they were not all years during which the theocracy could tranquilly enjoy its victory. . . . With the rise of Danby a more regular administration opened, and, as usual, the attention of the government was fixed upon Massachusetts by the clamors of those who demanded redress for injuries alleged to have been received at her hands. In 1674 the heirs of Mason and Gorges, in despair at the reoccupation of Maine, proposed to surrender their claim to the king, reserving one third of the product of the customs for themselves. The London merchants also had become restive under the systematic violation of the Navigation Acts. The breach in the revenue laws had, indeed, been long a subject of complaint, and the commissioners had received instructions relating thereto; but it was not till this year that these questions became serious. . . . New England was fast getting its share of the carrying trade. London merchants already began to feel the competition of its cheap and untaxed ships, and manufacturers to complain that they were undersold in the American market, by goods brought direct from the Continental ports. A petition, therefore, was presented to the king, to carry the law into effect. . . . The famous Edward Randolph now appears. The government was still too deeply embarrassed to act with energy. A temporizing policy was therefore adopted; and as the experiment of a commission had failed, Randolph was chosen as a messenger to carry the petitions and opinions to Massachusetts; together with a letter from the king, directing that agents should be sent in answer thereto. After delivering them, he was ordered to devote himself to preparing a report upon the country. He reached Boston June 10, 1676. Although it was a time of terrible suffering from the ravages of the Indian war, the temper of the magistrates was harsher than ever. The repulse of the commissioners had convinced

them that Charles was not only lazy and ignorant, but too poor to use force; and they also believed him to be so embroiled with Parliament as to make his overthrow probable. Filled with such feelings, their reception of Randolph was almost brutal. John Leverett was governor, who seems to have taken pains to mark his contempt in every way in his power. Randolph was an able, but an unscrupulous man, and probably it would not have been difficult to have secured his good-will. Far however from bribing, or even flattering him, they so treated him as to make him the bitterest enemy the Puritan Commonwealth ever knew. . . . The legislature met in August, 1676, and a decision had to be made concerning agents. On the whole, the clergy concluded it would be wiser to obey the crown, 'provided they be, with utmost care & caution, qualified as to their instructions.' Accordingly, after a short adjournment, the General Court chose William Stoughton and Peter Bulkeley; and having strictly limited their power to a settlement of the territorial controversy, they sent them on their mission. . . . The controversy concerning the boundary was referred to the two chief justices, who promptly decided against the Company; and the easy acquiescence of the General Court must raise a doubt as to their faith in the soundness of their claims. And now again the fatality which seemed to pursue the theocracy in all its dealings with England led it to give fresh provocation to the king by secretly buying the title of Gorges for 1,250 pounds. Charles had intended to settle Maine on the Duke of Monmouth. It was a worthless possession, whose revenue never paid for its defence; yet so stubborn was the colony that it made haste to anticipate the crown and thus became 'Lord Proprietary' of a burdensome province at the cost of a slight which was never forgiven. Almost immediately the Privy Council had begun to open other matters, such as coining and illicit trade; and the attorney-general drew up a list of statutes which, in his opinion, were contrary to the laws of England. . . . In the spring the law officers gave an opinion that the misdemeanors alleged against Massachusetts were sufficient to avoid her patent; and the Privy Council, in view of the encroachments and injuries which she had continually practised on her neighbors, and her contempt of his majesty's commands, advised that a 'quo warranto' should be brought against the charter. Randolph was appointed collector at Boston. Even Leverett now saw that some concessions must be made, and the General Court ordered the oath of allegiance to be taken; nothing but perversity seems to have caused the long delay. The royal arms were also carved in the courthouse; and this was all, for the clergy were determined upon those matters touching their authority. . . . Nearly half a century had elapsed since the emigration, and with the growth of wealth and population changes had come. In March, John Leverett, who had long been the head of the high-church party, died, and the election of Simon Bradstreet as his successor was a triumph for the opposition. Great as the clerical influence still was, it had lost much of its old despotic power, and the congregations were no longer united in support of the policy of their pastors. . . . Boston and the larger towns favored concession, while the country was the ministers' stronghold. The result of this divergence of opinion was that the moderate party, to which Bradstreet and Dudley belonged, predominated in the Board of Assistants, while the deputies remained immovable. The branches of the legislature thus became opposed; no course of action could be agreed on, and the theocracy drifted to its

destruction. . . . Meanwhile Randolph had renewed his attack. He declared that in spite of promises and excuses the revenue laws were not enforced; that his men were beaten, and that he hourly expected to be thrown into prison; whereas in other colonies, he asserted, he was treated with great respect. There can be no doubt ingenuity was used to devise means of annoyance; and certainly the life he was made to lead was hard. In March he sailed for home, and while in London he made a series of reports to the government which seem to have produced the conviction that the moment for action had come. In December he returned, commissioned as deputy-surveyor and auditor-general for all New England, except New Hampshire. . . . Hitherto the clerical party had procrastinated, buoyed up by the hope that in the fierce struggle with the commons Charles might be overthrown; but this dream ended with the dissolution of the Oxford Parliament, and further inaction became impossible. Joseph Dudley and John Richards were chosen agents, and provided with instructions bearing the peculiar tinge of ecclesiastical statesmanship. . . . The agents were urged to do what was possible to avert, or at least delay, the stroke; but they were forbidden to consent to appeals, or to alterations in the qualifications required for the admission of freemen. They had previously been directed to pacify the king by a present of 2,000 pounds; and this ill-judged attempt at bribery had covered them with ridicule. Further negotiation would have been futile. Proceedings were begun at once, and Randolph was sent to Boston to serve the writ of 'quo warranto'; he was also charged with a royal declaration promising that, even then, were submission made, the charter should be restored with only such changes as the public welfare demanded. Dudley, who was a man of much political sagacity, had returned and strongly urged moderation. The magistrates were not without the instincts of statesmanship: they saw that a breach with England must destroy all safeguards of the common freedom, and they voted an address to the crown accepting the proffered terms. But the clergy strove against them: the privileges of their order were at stake; they felt that the loss of their importance would be 'destructive to the interest of religion and of Christ's kingdom in the colony,' and they roused their congregations to resist. The deputies did not represent the people, but the church. . . . The influence which had moulded their minds and guided their actions controlled them still, and they rejected the address. . . . All that could be resolved on was to retain Robert Humphrys of the Middle Temple to interpose such delays as the law permitted; but no attempt was made at defence upon the merits of their cause, probably because all knew well that no such defence was possible. Meanwhile, for technical reasons, the 'quo warranto' had been abandoned, and a writ of 'scire facias' had been issued out of chancery. On June 18, 1684, the lord keeper ordered the defendant to appear and plead on the first day of the next Michaelmas Term. The time allowed was too short for an answer from America, and judgment was entered by default. . . . So perished the Puritan Commonwealth. The child of the Reformation, its life sprang from the assertion of the freedom of the mind; but this great and noble principle is fatal to the temporal power of a priesthood, and during the supremacy of the clergy the government was doomed to be both persecuting and repressive. Under no circumstance could the theocracy have endured: it must have fallen by revolt from within if not by attack from without."

—B. Adams, *Emancipation of Massachusetts*, ch. 6.—“December 19, 1686, Sir Edmund Andros arrived at Nantasket, in the *Kingfisher*, a 50 gun ship, with commissions from King James for the government of New England.”—T. Hutchinson, *History of the Colony of Massachusetts Bay*, v. 1, ch. 3.—See also NEW ENGLAND: 1686.

1686-1689.—Tyranny of Andros and its downfall.—“With the charter were swept away representative government, and every right and every

service, and introducing swearing by the Book in courts of justice. He left nothing undone to engage the people and prepare for revolution; and when he returned from unsuccessful Indian warfare in the east, the storm was ready to burst. News came of the landing of the Prince of Orange. Andros arrested the bearer of the tidings, and issued a proclamation against the Prince; but the act was vain. Without apparent concert or preparation Boston rose in arms, the signal-fire blazed on Beacon Hill, and the country people poured in, hot for revenge. Some of the old magistrates met at the town-house, and read a ‘declaration of the gentlemen, merchants, and inhabitants,’ setting forth the misdeeds of Andros, the illegality of the Dudley government by commission, and the wrongful suppression of the charter. Andros and Dudley were arrested and thrown into prison, together with the captain of the *Rose* frigate, which lay helpless beneath the guns of the fort, and a provisional government was established, with Bradstreet at its head. William and Mary were proclaimed, the revolution was complete, and Andros soon went back a prisoner to England.”—H. C. Lodge, *Short history of the English colonies*, ch. 18.

1689-1692.—Procuring of new charter.—Colonial republic transformed into a royal province.—Absorption of Plymouth.—“A little more than a month from the overthrow of Andros a ship from England arrived at Boston, with news of the proclamation of William and Mary. This was joyful intelligence to the body of the people. The magistrates were at once relieved from their fears, for the revolution in the old world justified that in the new. Three days later the proclamation was published with unusual ceremony. . . . A week later the representatives of the several towns, upon a new choice, met at Boston, and proposals were made that charges should be forthwith drawn up against Andros, or that all the prisoners but Andros should be liberated on bail; but both propositions were rejected. The representatives likewise urged the unconditional resumption of the charter, declaring that they could not act in any thing until this was conceded. Many opposed the motion; but it was finally adopted; and it was resolved that all the laws in force May 12, 1686, should be continued until further orders. Yet the magistrates, conscious of the insecurity of the position they occupied, used prudently the powers intrusted to them.” Meantime, Increase Mather, who had gone to England before the revolution took place, as agent for the colony, had procured an audience with the new king, William III, and received from him an assurance that he would remove Andros from the government of New England and call him to an account for his administration. “Anxious for the restoration of the old charter and its privileges, under which the colony had prospered so well, the agent applied himself diligently to that object, advising with the wisest statesmen for its accomplishment. It was the concurrent judgment of all that the best course would be to obtain first a reversion of the judgment against the charter by an act of Parliament, and then apply to the king for such additional privileges as were necessary. Accordingly, in the House of Commons, where the whole subject of seizing charters in the reign of Charles II. was up for discussion, the charters of New England were inserted with the rest; and, though enemies opposed the measure, it was voted that their abrogation was a grievance, and that they should be forthwith restored.” But before

SIR EDMUND ANDROS

political institution reared during half a century of conflict. The rule of Andros was on the model dear to the heart of his royal master—a harsh despotism, but neither strong nor wise; it was wretched misgovernment, and stupid, blundering oppression. And this arbitrary and miserable system Andros undertook to force upon a people of English race, who had been independent and self-governing for fifty years. He laid taxes at his own pleasure, and not even according to previous rates, as he had promised; he denied the Habeas Corpus to John Wise, the intrepid minister of Ipswich, arrested for preaching against taxation without representation, and he awakened a like resistance in all directions. He instituted fees, was believed to pack juries, and made Randolph licenser of the press. Worst of all, he struck at property, demanded the examination of the old titles, declared them worthless, extorted quitrents for renewal, and issued writs of intrusion against those who resisted; while, not content with attacking political liberty and the rights of property, he excited religious animosity by forbidding civil marriages, seizing the old South church for the Episcopal

the bill having this most satisfactory effect had been acted on in the House of Lords, the Convention Parliament was prorogued, then dissolved, and the next parliament proved to be less friendly. An order was obtained, however, from the king, continuing the government of the colony under the old charter until a new one was settled, and requiring Andros and his fellow prisoners to be sent to England for trial. On the trial, much court influence seemed to go in favor of Sir Edmund; the proceedings against him were summarily quashed, and he was discharged. Soon afterwards he was made governor of Virginia, while Dudley received appointment to the office of chief justice at New York. Contending against the intrigues of the Andros party, and many other adverse influences, the agents of Massachusetts were reluctantly forced at last to relinquish all hopes of the restoration of the old charter, and "application was made for a new grant, which should confirm the privileges of the old instrument, and such in addition as the experience of the people had taught them would be of benefit. . . . The king was prevailed upon to refer the affairs of New England to the two lords chief justices and the attorney and solicitor-general, all of whom were supposed to be friendly to the applicants. Mr. Mather was permitted to attend their meetings." Difficulties arose in connection with Plymouth Colony. It was the determination in England that Plymouth should no longer be separately chartered, but should be joined to Massachusetts or New York. In opposing the former more natural union, the Plymouth people very nearly brought about their annexation to New York; but Mather's influence averted that result. "The first draught of a charter was objected to by the agents, because of its limitation of the powers of the governor, who was to be appointed by the king. The second draught was also objected to; whereupon the agents were informed that they 'must not consider themselves as plenipotentiaries from a foreign state, and that if they were unwilling to submit to the pleasure of the king, his majesty would settle the country without them, and they might take what would follow.' Nothing remained, therefore, but to decide whether they would submit, or continue without a charter, and at the mercy of the king." The two colleagues who had been associated with Mather opposed submission, but the latter yielded, and the charter was signed. "By the terms of this new charter the territories of Massachusetts, Plymouth, and Maine, with a tract farther east, were united into one jurisdiction, whose officers were to consist of a governor, a deputy governor, and a secretary, appointed by the king, and 28 councillors, chosen by the people. A General Court was to be holden annually, on the last Wednesday in May, and at such other times as the governor saw fit; and each town was authorized to choose two deputies to represent them in this court. The choice of these deputies was conceded to all freeholders having an estate of the value of forty pounds sterling, or land yielding an income of at least forty shillings per annum; and every deputy was to take the oath of allegiance prescribed by the crown. All residents of the province and their children were entitled to the liberties of natural born subjects; and liberty of conscience was secured to all but Papists. . . . To the governor was given a negative upon all laws enacted by the General Court; without his consent in writing none were valid; and all receiving his sanction were to be transmitted to the king for approval, and if rejected at any time within three years were to be of no effect. The governor was empowered to establish courts, levy

taxes, convene the militia, carry on war, exercise martial law, with the consent of the council, and erect and furnish all requisite forts. . . . Such was the province charter of 1692—a far different instrument from the colonial charter of 1629. It effected a thorough revolution in the country. The form of government, the powers of the people, and the entire foundation and objects of the body politic, were placed upon a new basis; and the dependence of the colonies upon the crown was secured. . . . It was on Saturday, the 14th of May, 1692, that Sir William Phips arrived at Boston as the first governor of the new province."—J. S. Barry, *History of Massachusetts*, v. 1, ch. 18.

1692.—Salem witchcraft madness: Its beginning.—"The people of Massachusetts in the 17th century, like all other Christian people at that time,—at least, with extremely rare individual exceptions,—believed in the reality of a hideous crime called 'witchcraft.' . . . In a few instances witches were believed to have appeared in the earlier years of New England. But the cases had been sporadic. . . . With three or four exceptions . . . no person appears to have been punished for witchcraft in Massachusetts, nor convicted of it, for more than sixty years after the settlement, though there had been three or four trials of other persons suspected of the crime. At the time when the question respecting the colonial charter was rapidly approaching an issue, and the public mind was in feverish agitation, the ministers sent out a paper of proposals for collecting facts concerning witchcrafts and other 'strange apparitions.' This brought out a work from President [Increase] Mather entitled 'Illustrious Providences,' in which that influential person related numerous stories of the performances of persons leagued with the Devil. The imagination of his restless young son [Cotton Mather] was stimulated, and circumstances fed the flame." A poor Irish washerwoman, in Boston, accused by some malicious children named Goodwin, who played antics which were supposed to signify that they had been bewitched, was tried, convicted and sent to the gallows (1688) as a witch. "Cotton Mather took the oldest 'afflicted' girl to his house, where she dexterously played upon his self-conceit to stimulate his credulity. She satisfied him that Satan regarded him as his most terrible enemy, and avoided him with especial awe. . . . Mather's account of these transactions ['Late Memorable Providences relating to Witchcrafts and Possessions'], with a collection of other appropriate matter, was circulated not only in Massachusetts, but widely also in England, where it obtained the warm commendation of Richard Baxter; and it may be supposed to have had an important effect in producing the more disastrous delusion which followed three years after. . . . Mr. Samuel Parris was minister of a church in a part of Salem which was then called 'Salem Village,' and which now as a separate town bears the name of Danvers. He was a man of talents, and of repute for professional endowments, but avaricious, wrong-headed, and ill-tempered. Among his parishioners, at the time of his installation and afterwards, there had

been angry disputes about the election of a minister, which had never been composed. Neighbors and relations were embittered against each other. Elizabeth Parris, the minister's daughter, was now nine years old. A niece of his, eleven years old, lived in his family. His neighbor, Thomas Putnam, the parish clerk, had a daughter named Ann, twelve

win children so famous. They forced their limbs into grotesque postures, uttered unnatural outcries, were seized with cramps and spasms, became incapable of speech and of motion. By and by [March, 1692], they interrupted public worship. . . . The families were distressed. The neighbors were alarmed. The physicians were perplexed and

ARREST OF WITCH DURING SALEM WITCHCRAFT MADNESS

(Drawing by V. Bernstrom)

years of age. These children, with a few other young women, of whom two were as old as twenty years or thereabouts, had become possessed with a wild curiosity about the sorceries of which they had been hearing and reading, and used to hold meetings for study, if it may be so called, and practice. They learned to go through motions similar to those which had lately made the Good-

bailed, and at length declared that nothing short of witchery was the trouble. The kinsfolk of the 'afflicted children' assembled for fasting and prayer. Then the neighboring ministers were sent for, and held at Mr. Parris's house a prayer-meeting which lasted through the day. The children performed in their presence, and the result was a confirmation by the ministers of the opinion of the doctors. Of

course, the next inquiry was by whom the manifest witchcraft was exercised. It was presumed that the unhappy girls could give the answer. For a time they refused to do so. But at length, yielding to an importunity which it had become difficult to escape unless by an avowal of their fraud, they pronounced the names of Good, Osborn, and Tituba. Tituba—half Indian, half negro—was a servant of Mr. Parris, brought by him from Barbadoes, where he had formerly been a merchant. Sarah Good was an old woman, miserably poor. Sarah Osborn had been prosperous in early life. She had been married twice, and her second husband was still living, but separated from her. Her reputation was not good, and for some time she had been bedridden, and in a disturbed nervous state. . . . Tituba, whether in collusion with her young mistress, or, as was afterwards said, in consequence of having been scourged by Mr. Parris, confessed herself to be a witch, and charged Good and Osborn with being her accomplices. The evidence was then thought sufficient, and the three were committed to gaol for trial. Martha Corey and Rebecca Nurse were next cried out against. Both were church-members of excellent character, the latter, seventy years of age. They were examined by the same Magistrates, and sent to prison, and with them a child of Sarah Good, only four or five years old, also charged with diabolical practices."—J. G. Palfrey, *History of New England*, v. 4, bk. 4, ch. 4.

1692.—Salem witchcraft madness: Its culmination.—"Now a new feature of this thing showed itself. The wife of Thomas Putnam joined the children, and 'makes most terrible shrieks' against Goody Nurse—that she was bewitching her, too. On the 3d of April, Minister Parris preached long and strong from the Text, 'Have I not chosen you twelve, and one of you is a devil?' in which he bore down so hard upon the Witches accused that Sarah Cloyse, the sister of Nurse, would not sit still, but 'went out of meeting;' always a wicked thing to do, as they thought, but now a heinous one. At once the children cried out against her, and she was clapt into prison with the rest. Through the months of April and May, Justices Hawthorne and Curwin (or Corwin), with Marshal George Herrick, were busy getting the Witches into jail, and the good people were startled, astounded, and terror-struck, at the numbers who were seized. . . . Bridget Bishop, only, was then brought to trial, for the new Charter and new Governor (Phips), were expected daily. She was old, and had been accused of witchcraft twenty years before. . . . So, as there was no doubt about her, she was quickly condemned, and hung on the 10th day of this pleasant June, in the presence of a crowd of sad and frightened people. . . . The new Governor, Phips, one of Mather's Church, fell in with the prevailing fear, and a new bench of special Judges, composed of Lieutenant-Governor Stoughton, Major Saltonstall, Major Richards, Major Gidney, Mr. Wait Winthrop, Captain Sewall, and Mr. Sargent, were sworn in, and went to work. On the 30th of June, Sarah Good, Rebeka Nurse, Susannah Martin, Elizabeth How, and Sarah Wilder were brought to trial; all were found guilty, and sentenced to death, except Nurse, who, being a Church member, was acquitted by the jury. At this, the 'afflicted' children fell into fits, and others made great outcries; and the popular dissatisfaction was so great, that the Court sent them back to the jury room, and they returned shortly,

with a verdict of Guilty! The Rev. Mr. Noyes, of Salem, then excommunicated Nurse, delivered her to Satan, and they all were led out to die. Minister Noyes told Susannah Martin that she was a witch, and knew it, and she had better confess it; but she refused, and told him that 'he lied,' and that he knew it; and, 'that if he took away her life, God would give him blood to drink;' which curse is now traditionally believed, and that he was choked with blood. They were hanged, protesting their innocence; and there was none to pity them. On the 5th of August, a new batch was hailed before the Court. Reverend George Burroughs, John Proctor and his wife, John Willard, George Jacobs, and Martha Carrier. Burroughs was disliked by some of the Clergy, for he was tinctured with Roger Williams's Heresies of Religious Freedom; and he was particularly obnoxious to Mather, for he had spoken slightly of witchcraft, and had even said there was no such thing as a witch. Willard had been a constable employed in seizing witches, but, becoming sick of the business, had refused to do it any more. The children at once cried out, that he, too, was a witch; he fled for his life, but was caught at Nashua, and brought back. Old Jacobs was accused by his own grand-daughter; and Carrier was convicted upon the testimony of her own children. They were all quickly convicted and sentenced. . . . All but Mrs. Proctor saw the last of earth on the 10th of August. They were hanged on Gallows Hill. Minister Burroughs made so moving a prayer, closing with the Lord's Prayer, which it was thought no witch could say, that there was fear lest the crowd should hinder the hanging. As soon as he was turned off, Mr. Mather, sitting on his horse, addressed the people, to prove to them that Burroughs was really no Minister, and to show how he must be guilty, notwithstanding his prayer, for the devil could change himself into an angel of light. . . . Giles Cory, an old man of 80, saw that the accused were prejudged, and refused to plead to the charge against him. What could be done with him? It was found that for this, by some sort of old law, he might be pressed to death. So on the 10th of September, just as the autumn tints were beginning to glorify the earth, he was laid on the ground, bound hand and foot, and stones were piled upon him, till the tongue was pressed out of his mouth; 'the Sheriff with his cane forced it in again when he was dying.' Such cruel things did fear—fear of the Devil—lead these people to do. He was the first and last who died in New England in this way. On the 22d of September, eight of the sentenced were carted up Gallows Hill and done to death. Amid a great concourse of men, women, and children, from the neighboring villages, and from Boston, the victims went crying and singing, dragged through the lines of terror-stricken or pitying people. Some would have rescued them, but they had no leaders, and knew not how to act; so that tragedy was consummated; and the Reverend Mr. Noyes, pointing at them, said, 'What a sad thing it is to see eight fire-brands of hell hanging there!' Sad indeed! Nineteen had now been hung. One pressed to death. Eight were condemned. A hundred and fifty were in prison; and two hundred more were accused by the 'afflicted.' Some fifty had acknowledged themselves witches, of whom not one was executed. . . . It was now October, and this mischief seemed to be spreading like fire among the dry grass of the Prairies; and a better quality of persons was beginning to be accused by the bewitched. . . . But these accusations made people consider, and many began to think that they had been going on too

fast. 'The juries changed sooner than the judges, and they sooner than the Clergy.' 'At last,' says one of them, 'it was evidently seen that there must be a stop put, or the generation of the church of God would fall under that condemnation.' In other words, the better class of church members were in danger! At the January session, only three were convicted, and they were reprieved; whereat Chief Justice Stoughton rose in anger, and said, 'The Lord be merciful to this country!' In the spring, Governor Phips, being about to leave the country, pardoned all who were condemned, and the jails were delivered. The excitement subsided as rapidly as it had arisen, but the evil work was done."—C. W. Elliott, *New England history*, v. 2, ch. 3.

1692-1693.—Salem witchcraft madness: Its ending, and the reaction.—"On the second Wednesday in October, 1692, about a fortnight after the last hanging of eight at Salem, the representatives of the colony assembled; and the people of Andover, their minister joining with them, appeared with their remonstrance against the doings of the witch tribunals. Of the discussions that ensued no record is preserved; we know only the issue. The general court ordered by bill a convocation of ministers, that the people might be led in the right way as to the witchcraft. . . . They abrogated the special court, established a tribunal by statute, and delayed its opening till January of the following year. This interval gave the public mind security and freedom; and though Phips still conferred the place of chief judge on Stoughton, yet jurors acted independently. When, in January, 1693, the court met at Salem, six women of Andover, renouncing their confessions, treated the witchcraft but as something so called, the bewildered but as 'seemingly afflicted.' A memorial of like tenor came from the inhabitants of Andover. Of the presentments, the grand jury dismissed more than half; and of the twenty-six against whom bills were found through the testimony on which others had been condemned, verdicts of acquittal followed. . . . The people of Salem village drove Parris from the place; Noyes regained favor only by a full confession and consecrating the remainder of his life to deeds of mercy. Sewall, one of the judges, by rising in his pew in the Old South meeting-house on a fast-day and reading to the whole congregation a paper in which he bewailed his great offence, recovered public esteem. Stoughton never repented. The diary of Cotton Mather proves that he, who had sought the foundation of faith in tales of wonders, himself 'had temptations to atheism, and to the abandonment of all religion as a mere delusion.'"—G. Bancroft, *History of the United States*, v. 2, pt. 3.—"It was long before the public mind recovered from its paralysis. No one knew what ought to be said or done, the tragedy had been so awful. The parties who had acted in it were so numerous, and of such standing, including almost all the most eminent and honored leaders of the community from the bench, the bar, the magistracy, the pulpit, the medical faculty, and in fact all classes and descriptions of persons; the mysteries connected with the accusers and confessors; the universal prevalence of the legal, theological, and philosophical theories that had led to the proceedings; the utter impossibility of realizing or measuring the extent of the calamity; and the gen-

eral shame and horror associated with the subject in all minds; prevented any open movement. . . . Dr. Bentley describes the condition of the community in some brief and pregnant sentences: . . . 'As soon as the judges ceased to condemn, the people ceased to accuse. . . . Terror at the violence and guilt of the proceedings succeeded instantly to the conviction of blind zeal; and what every man had encouraged all professed to abhor. Few dared to blame other men, because few were innocent. The guilt and the shame became the portion of the country, while Salem had the infamy of being the place of the transactions.'"—C. W. Upham, *Salem witchcraft*, v. 2, *Supplement*.—"The probability seems to be that those who began in harmless deceit found themselves at length involved so deeply, that dread of shame and punishment drove them to an extremity where their only choice was between sacrificing themselves, or others to save themselves. It is not unlikely that some of the younger girls were so far carried along by imitation or imaginative sympathy as in some degree to 'credit their own lie.' . . . Parish and boundary feuds had set enmity between neighbors, and the girls, called on to say who troubled them, cried out upon those whom they had been wont to hear called by hard names at home. They probably had no notion what a frightful ending their comedy was to have; but at any rate they were powerless, for the reins had passed out of their hands into the sterner grasp of minister and magistrate. . . . In one respect, to which Mr. Upham first gives the importance it deserves, the Salem trials were distinguished from all others. Though some of the accused had been terrified into confession, yet not one persevered in it, but all died, protesting their innocence, and with unshaken constancy, though an acknowledgment of guilt would have saved the lives of all. This martyr proof of the efficacy of Puritanism in the character and conscience may be allowed to outweigh a great many sneers at Puritan fanaticism."—J. R. Lowell, *Witchcraft (Among my books, series 1)*.

1761.—Harsh enforcement of revenue laws.—Writs of assistance and Otis's speech.—"It was in 1761, immediately after the overthrow of the French in Canada, that attempts were made to enforce the revenue laws more strictly than heretofore; and trouble was at once threatened. Charles

Paxton, the principal officer of the custom-house in Boston, applied to the Superior Court to grant him the authority to use 'writs of assistance' in searching for smuggled goods. A writ of assistance was a general search-warrant, empowering the officer armed with it to enter, by force if necessary, any dwelling-house or warehouse where contraband goods were supposed to be stored or hidden. A special search-warrant was one in which the name of the suspected person, and the house which it was proposed to search, were accurately specified, and the goods which it was intended to seize were as far as possible described. In the use of such special warrants there was not much danger of gross injustice or oppression. . . . But the general search-warrant, or 'writ of assistance,' as it was called because men try to cover up the ugliness of hateful things by giving them innocent names, was quite a different affair. It was a blank form upon which the custom-house officer might fill in the names of persons and descriptions of houses and goods to suit himself. . . . The writ of assistance was therefore an abominable instrument of tyranny. Such writs had been allowed by a statute of the evil reign of Charles II.; a statute of William III. had clothed custom-house officers in the colonies with like powers to those which they possessed in England; and neither of these statutes had been repealed. There can therefore be little doubt that the issue of such search-warrants was strictly legal, unless the authority of Parliament to make laws for the colonies was to be denied. James Otis then held the crown office of advocate-general, with an ample salary and prospects of high favour from government. When the revenue officers called upon him, in view of his position, to defend their cause, he resigned his office and at once undertook to act as counsel for the merchants of Boston in their protest against the issue of the writs. A large fee was offered him, but he refused it. 'In such a cause,' said he, 'I despise all fees.' The case was tried in the council-chamber at the east end of the old town-hall, or what is now known as the 'Old State-House,' in Boston. Chief-justice Hutchinson presided, and Jeremiah Gridley, one of the greatest lawyers of that day, argued the case for the writs in a very powerful speech. The reply of Otis, which took five hours in the delivery, was one of the greatest speeches of modern times. It went beyond the particular legal question at issue, and took up the whole question of the constitutional relations between the colonies and the mother-country. At the bottom of this, as of all the disputes that led to the Revolution, lay the ultimate question whether Americans were bound to yield obedience to laws which they had no share in making. This question, and the spirit that answered it flatly and doggedly in the negative, were heard like an undertone pervading all the arguments in Otis's wonderful speech, and it was because of this that the young lawyer John Adams, who was present, afterward declared that on that day 'the child Independence was born.' Chief-justice Hutchinson . . . reserved his decision until advice could be had from the law-officers of the crown in London; and when next term he was instructed by them to grant the writs, this result added fresh impetus to the spirit that Otis's eloquence had aroused. The custom-house officers, armed with their writs, began breaking into warehouses and seizing goods which were said to have been smuggled. In this rough way they confiscated private property to the value of many thousands of pounds; but sometimes the owners of warehouses armed themselves and barricaded their doors and windows, and thus the officers were often successfully defied,

for the sheriff was far from prompt in coming to aid them."—J. Fiske, *War of Independence*, ch. 4.—See also U.S.A.: 1761.

1786-1787.—Shays' rebellion.—Business depression, with heavy taxes, and stringent laws bearing harshly upon debtors, had brought about a state of discontent which agitators made the most of. In the neighborhood of Worcester this came to a head, during the fall of 1786, in organized insurrection, under one Captain Daniel Shays. The sheriff was powerless, and friends of order were much alarmed. Congress "offered secret aid to the authorities of Massachusetts upon the pretext of dispatching troops against the Indians. But the tender was not accepted; for in James Bowdoin the State had an executive equal to the emergency. Availing himself of a temporary loan from patriotic citizens, he raised and equipped a militia force, large enough to overawe the rebels, which, under General Lincoln's command, was promptly marched against them. Shays appears to have had more of the demagogue than warrior about him, and his followers fled as the troops advanced [being finally surprised and routed at Petersham, Feb. 4, 1787]. By midwinter civil order was restored; but the legislature made some concessions not less just than prudent. The vanquished rebels were treated with marked clemency. But Governor Bowdoin's energy lost him a re-election the following spring, and one of the manliest pioneers of Continental reform was remitted to private life for the rest of his days."—J. Schouler, *History of the United States*, v. 1, ch. 1, sect. 1.

1787.—Suffrage qualifications. See SUFFRAGE, MANHOOD: United States: 1776-1787.

1788.—Ratification of Federal constitution. See U.S.A.: 1787-1789.

18th century.—Growth of education. See EDUCATION: Modern: 18th century: United States.

1800-1864.—Suffrage qualifications. See SUFFRAGE, MANHOOD: United States: 1800-1864.

1810-1860.—Agricultural revolution. See U.S.A.: 1810-1860.

1812.—Use of gerrymander in electoral districts. See GERRYMANDER.

1812-1814.—Opposition of Federalists to war with England. See U.S.A.: 1812.

1814.—Hartford convention. See U.S.A.: 1814 (December): Hartford convention.

1814-1819.—Agitation for separation by Maine.—Separation Act. See MAINE: 1814-1819.

1818-1821.—Founding of Amherst College. See UNIVERSITIES AND COLLEGES: 1818-1821.

1820.—District of Maine erected into distinct state. See MAINE: 1820.

1826.—Construction of first railway. See RAILROADS: 1826-1850.

1831.—Beginning of Abolitionist movement.—The campaign waged by the Abolitionists during the ensuing years until the Civil War was opened in Massachusetts in 1831 when William Lloyd Garrison founded his anti-slavery organ, *The Liberator*, at Boston. This paper advocated the immediate and unconditional emancipation of the negroes.—See also U.S.A.: 1829-1832.

1836.—First child labor law. See CHILD WELFARE LEGISLATION: 1813-1871.

1837.—Establishment of Board of Education. A state board of education with Horace Mann as its secretary was created in 1837. District agents of the state board served, under the system, to coordinate the central body with the local organizations. The state school fund, built up in 1834 from the proceeds of state claims against the federal government and against the state of Maine, together with a school tax, became the financial basis of the generally recognized excellent public school system of Massachusetts.

1838-1842.—Boundary dispute with Maine and New Brunswick. See AROOSTOOK WAR.

1841.—Boundary dispute with Rhode Island settled by United States Supreme Court. See RHODE ISLAND: 1841.

1841.—Brook Farm experiment. See SOCIALISM: 1840-1847.

1842.—Webster-Ashburton Treaty. See MAINE: 1841-1842; U.S.A.: 1842.

1844-1847.—Opposition to Mexican War.—Massachusetts maintained a consistent attitude of opposition to the policy of the administration which led to the Mexican War in 1846. The state legislature defeated a bill for the appropriation of funds to equip a regiment in 1847, although the money was collected privately by Caleb Cushing who raised the regiment and became its colonel.

1847-1850.—Election of Sumner as senator.—"The Whigs were in a minority in Massachusetts after the year 1848. But the constitution required a majority of all the votes to elect a Governor; and, in case of no choice, the Governor, the Lieutenant Governor, the Executive Council, and the Senators from counties where there had been no election were chosen on joint ballot by the members elected to the two Houses. The Whigs were able to carry the Legislature, and in that way chose their Governor and Lieutenant Governor, elected Councillors, and filled vacancies in the Senate. But the Free Soil and Democratic leaders were not content to leave the power in the hands of the Whig minority. In 1849 a few Representatives and Senators were chosen to the Legislature by a union of the Free Soil and Democratic Parties. In the autumn of 1850 this arrangement was extended through the State. The Whigs were in a minority in the Legislature, and the coalition proceeded to elect a Democratic Governor and Lieutenant Governor and an Executive Council. In consideration

of giving these offices to the Democrats, it was agreed that Mr. [Charles] Sumner should be chosen Senator. A few of the Democrats, who desired to keep their party relations with the South, refused to agree to this arrangement. Mr. Winthrop was the Whig candidate. The Senate, on its part, promptly elected Mr. Sumner, but there was a long contest in the House of Representatives, extending through three months. Twenty-six ballots were cast, of which no candidate had a majority until the last. Mr. Sumner several times came within two or three votes of an election. At last it was apparent that some member had cast more than one vote; and an order was offered by Sidney Bartlett, an eminent Whig member from Boston, requiring the members to bring in their votes in sealed envelopes. This resulted in the choice of Sumner."—G. F. Hoar, *Autobiography of seventy years*, pp. 185-186.

1848-1892.—Free libraries. See LIBRARIES: Modern: United States: Early history.

1854-1865.—Know Nothing party in the state.—Relation to anti-slavery.—Attitude of Sumner and Allen.—“The political history of Massachusetts from 1846 to 1865 is, in general, the history of the share of the Commonwealth in the great National contest with Slavery; the beginning and growth of the Free Soil or Republican Party and the putting down of the Rebellion. The rise and dominion for three years, and final overthrow of the Know Nothing Party is an episode which should not be wholly omitted. . . . This party swept Massachusetts in the autumn of 1854. It elected in that year Governor, Lieutenant Governor, all the officers of the State Government, every member of both Houses of the Legislature, except two from the town of Northampton, and every [Massachusetts] member of Congress. Its candidate for Governor was Henry J. Gardner, a very skillful political organizer. . . . But a good many Anti-Slavery men who thought the party feeling of the Whigs and Democrats was a great obstacle to their cause, joined the movement simply in order that they might get rid of the old parties, and prepare the State as with a subsoil plow for a new one. They had no belief in the proscriptive doctrines, and were willing that men of foreign births and Catholics should have their just rights, and expected to destroy the Know Nothing Party in its turn when it had destroyed Whiggery and Democracy. Of these was Henry Wilson, who owed his first election to the Senate to the Know Nothing Legislature; and Eli Thayer, who had been the organizer of the Emigrant Aid Society, and the movement for the deliverance of Kansas and Nebraska. Both these gentlemen abandoned the Know Nothing Party the year after its formation. Mr. Thayer was elected as a Republican to Congress in 1856, and reelected in 1858. But he separated from his political associates and espoused the squatter sovereignty doctrines of Stephen A. Douglas. He, I have no doubt, was a sincere Anti-Slavery man. But he liked to do things, in peculiar and original ways of his own, and was impatient of slow and old-fashioned methods. So he got estranged from his Republican brethren, was defeated as a candidate for Congress in 1860, took no part in public activities during the time of the war, became somewhat soured, and landed in the Democratic Party. I always had a great liking for him, and deem him entitled to great public gratitude for his services in the rescue of Kansas from what was known as Border Ruffianism. Neither Charles Sumner nor Charles Allen ever tolerated the Know Nothing movement or made any terms with it. Its proscriptiveness and its secrecy were alike repug-

nant to their honest, brave and liberty-loving souls. Sumner was advised, as the question of his reelection was coming on in January, 1857, to keep silent about Know Nothingism. He was told that the Slavery question was enough for one man to deal with, and that if he would only hold his peace all the parties would unite in his reelection. He answered the advice with his brave challenge. He went about the Commonwealth, denouncing the intolerant and proscriptive doctrine of the Know Nothings. He told them: ‘You have no real principle on which you can stand. You are nothing but a party of Gardnerites.’ Charles Allen addressed a little company, of which I was one, in the City Hall at Worcester in the autumn of 1854, when Know Nothingism was in the height of its strength. He said: ‘Perhaps I am speaking too boldly, but I learned to speak boldly a long time ago. I will speak my sentiments in the face of any organization; or, if it does not show its face, though its secret mines are beneath my feet, and unseen hands ready to apply the match, I will declare those sentiments that a freeman is bound to utter.’ The people of Massachusetts elected Gardner Governor in 1854, 1855 and 1856. But in the autumn of 1857 he was beaten under the leadership of General Banks. The party lingered until 1850 when there was an attempt to keep it alive in the Presidential campaign of that year when Millard Fillmore was its candidate for the Presidency. But it was destroyed in the consuming fire kindled by the Civil War, and has not since been heard of by its old name.”—G. F. Hoar, *Autobiography of seventy years*, pp. 180-191.—See also KNOW NOTHING PARTY.

1855-1875.—Building of Hoosac tunnel.—State credits appropriated over a period of about twenty years, built the tunnel through the Hoosac mountain in northwestern Massachusetts. This was the first important tunnel built in America.

1861.—Attack on sixth regiment in Baltimore.—Passage of eighth regiment through Maryland. See U. S. A.: 1861 (April): Activity of rebellion, etc.; 1861 (April-May: Maryland).

1865-1869.—Ratification of Thirteenth, Fourteenth and Fifteenth Federal Amendments.—Railroad commission.—No state in the union was more eager to ratify the amendment emancipating the negroes than was Massachusetts which had cradled and fostered the Abolitionist movement. Governor Andrews in his annual message on January 6th urged the state legislature to request the president to call Congress in extra session in case the 38th Congress failed to adopt the amendment. Massachusetts ratified it on February 8th. She also ratified the amendment granting the right of citizenship to freedmen on March 20th, 1867, and the amendment stating that the right to vote shall not be denied nor abridged on account of “race, color or previous condition of servitude” on March 12, 1860. An important event of 1860 was the appointment of state railroad commissioners. See RAILROADS: 1860.

1866.—Governor authorized to prevent illegal employment of children. See CHILD WELFARE LEGISLATION: 1866-1800.

1869.—Labor-reform party organized.—First state labor bureau. See LABOR PARTIES: 1827-1872; LABOR LEGISLATION: Aids in making and enforcing laws.

1872.—Boston fire. See BOSTON: 1872.

1874.—Mill river flood.—Democratic governor elected.—Sentiment voiced on Louisiana legislature trouble.—On May 16th the bursting of a reservoir dam on Mill river in Hampshire county worked considerable destruction of property and loss of life in the towns of Williamsburg, Leeds,

Haydensville and Skinnerville. The election of William Gaston, the Democratic nominee to the governorship in 1874 was a gesture showing the lack of confidence in the administration which was rife throughout the state. During the year an indignation meeting was held at Faneuil Hall in Boston denouncing the ejection of members of the Louisiana legislature by General Trobrand and his soldiers. See LOUISIANA: 1868-1874.

1875-1884.—Republican and Democratic majorities.—Limited woman suffrage.—In the fall of 1875 Alexander H. Rice, the Republican nominee was elected and became governor of Massachusetts, 1876-1879. The women of Massachusetts gained the privilege of voting for members of school committees in city and town elections during the year 1870. Governor Rice was followed by Thomas Talbot, 1879-1880, and John D. Long, 1880-1883, both Republicans, when the Democratic and Independent candidate Benjamin F. Butler came in. The Republicans were defeated in the gubernatorial election in Massachusetts in 1882 when Benjamin Franklin Butler was elected by the Democrats and Independents on a large majority. In 1884 Butler ran for the presidency as the candidate of the Greenback and Anti-Monopolist parties but was defeated.

1884-1905.—Republican tradition maintained with Democratic interruptions.—During the twenty-one years after Butler's governorship, the Republicans kept control of the state executive chair with the exception of the three years from 1891 to 1894 when, due to a scandal in the Republican legislature, William E. Russell was elected and twice reelected governor by the Democratic party. The Republican governors were George D. Robinson, 1884-1887; Oliver Ames, 1887-1890; John Q. A. Brackett, 1890-1891; Fred T. Greenhalge, 1894-1896; Roger Wolcott, 1896-1900; W. Murray Crane, 1900-1903; and John L. Bates, 1903-1905. The state election of 1904 resulted in the victory of William L. Douglas, the Democratic candidate who became governor in 1905.

1886.—Arbitration board created. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1886-1920.

1897.—Recovery of original manuscript of Governor Bradford's history of Plymouth colony, sometimes called "The Log of the Mayflower."—"It has long been well known that Governor Bradford wrote and left behind him a history of the settlement of Plymouth. It was quoted by early chroniclers. There are extracts from it in the records at Plymouth. Thomas Prince used it when he compiled his annals, Hubbard depended on it when he wrote his 'History of New England,' Cotton Mather had read it, or a copy of a portion of it, when he wrote his 'Magnalia,' Governor Hutchinson had it when he published the second volume of his history in 1767. From that time it disappeared from the knowledge of everybody on this side of the water. All our historians speak of it as lost, and can only guess what had been its fate. . . . In 1844 Samuel Wilberforce, Bishop of Oxford, afterward Bishop of Winchester, one of the brightest of men, published one of the dullest and stupidest of books. It is entitled 'The History of the Protestant Episcopal Church in America.' It contained extracts from manuscripts which he said he had discovered in the library of the Bishop of London at Fulham. The book attracted no attention here until, about twelve years later, in 1855, John Wingate Thornton . . . happened to pick up a copy of it while he was lounging in Burnham's book store. He read the bishop's quotations, and carried the book to his office, where he left it for

his friend, Mr. Barry, who was then writing his 'History of Massachusetts,' with passages marked, and with a note which is not preserved, but which, according to his memory, suggested that the passages must have come from Bradford's long-lost history. That is the claim for Mr. Thornton. On the other hand, it is claimed by Mr. Barry that there was nothing of that kind expressed in Mr. Thornton's note, but in reading the book when he got it an hour or so later, the thought struck him for the first time that the clue had been found to the precious book which had been lost so long. He at once repaired to Charles Deane, then and ever since, down to his death, as resident Eliot felicitously styled him, 'the master of historical investigators in this country.' Mr. Deane saw the importance of the discovery. He communicated at once with Joseph Hunter, an eminent English scholar. Hunter was high authority on all matters connected with the settlement of New England. He visited the palace at Fulham, and established beyond question the identity of the manuscript with Governor Bradford's history, an original letter of Governor Bradford having been sent over for comparison of handwriting. How the manuscript got to Fulham nobody knows. Whether it was carried over by Governor Hutchinson in 1774; whether it was taken as spoil from the tower of the Old South Church in 1775; whether, with other manuscripts, it was sent to Fulham at the time of the attempts of the Episcopal churches in America, just before the Revolution, to establish an episcopate here,—nobody knows."—G. F. Hoar, *Address, May 26, 1897, on the return of the manuscript to Massachusetts.*

After the discovery of the manuscript, several attempts to bring about its return to America were made: by Justin Winsor, in 1860, and again in 1877; by John L. Motley, in 1860; and by others. At length, Senator Hoar, after delivering an address at Plymouth, in 1895, on the anniversary of the landing of the Pilgrims, went abroad, with his interest in the matter warmly stirred up, and took steps, in concurrence with Ambassador Bayard, which led eventually to the restoration of the precious piece of writing to its proper home. April 12, 1897, the coveted manuscript book was formally delivered to the United States Ambassador, Mr. Bayard, for conveyance to the governor of the Commonwealth of Massachusetts. It was delivered by Mr. Bayard in person, on May 26, following, in the presence of the Senate and the House of Representatives of Massachusetts, sitting together in the chamber of the latter, with many guests invited for the occasion. The ceremonies of the occasion included the address by Senator Hoar from which the above account is taken. The manuscript volume is now deposited in the state library of Massachusetts at Boston. A new edition, carefully reproducing the text of the history from it, with a full report of the proceedings incident to its return to Massachusetts, was printed in 1900, under the direction of the secretary of the Commonwealth, by order of the General Court. The following remarks on the manuscript are from the introduction to that edition: "By very many it has been called, incorrectly, the log of the 'Mayflower.' Indeed, that is the title by which it is described in the decree of the Consistorial Court of London. The fact is, however, that Governor Bradford undertook its preparation long after the arrival of the Pilgrims, and it cannot be properly considered as in any sense a log or daily journal of the voyage of the 'Mayflower.' It is, in point of fact, a history of the Plymouth Colony, chiefly in the form of annals, extending from the inception of

the colony down to the year 1647. The matter has been in print since 1856, put forth through the public spirit of the Massachusetts Historical Society, which secured a transcript of the document from London, and printed it in the Society's Collections of the above-named year."

1899.—Tribute paid to Roger Williams.—Resolutions were introduced into the legislature during 1899 revoking the order of banishment issued against Roger Williams in 1635.

19th century.—Improvement in child welfare laws. See CHILD WELFARE LEGISLATION: 1880-1921.

19th century.—Education.—Certification of teachers. See EDUCATION: Modern: 19th century: United States: Evolution of public school system. 20th century.—Ballot system. See AUSTRALIAN BALLOT: 1882-1916.

1902.—Care of deaf and blind children. See CHARITIES: United States: 1874-1902.

1907.—Juvenile court established. See CHILD WELFARE LEGISLATION: 1899-1921.

1907-1910.—Commemoration of Pilgrims at Provincetown.—Reorganization of board of education.—On August 21, 1907, President Roosevelt laid the cornerstone of a monument commemorating the landing of the Pilgrims at Provincetown. The memorial was dedicated by President Taft on August 5, 1910. In 1909 the board of education, created in 1837, was reorganized. A commissioner and two deputies were appointed and several changes instituted in regard to the application of the state school fund. Industrial education was advocated under the reorganized system.

1911-1912.—Pension system.—Nine-hour law.—Minimum wage commission established.—In 1911 a pension system was adopted, to apply to the employees of the state and a law was passed limiting the work of women and of children under eighteen, to a nine-hour day. During the same year "representatives of a number of groups of Massachusetts people who had been studying social and industrial conditions and were particularly interested in the situation of our 350,000 working women, formed themselves into an organization for the purpose of presenting to the legislature some sort of definite proposal looking toward remedial legislation to meet certain conditions which seemed to be getting worse instead of better as time went on. . . . Under advice of counsel they presented to our General Court [the Massachusetts legislature] in 1911 a petition asking for such an investigation as would develop the facts relating to this matter authoritatively. It was said frankly that the petitioners believed that such an investigation would disclose conditions demanding remedy. . . . The *Prima facie* case made by the petitioners with such evidence as was already at their disposal so impressed the legislature that, without attracting much public attention, a resolve was passed creating an investigating commission upon whose report the legislation of 1912 was framed. . . . When this report came before our General Court, the fight opened in earnest. The proposal was denounced as socialistic, as revolutionary, as subversive of the conservative traditions of the commonwealth and as fatal to the continuance of our industries; all of which, it was predicted, would immediately pack up their belongings and depart from an ungrateful community. . . . Out of all the contending forces and over the most decided sort of opposition there came the minimum wage act of 1912. It was a compromise but a compromise which the believers in the measure were willing to accept as marking a great advance. The law establishes a permanent Minimum Wage Commission with authority to set in motion the machinery of investigation, and to

give wide publicity to the facts so ascertained. On the point of approval and promulgation of a minimum rate determined for the industry in question by a wages board composed of representatives of the workers, of the employers and of the public there is no change from the bill recommended by a majority of the Investigating Commission. The commission can not compel the payment of the rate which it recommends. Herein lay the practical compromise that was necessary to obtain the passage of any legislation. But the commission can give the widest publicity to the facts which it finds to exist and also it can tell the people of the commonwealth what employers follow and what employers do not follow its recommendations. The law does not go fully into effect until July 1 of this year [1913]."—H. L. Brown, *Massachusetts and the minimum wage (Annals of the American Academy of Political and Social Science, July, 1913)*.—See also LABOR REMUNERATION: 1910-1920.

1911-1920.—Development of port of Boston. See BOSTON: 1911-1920.

1912.—Seventeenth Federal Amendment ratified.—Inheritance tax law amended.—Department of labor and industries created.—In addition to enacting the minimum wage law in 1912, the state ratified on June 22 the Seventeenth Federal Amendment by which senators are elected by popular vote; the inheritance tax law was amended to apply only to real estate and not to include personal property; and a state board of labor and industries was created to take over the enforcement of all the labor laws in the state.

1913.—Mothers' pension law.—Continuation schools.—City planning and aviation acts.—Sixteenth amendment ratified.—Mothers' pensions and continuation schools for working children were provided for by state laws during 1913. By an act of April 16 every city in the state and every town having at the last preceding census a population of more than 10,000 was directed to create a planning board, which should study the municipal resources and needs and develop plans to meet those needs, with special reference to housing. The Aviation Act, which required aviators to have licenses, inspectors to examine airplanes and regulations to be made regarding the course of flight taken, was one of the first state acts in this field. The state legislature on March 4 ratified the sixteenth federal amendment, permitting the levying of a federal income tax.

1914.—Cape Cod canal.—On July 20 the Cape Cod canal, which is eight miles long and shortens the New York-Boston sea trip by seventy miles, was formally opened. It was constructed by a private company at a cost of \$12,000,000.—See also CANALS: American: Cape Cod canal.

1915.—Income tax and housing amendments to state constitution.—Two amendments to the state constitution were adopted by a large majority; one provided for the levying of a state income tax and the other empowered the legislature to authorize cities and towns to take, hold, improve, build on and sell land, in order to relieve the congestion of population and to provide homes for citizens.

1916.—Income tax law passed.—Jurisdiction of courts extended.—On the recommendation of the state tax commission, an income tax law was enacted, placing a tax of 1½ per cent upon annuities and salary or wage incomes in excess of \$2,000; there were other provisions applying to income from securities. (See STATE GOVERNMENT: 1913-1921.) An extension of the jurisdiction of district and municipal courts in civil and criminal cases was granted during the year.

1917.—Narcotic drug legislation.—An act was passed by the state legislature forbidding the sale of narcotic drugs except by prescription carefully regulated.

1917-1919.—Constitutional convention.—Twenty-two amendments submitted.—Significant articles.—Constitution adopted.—Board of education abolished.—“The constitutional convention of Massachusetts which assembled in the city of Boston, June 6, 1917, and finally terminated its labors at a short session of two days in August, 1919, is the fourth body of this kind which the Old Bay State has had. The first convention was held in 1779 and 1780 in Cambridge and Boston, and formulated the constitution of 1780. This instrument, to which sixty-six amendments have been added, is the oldest written constitution now in force anywhere in the world. The second convention was held in 1820, and submitted a series of resolutions part of which were adopted and part rejected by the people. A third convention met in 1853 all of whose proposals were rejected. After an interval of sixty-four years, a fourth convention was called, which met in 1917 and again in 1918 and yet again in 1919. It submitted to the people twenty-two amendments and a revised draft of the constitution, all of which were accepted. . . . The first of these [amendments] empowers the legislature to provide for voting by voters who are absent from home on election day. . . . Another amendment authorizes the legislature to make provision for public trading in the necessities of life and for shelter in time of public exigency. Massachusetts has been visited several times in recent years by such calamities as the great fire at Chelsea and Salem; and the rule laid down in *Lowell v. Boston*, 111 Mass. 454 (1873), seemed to make it impossible for the state to extend adequate relief. . . . The third amendment adopted by the people was the ‘anti-aid amendment,’ which prohibits any appropriations of public money to institutions not under public control. From 1860 to the end of 1916 Massachusetts had appropriated nearly \$10,000,000 for institutions of this kind. In recent years the attempts of various churches to obtain public funds for their schools and hospitals threatened to divide the people of the state into hostile groups and create an atmosphere of suspicion and antagonism.

“When these three amendments had been submitted to the people, the convention resumed its discussion of the initiative and referendum, and finally adopted a measure which provides for the initiation by the people of both constitutional amendments and of laws and also for a compulsory referendum on enactments of the legislature. [See INITIATIVE AND REFERENDUM: Development in the United States.] Having adopted this amendment by a vote of 163 to 125, and having provided that it should be submitted to the people at the state election of November, 1918, the convention adjourned until June, 1918. Eighteen amendments were . . . [then] approved by the convention, and at the election in November, 1918, they, as well as the amendments establishing the initiative and referendum—adopted too late for action in 1917—were ratified by the people. . . . Three of the amendments adopted in 1918 are such innovations that they may become landmarks in American constitutional history. The first authorizes the regulation of advertising in places within public view. Whether or not the control of bill-boards falls within the police power has long been a vexed question in law. [See BILLBOARDS.] Allied in some respects with the amendment for the regulation of advertising in public places is the amendment au-

thorizing the legislature ‘to limit buildings according to their use or construction to specified districts of cities and towns,’—in other words, to establish building zones. One of the most significant amendments adopted by Massachusetts is that which authorizes the establishment of compulsory voting. While the Massachusetts convention showed the prevailing opinion as to enlarging the sphere of government and removing restrictions on the action of governmental agents, it was essentially a conservative body. None of its recommendations was radical. It adopted the popular initiative and referendum, but surrounded it with many safeguards. It refused to make any substantial change in the judiciary. The substitution of biennial for annual elections was essentially a conservative measure. In fact, it may be said of all of the twenty-two amendments which it submitted to the people that they made only such changes as are to be expected in any enlightened and progressive community which endeavors to adapt itself to the demands of new conditions and to keep in touch with the expanding range of men’s thoughts.”—L. B. Evans, *Constitutional convention of Massachusetts* (*American Political Science Review*, May, 1921).—“For many years increase in the number of state boards and commissions in the Commonwealth of Massachusetts has been a growing problem and not infrequently a political issue of more or less importance. On the one hand was a tradition and a sentiment, not to say prejudice, against ‘one-man power’ in any form, and on the other was the inexorable march of social and political evolution building up governmental machinery which was becoming every year more and more unwieldy, more and more ridiculous. The constitution of 1918, Art. LXVI, attempts to bring the administrative and executive organization of the government up to date. The article follows. *Article LXVI*.—On or before January first, nineteen hundred twenty-one, the executive and administrative work of the commonwealth shall be organized in not more than twenty departments, in one of which every executive and administrative office, board and commission, except those officers serving directly under the governor or the council, shall be placed. Such departments shall be under such supervision and regulation as the general court may from time to time prescribe by law. *Act of 1919*.—In pursuance of the article just quoted, the general court of 1919 enacted a statute carrying into effect the intention of the new constitution. The new act was approved July 23, 1919, and was to become effective in part November 15, 1919; in part not before December 1, 1919; in part on January 1, 1921.”—H. C. Morrison, *New education department in Massachusetts* (*Elementary School Journal*, Mar., 1920).—The law approved July 23, 1919, established, in addition to the existing offices of governor and governor’s council, secretary, treasurer, auditor, and attorney-general, the following departments: agriculture, conservation, banking and insurance, corporations and taxation, education, civil service and registration, industrial accidents, labor and industries, mental diseases, correction, public welfare, public health, public safety, public works, and public utilities. Under the re-organized constitution of the state the old board of education was abolished and replaced by an advisory board working with a commissioner of education.

1918.—Part played in World War.—Eighteenth federal amendment ratified.—Budget system adopted.—The state furnished 132,610 soldiers, or 3.53 per cent of the whole force. A National Army camp, Camp Devens, was located at Ayer. On April 2, the legislature ratified the Eighteenth Fed-

eral (prohibition) amendment, Massachusetts being the eleventh state to ratify. A budget system for the state finances was adopted the same year 1918-1919.—Textile strikes. See LABOR STRIKES AND BOYCOTTS: 1918; 1919; Lawrence textile strike.

1919.—Nineteenth federal amendment ratified.—The nineteenth amendment, granting nation-wide suffrage to women, was ratified on June 25 by Massachusetts, the eighth state to take that action.

1920.—Election results.—The vote for governor (for a two-year term, as the result of legislation in 1918) was as follows: Cox (Republican), 643,869; Walsh (Democrat), 200,350. Governor Coolidge was elected vice president of the United States.

1920.—Workmen's compensation. See SOCIAL INSURANCE: Details for various countries: United States: 1920.

1921.—Pilgrim tercentenary celebrated at Plymouth.—As an outdoor pageant in the bleak winter weather of a New England coast town was hardly practicable, the tercentenary of the landing of the Pilgrims at Plymouth, Massachusetts, was celebrated during the summer following the actual anniversary. The replica of the *Mayflower* used for the occasion was built in Boston and sailed from that port to Plymouth. The landing itself was the culmination of the pageant (under the direction of Professor Baker of Harvard) which depicted also earlier arrivals in the New World from the Norsemen of the tenth century onward.

ALSO IN: N. J. O'Connor, *Plymouth pageant* (Bookman, Oct., 1921).

1922.—Operation of minimum wage law reviewed.—In May, 1922, nearly nine years after its enactment, the operation of minimum wage law in Massachusetts was reviewed by a member of the state department of labor and industries. "During this time, twenty-four occupations employing women have been investigated. Twenty-three bulletins based on investigations and inspections showing the wages of women workers have been published. Wage decrees fixing minimum rates for women and girls have been entered for sixteen different occupations employing from 70,000 to 80,000 women workers. Wage boards for eight occupations have been reconvened for the purpose of revising the decrees to meet the changes in the cost of living. The total expense of operations during the time the commission has been in existence has been approximately \$147,000. As the first state to enact minimum wage legislation, Massachusetts has had to bear the brunt of the opposition which any new proposal invariably incurs. The work of the wage boards was blocked. Amendments needed to enable the commission to carry out the intent of the law were defeated. Requests for needed appropriations were opposed. The constitutionality of the law was contested, and it was not until the fall of 1918, when the decision of the Supreme Judicial Court was rendered, upholding the law in its essential provisions, that the commission was free to go ahead with its work. Although still handicapped by the fact that there is no provision for penalty or fine for non-compliance, the law in its present form is much more than advisory. . . . The experience gained during the years the Massachusetts law has been in operation has served to show the modifications which are essential to insure effective and impartial enforcement. Of these modifications the most important are provision for prompt and scientific revision of rates to meet changes in the cost of living; provision for securing greater uniformity in minimum rates for different occupations; and provision for uniform enforcement of wage decrees."—E. M. Johnson, *Massachusetts minimum wage* (Survey, May 13, 1922).

MASSONISTI. See MASONIC SOCIETIES: Russia.
MASSORETES. See MASORETES.
MASTABA.—"One of the earliest forms of the
 building which marks the site of an Egyptian tomb
 is the mastaba, the finest examples of which were
 built at Sakkarah; it was called mastaba by the
 Arabs because its length, in proportion to its height,
 is great, and reminded them of the long, low seat
 common in Oriental houses, and familiar to them.
 The mastaba is a heavy massive building, of rec-
 tangular shape, the four sides of which are four
 walls symmetrically inclined towards their common
 centre. . . . It has been asserted that mastabas are
 only unfinished pyramids, but properly considered,
 it is evident that they form a class of buildings by
 themselves, and that they have nothing in com-
 mon with the pyramid, save in respect of being
 oriented towards the north, this orientation being
 the result not of a studied imitation of the pyra-
 mid, but of a religious intention, which at this early
 period influenced the construction of all tombs,
 whatever their external form. The mastabas at
 Sakkarah are built of stone and brick."—E. A. W.
 Budge, *Mummy*, pp. 318-319.
MASTERS AND WORKMEN ACT (1872).
 See ARBITRATION AND CONCILIATION, INDUSTRIAL:
 Great Britain: 1562-1896.
MAS'UDI (Abu'l Hasan 'Ali al Mas'udi) (died
 c. 956), Arabian historian. See HISTORY: 21.
MASULIPATAM, or Bandar, seaport of Brit-
 ish India, capital of the District of Kistna, Madras.
 It was taken by the British in 1750. See INDIA:
 1758-1761.
MASURIAN LAKES, series of lakes in East
 Prussia. The lakes and marshy land surrounding
 them were an important factor in the battle of
 Tannenberg, 1914, where the Germans, under Hin-
 denburg, obtained a decisive victory over the Rus-
 sians under Samsonov.
MATABELELAND, region of British southern
 Africa, and part of southern Rhodesia, east of the
 Bechuanaland protectorate. The majority of the
 inhabitants are of Bantu stock, Zulus who were
 driven out of the Transvaal by the Boers. In 1911
 the white inhabitants numbered about 11,000.

Matilda (1046-1115), countess of Tuscany. Espoused the cause of Gregory VII; deeded her lands to the church. See FLORENCE: 12th century; PAPACY: 1077-1102; TUSCANY: 685-1115.

MATISSE, Henri (1869-), French post-impressionist painter. See PAINTING: Europe (19th century).

MATRIARCHATE.—This term is applied to a form of society in which all transmissible rights and privileges are inherited through the mother. Descent and kinship are traced solely through the mother. "Matrilineal descent was at one time interpreted to mean that women govern not merely the family but also the primitive equivalent of the state. Probably there is not a single theoretical problem on which modern anthropologists are so thoroughly in accord as with respect to the utter worthlessness of that inference. The testimony of the ethnographic data is too clear to be swept aside by a priori speculation. Of the Australians some tribes are matrilineal, others patrilineal, but the lot of woman is not one jot better or more dignified among the former. The same holds for Melanesia."—R. H. Lowie, *Primitive society*, p. 189.—In most of the matriarchates, so-called, woman is merely the transmitter of certain rights and privileges without enjoying them herself. Among the tribes in which the matriarchate still flourishes in America are the Iroquois, the Pueblo Indians and the aborigines of the North Pacific Coast. In Polynesia the absence of any clan system also lessens the possibility of the existence of mother right. In New Zealand matrilocal residence in marriage is frequent and in some places a woman may become chief. In Micronesia however mother-right prevails; in the Marshall and Caroline Islands the matrilineal mode of transmission is general. The Hamitic and Semitic tribes of Northern Africa are strictly patrilineal, there are some examples of maternal descent among the Sudanese and Bantu people of the south. In northern Asia again paternal descent dominates. In India the Khasis are the best example of maternal descent.

Maurice (1567-1625), prince of Orange and count of Nassau. See **NETHERLANDS**: 1584-1585; 1588-1593; 1603-1610; **BRAZIL**: 1510-1661.

Maurice (1521-1553), duke and elector of Saxony. See **GERMANY**: 1546-1552; 1552-1561.

MAURITIUS, principal island of the Mascarene group, in the Indian ocean, 550 miles east of Madagascar. "The area of the island is 720 square miles, while the dependencies, of which the island of Rodrigues and the Chagos Group (Diego Garcia) are the chief, cover about 80 square miles. The total population is 385,000, of which 6,000 live in the dependencies; thus the density of population is 481 to the square mile. . . . Nearly 70 per cent. of the population is Indian by birth, and . . . a majority of the Indians are independent land owners. The population of European (mainly French) descent numbers about 120,000, and there are besides a few thousand Chinese. . . . The climate . . . is uniformly, although rarely excessively, hot, with a regular and sufficient rainfall from the S.E. trade winds. . . . The natural vegetation is an evergreen tropical forest, rich in palms and fruit trees. The Chagos Group resembles the smaller Pacific islands, the coco-nut being the principal tree."—E. G. R. Taylor, *Business man's geography*, p. 334.—About the middle of the 10th century the Dutch attempted a settlement on Mauritius, which they named from their stadtholder, Count Maurice. In 1712 they abandoned the island, and it was occupied soon afterwards by the French, who had

already planted a colony on the neighboring island, first named Isle de Bourbon, and afterwards Réunion. To Mauritius the French gave the name of the Isle of France. Under the celebrated La Bourdonnais, who became governor in 1734, these islands assumed great colonial importance and became the seat of a powerful attempt to establish French ascendancy in the East. (See **INDIA**: 1743-1752.) In 1810 all three islands were surrendered to the English. Réunion was restored to France, at the peace, but the Isle of France, with its older Dutch name of Mauritius reinstated, and Rodrigues were retained and have formed part of the British Empire since. (See also **INDIA**: 1805-1816). Mauritius is a crown colony, with a representative government since 1885.—See also **MASCARENE ISLANDS**.

MAYAS.—"In his second voyage, Columbus heard vague rumors of a mainland westward from Jamaica and Cuba, at a distance of ten days journey in a canoe. . . . During his fourth voyage (1503-4) when he was exploring the Gulf south-west from Cuba, he picked up a canoe laden with cotton clothing variously dyed. The natives in it gave him to understand that they were merchants, and came from a land called Maia. This is the first mention in history of the territory now called Yucatan, and of the race of the Mayas. . . . Maya was the patrial name of the natives of Yucatan. It was the proper name of the northern portion of the peninsula. No single province bore it at the date of the [Spanish] Conquest, and probably it had been handed down as a generic term from the period, about a century before, when this whole district was united under one government. . . . Whatever the primitive meaning and first application of the name Maya, it is now used to signify specifically the aborigines of Yucatan. In a more extended sense, in the expression 'the Maya family,' it is understood to embrace all tribes, wherever found, who speak related dialects presumably derived from the same ancient stock as the Maya proper. . . . The Maya language forms one of the rare examples of American languages possessing vitality enough not only to maintain its ground, but actually to force itself on European settlers and supplant their native speech. . . . The Mayas did not claim to be autochthones. Their legends referred to their arrival by the sea from the East, in remote times, under the leadership of Itzamina, their hero-god, and also to a less numerous immigration from the West, which was connected with the history of another hero-god, Kukul Càn. The first of these appears to be wholly mythical. . . . The second tradition deserves more attention from the historian. . . . It cannot be denied that the Mayas, the Kiches [or Quiches] and the Cakchiquels, in their most venerable traditions, claimed to have migrated from the north or west from some part of the present country of Mexico. These traditions receive additional importance from the presence on the shores of the Mexican Gulf, on the waters of the river Panuco, north of Vera Cruz, of a prominent branch of the Maya family, the Huastecs. The idea suggests itself that these were the rear-guard of a great migration of the Maya family from the north toward the south. Support is given to this by their dialect, which is most closely akin to that of the Tzendals of Tabasco, the nearest Maya race to the south of them, and also by very ancient traditions of the Aztecs. It is noteworthy that these two partially civilized

races, the Mayas and the Aztecs, though differing radically in language, had legends which claimed a community of origin in some indefinitely remote past. We find these on the Maya side narrated in the sacred book of the Kiches, the Popol Vuh, in the Cakchiquel 'Records of Tecpan Atillan,' and in various pure Maya sources. . . . The annals of the Aztecs contain frequent allusions to the Huastecs."—D. G. Brinton, *Maya chronicles, introd.*—"Closely enveloped in the dense forests of Chiapas, Guatemala, Yucatan, and Honduras, the ruins of several ancient cities have been discovered, which are far superior in extent and magnificence to any seen in Aztec territory. . . . Most of these cities were abandoned and more or less unknown at the time of the [Spanish] Conquest. They bear hieroglyphic inscriptions apparently identical in character; in other respects they resemble each other more than they resemble the Aztec ruins—or even other and apparently later works in Guatemala and Honduras. All these remains bear evident marks of great antiquity."—H. H. Bancroft, *Native races of the Pacific states*, v. 2, ch. 2, v. 4, ch. 3-6, v. 5, ch. 11-13.

"Broadly speaking, the Maya were a lowland people, inhabiting the Atlantic coast plains of southern Mexico and northern Central America. . . . There are at present upward of twenty tribes speaking various dialects of the Maya language, perhaps half a million people in all. These live in the same general region their ancestors occupied, but under greatly changed conditions. Formerly the Maya were the van of civilization in the New World, but to-day they are a dwindling race, their once remarkable civilization is a thing of the past, and its manners and customs are forgotten. . . . The ancient Maya . . . emerged from barbarism probably during the first or second century of the Christian Era. . . . [How long they had been engaged in their upward struggle it is impossible to say; but by that time they had brought] their complex calendar and hieroglyphic system to the point of graphic record. [Civilization thenceforward advanced for a period of upward of 400 years, during which city after city was built, and the art of sculpture was brought to a high state of development. Then something hitherto unexplained happened to arrest the advance.] There is strong documentary evidence that about the middle or close of the fifth century the southern part of Yucatan was discovered and colonized. In the century following, the southern cities one by one sank into decay; and coincidentally Chichen Itza, the first great city of the north, was founded and rose to prominence. . . . It seemed not improbable that after the discovery of Yucatan and the subsequent opening up of that vast region, the southern cities commenced to decline. . . . [Why the change of habitat was made no one can yet say; but the struggle for life in the new environment had an undoubted influence in checking their forward movement. Moreover they appear to have been for a long time quite unsettled. Bakhahal the first northern settlement was occupied for only sixty years. Chichen Itza was abandoned at the end of about a century, in favor of Chakanputun, which was occupied at the beginning of the eighth century. Here they lived until about 060 A. D. when the city was destroyed by fire.] By this time, however, some four centuries had elapsed since the first colonization of the [northern] country, and . . . once more their energies had begun to find outlet in artistic expression. . . . After the destruction of Chakanputun the horizon of Maya actively expanded. Some of the fugitives from Chakanputun re-occupied Chichen Itza while others established

themselves at a new site called Mayapan. About this time also the city of Uxmal seems to have been founded. In the year 1000 these three cities—Chichen Itza, Uxmal, and Mayapan—formed a confederacy, in which each was to share equally in the government of the country. Under the peaceful conditions which followed . . . for the next 200 years the arts blossomed forth anew. This was the second and last great Maya epoch . . . [during which the forgotten cities of Yucatan were built. This peaceful era was terminated about 1200 by war between Chichen Itza and Mayapan which plunged the country into civil strife. In the outcome Mayapan became supreme; but ruled with so much arrogance and oppression that] about the middle of the fifteenth century the Maya nobility banded themselves together under the leadership of the lord of Uxmal, sacked Mayapan, and slew its ruler. All authorities, native as well as Spanish, agree that the destruction of Mayapan marked the end of strongly centralized government in Yucatan. . . . That we have succeeded in deciphering, up to the present time, only the calendric parts of the inscriptions, the chronological skeleton of Maya history as it were, stripped of the events which would vitalize it, should not discourage the student nor lead him to minimize the importance of that which is already gained. Thirty years ago the Maya inscriptions were a sealed book, yet to-day we read in the glyphic writing the rise and fall of the several cities in relation to one another, and follow the course of Maya development even though we can not yet fill in the accompanying background. Future researches, we may hope, will reconstruct this background from the undeciphered glyphs, and will reveal the events of Maya history which alone can give the corresponding chronology a human interest.”—S. G. Morley, *Introduction to the study of the Maya hieroglyphs* (Smithsonian Institution, Bureau of American Ethnology, Bulletin 57, pp. 1-7, 250).—“The careful examination of the Maya ruins of Chichen-Itza, just completed by the American scientist Dr. Sylvanus G. Morley, has brought to light evidences of a civilization dating back to the middle of the fifth century A. D., which Dr. Morley says was the most advanced of any in the Western Hemisphere prior to the discovery of America by Columbus. The research in the ruins of Northern Yucatan was inaugurated a decade ago by the Carnegie Institute, but was interrupted by the war. The project was again taken up last month, when officers of the institution visited Yucatan and spent some time at Chichen-Itza studying scientific and practical aspects of the archaeological problem which it presents. It was apparent from this that the work would involve the services of a large number of scientific specialists, as well as extensive excavations covering a long term of years.”—*New York Times*, Apr. 3, 1923.—See also INDIANS, AMERICAN: Cultural areas in Mexico and Central America: Maya area; CENTRAL AMERICA: Aborigines; MEXICO: Aboriginal peoples; MYTHOLOGY: Latin American; AZTEC AND MAYA PICTURE WRITING; CHRONOLOGY: System of the Maya Indians; YUCATAN: Geographical description.

MAYOR OF THE PALACE.—“The Mayor of the Palace is met with in all the Frankish kingdoms. . . . The mayors were at first merely the first superintendents, the first administrators of the interior of the palace of the king; the chiefs whom he put at the head of his companions, of his leudes, still united around him. It was their duty to maintain order among the king's men, to administer justice, to look to all the affairs, to all the wants, of that great domestic society. They were the men of the king with the leudes; this was their first character, their first state. Now for the second. After having exercised the power of the king over his leudes, his mayors of the palace usurped it to their own profit. The leudes, by grants of public charges and fiefs, were not long before they became great proprietors. This new situation was superior to that of companions of the king; they detached themselves from him, and united in order to defend their common interests. According as their fortune dictated, the mayors of the palace sometimes resisted them, more often united with them, and, at first servants of the king, they at last became the chiefs of an aristocracy, against whom royalty could do nothing. These are the two principal phases of this institution: it gained more extension and fixedness in Austrasia, in the family of the Pepins, who possessed it almost a century and a half, than anywhere else.”—F. Guizot, *History of Civilization*, v. 2 (France, v. 1), lect. 19.—See also FRANKS: 511-752.

MEDAIN.—Medain, "the twin city," combined in one, under this Arabic name, the two contiguous Persian capitals, Seleucia and Ctesiphon. The name Medain signifies "cities," and "it is said to have comprised a cluster of seven towns, but it is ordinarily taken to designate the twin cities of Seleucia and Ctesiphon."—W. Muir, *Annals of the early caliphate*, ch. 10, 17.

MEDALS, War. See WORLD WAR: Miscellaneous auxiliary services: VIII. War medals.

MEDIA AND THE MEDES.—The country of the Medes, in its original extent, coincided very nearly with the northwestern part of modern Persia, between Farsistan and the Elburz mountains. "The boundaries of Media are given somewhat differently by different writers, and no doubt they actually varied at different periods; but the variations were not great, and the natural limits, on three sides at any rate, may be laid down with tolerable precision. Towards the north the boundary was at first the mountain chain closing in on that side the Urumiyeh basin, after which it seems to have been held that the true limit was the Araxes, to its entrance on the low country, and then the mountain chain west and south of

the Caspian. Westward, the line of demarcation may be best regarded as, towards the south, running along the centre of the Zagros region; and, above this, as formed by that continuation of the Zagros chain which separates the Urumiyeh from the Van basin. Eastward, the boundary was marked by the spur from the Elburz, across which lay the pass known as the Pylæ Caspia, and below this by the great salt desert, whose western limit is nearly in the same longitude. Towards the south there was no marked line or natural boundary. . . . We may place the southern limit with much probability about the line of the thirty-second parallel, which is nearly the present boundary between Irak and Fars."—G. Rawlinson, *Five great monarchies: Media*, ch. 1.—"The nation of the Medes belongs to the group of the Arian tribes, which occupied the table-land of Iran. This has been already proved by the statement of Herodotus that in ancient times the Medians were called Areans by all men, by the religion of the Medes, and by all the Median words and names that have come down to us. According to Herodotus the nation consisted of six tribes: the Arizanti, Busae, Struchates, Budii, Paraetaceni, and Magi. . . . The Magians we have already found to be a hereditary order of Priests."—M. Duncker, *History of antiquity*, bk. 8, ch. 1.—See also NUMIDIANS AND MAURI.—The Medes, who seem to have been long without any centralizing authority among them, became, at last, united under a monarchy which grew in power, until, in the later part

of the seventh century B.C., it combined with Babylonia against the decaying Assyrian kingdom. (See also ASSYRIA: Fall of the empire.) Nineveh was destroyed by the confederates, and the dominions of Assyria were divided between them. The Median empire which then rose, by the side of the Babylonian, endured little more than half a century. It was the first of the conquests of Cyrus (see PERSIA: B. C. 549-521), or Kyros, the founder of the Persian empire (B. C. 549).—Based on A. H. Sayce, *Ancient empires of the East*, appendix 5.—See also KURDISTAN AND THE KURDS; MILITARY ORGANIZATION: 4.

MEDICAL SCIENCE

ANCIENT

Chronology of development.—Renouard, in his "History of Medicine," arranges the chronology of the development of medical knowledge in three grand divisions or Ages, subdivided into eight periods. "The First Age commences with the infancy of society, as far back as historic tradition carries us, and terminates toward the end of the second century of the Christian era, at the death of Galen, during the reign of Septimus Severus. This lapse of time constitutes, in Medicine, the Foundation Age. The germ of the Healing Art, concealed, at first, in the instincts of men, is gradually developed; the basis of the science is laid, and great principles are discussed. . . . The Second Age, which may be called the Age of Transition, offers very little material to the history of Medicine. We see no longer the conflicts and discussions between partisans of different doctrines; the medical sects are confounded. The art remains stationary, or imperceptibly retrogrades. I can not better depict this epoch than by comparing it to the life of an insect in the nymphe state; though no exterior change appears, an admirable metamorphosis is going on, imperceptibly, within. The eye of man only perceives the wonder after it has been finished. Thus from the 15th century, which is the beginning of the third and last Age of Medicine, or the Age of Renovation, Europe offers us a spectacle of which the most glorious eras of the republics of Greece and Rome only can give us an idea. It would seem as if a new life was infused into the veins of the inhabitants of this part of the world; the sciences, fine arts, industry, religion, social institutions, all are changed. A multitude of schools are open for teaching Medicine. Establishments which had no models among the ancients, are created for the purpose of extending to the poorer classes the benefits of the Healing Art. The in-

genious activity of modern Christians explores and is sufficient for everything. These three grand chronological divisions do not suffice to classify, in our minds, the principal phases of the history of Medicine; consequently, I have subdivided each age into a smaller number of sections, easy to be retained, and which I have named Periods. The first Age embraces four periods, the second and third ages, each, two. . . . The first period, which we name Primitive Period, or that of instinct, ends with the ruin of Troy, about twelve centuries before the Christian era. The second, called the Mystic or Sacred Period, extends from the dissolution of the 'Pythagorean Society' to about the year 500 A. C. The third period, which ends at the foundation of the Alexandrian Library, A. C. 320, we name the Philosophic Period. The fourth, which we designate the Anatomic, extends to the end of the first age, i. e., to the year 200 of the Christian era. The fifth is called the Greek Period; it ends at the destruction of the Alexandrian Library, A. D. 640. The sixth receives the surname of Arabic, and closes with the 14th century. The seventh period, which begins the third age, comprises the 15th and 16th centuries; it is distinguished as the Eradite. Finally, the eighth, or last period, embraces the 17th and 18th centuries [beyond which the writer did not carry his history]. I call it the Reform Period."—P. V. Renouard, *History of medicine, introduction*.

Egyptian.—"Medicine is practised among them [the Egyptians] on a plan of separation; each physician treats a single disorder, and no more: thus the country swarms with medical practitioners, some undertaking to cure diseases of the eye, others of the head, others again of the teeth, others of the intestines, and some those which are not local."—Herodotus, *History* (tr. by Rawlinson), bk. 2, ch. 84.—"Not only was the study of medicine of very early date in Egypt, but medical men there

were in such repute that they were sent for at various times from other countries. Their knowledge of medicine is celebrated by Homer (Od. iv. 229), who described Polydamna, the wife of Thonis, as giving medicinal plants 'to Helen, in Egypt, a country producing an infinite number of drugs . . . where each physician possesses knowledge above all other men.' 'O virgin daughter of Egypt,' says Jeremiah (lxvi. 11), 'in vain shalt thou use many medicines.' Cyrus and Darius both sent to Egypt for medical men (Her. iii. 1, 132); and Pliny (ix. 5) says post mortem examinations were made in order to discover the nature of maladies. Doctors received their salaries from the treasury; but they were obliged to conform in the treatment of a patient to the rules laid down in their books, his death being a capital crime, if he was found to have been treated in any other way. But deviations from, and approved additions to, the sacred prescriptions were occasionally made; and the prohibition was only to prevent the experiments of young practitioners, whom Pliny considers the only persons privileged to kill a man with impunity. Aristotle indeed says 'the Egyptian physicians were allowed after the third day to alter the treatment prescribed by authority, and even before, taking upon themselves the responsibility' (Polit. iii. 11). Experience gradually taught them many new remedies; and that they had adopted a method (of no very old standing in modern practice) of stopping teeth with gold is proved by some mummies found at Thebes. Besides the protection of society from the pretensions of quacks, the Egyptians provided that doctors should not demand fees on a foreign journey or on military service, when patients were treated free of expense (Diod. i. 82); and we may conclude that they were obliged to treat the poor gratis, on consideration of the allowance paid them as a body by government. . . . Poor and superstitious people sometimes had recourse to dreams, to wizards, to donations to sacred animals, and to exvotos to the gods. . . . Charms were also written for the credulous, some of which have been found on small pieces of papyrus, which were rolled up and worn as by the modern Egyptians. Accoucheurs were women; which we learn from Exodus i. 15, and from the sculptures, as in modern Egypt. . . . The Egyptian doctors were of the sacerdotal order, like the embalmers, who are called (in Genesis i. 2) 'Physicians,' and were 'commanded by Joseph to embalm his father.' They were of the class called *Pastophori*, who, according to Clemens (Strom. lib. 6), being physicians, were expected to know about all things relating to the body, and diseases, and remedies, contained in the six last sacred books of Hermes. Manetho tells us that *Athotes*, the second king of Egypt, who was a physician, wrote the anatomical books; and his name, translated *Hermogenes*, may have been the origin of the tradition that ascribed them to Hermes, the Egyptian *Thoth*. Or the fable may mean that they were the result of intellect personified by *Thoth*, or *Hermes*.—*Ibid.*, note.—'The ancient Egyptians, though medical science was zealously studied by them, also thought that the efficacy of the treatment was enhanced by magic formulæ. In the Ebers Papyrus, an important and very ancient manual of Egyptian medicine, the prescriptions for various medicaments are accompanied by the forms of exorcism to be used at the same time, and yet many portions of this work give evidence of the advanced knowledge of its authors.'—G. Ebers, *Egypt*, v. 2, pp. 61-62.—'Works on medicine abounded in Egypt from the remotest times, and the great medical library of

Memphis, which was of immemorial antiquity, was yet in existence in the second century before our era, when Galen visited the Valley of the Nile. . . . *Ateta*, third king of the First Dynasty, is the reputed author of a treatise on anatomy. He also covered himself with glory by the invention of an infallible hair-wash, which, like a dutiful son, he is said to have prepared especially for the benefit of his mother. No less than five medical papyri have come down to our time, the finest being the celebrated Ebers papyrus, bought at Thebes by Dr. Ebers in 1874. This papyrus contains one hundred and ten pages, each page consisting of about twenty-two lines of bold hieratic writing. It may be described as an Encyclopædia of Medicine as known and practised by the Egyptians of the Eighteenth Dynasty; and it contains prescriptions for all kinds of diseases—some borrowed from Syrian medical lore, and some of such great antiquity that they are ascribed to the mythologic ages, when the gods yet reigned personally upon earth. Among others, we are given the recipe for an application whereby Osiris cured Ra of the headache. The Egyptians attached great importance to these ancient medical works, which were regarded as final. The physician who faithfully followed their rules of treatment might kill or cure with impunity; but if he ventured to treat the patient according to his own notions, and if that patient died, he paid for the experiment with his life. Seeing, however, what the canonical remedies were, the marvel is that anybody ever recovered from anything. Raw meat; horrible mixtures of nitre, beer, milk, and blood, boiled up and swallowed hot; the bile of certain fishes; and the bones, fat, and skins of all kinds of unsavory creatures, such as vultures, bats, lizards and crocodiles, were among their choicest remedies."—A. B. Edwards, *Pharaohs, Fellahs and explorers*, ch. 6.—'In Egypt . . . man does not die, but some one or something assassinates him. The murderer often belongs to our world, and can be easily pointed out. . . . Often, though, it belongs to the invisible world, and only reveals itself by the malignity of its attacks: it is a god, a spirit, the soul of a dead man, that has cunningly entered a living person, or that throws itself upon him with irresistible violence. . . . Whoever treats a sick person has therefore two equally important duties to perform. He must first discover the nature of the spirit in possession, and, if necessary, its name, and then attack it, drive it out, or even destroy it. He can only succeed by powerful magic, so he must be an expert in reciting incantations, and skilful in making amulets. He must then use medicine to contend with the disorders which the presence of the strange being has produced in the body; this is done by a finely graduated régime and various remedies. The cure-workers are therefore divided into several categories. Some incline towards sorcery, and have faith in formulas and talismen only; they think they have done enough if they have driven out the spirit. Others extol the use of drugs; they study the qualities of plants and minerals, describe the diseases to which each of the substances provided by nature is suitable, and settle the exact time when they must be procured and applied; certain herbs have no power unless they are gathered during the night at the full moon, others are efficacious in summer only, another acts equally well in winter or summer. The best doctors carefully avoid binding themselves exclusively to either method.'—G. Maspéro, *Life in ancient Egypt and Assyria*, ch. 7.—'The employment of numerous drugs in Egypt has been mentioned by sacred and

profane writers; and the medicinal properties of many herbs which grow in the deserts, particularly between the Nile and Red Sea, are still known to the Arabs, though their application has been but imperfectly recorded and preserved. . . . Pliny makes frequent mention of the productions of that country, and their use in medicine. He also notices the physicians of Egypt; and as if their number was indicative of the many maladies to which the inhabitants were subject, he observes that it was a country productive of numerous diseases. In this, however, he does not agree with Herodotus, who affirms that, 'after the Libyans, there are no people so healthy as the Egyptians, which may be attributed to the invariable nature of the seasons in their country.' In Pliny's time the introduction of luxurious habits and excess had probably wrought a change in the people; and to the same cause may be attributed the numerous complaints among the Romans, 'unknown to their fathers and ancestors.'—J. G. Wilkinson, *Manners and customs of ancient Egyptians*, v. 2, ch. 10.—"The Ptolemies, down to the very termination of their domination over Egypt, appear to have encouraged the curative art, and for the purpose of restoring declining health, surrounded themselves with the most illustrious physicians of the age. . . . The science of medicine of the period was fully represented at the Museum by distinguished professors, who, according to Athenæus, restored the knowledge of this art to the towns and islands of the Grecian Archipelago. . . . About the period of the absorption of the Egyptian kingdom into the expanding dominion of the Romans, the schools of Alexandria still continued to be the centre of medical studies; and notwithstanding the apparent dissidence between the demands of a strict science and public affairs, its professors exhibited, equally with their brother philosophers, a taste for diplomacy. Dioscorides and Serapion, two physicians of Alexandria, were the envoys of the elder Ptolemy to Rome, and at a later date were bearers of dispatches from Cæsar to one of his officers in Egypt."—G. F. Fort, *Medical economy during the Middle Ages*, ch. 3.

Babylonian.—The Babylonians "have no physicians, but when a man is ill, they lay him in the public square, and the passers-by come up to him, and if they have ever had his disease themselves or have known anyone who has suffered from it, they give him advice, recommending him to do whatever they found good in their own case, or in the case known to them. And no one is allowed to pass the sick man in silence without asking him what his ailment is."—Herodotus, *History* (tr. by G. Rawlinson), v. 1, bk. 1, ch. 107.—"The incantations against disease describe a great variety of cases. . . . But the most numerous are those which aim at the cure of the plague, fever, and 'disease of the head;' this latter, judging from the indications which are given of its symptoms and its effects, appears to have been a sort of erysipelas, or cutaneous disease. . . . These are the principal passages of a long incantation against 'the disease of the head:' the tablet on which we find it bears six other long formulæ against the same evil. 'The disease of the head exists on man. The disease of the head, the ulceration of the forehead exists on man. The disease of the head marks like a tiara, the disease of the head from sunrise to sunset. In the sea and the vast earth a very small tiara is become the tiara, the very large tiara, his tiara. The diseases of the head pierce like a bull, the disease of the head shoot like the palpitation of the heart. . . . The diseases of the head, like doves to their dove-cotes, like grasshoppers into the sky,

like birds into space may they fly away. May the invalid be replaced in the protecting hands of his god!' This specimen will give the reader an idea of the uniform composition of these incantations against diseases, which filled the second book of the work under consideration. They all follow the same plan throughout, beginning with the definition of the disease and its symptoms, which occupies the greater part of the formula; and ending with a desire for deliverance from it, and the order for it to depart. Sometimes, however, the incantation of the magician assumes a dramatic form at the end. . . . We must add . . . the use of certain enchanted drinks, which, doubtless, really contained medicinal drugs, as a cure for diseases, and also of magic knots, the efficacy of which was so firmly believed in, even up to the middle ages. Here is a remedy which one of the formulæ supposes to have been prescribed by Hea against a disease of the head: 'Knot on the right and arrange flat in regular bands, on the left a woman's diadem; divide it twice in seven little bands; . . . gird the head of the invalid with it; gird the forehead of the invalid with it; gird the seat of life with it; gird his hands and his feet; seat him on his bed; pour on him enchanted waters. Let the disease of his head be carried away into the heavens like a violent wind; . . . may the earth swallow it up like passing waters!' Still more powerful than the incantations were conjurations wrought by the power of numbers."—F. Lenormant, *Chaldean magic*, ch. 1, 3.

Finnish.—"The Finnish incantations for exercising the demons of diseases were composed in exactly the same spirit, and founded upon the same data, as the Accadian incantations destined for the like purpose. They were formulæ belonging to the same family, and they often showed a remarkable similarity of language; the Egyptian incantations, on the contrary, having been composed by people with very different ideas about the supernatural world, assumed quite another form. This is an incantation from one of the songs of the Kalevala: 'O malady, disappear into the heavens; pain, rise up to the clouds; inflamed vapour, fly into the air, in order that the wind may take thee away, that the tempest may chase thee to distant regions, where neither sun nor moon give their light, where the warm wind does not inflame the flesh. O pain, mount upon the winged steed of stone, and fly to the mountains covered with iron. For he is too robust to be devoured by disease, to be consumed by pains. Go, O diseases, to where the virgin of pains has her hearth, where the daughter of Wäinämöinen cooks pains, go to the hill of pains. There are the white dogs, who formerly howled in torments, who groaned in their sufferings.'"—F. Lenormant, *Chaldean magic*, ch. 17.

Hindu.—"There is reason to . . . conclude, from the imperfect opportunities of investigation we possess, that in medicine, as in astronomy and metaphysics, the Hindus once kept pace with the most enlightened nations of the world; and that they attained as thorough a proficiency in medicine and surgery as any people whose acquisitions are recorded, and as indeed was practicable, before anatomy was made known to us by the discoveries of modern enquirers. It might easily be supposed that their patient attention and natural shrewdness would render the Hindus excellent observers; whilst the extent and fertility of their native country would furnish them with many valuable drugs and medicaments. Their Nidana or Diagnosis, accordingly, appears to define and distinguish symptoms with great accuracy, and their

Dravyabhidhana, or *Materia Medica*, is sufficiently voluminous. They have also paid great attention to regimen and diet, and have a number of works on food and general treatment, suited to the complaint, or favourable to the operation of the medicine administered. This branch they entitle *Pathyapathya*. To these subjects are to be added the *Chikitsa*, or medical treatment of diseases—on which subject they have a variety of compositions, containing much absurdity, with much that is of value; and the *Rasavida*, or Pharmacy, in which they are most deficient. All these works, however, are of little avail to the present generation, as they are very rarely studied, and still more rarely understood, by any of the practising empirics. The divisions of the science thus noticed, as existing in books, exclude two important branches, without which the whole system must be defective—Anatomy and Surgery. We can easily imagine, that these were not likely to have been much cultivated in Hindustan. . . . The *Ayur Veda*, as the medical writings of highest antiquity and authority are collectively called, is considered to be a portion of the fourth or *Atharva Veda*, and is consequently the work of Brahma—by him it was communicated to Daksha, the Prajapati, and by him the two Aswins, or sons of Surya, the Sun, were instructed in it, and they then became the medical attendants of the gods—a genealogy that cannot fail recalling to us the two sons of Esculapius, and their descent from Apollo. Now what were the duties of the Aswins, according to Hindu authorities?—the gods, enjoying eternal youth and health, stood in no need of physicians, and consequently they held no such sinecure station. The wars between the gods and demons, however, and the conflicts amongst the gods themselves, in which wounds might be suffered, although death might not be inflicted, required chirological aid—and it was this, accordingly, which the two Aswins rendered. . . . The meaning of these legendary absurdities is clear enough, and is comfortable to the tenor of all history. Man, in the semi-barbarous state, if not more subject to external injuries than internal disease, was at least more likely to seek remedies for the former, which were obvious to his senses, than to imagine the means of relieving the latter, whose nature he could so little comprehend. Surgical, therefore, preceded medicinal skill; as Celsus has asserted, when commenting on Homer's account of Podalirius and Machaon, who were not consulted, he says, during the plague in the Grecian camp, although regularly employed to extract darts and heal wounds. . . . We may be satisfied that Surgery was once extensively cultivated, and highly esteemed by the Hindus. Its rational principles and scientific practice are, however, now, it may be admitted, wholly unknown to them. . . . It would be an enquiry of some interest to trace the period and causes of the disappearance of Surgery from amongst the Hindus: it is evidently of comparatively modern occurrence, as operative and instrumental practice forms so principal a part of those writings, which are undeniably most ancient; and which, being regarded as the composition of inspired writers, are held of the highest authority.”—H. H. Wilson, *Essays on Sanskrit literature*, pp. 260-276, 301.—“The number of medical works and authors is extraordinarily large. The former are either systems embracing the whole domain of the science, or highly special investigations of single topics, or, lastly, vast compilations prepared in modern times under the patronage of kings and princes. The sum of knowledge embodied in their contents appears really to be most respectable.

Many of the statements on dietetics and on the origin and diagnosis of diseases bespeak a very keen observation. In surgery, too, the Indians seem to have attained a special proficiency, and in this department European surgeons might perhaps even at the present day still learn something from them, as indeed they have already borrowed from them the operation of rhinoplasty. The information, again, regarding the medicinal properties of minerals (especially precious stones and metals), of plants, and animal substances, and the chemical analysis and decomposition of these, covers certainly much that is valuable. Indeed, the branch of *Materia Medica* generally appears to be handled with great predilection, and this makes up to us in some measure at least for the absence of investigations in the field of natural science. On the diseases, &c., of horses and elephants also there exist very special monographs. For the rest, during the last few centuries medical science has suffered great detriment from the increasing prevalence of the notion, in itself a very ancient one, that diseases are but the result of transgressions and sins committed, and from the consequent very general substitution of fastings, alms, and gifts to the Brahmans, for real remedies. . . . The influence . . . of Hindu medicine upon the Arabs in the first centuries of the Hijra was one of the very highest significance; and the Khalifs of Bagdad caused a considerable number of works upon the subject to be translated. Now, as Arabian medicine constituted the chief authority and guiding principle of European physicians down to the seventeenth century, it directly follows—just as in the case of astronomy—that the Indians must have been held in high esteem by these latter; and indeed Charaka is repeatedly mentioned in the Latin translations of Avicenna (Ibn Sina), Rhazes (Al Rasi), and Serapion (Ibn Serabi).”—A. Weber, *History of Indian literature*, pp. 260-271.

Jewish.—“If we are to judge from the frequent mention of physicians (Ex. xv. 26; Isa. iii. 7; Jer. viii. 22; Sir. x. 11, xxxviii. 1 ff.; Matt. ix. 12; Mark v. 26; Luke iv. 23, etc.), the Israelites must have given much attention to medicine from ancient times. The physicians must have understood how to heal wounds and external injuries with bandaging, mollifying with oil (Isa. i. 6; Luke x. 34), balsam (Jer. xlii. 11. li. 8), plasters (2 Kings xx. 7), and salves prepared from herbs (Sir. xxxviii. 8; Ex. xxi. 10; 2 Kings viii. 20; Ezek. xxx. 21). The ordinances respecting leprosy also show that the lawgiver was well acquainted with the various kinds of skin eruptions (comp. sect. 114). And not only Moses, but other Israelites also may have acquired much practical knowledge of medicine in Egypt, where the healing art was cultivated from high antiquity. But as to how far the Israelitish physicians advanced in this art, we have not more exact information. From the few scattered hints in the Old and New Testaments, so much only is clear, that internal diseases were also treated (2 Chron. xvi. 12; Luke viii. 43), and that the medicinal springs which Palestine possesses were much used by invalids. It by no means follows from the fact that the superintendence of lepers and the pronouncing of them clean are assigned by the law to the priests, that these occupied themselves chiefly with medicine. The task which the law laid on them has nothing to do with the healing of leprosy. Of the application of charms, there is not a single instance in Scripture.”—C. F. Keil, *Manual of biblical archaeology*, v. 2, pp. 276-277.—“The sur-

ger of the Talmud includes a knowledge of dislocations of the thigh, contusions of the head, perforation of the lungs and other organs, injuries of the spinal cord and trachea, and fractures of the ribs. Polypus of the nose was considered to be a punishment for past sins. In sciatica the patient is advised to rub the hip sixty times with meat-broth. Bleeding was performed by mechanics or barbers. The pathology of the Talmud ascribes diseases to a constitutional vice, to evil influences acting on the body from without, or to the effect of magic. Jaundice is recognized as arising from retention of the bile, dropsy from suppression of the urine. The Talmudists divided dropsy into anasarca, ascites, and tympanites. Rupture and atrophy of the kidneys were held to be always fatal. Hydatids of the liver were more favourably considered. Suppuration of the spinal cord, induration of the lungs, etc., are incurable. Dr. Baas says that these are 'views which may have been based on the dissection of (dead) animals, and may be considered the germs of pathological anatomy.' Some critical symptoms are sweating, sneezing, defecation, and dreams, which promise a favourable termination of the disease. Natural remedies, both external and internal, were employed. Magic was also Talmudic. Dispensations were given by the Rabbis to permit sick persons to eat prohibited food. Onions were prescribed for worms; wine and pepper for stomach disorders; goat's milk for difficulty of breathing; emetics in nausea; a mixture of gum and alum for menorrhagia (not a bad prescription); a dog's liver was ordered for the bite of a mad dog. Many drugs, such as assafœtida, are evidently adopted from Greek medicine. The dissection of the bodies of animals provided the Talmudists with their anatomy. It is, however, recorded that Rabbi Ishmael, at the close of the first century, made a skeleton by boiling the body of a prostitute. We find that dissection in the interests of science was permitted by the Talmud. The Rabbis counted 252 bones in the human skeleton."—E. Berdoe, *Origin and growth of the healing art*, bk. 2, ch. 2.

Greek: The Æsclepiadæ.—Cnidian and Coan schools.—Corpus Hippocraticum.—Hippocrates.—"It is well known that the oldest documents which we possess relative to the practice of Medicine, are the various treatises contained in the Collection which bears the name of Hippocrates. Their great excellence has been acknowledged in all ages, and it has always been a question which has naturally excited literary curiosity, by what steps the art had attained to such perfection at so early a period. . . . It is clearly established that, long before the birth of philosophy, medicine had been zealously and successfully cultivated by the Asclepiadæ, an order of priest-physicians that traced its origin to a mythical personage bearing the distinguished name of Æsculapius. Two of his sons, Podalirius and Machaon, figure in the Homeric poems, not however as priests, but as warriors possessed of surgical skill in the treatment of wounds, for which they are highly complimented by the poet. It was probably some generations after this time . . . that Æsculapius was deified, and that Temples of Health, called 'Asclepia,' presided over by the Asclepiadæ, were erected in various parts of Greece, as receptacles for the sick, to which invalids resorted in those days for the cure of diseases, under the same circumstances as they go to hospitals and spas at the present time. What remedial measures were adopted in these temples we have no means of

ascertaining so fully as could be wished, but the following facts, collected from a variety of sources, may be pretty confidently relied upon for their accuracy. In the first place, then, it is well ascertained that a large proportion of these temples were built in the vicinity of thermæ, or medicinal springs, the virtues of which would no doubt contribute greatly to the cure of the sick. At his entrance into the temple, the devotee was subjected to purifications, and made to go through a regular course of bathing, accompanied with methodical frictions, resembling the oriental system now well known by the name of shampooing. Fomentations with decoctions of odoriferous herbs were also not forgotten. A total abstinence from food was at first prescribed, but afterwards the patient would no doubt be permitted to partake of the flesh of the animals which were brought to the temples as sacrifices. Every means that could be thought of was used for working upon the imagination of the sick, such as religious ceremonies of an imposing nature, accompanied by music, and whatever else could arouse their senses, conciliate their confidence, and, in certain cases, contribute to their amusement. . . . It is also well known that the Asclepiadæ noted down with great care the symptoms and issue of every case, and that, from such observations, they became in time great adepts in the art of prognosis. . . . The office of priesthood was hereditary in certain families, so that information thus acquired would be transmitted from father to son, and go on accumulating from one generation to another."—F. Adams, *Preliminary discourse (Genuine works of Hippocrates, sect. 1)*.—"The school of the Asclepiadæ has been responsible for certain theories which have been more or less prominent during the earlier historical days. One of these which prevailed throughout the Hippocratic works is that of Coction and Crisis. By the former term is meant thickening or elaboration of humors in the body, which was supposed to be necessary for their elimination in some tangible form. Disease was regarded as an association of phenomena resulting from efforts made by the conservative principles of life to effect a coction, i. e., a combination, of the morbid matter in the economy, it being held that the latter could not be properly expelled until thus united and prepared so as to form excrementitious material. This elaboration was supposed to be brought about by the vital principles which some called nature (Phusis), some spirit (Psyche), some breath (Pneuma), and some heat (Thermon). The gradual climax of morbid phenomena has, since the days of Hippocrates, been commonly known as Crisis. All this was regarded as the announcement of the completion of this union by coction. The day on which it was accomplished was termed 'critical,' as were also the signs which preceded or accompanied it, and for the crisis the physician anxiously watched. Coction having been effected and crisis occurring, it only remained to evacuate the morbid material, which nature sometimes spontaneously accomplished by the critical sweat, urination, or stools; or sometimes the physician had to come to her relief by the administration of diuretics, purgatives, et cetera. The term 'critical period' was given to the number of days necessary for coction, which in its perfection was supposed to be four, the so-called quaternary, while the septenary was also held in high consideration. . . . This doctrine of crisis in disease left an impress upon the medical mind not yet fully eliminated."—Roswell Park, *Lectures on the history of medicine*.—"The earliest med-

ical school of which we have definite information is that of Cnidus, a Lacedaemonian colony in Asiatic Doris. Its origin may perhaps reach back to the seventh century B.C. We have actual records that the teachers of Cnidus were accustomed to collect systematically the phenomena of disease, of which they had produced a very complex classification, and we probably possess also several of their actual works. The physicians of Cos, their only contemporary critics whose writings have survived, considered that the Cnidian physicians paid too much attention to the actual sensations of the patient and to the physical signs of the disease. The most important of the Cnidian doctrines were drawn up in a series of Sentences or Aphorisms, and these, it appears, inculcated a treatment along Egyptian lines of the symptom or at most the disease, rather than the patient, a statement borne out by the contents of the gynaecological works of probable Cnidian origin included in the so-called 'Hippocratic Collection.' A few names of Cnidian physicians have, moreover, come down to us with titles of their works, and a later statement that they practised anatomy. There can be little doubt too that the Cnidian school drew also on Persian and Indian Medicine. The origin of the school of the neighbouring island of Cos was a little later than that of Cnidus and probably dates from the sixth century B.C. Of the Coan school, or at least of the general tendencies that it represented, we have a magnificent and copious literary monument in the *Corpus Hippocraticum*, a collection which was probably put together in the early part of the third century B.C. by a commission of Alexandrian scholars at the order of the book-loving Ptolemy Soter (reigned 323-285 B.C.). The elements of which this collection is composed are of varying dates from the sixth to the fourth century B.C., and of varying value and origin, but they mainly represent the point of view of physicians of the eastern part of the Greek world in the fifth and fourth centuries. The most obvious feature, the outstanding element that at once strikes the modern observer in these 'Coan' writings, is the enormous emphasis laid on the actual course of disease. 'It appears to me a most excellent thing,' so opens one of the greatest of the Hippocratic works, 'for a physician to cultivate *pronoia*. Foreknowing and foretelling in the presence of the sick the past, present, and future (of their symptoms) and explaining all that the patients are neglecting, he would be believed to understand their condition, so that men would have confidence to entrust themselves to his care. . . . Thus he would win just respect and be a good physician. . . . Just as the Cnidians by dividing up diseases according to symptoms over-emphasized diagnosis and over-elaborated treatment, so the Coans laid very great force on prognosis and adopted therefore a largely expectant attitude towards diseases. Both Cnidian and Coan physicians were held together by a common bond which was, historically if not actually, related to temple worship. . . . During the development of the Coan medical school along these lines in the sixth and fifth centuries, there was going on a most remarkable movement at the very other extreme of the Greek world. . . . A pupil of Pythagoras and an older contemporary of Empedocles was Alcmaeon of Croton (c. 500 B.C.), who began to construct a positive basis for medical science by the practice of dissection of animals, and discovered the optic nerves and the Eustachian tubes. He even extended his researches to Embryology. . . . Alcmaeon introduced also the doctrine

that health depends on harmony, disease on discord of the elements within the body. . . . Diogenes of Apollonia, the philosopher of pneumatism, a late fifth-century writer who must have been contemporary with Hippocrates the Great, himself made an investigation of the blood vessels; and the influence of the same school may be traced in a little work . . . *On the heart*, which is the best anatomical treatise of the Hippocratic Collection. This work describes the aorta and the pulmonary artery as well as the three valves at the root of each of the great vessels, and it speaks of experiments to test their validity. It treats of the pericardium and of the pericardial fluid and perhaps of the *musculi papillares*, and contrasts the thickness of the walls of right and left ventricles. . . . It is interesting to observe that we have here the first hint of human dissection, for the author tells us that the hearts of animals may be compared to that of man. The distinction of having been the first to write on human

HIPPOCRATES

anatomy, as such, belongs however, probably to a later writer, Diocles, son of Archidamus of Carystus, who lived in the fourth century B.C."—C. J. Singer, *Greek biology and Greek medicine*, pp. 84-86, 88-80.—"European medicine begins properly in the age of Pericles and its scientific advancement centers in the figure of Hippocrates (460-370 B.C.), who gave to Greek medicine its scientific spirit and its ethical methods."—F. H. Garrison, *History of medicine*, p. 80.—"Of the actual details of his life we know next to nothing. His period of greatest activity falls about 400 B.C. He seems to have led a wandering life. Born of a long line of physicians in the island of Cos, he exerted his activities in Thrace, Abdera, Delos, the Propontis (Cyzicus), Thasos, Thessaly (notably at Larissa and Meliboea), Athens, and elsewhere, dying at Larissa in extreme old age about the year 377 B.C. He had many pupils, among whom were his two sons Thessalus and Dracon, who also undertook journeys, his son-in-law Polybus, of whose works a fragment has been preserved

for us by Aristotle, together with three other Coans bearing the names Apollonius, Dexippus, and Praxagoras. This is practically all we know of him with certainty. But though this glimpse is very dim and distant, yet we cannot exaggerate the influence on the course of medicine and the value for physicians of all time of the traditional picture that was early formed of him and that may indeed well be drawn again from the works bearing his name. In beauty and dignity that figure is beyond praise. Perhaps gaining in stateliness what he loses in clearness, Hippocrates will ever remain the type of the perfect physician. Learned, observant, humane, with a profound reverence for the claims of his patients, but an overmastering desire that his experience shall benefit others, orderly and calm, disturbed only by anxiety to record his knowledge for the use of his brother physicians and for the relief of suffering, grave, thoughtful and reticent, pure of mind and master of his passions, this is no overdrawn picture of the Father of Medicine as he appeared to his contemporaries and successors. It is a figure of character and virtue which has had an ethical value to medical men of all ages comparable only to the influence exerted on their followers by the founders of the great religions. . . . The method of the Hippocratic writers is that known to-day as the 'inductive.' . . . They remain nevertheless, for the most part, patient observers of fact, sceptical of the marvellous and the unverifiable, hesitating to theorize beyond the data, yet eager always to generalize from actual experience; calm, faithful, effective servants of the sick. . . . The spirit of their practice cannot be better illustrated than by the words of the so-called 'Hippocratic oath': . . . 'I will follow that system of regimen which, according to my ability and judgment, I consider for the benefit of my patients, and abstain from whatever is deleterious and mischievous. . . . With purity and holiness I will pass my life and practise my Art. . . . Into whatever houses I enter, I will go there for the benefit of the sick, and will abstain from every act of mischief and corruption; and above all from seduction. . . . Whatever in my professional practice—or even not in connexion with it—I see or hear in the lives of men which ought not to be spoken of abroad, I will not divulge, deeming that on such matters we should be silent. While I keep this Oath unviolated, may it be granted me to enjoy life and the practice of the Art, always respected among men, but should I break or violate this Oath, may the reverse be my lot.' Respected equally throughout the ages by Arab, Jew, and Christian, the oath remains the watchword of the profession of medicine. . . . We may now turn to the Hippocratic Corpus as a whole. This collection consists of about 60 or 70 separate works, written at various periods and in various states of preservation. At best only a very small proportion of them can be attributed to Hippocrates, but the discussion of the general question of the 'genuineness' of the works is now admitted to be futile. . . . The system or systems of medicine that we shall thus attempt to describe was in vogue up to the Alexandrian period, that is, to the beginning of the third century B. C. Anatomy and physiology, the basis of our modern system, was still a very weak point in the knowledge of the pre-Alexandrians. The surface form of the body was intimately studied in connexion especially with fractures, but there is no evidence in the literature of the period of any closer acquaintance with human anatomical structure. . . .

There are in the Hippocratic works a certain number of comparisons between human and animal structures that would have been made possible by surgical operations and occasional accidents. . . . The unknown author of . . . *On the Sites of [diseases] in man*, a work written about 400 B. C., declares indeed that 'physical structure is the basis of medicine,' but the formal treatises on anatomy that we possess from Hippocratic times give the general anatomical standard of the corpus, and it is a very disappointing one. The tract *On Anatomy*, though probably of much later date (perhaps c. 330 B. C.), is inferior even to the treatise *On the Heart* (perhaps of about 400 B. C.). Physiology and Pathology are almost as much in the background as anatomy in the Hippocratic collection. As a formal discipline and part of medical education we find no trace of these studies among the pre-Alexandrian physicians. . . . The general state of health of the body was considered by the Hippocratists to depend on the distribution of the four elements, earth, air, fire, and water, whose mixture (*crasis*) and cardinal properties, dryness, warmth, coldness, and moistness, form the body and its constituents. To these correspond the cardinal fluids, blood, phlegm, yellow bile and black bile. The fundamental condition of life is the innate heat, the abdicating of which is death. This innate heat is greatest in youth when most fuel is therefore required, but gradually declines with age. Another necessity for the support of life is the *pneuma* which circulates in the vessels. All this may seem fanciful enough, but we may remember that the first half of the nineteenth century had waned before the doctrine of the humours which had then lasted for at least twenty-two centuries became obsolete, and perhaps it still survives in certain modern scientific developments. . . . The chief glory of the Hippocratic collection regarded from the clinical point of view is perhaps the actual description of cases. A number of these—forty-two in all—have survived. They are not only unique as a collection for nearly 2,000 years, but they are still to this day models of what succinct clinical records should be, clear and short, without a superfluous word, yet with all that is most essential, and exhibiting merely a desire to record the most important facts without the least attempt to prejudice the case. . . . The purely surgical treatises will be found no less remarkable than those of clinical observation. A very able surgeon, Francis Adams (1796-1861), who was eminent as a Greek scholar, gave it as his opinion in the middle of the nineteenth century that no systematic writer on surgery up to his time had given so good and so complete an account of certain dislocations, notably of the hip-joint, as that to be found in the Hippocratic collection. Some types of injury to the hip, as described in the Hippocratic writings, were certainly otherwise quite inadequately known until described by Sir Astley Cooper (1768-1841), himself a peculiarly Hippocratic character. . . . Among the surgical procedures of which descriptions are to be found in the Hippocratic writings are the opening of the chest for the condition known as *empyema* (accumulation of pus within the pleura frequently following pneumonia), and trephining the skull in cases of fracture of that part—two fundamental operations of modern surgery. . . . The work of these men may be summed up by saying that without dissection, without any experimental physiology or pathology, and without any instrumental aid they pushed the knowledge of the course and origin of disease as far as it is

ÆSCULAPIUS

Legendary Greek god of healing. The serpent coiled around the club-like staff is the symbol of renovation
(Original is in the National Museum, Naples)

conceivable that men in such circumstances could push it. This was done as a process of pure scientific induction. Their surgery, though hardly based on anatomy, was grounded on the most carefully recorded experience. In therapeutics they allowed themselves neither to be deceived by false hopes nor led aside by vain traditions. Yet in diagnosis, prognosis, surgery and therapeutics alike they were in many departments unsurpassed until the nineteenth century, and to some of their methods we have reverted in the twentieth. Persisting throughout the ages as a more or less definite tradition, which attained clearer form during and after the sixteenth century, Hippocratic methods have formed the basis of all departments of modern advance."—C. J. Singer, *Greek biology and Greek medicine*, pp. 89-92, 94-98, 103, 105, 115.—"It is observed that Homer, who describes the wounds which are inflicted in his battles with so much apparent anatomical precision, nowhere employs the word muscle. And even Hippocrates of Cos, the most celebrated physician of antiquity, is held to have had no distinct conception of such an organ. . . . Nor do we find much more distinctness on this subject even in Aristotle, a generation or two later. . . . He is held to have really had the merit of discovering the nerves of sensation, which he calls the 'canals of the brain' . . . , but the analysis of the mechanism of motion is left by him almost untouched. . . . His immediate predecessors were far from remedying the deficiencies of his doctrines. Those who professed to study physiology and medicine were, for the most part, studious only to frame some general system of abstract principles, which might give an appearance of connexion and profundity to their tenets. In this manner the successors of Hippocrates became a medical school, of great note in its day, designated as the Dogmatic school; in opposition to which arose an Empiric sect, who professed to deduce their modes of cure, not from theoretical dogmas, but from experience. These rival parties prevailed principally in Asia Minor and Egypt, during the time of Alexander's successors,—a period rich in names, but poor in discoveries; and we find no clear evidence of any decided advance in anatomy."—W. Whewell, *History of the inductive sciences*, v. 2, bk. 17, ch. 1, sect. 1.—"Making no pretension . . . to describe the regular medical practice among the Greeks, I shall here, nevertheless, introduce some few particulars more or less connected with it, which may be regarded as characteristic of the age and people. Great were the virtues which they ascribed to the herb alysson, (*biscutella didyma*.) which, being pounded and eaten with meat cured hydrophobia. Nay, more, being suspended in the house, it promoted the health of its inhabitants; it protected likewise both man and cattle from enchantment; and, bound in a piece of scarlet flannel round the necks of the latter, it preserved them from all diseases. Coriander-seed, eaten in too great quantity, produced, they thought, a derangement of the intellect. Ointment of saffron had an opposite effect, for the nostrils and heads of lunatics being rubbed therewith they were supposed to receive considerable relief. Melampus the goatherd was reported to have cured the daughters of Pratos of their madness by large doses of black hellebore, which thereafter received from him the name of Melampodium. Sea-onions suspended over the doors preserved from enchantment, as did likewise a branch of rhamnus over doors or windows. A decoction of rosemary and of the leaves and stems of the anemone was

administered to nurses to promote the secretion of milk, and a like potion prepared from the leaves of the Cretan dittany was given to women in labour. This herb, in order to preserve its virtues unimpaired, and that it might be the more easily transported to all parts of the country, was preserved in a joint of a ferula or reed. A plaster of incense, Cimolian earth, and oil of roses, was applied to reduce the swelling of the breasts. A medicine prepared from mule's fern, was believed to produce sterility, as were likewise the waters of a certain fountain near Pyrrha, while to those about Thespia a contrary effect was attributed, as well as to the wine of Heraclea in Arcadia. The inhabitants of this primitive region drank milk as an aperient in the Spring, because of the medicinal herbs on which the cattle were then supposed to feed. Medicines of laxative properties were prepared from the juice of the wild cucumber, which were said to retain their virtues for two hundred years, though simples in general were thought to lose their medicinal qualities in less than four. The oriental gum called kankamon was administered in water or honeyed vinegar to fat persons to diminish their obesity, and also as a remedy for the toothache. For this latter purpose the gum of the Ethiopian olive was put into the hollow tooth, though more efficacy perhaps was attributed to the root of dittander which they suspended as a charm about the neck. A plaster of the root of the white thorn or iris roots prepared with flour of copper, honey, and great centaury, drew out thorns and arrow heads without pain. An unguent procured from fern was sold to rustics for curing the necks of their cattle galled by the yoke. A decoction of marsh-mallow leaves and wine or honeyed vinegar was administered to persons who had been stung by bees or wasps or other insects; bites and burns were healed by an external application of the leaf smeared with oil, and the powdered roots cast into water caused it to freeze if placed out during the night in the open air; an unguent was prepared with oil from reeds, green or dry, which protected those who anointed themselves with it from the stings of venomous reptiles. Cinnamon unguent, or terebinth and myrtle-berries, boiled in wine, were supposed to be a preservative against the bite of the tarantula or scorpion, as was the pistachio nut against that of serpents. Some persons ate a roasted scorpion to cure its own bite; a powder, moreover, was prepared from sea-crabs supposed to be fatal to this reptile. Vipers were made to contribute their part to the materia medica; for, being caught alive, they were enclosed with salt and dried figs in a vase which was then put into a furnace till its contents were reduced to charcoal, which they esteemed a valuable medicine. . . . From the flowers of the sneezewort, a sort of snuff appears to have been manufactured, though probably used only in medicines. The ashes of old leather cured burns, galls, and blistered feet. The common remedy when persons had eaten poisonous mushrooms was a dose of nitre exhibited in vinegar and water; with water it was esteemed a cure for the sting of a burncow, and with benzoin it operated as an antidote against the poison of bulls' blood."—J. A. St. John, *Hellenes*, v. 3, bk. 6, ch. 6.

B. C. 4th-A. D. 2nd centuries.—Alexandrian school.—Medical writings from Hippocrates to Galen.—Advance in anatomy.—Aretaeus of Cappadocia.—"The history of Greek medicine did not end with the Hippocratic collection; in many respects it may indeed be held only to begin there;

yet we never get again a glimpse of so high an ethical and professional standard as that which these works convey. . . . A definite medical school was established at Alexandria and others perhaps at Pergamon and elsewhere. Athens, after the death of Aristotle and his pupils, passes entirely into the background and is of no importance so far as medicine is concerned. At Alexandria, where a great medical library was collected, anatomy began to be studied and two men whose discoveries were of primary importance for the history of that subject, Erasistratus [280 B.C.] and Herophilus [335-280 B.C.], early practised there."—C. J. Singer, *Greek biology and Greek medicine*, pp. 115, 116.—"Herophilus, ille *anatomicorum coryphaeus*, as Vesalius calls him, was a pupil of Praxagoras, and his name is still in everyday use by medical students, attached to the *torcular Herophili*. Anatomy practically dates from these Alexandrines, who described the valves of the heart, the duodenum, and many of the important parts of the brain; they recognized the true significance of the nerves (which before their day had been confounded with the tendons), distinguished between motor and sensory nerves, and regarded the brain as the seat of the perceptive faculties and voluntary action. Herophilus counted the pulse, using the water-clock for the purpose. . . . Erasistratus elaborated the view of the *pneuma*, one form of which he believed came from the inspired air, and passed to the left side of the heart and to the arteries of the body. It was the cause of the heart-beat and the source of the innate heat of the body, and it maintained the processes of digestion and nutrition. This was the vital spirit; the animal spirit was elaborated in the brain, chiefly in the ventricles, and sent by the nerves to all parts of the body, endowing the individual with life and perception and motion. In this way a great division was made between the two functions of the body, and two sets of organs: in the vascular system, the heart and arteries and abdominal organs, life was controlled by the vital spirits; on the other hand, in the nervous system were elaborated the animal spirits, controlling motion, sensation and the various special senses. These views on the vital and animal spirits held unquestioned sway until well into the eighteenth century, and we still, in a measure, express the views of the great Alexandrian when we speak of 'high' or 'low' spirits."—W. Osler, *Evolution of modern medicine*, pp. 73, 74.—"With anatomy as a basis medical education could become much more systematic. It is a very great misfortune that the works of these two eminent men have disappeared. Of Herophilus fragments have survived embedded in the works of Galen (A.D. 130-201), Caelius Aurelianus (fifth century), and others. . . . After the establishment of the school at Alexandria, medical teaching rapidly became organized, but throughout the whole course of antiquity it suffered from the absence of anything in the nature of a state diploma. Any one could practise, with the result that many quacks, cranks, and fanatics were to be found among the ranks of the practitioners who often were or had been slaves. The great Alexandrian school, however, did much to preserve some sort of professional standard, and above all its anatomical discipline helped to this end. Between the founding of the Alexandrian school and Galen we are not rich in medical writings. Apart from fragments and minor productions, the works of only five authors have survived from this period of over four hundred years, namely, Celsus, Dios-

corides [a Greek army surgeon in the service of Nero], Aretaeus of Cappadocia, and two Ephesian authors bearing the names of Rufus and Soranus. The work of Celsus [a Roman author, but not a physician] of the end of the first century B.C. [about 20 B.C.] is a Latin treatise, probably translated from Greek, and is the surviving medical volume of a complete cyclopaedia of knowledge. In spite of its unpromising origin it is an excellent compendium of its subject and shows a good deal of advance in many respects beyond the Hippocratic position. The moral tone too is very high, though without the lofty and detached beauty of Hippocrates. Anatomy has greatly improved, and with it surgical procedure, and the work is probably representative of the best Alexandrian practice. The pharmacopœia is more copious, but has not yet become burdensome. The general line of treatment is sensible and humane and the language concise and clear. . . . The *De re medica* [of Celsus] is in fact one of the very best medical text-books that have come down to us from antiquity. . . . With the second century of the Christian era we terminate the creative period of Greek medicine. We are provided with the works of four important writers of this century, of whom three, Rufus of Ephesus [2nd century], Soranus of Ephesus, and Aretaeus of Cappadocia, though valuable for forming a picture of the state of medicine in their day, were without substantial influence on the course of medicine in later ages. Rufus of Ephesus, a little junior to Dioscorides, has left us the first formal work on human anatomy and is of some importance in the history of comparative anatomy. In medicine he is memorable as the first to have described bubonic plague, and in surgery for his description of the methods of arresting haemorrhage and his knowledge of the anatomy of the eye. . . . He regarded nerves as originating from the brain, and distinguished between nerves of motion and of sensation. . . . Soranus of Ephesus . . . [2nd century], an acute writer on gynaecology, has left a book which illustrates well the anatomy of his day. It exercised an influence for many centuries to come, and a Latin abstract of it prepared about the sixth century by one Moschion has come down to us in an almost contemporary manuscript. . . . Aretaeus of Cappadocia was probably a contemporary of Galen (second half of the second century A.D.). As a clinical author his reputation stands high, perhaps too high, his descriptions of pneumonia, empyema, diabetes, and elephantiasis having especially drawn attention. In treatment he uses simple remedies, is not affected by polypharmacy, and suggests many ingenious mechanical devices. . . . There remains the huge overshadowing figure of Galen. The enormous mass of the surviving work of this man, the dictator of medicine until the revival of learning and beyond, tends to throw out of perspective the whole of Greek medical records."—C. J. Singer, *Greek biology and Greek medicine*, pp. 116, 110-122.

A.D. 1st century.—Status of physicians in Rome.—Pliny's picture of Greek physicians.—Asclepiades of Bithynia.—"Of the condition of medicine under the Romans, considerable is known but little need be said. Much of Roman medicine is found in the secular writers, particularly the satirists and epigrammatists, and in the inscriptions. Before the second century A.D., the Romans employed medical slaves (*servi medici*), or relied upon their special medical gods (Febris, Scabies, Uterina, and the rest), with an occasional dilettante interest in healing on their own account.

... Even after Asclepiades, Galen, and Soranus had made the status of medicine respectable, the Roman Quirites continued to regard the profession as beneath them."—F. H. Garrison, *Introduction to the history of medicine*, p. 101.—"The medical profession, according to the elder Pliny, was a Greek art which was seldom practised by Romans. Julius Caesar, by giving civic rights to physicians from Egypt and Hellenic lands, while he raised the status of the medical calling, also stimulated the immigration of foreign practitioners. The rank and fortune attained by the court physicians of the early Caesars, Antonius Musa, the Stertini, and others, which almost rivalled the medical successes of our own day, seemed to offer a splendid prize. Yet the profession was generally in low repute. It was long recruited from the ranks of old slaves, and men of the meanest callings. Carpenters and smiths and undertakers flocked into it, often with only a training of six months. Galen found most of his medical brethren utterly illiterate, and recommends them to pay a little attention to grammar in dealing with their patients. They compounded in their own shops, and touted for practice. They called in the aid of spells and witchcraft to reinforce their drugs. We need not believe all the coarse insinuations of Martial against their morality, any more than the sneers of Petronius against their skill. But we are bound to conclude that the profession held a very different place in public esteem from that which it enjoys and deserves in our own time."—S. Dill, *Roman society from Nero to Marcus Aurelius*, pp. 92-93.—Pliny's account of the Greek physicians in Rome in his time (first century) is not flattering to the profession. He says: "For the cure of King Antiochus—to give our first illustration of the profits realized by the medical art—Erasistratus received from his son, King Ptolemæus, the sum of one hundred talents. . . . I pass over in silence many physicians of the very highest celebrity, the Cassii, for instance, the Calpetani, the Aruntii, and the Rubrii, men who received fees yearly from the great, amounting to no less than 250,000 sesterces. As for Q. Stertinius, he thought that he conferred an obligation upon the emperors in being content with 500,000 sesterces per annum; and indeed he proved, by an enumeration of the several houses, that a city practice would bring him in a yearly income of not less than 600,000 sesterces. Fully equal to this was the sum lavished upon his brother by Claudius Cæsar; and the two brothers, although they had drawn largely upon their fortunes in beautifying the public buildings at Neapolis, left to their heirs no less than 30,000,000 of sesterces! such an estate as no physician but Arruntius had till then possessed. Next in succession arose Vettius Valens, rendered so notorious by his adulterous connection with Messalina, the wife of Claudius Cæsar, and equally celebrated as a professor of eloquence. . . . All at once, Charmis, a native . . . of Massilia, took the City by surprise. Not content with condemning the practice of preceding physicians, he proscribed the use of warm baths as well, and persuaded people, in the very depth of winter even, to immerse themselves in cold water. His patients he used to plunge into large vessels filled with cold water, and it was a common thing to see aged men of consular rank make it a matter of parade to freeze themselves; a method of treatment, in favour of which Annaeus Seneca gives his personal testimony, in writings still extant. There can be no doubt whatever, that all

these men, in the pursuit of celebrity by the introduction of some novelty or other, made purchase of it at the downright expense of human life. Hence those woeful discussions, those consultations at the bedside of the patient, where no one thinks fit to be of the same opinion as another, lest he may have the appearance of being subordinate to another; hence, too, that ominous inscription to be read upon a tomb, 'It was the multitude of physicians that killed me.' The medical art, so often modified and renewed as it has been, is still on the change from day to day, and still are we impelled onwards by the puffs which emanate from the ingenuity of the Greeks. . . . Cassius Hemina, one of our most ancient writers, says that the first physician that visited Rome was Archagathus, the son of Lysanias, who came over from Peloponnesus, in the year of the City 535, L. Æmilius and M. Livius being consuls. He states also, that the right of free citizenship was granted him, and that he had a shop provided for his practice at the public expense in the Acilian Cross-way; that from his practice he received the name of 'Vulnerarius'; that on his arrival he was greatly welcomed at first, but that soon afterwards, from the cruelty displayed by him in cutting and searing his patients, he acquired the new name of 'Carnifex,' and brought his art and physicians in general into considerable disrepute. That such was the fact, we may readily understand from the words of M. Cato. . . . 'Concerning those Greeks, son Marcus . . . they are a most iniquitous and intractable race, and you may take my word as the word of a prophet, when I tell you, that whenever that nation shall bestow its literature upon Rome it will mar everything; and that all the sooner, if it sends its physicians among us. They have conspired among themselves to murder all barbarians with their medicine; a profession which they exercise for lucre, in order that they may win our confidence, and dispatch us all the more easily. They are in the common habit, too, of calling us barbarians, and stigmatize us beyond all other nations, by giving us the abominable appellation of Opici. I forbid you to have anything to do with physicians.' Cato, who wrote to this effect, died in his eighty-fifth year, in the year of the City 605; so that no one is to suppose that he had not sufficient time to form his experience, either with reference to the duration of the republic, or the length of his own life. . . . Medicine is the only one of the arts of Greece, that, lucrative as it is, the Roman gravity has hitherto refused to cultivate. It is but very few of our fellow-citizens that have even attempted it."—Pliny, *Natural history* (tr. by Bohn), v. 5, bk. 20, ch. 3-8.—"After the destruction of Corinth (146 B. C.) Greek medicine may be said to have migrated to Rome. . . . Greek medicine was finally established on a respectable footing in Rome through the personality, tact, and superior ability of Asclepiades of Bythynia. . . . Asclepiades was a formal opponent of the Hippocratic idea that morbid conditions are due to a disturbance of the humors of the body (Humoralism), and attributed disease to constricted or relaxed conditions of its solid particles (Solidism)."—F. H. Garrison, *Introduction to the history of medicine*, pp. 01-02.

2nd century: Galen and the development of anatomy and pathology.—"The ancient period closes with the name of the greatest Greek physician after Hippocrates, Galen (131-201), the founder of experimental medicine. . . . At Rome,

where he commenced practice in 164 A.D., he soon attained the leadership of his profession."—F. H. Garrison, *Introduction to history of medicine*, pp. 97-98.—"The greatest name, after Hippocrates, in Greek medicine, [is] that of Galen, born at Pergamon A.D. 130, in whom was united as never before—and indeed one may say, never since—the treble combination of observer, experimenter and philosopher. . . . In his writings, Galen gives many details of his life, mentioning the names of his teachers, and many incidents in his *Wanderjahre*, during which he studied at the best medical schools, including Alexandria. . . . In the year 162, he paid his first visit to Rome, the scene of his greatest labors. Here he gave public lectures on anatomy, and became 'the fashion.' . . . There are records in his writings of many journeys, and busy with his practice in dissections and experiments he passed a long and energetic life, dying, according to most authorities, in the year 200 A.D. . . . Galen had an eclectic mind and could not identify himself with any of the prevailing schools, but regarded himself as a disciple of Hippocrates."—W. Osler, *Evolution of modern medicine*, pp. 74, 77, 79.—"Whether the Asclepiadæ availed themselves of the great opportunities which they must undoubtedly have had of cultivating human and comparative anatomy, has been much disputed in modern times. . . . It is worthy of remark, that Galen holds Hippocrates to have been a very successful cultivator of anatomy. . . . Of the 'Asclepia' we have mentioned above, it will naturally be supposed that some were in much higher repute than others, either from being possessed of peculiar advantages, or from the prevalence of fashion. . . . Above all others Hippocrates was strictly the physician of experience and common sense. In short, the basis of his system was a rational experience, and not a blind empiricism, so that the Empirics in after ages had no good grounds for claiming him as belonging to their sect. What he appears to have studied with particular attention is the natural history of diseases, that is to say, their tendencies to a favorable or fatal issue."—F. Adams, *Preliminary discourse (Genuine works of Hippocrates, sect. 1)*.—"For our purpose, [in studying Galen] both his philosophy and his practice are of minor interest in comparison with his great labors in anatomy and physiology. In anatomy, he was a pupil of the Alexandrians to whom he constantly refers. Times must have changed since the days of Herophilus, as Galen does not seem ever to have had an opportunity of dissecting the human body, and he laments the prejudice which prevents it. In the study of osteology, he urged the student to be on the lookout for an occasional human bone exposed in a graveyard, and on one occasion he tells of finding the carcass of a robber with the bones picked bare by birds and beasts. Failing this source, he advises the student to go to Alexandria, where there were still two skeletons. He himself dissected chiefly apes and pigs. His osteology was admirable, and his little tractate 'De Ossibus' could, with very few changes, be used today by a hygiene class as a manual. His description of the muscles and of the organs is very full, covering, of course, many sins of omission and of commission, but it was the culmination of the study of the subject by Greek physicians. His work as a physiologist was even more important, for, so far as we know, he was the first to carry out experiments on a large scale. In the first place, he was within an ace of discovering the

circulation of the blood. . . . Through errors of Praxagoras and Erasistratus, the arteries were believed to contain air and got their name on that account: Galen showed by experiment that the arteries contain blood and not air. He studied particularly the movements of the heart, the action of the valves, and the pulsatile forces in the arteries. . . . At the periphery, however, Galen recognized (as had been done already by the Alexandrians) that the arteries anastomose with the veins, ' . . . and they mutually receive from each other blood and spirits through certain invisible and extremely small vessels.' It is difficult to understand how Galen missed the circulation of the blood. He knew that the valves of the heart determined the direction of the blood that entered and left the organ, but he did not appreciate that it was a pump for distributing the blood, regarding it rather as a fireplace from which the innate heat of the body was derived. . . . No other physician has ever occupied the commanding position of Clarissimus Galen. For fifteen centuries he dominated medical thought as powerfully as did Aristotle in the schools."—W. Osler, *Evolution of modern medicine*, pp. 79-80, 82.—"Galen was from the first highly esteemed as an anatomist. . . . The emperors Marcus Aurelius and Lucius Verus would have retained him near them; but he preferred pursuing his travels, directed principally by curiosity. When he died, he left behind him numerous works, all of them of great value for the light they throw on the history of anatomy and medicine; and these were for a long period the storehouse of all the most important anatomical knowledge which the world possessed. In the time of intellectual barrenness and servility, among the Arabians and the Europeans of the dark ages, the writings of Galen had almost unquestioned authority; and it was only by an uncommon effort of independent thinking that Abdollatif ventured to assert, that even Galen's assertions must give way to the evidence of the senses. In more modern times, when Vesalius, in the sixteenth century, accused Galen of mistakes, he drew upon himself the hostility of the whole body of physicians."—W. Whewell, *History of the inductive sciences*, v. 2, bk. 17, ch. 1, sect. 1.—"Galen strongly denied being attached to any of the sects of his day, and regarded as slaves those who took the title of Hippocratists, Praxagoreans, or Herophilists, and so on. Nevertheless his predilection in favor of the Hippocratic writings is well marked, for he explains, comments upon them, and amplifies them at length, refutes the objections of their adversaries and gives them the highest place. He says, 'No one before me has given the true method of treating disease; Hippocrates, I confess, has heretofore shown the path, but as he was the first to enter it he was not able to go as far as he wished. . . . He has not made all the necessary distinction, and is often obscure, as is usually the case with ancients when they attempt to be concise. He says very little of complicated diseases; in a word, he has only sketched what another was to complete; he has opened the path, but has left it for a successor to enlarge and make it plain.' This implies how he regarded himself as the successor of Hippocrates, and how little weight he attached to the labors of others. He held that there were three sorts of principles in man—spirits, humors, and solids. Throughout his metaphysical speculations Galen reproduces and amplifies the Hippocratic dogmatism. Between perfect health and disease there were, he thought, eight kinds of temperaments

or imperfect mixtures compatible with the exercise of the functions of life. With Plato and Aristotle he thought the human soul to be composed of three faculties or parts, the vegetive, residing in the liver; the irascible, having its seat in the heart, and the rational, which resided in the brain. He divided diseases of the solids of the body into what he called distempers; he distinguished between the continued and intermittent fevers, regarding the quotidian as being caused by phlegm, the tertian as due to yellow bile, and the quartan due to atrabile. In the doctrine of coction, crises, and critical days, he agreed with Hippocrates; with him he also agreed in the positive statement that diseases are cured by their contraries."—R. Park, *Lectures on the history of medicine*.

2nd century: Women in medicine.—Greek.—Roman.—"There had evidently been quite a considerable amount of opportunity, if not of actual encouragement, for women in medicine, both among the Greeks and the Romans, in the early centuries of the Christian era. Galen, for instance, quotes certain prescriptions from women physicians. One Cleopatra is said to have written a book on cosmetics. This name came afterwards to be confounded with that of Queen Cleopatra, giving new prestige to the book, but neither Galen nor Aëtius, the early Christian physician, both of whom quote from her work, speak of her as anything except a medical writer. Some monuments to women physicians from these old times have escaped the tooth of time. There was the tomb of one Basila, and also of a Thecla, both of whom are said to have been physicians. Two other names of Greek women physicians we have, Origenia and Aspasia, the former mentioned by Galen, the latter by Aëtius in his 'Tetrabiblion.' Darenberg, the medical historian, announced in 1851 that he had found a Greek manuscript with the title, 'On Women's diseases,' written by one Metrodora, a woman physician. He promised to publish it. It was unpublished at the time of his death, but could not be found among his papers. There is a manuscript on medical subjects, bearing this name, mentioned in the catalogue of the Greek Codices of the Laurentian Library at Florence, but this is said to give no indication of the time when its author lived. We have evidence enough, however, to show that Greek women physicians were not very rare. The Romans imitated the Greeks so faithfully—one might almost say copied them so closely—that it is not surprising to find a number of Roman women physicians. The first mention of them comes from Scribonius Largus, in the first century after Christ. Octavius Horatianus whom most of us know better as Priscian, dedicated one of his books on medicine to a woman physician named Victoria. The dedication leaves no doubt that she was a woman in actual practice, at least in women's diseases, and it is a book on this subject that Priscian dedicates to her. He mentions another woman physician, Leoparda. The word *medica* for a woman physician was very commonly used at Rome. Martial, whose epigrams have been a source of so much information in medical history, especially on subjects with regard to which information was scanty, mentions a *medica* in an epigram. Apuleius [in the second century] also uses the word."—J. J. Walsh, *Old-time makers of medicine*, pp. 179-181.

3rd-6th centuries.—Development of hospitals.—Medical practice in Rome.—Women physicians.—"The hospital, even in its most rudimentary

shape, was not known in Rome much before the third century of the Christian era. . . . First, the members of the higher classes of society were not in need of public sanitary institutions; secondly, the slaves, of whom the manufacturing and trading class was chiefly composed, had to be assisted at the expense of their own masters in case of sickness; and besides, medicine was not known and practised as a science, but only in an empiric fashion. Hence patients were compelled to confide more in gods than in men, and to trust in supernatural help for the relief of their ailments. . . . "The more common cases of sickness to which mankind is subject were deified and idolized, and temples and shrines were set up in their honor. . . . In the year of the city 459, when Rome was in danger of annihilation by another plague, the Sibylline books were consulted, as they always were in cases of supreme danger. The answer was . . . Aesculapius must be removed from Epidaurus to Rome—and so he was. The new god was comfortably and neatly installed on an island in the Tiber, now called the island of S. Barolomeo, and his temple became the greatest sanitary establishment in the metropolis. The practice followed by the Roman lower classes was this: patients whose life was in danger were brought into the peristyle or atrium of the sanctuary and put to sleep there, evidently by means of narcotic drugs, in order that Aesculapius might manifest in their dreams the proper way of healing their troubles. Once the recipe was obtained, the priests themselves undertook the cure of the patients; and if the cure succeeded, by some unforeseen and wonderful coincidence, then an ex-voto [offering] was suspended in the sacristy of the sanctuary, together with a tablet describing the happy event. . . . Another strange practice, imported from the East into Rome, was the exposure of the sick in the streets and under open porticoes, in order that passers-by might give them advice from personal experience. . . . A successful physician was sure to receive high official distinction. Areazathus, a Peloponnesian who migrated to Rome in 219, not only was rewarded with citizenship, but obtained a residence, with shop and office, bought at public expense. Aesclepias . . . [of] Bithynia, was almost deified by the populace, and held in great estimation by Crassus and Cicero. Julius Caesar was the first statesman to promote the welfare of hygienists, by recognizing them as professors of a liberal art, with rights to citizenship. Augustus, when cured by his freedman, Antonius Musa, of a dangerous illness, by means of fomentations and cold compresses, made him a knight, honored him with a bronze statue in the temple of Aesculapius, and exempted forever his colleagues from any kind of income-tax. Nero organized the service by naming an archiaterus, or superintendent of court-physicians. Schools of medicine were opened, and students organized themselves into a corporation, the seat of which was on the Esquiline. When one of the professors was called to visit a patient, he was followed by the whole body of pupils, because, there being no hospitals at the time, this was the only way by which they could learn and gain experience. Martial describes one of these professional visits in the ninth epigram of the fifth book, and relates how Dr. Symmachus, when sent for, came at once to his bed, accompanied by more than one hundred disciples, who, one by one, felt his pulse with hands almost frozen by the northern wind, or tramontana, which happened to be blowing at

the time. The merit of organizing a service of public assistance, in the true modern and philanthropic sense of the word, belongs to Antonius Pius, who acted, I am sure, under the indirect pressure of Christian influence and charity, for the new faith had made immense progress in Rome under his wise and temperate rule. The new sanitary codex comprised the institution of head-physicians in every inhabited centre, and a set of rules for the medical service in the largest cities of the empire. These medical officers had to be elected by the town council, and to be approved by the *patres-familiae*. In process of time the election had further to be sanctioned by the College of Physicians practising in the same town, and even by the Emperor himself. Assistance to the poor was compulsory and gratuitous."—R. A. Lanciani, *Ancient Rome in the light of recent discoveries*, pp. 68-73.—"Very early in Christianity care for the ailing poor was taken up, and hospitals in our modern sense of the term became common in Christian communities. There had been military hospitals before this, and places where those who could afford to pay for service were kept during illness. Our modern city hospital, however, is a Christian institution. Besides, deformed and ailing children were cared for and homes for foundlings were established. Before Christianity the power even of life and death of the parents over their children was recognized, and deformed or ailing children, or those that for some reason were not wanted, were exposed until they died. Christianity put an end to this, and in two classes of institutions, the hospitals and the asylums, abundant opportunity for observation of illness was afforded. Just as soon as Christianity came to be free to establish its institutions publicly, hospitals became very common. The Emperor Julian, usually known as the Apostate, who hoped to re-establish the old Roman Olympian religion, wrote to Oribasius, one of the great physicians of this time, who was also an important official of his household, that these Christians had established everywhere hospitals in which not only their own people, but also those who were not Christians, were received, and cared for, and that it would be idle to hope to counteract the influence of Christianity until corresponding institutions could be erected by the government. . . . Just as soon as Christianity brought in a more peaceful state of affairs and had so influenced the mass of the people that its place in the intellectual life could be felt, there comes a period of cultural development during which we have a series of important contributors to medical literature. The first of these was Aëtius [c. 500]. . . . He was followed by Alexander of Tralles, [6th century] probably a Christian, for his brother was the architect of Santa Sophia, and by Paul of Aegina, with regard to whom we know only what is contained in his medical writings, but whose contemporaries were nearly all Christians. Their books are valuable to us, partly because they contain quotations from great Greek writers on medicine, not always otherwise available, but also because they were men who evidently knew the subject of medicine broadly and thoroughly, made observations for themselves, and controlled what they learned from the Greek forefathers in medicine by their own experience. Just at the beginning of the Middle Ages, then, under the fostering care of Christianity there is a period of considerable importance in the history of medical literature. . . . A very interesting chapter in the story of the early Chris-

tian physician is to be found in what we know of the existence of women physicians in the fourth and fifth centuries. Theodosia, the mother of St. Procopius the martyr, was, according to Carptzovius, looked upon as an excellent physician in Rome in the early part of fourth century. She suffered martyrdom under Diocletian. There was also a Nicerata who practised at Constantinople under the Emperor Arcadius. It is said that to her, St. John Chrysostom owed the cure of a serious illness. From the very beginning Christian women acted as nurses, and deaconesses were put in charge of hospitals. Fabiola, at Rome, is the foundress of the first important hospital in that city."—J. J. Walsh, *Old-time makers of medicine*, pp. 8-11.

7th-11th centuries.—Medical art of Arabs.—Jewish schools.—Spanish schools.—Avicenna.—"It probably sounds paradoxical (though it is not) to affirm that, throughout the first half of the Middle Ages, science made its home chiefly with the Semites and Græco-Romans (its founders), while, in opposition to the original relations, faith and its outgrowths alone were fostered by the Germans. In the sterile wastes of the desert the Arabians constructed a verdant oasis of science, in lands to-day the home once more of absolute or partial barbarism. A genuine meteor of civilization were these Arabians. . . . The Arabians built their medicine upon the principles and theories of the Greeks (whose medical writings were studied and copied mostly in translations only), and especially upon those of Galen, in such a way, that, on the whole, they added to it very little matter of their own, save numerous subtle definitions and amplifications. But Indian medical views and works, as well as those of other earlier Asiatic peoples (e.g., the Chaldeans), exercised demonstrably, but in a subordinate degree, an influence upon Arabian medicine. The Arabians interwove too into their medical views various philosophical theorems, especially those of Aristotle, already corrupted by the Alexandrians and still further falsified by themselves with portions of the Neo-Platonic philosophy; and finally they added thereto a goodly share of the absurdities of astrology and alchemy. Indeed it is nowadays considered proven that they even made use of ancient Egyptian medical works, e.g., the papyrus Ebers. Thus the medicine of the Arabians, like Grecian medicine its parent, did not greatly surpass the grade of development of mere medical philosophy, and, so far as regards its intrinsic worth, it stands entirely upon Grecian foundations. . . . Yet they constantly advanced novelties in the sciences subsidiary to medicine, *materia medica* and pharmacy, from the latter of which chemistry, pharmacology and the profession of the apothecary were developed. . . . The mode of transfer of Greek medicine to the Arabians was probably as follows: The inhabitants of the neighboring parts of Asia, including both the Persians and Arabians, as the result of multifarious business connexions with Alexandria, came, even at an early date, in contact with Grecian science, and by degrees a permanent alliance was formed with it. In a more evident way the same result was accomplished by the Jewish schools in Asia, the great majority of which owed their foundation to Alexandria. Such schools were established at Nisibis, at Nahardea in Mesopotamia, at Mathæ-Mechasja on the Euphrates, at Sura, &c., and their period of prime falls in the 5th century. The influence of the Nestorian universities was especially favorable and permanent, particularly the

school under Greek management founded at Edessa, in Mesopotamia, where Stephen of Edessa, the reputed father of Alexander of Tralles, taught (A. D. 530). . . . Still more influential in the transfer of Grecian science to the Arabians was the banishment of the 'heathen' philosophers of the last so-called Platonic school of Athens, by the 'Christian' despot Justinian I. (529). These philosophers were well received at the court of the infidel Chosroës, and in return manifested their gratitude by the propagation of Grecian science. . . . From all these causes it resulted that, even as early as the time of Mohammed (571-632), physicians educated in the Grecian doctrines lived among the Arabians. . . . Arabian culture (and of course Arabian medicine) reached its zenith at the period of the greatest power and greatest wealth of the Caliphate in the 9th and 10th centuries. At that time intellectual life was rooted in the schools of the mosques, i. e., the Arabian universities, which the great caliphs were zealous in founding. Such Arabian universities arose and existed in the progress of time (even as late as the 14th century) at Bagdad, Bassora, Cufa, Samarcand, Ispahan, Damascus, Bokhara, Firuzabad and Khurdistan, and under the scholastic Fatimides (909-1171) in Alexandria. Under the Ommyiades (755-1031), after the settlement of the Arabians in Spain in the beginning of the 8th century, were founded the famous universities of Cordova (possessing in the 10th century a library of 250,000 volumes), Seville, Toledo, Almeria and Murcia under the three caliphs named Abderrahman and Al Hakem. Less important were the universities of Granada and Valencia, and least important of all, those founded by the Edrisi dynasty (800-986) in the provinces of Tunis, Fez and Morocco. In spite of all these institutions the Arabians possessed no talent for productive research; still less, like the ancient Semites, did they create any arts, save poesy and architecture. Their whole civilization bore the stamp of its foreign origin."—J. H. Baas, *Outlines of the history of medicine*, pp. 216-229. —"The first of the Arabians, known throughout the Middle Ages as the Prince, the rival, indeed, of Galen, was the Persian Ibn Sina, better known as Avicenna, one of the greatest names in the history of medicine. Born about 980 A. D. in the province of Khorasan, near Bokhara, he has left a brief autobiography from which we learn something of his early years. . . . He was a voluminous writer to whom scores of books are attributed, and he is the author of the most famous medical text-book ever written. It is safe to say that the 'Canon' was a medical bible for a longer period than any other. It 'stands for the epitome of all precedent development, the final codification of all Graeco-Arabic medicine. It is a hierarchy of laws liberally illustrated by facts which so ingeniously rule and are subject to one another, stay and uphold one another, that admiration is compelled for the sagacity of the great organiser who, with unparalleled power of systematisation, collecting his material from all sources, constructed so imposing an edifice of fallacy. . . . The Western Caliphate produced physicians and philosophers almost as brilliant as those of the East. Remarkable schools of medicine were founded at Seville, Toledo and Cordova. The most famous of the professors were Averroës, Albucasis and Avenzoar. Albucasis was 'the Arabian restorer of surgery.' Averroës, called in the Middle Ages 'the Soul of Aristotle' or 'the Commentator,' is better known today among philosophers than physicians. On the revival of Moslem orthodoxy he fell upon evil

days, was persecuted as a free-thinker, and the saying is attributed to him—'*Sit anima mea cum philosophis.*' . . . The Graeco-Arabic learning passed into Europe through two sources. . . . Constantinus Africanus, a North African Christian monk, widely travelled and learned in languages, came to Salerno and translated many works from Arabic into Latin, particularly those of Hippocrates and Galen. . . . It is not unlikely that Arabic medicine had already found its way to Salerno before the time of Constantine, but the influence of his translations upon the later Middle Ages was very great. The second was a more important source—through the Latin translators in Spain, particularly in Toledo, where, from the middle of the twelfth till the middle of the thirteenth century, an extraordinary number of Arabic works in philosophy, mathematics and astronomy were translated. . . . Two universities have a special interest at this period in connection with the development of medical studies, Bologna and Montpellier. At the former the study of anatomy was revived. In the knowledge of the structure of the human body no advance had been made for more than a thousand years—since Galen's day. In the process of translation from Greek to Syriac, from Syriac to Arabic, from Arabic to Hebrew, and from Hebrew or Arabic to Latin, both the form and thought of the old Greek writers were not infrequently confused and often even perverted, and Galen's anatomy had suffered severely in the transmission."—W. Osler, *Evolution of modern medicine*, pp. 98, 103-104.—"The Saracens commenced the application of chemistry, both to the theory and practice of medicine, in the explanation of the functions of the human body and in the cure of its diseases. Nor was their surgery behind their medicine. Albucasis, of Cordova, shrinks not from the performance of the most formidable operations in his own and in the obstetrical art; the actual cautery and the knife are used without hesitation. He has left us ample descriptions of the surgical instruments then employed; and from him we learn that, in operations on females in which considerations of delicacy intervened, the services of properly instructed women were secured. How different was all this from the state of things in Europe; the Christian peasant, fever-stricken or overtaken by accident, hied to the nearest saint-shrine and expected a miracle; the Spanish Moor relied on the prescription or lancet of his physician, or the bandage and knife of his surgeon."—J. W. Draper, *History of the intellectual development of Europe*, v. 2, ch. 2.—"The accession of Gehwer to the throne of Mussulman Spain, early in the eleventh century, was marked by the promulgation of regulations so judiciously planned, touching medical science and its practice, that he deserves the highest commendation for the unwavering zeal with which he supervised this important branch of learning taught in the metropolis. Those evils which the provinces had suffered previous to his rule, through the practice of medicine by debased empirics, were quickly removed by this sagacious Caliph. Upon the publication of his rescripts, such medical charlatans or ambulatory physicians as boldly announced themselves to be medici, without a knowledge of the science, were ignominiously expelled from the provincial towns. He decreed that a college of skilled surgeons should be forthwith organized, for the single specified function of rigidly examining into the assumed qualifications of applicants for licenses to exercise the curative art in municipal or rural departments, or sought professional employment as

physicians in the numerous hospitals upon the Mahometan domains."—G. F. Fort, *Medical economy during the Middle Ages*, ch. 17.—"Anatomy and physiology, far from making any conquests under Arabian rule, followed on the contrary a retrograde movement. As those physicians never devoted themselves to dissections, they were under the necessity of conforming entirely to the accounts of Galen. . . . Pathology was enriched in the Arabian writings by some new observations. . . . The physicians of this nation were the first . . . who began to distinguish eruptive fevers by the exterior characters of the eruption, while the Greeks paid but little attention to these signs. Therapeutics made also some interesting acquisitions under the Arab physicians. It owes to them, among other things, the introduction of mild purgatives, such as cassia, senna, and manna, which replaced advantageously, in many cases, the drastics employed by the ancients; it is indebted to them, also, for several chemical and pharmaceutical improvements, as the confection of syrups, tinctures, and distilled waters, which are very frequently and usefully employed. Finally, external therapeutics, or surgery, received some minor additions, such as pomades, plasters, and new ointments; but these additions were very far from compensating for the considerable losses which it suffered by their abandoning a multitude of operations in use among the Greeks."—P. V. Renouard, *History of medicine*, p. 267.

10th century.—Medical schools.—Salerno.—Bologna.—North Italy.—France.—Anesthesia and antiseptis.—Dentistry.—Medicines.—"With the foundation of the medical school of Salerno in the tenth century, the modern history of medical education may be said to begin, for it had many of the features that distinguish our modern university medical schools. Its professors often came from a distance and had travelled extensively for purposes of study; they attracted patients of high rank from nearly every part of Europe, and these were generous in their patronage of the school. "Though much work has been done on the subject in recent years, it is not easy to trace the origin of the medical school at Salerno. The difficulty is emphasized by the fact that even the earliest chroniclers whose accounts we have were not sure as to its origin, and even had some doubt about the age of the school. Alphanus, usually designated Alphanus I because there are several of the name, who is one of the earliest professors, whose name and fame have come down to us, gives us the only definite detail as to the age of the school. He was a Benedictine monk, distinguished as a literary man, known both as poet and physician, who was afterwards raised to the Bishopric of Salerno. As a bishop he was one of the beneficent patrons, to whom the school owed much. He lived in the tenth century, and states that medicine flourished in the town before the time of Guimarus II, who reigned in the ninth century. . . . While we do not know exactly when the medical school at Salerno was founded, we know that a hospital was established there as early as 820. It was founded by the Archdeacon Adelmus, and was placed under the control of the Benedictines after it was realized that a religious order, by its organization, was best fitted for carrying on such charitable work continuously. Other infirmaries and charitable institutions, mainly under control of the religious, sprang up in Salerno. It was the presence of these hospitals in a salubrious climate that seems first to have attracted the attention of patients and then of

physicians from all over Europe and even adjacent Africa and Asia. Puschmann says that it is uncertain whether clinical instruction was imparted in these institutions or not, but the whole tenor of what we know about the practical character of the teaching at Salerno and of the fine development of professional medicine there, would seem to argue that probably those who came to study medicine here were brought directly in contact with patients. As early as the ninth century Salerno was famous for its great physicians. We know the names of at least two physicians, Joseph and Joshua, who practised there about the middle of the ninth century. Ragenifrid, a Lombard by his name, was private physician to Prince Wyamar of Salerno in the year 900. The fact that he was from North Italy indicates that already foreigners were being attracted, but more than this that they were obtaining opportunities unhampered by any Chauvinism. From early in the tenth century physicians from Salerno were frequently brought to foreign courts to become the attending physicians to rulers. Patients of the highest distinction from all over Europe began to flock to Salerno, and we have the names of many of them. In the tenth century Bishop Adalberon, when ailing, went there, though he found no cure for his ills. . . . Salerno's influence on Bologna is not difficult to trace, and the precious tradition of surgery particularly, which was carried to the northern university, served to initiate a period of surgery lasting nearly two centuries, during which we have some of the greatest contributions to this branch of medical science that were ever made. The development of the medical school at Bologna anticipated by but a short time that of a series of schools in the north Italian universities. Padua, Piacenza, Pisa, and Vicenza had medical schools in the later Middle Ages, the works of some of whose professors have attracted attention. It was from these north Italian medical schools that the tradition of close observation in medicine and of thoroughly scientific surgery found its way to Paris."—J. J. Walsh, *Old-time makers of medicine*, pp. 14-15, 142-145, 16.—Salerno had its great period in the 11th and 12th centuries. It declined after its sack by Henry VI, 1194, but, nevertheless it produced famous men in the thirteenth century such as Theodoric, bishop of Cervia, who advocated asepsis—for which he was reviled by the more famous Guy de Chauliac—and to whom with his master Hugh of Lucca the earliest use of anesthetics was for a longtime attributed. Anesthesia, however, was in use of Salerno certainly as early as the eleventh century. The means employed was the "soporific sponge" described by Nicholas of Salerno as being composed of a mixture of opium, hyos-cyamus, mulberry juice, lettuce, hemlock, mandragora and ivy. The school of Salerno was still in existence in 1811 when it was abolished by Napoleon.

MEDIEVAL

10th-12th centuries.—Medical school of Salerno.—Legal regulation of medical practice.—Constantine Africanus.—Women at Salerno.—"The Medical School at Salerno . . . is of great interest in modern times for a number of reasons. First it brought about in the course of its development an organization of medical education, and an establishment of standards that were to be maintained whenever and wherever there was a true professional spirit down to our own time. They insisted on a preliminary education of three years

of college work, on at least four years of medical training, on special study for specialist's work, as in surgery, and on practical training with a physician or in a hospital before the student was allowed to practise for himself. At Salerno, too, the department of women's diseases was given over to women professors, and we have the text-books of some of these women medical teachers. The license to practise given to women, however, seems to have been general and did not confine them merely to the care of women and children. We have records of a number of these licenses issued to women in the neighborhood of Salerno. . . . "The best proof of how thorough was the medical education at Salerno and how much influence it exerted even over public opinion is to be found in the regulation of the practice of medicine, which soon began, and the insistence upon proper training before permission to practise medicine was granted. The medical school at Salerno early came to be a recognized institution in the kingdom of the Two Sicilies, representing a definite standard of medical training, . . . and it is not surprising, then, that the legal authorities in this part of the country proceeded to the enforcement of legal regulations demanding the attainment of this standard. . . . As early as the year 1140, King Ruggiero (Roger) of the Two Sicilies promulgated the law: 'Whoever from this time forth desires to practise medicine must present himself before our officials and judges, and be subject to their decision. Anyone audacious enough to neglect this shall be punished by imprisonment and confiscation of goods. This decree has for its object the protection of the subjects of our kingdom from the dangers arising from the ignorance of practitioners.' Just about a century later the Emperor Frederick II, the Hohenstaufen, in the year 1240, extended this law, emphasized it, and brought it particularly into connection with the great medical school of the Two Sicilies, of which territory he was the ruler. . . . Before the introduction of Arabian medicine the Salernitan school of medicine was noted for its common-sense methods and its devotion to all the natural modes of healing. It looked quite as much to the prevention of disease as its treatment. Diet and air and water were always looked upon as significant therapeutic aids. . . . [Pagel says] 'Salerno, at the end of the twelfth century, had already reached its highest point of advance in medicine and was beginning to decline. Decadence was evident in so far as all the medical works that we have from that time are either borrowings or imitations from Arabian medicine with which eventually Salernitan medical literature became confounded. Only a few independent authors are found after this time. . . . Probably the most important representative of the medical school at Salerno, certainly the most significant member of its faculty, if we consider the wide influence for centuries after his time that his writings had, was Constantine Africanus [d. 1087]. He is interesting, too, for many other reasons, for he is the first representative, in modern times, that is, who, after the incentive of antiquity had passed, devoted himself to creating a medical literature by translations, by editions, and by the collation of his own and others' observations on medical subjects. He is the connecting link between Arabian medicine and Western medical studies. The fact that he was first a traveller over most of the educational world of his time, then a professor at the University of Salerno who attracted many students, and finally a Benedictine monk in the great abbey at Monte Cassino, shows how his life ran

the gamut of the various phases of interest in the intellectual world of his time. . . . The organization of the department of women's diseases at Salerno, under the care of women professors, and the granting of licenses to women to practise medicine, is not so surprising in the light of this tradition among Greeks and Romans, taken up with some enthusiasm by the Christians. We are not sure just when this development took place. The first definite evidence with regard to it comes in the life of Trotula, who seems to have been the head of the department. . . . She seems to have flourished about the middle of the eleventh century. . . . De Renzi has made out a rather good case for the tradition that Trotula was the wife of John Platearius I—so called because there were probably three professors of that name, . . . all of them distinguished members of the faculty at Salerno. Her reputation extended far beyond her native town, and even Italy itself, and, in later centuries, her name was used to dignify any form of treatment for women's diseases that was being exploited. . . . Two books are attributed to Trotula; one bears the title, 'De Passionibus Mulierum,' and the other has been called 'Trotula Minor,' or 'Summula Secundum Trotulam,' and is a compendium of what she wrote. This is probably due to some disciple, but seems to have existed almost in her own time. Her most important work bears two sub-titles, 'Trotula's Unique Book for the Curing of Diseases of Women, Before, During and After Labor,' and the other sub-title 'Trotula's Wonderful Book of Experience (*experimentalis*) in the Diseases of Women, Before, During, and After Labor, with Other Details Likewise Relating to Labor.' . . . There are many interesting details in the book, [which] . . . in many ways . . . anticipate modern solutions of difficult problems in women's diseases, and the care of the mother and child before, during, and after labor. For instance, there are a series of rules on the choice of the nurse, and on the diet and the régime which she should follow if the child is to be properly nourished without disturbance. . . . One of the most important books on medicine that has come to us from the twelfth century is that of a Benedictine abbess, since known as St. Hildegard, whose life was spent in the Rhineland. . . . [who] found leisure to write a series of books, most of them on mystical subjects, but two of them on medical subjects. The first is called 'Liber Simplicis Medicinæ,' and the second 'Liber Compositæ Medicinæ.' These books were written in order to provide information mainly for the nuns who had charge of the infirmaries of the monasteries of the Benedictines. . . . The first work consists of nine books, treating of plants, elements, trees, stones, fishes, birds, quadrupeds, reptiles, and metals, and is printed in Migne's 'Patrologia,' under the title 'Subtilitatum Divesarum Naturarum Libri Novem.' The second, in five books, treats of the general diseases of created things, of the human body and its ailments, of the causes, symptoms, and treatment of diseases. . . . Dr. Melanie Lipinska, in her 'Histoire des Femmes Médecins,' . . . says that the saint distinguishes a double mode of action of different substances, one chemical, the other physical, or what we would very probably call magnetic. She discusses all the ailments of the various organs, the brain, the eyes, the teeth, the heart, the spleen, the stomach, the liver. She had special chapters on redness and paleness of the face, on asthma, on cough, on fetid breath, on bilious indigestion, on gout. Besides, she has other chapters on nervous affections, on

icterus, on fevers, on intestinal worms, on infections due to swamp exhalations, on dysentery, and a number of forms of pulmonary diseases. Nearly all of our methods of diagnosis are to be found, hinted at at least, in her book. She discusses the redness of the blood as a sign of health, the characteristics of various excrementitious material as signs of disease, the degrees of fever, and the changes in the pulse. Of course, it was changes in the humors of the body that constituted the main causes for disease in her opinion. . . . For Hildegard the brain was the regulator of all the vital qualities, the centre of life. She connects the nerves in their passage from the brain and the spinal cord through the body with manifestations of life. She has a series of chapters with regard to psychology normal and morbid. She talks about frenzy, insanity, despair, dread, obsession, anger, idiocy, and innocency. She says strongly in

pellier. Many prominent rulers and ecclesiastics selected Jewish physicians. Some of these made distinct contributions to medicine, and a number of them deserve a place in any account of medicine in the making during the Middle Ages. One of them, Maimonides . . . deserves a place among the great makers of medicine of all time, because of the influence that he exerted on his own and succeeding generations. Any story of the preservation and development of medical teaching and medical practice during the Middle Ages would be decidedly incomplete without due consideration of the work of Jewish physicians. . . . Moses Ben Maimon [Maimonides] . . . was born at Cordova in Spain, on the 30th of March in the year 1135 or 1139, the year is in doubt. . . . After his preliminary education at home Maimonides studied the natural sciences and medicine with Moorish teachers. Jewish persecutions drove the family from Spain, and Maimonides finally settled and married in Egypt. He became one of the busiest of practising physicians. . . . He well deserves a place among the great practical masters of medicine, as well as high rank among the physicians of his time. There is little that is original in his writing, but his thorough-going common sense, his wide knowledge, and his discriminating eclectic faculty make his writings of special value. As might have been expected, the Aphorisms of Hippocrates attracted his attention, and, besides, he wrote a series of aphorisms of his own. The most interesting of his writings, however, is a series of letters on dietetics written for the son of his patron Saladin. . . . The rules of life and health that Maimonides laid down in these letters have become part of our popular medical tradition. Probably more of the ordinarily current maxims as to health have been derived from them than would possibly be suspected by anyone not familiar with them. . . . On other subjects Maimonides was just as sensible. Perhaps in nothing is this more striking than in his complete rejection of astrology. Considering how long astrology, in the sense of the doctrine of the stars influencing human health and destinies, had dominated men's minds, and how universal was the acceptance of it, Maimonides' strong expressions show how much genius lifts itself above the popular persuasions of its time, even among the educated, and how much it anticipates subsequent knowledge. It is well to remind ourselves that as late as the middle of the eighteenth century Mesmer's treatise on The Influence of the Stars on Human Constitutions was accepted by the faculty of the University of Vienna as satisfactory evidence not only of his knowledge of medicine but of his power to reason about it. At the end of the twelfth century Maimonides was trying to argue it out of existence on the best possible grounds. 'Know, my masters,' he writes, 'that no man should believe anything that is not attested by one of these three sanctions:—rational proof as in mathematical science, the perception of the senses, or traditions from the prophets and learned men.' . . . He died in 1204, just at the beginning of one of the great productive centuries of humanity. . . . [He] was . . . in his own time one of the world's teachers, and, in a certain sense, he must always remain that."—J. J. Walsh, *Old-time makers of medicine*, pp. 12, 105-108.

12th-15th centuries.—Roger's Practica.—Aseptic wound treatment.—Anesthesia.—College of St. Côme.—Lanfranc founder of French surgery.—Study of anatomy.—De Mondeville.—Guy de Chauliac.—Papal bulls.—Medical education.—Popular Pharmacopœia.—Belief in mi-

MOSES BEN MAIMON (MAIMONIDES)

Traditional portrait

one place that 'when headache and migraine and vertigo attack a patient simultaneously they render a man foolish and upset his reason. This makes many people think that he is possessed of a demon, but that is not true.'—J. J. Walsh, *Old-time makers of medicine*, pp. 141, 146, 147, 157, 163, 182-184, 190, 193, 195-197.

12th century.—Maimonides.—"During the early Christian centuries much was owed to the genius and the devotion to medicine of distinguished Jewish physicians. Their sacred and rabbinical writers always concerned themselves closely with medicine, and both the Old Testament and the Talmud must be considered as containing chapters important for the medical history of the periods in which they were written. At all times the Jews have been distinguished for their knowledge of medicine, and all during the Middle Ages they are to be found prominent as physicians. They were among the teachers of the Arabs in the East and of the Moors in Spain. They were probably among the first professors at Salerno as well as at Mont-

raculous cures.—“The principal outcome of the School of Salerno was the work of two surgeons, Roger . . . of Palermo and Roland . . . of Parma. . . . Roger’s *Practica*, became a standard text-book of Salerno, where he himself had been a student and teacher. He knew of cancer and (possibly) syphilis, described a case of hernia of the lungs, prescribed ashes of sponge and sea-weed (iodides) for goiter or scrofula, employed the significant mercurial salve for chronic dermal and parasitic affections, introduced the seton and suture of the intestines over a hollow tube, taught the use of styptics, sutures and ligatures in hemorrhage and the healing of wounds by second intention (laudable pus). Roger, Roland and the Four Masters were succeeded by the twelfth century surgeons, Jamerius and Hugh of Lucca (Ugo Borgognoni), . . . by Bruno of Longoburg, an advocate of dry (aseptic) wound treatment, whose ‘*Chirurgia magna*’ completed at Padua in 1252, is the first treatise of the time in which Arabic authors are drawn upon; by Hugh’s son or disciple, Teodorico Borgognoni (1205-1206), Bishop of Cervia, . . . [who] contradicted the pseudo-Galenist dogma of ‘coction’ or ‘laudable pus’ and stood out in his day as a sturdy pioneer of a rational asepis: ‘For it is not necessary, as Roger and Roland have written, as many of their disciples teach, and as all modern surgeons profess,’ he says, ‘that pus should be generated in wounds. No error can be greater than this.’ . . . This simple statement, as Allbutt points out, makes Theodoric one of the most original surgeons of all time, for only Mondeville, Paracelsus and Lister upheld these principles after him. . . . Hugh and Theodoric . . . are also associated with the medieval substitutes for anesthesia, the origins of which, however, go back to the remote past, probably to India. . . . [William of Saliceto of the school of Bologna, who flourished at the end of the thirteenth century, made a vigorous attempt to go back to the practice of independent observation. But he is quite overshadowed by his great pupil Lanfranc of Milan, who, for political reasons, was driven from his native town, and went first to Lyons and then to Paris.] Arriving in Paris in 1295, he found himself, as a married man, shut out of teaching at the university, where the professors were celibate clerics; and he therefore became associated with the College de Saint Côme, organized before 1260 by Jean Pitard, surgeon to Philip the Fair (1306-28). Here, by his straightforward style of lecturing and his use of bedside instruction, he became the virtual founder of French surgery, and died in 1315. . . . Lanfranc made a resolute and valiant stand against the medieval schism between surgery and medicine which had existed since Avicenna’s time. . . . He was the first to describe concussion of the brain, and his chapter on the symptoms of fracture of the skull is accounted a classic. . . . The work of Saliceto and Lanfranc, coincident with the development of the great medieval universities—Paris (1110), Bologna (1113), Oxford (1167), Montpellier (1181), Padua (1222), Naples (1224)—and the brilliant false dawn of culture and liberalism in the thirteenth century, did much to further the growth of surgical talent in France, England and Flanders. From the Italian families delle Preci and da Norsia came the Preciani and the Norsini, whole generations of itinerant surgeons.”—F. H. Garrison, *Introduction to the history of medicine*, pp. 135-138.—“At the school of Salerno it was decreed that the human body should be dissected at least once every five years, but it was with the greatest difficulty that per-

mission was obtained for this purpose. It seems probable that under the strong influence of Taddeo there was an occasional dissection at Bologna, but it was not until Mundinus (professor from 1306 to 1326) took the chair that the study of anatomy became popular. . . . In 1316, Mundinus issued his work on anatomy, which served as a text-book for more than two hundred years. . . . The other early mediæval university of special interest in medicine is that of Montpellier. With it are connected three teachers who have left great names in our story—Arnold of Villanova, Henri de Mondeville and Guy de Chauliac. The city was very favorably situated not far from the Spanish border, and the receding tide of the Arab invasion in the eighth century had left a strong Arab influence in that province. The date of the origin of the university is uncertain, but there were teachers of medicine there in the twelfth century, though it was not until 1289 that it was formally founded by a papal bull. Arnold of Villanova was one of the most prolific writers of the Middle Ages. He had travelled much, was deeply read in Arabic medicine and was also a student of law and of philosophy. He was an early editor of the *Regimen Sanitatis*, and a strong advocate of diet and hygiene. His views on disease were largely those of the Arabian physicians, and we cannot see that he himself made any very important contribution to our knowledge; but he was a man of strong individuality and left an enduring mark on mediæval medicine, as one may judge from the fact that among the first hundred medical books printed there were many associated with his name. He was constantly in trouble with the Church, though befriended by the Popes on account of his medical knowledge. There is a Bull of Clement V asking the bishops to search for a medical book by Arnold dedicated to himself, but not many years later his writings were condemned as heretical.”—W. Osler, *Evolution of modern medicine*, pp. 106-107.—“Contemporary with Lanfranc [of Milan] was his loyal follower, Henri de Mondeville (1260-1320), a hardy and original thinker, endowed with great powers of wit and sarcasm, who made a valiant last stand for the principle of avoiding suppuration by simple cleanliness, as originally taught by Hippocrates and as reintroduced by Hugh and Theodoric. Before 1301, he was one of the four body surgeons of Philip the Fair, and in 1304 he delivered lectures on anatomy at the University of Montpellier. The surgical treatise of Mondeville . . . abounds in directions of the rarest common sense for the aseptic treatment of wounds and in shrewd practical advice to the surgeon as to the conduct of his professional life. . . . A man of far different type was Guy de Chauliac (1300-70), the most distinguished authority on surgery in the fourteenth and fifteenth centuries. A country boy from Auvergne, Guy managed, through friends, to take holy orders and to get an excellent medical education at Toulouse, Montpellier and Paris, with a special course in anatomy at Bologna. He thus became the most erudite surgeon of his time, and in due course, settled down at Avignon as physician and ‘commensal chaplain’ to Pope Clement VI and to his successors, Innocent VI and Urban V (1352-78). He was a writer of rare learning, endowed with a fine critical and historic sense, and, indeed, the only medical historian of consequence between Celsus and Haller. As an operator, he set great store by the study of human anatomy. . . . He throws a great light upon the operative procedure of his time by his description of the narcotic or soporific inhalation, originally

attributed to Theodoric. This, the medieval substitute for anesthesia, as above described, was in vogue up to the seventeenth century. . . . Yet, in spite of his wide experience, Guy de Chauliac was on the whole a reactionary in the important matter of the treatment of wounds and, by his great authority, threw back the progress of surgery for some six centuries, giving his personal weight to the doctrine that the healing of a wound must be accomplished by the surgeon's interference—salves, plasters and other meddling—rather than by the healing power of nature. . . . Hand in hand with the medieval development of surgery, there necessarily went some effort to improve the status of human anatomy. Dissecting, at first rigorously prescribed by law and sentiment, became more and more a matter of course, following the decree of Emperor Frederick II in 1240. Payne has divided medieval anatomic teaching into three periods: First, the Salernitan (800-1200), in which instruction was based upon the dissection of animals as set forth in the 'Anatomia Porci' of Copho, one of the Jewish instructors at Salerno; second, the Arabist period (thirteenth century), in which such dissections were superseded by books and lectures. The leading authorities of this time were Richard, of Wendover, called Ricardus Anglicus (1252), physician to Gregory IX, whose work is preserved in the text of Robert Töply (Vienna, (1902); and Henri de Mondeville, who, long before Ambroise Paré, prefixed an anatomic treatise to his surgery, and who improved upon Wendover's teaching by the use of pictures, diagrams and a model of the skeleton. . . . In the Dark Ages, the clergy were the only class who had any pretense to education and, before the time of the School of Salerno, medicine was entirely in the hands of Jewish and Arabian physicians. The rest were simply vagrant quacks or stationary humbugs whose practice was discountenanced by the Church on the ground that faith, prayers and fasting were better than pagan amulets, while the sick were advised to emulate the saints in their capacity for endurance of suffering (Gregory of Tours). With the rise of the School of Salerno, European medicine began to look up a little, but, as soon as monks and clerics began to practise medicine, it was found that the seeking of medical fees to the detriment of regular duties, the sight of many aspects of the sick that might offend modesty, the possibility of being the cause of a patient's death and other happenings were somewhat inconsistent with the original intention of holy orders, and so we find the Church instituting that long series of edicts which, in the first instance, were aimed not so much at medicine as at its malpractice by monks. These were the decrees of the councils of Clermont (1130), Rheims (1131), the Second Lateran (1130), Montpellier (1162), Tours (1163), Paris (1212), the Fourth Lateran (1215), and Le Mans (1247), and their general effect was, unfortunately, not only to stop the monks from practising but to extend the special odium of these decrees to the whole medical profession. As Allbutt says, 'If Papal bulls conferred privileges, they usually implied or imposed restrictions.' The famous maxim of the Council of Tours ('*Ecclesia abhorret a sanguine*'), for example, went wide of its supposed intention, since, in casting discredit upon the sometimes murderous vagabond surgeon, the weight of its authority made the surgeon of best type still an inferior to the average practitioner, even in Protestant Germany to the end of the eighteenth century. Worse still, the bigots of the Paris Faculty went much further than the Papal See in widening the gap

between surgery and medicine. The Roman Pontiffs themselves were, some of them, liberal-minded men of the world, who did not hesitate to employ talented Jewish physicians at need and, in later times, did much to foster the arts and sciences, in Italy at least. John XXI and Paul II were physicians. 'Around the Papal Chair,' says Allbutt, 'the velvet of the hand of the Church was thicker than the iron. In the air of Rome or of Avignon the grim rigor of Paris was marvelously softened.'—F. H. Garrison, *Introduction to the history of medicine*, pp. 130, 141, 143, 152-153.—"One other great mediæval physician may be mentioned, Peter of Abano (a small town near Padua, famous for its baths). He is the first in a long line of distinguished physicians connected with the great school of Padua. Known as 'the Conciliator,' from his attempt to reconcile the diverse views on philosophy and medicine, he had an extraordinary reputation as a practitioner and author, the persistence of which is well illustrated by the fact that eight of the one hundred and eighty-two medical books printed before 1481 were from his pen. He seems to have taught medicine in Paris, Bologna and Padua. He was a devoted astrologer, had a reputation among the people as a magician, and, like his contemporary, Arnold of Villanova, came into conflict with the Church and appears to have been several times before the Inquisition; indeed it is said that he escaped the stake only by a timely death. . . . The University of Pavia was founded in 1361. . . . A list is given of the teachers in medicine for the year 1433, twenty in all, and there were special lectures for the morning, afternoon and evening. The subjects are medicine, practical medicine, physics, metaphysics, logic, astrology, surgery and rhetoric: very striking is the omission of anatomy, which does not appear in the list even in 1467. . . . The Arabians were famous for their vigor and resource in matters of treatment. Bleeding was the first resort in a large majority of all diseases. In the 'Practica' of Ferrari there is scarcely a malady for which it is not recommended. All remedies were directed to the regulation of the six non-naturals, and they either preserved health, cured the disease—or did the opposite. The most popular medicines were derived from the vegetable kingdom, and as they were chiefly those recommended by Galen, they were, and still are, called by his name. Many important mineral medicines were introduced by the Arabians, particularly mercury, antimony, iron, etc. There were in addition scores of substances, the parts or products of animals, some harmless, others salutary, others again useless and disgusting."—W. Osler, *Evolution of modern medicine*, pp. 110, 115-116, 118.—"A work translated from the German in the year 1561, and entitled 'A most excellent and perfecte homish apothecarye or physicke booke, for all the grefes and diseases of the bodye,' [throws light on the ideas and pharmacopœia of the period]. The first chapter is 'Concerning the Head and his partes.' 'Galen sayth, the head is divided into foure partes: in the fore part hath blood the dominion; Colera in the ryght syde, Melancholy in the left syde, and Flegma beareth rule in the hindermost part. If the head doth ake so sore by reason of a runninge that he cannot snoffe hys nose, bath hys fete in a depe tub until the knees and give him this medicine . . . which riseth into hys head and dryeth hys moyst braynes. Galen sayth He that hath payne in the hindermost part of hys head, the same must be let blood under the chynne, specially on the right side; also were it good ofte to burn

the heyre of a man before hys nose. The braynes are greved many wayes; many there are whom the head whyrleth so sore that he thinketh the earth torneth upsye doune: Cummin refraineth the whyling, comforteth the braynes and maketh them to growe agayne: or he may take the braynes of a hogge, rost the same upon a grede yron and cut slices thereof and lay to the greved parts.' This doctrine of like helping like was of universal application, and in medical works of the Middle Ages we meet constantly with such prescriptions as these:—"Take the right eye of a Frogg, lap it in a peece of russet cloth and hang it about the neck; it cureth the right eye if it bee enlamed or bleared. And if the left eye be greved, do the like by the left eye of the said Frogg.' Again—"The skin of a Raven's heel is good against the gout, but the right heel skin must be laid upon the right foot if that be gouty, and the left upon the left.' . . . We find it prescribed as a cure for the quartane ague to lay the fourth book of Homer's Iliad under the patient's head. . . . For weak eyes the patient is to 'take the toungue of a foxe, and hange the same about his necke, and so long it hangeth there his sight shall not wax feeble, as sayth Pliny.' The hanging of such amulets round the neck was very frequently prescribed, and the efficacy of them is a thing curiously well attested. Elias Ashmole in his diary for 1681 has entered the following—"I tooke this morning a good dose of elixir, and hung three spiders about my neck, and they drove my ague away. Deo gratias!" A baked toad hung in a silk bag about the neck was also held in high esteem, as was a toad, either alive or dried, laid upon the back of the neck as a means of stopping bleeding at the nose; and again, 'either frogg or toade, the nails whereof have been clipped, hanged about one that is sick of quartane ague, riddeth away the disease forever, as sayth Pliny.' We have even a striking instance of the benefit derived from an amulet by a horse, who could not be suspected of having helped forward the cure by the strength of his faith in it. 'The root of cut Malowe hanged about the neck driveth away blemishes of the eyes, whether it be in a man or a horse, as I Jerome of Brunswieg, have seene myselve. I have myselve done it to a blind horse that I bought for X crounes, and was sold again of XI. crounes'—a trick distinctly worth knowing."—E. A. King, *Medieval medicine (Nineteenth Century, July, 1893)*.—"The saints have proved sad enemies to the doctors. Miraculous cures are attested by monks, abbots, bishops, popes, and consecrated saints. . . . Pilgrimages and visits to holy shrines have usurped the place of medicine, and, as in many cases at our own watering places, by air and exercise, have unquestionably effected what the employment of regular professional aid had been unable to accomplish. Saint Dominic, Saint Bellinus, and Saint Vitus have been greatly renowned in the cure of diseases in general; the latter particularly, who takes both poisons and madness of all kinds under his special protection. . . . The credulity of mankind has never been more strongly displayed than in the general belief afforded to the authenticity of remarkable cures of diseases said to have been effected by the imposition of royal hands. The practice seems to have originated in an opinion that there is something sacred or divine attaching either to the sovereign or his functions. . . . The practice appears to be one of English growth, commencing with Edward the Confessor, and descending only to foreign potentates who could show an alliance with the royal family of

England. The kings of France, however, claimed the right to dispense the Gift of Healing, and it was certainly exercised by Philip the First; but the French historians say that he was deprived of the power on account of the irregularities of his life. Laurentius, first physician to Henry IV, of France, who is indignant at the attempt made to derive its origin from Edward the Confessor, asserts the power to have commenced with Clovis I, A. D. 481, and says that Louis I, A. D. 814, added to the ceremonial of touching, the sign of the cross. Mezeray also says, that Saint Louis, through humility, first added the sign of the cross in touching for the king's evil. . . . If credit is to be given to a statement . . . by William of Malmesbury, with respect to Edward the Confessor, we must admit that in England, for a period of nearly 700 years, the practice of the royal touch was exercised in a greater or lesser degree, as it extended to the reign of Queen Anne. It must not, however, be supposed that historical documents are extant to prove a regular continuance of the practice during this time. No accounts whatever of the first four Norman kings attempting to cure the complaint are to be found. In the reign of William III, it was not on any occasion exercised. He manifested more sense than his predecessors, for he withheld from employing the royal touch for the cure of scrofula; and Rapin says, that he was so persuaded he should do no injury to persons afflicted with this distemper by not touching them, that he refrained from it all his reign. Queen Elizabeth was also averse to the practice, yet she extensively performed it. It flourished most in the time of Charles II, particularly after his restoration, and a public register of cases was kept at Whitehall, the principal scene of its operation."—T. J. Pettigrew, *Superstitions connected with the history and practice of medicine and surgery*, pp. 34-37, 117-121.—"Medicine developed much more slowly than surgery, or, rather, lagged behind it, as it seems nearly always prone to do. . . . Medical problems are more complex and involve both art and science, so that solutions of them are often merely temporary and lack finality. During the Middle Ages, however, and especially towards the end of them, the most important branches of medicine, diagnosis and therapeutics, took definite shape on the foundations that lie at the basis of our modern medical science. We hear of percussion for abdominal conditions, and of the most careful study of the pulse and the respiration. There are charts for the varying color of the urine, and of the tints of the skin. With Nicholas of Cusa there came the definite suggestion of the need of exact methods of diagnosis. A mathematician himself, he wished to introduce mathematical methods into medical diagnosis, and suggested that the pulse should be counted in connection with the water clock, the water that passed being weighed, in order to get very definite comparative values for the pulse rate under varying conditions, and also that the specific gravity of fluids from the body should be ascertained in order to get another definite datum in the knowledge of disease. It was long before these suggestions were to bear much fruit, but it is interesting to find them so clearly expressed. At the very end of the Middle Ages came the father of modern pharmaceutical chemistry, Basil Valentine."—J. Walsh, *Old-time makers of medicine*, pp. 10-20.

16th century.—Paracelsus.—Paracelsus, of whose many names this one stands alone in history to represent him, was an extraordinary per-

son, born in Switzerland, in 1493. He died in 1541. "His character has been very variously estimated. The obstructives of his own age and many hasty judges since have pronounced him a quack. This is simply ridiculous. As a chemist, he is considered to have been the discoverer of zinc, and perhaps of bismuth. He was acquainted with hydrogen, muriatic, and sulphurous gases. He distinguished alum from vitriols, remarking that the former contained an earth, and the latter metals. He perceived the part played by the atmosphere in combustion, and recognized the analogy between combustion and respiration. He saw that in the organic system chemical processes are constantly going on. Thus, to him is due the fundamental idea from which have sprung the chemico-physiological researches of Liebig, Mulder, Boussingault, and others. By using in medicine, not crude vegetables, but their active principles, he opened the way to the discovery of the proximate principles of vegetables, organic alkalis, and the like. But perhaps the greatest service he rendered to chemistry, was by declaring it an essential part of medical education, and by showing that its true practical application lay not in gold-making, but in pharmacy and the industrial arts. In medicine he scouted the fearfully complex electuaries and mixtures of the Galenists and the Arabian polypharmacists, recommending simpler and more active preparations. He showed that the idea of poison is merely relative, and knew that poisons in suitable doses may be employed in medicine. He prescribed tin as a remedy for intestinal worms, mercury as an anti-syphilitic, and lead in the diseases of the skin. He also used preparations of antimony, arsenic, and iron. He employed sulphuric acid in the treatment of saturnine affections. The astonishing cures which he undoubtedly performed were, however, due not so much to his peculiar medicines, as to his eminent sagacity and insight. He showed the importance of a chemical examination of urine for the diagnosis of disease."—J. W. Slater, *Paracelsus (Imperial dictionary of universal biology)*.—See also CHEMISTRY: General: Iatro-, or medical chemistry; SCIENCE: Middle Ages and the Renaissance: 16th century.

16th century.—First English College of Physicians.—"The modern doctor dates only from the reign of Henry VIII., when the College of Physicians in England was founded as a body corporate by letters patent in the tenth year of the reign. This grant was in response to a petition from a few of the most notable members of the profession resident in London, who were perhaps moved by both a laudable zeal in the interests of science, and a compassion for the sufferings of the subjects of astrological and toxicological experiments. The charter thus obtained, though probably drafted by the promoters themselves, was found to be so inadequately worded and expressed, that it became necessary to obtain powers to amend it by Act of Parliament. Among these early members were Linacre, Wotton, and others, famous scholars beyond doubt, though possibly but indifferent practitioners. In fact, we are constantly struck throughout the early history of the profession by the frequent occurrence of names associated with almost every other branch of study than that strictly appertaining to the art of medicine. We have naturalists, magneticians, astronomers, mathematicians, logicians, and classical scholars, but scarce one who accomplished anything worthy to be recorded in the annals of medical science. Indeed it is difficult to conceive any useful object that could have been attained by the existence of

the College as a professional licensing body, other than the pecuniary interests of the orthodox. . . . It is most significant as to the social degradation of the science of medicine, that most of the notorious empirics of the latter half of the sixteenth century were both highly recommended and strenuously supported in their resistance to the proctors of orthodoxy by some of the greatest names of the age. These self-deluded victims of quackery were not indeed adverse in theory to the pretensions of more regular members of the profession. They would patronize the Court physicians, or, if favorites of the Crown, they might even submit to the Sovereign's recommendation in that behalf; but none the less their family doctor was in far too many cases some outlandish professor of occult arts, retained in learned state on the premises, who undertook the speedy, not to say miraculous, cure of his patron's particular disease by all the charms of the Cabala."—H. Hall, *Early medicus (Merry England)*.

MODERN

16th-17th centuries.—Barber surgeons.—Medical humanists.—Progress of medicine.—Anatomy.—Influence of Vesalius, Fallopius, Eustachius, and Paré.—Medical education.—Van Helmont's system.—Iatro-chemical and iatro-physical systems.—Sydenham.—At the close of the medieval period medical science was in a transition stage. "Minor surgery was in the hands of the barbers, who performed all the minor operations, such as bleeding; the more important operations, few in number, were performed by surgeons. . . . Even physicians of the most distinguished reputation practised judicial astrology. . . . That remarkable character, Michael Servetus, the discoverer of the lesser circulation, when a fellow student with Vesalius at Paris, gave lectures upon judicial astrology, which brought him into conflict with the faculty. . . . So far as science is concerned, the thirteenth century was an aurora followed by a long period. Medicine joined heartily though slowly in the revolt against mediævalism. . . . Gradually Hippocrates and Galen came to their own again. . . . Galen became the idol of the schools. A strong revulsion of feeling arose against the Arabians, and Avicenna, the Prince, who had been clothed with an authority only a little less than divine, became anathema."—W. Osler, *Evolution of modern medicine*, pp. 121, 126.—Efforts were already being made to raise minor surgery to a higher plane. "A special feature of Renaissance legislation in France and England was the improvement of the status of the barber surgeons. In 1505 the Paris Faculty took the barber surgeons under its wing, in order to spite the surgeons proper, of whom it was jealous, and a few years later, these 'surgeons of the long robe,' having failed to become a separate faculty, decided to make the best of a bad bargain by coming under the sway of the physicians. In England, in 1462, the numerous and prosperous Guild of Barbers became the Company of Barbers under Edward IV; the surgeons obtained a special charter in 1492."—F. H. Garrison, *Introduction to the history of medicine*, p. 226.—"While the College de Côme was doing much to elevate the character of surgery in France and to separate it from the 'barber shop,' an equally active influence was being exerted in England by the incorporation of the barber-surgeons in London. . . . In 1512 a new charter was granted

which forbade any person from practising surgery in London except the members of that corporation. In 1540 another act was passed forbidding the barbers who practised shaving and hair dressing from doing any surgical work except the extraction of teeth. On the other hand, the surgeons were forbidden to practice shaving. The final legal separation of the surgeons and barbers did not take place until 1735, when an act was passed making the College of Surgeons and the Corporation of Barbers entirely separate bodies and limiting the practise of surgery wholly to the membership of Colleges of Surgeons, Physicians and Apothecaries."—N. S. Davis, *History of medicine*, pp. 88-89.—In the field of medicine a group of medical humanists—who flourished in the sixteenth and seventeenth centuries—"has had a great and beneficial influence upon the profession. They were for the most part cultivated gentlemen with a triple interest—literature, medicine and natural history. . . . A large proportion of them were naturalists: Leoniceus, Linacre, Champier, Fernel, Fracastorius, Gonthier, Caius, J. Sylvius, Brasavola, Fuchsius, Matthiolus, Conrad Gesner, [who has been compared to Pliny] to mention only those I know best—form a great group. . . . Gonthier, Fernel, Fuchs and Mattioli were great scholars and greater physicians. Champier, one of the most remarkable of the group, was the founder of the Hôtel Dieu at Lyons, and author of books of a characteristic type. . . . In many ways greatest of all was Conrad Gesner [1516-1605], whose *mors inopinata* at forty-nine, bravely fighting the plague, is so touchingly and tenderly mourned by his friend Caius."—W. Osler, *Evolution of modern medicine*, pp. 128, 131.—In the early part of the sixteenth century, Thomas Linacre, physician to Henry VII and Henry VIII of England, published Latin versions of Galen's chief treatises. "These faithful and accurate translations had a wide circulation on the continent and made it clear to physicians of the day that for centuries they had relied upon garbled and second-hand versions of their favorite author." At the end of the same century Foesius or Foes, city physician of Metz, made a critical edition of the Greek text of Hippocrates. By this time a number of more or less "popular" works on medicine had appeared in Germany, France and England and "the effect of these vernacular writings was to get men's minds away from scholasticism and turn them toward realities. This Renaissance tendency reached its highest development in the most prominent of the medical leaders of the sixteenth century, Paracelsus, Vesalius, and Paré—three strong men, literally 'blazed the way,' not only for the general advance of medicine, but for keen and liberal thinking in all its branches."—F. H. Garrison, *Introduction to the history of medicine*, pp. 181, 188.—"That progress was at first slow was due in part to the fact that the leaders were too busy scraping the Arabian tarnish from the pure gold of Greek medicine and correcting the anatomical mistakes of Galen to hother much about his physiology or pathology. Here and there among the great anatomists of the period we read an experiment, but it was the art of observation, the art of Hippocrates, not the science of Galen, not the carefully devised experiment to determine function, that characterized their work. There was indeed every reason why men should have been content with the physiology and pathology of that day, as, from a theoretical standpoint, it was excellent. The doctrine of the four humors and of the natural, animal and vital spirits afforded a ready explanation for the symptoms of all diseases, and the practice of the day was

admirably adapted to the theories. There was no thought of, no desire for, change. But the revival of learning awakened in men at first a suspicion and at last a conviction that the ancients had left something which could be reached by independent research, and gradually the paralytic-like torpor passed away. The sixteenth and seventeenth centuries did three things in medicine—shattered authority, laid the foundation of an accurate knowledge of the structure of the human body and demonstrated how its functions should be studied intelligently—with which advances, as illustrating this period, may be associated with the names of Paracelsus, Vesalius and Harvey."—W. Osler, *Evolution of modern medicine*, pp. 131-132.

"Leonardo da Vinci . . . was the founder of iconographic and physiologic anatomy, although his chalk drawings (1512) remained buried for over two hundred years, when they were noted by William Hunter . . . and Blumenbach. . . . Startlingly modern in their accuracy and display of physiologic knowledge, these impromptu sketches, made beside the dissected subject, . . . fully justify William Hunter's claim that their author was 'the greatest anatomist of his epoch.' Leonardo, like his forerunners, believed that a scientific knowledge of artistic anatomy . . . can be gained only at the dissecting table. . . . Yet dissecting for teaching purposes was still hampered by the theologic idea of the sanctity of the human body and its resurrection. Moreover, . . . very little anatomic material could be obtained among a sparse and slowly growing population . . . [and] the anatomy of the schools was still the anatomy of Galen. . . . The Faust who was to release the subject from these trammels and uphold the doctrine of the *visum et repertum* was Andreas Vesalius (1514-64), the most commanding figure in European medicine after Galen and before Harvey. There were plenty of dissectors and dissections before Vesalius, but he alone made anatomy what it is today—a living working science. It was the effect of his strong and engaging personality that made dissecting not only visible, but respectable. . . . Five years' experience as public prosecutor at Padua, where he taught students to dissect and inspect the parts *in situ*, culminated in the magnificent *De Fabrica Humani Corporis* (1543), a work which marks an epoch in breaking with the past and throwing overboard Galenical tradition. . . . In a fit of indignation he burned his manuscripts, left Padua, and accepted the lucrative post of court physician to Emperor Charles V. He married, settled down, became a courtier, and gave up anatomy so completely that, during the long, tedious years in Madrid, 'he could not get hold of so much as a dried skull, let alone the chance of making a dissection.' He paid the penalty of 'the great refusal' when his favorite pupil, Gabriele Falloppio, came to the front as a worthy successor. . . . In the year 1563 Vesalius set out on a pilgrimage to Jerusalem, as a penance, some say, for an accidental human vivisection; more probably, the botanist Clusius thought, as a pretext for getting away from his tiresome surroundings. On his way back, in 1564, he received word of an invitation to resume his old chair at Padua, just vacated by the death of Fallopius. But . . . the sudden access of an obscure malady left Vesalius to die, solitary and unfriended, on the island of Zante. . . . What fate might have befallen him had he gone further is seen in the case of the heretic Miguel Servete or Servetus (1500-53), whom Calvin caused to be burned at the stake for a mere juggling of verbiage, a theologic quibble. Servetus was one of the world's martyrs for 'the crime of

honest thought.' His discovery that the blood in the pulmonary circulation passes into the heart, after having been mixed with air in the lungs is recorded in his book, the 'Restitutio Christianism' (1553), of which only the copies at Paris and Vienna are known to exist, the others having been burned with him. . . . The surpassing ability of Vesalius is seen not only in his establishment of anatomic norms for the description and figuration of the bones and muscles, in his thorough descriptions of such parts as the eye, the ear, the accessory sinuses of the nose, the pituitary body, or the pelvic cavity, but in his clean sweep of the whole subject. His ideas were sustained by his pupil Fallopius, and opposed not only by Sylvius and Columbus, but by an anatomist of equal rank with himself, Bartolommeo Eustachi (1524-74), called Eustachius. The latter was professor at the Collegia della Spaienza in Rome, where, in 1552, he completed his 'Tabulae anatomicae,' a set of superb plates, drawn by himself which remained unprinted in the Papal Library for one hundred and sixty-two years. . . . Eustachius discovered the Eustachian tube, the thoracic duct, the suprarenal bodies (1563), and the abducens nerve; described the origin of the optic nerves, the cochlea, the pulmonary veins, the muscles of the throat and neck, gave the first correct picture of the uterus, and wrote the best treatise of his time on the structure of the teeth. . . . Jacques Dubois (1478-1555), called Sylvius, Vesalius' teacher at Paris, was, in spite of his large following of pupils, a harsh, avaricious bigot, whose devotion to Galen was such that he declared Vesalius to be a madman (vesanus), and said, in reference to Galen's errors in human anatomy, that 'Man had changed but not for the better.' Sylvius named the jugular, subclavian, renal, popliteal, and other blood-vessels, gave equally characteristic names to many of the muscles, which we still retain today, and, in his 'Isagoge' (Venice, 1536), was one of the first to mention the Sylvian aqueduct and the valves in the veins. The other opponent of Vesalius, Matteo Realdo Colombo (1516?-1559), called Columbus, is sometimes spoken of as the discoverer of the pulmonary circulation, but the work in which his undoubtedly excellent account is contained, his 'De re anatomica,' was published in 1559, at least six years after the burning of Servetus and his book. . . . The effect of Vesalius on Renaissance surgery is seen in the life work of Ambroise Paré (1510-90), who made the 'Fabrica' popular and accessible to surgeons by writing an epitome of it in the vernacular. A rustic barber's apprentice when he came up from the province to Paris in 1520, and afterwards a dresser at the Hôtel Dieu, Paré became an army surgeon eight years later, was incontinently thrown into the wars, where he soon made himself the greatest surgeon of his time by his courage, ability, and common sense. . . . Paré's greatest contribution to surgery hinges on the baneful effect which the pseudo-Hippocratic aphorism that 'diseases not curable by iron are curable by fire' exerted on the treatment of gunshot wounds, the new feature of Renaissance surgery. Giovanni di Vizio (1460-1520), physician to Pope Julius II, had taught in his 'Practica' (1514), like Brunschwig before him, that such wounds were poisoned burns; and, therefore, should be treated with a first dressing of boiling oil. How Paré's supply of boiling oil gave out one night in camp and how he profited by the experience to the extent of letting well enough alone in future is a well-known story. Had it not been for his 'fat of puppy-dogs,' a lard or salve, which, from some tenacity of superstition, he con-

tinued to apply, he would have been a true asepsist."—F. H. Garrison, *Introduction to the history of medicine*, pp. 201-204, 206-208, 210-211.—"The great centers of medical education in the seventeenth century were Leyden, Paris, and Montpellier. At Leyden were Sylvius, Ruysch, Nuck, and Bidloo; van Deventer and Cornelis Solingen were at the Hague; Roonhuyze and Swammerdam at Amsterdam; Duverney, Vieussens, Pierre Dionis, Mauriceau, Jules Clément, and Paul Portal at Paris; Giorgio Gaglivi at Padua, and no less than Sydenham was a pupil of Charles Barbeirac at Montpellier. In Germany, however, medicine had little chance until after the Peace of Westphalia (1648), and even after that time many original scientific investigations all over Europe were made by practising physicians detached from universities. It is not without significance that the huge output of brilliant work in anatomy and physiology followed directly upon the close of the Thirty Years' War. . . . Dissecting as a means of teaching anatomy was more frequent in Italy, Holland, and France than in Germany or England. In the latter country, the material was usually obtained by grave-robbing. In Germany, dissections, *longo intervallo*, were in the nature of civic events attended by festivities. When Rolflink began to have two annual dissections upon executed criminals at Jena in 1629, the practice was held in holy horror by the peasantry, who watched newly made graves lest they be 'Rolflinked.' A skeleton for teaching purposes was a rarity, and although there were anatomic theaters in most of the continental cities in course of time, there was none in Edinburgh until 1697. The latter, however, became the starting-point of the Edinburgh ascendancy in anatomic teaching under the Monro dynasty."—F. H. Garrison, *Introduction to the history of medicine*, pp. 273-274.—"Van Helmont, at the beginning of the . . . [17th] century, endeavored to create a system of medicine by uniting the alchemists doctrines of Paracelsus with his own Archeus or dynamic force. This was soon superseded by the Iatro-chemical system, founded by Francois de la Boe or Sylvius, of Leyden, and Thomas Willis, of Oxford. They attributed diseases chiefly to changes in the saliva, pancreatic juice, and bile, or to fermentation in the blood, and endeavored to explain all the phenomena of both health and disease on chemical principles. [See also CHEMISTRY: General: Iatro-, or Medical Chemistry.] Somewhat in contrast with this, was the Iatro-Physical system, the ablest supporter of which was Sanctorius, a practitioner of Venice and professor at Padua. He prosecuted investigations concerning the insensible transpirations from the skin, the excretion by the kidney, the evacuations from the bowels, and the variations of temperature of the body and of the pulse by the aid of instruments of his own invention, with a perseverance and success but little less creditable than those prosecuted by Harvey regarding the circulation of the blood. Both the Iatro-Chemists and the Iatro-Physicists retained in their system much of the humoralism of preceding ages. But the Iatro-Mathematical system, founded by Giovanni Alfonzi Borelli, of Naples, was one of solidism. Borelli and co-workers sought to explain muscular action, circulation, secretion, and both physiological and pathological processes generally on purely mathematical and mechanical principles. They endeavored to explain movements produced by muscular action on the principle of the lever, and computed mathematically the amount of force employed. . . . While these various attempts to construct theoretical systems of medicine founded

on the coincident advancements in general science were in progress, the greater number of active practitioners, led by Sydenham, were making greater and better progress by a return to the Hippocratic method of patiently observing facts and deducing practical conclusions from them. Thomas Sydenham was born . . . in 1624, and died in London, 1689. . . . [He] took his Baccalaureate degree in 1648. Subsequently he pursued medical studies at Montpellier for a considerable time, finally took the doctor's degree at Cambridge, and was admitted to membership in the Royal College of Physicians of London. . . . His most important medical work was entitled 'Observationes Medicae,' published in 1666. He early adopted Hippocrates as his model, and discarding all attempts to construct theories or systems of medicine, and adopting the Hippocratic doctrine that disease is a more or less active effort of the natural functions to free the system from disturbing influences, he insisted that these efforts of nature were the chief agents for effecting cures. Consequently he insisted that the chief business of the physician is to observe carefully the conditions and circumstances under which diseases arise, and with equal care to note their symptoms, progress and terminations, that he may adopt rational methods for obviating the first, and such dietetic and therapeutic measures as would assist the natural tendencies towards a cure. He regarded 'inflammation of the blood' as the chief pathological condition in acute febrile affections, and often resorted to venesection, cathartics, diaphoretics, cool drinks, and, in the latter stages, more nourishment and tonics, especially the cinchona bark, which he aided much in gaining a favorable introduction to the profession generally. By his strenuous defence of the 'healing powers of nature' and his intelligent adherence to the study of facts and the phenomena of disease, through the more than forty years of his professional life, he wielded a greater influence, and did more to advance the real interests of practical medicine, than any other practitioner of the same century."—N. S. Davis, *History of medicine*, pp. 84-86.—"The middle of the seventeenth century saw the profession thus far on its way—certain objective features of disease were known, the art of careful observation had been cultivated, many empirical remedies had been discovered, the coarser structure of man's body had been well worked out, and a good beginning had been made in the knowledge of how the machinery worked—nothing more. What disease really was, where it was, how it was caused, had not even begun to be discussed intelligently."—W. Osler, *Evolution of modern medicine*, p. 183.

"While the medical science of the seventeenth century was making rapid strikes forward, its popular medicine was already in process of retrogression to the excesses of the Byzantine Period, which bears out our main thesis, that the folk-ways of medicine are inevitably the same and independent of time and place and circumstance. This can be easily verified by a glance at the *materia medica* of the period."—F. H. Garrison, *Introduction to the history of medicine*, p. 281.—See also SCIENCE: Middle Ages and the Renaissance: 16th century.

17th century.—Harvey and the discovery of the circulation of the blood.—Cesalpinus.—Mayow.—Malpighi.—Molyneux.—Capillaries.—"The greatest name in seventeenth century medicine is that of William Harvey (1578-1657), of Folkestone in Kent, who studied at Padua (1590-

1603) as a pupil of Fabricius and Casserius, and whose work has exerted a profounder influence upon modern medicine than that of any other man save Vesalius. The world has 'heard great argument' concerning the merits and status of the 'De Motu Cordis,' but the following simple facts seem irrefutable and unassailable. The observation that the blood is in motion may have occurred to the first primitive man who ever cut open a live animal or saw a wounded artery. The idea that this motion is along a definite path may well have been entertained by any ancient Egyptian or Greek, as well as by some hypothetic native of Muscovy or Hlyria in Harvey's day. Galen's false concept about the pores in the ventricular septum diverted all speculation into the wrong channel for fourteen centuries, and even Servetus, who came nearest the truth, could only admit that some (not all) of the blood takes a circuit through the lungs. In the drawings which Vesalius had made, indicating the close proximity of the terminal twigs of arteries and veins, the truth about the circulation was literally staring in the face of any observer who had eyes to see or wit to discover it. Yet anatomists continued to see everything in the light of Galenical prepossessions. [Cesalpinus (1510-1603) is regarded by Italians as a discoverer of the circulation of the blood. He had grasped, as pure theory, the truth about systemic and pulmonary circulations, but he, at best, had made only a clever guess]. Columbus, although he saw that the blood undergoes change in the lungs, in all likelihood appropriated the ideas of Servetus. But Harvey, who knew the whole history and literature of the subject, first made a careful review of existing theories, showing their inadequacy, and then proceeded, by experimental vivisection, ligation, and perfusion, to an inductive proof that the heart acts as a muscular force-pump in propelling the blood along, and that the blood's motion is continual, continuous, and in a cycle or circle. This was the starting-point of purely mechanical explanations of vital phenomena. The *crux* of Harvey's argument—that the actual quantity and velocity of the blood, as computed by him, make it physically impossible for it to do otherwise than return to the heart by the venous route—was the first application of the idea of measurement in any biologic investigation. . . . In his demonstration of the circulation, Harvey was brought to a standstill at one point only, viz., the capillary anastomosis between arteries and veins, which, having no microscope, he could not see. . . . The most brilliant outcome of Harvey's experimental method was in the clearing up of the obscure matter of the physiology of respiration, which, up to the time of Lavoisier, was entirely the work of English scientists. Before Harvey's day, men still believed, with Galen, that the object of respiration was to cool the fiery heart, the purpose of the chest movements being to introduce air for generating vital spirits by the pulmonary vein, and to get rid of the heart's smoky vapors by the same channel. [See also SCIENCE: Middle Ages and the Renaissance: 16th century.] . . . Finally John Mayow (1643-70), another Cornishman, demonstrated, in a series of convincing experiments, that the dark venous blood is changed to bright red by taking up a certain ingredient in this air which, as being a constituent of nitre (KNO₃), he termed the igneo-aërial spirit of air. Mayow was thus, in a sense, very close to the actual discovery of oxygen, and he fully grasped the idea that the object of breathing is simply to cause an interchange of gases between the air and the blood, the former giving up its nitro-aërial spirit (oxygen) and

taking away vapors engendered by the blood."—F. H. Garrison, *Introduction to the history of medicine*, pp. 232-234, 236, 257, 259.—"Marcello Malpighi, of Crevalnora, and professor in the University of Bologna, in 1661, with the aid of the microscope, discovered the movement of blood in the capillaries of the lungs and mesentery of frogs, and, in 1665, he described the corpuscles of the blood, the cutaneous glands and the pigmentary layer of the skin, which is still called the 'rete Malpighii.' In 1683, William Molyneux, of Dublin, observed the capillary blood currents in the lizard; and in 1688 Anton Von Loeuwenhoeck commenced his microscopic studies on the larvæ and feet of frogs, by which he was enabled to describe the blood corpuscles, both red and white; while William Cowper saw the arterial blood pass into the veins. To demonstrate the capillaries as the connecting link between arteries and veins, Marchetti, of Padua, and subsequently Friedrich Ruzsch, of Amsterdam, succeeded in minutely injecting them, and thus completing the circuit of blood vessels that Harvey had declared must exist. During the same period of time, the structure, position, and movements of the heart and lungs were studied by Nicolaus Steno, of Copenhagen, Joh. Jac. Harden, of Basel, Borrelli, and others, by whom the mechanism of respiration and the movements of the heart were more fully explained."—N. S. Davis, *History of medicine*, p. 77.

ALSO IN: R. Willis, *William Harvey: A history of the discovery of the circulation of the blood*.

17th century.—Discovery of lymphatic circulation.—"The discovery of the lymphatic vessels and their purpose was scarcely less remarkable than that of the circulation of the blood. It has about it less of éclat, because it was not the work of one man, but was a matter of slow development. Herophilus and Erasistratus had seen white vessels connected with the lymph nodes in the mesentery of certain animals, and had supposed them to be arteries full of air. Galen disputed this, and believed the intestinal chyle to be carried by the veins of the mesentery into the liver. In 1563 Eustachius had described the thoracic duct in the horse; in 1622 Aselli, professor of anatomy at Milan, discovered the lacteal vessels in a dog which had been killed immediately after eating. Having pricked one of these by mistake, he saw a white fluid issue from it. Repeating the same experiment at other times he became certain that the white threads were vessels which drew the chyle from the intestines. He observed the valves with which they are supplied, and supposed these vessels to all meet in the pancreas and to be continued into the liver. In 1647 Pecquet, who was still a student at Montpellier, discovered the lymph reservoir, or receptaculum chyli, and the canal which leads from it, i.e., the thoracic duct, which he followed to its termination in the left subclavian vein. Having ligated it he saw it swell below, and empty itself above the ligature. He studied the courses of the lacteals, and convinced himself that they all entered into the common reservoir. His discovery gave the last blow to the ancient theory, which attributed to the liver the function of blood making, and it confirmed the doctrine of Harvey, while, like it, it had been very strongly opposed. Strangely enough, Harvey in this instance united with his great opponent, Riolan, in making common cause against the discovery of Pecquet and its significance. From that time the lymphatic vessels and glands became objects of common interest and were investigated by many anatomists, especially Bartholin, Ruysch, the Hunters, Hewson, and above all by Mascagni.

He was the first to give a graphic description of the whole lymphatic apparatus."—R. Park, *Lectures on the history of medicine*.

17th century.—Descartes and the dawn of modern physiological science.—"The essence of modern, as contrasted with ancient, physiological science appears to me to lie in its antagonism to animistic hypotheses and animistic phraseology. It offers physical explanations of vital phenomena, or frankly confesses that it has none to offer. And, so far as I know, the first person who gave expression to this modern view of physiology, who was bold enough to enunciate the proposition that vital phenomena, like all the other phenomena of the physical world, are, in ultimate analysis, resolvable into matter and motion was René Descartes. The fifty-four years of life of this most original and powerful thinker are widely overlapped, on both sides, by the eighty of Harvey, who survived his younger contemporary by seven years, and takes pleasure in acknowledging the French philosopher's appreciation of his great discovery. In fact, Descartes accepted the doctrine of the circulation as propounded by 'Harvæus médecin d'Angleterre,' and gave a full account of it in his first work, the famous 'Discours de la Méthode,' which was published in 1637, only nine years after the exertion 'De motu cordis;' and, though differing from Harvey on some important points (in which it may be noted, in passing, Descartes was wrong and Harvey right), he always speaks of him with great respect. And so important does the subject seem to Descartes that he returns to it in the 'Traité des Passions' and in the 'Traité de l'Homme.' It is easy to see that Harvey's work must have had a peculiar significance for the subtle thinker, to whom we owe both the spiritualistic and the materialistic philosophies of modern times. It was in the very year of its publication, 1628, that Descartes withdrew into that life of solitary investigation and meditation of which his philosophy was the fruit. . . . Descartes uses 'thought' as the equivalent of our modern term 'consciousness.' Thought is the function of the soul, and its only function. Our natural heat and all the movements of the body, says he, do not depend on the soul. Death does not take place from any fault of the soul, but only because some of the principal parts of the body become corrupted. . . . Descartes' 'Treatise of Man' is a sketch of human physiology, in which a bold attempt is made to explain all the phenomena of life, except those of consciousness, by physical reasonings. To a mind turned in this direction, Harvey's exposition of the heart and vessels as hydraulic mechanism must have been supremely welcome. Descartes was not a mere philosophical theorist, but a hardworking dissector and experimenter, and he held the strongest opinion respecting the practical value of the new conception which he was introducing. . . . 'It is true,' says he, 'that as medicine is now practised, it contains little that is very useful; but without any desire to depreciate, I am sure that there is no one, even among professional men, who will not declare that all we know is very little as compared with that which remains to be known; and that we might escape an infinity of diseases of the mind, no less than of the body, and even perhaps from the weakness of old age, if we had sufficient knowledge of their causes and of all the remedies with which nature has provided us.' So strongly impressed was Descartes with this, that he resolved to spend the rest of his life in trying to acquire such a knowledge of nature as would lead to the construction of a better medical doctrine. The anti-Cartesians found material for cheap ridicule

in these aspirations of the philosopher; and it is almost needless to say that, in the thirteen years which elapsed between the publication of the 'Discours' and the death of Descartes, he did not contribute much to their realisation. But, for the next century, all progress in physiology took place along the lines which Descartes laid down. The greatest physiological and pathological work of the seventeenth century, Borelli's treatise 'De Motu Animalium,' is, to all intents and purposes, a development of Descartes' fundamental conception; and the same may be said of the physiology and pathology of Boerhaave, whose authority dominated in the medical world of the first half of the eighteenth century. With the origin of modern chemistry, and of electrical science, in the latter half of the eighteenth century, aids in the analysis of the phenomena of life, of which Descartes could not have dreamed, were offered to the physiologist. And the greater part of the gigantic progress which has been made in the present century is a justification of the prevision of Descartes. For it consists, essentially, in a more and more complete resolution of the grosser organs of the living body into physico-chemical mechanisms. 'I shall try to explain our whole bodily machinery in such a way, that it will be no more necessary for us to suppose that the soul produces such movements as are not voluntary, than it is to think that there is in a clock a soul which causes it to show the hours.' These words of Descartes might be appropriately taken as a motto by the author of any modern treatise on physiology.—T. H. Huxley, *Connection of the biological sciences with medicine (Science and Culture, etc., lect. 13)*.

17th century.—Introduction of Peruvian bark.
—Improved materia medica.—"The marked progress in physiology and chemistry during the seventeenth century was accompanied by the use of a larger number of chemical preparations and some very important vegetables as remedies in the treatment of disease, and of the latter class, several as food. The chemical preparations were newly discovered alkalies, acids, and salts, the most important of which were tartar emetic, oxide of zinc, Glauber's salts, and preparations of mercury and arsenic. Of the new vegetable remedies the most important were the cinchona bark and ipecacuanha. The first was originally introduced into Europe from South America, in 1640, by Juan del Vego, ordinary physician to the Count of Chinchon. It was called cinchona or 'Countess' bark' in honor of the wife of the Count who had been cured of an attack of fever by the remedy. It was obtained from the bark of several species of the cinchona tree, found chiefly in Peru, and consequently was later called Peruvian bark. Its use in Spain was favored by the Catholic clergy, and hence was often called 'Jesuits' bark' [sometimes 'Cardinal's bark']. Its introduction and use in England was greatly promoted by Sydenham, while Robert Tabor, an apothecary of Cambridge, introduced it as a secret remedy into Paris, and after effecting the cure of the Dauphin, he sold the secret to the government of France for 2,000 Louis d'or. . . . For many years it was used chiefly in the form of powder, and acquired so much reputation as a remedy for the arrest of malarious fevers that it sometimes sold for its own weight in gold."—N. S. Davis, *History of medicine*, pp. 80-81.

17th century.—Closing period of humeral pathology.—Doctrines of Hoffmann, Stahl and Boerhaave.—The system of Van Helmont, who belongs equally to the sixteenth and seventeenth centuries, began to put a period to blind credence in Galenism. According to Van Helmont's theory

the primary cause of all organization was Archæus, a "creative spirit which, working upon the raw material of water or fluidity, by means of 'a ferment' excites all the endless actions which result in the growth and nourishment of the body. Thus, digestion is neither a chemical nor a mechanical operation; nor is it, as was then supposed, the effects of heat, for it is arrested instead of aided by fever, and goes on in perfection in fishes and cold-blooded animals; but, on the command of Archæus, an acid is generated in the stomach, which dissolves the food. This is the first digestion. The second consists in the neutralization of this acid by the bile out of the gall bladder. The third takes place in the vessels of the mesentery. The fourth goes on in the heart, by the action of the vital spirits. The fifth consists in the conversion of the arterial blood into vital spirits, chiefly in the brain. The sixth consists of the preparation of nourishment in the laboratory of each organ, during which operation Archæus, present everywhere, is itself regenerated, and superintends the momentary regeneration of the whole frame. . . . It will be seen that by this theory the entire system of Galen was non-suited. There is no place for the elements and the humours."—J. R. Russell, *History and heroes of the art of medicine*, ch. 8.—The humeral doctrine was not "merely an erroneous speculation; it exerted the most decisive, the most pernicious influence on practice. The various diseased affections were denominated in accommodation to the theory. . . . The plan of cure was in unison with the rest of the hypothesis. Venesection was copiously employed to renew the blood, to attenuate its consistency, or to remove a part of the morbid matter with which it was impregnated; and cathartics, sudorifics, diuretics, were largely administered, with a similar intent. In a word, as plethora or cacochymia were the two great causes of disease, their whole therapeutic was directed to change the quantity or quality of the fluids. Nor was this murderous treatment limited to the actual period of disease. Seven or eight annual bleedings, and as many purgations—such was the common regimen the theory prescribed to insure continuance of health. . . . During the fifteen centuries of Humorism, how many millions of lives did medicine cost mankind? The establishment of a system founded on the . . . doctrine of Solidism, and purified from the crudities of the Iatro-mathematical and Iatro-chemical hypotheses was reserved for three celebrated physicians toward the commencement of the eighteenth century—Frederic Hoffmann—George Ernest Stahl—and Herman Boerhaave. The first and second of this triumvirate were born in the same year, were both pupils of Wedelius of Jena, and both professors, and rival professors, in the University of Halle; the third was eight years younger than his contemporaries, and long an ornament of the University of Leyden."—W. Hamilton, *Discussions on philosophy and literature*, pp. 246, 249.—"The great and permanent merits of Hoffmann [1660-1742] as a medical philosopher, undoubtedly consisted in his having perceived and pointed out more clearly than any of his predecessors, the extensive and powerful influence of the Nervous System, in modifying and regulating at least, if not in producing, all the phenomena of the organic as well as of the animal functions in the human economy, and more particularly in his application of this doctrine to the explanation of diseases. . . . It was reserved for Hoffmann . . . to take a comprehensive view of the Nervous System, not only as the organ of sense and motion, but also as the common

centre by which all the different parts of the animal economy are connected together, and through which they mutually influence each other. He was, accordingly, led to regard all those alterations in the structure and functions of this economy, which constitute the state of disease, as having their primary origin in affections of the nervous system, and as depending, therefore, upon a deranged state of the imperceptible and contractile motions in the solids, rather than upon changes induced in the chemical composition of the fluid parts of the body."—J. Thomson, *Account of the life, lectures and writings of William Cullen*, pp. 105-106.—"George Ernest Stahl (1660-1734), chemist, was professor of medicine at Halle (1694) and physician to the King of Prussia (1716). He opposed materialism, and substituted 'animism,' explaining the symptoms of disease as efforts of the soul to get rid of morbid influences. Stahl's 'anima' corresponds to Sydenham's 'nature' in a measure, and has some relationship to the Archeus of Paracelsus and Van Helmont. Stahl was the author of the 'phlogiston' theory in chemistry, which in its time has had important influence on medicine. Phlogiston was a substance which he supposed to exist in all combustible matters, and the escape of this principle from any compound was held to account for the phenomenon of fire. [See also CHEMISTRY: General Phlogiston period.] According to Stahl, diseases arise from the direct action of noxious powers upon the body; and from the reaction of the system itself endeavouring to oppose and counteract the effects of the noxious powers, and so preserve and repair itself. He did not consider diseases, therefore, pernicious in themselves, though he admitted that they might become so from mistakes made by the soul in the choice, or proportion of the motions excited to remove them, or the time when these efforts are made. Death, according to this theory, is due to the indolence of the soul, leading it to desist from its vital motions, and refusing to continue longer the struggle against the derangements of the body. Here we have the 'expectant treatment' so much in vogue with many medical men. 'Trusting to the constant attention and wisdom of nature,' they administered inert medicines as placebos, while they left to nature the cure of the disease. But they neglected the use of invaluable remedies such as opium and Peruvian bark, for which error it must be admitted they atoned by discountenancing bleeding, vomiting, etc. Stahl's remedies were chiefly of the class known as 'Antiphlogistic,' or anti-febrile"—E. Berdoe, *Origin and growth of the healing art*, bk. 5, ch. 7.—"The influence of Boerhaave [1668-1738] was immense while it lasted—it was world-wide; but it was like a ripple on the ocean—it had no depth. He knew everything and did everything better than any of his contemporaries, except those who made one thing, not everything, their study. He was familiar with the researches of the great anatomists, of the chemists, of the botanists, of historians, of men of learning, but he was not a great anatomist, chemist, or historian. . . . His greatness depended upon his inexhaustible activity. He had the energy of a dozen ordinary men, and so he was twelve times as powerful as one. . . . Boerhaave is now unknown. . . . He was not the founder of any system, nor did he make any discovery. He simply used with supreme success the thoughts and discoveries of others; as soon as he ceased to live, his influence began therefore to decline; and before his generation had passed away, his star had waned before the genius of Cullen, who succeeded in fixing the attention of Europe, and who, in his

turn, was soon to be displaced by others."—J. R. Russell, *History and heroes of the art of medicine*, pp. 297-298.

17th-18th centuries.—Introduction of microscope in medicine.—First glimmerings of germ theory of disease.—"Since Athanasius Kircher [1601-1680] mistook blood and pus corpuscles for small worms, and built up on his mistake a new theory of disease and putrefaction, and since Christian Lange, the Professor of Pathological Anatomy in Leipzig, in the preface to Kircher's book (1671) expressed his opinion that the purpura of lying-in-women, measles, and other fevers were the result of putrefaction caused by worms or animalcule, a 'Pathologia Animata' has, from time to time, been put forward to explain the causation of disease. . . . Remarkable as were Kircher's observations, still more wonderful were those of Anthony van Leeuwenhoek, a native of Delft in Holland, who in his youth had learned the art of polishing lenses, and who was able, ultimately, to produce the first really good microscope that had yet been constructed. Not only did Leeuwenhoek make his microscope, but he used it to such good purpose that he was able to place before the Royal Society of London a series of most interesting and valuable letters giving the result of his researches on minute specks of living protoplasm. . . . The world that Leeuwenhoek . . . opened up so thoroughly was rapidly invaded by other observers and theorists. The thoughtful physicians of the time believed that at last they had found the 'fons et origo mali,' and Nicolas Andry, reviewing Kircher's 'Contagium Animatum,' replaced his worms by these newly-described animalcule or germs, and pushing the theory to its legitimate and logical conclusion, he also evolved a germ theory of putrefaction and fermentation. He maintained that air, water, vinegar, fermenting wine, old beer, and sour milk were all full of germs; that the blood and pustules of smallpox also contained them, and that other diseases, very rife about this period, were the result of the activity of these organisms. Such headway did he make, and such conviction did his arguments carry with them, that the mercurial treatment much in vogue at that time was actually based on the supposition that these organisms, the 'causæ causantes' of disease, were killed by the action of mercury and mercurial salts. With a kind of prophetic instinct, and certainly as the result of keen observation, Varro and Lancisi ascribed the dangerous character of marsh or swamp air to the action of invisible animalcule; in fact the theory was so freely and forcibly propagated that even where no micro-organisms could be found their presence was inferred with the inevitable result, as Löffler points out, that these 'inconceivable' worms became the legitimate butts for the shafts of ridicule; and in 1726 there appeared in Paris a satirical work, in which these small organisms received the name of 'fainter,' 'body-pincher,' 'ulcerator,' 'weeping fistula,' 'sensualist'; the whole system was thus laughingly held up to satire, and the germ theory of disease completely discredited. Linnæus [1707-1778], however, with his wonderful powers of observation and deduction, considered that it was possible that there might be rescued from this 'chaos' small living beings which were as yet insufficiently separated and examined, but in which he firmly believed might lie not only the actual contagium of certain eruptive diseases, and of acute fevers, but also the exciting causes of both fermentation and

putrefaction. The man, however, who of all workers earliest recognized the importance of Linnaeus' observations was a Viennese doctor, Marcus Antonius Plenciz. . . . He it was who, at this time, insisted upon the specific character of the infective agent in every case of disease; for scarlet fever there was a scarlet fever seed or germ—a seed which could never give rise to smallpox. He showed that it was possible for this organism to become disseminated through the air, and for it to multiply in the body; and he explained the incubation stage of a febrile disease as dependent on the growth of a germ within the body during the period after its introduction, when its presence had not yet been made manifest. . . . As regards putrefaction, having corroborated Linnaeus' observations and found countless animalculæ in putrefying matter, he came to the conclusion that this process was the result of the development, multiplication, and carrying on of the functions of nutrition and excretion by these germs; the products of fermentation being the volatile salts set free by the organisms, which, multiplying rapidly by forming seeds or eggs, rendered the fluid in which they developed thick, turbid, and foul. This theory, admirable as it was, and accurate as it has since been proved to be, could not then be based on any very extensive or detailed observation, and we find that some of the most prominent and brilliant men of the period did not feel justified in accepting the explanation that Plenciz had offered as to the causes of disease and fermentation processes.”—G. S. Woodhead, *Bacteria and their products*, ch. 3.

17th-18th centuries.—Hahnemann and the origin of system of homœopathy.—Samuel Hahnemann, originator of the system of medicine called “Homœopathy,” was born in 1755, at Meissen, in Saxony. He studied medicine at Leipsic, and afterwards at Vienna. In 1784 he settled in Dresden, but returned to Leipsic in 1789. “In the following year, while translating Cullen’s *Materia Medica* out of English into German, his attention was arrested by the insufficient explanations advanced in that work of the cure of ague by cinchona bark. By way of experiment, he took a large dose of that substance to ascertain its action on the healthy body. In the course of a few days he experienced the symptoms of ague; and it thus occurred to him that perhaps the reason why cinchona cures ague is because it has the power to produce symptoms in a healthy person similar to those of ague. To ascertain the truth of this conjecture, he ransacked the records of medicine for well-attested cures effected by single remedies; and finding sufficient evidences of this fact, he advanced a step further, and proposed, in an article published in *Hufeland’s Journal*, in the year 1797, to apply this new principle to the discovery of proper medicines for every form of disease. Soon afterwards he published a case to illustrate his method. It was one of a severe kind of colic cured by a strong dose of veratrum album. Before this substance gave relief to the patient it excited a severe aggravation of his symptoms. This induced Hahnemann, instead of drops or grains, to give the fraction of a drop or grain, and he thus introduced infinitesimal doses. Some years later he applied his new principle in the treatment of scarlet fever; and finding that belladonna cured the peculiar type of that disease, which then prevailed in Germany, he proposed to give this medicine as a prophylactic, or preventive against scarlet fever. . . . In the year 1810 he published his great work, entitled *Organon of Medicine*, which has been translated into all the European languages, as well as into

Arabic. In this book he fully expounded his new system, which he called Homœopathy. His next publication was a *Materia Medica*, consisting of a description of the effects of medicines upon persons in health. These works were published between the years 1810 and 1821, at Leipsic, where he founded a school, and was surrounded by disciples. As his system involved the administration of medicines, each separately by itself, and in doses infinitely minute, there was no longer any need of the apothecaries’ intervention between the physician and the patient. In consequence of this the Apothecaries Company brought to bear upon Hahnemann an act forbidding physicians to dispense their own medicines, and with such effect that he was obliged to leave Leipsic. The Grand Duke of Anhalt Köthen, appointed him his physician, and invited him to live at Köthen. Thither, accordingly, he removed in the year 1821, and there he prepared various new editions of his *Organon*, and new volumes of his *Materia Medica* for publication. In 1835 . . . he left Köthen, and settled in Paris, where he enjoyed a great reputation till his death, which took place in the year 1843.”—W. Bayes, *Origin and present status of homœopathy (Translation of the Homœopathic Medical Society of the State of New York, 1869, art. 21)*.

18th century.—Work of John Hunter in surgery and anatomy.—Influence on noted surgeons.—“During the last part of the eighteenth century those who most successfully advanced the departments of anatomy, physiology and pathology beside those already mentioned, were Sommerring, of Mayence, and Cassel; William and John Hunter and John Bell, of London; G. B. Morgagni, of Forti, Italy; and M. F. X. Bichat, of Paris. Morgagni became a professor in Padua in 1715, and for many years industriously pursued the study of pathological anatomy, including the changes and products developed in the progress of a large number of the most common diseases. He published his great work on *Pathological Anatomy*, consisting of five books or volumes, in Venice in 1761, which justly entitles him to the honor of being the founder of that branch of medical science. William Hunter was born in Long Calderwood, Scotland, and was first educated for the ministry, but subsequently turned his attention to medicine and became a pupil of Cullen, in Edinburgh. He went to London in 1741, and commenced lecturing on Anatomy and Surgery in 1746. He rapidly acquired a high reputation and extensive practice in both surgery and midwifery.”—N. S. Davis, *History of medicine*, p. 96.—“The man who combined the qualities of Vesalius, Harvey and Morgagni in an extraordinary personality was John Hunter [1728-1793]. He was, in the first place, a naturalist to whom pathological processes were only a small part of a stupendous whole, governed by law, which, however, could never be understood until the facts had been accumulated, tabulated and systematized. By his example, by his prodigious industry, and by his suggestive experiments he led men again into the old paths of Aristotle, Galen and Harvey. He made all thinking physicians naturalists, and he lent a dignity to the study of organic life, and re-established a close union between medicine and the natural sciences. . . . The Wistar-Horner and the Warren Museums in this country originated with men greatly influenced by Hunter. He was, moreover, the intellectual father of that interesting group of men on

this side of the Atlantic who, while practising as physicians, devoted much time and labor to the study of natural history; such men as Benjamin Smith Barton, David Hossack, Jacob Bigelow, Richard Harlan, John D. Godman, Samuel George Morton, John Collins Warren, Samuel L. Mitchell and J. Aitken Meigs. He gave an immense impetus in Great Britain to the study of morbid anatomy, and his nephew, Matthew Baillie, published the first important book on the subject in the English language. . . . The man who gave the greatest impetus to the study of scientific medicine at this time was Bichat, who pointed out that the pathological changes in disease were not so much in organs as in tissues. His studies laid the foundation of modern histology. He separated the chief constituent elements of the body into various tissues possessing definite physical and vital qualities."—W. Osler, *Evolution of modern medicine*, pp. 197-198, 201.

18th century.—Preventive inoculation against smallpox.—Work of Edward Jenner.—“Toward the end of the century came one of the greatest triumphs in the history of medicine—the successful introduction of preventive inoculation by Edward Jenner (1749-1823), son of a Gloucestershire clergyman, who, in 1770, became a friend and pupil of John Hunter's, and helped him a good deal in his experiments. It had long been a countryside tradition in Gloucestershire that dairymaids who had contracted cow-pox through milking did not take smallpox, and similar observations had been noted in Germany and France. On learning of this fact from a milkmaid, Jenner early conceived the idea of applying it on a grand scale in the prevention of the disease. On communicating his project to Hunter, the latter gave him the characteristic advice: ‘Don't think, try; be patient, be accurate.’ On returning to his home at Berkeley he began to collect his observations in 1778, and on May 14, 1796, performed his first vaccination upon a country boy, James Phipps, using matter from the arm of the milkmaid, Sarah Nelmes, who had contracted cow-pox in the usual way. The experiment was then put to the test, by inoculating Phipps with smallpox virus on July 1st, and the immunization proved successful. By 1798 he had 23 cases, which he embodied in his work, *An Inquiry into the Causes and Effects of the Variolae Vaccinae*, a thin quarto with four colored plates, printed in 1798, and dedicated to Parry of Bath. This book establishes his main thesis that a vaccination with cow-pox matter protects from smallpox, and was followed, during the years 1799-1806, by five successive pamphlets, recording his subsequent experiments and improvements in technic up to the stage of recommending ivory points as the best vectors in inoculation. Jenner's work was rapidly taken up on the continent and in America; good statistics began to pour in, in less than a year's time, and, by 1800, as many as 6000 people had been vaccinated. In 1802 and 1807, Parliament voted grants amounting to £20,000 to Jenner in aid of prosecuting his experiments. At the same time he met with bitter opposition from jealous contemporaries, like Ingen-Housz, Woodville, and Pearson, who either claimed priority or acted upon the parliamentary principle that the duty of the opposition is to oppose. The mere idea of inoculation is apparently as old as the hills. Human inoculation of variolous virus is said to be mentioned in the Atharva Veda (Baas) and certainly in the Flos of the School of Salerno, and was

known to most Oriental peoples. The idea was introduced into England by Timoni's and Pilarini's communications to the Royal Society in 1713-16, and was afterward taken up by Sir Hans Sloane (1717). On March 18, 1718, Lady Mary Wortley Montagu had her three-year-old son inoculated in Turkey, and her five-year-old daughter was inoculated in England in April, 1721. During the sixth epidemic of smallpox in Boston, Massachusetts, Zabdiel Boylston (1679-1766) courageously inoculated his son and two negro slaves on June 26, 1721, and had inoculated 244 persons before its close, exciting great opposition and even threats of hanging. In the Boston epidemic of 1752, 2,109 were inoculated, and nearly 20,000 in England, under Daniel Sutton in 1764-65. Apart from the huge eighteenth century literature on inoculation, one of the most important items of which is the proposal of preventive inoculations against the plague (1755) by the Hungarian physician, Stephan Wesszprémi (1723-99), there had been successful cow-pox inoculations by the Dorset farmer, Benjamin Jesty, in 1774-89, and by Plett of Holstein in 1791. All these efforts were, however, ‘as an arrow shot in the air or a sword-stroke in the water.’ The merit of Jenner's work rests upon the fact that, like Harvey, he started out with the hope of making his thesis a permanent working principle in science, based upon experimental demonstration, and he succeeded to the extent of carrying his inoculations successfully through several generations in the body, and, above all, in overcoming the popular aversion to vaccination. In short, Jenner transformed a local country tradition into a viable prophylactic principle, and, although he was preceded by really scientific experts in inoculation (variolation), his reputation in his own field is fairly safe from the priority-mongers. Faults of diffuseness and lack of skill in marshaling facts have been imputed against the ‘Inquiry,’ but, on the whole, it remains an unimpeachable record of careful scientific work, the effect of which is seen to-day in the rapid strides that preventive medicine is making and in the results of compulsory vaccination in Prussia and Holland, where the mortality curve of smallpox approaches zero as its limit.”—F. H. Garrison, *Introduction to the history of medicine*, pp. 374-376.

18th century.—System of Haller.—“About the time when we seniors commenced the study of medicine, it was still under the influence of the important discoveries which Albrecht von Haller [1708-1777] had made on the excitability of nerves; and which he had placed in connection with the vitalistic theory of the nature of life. Haller had observed the excitability in the nerves and muscles of amputated members. The most surprising thing to him was, that the most varied external actions, mechanical, chemical, thermal, to which electrical ones were subsequently added, had always the same result; namely, that they produced muscular contraction. . . . He designated them by the common name of stimulus; he called the altered condition of the nerve the excitation, and its capacity of responding to a stimulus the excitability, which was lost at death. This entire condition of things, which physically speaking asserts no more than the nerves, as concerns the changes which take place in them after excitation, are in an exceedingly unstable state of equilibrium; this was looked upon as the fundamental property of animal life, and was unhesitatingly transferred to the other organs and tissues of the body, for which there was no similar justification. It was

believed that none of them were active of themselves, but must receive an impulse by a stimulus from without; air and nourishment were considered to be the normal stimuli. The kind of activity seemed, on the contrary, to be conditioned by the specific energy of the organ, under the influence of the vital force. Increase or diminution of the excitability was the category under which the whole of the acute diseases were referred, and from which indications were taken as to whether the treatment should be lowering or stimulating. The rigid one-sidedness and the unrelenting logic with which . . . [John] Brown had once worked out the system was broken, but it always furnished the leading points of view."—H. Helmholz, *On thought in medicine (Popular Lectures, series 2, lect. 5)*.

ALSO IN: F. H. Garrison, *History of medicine*, pp. 311-313.

18th century.—Brunonian system of stimulation.—Cullen.—Brown.—"Notwithstanding the many attempts to construct special systems of medical pathology and practice during the seventeenth century, a large majority of the educated practitioners followed the teachings of Sydenham and Boerhaave. . . . But the coincident discoveries in the department of physiology and pathological anatomy; more especially the demonstration of irritability and contractility in living tissues independent of nerve sensibility, by Haller, led rapidly to the final abandonment of what had remained of the humoral doctrines of the ancients and also of the vis anima of Stahl and vital ether of Hoffmann. In their stead, the irritability of Glisson and Haller was accepted as an inherent property of living organized matter, giving it the capacity to respond to the action of stimuli, which led directly to the inference that all vital action, whether normal or abnormal, resulted from the influence of stimuli. . . . Consequently before the middle of the eighteenth century all diseases came to be regarded as the direct or indirect result of the action of stimuli or irritants on the organic irritability, constituting a system of medicine as exclusively solidistic as any of those of the ancients were humoral. . . . The most eminent and influential advocate of the neurologic pathology was William Cullen, professor in the University of Edinburgh. . . . He embraced fully the doctrine of a 'nervous force,' or susceptibility, and that all the causes of disease made their primary impression on the nervous system producing either spasm or atony. . . . The nosology and chief pathological doctrines of Cullen were approved by a large proportion of the profession in Europe, and by a still larger proportion in the English colonies in America, among whom were many who had received their chief medical instruction in Edinburgh and subsequently became the founders of the first medical schools in America. The therapeutic agents relied upon by Cullen and his followers were rest, low diet, cooling drinks, cathartics, and sometimes emetics, opium and venesection in the earlier stages, and later, cinchona bark and wine, with more nourishment. . . . But the physician during the last part of the eighteenth century whose medical doctrines attracted the widest attention was John Brown, the author of the well known Brunonian system of medicine. He was born in Berwickshire, Scotland, in 1735, and died in 1788. . . . Being favored by Cullen he was enabled to pursue his studies in the medical school in Edinburgh, but finally received the degree of M. D. from the University of St. Andrew in 1770. As early at 1770, however, his irregular habits caused an interruption of his friendship with

Cullen, and he commenced giving private lectures, setting forth doctrines in many respects antagonistic to those of Cullen. They were attended by many students and members of the profession, and in 1780, was published his celebrated work entitled 'Elementa Medicinæ.' . . . Brown's whole theory of disease was founded on the assumption that living matter possessed a vital irritability and all active phenomena of life resulted from the action of stimuli on this irritability. In other words, life was simply a state of excitation. When from natural stimuli, as air, water and food in proper quantities, health was the result. When the stimuli were in excess or deficiency, or irritating in quality, disease was the result. If the stimuli were deficient or depressing the resulting disease was termed asthenic, if in excess or too active the result was sthenic. The resulting changes in structure were termed congestion, irritation and inflammation. His therapeutic principles were equally simple and easily applied. His doctrines found but few followers in England, but became quite popular on the continent, and found some influential advocates in America."—N. S. Davis, *History of medicine*, pp. 107-111.

ALSO IN: P. V. Renouard, *History of medicine*, pp. 555-560.

18th century.—Physiological views of Bichat.—"The earliest nineteenth century exponent of anatomy and of scientific medicine in France was Marie-François-Zavier Bichat (1771-1802), the creator of descriptive anatomy, . . . a successful surgeon and a master worker in the science which sustained one of its greatest losses by his early death. His '*Traité des membranes*' (1799-1800), his five volume '*Anatomie descriptive*' (1801-1803), and his work on general anatomy applied to physiology and medicine (1802) opened out an entirely new field for anatomists, that of a detailed description of parts and tissues of the body in health and disease. Before Bichat's time, . . . [text-books] were woefully elementary in spots and said next to nothing about the detailed anatomy of the nerves and viscera; while teaching by dissection, as Robert Knox has recorded, was on the most rough and ready basis. Bichat was a forerunner of Henle and the histologists, dividing the tissues into 21 (non-microscopic) varieties. . . . He was profoundly influenced by Bordeu, and like Hunter, he regarded disease as an alteration of vital properties or principles. His error was to assign a specific vital property, a different mode of vitalism, to each tissue. This physiologic doctrine, now obsolete, is summed up in his famous and fallacious definition of life as 'the sum of the forces that resist death.'"—F. H. Garrison, *Introduction to the history of medicine*, pp. 458-459.—Bichat "prepared the way for the brilliant developments in morbid anatomy and differential diagnosis by the French School of the first half of the nineteenth century. . . . He did much to check the purely theoretic tendencies of the profession, and to promote the careful observation of facts and their comparison as affording the chief basis for legitimate deductions. Probably there is the name of no other member of the profession on the pages of Medical History, who accomplished as much valuable scientific work in the brief period of eleven years, as was done by Bichat in the closing years of the eighteenth century."—N. S. Davis, *History of medicine*, pp. 98, 99.

18th-20th centuries.—Development of hospitals.—Care of mental cases.—Sanitaria for tuberculosis.—"In 1788, J. B. Tenon published a

series of memoirs on the hospitals of Paris, containing his famous description of the old Hôtel Dieu, which was at that time a veritable hotbed of disease. There were some 1,220 beds, the most of which contained from four to six patients, and about 486 beds for single patients. The larger halls contained over 800 patients crowded on pallets, or often lying about miserably on heaps of straw, which was in vile condition. Acute contagious diseases were often in close relation to mild cases, vermin and filth abounded, and the ventilation was often so abominable that the attendants and inspectors would not enter in the morning without a sponge dipped in vinegar held to their faces. Septic fevers and other contagia were the rule; the average mortality was about 20 per cent., and recovery from surgical operations was, in the nature of things, a rarity. The same thing was true of the Allgemeines Krankenhaus of Vienna, the Moscow Hospital, and many other institutions of size, and it was not until John Howard had made his exhaustive studies of the condition of European hospitals, prisons and lazarettos (1777-89), and Tenon had published his report, that any attempts at reforms were made. Bass says that, in Frankfurt am Main and other cities, 'even physicians declined hospital service as equivalent to a sentence of death.' Under Louis XVI and Joseph II, reforms were finally made in Paris and Vienna, with a very creditable and significant reduction of mortality. When the Czar Paul came to the throne, he was so horrified with the condition of the Moscow Hospital that he ordered its reconstruction in 1797, with the result that the new Moscow Hospital, with accommodations for 1,280 patients, was completed in 1802. But hospitals remained notorious for uncleanness and general danger to life well into the nineteenth century, and many persons alive to-day can recall the horror in which they were held. The real angel of purity and cleanliness was Florence Nightingale, and there was no such thing as surgical cleanliness before the time of Lister. Bad as was the management of hospitals, the treatment of the insane was even worse. They were either chained or caged when housed, or, if harmless, were allowed to run at large, the Tom o'Bedlams of England or the wizards and warlocks of Scotland. . . . The earliest insane asylums in the northern countries were St. Luke's in London (1751), the Quaker Asylum near York (1702), and the *Narrenthurm*, or 'Lunatics' Tower' (1784), one of the show places of old Vienna, where as in ancient Bedlam, the public were allowed to view the insane, like animals in a menagerie, on payment of a small fee. . . . Monkemöller's researches on German psychiatry in the eighteenth century, based on the records of Hanoverian asylums at Celle and elsewhere, confirm what Reil wrote of German asylums in his 'Rhapsodies' of 1803, and go to show that the theoretic part of the science in this period was nebulous philosophic speculation, insanity being still attributed to yellow and black bile or to heat in the dog days, while symptoms like exaggerated self-esteem, jealousy, envy, sloth, self-abuse, etc., were regarded as causes. The cases treated were all of the dangerous, unmanageable, or suicidal type, and no hope of recovery was held out. There was an extensive exhibition of drugs and unconditional belief in their efficacy. A case that did not react to drugs was regarded as hopeless. Melancholia was treated by opium pills, excited states by camphor, pruritus by diaphoresis, and a mysterious power was ascribed to belladonna: if it failed, everything failed. Other remedies were a mixture of honey and vinegar, a de-

coction of 'Quadenwurzel,' large doses of luke-warm water, or, if this failed, 'that panacea of psychiatry, tartarus tartarissatus.' The costly aqua benedicta Rolandi, with three stout ruffians to administer it, a mustard plaster on the head, venesection at the forehead and both thumbs, clysters, and plasters or Spanish fly, were other resources. Barbarities were kept in the background, but the harsh methods of medieval times were none the less prevalent. A melancholic woman was treated with a volley of oaths and a douche of cold water as she lay in bed. . . . The Quaker retreat, founded by William Tuke in 1794 at York, England, was the first attempt at humane treatment of the insane before the time of Pinel. . . . After the time of Pinel and Reil, the treatment of the insane without mechanical restraints (open-door method) was advanced by John Conolly (1856) and by the Tukes, of whom Daniel Hach Tuke (1827-95) collaborated with John Charles Bucknill in a 'Manual of Psychological Medicine' (1858), which played a great part in its day. Another advocate of the no-restraint system was Wilhelm Griesinger (1817-67), of Stuttgart, a pupil of Schönlein, a clinical assistant of Wunderlich, . . . who, apart from his work in psychiatry, distinguished himself by his early description of hook-worm infection as 'tropical chlorosis' (1866), and did much, in Germany at least, to clear up the status of typhus, typhoid, relapsing and malarial fevers, in his monographs on infectious diseases (1857-64). Griesinger's 'Pathology and Therapy of Psychic Disorders' (1845) did away with much of the mysticism of the past, gave clear and unmistakable clinical pictures based upon rational psychological analysis, aimed to connect the subject with pathologic anatomy and advocated the open-door and the psychiatric clinic. Since Griesinger's time, the scientific study of insanity has been mainly in the hands of the Germans. . . . Of the many admirable hospitals constructed in the modern period, the pavilion system attained a high plane of development in the Johns Hopkins Hospital, planned by T. S. Billings and opened in 1880, and the Hamburg-Eppendorf pavilion, opened in the same year. In hygienic advantages and economy of administration, these structures marked a great advance upon the huge, many-storied buildings (block hospitals) of the past. The Peter Bent Brigham Hospital at Boston (1913), also originally planned by Billings, follows the same idea. With the opening of the Rudolf Virchow Hospital at Berlin (1906) a new idea was introduced, that of a community of separate pavilions as detached hospital units, and upon this plan are based such hospitals as the new Allgemeines Krankenhaus at Vienna, the Toronto General Hospital, the Barnes Hospital (St. Louis), and the Cincinnati General Hospital. But, of late, the tendency, even in Germany, has been away from extreme decentralization and toward a compromise between the pavilion and block systems, the advantage being greater economy in space, excavation, piping and plumbing, also economy and centralization of administration. Examples of this tendency are to be found in the New Cook County Hospital (Chicago), the Henry Phipps Psychiatric and Brady Urologic Clinics (Baltimore) and the new buildings of Bellevue (New York).

"The introduction of outdoor life and open-air sanatoria for phthisical patients is a feature of modern medicine. Open-air treatment existed in Scotland about 1747 and a seaside hospital for scrofula was opened at Margate in 1701. George Bodington (1700-1882), of Sutton Colfield, England, in his *Essay on the Treatment of Pulmonary*

Consumption (1840) anticipated many modern views as to the advantages of cold dry air for 'healing and closing of cavities and ulcers of the lungs,' as also of exercise in the open and abundant nutrition; but his theory was so roughly handled by the medical critics of his day that he was discouraged from carrying it into practice to any extent. The first sanitarium for phthisical patients was established at Görbersdorf, in the Waldenburg Mountains, by Hermann Brehmer in 1859. It still exists, and its success has led to the foundation of many similar institutions in mountain and winter resorts, notably those of Carl Spengler at Davos and Edward L. Trudeau at Saranac Lake in the Adirondacks. In 1876, Peter Dettweiler founded the sanitarium at Falkenstein in the Taunus, introducing the reclining chair for rest-cure in the open air, portable receptacles for sputa, and other novelties. By 1880, England had 10 hospitals for consumptives. The sanitarium movement in Germany was especially fostered by Ernst von Leyden and there are now thousands of these institutions all over the world. . . . Since the gift of the Phipps Institute in 1903, the subject has awakened keen interest in America, especially through the labors of Trudeau, Vincent Y. Bowditch, L. F. Flick, Arnold Klebs, S. A. Knopf, Henry Barton Jacobs, Frank Billings, Edward R. Baldwin, Lawrason Brown, and others."—F. H. Garrison, *Introduction to the history of medicine*, pp. 406-408, 683-684, 769-770.

19th century.—Discovery of anæsthetics.—In 1798, Mr. Humphry Davy, an apprentice to Mr. Borlase, a surgeon at Bodmin, had so distinguished himself by zeal and power in the study of chemistry and natural philosophy, that he was invited by Dr. Beddoes of Bristol, to become the 'superintendent of the Pneumatic Institution which had been established at Clifton for the purpose of trying the medicinal effects of different gases.' He obtained release from his apprenticeship, accepted the appointment, and devoted himself to the study of gases, not only in their medicinal effects, but much more in all their chemical and physical relations. After two years' work he published his 'Researches, Chemical and Philosophical, chiefly concerning Nitrous Oxide.' . . . He wrote, near the end of his essay: 'As nitrous oxide in its extensive operation appears capable of destroying physical pain, it may probably be used with advantage during surgical operations in which no great effusion of blood takes place.' It seems strange that no one caught at a suggestion such as this. . . . The nitrous oxide might have been of as little general interest as the carbonic or any other, had it not been for the strange and various excitements produced by its inhalation. These made it a favourite subject with chemical lecturers, and year after year, in nearly every chemical theatre, it was fun to inhale it after the lecture on the gaseous compounds of nitrogen; and among those who inhaled it there must have been many who, in their intoxication, received sharp and heavy blows, but, at the time, felt no pain. And this went on for more than forty years, exciting nothing worthy to be called thought or observation, till, in December, 1844, Mr. Colton, a popular itinerant lecturer on chemistry, delivered a lecture on 'laughing gas' in Hartford, Connecticut. Among his auditors was Mr. Horace Wells, an enterprising dentist in that town, a man of some power in mechanical invention. After the lecture came the usual amusement of inhaling the gas, and Wells, in whom long wishing had bred a kind of belief that something might be found to make tooth-drawing painless, observed that one of the men excited by the gas

was not conscious of hurting himself when he fell on the benches and bruised and cut his knees. Even when he became calm and clear-headed the man was sure that he did not feel pain at the time of his fall. Wells was at once convinced—more easily convinced than a man of more scientific mind would have been—that, during similar insensibility, in a state of intense nervous excitement, teeth might be drawn without pain, and he determined that himself and one of his own largest teeth should be the first for trial."—J. Paget, *Escape from pain* (*Nineteenth Century*, Dec., 1879).—"One of the most important discoveries in the history of medicine was made during the last decade of the first half of the nineteenth century by members of the medical profession in the United States of America. During the last three or four centuries narcotics and alcoholic liquors had frequently been administered to patients to lessen the severity of their pains during surgical operations, and Sir Humphry Davy had vaguely suggested that the inhalation of nitrous oxide gas might be found useful for the same purpose. The first direct experiments for producing complete anæsthesia, or unconsciousness of pain for surgical purposes, however, were made by Horace Wells, a practitioner of dentistry in Hartford, Connecticut, in 1840. He was a native of that State, born in 1815. After several times demonstrating his ability to render a patient insensible to pain by the inhalation of nitrous oxide gas, he extracted teeth without pain under its influence, in Hartford, Dec. 11th, 1844. During the next month, January, 1845, he caused the inhalation of sulphuric ether vapor while Dr. Marcy removed a tumor (wen) from the head of a patient without pain or consciousness. During the same month he communicated these facts to the medical and surgical staff of the Massachusetts General Hospital in Boston, and attempted to anæsthetize a patient for an operation before a class in attendance. From mental trepidation and over-anxiety he failed to effect complete anæsthesia, and was hooted out by the students as a failure. He, however, continued to extract teeth under the successful anæsthetic effects of both the nitrous oxide and ether, which was well known to both Charles T. Jackson and Dr. W. T. G. Morton, of Boston. The latter had been a student of Dr. Wells and was a practitioner of dentistry. Dr. Jackson was an eminent chemist and well acquainted with the effects of inhaling ether, though he had made no attempt to apply its use in surgery. In October, 1846, Dr. Morton successfully anæsthetized a patient in the Massachusetts General Hospital with ether, while Dr. J. C. Warren performed an operation, a full account of which was published in the Boston Medical and Surgical Journal, November 18, 1846. Jackson and Morton claimed this as the first demonstration of the practicability and safety of surgical anæsthesia, and soon obtained a patent for their anæsthetic under the fictitious name of 'Lætheon.' This, however, was soon shown to be nothing but a pure specimen of sulphuric ether, and their patent became void. Several years later it was satisfactorily shown by Dr. J. Marion Sims, that so early as March 30, 1842, Dr. Crawford W. Long, of Georgia, had safely extirpated a tumor from the neck of a Mr. Venables while profoundly under the anæsthetic influence of ether. And during the next three years the same surgeon performed several other operations with the patients under the complete influence of the same anæsthetic. But he published no account of his work until 1840. Chloroform as a chemical substance was discovered independently, and nearly at the

same time, in 1831, by Mr. Samuel Guthrie, of Sackett's Harbor, N. Y., and Soubeiran in France. Its properties were studied by Liebig, and it was named chloroform by Dumas. It was first used by Sir J. Y. Simpson, of Edinburgh, for producing anesthesia instead of ether, in November, 1847."

19th century.—Study of fermentation and its results.—"It was . . . the current belief that epidemic diseases generally were propagated by a kind of malaria, which consisted of organic matter in a state of motor-decay; that when such matter was taken into the body through the lungs, skin, or stomach, it had the power of spreading there the destroying process by which itself had been assailed. Such a power was visibly exerted in the case of yeast. A little leaven was seen to leaven the whole lump—a mere speck of matter, in this supposed state of decomposition, being apparently competent to propagate indefinitely its own decay. Why should not a bit of rotten malaria act in a similar manner within the human frame? In 1836 . . . Cagniard de la Tour discovered the yeast-plant—a living organism, which when placed in a proper medium feeds, grows, and reproduces itself, and in this way carries on the process which we name fermentation. By this striking discovery fermentation was connected with organic growth. Schwann, of Berlin, discovered the yeast-plant independently about the same time."—J. Tyndall, *Fragments of science*, v. 1, ch. 5.—"Chemists generally—especially Liebig, who had a fermentation theory of his own—pooh-poohed this idea altogether; maintaining the presence of the yeast-plant to be a mere concomitant, and refusing to believe that it had any real share in the process. But in 1843, Professor Helmholtz, then a young undistinguished man, devised a method of stopping the passage of organic germs from a fermenting into a fermentable liquid, without checking the passage of fluids; and as no fermentation was then set up, he drew the inference that the 'particulate' organic germs, not the soluble material of the yeast, furnish the primum mobile of this change. . . . A little before Cagniard de la Tour's discovery, a set of investigations had been made by Schulze and Schwann, to determine whether the exclusion of air was absolutely necessary to prevent the appearance of living organisms in decomposing fluids. . . . These experiments, it should be said, had reference rather to the question of 'spontaneous generation,' or 'abiogenesis,' than to the cause of fermentation and decomposition; its object being to determine whether the living things found by the microscope in a decomposing liquid exposed to the air, spring from germs brought by the atmosphere, or are generated 'de novo' in the act of decay."—W. B. Carpenter, *Disease-germs (Nineteenth Century, Oct., 1881)*.

19th century.—Rise of modern clinical medicine.—Corvisart.—Laennec.—French school.—Experimental pathology.—Clinical neurology.—"The early years of the [nineteenth] century saw the rise of modern clinical medicine in Paris. In the art of observation men had come to a standstill. . . . There were still lectures on Hippocrates three times a week, and bleeding was the principal plan of treatment: one morning Frank saw thirty patients, out of one hundred and twelve, bled! . . . [Louis Corvisart] was the strong clinician of his generation, and his accurate studies on the heart

were among the first that had concentrated attention upon a special organ. To him, too, is due the reintroduction of the art of percussion in internal disease discovered by Auenbrugger in 1761. . . . The man who gave the greatest impetus to the study of scientific medicine at this time was Bichat. [See above: 18th century: Physiological views of Bichat.] . . . It was a pupil of Corvisart, Rene Theophile Laennec, who laid the foundation of modern clinical medicine. . . . Influenced by Corvisart, he began to combine the accurate study of cases in the wards with anatomical investigations in the dead-house. Before Laennec, the examination of a patient had been largely by sense of sight, supplemented by that of touch, as in estimating the degree of fever, or the character of the pulse. Auenbrugger's '*Inventum novum*' of percussion, recognized by Corvisart, extended the field; but the discovery of auscultation by Laennec, and the publication of his work—'*De l'Auscultation Médiate*,' 1819,—marked an era in the study of medicine. The clinical recognition of individual diseases had made really very little progress; with the stethoscope begins the day of physical diagnosis. . . . Laennec's book is in the category of the eight or ten greatest contributions to the science of medicine. . . . His description of tuberculosis is perhaps the most masterly chapter in clinical medicine. This revolution was effected by a simple extension of the Hippocratic method from the bed to the dead-house, and by correlating the signs and symptoms of a disease with its anatomical appearances. The pupils and successors of Corvisart—Bayle, Andral, Bouillaud, Chomel, Piorry, Bretonneau, Rayer, Cruveilhier and Trousseau—brought a new spirit into the profession. Everywhere the investigation of disease by clinical-pathological methods widened enormously the diagnostic powers of the physician. By this method Richard Bright, in 1836, opened a new chapter on the relation of disease of the kidney to dropsy. . . . In no direction was the harvest of this combined study more abundant than in the complicated and confused subject of fever. The work of Louis and of his pupils, W. W. Gerhard and others, revealed the distinction between typhus and typhoid fever, and so cleared up one of the most obscure problems in pathology. By Morgagni's method of 'anatomical thinking,' Skoda in Vienna, Schönlein in Berlin, Graves and Stokes in Dublin, Marshall Hall, C. J. B. Williams and many others introduced the new and exact methods of the French and created a new clinical medicine. A very strong impetus was given by the researches of Virchow on cellular pathology, which removed the seats of disease from the tissues, as taught by Bichat, to the individual elements, the cells. The introduction of the use of the microscope in clinical work widened greatly our powers of diagnosis, and we obtained thereby a very much clearer conception of the actual processes of disease. In another way, too, medicine was greatly helped by the rise of experimental pathology, which had been introduced by John Hunter, was carried along by Magendie and others, and reached its culmination in the epoch-making researches of Claude Bernard. . . . In no direction did the experimental method effect such a revolution as in our knowledge of the functions of the brain. Clinical neurology, which had received a great impetus by the studies of Todd, Romberg, Lockhart Clarke, Duchenne and Weir Mitchell, was completely revolutionized by the experimental work of Hitzig, Fritsch and Ferrier on the localization of functions in the brain. Under Charcot, the school of French

neurologists gave great accuracy to the diagnosis of obscure affections of the brain and spinal cord, and the combined results of the new anatomical, physiological and experimental work have rendered clear and definite what was formerly the most obscure and complicated section of internal medicine. The end of the fifth decade of the century is marked by a discovery of supreme importance. . . .

"One of the greatest contributions of the nineteenth century to scientific medicine was the discovery of the internal secretions of organs. The basic work on the subject was done by Claude Bernard. . . . More than any other man of his generation, Claude Bernard appreciated the importance of experiment in practical medicine. For him the experimental physician was the physician of the future—a view well borne out by the influence his epoch-making work has had on the treatment of disease. His studies on the glyco-genic functions of the liver opened the way for the modern fruitful researches on the internal secretions of the various glands. About the same time that Bernard was developing the laboratory side of the problem, Addison, a physician to Guy's Hospital, in 1855, pointed out the relation of a remarkable group of symptoms to disease of the suprarenal glands, small bodies situated above the kidneys, the importance of which had not been previously recognized. With the loss of the function of these glands by disease, the body was deprived of something formed by them which was essential to its proper working. Then, in the last third of the century, came in rapid succession the demonstration of the relations of the pancreas to diabetes, of the vital importance of the thyroid gland and of the pituitary body. Perhaps no more striking illustration of the value of experimental medicine has ever been given than that afforded by the studies upon those glands. . . . Experimental work has also demonstrated the functions of the suprarenal glands and explained the symptoms of Addison's disease, and chemists have even succeeded in making synthetically the active principle adrenalin. There is perhaps no more fascinating story in the history of science than that of the discovery of these so-called ductless glands. Part of its special interest is due to the fact that clinicians, surgeons, experimental physiologists, pathologists and chemists have all combined in splendid teamwork to win the victory. No such miracles have ever before been wrought by physicians as those which we see in connection with the internal secretion of the thyroid gland."—W. Osler, *Evolution of modern medicine*, pp. 200-201, 204-206, 215-216.

19th century.—Revolutionary experiments and discoveries.—"The brilliant and important advancements in organic chemistry under the leadership of Liebig in Germany; in pathological anatomy and physical diagnosis in France; in the physiology of the nervous system in England; and in anæsthesia in America during the first half of the nineteenth century, were all accomplished by close observation and diligent experimental application of chemical and physiological laws, with but little aid from the microscope. But they paved the way and furnished an excellent basis for the no less brilliant achievements of the last half of the same century. The compound microscope was brought to a degree of completion in 1832 that enabled other investigators to take the several primary structures of the anatomists and resolve them into the individual cells or organized atoms of which they were composed, thereby showing the manner of their evolution or

growth, and developing the interesting departments of histology and embryology. Under the leadership of Thomas Schwann, Lionel S. Beale, Louis Agassiz, Sharpey, Hassall, Bastian, Tyndal, Huxley, Virchow, and others, every organized structure of the living body was subjected to microscopic analyses and found to be composed of individual cells, varying in size and shape, and performing a great variety of functions, but all composed essentially of an organizable substance recognized as the physical basis of life, and called by some investigators protoplasm and by others bioplasm. Its most distinctive attribute is its vital capacity to grow and multiply or propagate itself. Thus they found all living bodies, both animal and vegetable, composed of protoplasm aggregated in minute forms called cells, and united in various ways to constitute all the organized matter in the fluids and solids of living bodies. . . . The modern investigators did not limit their microscopic analyses to normal structures, but extended them with equal diligence to all the morbid structures and products brought to light by the studies in morbid anatomy during the first half of the century. This soon resulted in demonstrating that all tumors or morbid growths were cellular in structure, and progressive by constant evolution of new cells; and the so-called inflammatory exudations, whether plastic or aplastic, were also composed of cells derived from the blood and tissues. The plastic exudations were found to consist largely of white corpuscles or leucocytes, formerly called migrating corpuscles. They were seen to attack and apparently consume such offending matter as they met with, and soon alter to disappear leaving the structure in its normal condition, or if their accumulation was too great or persistent, they united in the formation of adventitious tissue by which thickenings, indurations or adhesions might remain for indefinite periods of time. If the exudations were aplastic from the presence of pathogenic bacteria, or their toxic products, the vitality of the accumulated leucocytes was overwhelmed and they, with the cells of the tissues, were degenerated into pus corpuscles with more or less destruction of tissue by ulceration, suppuration or gangrene. From all the foregoing investigations the eminent German pathologist, Rudolph Virchow, was enabled to give to the world his great work on cellular pathology (*Cellular Pathologie*) published in 1858."—N. S. Davis, *History of medicine*, pp. 160-161.—"Coeval with the great discoveries made in microscopic life, there were made complete revolutions in the conceptions of the animal physiology and of pathology. These studies influenced greatly the progress of clinical medicine, so that in many instances accurate scientific measures were developed in the diagnosis and treatment of sickness. The study of the physiological action of drugs was an attempt to place medicinal therapeutics on a logical basis, and the advances made in pharmacology in recent years bespeak great hopes for this science in the future. . . . During the nineteenth century the whole question of physiology was thoroughly investigated, and a brilliant epoch in the progress of biological science was inaugurated. In 1811 Charles Bell (1774-1842) published a small essay entitled, 'Idea of a New Anatomy of the Brain,' in which he divined by deductive reasoning and not by experimentation that the nerve fibers of the anterior roots of the spinal cord belong to the motor type, while those of the posterior root belong to the sensory type."—M. Kahn, *History of modern medicine* (F. Tice, ed., *Practice of medicine*, v. 1, p. 93).—"Directly

parallel with the progress of both organic and general chemistry, came the brilliant discovery of Sir Charles Bell, of London, concerning the distinct sensory and motor functions of the posterior and anterior roots of the spinal nerves and their connections, published in 1824; the experiments of James H. Miller, of Baltimore, Md.; M. Brachet, of France, and Professor Reid, of the British Association of Science, concerning the functions of the great sympathetic or ganglionic system of nerves, between 1809 and 1838; the work of Marshall Hall in demonstrating the reflex or excito-motor system of nerves as published in 1838; and experiments to determine the special function of different parts of the brain and medulla oblongata, by Magendie, Flourens, Reid, H. H. Smith of Philadelphia, and others. The researches of all the foregoing investigators in the field of nerve physiology were well supplemented by the very valuable work of Dr. Samuel George Morton, of Philadelphia, entitled 'Crania Americana,' published in 1839."—N. S. Davis, *History of medicine*, p. 117.—"What Bell arrived at by poetic inspiration, the famous physiologist of Germany, Johannes Müller (1801-1858), proved in the laboratory. . . . Müller's scientific observations and his breadth of vision led him to make wonderful advances in many of the domains of biology—physiology, psychology, morphology, embryology, chemistry and pathology. We shall enumerate a few of his contributions: his studies on sensations, his discovery of the lymph heart in the frog, his experiments on the vocal cords and the voice, his experiments on the vision and color appreciation, his isolation of chondrin and gluten, and his discovery of the function of the bristle cells of the internal ear, may be mentioned as some of his memorable scientific attainments. The great pupil of Müller, Hermann von Helmholtz (1821-1804), did much to continue his teacher's work in physiology. In 1840, Müller had stated that no one could measure the velocity of a nervous impulse. Ten years later, Helmholtz had done so. His studies on optics and acoustics are classical. In 1851 he invented the ophthalmoscope, and established ophthalmology as one of the exact sciences. However, his great contribution to science is the universal application of the first law of thermodynamics. . . . Of the other German masters of physiology, Carl Ludwig (1816-1805), Du Bois-Reymond (1818-1896) and Hugo Kroecker are those who have shed great luster on the scientific annals of their country. In France also, simultaneously, there developed a great school of scientific investigation, led by the famous Claude Bernard (1813-1878). . . . He touched every field of this science, and made it much richer for his explorations. The glycogenic function of the liver was described by him in 1857, when he also isolated glycogen. Garrison . . . states . . . 'Bernard made it clear that the glycogenic function of the liver is in the nature of an *internal secretion*, a term which he first introduced.' 'This,' says Foster, 'at one blow destroyed the then dominant conception that the animal body was to be regarded as a bundle of organs, each with its appropriate functions.' His discoveries are too numerous to mention in detail here. He described the glycosuria that follows puncture of the floor of the fourth ventricle, investigated pancreatic digestion, studied the heat regulation of the body, described the vasodilator and vasoconstrictor nerve effects on the circulation, and made very many more contributions to physiology and pharmacology. The investigation of the physiological chemistry of diges-

tion was inaugurated by Bernard. Previous to him, an American army surgeon, William Beaumont (1785-1853), had studied the nature of the gastric juice and the movements of the stomach *in situ*, in the case of an accidental gastric fistula (1825). In 1834, Johann Eberle suggested that the function of pancreatic juice was to emulsify fats, and ten years later Gabriel Valentin discovered its amyolytic property. But to Bernard belongs the credit of thoroughly studying the digestive influence of the pancreas. He investigated its effects on starch, fats and protein, and demonstrated that it not only emulsifies but breaks up fats into fatty acids and glycerol. To Bernard's pupil, Willy Kühne (1837-1900), of Hamburg, is due the honor of identifying the proteolytic enzyme of the pancreas, which he called trypsin. But the great Russian physiologist, Ivan Petrovich Pavloff (1840-1916), made the thorough investigations on the chemistry of digestion and the effect of nervous stimulation on the quality and quantity of the juices secreted. . . . The study of the physiology of metabolism was begun by Justus von Liebig (1803-1873) and by Friedrich Wöhlen. . . . Foremost in the ranks of histologists, we must mention the name of Jacob Henle (1800-1885). . . . He studied the character of the epithelial cells of the skin and all mucous membranes, pointing out their similarity; described the involuntary muscle-fibers in the tunica media of the blood-vessels; gave an accurate account of the histology of the cornea; pointed out important new facts in the brain anatomy, pituitary structure, kidney histology (Henle's tubules), etc. Contemporary with Henle, the greatest histologists were Remak and Purkinje, and Albert von Kolliker (1817-1805), who studied under Henle."—M. Kahn, *History of modern medicine* (F. Tice, ed., *Practice of medicine*, v. 1, pp. 93-96, 98-100).

19th century.—Development of bacteriology.—"While one class of investigators was . . . successfully using the microscope to enable them to see more clearly the composition and modes of development of living organized structures, both in conditions of health and disease . . . another class consisting of J. K. Mitchell, Saulsbury, Sanderson, Beale, Lister, Pasteur, Koch, Sternberg, E. Hallier, and many others, both in Europe and America, were applying the same instrument with equal diligence in the domain of aetiology, searching for long-hidden causes of disease. In all the earlier periods of medical history most of the febrile and inflammatory diseases were attributed to the concoction or fermentation of the blood and other so-called humors in the living body. Later, by observation alone, the concoctions causing the active phenomena of diseases were traced in some instances to something emanating from moist soils rich in decomposable vegetable matter and exposed to high temperature. Other cases were traced to the influence of the air in over-crowded and ill-ventilated houses and the use of impure water. By long-continued observations the profession became satisfied that the combined influence of heat, moisture and decomposable vegetable matter in the soil, gave rise to a subtle toxic agent capable of impregnating both air and water, that was called Malaria or Koinoism. By similar observations it was made evident that both air and water, when impregnated with the excretions and eliminations from living animal bodies, became toxic and capable of producing a variety of severe and often fatal febrile diseases."—N. S. Davis, *History of medicine*, p. 162.—"The traditional expression *contagium vivum* received a more precise meaning in 1840 from [Jacob Henle

(1809-1855)], who in his 'Pathologischen Untersuchungen,' showed clearly and distinctly that the contagia till then invisible must be regarded as living organisms, and gave his reasons for this view. . . . If we are forced to recognise the characteristic qualities of living beings in these contagia, there is no good reason why we should not regard them as real living beings, parasites. For the only general distinction between their mode of appearance and operation and that of parasites is, that the parasites with which we are acquainted have been seen and the contagia have not. That this may be due to imperfect observation is shown by the experiments on the itch in 1840, in which the contagium, the itch-mite, though almost visible without magnifying power, was long at least misunderstood. It was only a short time before that the microscopic Fungus, Achorion, which causes favus, was unexpectedly discovered, as well as the Fungus which gives rise to the infectious disease in the caterpillar of the silkworm known as muscardine."—A. De Bary, *Lectures on bacteria*, p. 145.—"When the science of analytical chemistry had reached a high degree of development, many samples of supposedly impure soil, water and air were subjected to rigid chemical analysis, hoping thereby to isolate and identify the specific toxic agents called miasms, but without success. But when the same substances were properly placed in the field of the microscope an abundance of living germs, called bacteria, were discovered and found capable of propagation on suitable media in the laboratory. Copeland and a few earlier writers under the phrase 'contagium vivum' had suggested that the specific causes of some epidemic and contagious fevers consisted of sporules or fungi; and in 1849 Dr. J. K. Mitchell, of Philadelphia, published a very interesting monograph on the subject. He was followed by Dr. Salsbury, of Cleveland, Ohio, in 1866, who published two papers, giving the results of his own investigations concerning a vegetable fungus called palmella. Still later Drs. Klebs, and Thomasini Crudelli, of Italy, experimented with a fungoid growth found in the malarious soils near Rome that they called bacillus malarie, and claimed to have demonstrated its causative influence by inoculating rabbits with it. Their conclusions, however, were not sustained by a thorough experimental investigation by Dr. Geo. M. Sternberg, U. S. A., in a highly malarious district in Louisiana. Laveran and others extended their examinations to the blood of patients during the active progress of malarious fevers, and soon identified the supposed specific cause in the red corpuscles of the blood in the form of the plasmodium malarie. When, during the decade following 1860, it was shown by Huxley, Beale, Bastian and others that microscopic germs or fungi pervaded the atmosphere and were greatly increased both in number and variety in the air of over-crowded and unventilated rooms; and the process of fermentation was shown by Pasteur to be one of bacteriological development, not a few of the investigators regarded the bacteria as the product of spontaneous growth. Bastian published a large work in support of that doctrine. But all his positions were soon completely refuted by the further investigations of Huxley, Pasteur, Beale, Virchow, and others, showing that in all instances living germs are developed only from preceding germs. They proved conclusively not only that 'like begets like,' but also that every living cell and germ, whether vegetable or animal, is evolved from a preceding cell or germ. In 1835 Bassi and Belasma discovered the silk worm fungus, and

in 1855 Pollender discovered the bacillus of malignant pustule. In 1847 Joseph Leidy of Philadelphia, demonstrated the existence of the trichina spiralis, previously described by Richard Owen, in pork, and its communicability to man. During the decade following 1860, Pasteur demonstrated fully that without the presence of micro-organisms there could be neither fermentation nor decay. It was during the same period of time [in 1863] that Davaine proved his previously discovered germ in the blood of animals suffering from anthrax to be the cause of that disease [the germ had been seen by Pollender in 1849 and by Davaine in 1850]; and Oertel discovered fungi in the exudations accompanying diphtheria, which were more accurately described later by Klebs and Loeffler as bacilli."—N. S. Davis, *History of medicine*, pp. 162-164.—"In a series of studies on the diseases of beer, and on the mode of production of vinegar, . . . [Pasteur] became more and more convinced that these studies on fermentation had given him the key to the nature of the infectious diseases. It is a remarkable fact that the distinguished English philosopher of the seventeenth century, the man who more than any one else of his century appreciated the importance of the experimental method, Robert Boyle, had said that he who could discover the nature of ferments and fermentation, would be more capable than anyone else of explaining the nature of certain diseases. The studies on spontaneous generation, and Lister's application of the germ theory to the treatment of wounds, had aroused the greatest interest in the medical world, and Villemin, in a series of most brilliant experiments, had demonstrated the infectivity of tuberculosis. An extraordinary opportunity now offered for the study of a widespread epidemic disease, known as anthrax, which in many parts of France killed from 25 to 30 per cent. of the sheep and cattle, and which in parts of Europe had been pandemic, attacking both man and beast. As far back as 1838 minute rods had been noted in the blood of animals which had died from the disease; and in 1863 Davaine thought that these little bodies which he called bacteridia, were the cause of the disease. . . . In 1876 a young German district physician, Robert Koch, began a career, which in interest and importance rivals that of [Pasteur]. . . . Koch confirmed in every point the old researches of Davaine; but he did much more, and for the first time isolated the organism in pure culture outside the body, grew successive generations, showed the remarkable spore formation, and produced the disease artificially in animals by inoculating with the cultures. Pasteur confirmed these results, and in the face of extraordinary opposition succeeded in convincing his opponents. Out of this study came a still more important discovery, namely, that it was possible so to attenuate or weaken the virus or poison that the animal could be inoculated, and have a slight attack, recover, and be protected against the disease. . . . Studies on chicken cholera, yellow fever, and on swine plague helped to further the general acceptance of the germ theory. . . . When the Vale de Grâce physician, Villemin—a modest, gentle-voiced man, who, under his quiet exterior, hid a veritable thirst for scientific truth—after experimental researches carried on from 1865 to 1860, brought the proof that tuberculosis is a disease which reproduces itself, and cannot be reproduced but by itself; in a word, specific, inoculable, and contagious, he was treated almost as a perturber of medical order. . . . The bacillus of tuberculosis had not been discovered by Villemin; it was only found and isolated much

later, in 1882, by Dr. Koch; but Villemin suspected the existence of a virus."—R. Vallery-Radot, *Life of Pasteur* (tr. by Mrs. R. L. Devonshire), pp. x, xi, 226-227.—"In (1873) the spirochæte in the blood of recurrent fever patients [was found by Otto Obermeier, one of Virchow's assistants], and Joseph Lister prosecuted his investigations concerning the micro-organisms of suppurating wounds, erysipelas, and septicæmia, by which he was enabled, in 1878, to propose a system of antiseptic surgical practice that speedily effected a most beneficial revolution in the treatment of all wounds and surgical diseases. The decade following 1880 was equally remarkable for the microscopic achievements in the department of ætiology. It was at the beginning of that decade the announcement of the fungus of actinomycosis by Bottinger began to attract attention, and Prof. James Law, of Ithaca, N. Y., demonstrated its existence in 1883. The following year Drs. W. T. Belfield and J. B. Murphy presented

ROBERT KOCH

two well-marked cases of the disease in the human subject before the Chicago Medical Society, and the specific microbe was identified by Drs. Belfield and Fenger. In 1885 Pasteur commenced his inoculations for preventing hydrophobia in human subjects. In 1886, Koch announced his discovery of the cholera bacillus; in 1887 the bacillus of tuberculosis, and that of tetanus soon followed. The pneumococcus of pneumonia was announced by Friedlander; and before the end of the century the numerous workers in the field of bacteriology had claimed nearly all the diseases in the catalogue of human ailments as resulting from pathogenic germs of some form. Apparently the first thought excited by all the foregoing discoveries, both in relation to surgical wounds and to disease-producing bacteria, was the practical application of antiseptics and germicides for the destruction of the offending germs. . . . Clinical experience in their use soon demonstrated that by the external applications a much greater degree of cleanliness, of both patients and their surroundings, was secured, and corresponding improvements in the results of all external dressings and surgical procedures. But

the same experience with their internal use, for the purpose of destroying either the bacteria or their toxins already existing in the blood or tissues, resulted in only a limited degree of success. As soon as the bacteriologist announced the discovery of a pathogenic germ, or its toxin, as the cause of any acute disease, the clinician began to administer his germicide or antitoxin in all stages of the disease, regardless of the previously well known laws of development, progress, and decline in all acute diseases. Every pathogenic germ or toxin discovered was declared to be a contagious or infectious agent, to be either avoided by isolation or directly combated by specific germicides or antitoxins. And thus the nineteenth century closed with the medical profession throughout Christendom engaged in a determined effort to discover the specific causes of diseases and their specific remedies, aided by all the modern facilities and appliances for ensuring accuracy in the domain of scientific research."—N. S. Davis, *History of medicine*, pp. 164-165.—Louis Pasteur (1822-1895) was "one of the rare individuals who must be described by the term genius. The closing years of his life were full of interest in the work of his colleagues and assistants, and he had the great satisfaction of participating, with his assistant Roux, in another great victory over the dread scourge, diphtheria. Before his death in 1895 he had seen his work prosper in a way never before granted to any great discoverer. To no one man has it ever been given to accomplish work of such great importance for the well-being of humanity. As Paul Bert expressed it in the report to the French Government, Pasteur's work constitutes three great discoveries, which may be thus formulated. 1. Each fermentation is produced by the development of a special microbe. 2. Each infectious disease is produced by the development within the organism of a special microbe. 3. The microbe of an infectious disease culture, under certain detrimental conditions is attenuated in its pathogenic activity; from a virus it has become a vaccine."—R. Vallery-Radot, *Life of Pasteur* (tr. by Mrs. R. L. Devonshire), pp. xii, xiii.

19th century.—Antiseptic surgery and obstetrics.—The "experiments of Pasteur attracted the attention of the young English surgeon, Joseph Lister (1827-1912), and ultimately resulted in that wonderful application of these discoveries, one of the greatest boons to suffering mankind. The hospital conditions of those times were something fearful. Death stalked in gruesome shape in every ward where surgery was done. A serious surgical operation was in reality a death warrant. All surgical wounds were supposed to show 'laudable pus.' The pus was not 'laudable' if the patient died, 'laudable' if the patient recovered. . . . Lister was highly impressed with this awful mortality list from septicæmia, pyæmia, erysipelas, tetanus and hospital gangrene. [So terrible was the mortality that surgeons feared to operate.] Although he followed the accepted technic of the time in his amputation cases, used silver sutures, had free drainage and frequently changed the dressing, the death rate among . . . [Lister's] patients was forty-five per cent. He began to doubt whether any pus was 'laudable,' and became convinced that surgical healing by first intention was the proper way. But how obtain this desirable consummation in his cases? He directed his attempts at preventing the animalculæ and germs that infest the air from reaching his patients' wounds in a viable state. Heat was impractical, but he could use chemical disinfectants, and finally he

used (August 12, 1865) a carbolic acid solution in a case of compound fracture with complete success. In Lister's wards, all the instruments and dressings were first disinfected in a strong phenol solution, similar precautions being used for the hands of the surgeon and his assistants. In the operating room, a kettle was constantly boiling, vaporizing carbolic acid into the atmosphere. The wounds were dressed with a sort of gauze soaked in this solution. This was Lister's method, in brief. This revolutionized the entire practice of surgery, and deft physicians ventured to operate on the peritoneal viscera, on the blood-vessels, on the brain, with remarkable results. Before Pasteur and before Lister, Oliver Wendell Holmes (1809-1894), in Boston, in 1843, and Ignaz Philip Semmelweis (1818-1865), a Hungarian, in 1847, observed that puerperal fever was induced in most cases by the uncleanness with which the physician attended his cases. Instead of helping and healing, the obstetrician of those days infected and inflicted injury and sometimes mortal injury on his innocent patients. Semmelweis observed that with proper precautions and with extreme cleanliness, he could reduce his mortality rate in the obstetrical clinic from almost ten per cent. to as low as one per cent. His method consisted in washing his hands in a solution of chlorid of lime before attending or examining his patients. Both Holmes and Semmelweis were bitterly attacked. The orthodox, conservative obstetricians of that time heaped so much abuse on Semmelweis that he left Vienna and went to Budapest, where his broodings led to insanity and to an early death. Of the great men who have done good in the world, this Hungarian physician must be counted as one, for he has helped all mothers the world over. In their hour of greatest pain and greatest need he has assured them of a safe confinement. When, in 1883, Lister heard of Semmelweis, he honestly declared that to him belonged the precedence of originating antiseptic surgery. . . . In the specialties of surgery, the great advances made during the past century are too numerous to be recounted here in detail. To America belongs the credit of having made the initial advances in gynecological surgery. Ephraim McDowell (1771-1830), of Virginia, a pupil of John Bell, of Edinburgh, settled in the wilds of Kentucky and soon became a wonderful surgeon. He performed twenty-two lithotomy operations successively with complete cure, and in 1809 he did the first ovariectomy on a woman forty-seven years old. The initial work of McDowell was continued by James Marion Sims (1813-1883), of South Carolina, who in 1852 perfected an operation for the cure of vesicovaginal fistula, by Thomas Addis Emmet, by Sir Thomas Spencer Wells (1818-1897), by Lawson Tait (1845-1899), by Howard A. Kelly and by others. The advances in obstetrics, ophthalmology and the other specialties were marvellous. It is sufficient to state that the accomplishments in all surgical branches since the days of Pasteur and Lister far outshine the progress made until the middle of the nineteenth century."—M. Kahn, *History of modern medicine* (F. Tice, ed., *Practice of medicine*, v. 1, pp. 87-88, 93).

19th century.—Opsonins.—"Of Virchow's pupils, the most eminent was Julius Cohnheim (1830-84), of Demmin, Pomerania. . . . Under Willy Kühne, Cohnheim made an important investigation on the sugar-forming ferments (1863), but his inaugural dissertation on the inflammation of serous membranes (1861) marks his bent as a pioneer in experimental histology and pathology. . . . His monographs on inflammation and suppuration

(1867-73) revolutionized pathology, showing, in direct opposition to the teaching of Virchow, that the essential feature of inflammation is the passage of white blood-cells through the walls of the capillaries, and that pus and pus-cells are formed in this way from the blood. . . . The subject of immunity was developed on the solidist or cellular side by Elie Metchnikoff (1845-1916), the eminent Russian biologist, who, in his studies of *Daphnia* (1884), showed how ameboid cells in the connective tissues and the blood engulf solid particles and bacteria, destroying bacteria by absorbing them (phagocytosis). He called these cells 'phagocytes,' showed their function as scavengers, developed the doctrine of inflammation as the effect of the determination of swarms of phagocytes to the site of injury by chemiotaxis and upheld the solidist theory of immunity or phagocytosis. This theory, in the hands of Sir Almroth Wright and others, led to . . . vaccinotherapy (1902-7), with the superadded feature of measuring the protective substances in the blood by means of the opsonic index (1903)."—F. H. Garrison, *Introduction to the history of medicine*, pp. 605-606, 618-619.—"For many a day after the publication of Metchnikoff's discoveries regarding the germ-killing power of the phagocytes, it was held that these living cells alone accomplished the duty of disposing of troublesome invaders. Later on, other opinions were advanced to the effect that while the phagocytes did undoubtedly accomplish their work in the direction indicated, they demanded aid to that end from an outside source. This source was indicated and represented by the plasma or blood-fluid itself. . . . The investigators are of the opinion that the real source of the power possessed by the blood-fluid or 'plasma' is to be sought and found in substances contained therein and called 'Opsonins.'"—A. Wilson, *About opsonins* (Cornhill, Jan., 1907).

19th century.—Antitoxin.—"About 1890, Pasteur's theory of attenuated viruses was extended to the science of toxins and antitoxins by Emil von Behring (1854-), a Prussian army surgeon who became professor of hygiene at Halle (1894) and Marburg (1895). . . . While working in Koch's Institute with Kitasato, Behring demonstrated that the serum of animals immunized against attenuated diphtheria toxins can be used as a preventive or therapeutic inoculation against diphtheria in other animals, through a specific neutralization of the toxin of the disease (1890-93). After trying out the remedy in man, Behring began to produce it upon a grand scale (1894), and it soon became recognized as the specific treatment for diphtheria. The success of diphtheria antitoxin led to many attempts to treat other specific infections by immune sera, but, except in the case of tetanus and serpent-poisoning, these have not been uniformly successful. . . . Sir Almroth Edward Wright (1861-), of Dublin, Ireland, professor of pathology in the Army Medical School at Netley (1892-1902), . . . made typhoid vaccination practicable (1896-97), having inoculated over 3,000 soldiers in India (1898-1900), and the entire British forces in the South African War."—F. H. Garrison, *Introduction to the history of medicine*, pp. 618-619.

19th century.—Endocrinology.—"The brilliant results achieved in the study of the endocrine glands in the past quarter of century are the outcome of the initial experiments of Claude Bernard, who in 1855 described the glycogenic function of the liver as the *sécrétion interne*, in contradistinction to the secretion of bile which he designated a *sécrétion externe*. In the same year ap-

peared the book by Thomas Addison (1793-1860) 'On the Constitutional and Local Effects of Disease of the Suprarenal Capsules.' This inaugurated the study of diseases of the glands of internal secretion. . . . In 1880, Charles Edouard Brown-Séquard (1817-1894) found that subcutaneous injections of extracts of testis exercised considerable influence upon the general health as well as the muscular power and mental activity. The experiments were performed upon himself when he was seventy-two years old, and he described very marked rejuvenating effects. He, therefore, promulgated the theory that all tissues give off some unknown substance or substances to the blood, which is specific and particular for each tissue, and which plays an important rôle in the general nutrition of the body. . . . Brown-Séquard's contributions are his experimental production of Addison's disease by extirpation of the adrenal glands in animals, his testicular therapy, and his glandular treatment of acromegaly. Moritz Schiff (1823-1896), . . . added much to our knowledge of endocrinology. His experiments on the effects of excision of the thyroid in dogs, and the cure of these effects by thyroid grafts and by the injection or ingestion of thyroid extracts, are epoch making. To him is due the great discovery of the treatment of myxedema and cretinism. . . . In 1889, Von Mering and Minkowski described the artificial production of diabetes mellitus by the excision of the pancreatic gland. This was ascribed to the removal of the internal secretion produced by the islands of Langerhans, as shown by the experiments of Opie, of Szoboleff, and of W. G. MacCallum. The discovery of the effect of adrenal extract by Oliver and Schäfer, the study of thyroid disease by Graves, Basedow, Slemmon, and others, the discovery of iodine in the thyroid gland by Baumann, the investigation of parathyroid disease by Sandstrom, Gley, Halsted and others, of pituitary disease by Mohr, Pierre Marie, Fröhlich, Harvey Cushing, and others, of the thymus by Kopp, Richard Bright, Paltauf and others, and of the sexual glands by Paton, Battey and others, have added an interesting and very fruitful chapter to the science of physiology."—M. Kahn, *History of modern medicine* (F. Tice, ed., *Practice of medicine*, v. 1, pp. 97-98).

19th-20th centuries.—**Insect transmission of disease.—Secret of malaria.—Yellow fever.**—"Nothing illustrates more clearly the interdependence of the sciences than the reciprocal impulse given to new researches in pathology and entomology by the discovery of the part played by insects in the transmission of disease. The flea, the louse, the bedbug, the house fly, the mosquito, the tick, have all . . . taken their places as important transmitters of disease. The fly population may be taken as the sanitary index of a place. The discovery, too, that insects are porters of disease has led to a great extension of our knowledge of their life history. The fundamental study which set us on the track was a demonstration by Patrick Manson, in 1879, of the association of filarial disease with the mosquito. Many observations had already been made, and were made subsequently, on the importance of insects as intermediary hosts in the animal parasites, but the first really great scientific demonstration of a widespread infection through insects was by Theobald Smith . . . in 1880, in a study of Texas fever of cattle. . . . It is difficult to draw comparisons in pathology; but I think, if a census were taken among the world's workers on dis-

ease, the judgment to be based on the damage to health and direct mortality, the votes would be given to malaria as the greatest single destroyer of the human race. Cholera kills its thousands, plague, in its bad years, its hundreds of thousands, yellow fever, hookworm disease, pneumonia, tuberculosis, are all terribly destructive, some only in the tropics, others in more temperate regions: but malaria is today, as it ever was, a disease to which the word pandemic is especially applicable. . . . No disease illustrates better the progressive evolution of scientific medicine. It is one of the oldest of known diseases. The Greeks and Græco-Romans knew it well. It seems highly probable, as brought out by the studies of W. H. S. Jones of Cambridge, that, in part at least, the physical degeneration in Greece and Rome may have been due to the great increase of this disease. Its clinical manifestations were well known and admirably described by the older writers. . . . Ordinary observation carried on for long centuries had done as much as was possible. In 1880, a young French army surgeon, Laveran by name, working in Algiers, found in the microscopic examination of the blood that there were little bodies in the red blood corpuscles, amœboid in character, which he believed to be the germs of the disease. . . . Several years elapsed before Surgeon-General Sternberg called the attention of the English-speaking world to Laveran's work: it was taken up actively in Italy, and in America by Councilman, Abbott and by others among us in Baltimore. The result of these widespread observations was the confirmation in every respect of Laveran's discovery of the association with malaria of a protozoan parasite. . . . Another army surgeon, Ronald Ross, working in India, influenced by the work of Manson, proved that the disease was transmitted by certain varieties of mosquitoes."—W. Osler, *Evolution of modern medicine*, pp. 222-224.—In a lecture given in September, 1900, Dr. Ronald Ross stated that "the parasites which infested human blood were carried only by one genus of mosquito—'Anopheles'; the genus 'Culex' was harmless. The two genera could be readily distinguished. For example, 'Anopheles' rested on walls with their tails stuck out perpendicular to the wall; 'Culex' attached themselves with tails hanging downwards. 'Culex' bred in the water in pots and tubs; 'Anopheles' in pools. The larvæ of 'Culex,' if disturbed, sank to the bottom; the larvæ of 'Anopheles' skimmed along the surface. . . . The female of 'Anopheles' alone was the biter, and though the favourite feeding time was at night, in West Africa the insects had been found to bite all day. While 'Culex' could be detected by its humming, 'Anopheles' was silent, and it was possible to be bitten without knowing of it at the moment. He had found that a blood diet was always necessary to the maturing of the eggs. He had kept many thousands of mosquitoes under observation and had never known one to lay eggs except after a meal of blood. Malarial infection was derived chiefly from the native children, who swarmed everywhere, and whose blood was full of the infecting parasites." An expedition sent out to West Africa by the Liverpool School of Tropical Medicine, to pursue investigations there, reported in December, 1900, that its observations confirm the conclusion "that the blood parasite which gives rise to malarial fever in man is carried by the mosquito from the native to the European—and more especially from the native children. The examination of the blood of hundreds of native children re-

GREAT PHYSICIANS

vealed the interesting fact that between 50 and 80 per cent. of those under five years, between 20 and 30 per cent. of ages between five and ten years, and a small percentage over ten years contained malarial parasites, often in very large numbers. "Experiments came in to support the studies in etiology; two of those may be quoted. Mosquitoes which had bitten malarial patients in Italy were sent to London and there allowed to bite Mr. Manson, son of Dr. Manson. This gentleman had not lived out of England, where there is now no acute malaria. He had been a perfectly healthy, strong man. In a few days following the bites of the infected mosquitoes, he had a typical attack of malarial fever. The other experiment, though of a different character, is quite as convincing. In certain regions about Rome, in the Campania, malaria is so prevalent that, in the autumn, almost everyone in the district is attacked, particularly if he is a newcomer. Dr. Sambon and a friend lived in this district from June 1 to September 1, 1900. The test was whether they could live in this exceedingly dangerous climate for the three months without catching malaria, if they used stringent precautions against the bites of mosquitoes. For this purpose the hut in which they lived was thoroughly wired, and they slept under netting. Both of these gentlemen, at the end of the period, had escaped the disease. Then came the fifth and final triumph—the prevention of the disease. The anti-malarial crusade which has been preached by Sir Ronald Ross and has been carried out successfully on a wholesale scale in Italy and in parts of India and Africa, has reduced enormously the incidence of the disease. . . . The story of yellow fever illustrates one of the greatest practical triumphs of scientific medicine; indeed, in view of its far-reaching commercial consequences, it may range as one of the first achievements of the race. . . . By the year 1900, not only had the ground been cleared, but the work on insect-borne disease by Manson and by Ross had given observers an important clue. It had repeatedly been suggested that some relation existed between the bites of mosquitoes, and the tropical fevers, particularly by that remarkable student, Nott of Mobile, and the French physician, Beauperrhuy. But the first to announce clearly the mosquito theory of the disease was Carlos Finlay of Havana. Early in the spring of 1900, during the occupation of Cuba by the United States, a commission appointed by Surgeon-General Sternberg (himself one of the most energetic students of the disease) undertook fresh investigations. Dr. Walter Reed, Professor of Bacteriology in the Army Medical School, was placed in charge; Dr. Carroll of the United States Army, Dr. Agramonte of Havana and Dr. Jesse W. Lazear were the other members. . . . Many scientific discoveries have afforded brilliant illustrations of method in research, but in the work of these men one is at a loss to know which to admire more—the remarkable accuracy and precision of the experiments, or the heroism of the men—officers and rank and file of the United States Army; they knew all the time that they were playing with death, and some of them had to pay the penalty! The demonstration was successful—beyond peradventure—that yellow fever could be transmitted by mosquitoes, and equally the negative proposition—that it could not be transmitted by fomites. . . . Lazear permitted himself to be bitten by a stray mosquito while conducting his experiments in the yellow fever hospital. Bitten on the thirteenth, he sickened on the eighteenth and died on the twenty-fifth

of September, but not until he had succeeded in showing in two instances that mosquitoes could convey the infection. He added another to the long list of members of the profession who have laid down their lives in search of the cause of disease. . . . The sanitation of Havana was placed in the hands of Dr. Gorgas, and within nine months the city was cleared of yellow fever. . . . Following the example of Havana other centres were attacked, at Vera Cruz and in Brazil, with the same success, and it is safe to say that now, thanks to the researches of Reed and his colleagues, with proper measures, no country need fear a paralyzing outbreak of this once dreadful disease."—W. Osler, *Evolution of modern medicine*, pp. 224-227.—See also FLORIDA: 1888-1905.

19th-20th centuries.—Modification in use of drugs.—"It is only restating the same fact to say that new practice has followed on new theory, or, rather, new scientific knowledge of the nature of disease. The only object of acquiring the knowledge was to embody it in practice. With the discovery of the zymotic principle in disease, traced finally to bacterial action, there could not be the same or like treatment as when the body was supposed to be possessed by conflicting 'humors'; or when a fever was supposed to be an abnormal increase of vital fluids needing to be drained off; or when diseases were supposed to have no relation to any function of the body except the organs furnishing the dominant symptoms; or when one school supposed them waves of some sort, to be overborne by more powerful waves of the same class, and another school refused to entertain any theoretical suppositions at all, but relied on the history of cases, printed or traditional or experimental. But it may be said that the greatest revolution in the century, or at any rate the last half of it, is in the position assigned to drugs. At the outset the old faith in bleeding still held great sway; Boerhaave himself had made almost the whole art of medicine consist in its proper application, and at the end of the 18th century Washington had been sacrificed to it. But by the middle of the century it began to diminish. Both the homeopathic and the regular schools based their practice, and many still base it, on the study and administration of drugs. They differed in the size and strength of doses, from huge boluses, or powders or draughts whose efficacy was supposed to be in proportion to their nauseousness, to small bland triturations or dilutions; but not in the assumption that in them lay the one efficient method of dealing with disease. The advanced school of the present does not discard medicines; so far from it, it studies them with more care than ever, and values a few, well-tried and certain of quality and action, as highly as ever. It knows the mass of current medicines to be inert or worse, uncertain of action and applied to human functions of still more uncertain action; but it seeks to study thoroughly and apply scientifically the few real medicines or healing agents which must be used—quinine and digitalis, and opium, iron and mercury and iodide of potassium, etc.—instead of a swarm of dubious and varying materials. It is significant that some of the stand-bys are extremely old; iodine, as ashes of burnt sponge, was known in classic times, and ergot impressed its peculiar action on stockraisers' minds from very early ages; even Peruvian bark is nothing new. . . . Chemistry has done vast services for us, and will probably do far more. [See CHEMISTRY: Practical application; Drugs.] Aside from the discovery of new substances like cocaine, it has given us the active principles, of calculable

strength and purity, in place of crude drugs of varying strength at best, and of varying purity and age; and there is no reason why we may not have new specifics as sure (and for as important diseases) as quinine. But the new school does not feel itself under obligation to give any medicines whatever, while a generation ago not only could few physicians have held their practice unless they did, but few would have thought it safe or scientific. Of course, there are still many cases where the patient or the patient's friends must be humored by administering medicine or alleged medicine where it is not really needed, and indeed often where the buoyancy of mind, which is the real curative agent, can only be created by making him wait hopefully for the expected action of medicine; and some physicians still cannot unlearn their old training. But the change is

AUGUST VON WASSERMANN

great. The modern treatment of disease relies very greatly on the old so-called 'natural' methods, diet and exercise, bathing and massage—in other words, giving the natural forces the fullest scope by easy and thorough nutrition, increased flow of blood, and removal of obstructions to the excretory systems or the circulation in the tissues. One notable example is typhoid fever. At the outset of the 19th century it was treated with 'remedies' of the extremest violence—bleeding and blistering, vomiting and purging, and the administration of antimony and mercury and plenty of other heroic remedies. Now the patient is bathed and nursed and carefully tended, but rarely given medicine. This is the result partly of the remarkable experiments of the Paris and Vienna schools into the action of drugs, which have shaken the stoutest faiths, and partly of the constant and reproachful object-lesson of homeopathy. No regular physician would ever admit that the homœopathic preparations, 'infinitesimals,' could do any good as

direct curative agents, and yet it was perfectly certain that homœopaths lost no more of their patients than others. There was but one conclusion to draw—that most drugs had no effect whatever on the diseases for which they were administered. These 'natural methods' have been indicated above; but some further analysis of the individual elements is worth while. It will be noted that this is not, as a hasty reader might assume, the discarding of all the results of civilization and a return to barbarism. That the natural methods are efficient is precisely because scientific knowledge and modern improvements in appliances, as well as the thousand civilized devices for comfort and cleanliness, unattainable even a generation ago, have raised them to the level of first-rate therapeutic agents. Perhaps foremost in the rank is the trained nurse, who is not only a greater agent of philanthropy than many professed altruists, but sets free the physician from a load of care and anxiety. In place of ignorant and stubborn, usually conceited and often superstitious women, who pride themselves on defying all the doctor's commands, these intelligent and loyal women can be relied on to carry out all his injunctions, to watch carefully for indications of danger, and to furnish notes enabling him to view the progress and hourly changes of a critical case."

—W. Osler, *Concise history of medicine*, pp. 54-60.
19th-20th centuries.—Serotherapy.—Side-chain theory.—Immunology.—"That great plague of man, . . . syphilis, has been lately robbed of many of its terrors. Its cause was unknown until Fritz Schaudinn (1871-1906) described that highly motile, corkscrew-shaped spirochete which he named *Spirocheta* or *Treponema pallida*, and which was later cultured in pure form by Hideyo Noguchi. But the greatest boon in the treatment and diagnosis of this disease was discovered by Paul Ehrlich (1864-1916) and by August von Wassermann. . . . Pasteur's and Koch's experiments led to the development of specific serotherapy in various diseases. In 1890, Emil von Behring described the serum method for the treatment of diphtheria, and it is now universally accepted as a specific for this disease. Excellent results were also obtained in the treatment of tetanus infection by antitoxin. The genius and experimentation of Ehrlich and of Metchnikoff have established the sciences of immunology and serology. In 1883, when Elie Metchnikoff (1845-1917) showed that certain of the body cells, and especially the polynuclear neutrophile leukocytes, were active in the defense of the human body against invasion by microorganisms, a great advance was made in the understanding of immunity. This theory of phagocytosis is an easily demonstrated fact. According to this law, certain of the body cells are able to ingest an infecting parasite, a red corpuscle or other cell in the same manner as an amoeba ingests a food particle, and to dispose of it by intracellular digestion through the agency of ferments known as 'cytases.' But the great concept of Immunity was advanced by Ehrlich in 1885. Twenty years previously, August Kekulé had revolutionized and widely broadened the horizon of Organic Chemistry by suggesting that the benzol ring, composed of six atoms each of carbon and hydrogen, be imagined to conform to a regular hexagon. This induced Ehrlich to assume a similar hypothesis for his theory of Immunity. According to this assumption, the protoplasm of the cell consists of a central group of molecules (*Leistungskern*); in which the inherent vital characteristics are located, and whose integrity is necessary, for normal life.

The numerous molecules are assumed to be supplied with numerous side arms, or side-chains, which are capable of uniting with various substances with which they may come in contact—foods, toxins, and other harmful bodies. In order that nutritive matter may be taken up by the cell it must possess a certain conformation which will enable it to unite, or dove-tail in, with the conformation of the side-chain. This conformation may be imagined as the relationship of a key to the lock—they must fit; in the words of Ehrlich they must be homologous. Ehrlich called the side-chains 'receptors,' and the foreign group which unites with it 'haptophore.' Based upon this hypothesis, Wassermann developed a method for the diagnosis of syphilis by means of fixation of the complement, a phenomenon discovered by Jules Bordet and Octave Gengou of Brussels. This has markedly facilitated the diagnosis of luetic infection, and has given the physician an idea as to the course of the specific treatment of this disease. The great climax of Ehrlich's life was the discovery of salvarsan, that wonderful organic arsenical preparation which acts so markedly in the cure of syphilis."—M. Kahn, *History of modern medicine* (F. Tice, ed., *Practice of medicine*, v. 1, p. 89).

10th-20th centuries.—Surgery in warfare.—"Four months before the . . . [Franco-Prussian war (1870) Lister] propounded the principles which should guide surgeons, but it occurred to no one in France, in the first battles, to apply the new method. . . . Hundreds and thousands of wounded . . . succumbed between the eighth and tenth day to gangrene and erysipelas. . . . It was only at the end of the war that it occurred to Alphonse Guérin . . . that 'the cause of purulent infection may perhaps be due to the germs or ferments discovered by Pasteur to exist in the air.' . . . 'I thought more firmly than ever,' he declared, 'that the miasms emanating from the pus of the wounded were the real cause of this frightful disease, to which I had the sorrow of seeing the wounded succumb. . . . In my despair . . . I be thought me that the miasms, whose existence I admitted . . . might well be living corpuscles, of the kind which Pasteur had seen in atmospheric air, and, from that moment, the history of miasmatic poisoning became clearer to me. "If," I said, "miasms are ferments, I might protect the wounded from their fatal influence by filtering the air, as Pasteur did." I then conceived the idea of cotton-wool dressings, and I had the satisfaction of seeing my anticipations realized.' . . . Other surgeons learnt with amazement that, out of thirty-four patients treated in that way, nineteen had survived operation. Dr. Reclus, who could not bring himself to believe it, said: 'We had grown to look upon purulent infection as upon an inevitable and necessary disease, an almost Divinely instituted consequence of any important operation.' There is a much greater danger than that of atmospheric germs, that of the contagium germ, of which the surgeon's hands, sponges and tools are the receptacle, if minute and infinite precautions are not taken against it. Such precautions were not even thought of in those days. . . . It had, therefore, been sufficient to institute careful washing of the wounds, and especially to reduce the frequency of dressings, and so diminish the chances of infection to obtain—thanks to a reform inspired by Pasteur's labours."—R. Vallery-Radot, *Life of Pasteur* (tr. by Mrs. R. L. Devonshire), pp. 236-237.—"Contrary to immortal popular tradition, which is usually wrong, Napoleon's ghastly defeat in his final Russian campaign was

due neither to the wasting of the country with fire and sword by the Russians as they retreated—for the Great Commander never for a moment attempted to live off the country in any of his campaigns, and insisted upon his armies being as well supplied with food as they were with ammunition—nor yet by 'General January and General February.' For in spite of all the snow-scene pictures which have been painted of the great retreat, remnants of his army came back across the Beresina early in November, before the winter had set in. The real enemy that mowed down his magnificent army, well-fed, well-clothed, superbly equipped as it was, was spotted typhus, due to lice, which raged through its ranks like a forest fire. By the middle of the last century the death-rate from disease in war had fallen somewhat, and in the American Civil War the ratio was about five deaths from disease to one in battle. Almost the same ratio was maintained in the Spanish-American War and the Boer War in spite of sanitary improvements, and the first clean reduction was made in the Russo-Japanese War on the Japanese side. It was here for the first time in history that the doctor was given real power and authority in an army and the control of its sanitary conditions. This brilliant new nation was just innocent enough actually to put into practice the sanitary principles which all the European armies had simply talked about, but never dreamed of putting into force, with the result that the death-rate from disease fell to less than half its former amount—that is, to about two and one half times as great as the battle—and wound-rate."—W. Hutchinson, *Doctor in war*, pp. 9-10.

19th-20th centuries.—Use of electricity for medical purposes.—Röntgen or x-rays, etc. See CHEMISTRY: Radio-activity; ELECTRICAL DISCOVERY: Electric lighting: 1841-1921.

20th century.—Progress in bacteriology.—Chemotherapy.—"In 1805, the announcement was made at the 67th meeting of the German Society of Naturalists and Physicians that diphtheria, one of the most severe and fatal diseases of mankind, had been conquered by means of an antitoxin. This great event is a landmark, not alone in the history of medicine, but also in the history of the world, and it provides a high peak of achievement from which the growth of bacteriology may be viewed. . . . Koch's greater contribution to bacteriology consisted of a method of cultivation so perfected that pure growths of bacterial species were readily obtainable. The consequence was that in a very brief period of years a whole host of pathogenic bacteria or incitants of diseases of man and animals was secured, among which were the highly important bacilli of tuberculosis, cholera, typhoid fever, diphtheria, tetanus, dysentery, plague, meningitis and many others. Up to the period we are now considering, all the diseases of microbic origin thus far investigated successfully belonged to the class in which the bacteria invaded the blood and the internal organs. But now we are about to learn of another kind of disease induced by a class of bacteria which are peculiar in that they do not migrate throughout the body but remain fixed in a special tissue or part, where they multiply and secrete a poison which finds its way first into the lymph, then into the blood and the organs generally. This latter class of microbes produces its effects to which we give the name of disease, and of which diphtheria and tetanus are examples. . . . [Emil von Behring (1854-) and Shibamiro Kitasato] chose the task of inducing in animals immunity, to diph-

theria on the one hand and to tetanus on the other. . . . Moreover, the restricted local development of the two bacilli and their generally poisonous or toxic effects aroused in them an eager interest intensified by the epochal discovery just made by [Emile] Roux and [Alesandre] Yersin that the toxin of the diphtheria bacillus was readily separable from the bacilli producing it. . . . The isolation of the diphtheria toxin, quickly to be followed by the similar isolation of the tetanus toxin, was an event of capital importance and reacted at once vigorously on the chemical aspects of bacteriology just struggling into the light. The immediate effect of the study of the new poisons, called toxalbumins, was to discredit a whole series of pure, crystalline basic substances obtained not long before from a wide variety of bacteria, to which the name of ptomaines had been given. . . . The rendering of animals immune to diphtheria, on the one hand and to tetanus on the other, proved a difficult but not impossible task. The method adopted was to admix disinfectant chemicals, of which the one finally selected was iodine trichlorid, with the bacilli to be injected under the skin of animals, or with the contents of the culture flasks at the end of the incubation period. . . . The fluids or 'humors' of the body, to employ a term made respectable by age, as represented by the serum of the blood, had been shown to carry the immunity principles, but what part did the cells of the body play in the process? Both fluids and cells were now submitted to rigid and ingenious scrutiny, and about them an immense literature has grown up. Soon the students in the field divided into two camps, namely, one led by Ehrlich, defending the humoral doctrine, the other led by Metchnikoff, urging the cellular or phagocytic doctrine. . . . We are moving now in more peaceful times, the heat of the earlier conflicts having largely subsided, and it may be stated that neither the one nor the other doctrine finally triumphed, but that the humors or fluids of the body on the one hand and the cells on the other have come to be recognized as the active participating factors in the immunity process, the one complementing the other. . . . The unraveling of the intricacies of the immune state, following upon the work of Behring, has brought about a sudden and unprecedented enlargement of the scope of bacteriology. . . . It may suffice at this point merely to mention certain of the devices for diagnosis and means of preventing or of treating disease, which are the immediate heritage of studies in the field of immunity. . . . In this manner have been secured the Widal test for typhoid fever [discovered by Ferdinand Widal, a native of Algiers (1862-)], the Wassermann [August von Wassermann (1866-)] and allied reactions, the hypersensitive or Schick test for diphtheria susceptibility, the hypersensitive reaction as now applied to the detecting of the offending agency in hay fever and allied states, the refinements of bacterial vaccination in the prevention and sometimes in the treatment of disease, and so-called specific serum therapy. . . . A curative serum for one of the specific types of pneumonia has been secured, and through its application many lives have been saved; while beginnings have been made in respect to vaccination against the disease when, as sometimes happens in institutions and in communities, epidemics prevail and claim many victims, as occurred in the [United States] Army training camps during the measles epidemic of 1917-18. . . . We now recognize a class of microbes or viruses which are so minute as to be regarded

as ultramicroscopic, and yet so active as to be capable of setting up disease in animals and man. . . . When we consider that there remain still to be detected the microbial incitants of some of the most contagious as well as common of diseases, our minds readily seize hold of the possibility of their being of this nature. Thus the microbes responsible for such contagious maladies as measles, scarlet fever, and chicken-pox, and those inducing small-pox and rabies are not known, and not a little obscurity still surrounds the etiology, as we say, or immediate origin of epidemic influenza. . . .

"Perhaps no subject in experimental pathology has been pursued with more thought and energy than the one to which the name of cancer research is applied. The reasons are obvious. The nature of the source of the cancerous tumors is still shrouded in essential darkness. . . . A long series of biological conditions governing the growth and recession of the tumors has been uncovered, and by altering those conditions, on the one hand growth can be promoted, and on the other, retarded. In this way, Murphy and his co-workers have accounted for the influence of the action of the X-ray in effecting cancer growth; and by observing the correlative effects on the lymphoid structures of the body, which are very sensitive to the rays, and the changes corresponding to them in the circulating blood. . . . Chemotherapy is the name applied to the branch of experimental medicine in which chemicals, or drugs, are searched for, and when necessary and possible, fashioned to subdue a particular kind or class of infection. The beginnings of chemotherapy reach into the dim past; the science of chemotherapy is just being built up. . . . The outstanding instance in which experimental chemotherapy has registered a great success is in connection with the organic compounds of arsenic, which have been adapted to the overcoming of infection induced on the one hand by spirochetes and on the other by trypanosomes. That arsenical compounds possess therapeutically active properties against these two classes of parasitic diseases—as represented on the one hand by syphilis and on the other by African sleeping sickness—is not entirely a recent discovery; but until the systematic investigations of Ehrlich were instituted, which ultimately yielded salvarsan, knowledge was fragmentary, medical practice based on it ineffective, and the road to progress obscure."—S. Flexner, *Twenty-five years of bacteriology; a fragment of medical research (Contemporary Science, Modern Library, pp. 115, 119-124, 127, 137, 140, 145-147)*.

20th century.—**Experimental method.**—**Serology.**—"The most noticeable thing about twentieth century medicine is the growth of coöperation and the fact that nearly every important advance that has been made is prophylactic—that is, comes within the scope of preventing the occurrence, the recurrence, or the spread of disease. The tendency in all branches of recent sciences, even in zoölogy, sociology, therapeutics, internal medicine, and surgery, has been to pass out of the descriptive into the experimental stage. Loeb (1859-), . . . head of the Department of Experimental Biology in the Rockefeller Institute, has been a brilliant investigator in many branches of physiology. Ehrlich (1854-1915) has done the most effective work since Pasteur and Koch in the science of infectious diseases, and he has added new territory to the domain of experimental pharmacology and therapeutics by his genius for research and his wonderful industry. . . . Bordet . . . a great pioneer in the theory of serology and immunity

reactions . . . discovered bacterial hemolysis (1898) and, with Gengou, fixation of the complement (1900). He also discovered with Gengou the specific bacillus of whooping-cough (1906), the causal relation of which has been recently demonstrated according to Koch's postulates by Mallory and others (1913). Simon Flexner (1863-) has distinguished himself by his work on the etiology and therapy of cerebrospinal meningitis (1906). Apart from the work of Bordet, Metchnikoff and Ehrlich, there have been many advances in serology of great practical value: notably, the discovery of agglutination and its application to the diagnosis of typhoid fever (1896) by Widal and Sicard; the diagnostic use of tuberculin by Calmette, von Pirquet and Moro (1907); Sir Almroth Wright's preventive inoculation against typhoid fever by killed cultures of the bacillus (1900); Abderhalden's enzyme reaction in the diagnosis of pregnancy (1912); and the principle of filterable viruses. . . . Pneumonia was one of the first diseases which engaged attention through serum therapy. The Klemperer Brothers (1891) were pioneers in the field of serum treatment of pneumonia."—*Modern biologic therapeutics*, pp. 19-20, 116.—Through his work in the South African War, Sir Almroth Wright "originated general vaccino-therapy (1902-7), with the superadded feature of measuring the protective substances in the blood by means of the opsonic index (1903). . . . Bacteriology and pathology have been specially advanced in America by William Henry Welch (1850-), of Norfolk, Connecticut, a pupil of Cohnheim's, who became professor of pathology at the Bellevue Hospital Medical College (1870-84) and at the Johns Hopkins University (1884), where he has turned out a long line of worthy pupils. Welch investigated acute edema of the lungs in Cohnheim's laboratory (1877), discovered the *Staphylococcus epidermidis albus* and its relation to wound infection (1892), also the *Bacillus aerogenes capsulatus* (1892), grouping the diseases caused by it (1900). He also made important studies of embolism and thrombosis, and, with Flexner, demonstrated the pathological changes produced by experimental injection of the toxins of diphtheria (1891-02) simultaneously with von Behring. Simon Flexner (1863-), of Louisville, Kentucky, . . . has distinguished himself by his work on terminal infections, his experimental work on venoms (1901), and the etiology and therapy of cerebrospinal meningitis (1909) and infantile poliomyelitis (1910-13)."—F. H. Garrison, *Introduction to the history of medicine*, p. 620.

20th century.—Study and modern treatment of cancer.—"In few parts of surgery has more progress been made than in the treatment of cancer. We have no certain knowledge of the causes of this disease, though it is becoming more and more clear that heredity has very little to do with the occurrence of cancer; this is directly opposed to the opinion formerly held when it was thought that cancer occurred in certain families. Until recently operations on cancer gave not very favourable results, for in nearly all cases the disease returned sooner or later. At the present time surgeons have fully recognised two things in connection with cancer. The first is that the operation has to be more thorough than was thought sufficient before, and the second is that the operation must be done at an early stage of the disease. At one time it was thought that cancer was a general disease of the body, though it manifested itself only at one or two spots; but now it is known with certainty that cancer is at first

entirely a local disease and that if this local disease be removed completely it will not return, but that if it is left too long it may affect many parts of the body. The conclusion to be drawn from this fact is that any operation for its removal must be thorough, and it must also be performed early while the disease is still confined to its original site. . . . At present we do not know of any medicine capable of removing a cancer from the body, but it is not improbable that in time such a medicine may be discovered."—W. Evans, *Medical science of to-day*, p. 166.—"The object of a group of American women to enable Madame Curie, French scientist, to continue her researches, especially in connection with the treatment of cancer, has been attained. Madame Curie has received the radium, and will be given the large over-subscription to pay for further equipment

SIMON FLEXNER

needed in her investigations. [See also CHEMISTRY: Radio-activity: Radium.] Important developments will without question be made in the near future concerning the problem, still unsolved, as to whether radiation treatment will ever replace surgery in the cure of cancer. What, then, in the opinion of specialists, is the status of radium today in the treatment of this disease? One thing is certain, and that is that the rays from radium or from the X-ray tube are the best present form of treatment for any form of cancer which, because of its advanced stage, is beyond the scope of surgery. The debate at the present time is entirely over the question of the advisability of treating operable cancers by radiation instead of by cutting them out. Despite the widely circulated statements that cancer is a general disease and not curable by surgery, thousands of successfully treated patients now living and happy prove the fact to be exactly the contrary. Every surgeon of experience knows that 90 per cent of certain types of cancer can be permanently cured

by operation, and from 20 to 50 per cent of other forms; while some forms occurring internally are quite incurable by any means. The question at issue in radium treatment is: Does it cure cancer with the same efficacy as operation? Now, while many cures have been reported, in general the patients have not yet lived sufficiently long since the treatment to enable us to judge whether the results will be permanent; and a large proportion of those treated by radiation, while temporarily benefited, have nevertheless died within a year or two after an apparent cure. . . . The consensus of opinion among such a group as the American Society for the Control of Cancer is, however, that until the radium operator can guarantee that his results will be better than surgery, radium should not be used to treat tumors in the stage at which surgery is still effective. . . . At the laboratories of the George Crocker Research Fund at Columbia University, experiments have been conducted on animal tumors, and the exact dosage necessary to kill cancer cells has been established. Further research is being carried on in New York City at the Memorial Hospital under the direction of James Ewing, M. D., professor of Pathology at Cornell University. The New York State Institute for the Study of Malignant Diseases has received two grams of radium through an appropriation of \$225,000 made by the state legislature during the spring of 1920 and is carrying on research. . . . While . . . it is impossible at this time to evaluate the part that radium will ultimately play in the cure of cancer, enough has been learned to assure its position in palliative treatment. Perhaps its greatest usefulness to date has been in limiting the extension of growth, decreasing the mass of cancerous tissue, reducing pain, and in general making the patient far more comfortable than without its use."—F. C. Wood, *Radium versus surgery* (Survey, June 4, 1921).—See also above: 20th century: Progress in bacteriology.

20th century.—Infantile paralysis (Anterior poliomyelitis).—"Until recently nothing was definitely known of the etiology of Poliomyelitis, infantile paralysis. Within the last few years, however, a series of studies has been made which has added considerably to our knowledge of its cause and transmission. . . . Summarizing the results obtained from laboratory investigations, the following facts regarding the cause and transmission of the disease may be said to have been practically established: (1) The specific cause of poliomyelitis is a so-called filtrable virus . . . [which] is invisible under the microscope in some of its forms. . . . While various micro-organisms have been described and claimed to be the cause of the disease, absolute proof of any one of these being the specific etiological agent is lacking. . . . (2) The virus obtained from human cases of this disease injected into monkeys produces in them characteristic effects almost identical with those produced in man. . . . (3) The virus has been demonstrated in the tissues and secretions of persons dead of poliomyelitis, namely, in the brain and spinal cord, the mesenteric glands, in the tonsils, and in the mucous secretions of the nasopharynx, the trachea and the intestines; also in the secretions of persons acutely ill with poliomyelitis, namely, in the naso-pharyngeal secretions, and in washings from the rectum; also in the naso-pharyngeal and intestinal secretions of persons convalescing from acute attacks of poliomyelitis, and in the naso-pharyngeal secretions of apparently well persons who have been more or less intimately associated with other persons suffering from poliomyelitis. (4)

Outside of the human body, the virus is reported as having been found in nature in the dust of rooms occupied by poliomyelitis patients. The virus has been shown to be very resistant to the influence of low temperatures, certain standard disinfectants (such as carbolic acid) and drying by sunlight, although it is readily killed by high temperatures. (5) As to the modes by which the virus may enter the human body to cause infection, these can be only inferred from experiments which have been made on animals. . . . Although the results obtained from laboratory experiments concerning natural modes of infection are somewhat inconclusive, they would seem to indicate that the most probable means of transmission of the disease in nature are such as usually serve to transmit secretions from infected persons to the respiratory (or digestive) tract of others, namely, by . . . direct or indirect, immediate or intermediate, personal contact. . . . But by whatever means the virus may be transmitted, having once gained entrance into the body, it circulates with the blood stream and thus produces the disease. One attack of poliomyelitis apparently confers a high degree of immunity. Recurrent cases and second attacks have been reported. During and since the . . . epidemic of poliomyelitis in 1916, original investigations as to the cause of the disease have been undertaken by the Research Laboratories of the Department of Health."—*Monograph on the epidemic of poliomyelitis* (New York City Health Reports, 1917, pp. 82-88).

20th century.—Trypanosomes.—"John Atkins, a British naval surgeon, in 1734, on his return from a voyage from West Africa, gave a clear description of cases of sleeping sickness as it occurred on the Guinea coast. 'The Sleepy Distemper (common among the Negroes) gives no other previous Notice, than a want of Appetite two or three days before; their sleeps are sound and Sense and Feeling very little. . . . Young people are more subject to it than the old; and the Judgment generally pronounced is Death, the Prognostick seldom failing.' . . . Winterbottom in his African travels in 1803 mentioned the disease under the name of 'kondee.' . . . In 1870 Lewis in Calcutta first described the mammalian species of trypanosoma in the blood of a rat. *Trypanosoma lewisi*, now known to be transmitted by the rat flea *Ceratophyllus fasciatus*, or the rat louse *Hamatopinus spinulosus*. In the following year Evans found a similar parasite *Trypanosoma evansi*, to be the cause of the disease among horses in India, known as 'surra.' Fifteen years later, 1895, Bruce in Africa showed that nagana, a similar disease affecting both horses and cattle, was also due to another species of trypanosoma, and that, as had been strongly suspected the infection was transmitted from animal to animal by means of the bite of a species of tsetse fly, *Glossina morsitans*. Up to 1800, trypanosomes had been found only in animals and not in man. In 1800 Nepveu found a trypanosome in the blood of a man in Algeria, but owing to the nature of the description, the discovery did not attract wide attention. In 1901 and 1902 Ford and Dutton discovered a trypanosome in the blood of a patient in Gambia with a peculiar irregular fever and named it *Trypanosoma gambiense*. In 1902 Castellani found a trypanosome in the cerebrospinal fluid in five cases of sleeping sickness, in one of which the parasite was also present in the blood, thereby establishing a connection between the febrile stage with a trypanosome in the blood, and the sleeping sickness stage with a trypanosome in the cere-

brospinal fluid. The following year Bruce and Nabarro confirmed these observations and showed that the disease was spread by another species of tsetse fly, *Glossina Palpalis*. At first they considered the transmission by the fly as purely mechanical, but Kleine afterwards showed that the parasite undergoes true development in the body of the tsetse fly, a fact later confirmed by Bruce, Robertson, Taute, Mackie, and others. In 1910 Stephens and Fantham described as the cause of Rhodesian or a more acute form of sleeping sickness, a new species, *Trypanosoma rhodesiense*. Kinghorn and York in 1912 showed this organism to be transmitted by *Glossina morsitans*. In 1910 Chagas discovered a form of human trypanosomiasis in children, caused by *Trypanosoma cruzi*, the infection being transmitted by the bite of a beetle, *Conorhinus (Lamius megistus)*."—R. P. Strong, *Trypanosomiasis (Nelson's Living medicine, v. 2, pp. 333-334)*.

20th century.—Advance in surgical methods.—"It is, of course, notorious that life and limb are saved by preventing the diseases of wounds, and by the practical abolition of pyæmia, septicæmia, erysipelas, spreading gangrene and suppuration. But . . . the operative technique of surgery owes much of its progress to a less well recognised result of completely aseptic wound treatment. Apart from the graver infections almost every wound was formerly associated with at least some surrounding inflammation. . . . Five and twenty years ago [written in 1910] most wounds did present some such change and . . . therefore we could not be certain when we operated that the injury inflicted would be absolutely located to the tissues mechanically divided. To-day this is no longer the case. To-day we know that the injury done by the knife is limited to the track of the knife itself and that it will be repaired with a rapidity so great that after a very few hours the most extensive dissections have left no obvious trace. It is probably to this fact above all others that we owe the comparatively recent extension of surgical dissection. The surgeon of to-day must avoid the cutting or bruising of structures essential to life. There are tracts in the brain and in the spinal cord which he must not divide; there are a few—a very few—great blood-vessels which he must not tie or cut. But with these reservations he finds no barrier to his work. He can safely open, divide and restore the great canals and ducts of the body. He can freely expose all its cavities and work in their interior with calm and confidence. He is not limited to a short direct incision giving an imperfect view of what lies beneath; he can fully reveal the parts he has to attack. . . . The tissues of the body can now be laid bare as in the dissecting room: great joints can be opened up and closed again with almost every fibre in its original position; the abdomen is opened without cutting its muscular walls; the brain is exposed, not through a hole of say an inch in diameter, but by turning down the side of the skull like the lid of a box and replacing it at the end of our operation; even the heart itself has of late been similarly dealt with. The perfection of asepsis has so wholly altered our methods that the greatest advances in the mechanical art of surgery in my day have I think been due to a freedom of action. . . . Modern surgical operations have taught us much of the real nature of disease. So long as treatment is confined to the use of drugs or to a few comparatively simple operations with a minimum of anatomical dissection we rarely become thoroughly acquainted with pathological processes: the affected parts are never seen during life and we have either no visual knowl-

edge of them at all or such knowledge as we do possess is derived from an examination made after death, when the ultimate stage alone is seen, and seen under conditions far different from those of life. But let surgery enter the field and we acquire at once an actual concrete picture, certainty replaces conjecture and we act with confidence instead of groping in the dark. How many centuries of 'clinical observation' went by without the recognition of appendicitis, of the results of pyloric obstruction, or of the diseased conditions of the gall bladder. But now that the surgeon has fully explored the once dreaded abdomen all these things have become common-places of our knowledge. . . .

And again we are led by a most natural transition to another factor in the evolution of surgery. The extension of operative treatment has demanded and obtained an accuracy of diagnosis which was formerly not required and not obtained. The operating surgeon has been obliged to make a call upon the physician which the latter has had to meet. . . . Five and twenty years ago if a man had a tumour of the brain or spinal cord it was of no practical importance where it lay or what it was. But the moment that surgery can undertake to remove some of these tumours and thus to cure the patient it becomes absolutely essential to know their exact size and position and as far as possible even their shape and consistency. . . . In 1876 Lawson Tait first removed some stones from the gall bladder and the daring operation was regarded as one which might be occasionally adopted: in 1909 Mayo Robson had collected 3,000 of such operations performed by three surgeons alone, and with a mortality of less than 2 per cent. Some 20 years ago the operation of gastro-enterostomy was introduced to surgery; it is now one of the commonest of remedial measures and many thousands have been rescued by it from the slow martyrdom of so-called dyspepsia. In 1806, an Italian surgeon, Farina, made the first attempt to suture a wound of the heart itself and in 1909 Vaughan collects 150 cases with 35 per cent. saved from certain death. Still more recently we have seen successful operations for the diseases of the heart, while an ingenious device now makes it possible to open the chest with the surrounding atmospheric pressure reduced to that in the bronchial tubes and thus to operate upon the lungs and pleura. Not long ago the diseases of the brain and spinal cord were beyond the reach of surgery but they are now attacked with no inconsiderable measure of success, although we must admit that in this branch of our work we have had many disappointments, mainly, perhaps, because diagnosis has here not kept pace with surgical requirements. And of the other great organs of the body we have said enough. Surely operative surgery had not reached finality thirty years ago, and surely we may look to the future for an evolution not less wonderful than that of the past"—Wm. Thorburn, *Evolution of surgery (pamphlet), pp. 12-18*.—"The surgery of the twentieth century has been devoted mainly to refinements, inventions and improvements in procedure." August Bier of Berlin (1861-) is famous for a new method of treating amputation stumps, and for the introduction of "intraspinal anesthesia with cocaine," in which he was preceded by James Leonard Corning, of New York, and George W. Crile, of Chile, Ohio. Ernst Ferdinand Sauerbach (1875-), professor at Marburg, Germany, "greatly advanced the possibilities of thoracic surgery," by the invention of the pneumatic chamber at negative pressure, and the positive pressure cabinet. Theodor Kocher, of Bern (1841-), is well known for his method of reducing dislocations of the shoulder-joint, and his

work on the thyroid gland. William Stewart Halsted (1852-), of New York introduced a better aseptic technic by the use of gutta percha tissue in drainage, rubber gloves, silver foil in dressing. Harvey Cushing (1869-), of Cleveland, Ohio, is famous for his marvelous neurological surgery, especially of the head and pituitary body. "Alexis Carrel (1873-), of Sainte-Foy-les-Lyon, France, a graduate of the University of Lyons . . . who came to America in 1905 . . . has revolutionized the surgery of the vascular system and made great advances in physiology and physiological surgery, for which he was made a Nobel prize man in 1912. In 1902, he published his first paper on vascular anastomoses and visceral transplantation, in which he showed that perfect end-to-end anastomosis of blood-vessels can be secured by inserting in the

ALEXIS CARREL

opposing ends a triple-threaded suture, which, when drawn tightly, converts the round lumen of the vessel into an equilateral triangle. . . . From end-to-end anastomosis of arteries he advanced, by means of specially invented needles and rigid asepsis, to the substitution of a lost piece of an artery, by pieces of artery or vein, and thence to the transplantation of organs from animal to animal. Thus, he has transplanted a kidney, with its vascular supply, from cat to cat, secretion of urine beginning before the end of the operation, and this feat has not only been proved successful in man, but extended to other viscera also. [The new vascular suture made possible a new and safe method of blood transfusion.] Transplantations in mass of blood-vessels, organs, viscera, and limbs have been also successful. Carrel's investigations of the latent life of arteries (1910) led to the preservation of portions of blood-vessels in cold storage for days or weeks before using them in transplantation. Lat-

terly, he has applied the principle of . . . experiments [made] on extravital cultivation of nerve-cells (1910) to the extravital cultivation and rejuvenation of tissues (1911), culminating in his remarkable experiment of keeping the excised viscera of an animal alive and functioning physiologically in vitro (1912). He has also succeeded in activating and accelerating the growth of connective tissues by dressings of thyroidal, splenic, embryonic, and other animal extracts (1913). . . . Two prominent innovations in eye surgery of recent times have been made by officers of the Indian Medical Service. The operation of extraction of cataract within the capsule was introduced by Lieut. Colonel Henry Smith in 1900, and his success with it has been remarkable. . . . Another new operation, that of sclerocorneal trephining for glaucoma, was introduced by Major Robert Henry Elliot, I.M.S., in August, 1900. The operation of von Graefe had held the field for half a century, Lagrange and Herbert had emphasized the value of sclerectomy, and even corneal trephining had been essayed by Argyll Robertson, Blanco, Fröhlich, and Freeland Fergus, but Elliot has made the operation his own by many improvements and has made it viable."—F. H. Garrison, *Introduction to the history of medicine*, pp. 743-746.

20th century.—European influences on medicine and sanitation in Japan, China and India.—Medical missionaries. See ASIA: European influences, etc.: 3.

1914-1918.—War medicine and surgery.—Improved sanitation.—Inoculation.—Wound irrigation.—Mortality in lung cases.—"The army surgeons engaged in . . . [the World War were] as much exposed to fire and . . . sustained as high a mortality as the line officers and infantry, and our profession . . . made a brilliant record in quick thinking and fertility of resource in meeting the difficult problems imposed upon the medical officer. Remarkable success . . . [was] attained in the prevention of typhoid fever by vaccines, in the tetravaccines employed against typhoid, the two paratyphoids, and cholera, in the destruction of the vermin which transmit typhus and other diseases, in Carrel's antiseptic treatment of wounds by the sodium hypochlorite solution (eusol), of . . . H. D. Dakin, in the employment of Wright's hypertonic solution and his autogenous vaccines against purulent wound infection, in the purification of army water-supplies by the Javel hypochlorite solution (javellisation), in the localization of projectiles in the body by the Hirtz compass, the wonderful prosthetic devices speedily improvised to serve as artificial hands and limbs, and in the training of these badly mangled defectives to earn a future livelihood, in the remarkable restorations of teeth and jaws by American dental surgeons, in the treatment of gunshot fractures by autogenous bone-grafts, in the military surgery of all parts of the body, in the effective treatment of extensive burns by the paraffin-resin solution (ambrine) of Barthe de Sandfort (kerithery), in the training of the blind and of cardiac, pulmonary, and neurotic defectives for future efficiency in life."—F. H. Garrison, *Introduction to the history of medicine*, p. 787.—"The doctor's control over wound infections is so masterly that of the wounded who survive six hours ninety per cent recover, of those who reach the field hospitals ninety-five per cent recover, and of those who arrive at the base hospitals ninety-eight per cent get well. The twin angels, anaesthetics and antiseptics, have not only enormously diminished pain and agony, but have made amputations rarer and grave crippling fewer than ever before in war history. Barely two per cent of the

wounded are crippled or permanently disabled . . . An army camp used to be a hotbed of epidemics, a breeding-place of pestilences. The soldier's worst enemy enlists with him, for what killed most men in war was not bullets, but 'bugs,' not the sword but the streptococcus. Whenever you mobilize and call to the colors a thousand men, you call with them at least twenty billion tubercle bacilli, ten billion typhoid, five billion pneumonia, and a couple of million dysentery germs. An army assembles literally primed and loaded for trouble—from the inside. . . . Inoculation protected them against typhoid; splendid feeding, with plenty of meat and fat, against pneumonia and consumption; fly campaigns against dysentery and diarrhoea; shower baths and clean underwear against spotted typhus; and quarantine against all the mild, infectious measles, summer diarrhoea, diphtheria, and influenza. The old plagues of army camps, cholera, Black Death and spotted typhus, all lifted their heads and began to 'resurrect,' in Italy, in Serbia, and in Russia, but all were promptly stamped out by modern sanitary science—cholera by isolation, disinfection, and the vaccine, Black Death by exterminating fleas, typhus by 'unlousing' and hot shower baths. . . . As for the ancient and classic plague of armies, venereal disease, in spite of the special temptations to which soldiers in the field are exposed . . . the average incidence of venereal disease in the British Army in France . . . [was] no higher than that believed to exist among men of military age in time of peace; while in the American army in France, by cutting out sentiment and treating venereal disease like any other contagious disease, it . . . [was] brought down to less than one per cent. . . . In fact, disease as a factor in the army death-rate . . . [was] almost wiped out, completely so in the sense that the amount of sickness in the camp and the deaths from disease at the front have been barely half what they were in barracks in times of peace. This magnificent result . . . [was] brought about chiefly in three ways, protection of the troops against infectious disease by the antityphoid inoculations and other sanitary measures, by surgical skill and superb hospital organization enormously increasing the recovery rate from wounds, and by the splendid way in which the armies . . . [were] fed. The greatest single sanitary triumph of the war . . . [was] the wiping out of typhoid fever by means of inoculation or vaccination. . . . As the fighting in Belgium and Northern France . . . [was] over the most intensively cultivated and richly fertilized soil in Europe, all the germs which exist in stable manure and fertilizers of all sorts . . . [were] hurled into the utmost depths and remotest corners of every wound. Unfortunately two of the deadliest germs known to surgery, the tetanus bacillus and the bacillus of gas gangrene, have their normal habitat in the intestines of the horse; therefore there was a terrific outbreak of both tetanus and gas gangrene in the very first months of the war. The tetanus or lockjaw was quickly brought down by the use of the tetanus anti-toxin, and the gas gangrene was successfully attacked by new methods of operations and irrigating the wounds. . . . [By 1918] any army medical service that . . . [lost] more than five or six per cent of its wounded . . . [considered] itself disgraced. The methods by which these wonderful savings of life and suffering have been accomplished, the triumphs of antiseptic surgery, need no description; for they are common knowledge, as well as one of the wonders of the age. The strictest and most scrupulous cleanliness, the boiling of instruments, and cleaning of surgeon's and nurses' hands—these are practiced in every hospital and taught to the rising

generation in our schools. . . . Against the tetanus bacillus we have an effective weapon, a certain shield in the form of the tetanus anti-toxin. By the mercy of Heaven, the tetanus germ is extremely slow in starting to grow in a wound, so that if a dose of the anti-toxin is injected into the blood, within one or even two days after the wound, though preferably within a few hours, it protects the body against its invasion. Against the gas-bacillus we had no such direct remedy, so a new line of defense has had to be worked out. This germ . . . is a peaceful and blameless agriculturist living in and on the soil, attacking and breaking up the decaying animals and vegetable matters contained in it, and preparing them for absorption by the roots of the plants. . . . In the course of this beneficent process, the bacillus produces a considerable amount of gas. . . . This gas in the soil is perfectly harmless, indeed probably rather beneficial than otherwise, by increasing its porousness and assisting the growth of other bacteria. But when it gets into the human body . . . some very distressing effects are produced, and it is this fact which has given to it its name—now all too familiar. . . . [Gas-gangrene was] not actively contagious or inclined to spread; which was probably because modern surgical precautions were able to bar out the pus-forming germs and prevent them from forming that 'wicked partnership' with the gas-bacillus which gave its infection wings, so to speak. As we have only just recently developed an anti-toxin, for three years of struggle and experiment we were driven to hunt for other weapons. The first hold which we got on the germs came from the fact that they are what are known as 'anaerobic'; . . . can live without air, and not only that, but are killed by, or grow very slowly in, the presence of air and oxygen. This being the case it was quite evident that our modern aseptic method of closing and sewing up all wounds tightly at the earliest possible moment, was exactly in the wrong direction. . . . Consequently it became the rule to leave all shell wounds of any considerable depth . . . as wide open as possible for the first three to five days. This at once diminished the number of our cases of gas-gangrene. The next step was the discovery that . . . all conditions which tended to lower the vitality of the wounded man, or . . . the vitality of the tissues in his wound by lack of timely and prompt attention, increased the probability of a gas-infection. The first and second preventive steps, namely, the thorough cleaning-out of all dead or dying tissues in the wound, technically known as 'debridement,' are steps in the now famous and magnificently successful Carrel treatment. . . . Dr. Flexner, of the Rockefeller Institute . . . perfected an anti-toxin against gas-gangrene . . . [which gave] excellent results, and . . . [provided] the finishing touch to our victory over gas-gangrene. . . . The only thing, apparently, [left] to be done was, so to speak, to attack them in their lair, by keeping the wounds constantly flushed with some fluid capable of destroying the growth of the germ. Scores of surgeons and bacteriologists were working on this problem, but it was first perfectly solved by the genius of a brilliant young French surgeon, Alexis Carrel, born and educated in France, who had lived for years and won national reputation in America as a discoverer and research worker in surgery. . . . His first great advance was his discovery, after months of careful observation in the hospital and experiments in the laboratory, that these bacteria could not live upon living tissue, and that, therefore, in cleaning the wound out at the first dressing, or operation, it was not necessary to get rid of all the bacteria, but

only the dead and damaged fragments and surfaces of the tissue which would furnish food for them to live upon. . . . The second great step . . . [was] that of the continual irrigation of the wounds, with an antiseptic fluid strong enough to kill the germs; but not irritating or dangerous to the tissues of the body itself. This last requirement is by no means as simple as it sounds, for ever since the very first discovery of antiseptics by Lister, the medical profession had been driven more and more strongly to the conclusion that almost all antiseptics capable of destroying germs were even more capable of damaging the tissues of the body. . . . So far had this conviction gone that the vast majority of surgeons objected to the very name 'antiseptics,' which means literally, 'against infection,' poisoning the germs after they had got into the wound. They insisted upon a new term, invented after Lister, 'asepsis,' which means 'without infection,' never allowing any germs to enter the wound from the patient's body, the surgeon's hands or instruments. The majority of our surgical operations within the last twenty years have been carried out on this aseptic plan, using no germicides on the instruments or surgeon's hands, and nothing at all in the wound except sterilized water or a little alcohol. So that it was entirely against our modern, and already traditional, practice and ideas to attempt to use antiseptics for the purpose of killing the germs in wounds. A hundred eager objections were made to prove at once that any antiseptic fluid was necessarily a poison to cell life, and must be far more dangerous to the cells of the patient's body than to the germs. This accounted, in considerable degree, for the tremendous prejudice and opposition on the part of many doctors to the Carrel treatment in the beginning, a prejudice that was scarcely creditable to the open-mindedness of the medical profession. The Dakin-Carrel antiseptic fluid might and even should do more damage to the patient's body than it did to the cells themselves, but there was absolutely no denying or getting away from the fact that a patient treated with it got well in less than half the time than under any other, and even though a few cells be destroyed, the millions left seemed to be invigorated by the process. The Carrel treatment, even with its innumerable modifications, . . . [did] more to save life, save limbs from amputation, to diminish suffering and hasten recovery than any other surgical procedure of the war. . . . The equipment for irrigating every nook and corner of the wound is the most ingenious part of the Carrel treatment, and from the fact that it is also the most visible, the one that is constantly to be seen in operations at all hours . . . it has come to be looked upon as being the treatment itself. . . . After many skillful and patient experiments by Dr. Carrel and Dr. Dakin, a young English physiologic chemist who was Dr. Carrel's associate in this part of the work, . . . the chemical which they found to . . . give [the] best practical results was . . . a modification of . . . 'chloride of lime.' . . . The Dakin solution, of course, required the most elaborate and delicate modification of the chlorine powder. . . . This was finally found to be best done by a careful addition of boric acid, and the perfected antiseptic, 'Dakin's Fluid,' is a marvel of ingenious and delicate adjustment to the particular work it has to do."—W. Hutchinson, *Doctor in war*, pp. 2-4, 6, 10-12, 16, 35-36, 134, 140, 140-150, 152-154, 156, 160-162.—At a meeting of the Paris Société de Chirurgie, in 1918, Dr. P. Duval reported on the surgical treatment of lung wounds. "Duval and Vaucher communicated the statistics on all lung wounds observed during two attacks in one surgical sector of the armies. . . . Of 161 patients, 13

were dead on arrival; 29 had been operated on at once for hemorrhage, open thorax, or severe visceral trauma; the general mortality in these emergency operation cases was 44.8 per cent. Duval and Vaucher insisted especially that a certain number of operations were necessary—not urgent—for the purposes of extracting an intrapulmonary projectile, and the lung wound . . . was then treated subsequently. Of the remaining 110 cases of lung wounds, in 17 this treatment had been applied, and expectant treatment was adopted in 102 cases. The 17 patients treated according to the general therapeutic principles usually employed in all cases of shell wounds recovered. In the 102 cases in which expectant treatment had been given, only one case terminated fatally, the result of a severe pleural infection proceeding from an unrecognized fracture of the scapula. Six cases of purulent pleurisy ended in recovery."—United States Surgeon General's Office, *Treatment of war wounds of the lung* (*Journal of American Medical Association*, June, 1918, p. 17).

MEDINA DEL RIO SECO, Battle of. See SPAIN: 1808 (May-September).

MEDINA SIDONIA, Don Alonso Perez de Guzman el Bueno, 7th Duke of (1550-1615), Spanish admiral. Became commander-in-chief of the Spanish Armada, 1588; defeated by the English, 1588. See ENGLAND: 1588: Spanish Armada; Destruction of Armada.

MEDIOLANUM, modern Milan. See MILAN.

MEDIOMATRICI, original form of the name of the city of Metz, which had been called Divodurum by the Gauls at an earlier day. See METZ: Original names.

MEDISM, MEDIZED GREEKS.—During the wars of the Persians against the Greeks, the former had many friends and allies, both secret and open, among the latter. These were commonly called Medized Greeks, and their treason went by the name of Medism.—See also GREECE: B. C. 492-491.

MEDITERRANEAN FUND, special fund provided by the United States Congress, in 1803, for the War with Tripoli.—Based on H. Adams, *History of the United States*, v. 2, ch. 7.

MEDITERRANEAN, or SOUTHERN, RACE. See EUROPE: Introduction to historic period: Distribution of races; FRANCE: People.

MEDITERRANEAN SEA, inland sea confined between the south of Europe, and the north of Africa, bounded on the east by Asia Minor. It communicates with the Atlantic by the narrow Straits of Gibraltar, while the Suez canal has been cut through the Isthmus of Suez to provide a passageway through the Red sea to the Indian ocean. "For this sea . . . the Greeks had no distinctive name, because it had so long been practically the only one known to them; and Strabo can only distinguish it as 'the Inner' or 'Our' Sea. . . . The now familiar appellation of Mediterranean is in like manner first used by Solinus [third century], only as a convenient designation, not as a strictly geographical term. . . . The first extant author who employs it distinctly as a proper name is Isidorus, who wrote in the seventh century."—E. H. Bunbury, *History of ancient geography*, v. 2, ch. 21, sect. 1, ch. 23, sect. 2, foot-note, ch. 31.—The shores of the Mediterranean "include about 3,000,000 square miles of the richest country on the earth's surface, enjoying a climate where the extremes of temperature are unknown, and with every variety of scenery, but chiefly consisting of mountains and elevated plateaux. . . . The Mediterranean region is the emblem of fertility and the cradle of civilization. . . . It is a mere gulf, which, now bridged by steam, rather unites than separates the two shores. Civilization never could have existed if this inland sea had not formed the junction between the three surrounding continents, rendering the coasts of each easily accessible, whilst modifying the climate of its shores. . . . For all practical purposes the Mediterranean may be accepted as being, what it is popularly supposed to be, a tideless sea; but it is not so in reality. In many places there is a distinct rise and fall."—R. L. Prayfair, *Mediterranean, physical and historical* (Smithsonian Institution, Annual Report, Board of Regents, July, 1800).—See also EUROPE: Geography.—"For many centuries the commerce of the world was limited to the Mediterranean, and when it extended in the direction of the East it was the merchants of the Adriatic, of Genoa, and of Pisa who brought the merchandise of India, at an enormous cost, to the Mediterranean by land, and who monopolized the carrying trade by sea. . . . Long before the rise of Greece and Rome its shores and islands were the seat of an advanced civilization. . . . For a long time the Phœnicians had no rivals in navigation, but subse-

quently the Greeks—especially the Phocians—established colonies in the western Mediterranean, in Spain, Corsica, Sardinia, Malta, and the south of France, through the means of which they propagated not only their commerce but their arts, literature, and ideas. . . . The [Phœnician] Tyrian colony of Carthage became the capital of . . . a vast empire, which, from its situation midway between the Levant and the Atlantic Ocean, enabled it to command the Mediterranean traffic. . . . [But when the might of Rome arose and threatened Carthage, the Carthaginians had no friends. When Sicily was lost to them, they lost control of the Mediterranean, and when Carthage was destroyed Rome became absolute mistress of the seas. Under Roman rule, commerce languished on the Mediterranean, and did not again flourish until the early Middle Ages.—See also COMMERCE: Ancient: B. C. 1000-600, to B. C. 200-A. D. 800.] Commerce, discouraged by the Romans, was highly honored by the Arabs, and during their rule the Mediterranean recovered the trade which it possessed in the time of the Phœnicians and Carthaginians. . . . “The Carolingian empire gave an impulse to the maritime power of the south of Europe, and in the Adriatic the fleets of Venice and Ragusa monopolized the traffic of the Levant. . . . English commercial intercourse with the Mediterranean was not unknown even from the time of the Crusades, but it does not appear to have been carried on by means of . . . [English] vessels till the beginning of the sixteenth century. In 1522 it was so great that Henry VIII appointed a Cretan merchant, Censio de Balthazari, to be ‘master, governor, protector, and consul of all and singular the merchants and others, his lieges and subjects, within the port, island, and country of Crete or Candia’ . . . Piracy has always been the scourge of the Mediterranean, but we are too apt to associate its horrors entirely with the Moors and Turks. The evil had existed from the earliest ages; even before the Roman conquest of Dalmatia the Illyrians were the general enemies of the Adriatic. . . . After the discovery of America and the expulsion of the Moors from Spain, piracy developed to an extraordinary extent. The audacity of the Barbary Corsairs seems incredible at the present day. . . . The most formidable of . . . [the] piratical states was Algiers, a military oligarchy, consisting of a body of janissaries, recruited by adventurers from the Levant, the outcasts of the Mohammedan world, criminals and renegades from every nation in Europe. . . . Nothing is sadder or more inexplicable than the shameful manner in which this state of things was accepted by civilized nations. [The United States alone refused to submit to the exactions of the pirates.] Many futile attempts were made during successive centuries to humble their arrogance, but it only increased by every manifestation of the powerlessness of Europe to restrain it. It was reserved for . . . Lord Exmouth, by his brilliant victory in 1816, forever to put an end to piracy and Christian slavery in the Mediterranean. His work, however, was left incomplete. . . . The French took the only means possible to destroy this nest of ruffians by the almost unresisted occupation of Algiers and the deportation of its Turkish aristocracy.”—R. L. Prayfair, *Mediterranean, physical and historical* (Smithsonian Institution, Annual Report, Board of Regents, July, 1890).—See also COMMERCE: Medieval: 12th-16th centuries; BARBARY STATES: 1505-1510, and after.

“The Mediterranean is the greatest trade route in the world. It is the gateway from the Occident to the Orient. Through it a large part of the maritime commerce of England and Germany passes. . . .

For centuries Russia has looked with unsatisfied eyes toward the Bosphorus as an outlet from the Black Sea, through which her wheat would find a market. . . . The Balkan states were moved by the same urge to gain access to some port upon the Mediterranean; otherwise their exports and imports must pass through hostile territory. Austria, like Russia, desired free access to the Mediterranean, unchecked by Italy. The new industrial forces which have revolutionized Europe during the past fifty years were all crowding against the barriers which, in one way or another, shut them out from free contact with the outside world. At the outbreak of the . . . [World] war England was mistress of the Mediterranean, which is in fact a British sea. Its western and eastern entrances are controlled by Gibraltar and the Suez Canal. . . . [Since the acquisition of the control of the canal,] British capital has flowed into Egypt in immense sums. The protection of these investments and the prevention of internal disorder was responsible for the bombardment of Alexandria and the occupation of Egypt in 1882. This . . . marks the beginning of the struggle for colonial possessions on the part of all the greater powers and the identification of their governments with the bankers and concession-seekers that . . . brought a great part of the uncivilized world under the dominion of Great Britain, France, and Germany. The Mediterranean has since been the storm centre of Europe. The colonial policies of England, France, Germany, Italy, and Russia have, in the main, revolved about the control of the lands bordering upon it. Crowded out of Egypt by Great Britain, France turned to northwest Africa. She had possessed Algeria since 1830. [See ALGERIA: 1830-1898.] . . . She expanded eastward from Algeria into Tunis, over which she soon acquired a protectorate. To the west, in Morocco, her task was more difficult. Morocco covered an immense stretch of territory bordering upon the Mediterranean and Atlantic Ocean. Here Great Britain, Germany, and Spain claimed interests, all more or less fictitious but all loaded with potential controversies. The interest of England was political. Her chief concern was that the shores of Morocco should not fall into the hands of a hostile power that would menace Gibraltar and her exclusive control of the western entrance to the Mediterranean. The claims of Germany were based upon concessions from the Sultan, while those of France were those of the nearest colonial power fearing a dangerous neighbor. Germany also possessed mining concessions granted to the Krupps and Mannesmanns. She had banking, dock, and other concessions granted by the Sultan. She was assured of an open door for her trade and commerce by the Sultan. These were the explosives which nearly ignited into war in 1911 by the landing of French troops in Morocco, the bombardment of Casablanca, and the penetration of French troops into the Moroccan capital. . . . Only a miracle saved Europe from war as a result of the Morocco incident. But the seeds of hatred between Germany and England were laid, and in the minds of many the Morocco imbroglio was the prelude to the . . . [World] war. From 1911 dates the tension, the aggravated suspicions, and the irritation of peoples among the warring nations of Europe. As a result of the Morocco settlement, France, a nation friendly to Great Britain, gained control of all the lands bordering upon the Atlantic and the Mediterranean, to the east of Egypt and Tripoli. England's trade route to the Orient was made further secure, while France obtained possession of a country rather rich in minerals but with small purchasing power for goods and com-

modities. [See also MOROCCO: 1895-1906, to 1911-1914.] Balked in the west, German activity turned even more feverishly to the Near East—to Turkey and Asia Minor. As early as 1889 the Deutsche Bank had obtained concessions for certain railroad-building in Turkey. In that year the Kaiser made a trip to Constantinople to bring about a commercial and financial rapprochement between Germany and Turkey. . . . One of the terms of the German-Turkish understanding was a concession for the building of the Bagdad Railway, which began at the Bosphorus and extended through to the Persian Gulf at Koweit. . . . By means of this all-rail route Germany would free herself from the British control of the Mediterranean; she would avoid Gibraltar and the Suez Canal. She would be able to place her surplus products in the markets of the Orient far more expeditiously than would Great Britain, compelled to follow an all-sea route. [See also BAGDAD RAILWAY.] . . . One morning European foreign offices were electrified by the news that a British gunboat had entered the harbor of Koweit and that the British flag was flying over this port. Great Britain had again balked Germany in her ambitions about the Mediterranean; she had balked the dream of years of a drive to the East and a free, unimpeded highway from the North Sea to the Indian Ocean. . . . [The struggle for the Mediterranean is] almost as old as the world. It is a struggle for the historical centre of civilization. To Great Britain it involves not only Egypt and the Suez Canal, it involves the life-cord that unites the empire. It involves the free passage of her ships of war, of her merchant marine, of raw materials and food supplies. Were this life-cord severed, the eastern colonies and dependencies would be open to attack or severance from the mother country."—F. C. Howe, *Struggle for the Mediterranean* (*Scribner's Magazine*, May, 1916).—See also LONDON, TREATY OR PACT OF.

MEERSEN, or Mersen, Treaty of (870). See BELGIUM: Ancient and medieval period.

MEERUT, city, district and division of British India, in the United Provinces; important military station. The city was the scene of the first outbreak in the Indian Mutiny, 1857. See INDIA: 1857; 1857 (May); also Map.

MEGABYZUS, or Megabazus, Persian general. See ATHENS: B. C. 460-455.

MEGALESIA, or Megalenses, ancient Roman theatrical performances in honor of the goddess Cybele. See LUDI.

MEGALITHIC TOMB. See EUROPE: Prehistoric; Neolithic period.

MEGALOPOLIS, ancient Greek city, built in Arcadia, on the banks of the Helisson. It was the seat of the federal diet of Arcadia, and served as a protection for southern Arcadia against the Spartans.

B. C. 371.—Founding of city. See GREECE: B. C. 371.

B. C. 317.—Defense against Polysperchon. See GREECE: B. C. 321-312.

B. C. 222.—Destruction and restoration.—The last exploit of Cleomenes of Sparta, in his struggle with the Achæan League and its ally, the king of Macedonia, before the fatal field of Sellasia, was the capture of Megalopolis, 222 B. C. Most of the citizens escaped. He offered to restore their town to them if they would forsake the League. They refused, and he destroyed it, so utterly that its restoration was believed to be impossible. But in the following year the inhabitants were brought back and Megalopolis existed again, though never

with its former importance.—Based on Polybius, *Histories*, v. 1, bk. 2, ch. 55 and after.

B. C. 194-183.—Achæan League.—"The city of Megalopolis held at this time [194-183 B. C.], the same sort of position in the Achæan League which the State of Virginia held in the first days of the American Union. Without any sort of legal pre-eminence, without at all assuming the character of a capital, Megalopolis was clearly the first city of the League, the city which gave the nation the largest proportion of its leading statesmen. Megalopolis, like Virginia, was 'the Mother of Presidents,' and that too of Presidents of different political parties. As Virginia produced both Washington and Jefferson, so Megalopolis, if she produced Philopomen and Lykortas, produced also Aristainos and Diophanes."—E. A. Freeman, *History of federal government*, ch. 9, sect. 2.—See also GREECE: B. C. 280-146.

MEGARA.—Megara, the ancient Greek city and state whose territory lay between Attica and Corinth, forming part of the Corinthian isthmus (see GREECE: Map of ancient Greece), "is affirmed to have been originally settled by the Dorians of Corinth, and to have remained for some time a dependency of that city. It is further said to have been at first merely one of five separate villages—Megara, Heræa, Peiræa, Kynosura, Tripodiskus—inhabited by a kindred population, and generally on friendly terms, yet sometimes distracted by quarrels [see CORINTH: B. C. 745-725]. . . . Whatever may be the truth respecting this alleged early subjection of Megara, we know it in the historical age, and that too as early as the 14th Olympiad, only as an independent Dorian city, maintaining the integrity of its territory under its leader Orsippus, the famous Olympic runner, against some powerful enemies, probably the Corinthians. It was of no mean consideration, possessing a territory which extended across Mount Geranea to the Corinthian Gulf, on which the fortified town and port of Pégæ, belonging to the Megarians, was situated. It was mother of early and distant colonies,—and competent, during the time of Solon, to carry on a protracted contest with the Athenians, for the possession of Salamis; wherein, although the latter were at last victorious, it was not without an intermediate period of ill-success and despair."—G. Grote, *History of Greece*, pt. 2, ch. 9.—See also GREECE: Migrations of Hellenic tribes.

Circa B. C. 570.—Loss of Salamis to Athens. See ATHENS: B. C. 700-565.

MEGARA, suburbs and gardens of Carthage. See CARTHAGE: Divisions.

MEGASTHENES (fl. c. 300 B. C.), ancient Greek writer and teacher. See HISTORY: 14; EDUCATION: Ancient: B. C. 15th-5th centuries: India.

MEGIDDO.—The Valley of Megiddo, forming the western part of the great Plain of Esdraelon, in northern Palestine—stretching from the valley of the Jordan to the Mediterranean sea, along the course of the river Kishon—was so often the meeting place of ancient armies that it seems to have

come to be looked upon as the typical battleground, and apparently the name Armageddon in *Revelation* is an allusion to it in that sense. The ancient city of Megiddo has been identified in site with the present town of Ledjun (El Lejjun), which is the legio of the Romans—the station of a Roman legion.

MEGIDDO, Battles of (c. 1500 B. C. and 608 B. C.). See **EGYPT**: About B. C. 1700-1400; **JEW**: B. C. 724-604.

MEGISTANES.—"The king [of the Parthian monarchy] was permanently advised by two councils, consisting of persons not of his own nomination, whom rights, conferred by birth or office, entitled to their seats. One of these was a family conclave, . . . or assembly of the full-grown males of the Royal House; the other was a senate comprising both the spiritual and the temporal chiefs of the nation, the Sophi, or 'Wise Men,' and the Magi, or 'Priests.' Together these two bodies constituted the Megistanes, the 'Nobles' or 'Great Men.'"—G. Rawlinson, *Sixth great oriental monarchy*, ch. 6.

MEHEMET AALI. See **AALI**, **MEHEMET**.

MEHEMET ALI (1760-1849), viceroy of Egypt. Involved in the disputes with the Mamelukes; waged a war against the Wahhabis, 1811-1818; and conquered Nubia, Sennaar, Kordofan and Syria. See **EGYPT**: 1803-1811; 1840-1869; **BOSPORUS**: 1832-1878; **TURKEY**: 1831-1840.

MEHERRINS, American aboriginal tribe. See **IROQUOIS CONFEDERACY**: Tribes of the south.

MEHRING, Franz (1846-1919), German writer and socialist. See **SOCIALISM**: 1912-1918.

MEHTAR, Persian title. See **INDIA**: 1895 (March-September).

MEHUL, Etienne Henri (or Etienne Nicolas) (1763-1817), French composer. Studied with Hauser at Laval Dieu convent; later in Paris with Edelmann and Gluck; furthered the development of instrumental parts in orchestral composition, carrying on Gluck's ideas; his opera "Joseph" is his best known work.—See also **MUSIC**: Modern: 1774-1864; 1860-1908.

MEIGHEN, Arthur (1874-), Canadian statesman. Member of the House of Commons, 1908-1917; became secretary of state, minister of mines, minister of interior, and superintendent-general for Indian affairs, 1917; became prime minister and secretary of state for external affairs, 1920. See **BRITISH EMPIRE**: Colonial and imperial conferences: 1921; **CANADA**: 1920 (July).

MEIGS, Fort, Siege of (1813). See **U. S. A.**: 1812-1813: Harrison's northwestern campaign.

MEIJI, name applied to the era following the restoration of the authority of the emperor of Japan in 1868. It means "enlightened rule." The name Meiji Tenno was given after his death to the emperor Mutsuhito. See **JAPAN**: 1804-1912.

MEISSEN, Heinrich von (Frauenlob, pseud.) (c. 1260-1318), German poet and minnesinger. See **MUSIC**: Medieval: 12th-14th centuries.

1910-1911.—Gun running of the Afghans and Baluchis. See **BALUCHISTAN**: 1903-1914.

MELA, Pomponius (fl. c. 43 A. D.), Latin writer and geographer. See **ALBION**.

MELANCHTHON, Philipp (1497-1560), German reformer and associate of Luther. Became professor of Greek at Wittenberg, 1518; took a bachelor's degree in theology, 1519, but was never ordained; his first contribution to the Reformation was his "Locci Communes," 1521; became professor of theology, 1526; revised the "Augsburg Confession," 1530; drew up the "Apology," 1530; took part in the various Protestant conferences with the Roman Catholics.—See also **EDUCATION**: Modern: 15th-16th centuries: Relation of Renaissance and Reformation; 16th century: Melanchthon; **EUROPE**: Renaissance and Reformation: Melanchthon an aid to Luther; **ASTRONOMY**: 130-1600; **PAPACY**: 1517-1521; 1530-1531.

MELANESIA.—"Under the name of Melanesia, we comprehend all the islands and groups of islands stretching from New Guinea in the west to Viti or Fiji in the east; that is to say, the domain chiefly occupied by the Papuan race. The series begins with the still but little explored New Guinea, with its surrounding islands; and the Admiralty Isles, New Britain, and New Ireland, to the north-east. Proceeding still eastwards, or rather to the south-east, we meet with the Solomon Islands, the Santa Cruz or Queen Charlotte group, the New Hebrides, the French settlements of New Caledonia and the Loyalty Islands, and lastly, considerably farther east, the Fiji Archipelago."—A. R. Wallace, *Australasia* (*Stanford's compendium of geography*), ch. 22.—The Solomon islands, the Santa Cruz group, and the northern New Hebrides were discovered by Spanish navigators between 1567 and 1606. The French voyager Bougainville added some discoveries in 1768, which were carried farther by Captain Cook in 1774. Between these explorations and the visits of whalers and missionaries in the present century there is every reason, says Dr. Coddington, "to believe that all memory and tradition of white men had died away in the Solomon Islands and Santa Cruz."—R. H. Coddington, *Melanesians*.—The Solomon islands are controlled by Great Britain. A German protectorate was declared in 1884 over the New Britain and New Ireland groups and several adjacent islands, which were then renamed the Bismarck Archipelago. The Admiralty islands were also taken by Germany. New Caledonia, the Loyalty islands, and the New Hebrides belong to France, the former being a penal colony.—By the Versailles Treaty (1919) the Bismarck Archipelago was given under mandate to Australia.—See also **BISMARCK ARCHIPELAGO**; **NEW HEBRIDES**.

First movements of the people. See **PACIFIC OCEAN**: People; B. C. 2500-A. D. 1500.

Their mythology. See **MYTHOLOGY**: Oceanic: Melanesian.

MELAS, Baron Michael von (1729-1806), Austrian commander. Served at Cassano, 1799; Genoa, 1799; and Marengo, 1800. See **FRANCE**: 1800-1801 (May-February).

MELAZKERD, or Manzikert, Battle of (1071). See **ARMENIA**: 908-1085.

MELBOURNE, William Lamb, 2nd Viscount (1770-1848), English statesman. Entered Parliament, 1806; chief secretary for Ireland, 1827; succeeded to the peerage, 1829; home secretary, 1830-1834; prime minister, 1834; 1835-1841.—See also **ENGLAND**: 1834-1837; 1837-1839; 1841-1842.

MELBOURNE, important seaport, capital of the state of Victoria, Australia, on Hobson's bay in the harbor of Port Philip, the entrance of which is forty miles south of the city. (See **AUSTRALIA**: Map.) It has the largest population of any Australian city (about 743,000 in 1919), and occupies

a high rank among British overseas ports; its tonnage being second only to that of Sydney in the over-seas trade. It was first given the native name of Dootigola, afterwards changed to Melbourne in honor of Viscount Melbourne, premier of Great Britain. Melbourne is an important manufacturing town, and commercial center. Almost the entire commerce of the state is carried on there, the chief exports being wool, hides, cattle, gold, silver and sheep. The first settlement was made in 1835. (See AUSTRALIA: 1787-1840.) In 1841 the population had leaped to 11,000, and scarcely more than a decade later the discovery of the Ballarat gold field brought such an influx of adventurers that the town increased rapidly in size, and had a population of 100,000 by 1842 when it was incorporated as a city, and sent representatives to the Parliament of New South Wales, of which colony it was still a part. In 1807, however, the Port Phillip district broke away from New South Wales, and became a separate colony under the name of Victoria, with Melbourne as the capital. After the federation of the Commonwealth, Melbourne became the temporary capital, and the first federal parliament was opened in the Exhibitions buildings in Carlton Gardens in 1901 by the Duke of York (George V).—See also AUSTRALIA: 1787-1840.

MELCHITES, name applied in the religious controversies of the sixth century, by the heretical Jacobites, to the adherents of the orthodox church.—Based on H. F. Tozer, *Church and the Eastern empire*, ch. 5.

MELIAN FAMINE. See GREECE: B. C. 416.

MELIGNANO, or Marignano, Battle of. See FRANCE: 1515.

MELIKOV, Loris, Count. See LORIS-MELIKOV, MICHAEL TARIELOVICH.

MELILLA, Spanish penal settlement and fortified station on the northern coast of Morocco. It was created a municipality in 1918, and in 1922 had a population of 42,500.

MÉLINE, Félix Jules (1838-), French statesman. Secretary of agriculture, 1883-1885; president of the Chamber of Deputies, 1888-1889; premier and minister for agriculture, 1896-1898; presidential candidate, 1899. See FRANCE: 1896 (April-May); 1898 (May-November).

MELLON, Andrew William (1854-), American cabinet officer. Appointed secretary of the treasury, 1921. See U. S. A.: 1921 (March); President Harding's cabinet.

MELORIA, Battle at (1284). See PISA: 1063-1203.

MELOS, Siege and massacre of. See GREECE: B. C. 416; ATHENS: B. C. 419-416.

MELUN, Siege of (1420), one of the important sieges in the second campaign of the English king, Henry V, in France.

MELVILLE, or Melvill, Andrew (1545-1622), Scottish reformer. See PURITANS: 1620-1660.

MEMEL, Baltic port, about seventy miles north of Königsberg, formerly belonging to Germany. "Article 99 of the Versailles Treaty compelled Germany to cede this extreme northeast corner of her territory, with a population of 140,000 [to the Allies], but as at that time the western powers had not yet decided what to do with Lithuania itself, they left the fate of the city to be determined later. The matter is now to be settled by the Council of Ambassadors. . . . Though governed by an allied high commissioner, Memel still has German police, German clergy, German school teachers, German law officers. Until last August German was the only language permitted in the courts; and even now Lithuanian is formally ex-

cluded from 130 primary schools. As to the nationality of the district, the Allied Supreme Council on June 18, 1919, made to the German protests against Article 99 the following reply: "The region in question has always been Lithuanian; a majority of the population is of Lithuanian origin and tongue. . . . The delay in the final attribution of the city has been used by the German residents of Memel, members of the German 'Heimathbund' of Berlin, to agitate, not in favor of being reintegrated with the Reich, which would seem at present impossible, but to have Memel put upon the same status as Danzig, that is, 'internationalized' as a free city. In order to counteract the Lithuanian element, they have proposed that Poles be invited to participate in the administration, to which the Lithuanians object that the part of the River Niemen bordered by Poland is not navigable."—*Christian Science Monitor*, Nov. 15, 1922.—"The Council of Ambassadors, on Feb. 16, awarded the Memel district, which Lithuanian forces had seized, to Lithuania, on the condition that the city and its vicinity be left autonomous, and that Poland and other interested nations be allowed to use the port. . . . Lithuania, on Feb. 20, notified the League Council of her acceptance of the terms of her sovereignty over Memel."—*New York Times Current History*, Apr., 1923, p. 160.—See also VERSAILLES, TREATY OF: Part III: Section X.

MEMORIAL DAY, United States. See DECORATION DAY.

MEMPHIS, capital of ancient Egypt, a short distance south of modern Cairo. "The foundation of Memphis is the first event in Egyptian history, the one large historical incident in the reign of the first king, who emerges a real man from the shadowland which the Egyptians called the reign of the gods. . . . Menes, the founder of Memphis and Egyptian history, came from the south. Civilization descended the Nile. His native place was Thisis, or This, in Upper Egypt, a still older town, where his shadowy predecessors ruled. . . . A great engineering work was the first act of the builder. He chose his site . . . but the stream was on the wrong side, flowing below the Libyan chain, flowing over where the city should be, offering no waterbulwark against the invader from the eastern border. So he raised, a few miles to the south, a mighty dyke, and turned the river into the present course, founding the city on the west bank, with the desert behind and the Nile before. . . . The new city received a name which reflects the satisfaction of the ancient founder; he called it Mennufre, 'the Good' or 'Perfect Mansion.' This was the civil name. . . . The civil name is the parent of the Greek Memphis and the Hebrew Moph, also found in the form Noph."—R. S. Poole, *Cities of Egypt*, ch. 2.—See also EGYPT: Old empire and the middle empire; BABYLONIA: Map.

B. C. 6th century.—Destroyed by Persians. See EGYPT: B. C. 525-332.

A. D. 640-641.—Surrender to Moslems. See CALIPHATE: 640-646.

MEMPHIS, city in southwestern Tennessee, on the Mississippi river. Generals Andrew Jackson and James Winthrop and Judge John Overton laid out the town and gave it its name. It was incorporated in 1826, and was granted an amended charter in 1899, which provided for a commission form of government. The population in 1920 was 162,351.

1862.—Naval fight on the river.—Surrender of city to Union forces. See U. S. A.: 1862 (June: On the Mississippi).

1907.—Surrender of charter and evasion of prohibition law. See TENNESSEE: 1887-1908.

1921.—Poverty relief. See CHARITIES: United States: 1921.

MENANDER (342-201 B. C.), Greek dramatist. See LATIN LITERATURE: B. C. 234-103.

MENANDER (fl. 2nd century B. C.), Græco-Indian dynasty. Referred to in Buddhist literature as Milinda. See INDIA: B. C. 231-A. D. 480.

MENAPII, Belgic tribe. See BELGÆ; IRELAND: Tribes of early Celtic inhabitants.

MÉNARD, René (1604-1661), French Jesuit missionary. See WISCONSIN: 1658-1669.

MENCIUS (372-287 B. C.), Chinese moral teacher. "He studied under K'wung Chi, the grandson of Confucius; and after having attained to a perfect apprehension of the roms or Way of Confucius, became, at the age of about forty-five, Minister under Prince Hsüan of the Ch'i State. But the latter would not carry out his principles, and Mencius threw up his post. Thence he wandered away to several States, advising their rulers to the best of his ability, but making no very prolonged stay. He then visited Prince Hui of the Liang State, and abode there until the monarch's death in B. C. 310. After that event he returned to the State of Ch'i and resumed his old position. In B. C. 311 he once more felt himself constrained to resign office, and retired finally into private life, occupying himself during the remainder of his days in teaching and in preparing the philosophical record which now passes under his name. He lived at a time when the feudal princes were squabbling over the rival systems of federation and imperialism, and he vainly tried to put into practice at an epoch of blood and iron the gentle virtues of the Golden Age. His criterion was that of Confucius, but his teachings were on a lower plane, dealing rather with man's well-being from the point of view of political economy. He was therefore justly named by Chao Ch'i the Second Holy One or Prophet, a title under which he is still known. He was an uncompromising defender of the doctrines of Confucius, and he is considered to have effectually 'snuffed out' the heterodox schools of Yang Chu and Mo Ti."—H. A. Giles, *History of Chinese literature*, pp. 35-37.—"While Confucius did not claim to be an originator but only a transmitter, Mencius was an independent and original thinker. He expounded the teachings of his great Master, and also added his own reflections on the nature of man and the essentials of good government. He held an extremely optimistic view as to the original goodness of human nature, and believed that it was possible for man by his own efforts to reach the state of perfection. His sayings are now included among the principal classics of Chinese literature, and he himself is regarded as being second only to Confucius."—F. L. H. Pott, *Sketch of Chinese history*, p. 29.—See also CONFUCIANISM: Origin and principles.

MENDAÑA DE NEYRA, Alvaro de (1541-1595), Spanish navigator and explorer. See MARIQUESAS ISLANDS.

MENDEL, Gregor Johann (1822-1884), Austrian botanist. See EVOLUTION: Mendel's law.

MENDELEEFF, Dmitri Ivanovich (1834-1907), Russian chemist. Famous for his work on the Periodic Law. See CHEMISTRY: General: Modern: Lavoisier's theories; SCIENCE: Modern: 20th century: Chemistry.

MENDELSSOHN, Moses (1729-1786), German-Jewish philosopher. See JEWS: Germany: 18th-19th centuries; Zionism: Definition; also Language and literature.

MENDELSSOHN-BARTHOLDY, Jakob

Ludwig Felix (1800-1847), German composer. Studied with Berger, Zelter, and Moscheles; produced the "Octet" for strings (Opus 20), 1825; "Midsummer Night's Dream," overture, 1827; appointed conductor of the Düsseldorf Festival, 1833; accepted the conductorship of the Gewandhaus concerts, Leipzig, 1835, and was instrumental in the founding of the Leipzig Conservatory; produced the oratorios "Saint Paul," at Düsseldorf, 1836; and "Elijah" at Birmingham, England, 1846.—See also MUSIC: Modern: 1818-1880.

MENDEZ, Joaquin (1862-), Guatemalan diplomat. Representative at the Paris peace conference, 1919. See VERSAILLES, TREATY OF: Conditions of peace.

MENKARA, or Menkaura. See MYCERINUS.

MENNONITES.—“The Mennonites take their name from Menno Simons, born in Witmarsum, Holland, in 1492. He entered the priesthood of the Roman Catholic Church; . . . renounced Catholicism early in 1536, and was baptized at Leeuwarden. In the course of the following year he was ordained a minister in what was then known as the Old Evangelical or Waldensian Church. From this time on to his death, in 1550, he was active, . . . traveling through northern Germany, and preaching everywhere. The churches which he organized as a result of his labors rejected infant baptism and held to the principle of non-resistance. A severe persecution began to make itself felt against his followers, the Mennonites, and, having heard accounts of the colony established in the New World by William Penn, they began to emigrate to Pennsylvania near the close of the 17th century. . . . Successive immigrations from Holland, Switzerland, Germany, and, in the last twenty-five years, from southern Russia, have resulted in placing the great majority of Mennonites in the world on American soil, in the United States and Canada.”—H. K. Carroll, *Religious forces of the United States*, ch. 28.—“Since their settlement in this country [the United States], a number of minor divisions have taken place among the Mennonites occasioned by divergent views on some questions, but of late years the feeling has developed among nearly all branches that closer union and coöperation along certain common lines of gospel work would be desirable.”—United States Census, *Religious bodies*, 1916, pt. 2, p. 416.—In 1920, there were 887 churches of the denomination with 82,722 members.—See also BRETHREN, RIVER.

MERCER, Fort, on the Delaware river, New Jersey. See U. S. A.: 1777 (January-December).

MERCHANT ADVENTURERS.—“The original Company of the Merchant Adventurers carried on trade chiefly with the Netherlands. . . . In distinction from the staplers, who dealt in certain raw materials, the Merchant Adventurers had the monopoly of exporting certain manufactured articles, especially cloths. Though of national importance, they constituted a strictly private company, and not, like the staplers, an administrative organ of the British government. The former were all subjects of the English crown; the staplers were made up of aliens as well as Englishmen. . . . To carry on foreign trade freely in wool as well as in cloth, a merchant had to join both companies. . . . The earliest charter granted to it as an organized association dates from the year 1407. Their powers were greatly increased by Henry VII. The soul of this society, and perhaps its original nucleus, was the Mercers' Company of London. . . . Though the most influential Merchant Adventurers resided in London, there were many in other English towns. . . . The contrast between the old Gild Merchant and the Company of Merchant Adventurers is striking. The one had to do wholly with foreign trade, and its members were forbidden to exercise a manual occupation or even to be retail shopkeepers; the other consisted mainly of small shopkeepers and artisans. The line of demarcation between merchants and manual craftsmen was sharply drawn by the second half of the sixteenth century, the term ‘merchant’ having already acquired its modern significance as a dealer on an extensive scale. Besides the Company of Merchant Adventurers trading to the Low Countries—which during the eighteenth century was called the Hamburg Company—various new Companies of Merchant Adventurers trading to other lands arose in the sixteenth and seventeenth centuries, especially during the reigns of Elizabeth and her immediate successors. Among them were the Russian or Muscovy Company, the Turkey or Levant Company, the Guinea Company, the Morocco Company, the Eastland Company, the Spanish Company, and the East India Company.”—C. Gross, *Gild merchant*, pp. 148-156.—See also COMMERCE: Era of geographic expansion: 16th-17th centuries; Industry and trade in England; Merchant trading companies; East India Company: British.

MERCY FOR THE REDEMPTION OF CHRISTIAN CAPTIVES, Order of.—"For the institution of this godlike order, the Christian world was indebted to Pope Innocent III., at the close of the 12th century. . . . The exertions of the order were soon crowned with success. One third of its revenues was appropriated to the objects of its foundation, and thousands groaning in slavery were restored to their country. . . . The order . . . met with so much encouragement that, in the time of Alberic, the monk (who wrote about forty years after its institution), the number of monastic houses amounted to 600, most of which were situated in France, Lombardy and Spain."—S. A. Dunham, *History of Spain and Portugal*, v. 4, bk. 3, sect. 3, ch. 4.

MERSINA, seaport, in the vilayet of Adana, on the southern coast of Asia Minor. In 1909 Armenian inhabitants were massacred by the Turks. See TURKEY: 1909.

MERTÆ, Celtic tribe in ancient Britain. See BRITAIN: Celtic tribes.

MERTON, Statutes of (1236).—A body of laws enacted at a Great Council held at Merton, in England, under Henry III, which marks an important advance made in the development of constitutional legislation.—Based on G. W. Prothero, *Simon de Montfort*.

MERV, Meru, or Maur.—Merv is the name of an oasis and town now included in Transcaspia. It occupies a strategic position at the northwestern entrance into Afghanistan. Previous to the siege by Jenghiz Khan in 1221, it was one of the most famous cities of the East. In Hindu, Parsi, and Arab tradition it is looked upon as the ancient Paradise where the human race was born, and whence the Aryan tribes dispersed to rule the earth. It formed one of the satrapies of the ancient Persian empire, and a province of the Græco-Syrian, Parthian, and Persian kingdoms. During the fifth century it was the seat of a Christian archbishopric of the Nestorian church. Between 646 and 874 it was ruled by the Arabs, during whose domination it was one of the greatest schools of learning. In 1040 it fell into the hands of the Seljuk Turks under whom Merv reached the zenith of fame and splendor, as a luxurious and cultivated metropolis in a rich and bountiful agricultural district. "Merv Shahjahan" it was then called—"Meru, king of the world." In 1884 the Russians annexed the oasis as part of the Transcaspian province of the empire. In 1898 a strategical railroad from Merv to the frontier of Afghanistan was opened up. The

town of "New Merv," situated on both banks of the Murghab, is now the metropolis of the oasis, and a center for the export of the products of the district.

MESNIL ST. GEORGES, village four miles west of Montdidier and about the same distance south of Cantigny, northern France. It was occupied by the Germans in 1918. See WORLD WAR: 1918: II. Western front: d, 3.

MESOPOTAMIA, or Irak: Geography, area and population.—Strategic importance.—"Between the outer limits of the Syro-Arabian desert and the foot of the great mountain-range of Kurdistan and Luristan intervenes a territory long famous in the world's history. . . . Known to the Jews as Aram-Naharaim, or 'Syria of the two rivers' [see JEWS: Early Semitic migrations]; to the Greeks and Romans as Mesopotamia, or 'the between-river country'; to the Arabs as Al-Jezireh, or 'the island,' this district has always taken its name from the streams [the Tigris and Euphrates] which constitute its most striking feature."—G. Rawlinson, *Five great monarchies: Chaldaea, ch. 1*.—See also BABYLONIA: Position and importance, etc.; Land and its characteristics; TURKEY: The land; Map of Asia Minor.—It has an area of 143,250 square miles. Agriculture is being developed, and dates, cotton, wheat and barley are produced, but the chief product of the country is oil. "The revised figures of a recently completed census [1920] of Mesopotamia show the total population of the country to be 2,840,282. . . . Though the present population is exceedingly small, yet the evidences are abundant to justify the expectation that, under a decent government, there will be a steady increase fully commensurate with the needs of the country as it gradually develops. In less than three years the population of Basra, for example, increased nearly threefold: thousands of Arabs, who fled from Turkish oppression, having returned from India and elsewhere. All the other towns in Mesopotamia show signs of a substantial increase in numbers. Thousands of Indians were permanently domiciled in Kerbela, Kasmain, and Bagdad before the war; the pilgrims from Persia have enormously increased in numbers, and the sacred shrines will no doubt continue to attract many pilgrims and permanent settlers when the government has banished brigandage and blackmail from all the pilgrim roads. Some of the finest workers in Bagdad are the Christian Chaldeans who come from the villages in the north. If there is work to be done and decent pay to be had, the prolific Kurds will give up their predatory habits; for, in the absence of the patronage hitherto accorded them by the Turkish régime, they will be forced to provide sustenance for their large families by more legitimate means. The enormous emigra-

tion of the Christian population which took place under the stress of persecution and oppression will also cease when security of life and adequate employment can be found in Mesopotamia. There is not the slightest cause for anticipating that the development of the country will be retarded on account of the sparseness of the population. Some of the same circumstances that will henceforth give a new value to Mesopotamia will also help to provide it with the necessary population. This country will have a strategic value for many years to come. . . . The Berlin-Bagdad Railway was no fanciful enterprise; it threatened the existence of the British Empire. . . . [See BAGDAD RAILWAY: Plan.] The most obvious reason for placing the highest possible value upon Mesopotamia is its central geographical position in view of the development of overland traffic and the needs of aerial navigation. Here are the natural junctions for some of the greatest and busiest of the world's future highways."—J. T. Parfit, *Marvellous Mesopotamia*, pp. 15, 21-23.

1919-1921.—Effect of Treaty of Versailles.—Oil controversy. See ARABIA: 1919: Results of treaty; U. S. A.: 1920 (November): Note to Great Britain; 1921 (April-September).

1920-1921.—Becomes British mandatory.—Assumes ancient name.—Feisal crowned king.—In accordance with the Treaty of Sèvres, 1920, Mesopotamia became a mandatory state of Great Britain. (See SÈVRES, TREATY OF: 1920: Contents of treaty: Part III: Political clauses: Syria and Mesopotamia.) In 1921 the country assumed its ancient name of Irak, and Emir Feisal was crowned king at Bagdad, August 23, of the same year.

1922.—Treaty with Great Britain.—"A treaty of alliance between Great Britain and Iraq [Irak] was signed at Bagdad on Oct. 10 [1922]. Although in British official quarters it is said that the treaty represents a first step toward the granting of self-government to Iraq, . . . Great Britain will continue to exercise a very large amount of

control, so large in fact that the independence of the new kingdom is merely nominal. Sir Percy Cox, British High Commissioner and Consul General, in the course of a statement on the occasion of signing the treaty, said that everything would be done to secure the speedy delimitation of the frontiers, so that Iraq might be in a position, when the treaty and the subsidiary agreements had been ratified and the organic law had been brought into operation, to apply for membership in the League of Nations."—*New York Times Current History*, Dec. 1922, p. 490.

B. C. 338.—Territories restored by Philip of Macedon. See GREECE: B. C. 357-336.

B. C. 184.—Revolt from Achæan League.—A faction in Messene which was hostile to the Achæan League having gained the ascendancy, 184 B. C., declared its secession from the League. Philopœmen, the chief of the League, proceeded at once with a small force to reduce the Messenians to obedience, but was taken prisoner and was foully executed by his enemies. Bishop Thirlwall pronounces him "the last great man whom Greece produced." The death of Philopœmen was speedily avenged on those who caused it and Messene was recovered to the League.—Based on C. Thirlwall, *History of Greece*, ch. 65.

ALSO IN: Plutarch, *Philopœmer*.

MESSENE, Sicily. See MESSINA.

MESSENIAN WARS.—The Spartans were engaged in two successive wars with their neighbors of Messenia, whose territory, adjoining their own in the southwestern extremity of Peloponnesus, was rich, prosperous and covetable. "It was unavoidable that the Spartans should look down with envy from their bare rocky ridges into the prosperous land of their neighbours and the terraces close by, descending to the river, with their well-cultivated plantations of oil and wine. Besides, the Dorians who had immigrated into Messenia had, under the influence of the native population and of a life of comfortable ease, lost their primitive character. Messenia seemed like a piece of Arcadia, with which it was most intimately connected. . . . Hence this was no war of Dorians against Dorians; it rather seemed to be Sparta's mission to make good the failure of the Dorization of Messenia which had sunk back into Pelagic conditions of life, and to unite with herself the remains of the Dorian people still surviving there. In short, a variety of motives contributed to provoke a forcible extension of

Spartan military power on this particular side."—E. Curtius, *History of Greece*, v. 1, bk. 2, ch. 1.—The First Messenian War was commenced B. C. 745 and lasted twenty years, ending in the complete subjugation of the Messenians, who were reduced to a state of servitude like that of the Helots of Sparta. After enduring the oppression for thirty-nine years, the Messenians rose in revolt against their Spartan masters, 685 B. C. The leader and great hero of this Second Messenian War was Aristomenes, whose renown became so great in the despairing struggle that the latter was called among the ancients the Aristomenean War. But all the valor and self-sacrifice of the unhappy Messenians availed nothing. They gave up the contest, 608 B. C.; large numbers of them escaped to other lands and those who remained were reduced to a more wretched condition than before. (See also SPARTA: B. C. 743-511.) "The whole of Laconia [B. C. 404] was shaken by an earthquake, which opened great chasms in the ground, and rolled down huge masses from the highest peaks of Taygetus: Sparta itself became a heap of ruins, in which not more than five houses are said to have been left standing. More than 20,000 persons were believed to have been destroyed by the shock, and the flower of the Spartan youth was overwhelmed by the fall of the buildings in which they were exercising themselves at the time."—C. Thirlwall, *History of Greece*, ch. 17.—The Helots of Sparta, especially those who were descended from the enslaved Messenians, took advantage of the confusion produced by the earthquake, to rise in revolt. Having secured possession of Ithome, they fortified themselves in the town and withstood there a siege of ten years,—sometimes called the Third Messenian War. The Spartans invited the Athenians to aid them in the siege, but soon grew jealous of their allies and dismissed them with some rudeness. This was one of the prime causes of the animosity between Athens and Sparta which afterward flamed out in the Peloponnesian War. In the end, the Messenians at Ithome capitulated and were allowed to quit the country; whereupon the Athenians settled them at Naupactus, on the Corinthian gulf, and so gained an ardent ally, in an important situation.—Based on Thucydides, *History*, bk. 1, sect. 101-103.—Nearly one hundred years later (360 B. C.) when Thebes, under Epaminondas, rose to power in Greece and Sparta was humiliated, it was one of the measures of the Theban statesman to found at Ithome an important city which he named Messene, into which the long oppressed Messenians were gathered from slavery and from exile, and were organized in a state once more, free and independent.—Based on C. Thirlwall, *History of Greece*, ch. 9, 17, 30.—See also GREECE: B. C. 8th-5th centuries: Growth of Sparta; B. C. 425.

MESSINA, or **Messene**, important town in northeastern Sicily, built on the harbor and Straits of Messina, which take their name from the town. The estimated population in 1915 was 537,348. Calabria can be seen across the straits which are here only three and a half miles wide, while at the promontory of Faro they are but two miles across. "Zancle was originally colonised by pirates who came from Cyme the Chalcidian city in Opicia. . . . Zancle was the original name of the place, a name given by the Sicels because the

site was in shape like a sickle, for which the Sicel word is Zancle. These earlier settlers were afterwards driven out by the Samians and other Ionians, who when they fled from the Persians found their way to Sicily. Not long afterwards Anaxilas, the tyrant of Rhegium, drove out these Samians. He then re-peopled their city with a mixed multitude, and called the place Messene, after his native country."—Thucydides, *History* (tr. by Jowett), bk. 6, sect. 4.

MESTA.—"So that raw wool might be readily procured, the Catholic Kings recognized and even extended the privileges of the great corporation of the *Mesta*. Starting from La Mancha and Extremadura in April, flocks of sheep annually ravaged Castile, returning in September to the place whence they had come. The *cañada real*, or royal sheepwalk, was set aside for their exclusive use, and a prohibition was placed on clearing, working, or enclosing any part of that strip. In fact the sheppens ventured beyond the legal limits, and although required by law to pay damages in such cases were so powerful that they rarely did so. Withal, the stimulus to manufacturing was almost purely artificial, and the Spanish cities, even Barcelona, found competition with foreign cloths and other goods too keen. In the main, Spain continued to be a raw material land, exporting primary articles to foreign countries, in return for manufactures. Attempts were made to encourage agriculture, but the spirit of legislative interference and the superior importance accorded the grazing industry were not conducive to progress. The menace of the *Mesta* was responsible for the almost complete destruction of forestry and agriculture in many regions which were suitable to development in those respects, while the irrigation ditches of Andalusia and other former Moslem lands were too often allowed to decay."—C. E. Chapman, *History of Spain*, pp. 228-229.—See also SPAIN: 1750-1788.

METHODIST CHURCH, term broadly applied to the various forms of organization of the religious sect which came into being in consequence of the teaching of John Wesley.

Origin of name.—**Background.**—**Statistics.**—“The word Methodism was only an old term revived, and not one newly coined. There had been, ages earlier, a school of physicians who discarded observation and held to the pure deductions of reason and logic. They took the name of Methodists, conveying thereby their strict adherence to logical processes. Their success in practice is not reported; their school was not long-lived. When . . . in 1729, John Wesley leading half a dozen young gentlemen at Oxford University began to read the New Testament in Greek and to try to conform their ideas and their behavior most strictly to the same, a young gentleman of Christ Church College called out: ‘Here is a new set of Methodists sprung up!’ The new quaint name found instant currency, and the ‘set’ were known as *Methodists* all over the University. Thus came the word now familiar through all the world. All to whom it was given were zealous members of the Church of England, and the idea of founding any new Christian body was far from their minds. They proposed to live logically and honestly after the rules given in their New Testament—blameless and harmless, doing good, as they found opportunity, to all men.”—A. B. Hyde, *Story of Methodism*, pp. 17-18.—The early eighteenth century in which Methodism arose called for a revival in the religious life of the Church of England. “A colorless moderation lacking in energizing power was the result of the attempt to steer safely between the Charybdis of Romanism and the Scylla of Puritanism. Sermons were generally dry moral dissertations on disputed subjects for which the people had little concern and less understanding. . . . Non-residence and pluralities and the abuse of ecclesiastical patronage in the interests of politics were widely prevalent. The gulf between the higher and the lower clergy became deeper. . . . Walpole’s political policy cast a blighting atmosphere over the whole church. He opposed all religious activity on the ground that it was inimical to the tranquil condition of the State. The majority of the people, though seemingly attached to the outward establishment, refused the obedience of their lives to its teaching.

They loved the Church, scouted the clergy, and obeyed neither. The religious situation among the Dissenters was almost equally bad. Presbyterian congregations lapsed into a sort of Arianism, and the religious life among the Baptists and Independents was in a lamentable condition. . . . Drunkenness, gambling, and immorality . . . seem to have been prevalent to an extraordinary extent in the period under discussion. . . . The economic change [brought about by the industrial revolution] caused suffering and hardship, and the new problems with which nobody seemed able to cope were not even considered by the Anglican Church. The masses were hoarded together in new congested districts. They were without schools and churches and were as wax in the hands of demagogues. . . . Idealism and self-sacrifice were swallowed up by an extremely sordid individualism, each man for himself. Conditions in England were rapidly approaching those which deluged France in blood toward the close of the century, and Lecky affirms that the new religious enthusiasm enabled England to escape the contagion by enlisting the turbulent spirits in its service.”—A. W. Nagler, *Pietism and Methodism*, pp. 75-78, 80-81.—The most numerous and influential bodies of Methodists in England, Wales and adjacent islands today are the original Wesleyan Methodists who had, by the latest statistics available in 1922, 484,000 members; the Primitive Methodists which sprang up in Staffordshire in 1810 under the leadership of Hugh Bowne and William Clowes after their expulsion from the Wesleyan Conference caused by excesses attending camp meeting services; the United Methodist Church formed in 1907 by the union of three Methodist denominations more or less related; the Independent Methodists, a body, congregational in its organization, with an unpaid ministry which held its first conference in 1805; and the Wesleyan Reform Union which seceded from the parent body in 1849 and counts its adherents mainly in the midland counties. By statistics available in 1922, Calvinistic Methodists were estimated to number 560,000 and the Lady Huntingdon Connexion 13,000. The total number of Methodists in Ireland was 62,382. There are also small groups in Scotland. In 1920 the total number of Methodists in the British Isles was estimated at 1,300,000; in the United States and Canada, 7,600,000; elsewhere, 3,000,000.

1729-1791: In Great Britain.—Whitefield and the Wesleys.—Early development.—First Methodist church.—In Ireland and Scotland.—Calvinistic controversy.—Calvinistic Methodism in Wales.—Countess of Huntingdon Connexion.—Separation from established church.—Later development of Calvinistic Methodism.—“Three figures detached themselves from the group [of Methodists] as soon as, on its transfer to London in 1738, it attracted public attention by the fervour and even extravagance of piety; and each found his special work in the task to which the instinct of the new movement led it from the first, that of carrying religion and morality to the vast masses of population which lay concentrated in the towns or around the mines and collieries of Cornwall and the north. Whitefield, a servitor of Pembroke College, was above all the preacher of the revival. Speech was governing English politics; and the religious power of speech was shown when a dread of ‘enthusiasm’ closed against the new apostles the pulpits of the Established Church, and forced them to preach in the fields. Their voice was soon heard in the wildest

and most barbarous corners of the land, among the bleak moors of Northumberland, or in the dens of London, or in the long galleries where in the pauses of his labour the Cornish miner listens to the sobbing of the sea. Whitefield's preaching was such as England had never heard before, theatrical, extravagant, often commonplace, but hushing all criticism by its intense reality, its earnestness of belief, its deep tremulous sympathy with the sin and sorrow of mankind. It was no

stood next to Whitefield; as hymn-writer he stood second to his brother Charles. But while combining in some degree the excellences of either, he possessed qualities in which both were utterly deficient; an indefatigable industry, a cool judgment, a command over others, a faculty of organization, a singular union of patience and moderation with an imperious ambition, which marked him as a ruler of men. He had besides a learning and skill in writing which no other of the Methodists possessed; he was older than any of his colleagues at the start of the movement, and he outlived them all. His life indeed almost covers the century. He was born in 1703 and lived on till 1791, and the Methodist body had passed through every phase of its history before he sank into the grave at the age of eighty-eight. It would have been impossible for Wesley to have wielded the power he did had he not shared the follies and extravagance as well as the enthusiasm of his disciples. Throughout his life his asceticism was that of a monk. At times he lived on bread only, and he often slept on the bare boards. He lived in a world of wonders and divine interpositions. It was a miracle if the rain stopped and allowed him to set forward on a journey. It was a judgment of heaven if a hailstorm burst over a town which had been deaf to his preaching. . . . But with all this extravagance and superstition Wesley's mind was essentially practical, orderly, and conservative. No man ever stood at the head of a great revolution whose temper was so anti-revolutionary. In his earlier days the bishops had been forced to rebuke him for the narrowness

CHARLES WESLEY

common enthusiast who could wring gold from the close-fisted Franklin and admiration from the fastidious Horace Walpole, or who could look down from the top of a green knoll at Kingswood on twenty thousand colliers, grimly from the Bristol coal-pits, and see as he preached the tears 'making white channels down their blackened cheeks.' On the rough and ignorant masses to whom they spoke the effect of Whitefield and his fellow Methodists was mighty both for good and ill. . . . All the phenomena of strong spiritual excitement, so familiar now, but at that time strange and unknown, followed on their sermons; and the terrible sense of a conviction of sin, a new dread of hell, a new hope of heaven, took forms at once grotesque and sublime. Charles Wesley, a Christ Church student, came to add sweetness to this sudden and startling light. He was the 'sweet singer' of the movement. His hymns expressed the fiery conviction of its converts in lines so chaste and beautiful that its more extravagant features disappeared. The wild throes of hysteric enthusiasm passed into a passion for hymn-singing, and a new musical impulse was aroused in the people which gradually changed the face of public devotion throughout England. But it was his elder brother, John Wesley, who embodied in himself not this or that side of the new movement, but the movement itself. Even at Oxford, where he resided as a fellow of Lincoln, he had been looked upon as head of the group of Methodists, and after his return from a quixotic mission to the Indians of Georgia he again took the lead of the little society, which had removed in the interval to London. In power as a preacher he

and intolerance of his churchmanship. When Whitefield began his sermons in the fields, Wesley 'could not at first reconcile himself to that strange way.' He condemned and fought against the admission of laymen as preachers till he found himself left with none but laymen to preach. To the last he clung passionately to the Church of England, and looked on the body he had formed as but a lay society in full communication with it. He broke with the Moravians, who had been the

earliest friends of the new movement, when they endangered its safe conduct by their contempt of religious forms. He broke with Whitefield when the great preacher plunged into an extravagant Calvinism. But the same practical temper of mind which led him to reject what was unmeasured, and to be the last to adopt what was new, enabled him at once to grasp and organize the novelties he adopted. He became himself the most unwearied of field preachers, and his journal for half a century is little more than a record of fresh journeys and fresh sermons. When once driven to employ lay helpers in his ministry he made their work a new and attractive feature in his system. His earlier asceticism only lingered in a dread of social enjoyments and an aversion from the gayer and sunnier side of life which links the Methodist movement with that of the Puritans. As the fervour of his superstition died down into the calm of age, his cool common sense discouraged in his followers the enthusiastic outbursts which marked the opening of the revival. His powers were bent to the building up of a great religious society which might give to the new enthusiasm a lasting and practical form. The Methodists were grouped into classes, gathered in love feasts, purified by the expulsion of unworthy members, and furnished with an alternation of settled ministers and wandering preachers; while the whole body was placed under the absolute government of a Conference of ministers. But so long as he lived, the direction of the new religious society remained with Wesley alone. 'If by arbitrary power,' he replied, with a charming simplicity to objectors, 'you mean a power which I exercise simply without any colleagues therein, this is certainly true, but I see no hurt in it.' The great body which he thus founded numbered a hundred thousand members at his death, and now counts its members in England and America by millions.—J. R. Green, *History of the English people*, v. 4, pp. 145-149.—See also CHURCH OF ENGLAND: 18th century.—During the year 1739 occurred the organization of the Methodist movement into the United Society and the publication by the Wesleys of their "Hymns and Sacred Poems," the source of Methodist psalmody. In the Calvinistic controversy which developed in the early years of the movement Wesley took the Arminian or general view of the redemption while Whitefield was convinced of Calvin's doctrine of predestination. They separated but were soon personally reconciled and even exchanged pulpits. "As a result of the labors of Wesley and Whitefield, the Methodist movement assumed broader proportions, and at Bristol the first Methodist church was planned and built. [See BRISTOL: 1739.] But before the Bristol church was opened for worship, John Wesley had purchased the old foundry near Moorfields, a building that was used by the British government for the molding of cannon. The foundry was subsequently remodeled and became the cradle of Methodism, the first Methodist church ever opened for worship [1739]."—G. S. Frazer, *Methodism*, pp. 23-24.—Wesley introduced Methodism into Ireland in 1747 where it was frequently asserted by its adherents notwithstanding considerable protests by the general populace. In Scotland Whitefield gained numerous adherents.

"Whitefield, being what he was, could hardly be expected to create any ecclesiastical organisation comparable with the one Wesley reared. Yet even in that direction his labours were not without result. In Wales, indeed, he left upon the reviving

religion of his times so strong an impress that 'Calvinistic Methodism' became one of the Principality's most prominent varieties of religious life, and so continues to this day. . . . Even in England a number of Churches—they remained so loosely bound together that it would be stretching language too far to look on them as in the full sense a Church—indirectly owed their origin to him. The title by which they have always been and still are known—for though now presided over for the most part by Congregational ministers, they preserve such corporate denominational separateness as they assumed at the beginning—that of 'The Countess of Huntingdon's Connexion,' appropriately indicates both their direct creator and their character. They make a 'Connexion' rather than a 'Church,' being really a number of congregations with no other bond than that implied in the common holding of Church of England doctrine interpreted in an evangelical spirit, and in the common usage of the Church of England prayers. And they make the 'Countess of Huntingdon's Connexion,' because it was under the direction and control of Selina, Countess of Huntingdon, that they were set each in its place. Undoubtedly the relation of the body to other denominations and its place in the general religious development of the country would have been more immediately conveyed to the observer if the body had borne in England the name it bore and bears in Wales; for the title 'Calvinistic Methodism' suggests at once both a likeness and an unlikeness between those Churches descending from Whitefield and those whose ancestry is traceable along the Wesley line. Yet it was natural enough, under the circumstances, that English Calvinistic Methodism—the Methodism which Whitefield fathered—should obtain the name it actually won. For the Countess of Huntingdon it was that built the Churches in which Whitefield's type of doctrine prevailed. . . . Whitefield's ministry had not long begun when the Countess invited him to preach in her drawing-room. . . . By degrees, the association grew closer; till in 1749 Whitefield, perhaps realising that Lady Huntingdon might be able to supply, or at any rate provide for, that 'watering' which he left undone, sent to her an impassioned appeal. 'A leader is wanting.' . . . The Countess was ready enough to respond. More and more her purse was placed at Whitefield's disposal, her influence at his back. By and by commenced the erection of churches, in various places—Brighton, Bath, Tunbridge Wells, Spa Fields in London, and others—all of them put in trust for the conducting of public worship after the Church of England manner, but all of them open to preachers of every order who struck the truly evangelical note. . . . A legal decision to the effect that the Bishop had a right to inhibit Church of England clergymen from preaching at Spa Fields . . . compelled the Countess in 1781—since only Nonconformist ministers could thenceforward be employed—to register her buildings under the Toleration Act as Whitefield registered the two Tabernacles which were specially his own; and in 1783, four years before Wesley took his decisive plunge on the same matter, an ordination was held within the walls. This was separation. . . . By 1787 Wesleyan Methodism, under Wesley's own supervision, had achieved [its] . . . marvellous organisation Calvinistic Methodism, deriving from Whitefield and fostered by Lady Huntingdon's affectionate care, had achieved an organisation not indeed comparable with that of Wesleyan Methodism, but

not by any means to be despised; and both these organisations were to all intents and purposes outside the pale of the established church."—H. W. Clark, *History of English nonconformity*, v. 2, pp. 235-238.—"The Calvinistic Methodists who had generally recognized in Lady Huntingdon's patronage and superintendance a bond of unity, were resolved, after Whitefield's death, into three sects: The first was known as Lady Huntingdon's Connection; it observed strictly the liturgical forms of the English Church, and its ministry ceased to itinerate; it possesses in our day about sixty chapels. . . . The second was called the Tabernacle Connection, or Whitefield Methodists. Some of its churches used the national liturgy, but many adopted the forms of the Congregational Independents, and most of them have been absorbed by the latter denomination. The third is known as the Welsh Calvinistic Methodists; it has continued to prosper down to our day. Its chapels are found in almost every village in Wales, and are alone equal to more than two-thirds the number belonging to the establishment. Its first Association was held in 1743; in 1785 it was more thoroughly organized by Rev. Thomas Charles, whose legislative genius has thus perpetuated in effective vigor the usefulness of Griffith Jones, Howell Harris, Daniel Rowlands, and their Calvinistic Methodist coadjutors."—A. Stevens, *History of Methodism*, v. 1, pp. 476-477.

1766-1920: In America.—First gatherings and chapel.—First conference.—Foundation of Methodist Episcopal church.—Growth.—Contrast with English Wesleyism.—Division.—Centenary movement.—"The first interest of the Wesleys in America was connected with a philanthropic movement started by General Oglethorpe in Georgia in 1733. They had apparently attracted his attention by their manner of life at Oxford, and in 1735 he invited them to come as spiritual advisers to his colony. Both accepted his invitation, and John Wesley remained until 1738, though Charles Wesley returned earlier. It was at this time that they first came into relations with the Moravians, through the colony established in the same vicinity by Count Zinzendorf. . . . In 1760 Philip Embury, a Wesleyan local preacher from Ireland, landed in New York with members of his Irish class, and six years later he gathered for regular worship a company of Methodists, who in 1768 erected and dedicated a chapel, since known as the 'John Street Church.' About the same time Robert Strawbridge, also an Irish Wesleyan preacher, assembled a small company in Frederick County, Md. Subsequently itinerant preachers were sent over by John Wesley . . . and in 1773 the first annual conference was held in Philadelphia. . . . The Bishop of London, having refused to ordain ministers for the Methodist societies in America, which were left by the Revolutionary War without the sacraments, Wesley, in 1784, by the laying on of hands, appointed or ordained men and gave them the authority to ordain others. He thus ordained Thomas Cnke, D. C. L., who was already a presbyter of the Church of England, to be superintendent of the Methodist societies in America. . . . On December 24 [1784], what has been known as the 'Christmas Conference' began in Baltimore, Md., 60 preachers meeting with Doctor Coke and his companions. . . . The conference then proceeded to form a Methodist Episcopal Church. . . . From the beginning the growth of the church has been remarkable. . . . In 1790 there were . . . 61,351 communicants. . . . In 1812 the number had increased to . . . 105,357;

[and in 1920 to 7,867,863]. The development of church government, while following the general lines laid down by Wesley, was somewhat different in England and in America. In England the conference remained supreme, and the superintendency was not emphasized. [See *BISHOP*: Since the Reformation.] In America the superintendency was in fact an episcopacy which while not corresponding exactly to the episcopacy of the Church of England, became a very decided factor in church life. In each country, but especially in America, considerable opposition has developed at different times in connection with some features of the parent body, and divisions have resulted. In every case, however, the general principles of the founders have been preserved, and, notwithstanding the various separations, the Wesleyan Methodist Connection in England and the Methodist Episcopal Church in the United States remain the strongest representatives of the movement initiated in Oxford nearly two centuries ago. It is to be noted that the influence of the Methodist doctrine and church organization have not been confined to those bodies which have adopted the name Methodist, but has been manifest in the development of a number of bodies which use modified forms of the episcopal, presbyterial, and congregational systems. In the United States several bodies, including the Evangelical Association and the United Evangelical Church, the United Brethren bodies, and particularly the large number of organizations emphasizing the doctrine of 'holiness,' or entire sanctification, claim to be true exponents of the doctrines of the Wesleys, while their polity is generally Methodist in type. On the other hand, the Welsh Calvinistic Methodists, with whom Whitefield identified himself, were Presbyterian in polity, though Methodist in every other respect, as are the Wesleyan Methodist and some other Methodist churches in England and America. . . . The question of union between the different branches of Methodism in the United States has been much discussed. . . . As yet, however, there has been no formal action toward the union of these bodies. The church has entered cordially into all general movements for church unity."—United States Census, *Religious bodies*, 1916, pt. 2, pp. 446-449.—"American Methodism remained as a single organization, under the direction of one General Conference, until 1844. The fires of controversy which enveloped the whole nation and found expression in the Civil War, began to rage in the Church itself. The General Conference of 1844 gave full and exclusive authority to the 'Annual Conferences in the slave-holding States' to decide upon the necessity of organizing a separate ecclesiastical connection in the South. A separation was duly and legally effected, and American Methodism was divided into two distinct ecclesiastical bodies—the Methodist Episcopal Church and the Methodist Episcopal Church, South, both bodies remaining essentially one in doctrine and practice."—G. S. Frazer, *Methodism*, pp. 27, 28.—To celebrate the centenary of the Methodist Missionary Society, organized in 1810, the Methodist Episcopal Church, and the Methodist Episcopal Church, South, (both American churches) united in 1910 for a great financial drive and a general awakening of activity. A survey was made of home and foreign mission fields, with estimates of money needed for new personnel and equipment. In every local church a commission was organized, to canvass the membership for special subscriptions, to enlist new religious workers, etc. The original amount of money asked for by the Meth-

odist Episcopal Church for home and foreign missions was \$80,000,000 but this was later increased to about \$105,000,000 by the addition of the amount needed for war work, etc. The Methodist Episcopal Church, South, organized according to a similar plan, and asked for \$45,000,000 for home and foreign missions. A joint commission represented both churches. A great missionary world exhibit was held at Columbus, Ohio, attended by millions of people, and featured by a vast musical pageant, *The Wayfarer*. By July, 1919, the Methodist Episcopal Church reported subscriptions of more than \$113,000,000, and the Methodist Episcopal Church, South, reported more than \$54,000,000. Both of these were afterward increased.

1713.—Treaty abrogated. See TARIFF: 1689-1721.

MÉTIS, Canadian descendants of Indian mothers and French or Scotch fathers. See CANADA: 1860-1873.

METOACS, tribe of North American Indians. See ALGONQUIAN FAMILY.

METÆCI.—"Resident aliens, or Metæci, are non-citizens possessed of personal freedom, and settled in Attica. Their number, in the flourishing periods of the State, might amount to 45,000, and therefore was about half that of the citizens."—G. F. Schömann, *Antiquity of Greece: The state*, pt. 3, ch. 3, sect. 2.

METON, Year of.—"Hitherto [before the age of Pericles] the Athenians had only had the Octaëteris, i. e., the period of eight years, of which three were composed of thirteen months, in order thus to make the lunar years correspond to the solar. But as eight such solar years still amount to something short of 90 lunar months, this cycle was insufficient for its purpose. . . . Meton and his associates calculated that a more correct adjustment might be obtained within a cycle of 6,940 days. These made up 235 months, which formed a cycle of 19 years; and this was the so-called 'Great Year,' or 'Year of Meton.'"—E. Curtius, *History of Greece*, v. 2, bk. 3, ch. 3.

METRETES, Greek unit of measurement. See EPHAH.

METRIC SYSTEM, standard of measurement based on decimals. See INVENTIONS: 18th century: Measurement; Instruments.

METROPOLITAN, ecclesiastical title. See CHRISTIANITY: 312-337; PRIMATES.

METROPOLITAN MUSEUM OF ART.—"Incorporated April 13, 1870, for the following purposes: to establish and maintain in the City of

New York a Museum and Library of Art; to encourage and develop the study of fine arts, and the application of the arts to manufactures and practical life; to advance the general knowledge of kindred subjects, and to that end, to furnish popular instruction. . . . Collections include the fine arts—painting, sculpture, and architecture—as well as decorative or industrial arts. Ancient art includes Egyptian, Babylonian, Assyrian, Phœnician, Cypriote, Etruscan, Greek, and Roman antiquities. In painting the attempt is made to illustrate the history of the art from the Middle Ages to the present time, with special attention to the work of American artists. The decorative arts include woodwork, metalwork, ceramics, and textile. The collections represent the East and the Near East (China, Japan, Persia, and Asia Minor), Europe and America."—*Year's Art*, 1921, pp. 248-249.—See also NEW YORK CITY: 1870-1921.

METROPOTAMIA, name of proposed state, to have been formed out of part of the Northwest Territory. See NORTHWEST TERRITORY OF UNITED STATES: 1784.

METTERNICH-WINNEBURG, Clemens Wenzel Nepomuk Lothar, Prince (1773-1859), Austrian statesman and diplomat. Appointed Austrian envoy to Saxony, 1801; ambassador to Berlin, 1803; ambassador to Paris, 1806; minister for foreign affairs, 1809-1848; appointed chancellor, 1821; leading statesman of Europe, 1815-1848; overthrown by revolution of 1848. MEXICO: Land.—Population.—Resources.—“Excluding the Yucatan Peninsula, the territory of the ‘United States of Mexico’ is a triangular mass which forms the southern extremity of the North American continent properly so called. These Hispano-American United States are bounded on the east side by the long curve of the Gulf of Mexico, on the west by the shores of the Pacific, which describe a still more extensive arc of a circle. Both curves gradually converge southwards in the direction of the Isthmus of Tehuantepec, where Central America proper begins, if not in a political, at least in a geographical and historical sense. Both on the north and south sides, the frontiers are purely conventional, corresponding in no way with the natural parting lines of the fluvial basins. Doubtless, the north-east frontier, for a distance of about 750 miles, is traced by the Rio Bravo del Norte [Rio Grande], which separates Mexico from Texas. But this narrow stream is not a sufficiently salient geographical feature to constitute a true dividing line; on both sides the plains and hills present the same general aspect, and are subject to the same climate. . . . West of the Rio Bravo the frontiers, as laid down by the treaty between Mexico and the United States, are a mere succession of geometrical lines. At first they coincide with 30° 47′ north latitude for a distance of 100 miles; then they suddenly

drop southwards to 30° 20′ N., along which parallel they run westwards to 111° W. of Greenwich. At this point, the line is drawn obliquely to the Rio Colorado, 20 miles below the Rio Gila confluence, and then ascends this river to the confluence at Yuma, whence it follows a straight line across the neck of the Californian peninsula to the Pacific coast, 12 miles south of San Diego. Despite the fantastic character of this geometrical frontier, it coincides at certain points with prominent physical traits in the general relief of the land. Thus it connects the upper Bravo valley with the head of the Gulf of California, not far from the profound depressions between two distinct spurs of the Rocky Mountains traversed by the Rio Gila.”—E. Reclus, *Universal geography*, pp. 14-15.—“The boundary with Guatemala, which was finally adjusted by treaty in 1895, fixes the southern point of the republic almost at the mouth of the Zachiate River. The area of the country, inclusive of a few small outlying islands, is some 767,000 square miles. . . . Mexico has two peninsular parts—the peninsula of Lower California (officially, *Baja California*) and Yucatan, the latter properly comprising the two States of Yucatan and Campeche. The great Gulf of California, which separates the main mass of the republic from Lower California and receives at its northern extremity the Colorado River from the United States, occupies seemingly the position of a sunken block of the Earth's crust which broke continuity between what is now the peninsula apex and the protruding coastline of the State of Jalisco.”—A. Heilprin, *International geography*, p. 774.—In 1910 the population numbered 15,115,612. At the end of 1921, according to figures made public at the Mexican embassy in Washington on June 10, 1922, the population was 13,887,080, the decrease being attributed to the decade of revolution. The soil is rich throughout Mexico. Owing to the varying altitude of the country, crops of the tropical, semi-tropical and temperate zones may be produced. The principal industry is mining. The most important oil fields are in the Ebanos, Panuco, Huastaca, Tuxpam and the Tehuantepec-Tabasco districts. There were 334 productive wells in 1921, and 163,540,000 barrels of petroleum were produced in 1920. Vera Cruz and Tampico, both on the gulf of Mexico, are the most important ports of the country.

Agriculture.—“The rainfall conditions have been vitally important in the determination of the entire agricultural tendency of the country. . . . They have made corn (maize) the staple food of the country, as wheat is the staple of lands where there is winter snow and regular rainfall throughout the year. They have allowed the development of only the tropical products in the rich districts of Vera Cruz and Oaxaca which were partially developed by foreign stock companies under Diaz. They have, more than all, enthroned, as the chief agricultural export of Mexico, the sisal hemp of Yucatan. This desert product, which requires slow growth for the maturing of the long, stout fibers out of which are made rope and binder twine, is the greatest item of export of Mexico which is the combined product of nature's bounty and human enterprise. Coffee and some rubber and tobacco and a little sugar Mexico has raised for export in other days, but only sisal hemp, the product of the desert henequen plant, and cotton in a few favored localities have become wealth producers in any great quantity. Mexico has long been an importer of foodstuffs, for before the days of modern commerce famine came with terrible regularity. Under Diaz, food was imported in in-

creasing quantities, and since his fall, Mexico has been utterly dependent on the outside world for a large portion of the nutriment of her people."—*Mexican Year Book*, 1920-1921, pp. 92, 94.

Ahoriginal peoples.—Aztec civilization: Social and political organization.—Calendar Stone.—Religion.—Poetry and music.—Minor arts.—Costume.—Maya civilization: Government.—Architecture, sculpture and minor arts.—Calendar.—Comparison between Aztecs and Mayas.—Toltecs.—In Mexico there lived a great number of Indian tribes representing several linguistic stocks and various stages in the development of culture. Some of them reached the highest stage of civilization attained in the New World before the coming of the whiteman. Many theories have been put forth to explain the elaborate culture that existed in pre-historic times but on close analysis it is found that the fundamental elements of Mexican culture are exactly the same as the features which exist in the simpler cultures to the north.—See also INDIANS, AMERICAN: Cultural areas in Mexico, etc.; QUICHES AND CAKCHIQUELS.—“At the time of the conquest by the Spaniards of the province of Mexico, the dominant people was the Aztec population of Tenochtitlan (Mexico city), inhabiting a town built on an island in the lake of Tezcoco, or rather that portion of it known as the lake of Mexico. The Aztecs were confessedly immigrants, who had wandered south less than five hundred years before the conquest; by their superiority as fighting-men they had won the hegemony over the kindred tribes which they found settled in the valley of Mexico, and had extended their power to both oceans and as far at least as the isthmus of Tehuantepec. Both they and their immediate predecessors spoke the same language, called *Nahua* (strictly, *Nahuatl*), and they appear to be a branch of the great Shoshonean family which reaches as far north as the state of Montana. Beyond this, their ethnography and language would seem to connect them rather with the coastal tribes of the far North-West than with those to the east of the Rockies, but on this point little can be said at present. Immediately to the north and northwest of the settled peoples of the valley, the steppe country was inhabited by tribes, who lived mainly by hunting, called Chichimec and Otomi. . . . In the hilly volcanic country around lakes Pazcuaro and Chapala, a third speech was found, the Tarascan, of which the exact affinities are still doubtful. . . . Along the East coast, from the Panuco valley southward, were two peoples, speaking dialects of yet another language, the Maya tongue. In the north were the Huastec, primitive Maya, extending as far south as Tuxpan, where they were in touch with the linguistically related Totonac. To the north they stretched beyond the Panuco, but the remains of this region are practically unknown. . . . The early history of these tribes is very difficult to elucidate from the tangled mass of migration myths, often contradictory, which have survived. What may be termed the historical period starts only with the election of the first Aztec king, some years after the settlement of the tribe at Tenochtitlan, and this takes us back only to about 1376, or not much more than a century before the Spanish conquest. . . . Modern research has proved conclusively the existence, at those very localities especially associated with the Toltec, of pre-Aztec ruins, and of a relatively high culture which prevailed throughout the valley (and beyond) for a period considerably longer than that which elapsed between the Aztec

immigration and the Spanish conquest.”—T. A. Joyce, *Mexican archaeology*, pp. 5-8.—“Spanish historians often liken Tenochtitlan to the seat of an empire and speak of the ruler as one who had the power of an absolute monarch while other and more recent writers have declared that the tribal organization of the Aztecs was essentially democratic. The truth doubtless lies between these extremes. The people were warlike by nature and all men, except a few of the priesthood, were soldiers. Honors depended largely upon success in war and warriors were arranged in ranks according to their deeds. The common warriors formed one rank and next came those who had distinguished themselves by definite achievements which gave the right to wear certain articles of dress or to bear certain titles. The chiefs were elected for an indefinite term of office from the most distinguished fighters and could be removed for cause. But while the offices of state were elective there was, nevertheless, a tendency to choose from certain powerful families, and at least the foundation of an aristocratic policy. A chief was succeeded by his son or brother except when these candidates were manifestly unfit. In the actual succession of the great war chiefs of Tenochtitlan, a peculiar system seems to have been followed in that the candidates from the older generation were ordinarily exhausted before the next lower generation became eligible. Thus Huitzilihuitl, Chimalpopoca, and Itzcoatl were all sons of Acamapichtli, and the last and greatest was born of a slave mother. Then followed Moctezuma Ilhuicamina I, the son of Huitzilihuitl. This chief had no male heirs but the children of his daughter ruled in order; Axayacatl, Tizoc, and Ahuizotl. Moctezuma II was the son of the first of these as was Cuitlahua, while Cuauhtemoc, the last Aztec ruler, was the son of Ahuizotl. This peculiar succession was not in vogue in Tezcoco, where son succeeded father and the lawful wife was chosen from the royalty of Tenochtitlan. In the various annals, the genealogies are often indicated and the evidence that aristocracies existed is too strong to be overthrown. There are even cases of queens who succeeded to the chief power after the death of the royal husband.

“The great sculptured monument known as the Calendar Stone or Stone of the Sun, is the most valuable object that has come down intact from the time of the Aztecs. It is a single piece of porphyry, irregular except for the sculptured face. It now weighs over twenty tons and it is estimated that the original weight was over twice as much. The sculptured disk is about twelve feet in diameter. This great stone was transported by men over many miles of marshy lake bottom before it could be placed in position in front of the Temple of the Sun in the temple enclosure. . . . It is believed to have been set up horizontally and to have served as a sort of altar upon which human victims were sacrificed. The stone was doubtless thrown down from its original position by the soldiers of Cortez and may have been lost to sight. We know, however, that it was exposed to view about 1560 and was then buried by order of the archbishop of Mexico City lest its presence should cause the Indians to revert to their original pagan beliefs. It was rediscovered in 1700 and was afterwards built into the façade of the Cathedral where it remained until 1885, when it was removed to the nearby museum. The Calendar Stone is not only a symbol of the sun's face marked with the divisions of the year but it is a record of the cosmogonic myth of the Aztecs and the creations and

destructions of the world. In the center is the face of the sun god, Tonatiuh, enclosed in the middle of the symbol called Olin. Tonatiuh is often represented by a much simpler sign of a circle with four or more subdivisions resembling those of a compass which are intended to represent the rays of the sun. Olin is one of the day signs and means movement, or perhaps earthquake. It has also been explained as a graphic representation of the apparent course of the sun during the year. The history of the world, according to the Aztecs

that are intended to bring out the various aspects of his power. Over-lapping functions make it impossible to assign each god to his special province. There are universal gods, there are special gods, and there are patron gods of trade guilds. Moreover, there are foreign gods, some recent, some ancient. The religion of central Mexico had its objective, ritualistic side, which appealed directly to the understanding of the masses, and its more subtle theological or philosophical side, seen, for instance, in the poems written by priests and rulers. It was

CALENDAR STONE OF MEXICO

Original in the National Museum, Mexico City

myth, is divided into five suns or ages, four of which refer to the past and one to the present. . . . The religion of the Aztecs . . . was a polytheism in which special divinities controlled the powers of nature and the activities of men. The gods were perhaps further advanced towards human form and attributes than were those of the earlier culture to the south, but definite characterization was still accomplished by grotesque features and certain animal connections were still evident. The situation is confused beyond the point of analysis. The mythologies often ascribe different origins to the same deity. One god is addressed by many names, descriptive or figurative,

a mixture of spiritualism and the grossest idolatry. The ceremonial calendar, with a description of the feasts and sacrifices that occurred at different times of the year, has been preserved in a number of documents. Pageants, incense burning, and human sacrifice gave a strong dramatic quality to the religious rites. The conception of a supreme deity is seen in *Ometeuctli*, the Lord of Duality, a vague god head and creator who is sometimes addressed in some of the religious poems as the "Cause of All." In the background of the popular religion was the belief in the Earth Mother and the Sky Father and in the divinity of the Sun, the Moon, the Jaguar, the Serpent, and whatever else was

beautiful, powerful, and inexplicable. Tezcatlipoca, by reason of his magic and his omniscience, was placed at the head of the pantheon of active gods. Huitzilopochtli was, however, the favorite god of the Aztecs through his relation to war. Tlaloc, the god of rain, was naturally of great importance to agriculturists living in a rather arid region. Tonatiuh, the Sun God, was a more or less abstract deity who acted in part through other gods. But the list is too long to be repeated here. [See also MYTHOLOGY: Latin American.] . . . The languages of Central America were capable of considerable literary development. This is seen especially in the songs that were used in different religious ceremonies of the Aztecs, as well as in the reflective poems written by educated natives. Several very fine pieces have been preserved, and while there is no rhyme, there is much rhythm. When recited by a person speaking fluently the native tongue these poems are very impressive. Of course, translation is always hazardous, and fundamental differences in language, such as exist between English and Aztec, make it almost impossible. The most famous poet whose name has come down to us was Nezahualcoyotl, or Famishing Coyote, who was a ruler of Tezcoco and died at the advanced age of eighty years in 1472. . . . The Aztecs held concerts in the open air where poems were sung to the accompaniment of the drum and other simple instruments. [See MUSIC: Primitive: Mexico.] . . .

"Objects of minor art comprise pottery vessels, ornaments of gold, silver, copper, jade, and other precious materials, textiles, pieces of feather work, etc. The best known ceramic products are made of orange colored clay and carry designs in black that sometimes are realistic, but more often not. The tripod dishes with the bottoms roughed by cross scoring were used to grind chili. Heavy bowls with loop handles on the sides and a channel across the bottom were seemingly made to be strung on ropes. They may have held pitch and been used for street lights. The pottery figurines of the Aztec period are nearly all moulded and lack the sharp detail of the earlier examples. They often represent deities wearing characteristic dress and carrying ceremonial objects. Comparatively few specimens of ancient gold work in Mexico escaped the cupidity of the Spanish conquerors, but these attest a remarkable proficiency in casting. The moulds were made of clay mixed with ground charcoal and the melting of gold was accomplished by means of a blow pipe. The technique seen in Costa Rican gold work according to which details falsely appear to be added by soldered wire, was followed in Mexico. Modern Mexican filigree bears little relation to the ancient Indian work, but is probably of Moorish origin. The examples of Aztec gold work include finger rings, earrings, noserings, labrets, and pendants. Among the precious and semi-precious stones known to the Aztecs, the most valuable in their eyes was turquoise. This was probably obtained by trade from the Pueblo Indians. It was mostly cut into thin plates and used in the manufacture of mosaic objects. Red jasper, green jade, jet, gold, and shell of various colors was also used in these mosaics. Jade was highly prized and was known as *Chalchihuitl*. Ornaments of obsidian, a black volcanic glass, and of crystal quartz, are fairly common and others of opal and amethyst have been found. The textile decorations in vogue at the coming of the Spaniards can be restored from the pictures in codices. Mantles were often demanded as tribute and the designs are given on the conventional

bundles in the tribute lists. Garments with certain designs served as insignia of office for several of the priesthoods. Feather mosaic was highly prized and was made according to several methods. Capes as well as shields and other objects were covered with brilliant feathers so arranged as to bring out designs in the natural colors."—H. J. Spinden, *Ancient civilization of Mexico and Central America*, pp. 184-185, 189, 191, 201, 203, 205, 212-216.

"Clothing was made from textiles, and was usually assumed about the age of five or six, children under that age going nude. The principal garment worn by men was a girdle of about a hand's breadth, the ends falling down before and behind. . . . These ends were ornamented by the women with embroidery or feather-work, and in the monuments they are shown furnished with the most elaborate designs, of which the most frequent is a grotesque face, often highly conventionalized, with long nose-ornaments, probably representing a water-deity. Wide, square shoulder-mantles were also worn, as well as sandals of plaited hemp or hide. The sandal-strings, again, were often highly decorative, and in the monuments the sandal itself is of so elaborate a nature that it may almost be said to be a shoe. . . . The manuscripts seem to show some sort of a leg-covering also. . . . Women wore a skirt, and often covered the upper portion of the body with a cloth or a tunic open at the sides; the breast-cloth was worn at Campeche and Balcalar and tunics elsewhere in Yucatan at the time of the conquest. It is possible that the ceremonial dress of the men in early times included a skirt, for it hardly seems probable that all the skirted figures in the monuments represent women. Ornaments were worn in great variety, beads of jadeite and other hard stone were strung as necklaces; masks, also of stone, were worn as breast ornaments, and shells appeared as fringes to the edges of garments."—T. A. Joyce, *Mexican archaeology*, p. 207.—See also MITLA.—While the Aztec civilization is usually thought of as the typical civilization of ancient Mexico, and the history of modern Mexico has been chiefly associated with the seat of the old Aztec culture in the Valley of Mexico, part of the old territory of the Mayan Indians is also included within the bounds of Mexico.

"At the discovery, the rule in Yucatan was divided among a number of princely houses who constituted a sort of feudal nobility. A chief was succeeded by his son, though his brothers ranked high and possessed much influence. The rulers governed their territory through sub-chiefs appointed in the outlying villages, who consulted them on all important matters, such interviews usually taking place at night. They maintained considerable state, being accompanied by a retinue when they left their residences, and etiquette enjoined that all visitors should bring some ceremonial present when they approached their overlord. This apart from the ordinary tribute of cotton tunics, game, cacao and personal service (such as house-building) which constituted the princely revenue. . . . Inheritance among petty chiefs followed Mexican lines, that is to say a petty chief was succeeded by his brothers in order of age, and his sons only came to power after the death of their paternal uncles. At an earlier period the various chieftains had been subjects of an overlord at Mayapan, to whom all paid tribute. The city was founded, according to tradition, by the descendants of the Tatal Xiu, now called the Itza, whose protecting deity was Kukulcan (in his later and degraded manifestation). The family of the

Cocomes, however, seem to have gained the supreme power, but in any case the government was for a time centralized. The tributary lords possessed residences at the capital which were under the charge of intendants appointed by them, and were supported by their respective provinces; the inhabitants of the actual district of Mayapan were exempt from tribute, but the members of the aristocracy served in the temples, assisting in the festivals by day and night. Eventually, however, the centrifugal tendency so characteristic of Mexican and Central American politics reasserted itself, and the 'league' split up into a number of independent, and often hostile, princelings. It is probable that each important group of ruins marks the site of some former centre of power, and buildings not definitely associated with religion may have been in part the residences of feudal

which is a great terraced mound serving as a common base or platform from which the individual pyramidal bases of several temples rise. At some sites this acropolis is a natural hill which has been trimmed down or added to, but at other sites it is entirely artificial. At Copan there is an especially fine example of artificial platform mound rising from one end of the Great Plaza and affording space for several temples as well as for sunken courts with stepped sides that may have been theatres. The river washing against one side of this great mound has removed perhaps a third of it and made a vertical section that shows the method of construction. It is apparent that the mound was enlarged and old walls and floors buried. Mayan buildings are of two principal kinds. One is a temple pure and simple and the other has been called a palace. The temple is a

RESTORATION OF THE PYRAMID AT XOICHICALCO

(Restoration by C. Niebel)

lords."—T. A. Joyce, *Mexican archaeology*, pp. 278-279.—"The wonderful culture of the Mayan Indians . . . was developed in the humid lowlands of Central America and especially in the Yucatan peninsula. Artists are everywhere of the opinion that the sculptures and other products of the Mayas deserve to rank among the highest art products of the world, and astronomers are amazed at the progress made by this people in the measuring of time by the observed movements of the heavenly bodies. Moreover, they invented a remarkable system of hieroglyphic writing by which they were able to record facts and events and they built great cities of stone that attest a degree of wealth and splendor beyond anything seen elsewhere in the New World. [See AZTEC AND MAYA-PICTURE WRITING.] . . . The idea of a civic center is admirably illustrated in Mayan cities, particularly those of the first brilliant period. The principal structures are built around courts or plazas and there is usually an artificial acropolis

rectangular structure crowning a rather high pyramid that rises in several steps or terraces. As a rule the temple has a single front with one or more doorways and is approached by a broad stairway. The pyramid is ordinarily a solid mass of rubble and earth faced with cement or cut stone and rarely contains compartments. Some temples have but a single chamber while others have two or more chambers, the central or innermost one being specially developed into a sanctuary. [See TEMPLES: Stage of culture represented, etc.] The so-called palace, are clusters of rooms on low and often irregular platforms. These palaces may have been habitations of the priests and nobility. The common people doubtless lived in palm-thatched huts similar to those used today in the same region. . . . The decoration of Mayan buildings may be considered under three heads: first, interior decoration; second, façade decoration; third, supplementary monuments. In many temples at Yaxchilan, Tikal, etc., are found splendidly sculptured

lintels of stone or wood. At Copan we see wall sculptures that adorn the entrance to the sanctuary and at Palenque finely sculptured tablets let into the rear wall of the sanctuary. Elsewhere are occasional examples of mural paintings, sculptured door jambs, decorated interior steps, etc. The

façade decorations of the earlier Mayan structures are freer and more realistic than those of the later buildings. In many cases they consist of figures of men, serpents, etc., modeled in stucco or built up out of several nicely fitted blocks of stone. Grotesque faces also occur. In the later styles,

STONE LINTEL OF A TEMPLE AT MENCHÉ, MEXICO

Showing a worshipper making an offering of blood, by drawing a cord, armed with thorns, through his tongue, before a divine figure
(Exhibited in the British Museum)

decoration consists largely of 'mask panels,' which are grotesque front view faces arranged to fill rectangular panels, but there is an increasing amount of purely geometric ornament. The masked panels represent in most instances a highly elaborated serpent's face which sometimes carries the special markings of one of the greater gods. These panels, considered historically, pass through some interesting developments. Angular representations of serpent heads in profile are sometimes used at the sides of doorways. The supplementary monuments are stelæ and altars. These are monolithic sculptures that are often set up in definite relation to a building either on the terraces or at the foot of the stairway. The stelæ are great plinths or slabs of stone carved on one or more sides with the figures of priests and warriors loaded down with religious symbols. The altars are smaller stones usually placed in front of the stelæ. Many stelæ and altars are set up in plazas and have no definite architectural quality. . . . While the richly ornamented temples and the great monoliths attract first attention as works of art, the humbler products of the potter, the weaver, and the lapidary also attained to grace and dignity. The Mayas were expert potters and employed a variety of technical processes in the decoration of their wares, such as painting, modeling, engraving, and stamping. We can only take time to examine a few examples of the best works, leaving the commoner products practically undescribed. Suffice it to say, that tripod dishes were much used, as well as bowls, bottle-necked vessels, and cylindrical vases, and that the common decorative use of hieroglyphs serves to mark off Mayan pottery from that of other Central American peoples. The realistic designs are drawn in accordance with the highest principles of decorative art. Serpents, monkeys, jaguars, various birds, as well as priests and supernatural beings, are used as subjects for pottery embellishment. Geometric decoration is also much used. The polychrome pottery is rare and exceptionally beautiful, with designs relating to religious subjects. The background color of these cylindrical vases is usually orange or yellow, the designs are outlined in black, and the details filled in with delicate washes of red, brown, white, etc. The surface bears a high polish made by rubbing. . . . The textile arts of the ancient Mayas can be recovered in part from a study of the monuments since the designs on many garments are reproduced in delicate relief. The designs are mostly all-over geometric patterns, but borders reproducing the typical 'celestial band,' a line of astronomical symbols, are also seen. The techniques of brocade and lace were understood by the ancient weavers. In the minor textile art of basketry the products must also have ranked high. . . . Jade and other semi-precious stones were carved by the Mayas into beautiful and fantastic shapes. There was a considerable use of mosaic veneer on masks and other ceremonial objects. Metal was rare and could not be used for tools, but the working of gold and copper in the manufacture of ornaments was on a high plane. . . .

"The Mayan calendars were made possible by: first, the knowledge of astronomical time periods; second, the possession of a suitable notation system; third, the discovery of a permutation system of names and numbers. . . . There is reason to believe that the Mayas had first a lunar calendar of twelve months of thirty days, each, making a year of 360 days, and that they modified this so that the number of days in the 'month' became

twenty instead of thirty to agree with the value of the second digit in their notation system and that the number of months was increased from twelve to eighteen, still making up a total of 360 days which agreed with the value of the third digit. With a truer knowledge of the length of the year an extra five day month was added to make a year of 365 days. Beyond this the "leap year" error was calculated but not interpolated. As proof that the lunar month of thirty days preceded the notation of month of twenty days, it need only be pointed out that the name for this period, *uinal*, seems to be connected with the name for moon, *u*, and that the hieroglyph for moon has the value, twenty, in the inscriptions and ancient books. . . . A remarkably close analogy may be drawn between the Mayas and Aztecs in the New World and the Greeks and Romans in the Old, as regards character, achievements, and relations one to the other. The Mayas, like the Greeks, were an artistic and intellectual people who developed sculpture, painting, architecture, astronomy, and other arts and sciences to a high plane. Politically, both were divided into communities or states that bickered and quarreled. There were temporary leagues between certain cities, but real unity only against a common enemy. Culturally both were one people, in spite of dialectic differences, for the warring factions were bound together by a common religion and a common thought. To be sure the religion of the Mayas was much more barbaric than that of the Greeks but in each case the subject matter was idealized and beautified in art. The Aztecs, like the Romans, were a brusque and warlike people who built upon the ruins of an earlier civilization that fell before the force of their arms and who made their most notable contributions to organization and government. The Toltecs stand just beyond the foreline of Aztec history and may fitly be compared to the Etruscans. They were the possessors of a culture derived in part from their brilliant contemporaries that was magnified to true greatness by their ruder successors."—H. J. Spinden, *Ancient civilization of Mexico and Central America*, pp. 65, 69, 76, 77, 79, 81, 97, 178-179.

"Notwithstanding evident marks of similarity in nearly all the manifestations of the progressional spirit in aboriginal America, in art, thought, and religion, there is much reason for and convenience in referring all the native civilization to two branches, the Maya and the Nahua, the former the more ancient, the latter the more recent and widespread. . . . It is only, however, in a very general sense that this classification can be accepted, and then only for practical convenience in elucidating the subject; since there are several nations that must be ranked among our civilized peoples, which, particularly in the matter of language, show no Maya nor Nahua affinities. Nor is too much importance to be attached to the names Maya and Nahua, by which I designate these parallel civilizations. The former is adopted for the reason that the Maya people and tongue are commonly regarded as among the most ancient in all the Central American region, a region where formerly flourished the civilization that left such wonderful remains at Palenque, Uxmal, and Copan; the latter as being an older designation than either Aztec or Toltec, both of which stocks the race Nahua includes. The civilization of what is now the Mexican Republic, north of Tebuantepec, belonged to the Nahua branch, both at the time of the conquest and throughout the historic period preceding. Very few traces of the Maya element occur north

of Chiapas, and these are chiefly linguistic, appearing in two or three nations dwelling along the shores of the Mexican gulf. In published works upon the subject the Aztecs are the representatives of the Nahuatl element; indeed, what is known of the Aztecs has furnished material for nine tenths of all that has been written on the American civilized nations in general. The truth of the matter is that the Aztecs were only the most powerful of a league or confederation of three nations, which in the 16th century, from their capitals in the valley, ruled central Mexico."—H. H. Bancroft, *Native races of the Pacific states*, v. 2, ch. 2.—"The national names that appear in connection with the closing struggles are the Toltecs, Chichimecs, Quichés, Nonohualcas, and Tatal Xius, none of them apparently identical with the Xibalbans. . . . Of the tribes that were successively defeated and forced to seek new homes, those that spoke the Maya dialects, although considering themselves Nahuas, seem to have settled chiefly in the south and east. Some of them afterwards rose to great prominence in Guatemala and Yucatan. . . . The Nahuatl-speaking tribes as a rule established themselves in Anáhuac and in the western and north-western parts of Mexico. . . . The valley of Mexico and the country immediately adjoining soon became the centre of the Nahuas in Mexico."—*Ibid.*, v. 5, ch. 3.—See also MAYAS; AZTEC AND MAYA PICTURE-WRITING.—"The natives of the city of Tula were called, from its name, Tolteca, which simply means 'those who dwell in Tollan.' And who, let us ask, were these Toltecs? They have hovered about the dawn of American history long enough. To them have been attributed not only the primitive culture of Central America and Mexico, but of lands far to the north, and even the earthworks of the Ohio Valley. It is time they were assigned their proper place, and that is among the purely fabulous creations of the imagination, among the giants and fairies, the gnomes and sylphs, and other such fancied beings which in all ages and nations the popular mind has loved to create. Toltec, Toltecatl, which in later days came to mean a skilled craftsman or artificer, signifies . . . an inhabitant of Tollan—of the City of the Sun—in other words, a Child of Light. . . . In some, and these I consider the original versions of the myth, they do not constitute a nation at all, but are merely the disciples or servants of Quetzalcoatl. They have all the traits of beings of supernatural powers."—D. G. Britton, *American hero-myths*, ch. 3, sect. 3.—"The old-time story, how the Toltecs in the 6th century appeared on the Mexican table-land, how they were driven out and scattered in the 11th century, how after a brief interval the Chichimecs followed their footsteps, and how these last were succeeded by the Aztecs who were found in possession,—the last two, and probably the first, migrating in immense hordes from the far northwest,—all this is sufficiently familiar to readers of Mexican history. . . . It is probable, however, that this account, accurate to a certain degree, has been by many writers too literally construed; since the once popular theory of wholesale national migrations of American peoples within historic times, and particularly of such migrations from the north-west, may now be regarded as practically unfounded. The 6th century is the most remote period to which we are carried in the annals of Anáhuac by traditions sufficiently definite to be considered in any proper sense as historic records. . . . At the opening . . . of the historic times, we find the Toltecs in possession of Anáhuac and the surrounding country. Though

the civilization was old, the name was new, derived probably, although not so regarded by all, from Tollan, a capital city of the empire, but afterward becoming synonymous with all that is excellent in art and high culture. Tradition imputes to the Toltecs a higher civilization than that founded among the Aztecs, who had degenerated with the growth of the warlike spirit, and especially by the introduction of more cruel and sanguinary religious rites. But this superiority, in some respects not improbable, rests on no very strong evidence, since this people left no relics of that artistic skill which gave them so great traditional fame; there is, however, much reason to ascribe the construction of the pyramids at Teotihuacan and Cholula to the Toltec or a still earlier period. Among the civilized peoples of the 16th century, however, and among their descendants down to the present day, nearly every ancient relic of architecture or sculpture is accredited to the Toltecs, from whom all claim descent. . . . So confusing has been the effect of this universal reference of all traditional events to a Toltec source, that, while we can not doubt the actual existence of this great empire, the details of its history, into which the supernatural so largely enters, must be regarded as to a great extent mythical. There are no data for fixing accurately the bounds of the Toltec domain, particularly in the south. There is very little, however, to indicate that it was more extensive in this direction than that of the Aztecs in later times, although it seems to have extended somewhat farther northward. On the west there is some evidence that it included the territory of Michoacan, never subdued by the Aztecs; and it probably stretched eastward to the Atlantic. . . . During the most flourishing period of its traditional five centuries of duration, the Toltec empire was ruled by a confederacy, similar in some respects to the alliance of later date between Mexico, Tezcuco and Tlacopan. The capitals were Culhuacan, Otompan, and Tollan, the two former corresponding somewhat in territory with Mexico and Tezcuco, while the latter was just beyond the limits of the valley toward the north-west. Each of these capital cities became in turn the leading power in the confederacy. Tollan reached the highest eminence in culture, splendor, and fame, and Culhuacan was the only one of the three to survive by name the bloody convulsions by which the empire was at last overthrown, and retain anything of her former greatness. Long-continued civil wars, arising chiefly from dissensions between rival religious factions, . . . gradually undermine the imperial thrones. . . . So the kings of Tollan, Culhuacan, and Otompan, lose, year by year, their prestige, and finally, in the middle of the 11th century, are completely overthrown, leaving the Mexican table-land to be ruled by new combinations of rising powers."—H. H. Bancroft, *Native races of the Pacific states*, v. 2, ch. 2.

1325-1502.—Chichimecs.—Aztecs.—Empire of Montezuma.—"The new era succeeding the Toltec rule is that of the Chichimec empire, which endured with some variations down to the coming of Cortés. The ordinary version of the early annals has it, that the Chichimecs, a wild tribe living far in the north-west, learning that the fertile regions of Central Mexico had been abandoned by the Toltecs, came down in immense hordes to occupy the land. . . . The name Chichimec at the time of the Spanish conquest, and subsequently, was

used with two significations, first, as applied to the line of kings that reigned at Tezcuco, and second, to all the wild hunting tribes, particularly in the broad and little-known regions of the north. Traditionally or historically, the name has been applied to nearly every people mentioned in the ancient history of America. This has caused the greatest confusion among writers on the subject, a confusion which I believe can only be cleared up by the supposition that the name Chichimec, like that of Toltec, never was applied as a tribal or national designation proper to any people, while such people were living. It seems probable that among the Nahuatl peoples that occupied the country from the 6th to the 11th centuries, a few of the leading powers appropriated to themselves the title Toltecs, which had been at first employed by the inhabitants of Tollan, whose artistic excellence soon rendered it a designation of honor. To the other Nahuatl peoples, by whom these leading powers were surrounded, whose institutions were identical, but whose polish and elegance of manner were deemed by these self-constituted aristocrats somewhat inferior, the term Chichimecs, barbarians, etymologically 'dogs,' was applied. After the convulsions that overthrew Tollan, and reversed the condition of the Nahuatl nations, the 'dogs' in their turn assumed an air of superiority and retained their designation, Chichimecs, as a title of honor and nobility."—H. H. Bancroft, *Native races of the Pacific states*, v. 2, ch. 2.—"We begin to leave . . . [the] twilight of legend when we meet the Aztecs already encamped in the Valley of Mexico. Finding the most obviously eligible sites preoccupied, they were sagacious enough to detect the advantages of a certain marshy spot through which the outlets of lakes Chalco and Xochimilco, besides sundry rivulets, flowed northward and eastward into Lake Tezcuco. Here in the year 1325 they began to build their pueblo, which they called Tenochtitlan,—a name whereby hangs a tale. When the Aztecs, hard pressed by foes, took refuge among these marshes, they came upon a sacrificial stone which they recognized as one upon which some years before one of their priests had immolated a captive chief. From a crevice in this stone, where a little earth was imbedded, there grew a cactus, upon which sat an eagle holding in its beak a serpent. A priest ingeniously interpreted this symbolism as a prophecy of signal and long-continued victory, and forthwith diving into the lake he had an interview with Tlaloc, the god of waters, who told him that upon that very spot the people were to build their town. The place was therefore called Tenochtitlan, or 'place of the cactus-rock,' but the name under which it afterward came to be best known was taken from Mexitl, one of the names of the war-god Huitzilopochtli. The device of the rock and cactus, with the eagle and serpent, formed a tribal totem for the Aztecs, and has been adopted as the coat-of-arms of the present Republic of Mexico. The pueblo of Tenochtitlan was surrounded by salt marshes, which by dint of dikes and causeways the Aztecs gradually converted into a large artificial lake, and thus made their pueblo by far the most defensible stronghold in Anáhuac,—impregnable, indeed, so far as Indian modes of attack were concerned. The advantages of this commanding position were slowly but surely realized. A dangerous neighbour upon the western shore of the lake was the tribe of Tecpanecas, whose principal pueblo was Azcatputzalco. The Aztecs succeeded in making an alliance with these Tecpanecas, but it was upon unfavourable terms and involved the

payment of tribute to Azcatputzalco. It gave the Aztecs, however, some time to develop their strength. Their military organization was gradually perfected, and in 1375 they elected their first tlacatecuhtli, or 'chief-of-men,' whom European writers, in the loose phraseology formerly current, called 'founder of the Mexican empire.' The name of this official was Acamapichtli, or 'Handful-of-Reeds.' During the eight-and-twenty years of his chieftaincy the pueblo houses in Tenochtitlan began to be built very solidly of stone, and the irregular water-courses flowing between them were improved into canals. Some months after his death in 1403 his son Huitzilbuhtli, or 'Humming-bird,' was chosen to succeed him. This Huitzilbuhtli was succeeded in 1414 by his brother Chimalpopoca, or 'Smoking Shield,' under whom temporary calamity visited the Aztec town. The alliance with Azcatputzalco was broken, and that pueblo joined its forces to those of Tezcuco on the eastern shore of the lake. United they attacked the Aztecs, defeated them, and captured their chief-of-men, who died a prisoner in 1427. He was succeeded by Icoatzin, or 'Obsidian Snake,' an aged chieftain who died in 1436. During these nine years a complete change came over the scene. Quarrels arose between Azcatputzalco and Tezcuco; the latter pueblo entered into alliance with Tenochtitlan, and together they overwhelmed and destroyed Azcatputzalco, and butchered most of its people. What was left of the conquered pueblo was made a slave mart for the Aztecs, and the remnant of the people were removed to the neighbouring pueblo of Tlacopan, which was made tributary to Mexico. By this great victory the Aztecs also acquired secure control of the springs upon Chepultepec, or 'Grasshopper Hill,' which furnished a steady supply of fresh water to their island pueblo. The next step was the formation of a partnership between the three pueblo towns, Tenochtitlan, Tezcuco, and Tlacopan, for the organized and systematic plunder of other pueblos. All the tribute or spoils extorted was to be divided into five parts, of which two parts each were for Tezcuco and Tenochtitlan, and one part for Tlacopan. The Aztec chief-of-men became military commander of the confederacy, which now began to extend operations to a distance. The next four chiefs-of-men were Montezuma, or 'Angry Chief,' the first, from 1436 to 1464; Axayacatl, or 'Face-in-the-Water,' from 1464 to 1477; Tizoc, or 'Wounded Leg,' from 1477 to 1486; and Ahuizotl, or 'Water-Rat,' from 1486 to 1502. Under these chiefs the great temple of Mexico was completed, and the aqueduct from Chepultepec was increased in capacity until it not only supplied water for ordinary uses, but could also be made to maintain the level of the canals and the lake. In the driest seasons, therefore, Tenochtitlan remained safe from attack. Forth from this well-protected lair the Aztec warriors went on their errands of blood. Thirty or more pueblo towns, mostly between Tenochtitlan and the Gulf coast, scattered over an area about the size of Massachusetts, were made tributary to the Confederacy; and as all these communities spoke the Nahuatl language, this process of conquest, if it had not been cut short by the Spaniards, might in course of time have ended in the formation of a primitive kind of state. This tributary area formed but a very small portion of the country which we call Mexico. If the reader will just look at a map of the Republic of Mexico in a modern atlas, and observe that the states of Queretaro, Guanajuato, Michoacan, Guerrero, and a good part of La Puebla, lie outside the region

sometimes absurdly styled 'Montezuma's Empire,' and surround three sides of it, he will begin to put himself into the proper state of mind for appreciating the history of Cortés and his companions. Into the outlying region just mentioned, occupied by tribes for the most part akin to the Nahuas in blood and speech, the warriors of the Confederacy sometimes ventured, with varying fortunes. They levied occasional tribute among the pueblos in these regions, but hardly made any of them regularly tributary. The longest range of their arms seems to have been to the eastward, where they sent their tax-gatherers along the coast into the isthmus of Tehuantepec, and came into conflict with the warlike Mayas and Quiches. . . . Such was, in general outline, what we may call the political situation in the time of the son of Axayacatl, the second Montezuma, who was elected chief-of-men in 1502, being then thirty-four years of age.—J. Fiske, *Discovery of America*, v. 2, ch. 8.

1517-1518.—First found by the Spaniards. See AMERICA: 1517-1518.

1519 (February-April).—Coming of Cortés and the Spaniards.—Some time in the latter part of the year 1517, the Spaniards in Cuba had acquired definite knowledge of a much civilized people who inhabited "terra firma" to the west of them, by the return of Hernandez de Cordova from his involuntary voyage to Yucatan. (See AMERICA: 1517-1518.) In the spring of 1518 the Cuban governor, Velasquez, had enlarged that knowledge by sending an expedition under Grijalva to the Mexican coast, and, even before Grijalva returned, he had begun preparations for a more serious undertaking of conquest and occupation in the rich country newly found. For the command of this second armament he selected Hernando Cortés, one of the boldest and most ambitious of the adventurers who had helped to subdue and settle the island of Cuba. Before the fleet sailed, however, a jealous distrust of his lieutenant had become excited by some cause in the governor's mind, and he attempted to supersede him in the command. Cortés slipped out of port, half prepared as he was for the voyage, defied the orders of his superior, and made his way (February, 1519) to the scene of his future conquests, actually as a rebel against the authority which commissioned him. "The companions of Cortés were unfamiliar with fear. Cortés followed the same route as Grijalva. . . . At the Tabasco River, which the Spanish called Rio de Grijalva, because that explorer had discovered it, they had a fight with some natives who resisted their approach. These natives fought bravely, but the fire-arms, and above all the horses, which they conceived to be of one piece with their riders, caused them extreme terror, and the rout was complete. . . . The native prince, overcome, sent gifts to the conqueror, and, without much knowing the extent of his agreement, acknowledged himself as vassal of the king of Spain, the most powerful monarch of the world." Meantime, tidings of a fresh appearance of the same strange race which had briefly visited the shores of the empire the year before were conveyed to Montezuma, and the king, who had sent envoys to the strangers before, but not quickly enough to find them, resolved to do so again. "The presents prepared for Grijalva, which had reached the shore too late, were, alas! all ready. To these were now added the ornaments used in the decoration of the image of Quetzalcoatl, on days of solemnity, regarded as the most sacred among all the possessions of the

royal house of Mexico. Cortés accepted the rôle of Quetzalcoatl and allowed himself to be decorated with the ornaments belonging to that god without hesitation. The populace were convinced that it was their deity really returned to them. A feast was served to the envoys, with the accompaniment of some European wine which they found delicious. . . . During the feast native painters were busy depicting every thing they saw to be shown to their royal master. . . . Cortés sent to Montezuma a gilt helmet with the message that he hoped to see it back again filled with gold. . . . The bearer of this gift and communication, returning swiftly to the court, reported to the monarch that the intention of the stranger was to come at once to the capital of the empire. Montezuma at once assembled a new council of all his great vassals, some of whom urged the reception of Cortés, others his immediate dismissal. The latter view prevailed, and the monarch sent, with more presents to the unknown invader, benevolent but peremptory commands that he should go away immediately. . . . Meanwhile the Spanish camp was feasting and reposing in huts of cane, with fresh provisions, in great joy after the weariness of their voyage. They accepted with enthusiasm the presents of the emperor, but the treasures which were sent had an entirely different effect from that hoped for by Montezuma; they only inflamed the desire of the Spaniard to have all within his grasp, of which this was but a specimen. It was now that the great mistake in policy was apparent, by which the Aztec chieftain had for years been making enemies all over the country, invading surrounding states, and carrying off prisoners for a horrible death by sacrifice. These welcomed the strangers and encouraged their presence."—S. Hale, *Story of Mexico*, ch. 13.

1519 (June-October).—Advance of Cortés to Tlascala.—"Meanwhile Cortés, by his craft, quieted a rising faction of the party of Velasquez which demanded to be led back to Cuba. He did this by seeming to acquiesce in the demand of his followers in laying the foundations of a town and constituting its people a municipality competent to choose a representative of the royal authority. This done, Cortés resigned his commission from Velasquez, and was at once invested with supreme power by the new municipality. The scheme which Velasquez had suspected was thus brought to fruition. Whoever resisted the new captain was conquered by force, persuasion, tact, or magnetism; and Cortés became as popular as he was irresistible. At this point messengers presented themselves from tribes not far off who were unwilling subjects of the Aztec power. The presence of possible allies was a propitious circumstance, and Cortés proceeded to cultivate the friendship of these tribes. He moved his camp day by day along the shore, inuring his men to marches, while the fleet sailed in company. They reached a large city [Cempoalla, or Zempoalla, the site of which has not been determined], and were regaled. Each chief told of the tyranny of Montezuma, and the eyes of Cortés glistened. The Spaniards went on to another town, slaves being provided to bear their burdens. Here they found tax-gatherers of Montezuma collecting tribute. Emboldened by Cortés's glance, his hosts seized the Aztec emissaries and delivered them to the Spaniards. Cortés now played a double game. He propitiated the servants of Montezuma by secretly releasing them,

and added to his allies by enjoining every tribe he could reach to resist the Aztec collectors of tribute. The wandering municipality, as represented in this piratical army, at last stopped at a harbor where a town (La Villa Rica de Vera Cruz) sprang up, and became the base of future operations." At this point in his movements the adventurer despatched a vessel to Spain, with letters to the king, and with dazzling gifts of gold and Aztec fabrics. "Now came the famous resolve of Cortés. He would band his heterogeneous folk together—adherents of Cortés and of Velasquez—in one common cause and danger. So he adroitly led them to be partners in the deed which he stealthily planned. Hulk after hulk of the apparently worm-eaten vessels of the fleet sank in the harbor, until there was no flotilla left upon which any could desert him. The march to Mexico was now assured. The force with which to accomplish this consisted of about 450 Spaniards, six or seven light guns, fifteen horses, and a swarm of Indian slaves and attendants. A body of the Totonacs accompanied them. Two or three days brought them into the higher plain and its enlivening vegetation. When they reached the dependencies of Montezuma, they found orders had been given to extend to them every courtesy. They soon reached the Anáhuac plateau, which reminded them not a little of Spain itself. They passed from cacique to cacique, some of whom groaned under the yoke of the Aztec; but not one dared do more than orders from Montezuma dictated. Then the invaders approached the territory of an independent people, those of Tlascalala, who had walled their country against neighboring enemies. A fight took place at the frontiers, in which the Spaniards lost two horses. They forced passes against great odds, but again lost a horse or two,—which was a perceptible diminution of their power to terrify. The accounts speak of immense hordes of the Tlascalans, which historians now take with allowances, great or small. Cortés spread what alarm he could by burning villages and capturing the country people. His greatest obstacle soon appeared in the compacted army of Tlascalans arrayed in his front. The conflict which ensued was for a while doubtful. Every horse was hurt, and 60 Spaniards were wounded; but the result was the retreat of the Tlascalans. Divining that the Spanish power was derived from the sun, the enemy planned a night attack; but Cortés suspected it, and assaulted them in their own ambush. Cortés now had an opportunity to display his double-facedness and his wiles. He received embassies both from Montezuma and from the senate of the Tlascalans. He cajoled each, and played off his friendship for the one in cementing an alliance with the other. But to Tlascalala and Mexico he would go, so he told them. The Tlascalans were not averse, for they thought it boded no good to the Aztecs, if he could be bound to themselves. Montezuma dreaded the contact, and tried to intimidate the strangers by tales of the horrible difficulties of the journey. Presently the army took up its march for Tlascalala, where they were royally received, and wives in abundance were bestowed upon the leaders. Next they passed to Cholula, which was subject to the Aztecs."—J. Winsor, *Narrative and critical history of America*, v. 2, ch. 6.

1519 (October).—Massacre at Cholula.—March to Mexico.—"The distance from Tlascalala to Chololan [or Cholula] is but from 15 to 20 miles. It was a kind of holy place, venerated far and wide in Anáhuac; pilgrimages were made thither, as the Mahometans go to Mecca, and

Christians to Jerusalem or Rome. The city was consecrated to the worship of Quetzalcoatl, who had there the noblest temple in all Mexico, built, like all the temples in the country, on the summit of a truncated pyramid. The traveller of the present day beholds this pyramid on the horizon as he approaches Puebla, on his route from Vera Cruz to Mexico. But the worship of the beneficent Quetzalcoatl had been perverted by the sombre genius of the Aztecs. To this essentially good deity 6,000 human victims were annually immolated in his temple at Chololan. . . . The Spaniards found at Chololan an eager and, to all appearance at least, a perfectly cordial welcome." But this hospitality masked, it is said, a great plot for their destruction, which Montezuma had inspired and to aid which he had sent into the neighborhood of the city a powerful Mexican army. The plot was revealed to Cortez—so the Spanish

HERNANDO CORTÉS

historians relate—and "he took his resolution with his accustomed energy and foresight. He made his dispositions for the very next day. He acquainted the caciques of Chololan that he should evacuate the city at break of dawn, and required them to furnish 2,000 porters or 'tamanes,' for the baggage. The caciques then organized their attack for the morrow morning, not without a promise of the men required, whom, in fact, they brought at dawn to the great court in which the foreigners were domiciled. The conflict soon began. The Spaniards, who were perfectly prepared, commenced by massacring the caciques. The mass of Chololans that attempted to invade their quarters were crushed under the fire of their artillery and musketry, and the charges of their cavalry. Hearing the reports, the Tlascalans, who had been left at the entrance of the city, rushed on to the rescue. . . . They could now glut their hatred and vengeance; they slaughtered as long as they could, and then set to work at plunder. The Spaniards, too, after having killed all that resisted, betook themselves to pillage. The unfortunate city of Chololan was thus inundated with blood, and sacked. Cortez, however, enjoined that the women and children should be spared, and we are assured that

in that he was obeyed, even by his cruel auxiliaries from Tlascalala. . . . To the praise of Cortez it must be said that, after the victory, he once more showed himself tolerant: he left the inhabitants at liberty to follow their old religion on condition that they should no longer immolate human victims. After this signal blow, all the threats, all the intrigues of Montezuma, had no possible effect, and the Aztec emperor could be under no illusion as to the inflexible intention of Cortez. The latter, as soon as he had installed new chiefs at Chololan, and effaced the more hideous traces of the massacre and pillage that had desolated the city, set out with his own troops and his Indian auxiliaries from Tlascalala for the capital of the Aztec empire, the magnificent city of Tenochtitlan."—M. Chevalier, *Mexico, ancient and modern*, v. 1, pt. 2, ch. 4.

CAPITAL OF MONTEZUMA AS DESCRIBED BY CORTÉS AND BERNAL DIAZ.—"This Province is in the form of a circle, surrounded on all sides by lofty and rugged mountains; its level surface comprises an area of about 70 leagues in circumference, including two lakes, that overspread nearly the whole valley, being navigated by boats more than 50 leagues round. One of these lakes contains fresh, and the other, which is the larger of the two, salt water. On one side of the lakes, in the middle of the valley, a range of highlands divides them from one another, with the exception of a narrow strait which lies between the highlands and the lofty Sierras. This strait is a bow-shot wide, and connects the two lakes; and by this means a trade is carried on between the cities and other settlements on the lakes in canoes without the necessity of travelling by land. As the salt lake rises and falls with its tides like the sea, during the time of high water it pours into the other lake with the rapidity of a powerful stream; and on the other hand, when the tide has ebbed, the water runs from the fresh into the salt lake. This great city of Temixtitlan [Tenochtitlan—Mexico] is situated in this salt lake, and from the main land to the denser parts of it, by whichever route one chooses to enter, the distance is two leagues. There are four avenues or entrances to the city, all of which are formed by artificial causeways, two spears' length in width. The city is as large as Seville or Cordova; its streets, I speak of the principal ones, are very wide and straight; some of these, and all the inferior ones, are half land and half water, and are navigated by canoes. All the streets at intervals have openings, through which the water flows, crossing from one street to another; and at these openings, some of which are very wide, there are also very wide bridges, composed of large pieces of timber, of great strength and well put together; on many of these bridges ten horses can go abreast. . . . This city has many public squares, in which are situated the markets and other places for buying and selling. There is one square twice as large as that of the city of Salamanca, surrounded by porticoes, where are daily assembled more than 60,000 souls, engaged in buying and selling; and where are found all kinds of merchandise that the world affords, embracing the necessaries of life, as for instance articles of food, as well as jewels of gold and silver, lead, brass, copper, tin, precious stones, bones, shells, snails, and feathers. . . . Every kind of merchandise is sold in a particular street or quarter assigned to it exclusively, and thus the best order is preserved. They sell everything by number or measure; at least so far we have not observed them to sell any thing by weight. There is a building in the great square that is used as an audience house, where ten or

twelve persons, who are magistrates, sit and decide all controversies that arise in the market, and order delinquents to be punished. . . . This great city contains a large number of temples, or houses for their idols, very handsome edifices, which are situated in the different districts and the suburbs. . . . Among these temples there is one which far surpasses all the rest, whose grandeur of architectural details no human tongue is able to describe; for within its precincts, surrounded by a lofty wall, there is room enough for a town of 500 families. Around the interior of this enclosure there are handsome edifices, containing large halls and corridors, in which the religious persons attached to the temple reside. There are full 40 towers, which are lofty and well built, the largest of which has 50 steps leading to its main body, and is higher than the tower of the principal church at Seville. The stone and wood of which they are constructed are so well wrought in every part that nothing could be better done. . . . This noble city contains many fine and magnificent houses; which may be accounted for from the fact that all the nobility of the country, who are the vassals of Montezuma, have houses in the city, in which they reside a certain part of the year; and, besides, there are numerous wealthy citizens who also possess fine houses."—H. Cortés, *Despatches* (tr. by G. Folsom), letter 2, ch. 5. —"We had already been four days in the city of Mexico, and neither our commander nor any of us had, during that time, left our quarters, excepting to visit the gardens and buildings adjoining the palace. Cortés now, therefore, determined to view the city, and visit the great market, and the chief temple of Huitzilopochtli. . . . The moment we arrived in this immense market, we were perfectly astonished at the vast numbers of people, the profusion of merchandise which was there exposed for sale, and at the good police and order that reigned throughout. . . . Every species of goods which New Spain produces were here to be found; and everything put me in mind of my native town Medina del Campo during fair time, where every merchandise has a separate street assigned for its sale. . . . On quitting the market, we entered the spacious yards which surround the chief temple. . . . Motecusuma, who was sacrificing on the top to his idols, sent six papas and two of his principal officers to conduct Cortés up the steps. There were 114 steps to the summit. . . . Indeed, this infernal temple, from its great height, commanded a view of the whole surrounding neighbourhood. From this place we could likewise see the three causeways which led into Mexico. . . . We also observed the aqueduct which ran from Chapultepec, and provided the whole town with sweet water. We could also distinctly see the bridges across the openings, by which these causeways were intersected, and through which the waters of the lake ebbed and flowed. The lake itself was crowded with canoes, which were bringing provisions, manufactures and other merchandise to the city. From here we also discovered that the only communication of the houses in this city, and of all the other towns built in the lake, was by means of drawbridges or canoes. In all these towns the beautiful white plastered temples rose above the smaller ones, like so many towers and castles in our Spanish towns, and this, it may be imagined, was a splendid sight."—Bernal Diaz del Castillo, *Memoirs* (tr. by Lockhart), v. 1, ch. 92.

VIEWED IN THE LIGHT OF MODERN HISTORICAL CRITICISM.—"In the West India Islands the Spanish

discoverers found small Indian tribes under the government of chiefs; but on the continent, in the Valley of Mexico, they found a confederacy of three Indian tribes under a more advanced but similar government. In the midst of the valley was a large pueblo, the largest in America, surrounded with water, approached by causeways; in fine, a water-girt fortress impregnable to Indian assault. This pueblo presented to the Spanish adventurers the extraordinary spectacle of an Indian society lying two ethnical periods back of European society, but with a government and plan of life at once intelligent, orderly, and complete. . . . The Spanish adventurers who captured the pueblo of Mexico saw a king in Montezuma, lords in Aztec chiefs, and a palace in the large joint-tenement house occupied, Indian fashion, by Montezuma and his fellow-householders. It was, perhaps, an unavoidable self-deception at the time, because they knew nothing of the Aztec social system. Unfortunately it inaugurated American aboriginal history upon a misconception of Indian life which has remained substantially unquestioned until recently. The first eye-witnesses gave the keynote to this history by introducing Montezuma as a king, occupying a palace of great extent crowded with retainers, and situated in the midst of a grand and populous city, over which, and much besides, he was reputed master. But king and kingdom were in time found too common to express all the glory and splendor the imagination was beginning to conceive of Aztec society; and emperor and empire gradually superseded the more humble conception of the conquerors. . . . To every author, from Cortés and Bernal Diaz to Brasseur de Bourbourg and Hubert H. Bancroft, Indian society was an unfathomable mystery, and their works have left it a mystery still. Ignorant of its structure and principles, and unable to comprehend its peculiarities, they invoked the imagination to supply whatever was necessary to fill out the picture. . . . Thus, in this case, we have a grand historical romance, strung upon the conquest of Mexico as upon a thread; the acts of the Spaniards, the pueblo of Mexico, and its capture, are historical, while the descriptions of Indian society and government are imaginary and delusive. . . . There is a strong probability, from what is known of Indian life and society, that the house in which Montezuma lived, was a joint-tenement house of the aboriginal American model, owned by a large number of related families, and occupied by them in common as joint proprietors; that the dinner [of Montezuma, in his palace, as described by Cortés and Bernal Diaz] . . . was the usual single daily meal of a communal household, prepared in a common cook-house from common stores, and divided, Indian fashion, from the kettle; and that all the Spaniards found in Mexico was a simple confederacy of three Indian tribes, the counterpart of which was found in all parts of America. It may be premised further that the Spanish adventurers who thronged to the new world after its discovery found the same race of Red Indians in the West India Islands, in Central and South America, in Florida, and in Mexico. In their mode of life and means of subsistence, in their weapons, arts, usages, and customs, in their institutions, and in their mental and physical characteristics, they were the same people in different stages of advancement. No distinction of race was observed, and none in fact existed. . . . Not a vestige of the ancient pueblo of Mexico (Tenochtitlan) remains to assist us to a knowledge

of its architecture. Its structures, which were useless to a people of European habits, were speedily destroyed to make room for a city adapted to the wants of a civilized race. We must seek for its characteristics in contemporary Indian houses which still remain in ruins, and in such of the early descriptions as have come down to us, and then leave the subject with but little accurate knowledge. Its situation, partly on dry land and partly in the waters of a shallow artificial pond formed by causeways and dikes, led to the formation of streets and squares, which were unusual in Indian pueblos, and gave to it a remarkable appearance. . . . Many of the houses were large, far beyond the supposable, wants of a single Indian family. They were constructed of adobe brick and of stone, and plastered over in both cases with gypsum, which made them a brilliant white; and some were constructed of a red porous stone. In cutting and dressing this stone flint implements were used. The fact that the houses were plastered externally leads us to infer that they had not learned to dress stone and lay them in courses. It is not certainly established that they had learned the use of a mortar of lime and sand. In the final attack and capture, it is said that Cortés, in the course of seventeen days, destroyed and levelled three-quarters of the pueblo, which demonstrates the flimsy character of the masonry. . . . It is doubtful whether there was a single pueblo in North America, with the exception of Tlascalala, Cholula, Tezucoco, and Mexico, which contained 10,000 inhabitants. There is no occasion to apply the term 'city' to any of them. None of the Spanish descriptions enable us to realize the exact form and structure of these houses, or their relations to each other in forming a pueblo. . . . It is evident from the citations made that the largest of these joint-tenement houses would accommodate from 500 to 1,000 or more people, living in the fashion of Indians; and that the courts were probably quadrangles, formed by constructing the building on three sides of an inclosed space, as in the New Mexican pueblos, or upon the four sides, as in the House of the Nuns, at Uxmal.—L. H. Morgan, *Houses and house-life of the American aborigines* (*United States Geographical and Geological Survey of Rocky Mountain Regions: Contributions to North American Ethnology*, v. 4, ch. 10).

1519-1520.—Captivity of Montezuma, Cortés ruling in his name.—Discomfiture of Narvaez.—Revolt of the capital.—“When Cortés had time to survey and to realize his position in the Mexican capital, he saw that it was full of extreme danger. To be isolated with so small a force in the midst of any hostile, populous city would be perilous; but in Mexico that peril was immeasurably increased by the peculiar situation and construction of the island city—Venice-like in its insulation, and connected with the mainland by long and narrow causeways and bridges, easily broken and difficult to secure for retreat. With characteristic audacity, the Spanish leader mastered the danger of the situation, so to speak, by taking Montezuma himself in pledge for the peace and good behavior of his subjects. Commanded by Cortés to quit his palace, and to take up his residence with the Spaniards in their quarters, the Mexican monarch remonstrated but obeyed, and became from that day the shadow of a king. ‘During six months that Cortés remained in Mexico [from November, 1510, until May, 1520], the monarch continued in the Spanish quarters, with an appearance of as entire satisfaction and tranquillity

as if he had resided there, not from constraint, but through choice. His ministers and officers attended him as usual. He took cognizance of all affairs; every order was issued in his name. . . . Such was the dread which both Montezuma and his subjects had of the Spaniards, or such the veneration in which they held them, that no attempt was made to deliver their sovereign from confinement, and though Cortés, relying on this ascendant which he had acquired over their minds, permitted him not only to visit his temples, but to make hunting excursions beyond the lake, a guard of a few Spaniards carried with it such a *terror* as to intimidate the multitude, and secure the captive monarch. Thus, by the fortunate temerity of Cortés in seizing Montezuma, the Spaniards at once secured to themselves more extensive authority in the Mexican empire than it was possible to have acquired in a long course of time by open force; and they exercised more absolute sway in the name of another than they could have done in their own. . . . Cortés availed himself to the utmost of the powers which he possessed by being able to act in the name of Montezuma. He sent some Spaniards, whom he judged best qualified for such commissions, into different parts of the empire, accompanied by persons of distinction, whom Montezuma appointed to attend them both as guides and protectors. They visited most of the provinces, viewed their soil and productions, surveyed with particular care the districts which yielded gold or silver, pitched upon several places as proper stations for future colonies, and endeavoured to prepare the minds of the people for submitting to the Spanish yoke.' At the same time, Cortés strengthened his footing in the capital by building and launching two brigantines on the lake, with an equipment and armament which his royal prisoner caused to be brought up for him from Vera Cruz. He also persuaded Montezuma to acknowledge himself a vassal of the King of Castile, and to subject his kingdom to the payment of an annual tribute. But, while his cunning conquest of an empire was advancing thus prosperously, the astute Spanish captain allowed his prudence to be overridden by his religious zeal. Becoming impatient at the obstinacy with which Montezuma clung to his false gods, Cortés made a rash attempt, with his soldiers, to cast down the idols in the great temple of the city, and to set the image of the Virgin in their place. The sacrilegious outrage roused the Mexicans from their tame submission and fired them with an inextinguishable rage. At this most unfortunate juncture, news came from Vera Cruz which demanded the personal presence of Cortés on the coast. Velasquez, the hostile governor of Cuba, to whom the adventurer in Mexico was a rebel, had sent, at last, an expedition, to put a stop to his unauthorized proceedings and to arrest his person. Cortés faced the new menace as boldly as he had faced all others. Leaving 150 men in the angry Mexican capital, under Pedro de Alvarado, he set out with the small remainder of his force to attack the Spanish intruders. Even after picking up some detachments outside and joining the garrison at Vera Cruz, he could muster but 250 men; while Narvaez, who commanded the expedition from Cuba, had brought 800 foot soldiers and 80 horses, with twelve pieces of cannon. The latter had taken possession of the city of Zempoalla and was strongly posted in one of its temples. There Cortés surprised him in a night attack, took him prisoner, in a wounded state, and compelled

his troops to lay down their arms. Nearly the whole of the latter were soon captivated by the commanding genius of the man they had been sent to arrest, and enlisted in his service. He found himself now at the head of a thousand well-armed men; and he found in the same moment that he needed them all. For news came from Mexico that Alvarado, thinking to anticipate and crush a suspected intention of the Mexicans to rise against him, had provoked the revolt and made it desperate by a most perfidious, brutal massacre of several hundred of the chief persons of the empire, committed while they were celebrating one of the festivals of their religion, in the temple. The Spaniards at Mexico were now beleaguered as the consequence, in their quarters, and their only hope was the hope that Cortés would make haste to their rescue,—which he did."—W. Robertson, *History of America*, v. 2, bk. 5.

1520 (June-July).—Return of Cortés to the Mexican capital.—Battle in the city.—Death of Montezuma.—Disastrous retreat of the Spaniards.—“La noche triste.”—The alarming intelligence which came to him from the Mexican capital called out in Cortés the whole energy of his nature. Hastily summoning back the various expeditions he had already sent out, and gathering all his forces together, he “reviewed his men, and found that they amounted to 1,300 soldiers, among whom were 96 horsemen, 80 cross-bowmen, and about 80 musketeers. Cortez marched with great strides to Mexico, and entered the city at the head of this formidable force on the 24th of June, 1520, the day of John the Baptist. Very different was the reception of Cortez on this occasion from that on his first entry into Mexico, when Montezuma had gone forth with all pomp to meet him. Now, the Indians stood silently in the doorways of their houses, and the bridges between the houses were taken up. Even when he arrived at his own quarters he found the gates barred, so strict had been the siege, and he had to demand an entry.” The Mexicans, strangely enough, made no attempt to oppose his entrance into the city and his junction with Alvarado; yet the day after his return their attack upon the Spanish quarters, now so strongly reinforced, was renewed. “Cortez, who was not at all given to exaggeration, says that neither the streets nor the terraced roofs (‘azoteas’) were visible, being entirely obscured by the people who were upon them; that the multitude of stones was so great that it seemed as if it rained stones; and that the arrows came so thickly that the walls and the courts were full of them, rendering it difficult to move about. Cortez made two or three desperate sallies, and was wounded. The Mexicans succeeded in setting fire to the fortress, which was with difficulty subdued, and they would have scaled the walls at the point where the fire had done most damage but for a large force of cross-bowmen, musketeers, and artillery, which Cortez threw forward to meet the danger. The Mexicans at last drew back, leaving no fewer than 80 Spaniards wounded in this first encounter. The ensuing morning, as soon as it was daylight, the attack was renewed. . . . Again, and with considerable success, Cortez made sallies from the fortress in the course of the day; but at the end of it there were about 60 more of his men to be added to the list of wounded, already large, from the injuries received on the preceding day. The

AZTEC RUINS, MITLA, MEXICO

third day was devoted by the ingenious Cortez to making three movable fortresses, called 'mantas,' which, he thought, would enable his men, with less danger, to contend against the Mexicans upon their terraced roofs. . . . It was on this day that the unfortunate Montezuma, either at the request of Cortez, or of his own accord, came out upon a battlement and addressed the people." He was interrupted by a shower of stones and arrows and received wounds from which he died soon after. The fighting on this day was more desperate than it had been before. The Spaniards undertook to dislodge a body of the Indians who had posted themselves on the summit of the great temple, which was dangerously near at hand. Again and again they were driven back, until Cortés bound his shield to his wounded arm and led the assault. Then, after three hours of fighting, from terrace to terrace, they gained the upper platform and put every Mexican to the sword. But 40 Spaniards perished in the struggle. "This fight in the temple gave a momentary brightness to the arms of the Spaniards and afforded Cortez an opportunity to resume negotiations. But the determination of the Mexicans was fixed and complete. . . . They would all perish, if that were needful, to gain their point of destroying the Spaniards. They bade Cortez look at the streets, the squares, and the terraces, covered with people; and then, in a business-like and calculating manner, they told him that if 25,000 of them were to die for each Spaniard, still the Spaniards would perish first. . . . It generally requires at least as much courage to retreat as to advance. Indeed, few men have the courage and the ready wisdom to retreat in time. But Cortez, once convinced that his position in Mexico was no longer tenable, wasted no time or energy in parleying with danger. Terror had lost its influence with the Mexicans, and superior strategy was of little avail against such overpowering numbers. . . . Cortez resolved to quit the city that night [July 1, 1520]. . . . A little before midnight the stealthy march began. The Spaniards succeeded in laying down the pontoon over the first bridge-way, and the vanguard with Sandoval passed over; but, while the rest were passing, the Mexicans gave the alarm with loud shouts and blowing of horns. . . . Almost immediately upon this alarm the lake was covered with canoes. It rained, and the misfortunes of the night commenced by two horses slipping from the pontoon into the water. Then the Mexicans attacked the pontoon-bearers so furiously that it was impossible for them to raise it up again." After that, all seems to have been a confused struggle in the darkness, where even Cortés could do little for the unfortunate rear-guard of his troops. "This memorable night has ever been celebrated in American history as 'la noche triste.' In this flight from Mexico all the artillery was lost, and there perished 450 Spaniards, . . . 4,000 of the Indian allies, 46 horses, and most of the Mexican prisoners, including one son and two daughters of Montezuma, and his nephew the King of Tezcoco. A loss which posterity will ever regret was that of the books and accounts, memorials and writings, of which there were some, it is said, that contained a narrative of all that had happened since Cortez left Cuba. . . . In the annals of retreats there has seldom been one recorded which proved more entirely disastrous."—A. Helps. *Spanish conquest in America*, v. 2, bk. 10, ch. 7-8.

1520-1521.—Retreat to Tlascalala.—Reinforcements and recovery.—Cortés in the field again.

—Preparations to attack Mexico.—"After the disasters and fatigues of the 'noche triste,' the melancholy and broken band of Cortez rested for a day at Tacuba, whilst the Mexicans returned to their capital, probably to bury the dead and purify their city. It is singular, yet it is certain, that they did not follow up their successes by a death blow at the disarmed Spaniards. But this momentary paralysis of their efforts was not to be trusted, and accordingly Cortez began to retreat eastwardly, under the guidance of the Tlascalans, by a circuitous route round the northern limits of lake Zumpango. The flying forces and their auxiliaries were soon in a famishing condition, subsisting alone on corn or on wild cherries gathered in the forest, with occasional refreshment and support from the carcass of a horse that perished by the way. For six days these fragments of the Spanish army continued their weary pilgrimage, and, on the seventh, reached Otumba." At Otumba their progress was barred by a vast army of the Aztecs, which had marched by a shorter road to intercept them; but after a desperate battle the natives fled and the Spaniards were troubled no more until they reached the friendly shelter of Tlascalala. The Tlascalans held faithfully to their alliance and received the flying strangers with helpful hands and encouraging words. But many of Cortez' men demanded permission to continue their retreat to Vera Cruz. "Just at this moment, too, Cuitlahua, who mounted the throne of Mexico on the death of Montezuma, despatched a mission to the Tlascalans, proposing to bury the hatchet, and to unite in sweeping the Spaniards from the realm." A hot discussion ensued in the council of the Tlascalcan chiefs, which resulted in the rejection of the Mexican proposal, and the confidence of Cortez was restored. He succeeded in pacifying his men, and gave them employment by expeditions against tribes and towns within reach which adhered to the Mexican king. After some time he obtained reinforcements, by an arrival of vessels at Vera Cruz bringing men and supplies, and he began to make serious preparations for the reconquest of the Aztec capital. He "constructed new arms and caused old ones to be repaired; made powder with sulphur obtained from the volcano of Popocatepetl; and, under the direction of his builder, Lopez, prepared the timber for brigantines, which he designed to carry, in pieces, and launch on the lake at the town of Tezcoco. At that port, he resolved to prepare himself fully for the final attack, and, this time, he determined to assault the enemy's capital by water as well as by land." The last day of December found him once more on the shores of the Mexican lake, encamped at Tezcoco, with a Spanish force restored to 600 men in strength, having 40 horses, 80 arquebuses and nine small cannon. Of Indian allies he is said to have had many thousands. Meantime, Cuitlahua had died of smallpox—which came to the country with the Spaniards—and had been succeeded by Guatemozin, his nephew, a vigorous young man of twenty-five. "At Tezcoco, Cortez was firmly planted on the eastern edge of the valley of Mexico, in full sight of the capital which lay across the lake, near its western shore, at the distance of about twelve miles. Behind him, towards the sea-coast, he commanded the country. . . . while, by passes through lower spurs of the mountains, he might easily communicate with the valleys of which the Tlascalans and Cholulans were masters." One by one he reduced and destroyed or occupied the neighboring towns,

and overran the surrounding country, in expeditions which made the complete circle of the valley and gave him a complete knowledge of it, while they re-established the prestige of the Spaniards and the terror of their arms. On the 28th of April the newly built brigantines, 12 in number, were launched upon the lake, and all was in readiness for an attack upon the city, with forces now increased by fresh arrivals to 87 horse and 818 Spanish infantry, with three iron field pieces and 15 brass falconets.—B. Mayer, *Mexico, Aztec, Spanish and Republican*, v. 1, bk. 1, ch. 6-8.

1521 (May-July).—**Beginning of siege of Aztec capital.**—"The observations which Cortés had made in his late tour of reconnaissance had determined him to begin the siege by distributing his forces into three separate camps, which he proposed to establish at the extremities of the principal causeways," under three of his captains, Alvarado, Olid and Sandoval. The movement of

PEDRO DE ALVARADO

forces from Tezcuco began on the 10th of May, 1521. Alvarado and Olid occupied Tacuba, cut the aqueduct which conveyed water from Chapultepec to the capital, and made an unsuccessful attempt to get possession of the fatal causeway of "the noche triste." Holding Tacuba, however, Alvarado commanded that important passage, while Sandoval, seizing the city of Iztapalapan, at the southern extremity of the lake, and Olid, establishing himself near the latter, at Cojohuacan, were planted at the two outlets, it would seem, of another of the causeways, which branched to attain the shore at those two points. When so much had been accomplished, Cortés, in person, set sail with his fleet of brigantines and speedily cleared the lake of all the swarm of light canoes and little vessels with which the unfortunate Mexicans tried vainly though valorously to dispute it with him. "This victory, more complete than even the sanguine temper of Cortés had prognosticated, proved the superiority of the Spaniards, and left them, henceforth, undisputed masters of the Aztec sea. It was nearly dusk when the squadron, coasting along the great southern cause-

way, anchored off the point of junction, called Xoloc, where the branch from Cojohuacan meets the principal dike. The avenue widened at this point, so as to afford room for two towers, or turreted temples, built of stone, and surrounded by walls of the same material, which presented altogether a position of some strength, and, at the present moment, was garrisoned by a body of Aztecs. They were not numerous; and Cortés, landing with his soldiers, succeeded without much difficulty in dislodging the enemy, and in getting possession of the works." Here, in a most advantageous position on the great causeway, the Spanish commander fortified himself and established his headquarters, summoning Olid with half of his force to join him and transferring Sandoval to Olid's post at Cojohuacan. "The two principal avenues to Mexico, those on the south and the west, were now occupied by the Christians. There still remained a third, the great dike of Tepejacac, on the north, which, indeed, taking up the principal street, that passed in a direct line through the heart of the city, might be regarded as a continuation of the dike of Iztapalapan. By this northern route a means of escape was still left open to the besieged, and they availed themselves of it, at present, to maintain their communications with the country, and to supply themselves with provisions. Alvarado, who observed this from his station at Tacuba, advised his commander of it, and the latter instructed Sandoval to take up his position on the causeway. That officer, though suffering at the time from a severe wound, . . . hastened to obey; and thus, by shutting up its only communication with the surrounding country, completed the blockade of the capital. But Cortés was not content to wait patiently the effects of a dilatory blockade." He arranged with his subordinate captains the plan of a simultaneous advance along each of the causeways toward the city. From his own post he pushed forward with great success, assisted by the brigantines which sailed along side, and which, by the flanking fire of their artillery, drove the Aztecs from one barricade after another, which they had erected at every dismantled bridge. Fighting their way steadily, the Spaniards traversed the whole length of the dike and entered the city; penetrated to the great square; saw once more their old quarters; scaled again the sides of the pyramid-temple, to slay the bloody priests and to strip the idols of their jewels and gold. But the Aztecs were frenzied by this sacrilege, as they had been frenzied by the same deed before, and renewed the battle with so much fury that the Spaniards were driven back in thorough panic and disarray. "All seemed to be lost;—when suddenly sounds were heard in an adjoining street, like the distant tramp of horses galloping rapidly over the pavement. They drew nearer and nearer, and a body of cavalry soon emerged on the great square. Though but a handful in number, they plunged boldly into the thick of the enemy," who speedily broke and fled, enabling Cortés to withdraw his troops in safety. Neither Alvarado nor Sandoval, who had greater difficulties to overcome, and who had to help from the brigantines, reached the suburbs of the city; but their assault had been vigorously made, and had been of great help to that of Cortés. The success of the demonstration spread consternation among the Mexicans and their vassals, and brought a number of the latter over to the Spanish side. Among these latter was the prince of Tezcuco, who joined Cortés, with a large force, in the next assault which the latter made presently upon the

city. Again penetrating to the great square, the Spaniards on this occasion destroyed the palaces there by fire. But the spirit of the Mexicans remained unbroken, and they were found in every encounter opposing as obstinate a resistance as ever. They contrived, too, for a remarkable length of time, to run the blockade of the brigantines on the lake and to bring supplies into the city by their canoes. But, at length, when most of the great towns of the neighborhood had deserted their cause, the supplies failed and starvation began to do its work in the fated city. At the same time, the Spaniards were amply provisioned, and their new allies built barracks and huts for their shelter. Cortés "would gladly have spared the town and its inhabitants. . . . He intimated more than once by means of the prisoners whom he released, his willingness to grant them fair terms of capitulation. Day after day, he fully expected his proffers would be accepted. But day after day he was disappointed. He had yet to learn how tenacious was the memory of the Aztecs."—W. H. Prescott, *History of the conquest of Mexico*, bk. 6, ch. 4-5.

1521 (July).—Disastrous repulse of Spaniards.—"The impatience of the soldiers grew to a great height, and was supported in an official quarter—by no less a person than Alderete, the king's treasurer. Cortez gave way, against his own judgment, to their importunities" and another general attack was ordered. "On the appointed day Cortez moved from his camp, supported by seven brigantines, and by more than 3,000 canoes filled with his Indian allies. When his soldiers reached the entrance of the city, he divided them in the following manner. There were three streets which led to the market-place from the position which the Spaniards had already gained. Along the principal street, the king's treasurer, with 70 Spaniards and 15,000 or 20,000 allies, was to make his way. His rear was to be protected by a small guard of horsemen. The other two streets were smaller, and led from the street of Tacuba to the market-place. Along the broader of these two streets Cortez sent two of his principal captains, with 80 Spaniards and 10,000 Indians; he himself, with eight horsemen, 75 foot-soldiers, 25 musketeers, and an 'infinite number' of allies, was to enter the narrower street. At the entrance to the street of Tacuba he left two large cannon, with eight horsemen to guard them, and at the entrance of his own street he also left eight horsemen to protect the rear. . . . The Spaniards and their allies made their entrance into the city with even more success and less embarrassment than on previous occasions. Bridges and barricades were gained, and the three main bodies of the army moved forward into the heart of the city." But in the excitement of their advance they left unrepaired behind them a great breach in the causeway, ten or twelve paces wide, although Cortez had repeatedly enjoined upon his captains that no such dangerous death-trap should be left to catch them in the event of a retreat. The neglect in this case was most disastrous. Being presently repulsed and driven back, the division which had allowed this chasm to yawn behind it was engulfed. Cortez, whose distrust had been excited in some way, discovered the danger, but too late. He made his way to the spot, only to find "the whole aperture so full of Spaniards and Indians that, as he says, there was not room for a straw to float upon the surface of the water. The peril was so imminent that Cortez not only thought that the Conquest of Mexico was gone, but that the term of his life

as well as of his victories had come, and he resolved to die there fighting. All that he could do at first was to help his men out of the water; and, meanwhile, the Mexicans charged upon them in such numbers that he and his little party were entirely surrounded. The enemy seized upon his person, and would have carried him off but for the resolute bravery of some of his guard, one of whom lost his life there in succouring his master. . . . At last he and a few of his men succeeded in fighting their way to the broad street of Tacuba, where, like a brave captain, instead of continuing his flight, he and the few horsemen who were with him turned round and formed a rear guard to protect his retreating troops. He also sent immediate orders to the king's treasurer and the other commanders to make good their retreat."—A. Helps, *Spanish conquest in America*, v. 2, bk. 11, ch. 1.—"As we were thus retreating, we continually heard the large drum beating from the summit of the chief temple of the city. Its tone was mournful indeed, and sounded like the very instrument of Satan. This drum was so vast in its dimensions that it could be heard from eight to twelve miles distance. Every time we heard its mournful sound, the Mexicans, as we subsequently learnt, offered to their idols the bleeding hearts of our unfortunate countrymen. . . . After we had at last, with excessive toil, crossed a deep opening, and had arrived at our encampment, . . . the large drum of Huitzilopochtli again resounded from the summit of the temple, accompanied by all the hellish music of shell trumpets, horns, and other instruments. . . . We could plainly see the platform, with the chapel in which those cursed idols stood; how the Mexicans had adorned the heads of the Spaniards with feathers, and compelled their victims to dance round the god Huitzilopochtli; we saw how they stretched them out at full length on a large stone, ripped open their breasts with flint knives, tore out the palpitating heart and offered it to their idols. Alas! we were forced to be spectators of all this, and how they then seized hold of the dead bodies by the legs and threw them headlong down the steps of the temple, at the bottom of which other executioners stood ready to receive them, who severed the arms, legs, and heads from the bodies, drew the skin off the faces, which were tanned with the beards still adhering to them, and produced as spectacles of mockery and derision at their feasts; the legs, arms, and other parts of the body being cut up and devoured. . . . On that terrible day the loss of the three divisions amounted to 60 men and 7 horses."—Bernal Diaz del Castillo, *Memoirs* (tr. by Lockhart), v. 2, ch. 152.

1521 (August).—Last days of the siege.—Taking of ruined city by the Spaniards.—End of Aztec dominion.—"Guatemozin's victory diffused immense enthusiasm among the Aztecs and those who remained united to them. The priests proclaimed that the gods, satiated by the sacrifice of the Spanish prisoners, had promised to rid the country of the foreigners, and that the promise would be fulfilled within eight days. This intelligence spread alarm among the allies of the Spaniards. They deserted in great numbers—not to go over to the Aztecs, whose anger they dreaded, but to return to their homes. Cortez had good watch kept in the camp. The sorties of the besieged were repulsed; the eight days passed without the Spaniards having lost more than a few marauders. The allies, seeing that the oracle was wrong, came back to their former friends. The

aggressive ardour of the besieged grew cooler, and they soon found themselves assailed by the plagues that ordinarily attack troops massed in a city—not only famine, but epidemic diseases, the result of want and overcrowding. . . . Famine pinched them more cruelly day after day. Lizards and such rats as they could find were their richest nourishment; reptiles and insects were eagerly looked for, trees stripped of their bark, and roots stealthily sought after by night. Meanwhile, Cortez, seeing that there was no other means of bringing them to submission, pursued the work of destruction he had resolved on with so much regret. . . . Heaps of bodies were found in every street that was won from them; this people, so punctilious in their customs of sepulture, had ceased to bury their dead. . . . Soon there was left to the besieged but one quarter, and that the most incommodious of all, forming barely an eighth of the city, where there were not houses enough to give them shelter. . . . The 13th August, 1521, had now arrived, and that was to be the last day of this once flourishing empire. Before making a final assault, Cortez once more invited the emperor to his presence. His envoys came back with the 'cihuacoatl,' a magistrate of the first rank, who declared, with an air of consternation, that Guatemozin knew how to die, but that he would not come to treat. Then, turning towards Cortez, he added: 'Do now whatever you please.' 'Be it so,' replied Cortez; 'go and tell your friends to prepare; they are going to die.' In fact, the troops advanced; there was a last mêlée, a last carnage, on land and on the lake. . . . Guatemozin, driven to the shore of the lake, threw himself into a canoe with a few warriors, and endeavoured to escape by dint of rowing; but he was pursued by a brigantine of the Spanish fleet, taken and brought to Cortez, who received him with the respect due to a crowned head. . . . The Aztec empire had ceased to exist; Spanish sway was established in Mexico. The Cross was triumphant in that fine country, and there was no sharer in its reign. The number of persons that perished in the siege has been differently estimated. The most moderate calculation puts it at 120,000 on the side of the Aztecs. Very many Indians fell on the side of the besiegers. The historian Ixtlixochitl says there were 30,000 dead of the warriors of Tezucuo alone. All that were left alive of the Aztecs were, at the request of Guatemozin, allowed to leave the city in freedom, on the morning after it was taken. . . . They dispersed in all directions, everywhere spreading a terror of the Spaniards, and the feeling that to resist them was impossible. That conviction must have been established speedily and firmly, for there was no further attempt at resistance, unless it were at one point, in the territory of Panuco, near the Atlantic Ocean."—M. Chevalier, *Mexico, ancient and modern*, v. 1, pt. 2, ch. 8-9.

1521-1524.—Rebuilding of the capital.—Completion of the conquest.—"The first ebullition of triumph was succeeded in the army by very different feelings, as they beheld the scanty spoil gleaned from the conquered city;" and Cortés was driven, by the clamors and suspicions of his soldiers, to subject his heroic captive, Guatemozin, to torture, in the hope of wringing from him a disclosure of some concealment of his imagined treasures. Its only result was to add another infamy to the name and memory of the conquerors.

"The commander-in-chief, with his little band of Spaniards, now daily recruited by reinforcements from the Islands, still occupied the quarters of Cojohuacan, which they had taken up at the termination of the siege. Cortés did not immediately decide in what quarter of the Valley to establish the new capital which was to take the place of the ancient Tenochtitlan. . . . At length he decided on retaining the site of the ancient city, . . . and he made preparations for the reconstruction of the capital on a scale of magnificence which should, in his own language, 'raise her to the rank of Queen of the surrounding provinces, in the same manner as she had been of yore.' The labor was to be performed by the Indian population, drawn from all quarters of the Valley, and including the Mexicans themselves, great numbers of whom still lingered in the neighborhood of their ancient residence. . . . In less than four years from the destruction of Mexico, a new city had risen on its ruins, which, if inferior to the ancient capital in extent, surpassed it in magnificence and strength. It occupied so exactly the same site as its predecessor that the 'plaza mayor,' or great square, was the same spot which had been covered by the huge 'teocalli' and the palace of Montezuma; while the principal streets took their departure as before from this central point, and, passing through the whole length of the city, terminated at the principal causeways. Great alterations, however, took place in the fashion of the architecture." Meantime, Cortés had been brought into much danger at the Spanish court, by the machinations of his enemies, encouraged by Bishop Fonseca, the same minister who pursued Columbus with hostility. His friends in Spain rallied, however, to his support, and the result of an investigation, undertaken by a board to which the Emperor Charles V. referred all the charges against him, was the confirmation of his acts in Mexico to their full extent. "He was constituted Governor, Captain-General, and Chief Justice of New Spain, with power to appoint to all offices, civil and military, and to order any person to leave the country whose residence there he might deem prejudicial to the interests of the Crown. This judgment of the council was ratified by Charles V., and the commission investing Cortés with these ample powers was signed by the emperor at Valladolid, October 15th, 1522. . . . The attention of Cortés was not confined to the capital. He was careful to establish settlements in every part of the country which afforded a favourable position for them. . . . While thus occupied with the internal economy of the country, Cortés was still bent on his great schemes of discovery and conquest." He fitted out a fleet to explore the shores of the Pacific, and another in the Gulf of Mexico—the prime object of both being the discovery of some strait that would open one ocean to the other. He also sent Olid in command of an expedition by sea to occupy and colonize Honduras, and Alvarado, by land, at the head of a large force to subdue Guatemala. The former, having partly accomplished his mission, attempted to establish for himself an independent jurisdiction, and his conduct induced Cortés to proceed to Honduras in person. It was in the course of this expedition that Guatemozin, the dethroned Mexican chief, who had been forced to accompany his conqueror, was accused of a plot against the Spaniards and was hung to a tree. We have the testimony of Bernal Diaz, one of the Spaniards on the spot, that the execution "was most unjust, and was thought wrong by all of

us." "Within three short years after the Conquest [Cortés] had reduced under the dominion of Castile an extent of country more than 400 leagues in length, as he affirms, on the Atlantic coast, and more than 500 on the Pacific; and, with the exception of a few interior provinces of no great importance, had brought them to a condition of entire tranquillity."—W. H. Prescott, *History of the conquest of Mexico*, bk. 7, ch. 1-3.

1535-1540.—Introduction of printing. See PRINTING AND THE PRESS: 1535-1705.

1535-1822.—Under Spanish viceroys.—"Antonio de Mendoza, Conde de Tendilla, was the first viceroy sent by Charles V. to New Spain. He arrived in the autumn of 1535. . . . He had a well-balanced and moderate character, and governed the country with justice and generosity combined. He . . . set himself to reform the abuses which had already appeared, protected the Indians from the humiliations which the newly arrived Spaniards were disposed to put upon them; he stimulated all branches of agriculture, and finding the natives were already well informed in the cultivation of land, he encouraged them in this pursuit by all possible efforts. . . . To the religious orders in Mexico is due in great measure the firm base upon which the government of Spain was established there. The new viceroy fully recognized this, and encouraged the foundations of colleges and schools already undertaken by them. In every way he promoted the prosperity and growth of the country, and had the satisfaction in the course of his government, which lasted 15 years, to see everything bear the marks of his judgment and enterprise. It was he who founded two cities [Guadalajara and Valladolid] which have reached great importance. . . . Cortés was away when the Viceroy Mendoza arrived in Mexico. He still retained his title as governor, with the same powers always conferred upon him; but his long absences from the capital made it necessary, as he fully recognized, that some other strong authority should be established there. Nevertheless, he never got on very well with such other authorities, and on his return soon became at odds with Mendoza, who, in his opinion, interfered with his prerogatives. It was then that Cortés bade farewell to his family, and taking with him his eldest son and heir, Don Martin, then eight years old, he embarked for Spain, leaving Mendoza undisturbed in the execution of his office. . . . In 1530 was issued the first book printed in Mexico, on a press imported by Mendoza, and put into the hands of one Juan Pablos. . . . In 1550 this good ruler [Mendoza] sailed away from Mexico. . . . He passed on to take charge of the government of Peru, by a practice which came to be quite common—a sort of diplomatic succession by which the viceroys of New Spain were promoted to the post at Peru. Don Luis de Velasco, second viceroy of New Spain, made his entrance into the capital with great pomp, at the end of the year 1550. He, like his predecessor, had been selected with care by the orders of Charles V. . . . His first decree was one liberating 150 Indians from slavery, who were working chiefly in the mines. . . . He established in Mexico, for the security of travellers upon the highway, the tribunal of the Holy Brotherhood, instituted in Spain for the same purpose in the time of Isabella. He founded the Royal University of Mexico, and the Royal Hospital for the exclusive use of the natives. . . . The good Viceroy Velasco died in 1564, having gov-

erned the country for 14 years. . . . During the government of this ruler and his predecessor all the administration of New Spain, political, civil, and religious was established upon so firm a foundation that it could go on in daily action like a well regulated machine." In the meantime, Charles V had resigned the burden of his great sovereignty, transferring all his crowns to his narrow-souled son, Philip II, who cared nothing for the New World except as a source of gold and silver supply and a field for religious bigotry. Under Philip "the character of the viceroys was lowered from the high standard adhered to when Charles the Emperor selected them himself. To follow the long list of them would be most tedious and useless, as they passed in rotation, governing according to the best of their lights for several years in Mexico, and then passing on, either by death or by promotion to Peru. In 1571 the Inquisition was fully established. . . . and the next year the Jesuits arrived. . . . The first 'auto-da-fé' was celebrated in the year 1574, when, as its chronicler mentions cheerfully, 'there perished 21 pestilent Lutherans.' From this time such ceremonies were of frequent occurrence, but the Inquisition never reached the point it did in Old Spain. [See INQUISITION: 1487-1567.] . . . The viceroys of New Spain under Philip III. [1578-1621] were, for the most part, men of judgment and moderation. While the government at home, in the hands of profligate favorites, was growing weaker and weaker, that of Mexico was becoming more firmly established." It was not shaken nor disturbed by the War of the Spanish Succession, during the early years of the eighteenth century; but the Revolution in France, which convulsed Europe before that century closed, wrought changes which were lasting in the New World as well as the Old. "There were in all 64 viceroys, beginning with Don Antonio de Mendoza, 1535, and ending with Juan O'Donoju in 1822."—S. Hale, *Story of Mexico*, ch. 20-22.

1810-1819.—First revolutionary movement causes.—Hidalgo.—Allende.—Morelos.—"The causes of the coming revolution were not hidden. The law that excluded Spaniards born in America from equal rights with those who were immigrants was a natural, not to say necessary, source of discontent among people whose good-will was much needed by any viceroy. There was inevitably not a little mutual repugnance between the Mexican and Spanish stocks, and the home government did nothing to mollify such asperities. There were commercial monopolies militant against public interests. The clergy were alienated, and since they were not thus so serviceable as formerly in the part of mediators in enforcing governmental aims, it was found necessary to use force where the people were not accustomed to it. The Viceroy José de Iturrigaray practised a seeming concession that deceived no one, and he pursued

his exactions partly by reason of self-interest, and partly in order to supply Madrid with means to meet the financial troubles that the Napoleonic era was creating. After some years of these conditions in New Spain, a conspiracy, resulting from a reaction, sent the viceroy back to Spain a prisoner. This gave strength to revolutionary sentiments, and a few trials for treason increased the discontent. The men who were now put successively in the vice-regal place had few qualities for the times, and a certain timidity of policy was not conducive to strength of government. . . . The outbreak, when it came, brought to the front a curate of Dolores, a native priest, Miguel Hidalgo, who commanded the confidence of the disaffected, and was relied upon to guide the priesthood. Ignacio de Allende had some of the soldierly qualities needed for a generalissimo. The purpose of these

MIGUEL HIDALGO Y COSTILLA

men and their allies, before they should openly proclaim a revolt, was to seize some of the leading Spaniards; but their plot being discovered, they hastily assembled at Dolores and raised the standard of revolt (1810). Thus banded together, but badly organized and poorly armed, a body of 5,000 insurgents marched from Dolores, headed by Hidalgo and Allende, and approached Guanajuato, where the intendente Riaña had entrenched himself in a fortified alhondiga, or granary. The attack of the rebels was headlong and bloody. The gates were fired with flaming rubbish, and through the glowing way the mad throng rushed, and after a hand-to-hand conflict (September 28, 1810) the fortress fell. The royalist leader had been killed, and scenes of pillage and riot followed. Meanwhile the viceroy in Mexico prepared to receive the insurgents, and his ally, the church, excommunicated their leaders. The military force of the royalists was inconsiderable, and what there was, it was feared, might prove not as loyal as was desirable. As Hidalgo marched towards

the capital, he tried to seduce to his side a young lieutenant, Augustin Iturbide, who was in command of a small outlying force. The future emperor declined the offer, and, making his way to the city, was at once sent to join Trujillo, who commanded a corps of observation which confronted the insurgents, and who finally ran the chances of a battle at Las Cruces. . . . The insurgents soon surrounded him, and he was only able to reach the city by breaking with a part of his force through the enveloping line. Hidalgo had lost 2,000 men, but he had gained the day. He soon intercepted a despatch and learned from it that General Calleja had been put in motion from San Luis Potosi, and it seemed more prudent to Hidalgo that, instead of approaching Mexico, he should retreat to be nearer his recruiting ground. The retrograde movement brought the usual result to an undisciplined force, and he was already weakened by desertions when Calleja struck his line of march at Aculco. Hidalgo felt it important for the revolution to have time enough to spread into other parts of the province, and so he merely fought Calleja to cover his further retreat. The rebel leader soon gathered his forces at Celaya, while Allende, his colleague, posted himself at Guanajuato. Here the latter was attacked by Calleja and routed, and the royal forces made bloody work in the town. Hidalgo, moving to Valladolid, reorganized his army, and then, proceeding to Guadalajara, he set up a form of government, with Ignacio Lopez Rayon as Secretary-general. At this time the insurgents held completely the provinces of Nueva Galicia, Zacatecas, and San Luis Potosi, a belt of country stretching from sea to sea in the latitude of Tampico. . . . In January, 1811, the signs were not very propitious for the royalists. . . . At this juncture . . . Hidalgo moved out from Guadalajara with his entire force, which was large enough, consisting of 60,000 foot, 20,000 horse, and 100 canon; but it was poorly armed, and without effective discipline; while Calleja commanded a well-equipped and well-organized force, but in extent it only counted 3,000 foot, with as many horse, and ten guns. At the bridge of Calderon, 10 or 11 leagues from the city, Hidalgo prepared to stand. Here Calleja attacked him," and won the day, entering Guadalajara as a victor on the 21st of January, 1811. "Hidalgo fled with his broken army, and soon resigned the command to Allende. This general had scarcely 4,000 or 5,000 men left when he reached Saltillo, where he joined Jimenes. The disheartenment of defeat was spreading through the country. Town after town was heard from as yielding to the victors. The leaders, counselling together at Saltillo, resolved to escape to the United States; but, as they were marching,—about 2,000 in all, with 24 guns and a money-chest,—they fell into an ambush planned in the interest of a counter-revolution by one Elizondo, and, with nothing more than a show of resistance, the party was captured, one and all. The judgment of death upon Hidalgo, Allende, and Jimenes soon followed. The main force of the insurgents had thus disappeared, but a small body still remained in arms under the lead of José Maria Morelos." Morelos was uneducated, but capable and energetic, and he kept life in the rebellion for two years. He captured Orizaba in October, 1812, Oajaca in the following month, and Acapulco in the spring of 1813. In November of that year he appeared before Valladolid, the capital of Michoacan, but was attacked there by Iturbide and routed. "In January, 1814, Morelos

made a final stand at Puruaran, but Iturbide still drove him on. Disaster followed upon disaster, till finally Morelos was deposed by his own congress. This body had adherents enough to make it necessary for Calleja to appeal to the home government for a reinforcement of 8,000 troops. . . . Morelos, meanwhile, commanding an escort which was protecting the migratory congress, was intercepted and captured by a force of royalists, and, after the forms of a trial, he was executed December 22, 1815. The campaign of 1816 was sustained by the insurgents against a force of 80,000 men which Calleja had collected. . . . Neither side had much success, and the war was simply tedious. At last, in August, a new viceroy, Juan Riaz de Apodaca, succeeded to Calleja, and uniting a more humane policy with vigor in disposing his forces, the leading rebel officers . . . surrendered in January, 1817. . . . A certain quixotic interest is lent to the closing months of the revolution by the adventurous exploits of Espoz y Mina. He had fitted out a small expedition in the United States, which, landing on the Gulf coast, for a while swept victoriously inland. . . . But Mina was finally surprised and executed. Other vagrant rebel leaders fell one by one into the hands of the royalists; but Guadalupe Victoria held out, and concealed himself in the wilds for two years."—J. Winsor, *Spanish North America (Narrative and critical history of America, v. 8, ch. 4)*.

1819.—Texas occupied as a province. See TEXAS: 1819-1835.

1820-1826.—Independence from Spain.—Brief empire of Iturbide and its fall.—Constitution of republic of united Mexican states.—"The establishment of a constitutional government in Spain, in 1820, produced upon Mexico an effect very different from what was anticipated. As the constitution provided for a more liberal administration of government in Mexico than had prevailed since 1812, the increased freedom of the elections again threw the minds of the people into a ferment, and the spirit of independence, which had been only smothered, broke forth anew. Moreover, divisions were created among the old Spaniards themselves; some being in favor of the old system, while others were sincerely attached to the constitution. Some formidable inroads on the property and prerogatives of the church alienated the clergy from the new government, and induced them to desire a return to the old system. The Viceroy, Apodaca, encouraged by the hopes held out by the Royalists in Spain, although he had at first taken the oath to support the constitution, secretly favored the party opposed to it, and arranged his plans for its overthrow. Don Augustin Iturbide, the person selected by the Viceroy to make the first open demonstration against the existing government, was offered the command of a body of troops on the western coast, at the head of which he was to proclaim the re-establishment of the absolute authority of the king. Iturbide, accepting the commission, departed from the capital to take command of the troops, but with intentions very different from those which the Viceroy supposed him to entertain. Reflecting upon the state of the country, and convinced of the facility with which the authority of Spain might be shaken off,—by bringing the Creole troops to act in concert with the old insurgents,—Iturbide resolved to proclaim Mexico wholly independent of the Spanish nation. Having his head quarters at the little

town of Iguala, on the road to Acapulco, Iturbide, on the 24th of February, 1821, there proclaimed his project, known as the 'Plan of Iguala,' and induced his soldiers to take an oath to support it. This 'Plan' declared that Mexico should be an independent nation, its religion Catholic, and its government a constitutional monarchy. The crown was offered to Ferdinand VII, of Spain, provided he would consent to occupy the throne in person; and, in case of his refusal, to his infant brothers, Don Carlos and Don Francisco. A constitution was to be formed by a Mexican Congress; . . . all distinctions of caste were to be abolished. . . . The Viceroy, astonished by this unexpected movement of Iturbide, and remaining irresolute and inactive at the capital, was deposed, and Don Francisco Novello, a military officer, was placed at the head of the government; but his authority was not generally recognized, and Iturbide was left to pursue his plans in the interior without interruption. Being joined by Generals Guerrero

AUGUSTIN ITURBIDE

and Victoria as soon as they knew that the independence of their country was the object of Iturbide, not only all the survivors of the first insurgents, but whole detachments of Creole troops flocked to his standard, and his success was soon rendered certain. The clergy and the people were equally decided in favor of independence; . . . and, before the month of July, the whole country recognized the authority of Iturbide, with the exception of the capital, in which Novello had shut himself up with the European troops. Iturbide had already reached Queretaro with his troops, on his road to Mexico, when he was informed of the arrival, at Vera Cruz, of a new Viceroy. . . . At Cordova, whither the Viceroy had been allowed to proceed, for the purpose of an interview with Iturbide, the latter induced him to accept by treaty the Plan of Iguala, as the only means of securing the lives and property of the Spaniards then in Mexico, and of establishing the right to the throne in the house of Bourbon. By this agreement, called the 'Treaty of Cordova,' the Viceroy, in the name of the king, his master, recognized the independence of Mexico, and gave up the capital

to the army of the insurgents, which took possession of it, without effusion of blood, on the 27th of September, 1821. All opposition being ended, and the capital occupied, in accordance with a provision of the Plan of Iguala a provisional junta was established, the principal business of which was to call a congress for the formation of a constitution suitable to the country. At the same time a regency, consisting of five individuals, was elected, at the head of which was placed Iturbide. . . . When the congress assembled [Feb. 24, 1822], three distinct parties were found amongst the members. The Bourbonists, adhering to the Plan of Iguala altogether, wished a constitutional monarchy, with a prince of the house of Bourbon at its head; the Republican, setting aside the Plan of Iguala, desired a federal republic; while a third party, the Iturbidists, adopting the Plan of Iguala with the exception of the article in favor of the Bourbons, wished to place Iturbide himself upon the throne. As it was soon learned that the Spanish government had declared the treaty of Cordova null and void, the Bourbonists ceased to exist as a party, and the struggle was confined to the Iturbidists and the Republicans." By the aid of a mob demonstration in the city of Mexico, on the night of May 18, 1822, the former triumphed, and Iturbide was declared emperor, under the title of Augustin the First. "The choice was ratified by the provinces without opposition, and Iturbide found himself in peaceable possession of a throne to which his own abilities and a concurrence of favorable circumstances had raised him. Had the monarch-elect been guided by counsels of prudence, and allowed his authority to be confined within constitutional limits, he might perhaps have continued to maintain a modified authority; but forgetting the unstable foundation of his throne, he began his reign with all the airs of hereditary royalty. On his accession a struggle for power immediately commenced between him and the congress." After arbitrarily imprisoning the most distinguished members of that body, Iturbide, at last, proclaimed its dissolution and substituted a junta of his own nomination. "Before the end of November an insurrection broke out in the northern provinces, but this was speedily quelled by the imperial troops." It was followed in December by a more formidable revolt, led off by Santa Anna (or Santana), a young general who had supported Iturbide, but who had been haughtily dismissed from the government of Vera Cruz. Santa Anna was joined by Victoria and other old Republican leaders, and the power of Iturbide crumbled so rapidly that he resigned his crown on the 19th of March, 1823, promising to quit the country, on being assured a yearly allowance of \$25,000 for his support. "With his family and suite he embarked for Leghorn on the 11th of May. . . . From Italy he proceeded to London, and made preparations for returning to Mexico; in consequence of which, congress, on the 28th of April, 1824, passed a decree of outlawry against him. He landed in disguise at Soto la Marina, July 14th, 1824; was arrested by General Garza, and shot at Padilla by order of the provincial congress of Tamaulipas, on the 10th of that month. . . . On the departure of Iturbide, a temporary executive was appointed, consisting of Generals Victoria, Bravo, and Negrete, by whom the government was administered until the meeting of a new congress, which assembled at the capital in August, 1823. This body immediately entered on the duties of preparing a new constitution, which was submitted on the 31st of January, 1824, and

definitively sanctioned on the 4th of October following. By this instrument, modeled somewhat after the constitution of the United States, the absolute independence of the country was declared, and the several Mexican Provinces were united in a Federal Republic. The legislative power was vested in a Congress, consisting of a Senate and a House of Representatives. . . . The supreme executive authority was vested in one individual, styled the 'President of the United Mexican States.' . . . The third article in the constitution declared that 'The Religion of the Mexican Nation is, and will be perpetually, the Roman Catholic Apostolic. The Nation will protect it by wise and just laws, and prohibit the exercise of any other whatever.' . . . On the 1st of January, 1825, the first congress under the federal constitution assembled in the city of Mexico; and, at the same time, General Guadalupe Victoria was installed as president of the republic, and General Nicholas Bravo as vice-president. The years 1825 and 1826 passed with few disturbances; the administration of Victoria was generally popular; and the country enjoyed a higher degree of prosperity than at any former or subsequent period."—M. Willson, *American history*, bk. 3, pt. 2, ch. 4-5.

1822-1824.—Duration of union of Costa Rica with Mexico. See COSTA RICA: 1821-1848.

1822-1828.—Free-Masonry in politics.—Rival branches of the order.—Escocés and the Yorkinos.—For some years a furious contest raged between two political societies, "known as the 'Escocés' and 'Yorkinos'—or, as we should call them, Scotch Free-Masons and York Free-Masons—whose secret organizations were employed for political purposes by two rival political parties. [See MASONIC SOCIETIES: Central and South America.] At the time of the restoration of the Constitutional Government of Spain in 1820, Free-Masonry was introduced into Mexico; and as it was derived from the Scotch branch of that order, it was called, after the name of the people of Scotland, 'Escocés.' Into this institution were initiated many of the old Spaniards still remaining in the country, the Creole aristocracy, and the privileged classes—parties that could ill endure the elevation of a Creole colonel, Iturbide, to the Imperial throne. When Mr. Poinset was sent out as Ambassador to Mexico [1822], he carried with him the charter for a Grand Lodge from the American, or York order of Free-Masons in the United States. Into this new order the leaders of the Democratic party were initiated. The bitter rivalry that sprang up between these two branches of the Masonic body kept the country in a ferment for ten years, and resulted finally in the formation of a party whose motto was opposition to all secret societies, and who derived their name of Anti-Masons from the party of the same name then flourishing in the United States. When the Escocés had so far lost ground in popular favor as to be in the greatest apprehension from their prosperous but imbibed rivals, the Yorkinos, as a last resort, to save themselves, and to ruin the hated organization, they pronounced against all secret societies. . . . 'General Bravo, Vice-President of Mexico, and leader of the Escocés, having issued his proclamation declaring that, as a last resort, he appealed to arms to rid the republic of that pest, secret societies, and that he would not give up the contest until he had rooted them out, root and branch, took up his position at Tulansingo—a village about 30

BATTLE OF BUENA VISTA, 1847
In the foreground are General Taylor and Captain Bragg
(After painting by W. H. Powell)

miles north of the City of Mexico. Here, at about daylight on the morning of the 7th January, 1828, he was assailed by General Guerrero, the leader of the Yorkinos, and commander of the forces of government.' After a slight skirmish, in which eight men were killed and six wounded, General Bravo and his party were made prisoners; and thus perished forever the party of the Escocés. This victory was so complete as to prove a real disaster to the Yorkinos. The want of outside pressure led to internal dissensions; so that when two of its own members, Guerrero and Pedraza, became rival candidates for the presidency, the election was determined by a resort to arms."—R. A. Wilson, *Mexico: Its peasants and its priests*, ch. 5.

1828-1844.—Rise of Santa Anna.—Dissolution of the federal system.—Pastry War.—Unitary republic established.—Recognition by Spain.—Retgression and decline.—"After the death of Iturbide, by far the most powerful person in the nation was the Creole general Santa Anna, who, at the age of 24, had already destroyed the military empire of his chief. Santa Anna at first interested himself in the visionary project of Bolivar for framing a general confederation of the new nations of South America. [See COLOMBIA: 1826.] This project . . . failed completely; and for several years he settled down as governor of Vera Cruz, reconciled himself to the Federal Republic, and took no part in public life. In 1828, however, the Presidential election led to a civil war in which Santa Anna and his favourite Vera-crusanos first found out their capabilities; and they had an opportunity of testing them again in the next year, when the feeble force of Barrados, the last military attempt made by Spain to reduce Mexico, was cut to pieces at Tampico. From that movement Santa Anna became the sole controller of the destinies of the country: and in 1833 he was elected President. Forty years ago all Europe knew the picture of Santa Anna, with his tall spare figure, sunburnt face, and black hair curling over his forehead; how he lived on his hacienda of Manga de Clavo, cockfighting, gambling, and horse-racing, occasionally putting himself at the head of his bronzed troops, and either making a dash at an insurrection, or making a pronunciamiento on his own account. Mexican histories tell how gallantly he defended Vera Cruz in 1830, against the French invasion under Prince de Joinville [called 'the Pastry War,' because consequent on the non-payment of French claims, among which there was prominence given to a certain pastry-cook's claim for goods destroyed in the riot of a revolution at the capital in 1828]; how his leg, having been shattered by a ball, was buried with a solemn service and a funeral oration in the cemetery of Santa Paula in Mexico; and how, in a few years, when Santa Anna was in disgrace with the people, they destroyed the tomb, and kicked Santa Anna's limb about the streets with every mark of hatred and contempt. . . . The manifold difficulties of government in Mexico sufficiently attested the weakness of the Federal constitution; and in 1835, after a trial of eleven years, the state governments were dissolved, and

the Republic, one and indivisible, set up for a time in their place. There was now to be a President, elected by an indirect vote for eight years, a Senate, and a House of Deputies, both elected by a direct popular vote, and an elective Supreme Court. Santa Anna, who was identified with the Unitary principle, was re-elected three times; so that with some intermission he governed Mexico for 20 years. The dissolution of the Federal government naturally strengthened the hands of Santa Anna; and in 1836 Mexico was for the first time recognized by Spain. But the unitary republic was a time of disaster and disgrace; and from the point of view of progress it was a period of reaction. . . . Europe looked forward, almost without jealousy, to the time when the great nation of North America should absorb this people of half-civilized Indians mixed with degenerate Spaniards. Events which now happened greatly strengthened this impression."—E. J. Payne, *History of European colonies*, ch. 20, sect. 6-7.

1829-1837.—Abolition of slavery.—"The general affairs of the country in the second half of 1829 were in a chaotic state. Disorganization fettered every branch of the government. . . . And yet, amidst its constant struggle, Guerrero's administration decreed several progressive measures, the most important of which was the abolition of slavery. African slavery had indeed been reduced to narrow limits. The Dominican provincial of Chiapas, Father Matias Cordoba, gave freedom to the slaves on the estates of his order. On the 16th of September, 1825, President Victoria had liberated in the country's name the slaves purchased with a certain fund collected for that purpose, as well as those given up by their owners to the patriotic junta. The general abolition, however, was not actually carried out for some time, certain difficulties having arisen; and several states, among which was Zacatecas, had decreed the freedom of slaves before the general government arrived at a final conclusion on the subject. As a matter of fact, the few remaining slaves were in domestic service, and treated more like members of families than as actual chattels. At last Deputy Tornel, taking advantage of the time when Guerrero was invested with extraordinary powers, drew up and laid before him a decree for total abolition. It was signed September 15, 1820, and proclaimed the next day, the national anniversary. The law met with no demur save from Coahuila and Texas, in which state were about 1,000 slaves, whose manumission would cost heavily, as the owners held them at a high valuation. It seems that the law was not fully enforced; for on the 5th of April, 1837, another was promulgated, declaring slavery abolished without exception and with compensation to the owners."—H. H. Bancroft, *History of the Pacific states*, v. 8 (*Mexico*, v. 5), ch. 4.—See also TEXAS: 1824-1830.

1846.—American aggression which precipitated war.—"Texas had claimed the Rio Grande as her western limit, though she has never exercised actual control over either New Mexico or the country lying between the Nueces and the Rio Grande. The groundless character of the claims of Texas to the Rio Grande as its western

boundary was even admitted by some friends of the measure. . . . Silas Wright, . . . referring to the boundaries of Texas, declared that 'they embraced a country to which Texas had no claims, over which she had never asserted jurisdiction, and which she had no right to cede.' Mr. Benton denounced the treaty [of annexation and cession of territory] as an attempt to seize 2,000 square miles of Mexican territory by the incorporation of the left bank of the Rio del Norte, which would be an act of direct aggression. . . . In ordering, therefore, General Taylor to pass a portion of his forces westward of the river Nueces, which was done before annexation was accomplished, President Polk put in peril the peace and the good name of the country. In his Annual Message of December of that year [1845] he stated that American troops were in position on the Nueces, 'to defend our own and the rights of Texas.' But, not content with occupying ground on and westward of the Nueces, he issued, on the 13th of January, 1846, the fatal order to General Taylor to advance and 'occupy positions on or near the left bank of the Rio del Norte.' That movement of the army from Corpus Christi to the Rio Grande, a distance of more than 100 miles, was an invasion of Mexican territory,—an act of war for which the President was and must ever be held responsible by the general judgment of mankind."—H. Wilson, *History of the rise and fall of the slave power in America*, v. 2, ch. 2.

1846-1847.—War with the United States.—First movements of American invasion.—Palo Alto.—Resaca de la Palma.—Monterey.—Buena Vista.—Fifémont in California.—"The annexation of Texas accomplished [see TEXAS: 1824-1835; 1835-1836; 1836-1845], General Taylor, the United States commander in the Southwest, received orders to advance to the Rio Grande. Such was the impoverished and distracted condition of Mexico that she apparently contemplated no retaliation for the injury she had sustained, and, had the American army remained at the Nueces, a conflict might perhaps have been avoided. But, on Taylor's approaching the Rio Grande, a combat ensued [May 8, 1846] at Palo Alto with Arista, the Mexican commander, who crossed over that stream. It ended in the defeat of the Mexicans, and the next day another engagement took place at Resaca de la Palma, with the same result. These actions eventually assumed considerable political importance. They were among the causes of General Taylor's subsequent elevation to the Presidency. As soon as intelligence of what had occurred reached Washington, President Polk, forgetting that the author of a war is not he who begins it, but he who has made it necessary, addressed a special message to Congress announcing that the Mexicans 'had at last invaded our territory, and shed the blood of our fellow-citizens on our own soil.' Congress at once (May 13th, 1846) passed an act providing money and men. Its preamble stated, 'Whereas, by the act of the Republic of Mexico, a state of war exists between that country and the United States, be it enacted,' etc. As long previously as 1843, Mr. Bocanegra, the Mexican Minister of Foreign Relations, had formally notified the American government that the annexation of Texas would inevitably lead to war. General Almonte, the Mexican minister at Washington, in a note to Mr. Upshur, the Sec-

retary of State, said that, 'in the name of his nation, and now for them, he protests, in the most solemn manner, against such an aggression; and be moreover declares, by an express order of his government, that, on sanction being given by the executive of the Union to the incorporation of Texas into the United States, he will consider his mission ended, seeing that, as the Secretary of State will have learned, the Mexican government is resolved to declare war as soon as it receives intimation of such an act.' War being thus provoked by the American government, General Scott received orders (November 18th, 1846) to take command of the expedition intended for the invasion of Mexico."—J. W. Draper, *History of the American Civil War*, v. 1, ch. 23.—After his defeat at Resaca de la Palma, the Mexican general Arista "retreated in the direction of San Luis Potosi, and was superseded by Gen. Pedro Ampudia. General Taylor marched his forces across the Rio Grande on the 17th of May and the invasion of Mexico was begun in earnest. From the 21st to the 24th of September, he was engaged with 7,000 men in the attack upon Monterey, the capital of Nueva Leon, garrisoned by a force of 9,000. He met with the same success which had attended his former engagements. General Ampudia was also forced to retire to San Luis Potosi. The brilliant features of this attack were the assault upon Obispaño Viejo by General Worth on the first day of the fight, and the storming of the heights above on the following day. . . . Upon the defeat of Ampudia, Santa Anna, having then just attained to the chief magistracy of Mexico [the American blockading squadron at Vera Cruz had permitted him to return to the country, expecting that his presence would be advantageous to the invaders], and left it in the hands of his Vice-President, Gomez Farias, took the command of the Mexican forces and set out to check the advance of General Taylor. On the 23d of February, 1847, the bloody battle of Angostura, as it is called by the Mexicans (known to the Americans as the battle of Buena Vista), was fought, and lost by the Mexican army. Santa Anna returned to San Luis Potosi, whence he was called to the capital to head off the insurrection against Gomez Farias, by the party called derisively the Polkos, because their insurrection at that time was clearly favorable to the movements of the American army, and because James K. Polk was then the President of the United States and head of the American party favorable to the war. It was at this time that the army of Taylor was reduced to about 5,000 men in order to supply General Winfield Scott with forces to carry out his military operations, and the field of war was transferred to the region between Vera Cruz and the capital. While these events were in progress an expedition under Gen. John C. Fremont had been made over-land through New Mexico and into California [see CALIFORNIA: 1846-1847; NEW MEXICO: 1846], and under the directions of the United States government the Mexicans of California had been invited to revolt."—A. 1847 (March-September).—General Scott's campaign.—From Vera Cruz to the capital.—Cerro Gordo.—Contreras.—Churubusco.—Molino del Rey.—Chapultepec.—Conquest complete.

—“General Winfield Scott was ordered to Mexico, to take chief command and conduct the war according to his own plan. This was, in brief, to carry an expedition against Vera Cruz, reduce its defences, and then march on the city of Mexico by the shortest route. . . . On the 7th of March [1847], the fleet with Scott’s army came to anchor a few miles south of Vera Cruz, and two days later he landed his whole force—nearly 12,000

men—by means of surf-boats. Vera Cruz was a city of 7,000 inhabitants, strongly fortified. . . . On the 22d the investment was complete. A summons to surrender being refused, the batteries opened, and the bombardment was kept up for four days, the small war vessels joining in it. The Mexican batteries and the castle [of San Juan de Ulloa, on a reef in the harbor] replied with spirit, and with some little effect; but the city and

castle were surrendered on the 27th. The want of draught animals and wagons delayed till the middle of April the march upon the capital of the country, 200 miles distant. The first obstacle was found at Cerro Gordo, 50 miles northwest of Vera Cruz, where the Mexicans had taken position on the heights around a rugged mountain pass, with a battery commanding every turn of the road. A way was found to flank the position on the extreme left, and on the morning of April 18th the Americans attacked in three columns. . . . The divisions of Twiggs and Worth . . . attacked the height of Cerro Gordo, where the Mexicans were most strongly intrenched, and where Santa Anna commanded in person. This being carried by storm, its guns were turned first upon the retreating Mexicans, and then upon the advanced position that Pillow was assaulting in front. The Mexicans, finding themselves surrounded, soon surrendered. Santa Anna, with the remainder of his troops, fled toward Jalapa, where Scott followed him and took the place."—W. C. Bryant and S. H. Gay, *Popular history of the United States*, v. 4, ch. 14.—"Less than a month later [after the battle of Cerro Gordo] the American army occupied the city of Puebla. Scott remained at Puebla during June and July, awaiting reinforcements and drilling them as they arrived. On the 7th of August he set out for the capital, which was now defended by about 30,000 troops. A series of encounters took place on the 10th, and on the next day three battles were fought, at Contreras, Churubusco, and San Antonio. They were in reality parts of one general engagement. The troops on both sides fought with stubbornness and bravery, but in the end the Mexicans were completely routed, and the pursuit of the flying enemy reached almost to the gates of the capital. A commissioner, Nicholas P. Trist, having been previously appointed to negotiate with the Mexicans, an armistice was now agreed upon, to begin on the 23d of August. The armistice, from a strategic point of view, was a mistake, the advantage of the overwhelming victories of the 19th and 20th was in great part lost, and the Mexicans were enabled to recover from the demoralization which had followed their defeat. The position of the American army, in the heart of the enemy's country, where it might be cut off from reinforcements and supplies, was full of danger, and the fortifications which barred the way to the capital, Molino del Rey, Casa Mata, and Chapultepec, were exceedingly formidable. On the 7th of September the armistice came to an end. The negotiations had failed, and General Scott prepared to move on the remaining works. A reconnoissance was made on that day, and on the 8th Scott attacked the enemy. The army of Santa Anna was drawn up with its right resting on Casa Mata and its left on Molino del Rey. Both these positions were carried by assault, and the Mexicans, after severe loss, were defeated and driven off the field. The next two days were occupied in preparing for the final assault upon Chapultepec. A careful disposition was made of the troops, batteries were planted within range, and on the 12th they opened a destructive fire. On the 13th a simultaneous assault was made from both sides, the troops storming the fortress with great bravery and dash, and the works were carried, the enemy flying in confusion. The army followed them along the two causeways of Belen and San Cosmé, fighting its way to the gates of the city. Here a struggle continued till after nightfall, the enemy making a desperate defence. Early the next morning, a deputation of the city council waited upon Gen-

eral Scott, asking for terms of capitulation. These were refused, and the divisions of Worth and Quitman entered the capital. Street fighting was kept up for two days longer, but by the 16th the Americans had secured possession of the city. Negotiations were now renewed, and the occupation of the territory, meanwhile, continued. The principal towns were garrisoned, and taxes and duties collected by the United States. Occasional encounters took place at various points, but the warfare was chiefly of a guerrilla character. Towards the close of the war General Scott was superseded by General Butler. But the work had been already completed."—J. R. Soley, *Wars of the United States, 1789-1850 (Narrative and critical history of America, v. 7, ch. 6)*.

Also in: H. H. Bancroft, *History of the Pacific states*, v. 8, (*Mexico*, v. 5), ch. 17-20.—Gen. W. Scott, *Memoirs, by himself*, v. 2, ch. 27-32.—J. Smith, *War with Mexico.—President's message and documents*, Dec. 7, 1847 (*Senate Executive Document, no. 1, 30th Congress, 1st session*).

1848.—Treaty of Guadalupe Hidalgo.—Territory ceded to the United States.—"The Mexican people had now succumbed to the victorious armies of the 'barbarians of the North.' The Mexican Government was favorable to the settlement of the questions which had caused this unhappy war. A new administration was in power. General Anaya on the 11th of November was elected President of the Mexican Republic until the 8th of January, 1848, when the constitutional term of office would expire. . . . National pride . . . bowed to the necessities of the republic, and the deputies assembled in the Mexican Congress favored the organization of a commission for the purpose of reopening negotiations with Mr. Trist, who still remained in Mexico, and was determined to assume the responsibility of acting still as agent of the United States [although his powers had been withdrawn]. The lack of coöperation by the adherents of Santa Anna prevented immediate action on the part of these commissioners. On the 8th of January, 1848, General Herrera was elected Constitutional President of the Mexican Republic. . . . Under the new administration negotiations were easily opened with a spirit of harmony and concession which indicated a happy issue. Mexico gave up her claim to the Nueces as the boundary-line of her territory, and the United States did not longer insist upon the cession of Lower California and the right of way across the Isthmus of Tehuantepec. The previous offer of money by the United States for the cession of New Mexico and Upper California was also continued. . . . On the 2d of February a treaty of peace was unanimously adopted and signed by the commissioners at the city of Guadalupe Hidalgo. . . . The ratifications of the Mexican Congress and of the United States Senate were exchanged May 30th, 1848. The United States, by the terms of this treaty, paid to Mexico \$15,000,000 for the territory added to its boundaries. They moreover freed the Mexican Republic from all claims of citizens of the United States against Mexico for damages, which the United States agreed to pay to the amount of \$3,250,000. The boundary-line was also fixed between the two republics. It began in the Gulf of Mexico three miles from the mouth of the Rio Grande del Norte, running up the centre of that river to the point where it strikes the southern boundary of New Mexico; then westward along that southern boundary which runs north of El-paso, to its western termination; thence northward along the western line of New Mexico until it in-

tersects the first branch of the river Gila, thence down the middle of the Gila until it empties into the Rio Colorado, following the division line between Upper and Lower California to the Pacific Ocean, one marine league south of the port of San Diego. On the 12th of June, the last of the United States troops left the capital of Mexico. . . . The partisan supporters of President Polk's administration did not hesitate to avow that the war with Mexico was waged for conquest of territory. . . . The demands of indemnity from Mexico first made by the United States were equal, exclusive of Texas, to half of the domain of Mexico, embracing a territory upward of 800,000 square miles. . . . The area of New Mexico, as actually ceded by treaty to the United States, was 526,078 square miles. The disputed ground of Texas, which rightfully belonged to Mexico, and which was also yielded in the treaty of peace, contained no less than 125,520 square miles. The acquisition of the total amount of 651,591 square miles of territory was one of the direct results of this war, in which President Polk was ever pretending 'to conquer a peace.' To this must be added the undisputed region of Texas, which was 325,520 square miles more, in order adequately to represent the acquisition of territory to the United States, amounting to 851,590 square miles. This has been computed to be seventeen times the extent of the State of New York. . . . The territory thus acquired included ten degrees of latitude on the Pacific coast, and extended east to the Rio Grande, a distance of 1,000 miles. . . . [More than 1000] miles of sea-coast were added to the possessions of the United States. . . . The mineral resources of the conquered territory, including California, New Mexico, Arizona, Western Colorado, Utah, and Nevada, have been developed to such an extent that their value is beyond computation."—H. O. Ladd, *History of the war with Mexico*, ch. 30-31.

1848-1861.—Succession of revolutions and the War of the Reform.—New constitution.—Government of Juarez and the nationalization of church property.—“For a brief period, after the withdrawal of the American army, the Mexican people drew the breath of peace, disturbed only by outbreaks headed by the turbulent Paredes. . . . In June, 1848, Señor Herrera (who had been in power at the opening of the war with the United States) took possession of the presidential chair. For the first time within the memory of men then living, the supreme power changed hands without disturbance or opposition. . . . The army . . . was greatly reduced, arrangements were made with creditors abroad, and for the faithful discharge of internal affairs. General Mariano Arista, formerly minister of war, assumed peaceful possession of power, in January, 1851, and continued the wise and economical administration of his predecessor. But Mexico could not long remain at peace, even with herself; she was quiet merely because utterly prostrated, and in December, 1852, some military officers, thirsting for power, rebelled against the government. They commenced again the old system of ‘pronunciamientos’; usually begun by some man in a province distant from the seat of government, and gradually gaining such strength that when finally met by the lawful forces they were beyond control. Rather than plunge his country anew into the horrors of a civil war, General Arista resigned his office and sailed for Europe, where he died in poverty a few years later. It

may astonish any one except the close student of Mexican history to learn the name of the man next placed in power by the revolutionists, for it was no one else than General Antonio Lopez de Santa Anna! Recalled by the successful rebels from his exile in Cuba and South America, Santa Anna hastened to the scene of conflict. . . . He commenced at once to extend indefinitely the army, and to intrench himself in a position of despotic power, and, in December, 1853, he issued a decree which, in substance, declared him perpetual dictator. This aroused opposition all over the country, and the Liberals, who were opposed to an arbitrary centralized government, rose in rebellion. The most successful leaders were Generals Alvarez and Comonfort, who, after repeated victories, drove the arch conspirator from the capital, on the 9th of August, 1855. Santa Anna secretly left the city of Mexico, and a few days later embarked at Vera Cruz for Havana. During several years he resided in Cuba, St. Thomas, Nassau, and the United States, constantly intriguing for a return to power in Mexico.”—F. A. Ober, *Young folks' history of Mexico*, ch. 33.—“Upon the flight of Santa Anna, anarchy was imminent in the capital. The most prominent promoters of the revolution assembled quickly, and elected Gen. Romulo Diaz de la Vega acting-president, and he succeeded in establishing order. . . . By a representative assembly Gen. Martin Carrera was elected acting-president, and he was installed on the 15th of August, 1855, but resigned on the 11th of the following month, when the presidency devolved a second time upon Gen. Romulo Diaz de la Vega. The revolution of Alvarez and Comonfort, known as the Plan de Ayotla, was entirely successful, and under the wise and just administration of Diaz de la Vega, the country was brought to the wholly abnormal state of quiet and order. Representatives of the triumphant party assembled in Cuernavaca and elected Gen. Juan Alvarez president ad interim, and upon the formation of his cabinet he named Comonfort his Minister of War. Returning to the capital, he transferred the presidency to his Minister of War, and on the 12th of December, 1855, Gen. Ignacio Comonfort entered upon the discharge of his duties as acting-president. He was made actual president by a large majority in the popular election held two years later, and was reinstalled on the 1st of December, 1857. He proved to be one of the most remarkable rulers of Mexico, and his administration marks the beginning of a new era in Mexican history. Scarcely had Comonfort begun his rule as the substitute of Alvarez, when revolutions again broke out and assumed formidable proportions. Puebla was occupied by 5,000 insurgents. Federal troops sent against them joined their cause. Comonfort succeeded in raising an army of 16,000 men, well equipped, and at its head marched to Puebla and suppressed the revolution before the end of March. But in October another rebellion broke out in Puebla, headed by Col. Miguel Miramon. The government succeeded in suppressing this, as well as one which broke out in San Luis Potosi, and another, under the leadership of Gen. Tomas Mejia, in Queretaro. It was by Comonfort that the war between the Church and the government, so long threatened, was precipitated. In June, 1856, he issued a decree ordering the sale of all the unimproved real estate held by the Church, at its assessed value. The Church was to receive the proceeds, but the land was to become thereby freed from all ecclesiastical control.” Upon information of a conspiracy centering in one of the

monasteries of the city of Mexico, the president sent troops to take possession of the place, and finally ordered it to be suppressed. These measures provoked an implacable hostility on the part of the supporters of the Church. "On the 5th of February, 1857, the present [written in 1903] Constitution of Mexico was adopted by Congress. Comonfort, as Provisional President, subscribed it, and it was under its provisions that he was elected actual president. But ten days after his inauguration in December, 1857, and his taking the oath to support the new Constitution, the President, supposing that he could gain the full support of the Liberals, and claiming that he had found the operation of the Constitution impracticable, dissolved Congress and set the Constitution aside. He threw his legal successor, Benito Juarez, the President of the Supreme Court of Justice, and one of the supporters of the new Constitution,

BENITO PABLO JUAREZ
(After painting by Chappel)

into prison." Revolution upon revolution now followed in quick succession. Comonfort fled the country. Zuloaga, Pezuela, Pavon, Miramon, were seated in turn in the presidential chair for brief terms of a half recognized government. "Constitutionally (if we may ever use that word seriously in connection with Mexican affairs), upon the abandonment of the presidency by Comonfort, the office devolved upon the President of the Supreme Court of Justice. That office was held at the time by Don Benito Juarez, who thereupon became president de jure of Mexico. . . . The most curious specimen of the nomenclature adopted in Mexican history is that which gives to the struggle between the Church party and its allies and the Constitutional government the name of the War of the Reform. . . . What was thereby reformed it would be difficult to say, . . . further than the suppression of the outreaching power, wealth, and influence of the Church, and the assertion of the supremacy of the State. . . . But the 'War of the Reform' had all the bitterness of a

religious war. . . . Juarez, who is thus made to appear as a reformer, was the most remarkable man Mexico has ever produced. He was born in 1806 in the mountains of Oaxaca. . . . He belonged to the Zapoteca tribe of Indians. Not a drop of Spanish blood flowed in his veins. . . . Upon the flight of Comonfort, Juarez was utterly without support or means to establish his government. Being driven out of the capital by Zuloaga he went to Guadalajara, and then by way of the Pacific coast, Panama, and New Orleans, to Vera Cruz. There he succeeded in setting up the Constitutional government, supporting it out of the customs duties collected at the ports of entry on the Gulf coast. It was war to the knife between the President in Vera Cruz and the Anti-Presidents in the capital. . . . On the 12th of July, 1859, Juarez made a long stride in advance of Comonfort by issuing his famous decree, 'nationalizing'—that is, sequestrating, or more properly confiscating—the property of the Church. It was enforced at Vera Cruz at once. . . . The armies of the two rival governments met in conflict on many occasions. It was at Calpulalpan, in a battle lasting from the 21st to the 24th of December, 1860, that Miramon was defeated and forced to leave the country. General Ortega, in command of the forces of Juarez, advanced to the capital and held it for the return of his chief. When the army of Juarez entered the capital, on the 27th of December, the decree of sequestration began to be executed there with brutal severity. . . . Monasteries were closed forthwith, and the members of the various religious orders were expelled from the country. . . . It is said that from the 'nationalized' church property the government secured \$20,000,000, without, as subsequent events showed, deriving any permanent benefit from it. It helped to precipitate another war, in which it was all dissipated, and the country was poorer than ever. . . . The decree issued by Juarez from Vera Cruz in 1859, nationalizing the property of the Church, was quickly followed up by a decree suspending for two years payment on all foreign debts. The national debt at that time amounted to about \$100,000,000, according to some statements, and was divided up between England, Spain, and France. England's share was about \$80,000,000. France's claim was comparatively insignificant. They were all said to have been founded upon usurious or fraudulent contracts, and the French claim was especially dubious. . . . Upon the issuing of the decree suspending payment on these foreign debts, the three creditor nations at once broke off diplomatic relations with Mexico, and Napoleon III., of France, proceeded to carry out a plan which had for some time occupied his mind."—A. H. Noll, *Short history of Mexico*, ch. 10-11.

1861-1867.—French intervention.—Maximilian's ill-starred empire and its fate.—The expedition against Mexico "was in the beginning a joint undertaking of England, France, and Spain. Its professed object, as set forth in a convention signed in London on October 31st, 1861, was 'to demand from the Mexican authorities more efficacious protection for the persons and properties of their (the Allied Sovereigns') subjects, as well as a fulfilment of the obligations contracted toward

their Majesties by the Republic of Mexico.' . . . Lord Russell, who had acted with great forbearance towards Mexico up to this time, now agreed to co-operate with France and Spain in exacting reparation from Juarez. But he defined clearly the extent to which the intervention of England would go. England would join in an expedition for the purpose, if necessary, of seizing on Mexican custom-houses, and thus making good the foreign claims. But she would not go a step further. She would have nothing to do with upsetting the Government of Mexico, or imposing any European system on the Mexican people. Accordingly, the Second Article of the Convention pledged the contracting parties not to seek for themselves any acquisition of territory or any special advantage, and not to exercise in the internal affairs of Mexico any influence of a nature to prejudice the right of the Mexican nation to choose and to constitute freely the form of its government. The Emperor of the French, however, had already made up his mind that he would establish a sort of feudatory monarchy in Mexico. He had long had various schemes and ambitions floating in his mind concerning those parts of America on the shores of the Gulf of Mexico, which were once the possessions of France. . . . At the very time when he signed the convention with the pledge contained in its second article, he had already been making arrangements to found a monarchy in Mexico. If he could have ventured to set up a monarchy with a French prince at its head, he would probably have done so; but this would have been too bold a venture. He, therefore, persuaded the Archduke Maximilian, brother of the Emperor of Austria, to accept the crown of the monarchy he proposed to set up in Mexico. The Archduke was a man of pure and noble character, but evidently wanting in strength of mind, and he agreed, after some hesitation, to accept the offer. Meanwhile the joint expedition sailed. We [the English] sent only a line-of-battle ship, two frigates, and 700 marines. France sent in the first instance about 2,500 men, whom she largely reinforced immediately after. Spain had about 6,000 men, under the command of the late Marshal Prim. The Allies soon began to find that their purposes were incompatible. There was much suspicion about the designs of France. . . . Some of the claims set up by France disgusted the other Allies. The Jecker claims were for a long time after as familiar a subject of ridicule as our own Pacific claims had been. A Swiss house of Jecker & Company had lent the former Government of Mexico \$750,000, and got bonds from that Government, which was on its very last legs, for \$15,000,000. The Government was immediately afterwards upset, and Juarez came into power. M. Jecker modestly put in his claim for \$15,000,000. Juarez refused to comply with the demand. He offered to pay the \$750,000 lent and five per cent. interest, but he declined to pay exactly twenty times the amount of the sum advanced. M. Jecker had by this time become somehow a subject of France, and the French Government took up his claim. It was clear that the Emperor of the French had resolved that there should be war. At last the designs of the French Government became evident to the English and Spanish Plenipotentiaries, and England and Spain withdrew from the Convention. . . . The Emperor of the French 'walked his own wild road, whither that led him.' He overran a certain portion of Mexico with his troops. He captured Puebla after a long and desperate resistance [and after suffering a defeat on the 5th

of May, 1862, in the battle of Cinco de Mayo]; he occupied the capital, and he set up the Mexican Empire, with Maximilian as Emperor. French troops remained to protect the new Empire. Against all this the United States Government protested from time to time. [See MONROE DOCTRINE: 1827-1867.] . . . However, the Emperor Napoleon cared nothing just then about the Monroe doctrine, complacently satisfied that the United States were going to pieces, and that the Southern Confederacy would be his friend and ally. He received the protests of the American Government with unveiled indifference. At last the tide in American affairs turned. The Confederacy crumbled away; Richmond was taken; Lee surrendered; Jefferson Davis was a prisoner. Then the United States returned to the Mexican Question, and the American Government informed Louis Napoleon that it would be inconvenient,

MAXIMILIAN

gravely inconvenient, if he were not to withdraw his soldiers from Mexico. A significant movement of American troops under a renowned General, then flushed with success, was made in the direction of the Mexican frontier. There was nothing for Louis Napoleon but to withdraw [March, 1867]. . . . The Mexican Empire lasted two months, and a week after the last of the French troops had been withdrawn. Maximilian endeavoured to raise an army of his own, and to defend himself against the daily increasing strength of Juarez. He showed all the courage which might have been expected from his race, and from his own previous history. But in an evil hour for himself, and yielding, it is stated, to the persuasion of a French officer he had issued a decree that all who resisted his authority in arms should be shot. By virtue of this monstrous ordinance, Mexican officers of the regular army, taken prisoners while resisting, as they were bound to do, the invasion of a European prince, were shot like brigands. The Mexican general, Ortega, was one of

those thus shamefully done to death. When Juarez conquered, and Maximilian, in his turn, was made a prisoner, he was tried by court-martial, condemned and shot. . . . The French Empire never recovered from the shock of this Mexican failure."

1861-1905.—Free Zone.—The Free Zone was a narrow strip of territory extending along the northern border from the gulf of Mexico to the

practicable to export such products to that country. All merchandise imported into the zone destined for consumption therein was admitted on a basis of ten per cent of the regular tariff duties, but such merchandise when reshipped into the interior of Mexico was required to pay an additional duty of 90 per cent, making, in connection with the 10 per cent already paid, the regular tariff duty of Mexico. The franchise granted the Free Zone consisted, in the beginning, in not levying any duty upon imported articles; afterwards, however, some small duties, purely local, were established, and the ordinance of 1887 established as a fixed basis 3 per cent on the value of the duties according to tariff—a basis which was raised to 10 per cent by the ordinance of 1891. By subsequent decrees the duties were raised 1½ per

LAST MOMENTS OF MAXIMILIAN OF MEXICO

Pacific ocean, with a latitudinal area of about twelve and one-half miles to the interior, and embracing a portion of the states of Tamaulipas, Coahuila, Chihuahua, Sonora, and the territory of Lower California. It was established in 1861 by the Central Government, as a compromise or concession to the states bordering the Rio Grande, as a protection against smuggling from the United States. The principal cities of the zone were Matamoros, Camargo, Mier, Guerrero, Laredo, Porfirio Diaz (Piedras Negras), Juarez and Nogales. The total population did not exceed 100,000 people. According to the official reports, there existed within the limits of the free zone no industries worth mentioning, which was explained by the fact that all industrial products manufactured in the zone when sent into the interior of the country were required to pay the regular duties charged on imports into the country; and, on account of the protective tariff of the United States, it was im-

cent for the municipality and 7 per cent for stamps for internal revenue, the result of all this being that the merchandise introduced into the Free Zone from abroad paid 18½ per cent upon the importation duties according to tariff. The Free Zone was abolished July 1, 1905.

1867-1892.—Restored republic.—“On the 15th of July [1867] Juarez made a solemn entry into the capital. Many good citizens of Mexico, who had watched gloomily the whole episode of the French intervention, now emerged to light and rejoiced conspicuously in the return of their legitimate chief. . . . He was received with genuine acclamations by the populace, while high society remained within doors, curtains close-drawn, except that the women took pride in showing their deep mourning for the death of the Emperor. . . . Peace now came back to the country. A general election established Juarez as President, and order and progress once more consented to test the good

resolutions of the Republic." Santa Anna made one feeble and futile attempt to disturb the quiet of his country, but was arrested without difficulty and sent into exile again. But Juarez had many opponents and enemies to contend with. "As the period of election approached, in 1871, party lines became sharply divided, and the question of his return to power was warmly contested. A large body still advocated the re-election of Juarez, as of the greatest importance to the consolidation of the Constitution and reform, but the admirers of military glory claimed the honors of President for General Diaz, who had done so much, at the head of the army, to restore the Republic. A third party represented the interests of Lerdo, minister of Juarez all through the epoch of the intervention, a man of great strength of character and capacity for government. . . . The campaign was vigorous throughout the country. . . . The election took place; the Juaristas were triumphant. Their party had a fair majority and Juarez was re-elected. But the Mexicans not yet had learned to accept the ballot, and a rebellion followed. The two defeated parties combined, and civil war began again. Government defended itself with vigor and resolution, and, in spite of the popularity of General Diaz as a commander, held its own during a campaign of more than a year. Its opponents were still undaunted, and the struggle might have been long continued but for the sudden death of Juarez, on the 10th of July, 1872. . . . Don Sebastian Lerdo de Tejada, then President of the Supreme Court, assumed the government, was elected President, and the late agitation of parties was at an end. For three years peace reigned in Mexico, and then began another revolution. Towards the end of 1875, rumors of dissatisfaction were afloat. . . . Early in the next year, a 'Plan' was started, one of those fatal propositions for change which have always spread like wildfire through the Mexican community. By midsummer, the Republic was once more plunged in civil war. Although he had apparently no hand in the 'Plan' of Tuxtepec, General Porfirio Diaz appeared at the head of the army of the revolutionists. . . . During the summer there was fighting and much confusion, in the midst of which the election took place for the choice of President for another term of four years. The result was in favor of Lerdo de Tejada, but he was so unpopular that he was obliged soon after to leave the capital, on the 20th of November, accompanied by his ministers and a few other persons. The other Lerdistas hid themselves, Congress dissolved, and the opposition triumphed. Thus ended the government of the Lerdistas, but a few days before the expiration of its legal term. On the 24th of November, General Porfirio Diaz made his solemn entry into the capital, and was proclaimed Provisional President. After a good deal of fighting all over the country, Congress declared him, in May, 1877, to be Constitutional President for a term to last until November 30, 1880. . . . President Diaz was able to consolidate his power, and to retain his seat without civil war, although this has been imminent at times, especially towards the end of his term. In 1880, General Manuel Gonzalez [Gonzalez] was elected, and on the 1st of December of that year, for the second time only in the history of the Republic, the retiring President gave over his office to his legally elected successor. . . . The administration of Gonzalez passed through its four years without any important outbreak. . . . At the end of that term General Diaz was re-elected and became President December 1, 1884. The treasury of the country was empty, the Republic without credit, yet he has [1888, when

he was re-elected for a third term] . . . succeeded in placing his government upon a tolerably stable financial basis, and done much to restore the foreign credit of the Republic."—S. Hale, *Story of Mexico*, ch. 41-42.—President Diaz was re-elected for a fourth term, December 1, 1892.

1873-1882.—Railroad development under Diaz.—Plans for railway across isthmus. See RAILROADS: 1854-1906.

1885-1908.—Yaqui Indians.—Under Spanish and Mexican rule until coming of Diaz.—Under Diaz régime.—Execution of their chief, Cajeme.—Confiscation of their lands.—Revolt and wholesale destruction of Yaquis.—Deportation to Yucatan.—"There are few things in the history of the native races of North America of such absorbing interest as the career of the Yaqui Indians. The Spanish conquistadores found them living in this country three hundred and fifty years ago. They were a strong and stalwart race. Put a Yaqui by the side of an Iroquois and you can hardly tell them apart. Put a Yaqui and an Iroquois by the side of any other Indians in North America, and their physical superiority is seen at once. Compare them physically with all the other races of the earth and you will find that they have few, if any, superiors. The Yaquis were not, however, like their prototypes, the Iroquois, dependent upon the chase for their food. From the beginning they were not woodsmen, but farmers. Cabeza de Yaca, after his long, romantic and perilous journey across the continent, found great fields of Indian corn waving along the Yaqui River as far back as 1636. When the early Spanish missions were established in the Californias they obtained their supplies from the agricultural Indians in the Yaqui Valley, and many are the Spanish armies that have been saved from starvation in times past by the Yaqui corn fields."—W. S. Logan, *Yaqui, the land of sunshine and health*, p. 17.—"At the time of the Spanish conquest they were a nation of from one to two hundred thousand people, supposed by some authorities to have been offshoots from the Aztecs. The Spanish were never able to subdue them completely, and after two hundred and fifty troublous years a peace was entered into whereby the Yaquis gave up a part of their territory and, as acknowledgement of their rightful ownership of the rest of it, the King of Spain gave them a patent signed by his own hand. This was nearly one hundred and fifty years ago [written in 1010], but the royal patent was honored by every ruler and chief executive of Mexico down to Diaz. During all that time the Yaquis were at peace with the world. Their reputation as a naturally peaceful nation was established. It remained for the government of Diaz to stir them into war. During these years of peace the Yaquis became part and parcel of the Mexican nation. They lived like other Mexicans. They had their own personal farms, their own homes, and they paid taxes on their property like other Mexicans. During the war against Maximilian they sent soldiers to help Mexico, and many of them distinguished themselves by brilliant service. But the Yaquis were goaded into war. The men at the head of the government of Sonora wanted the Yaqui lands. . . . They sent . . . surveyors through the Yaqui valley to mark out the land and tell the people that the government had decided to give it to foreigners. They confiscated \$80,000 in a bank belonging to Chief Cajeme. Finally, they sent armed men to arrest Cajeme, and when the latter could not find him they set fire to his house and

to those of his neighbors, and assaulted the women of the villages, even Cajeme's wife not being respected. . . . Since that day twenty-five years ago [written in 1910] the Mexican government has maintained an army almost perpetually in the field against the Yaquis, an army ranging in numbers from 2,000 to 6,000 men. Thousands of soldiers and tens of thousands of Yaquis have been killed in battle and many hundreds of the latter have been executed after being taken prisoners. After a few years Chief Cajeme was captured and publicly executed in the presence of a large body of his people who had been taken prisoner with him. Tebiate, another Yaqui, was promptly elected to Cajeme's place, and the fight went on. Finally, in 1894, at one fell swoop, as it were, the ground was literally taken from under the feet of the rebels. By act of the federal government the best of their lands were taken from them and handed over to one man, General Lorenzo Torres, who is at this writing chief of the army in Sonora, then second in command. . . . In 1898 the government troops were armed for the first time with the improved Mauser rifle, and in that year they met and wiped out an army of Yaquis at Mazacoba, the killed numbering more than 1,000. This ended warfare on anything like an equal footing. There were no more large battles; the Yaqui warriors were merely hunted. Thousands of the Indians surrendered. Their leaders were executed, and they and their families were granted a new territory to the north, to which they journeyed as to a promised land. But it proved to be a barren desert, entirely waterless and one of the most uninhabitable spots in all America. Hence the peaceful Yaquis moved to other sections of the state, some of them becoming wage-workers in the mines, others finding employment on the railroads, and still others becoming peons on the farms. Then and there this portion of the Yaqui nation lost its identity and became merged with the people about it. But it is these Yaquis, the peaceful ones, who are sought out and deported to Yucatan. . . . The deportation of Yaquis to Yucatan and other slave sections of Mexico began to assume noticeable proportions about 1905. It was carried out on a small scale at first, then on a larger one. Finally, in the spring of 1908, a despatch was published in American and Mexican newspapers saying that President Diaz had issued a sweeping order decreeing that every Yaqui, wherever found, men, women and children, should be gathered up by the War Department and deported to Yucatan. During my journeys in Mexico I inquired many times as to the authenticity of this despatch, and the story was confirmed. It was confirmed by men in the public departments of Mexico City. It was confirmed by Colonel Cruz, chief deporter of Yaquis. And it is certain that such an order, wherever it may have come from, was carried out. Yaqui workingmen were taken daily from mines, railroads and farms, old workingmen who never owned a rifle in their lives, women, children, babes, the old and the young, the weak and the strong. Guarded by soldiers and *rurales* they traveled together over the exile road. And there are others besides Yaquis who traveled over that road. Pimas and Opatas, other Indians, Mexicans, and any dark people found who were poor and unable to protect themselves were taken, tagged as Yaquis, and sent away to the land of Henequen."—J. K. Turner, *Barbarous Mexico*, pp. 40-41, 44, 46.

1890. — Represented at first international American congress. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1890.

1898.—Material progress under Diaz.—Im-

provement of national harbors.—**Drainage canal.**—"One of the most important of the lines of material progress under Porfirio Diaz was the improvement of the national harbors. Improvement at Tampico was undertaken when Porfirio Diaz was in the cabinet of Manuel Gonzales as Minister of Fomento. In the old days Tampico was a place of small significance; located near the mouth of the Panuco river, it was accessible to vessels of small draught only in favorable conditions of the weather. Ships drawing more than nine feet could never be sure of entrance, on account of the formation of sandbars at the river's mouth in connection with gulf storms. The improvements at Tampico were planned by American engineers and largely carried out by our people; to-day the mouth of the Panuco river is at all times open to the entrance of vessels drawing even as much as twenty or twenty-two feet. As a result, the city of Tampico has grown by leaps and bounds; its business, both of import and of export, has developed handsomely. Since those days, great improvements have been made in all the other important harbors of Mexico on both coasts. Many millions of dollars were spent during the Diaz administration on the port of Vera Cruz. The harbor of Coatzacoalcos, in connection with the development of the Tehuantepec Railway, has been enormously bettered; it is now called Puerto Mexico. At the other end of the Tehuantepec Railroad, the Pacific port of Salina Cruz has been practically created. Other Pacific ports, as those of Mazatlan and Manzanillo, have been developed beyond recognition. . . . In the direction of public utility, many important enterprises were carried through. Preëminent among these is the famous drainage canal of the valley of Mexico. In the olden time, the lakes in the valley of Mexico were subject to serious overflow. With this overflow the city was subject to frightful inundation, with resulting loss of life, property, and subsequent disease. During the three hundred years of Spanish rule, the problem was a serious one, and many efforts were made toward its solution. The great cut of Nichistongo remains as an impressive monument of such endeavors. In the cutting of the great tunnel of Nichistongo years of time, millions of dollars, hundreds of lives were demanded; when it was finished, it was not a complete solution of the difficulty. Things were improved, but inundation of the city still took place at times with all its frightful losses. The drainage canal, however, undertaken [1885] and carried through to completion under Porfirio Diaz [1898], has satisfactorily settled the problem, and to-day the city is free from danger of floods. The drainage canal is but one of many enterprises for public advantage to be credited to the past regime. Many institutions of philanthropy, education, and betterment were due to the Porfirian administration."—F. Starr, *Mexico and the United States*, pp. 223-224.

1898-1900.—Results of twenty years of presidency of Porfirio Diaz.—**Material progress.**—**Status of education.**—"Diaz governed well in a financial way. When he succeeded Gonzalez the finances of Mexico were at the lowest ebb. The country had no credit at home or abroad. Diaz, with the help of his able Minister of Finance, Limantour, managed so that debts were paid as they became due and a large national capital accumulated. This was partly through economy in the administration of the government, and partly through the increased revenues due to the growth of Mexican commerce and industries. When Diaz first came to the Presidency, there was but one short railroad in the country—the one which con-

nected Vera Cruz with the capital. Before he ended there were more than ten thousand miles of railroad. The country was opened up from ocean to ocean, and from the United States to Yucatan. Most of these were built by United States capital. Trolley lines and electric lights, telephones and telegraphs, improved street cleaning and water systems, made the larger Mexican cities as comfortable to live in as American ones, and incidentally made money for the foreigners who installed them. The pueblos of the Indians, however, remained just as primitive and probably more unsanitary than in Aztec times. Great engineering works, also accomplished by foreigners, improved the harbors on both coasts. Cotton mills, tobacco factories, sugar refineries, sprang up as if by magic. Before Diaz, mining rights in Mexico had been difficult for foreigners to obtain. He made them easy. He allowed foreigners to acquire control of the great plantations in coffee, rice, sugar, cocoa and other products, which were worked by cheap native labor."—L. S. Hasbrouck, *Mexico from Cortés to Carranza*, pp. 200-202.—"Education, . . . is administered under three branches—gratuitous, lay, and obligatory. . . . The law making education compulsory was promulgated March 23, 1888, but its enforcement was not decreed at that time, and the first Congress of Public Education was convened for the purpose of adopting such measures as should tend to establish an efficient and uniform system of education. This congress met on December 1, 1889, and closed its sessions on March 31, 1890. . . . A second congress was convened on December 1, 1890, which solved certain problems on compulsory elemental education, fixed the methods to be followed in the schools of superior primary education, and settled matters pertaining to normal schools, preparatory education, and special schools. As the result of this congress, the law of March 21, 1891, was enacted, regulating compulsory education in the Federal District and the Territories of Tepic and Lower California, which law became effective on January 17, 1892. . . . On May 10, 1896, the law of public education was promulgated, its salient points being as follows: Official primary elemental education in the Federal Districts and Federal Territories was placed under the exclusive control of the Executive; primary superior education was organized as an intermediate educational system between elementary and preparatory instruction. A general board of primary education was created, charged to develop and maintain the same under a scientific and administrative plan. Preparatory education was decreed to be uniform for all professions, its extent being limited to the study of such matters as are necessary to the development of the physical and intellectual faculties and the morals of youth, it being further directed that professional education be reorganized, limiting it to technical matters which pertain to the profession or professions to which each particular school is devoted. By virtue of this law public education ceased to be in charge of the Board of Aldermen (ayuntamientos) of the above-mentioned sections. At the time of its promulgation the municipality of Mexico contained 113 schools, supported by the Board of Aldermen, 14,246 students being entered on the rolls, with an average attendance of 9,708. Each State defrays the expenses of public education, either with funds specially appropriated for that purpose or with the municipal funds. According to statistical data, in 1876, there were throughout the country 8,165 primary schools, with 368,754 students of both sexes. In 1895 Government schools reached the number of 4,056, of

which 2,189 were for males, 1,119 for females, and 748 for both sexes; municipal schools numbered 3,394—for males, 1,754; females, 932; both sexes, 708. These comprised 7,380 primary, 32 secondary, and 35 professional schools, the number of students enrolled being 310,496 males and 181,484 females (a total of 491,980), and the mean attendance 338,066. The total cost to the Government and the municipalities for the maintenance of these institutions was \$3,973,738. In the same year private schools to the number of 1,816 were being conducted, 659 for males, 460 for females, and the remainder under a coeducational system. In addition, 276 were supported by the clergy and 146 by associations, the total number of students enrolled being 68,879, of which 40,135 were males and 38,744 females. The total number of private schools was accordingly 2,238, of which 2,193 were devoted to primary education, 34 to secondary instruction, and 11 to professions. Using the figures given in 1896 for Vera Cruz and the Federal District as identical for 1897, it may be safely assumed that on December 31, 1897, the public schools in Mexico (Federal, State, and municipal) stood as follows:

Number of schools.....	9,065
Students enrolled.....	666,787
Average monthly attendance.....	458,035
Private institutions.....	2,361
Number of students.....	92,387
Average attendance.....	75,857."

—*Bureau of American republics, Mexico: Geographical sketch*, p. 313.—"The percentage of illiteracy in the thirty-five years of [Diaz'] . . . rule was lowered from ninety to eighty-six percent., but only in the cities. The rural school system was almost completely neglected, or was turned over to the care of priests and nuns."—Carlo de Fornaro, *Carranza and Mexico*, p. 46.—"The 'hacendados' opposed any attempt to educate their peons. 'Luis Caberra . . . who was a school master in Tlaxcala in the year 1895 [in a speech delivered in the Chamber of Deputies, December 3, 1912, said] although he was paid by the government, when he arrived at the 'hacienda,' he was furnished with the following instructions by the . . . manager of the farm: 'You must teach here only reading, writing, and the Catholic catechism. I forbid you absolutely to teach arithmetic and that useless thing called civics.'"—R. B. Brinsmade, *Mexican problems*, p. 5.

1899.—Represented at peace conference at The Hague. See HAGUE CONFERENCE: 1899: Constitution.

1900 (January).—Reëlection of President Diaz.—President Porfirio Diaz was reëlected on January 1, for a sixth term of four years.

1900.—Allied with Salvador. See CENTRAL AMERICA: 1895-1902.

1901.—Represented at second international American conference at Mexico City. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1901-1902.

1902.—Pan-American conference. See ARBITRATION, INTERNATIONAL: MODERN: 1902.

1904-1905.—Arbitration Treaty with the United States.—Reëlection of President Diaz for seventh term.—Extension of the term.—Currency reform.—"Mexico was one of the countries with which the United States government negotiated an arbitration treaty early in the year [1905], a treaty which was dropped, like its fellows, by the Washington administration, because of the Senate amendments. . . . Though the

tentative arbitration treaty between the United States and Mexico . . . fell through, another very practical and useful arbitration convention was concluded between the two nations during the year. This was the convention agreed to in principle during the Pan-American Conference in the city of Mexico in the winter of 1901-02, which provides for the settlement by arbitration of all international questions growing out of pecuniary claims. The representatives of several of the nations taking part in that conference affixed their signatures to this preliminary compact, and it has since become operative among a number of them. It was ratified by the Mexican Senate during its spring sessions. As pecuniary claims have in point of fact been one of the most fruitful sources of difficulty between the United States and the other nations of the western hemisphere, the conclusion of an agreement, in a binding form, to dispose by arbitration of any such cases as may arise in the future, is a distinct gain for the cause of the rational adjustment of international controversies, and is a guarantee, not indeed absolute, but most substantial, of lasting peace among the nations of this continent. . . . There were no striking developments in the political situation in Mexico. On December 1 of the previous year (1904) President Diaz had entered on his sixth consecutive term and his seventh term in all. By a constitutional amendment, a regular vice-president of the republic, for the first time since the early days of Mexico's history, took the oath of office at the same time as the president, on December 1, 1904. The gentleman previously elected, and now occupying the position of vice-president, is the Honorable Ramon Corral, formerly governor of the state of Sonora. By virtue of another constitutional amendment, the present and future presidential terms will be six years, instead of four as formerly. . . . A measure of vital importance to the economic well-being of the nation was promulgated on March 25, 1905. This was the decree for the reform of the currency, issued by the Executive under an enabling Act of Congress, approved on December 9, 1904. The new monetary system, due to the initiative of the very able finance minister Señor José Yves Limantour, went into effect on the first of May, but the free coinage of silver ceased on April 16. Broadly speaking, the new system gives Mexico a fifty-cent dollar. It declares that the theoretical unit of the monetary system of the United Mexican States is represented by seventy-five centigrams of pure gold, and is denominated a peso."—F. R. Guernsey, *Year in Mexico* (*Atlantic Monthly*, v. 97).

1906.—Celebration of the centenary of Benito Juárez.—His relation to the secularizing movement a generation ago.—Present pacific relations between church and state.—"Though Juárez is generally credited with the paternity of the laws generically known as the Reform Laws, and although he undoubtedly was the life and soul of the secularizing movement of his day, it is worthy of note that he had no formal participation in the chief measures framed against the Church. . . . He was not a signatory of the Constitution of 1857, which first attacked the existence of the religious orders; the law for the confiscation of church property was framed by Miguel Lerdo de Tejada, the Finance Minister of President Comonfort (1856); and the constitutional amendments which definitely established the separation of Church and State, instituted civil marriage, placed monastic communities outside the pale of the law, and forbade open-air religious services, were not enacted until 1873 and 1874, after the death of Juárez, and

during the presidency of Sebastian Lerdo de Tejada. March 21, 1906, was, by a decree of Congress, observed as a general holiday in Mexico. Pilgrimages to the tomb of Juárez took place in the morning; commemorative tablets were unveiled in the afternoon, and at night General Diaz, surrounded by his cabinet, presided in the Arbu Theatre at an apotheosis of Juárez, during which the career and character of the reforming president were extolled in an eloquent oration by Hon. Justo Sierra, Minister of Public Instruction. On the stage with the President during these exercises were the son and other surviving descendants of Juárez, who are numerous. Curiously enough, a question involving the interpretation of the Reform Laws arose soon after the celebration of the Juárez centenary. The ministers of all denominations in Mexico had been accustomed to conduct a service at the graveside in connection with the burial of the dead. It was generally held that this practice did not conflict with Article 5 of the Law of December 14, 1874, forbidding all forms of religious service other than those held inside the churches. But in May, 1906, the Interior Department issued a circular declaring open-air burial services conducted in the cemeteries to be illegal. This rule has led to the erection of mortuary chapels in the cemeteries which previously were unprovided with them, and the burial services are held inside these chapels. While this episode shows that there is no intention on the part of the governmental authorities of Mexico to relax one iota of the laws which curtailed the power of the Church, it is worthy of note that there is no serious religious conflict in Mexico at the present time [1907]; and, under laws which are probably as restrictive as those recently enacted in France, which have so agitated that country, Church and State in the Mexican Republic move smoothly in their separate orbits, with conciliatory if not cordial sentiments toward each other."—F. R. Guernsey, *Year in Mexico* (*Atlantic Monthly*, v. 99).

1908.—Creelman interview with Diaz.—Effect.—"It is not often that a reporter's interview for periodical publication becomes an important political document. Such a fate was, however, in store for an interview of James Creelman with President Diaz, which was printed in the March number of Pearson's Magazine for 1908. In that interview the President of the Mexican Republic said: 'No matter what my friends and supporters say, I retire when my presidential term of office ends, and I shall not serve again. I shall be eighty years old then. I have waited patiently for the day when the people of the Mexican Republic should be prepared to choose and change their government at every election without danger of armed revolution and without injury to the national credit or interference with national progress. I believe that day has come. I welcome an opposition party in the Mexican Republic. If it appears, I will regard it as a blessing, not an evil.

And if it can develop power, not to exploit, but to govern, I will stand by it, support it, advise it, and forget myself in the successful inauguration of complete democratic government in the country.' This interview became the rallying cry for the opposition which voiced the sentiments of 'No reelection.' It precipitated the book of Francisco I. Madero—*La Sucesion Presidencial en 1910*; it unquestionably hastened the revolution.—F. Starr, *Mexico and the United States*, p. 253.

1909.—Last year of presidency of Diaz.—His long practical autocracy, and its effects on the nation.—Since Napoleon remodeled a French republic into an empire there has been nothing of its kind in political workmanship to equal the masterpiece of practical autocracy which Porfirio Diaz erected in Mexico, on a basis of nominal democracy, within 30 years. On December 1, 1909, Diaz entered the last year of his presidency. "It is only fair to Diaz to say that his long rule has been divided by the historians into two periods: the first, when he governed without help; the second, when, as he grew older, he came under the influence of a group of advisers, consisting of his Cabinet and the so-called *científicos*, who were not really scientific men, as the Spanish term implies, but merely clever, unscrupulous persons, solely on the outlook for their own interests. The first part of Diaz' rule was much better than the last. At the first, the Indians loved him; at the last, they hated him. Under the influence of his advisers, his love of power grew, until it robbed his administration of even the pretense of justice. . . . The Mexican Congress under Diaz resembled a school debating society. The members spent their time listening to minutes of the last meeting, and holding debates of a literary character. Occasionally they all stood up and waved their hands in the air, which was their way of voting approval of one of Diaz' decrees. In a free country like the United States the elections are always hotly contested. Does it not seem strange that in Mexico, with many millions of inhabitants, *not one vote* should be cast for any one but the President for eight successive elections? It is more than strange—it is incredible—unless the presidential forces were in complete control of the voting booths. And such was the case. Not one real election was held during all the Diaz régime. So it came about that in spite of the wealth and apparent prosperity and order which came to Mexico under the rule of Porfirio Diaz, there was discontent all over the land. There was discontent among the peons, toiling until they dropped in mines and plantations; there was discontent in the army, which held so many men drafted unwillingly on account of being obnoxious to the Government that it was called the 'National Chain-gang'; and there was discontent among the educated people of democratic ideas, who saw that Porfirio Diaz, once a leading Liberal, had become a worse despot than the Czar of Russia. Such discontent is never repressed for long. Suddenly, towards the close of the last century, Liberal clubs began to organize. At first there was nothing political in their nature. No, indeed! They had merely organized for purposes of peaceful reform. But by and by, towards the beginning of the twentieth century, it was rumored that the Liberals planned to nominate a candidate of their own at the next Presidential election. This was going too far! Their meetings, no matter how peaceful, were broken up by the police, their members imprisoned or drafted into the army. As a consequence the Liberal party disappeared; but it was not long before the Democratic party took its place. This party, organized

in 1909, adopted a program of reform, but at the same time nominated Diaz for President in the coming election. However, they named for Vice-President a different man from the Government candidate. The Government objected strongly and began oppressing the Democrats as it had the Liberals. But the feeling of the opposition had grown so deep that persecution only aroused, instead of suppressing it. Steadily the Democratic movement grew. Finally the members had the audacity to nominate their own candidate, Francisco I. Madero, for President against Diaz."—L. S. Hasbrouck, *Mexico from Cortés to Carranza*, pp. 292-295.

PORFIRIO DIAZ

1910-1913.—Revolution.—Fall of Diaz.—Madero in power.—Uprisings.—Criticisms of Madero.—His fall and death.—Dictatorship of Huerta.—"Long immunity and an atmosphere of adulation had rendered Diaz absurdly confident in his power, and in common with the *Scientíficos* he remained up to the last moment entirely blind to the powerful spirit of revolt among the people. On the other hand, he allowed himself to be foolishly irritated by some mild attacks made upon him by an academic politician named Francisco Madero, a member of the wealthy and influential Madero family of Jewish origin. To draw this new enemy into the open and test his strength, Diaz cunningly announced that he would not present himself again as candidate for President. Cunningly, we say, but not wisely, for Madero immediately announced himself as candidate for President on a radical platform which insured him the support of the whole Mexican common people. The audacity of the move caught Diaz off his guard. Unable to stem the tide of popular enthu-

siasm for the new candidate, he threw him into jail, and when the elections came due in July, 1910, had himself proclaimed once more President of Mexico. Even then he failed to recognize the real seriousness of the situation, and yielding to the pressure of the wealthy and powerful Madero family he released Francisco Madero on bail, and permitted him to flee the country, confident that he had received sufficient warning to keep him from creating further disturbance. In this he was entirely mistaken. Encouraged by the tremendous success of his campaign, Francisco Madero, before leaving Mexico, drew up and signed a manifesto [Plan of San Luis Potosí] calling upon the people to rise in arms for the defence of the following principles: 1. Effective suffrage (free ballot). 2. Non-re-election (single term for all executive officers throughout the country). 3. Restoration of the lands of

FRANCISCO INDALECIO MADERO

the common people. After he had gained the temporary safety of the United States he caused this manifesto to be widely distributed throughout Mexico. The response was tremendous. Through the activity of the Liberal junta the Mexican people were already well aware of the strong fraternal feeling of the American labour organizations toward them, and their spirit was consequently no longer crushed by fear of United States intervention. In the month of November, 1910, Castulo Herrera, president of the Boiler Makers' and Mechanics' Union, and Pascal Orozco, a small commission merchant, started the revolt with a handful of mountaineers in Chihuahua. It was a fitting thing that the state which saw the massacre of Tomochic, Temosachic, and Guerrero should fire the first shot in the new struggle against the oppressor. Within a few weeks the entire country was ablaze. In Durango, Coahuila, in Zacatecas and Sinaloa, thousands of peons flocked to the

standard of revolt. In the State of Morelos, Emiliano Zapata and Eufemio Zapata, his brother, dispossessed small land-owners, gathered a strong force of peons under their leadership and entered upon an uncompromising fight for their liberties. In Guerrero, Ambrosio Figueroa headed a similar uprising, while in the old revolutionary states of Jalisco, Nuevo Leon, and Tamaulipas, where some remnants of the agrarian democracy still remained, the people rose to a man. . . . Meanwhile the Científicos had awakened to the fact that Madero personally would prove as convenient a tool as Diaz, and that his installation as President would put an end at once to a condition of affairs that was beginning to prove ruinous to their financial operations. Accordingly Porfirio Diaz was dismissed from the presidency. Francisco Leon de la Barra, the recognized leader of the Catholic Church, was proclaimed provisional President in his place, and the nation was summoned to a constitutional election. This change of tactics was entirely successful, and the peons gladly threw down their arms to engage in the political struggle. In order to keep some check upon Madero, the Científicos then endeavoured to force the candidacy of Francisco Leon de la Barra upon the people as Vice-President; failing in this they put him forward as candidate for the presidency itself. The people, however, were fully alive to the issue and the first phase of the Revolution closed in an incredibly short space of time with the election of Madero as constitutional President of the Republic of Mexico by the largest popular vote ever cast for a President in the history of the country."—L. Gutiérrez de Lara and E. Pinchon, *Mexican people: Their struggle for freedom*, pp. 345-346.—"Francisco I. Madero, who was elected President on October 2, 1911, with Pino Suarez as Vice-President, was in every respect a contrast to his predecessor. He was a sincere idealist who really believed in his mission to restore freedom to Mexico and in the practicability of free elections and an impartial judiciary. He was anxious to conciliate all parties, and disgusted his northern supporters by his moderation towards the defeated. Through his family he was in touch with the ruling class of the old régime, and he made no general change in the administrative officials. Gustavo Madero, who was his brother's political manager during the revolution and after his advent to power, was a man of a completely different type who employed to some extent the violent and corrupt methods of the Diaz system in support of the new régime. His power was based on the Extreme Democrats, while the rest of the family were Conservatives. The new Government failed utterly to put an end to the disorder which had broken out everywhere on the fall of Diaz. In the south Zapata, whose followers were chiefly Indians, and who demanded the division of a third of the arable land amongst the peons, was supreme in Morelos, and there was another serious rising in the Isthmus of Tehuantepec. In the north General Reyes's attempt at the end of 1911 was a complete failure, but in the following spring a far more serious rising under Pascual Orozco and Vasquez Gomez broke out in Chihuahua. . . . Their party included many of the leaders of Madero's rising, and in a short time Orozco had made himself master of the whole state. However, in May the Federal forces under General Huerta inflicted some severe defeats on the insurgents and after July they were reduced to guerrilla fighting. In October 1912 the new Congress met—the result of the first free election that had taken place for at least a generation.

The official government party, known as the Constitutional Progressive party, was under the management of Gustavo Madero, but the President had also encouraged the formation of the National Catholic party under the leadership of Señor Gamboa, which was to play the part of an official opposition. There were in addition several independent parties. Although the elections were free the final results were said to have been manipulated by Gustavo Madero so as to leave 190 out and 232 seats in the hands of the supporters of the Government. . . . By the autumn of 1912 the situation of the Government had become very precarious. The President had quite lost his popularity with the Liberals, while Gustavo had aroused the hatred of the official classes and of the supporters of Diaz. On October 23, 1912, the attempted rising of Felix Diaz, nephew of the dictator, at Vera Cruz was crushed and its leader captured. Thus the two chief opponents of Madero, were both prisoners; it is characteristic of the moderation of the President that neither of them was executed."—*Handbook of Mexico (Prepared by the Geographical Section of the Naval Intelligence Division, Naval Staff, Admiralty Great Britain, pp. 86-88)*.—"Among the criticisms of the President [Madero], which were heard on every hand, were such as these: First: He had not destroyed the old régime, root and branch. He had promised to do so. When the time came to carry out his promise, he found it difficult and inexpedient. . . . Second: He had not kept his promises in reference to a complete investigation and overhauling of the financial affairs of the old administration. In the Plan of San Luis Potosi he had definitely promised [to do so]. . . . Third: In the same famous document Madero had said: 'by taking advantage of the law of public uncultivated lands numerous small proprietors, for the most part indigenes, have been despoiled of their property, either by the approval of the Secretary of Fomento or by decisions of the tribunals of the Republic. It being the part of justice to restore to their ancient possessors the lands of which they had been despoiled in a mode so arbitrary, such dispossessions and judgments are declared to be subject to revision, and it will be demanded of those who have acquired them in a mode so immoral, or from their heirs, that they should restore them to their primitive owners, to whom also they will pay an indemnity for the losses suffered. Only in the case where such lands have passed to a third party before the promulgation of this plan, the ancient proprietors will receive indemnification from those in whose benefit the spoliation took place.' This was one of the powerful influences which had helped him in his revolution. The fact that he had promised to the dispossessed the return of their little properties had been a mighty factor in his favor. It was easy for the leader of a revolution to make such promises. It was difficult for a man at the head of the government to keep them. Fourth: It is probable that the election of Madero was honest; it was more nearly a genuine election than Mexico had known for many years. But if his own election was honest, the same could not be said for that of the Vice-President, Pino Suarez. To secure the election of his friend and helper in the revolution, Madero lent himself to the same unscrupulous methods of which he had complained so bitterly under the old régime. Fifth: One of the chief complaints against Porfirio Diaz was that he held unfit, unpopular, and wicked men in office, simply because they were devoted to his personal interests or could be depended upon, on

account of their own interests, to support him at every cost. No one had more loudly complained of this condition than Madero. Yet once in power, he forced unpopular officials upon the public simply because they were his friends or relatives. Pino Suarez had no claim to be made Governor of Yucatan, a post of special difficulty and delicacy; nor was he the man for Vice-President of the Republic. Nor was it wise to use his own personal family largely in official life. A brother and an uncle in the Cabinet was too large a representation. . . . Sixth: Money had been squandered; the treasury was empty; the nation faced bankruptcy. Worse, the Secretary of the Treasury, Ernesto Madero, was arbitrary in his rendering of accounts. He claimed the right to disburse large sums of money without a statement as to the purpose of expenditure. The money which the family claimed to have expended in the conduct of the revolution had been reimbursed. The very respectable sum of 700,000 pesos was entered as a single item without a word as to its destination. Here indeed was opportunity for suspicion, and it was claimed by many that this large sum was the return of loans from American interests, who had advanced aid to the revolution. Seventh: Under the influence of Gustavo Madero and Pino Suarez, it was claimed that the idealist, the Democrat, was tending toward an autocracy as arbitrary as that of the old dictator. Eighth: Doubt was felt as to the sincerity of Madero in the matter of reflection. . . . This doubt was increased by the fact that the President had already broken pledges made in the Plan of San Luis Potosi. If he had not destroyed the old régime, if he had not investigated their financial record, if he had not taken steps to restore the properties to the little dispossessed land-owners, what reason was there to believe that he would hold to the motto of his revolution—effective suffrage and no reflection? These were but a part of the just causes of complaint so violently urged in the opposition press and on the floors of Congress."—F. Starr, *Mexico and the United States*, pp. 316-319.—"In February, 1913, came the blow that put an end to all of Madero's efforts and aspirations. A military uprising in the city of Mexico made him a prisoner, forced him to resign, and set up a provisional government under the dictatorship of Victoriano Huerta, one of his chief lieutenants. Two weeks later both Madero and the Vice-President were assassinated while on their way supposedly to a place of safety."—W. R. Shepherd, *Hispanic nations of the New World*, pp. 202-203.

Also in: D. Hanny, *Diaz*, pp. 293-306.

1910-1923.—Agrarian situation.—Growth of peonage.—Absentee landlordism.—Origin of land companies.—Reforms.—"During the epoch of Diaz, the current sophism of the landowners seeking to excuse themselves to compassionate foreigners for the miserable condition of the peon was: 'The huge landed estates have nothing to do with the poverty of the masses, for the Indians would not till the soil even if each one of them owned a ranch.' This statement is false, not only in the light of history, both before and after the conquest, but also at the present time [1910], as any one may discover for himself by travelling a little. I have journeyed many miles through rich, extensive valleys owned by absent millionaires (who lived in the capital of the States or in Europe) where the only dwellings were huts erected within the boundaries of the farm and inhabited by the miserable serfs of the region. The free Indians were confined to the neighboring

mountains, where very often they had under extensive cultivation, slopes as abrupt and arid as the thatched roof of a hut, while at the foot of the hills spread the monotonized valleys of badly cultivated lands. The Mexican farm (*hacienda*) is a modern representative of the old Phœnician latitud; that pernicious agricultural system of extensive lands owned by absentees and worked by serfs which caused the ruin of Carthage. . . . Although slavery was abolished in Mexico in the year 1810, the War of Independence did not give freedom to the land slave, or peon. Peonage is absolutely forbidden by article Five of the Federal Constitution; . . . but notwithstanding, it flourished everywhere during the Díaz régime, and the principal duty of the *Rurales* was to maintain it. A peon was enslaved not only for his own debts, but also for those of his father, as debts were transmitted from father to son in an interminable chain. His debts increased constantly, because his ordinary salary was insufficient for the sustenance of his family, and consequently he was bound to request advances of money on the eve of religious holidays for which he received no pay. These advances usually amounted to \$20.00 or \$30.00 in the year, and he was never able to pay them off so as to be finally free from indebtedness unless the manager or 'majordomo' of the *hacienda* cancelled the debt as a special favor. The average salary of a peon—18 to 25 cents per day—which prevailed in Puebla, for example, at the time of President Lerdo de Tejada, was not insufficient then, because with it the peon was enabled to provide food and cover for his family which compared favorably with what was given to cattle. But in 1910, the day wages in Puebla were 25 to 37 cents, the increase since 1870 being merely 50% while the price of corn had increased 200% and that of chile 800%; an investigation made by the Federal Department of Communications and Industry in 1913 has proved that this condition was not merely local, but prevailed almost everywhere in the country. The peon in the '*haciendas*' had truly reached the 'minimum of subsistence' of the classical economists; had he received one cent less, he would have starved. . . . As the '*haciendados*' refused to increase salaries while the price of necessities rose, the peon, conquered by hunger, was forced to escape and try to secure work in the mines or in the cities. The inhabitants of the farms near the railway were often successful in their flight; but in sections farther from the railroad they were caught and if the first and second attempts resulted simply in a beating, the third meant two years in the army. . . . In order to replace the peons who escaped from the '*haciendas*' situated in the highlands, and to obtain new victims for the inhuman conditions of tropical agriculture existing in Yucatan and in the Valle Nacional, the system of 'enganche' was installed with the help of the *Rurales*. [See also PEONAGE: Mexico.] . . .

"In the year 1910, at the beginning of the last Revolution, the ownership and the value of Mexican lands was as follows:

Kinds of Land	Area Square kilmts.	%
11,000 ' <i>Haciendas</i> '	880,000	44
18 ' <i>Land Companies</i> '	80,000	4
Other <i>Land Companies</i>	120,000	6
' <i>Sitios</i> ' and ' <i>commons</i> '	120,000	6
Small ranches	400,000	20
National Lands	400,000	20
Total Rural property	2,000,000	100

. . . This table shows a concentration of property which is surprising: 11,000 *haciendas* embrace 44% of the total area of the country, and the best lands at that. The average area of these farms is about 80 square kilometers (8,000 hectares), the equivalent of three square Spanish leagues. When, as is often the case, one person owns several farms, his holdings constitute a colossal amount. In this way, therefore, Luis Terrazas, in Chihuahua, owns about 60,000 square kilometers, a larger area than that contained in all Costa Rica; and the Central Mexican Railway in Hidalgo traverses thirty leagues of land belonging to José Escandón. The estates of Lorenzo Torres, in Sonora; of the Gurza brothers, in Durango; of 'Los Cedros,' in Zacatecas; of Inigo Noriega, in the State of Mexico; of García Pimentel, in Morelos; of Juventino Ramirez, in Puebla; and of the Madero family, in Coahuila; are a few of the many examples which could be quoted of enormous family estates throughout the country. The estates of the eighteen more important land companies average 4,444 square kilometers each, that is to say, about one half of the area of Portugal; while about a dozen other companies are in possession of ten per cent (10%) of the total area, that is to say, one half of what is owned by the small farmers, and about 67% more than the land which constitutes communal property. The whole free population of Mexico is, therefore, restricted to practically one-fourth of the total area, and this consists of the poorer class of land; while the greater part of the national lands is taken up by mountainous or desert lands, or marshes. At the present time, [1910] several thousand individuals and a few companies hold the power to exclude a nation of fifteen millions from the best lands of their own country. The small ranches of the present day originated principally from the division of the national lands which began in 1821, or of the '*commons*,' which started in 1856. Some of the '*haciendas*' date from the period of the Conquest, (and they have often increased by the acquisition of lands from the division of national lands or of commons) while others are formed from lands that belonged to the nation and which were created in order to benefit fortunate politicians. It now remains for us to explain the origin of the vast possessions of the land companies. European capital, not Spanish, began to pour into Mexico at the same time that the new Creoles began to settle here, after the year 1821; but foreign wealth was invested principally in mining and commercial ventures. Although the first railroad, from Vera Cruz to Mexico City, was completed in 1873, it was only when the Central Railway (Mexico City to El Paso) was finally in operation in the year 1884, that the real influx of foreign capital into the country began. Besides mines and railroads, ranches and woods offered great and sure sources of profit. The best woods were the property of feudal landowners who generally refused to sell, since they had kept their '*haciendas*' with an eye to political influence and social prestige, sometimes from personal vanity, as well as for the rental value of the property. After the '*haciendas*' the best large properties were the undivided commons of the Indians, and very soon the ambitious speculators in land found 'defects' in the titles of ownership, and won President Díaz to their side. Between the years 1883 and 1894, a series of decrees was issued under the name of '*Leyes de Deslindes*' ('*Leyes sobre Tierras*,' 1863 a 1912, Sec. de Fomento, México, D.F.), '*Boundary Laws*,' which ruined financially thousands of Indian villages lo-

cated principally in the North and the West. The system followed was this: The natural boundaries of the 'ejidos,' as described in the royal concessions of the year 1573 and following ones, were declared null, and all the lands of an 'ejido' over and above the 'sitio' (one square league), were called 'demasias,' (excess) and liable to public protest and claim. Then the Mexican politicians established what was known as the 'Compañía de Deslindes' (Demarcation companies) with the object of securing concessions from the Federal Government to carry out the survey of a State in whole or in part. In exchange for such survey, (generally cheap, inaccurate, or even fraudulent), the company received on account of the concession, two-thirds of the surface of 'the excess' which it found within the commons. Not only that, but often, after the topographic survey had been made, the 'sitio' for the Indians was allotted from the poorer land, and they were notified that they had to vacate their original grant, or pay rent. If any of them opposed this measure, a force of Rurales was detailed to 're-establish order,' and to apprehend or, if necessary, to shoot the recalcitrants. The surveying companies had also the option to purchase the third left of the national excess, and of any other public lands comprised in their concessions, at a normal price, (usually, 50 cts. Mex. per hectare) under some pretext, such as that of 'projected colonization.' About one year after a company had secured in this manner all the land which it wanted, it would allege impossibility to colonize; and immediately, the complaisant officials would relieve it of a fine amounting to about 25 cts. Mex. per hectare. Feudal land-holders lost nothing through the surveying operations, and the more ambitious ones had an opportunity for gain, whether as shareholders in the companies, or by annexing to their farms, under some plausible pretext, choice sections of the land which might still have been left within the 'commons.' These Land Companies were surreptitiously incorporated in the United States or in Europe, with a view to impede any efforts which a native government might make to annul at a future time land titles thus secured."—R. B. Brinsmade, *Mexican problems (pamphlet)*, pp. 3-4, 8-11.—"Realizing that there would be no peace until land monopoly had been corrected, the leaders of the revolution determined to make the Indian villagers independent of the hacendado by providing them with land on which they might grow their food. Early in 1915 the Carranza government put out an 'agrarian law' which called for a National Agrarian Commission, with a local agrarian commission in every state, which should pass on petitions for ejidos. If such were approved, the village should receive land either as 'restitution' or 'donation.' Wanting a claim for 'restitution,' the village might be 'donated' land sufficient to provide each head of a family or male over eighteen years of age with twelve and one-half acres of irrigated land, or fifteen acres of plow land not irrigated, or inferior land in proportion. For villages near the city or the railway the allotment was one-third or two-fifths less. The new ejido was to be carved from the surrounding properties exceeding a certain maximum, which ran from 375 acres to 1250 acres according to the quality of the land. Land reform was not pushed energetically under Carranza and this was one cause of his downfall. Since the Obregon government came in in May 1920, much energy has been shown in putting through this program, so that the agrarian commissions are now about halfway down their row. Three thou-

sand, or nearly one half, of the villages of Mexico have petitioned for land. Of these petitions about one hundred have been denied, twenty-four hundred are pending, while five hundred and twenty have actually received land. Of this, 600,000 acres have been 'restituted,' while 1,500,000 acres have been 'donated,' out of the larger adjacent properties. Altogether about a thousand haciendas have been nicked. When, in about two years, the work is completed, it will take rank as one of the giant agrarian adjustments of history. . . . As authorized by the Constitution of 1917 and on lines which it lays down, several of the states have passed agrarian laws of their own. Of these the pace setter is San Luis Potosi, which aspires to lead Mexico in constructive reform legislation. . . . Here the hacendados are given a year to 'fraction' their estate and if they neglect to do so the State may go about it. In the western semi-arid section of San Luis Potosi the owner may reserve for himself any block of 10,000 acres in his hacienda; in the middle section 7,500 acres; in the well-watered eastern section 5,000 acres. The rest may be taken, divided into single-family farms and sold on installments to persons who are equipped to work a farm. . . . The states of Michoacan, Durango, and Zacatecas have passed laws modeled more or less on that of San Luis Potosi. Last spring the state of Chihuahua passed a law which fixes the maximum holding at 2,500 to 10,000 acres (depending on the water supply) plus 100,000 acres of grazing land. Governor Truchuelo of Queretero is a strong man. For example, he cleaned up the ejidos matter in short order. He convened the fifty big land owners in his small state, convinced them that land reform is inevitable and got them to agree to fit out the twenty-five petitioning villages with ejidos and to take the bonds offered them. Now he proposes that his state break up the big haciendas by taking land holders progressively according to the amount of their holdings and to fix a term of years, say seven, at the expiration of which no one in the state shall own land in excess of 3,750 acres. The state of Vera Cruz has been notorious for its drastic land policy."—E. A. Ross, *Land reform in Mexico (New Republic, Apr., 1923)*.

1913-1914.—Huerta in power.—Refusal of United States to recognize his administration.—Revolt led by Carranza and Villa.—Arrest of United States marines at Tampico.—Mediation conference at Niagara.—Fall of Huerta.—"Huerta was a rough soldier of Indian origin, possessed of unusual force of character and strength of will, ruthless, cunning, and in bearing alternately dignified and vulgar. A *científico* in political faith, he was disposed to restore the Diaz régime, so far as an application of shrewdness and force could make it possible. But from the outset he found an obstacle confronting him that he could not surmount. Though acknowledged by European countries and by many of the Hispanic republics, he could not win recognition from the United States, either as provisional President or as a candidate for regular election to the office. Whether personally responsible for the murder of Madero or not, he was not regarded by the Ameri-

can Government as entitled to recognition, on the ground that he was not the choice of the Mexican people. [See U.S.A.: 1913 (October).] In its refusal to recognize an administration set up merely by brute force the United States was upheld by Argentina, Brazil, Chile and Cuba. The elimination of Huerta became the chief feature for a while in its Mexican policy."—W. R. Shepherd, *Hispanic nations of the New World*, p. 203.—"Venustiano Carranza, governor of Coahuila during the Madero administration, and an earnest friend and supporter of Madero, refused from the first to acknowledge Huerta as President and lost no time in organizing a revolt against him. . . . The first act in the war drama was played by General Obregon. . . . He was now put in command of the forces raised, and fought a fierce battle with the Federal troops, driving them from

VICTORIANO HUERTA

the whole of Sonora except the port of Guaymas, which they continued to hold. At the same time Villa, who had so narrowly escaped execution at the hands of Huerta, and had no love for that personage, organized a force in Sonora, while Urbina did the same in the north of Durango. The greatest difficulty of the revolutionists at this stage of the conflict was the lack of arms and money, but this was partly overcome by the Madero family, which contributed \$1,000,000 in support of the movement. [See also U.S.A.: 1914 (April): Mexican situation.] . . . The Constitutionalists were ready to make peace, but only on the acceptance by the Mexican people of the following conditions: 1st. The elimination from the government of Huerta and his supporters. 2d. Complete surrender to the Constitutionalist cause of the political faction opposing it. 3d. Restoration of the Constitution as the basis of the Mexican government. 4th. Selection of a Provisional President acceptable to the Constitution-

alists, and suitable provision for a popular election. 5th. Guarantee of a change in the land laws so that deeds to land would be more generally distributed. 6th. Ratification of the confiscation of the Terrazas, Creel, and other large landed estates. 7th. Nullification of all acts of the Huerta régime. Such were the planks of the platform for which the Constitutionalists were fighting, and such the state of affairs existing on December 1, 1913."—C. Morris, *Story of Mexico*, pp. 276, 278-279, 285-286.—May 13, 1914, the Carranza forces captured Tampico, depriving Huerta of his base in the north and the chief remaining source of revenue. "The order to assemble a great naval force at Tampico, on the Mexican coast, was issued by Secretary Daniels, on the President's instruction, on Tuesday, April 14 [1914]. . . . A few days earlier several American bluejackets had been arrested in Tampico and detained by the Federal soldiers who were in control of the place, and against whom the Constitutionalist troops were at that time fighting."—*Review of Reviews*, May, 1914, p. 517. (See also U.S.A.: 1914 (April): Occupation of Vera Cruz.) "On April 27 [1914] it became known, through the Spanish Ambassador at Washington that the offer laid before General Huerta by the representatives of the three A. B. C. powers in Mexico City had been accepted 'in principle' by him. . . . The date for the meeting of the conference was set for May 20 [1914] at Niagara Falls, Canada, so that the deliberations might be on neutral ground."—*Ibid.*, June, 1914, pp. 670-671.—"On May 20 the mediation conference was opened at Niagara. It was suggested that Huerta should resign, and that a government should be formed under a provisional president nominated by Huerta, which should hold office until a new government pledged to reform should be installed. This plan, however, was wrecked by the refusal of Carranza, supported by President Wilson, to recognize any government appointed by Huerta, or including any of his supporters. It was indeed obvious that the Constitutionalists were now masters of the situation."—*Handbook of Mexico (Prepared by the Geographical Section of the Naval Intelligence Division, Naval Staff, Admiralty Great Britain, pp. 92-93.)* (See also A B C CONFERENCE.) Huerta finally realized that his situation was hopeless and left Mexico City, July 15, 1914, embarking with his family from Puerto Mexico for Spain. The following year he returned to the United States, and was arrested on charges of conspiracy to start a revolution, but died before his case came up for trial.

1914-1915.—Convention at Aguas Calientes.—War between Carranza and Villa.—Carranza recognized as provisional president of Mexico by the United States and principal countries of South America.—"The Federals, on Huerta's departure, ceased serious opposition to the constitutionalist cause, and within a month General Obregon occupied the capital. Felix Diaz, who had returned to the country, announced that he would start a new revolution. In the north Maytorena led an uprising in Sonora. Obregon and Villa, sent to suppress the outbreak, fell out, and Villa placed Obregon under arrest. Obregon managed, however, to escape and return to Mexico City, while Villa, after announcing himself as dictator of Northern Mexico, declared war on the

Constitutionalists, so that, five weeks after the latter had occupied Mexico City, they had a new revolution on their hands. Leaders in Mexico City called a national convention, to meet at Aguas Calientes, partly for the purpose of organizing a permanent government and partly to secure, if possible, a union of all parties in a new program. Villa, at the head of a large force of light cavalry, swept down unexpectedly from the North, and overawed the convention, which resulted in the formation of a Villa-Zapata party called the Conventionalists. The Constitutionalists, meanwhile, had organized a government in the Capital. One of their first acts was to ask the United States to withdraw its troops from Vera Cruz, which was evacuated by the American forces on November 23rd [1914]. The Belgian minister was given his passports as a result of a communication which offended the government. The government took over the operation of the National Railways, partly for military reasons and partly, doubtless, as a source of income. At the same time the government took possession of the tramways system in Mexico City. The Constitutionalists, threatened by the Zapata forces from the south and Villa forces from the North, decided to evacuate Mexico City, and withdrew on November twenty-fifth, going to Vera Cruz, which then became their headquarters. . . . Mexico City, during the next two months, witnessed a series of political and military shifts probably never equaled in history. Zapata occupied the city on November twenty-fifth. . . . Ten days later Villa entered the city with a large force and was soon wrangling with Zapata over the latter's suggestion that Emilio Vasquez Gomez should be named President. The Zapata forces withdrew from the city the first of December to engage the Constitutionalist army, abandoned the capital. In the meanwhile Gutierrez, installed as provisional president by a combination of different elements in the city, including Villa, had refused to be Villa's tool and had to flee, being succeeded by Roque Gonzalez Garza. The latter now attempted to reach some arrangement with Carranza, but, the negotiations failing, he left the city, Obregon, with the Constitutionalist troops, reëntering on January twenty-eighth. . . . Villa proclaimed himself dictator of all Mexico and, with a large force supporting him, he threatened to make his claim good. Obregon . . . on March eleventh, again evacuated Mexico City, the 'Zaps' marching in and assuming control of affairs. The seat of government continued to be in Vera Cruz, from which point General Carranza directed the campaign. The Constitutionalist armies led by Obregon, Gonzales and Trevino, had the great advantage that they were acting in a common cause and were loyal to one chief, while their opponents, Villistas, Zapatistas and other 'istas' were running more or less individual affairs and unlikely to act in unison. The campaign was pushed through the Spring and early Summer of 1915. Obregon, operating in the North, defeated Villa forces in many skirmishes and some heavy fighting. Trevino dislodged Villa troops from important points in Tamulipas and Nuevo Leon, and Gonzalez, by a long series of operations, secured control of all territory surrounding Mexico City. On July tenth the Zapatistas evacuated the City, and the Constitutionalists again took possession."—E. D. Trowbridge, *Mexico*, pp. 151-152, 154-155.—In October, 1915, Carranza was recognized as the provisional president of Mexico by the United States and the principal countries of South America.

1916-1917.—Villa's raids into New Mexico.—General Pershing ordered to Mexican border.—American troops in Mexico.—Carranza demand for the immediate withdrawal of American troops from Mexico.—Battle of Carrizal between Carranzistas and United States troops.—Gradual withdrawal of American troops.—In the spring of 1916 Villa, with a small band, crossed into New Mexico and killed a number of Americans. To prevent further outrages President Wilson sent a detachment of the regular army, under the command of General Pershing, to pursue Villa. The troops penetrated more than a hundred miles into Mexico, but were unable to capture the bandit. "Carranza was supposed to consent to the invasion, but in April, a month after the Americans had entered, a small force of United States soldiers were attacked by his men. This led to a dispatch of heavy reinforcements to General Pershing and

VENUSTIANO CARRANZA

the general contraction of the American lines. The pursuit of Villa was virtually abandoned, but our troops were still kept in the country. On May 31, the United States government received a note from Carranza stating that the Pershing expedition had gone into Mexico without Carranza's consent, and asking for the immediate withdrawal of the American troops in Mexican territory. On June 16, Carranza's representative, General Trevino, informed General Pershing that if the American troops moved in any direction but northward it would be considered a hostile act. . . . President Wilson informed Carranza that he refused to withdraw the American troops and that any attempt to expel the American troops by force would be followed by 'the gravest consequences.' Then occurred the battle at Carrizal, Chihuahua [see U.S.A.: 1916 (March): Villa], where Pershing's soldiers were ambushed by Carranzistas and a score of them killed. The responsibility for this affair has never been fully fixed. Secretary Lane called the explanatory statement submitted by the Mexican government 'a

formal avowal of a deliberately hostile action.' Soon after, President Wilson accepted Carranza's offer for a joint commission to confer regarding the withdrawal of American troops and the origin of bandit raids. This commission met in September and continued till November, when it drew up a protocol. Carranza found this unsatisfactory and refused to sign it. The Pershing forces were gradually withdrawn from Mexico during the winter of 1917, the National Guard having returned to their homes by detachments during the fall. [See U.S.A.: 1917 (January-March).] Though the expedition had not succeeded in capturing Villa, it showed that the United States was ready and able to protect its border against his or similar depredations. . . . He was soon defeated by Carranza and his faction under the leadership of General Obregon. . . . For a year or more his whereabouts and even existence were in doubt. In the fall of 1917 . . . he reappeared. . . . He attacked the Mexican town of Ojinaga with a small force, and defeated the Carranzista troops, but the victory was unimportant."—L. H. Hasbrouck, *Mexico from Cortés to Carranza*, pp. 322-324.

1917.—New constitution.—"The new constitution was promulgated with great solemnity on February 5, 1917, and became operative on May 1, 1917. The new constitution . . . follows the principles of the constitutions of the United States and of New Zealand and Australia. Its main differences as compared with the old constitution are: the independence of the Judicial Power, the division of large estates, the creation of small property and homestead, the autonomy of municipalities as the basis for the political organization of the States, the establishment of the basis on which Congress and the State legislatures may legislate on labor matters and labor contracts, and the recognition of the right of the workmen to strike and of the employers to the lockout."—*Latin-American Year Book*, 1920, p. 438.

1917-1918.—Efforts to make peace.—Neutrality in World War.—Refusal to take part in League of Nations.—Part in final re-adjustment of peace.—Meeting of new congress.—Improvement of political and social conditions.—"On Feb. 11, [1917] the Government of Mexico addressed a note to each of the countries still neutral in the European war, including the United States, proposing in an effort 'toward bringing about the earliest possible termination of the European war, or at least so circumscribing it as to remove the possibility of future complications and thus bringing into sight an early ending,' that 'the groups of contending powers be invited, in common accord and on the basis of absolutely perfect equality on either side, to bring this war to an end, either by their own effort or by availing themselves of the good offices of friendly mediation of all the countries which would jointly extend that invitation. If within a reasonable term peace could not be restored by this means, the neutral countries would then take the necessary measures to reduce the conflagration to its nar-

rowest limit by refusing any kind of implements to the belligerents and suspending commercial relations with the warring nations until the said conflagration shall have been smothered.' [The text of the note goes on as follows]: 'The Mexican Government is not unconscious of its somewhat departing from the principles of international law which have heretofore regulated the relations between neutrals and belligerents when it offers its propositions; but it must be admitted that the present war is a conflict without a precedent in the history of mankind that demands supreme efforts, and novel remedies that are not to be found among the narrow and somewhat selfish rules of international law as accepted until now. Mexico believes that, confronted by a catastrophe of such large proportions the like of which never was seen, by a war in which political, social, military, and economic factors that could never be foreseen have been brought into play, it can not go astray in proposing that the remedies to be applied to the conflict be also new, extraordinary, and commensurate with the circumstances. The Government of Mexico understands that no neutral nation, no matter how mighty, could singly take a step of this character, and that the measure can only be brought to a successful issue through the coöperation of the neutral governments wielding the greatest international influence with the belligerent nations. It is specially incumbent on the United States, Argentina, Brazil, and Chile in America; Spain, Sweden, and Norway in Europe, as being more influential and freer to arrive at a decision toward the belligerents to father an initiative which is none the less worthy of thorough study and earnest consideration than for its coming from a nation which is supposed to be weakened at present and therefore incapable of any effective international effort. The Government of Mexico cherishes the hope that if this idea is accepted and put into practice it may serve as a precedent and basis for a new shaping of international law that would give neutrals the opportunity to assist in preventing and mending future international wars while most strictly respecting the sovereignty of the belligerents.' In its reply, dated March 16, the American Government expressed its regret at its inability to accept the proposal of the Mexican Government and referred to the futile peace efforts of President Wilson, the recent activities of the German Government and the position taken by the Government of the United States in reply to the Austro-Hungarian note of Aug. 12, 1915, with reference to the shipment of munitions of war to the belligerents. The note concluded: "The President would not be understood, however, as desiring to impede the progress of a movement leading to the resumption of peaceful relations between all of the belligerents, and would not, therefore, wish the Mexican Government to feel that his inability to act in the present stage of affairs should in any way militate against the attainment of the high ideals of General Carranza by the coöperation of other neutral Governments in the use of their good offices and friendly mediation to bring about the end of the terrible war which is being waged between the great powers of Europe.'"—F. G. Wickware, ed., *American Year Book*, 1917, pp. 49-50.—"The Mexican Republic observed, as it is well known, a perfect neutrality during that conflict, for even though certain enemies of the Government and people interested on various occasions expressed the opinion that the Mexican Government was not strictly neutral, it must be admitted that no one may at

present nor shall ever be able to mention an act or omission of the Mexican Government to prove the slightest breach of our neutrality if judging in accordance with the most exacting principles of International Law, of the Treaties in force and of practices universally established. But at the same time, most unfortunately, the rights of Mexico as a neutral were not always duly respected, for some United States warships remained in exceptional cases over twenty-four hours in our territorial waters, and have constantly been and still are anchored in Tampico, under the excuse of affording protection to their citizens. When the struggle was over the Governments of the Allied Powers got together to constitute a League of Nations, to which it was said that almost all countries would have access under certain conditions; all of them were invited excepting a few, Mexico among them, and our Government has done nothing, nor shall ever do, to enter into that international society, because the bases upon which it was formed do not establish, neither as to its functions nor as to its organization, a perfect equality for all nations and all races, while the Mexican Government has proclaimed as the main principles of its international policy that all the powers of earth must have the same rights and the same obligations, and also that no individual may pretend to be placed in a privileged situation nor demand extraordinary protection in a country under the pretext of being a foreigner or for any other reason. In view that the acceptance of the Monroe Doctrine was discussed at the Paris Conference, the Government of Mexico found itself compelled to make a public declaration and notify officially the friendly powers, that Mexico had not recognized nor would do it, that doctrine because it upholds, without the consent of all the peoples of America, a thesis and creates a situation on which no opinion has ever been consulted with such peoples, and therefore that doctrine impairs the sovereignty and independence of Mexico and would constitute for all the nations of America a forced tutelage. Last December the French Legation informed the Department of Foreign Affairs that according to the clauses of the Armistice signed at Treveris in November last year, the German delegates had agreed with the Allied powers not to dispose, without their previous consent, of any stock in money, securities, etc., owned in foreign countries by the German Government or by private German subjects, and informed also that measures would be adopted to deprive of such property whoever might acquire it through purchase or transfer of any kind, for all dealings regarding such property would be fraudulent. The Italian Legation addressed an identical note to our Foreign Office, to which the Mexican Government replied that it could not recognize any effect to that agreement within our territory, because it was against our Constitution, as also against a treaty still in force between Mexico and Germany, more so since the German authorities had given no special advice to Mexico in that regard. The United States Embassy and the Legations of Italy and France in April ult., informed our Department of Foreign Affairs that the Supreme Allied Council of Paris had entrusted the United States Government with the mission to take from Mexican waters the merchant-ships belonging to citizens or subjects of enemy countries, and that the German Government would notify Mexico also in that regard. The Department answered that it expected to receive Germany's advice in order to then resolve the case and such advice was

received last July in our Department, expressing the agreement to place at the disposal of the Allies, while the armistice lasted, German steamships from 500 to 2,000 tons. The official who was in charge of the British interests in Mexico addressed himself directly to the Executive, informing that, without including the sailships, the enemy ships referred to in the above mentioned notes should be delivered to the British Government instead of to the United States, as was said before, and that the only ship in the conditions described was the *Antonino*, anchored at Tampico.—*Message of President Carranza to the National Congress, Sept. 1, 1919 (L. J. De Bekker, Plot against Mexico, pp. 257-260)*. —“During 1917 . . . a new Congress duly assembled in Mexico City, and this was the first national legislature to be convened since 1913, when the Mexican Parliament was forcibly dissolved by the usurping dictator, ‘General’ Huerta. It was therefore legitimate to assume that the republic was returning to more stable conditions. General Carranza remained in power throughout 1918, and the improvements in political and social conditions continued.”—*Annual Register, 1918, p. 307*.

1918.—Importance of oil industry.—Oil situation.—Survey of legal ownership.—Ownership of oil under new constitution.—Taxation.—“That Mexico's destinies should be influenced if not dominated by the oil interests is natural and inevitable. These constitute such a paramount element in her economic life that even domestic politics in that country is now [written in 1921] wedded to them for better or for worse. The American oil companies in Mexico recently announced that during the first quarter of 1921 oil stood for no less than 62.1 per cent. of that country's total exports to the United States, while of its principal imports (manufactures of iron and steel), 40 per cent. enter very largely into the oil industry. Thus it is petroleum that supplies the staple of Mexico's foreign trade and industry and will have to bear the brunt of taxation. The bulk of the revenue is drawn from that, and before other forms of commerce and industry can be fully revived or be called to life to vie with oil, the treaty, it is assumed, will have been signed and the Constitution amended or abolished, or else Mexico will be on the way to Cubanization. That is the current belief in the United States. No wonder the attention of natives and foreigners is focussed upon the subsoil and its treasures, or that the current history of the Republic is soaked through and through with oil. But the allegation that the oil men have lately broken bounds and encroached upon the domain of politics should not blind one to the facts that certain of their grievances were genuine and their demand for the protection of property justified at least in law.”

—E. J. Dillon, *Mexico on the verge*, pp. 160-161. —“The oil industry in Mexico has been developed by foreigners, principally Americans, since 1901, though the presence of asphalt and oil was known in Mexico even before the Spanish occupation. The value of the Mexican fields, however, was not proved until the exploration work of two Americans, Messrs. Doheny and Canfield, was crowned with success in 1901. Since then the development has been very rapid. . . . The total output has risen from 10,345 barrels in 1901 to 55,202,770 in 1917, with an estimated possible production of 250,000,000 barrels a year, or nearly one-half of the total world production in 1917. The oil is nearly all exported, and consumed on foreign ships or engines or in foreign automobiles. In July, 1918, for example, 3,435,545 barrels were shipped to the United States, and 1,309,200 barrels to other points

abroad. The Mexican Government is now [written in 1919] receiving a share of the profits. . . . The tendency has been for the ownership and handling of the oil to be concentrated in the hands of foreign interests which own the refineries, the pipe lines, and the tank ships. The principal organizations are the Mexican Petroleum (Doheny interests), the Waters-Pierce (Standard Oil), the Pan-Mexican Fuel Oil (Standard Oil), the East Coast Oil (Southern Pacific), the Corona Oil (Dutch Shell), and the Mexican Eagle (Pearson English interests). The amount invested is already very large. A recent estimate puts the British and American capital invested in this business at \$300,000,000, of which \$200,000,000 is American. The legal history of the ownership of oil in Mexico begins with the Spanish period. All grants of land were made by authority of the king, but they did not include minerals underlying the surface, which were granted separately on condition of exploitation and the payment of an annual production tax. The law was based on the principle that the right to develop the natural wealth of the subsoil should be granted only to persons who would utilize it, and on the condition that it be utilized, so that the industry might be developed and the royal treasury enriched by a share of the proceeds. If the concessionaire did not fulfill the conditions of his grant, the property reverted to the crown. In 1783 the mining edicts were combined into a code. On achieving independence, the Mexican nation succeeded to the ownership of minerals as well as to the other rights of the Spanish crown, and the old system of granting mining concessions was followed. In the Constitution of 1857, mining legislation was left to the States, but a constitutional amendment in 1883 transferred that right to the Federal Congress, and in 1884 the President, acting on a general authorization of the Congress, issued a decree containing a federal mining code. The code changed the policy of the law in regard to certain products of the subsoil, among which were coal and petroleum, by expressly declaring them to be the property of the owner of the surface. Since 1783 there had been conflicting opinions as to whether coal, at least, was the property of the owner of the surface or of the State, and the draftsman of 1884 decided in favor of the land owner. There was no declaration of national ownership of the other minerals, but as they could be acquired only through concession from the Government on conditions laid down by the Government, they were practically part of the public domain. This division of minerals was the result of the deliberate action of the executive commission which drafted the decree, contrary to the judgment of many Mexican authorities. The division of the subsoil products was reaffirmed in an act of Congress of 1892, which introduced another important change in the mining law by making the grant of publicly-owned minerals perpetual, dependent only on the payment of taxes. Even in regard to these minerals, therefore, the principle of the Spanish law that a mine must be continuously worked was given up, and the necessity of paying a tax was depended upon to insure operation. The latest mining code, that of 1909, adopted by Congress since the great expansion of the petroleum industry, follows the preceding act in these respects. It expressly states that minerals in general are the property of the nation, but that certain products, including mineral combustibles and bituminous substances, are 'the exclusive property of the owner of the soil.' In the debate over the code in Congress, it was said that the legislature could not change the conditions of the substances which the code of 1884 had declared to be private property, and thus

placed under the protection of the Constitution. The Mexican law-making power, in other words, has repeatedly recognized the proprietor of the surface as the owner of the petroleum, and the Mexican Government has permitted, indeed encouraged, the investment of large sums of money in the purchase of oil-bearing lands, or of leases of the right to pump oil, depending on the existing statutes, and in the erection of refineries and other plants to utilize the property so acquired. Article 27 of the new Constitution [1917] profoundly changed this legal situation. [See MEXICO, CONSTITUTION OF.] Petroleum was expressly included among the mineral resources of the nation which are inalienable, but which may be exploited by individuals under concession on condition of regular development. The Constitutional Convention returned in general to the Spanish theory of mining ownership. Concessions can be granted only to Mexican citizens, to Mexican corporations, or to foreigners who agree to be considered as Mexicans in regard to such property and not to invoke the protection of their Governments in respect of it; furthermore, Mexican citizens are to be preferred in grants of concessions. Foreign corporations cannot acquire ownership in concessions, consequently foreign corporations cannot continue in the industry in Mexico. Mexican corporations owning oil lands suffer a further limitation. Article 27 allows them to hold only as much land as 'is absolutely necessary for their purpose,' the amount to be fixed by the Executive; so that a corporation loses not only the oil underlying the land which it owned, but in addition the land itself, unless it obtains a concession to utilize the petroleum, when it may keep the amount of land necessary for its purposes. This provision of Article 27 has not as yet been put into effect. Realizing the finality of constitutional provisions, save as changed by regularly adopted amendments, those who believe that the petroleum should remain in private ownership attempt to construe the Constitution to meet their opinion. It is argued that Article 27, so far as it deprives the owners of the soil of their petroleum rights, is nullified by other rules laid down in the same instrument. Article 14 provides that no law shall be given a retroactive effect, and Article 27 itself stipulates that private property shall not be taken except for public purposes and upon indemnification. Article 14 undoubtedly prohibits retroactive legislation by Congress, but it cannot limit the power of the Constitutional Convention, nor has one section of the Constitution more authority than another. If Article 14 can be said to limit Article 27, Article 27 can equally limit the application of Article 14. The meaning of the Constitution is the only question at issue. The only value of Article 14, as applied to Article 27, is that it lays down a general principle which would help in its interpretation if its meaning be doubtful; but there can be no doubt of the meaning of the language used in Article 27. As practically all the known oil-bearing lands are privately owned, Article 27, if it is to have any extended application, must apply to lands held in private ownership; so to admit the argument drawn from Article 14 would be practically to nullify Article 27, in enacting which the Convention evidently did not intend a 'vain thing.' Señor Pastor Rouaix, now a member of the Mexican Cabinet, the draftsman of the article, which was adopted practically without amendment, authoritatively states that the national ownership of all petroleum was intended whether or not it underlay lands privately owned. The Mexican Government, also, composed of men intimately acquainted with the intent of the Convention and headed by President Carranza, its

master spirit, has acted on the same theory in its subsequent decrees. The words of the article, and its contemporary interpretation by the Government and by its draftsman, are too clear to permit the general rule laid down in Article 14 to be resorted to for aid in its interpretation, even if Article 14 applies to the Constitution at all. It is equally evident that the limitation on the right to take property except for a public use and on payment of compensation does not apply to such taking by the Constitution itself. The former operators were allowed to continue work under the new Constitution. Taxes were laid on their product, but their possession was not threatened until the President acting under the general power in regard to finance granted by Congress, issued the decree of February 19, 1918. This decree fixed a royalty of five per cent. on output, a tax of five pesos (\$2.50) a hectare (2½ acres) on all oil lands, and a steeply-graduated tax on the rent paid under oil leases running up to fifty per cent. of the royalty. The intention to maintain the ownership of the nation, resulting from Article 27, was evidenced by a section requiring owners or lessees who desired to operate the land held by them to file a statement within three months, and by providing that at the expiration of that period all lands not so registered would be open to claim. Only leases executed prior to May 1, 1917, were recognized. This decree gave a privilege to the holders of oil lands or oil leases, an exclusive prior right for three months to file claims on the oil lands previously held, plainly foreshadowing the grant of a concession. It apparently recognizes their moral right to consideration, and also the economic advantage to the state and to the laborers in the oil fields of a steady continuation of production. This decree caused great commotion among the oil operators, who affirmed that it showed an intention to take away their property. If, however, Article 27 is to be given the effect which we believe it has, it had already appropriated the oil rights, so there was nothing left for the decree to confiscate. The United States, in a note dated April 2, 1918, protested against the decree as an interference with the rights of operators who were American citizens. It also objected to the tax imposed 'as indicating a trend' towards confiscation, and criticised other objectionable features in the system of collecting the royalty. England, France, and Holland have also entered protests on behalf of their nationals. The Mexican Government could not be shaken from its legal position; but it showed its unwillingness to take action by extending the period for registration to July 31, this being done through the decree of May 18, issued on the day before the expiration of the three months' period of the decree of February 19. On July 31, again, after a conference with representatives of foreign interests, the period was extended through August 15. On August 8 a new decree was issued, requiring the owner or lessee who had registered his property to file a claim for a concession within three months (the lessee within two months) after August 15, or his prior right would lapse. A foreign corporation could transfer its right to a Mexican corporation, and a foreign individual must relinquish the protection of his Government in respect of the concession. Tracts of land of over four hectares (ten acres), which was declared to be the size of a petroleum claim, could, if they had been registered before August 15, be patented only if wells were already in operation or were being drilled. The legal and economic position resulting from these decrees was unsatisfactory to the foreign operators, who refused to register their lands. The Government again did not join issue. A decree of

August 12, only four days before the expiration of the preferential right of the owners and lessees, provided that no surveyed oil property in which capital had been invested should be open to claim, but that the owner or lessee might operate the property until the 'special contracts' were prepared under which he was to be allowed to operate in the future. He must, however, pay the land tax and the five per cent. royalty on output. The Mexican Government, without abandoning its position that the nation is the owner of the oil, which it emphatically defends in a statement dated August 25, has impliedly admitted that the operators should in justice be given concessions for the operation of the petroleum underlying land owned or leased by them, and which they had begun to develop. The rights arising from the concession, however, would be different from those of an owner. The concessionaire cannot speculate on his oil for higher prices by holding it unused; he must submit to regulations, and, until the bases of the 'special contracts' are made public, he will not know the limitations on his privilege or the rapidity with which he must develop the property conceded. The Carranza Government, on November 23, introduced a bill into Congress dealing with the oil situation. The bill is based on Article 27 of the Constitution. Owners are given consideration in the provisions that lands in which capital was invested before May 1, 1917, for the exploitation of petroleum, shall not be subject to denunciation, and granting to the owner or lessee three months in which to justify his rights. These properties, however, must pay the land taxes and taxes on production. Leases are continued during the term fixed in each lease, subject to the 50 per cent. tax on the royalty paid under the lease; then the lessee may secure the oil rights on application within three months. The owner of lands, or lessees on leases made before May 1, 1917, who have not put capital into their land, are to have a preference for one year if they justify their right within three months. The problem of the taxation of the oil fields is apart from the far more serious question of their ownership. Originally there was no taxation upon oil; indeed, following the policy of the Diaz Government in encouraging development of the natural wealth of the country, petroleum was included with certain other mineral products in an exemption from all Federal, local, and municipal taxes by the law of June 6, 1887. Under the revolution, however, a light tax was laid upon petroleum, which subsequently developed into a tax of ten per cent. ad valorem, the value to be fixed every two months by the Mexican finance authorities, not on the basis of the price at Tampico, but on the basis of the price in the United States, whither most of the product was shipped. The tax is in effect an export tax, and is defended as an economic measure by the Mexican Government on the ground that Mexico was being deprived of the advantage of its petroleum deposits, since the developing companies were interested in the large foreign market and paid little attention to the smaller Mexican needs. Consequently, this tax was used as an economic, as well as a fiscal, measure to make it worth while to the oil companies to develop the Mexican market. The tax is fixed every two months and is in addition to the royalty and the land tax provided in the decrees cited. It is also in addition to a land tax on mining claims."—J. P. Chamberlain, *Mexican oil situation* (*Nation*, Jan. 11, 1910).

1919.—Improved conditions.—Finances.—Army.—International relations.—“The Republic had sensibly progressed in spite of the vain designs of the reactionaries and bandits. The interior admini-

istration is firm and has not been weakened by the elections of local officials. It is true that in some States elections have provoked effervescence, but the local troubles have developed in a legal form. Highly significant is the persistency with which our institutions have been transformed by means of the initiatives of law presented to the Congress, the decrees that the Executive has issued in use of its extraordinary powers and the regulations that have been approved upon an ascending scale of order and justice. The intervened properties have been returned to their owners, with the exception of those belonging to the responsible accomplices of the uprising in 1913, who have responsibilities clearly determined by our constitution. Nationals and foreigners have confidence in the interior conditions of the Republic and this is proved by the increasing of immigration and the return of Mexicans. The solicitation of concessions to invest capital in the Republic is a fact upon which the foreign press have made comment as well as the investors interested in bringing to Mexico their elements of labour. Comparisons of the importations and exportations of the period previous to the revolution and the last year, 1918, in which the commerce of the world was very much restricted, shows that in spite of all circumstances our foreign commerce considerably exceeded that of the best years registered in our statistics. The exportation was almost double that of 1910. The public finances offer a decisive betterment. In 1917 the deficit was \$35,000,000, more or less; in 1918 it was \$18,000,000, and in the present year the expenses will be totally covered. The time is coming when the Government will begin to pay its debts. The army has a disproportionate organization, as it was observed that an excess of officials over the troops always existed. At present the army is thoroughly organized, it is subject to ordinances, and it can be asserted that the discipline is habitual in almost all military components. The majority of the rebel leaders have died, and those that still menace the absolute pacification are dispersed. As proofs of the national development are the statistics of the departments of Communications, Industry and Commerce, and of Agriculture and Development, in comparison with the administrative volume of the preceding years. . . . The agricultural school is in operation. We have continued the purchasing of agricultural machinery in great quantities to extend its use among the farmers. From the immigration, the prosperity of agriculture and industry, the equalization of the expenses and the income, the solidification of the administration, the accomplishment of all the revolutionary promises, especially that regarding lands, the watching of the finances of the government, the impulse given to our culture, and all the detailed news you have heard, you cannot doubt the importance of the labour of the administration which has given all the possible profits in accordance with its capacity in this period of world wide crisis. The respectability of Mexico before all the nations of the world has been maintained with the energy and prudence demanded by internationalities. The cause of trouble can be divided into four different sections: Those regarding special conditions on the border of the United States; those originated by damages to foreign properties; those which refer to personal injuries of citizens of foreign countries residing in Mexico; and those arising from the application of the revolutionary laws. Regarding the first one, history mentions the frequent passage of American troops into the national territory and the problem principally is of policing for the safety of both countries. The invasions of American troops have

been repeated since the middle of last century, and various arrangements have been projected with the object of prosecuting the bandits who cross from one country into the other. The government believes that this cause of trouble will disappear as soon as an agreement is reached to protect the border. Regarding the damages to foreign properties, it may be stated that in spite of the fact that a mixed commission of reclamations has been operating, only a small number of foreigners have demanded indemnizations for the damages caused by the revolution since 1913. As a proof of the goodwill the government has to repair even the damages caused by the bandits, there has been introduced into the law of the Commission of Indemnizations a new rule of covering the damages caused by bandits, when these damages are not caused by the imprudence of the injured person, and the authorities can be blamed with omissions, and also when the injured persons are not in sympathy with the bandits. The law recognizes the damages to foreigners and pledges to the immediate payment of the indemnization with the same limits that are mentioned for the damages to properties. Regarding this point, it is to be stated that it is impossible for a government, especially after a revolution, to prevent in all the regions of the nation the attacks against nationals or foreigners. The efficacy with which the government has punished those responsible for offences against foreigners is very significant, when it is considered that Mexico and the United States have unfortunately been in the same circumstances regarding the attacks that the inhabitants of one country have committed against the citizens of the other. . . . The fourth cause of trouble is of a severe nature. It deals with objections that are practically a limitation to our national sovereignty. The revolution has put in force reforms that represent the welfare and the progress and tranquillity of the Mexican people, renewing its institutions in important branches, as that regarding lands and the exploitation of the natural wealth. The government desires to respect and consolidate the existent rights, but it absolutely cannot accept the limitation of the liberty of the Mexicans to be governed in accordance with their own needs. A conciliatory spirit and a desire for harmony in accordance with the law will be exerted to conquer the difficulties which may arise, but always maintaining firm our sovereignty. Mexico will comply with its obligations with nationals and foreigners. The doubts arising in this matter have been due only to misinterpretations of the conduct of the government, which is not capable of denying its legitimate obligations. The delay in the payment is due to motives that cannot be overcome at present."—*Message of President Carranza to the national congress, Sept., 1, 1919.* (L. J. De Bekker, *Plot against Mexico*, pp. 267-272).

1919 (June-December).—Mexican bandits cross American border and fire into El Paso.—Bandits pursued into Mexico by American forces.—Kidnapping of W. O. Jenkins.—“Unfortunately the friction between the United States and Mexico continued throughout the year [1919]. In the middle of June some of ‘General’ Villa’s bandits crossed the American border and fired into the town El Paso, and a number of Americans were said to have been killed. A small American force under the command of Major-General de Resey Cabell was then thrown across the border into the town of Juarez; and cavalry was sent in pursuit of the bandits. One body of the Mexicans was rounded up and an engagement ensued in which the Mexicans were reported to have lost twenty killed and seventy wounded. After thus punishing and

Maps prepared specially for the NEW LARNED
under direction of the editors and publishers.

dispersing the Villista forces, the American troops were withdrawn across the border. . . . Another incident of a somewhat more serious character arose at the end of October. The American Consular Agent at Puebla, a certain Mr. W. O. Jenkins, was kidnapped by bandits and held for a ransom of 150,000 dollars. The ransom was paid by Mr. Jenkins's friends and he was released by the bandits, but he was then suddenly arrested by the agents of the Mexican Government itself, who declared that Mr. Jenkins had been conspiring with the bandits. The American Government then peremptorily demanded that Mr. Jenkins should be released. The Mexican Government procrastinated and made all manner of excuses, but at the beginning of December Carranza yielded to direct threats from Washington and Mr. Jenkins was released."—*Annual Register*, 1919, pp. 288-289.

1920 (April-May).—State of Sonora rebels against Carranza.—Revolutionary plan.—Rapid spread of revolution.—Mexico City abandoned by Carranza and occupied by revolutionary forces.—Extraordinary session of Congress.—Adolfo de la Huerta elected provisional president.—In April, 1920, the State of Sonora rebelled against President Venustiano Carranza, who had been elected for the term, 1916-1920, because the president attempted to invade the State with troops in order to interfere with the presidential election. On April 23, a revolutionary plan was adopted at Agua Prieta, Sonora, repudiating President Carranza, on the ground that he had interfered with freedom of election. The text of the plan adopted by the revolution is as follows:

"Article 1. Venustiano Carranza ceases hereby in his capacity as chief executive of the Republic.

"Art. 2. All public officials whose authority has its origin in the last election in the States of Guanajuato, San Luis Potosi, Queretaro, Nueva Leon, and Tamaulipas, are hereby repudiated.

"Art. 3. The members of the municipal council of the City of Mexico who were declared elected in consequence of the recent election are also hereby repudiated.

"Art. 4. José Santos Godínez is hereby recognized as Constitutional Governor of the State of Nayarit.

"Art. 5. Recognition is also granted hereby to all legitimate Federal and State authorities. The Liberal Constitutional Army will support said authorities, as long as they do not oppose or antagonize the present movement.

"Art 6. The political Constitution of February 5, 1917, is hereby expressly recognized.

"Art. 7. The Liberal Constitutionalist Army shall be formed by all generals and officers who may support this program. The present Constitutional governor of Sonora, C. Adolfo de la Huerta, shall act temporarily as supreme head of the army, with all necessary power for the political, military, and administrative organization of this movement.

"Art. 8. The Constitutional governors of the States supporting and assisting this movement shall each appoint within thirty days after the date of the present program a representative, duly authorized, and said delegates, at a meeting to be held sixty days after the date of the present programs,

at such place as designated by the supreme chief ad interim, shall appoint, by a majority of votes, the permanent supreme chief of the Constitutional Army.

"Art. 9. If for any circumstances, originated by the campaign, the meeting provided for in Article 8 is not attended by the required majority, the present Constitutional governor, C. Adolfo de la Huerta, shall act thereafter as the permanent head of the Liberal Constitutional Army.

"Art. 10. As soon as the present program is adopted by the majority of the country, and the City of Mexico is occupied by the Liberal Constitutionalist Army, a provisional president of the Republic shall be designated in the manner provided below.

"Art. 11. Should the present movement be accomplished before the end of the present congressional term, the Supreme Chief of the Liberal Constitutionalist Army shall call an extraordinary session of Congress, at the best available place, and the members of the Congress shall elect the provisional president in conformity with the Constitution.

"Art. 12. Should the case referred to in Article 11 occur after the end of the present congressional term, the supreme chief of the Liberal Constitutionalist Army shall assume the office of provisional president of the Republic.

"Art. 13. The provisional president shall call the election of legislative and executive powers of the Republic immediately after he assumes office.

"Art. 14. The supreme chief of the Liberal Constitutionalist Army shall appoint provisional governors for the States of Guanajuato, San Luis Potosi, Queretaro, Nuevo Leon, and Tamaulipas, and of any other State whose governor may oppose or repudiate this movement.

"Art. 15. After the triumph of this program is consolidated, the provisional president shall give the provisional governors the authority to call immediately a local election in accordance with the respective statutes.

"Art. 16. The Liberal Constitutionalist Army shall be governed by the military laws and regulations now in force in the Republic.

"Art. 17. The supreme chief of the Liberal Constitutionalist Army and all military and civil authorities supporting this program shall grant both Mexicans and foreigners full guaranties, and shall protect especially commerce and business in general."

—*Latin-American Year Book*, pp. 439-440.—"President Carranza sought to compromise with the revolutionary leaders and sent eighteen members of the Mexican National Congress to Sonora to attempt a settlement of the difficulties between the States and the Federal Government. They arrived at Hermosillo on April 25. . . . Their efforts were fruitless. . . . The first clash between Carranza troops and the revolutionists occurred on April 25 in the mountains dividing the States of Chihuahua and Sonora near Pulpito Pass."—*New York Times Current History*, June, 1920, pp. 408-409.—"The revolution swept the whole country so rapidly that President Carranza was compelled to abandon the city of Mexico on May 7, and on the next day revolutionary forces occupied the city. An extraordinary session of Congress was called in accordance with the revolutionary plan, and Governor Adolfo de la Huerta, of Sonora, was elected provisional president. The presidential election was called for September, and General Alvaro Obregón resumed his election campaign with every chance in his favor of being elected."—*Latin-American Year Book*, 1920, p. 440.

1920 (May).—Flight and death of Carranza.—"The body of President Carranza was borne into

Necaxa, in the northern part of the State of Puebla, on Sunday, May 23. It had been brought from Tlaxcalantongo, where he was the victim of a most brutal and cowardly assassination on the morning of May 21. After escaping on May 14 through the cordon of revolutionary troops which almost surrounded him in the battle of Rinconda . . . Carranza with about 150 soldiers had turned north toward the Zacapoaxtia mountains. . . . He was reported on May 8 at Cuautempano. There he called a conference to decide on the route to be taken. General Murguía, who commanded the Carranza forces, General Francisco Muriel, Ygnacio Bonillas and others took part. They were advised by people living in the mountains that it was dangerous to continue, as Colonel Lindoro Hernandez and General Rodolfo Herrera, whose soldiers were known to be in the vicinity, had joined the revolution. Nevertheless General Mariel insisted that they proceed. Soon afterward General Herrera, with a small body of troops at Patla, met the Carranza party. . . . No distrust was felt, as Herrera had surrendered to Carranza last March and had been assigned to the forces of General Mariel. . . . Under Herrera's guidance Carranza and his escort continued north, arriving on May 20 at Tlaxcalantongo. . . . Here Herrera assured Carranza he was absolutely safe from attack and personally escorted him to a hut. . . . Just before 4 o'clock the next morning all were awakened by the sound of brisk firing. Herrera's men were attacking the hut where Carranza was sleeping. . . . The firing was soon over and Carranza was dead. . . . The four men who had been sleeping in the same room were made prisoners, as were about sixty others of the Carranza party. These were hastily driven north by the forces of Herrera, who feared the return of General Mariel. They were freed later, Herrera forcing the leaders to sign papers saying that Carranza had committed suicide. . . . Details of the tragedy were telegraphed from Necaxa that evening in a dispatch signed by Ygnacio Bonillas. . . . General Obregon thereupon ordered the arrest of Herrera and his forces, commanding that they be brought to Mexico City for trial by court-martial. . . . General Herrera, who voluntarily went to Mexico City, repeated the suicide story before the military court which was conducting an official inquiry. . . . During the session, which lasted ten hours, so many contradictions in his testimony were revealed that the Judge ordered his immediate arrest."—*New York Times Current History*, July, 1920, pp. 585-587.

1920 (July).—Revolt.—Capture of General Pablo Gonzalez.—On July 14 General Pablo Gonzalez, one of the presidential candidates, started a revolt. General Villareal, one of his commanders, attacked Monterey, but was easily repulsed by the Obregon troops. General Gonzalez and two of his officers were captured.

1920-1921.—Obregón formally declared president.—His administration.—The Mexican congress, acting as the Electoral College, formally declared Alvaro Obregón president for the term beginning December 1. Obregón received 1,131,751 votes. Robles Dominguez, the opposing candidate, had 47,000 votes, and 2,357 were scattered. On December 1, Obregón took the oath of office before the Deputies in Mexico City. "During the brief period that has passed since his inauguration, [written in 1921] the new President has swept away some of the worst abuses, drafted a series of excellent schemes which are gradually being inscribed on the Statute Book, and accomplished more in the direction of reforms than was done by the best of his predecessors during their whole

term of office. The masterly way in which he checkmated the railway strikers won for him a high tribute of universal praise. He has closed gambling houses and other haunts of vice, has begun to purge the prisons which were seminaries of crime and has adopted a series of measures for the reformation of criminals. Further, he has issued a number of hygienic regulations in various parts of the Republic, and has put disinfecting apparatus in forty towns and the principal ports. He has begun the irrigation of vast tracts of land in Guanajuato, framed a law for disposing of the agrarian movement, given orders for the preservation and expansion of ancient crafts and industries, laid extensive plans for improving communications by land and water, bettered the railway services and laid a bill for the creation of a merchant marine before Congress. The problem of colonization by foreign immigrants has also received careful attention, and comprehensive arrangements have already been made for the sifting, classification and reception of many thousands of husbandmen from Canada, Italy, Germany, Austria and other countries, to whom considerable inducements are being offered, during the first years of their residence in the Republic. The army is being rapidly demobilized, and has already been reduced to fifty thousand men, the strength adequate for a minor State whose sheet-anchor of safety is henceforward to be the moral support of the civilized world. The numerous misunderstandings with foreign governments, corporations and citizens have likewise been closely studied in a spirit of equity and with a sincere desire to deal fairly by all. The national debt has been recognized and means considered for resuming payment of the interest. A plan for meeting the demands of foreign residents who sustained losses during the Revolution has also been formulated and will be duly acted upon. It is right to say that this scheme was originally thought out by Carranza, who first laid down the principle involved. General Obregon has merely resolved to redeem the promises of his predecessor."—E. J. Dillon, *Mexico on the verge*, pp. 288-289.—"Business has revived to such an extent that in the month of May 1921 only four countries bought more goods in the United States than Mexico, who imported more than all the countries of South America by nearly two million dollars. . . . Despite the defective condition of much of the railways' rolling stock, the trains run almost on time, and accidents are fewer in relation to the number of passengers than in France."—*Ibid.*, p. 167.

1922.—Agreement on debt.—American oil interest safeguarded.—Elections.—Recognition of Obregón government.—"Agreement was reached on the Mexican debt question on June 16 [1922] at the conclusion of conferences held in New York between international bankers and Adolfo de la Huerta, Mexican Finance Minister. The plan of adjustment relates to all external Mexican Government debt direct or guaranteed, the National Railways' debts largely held outside of Mexico. Payments on current interest on Mexican bonds are to be begun after Jan. 2, 1923. For such part as is not met in cash, scrip will be issued. A special fund for the payment of current interest will be increased each year until Jan. 1, 1928, when full service will be resumed. The oil export taxes and a surcharge on railway receipts will be paid into this fund. The National Railways are to be operated by private management as before the Revolution, the Government retaining its 56 per cent. of the stock. . . . American oil interests are safeguarded against any confiscatory action under Article 27 of the Mexican Constitution by recent decisions of the Supreme

Court, according to assurances received by the embassy in Washington from the Mexican Foreign Office on July 7. The statement declares that Article 27, under which the Carranza régime took action against the oil interests, is not retroactive or confiscatory. . . . Elections for the new Congress which meets in September were held on July 2 and resulted in a great increase in both houses of the Coalition parties which support President Obregon. The Liberals and the Nacionalistas—the latter the Catholic party—were overwhelmed. The Constitutionalists, the leading party when Obregon was elected, has been split since then and the groups which have gained the ascendancy include the Co-operationists, the Labor men, the Social Democrats and various factions of Socialists. In addition to twenty-seven previous recognitions [numbering among them Argentina, Brazil, Japan, Germany, Austria, Italy, Spain, Norway and Holland] President Obregon's Administration has received recognition from Poland, Finland, Czecho-Slovakia, Georgia and the Free State of Fiume and has recognized them in turn."—*New York Times Current History, Aug., 1922, p. 911.*

1922.—Labor laws.—Eight hour day.—Legislation for women.—Labor organization. See LABOR LEGISLATION: 1921-1922; Canada; LABOR ORGANIZATION: 1920-1922; MEXICO, CONSTITUTION OF.

1922-1923.—End of thirtieth congress.—Fascista movement.—Amnesty granted to rebels.—"Violence marked the end of the Thirtieth Mexican Congress, which adjourned on Dec. 30. Pistols were drawn and challenges to duels freely made, owing to a revival of the long-standing feud between the Co-operistas, the party of President Obregon, and the Liberal Constitutionalists. Petroleum legislation went over to the next Congress, which the President is expected to convene in extra session in April. A bill proposing amnesty for all rebel prisoners was passed by the chamber on Dec. 26. The Fascisti movement, which began in Jalapa, Vera Cruz, last Autumn, has made rapid strides, at present claiming a membership of 100,000. . . . [Gustavo Lainz de Sicilia] opened headquarters in Mexico City in December and said in an interview that the Mexican Fascisti were not organized on a military basis, like the Italians, but would endeavor to control the Government through economic pressure. Clashes between the Fascisti and radicals were reported from Jalapa, necessitating the intervention of Federal troops. The Secretary of War, Señor Serrano, made a special trip from Mexico City to confer on the subject with Governor Tejeda of Vera Cruz. . . . Mexico is one of the few countries spending less on military affairs than on instruction. The Department of Education has been allotted 45,000,000 pesos for this year, [1923] and the War Department 33,000,000. At the request of President Obregon amnesty was granted to all rebel prisoners in order to turn them back into useful occupations and 256 were released from jail on Jan. 5. The War Department has dissolved the numerous rural auxiliary military bodies which have acted as home defense troops, supplementing the Federal forces."—*New York Times Current History, Feb., 1923, pp. 877-878.*

1923 (February).—Concession for railway.—Recognition of Obregon government.—Obregon resolution regarding recognition.—"A concession for a railway from Vera Cruz into the State of Campeche, passing through the Isthmus of Tehuantepec, opening up one of the richest farming parts of Mexico, and bringing the Southern States within four days of Mexico City, was granted Feb. 10. The National Railways of Mexico have signed a contract to operate drilling works in the

Federal oil fields for the purpose of obtaining mineral oil to run their trains, thus making them independent of foreign companies. . . . Colombia has recognized Mexico and named Dr. Luis Felipe Angulo as Minister after a lapse of diplomatic relations lasting 25 years, according to a dispatch from Mexico City on Feb. 21. The Oregon State Senate on Feb. 17 unanimously adopted a resolution calling on President Harding to recognize the Obregon Government."—*New York Times Current History, Apr., 1923, p. 170.*

MEXICO, Constitution of.—The new constitution was promulgated February 5, 1917, and became operative May 1, 1917. "The legislative power of the United States of Mexico is vested by the new constitution, as it was by the old [one of 1857] in a general Congress which shall consist of a House of Representatives and a Senate. The House of Representatives consists of representatives of the nation, all of whom shall be elected every two years by the citizens of Mexico, one representative to be chosen for each 60,000, or any fraction thereof exceeding 20,000, on the basis of a general federal census of the district and of each state and territory. Every state or territory shall have at least one representative regardless of the amount of population. The representatives are to be elected by a direct vote of the people; they must be citizens by birth and under no legal disability; they must be over 25 years of age on the day of election; they must be natives of the states or territories respectively electing them, or domiciled and actual residents therein for six months immediately prior to the election. They must not be in the active service of the federal army, nor in command of any police force or rural constabulary in the district where the election takes place, nor must they have been during the 90 days immediately prior to the election. They shall not hold office as secretary or assistant secretary of any executive department, nor justice of the Supreme Court, unless they shall have resigned therefrom 90 days prior to the election, and no state Governor, secretary of state of any state, or state judge shall be eligible in the district within their several jurisdictions, unless they have resigned at least 90 days prior to the election; no minister of any religious creed is eligible. The Senate shall consist of two Senators from each state and two from the federal district, chosen in direct election (Article 56). The Senators shall serve for four

years, one from each state retiring every two years, and the qualifications are the same as those of a Representative, except that the Senator must have attained the age of 35 years on the day of election. By Article 61 both Senators and Representatives are guaranteed immunity for all opinions expressed by them in the discharge of their duties. Both Representatives and Senators are prohibited from accepting any other office, federal or state, or accepting a commission of any kind, federal or state, for which any emolument is received, without previous permission of the House of which he is a member, and in the event that any Senator or Representative accepts any such commission or office, he shall forthwith lose his representative character for such time as he shall hold such appointive office, violation of this provision being punished by forfeiture of the office as Representative or Senator, as the case may be. Reasonable provisions are made for enforcing attendance of members. Regular sessions of the Congress shall be held each year, beginning on the 1st day of September and ending by operation of law not later than the 31st day of December. Congress may be called in extraordinary session, or either House may be called in extraordinary session, when in the judgment of the President that becomes necessary. The Houses must meet at the same place and shall not move to another place to hold their sessions without having first agreed upon the time, the manner and place of so doing. By the terms of Chapter II of Title III, at the same time and in the same manner that Representatives and Senators are elected, alternates for each must be elected, possessing the same qualifications the principals have, to the end that should the principal fail for any reason to discharge his functions there shall exist no vacancy in the office, but that the rights, privileges, duties and emoluments conferred by the constitution or the laws upon the principal shall forthwith devolve on the alternate who shall thereafter discharge all the duties resting on such Representative or Senator, as the case may be. By section II of Article 71, Title III, the right to originate legislation pertains first to the President of the republic, second to the Representatives and Senators of the Congress, and third to the state legislatures, with the proviso that all bills submitted by the President of the republic, by state legislatures, or by delegations of the states, shall be at once referred to committee, whereas those introduced by Representatives or Senators shall be subject to the rules of procedure. Provisions are made for reference to committees and consideration of proposed laws by the House and Senate, respectively, which are not dissimilar to those ordinarily found in American state constitutions. Provisions for vetoing by the executive and procedure in cases of veto are substantially those with which American lawyers are familiar. By Section III of Title III the powers of Congress are prescribed and defined. . . . By Section IX of Article 73 it is provided that the Congress shall have power 'to enact tariff laws on foreign commerce and to prevent restrictions from being imposed on interstate commerce.' This is the interstate commerce clause of the Mexican Constitution. Congress is especially authorized to legislate for the entire republic in all matters relating to mining, commerce and credit institutions, and to establish the sole bank of issue as provided for in Article 28 of the constitution; to create and abolish federal offices and to fix, increase or diminish the compensations assigned thereto; to declare war; to regulate the manner in which letters of marque may be issued; to enact laws according to which prizes on land and sea shall be adjudged

valid or invalid; and to frame the admiralty law in times of peace and war. It is authorized to raise and maintain an army and navy; provide for a national guard, reserving, however, to the citizens who compose it the right to appoint their respective commanders and officers, and to the states the power of instructing it in conformity with discipline prescribed by the regulations of the federal government. It is authorized to enact laws on means of communication, post roads and post offices; to establish mints, regulate the value and kinds of the national currency, fix the value of foreign moneys and adopt a general system of weights and measures; to make rules for the occupation and sale of public lands; to enact laws for the organization of the diplomatic and consular services; to define crimes and prescribe punishments therefor. The Congress is authorized to grant amnesty for offenses subject to the jurisdiction of the federal courts, but by Section XIV of Article 89 the pardoning power is expressly granted to the executive. The Congress is also authorized to elect justices of the Supreme Court, and superior and inferior judges of the federal district and territories, and to accept the resignations of the several judges which it is authorized to elect. It is further authorized to establish professional schools, museums, libraries, observatories and other institutions of higher learning, but it is expressly provided that these powers shall not pertain exclusively to the federal government. In certain contingencies it is authorized to elect a President of the republic and to accept the resignation of the President; to audit the accounts which must be submitted to it by the executive, and to see that the money is expended for the purpose for which it is appropriated; to make all laws necessary to carry into effect the powers expressly granted to it, and all other powers vested by the constitution in the several branches of the government. By Article 74 the House of Representatives is given the following exclusive powers: First, to sit as an electoral college to exercise the powers conferred by law as to the election of the President. It is quite difficult to see just what the meaning of this clause is, as the power of electing a President in certain contingencies is given to Congress, which includes both House and Senate, and there is no provision in the constitution which expressly authorizes an election of the House alone. Second, to supervise the general auditor of the republic in the discharge of his duty. Third, to appoint the higher officers and employees of the auditing department. Fourth, to approve the annual budget after determining what taxes in its judgment must be made to meet the fixed expenditures. Fifth, to take cognizance of all charges brought against public officials, and, where the circumstances warrant, to impeach before the Senate. By Article 76 the Senate shall have the following exclusive powers: First, to approve the treaties and diplomatic conventions concluded by the executive with foreign powers. Second, to ratify nominations for public office made by the President, where confirmations are necessary. Third, to authorize the executive to allow the national troops to go beyond the limits of the republic, or to permit foreign troops to pass through the national territory and to consent to the presence of foreign fleets for more than one month in Mexican waters. Attention is called to the fact that neither the executive nor any other department of the government is authorized by this constitution to permit foreign troops to remain within any portion of the republic for any purpose whatsoever. . . . By Section IV of Article 70 the Senate is authorized to give its consent to the use by the President of the national guard beyond the

limits of the respective states or territories and to fix the amount of force to be used. Section V of Article 76 is one that finds no parallel in the American Constitution; it reads as follows:

"Art. 76. The Senate shall have the following exclusive powers:

"V. To declare when the constitutional powers of any state have disappeared, that the occasion has arisen to give to the said state a provisional Governor, who shall call for elections to be held according to the constitution and laws of the said state. The appointment of such a Governor shall be made by the Senate with the approval of two-thirds of its members present or during recess by the Permanent Committee by the same two-thirds majority from among three names proposed by the President. The official thus elected shall not be chosen constitutional Governor in the elections to be held under the call which he shall issue. This provision shall govern whenever the state constitutions do not provide for the contingency."

"Section VIII of the same article reads as follows:

"VIII. To adjust all political questions arising between the powers of a state whenever one of them shall appeal to the Senate or whenever by virtue of such differences a clash of arms has arisen to interrupt the constitutional order. In this event the Senate shall decide in accordance with the federal constitution and the constitution of the state involved."

"Section VI of Article 76 reads as follows:

"Art. 76. The Senate shall have the following exclusive powers: . . .

"VI. To sit as a Grand Jury to take cognizance of such official offenses of functionaries as are expressly prescribed by this constitution."

"It would seem that the use of the term 'Grand Jury' was inaccurate; all of the functions of the grand jury in matters of official misconduct are performed by the House of Representatives. The function of the Senate is that of a petit jury to try where the House as a grand jury has indicted. This brings us to the consideration of a governmental agency which finds no counterpart under our system of government and that is the Permanent Committee authorized by Articles 78 and 79 of the new constitution. Those articles read as follows:

"Art. 78. During the recesses of the Congress there shall be a Permanent Committee consisting of 20 members, 15 of whom shall be Representatives and 14 Senators, appointed by the respective Houses on the eve of the day of adjournment.

"Art. 79. In addition to the powers expressly vested in it by this constitution, the Permanent Committee shall have the following powers:

"I. To give its consent to the use of the national guard as provided in Article 76, Clause IV.

"II. To administer the oath of office, should the occasion arise, to the President, to the members of the Supreme Court, to the superior judges of the federal district and territories, on such occasions as the latter officials may happen to be in the City of Mexico.

"III. To report on all pending matters, so that they may be considered in the ensuing session.

"IV. To call extraordinary sessions in the case of official offenses or offenses of the common order committed by secretaries of executive departments or justices of the Supreme Court, and official offenses committed by state Governors, provided the case shall have been already instituted by the Committee of the Grand Jury, in which event no other business of the Congress shall be con-

sidered, nor shall the session be prolonged beyond the time necessary for a decision. . . . The exercise of the supreme executive power of the nation is vested in a single individual who shall be called "President of the United States of Mexico." (Article 80.) 'The election of the President shall be direct in accordance with the provisions of the electoral law.' The qualifications are, he shall be a Mexican citizen by birth, in the enjoyment of his legal rights, and he must be the son of Mexican parents by birth. He must be over 35 years of age at the time of his election; he must have resided in the country the entire year preceding the election; he must not belong to any ecclesiastical order nor be a minister of any religious creed. If he has ever belonged to the army he must have retired from active service 90 days immediately preceding the election. If he has been secretary or assistant secretary of any executive department he must have resigned from office 90 days prior to the election, and 'he shall not have taken part, directly or indirectly, in any uprising, riot or military coup.' . . . The office of Vice-President does not exist in Mexico, but in the event of the permanent disability of the President, the Congress, two-thirds of its whole membership being present, shall elect, by secret ballot and majority vote, some one to fill the office until a President can be elected, should the vacancy or disability occur during the first two years of the presidential term. If it occurs during the last two years of the presidential term the President so elected shall hold to the end of the term. Should Congress not be in session when the death or disability of the President occurs, the Permanent Committee shall elect an *ad interim* President to hold until a President can be elected by Congress which shall forthwith be called in extraordinary session. The citizen designated as President *ad interim* cannot be elected to fill the vacancy. If the disability of the President be only temporary, the Permanent Committee designates a citizen to discharge the duty during the interim. The President possesses the veto power, as does the American President. He is expressly given the power to initiate legislation, . . . and is charged with the specific duties as to many details of government, such as enforcing the laws of the republic as to public health, expenditures of public money and other duties ordinarily vested under our government in chief clerks and bureau heads. On the other hand, in addition to the executive powers generally vested in the President, powers of such transcendent importance are given to him as the power to revoke franchises, forfeit land grants, expel any foreigner from the republic that he may see fit to expel, and . . . 'in cases of grave disturbance to the public peace or any other emergency which may place society in grave danger or conflict, he shall have the power to suspend throughout the republic, or any portion thereof, such provisions of the Bill of Rights and other constitutional guaranties as shall be a hindrance to meeting the situation promptly and readily.' . . . The judicial power of the federation is vested in a Supreme Court and in circuit and district courts whose number and powers shall be fixed by law. The Supreme Court of Justice consists of 11 members. . . . Two-thirds of the members are necessary to a quorum, and all decisions shall be rendered by a majority vote. The first court created shall serve for two years; those elected at the conclusion of the first term shall serve for four years, and from and after the year 1923 the justices of the Supreme Court and the circuit and district judges can only be re-

moved for malfeasance and after impeachment proceedings. A justice of the Supreme Court must be a Mexican citizen by birth, possessed of all civil and political rights, over 35 years of age at the time of his election, and must be a graduate in law of some institution or corporation authorized by law to confer such degrees. The constitution expressly provides that they (the justices of the Supreme Court or judges) 'shall be of good repute and not have been convicted of any offense punishable with more than one year's imprisonment, but conviction of larceny, deceit, forgery, embezzlement, or any offense seriously impairing their good names in the public mind shall disqualify them for office whatever may have been the penalty imposed.' (Sub. IV, Art. 95.) The justices of the Supreme Court must have resided in the country for the last five years, except in the case of absence due to public service abroad for a period not exceeding six months. . . . Circuit and district judges hold office for four years, unless removed by impeachment proceedings, or for incapacity to discharge their duties, but after 1923 will hold during good behavior. They are appointed by the Supreme Court, and that court is authorized to remove judges from one district to another, or to fix their seats as it may be most advantageous to the public business, and the same procedure applies to circuit judges. The Supreme Court is also authorized to appoint auxiliary circuit and district judges where the work in the court becomes so excessive as to make this necessary for the speedy administration of justice. The Supreme Court is also authorized to appoint whenever it shall deem it advisable, or on the request of the President or either House of Congress, or of any state Governor, special commissioners charged with the duty of inquiring into the behavior of any judge or federal justice, or into any fact or facts which amount to a violation of any individual rights, or to subversion of the popular will, or any other offense punishable by federal statute. It is also provided that the Supreme Court judges shall be made supervisors over the several circuit and district judges, and shall visit them periodically, observing the conduct of the judges, listening to any complaints presented against them, 'and they shall perform all such other acts as the law may require.' The Supreme Court is authorized to choose one of its own members as Chief Justice. . . . In an examination of those articles of the constitution establishing the executive, legislative and judicial departments of the government a number of provisions appear giving each of those departments control over the states in certain respects. When we consider Title V of the constitution we find many limitations on the rights and powers of the states, while the constitution itself declares it is the will of the Mexican people to constitute themselves into a democratic, federal, representative republic. These limitations upon the powers of the states make the Mexican Republic far less a federal republic than our own. . . . Speaking generally, however, it is fair to say that the new constitution of Mexico provides for that country a representative republican form of government in which the powers of the government are divided into three departments; that the general functions of these departments are similar to those of the corresponding departments of our own, and that while there are many pronounced differences the general forms, powers and functions of the governments are not wholly unlike. The three features of this constitution which distinguish it most from all others . . . are to

be found in Title I, The Rights of Man, Title VI, Labor and Social Welfare, and Title VII, containing general provisions, most of which look to the regulation of religious institutions generally. . . . The Bill of Rights is most elaborate. The proponents of this constitution claim for it that it is a justification of the revolution which has so torn and impoverished Mexico during the last six years and a half [written in 1917], and that it offers more and stronger guaranties of individual liberty than any charter of human rights ever written. . . . The Bill of Rights starts with a declaration that those rights shall never be abridged or suspended except in cases and under the conditions as therein provided, and it later provides for the suspension of every one of them at the will of the executive, not only in cases of invasion or grave disturbance of the public peace but in any other emergency which may place society in grave danger or conflict. By the terms of the Bill of Rights slavery is forbidden. Instruction is declared to be free, but must be non-sectarian. Religious corporations and ministers of any religious creed are forbidden to establish or direct schools of primary instruction. All private primary schools shall be under government supervision, and in public institutions instruction shall be free. It is to be noted, however, that no provision is made in the constitution itself for the establishment of a system of public education. The right to engage in any profession or industrial or commercial pursuit is guaranteed by Article 4, but by the terms of the same article may be expressly forbidden by executive decree. By Article 5 the system of peonage is declared illegal and contracts tending to abridge the liberty of man by any means whatever are forbidden, this being declared to apply especially to monastic orders. . . . Full and adequate provisions are made for guaranteeing the freedom of speech and freedom of the press, but these rights are guaranteed, for all practical purposes, to citizens of Mexico only. The rights of peaceable assembly and petition are guaranteed by Article 9, but, as in so many other provisions of the Bill of Rights, this article carries the seeds of its own death in it. It provides, among other things:

"No meeting or assembly shall be deemed unlawful, nor may it be dissolved, which shall have for its purpose the petitioning of any authority or the presentation of any protest against any act, provided no insults are proffered against the said authority, nor violence resorted to, nor threats used to intimidate or to compel the said authority to render a favorable decision.' . . . The right to keep and to bear arms is guaranteed, but with limitations. The right to enter and to leave the republic, and to travel through its territory, and to change his residence, is vouchsafed to the citizen, but the clause that guarantees it carries a limitation on that right in that the power is given to the executive to regulate the right. Titles of nobility are forever prohibited. Article 13 provides that no one shall be tried according to special laws or by special tribunals; that military jurisdiction is confined to persons within the army and to military offenses, and that no one shall have special privileges or emoluments. Retroactive laws are forbidden, and in Article 14 we find the broad, comprehensive provision:

"No person shall be deprived of life, liberty, property, possessions or rights without due process of law instituted before a duly created court, in which the essential elements of procedure are observed and in accordance with previously existing laws. In criminal cases no penalty shall be imposed by mere analogy or even by a *priori* evi-

dence, but the penalty shall be decreed by a law in every respect applicable to the crime in question.'

"Of course, we must bear in mind this does not apply to persons not citizens of Mexico, for as to them the executive is given by express grant the power to expel them from the republic and to confiscate their property. Adequate provisions are made against the surrender, through extradition treaties, of political offenders. Unlawful searches and seizures, and imprisonment for debt, are forbidden; and the old practice of holding a man accused of crime *incommunicado* is abolished. The citizen is guaranteed a speedy, impartial, public trial. He is allowed bail prior to his trial. He may not be forced to be a witness against himself. He must be publicly notified within 48 hours after his arrest of the offense with which he is charged. He must be confronted with the witnesses against him who must testify in his presence, if they are to be found in the place where the trial is held, so that he may cross-examine them in his defense. However, under a similar provision in the previous constitution, actually confronting the witnesses was held to be not necessary and depositions could be taken against the defendant in a criminal case. The defendant must be given adequate time to obtain the attendance of his witnesses if they are to be found at the place of the trial. He shall be furnished with all the information of record needed for his defence. He must be tried within four months for an offense the maximum penalty of which does not exceed two years' imprisonment, and within one year if the maximum penalty be greater. He shall be heard in his own defense, either personally or by counsel, or both, as he may desire, and if he is without means to employ counsel the court must appoint counsel to defend him. The accused shall have the right to name his counsel immediately on arrest and shall be entitled to have him present at every stage of the trial. For the first time in Mexico, trial by jury is made a matter of constitutional right. . . . Punishments by mutilation, infamy, branding, flogging, torture of any kind, excessive fines and penalties, confiscation and unusual punishments are prohibited. Capital punishment is likewise forbidden for all political offenses, and in case of offenses other than political it shall only be imposed for high treason committed during a foreign war, parricide, murder with malice aforethought, arson, abduction, highway robbery, piracy and grave military offenses. No one shall be twice put in jeopardy for the same offense. By Article 24 it is provided:

"Every man is free to embrace the religion of his choice and to practice such ceremony, devotions of observances of the respective creed, either in places of public worship or at home, provided they do not constitute an offense punishable by law. Every religious act of public worship shall be performed strictly within the places of public worship which shall be at all times under governmental supervision.' By Article 25 the inviolability of the mail is provided for, and Article 26 provides against quartering soldiers on citizens in times of peace. . . . The right of the nation at all times to impose such limitations on private property and upon the development of natural resources, as it may see fit in order to conserve them and equitably distribute the public wealth, is expressly declared. By Article 27 the distribution of large landed estates for the purpose of developing small land holdings, establishing centers of rural population, for the encouragement of agriculture, and the prevention of the destruction of the natural resources, and the protection of property from damage which would be

detrimental to society, is provided for. All the grants of land made up to the date of the adoption of the constitution under the decree of January 6, 1915, are confirmed, and all private property acquired for that purpose is declared to have been taken for public use. By the terms of the same article it is expressly provided that the ownership of all minerals or substances which in veins, masses, or beds constitute deposits whose nature is different from the components of the land, such as minerals from which metals and metalloids used for industrial purposes are extracted; beds of precious stones, rock, salt and salt lakes formed directly by marine waters; products derived from the decomposition of rocks, when their exploitation requires underground work; phosphates which may be used for fertilizers; solid mineral fuels; petroleum and all hydrocarbons—solid, liquid or gaseous—is in the nation. The waters, as well as the minerals and lands, are declared to be the property of the nation, with certain minor exceptions. The legal capacity to acquire the ownership of lands and waters of the nation shall be governed by the following provisions:

"I. Only Mexicans by birth or naturalization and Mexican companies have the right to acquire ownership in lands, waters and their appurtenances, or to obtain concessions to develop mines, waters, or mineral fuels in the Republic of Mexico. The nation may grant the same right to foreigners, provided they agree before the Department of Foreign Affairs to be considered Mexicans in respect to such property, and accordingly not to invoke the protection of their governments in respect to the same, under penalty, in case of breach, of forfeiture to the nation of property so acquired. Within a zone of 100 kilometers from the frontiers, and of 50 kilometers from the seacoast, no foreigner shall under any condition acquire direct ownership of lands and waters.

"II. The religious associations known as churches, irrespective of creed, shall in no case have legal capacity to acquire, hold or administer real property or loans made on such real property; all such real property or loans as may be at present held by the said religious associations, either on their own behalf, or through third parties, shall vest in the nation, and anyone shall have the right to denounce property so held. Presumptive proof shall be sufficient to declare the denunciation well-founded. Places of public worship are the property of the nation, as represented by the federal government, which shall determine which of them may continue to be devoted to their present purposes. Episcopal residences, rectories, seminaries, orphan asylums or collegiate establishments of religious associations, convents or any other buildings built or designed for the administration, propaganda, or teaching the tenets of any religious sect shall forthwith vest, as of full right, directly in the nation, to be used exclusively for the public services of the federation or of the states, within their respective jurisdictions. All places of public worship which shall later be erected shall be the property of the nation.

"III. Public and private charitable institutions for the sick and needy, for scientific research, or for the diffusion of knowledge, mutual aid societies, or organizations formed for any other purpose shall in no case acquire, hold and administer loans made on real property, unless the mortgage terms do not exceed 10 years. In no case shall institutions of this character be under the patronage, direction, administration, charge or supervision of religious corporations or institutions, nor of ministers of any religious sect or of their dependents, even though

either the former or the latter shall not be in service.

"IV. Commercial stock companies may not acquire, hold, or administer rural properties. Companies of this nature which may be organized to develop any manufacturing, mining, petroleum or other industry, excepting only agricultural industries, may acquire, hold or administer lands only in an area absolutely necessary for their establishments or adequate to serve the purposes indicated, which the executive of the Union or of the state in each case shall determine.

"V. The banks duly organized under the laws governing institutions of credit may make mortgage loans on rural and urban property in accordance with the provisions of the said laws, but they may not own or administer more real property than that absolutely necessary for their direct purpose; and they may furthermore hold temporarily for the brief term fixed by law such real property as may be judicially adjudicated to them in execution proceedings.' By the same article of the constitution it is provided that the state and federal laws shall determine, within their respective jurisdictions, those cases in which the occupation of private property is to be considered of public utility. Where they have so determined they may take the land upon paying therefor the amount at which it is valued for fiscal (taxation) purposes in the revenue office, whether this value be that manifested by the owner or merely impliedly accepted by reason of the payment of his taxes on such a basis, and to which basis there shall be added 10 per cent. If improvements have been made on the land after the assessment of its value, the amount to be paid for the improvements is left open for determination. This article of the constitution also contains one of the provisions under which the holdings of Americans and other foreigners, and corporations owned by them, are to be taken from them. It reads as follows:

"All proceedings, dispositions, decisions and all operations of demarcation, concession, composition, judgment, compromise, alienation, or auction which may have deprived properties held in common by co-owners, hamlets situated on private property, settlements, congregations, tribes and other settlement organizations still existing since the law of June 25, 1856, of the whole or a part of their lands, woods and waters, are declared null and void. All dispositions, resolutions and operations which may subsequently take place and produce the same effects, shall likewise be null and void.' By the terms of this article it is made the duty of the several administrative officers of the state and federal governments to immediately take over this property, and while it is declared that this shall be done by judicial process, it is expressly provided that the order under which it is done shall be issued within the period of one month, and that the administrative officers shall proceed to the occupation of the lands and waters, and that in no event shall their acts be set aside until the final decree. [This is no longer valid. (See MEXICO: 1922.)] The constitution, by the same article, provides that in each state and territory there shall be fixed the maximum area of land which one individual or legally organized corporation may own. The remainder is to be subdivided and forthwith sold, payments to be made in annual amounts sufficient to amortize the principal and interest within a period of not less than 20 years, during which time the purchaser cannot sell. The rate of interest shall not exceed 5 per cent, and it is provided that the owner shall be compelled to receive special bonds to guarantee the payment of the

property expropriated, and that the Congress shall issue a law authorizing the states to issue bonds to meet their agrarian obligations. By subdivision 'f' of the same article it is provided that the local laws will govern the extent of the family estate and determine what property will constitute the same on the basis of its inalienability. Attention is directed especially to the following general clause of confiscation:

"All contracts and concessions made by former governments from and after the year 1870, which shall have resulted in the monopoly of land, waters and natural resources of the nation by a single individual or corporation, are declared subject to revision, and the executive is authorized to declare those null and void which seriously prejudice the public interests.' . . . Monopolies and combinations in restraint of trade are provided for and prohibited by the terms of Article 28 of the Bill of Rights; that is to say, those relating to the coinage of money, to the postal, telegraphic and radio-telegraphic service, the issuance of bills by a single banking institution to be controlled by the federal government, are given to the government, and all others prohibited. Associations of labor organized to protect their own interests are declared to be not a monopoly. Under certain conditions, combinations may be formed between producers when, in defense of their own interests or the general public, they sell directly in foreign markets national or industrial products which are the principal source of the wealth of the region in which they are produced, provided they be not necessities; and provided further that such associations are under the supervision and protection of the federal government or the state, and provided further that authorization be in each case obtained from the respective legislative bodies. The cornering of necessities is expressly prohibited, as are any agreements or combinations entered into between producers, manufacturers, merchants, common carriers, or any of them, to compel the consumer to pay exorbitant prices. Title VI, 'Of Labor and Social Welfare,' is the most remarkable feature of the new constitution. . . . The Congress and the state legislatures are especially charged with the duty of making labor laws in conformity with the general principles announced in the constitution, but bearing in mind the special needs and conditions of the localities in which they are to apply. The laws are to be made applicable to all labor, 'skilled and unskilled workmen, employees, domestic servants, and artisans, and, in general every contract of labor.' This, it will be observed, is without regard to whether they be employees of individuals or of corporations, whether in hazardous or safe employments, whether in public, quasi-public or domestic service. Eight hours is made the maximum of a day's work, seven hours the maximum limit of night work. Women, and children under 16 years of age, are forbidden employment in unhealthy and dangerous occupations. Night work in factories is likewise forbidden to women, and children under 16 years of age, nor shall they be employed in commercial establishments after 10 o'clock at night. The maximum limit of a day's work for children over 12 and under 16 is 6 hours, and the work of children under 12 is not to be the subject of a contract; while one day's rest for every six days' work is mandatory. . . . By Subdivision V of Article 123 it is provided that 'women shall not perform any physical work requiring considerable effort during the three months immediately preceding parturition. During the months following parturition they shall necessarily enjoy a period of rest and shall receive their salary or wages in full, and

retain their employment, and the rights they may have acquired under their contracts. During the period of lactation they shall enjoy two extraordinary daily periods of rest of one-half hour each in order to nurse their children.' . . . By Sub-division VI it is provided that a minimum wage shall be paid to a worker, and that that minimum 'wage shall be considered sufficient, according to the conditions prevailing in the region or country in which he is situated, to satisfy the normal needs of the life of the workman, his education and his lawful pleasures, considering him as the head of a family'; and that in all agricultural, commercial, manufacturing and mining enterprises he shall have a right to participate in the profits of the business, the extent of this participation to be determined by special commissions to be appointed by each municipality, they in turn to be subordinated to the central Board of Conciliation to be established in each state. This minimum wage shall be exempt from attachment, set-off or discount, and the same compensation shall be paid for the same work without regard to sex or nationality. All wages shall be paid in legal currency, and shall not be paid in merchandise, orders, counters, or any other representative token. Should special circumstances arise in which extra work becomes necessary it shall be paid for at the rate of 100 per cent more than the regular rate. In no event can the extra hours exceed three, nor continue for more than three successive days, and no woman, or boy under the age of 16 years, can engage in overtime work under any conditions. In every agricultural, industrial, mining, or similar class of work, the employers are bound to furnish their workmen with comfortable, sanitary homes, for which they may charge rents not exceeding one-half of 1 per cent a month of the assessed value of the properties. They shall establish schools, dispensaries, and other services necessary to the community, and in all labor centers, wherever the population exceeds 200, the employer shall set aside a space of land, of not less than 5000 square meters, for the establishment of public markets, and the construction of buildings designed for municipal services, and places of amusement. No saloons, nor gambling houses, shall be permitted in such labor centers. The employers shall be bound to observe in the installation of their establishments all the provisions of law regarding hygiene and sanitation, and to prevent accidents due to the use of machinery, tools and working materials, and so organize the work as to insure the greatest guaranties possible for the health and lives of workmen, compatible with the nature of the work; all of this under penalties which the law shall determine. The employers are made absolutely liable for occupational diseases or accidents, for which they must pay proper indemnity, whether the accident or occupational disease result in death or only permanent or temporary disability. It is expressly provided that the workmen and employers shall have the right to unite in the defense of their respective interests by forming syndicates and unions, and the right of laborers to strike is expressly recognized. Strikes are declared to be 'lawful when, by the employment of peaceful means, they shall aim to bring about a balance between the various factors of production and to harmonize the rights of capital and labor.' Strikes are only unlawful when the *majority* of the strikers shall resort to acts of violence against persons or property, or in case of war when the strikers belong to establishments and services dependent on the government. It is provided that workmen in public service must give 10 days' notice in advance to the Board of Conciliation of the date set for the

suspension of work, and these provisions do not apply to employees of military manufacturing establishments. Lockouts are declared to be 'lawful when the excess of production shall render it necessary to shut down in order to maintain prices reasonably above the cost of production, subject to the approval of the Board of Conciliation and Arbitration.' Differences between employers and employees must be settled by arbitration, the board to consist of an equal number of representatives of the workmen and the employers, and one representative of the government. If the employer shall refuse to submit the differences to arbitration, or to accept the award rendered by the board above provided for, the labor contract shall be considered terminated and the employer bound to pay to the workmen three months' wages, in addition to the liability which he may have incurred by reason of the dispute. If the workmen reject it, the contract is simply terminated. If an employee is discharged on account of joining a union, or without proper cause, or because he has taken part in a lawful strike, the employer shall, at the worker's option, be compelled to perform the labor contract or pay the employee three months' wages, and he incurs the same liability if the employee leaves his employment on account of maltreatment, either towards his own person, or his wife, parents, children, or brothers and sisters, or on account of bad faith on the part of the employer. All claims of workmen for salary and wages accrued during the past year, and all indemnity claims, are first liens in case of bankruptcy or execution proceedings. Debts contracted by workmen in favor of their employers or their employers' associates, subordinates or agents, may only be charged against the workmen themselves, and they shall not in any event be paid by the taking of more than the entire wages of the workmen for any one month. By Article 27 certain provisions in labor contracts are held and declared to be null and void. Among these are stipulations providing for an inhuman day's work on account of its notorious excessiveness in view of the nature of the work; stipulations for a rate of wage that, in the opinion of the Board of Conciliation, is not remunerative; stipulations providing for a term of more than one week before the payment of wages; stipulations providing for the assignment to places of amusement, eating places, cages, taverns, saloons or shops, of wages, when employees of such establishments are not involved; stipulations involving a direct or indirect obligation to purchase articles of consumption in specified shops or places; stipulations permitting the retention of wages by way of fines; stipulations constituting a waiver on the part of the workman of the indemnities to which he may become entitled by reason of labor and accidents or occupational diseases; stipulations for non-performance of the contract or for discharge from work; and all other stipulations implying the waiver of some right vested in the workman by labor laws. . . . The most interesting features of Title VII are those covering the subject of religious freedom. . . . Article 130 provides that the federal authorities shall have exclusive power in matters of religious worship and outward ecclesiastical forms. Congress is forbidden to enact any law establishing or forbidding any religion whatsoever. Marriage is declared to be a civil contract. Judicial and other oaths are abolished, and a simple promise to tell the truth is substituted. Corporate existence in religious associations known as churches shall not be recognized. Ministers of religious creeds are especially made the subject of the laws enacted on the subject of professions. State legislatures are

given the power to determine the maximum number of ministers of religious creeds, according to the needs of each locality, and only a Mexican by birth may be a minister of any religious creed in Mexico. No minister shall in public or private meeting, or in acts of worship or religious propaganda, criticise the fundamental laws of the country, the public authorities or the government. They shall not have the right to vote, or to participate in any meeting for political purposes, nor are they eligible to any office. Before a new temple of worship for public use can be dedicated permission must be obtained from the Department of the Interior, and the opinion of the Governor of the state must be learned. Every such place shall have a person charged with its care and maintenance, who shall be legally responsible for the faithful performance of the laws within the said place of worship, and for all the objects used for purposes of worship. The caretaker himself, together with 10 other citizens, must advise the municipal authorities as to who is in charge of the said place of worship. The outgoing minister must give notice of any change, being accompanied in so doing by the incoming minister and 10 other citizens of the place. Municipal authorities, under penalty of \$1000 and of dismissal, shall be responsible for the exact performance of this condition. They shall keep a register of the places of worship, and another of the caretakers, upon the same penalty. The municipal authorities shall give notice to the Department of the Interior, through the intermediary of the state Governor, of any permission to open to the public a new place of worship, as well as of any change in the caretakers. Under no conditions shall the studies carried on in institutions devoted to training ministers of religious creeds receive the ratification of official institution. Any public officer violating this shall be punished criminally and the approval shall be null and void. No periodical publication 'which, either by reason of its program, its title, or merely by its general tendency, is of a religious character shall comment on any political affairs of the nation, nor publish any information regarding the acts of the authorities of the country, or of private individuals in so far as the latter have to do with public affairs.' 'Every kind of political association whose name shall bear any word or any indication relating to any religious belief is hereby strictly forbidden. No assemblies of any political character shall be held within places of public worship.' 'No minister of any religious creed may inherit, either on his own behalf or by means of a trustee or otherwise, any real property occupied by any association of religious propaganda or religious charitable purposes. Ministers of religious creeds are incapable legally of inheriting by will from ministers of the same religious sect or from any private individual to whom they are not related by blood within the fourth degree.' And finally: 'No trial by jury shall ever be granted for the infraction of any of the preceding provisions.' . . . All places of public worship are declared to be the property of the federal government. The property belonging to the churches, whether church buildings, rectories, episcopal residences, seminaries, orphan asylums or collegiate establishments, by the terms of Subdivision II of Article 27 are confiscated by the federal government. It is expressly declared that hereafter all places of public worship shall be the property of the nation, and, as if not satisfied with this, the churches and the ministers of any religious sects, and their dependents, are forbidden to patronize, direct, administer, have charge of or supervise public or private charitable institutions for the sick,

for the needy, for scientific research, or for the diffusion of knowledge."—W. H. Burges, *Hot-house constitution: Mexican constitution of 1917* (pamphlet), pp. 4-13, 10-33, 36-38.

MEXICO CITY, capital of the republic of Mexico, about 7,500 feet above sea level in the southwest of the Valley of Mexico. (See MEXICO: Map.) Water is obtained from the western mountains, and sewage is carried by means of a canal forty-three miles through the mountains to a river which flows into the gulf of Mexico. Originally the city was built on an island in Lake Texcoco, and on its western margin, but the lake, which is constantly receding, is now three miles away. The traditional date of the founding of the city of Tenochtitlán by the Aztecs, who later changed the name to Mexico, is 1325. When the Spaniards arrived in 1519 the city was about twelve miles in circumference, and is said to have had 300,000 inhabitants. (See MEXICO: 1519 [October].) It was almost totally destroyed by Cortés two years later, but he induced the natives to rebuild it on the same site. (See MEXICO: 1521 [May-July].) Chief among its notable buildings are the cathedral, begun in 1573 and completed in 1811, the legislative palace, the national museum, the national picture gallery of San Carlos, the schools of medicine, arts and mines, and the national library. (See LIBRARIES: Modern: Mexico.) The University of Mexico was founded in 1551. According to the latest census, taken in 1910, the population of the city was 989,510, while the estimated population of 1912 was 1,000,903.

MICHELOZZO DI BARTOLOMEO (1396-1472), Florentine architect, sculptor and goldsmith. Employed by the Medici in Florence, and in Milan by Francesco Sforza; his most famous work is the Riccardi palace in Florence. See ARCHITECTURE: Renaissance: Italy.

MICHELSON, or Michaelson, Albert Abraham (1851-), American physicist of German birth. See INVENTIONS: 19th century: Instruments; ASTRONOMY: Measuring the size of stars; NOBEL PRIZES: Physics: 1907.

MICHIGAN, known as the "Wolverine" state, is one of the north central states of the United States consisting of two peninsulas and several islands. The international boundary line between the United States and the Dominion of Canada forms the eastern and most of the northern boundaries of the state. Ohio and Indiana lie to the south of the lower peninsula, and Wisconsin south of the western part of the upper peninsula. The lakes Superior, Michigan, Huron, St. Clair, Erie and Georgian Bay give the state a total coast line of 1620 miles; it has an area of 57,980 square miles exclusive of the water area, and a population, 1920, of 3,668,412.

ALSO IN: G. N. Fuller, *Economic and social beginnings of Michigan*, pp. 1-2.

Resources.—Michigan is largely an agricultural state and in 1920 had 196,447 farms with a total area of 9,340,204 acres, given over to the cultivation of oats, corn, wheat, hay, beans, potatoes and sugar beets. In 1921 the state had 5,767,000 head of cattle. Michigan, which yields iron ore, copper, silver, coal, clay and clay products, graphite, asbestos, gypsum petroleum, and building stone, ranks first among the states in the production of iron ore and sixth in general mineral production, with an output, 1918, valued at \$199,264,604. The other industries of the state are chiefly concerned with lumber, metal-working, and the manufacture of automobiles. See U.S.A.: Economic map.

Aboriginal inhabitants. See HURONS; OJIBWAYS.

1616-1701.—Explored by La Salle.—Early trading posts.—Michilimackinac.—Founding of French post at Detroit.—Médard Chouart, Sieur de Groseilliers, Pierre Radisson, and Robert de la Salle deserve to be ranked among the forerunners of Michigan [fur] traders. The first two are said to have spent the entire winter of 1659-60 at Sault Ste. Marie. . . . La Salle, with Father Louis Hennepin, Henry de Tonty, and twenty-five others, . . . came to Detroit [1659], and from there pushed on to Green Bay, Wisconsin. After loading his boat, the *Griffin*, with furs, he sent her back, while he and a few others struck boldly across to the Michigan shore and went down to the mouth of the St. Joseph River. There he established a fort [1679]. (See also CANADA: 1660-1687.) . . . Sault Ste. Marie was first to assume importance as a trading center. It was the rallying point for most of the savages in this section, for this was the great fish region, much sought by the Indians. Naturally, it became early the center of a wide-spreading fur trade, a position it held until Mackinac rose into prominence. . . . Traders came to this spot as early as 1616. Monsieur de Saint Lussou in May, 1671, took possession of this region in the name of the French. But by 1689, Sault Ste. Marie was practically abandoned as a trading post and from then on formed merely a station on the trade route to the Northwest, and was not re-established until De Repentigny was sent there in 1750 to re-occupy the post. Of all Michigan trading posts, there was none that grew to greater importance in the fur régime than Michilimackinac, and that importance was assumed early. Nicolet passed through the Straits in 1634, and Denonville claims that French traders lived there in 1648. . . . From the beginning of the fur trade régime to its close a bitter warfare was waged for the possession of this 'golden fleece' of the New World; monopolizing companies competed with coureurs de bois, Indian tribe with Indian tribe, French with English, English with American, independent traders with trading companies, and vice versa. It was a competition that lasted until the forest was stripped of its

rich supply of peltries. . . . The British and the Flemings of New York also had their eyes on Michilimackinac trade. . . . In 1686 a small party of these arrived, traded with the savages and were invited by them to come again. This invitation was accepted and soon a second expedition was planned. Two bands, one led by Rooseboom and the other by McGregor, each floating an English flag and armed with an English passport, set out for this upper post. Rooseboom came on ahead. With him were some savages of the nation Lupes and some Iroquois who were to serve as guides and hunt for food. . . . La Durantaye . . . set out to meet them, and he soon settled the matter with Rooseboom by capturing him and his goods. . . . Then he proceeded to Detroit where he was joined by Du Lhut and Tonty with their army of *coureurs de bois* and Indians, and together they started towards Niagara. They encountered the second band on the way and these, too, were captured. . . . As a military encounter it was perhaps of little significance, but it wrought mischief among the Hurons and Ottawas and made them restless under French rule. . . . English effort to snatch from the French the upper commerce was a powerful inducement for the latter to establish a post in the environs of the Detroit River, and so shut the door to this region against these aggressive Britons and their capable Iroquois allies. The first expedition of the English had been made in the early months of 1686. In June of that same year Denonville ordered Du Lhut who was then *commandant* at Michilimackinac, to establish a combined fort and trading post at the Detroit with a garrison of fifty men, choosing an advantageous position, that he might control the strait and protect the savages hunting there, giving them a place of refuge against their enemies. Du Lhut at once repaired thither with fifty *coureurs de bois* and built a stockade on the strait. On June seventh, the following year, La Durantaye took formal possession of the region for France. . . . This was a short-lived fort. France was waging war with the Iroquois, and La Hontan, hearing that Fort Niagara had been deserted and, as he says, that Denonville 'had a mind to clap up a Peace,' concluded that this post would be of no use; so he set fire to the fort and sailed with his crew to Michilimackinac. Thus ended Fort St. Joseph on the Detroit. . . . When the intercolonial wars began in 1689, Michigan trade suffered. . . . Many French posts were abandoned; but Michilimackinac, Michigan's only post during the early years of the war, held her own. . . . When, in 1694, La Motte Cadillac took charge of the post, there were present about two hundred French troops, besides the *coureurs de bois*, traders and artisans, while at certain seasons thousands of Indians assembled. After the abandonment of La Salle's fort at the mouth of the St. Joseph, the history of this river valley, as far as known, remains a silent chapter until the opening of the eighteenth century. . . . When at the opening of the eighteenth century the little trade center Detroit was established, it at once assumed the lead in peltry traffic. Sault Ste. Marie had been abandoned, Michilimackinac had dwindled to insignificance, and the St. Joseph trade had been largely absorbed. Detroit was practically Michigan's only depot of trade during the earlier years of its existence, dominating and controlling her entire forest commerce. . . . The fur trade, the French desire to control it, to continue it, and to keep it from the grasp of the British was, generally, the impelling motive leading the pioneers to seize key points and establish posts there. The English frontier line was fast moving westward, and at the

close of the seventeenth century, British traders were coming dangerously near to territory claimed by France. Rivalry for the fur trade was becoming more intense, and it was necessary to check these advancing Englishmen, so keen for trade. The strategic position of the Detroit was fully appreciated by the French, for already in 1686 they had taken steps to shut out the English, Dutch, and Iroquois from the upper country commerce by ordering Du Lhut to establish a post there. [See DETROIT: 1686-1701.] But this had been abandoned and France had made no effort to re-occupy and to make a permanent post there. The door stood open, by which the enemy could go in and out among the French Indian allies, and get control of the Detroit and the fur trade of the upper countries. . . . The rise of Detroit [1701] proved a death blow to Michilimackinac and her trade, for, accepting the invitation extended by Cadillac to every savage tribe within reach to join the Indian settlement at Detroit, Huron and Ottawa deserted the old post for the new."—I. A. Johnson, *Michigan fur trade*, pp. 11-12, 15-22, 31-32, 52.—See also CANADA: 1660-1687.

1640-1671.—French missionaries.—First settlements.—"So early as 1641 the Jesuit fathers Raymbault and Jogues had visited the Sault Ste. Marie and had established a mission there for the Chippewas but the sickness and death of Raymbault caused its early abandonment. The position was too important to permit of its being permanently given up, and Father Marquette was sent there in the spring of 1668, and renewing the mission, he founded there the first permanent settlement in Michigan. . . . When in 1670 the Hurons fled before their new enemies the Sioux, Father Marquette cast his lot with them in the following year and gathered them about him at the Straits of Michilimackinac. . . . The mission now established by Father Marquette was located on the north side of the Straits and was named by him for Saint Ignatius."—T. M. Cooley, *Michigan*, pp. 10-12.

1763-1774.—Pontiac's War. See PONTIAC'S WAR.
1763-1777.—Governmental beginnings.—Quebec Act of 1774.—First court.—"The King of Great Britain, at the close of the French and Indian war, under the treaty of Paris, in 1763, established four separate governments known as Quebec, East Florida, West Florida and Granada. [See SEVEN YEARS' WAR: Treaties; NORTHWEST TERRITORY OF UNITED STATES: 1763.] . . . Eleven years passed before the territory of Michigan, under the Quebec Act, came within the pale of civil government, and then in little more than name. In the meantime the people of Michigan knew no government other than that of military absolutism. The *commandants* were the source of authority, which they exercised either in person or through some subordinate. Under some such arrangement one Gabriel La Grand, in 1765, seems to have exercised a part of the functions of a justice of the peace. . . . In 1767, the *commandant*, Captain George Turnbull, commissioned Phillip Dejean a justice of the peace, with powers to make inquiry but not to render judgment except upon the joint request of the parties. In the same year he received a further commission as 'Second Judge,' 'to hold a temporary court of justice twice each month at Detroit to decide of all actions of debt, bonds, hills, contracts, and trespasses above the value of five pounds of New York currency.' . . . The English authorities, like some of their French predecessors, saw but one purpose to be achieved in the lake country, and that was the nurturing of the fur trade. To this end the proclamation of the king forbade the surveying, granting, or patenting of any lands within

... [Michigan's] territorial limits, or the acquiring of title through Indian grants. . . . When the storm of the American revolution came . . . it found the Canadian either passive, or active for the English King. Some of this may have been brought about by the passage by the British Parliament of the Quebec Act of 1774. [See CANADA: 1763-1774.] . . . One of the provisions of this act was to bring Michigan territory under the pale of civil government, as a part of the province of Quebec. On November 9th, 1775, Henry Hamilton arrived at Detroit as Lieutenant Governor to be the first civil officer of the English period. Detroit and Michilimackinac were now upon the frontier of civil government, but so far removed from the seat of judicial authority at Montreal that there was little or no actual operation of government. Lieutenant Governor Hamilton was clothed with, or at least assumed, well nigh unlimited administrative and judicial powers. Under his sway Dejean continued to exercise his powers as a justice of the peace. . . . The lack of courts was very much felt at Detroit, and in 1777, under permission of the lieutenant governor, the merchants of the place established a court of trustees or arbitration. Eighteen of them entered into a bond that three of them should be a weekly court in rotation, and were to defend any appeal that might be taken from their decisions. . . . This volunteer court rendered judgments, issued executions, and imprisoned in the guard house."—L. T. Hemans, *History of Michigan*, pp. 74-77.

1775-1783.—Held by British throughout the Revolutionary War. See U.S.A.: 1778-1779; Clark's conquests.

1775-1796.—Indian unrest.—Peace treaty.—Treaty of Paris, 1783.—"The war [of the American Revolution] . . . caused unrest among the Indians and thus endangered the life of the traders. Numerous rumors reached the posts of men who had been killed by the savages while on their way to the hunting grounds. . . . Whatever the cause, these murders spread alarm, and traders hesitated to penetrate into the wilderness. Major Henry Basset of Detroit in 1773 denied passes for St. Joseph's Valley to English and French alike, and informed the red men that until they behaved better and ceased their depredations, no traders would be sent among them. . . . When the war closed the Indians were in a turmoil. . . . At Michilimackinac they were almost beyond control. John Dease, who had been made deputy superintendent of the Indians in 1786, removed to that place from Niagara. After holding several councils with representatives from the various Indian tribes, he finally concluded a treaty of peace with them in July, 1787, in which they acknowledged the king of England as their father, next to the Great Spirit."—I. A. Johnson, *Michigan fur trade*, pp. 78-80.—By the Treaty of Paris, 1783, the region passed to the United States. England, however, retained possession of Detroit and Mackinac (or Michilimackinac) till 1796, when they were surrendered in accordance with Jay's Treaty of 1794.—See U.S.A.: 1793-1795.

1784.—Included in proposed states of Cherokee and Sylvania. See NORTHWEST TERRITORY OF UNITED STATES: ¶784.

1785-1786.—Partially covered by western land claims of Massachusetts and Connecticut, ceded to the United States. See U.S.A.: 1781-1786.

1787.—Ordinance for the government of Northwest Territory.—Perpetual exclusion of slavery. See NORTHWEST TERRITORY OF UNITED STATES: 1787.

1796-1840.—Exploitation of fur-bearing ani-

mals.—Rapid settlement.—Government trading houses.—"The Michigan fur trade passed under three successive régimes—the French [1634-1760], the English [1760-1796], and the American [1796-1840]. . . . This latter period saw not only the 'Golden Age' of Michigan's forest commerce but also its decline and destruction. It was a period of systematic, wholesale exploitation of the furred creatures of her forests by factory, fur-trading company, and independent trader, without thought of reservation or preservation; a period when the dollar took the place of the beaver pelt, salaries the place of the credit system, and the Yankee the place of the Briton; a period when her splendid forests and Indian hunting grounds were transformed into pastures and farms, and her trading rendezvous became the sites of villages and thriving cities; when the trapper and the hunter and savage gave way to the man with the axe and the hoe, the lumberman, the merchants, and the farmer. The factory, fur-trading company, and independent trader were all at work, each contending for the largest share of the spoils. The two latter existed during the British régime; the first named is a new element. The factory system was an attempt made by the United States to control the Indian trade by establishing trading houses under the supervision of government officials. The purpose was two-fold: to keep the savage supplied with merchandise, and to furnish him protection and justice against the greed and avarice of traders. It had its origin in 1795, when Congress, to test the system, appropriated \$50,000 to purchase goods for supplying the Indians in that year. . . . In Michigan all accounts, vouchers, abstracts, and estimates of these Indian agents were sent to the Governor of the territory for examination. The act providing these trading houses remained in force only two years. It was revived again in 1802 and retained until 1822, when trading houses were finally abolished. . . . The history of Michigan's forest commerce during this period is the history of a gradual elimination of English influence by American up to the year 1812, when war called a halt to trade for a few years; after which British traders were barred from seeking peltries in American territory and British influence ceased. After the war this commerce was pushed to the utmost in certain regions and centers of trade until it reached its zenith. Then followed a period of decline, when the Indians through the influence of traders peacefully relinquished their hunting grounds to the incoming settlers."—I. A. Johnson, *Michigan fur trade*, pp. 102-104, 106.

19th century.—Educational developments.—Teacher training and certification. See EDUCATION: Modern; 19th century; United States: Evolution of public school system.

1800-1802.—Michigan as part of the new Indiana Territory.—When the Northwest Territory was divided in 1800, the western part of Michigan was incorporated in the new Indiana Territory, and in 1802 the remainder of what is now Michigan was also added to that territory. See INDIANA: 1800-1818.

1804-1884.—Development of state educational system.—"The early schools in the territory were of course French, and connected with the church. . . . But private schools in which English was taught were in existence from the time of the outbreak of the Revolutionary War. . . . When Father Richard came, he made an endeavor in the direction of better church schools, and with considerable success. In 1804 he established a school for girls, . . . and also a Latin school for young men. Both of these were broken up by the great fire of the next year, but schools of less ambitious

character were established shortly afterwards, and Father Richard in 1808 reports six of such schools, three of which were taught by Indian teachers. . . . [In 1809] an act was adopted which provided for the laying off into school districts of all the settled portions of the territory, and for an enumeration of the children between the ages of four and eighteen in each of the districts. . . . Rev. John Monteith, a well-educated Presbyterian clergyman, had come to Detroit in 1816, where he had collected a congregation composed of various denominations of Protestants, to whom he preached on Sundays. He soon formed the acquaintance of Father Richard, and friendly intercourse between them brought out the fact that both were greatly concerned at the want of means of education for the youth of the territory, and willing and desirous to assist in supplying them. From Governor Cass they found ready and hearty cooperation, and the chief justice also lent assistance. The latter in August, 1817, drew up and secured the adoption of 'An act to establish the Catholepistemiad or University of Michigan,' in which an elaborate plan for a university was marked out. The plan was crude and pedantic, but its author had grasped certain principles which were of the very highest importance, and which from this time became incorporated in the polity of the territory, and subsequently of the State also. [See also UNIVERSITIES AND COLLEGES: 1804-1837.] . . . The practical development of the common school system was much more rapid. . . . Early in 1826 Congress was induced to grant an additional township of land towards the endowment of the university; and Governor Cass, in calling the attention of the legislative council to this grant in the following November, strongly urged the establishment of schools to be supported by taxation. . . . The territorial council granted charters for academies, but the name in most cases indicated rather an aspiration than an existence. In two or three places good service was being done; notably at Ann Arbor by Mr. O. C. Thompson, a graduate of Princeton, sent out for missionary work by the Presbyterian Church. . . . The constitutional convention of 1835 had recognized the supreme importance of education, and had made the position of superintendent of public instruction a permanent constitutional office. It had required a school to be kept in each school district for at least three months in every year, and had pledged the faith of the State to the preservation of all donations for schools or for the university, as permanent funds for the purposes for which they were given. But as yet the State was not admitted to the Union, and it was not known what form any donation by the federal government would take. General Isaac E. Crary, . . . [who had been a member of the constitutional convention, believed] that education ought to be an independent department of the state government; and . . . that the lands granted by the general government for school purposes ought to be granted directly to the State as trustee. . . . Fortunately for the State, General Crary was its first representative in Congress; and through his prudent and cautious management the grant by the general government was so shaped as to meet his views. . . . The services of General Crary to education were not confined to those performed at Washington. . . . [He] recommended the young missionary [John D. Pierce] as the suitable person for superintendent of public instruction. . . . The result was his appointment to the office [by Governor Mason], and the commitment to his control of the whole subject of state education, with the charge and management of a million acres of land. The

legislature called upon him to prepare and report a system of common school and university education, and the report was made, approved, and adopted the very year the State entered the Union. The system reported has in the main been in existence ever since. . . . The common schools of the State came in time to do admirable work, and in the leading towns they grew into high schools. . . . The constitution of 1850 made it the duty of the legislature, within five years from its adoption, to make provision in every school district for free instruction at least three months in the year. . . . Such in brief has been the progress of instruction in the common schools, which are the foundation of the state system of education, and in the university which crowns and completes the structure. But between the common school and the university are other institutions, each of which has its appropriate place in the system, and is necessary to complete it. Foremost of these are the State Normal School at Ypsilanti, and the State Agricultural College at Lansing. A school for the deaf and dumb at Flint and another for the blind at Lansing are liberally supported by the State, and make ample provision for such education as those unfortunate classes are capable of receiving. In 1874 a state school for dependent children was opened at Coldwater. . . . Such is the educational system of Michigan. Its founders took position in advance of the thought of their day, and those who followed them have endeavored to give effect in full measure to their views."—T. M. Cooley, *Michigan*, pp. 307-310, 314, 317-322, 326-327.

1805.—Detached from Indiana Territory and distinctly named and organized. See INDIANA: 1800-1818.

1805-1842.—Treaties with Indians.—"The Governor [General Hull] reached Detroit on the 1st of July, 1805. [He served until 1813.] . . . For judicial purposes the territory was divided into three districts known as the districts of Eric, Detroit, and Huron. Later a fourth district was created called the district of Mackinaw. . . . Matters of small importance were left to the disposal of justices of the peace. A court of intermediary jurisdiction was created for each district, while the supreme court reserved to itself jurisdiction over all land cases and concurrent jurisdiction over civil cases, involving at first \$200 and later \$500. The courts had the general powers of an appellate court. The district courts survived until 1809. . . . In April, 1806, congress gave the governor and judge authority to lay out a new town of Detroit, and appropriated 10,000 acres of land for its purpose. It was September 13, 1806, before the basis of the town was laid. . . . [In 1807] General Hull negotiated a new treaty with the Ottawas, Chippewas, Wyandottes, and Pottawattamies, whereby the Indian title was extinguished to the southern portion of the territory. . . . Detroit was hardly settled in the new abodes when disquieting rumors as to Indian intrigues and war with England again filled the settlement with alarm. . . . In 1809, Governor Hull heard the rumors, and on the 28th of August he met the Ottawa and Chippewa nations at Michilimackinac, and in an address, sought to win their favor. The following month the famous Wyandotte chief, Walk-in-the-water, and his people, in special council at Brownstown, plainly told Governor Hull of their dissatisfaction at the growing encroachments of the whites upon the Indians' preserve."—L. T. Hemans, *History of Michigan*, pp. 104-105, 107-108.—"If the French and the English had discouraged settlement [in Michigan], the Yankee made no effort in that direction; rather, he put forth every effort to persuade the red men

to give up their hunting grounds. The War of 1812 had brought a change of spirit, because during the struggle men had penetrated into the wilds of this region and had come to realize that the interior was not as bad as had been depicted. . . . But there was one obstacle in the way of transforming this wilderness into cultivated fields, and that was its original owner, the Indian. He claimed as his property the hunting ground which the Yankee trader had almost despoiled of its wild animals. It was here that the influence of the old trader upon the Indian was brought into service, who was largely instrumental in inducing the latter to cede large tracts of land to the Government. In 1807 the region around Detroit was turned over to the United States, with the stipulation that as long as it remained government property the savage should have the privilege of hunting and fishing there. The Saginaw [or Cass] treaty of 1810 gave another portion of eastern Michigan. Then followed the treaty of Sault Ste. Marie in 1820, the two Chicago treaties in 1821 and 1833, and the Washington treaty in 1836, until, finally, by the treaty of La Pointe in 1842, the last strip of Indian land in Michigan passed into the hands of the United States Government."—I. A. Johnson, *Michigan fur trade*, pp. 149-150.

1813-1834.—Organization under Lewis Cass.—Expedition to head of Mississippi.—Completion of Erie canal.—Immigration to the state.—Changes in judicial system.—Cholera epidemic.—"General Lewis Cass was made governor of the territory in 1813 and his energy and administrative ability were soon felt in its development. Americans came into the territory in increasing numbers, bringing improved methods of farming and of carrying on other business. Changes were also made in the form of government, so that the people gradually began to share in its administration. General Cass remained governor to the territory until 1831. . . . During his long administration many counties were organized, roads were built, settlements were made, farms were cleared and the territory forged rapidly ahead."—C. S. Larzelere, *Government of Michigan*, p. 16.—"Congressional action, in 1819, had given to Michigan the right to elect a territorial delegate. . . . The year 1819 witnessed the organization of the bank of Michigan at Detroit. . . . The same year the *Walk-in-the-water*, the first steamship of the lakes, made a round trip from Buffalo to Mackinaw. It had made the port of Detroit the year previous. From this date, this boat and its successor continued a means of easy transit from Buffalo to Detroit. . . . That the territory and the country might profit by a more acute knowledge of the lake country, Governor Cass, in 1820, projected an expedition to explore the country through the upper lakes to the head of the Mississippi. The expedition consisted of the governor, a corps of scientific men, and a company of thirty soldiers, and left Detroit on the 24th of May. . . . They reached Mackinaw in safety, and providing an extra escort, they pushed on to the Sault, where they arrived June 14th. . . . The year 1825 was a very important one for Michigan. It marked the completion of the Erie Canal, connecting Michigan by continuous means of transit with the tide water at New York."—L. T. Hemans, *History of Michigan*, pp.

129, 131, 134.—"In 1831, Governor Cass . . . was called to be Secretary of War in the cabinet of President Jackson. . . . General John T. Mason on September 24, 1830, had been appointed secretary of the territory, and upon the retirement of Governor Cass the year following, became the acting governor. . . . Failing fortune and business interests required his personal attention, and he was obliged to resign. . . . The Anti-Masonic Party . . . at the previous election had elected several members of the territorial council. When the news reached Detroit, in the early days of 1831, that President Jackson had given the appointment [of Secretary of the Interior] to Stevens T. Mason, the minor son of the retiring secretary, the joint causes produced a protest of more than usual volume. . . . Although opposition was carried to the Senate, the appointment was nevertheless confirmed in July, 1831. . . . The feeling with which the young man's appointment was received was, in some

LEWIS CASS

measure, intensified by the fact that the office of governor was vacant, and as secretary he was the acting governor. This condition was soon remedied by the appointment of George B. Porter of Lancaster, Pennsylvania. . . . Every month was now adding to the population of Michigan. Steamships had multiplied; some six or seven now plied the lake between Detroit and Buffalo. They were daily bringing the material for the peopling of a state. The pioneers were mostly of hardy New England stock, those from Vermont, New Hampshire, and New York predominating. . . . In the year 1833, the legislative council made a change in the judicial system by creating a circuit court for that portion of Michigan territory east of the lake [Michigan], and outside of the present limits of Wayne county. . . . The Supreme Court of the Territory continued to exist as such, and its functions as a circuit court were likewise retained and exercised under the name of superior circuit court. On the 28th of June, 1834, Congress attached all of the territory west of the Mississippi river, and north and east of the Missouri and White-Earth

rivers to the territory of Michigan. The questions of a state government were now forcing themselves upon the people of the territory, and becoming the topic of public discussion. It was generally conceded that, before the close of the year, active measures would be taken toward that end. While the public mind was so occupied, the people were again disturbed by a second visitation of the cholera. It claimed Governor Porter as one of its victims, and the mortality in a single month was one-seventh of the population. . . . The place of governor was never filled, although Henry D. Gilpin was nominated, but not confirmed for the position. Until a complication with Ohio called for the intervention of the President, Stevens T. Mason continued the acting governor of the territory. The territorial council, at its session in September, 1834, set off the territory that had recently been attached to Michigan into the counties of Dubuque and Des Moines, and placed them in a circuit with the previously formed county of Iowa."—L. T. Hemans, *History of Michigan*, pp. 136-139, 143-144.

1818-1836.—Extension of territorial limits to Mississippi and beyond.—Inclusion of part of Minnesota. See WISCONSIN: 1805-1848; MINNESOTA: 1652-1847.

1824.—Charter granted to Detroit. See DETROIT: 1805-1847.

1830-1846.—Railroad development.—"In 1830, the territorial council had granted incorporation to the Pontiac and Detroit Railway Company. This was only about nine months after George Stephenson had made his trial trip with the 'Rocket,' the first successful locomotive constructed. Although no results seem to have come from this venture, a better fate was in store for the Erie and Kalamazoo Railway Company, which the territorial legislature incorporated, in 1833. Its road was open for traffic from Toledo to Adrian in 1836. . . . The national government had already given to the state five per cent of the net proceeds from the sales of public lands for internal improvements. A more liberal donation for the same purpose was realized, in 1841, by the grant of 500,000 acres of land. Enough had been done in railroad construction to demonstrate its practicability. . . . Governor Mason shared the general enthusiasm. His message of 1837 recommended a most liberal policy in the direction of internal improvements. . . . After much contention, the legislature determined to build the works wholly at the expense of the state treasury, and place their management solely under state control. . . . The first act, as reported from the committee, had made provision for only one road, the Central from Detroit westward. Here the defect of building solely from the state treasury appeared. Every legislator brought forward the claim of his constituents to a share in the blessings that were to flow from the expenditure for which all were to be taxed, and so three roads were undertaken instead of one. . . . In 1846, the Central road was completed as far as Kalamazoo, and the Southern as far as Hillsdale. . . . The conviction had grown that such works could be more economically prosecuted through private or corporate enterprise. Certain Boston capitalists purchased the Central road for \$2,000,000, and chartered the Michigan Central Railroad Company for its operation. The Southern road was sold . . . for . . . \$500,000."—L. T. Hemans, *History of Michigan*, pp. 164-166, 176-177.

1837.—Admission into the Union as a state.—Settlement of boundaries.—Constitution.—A conflict between the terms of the constitution under which the state of Ohio was admitted into the

Union in 1803 and the Act of Congress which, in 1805, erected the territory of Michigan, gave rise to a serious boundary dispute between the two. The Michigan claim rested not only upon the Act of 1805, but primarily upon the great Ordinance of 1787. It involved the possession of a wedge-shaped strip of territory, which "averaged six miles in width, across Ohio, embraced some 468 square miles, and included the lake-port of Toledo and the mouth of the Maumee river." In 1834, Michigan began to urge her claims to statehood. "In December, President Jackson laid the matter before congress in a special message. Congress quietly determined to 'arbitrate' the quarrel by giving to Ohio the disputed tract, and offering Michigan, by way of partial recompense, the whole of what is to-day her upper peninsula; . . . making this settlement of the quarrel one of the conditions precedent to the admission of Michigan into the Union. In September, 1836, a state convention, called for the sole purpose of deciding the question, rejected the proposition; a second convention, however, approved of it on the 15th of December following, and congress at once accepted this decision as final. Thus Michigan came into the sisterhood of states, January 26, 1837, with the territorial limits which she possesses to-day."—R. G. Thwaites, *Boundaries of Wisconsin*, (*Wisconsin Historical Society Collections*, v. 11, pp. 456-460).—When Michigan was admitted, the state was recognized as having existed since November, 1835. "The Constitution adopted was, in many ways, well suited to meet the requirements of a growing community. It embraced a comprehensive bill of rights; simple but ample provisions were made for the legislative, executive, and judicial branches of the state government. This constitution enjoined upon the legislature the organization of the militia, the creation of a system of common schools, and the duty of providing for internal improvements. It safeguarded the funds set apart for the support of the university and primary schools, providing that the interest only should be applicable to such uses. Few limitations were placed upon the power of the legislature. That body was left quite free from such restraining provisions as were later incorporated into the constitution of 1850. . . . The Legislature met in January, 1837. . . . All branches of the government were ambitious to promote the development of the State, and the enactments of the legislature covered a broad and varied field. One of the acts provided for the appointment of a state geologist, and appropriated \$20,000 to be expended in sums ranging from \$3,000, in 1837, to \$12,000, in 1840, for the purposes of a geological survey. . . . The university was given legal existence on March 18, 1837, and two days later a law was passed fixing its location at Ann Arbor. [See above: 1804-1884]."—L. T. Hemans, *History of Michigan*, pp. 155, 161, 163.

1837-1841.—Wild cat banks. See MONEY AND BANKING: Modern: 1837-1841.

1840-1848.—Gubernatorial changes.—Lansing becomes state capital.—Mormon colonists.—Colonists from the Netherlands.—"The ascendancy of the Whig Party in Michigan was limited to one administration. The party organization was disrupted by the quarrels that followed the death of President Harrison. In Michigan, the situation was not rendered more harmonious by the selection, in 1841, of Governor Woodbridge to succeed John Norvell in the United States Senate. . . . In the state campaign of 1841, the reaction was

at its height, and John S. Barry, the democratic candidate for governor, with state officers and a legislature of his political faith, were chosen by large majorities. At this time, the financial condition of the state was at its lowest ebb. Both the Morris Canal and Banking Company, and the Bank of the United States at Philadelphia, had now defaulted in their payments upon the five million dollar loan. There was scarcely a banking institution left in the state, and only one in Detroit. . . . Governor Barry was especially fitted to hold the reins of government during these years. He practised and enforced the most rigid economy, without weakening or dwarfing the institutions of the state. . . . With returning national prosperity, Michigan began a career of recuperation and progress. Governor Barry was chosen by an increased majority at the election of 1843. The constitution prohibited a governor from holding more than two consecutive terms, so that his official tenure terminated January 5, 1846. . . . Governor Felch was elected in 1845, and served from January 5, 1846, to March 4, 1847. He was elected United States Senator by the legislature, and the balance of his term was filled by Greenley, lieutenant governor. Ransom became governor, January 3, 1848, and served one term. Governor Ransom was one of the members of the first supreme court, holding the position until his elevation to the governorship. . . . The State Constitution had provided that the seat of government should be at Detroit, or such other place as might be prescribed by law, until the year 1847, when it should be permanently located by the legislature. . . . Many towns made active competition for the prize . . . but finally the township of Lansing, in Ingham county, where there was not even a village, was selected. . . . The first session of the legislature . . . convened at the new capital January 1, 1848. The year 1848 likewise marked the first action of the state looking to state care for its unfortunates. Governor Ransom signed the bill which resulted in the establishment of the state asylum for the insane at Kalamazoo, and the school for the deaf, dumb, and blind at Flint. . . . As if to make Michigan's diversified experiences complete, in 1846, a colony of Mormons took up their abode upon the Beaver Islands, adjacent to the northwestern shore of the lower peninsula. They were an outgrowth of the main body under Joseph Smith at Nauvoo, Illinois; James J. Strang became the leader of the Michigan colony, and was generally known as King Strang. He was a man of considerable force of character and education but, his practices and teachings characteristic of the Mormon church did not harmonize with established religious opinions. Bitter feelings were engendered among his followers and he was assassinated in July, 1856, and his colony soon dispersed. The year, 1847, brought the state . . . colonists from the Netherlands who sought, upon the west shore of Michigan, to secure for themselves and their children a higher degree of material prosperity and religious liberty than was afforded in the Fatherland. They became the founders of the city of Holland."—L. T. Hemans, *History of Michigan*, pp. 185-187, 191-193.

1842-1900.—Opening of copper and iron mines.—Extent of mineral wealth in upper peninsula.—"In point of antiquity copper is widest known of all the varied mineral resources of Michigan. The evidences of the mining of this metal go back to the prehistoric times when a race of intelligent men of whom we have absolutely no knowledge mined copper systematically on Isle Royale and in

the neighborhood of Ontonagon. In the pits which they dug have been found masses of metal, some of them of enormous weight, accompanied by crude implements, and in some cases timber platforms evidently designed for the purpose of lifting the masses to the surface. In some instances the openings of these mines were choked with debris and earth upon which grew the largest of large forest trees, indicating the lapse of centuries since their abandonment. The very first European explorers of Lake Superior found abundant evidences of the existence of copper and reported it in their journals published in Paris in the seventeenth century. The first attempt by white men to mine the metal was made by Alexander Henry in 1770 on behalf of a company which had been organized in London. His efforts were a failure and the money which the company invested brought them no return. Doctor Douglas Houghton, the first state geologist of Michigan was the first to intelligently explore [about 1835] the district and reduce the geologic data which he gathered to such form and system as to afford practical information to the miner. . . . It was Boston capital which first undertook the development of the copper region and Boston capitalists have profited immensely in the aggregate by their enterprise. Actual operations were begun in 1842 in the vicinity of Keweenaw Point where fissure veins were opened which proved moderately profitable workings. In the early days of operations the Cliff, Phoenix and Copper Falls, were opened on the fissure veins and successfully worked for a time but were afterwards abandoned. The Central was profitably worked longer than any other of its class. In 1846 some exploring was done at Portage lake, near the site of the present Quincy mine, but that district did not come into prominence until 1860, when the Quincy took a position long held in the front rank of amygdaloid mines. In 1843 operations were begun near Ontonagon, but it was not until 1847, when the discovery of the Minnesota lode brought the district into prominence, that mining was conducted on a large scale. The discovery of the Calumet and Hecla conglomerate lode in 1866 marked a new era in copper mining, and another epoch was marked in 1885 when the Calumet and Hecla lode was cut at a vertical depth of two thousand two hundred and seventy feet by the Tamarack shaft. This demonstrated the possibility and profit of deep mining. Until the development of copper mining in Arizona, Montana and other Rocky Mountain states in the early eighties the Michigan mines were practically the only source of domestic production of copper, and produced approximately about twenty per cent of the world's supply. . . . No other section of the United States, and no other district in the world has shown such marvelous development or produced so much iron ore as this region, which is embraced in northern Michigan and Wisconsin, and eastern Minnesota. So far as Michigan is concerned there are three distinct districts which lie in the western half of the northern peninsula. These are the Marquette, Menominee, and Gogebic ranges. All these are wholly within the limits of Michigan, except a small portion of the Menominee and Gogebic, which lie in Wisconsin. . . . The initial shipment is credited to the year 1856. From that time the development has continued steadily. . . . In 1880 the amount of iron ore mined in Michigan was one million six hundred and forty thousand eight hundred and fourteen long tons, giving the state second rank, Pennsylvania being first. The output increased in 1890 to five million eight hundred and

sixty-nine long tons, Michigan then ranking first of the states, a position it has continued to hold. In 1900 the production increased to eleven million one hundred and thirty-five thousand two hundred and fifteen, nearly double that of the previous census. . . .

"The earliest mining in the Lake Superior district was on the Marquette range and one of the oldest operations is the Cleveland mine which has been supplying ore constantly for fifty years. None of the records go back beyond 1854, in which year one mine was reported as operating in the Marquette district, the shipments amounting to three thousand tons. In 1900 the shipments of that district were upwards of three million tons."

—H. M. Utley and B. M. Cutcheon, *Michigan as a province, territory and state*, v. 4, pp. 291-295. 1849-1860.—Republican ascendancy.—Constitution of 1850 compared with constitution of 1835.—"Governor Barry was reelected in 1849. . . .

[and was followed in 1851 by Robert McClelland, who was] reelected for two years in 1852, but resigned to become a member of the cabinet of President Pierce. Andrew Parsons, the lieutenant-governor, was left to serve out the unexpired portion of his term. . . . From 1841, the Democratic party had been in power in the State, but in 1854 the newly formed Republican party obtained the ascendancy [see U.S.A.: 1854-1855] and maintained it unbroken for twenty-eight years, electing Kinsley S. Bingham governor in 1854 and 1856, and Moses Wisner in 1858. Austin Blair was elected in 1860 and became the 'war governor' of the State."—T. M. Cooley, *Michigan*, pp. 298, 304-305.—"The constitution of 1835 had well served the purposes of the state, but it embraced some features that were at variance with the growing sentiment of the people. . . . The legislature of 1849 submitted the question of a constitutional convention to the voters at the general election. The people showed their practical unanimity by declaring for a convention by a vote of 33,193 in a total vote of 37,291. The convention, composed of one hundred delegates, assembled at Lansing on the first Monday of June, 1850. Their work was completed and submitted to the people the following November. The constitution was adopted by the decisive vote of 36,169 to 9,433. An amendment providing for 'equal suffrage to colored persons,' submitted at the same time, was defeated by a vote of 32,026 to 12,840. The constitution of 1850 in some respects was a radical departure from the one of 1835. The elective was substituted for the appointive system in the selection of the heads of various departments of government. . . . Provision was made for a judiciary composed of eight circuit judges with supreme court powers. . . . County courts were abolished, and provisions made whereby grand juries might be dispensed with. . . . The rights of married women were now guaranteed by the constitution. . . . Free schools were made a part of the educational system. . . . The credit of the state was not to be given to any person, association, or corporation. A general banking law could not be enacted until it first received the affirmative vote of the people. Except in the instances of repelling invasion, suppressing insurrection, and defending the state in time of war, no debt could be incurred beyond \$50,000. . . . The legislature was to meet every two years instead of yearly, as under the former constitution. . . . The legislature again called the attention of congress to the urgent need of a ship canal around the Falls of the Sault Ste. Marie. In 1852, Congress made a grant to the state of 750,000 acres

of public lands to aid in the project. . . . The state was successful in securing the construction of the work within the appropriation, and in 1855, it was opened for the passage of navigation. . . . By the constitution [of 1850] the creation of an independent supreme court had been postponed for a period of at least six years. Legislation to that end was enacted during the session of 1857, when provisions were made for a supreme court of four members, to be organized January 1, 1858. Except as to the number of members, and that it met alternately at Lansing and Detroit, the court remains essentially as then constituted. By election, George Martin became the first chief justice. . . . The year of the organization of the supreme court, 1858, also witnessed the creation of ten circuits within the state, with a circuit judge presiding over each. In a general way, their powers and jurisdiction have remained unchanged through succeeding years."—L. T. Hemans, *History of Michigan*, pp. 195, 197-198, 201-202, 211-212.

1850-1860.—Railroad conspiracy case.—Strong anti-slavery sentiment in the state.—Passage of the personal liberty law.—"About . . . [1851] the Michigan Central Railroad Company suffered the loss of its depot at Detroit by a mysterious fire. Suspicion was directed towards a large number of citizens, residing near the railroad, between Grass Lake and Jackson. It was charged that they had been the authors of depredations upon the property and business of the company since 1849. It was claimed that their motive was revenge and retaliation for losses occasioned by the killing of stock upon the road, for which the company would pay no compensation. In April, 1851, the grand jury of Wayne county indicted about fifty of the citizens of Leoni and Michigan Center for conspiracy. Many of these were men of standing in the communities. They were tried at Detroit, the trial consuming the greater part of the summer of 1851. Some of the most eminent attorneys of the country, among whom was William H. Seward of New York, participated in the trial. It resulted in the conviction of twelve of the number indicted, who were sentenced to terms of imprisonment varying from five to ten years. Public opinion was far from satisfied with the fairness of the trial or the guilt of the accused, and they were all soon pardoned. The case was the occasion of great public interest at the time and is known to history as the railroad conspiracy case. . . . The question of slavery had been, for years, one of growing perplexity in state. . . . From a combination of causes, anti-slavery sentiment was strong in Michigan. . . . Geographically situated within easy access to Canada, its southeastern portion became one of the best traveled routes of the underground railway. [See SLAVERY: 1840-1860.] The passage of the Fugitive Slave Law [see U.S.A.: 1850 (March); 1850 (April-September)], brought loud murmurs of discontent. It loosened political ties and created discordant elements. . . . A more effective protest was registered against the Fugitive Slave Law by the passage of the stringent Personal Liberty Law, by the terms of which the right of trial by jury, and the benefit of habeas corpus, were insured to every person claimed as a fugitive slave. Their defense was made obligatory upon the prosecuting attorneys of the state. Common jails were closed against their detention, and at least two witnesses were required to make a *prima facie* case against any person claimed to be a slave. With such a law, backed by strong public opinion, the Fugitive Slave Law became but little more than a

source of irritation to keep alive the sentiments of opposition to slavery, as a hateful institution. There was no session from 1854 to 1860 that was unmarked by resolution or enactment indicative of the tense feeling on the great slavery question."—L. T. Hemans, *History of Michigan*, pp. 200-201, 204, 209-210.

1850-1880.—Reclamation of wet lands.—Development of water transportation.—Railroad building.—Financial conditions.—In 1850, Congress granted Michigan, among other states, the wet lands within her limits for reclamation. In this state, as well as Wisconsin and Minnesota, the selection was made not by state agents, as it was customary to provide in some of the other states, but by federal officers—either the Surveyor-General or the Commissioner of the General Land Office. . . . The total amount of land granted by Congress for the construction of canals from 1852 to [1878] . . . was 1,250,000 acres. . . . Water transportation was also promoted by deepening the channel between Lakes St. Clair and Huron. On account of the vast natural resources of the state, the entire district about the lakes demanded improved facilities for transportation by water. . . . The lands granted for the building of wagon roads exceeded 221,000 acres by June 20, 1864, after which date the practice ceased. . . . In 1860 there were less than 800 miles of railroad in operation in the state; ten years later there were over 1,700 miles; and by 1876 there were 3,615 miles. The crisis of 1873 abruptly checked construction and the following year only 61 miles were added. However, there were in 1874 thirty-four corporations operating in the state, with about three-fifths of their mileage lying within its boundaries. For the period from 1865 to 1875 which marked the greatest activity in railroad building, the average annual construction was 330 miles, but the climax was reached in 1872 when 901 miles were added. The greatest mileage in 1876 was operated by the Lake Shore and Michigan Southern with its branches, the Grand Rapids and Indiana ranked next, the Flint and Pere Marquette, the Chicago and Michigan Lake Shore, and the Michigan Central followed in the order named. The railroads . . . were the chief recipients of federal aid. All attempts to secure land grants in their behalf failed until June 3, 1856, but from that date until the close of this period almost 3,356,000 acres were given the state for their benefit. The mileage of exclusively land grant railroads, however, did not exceed 1,005 by June 30, 1880. . . . The bonded indebtedness of the state had reached very nearly \$4,000,000 by the close of 1866 and annual reductions brought the debt down to approximately \$2,385,000 in 1870. The crisis of 1873 caused the proceeds from the sale of lands to fall from over \$230,000 in 1873 to less than \$62,000 the next year. The years of 1874 and 1875 were the most important politically with reference to the management of the state finances. The Constitution provided for a sinking fund to be applied solely to the payment and extinguishment of the principal of the state debt, with certain qualifications. The specific taxes applicable to the purpose not only met the interest on the entire indebtedness, both bonded and trust, but afforded a surplus more than sufficient to pay the maturing principal of the bonded debt. The surplus from this source averaged about \$210,000 per annum during the early years of the decade. It was this constantly increasing surplus that the Democrats strongly objected to, alleging that it was loaned to favored banks, in which state officials were interested, at a lower rate of interest than

was generally current, and with poor security. They urged in 1874 that due to this accumulation of state funds in 1874 the state taxes should not be assessed this year, but their demand was not complied with. This agitation was certainly an influence in bringing about legislation in the session of 1875 authorizing the purchase of unmatured bonds at such rates as the Governor, State Treasurer and Auditor General should see fit. Under this act bonds to the amount of \$125,000 were purchased at a premium of a fraction over three per cent. The Republicans could substantiate their boast that in the face of accumulation of the surplus, taxation had been reduced. From approximately \$500,000 in 1866 it had risen and fallen until in 1870 it was less than \$483,000. In 1872, however, it rose to over \$920,000, and in the year of the crisis the receipts fell short of the disbursements by over \$170,000. The specific taxes for the period from 1866 to 1875 were received mainly from railroads, insurance companies, mines and banks, and the total receipts of this nature were almost three times as great at the close of the decade as at the beginning. The entire appropriations to institutions charitable, reformatory, penal, and educational, increased from almost \$178,000 to \$427,000. It was not strange, then, that the dominant party should point with pride to the financial condition of the state, especially as it appeared before the panic, and that they should claim to have secured a surplus in the treasury notwithstanding the reduction of taxation. The charges brought against the financing of the surplus, and the censure naturally attached by the Democrats in 1873 to the railroad policy of the Republicans both aided to give the combined opposition great gains in the fall election of 1874. The suspicion aroused by the accumulation of over \$1,000,000, with no intention of exempting the state from taxation for one year, obviously helped turn the tide in state politics against the dominant party."—H. M. Dilla, *Politics of Michigan, 1865-1878* (Faculty of Political Science of Columbia University, ed., *Studies in history, economics and public law*, 1912, pp. 244-250).

1861-1865.—Part taken in Civil War.—"The 21st legislature of the State of Michigan met at Lansing on January 1, 1861. . . . On the next day Governor Austin Blair delivered his inaugural. . . . On February 2, 1861, the Governor approved the following resolution of the two houses of the legislature: 'Resolved, That Michigan adheres to the government as ordained by the Constitution, and for sustaining it intact hereby pledges and tenders to the general government *all its military power and material resources*.' . . . On April 24 the Adjutant General issued his order (by direction of the governor) organizing the First Regiment, Michigan Infantry. . . . [It] was one of the first to advance into Virginia, and, on the 24th of May took possession of Alexandria. . . . [The legislature passed] an act to amend the act of March 16, 1861, 'to provide a military force.' This act it elaborated and extended so as to provide for one hundred companies to be recruited from the Volunteer Militia. . . . During the first year of the war . . . the State of Michigan, recruited, organized and put in the field (besides the three months' regiment) sixteen regiments of infantry, three regiments of cavalry (1st, 2nd and 3rd), eight batteries of light artillery, one regiment of engineers and mechanics, two companies U. S. sharpshooters, and two companies of cavalry, which joined a Missouri regiment, known as the 'Merrill Horse,' making a total equivalent of twenty-two full regiments, raised and sent to the front in less

than twelve months, out of a population of about 750,000. . . . During the second year of the war . . . Michigan raised, equipped and sent to the seat of war eleven regiments of infantry (17th to 27th inclusive), eight regiments of cavalry (4th to 11th inclusive), four batteries of field artillery, (Co.'s I, K, and L, and M), one regiment sharpshooters, and one company of cavalry (L, Merrill Horse), an equivalent of twenty-one regiments. Of these the 17th, 20th, 24th, 25th, 26th and 27th infantry regiments were sent to the army of the Potomac, and shared in all its campaigns (except the regiments attached to the Ninth Army Corps), until the end of the war. . . . During the remaining two years of the war, the energies of the state were necessarily given principally to filling up the ranks of the regiments already in the field, some of them reduced to mere companies by the casualties of battle and sickness."—H. M. Utley and B. M. Cutcheon, *Michigan as a province, territory and state*, v. 3, pp. 435-436, 441-443, 450, 452-453.

ALSO IN: T. M. Cooley, *Michigan*.

1865-1881.—Attempted revision of constitution.—Organization of state board of charities and correction.—Forest fires.—"Section 2 of Article XX of the Constitution of 1850 provided that at the general election to be held in the year 1866, and in each sixteenth year thereafter, and also at such other times as the legislature may by law provide, the question of a general revision of the constitution shall be submitted to the electors. . . . In his inaugural message to the legislature of 1865 Governor Henry H. Crapo called attention to this provision and recommended that the necessary steps be taken to carry it into effect. . . . [At the general election held November 6, 1866, a revision was decided upon, and a] constitution was submitted to the electors at the general election on the first Monday of April, 1868. At this election the number of votes cast on the adoption of the constitution was 182,311, of which 71,729 were in favor of its adoption and 110,582 against, a negative majority of 38,853. . . . A post-mortem to discover the cause of this untimely end of the good work of the convention leads to the conclusion that it was largely political."—H. M. Utley and B. M. Cutcheon, *Michigan as a province, territory and state*, v. 4, pp. 29, 39.—January 1, 1860, Henry H. Crapo was succeeded in the governorship by Henry P. Baldwin, who held office for two terms, retiring at the beginning of 1873. During his administration, a commission investigating public institutions "made a report in which it recommended that the state assume control of its dependent children and provide for and educate them. This was the inauguration of the State Public School, soon thereafter established at Coldwater, which was the first institution of its kind in this or any other country. . . . The school was completed and opened in 1874 and was enlarged in 1875 to a capacity of two hundred and fifty children. It was organized upon the congregate and cottage plan combined. . . . The State Board of Charities and Corrections was organized in 1871. . . . One of the most notable events of the period . . . was the great destruction of life and property by the forest fires which swept across the state in the autumn of 1871. . . . [On the] night of October 8, and on the following day and night, the fires crossed the entire state from Lake Michigan to Lake Huron. The city of Holland in Ottawa county was entirely destroyed, and the city of Manistee in the county of that name, was nearly wiped out. . . . Holland and Manistee were lumber towns. . . . Huron and

Sanilac counties, though largely devoted to lumbering, were nevertheless, quite well settled by an agricultural population and abounded in prosperous and well cultivated farms and orchards. Throughout this whole region, a tract at least forty miles square, scarcely a vestige of life was left. . . . There were along the Huron shore or near it the following villages of two hundred to six hundred inhabitants: Glen Haven, White Rock, Forestville, Sand Beach, Port Hope, Elm Creek, Huron City, Forest Bay, Center Harbor, Rock Falls, Verona Mills. These villages were almost wholly obliterated and the people who lived in them were left entirely destitute, without food and with only the clothing which they wore. . . . Governor Baldwin took hold of the matter and appointed relief committees. . . . The committee rebuilt one thousand two hundred and five dwellings; distributed clothing of the estimated value of fifty thousand dollars, and provisions of the estimated value of thirty-five thousand dollars. All this was outside the relief work done by the committees at Saginaw and Port Huron, by the mayor of Detroit and by numerous individuals operating independently. No comprehensive statistics were ever gathered of the losses of life and property in these fires, nor of the money collected and disbursed for the relief of sufferers. On the 5th of September, 1881, almost exactly ten years later, a second visitation of fire swept through four counties, covering a considerable part of the region which suffered so severely before. . . . For three consecutive days the conflagration raged with the violence of that of ten years before, and with even more disastrous results, because at this latter date there was a greatly increased population and more valuable improvements in the way of buildings, orchards, fences, bridges, than formerly. The wind blew with such violence as to uproot large forest trees and lift the roofs from buildings. At the same time, the temperature outside the fire swept district was one hundred and upwards in the shade. Under these conditions, it may well be conceived that the sufferings of those exposed to the disastrous fires were something appalling. . . . Half naked creatures made their way into village streets, often bearing the charred remains of their dead with them. Some took refuge in the waters of the lake, wading out until only their heads were above water, but even here they were suffocated by the intense heat, the smoke and the flying cinders. Animals, wild and tame, were destroyed in vast numbers or herded together by the instinct of self-preservation."—H. M. Utley and B. M. Cutcheon, *Michigan as a province, territory and state*, v. 4, pp. 67-68, 77-78, 80-81, 83-85.—At this second fire the number of buildings destroyed was estimated at 3,437 and the loss at \$2,003,390.

1873-1885.—Creation of a state board of health.—First state fish hatchery.—Development of rail and water transportation.—Other legislation.—"There was much important legislation during the first term of Governor Bagley. Chief of this was probably the act creating a state board of health. . . . One other matter of some moment was brought forward. On account of its extended coast line and vast expanse of interior lakes, fishing had been a very profitable industry. . . . But for years the catch had been decreasing. . . . The legislature of 1873 created a fish commission [to remedy this evil.] . . . The first state hatchery was established at Pokagon, and at the end of the first season it turned out five million fry which were carefully deposited in suitable waters. . . . At the election of 1876 . . . [Charles M. Crosswell

was elected governor and held office until 1881]. At the biennial election in 1880, David H. Jerome of Saginaw, was chosen governor. . . . During his administration of a single term [1881-1883] as governor there were some important events, chief of which was the transfer to the general government of the St. Mary's Falls ship canal. . . . By the extension of one Jackson, Lansing and Saginaw railroad northward to the Straits of Mackinaw, and the opening of the Detroit, Mackinaw and Marquette railway the two peninsulas were for the first time connected by rail. This marked an epoch in the commercial development of the state. . . . Among the important things done by the legislature at this session [1883-1885] was . . . the creation of a bureau of labor statistics, of which the governor appointed John W. McGrath as the first commissioner. . . . Insurance companies came in for some attention. A stringent law was passed to prevent companies combining to fix a rate, and to protect companies which were disposed to act independently. . . . The labor element succeeded in enacting a law forbidding the employment of children under fourteen years of age. Coupled with this a law compelling school attendance for at least six months every year was an advanced step in the interests of education. . . . At the biennial election of 1884 Governor Begole [elected 1882] was a candidate for reelection. He was defeated, however, by Russell A. Alger, republican. . . . One of the events of Governor Alger's administration was the transfer of the Portage Lake and Lake Superior ship canal to the general government. . . . It was sold to the United States for \$350,000, on the condition that it should be maintained for free navigation. . . . An important piece of legislation was the creation of a pardon board of four members."—H. M. Utley and B. M. Cutcheon, *Michigan as a province, territory and state*, v. 4, pp. 106, 108, 131, 141-142, 155-156, 158-159.

1884.—First state Young Women's Christian Association organized. See YOUNG WOMEN'S CHRISTIAN ASSOCIATION: 1884.

1885-1895.—New banking law.—Ballot reform.—Special charter of the Michigan Central repealed.—Railroad strike.—Abolition of prison contract labor.—New election law.—Gerrymandering.—"After serving a single term [1885-1887], Governor Alger was succeeded by Cyrus G. Luce, . . . a man intimately acquainted with the State and the management of its institutions. During his administration [1887-1891] a banking law, modeled on the national statute, was submitted to the people and adopted. Under the provisions of this law more than one-half of the commercial banking capital of the State finds investment."—T. M. Cooley, *Michigan*, p. 302.—"For the first time since the republican party was organized in 1854, a period of nearly forty years, the democrats were successful in a state election in 1890. . . . Edwin B. Winans was elected governor by a plurality over James M. Turner, republican, of eleven thousand, five hundred and twenty. . . . The democratic platform in the campaign of 1890 declared for ballot reform. . . . The legislature of 1891 . . . improved the law passed by the preceding legislature. Most of the recommendations of the governor were incorporated in this act, especially those relating to the Australian ballot and the printing and handling of the ballot. . . . This legislature also changed the method of choosing presidential electors by providing for their election by congressional districts, instead of upon a general state ticket. . . . There was one untoward incident in the administration of Governor Winans.

. . . [In] 1891, the secretary of state, Daniel E. Soper, was found to have been guilty of malfeasance and misfeasance in office [and forced to resign]. . . . One of the important acts of the legislature of 1891 was that requiring the Lake Shore and Michigan Southern Railway to operate under the general railroad law of the state instead of its special charter. . . . A few years later the special charter of the Michigan Central, the last of the special chartered roads, was repealed and the road was brought under the general law. . . . At the election in 1892 Governor Rich was elected. . . . In 1894 he was re-elected by a plurality of more than one-hundred thousand over Spencer O. Fisher, democrat. . . . The state had suffered from labor disturbances which interrupted industrial operations in many ways. The railroads were more or less hampered by striking employes. It was necessary to send troops to Negaunee in 1894 to suppress riots started by striking miners. . . . The legislature of 1895 took steps to abolish the contract system and to utilize the labor of prisoners for the benefit of the state. . . . The legislature passed an act to stop the fusion of political parties, by forbidding the printing of the name of any candidate more than once upon the Australian ballot. Before the April election a case was made up to test this act and the Supreme Court sustained the law."—H. M. Utley and B. M. Cutcheon, *Michigan as a province, territory and state*, v. 4, pp. 170, 182-183, 186-187, 215, 220.—"The state of Michigan suffered a good deal from frequent unscrupulous gerrymandering, as the constitution did not prescribe a definite period of apportionment. The Republicans in 1885, and the Democrats in 1891, in the first case upon a majority of less than 4,000 in a total vote of 400,000, so gerrymandered the senatorial districts as to yield their own party twenty-one senators and their opponents eleven. Under the apportionment of 1891, eight counties with a population of 40,000 were formed into a district having one senator, and nine adjoining counties with 97,000 inhabitants were given the same representation. Both of the acts mentioned were held unconstitutional by the Supreme Court, which decided among other things that it was not a due exercise of legislative discretion under the constitution, to give a county of less population than another greater representation, and that the discretion of the legislature must be honestly exercised so as to preserve the equality of representation as nearly as may be. The judges, in their written opinions, used very strong language in denouncing the practice of gerrymandering. Chief Justice Morse declared that the courts alone could in this matter save the rights of the people and assure them of equality in representation; and another justice said, 'Such laws breed disrespect for all law, for lawmakers become law breakers.' . . . In deciding upon questions of apportionment the courts often face a difficult problem in the fact that by declaring the act under consideration void, the state is left at the mercy of still more intolerable conditions under earlier acts. In the Michigan cases of 1892, the Supreme Court held void not only the apportionment of 1891, but also the act of 1885, under which three elections had been held; and prescribed that election notices should be issued by the secretary of state under the old law of 1881, unless a new and valid apportionment should be made by the legislature."—P. S. Reinsch, *American legislatures and legislative methods*, pp. 208-209, 211.

1896-1900.—Part played in the Spanish-American War.—Governor Pingree's efforts toward taxation of corporations.—"In 1896 Mr. Pingree

received the Republican nomination for governor. . . . In his inaugural message to the legislature of 1897 Governor Pingree sounded the keynote of the policy which he faithfully followed through his entire gubernatorial career—primary election reform and railroad taxation. . . . It happened that the Legislature was in session when the war broke out. It promptly passed an act for a war loan of a half million dollars. Governor Pingree threw himself with all his wonderful energy into the task of raising, equipping and sending into the field at the earliest possible moment the state's quota. . . . The whole number of men mustered was six thousand six hundred and seventy-seven, and the total number of deaths about two hundred and fifty. . . . Beside the infantry regiments furnished to the volunteer service Michigan was represented in the naval arm. . . . Through the whole session of the Legislature of 1897 Governor Pingree and his close friends in the house had strenuously and persistently urged a measure [the Atkinson Bill] for the increase of taxation of corporations. . . . In the regular session of the Legislature of 1899 Governor Pingree devoted the main portion of his very lengthy and elaborate message to this same subject. . . . [The Atkinson Bill] finally passed in March after having been modified in some respects. . . . The Supreme Court in the following April in a telephone case declared the provisions of a similar act with reference to ad valorem taxation of corporations in violation of the constitution. Thereupon Governor Pingree called an extra session of the Legislature in December, 1899, and an amendment to the constitution was proposed to cover the point. . . . At the general election in November, 1900, it carried by the overwhelming popular majority. . . . The Governor . . . urged the re-enactment of a measure along the lines of the Atkinson law, . . . but the Senate refused to pass any measure to which the House would consent, and so the effort for legislation satisfactory to the Governor was fruitless. . . . The corporations were sufficiently powerful through their friends in the Senate to defeat his purpose. . . . One of the notable events attendant upon the Legislature of 1899, was the passage of an act for the municipal ownership of street railways in Detroit. Governor Pingree was greatly incensed when all the street railway corporations in that city practically consolidated, by passing into the hands of a single corporation owned and controlled by New York capitalists. . . . Other measures of importance were an inheritance tax, a board of registration of physicians, and a board of library commissioners to look after the establishment and development of public libraries throughout the state. A board of arbitration in labor disputes opened the way for a better understanding between employers and their workmen. A Northern Normal school was established at Marquette. An unfortunate incident developed during the last term of Governor Pingree which cannot be ignored. This was criminal conduct on the part of some of his appointees in the military department. . . . A scheme was hatched through which the state was defrauded to the extent of some thirty-five thousand dollars and the several parties concerned in it divided the profits. [The guilty were eventually brought to justice and the state was re-imbursed.] . . . At the election of 1900 Aaron T. Bliss of Saginaw, was chosen governor by a plurality of about eighty thousand over William C. Maybury, democrat."—H. M. Utley and B. M. Cutcheon, *Michigan as a province, territory and state*, v. 4, pp. 229-230, 234, 241, 244-250, 252.

1900-1915.—Direct nomination legislation.—Home rule for cities.—"Since 1900 the Michigan legislature has passed more than thirty acts, original and amendatory, having to do with direct nominations. [See also INITIATIVE AND REFERENDUM: Development in the United States.] From 1901 to 1905 the legislation was entirely local; from 1905 to 1909 it was both local and general but optional with the parties and with the localities; since 1909 it has been general and mandatory. . . . The movement for direct nominations started within the majority party. After the beginning of the movement, strong Democratic endorsements seem to have had slight effect on the course of events. Democratic influence in the legislature was practically nil; and in the legislature of 1905, which passed the first general law, there was not a single Democratic member. In the course of debates and newspaper discussions laws of other States were occasionally cited, and among these the Minnesota law was most frequently mentioned. Michigan's direct primary legislation, as it now stands [written in 1915], is still far from finality. The most thoughtful politicians are not satisfied with it. . . . Opportunism has marked the course of direct primary legislation. Its early defeats in the legislature were partly occasioned by factional antagonisms growing out of the personality and the policies of Governor Pingree. The forty per cent clause in the law of 1905 was probably designed to protect the machine candidate for governor in 1906. The presidential primary bill of 1912, the act for the election of state central committees in 1913, and the revision of the general law in 1915 were all influenced more or less by Republican factional fights. The legislation shows many defects and inconsistencies. . . . For example, in the law of 1909 there was no provision for the filling of vacancies among nominees for the legislature. In 1910, where the county commissioner of schools was elected in the fall, direct primaries applied to his office; where he was elected in the spring they did not apply. . . . The law of 1901 applied only to the city of Grand Rapids; the law of 1903 applied to the whole county; from 1905 to 1909 there were two laws applying to the county. . . . Since the legislature, in the amending act of 1907, absentmindedly omitted to reenact the provision for the direct nomination of city officers, the city of Grand Rapids, which was the first to have direct primaries, had to nominate in 1908 under the old system."—A. C. Millsbaugh, *Party organization and machinery in Michigan since 1890* (*Board of University Studies of the Johns Hopkins University*, pp. 72-76).—In 1905, Fred M. Warner succeeded Aaron T. Bliss as governor and held office until 1911. During his first term (1905) the compulsory education law was passed but was revised in 1911. In 1908 the constitution was revised and went into effect the next year. The constitution of 1900 authorized cities and villages to frame, adopt and amend their charters, and to pass laws and ordinances in regard to their municipal concerns. Under this improved constitution, the Michigan legislature of 1900 adopted the necessary legislation for the formulation of action and for the limitation of taxes and debts. In 1900, a child labor law was passed and was amended in 1911. In 1910, Chase S. Osborne was elected governor; and in the next election, 1912, W. N. Ferris, was elected. At this election an amendment was passed providing that amendments to the constitution could be made by the initiative and referendum without recourse to the legislature; and in 1915 an amendment was passed for the recall of

ected officials. In 1913, a law was passed governing the sale of text books.

1911-1916.—Progressive legislation along economic lines.—Constitutional amendments.—In 1911 the legislature passed a bill designed to subject to taxation the mineral rights as well as the surface valuation of the lands in the state. The same body approved an act which gives to married women a legal right to their property by contract as they desire. Before adjournment the legislature ratified the Sixteenth Amendment to the Federal constitution granting Congress the right to levy an income tax. In 1912 an employers' liability law was passed, which is optional instead of compulsory, but employers lose their rights of defense against suits for damages if they do not conform to it. In 1915 the United States district court at Detroit held a blue sky law, passed in 1913, invalid. An amendment to the constitution was adopted in November, 1916, providing for state-wide prohibition after May 1, 1918.

1913.—Apportionment of representation. See APPORTIONMENT: Gerrymannder.

1917.—Legislation.—"The regular session of the 49th Legislature of Michigan met at Lansing January 3, 1917, and continued in session for seventy-one days. . . . Eight Joint Resolutions and six Constitutional Amendments were passed. . . . The two houses met in joint assembly on the second day of the session, Jan. 4, to receive the benediction of the outgoing Governor [Ferris] and the recommendations of the newly inaugurated Executive [L. Sleeper]. . . . Laws were enacted; providing for conservation and reclamation of the State's agricultural resources through a soil survey, drainage, and educational means; promoting interest in the public health and safety; stimulating road building throughout the State and taking preliminary steps toward the adoption of the budget system at the next regular session of the Legislature. . . . An act was passed authorizing the formation of health districts composed of continuous townships and villages and providing for a health board with power to appoint a health officer. A housing law, accepted by sociologists as the best in the United States, was adopted. An appropriation was made of three-hundred-fifty thousand dollars for the erection, construction, furnishing and equipping of new hospital buildings for the University of Michigan at Ann Arbor. . . . A joint resolution submitted to the voters of the State an amendment to the State constitution relative to the franchise. This amendment, ratified by the people of the State April 2, 1917, provided, 'that no qualified elector in the actual service of the United States or of this State, or any enrolled member of any citizens' military or naval training camp held under the authority of the Government of the United States or the State of Michigan, shall be deprived of his vote by reason of his absence from the township, ward or State in which he resides.'"—C. H. Landrum, *Michigan war legislation, 1917* (*Michigan History Magazine, Oct., 1920, p. 799*).—Among other emergency measures was an act permitting municipalities to seize food and fuel and resell it to the people at reasonable prices.

1918.—Part played in World War.—In the World War Michigan furnished 135,485 men or 3.61 per cent of the whole force. "For the defense and protection of the State there has been organized and equipped a force of 200 men in a State constabulary known as the Permanent Force, Michigan State Troops. . . . The Permanent Force broke an I. W. W. strike which threatened to close the iron mines of the Upper Peninsula [in 1917]."

—R. C. Vandercook, *Michigan in the Great War* (*Michigan History Magazine, Apr., 1918*).

ALSO IN: C. H. Landrum, *Michigan war legislation, 1917* (*Michigan Historical Magazine, Oct., 1920*).

1918.—Woman suffrage granted. See U.S.A.: 1918 (November).

1919.—Legislation.—Administrative reforms.—"On May 2, 1919, the Governor affixed his signature to an Act creating a community council commission. . . . The commission was given power to investigate and consider all problems of reconstruction and matters involving the general public welfare. . . . An Act was passed substituting a State Health Commission for the State Board of Health. . . . The housing law of 1917 was amended to relieve the distressing conditions of housing in the larger cities and to safeguard health. . . . The enactment of legislation looking toward the development of a State park system . . . is one of the important Acts of the Legislative session of 1919 . . . and resulted in the creation of a State Park Commission. . . . The Legislature of 1919 was especially active in labor interests. . . . The Workmen's Compensation Act was extended to provide greater protection to workers. . . . Discrimination between men and women in wages in manufacture or production of any article was made illegal, and the employment of women or boys under 18 years of age was restricted to a 10-hour day, or 54-hour week."—C. Landrum, *Michigan War Legislation 1919* (*Michigan History Magazine, Jan.-Apr., 1921*).—An act was passed for the promotion of deep water connection between the Great Lakes and the Atlantic ocean; and three administrative changes were made: the creation of a state constabulary; the adoption of a budget system; and the creation of a public utilities commission. On January 2, the Eighteenth Federal Amendment (prohibition) was ratified; and on June 10, the Nineteenth (suffrage) was ratified.

1919-1922.—Trial of Senator Truman H. Newberry.—As a result of a close and heated campaign for the senatorship, in 1918, Truman H. Newberry and 135 others were indicted for violation of the law which limits the use of money to be expended in elections. (The amount in this case was said to have been about \$200,000.) The case involved a constitutional point of interest. The investigation first began in the New York Federal Court and objection was made. The United States Supreme Court was appealed to and held that a Federal court may try a case regardless of the section in which it arises. The case was finally called for trial at Grand Rapids in January, 1920. On March 20, the jury gave out its verdict convicting seventeen of the eighty-four defendants whose indictments had not been thrown out during the trial. Senator Newberry was sentenced by the trial judge to serve two years in Leavenworth prison and pay \$10,000 fine. The sixteen others were subjected to sentences of fine or imprisonment or both. The case was appealed to higher Federal courts by the Newberry counsel. The United States Supreme Court set aside the conviction May 2, 1921; on January 12, 1922, the United States Senate decided by vote of forty-six to forty-one that Newberry was entitled to his seat. On November 18, 1922, after the elections, Newberry sent his resignation to Governor Groesbeck. By resigning at this time he saved himself from a renewed attempt to have his seat declared vacant.

1920.—Attempt to abolish parochial schools.—Court decision on proportional representation.—On July 9, 1920, Attorney-general Groesbeck ruled that a proposed amendment to the state

constitution designed to abolish parochial schools should not be placed upon the ballot in November. In his opinion supporting the ruling, the attorney-general held that the proposed amendment was in conflict with the Fourteenth Amendment of the Federal constitution prohibiting the states from abridging the privileges and immunities of citizens. The attorney-general stated that in making it unlawful for any person to instruct children between the ages of five and sixteen in other than public schools, the state was attempting to abridge the "privileges and immunities" of citizens guaranteed in the Federal constitution.

"A circuit court in Michigan has recently [1920] declared unconstitutional the provision of the charter of Kalamazoo establishing the Hare system of proportional representation in the election of city commissioners. The decision was rendered in a *quo warranto* suit brought by a man who had been an unsuccessful candidate for election under the system. The ground for the decision was the opinion of the judge that the section of the state constitution (III. 1) declaring that every person possessing the designated qualifications 'shall be an elector and entitled to vote' implies that each person is entitled to vote for every officer for which he is qualified to vote, whereas under the charter provision in question the ballot of any voter is counted for one candidate only, although seven candidates are to be elected; and another section of the constitution (VIII. 8) provides expressly that 'no city or village shall have power to abridge the right of elective franchise.'"—F. W. Coker, *Municipal affairs* (*American Political Science Review*, Nov., 1920).—In the 1920 elections Attorney-General Groesbeck was elected governor.

MICRONESIA, or Mikronesia.—"North of the equator, between New Guinea and the south coast

of Japan, the great ocean is studded with countless little islands, which, running partly parallel with those of Melanesia, form a second and outer zone round the Australian mainland. In consequence of their remarkably small size, they are collectively called Mikronesia, and are conveniently grouped in three archipelagoes. Of these the most easterly is again subdivided into the two clusters of the Gilbert and Marshall Islands [the former belonging to England, the latter under German protection]. Farther west follows the large group of the Carolines [belonging to Spain], including the Pelew Isles, still farther to the west, called also the Western Carolines. North of them are the Ladrões or Mariannes [occupied by the Spaniards since 1565], beyond which, in the same direction, are a number of small groups, the most important of which are the Bonin Isles, on many maps named the Magalhaes, or Anson Archipelago, almost all of which are uninhabited. Most of these groups are inhabited by the fair race scattered over Polynesia, and presenting the most striking contrast to the Papuas of Melanesia."—A. R. Wallace, *Australasia*, ch. 25 (*Stanford's compendium of geography and travel*).—See also PACIFIC OCEAN: People; B. C. 2500-A. D. 1500.

MIKADO.—"Though this is the name by which the whole outer world knows the sovereign of Japan, it is not that now used in Japan itself, except in poetry and on great occasions. The Japanese have got into the habit of calling their sovereign by such alien Chinese titles as Tenshi, 'the Son of Heaven'; Ten-ō, or Tennō, 'the Heavenly Emperor'; Shujō, 'the Supreme Master.' His designation in the official translations of modern public documents into English is 'Emperor.' . . . The etymology of the word Mikado is not quite clear. Some—and theirs is the current opinion—trace it to 'mi,' 'august,' and 'kado,' a 'gate,' reminding one of the 'Sublime Porte' of Turkey. . . . The word Mikado is often employed to denote the monarch's Court as well as the monarch himself."—B. H. Chamberlain, *Things Japanese*, p. 220.—"In official documents, 'Kotēi,' meaning imperial ruler, is employed and 'Hēika' has the force of 'His Majesty.' There are numerous other expressions relating to the Throne and its occupant used in rhetoric or poetry. The appellations by which the Mikados both male and female, in the line, are known in history are all posthumous. Only expert scholars and antiquarians can recall the names by which the rulers of Japan were known during their lifetime. The official action of 1912 which declares that Mutsuhito (the Great) shall lose his personality and be known as the Meiji Tennō may follow national custom, but to the Western mind seems abominable. The Mikado has no family name, but only a personal designation. This in itself is a note of very great antiquity. The fact that the Mikado has no name, like that of the Guelphs, Hapsburgs, Hohenzollerns, or others who have arisen out of the impersonal ooze of barbarism, shows that his predecessors ruled in a day more ancient than that of any Occidental house now reigning or acting as figureheads of social order in Europe. The line of Mikados has ruled from time immemorial, or as the Constitution declares 'from ages eternal.'—

MILAN, chief city in Lombardy, capital of the Province of Milan, and second largest city in Italy, with an estimated population in 1915 of 663,059. It is the chief financial center of Italy, and the wealthiest manufacturing and commercial town in the country. The city is rich in works of art, and famous for fine churches, the principal one being the world-renowned Gothic cathedral, the Duomo of Milan, which ranks with St. Peter's at Rome.

B. C. 223-222.—Capital of the Insubrian Gauls (Mediolanum).—Taken by the Romans. See ROME: Republic: B. C. 205-191.

A. D. 268.—Aureolus besieged.—During the miserable and calamitous reign of the Roman emperor, Gallienus, the army on the upper Danube invested their leader, Aureolus, with the imperial purple, and crossed the Alps to place him on the throne. Defeated by Gallienus in a battle fought near Milan, Aureolus and his army took refuge in that city and were there besieged. During the progress of the siege a conspiracy against Gallienus was formed in his own camp, and he was assassinated. The crown was then offered to the soldier Claudius—afterwards called Claudius Gothicus—and he accepted it. The siege of Milan was continued by Claudius, the city was forced to surrender and Aureolus was put to death.—Based on E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 11.

286.—Roman imperial court.—"Diocletian and Maximian were the first Roman princes who fixed, in time of peace, their ordinary residence in the provinces. . . . The court of the emperor of the west [Maximian] was, for the most part, established at Milan, whose situation, at the foot of the Alps, appeared far more convenient than that of Rome, for the important purpose of watching the motions of the barbarians of Germany. Milan soon assumed the splendour of an imperial city. The houses are described as numerous and well-built; the manners of the people as polished and liberal."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 13.

312.—Siege and occupation by Constantine. See ROME: Empire: 305-323.

313.—Constantine's Edict of Toleration. See ROME: Empire: 313; CHRISTIANITY: 312-337.

374-397.—Ambrosian church.—The greatness of the Milanese, in later times, "was chiefly originated and promoted by the prerogatives of their Archbishop, amongst which that of crowning, and so in a manner constituting, the King of Italy, raised him in wealth and splendour above every other prelate of the Roman Church, and his city above every other city of Lombardy in power and pride. . . . It is said that the Church of Milan was founded by St. Barnabas; it is certain that it owed its chief aggrandisement, and the splendour which distinguished it from all other churches, to St. Ambrose [Archbishop from 374 to 397], who, having come to Milan in the time of Valentinian as a magistrate, was by the people made Bishop also, and as such was able to exalt it by the ordination of many inferior dignitaries, and by obtaining supremacy for it over all the Bishops of Lombardy. . . . This church received from St. Ambrose a peculiar liturgy, which was always much loved and venerated by the Milanese, and continued longer in use than any of those which anciently prevailed in other churches of the West. To the singing in divine service, which was then artless and rude, St. Ambrose, taking for models the ancient melodies

still current in his time, the last echoes of the civilisation of distant ages, imparted a more regular rhythm [known as 'the Ambrosian Chant']; which, when reduced by St. Gregory to the grave simplicity of tone that best accords with the majesty of worship, obtained the name of 'Canto fermo'; and afterwards becoming richer, more elaborate, and easier to learn through the many ingenious inventions of Guido d'Arezzo, . . . was brought by degrees to the perfection of modern counterpoint. . . . St. Ambrose also composed prayers for his church, and hymns; amongst others, according to popular belief, that most sublime and majestic one, the *Te Deum*, which is now familiar and dear to the whole of Western Christendom. It is said that his clergy were not forbidden to marry. Hence an opinion prevailed that this church, according to the ancient statutes, ought not to be entirely subject to that of Rome."—G. B. Testa, *History of the war of Frederick I against the communes of Lombardy*, pp. 23-24.

404.—Removal of imperial court. See **ROME**: Empire: 404-408.

452.—Capture by the Huns. See **HUNS**: 452.

539.—Destroyed by Goths.—When Belisarius, in his first campaign for the recovery of Italy from the Goths, had secured possession of Rome, 538, he sent a small force northward to Milan, and that city, hating its Gothic rulers, was gladly surrendered to him. It was occupied by a small Roman garrison and unwisely left to the attacks upon it that were inevitable. Very soon the Goths appeared before its walls, and with them 10,000 Burgundians who had crossed the Alps to their assistance. Belisarius despatched an army to the relief of the city, but the generals in command of it were cowardly and did nothing. After stoutly resisting for six months, suffering the last extremes of starvation and misery, Milan fell, and a terrible vengeance was wreaked upon it. "All the men were slain, and these, if the information given to Procopius was correct, amounted to 300,000. The women were made slaves, and handed over by the Goths to their Burgundian allies in payment of their services. The city itself was razed to the ground: not the only time that signal destruction has overtaken the fair capital of Lombardy."—T. Hodgkin, *Italy and her invaders*, bk. 5, ch. 11.—See also **ROME**: Medieval city: 535-553.—"The Goths, in their last moments, were revenged by the destruction of a city second only to Rome in size and opulence."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 41.

1277-1447.—Rise and reign of the Visconti.—Extension of their tyranny over Lombardy.—Downfall of their house.—"The power of the Visconti in Milan was founded upon that of the Della Torre family, who preceded them as Captains General of the people at the end of the 13th century. Otho, Archbishop of Milan, first laid a substantial basis for the dominion of his house by imprisoning Napoleone Della Torre and five of his relatives in three iron cages in 1277, and by causing his nephew Matteo Visconti to be nominated both by the Emperor and by the people of Milan as imperial Vicar. Matteo, who headed the Ghibelline party in Lombardy, was the model of a prudent Italian

despot. From the date 1311, when he finally succeeded in his attempts upon the sovereignty of Milan [see **ITALY**: 1310-1313: Visitation, etc.], to 1322, when he abdicated in favour of his son Galeazzo, he ruled his states by force of character, craft, and insight, more than by violence or cruelty. Excellent as a general, he was still better as a diplomatist, winning more cities by money than by the sword. All through his life, as became a Ghibelline chief at that time, he persisted in fierce enmity against the Church. . . . Galeazzo, his son, was less fortunate than Matteo, surnamed *Il Grande* by the Lombards. The Emperor Louis of Bavaria threw him into prison on the occasion of his visit to Milan in 1327 [see **ITALY**: 1313-1330], and only released him at the intercession of his friend Castruccio Castracane. To such an extent was the growing tyranny of the Visconti still dependent upon their office delegated from the Empire. . . . Azzo [the son of Galeazzo] bought the city, together with the title of Imperial Vicar, from the same Louis who had imprisoned his father. When he was thus seated in the tyranny of his grandfather, he proceeded to fortify it further by the addition of ten Lombard towns, which he reduced beneath the supremacy of Milan. At the same time he consolidated his own power by the murder of his uncle Marco in 1329, who had grown too mighty as a general. . . . Azzo died in 1339, and was succeeded by his uncle Lucchino [who was poisoned by his wife in 1340]. . . . Lucchino was potent as a general and governor. He bought Parma from Obizzo d'Este, and made the town of Pisto dependent upon Milan. . . . Lucchino left sons, but none of proved legitimacy. Consequently he was succeeded by his brother Giovanni, son of old Matteo *il Grande* and Archbishop of Milan. This man, the friend of Petrarch, was one of the most notable characters of the 14th century. Finding himself at the head of 16 cities, he added Bologna to the tyranny of the Visconti, in 1350, and made himself strong enough to defy the Pope. . . . In 1353 Giovanni annexed Genoa to the Milanese principality, and died in 1354, having established the rule of the Visconti over the whole of the north of Italy, with the exception of Piedmont, Verona, Mantua, Ferrara, and Venice. The reign of the Archbishop Giovanni marks a new epoch in the despotism of the Visconti. They are now no longer the successful rivals of the Della Torre family, or dependents on imperial caprice, but self-made sovereigns, with a well-established power in Milan and a wide extent of subject territory. Their dynasty, though based on force and maintained by violence, has come to be acknowledged; and we shall soon see them allying themselves with the royal houses of Europe. After the death of Giovanni, Matteo's sons were extinct. But Stefano, the last of his family, had left three children, who now succeeded to the lands and cities of the house. They were named Matteo, Bernabo, and Galeazzo. Between these three princes a partition of the heritage of Giovanni Visconti was effected. . . . Milan and Genoa were to be ruled by the three in common." Matteo was put out of the way by his two brothers in 1355. Bernabo reigned brutally at Milan, and Galeazzo with great splendor at Pavia. The latter married his daughter to the Duke of Clarence, son of Edward III. of England, and his son to Princess Isabella, of France. "Galeazzo died in 1378, and was succeeded in his own portion of the Visconti domain by his son Gian Galeazzo," who was able, seven years afterwards, by singular refinements of treachery, to put his uncle to death and take possession of his territories. "The reign of Gian Galeazzo, which began with this coup-de-main (1385-1402), forms a very important

chapter in Italian history. . . . At the time of his accession the Visconti had already rooted out the Correggi and Rossi of Parma, the Scotti of Piacenza, the Pelavicini of San Donnino, the Torielli of Novara, the Ponzoni and Cavalcabò of Cremona, the Beccaria and Languschi of Pavia, the Fisiraghi of Lodi, the Brusati of Brescia. . . . But the Carrara family still ruled at Padua, the Gonzaga at Mantua, the Este at Ferrara, while the great house of Scala was in possession of Verona. Gian Galeazzo's schemes were at first directed against the Scala dynasty. Founded, like that of the Visconti, upon the imperial authority, it rose to its greatest height under the Ghibelline general Can Grande and his nephew Mastino in the first half of the 14th century (1312-1351). Mastino had himself cherished the project of an Italian Kingdom; but he died before approaching its accomplishment. The degeneracy of his house began with his three sons. The two younger killed the eldest; of the survivors the stronger slew the weaker and then died in 1374, leaving his domains to two of his bastards. One of these, named Antonio, killed the other in 1381, and afterwards fell a prey to the Visconti in 1387. In his subjugation of Verona Gian Galeazzo contrived to make use of the Carrara family, although these princes were allied by marriage to the Scaligers, and had everything to lose by their downfall. He next proceeded to attack Padua, and gained the co-operation of Venice. In 1388 Francesco da Carrara had to cede his territory to Visconti's generals, who in the same year possessed themselves for him of the Trevisan Marches. It was then that the Venetians saw too late the error they had committed in suffering Verona and Padua to be annexed by the Visconti. . . . Having now made himself master of the north of Italy with the exception of Mantua, Ferrara, and Bologna, Gian Galeazzo turned his attention to these cities." By intrigues of devilish subtlety and malignity, he drew the Marquis of Ferrara and the Marquis of Mantua into crimes which were their ruin, and made his conquest of those cities easy. "The whole of Lombardy was now prostrate before the Milanese viper. His next move was to set foot in Tuscany. For this purpose Pisa had to be acquired; and here again he resorted to his devilish policy of inciting other men to crimes by which he alone would profit in the long run. Pisa was ruled at that time by the Gambacorta family, with an old Merchant named Pietro at their head." Gian Galeazzo caused Pietro to be assassinated, and then bought the city from the assassins (1390). "In 1399 the Duke laid hands on Siena; and in the next two years the plague came to his assistance by enfeebling the ruling families of Lucca and Bologna, the Guinizzi and the Bentivogli, so that he was now able to take possession of those cities. There remained no power in Italy, except the Republic of Florence and the exiled but invincible Francesco da Carrara, to withstand his further progress. Florence [see FLORENCE: 1390-1402] delayed his conquests in Tuscany. Francesco managed to return to Padua. Still the peril which threatened the whole of Italy was imminent. . . . At last, when all other hope of independence for Italy had failed, the plague broke out with fury in Lombardy," and Gian Galeazzo died of it in 1402, aged 55. "At his death his two sons were still mere boys. . . . The generals refused to act with them, and each seized upon such portions of the Visconti inheritance as he could most easily acquire. The vast tyranny of the first Duke of Milan fell to pieces in a day." The dominion which his elder son lost (see ITALY: 1402-1406) and which his younger son regained (see ITALY: 1412-1447) slipped from the family on the

death of the last of them, in 1447.—J. A. Symonds, *Renaissance in Italy: The age of the despots*, ch. 2.—"At the end of the fourteenth century their [the Visconti's] informal lordship passed by a royal grant [from the Emperor Wenceslaus to Gian Galeazzo, 1395] into an acknowledged duchy of the Empire. The dominion which they had gradually gained, and which was thus in a manner legalized, took in all the great cities of Lombardy, those especially which had formed the Lombard League against the Swabian Emperors. Pavia indeed, the ancient rival of Milan, kept a kind of separate being, and was formed into a distinct county. But the duchy granted by Wenceslaus to Gian Galeazzo stretched far on both sides of the lake of Garda."—E. A. Freeman, *Historical geography of Europe*, ch. 8, sect. 3.

1447-1454.—Competitors for the ducal succession to the Visconti.—Prize carried off by Francesco Sforza.—War of Milan and Florence with Venice, Naples, Savoy, and other states.—John Galeazzo Visconti had married (as stated above) a daughter of King John of France. "Valentine Visconti, one of the children of this marriage, married her cousin, Louis, duke of Orleans, the only brother of Charles VI. In their marriage contract, which the pope confirmed, it was stipulated that, upon failure of heirs male in the family of Visconti, the duchy of Milan should descend to the posterity of Valentine and the duke of Orleans. That event took place. In the year 1447, Philip Maria, the last prince of the ducal family of Visconti, died. Various competitors claimed the succession. Charles, duke of Orleans, pleaded his right to it, founded on the marriage contract of his mother, Valentine Vis-

conti. Alfonso, king of Naples, claimed it in consequence of a will made by Philip Maria in his favor. The emperor contended that, upon the extinction of male issue in the family of Visconti, the fief returned to the superior lord, and ought to be re-annexed to the empire. The people of Milan, smitten with the love of liberty which in that age prevailed among the Italian states, declared against the dominion of any master, and established a republican form of government. But during the struggle among so many competitors, the prize for which they contended was seized by one from whom none of them apprehended any danger. Francis Sforza, the natural son of Jacomuzzo Sforza, whom his courage and abilities had elevated from the rank of a peasant to be one of the most eminent and powerful of the Italian condottieri, having succeeded his father in the command of the adventurers who followed his standard, had married a natural daughter of the last duke of Milan. [See ITALY: 1412-1447.] Upon this shadow of a title Francis founded his pretensions to the duchy, which

LODOVICO SFORZA

he supported with such talents and valor as placed him at last on the ducal throne."—W. Robertson, *History of Charles the Fifth: View of the progress of society*, sect. 3.—"Francesco Sforza possessed himself of the supreme power by treachery and force of arms, but he saved for half a century the independence of a State which, after 170 years of tyranny, was no longer capable of life as a commonwealth, and furthered its prosperity, while he powerfully contributed to the formation of a political system which, however great its weakness, was the most reasonable under existing circumstances. Without the aid of Florence and Cosimo de' Medici, he would not have attained his ends. Cosimo had recognised his ability in the war with Visconti, and made a close alliance with him. . . . It was necessary to choose between Sforza and Venice, for there was only one alternative; either the condottiere would make himself Duke of Milan, or the Republic of San Marco would extend its rule over all Lombardy. In Florence several voices declared in favour of the old ally on the Adriatic. . . . Cosimo de' Medici gave the casting-vote in Sforza's favour. . . . Without Florentine money,

Sforza would never have been able to maintain the double contest—on the one side against Milan, which he blockaded and starved out; and on the other against the Venetians, who sought to relieve it, and whom he repulsed. And when, on March 25, 1450, he made his entry into the city which proclaimed him ruler, he was obliged to maintain himself with Florentine money till he had established his position and re-organised the State. . . . Common animosity to Florence and Sforza drew Venice and the king [Alfonso, of Naples] nearer to one another, and at the end of 1451 an alliance, offensive and defensive, was concluded against them, which Siena, Savoy, and Montferrat joined. . . . On May 16, 1452, the Republic, and, four weeks later, King Alfonso, declared war, which the Emperor Frederick III, then in Italy, and Pope Nicholas V., successor to Eugenius IV. since 1447, in vain endeavoured to prevent." The next year "a foreign event contributed more than all to terminate this miserable war. . . . On May 29, 1453, Mohammed II. stormed Constantinople. The West was threatened, more especially Venice, which had such great and wealthy possessions in the Levant, and Naples. This time the excellent Pope Nicholas V. did not exert himself in vain. On April 9, 1454, Venice concluded a tolerably favourable peace with Francesco Sforza at Lodi, in which King Alfonso, Florence, Savoy, Montferrat, Mantua, and Siena, were to be included. The king, who had made considerable preparations for war, did not ratify the compact till January 26 of the following year. The States of Northern and Central Italy then joined in an alliance, and a succession of peaceful years followed."—A. von Reumont, *Lorenzo de' Medici*, v. 1, bk. 1, ch. 7.

1512.—Expulsion of the French and restoration of the Sforzas.—Notwithstanding the success of the French at Ravenna, in their struggle with the Holy League formed against them by Pope Julius II (see ITALY: 1510-1513), they could not hold their ground in Italy. "Cremona shook off the yoke of France, and city after city followed her example. Nor did it seem possible longer to hold Milan in subjection. That versatile state, after twice bending the neck to Louis, a second time grew weary of his government; and greedily listened to the proposal of the Pope to set upon the throne Massimiliano Sforza, son of their late Duke Ludovico. Full of this project the people of Milan rose simultaneously to avenge the cruelties of the French; the soldiers and merchants remaining in the city were plundered, and about 1,500 put to the sword. The retreating army was harassed by the Lombards, and severely galled by the Swiss; and after encountering the greatest difficulties, the French crossed the Alps, having preserved none of their conquests in Lombardy except the citadel of Milan, and a few other fortresses. . . . At the close of the year, Massimiliano Sforza made his triumphal entry into Milan, with the most extrava-

gant ebullitions of delight on the part of the people."—R. Comyn, *History of the Western empire*, v. 2, ch. 37.—See also FLORENCE: 1502-1560.

A.: 1898 (June-July); 1898 (July-August: Porto Rico); U. S. A.: 1898-1899.

MILESIANS, Irish.—In Irish legendary history, the followers of Miled, who came from the north of Spain and were the last of the four races which

colonized Ireland.—Based on T. Wright, *History of Ireland*, v. 1, bk. 1, ch. 2. See IRELAND: Primitive inhabitants.

MILETUS, in ancient times, the greatest city of Ionia in Asia Minor. It lies on the southern shore of the Latmian gulf. (See GREECE: Map of ancient Greece.) Its woollen manufactures made it famous, also its extensive trade with Phrygia, as well as with the north and south. Dr. Wiegand has excavated pottery which proves that the city had come in contact with the Aegean civilization in the latest Minoan period. Miletus "with her four harbours, had been the earliest anchorage on the entire coast. Phœnicians, Cretans, and Carians, had inaugurated her world-wide importance, and Attic families, endowed with eminent energy, had founded the city anew. [See ASIA MINOR: B. C. 1000.] True, Miletus also had a rich territory of her own in her rear, viz., the broad valley of the Mæander, where among other rural pursuits particularly the breeding of sheep flourished. Miletus became the principal market for the finer sorts of wool; and the manufacture of this article into variegated tapestry and coloured stuffs for clothing employed a large multitude of human beings. But this industry also continued in an increasing measure to demand importation from without of all kinds of materials of art, articles of food, and slaves. [See ASIA MINOR: B. C. 724-539.] In no city was agriculture made a consideration so secondary to industry and trade as here. At Miletus, the maritime trade even came to form a particular party among the citizens, the so-called 'Acinautæ,' the 'men never off the water.'"—E. Curtius, *History of Greece*, v. 1, bk. 2, ch. 3.—Especially does the city stand out in the history of Greek literature as having been the birthplace of the philosophers Thales, Anaximander, and Anaximenes, of the historians Cadmus and Hecataeus and of the poet Timæus, likewise of Aspasia, the wife of Pericles. Miletus took an early leading part in the great Ionian enterprises of colonization and trade, particularly in the Pontus, or Black sea, where the Milesians succeeded the Phœnicians, establishing important commercial settlements at Sinope, Cyzicus and elsewhere. (See also SYBARIS.) They were among the last of the Asiatic Ionians to succumb to the Lydian monarchy, and they were the first to revolt against the Persian domination, when that had taken the place of the Lydian. The great revolt failed and Miletus was practically destroyed. (See PERSIA: B. C. 521-493.) In 479 B. C., Persians were driven from the coast, and Miletus became a member of the Delian League. In 412 B. C., the city revolted from Sparta, (see GREECE: B. C. 413-412) and passed again into the hands of the Carians. Once more the city arose under Rome. It was visited by Saint Paul on his last journey to Jerusalem before he was imprisoned at Rome, and Trajan gave Miletus especial attention. It became the seat of a Christian bishopric, during the Byzantine period, and was fortified by a castle. But nothing could avert its decay, inasmuch as the centers of the world's life had shifted elsewhere. Its site has been for some centuries a marsh. Since the beginning of the twentieth century it has been the scene of extensive excavations.

MILITARY LAW.—"This term applies to and includes such rules of action and conduct as are imposed by a state upon persons in its military service, with a view to the establishment and maintenance of military discipline. It is largely, but not exclusively, statutory in character, and prescribes the rights of, and imposes duties and obligations upon, the several classes of persons composing its military establishment; it creates military tribunals, endows them with appropriate jurisdiction and regulates their procedure; it also defines military offenses and, by the imposition of adequate penalties, endeavors to prevent their occurrence."—G. B. Davis, *Treatise on the military law of the United States*, p. 1.
