Sources of military jurisdiction.—"The sources of, and the authority for, the military jurisdiction of the Government of the United States are three: Reason, history, and the Constitution of the United States. The Constitution (art. 1, sect. 8), provides that Congress shall have the power to declare war; to make rules concerning captures on land and water; to raise and support armies; to provide and maintain a navy; to make rules for the government and regulation of the land and naval forces; to provide for calling forth the militia to execute the laws of the Union, suppress insurrections and repel invasions; to provide for organizing, arming, and disciplining the militia and for governing such part of them as may be employed in the service of the United States, reserving to the states respectively the appointment of officers, and the authority of training the militia according to the discipline prescribed by Congress; and finally to make all laws which shall be necessary and proper for carrying into execution the foregoing powers and all other powers vested by the Constitution in the Government of the United States. The Fifth Amendment to the Constitution provides that no person shall be held to answer for a capital or otherwise infamous crime unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service in time of war or public danger."—A. W. Scott, *Handbook of military law*, p. 3.

Kinds of military jurisdiction.—"Military jurisdiction is of four kinds: (a) **MILITARY GOVERNMENT.**—(The law of hostile occupation); that is, military power exercised by a belligerent by virtue of his occupation of an enemy's territory and its inhabitants. This belongs to the law of war and therefore to the law of nations. When a conquered territory is ceded to the conqueror, military government continues until civil government is established by a new sovereign. (b) **MARTIAL LAW AT HOME.**—This is the military power exercised in time of war, insurrection, or rebellion in parts of the country retaining their allegiance, and over persons and things not ordinarily subjected to it. (c) **MARTIAL LAW APPLIED TO THE ARMY.**—This is the military power over persons in the military service, in time of war, exercised over obligations arising out of emergencies not falling within the domain of military law, nor otherwise regulated by law. (d) **MILITARY LAW.**—This is the legal system that regulates the government of the military establishment. It is a branch of the municipal law, and in the United States derives its existence from special constitutional grants of power. It is both written and unwritten. The sources of written military law are the 'Articles of War' enacted by Congress

August 20, 1916; other statutory enactments relating to military service; the Army Regulations; and general and special orders and decisions promulgated by the War Department and by the department, post and other commanders. The unwritten military law is the 'custom of War,' consisting of customs of service, both in peace, and war."—*Manual for courts-martial*, pp. 1, 2.

Origin and history.—"As the system of military law which has received constitutional recognition in the United States is in great part derived from the rules of discipline which prevailed in the British Army at the outbreak of the American revolution, its origin and development can best be understood by a brief reference to the history of the military institutions of the country from which our own disciplinary system is a direct inheritance. During the period intervening between the Norman conquest and the establishment of representative institutions in England, the sovereign was regarded not only as the fountain of justice, but as the ultimate source of legal authority, and his edicts and ordinances had the obligatory force now assigned to the formal enactments of Parliament. During this period the king, by suitable decrees, or proclamations, established such rules for the government of the military forces as seemed to him proper or necessary, and these rules were enforced by tribunals called constable's and marshall's courts and the Court of Chivalry. The Court of Chivalry in the course of time began to intrude upon the jurisdiction of the common-law courts, and acts were passed from time to time restricting its authority until, during the reign of Henry VIII, it finally ceased to exist, its functions in respect to questions of honor and pedigree having become practically obsolete, and its jurisdiction over military offenses having been transferred to the council of war, the predecessor of the modern court-martial. Although the control of the military establishment gave rise to occasional differences of opinion between the Crown and Parliament during the reigns of the Tudor sovereigns, the questions in controversy were adjusted without serious difficulty, usually by the enactment of statutes calculated to apply an appropriate remedy to the particular wrong complained of; and it was not until the accession of the Stuart sovereigns that the controversy attained the importance of a constitutional question of serious national concern."—G. B. Davis, *Treatise on the military law of the United States*, pp. 1-2.

Mutiny Act.—"In conformity of the agreement with which William and Mary ascended the throne in 1688, which, as embodied in the Bill of Rights, has since been regarded as an important part of the British Constitution, the right of command and the power to enforce and discipline were vested in the sovereign, as the constitutional commander-in-chief; but these powers were to be regulated in their exercise by the terms of an important statute called the Mutiny Act. This act recognized mutiny and desertion as two of the most serious military offenses and authorized their trial and punishment by court-martial. All matters affecting discipline, however, which were not expressly provided for in the Mutiny Act were left to be regulated by the Royal prerogative, and in conformity to such disciplinary rules as the sovereign might see fit to impose. Indeed, such a body of rules already existed in a code of regulations, known as the Articles of War, which had been issued by James II in 1686. These Articles, though frequently added to and amended, or modified, by the issue of subsequent articles, continued in force, side by side with the Mutiny Act, and in subordination to that instrument, until 1879, when the Mutiny Act and Articles of War were

merged in an enactment known as the Army Discipline Act, which as re-enacted in the Army Act of 1881, is still in force throughout the British Empire. In strictness, the Army Act of 1881 has of itself no force, but requires to be brought into operation annually by another act of Parliament, thus securing the constitutional principle of the control of Parliament over the discipline requisite for the government of the Army."—G. B. Davis, *Treatise on the military law of the United States*, pp. 2-3.

Articles of War.—"It will be seen that from 1680 until 1881, military discipline was regulated in England by two authoritative instruments: (1) The Mutiny Act, of 1680, which was statutory in character and contained the more important disciplinary provisions, together with the power to appoint the several military tribunals; and (2) the Articles of War, of 1686, issued by the sovereign, and so non-statutory in character, containing the great body of rules for the government and discipline of the military forces of the crown. The Articles of War were added to and amended from time to time, as occasion demanded, and were in force throughout the realm at the outbreak of the American revolution in 1775. As a consequence, the Mutiny Act and Articles of War were well known to the colonists in America, and when the royal troops served in conjunction with the colonial forces during the wars with the French and Indians, prior to the revolution, both species of military force were governed by their provisions. At the outbreak of hostilities in 1775, the Revolutionary Congress found itself confronted with the necessity of raising and disciplining armies and turned to the British Military code as a body of disciplinary rules with a scope and operation of which the troops of the several colonies were already familiar. With some modifications the Mutiny Act and the Articles of War then in force in the British army were adopted by the Congress for the government of the armies of the United States."—G. B. Davis, *Treatise on the military law of the United States*, pp. 3-4.

Courts-martial.—Military tribunals.—History.—"Military law is enforced by means of certain tribunals, created for the purpose, called courts-martial. Their sentences have in themselves no legal validity, being in the nature of recommendations merely, until they have received the approval of a military commander, designated by law for this purpose, called the reviewing authority. With such approval or confirmation their sentences become operative and acquire the same sanction as the sentences of civil courts having criminal jurisdiction, and are entitled to the same legal consideration. Courts-martial are no part of the judiciary of the United States, but simply instrumentalities of the executive power. They are the creatures of orders; the power to convene them, as well as the power to act upon their proceedings, being an attribute of command. Though transient and summary, their judgments, when rendered upon subjects within their limited jurisdiction, are as legal and valid as those of any other tribunals, nor are the same subject to be appealed from, set aside, or reversed by the courts of the United States or of any State. . . . [The military tribunals] are as follows:

- | | | |
|--|---|--|
| Court-martial with power to try and sentence | } | 1. The general court-martial with complete jurisdiction. |
| | | 2. The special court-martial. |
| | | 3. The Summary court-martial with restricted jurisdiction. |

The Court of Inquiry { 1. Court of Inquiry with power to investigate only.

. . . The court-martial, as a military tribunal, antedates the standing army in English history. As an agency for the maintenance of discipline in armies, its history can be traced back to a period considerably earlier than the Christian era; especially among the Romans from whose system of jurisprudence it was borrowed by the Teutonic leaders of the Middle Ages and adapted to the peculiar conditions of the feudal system. It had become fully established on the continent of Europe at the time of the Norman Conquest, and was introduced into England, as an incident of that system, by William the Conqueror and his immediate successors in the latter part of the eleventh century."—G. B. Davis, *Treatise on the military law of the United States*, pp. 13-16.

1921.—New court-martial law.—"The army of the United States is now governed by a new manual of court-martial, adopted as a result of the abuses under the old system during the World War. The changes in military law brought about by the new manual are far-sweeping. Under its terms equal justice is assured to all members of the military establishment. The rights of even the humblest private in the ranks before a military court are equal to those of the highest General. Any person accused of a violation of military law under this new manual is given a greater opportunity to defend his rights than is given by civil courts. Under the old court-martial manual, based on the Articles of War of 1916, the rights of enlisted men were decidedly inferior to those of officers. Any officer might charge an enlisted man with an offense, but no matter how great the provocation, no matter how gross the outrage, no enlisted man could bring a charge against an officer. Only officers could bring charges. It was not necessary that an officer investigate or have personal knowledge of the offense charged. He might bring any charge either as of his own knowledge or based on his belief. A custom of the service, however, protected the accused in that officers were generally supposed to investigate before bringing charges and, to their credit, usually did. But the new court-martial manual takes away this power and imposes an iron mandate to protect all accused persons from any vagaries of custom in these words: 'Charges and specifications must be signed by a person subject to military law, and under oath either that he has personal knowledge of or has investigated the matters set forth herein, and that the same are true in fact, to the best of his knowledge and belief. No charges will be referred for trial until after a thorough and impartial investigation thereof shall have been made. This investigation will include inquiries as to the truth of the matter set forth in said charges, form of charges, and what disposition of the case should be made in the interests of justice and discipline.'

"Article 70 of the new manual states:

"At an investigation full opportunity shall be given to the accused to cross-examine witnesses against him if they are available and to present anything he may desire in his own behalf either in defense or mitigation, and the investigating officer shall examine available witnesses requested by the accused. If the charges are forwarded after such investigation they shall be accompanied by a statement of the substance of the testimony taken on both sides.' Under the old manual no enlisted man might bring a charge against any one. Even if struck across the face by an officer, his only re-

course lay in an appeal to another officer to bring charges in his behalf. The old manual gave such great power to the officer and so little to the enlisted man that it speaks well for the high standard of decency of the regular army officer that seldom was this vast power abused. It was an honored custom of the service to protect the enlisted man from abuse because of his very helplessness. The new manual specifically remedies this by stating, in Article 2, that the following shall be considered as persons subject to military law: 'Officers, members of the army nurse corps, warrant officers, army field clerks, field clerks, quartermaster corps, soldiers of the regular army, volunteers, cadets, officers and soldiers of the marine corps serving with the army, all retainers and persons accompanying armies of the United States in the field.' Article 2 defines all these persons as subject to military law. And Article 70 provides that any person subject to military law may bring charges. This opens the way of redress not only to the enlisted man but to all others in the service, including the trained nurse, who is now an officer herself. Article 70, while opening the way to bring charges, also provides that all charges sufficiently grave to demand a general court-martial shall be given legal scrutiny by a lawyer—a staff Judge Advocate. In this connection Article 70 provides:

"Before directing the trial of any charge by general court-martial the appointing authority will refer it to his staff Judge Advocate for consideration and advice.' Under the old manual, a court-martial met, considered the evidence and returned a verdict or decision which every member of the court was bound by oath to guard sacredly until the finding should be made public. The new manual provides that findings and sentence shall

be announced immediately in open court, unless there is a good reason to keep such findings and sentences secret, such reason to be made part of the record. Announcement of acquittal is mandatory. Before the convening authority who appointed the court takes action of any nature, the entire proceedings must be reviewed by the staff Judge Advocate, a lawyer. This staff Judge Advocate must advise as to proper action and he must have had no part in the trial. Before a plea of guilty is accepted by a court-martial operating under the new manual a great and vast protection is given the accused. The accused is warned by the law member that his plea admits his guilt, warns him as to the punishment for such an offense and informs him he may change his plea. If the accused still persists in pleading guilty then the court will hold its trial as though he had not pleaded guilty until every bit of evidence against the accused is in the record. So, throughout, the new manual of court-martial protects the accused in his rights, provides for his defense, and provides for the protection of all members of the military service on an equal basis."—*New York Times*, Apr. 3, 1921.

MILITARY ORGANIZATION

1. **Introduction.**—**Combative spirit in man.**—**Origin of armies.**—**Development of arms, fortifications, and strategy.**—"So long as man has existed on the earth he has been a fighting animal. After settling his quarrels with the weapons of nature, he resorted to clubs and stones, that is, weapons for use hand to hand and at a distance; and no doubt at an early day built himself huts and surrounded them with stakes, stones and earth, so as to keep away aggressive neighbors. Herein we have the origin of weapons and of fortification. As men joined themselves into communities, the arts of attack and defense, and their uses as applied to numbers, grew. The citizen was always a soldier. But often only a portion of the citizens required to be sent away from home to fight, and this originated standing armies, which became a well-settled institution when conquerors made themselves kings. As man invented useful arts, these were first applied to the demands of war. Bows and arrows, lances, slings, swords, breastplates and shields came into use, and horses were tamed and employed for war, first as beasts of burden, and then in chariots and for cavalry. Chariots and horses for cavalry were first adopted because they afforded the fighters a higher position from which to cast their weapons, as well as rendered their aspect more dreadful. Elephants and camels came into warfare for a similar reason. No doubt chariots antedated cavalry. Troops began by fighting in masses, without settled order, and the victory was won by those who had the bravest, strongest, or most numerous array. With better weapons came greater order. The best-armed warriors were placed together. The slingers could not do good work side by side

with the pikemen, nor the charioteer or mounted man with the foot-soldier. Thus certain tactical formations arose, and as the more intelligent soldiers were put in charge of the less so, rank and command appeared. It was soon found that the light-armed, bowmen and slingers, could best use their weapons and most rapidly move in open, skirmishing order; that the heavy-armed, pikemen and swordsmen could best give decisive blows when ployed in masses. The growth of army organization came about in a perfectly natural sequence, and grew side by side with all other pursuits. Fortification originated in a similar manner. Tribes built their villages in inaccessible places,—on rocks or hills,—and surrounded them with ditches, stockades or loosely-piled walls. Such simple habitations gradually grew into fortified cities, and the walls and ditches increased in size and difficulty of approach. Inner citadels were built; and towers crowned the walls, to enable these to be swept by missiles if reached by the besiegers. The art of sieges was of much later and more formal growth. For many generations fortified cities were deemed inexpugnable, and artifice or hunger were resorted to for their capture. But gradually it was found that walls could be undermined or weakened or breached, or that they could be mounted by various means, and the art of besieging cities began to take on form. As tribes grew into nations war assumed larger dimensions. As a rule, it was brute weight alone which accomplished results, but sometimes the weaker party would resort to stratagems to defend itself,—such as declining battle, and making instead thereof night or partial attacks, defending river fords or mountain passes, and falling

on the enemy from ambush or from cities. Out of such small beginnings of moral opposition to physical preponderance has come into existence, by slow degrees and through many centuries, what we now know as the science of war."—T. A. Dodge, *Alexander*, pp. 9-11.

2. Ancient Egypt and Persia.—Army of Ramesis II.—Privileges of soldiers.—Equipment and armament.—Battle formation and tactics.—Armies of Cyrus and Cambyses.—The earliest military organization in ancient Egypt appears to have existed at Thebes and Memphis. The chief power of the land lay in the hands of the priestly caste; the warrior caste came a strong second. About the time Ramesis II (Sesostris) was born, his father ordered all the boys born in Egypt on the same day to be enrolled into a military school. From this institution he recruited his confidential body-guard, as well as several of his generals. To the military caste was assigned "one of the three portions into which the land of Egypt was divided by an edict of Sesostris (Ramesis II, 14th century B. C.), in order, says Diodorus, 'that those who exposed themselves to danger in the field might be more ready to undergo the hazards of war, from the interest they felt in the country as occupiers of the soil; for it would be absurd to commit the safety of the community to those who possessed nothing which they were interested in preserving.' Each soldier, whether on duty or no, was allowed twelve arura of land . . . [about eight acres], free from all charge; and another important privilege was, that no soldier could be cast into prison for debt; Bochoris, the framer of this law, considering that it would be dangerous to allow the civil power the right of arresting those who were the chief defence of the state. They were instructed from their youth in the duties and requirements of soldiers, and trained in all the exercises that fitted them for an active career; and a sort of military school appears to have been established for the purpose. Each man was obliged to provide himself with the necessary arms, offensive and defensive, and everything requisite for a campaign; and he was expected to hold himself in readiness for taking the field when required, or for garrison duty. The principal garrisons were posted in the fortified towns of Pelusium, Marea, Eileithyia, Heracleopolis, Syene, Elepbantia, and other intermediate places; and a large portion of the army was frequently called upon, by the warlike monarchs, to invade a foreign country, or to suppress those rebellions which occasionally broke out in the conquered provinces. The whole military force, consisting of 410,000 was divided into two corps, the Calasiries and Hermotybies. They furnished a body of men to do the duty of royal guards, 1000 of each being annually selected for that purpose; and each soldier had an additional allowance of 'five *mina* of bread, with two of beef, and four *arusters* of wine,' as daily rations, during the period of his service. The Calasiries (*Klashr*) were the most numerous, and amounted to 250,000 men, at the time that Egypt was most populous. They inhabited the nomes [provinces] of Thebes, Bubastis, Apthhis, Tanis, Mendes, Sebennytus, Athribis, Pharbæthus Thmuis, Onuphis, Anysis, and the Isle of Mycephoris, which was opposite Bubastis; and the Hermotybies, who lived in those of Busiris, Saïs, Chemmis, Papremis, the Isle of Prosopitis, and the half of Natho, made up the remaining 160,000. It was here that they abode while retired from military service and in these nomes their farms or portions of land were situated, which tended to encourage habits of industry, and keep up a taste for active employment. Besides the native corps they had mercenary troops,

who were enrolled either from the nations in alliance with the Egyptians, or from those who had been conquered by them. They were divided into regiments, sometimes disciplined in the same manner as the Egyptians, though allowed to retain their arms and costume; but they were not on the same footing as the native troops; they had no land, and merely received pay, like other hired soldiers. Strabo speaks of them as mercenaries; and the million of men he mentions must have included these foreign auxiliaries. When formally enrolled in the army, they were considered a part of it, and accompanied the victorious legions on their return from foreign conquest; and they sometimes assisted in performing garrison duty in Egypt, in the place of those Egyptian troops which were left to guard the conquered provinces. The strength of the army consisted in archers, whose skill contributed mainly to the success of the Egyptians, as of our own ancestors; and their importance is shown by the Egyptian 'soldier' being represented as an archer kneeling, often preceded by the word *Klashr*, converted by Herodotus into *Calasiries*. They fought either on foot or in chariots, and may therefore be classed under the separate heads of a mounted and unmounted corps; and they constituted a great part of both wings. Several bodies of heavy infantry, divided into regiments, each distinguished by its peculiar arms, formed the centre; and the cavalry [in later periods] covered and supported the foot.

"The offensive weapons of the Egyptians, were the bow, spear, two species of javelin, sling, a short and straight sword, dagger, knife, falchion or *ensis falcatus* axe or hatchet, battle-axe, pole-axe, mace or club, and the *lisan*—a curved stick similar to that still in use among the modern Ethiopians. Their defensive arms consisted of a helmet of metal or a quilted head-piece; a cuirass, or coat of armour, made of metal plates, or quilted with metal bands, and an ample shield. The soldier's chief defence was his shield, which, in length, was equal to about half his height, and generally double its own breadth. It was most commonly covered with bull's hide having the hair outward, sometimes strengthened by one or more rims of metal, and studded with nails or metal pins, the inner part being a wooden frame. The Egyptian bow was a round piece of wood, from five to five and a half feet in length, tapering to a point at both ends. Their arrows varied from twenty-two to thirty-four inches in length; some were of wood, others of reed; frequently tipped with a metal head; and winged with three feathers, glued longitudinally, and at equal distances, upon the other end of the shaft. . . . The spear, or pike, was of wood, between five and six feet in length with a metal head into which the shaft was inserted and fixed with nails. The head was of bronze or iron, often very large, and with a double edge. The javelin, lighter and shorter than the spear, was also of wood, and similarly armed with a strong two-edged metal head, of an elongated diamond, or leaf shape, either flat or increasing in thickness at the centre, and sometimes tapering to a very long point. The sling was a thong of leather, or string plaited; broad in the middle, and having a loop at one end, by which it was fixed upon and firmly held with the hand; the other extremity terminating in a lash, which escaped from the finger as the stone was thrown. The Egyptian sword was straight and short, from two and a half to three feet in length, having generally a double edge, and tapering to a sharp point. It was used for cut and thrust. They had also a dagger. The axe, or hatchet, was small and simple, seldom exceeding two or two and a

half feet in length; it had a single blade, and no instance is met with of a double axe resembling the *bipennis* of the Romans. The blade of the battle-axe was, in form, not unlike the Parthian shield; a segment of a circle, divided at the back into two smaller segments, whose three points were fastened to the handle with metal pins. It was of bronze, and sometimes . . . of steel; and the length of the handle was equal to, or more than double that of, the blade. The pole-axe was about three feet in length, but apparently more difficult to wield than the . . . [other], owing to the great weight of a metal ball to which the blade was fixed; and required, like the mace, a powerful as well as a skilful arm. The mace was very similar to the pole-axe, without a blade. It was of wood, bound with bronze, about two feet and a half in length, and furnished with an angular piece of metal, projecting from the handle, which may have been intended as a guard, though in many instances they represent the hand placed above it, while the blow was given. In ancient times, when the fate of a battle was frequently decided by personal valour, the dexterous management of such arms was of great importance; and a band of resolute veterans, headed by a gallant chief, spread dismay among the ranks of an enemy. The curved stick, or club (called *lisan*, 'tongue'), was used by heavy and light-armed troops as well as by archers. . . . The helmet was usually quilted; and though bronze helmets are said to have been worn by the Egyptians, they generally adopted the former, which being thick, and well padded, served as an excellent protection to the head, without the inconvenience of metal in so hot a climate. Some of them descended to the shoulder, others only a short distance below the level of the ear, and the summit, terminating in an obtuse point, was ornamented with two tassels. They were of a green, red, or black colour; and a longer one, which fitted less closely to the back of the head, was fringed at the lower edge with a broad border, and in some instances consisted of two parts, or an upper and under fold. Another, worn by the spearmen, and many corps of infantry and charioteers, was also quilted, and descended to the shoulder with a fringe; but it had no tassels, and, fitting close to the top of the head, it widened towards the base, the front, which covered the forehead, being made of a separate piece attached to the other part. . . . The outer surface of the corselet of mail, or coat of scale-armour, consisted of about eleven horizontal rows of metal plates, well secured by bronze pins; and at the hollow of the throat a narrower range of plates was introduced, above which were two more, completing the collar or covering of the neck. The breadth of each plate or scale was little more than an inch, eleven or twelve of them sufficing to cover the front of the body; and the sleeves, which were sometimes so short as to extend less than halfway to the elbow, consisted of two rows of similar plates. . . . Heavy-armed troops were furnished with a shield and spear; some with a shield and mace; and others, though rarely, with a battle-axe, or a pole-axe, and shield. They also carried a sword, falchion, curved stick or *lisan*, simple mace, or hatchet; which may be looked upon as their sidearms. The light troops had nearly the same weapons, but their defensive armour was lighter; and the slingers and some others fought, like the archers, without shields.

"The chariot corps constituted a very large and effective portion of the Egyptian army. Each car contained two persons, like the *diphros* . . . of the Greeks. On some occasions it carried three, the charioteer or driver and two chiefs; but this was

rarely the case, except in triumphal processions, when two of the princes accompanied the king in their chariot, bearing the regal sceptre, or the *flabella*, and required a third person to manage the reins. In the field each had his own car, with a charioteer; and the insignia of his office being attached behind him by a broad belt, his hands were free for the use of the bow and other arms. The driver generally stood on the off-side, in order to have the whip-hand free; and this interfered less with the use of the bow than the Greek custom of driving on the near-side; which last was adopted in Greece as being more convenient for throwing the spear. . . . In the battle scenes of the Egyptian temples, the king is represented alone in his car, unattended by any charioteer; with the reins fastened around his body, while engaged in bending his bow against the enemy; though it is possible that the driver was omitted, in order not to interfere with the principal figure. The king had always a 'second chariot,' in order to provide against accidents; as Josiah is stated to have had when defeated by Neku; and the same was in attendance on state occasions. The cars of the whole chariot corps contained each two warriors, comrades of equal rank; and the charioteer who accompanied a chief was a person of confidence, as we see from the familiar manner in which one of them is represented conversing with a son of the great Rameses. . . . When an expedition was resolved upon against a foreign nation, each province furnished its quatum of men. The troops were generally commanded by the king in person; but in some instances a general was appointed to that post, and entrusted with the sole conduct of the war. A place of rendezvous was fixed, in early times generally at Thebes, Memphis, or Pelusium; and the troops having assembled in the vicinity, remained encamped there, awaiting the leader of the expedition. As soon as he arrived, the necessary preparations were made; a sacrifice was performed to the gods whose assistance was invoked in the approaching conflict; and orders having been issued for their march, a signal was given by sound of trumpet; the troops fell in, and with a profound bow each soldier in the ranks saluted the royal general, and prepared to follow him to the field. The march then commenced, as Clemens and the sculptures inform us, to the sound of the drum; the chariots led the van; and the king, mounted in his [war chariot] and attended by his chief officers carrying *flabella*, took his post in the centre, preceded and followed by bodies of infantry armed with bows, spears, or other weapons, according to their respective corps. On commencing the attack in the open field, a signal was again made by sound of trumpet. The archers drawn up in line first discharged a shower of arrows on the enemy's front, and a considerable mass of chariots advanced to the charge; the heavy infantry, armed with spears or clubs, and covered with their shields, moved forward at the same time in close array, flanked by chariots and cavalry, and pressed upon the center and wings of the enemy, the archers still galling the hostile columns with their arrows, and endeavouring to create disorder in their ranks. Their mode of warfare was not like that of nations in their infancy, or in a state of barbarism; and it is evident, from the number of prisoners they took, that they spared the prostrate who asked for quarter; and the representations of persons slaughtered by the Egyptians, who have overtaken them, are intended to allude to what happened in the heat of action, and not to any wanton cruelty on the part of the victors. . . . The arms, horses, chariots, and booty, taken in the field or in camp,

were also collected, and the same officers wrote an account of them, and presented it to the monarch. The booty was sometimes collected in an open space, surrounded by a temporary wall, indicated in the sculptures by the representation of shields placed erect, with a wicker gate, on the inner and outer face of which a strong guard was posted, the sentries walking to and fro with drawn swords. It was forbidden to the Spartan soldier, when on guard, to have his shield, in order that, being deprived of this defense, he might be more cautious not to fall asleep; and the same appears to have been a custom of the Egyptians, as the watch here on duty at the camp-gates are only armed with swords and maces, though belonging to the heavy-armed corps, who, on other occasions, were in the habit of carrying a shield.

"A system of regular fortifications was adopted in the earliest times. The form of the fortresses was quadrangular; the walls of crude brick fifteen feet thick, and often fifty feet high, with square towers at intervals along each face. But though some were kept up after the accession of the XVIIIth Dynasty, the practice of fortifying towns seems to have been discontinued, and fortresses or walled towns were not then used, except on the edge of the desert, and on the frontiers where large garrisons were required. To supply their place, the temples were provided with lofty pyramidal stone towers, which, projecting beyond the walls, enable the besieged to command and rake them, while the parapet-wall over the gateway shielded the soldiers who defended the entrance; and the whole plan of an outer wall of circumvallation was carried out by the large crude brick enclosure of the *temenos*, within which the temple stood. Each temple was thus a detached fort, and was thought as sufficient a protection for itself and for the town as a continuous wall, which required a large garrison to defend it; and neither Thebes nor Memphis, the two capitals, were walled cities. The field encampment was either a square, or a parallelogram, with a principal entrance in one of the faces; and near the center were the general's tent, and those of the principal officers. The general's tent was sometimes surrounded by a double rampart or fosse, enclosing two distinct areas, the outer one containing three tents, probably of the next in command, or of the officers on the staff; and the guards slept or watched in the open air. Other tents were pitched outside these enclosures; and near the external circuit, a space was set apart for feeding horses and beasts of burden, and another for ranging the chariots and baggage. It was near the general's tent, and within the same area, that the altars of the gods, or whatever related to religious matters, the standards, and the military chest, were kept; and the sacred emblems were deposited beneath a canopy, with an enclosure similar to that of the general's tent. In attacking a fortified town, they advanced under cover of the arrows of the bowmen; and either instantly applied the scaling-ladder to the ramparts, or undertook the routine of a regular siege; in which case, having advanced to the walls, they posted themselves under cover of testudos, and shook and dislodged the stones of the parapet with a species of battering-ram, directed and impelled by a body of men expressly chosen for this service; but when the place held out against these attacks, and neither a *coup de main*, the ladder, nor the ram, was found to succeed, they used the testudo for concealing and protecting the sappers, while they mined the place; and certainly, of all people, the Egyptians were the most likely to have recourse to this stratagem of war, from the great practice they had in under-

ground excavations and in directing shafts through the solid rock."—E. Meyer, *Geschichte des Altertums*.—See also EGYPT: State organization, etc.

"Under Cyrus [king of Persia] the warrior caste was not only the uppermost, but was hereditary, and at all times thoroughly prepared for war. Assuming the *Cyropædia* to be exact, Cyrus undertook his great conquests with but thirty thousand men, which later increased to seventy thousand, and still more by accessions from the conquered provinces. In all these provinces a kernel of Persian troops was stationed, but the local government was uniformly preserved. . . . The *Cyropædia* is, however, a sort of military romance, . . . full of exaggerated hero-worship. While its main features are correct, its details are unquestionably dressed up. . . . The Persians fought mainly on foot. There were few horses in Persia proper. But Cyrus found cavalry necessary against the Asiatics, who had much which was excellent. He collected ten thousand horsemen from various sources, and at Thymbra used the body to good advantage. This was the origin of the superb Persian cavalry of later days. The foot had bows, slings, darts and small shields, to begin with, but gradually bettered these weapons as they hewed their way into Asia, and thereafter used battle-axes and swords, and wore helmet and mail. Thus, from what was at first but a species of light infantry grew up a later body of heavy foot, in addition to much that remained light. . . . Cambyses, son of Cyrus, divided the male population of his kingdom into children, youths, men, old men. Each class had twelve chiefs, chosen from among the last two classes. Every lad of ten began his career by entering the first. Here he stayed till twenty; among the youths till thirty; among the men till forty; and until fifty-five he was in the last class. After this he was free from military duty."—T. A. Dodge, *Alexander*, pp. 21, 23, 25-26.

3. Ancient Greek military systems.—Siege of Troy.—Sparta and Athens.—"The early kings of Greece held both the civil and military power. Every freeman was a soldier, and was trained as such from his youth up. Bronze weapons were already familiar to the Greeks at the time of the Trojan war. The nobles and chiefs used thrusting pike, casting lance and sword, and left missile-weapons—bows and slings—to the less brave or expert. The Trojan chiefs did not disdain bows. Helmets, breastplates and large shields were likewise made of bronze. Fighting on foot and in chariots—the latter was the prerogative of the great—were the usual methods. There was no cavalry, for the hilly character of Greece (except Thessaly and Bœotia) was unsuited to its evolutions, and neither, as a rule, were the horses good nor the men of Greece used to riding. The constant employment of chariots is all the more curious. . . . In the tradition of the Seven against Thebes, to assert Polynices' claims as king, there are some traces of organization suggested. . . . At the siege of Troy (1103-1184 B. C.) [also stated as 1335 and 1160 B. C.] we find clear evidences of organization. Agamemnon evidently had the legal power to compel the reluctant Greek monarchs to join him in an expedition based on a mere personal quarrel. Achilles had twenty-five hundred men, divided into five regiments of five hundred men each. . . . From the time of the Trojan war till the sixth century B. C. the Grecian states made gradual advances in military organization. The warrior's was the highest duty in the state, as well as the precious privilege of the freeman. Religion, education and public games combined to train the youth to war. . . . The right and duty of war

existed from the eighteenth to the sixtieth year, varying somewhat in different states. When war occurred, a draft of the requisite number was made by lot, or rote, or age. A given number of years' honorable service yielded a citizen many privileges, and opened to him every civil office. Warriors crippled in battle were cared for by the state and highly honored. About the sixth century B. C. the Greeks fought almost exclusively on foot. The hoplites or phalangites were the heavy, the psiloi the light, infantry. The former came from the best classes, and were armed with pikes up to ten feet long, short swords and large shields, and wore both helmet and breastplate, and sometimes greaves. The breastplate was often of leather, and everything being provided by each hoplite for himself made the arms and equipments as various as the tastes of the individuals. The psiloi had no defensive armor, and carried only bows and slings. Recruited from the poorer classes, they were of far less value in action than the hoplites, but some psiloi, like the Cretan bowmen, were celebrated for their accurate aim and the penetration of their arrows. . . . To the government, whatever it might be, was intrusted the care of all things pertaining to the military establishment. . . . The weak feature of the Greek military organization was the lack of unity of command. The armies were as a rule commanded alternately, for a given period,—often but a day,—by one of several leaders, elected by the people, who jointly made a council of war, and who were apt to be under the control of other non-military officials sent by the government to watch them. This system very naturally arose from the history and tendencies towards liberty of the various states, but was coupled with very difficult problems, and often resulted in disaster. The Greek served his country without pay. To receive money for a duty was in early days considered an indignity. Plunder, however, made up for this lack of remuneration. After a victory, the booty was collected; part was vowed to the gods and placed in their temples, and the rest was divided according to rank and merit,—the leaders being usually entitled to the lion's share. . . . Among all the Greek states, Sparta in the ninth century B. C., and Athens in the sixth, were distinguished for the perfection of their military organization. . . . Heavy infantry was the main reliance of Sparta. [See also HIPPEIS.] The soldier wore full armor; he held it a duty to the state to preserve intact his body for the state, but he did not seek safety by the method of Hudibras. He deemed it dishonor to lose, or to fight without, his shield. Not to have it with him implied that in his haste to run away he had cast it aside, so as to run the faster. He bore a heavy pike, generally a lighter lance, and a short double-edged sword. There was little light infantry, and the cavalry was mediocre. It was formed in eight ranks, and generally got beaten. . . . From the abolition of the kings down to the days of Solon (1068-594 B. C.), owing to the internal discords and external conflicts of Athens, the war-establishment was uncertain. . . . Every citizen was bound to service. Though Athens was a democracy, the citizens were often in a small minority. There were at one time but ninety thousand of them to forty-five thousand foreigners and three hundred and sixty thousand slaves. . . . Every Athenian freeman was held to pursue a certain gymnastic and military training in the public schools. At eighteen years of age he took a solemn oath of fealty to the state, and entered upon his military duties. From twenty to forty he was bound to serve, whenever drawn, within or beyond the Attic territory. After twenty years' service the citizen was dis-

charged, and entered upon civil pursuits. But up to his sixtieth year he must be ready at all times to fall into the ranks to resist invasion. . . . The heavy infantry was the strong arm of Athens, as of Sparta. The hoplite still bore the Homeric arms, consisting of large shield, long lance and short sword. The Homeric armor remained substantially the same among the Greeks ever after. . . . The organization of the troops at this time is not accurately known. It appears to have been much the same as the Spartan,—the names merely differing."—T. A. Dodge, *Alexander*, pp. 28-29, 31-36, 39-42.—See also ATHENS: B. C. 650-594.

4. Ancient Oriental armies.—Biblical times.—Moses, Saul, David and Solomon.—Assyrians, Babylonians and Medes.—According to Diodorus, the Greek historian who lived in the first century B. C., Queen Semiramis and her husband Ninus, said to have been the founder of Nineveh, had armies of nearly two million fighting men. So far as can be gathered from ancient records, the first guards and regular troops as a standing army were formed by Saul, 1093 B. C. (1 Samuel, 13:2). The army of Xerxes invading Greece in 480 B. C. is said to have been composed of 1,700,000 foot and 80,000 horse. One of the earliest standing armies of which we have any account is that of Philip of Macedon. The army with which Darius opposed Alexander the Great in 332 B. C. is stated to have numbered close to a million. "Among the ancient Oriental nations, military service was generally confined to a caste. . . . There was plenty of courage in the Eastern armies, but small discipline and *ensemble*. There was no strategic manœuvring; armies simply met and fought. Battle was opened by the light troops; the chariots then charged, and were followed up by an advance of the heavy foot, while the cavalry sought to surround the flanks of the enemy. The parallel order was universal, and open plains were chosen as battlefields. The Jews had, even under Moses, a fine organization. There was a sort of landwehr of two hundred and eighty-eight thousand men, of which a twelfth was always on duty. While using other arms, the sling remained a favorite weapon. The Jews learned much of war from the Philistines. The Egyptians were excellent soldiers in early times; but their chariots and cavalry were gradually driven out by the extension of the canal system, which prevented their manœuvring; and mercenaries crept into use to the detriment of the service. The Egyptian formation was generally in huge squares of one hundred files one hundred deep."—T. A. Dodge, *Alexander*, p. 14.—"The army organization of the Assyrians, Babylonians and Medes had a similar origin and much common likeness in form. Military service was the sole right of a certain caste, and among the Medes was looked on as the highest of pursuits. The standing armies consisted of the king's body-guard, often very large; particular corps under command of nobles of high degree, which helped to sustain the centralized government; and provincial troops. The population was divided into bodies of ten, one hundred, one thousand, ten thousand, each of which furnished its quota of men; and the army was itself organized on a decimal basis. A vast horde of nomads, mostly horse, and excellent of its kind, was wont to accompany the regular army, either for pay or in hope of plunder. [Infantry constituted the bulk, cavalry the flower, of the Oriental armies.] For many generations after the Greek infantry had shown to the world its superiority over any other, the Oriental cavalry was still far ahead of that of Greece. . . . The armament of the light troops consisted of bows and slings;

they wore no defensive armor. The nobles and well-to-do, who served as heavy troops, were superbly armed and equipped. They bore a sword, battle-axe, javelins, pike and dagger, or some of these. . . . Among the Jews, every man over twenty years of age, with certain stated exceptions, was a warrior. The twelve tribes each furnished a corps, which, at the time of the flight from Egypt, was, on the average, fifty thousand strong. From this corps, in times of war, the needed number of recruits was selected by lot or rote. It was a draft pure and simple. Saul first established a body-guard. In David's time (1025 B. C.) the number of Jews fit for war was one million three hundred thousand, and each tribe furnished twenty-four thousand men for active duty. One of these bodies served each month, under a captain who reviewed it, and was held responsible for its effectiveness. . . . Solomon largely increased the number of cav-

that his army was divided into three corps. There was clearly an established rank and command. Under Moses, the Jews fortified their daily camp in form of a square. But permanent fortification of cities they only learned after conquering Palestine. Jerusalem was strongly fortified by David, on the method then usual among the Orientals."—T. A. Dodge, *Alexander*, pp. 14-16, 18-21.

5. Persian army under Darius.—Greek, Spartan and Athenian armies.—Peloponnesian War.—Theban Sacred Band.—Athens after Marathon.—“The Persian kingdom founded by Cyrus first received a regular military organization from Darius, son of Hystaspes (B. C. 521-485). This monarch divided his territory into twenty satrapies, confided to each satrap only the civil power, while he himself appointed and controlled the commander of the military forces. These troops were fed from the taxes collected in each satrapy. There were

CHARGE OF PERSIAN SCYTHIE CHARIOTS

(After drawing by A. Castaigne)

alry and chariots, and perfected their organization and discipline. . . . At a later day the Jews acquired and used short, wide, curved swords and lances. But the sling always remained a favorite weapon, and in its use they were curiously expert. In the *corps d'élite* of the time of the Judges, which consisted of twenty-six thousand men who drew the sword, was a body of seven hundred left-handed slingers, who could cut a hair hung up as a target. So early as the time of Moses, even, the drill and discipline of the Jewish army was considerable. . . . Solomon kept on foot fourteen hundred chariots and twelve thousand cavalry. He had stalls for forty thousand chariot-horses, which probably included the equipages for the royal household and the army trains. These figures, compared with the numbers of chariots at Thymbra and Arbela, seem exaggerated; but they serve to show that the main reliance for the day was on chariots rather than on cavalry. A careful military organization no doubt existed. We read in Holy Writ that David appointed Joab captain-general over his army, with twenty-seven lieutenants under him, and

active and garrison troops. The former were divided into bodies of one thousand men each, and did duty on the borders and along the great highways which traversed the kingdom. They were rigidly inspected, and a grand review of them held each year. The whole kingdom was divided into military districts, with central assembly points in each. The garrison troops were kept under separate control for the protection of the city fortresses, and were not obliged to assemble for the annual inspection. Their organization was quite apart from the active army, though resembling it in minor detail. Several corps, each ten thousand strong, served at court. The most noble and brave of the Persians served in a *corps d'élite*, which was kept always at ten thousand men, and was known as the Immortals. These held the first place of honor in the army. The second belonged to a somewhat similar corps of Medes. The satraps and great officials each had his own body-guard, which he regulated himself. The whole population, like the Jews, was divided into tens, hundreds, thousands and ten thousands, and in case of war fresh

corps or reinforcements could be raised quickly and effectively. These levies, when made, were apt to be commanded by the large land-owners of the districts where raised, thus preserving the national character of the force. Sometimes, as in Darius' expedition against the Scythians, or Xerxes' against Greece, a general draft of the entire people was made, and the king determined how much each province should furnish in men, material, horses, ships and so forth. . . . The troops were not paid. During active service they were fed by simply seizing and gathering in supplies wherever found. Provinces through which a Persian army passed were eaten up as by a plague of grasshoppers. . . . Though the Persians became a luxurious people and lost much of their warlike quality, they were in early days simple, soldierly and brave. They received an excellent training for war. It was only cohesion which the Persian army lacked. But after the days of Xerxes I. (465 B. C.) they began to fall backwards. . . . Mercenary troops were gradually introduced, and to the best of these the safety of the kingdom was confided. This labor-saving system grew fast when it was found easy to raise mercenaries. Asiatics and Greeks were both enlisted. The former made the bulk, the latter the kernel of the Persian armies. The Greek phalangites received pay at the rate of one daricus (a ducat) per head per month, between four and five dollars, in addition to which sum, it is probable, they received an equal amount for rations. . . . The most effective part of the Asiatic armies was cavalry. In this the Orientals have always excelled. The horse was in the East then, as now, the constant companion of man, and cavalry was the natural arm. The best heavy cavalry was the Persian; then followed the Median, that of Asia Minor, the Parthian. The nomad tribes furnished an excellent light cavalry, much like the Cossacks of to-day. The foot was more numerous but less good. The light troops, slingers, darters and archers, were abundant, but had little discipline. The Greek mercenaries furnished the stanchest of the heavy troops. There were as high as fifty thousand in the Persian service at one time. Bodies of native troops were organized in like fashion. Some of the Persians were accoutred in the most splendid manner; wore scaled armor and carried weapons of the finest description. Chariots, plain and scythed, were in vogue, and camels bearing archers and darters were not uncommon. . . . Organization and discipline in the field were wretched. On the march there was no order. The army camped near water and pasturage, and surrounded the camps with wagons, stockades and earthworks,—sometimes using their shields as a capping to the latter. The higher generals had tents; the commonalty slept in huts in permanent camps, or without shelter in daily camps. . . .

"Down to the battle of Plataea (479 B. C.) there was small change in the organization of the Greeks. From that time on, many alterations came gradually about. A number of slaves appeared in the ranks. The first instance of a standing army was the occasion when the Greek cities, during the Persian wars, mutually agreed to keep under arms ten thousand foot, one thousand horse, and one hundred warships. Wars beyond the borders of Greece called for larger forces than had been necessary, and in addition to the citizen-soldier . . . large forces of freedmen, slaves, and particularly mercenary troops, were created. In the Peloponnesian war, and during the period of her greatest splendor (465-429 B. C.), Athens made use extensively of mercenary troops, and other Greek states soon followed suit. Down to the

Peloponnesian war the Athenians had retained their civil and military virtues in full force. But this internecine struggle ruined the population, devastated Greece, and familiarized the Greeks with serving for gold. Pericles found it necessary to pay the troops. The hoplites had nothing left to subsist upon. They had already served for pay in Asia, on a limited scale; but after the Peloponnesian war, the Oriental princes or satraps, Carthage, or indeed any other people or prince who needed them, had no difficulty in collecting large bodies of Greek mercenaries. From this paid foreign service it was but a step to the point where the Greeks were willing to serve in preference him who paid the most. The pay varied from five to twenty cents a day. The best of the Greek population embraced arms as a profession, engaged mostly abroad, and left the poorer material at home. Greek cities themselves had to hire soldiers. The better citizens would no longer serve. They procured substitutes, and the armies, often kept standing, were filled with wretched stuff. But in most of the Greek cities there remained a better nucleus, a *corps d'élite*, in which alone the highest citizens had a place. Though this was small, it was a leaven. Such was the Theban Sacred Band, or Band of Lovers, which was bound together by ties of affection and oaths of fidelity, and, but three hundred strong, so often saved the day for Thebes. This gallant body was finally cut to pieces at Chæronea. It would not yield a foot. Every man fell where he stood, sword in hand. . . . The hoplites continued to be the favorite troops. Only they were looked on as warriors. Their armament remained the same, except that their shields grew smaller,—from four to two and a half feet in height, while the pike grew longer,—from ten to as much as twenty-one feet, or, as some state, twenty-four feet, which was the sarissa of Macedon. . . . It was reserved for Iphicrates of Athens to better their discipline and condition, and prove their utility in service. After the Peloponnesian war he created a new body, armed with well-poisoned spears for casting, light but good linen armor, and a small, round shield (*pelte*), from which they were called *pelastai*. . . . This new arm proved useful, and was shortly imitated by the other Greek cities. Scarlet or crimson were the favorite colors of the warrior. The Greek cavalry was either heavy,—*cataphracti*, bearing long double-ended lances, sword and axe, small shield, and fully armored, as was also the horse; or light,—*acrobolisti*, far-shooters,—who were merely light-armed riders and like nomads in their methods. . . . But the Greek cavalry was essentially poor, though certain leaders, like Epaminondas, managed to get good work out of it. The Greeks were not a nation of horsemen. . . . Until Plataea the Greek troops served without remuneration. The Athenians first began to pay the troops. The amount varied. It averaged ten drachmas (two dollars) per month for a foot soldier. The cavalry received two, three, and four times as much, according to its grading. The officers were paid twice to five times as much as the men. . . . Discipline varied much at different times and with different nations, being naturally a reflection of the character of the people, or of the leaders. Down to the Peloponnesian war, discipline and the feeling of honor among the troops was markedly good in almost all Greek states. . . .

"Sparta's system remained substantially the same from the time of Lycurgus down to the Peloponnesian war. But rivalry with Athens and the necessity of possessing a fleet, if Sparta would arrest her competitor's preponderance in Greece, changed the habits of centuries. Money became essential

to conduct war against wealthy Athens, and money brought into Sparta those things which soon drove out the ancient national simplicity. And this all the more speedily from its novelty. The armies now no longer contained citizens alone, though these were still the kernel; but the Laconians, freedmen, helots and mercenary troops composed a large part of it. The free population was divided into five classes, from which the ephors called into service in war as many as were needed, according to age. Cleombrotus, at Leuctra, had in the ranks the citizens from twenty to thirty-five; after Leuctra, those up to forty were called in. The number of freedmen who gradually crept into service was large. Agesilaus had three thousand in Asia. The helots were called in only in cases of grave danger, as before Mantinæa. The kings still held the command, but came more and more under the control of the ephors. The latter held the real power, and went on occasion so far as to displace the kings from command. The troops were not yet on a paid basis, excepting the helots and mercenaries; but the kings and their staff or suite were victualled. . . . After the Peloponnesian war, discipline declined and the state was often forced to resort to largesses to encourage the troops to those exertions they had been in the habit of yielding as of course. . . . Athens, after Marathon, which redounded to her greatest honor, rose rapidly in power, and the tendency towards democracy brought about many changes. Citizens from twenty to forty were still subject to military duty, but were permitted to procure substitutes. The list of citizens freed from military duty grew large. Aliens, freedmen and even slaves gradually crept into the ranks, the latter mostly in the fleet. Auxiliary troops from allied or tributary nations and mercenaries increased in proportion to the citizen-soldiers. The forces of Athens were large, especially at sea; and during the height of her power the conduct of her leading citizens and of the troops was uniformly patriotic and brilliant. Ten strategoi commanded the forces, —one for each tribe (phylê),—and were selected by lot or vote. At the expiration of a year they laid down their command, and rendered an account of their doings to the people. They were often re-elected. . . . Under the ten strategoi were ten taxiarchs, who were a sort of aide-de-camp, but with specific duties and command. The taxiarchs looked after victual, camps, the order of march, weapons, and so forth. Each strategos also had one or more heralds. . . . The richest and best fitted citizens served in the cavalry. Rigid examinations of physical strength and financial ability to support the cost of cavalry service were required. But this arm none the less remained very mediocre. The Athenians were seamen, not horsemen.”—T. A. Dodge, *Alexander*, pp. 57-64; 70-71, 78-82.—See also ATHENS: B. C. 650-594; GREECE: B. C. 479; Persian Wars: Mycale.

6. Macedonia.—Armies of Philip and Alexander.—Military reforms of Alexander.—“It was Philip who first gave shape to the army, transforming what was a mere manhood duty of service, or obligatory militia system, into a standing army, which rose under him to number forty thousand men. This was the first instance in which a free people subordinated itself to a military autocracy whose head was the king. It was this which made Macedonia the superior of Greece, which had lost its old habits of personal service, and now depended largely upon mercenary soldiers, or upon volunteer service and substitutes. Personal service, unless coupled with the discipline and methods of a standing force, makes an army of volunteers rather than of regulars. In former days the Greeks

had had what came very close to the best discipline attained by a standing army. But the phalanx had gradually lost its cohesion. . . . No doubt the Greek habit of relying on voluntary service made for true freedom, as our own [American] organization rather than that of the Prussians yields the greatest good to the greatest number; but as a military machine Macedonia with its standing forces was far ahead of the rest of Greece. When Philip was elected to the throne (B. C. 359) to succeed his brother, Perdiccas III., the Macedonian infantry was composed of raw and ragged material, mostly hide-clad shepherds, armed with wicker shields and ill-assorted weapons. It was a rabble rather than an army. The cavalry was better, in fact the best in Greece, where horse had not been much in vogue, and had been drilled to charge in compact order, and with a short thrusting pike as weapon. Still it could not be pronounced satisfactory. Philip saw that cavalry would not suffice; he must have infantry to meet the solid ranks of the Theban, Athenian and Spartan phalanx. The foot-soldier, with whom he had by his Theban education become familiar, was the one who, under Epaminondas' skillful tactics, had broken the theretofore invincible array of the Lacedæmonians. Philip must build up an infantry which could break the Theban formation. . . . [He] invented the sarissa or long two-handed pike, which protruded so far beyond the front rank that the Greek hoplite could not reach his enemy so as to use his shorter weapons; and by this device he overcame the Grecian phalanx. . . . The army for war was raised: first, from the Macedonian people, as a kernel; second, from tributary tribes,—Thessalians, Thracians, Phæonians, Triballians, Odrysians, Illyrians and others; third from allied nations, such as the Greeks; fourth, from mercenary troops, Greeks and others. The Thessalians were really allies; but they were under a Macedonian chief, as were also the Greek allies. . . . To Philip is due the credit of organizing the whole Macedonian military establishment; Alexander in no material manner changed what he inherited, but only expanded the system, so as to make room for the introduction of new elements in the East, and to create *cadres* of sufficient size to treble the strength of the army. He was wise enough to recognize that he could not better the results of his father's wonderful capacity for organization. . . . The Spartan and the Athenian phalanxes . . . were superb of their kind; but the Macedonian phalanx will always remain in history as the ideal of shock tactics.”—T. A. Dodge, *Alexander*, pp. 135-137.—See also GREECE: B. C. 350-358.—“Alexander was a soldier and a general in the first place. His greatness in this respect is admitted even by his detractors. If the ability of a general consists of swift discovery and vigorous execution of what is required for victory and of unswerving pursuit of his aim by the best means available, then Alexander was one of the greatest generals that have ever lived. His method was energetic action directed to a single point, and that point the main one; and this is no doubt the best method. In the control of his soldiers he has been rivalled by few generals, and he also knew how to yield to them at the right moment. Only one reproach can be made against him as a soldier, viz., that he risked his life too often. True, he achieved many a success by it more quickly than he otherwise would have done, and we know that even aged generals have occasionally exposed themselves to danger more than was proper. Alexander exhibited prudence when it was necessary, and daring when it led him to the goal. But Alexander was also a first-rate military organizer.

. . . The heavy infantry were called Pezetairi, the Macedonian cavalry Hetairi. The expression friends' denotes the Macedonian soldiers who served the king for friendship's sake, the retainers of the king, who besides called out as many men in his own country as he liked. But there were also light infantry called Hypaspistæ in the Macedonian army. The concentration and authority of the chief command were greater in the Macedonian than in any Greek army, not excepting the Spartan, where . . . the superior officers were often wanting in discipline. A select body of all classes of troops formed the king's guard, and was called Agema. Distinct from these are the body-guard (Somatophylakes), a small number of men, selected from among the ablest officers in the army; they have rightly been compared to the adjutant-generals of our modern armies. The commands over the various divisions of the army were distributed each time as occasion required. There were also Greeks in the army, but they were mostly professional soldiers. Alexander appears to have taken very few contingents from the various states, with the exception of Thessaly, which he regarded as his own territory. . . . The troops received on an average ten staters (20 drachmæ) a month, and their food as well. They could not save much with this, and booty could not be made everywhere. They did not therefore get rich as a matter of course. If the army stayed anywhere for a time, as in Bactria and Sogdiana, the rank and file naturally had a pleasant life. Rewards consisted chiefly of assignments of lands in the neighbourhood of the cities founded by the king. Many soldiers too who had seen long service or were wounded were sent home with gifts from the king."—A. Holm, *History of Greece*, pp. 376-377.—"Alexander employed more cavalry than any one up to his day, and handled it better. No one has ever surpassed his cavalry tactics. Epaminondas had but one tenth of his force mounted. Alexander had one sixth to one quarter. This he found essential in order to cope with the great and admirable force of cavalry in the Persian army. For cavalry was the choice arm of the Asiatics, and it was very skillful. The cavalry, as a rule, was composed of Macedonians and Thessalians, who were heavy horse, and Thracians and Ætolians, who were light horse. . . . The changes in the cavalry made by Alexander in the East were also on a different basis. The army here described is Philip's army. This Alexander modified without changing substantially that in it which made it so efficient. It was a disciplined army, and discipline cannot be described in words; it is only shown in deeds. . . . No Asiatic cavalry could ever stand their shock, no infantry resist their onset. Alexander's battles were uniformly decided by them. The marches they could execute were well exemplified in the pursuit of Darius, when they made three thousand three hundred stades—three hundred and sixty-six miles—in eleven days, under a burning sun, and part way across a desert country without water. . . . Later Alexander made a special body of *sais-sophori* or lancers. Just wherein they differed from other pike-carrying horsemen, unless that the lance was longer, is not known. Third were the *dimachias* (two-fashioned fighters), light dragoons, who could engage either on foot or mounted. They had light defensive armor and shields, swords and a lance which they could use for thrusting or casting. They opened the combat and pursued the broken enemy. These were a sort of mounted peltast, midway between heavy and irregular cavalry. . . . The light cavalry was especially recruited among the allies. Alexander used to mix archers and sometimes targeteers, *i.e.*, peltasts, or sometimes even

shield-bearing guards with his horse. These footmen proved useful in checking disorder, and the archers were so active as to be able to keep up with the horse in all their marches and evolutions. . . . Finally, there were in Asia numerous bodies of irregular light troops, both foot and horse, slingers, archers and javelin-throwers. These were used much as the Austrians used Pandours in the Seven Years' War, or as the German Uhlans or the Russian Cossacks are to-day. Of the light foot the Agrianians, who were javelin-throwers from the Mount Hæmus region, under command of Attalus, were the most important and numerous; and the Thracian javelin-throwers, Sitalces commanding, were equally useful and steady on all occasions. These were the flankers of the army. Famous archers came from Crete. Clearchus was their commander at the outset; but the chiefs mentioned were often subject to change on account of death or wounds. . . . We know nothing about the baggage or wagon train, but it must have been much what it is to-day, except that pack-animals were more common than wagons. Horses had to have forage and soldiers rations then as now, and we do not hear that Alexander's men carried twenty days' victual, like Cæsar's legionaries, on their persons. They had basket-work haversacks, and their rations consisted of salt meat, cheese, olives, onions and corn. At one time there was, according to Philip's orders, a porter for every ten phalangites, and the hetairai or cavalry Companions always had servants. Philip is said to have first taken from the infantry their baggage-wagons and cut down the horseman's servants to one, and he often marched his men with full complement of equipment, baggage and provision, even in summer heat, thirty miles a day as a mere matter of training. Headquarters must necessarily have had certain facilities for doing business. That there were provost-marshals we know, and there are one or two references which sound as if there was a regular field-hospital service. All this demanded transportation. The quartermaster's and commissary's as well as engineer departments we read little about. But there is evidence of their wonderful efficiency in everything which Alexander did. The system was the creation of Philip. . . . The corps of 'pages' was perhaps the first institution which may be said to have been an embryo military school,—a by no means incomplete West Point. From these pages came eventually all the higher officers. . . . Philip had introduced the graduated system of rank and command, and of advancement strictly according to merit. . . . The word of the king was supreme law. But it was common to summon councils of war from time to time to decide matters of great moment. . . . In such councils the officers of given rank, whether of Macedonians or Greeks, auxiliary or mercenary, Thracians or Agrianians, Odrussians, or Pæonians, were all present and had equal right to be heard and considered. But it is probable that the Macedonians had higher rank and more influence in such councils. . . . But Alexander invariably, excepting at the Hyphasis, carried his point. His persuasiveness was always equal to the respect and affection of his subordinates."—T. A. Dodge, *Alexander*, pp. 150-155, 158, 163, 168, 170.

7. Carthage.—Military system and weapons.—Development under Hamilcar, Barca, and Hannibal.—"Carthage preferred mercenary troops to a system of personal military service. Her citizens being mostly traders or rich planters, whose time was too valuable to the state, or whose social position was too high, to allow them to spend their years in the ranks, it was natural that a standing army should

grow up by permitting substitution. Moreover the hiring, for such an army, of soldiers and sailors among the numerous semi-civilized tribes with which Carthage traded, kept up her pleasant relations with these tribes and enabled her gradually to extend her influence over their neighbors. Commerce with the barbarians was highly remunerative. The same rule applied to the navy, which was in like fashion manned by bought and hired crews. held two hundred thousand complete suits of armor, an immense number of darts and javelins and two thousand catapults, and Strabo repeats the fact, making the number of engines three thousand. Trained artificers in these arsenals were able to turn out each day one hundred to one hundred and twenty shields or bucklers, three hundred swords, one thousand catapult-missiles, five hundred lances and a number of engines. The Carthaginian citizen was found only to a limited numerical extent in the army. But in the cavalry, where wealth was required and honor sought, and especially in a *corps d'élite* called the Sacred Band,—the body-guard of the commander-in-chief and a sort of training-school for officers like the Macedonian Pages,—and in the higher official berths, he was fairly well represented. The Sacred Band, which consisted of fifteen hundred infantry, was sumptuously clad and equipped, and was noted for its courage and discipline. The cavalry, one thousand strong, came next in order of importance, and appears to have formed an appendage to the Sacred Band. Thus but twenty-five hundred of those who were fortunate enough to hold Carthaginian citizenship served in an army then numbering seventy thousand men. Though not commonly in the ranks, the citizen was in times of public danger held to service, and the city alone could put on foot an army of forty thousand hoplites and one thousand horse. The next grade of land troops came from the Liby-Phœnicians, peoples lying near by and tributary to Carthage, and the outcome of an admixture of the colonial and native blood. These tribes furnished a much higher number than Carthage herself. The foreign mercenaries were the bulk of the army. These last troops were recruited among all nations in Africa and Europe with which Carthage had commercial relations, with the idea, says Polybius, of avoiding conspiracies and mutiny by having no common political aspirations among the several divisions of the army. Indeed, the different bodies did not generally understand each other's language. They were apt to be devoted only to their immediate chief. These troops were got in bodies of hundreds and thousands by bargain and sale from the governments of their respective countries. As a rule, some senator was sent as ambassador to such nations as it was desired to reach, and a given number of troops arranged for on given terms of payment. The best of these mercenary troops were the Iberians from the Spanish peninsula. Among the most recklessly brave were the half-naked Gauls, who at a very early period served for pay in the Carthaginian ranks. The most numerous were the nomad soldiers collected from every part of the African coast, from Egypt to the Pillars of Hercules. The general plan of recruitment was not dissimilar to the Persian. The Great King assembled under his banners all the peoples of the East; Carthage all the nations of the West. The numbers under arms have probably been vastly over-estimated by the ancient Greek and Roman historians. . . . In seasons of peace, the nucleus of the army was kept intact, with plenty of weapons in the arsenals, and horses and beasts of burden. The citadel was not only the centre of

military defense, but the headquarters of the army as well. Here were the barracks for the troops; and here the commander of the citadel and of the troops in garrison was in sole authority. . . . The generals were chosen from the citizens by the people. . . . At the side of the general in command stood a deputy of the senate, who not only watched his proceedings, but to a certain extent might direct them. In the fifth century there had been an attempt by an army-commander named Malchus to seize the reins of government, and there was at once constituted the above-named *gerousia* or Elders' War Council of one hundred and four senators, who thereafter were the supreme commanders, and who directed and controlled all military operations, however distant, drew up the plans of campaign, required strict compliance with their demands, and rewarded or punished the successful or unsuccessful captains as they chose. Even a reasonable or necessary variation from their plan was sometimes mercilessly chastised. The War Council's plan could rarely accord with the existing facts; generals dared assume no responsibility; their conduct was apt to be indecisive or weak; and if a campaign was successful, it was in spite of the system. Over half-civilized or quite barbarous nations victory could be easily won. But when the Carthaginians met even smaller armies of well-disciplined troops under good generals whose hands were free, they were apt to fail. The defeats they suffered at the hands of Gelon, the elder Dionysius and Timoleon abundantly prove this fact. The Carthaginian foot and horse were each divided into heavy and light, regular and irregular. The weapons, equipment and manner of fighting were almost as various as the nationalities. Each petty detachment came to swell the host of irregulars with its own peculiar arms and habits. The Sacred Band was a body of heavy-armed infantry, composed, says Diodorus, only of leading Carthaginian citizens. Plainer citizens served in the phalanx when on duty. The infantry of the Sacred Band carried a large circular shield over three feet in diameter, a short sword and probably also a pike or lance; were clad in a red tunic and wore sandals. Though not mentioned in the authorities, they no doubt wore armor. Others among the richer of the Carthaginians who entered service were appointed to the heavy cavalry, a position which entailed great expense to maintain at a proper level. These cavalrymen were distinguished by wearing golden rings, one for each campaign served by them, and their weapons were a buckler, a longer and a shorter lance and a wide, short sword. They were clad in mail and wore a helmet and greaves. That there were so few of these leading Carthaginian citizens in a large army shows the system up in its weakest aspect. The Liby-Phœnicians fought mainly as heavy foot and horse. All these infantry troops carried a heavy and long spear as their chief weapon, much like the Greek hoplite, on whom indeed they were at this time patterned so far as race peculiarities permitted.

"The Spanish infantry and horse were also classed as heavy, but their chief weapon was a powerful cut-and-thrust sword for close quarters, in the use of which they were wonderfully expert. They wore white woolen tunics, with red edges, and carried a huckler made of bull's hide. The Spaniards were then, and have always been, under good generals, the making of excellent soldiers. The Gauls were of light complexion, and were fond of dyeing their hair red. They wore it long, hanging over the shoulders or tied in a knot at the top of the head. The men wore full beards, the officers

only a mustache. Up to the time of the Gauls with Rome, the Gauls fought on foot, almost naked, with a sword good only for cutting, of no use except at swinging distance and apt to be dulled or bent by the first blow upon a good helmet or shield. The Roman soldier, who with gladius and scutum closed sharply with his man, had the Gaul at an utter disadvantage. The Gauls were noted for genial qualities and courage, but equally for inconstancy, wildness and brutality. When not in battle, they were clad in a shirt, loose tunic and cloak. Their helmets, not always worn, were decked with horns or feathers, and were made of considerable height to give to the soldier a taller look and thus increase the terror of his aspect. They wore many bracelets, necklaces, and rings. For additional arms they had slings, a lance with fire-sharpened point, a pike or halberd with curved blade and a club. They were most dangerous as swordsmen and Hannibal replaced all their other weapons with their one peculiar arm, manufacturing these in Cartagena, so as to give them the advantage of the best of material. They later adopted armor and a shield, which in early days they had despised. The next most valuable arm was the corps of two thousand Balacrean slingers, then peculiar to Carthage. They carried two slings, one for long, one for short distance firing. The distance and accuracy of their aim with pebble-stones and leaden bullets are so well vouched for that we are fain to believe the feats narrated of them, and can fully understand their military value. We know that the Jewish left-handed slingers could sling stones at a hair's breadth; and on the Retreat of the Ten Thousand, Xenophon was not satisfied with his light troops until he had organized a band of slingers, for these seemed best able to keep the enemy at a distance when protecting the column. Their fire was more severe than that of the best archers of the day. The ordinary light footman had lance and javelins and a small round shield of hide-covered wood. He was a fine marcher, and some of the men could keep pace with a galloping horse. They and the Gauls were wont to indulge in fearful outcries in battle. They were very clever in casting darts, and were not apt to miss their aim at any fair distance. The Africans were straight-featured, strong and hardy. They shaved their heads and left but a small fringe of beard. They tattooed extensively. They wore a red hood, a white woolen shirt hanging to the knees and belted at the waist. A bournous, or cloak, or the skin of a goat or some wild beast, covered their shoulders. Their legs were bare. A long lance, bow and arrows, a buckler of elephant's or bull's hide, sometimes a long sword, were their weapons. Some had special arms, such as flails, and harpoons held by a cord. Later, Hannibal armed these men with the Roman weapons picked up on the battle-fields of the Trebia and Transimene and Cannae. The Africans were peculiarly tough, faithful and uncomplaining. They were hideously cruel to their prisoners, and hard to restrain from massacre; but they were the best of material from which to make a devoted army. . . . The Carthaginian army was quickly moved because not loaded down with baggage, nor consisting of much heavy material. It could march long distances, and its light troops preserved it from surprises. But these light troops at the same time devastated the country, making subsistence difficult and retreat impossible; and were often hard to control. There was little organization, and under the every-day general little discipline. Owing to the vast numbers of cavalry-horses, and

generally the presence of elephants, it could not be readily transported across sea; and, like all armies full of unintelligent material, it was subject to severe epidemics of sickness. It must not be understood that such was the complexion of the army of Hamilcar or Hannibal. These partook peculiarly of the genius of their leaders, as armies always do. The above description applies to the Carthaginian army as a whole, and in most points not to those bodies which did such wonderful work in Spain and Italy. . . . So far as minor tactics, arms, organization, and marches and battles are concerned, we do not know as much about those of the Carthaginians as about those of other nations. It is generally understood that, during the First Punic and down to the beginning of the Second Punic War, the heavy and regular foot and horse approximated largely to the Macedonian type. Xanthippus, during the First Punic War, joined the Carthaginian army with a body of Greek mercenaries. These of course retained the phalangial habit, and as they were the best troops in the army, and Xanthippus was placed in command of all the Carthaginian forces, the Greeks no doubt gave a phalangial training to the Carthaginians, whose foot was already set up somewhat after this fashion; for intercourse with Greece as well as the traditions of Tyre would no doubt accomplish so much; and the knowledge of Alexander's wonderful successes would lead the Carthaginians to imitate his method, so far as they could learn it. The light and mercenary troops retained their own methods of combat, regulated by such masters as Hamilcar and Hannibal to suit the occasions which might arise. We shall see the latter introducing a number of Roman methods. . . . The cavalry, if organized on a Greek basis, was light and heavy, the former being mostly used in outpost duty. The heavy fought in a unit of sixteen ranks, four men deep, called an ilē. How the Numidian and other light cavalry was organized is not known, but the Carthaginian army decidedly lacked homogeneity. . . . Of light cavalry there was an indefinite number. Several of these phalanxes acting together in one line were known as a grand phalanx. That the Carthaginian army adopted exactly this formation is not known, but its organization was unquestionably phalangial. From the time of the First Punic War, the military power of Carthage was markedly on the wane. It was only the wonderful military capacity of Hamilcar Barca and his family which made the light to brighten—as it did indeed in a manner seen but a few times in the world's history—before it finally flickered and went out. . . . But it must be noted, though the military power of Carthage was about to expire, that, owing to the extraordinary military talent of the Barcas, Carthage never possessed an army so hardened by campaigns, so inured to discipline and so devoted to its chief as the one which Hannibal commanded when he left Spain on his way to Italy. This was in spite of the decadence of Carthage, and purely the individual work of this remarkable family. Military capacity is infrequently transmitted to posterity. The few exceptions to this rule shine with all the more radiance from their rarity. It is a curious fact that out of the six greatest captains of history, three, Alexander, Hannibal and Frederick, owe their armies to their fathers' skill as organizers, and the two former came honestly by their military genius."—T. A. Dodge, *Hannibal*, pp. 11-12, 14-19, 23, 25-30.

8. Rome.—Marius, founder of professional army.—Changes in service and administration.—Abolition of distinctions.—"It was Marius

[c. 155-86 B.C.], the first professional general, who formed the first professional army. . . . Greece, even before the end of the fifth century, had already begun to use paid and trained soldiers, partly owing to the unwillingness of her comfortable or busy citizens to engage in annual campaigns, but still more because it was found that the more highly trained and better disciplined mercenaries were far more efficient at their business. So for many centuries Rome had now been the only power in the Mediterranean world to rely upon a citizen militia. [See *COMITIA CENTURIATA*.] That citizen militia had indeed conquered the world; but certainly in dealing with the trained troops of Pyrrhus and Hannibal, the Roman forces had already begun with disaster and slowly been schooled to their trade by defeat. So it was now in the Jugurthan [111-107 B.C.] and Cimbric [113-105 B.C.] wars: the generals had to train their armies in the face of the enemy, and while that is no doubt the best training ground it is terribly dangerous and expensive. It implies, too, an almost inexhaustible stock of recruits to fall back upon. With the decline of Italian agriculture and the growth of city life the stock of recruits was no longer inexhaustible. Moreover the art of war was becoming more intricate. Rome found it necessary to appoint a genuine soldier for her general against Jugurtha in view of the disastrous failures of aristocratic amateurs. In the same way Marius found it necessary to overhaul the Roman fighting machine, and by the end of his five years of successive consulship he had organised a professional army on much the same system as our own [British]. Rome . . . required a highly trained expeditionary force and behind it a large reserve. The principal change instituted by Marius seemed at first a small one and required no legislative sanction. Hitherto the army had consisted only of the propertied classes, the infantry of those who could afford a suit of arms, and the cavalry of the richest citizens who could maintain one of the state horses. The minimum property for a Roman soldier is said to have been £115. The poorest had originally formed a light-armed support, the three middle classes were the line, and the richest the cavalry. But the three classes of the line had by now come to be drawn up not according to property but according to length of service. . . . But social changes were changing the army. As wealth increased and the gulf between rich and poor grew wider the comfortable burgesses were no longer obedient or willing soldiers. Bad discipline—a monstrous violation of the old Roman spirit—had begun to appear in the ranks as early as the Macedonian wars. In the Jugurthan wars it was deplorably rife. The equestrian class as the richest was also the most mutinous: as early as the third century the knights had refused to work in the trenches alongside of the legionaries. By 140 B.C. they had ceased to act as a military force and become merely a grade of honour, or rather of income, in the state, though the younger knights continued to form a corps of noble guards to the general. As for the army as a whole, the theory down to the time of Marius was still that of the annual spring campaign; each consul levied his own army for a specific purpose. This levy had become more and more difficult. The simple innovation which Marius introduced was that in the process of holding his levy he began by asking for volunteers and enrolling those first. There was generally a distinct promise of rewards on discharge. Thus instead of the moneyed classes Marius filled his ranks with the poorest and hardest inhabitants of

Rome and Italy. Of course the obligation to serve still remained part of the condition of certain subject peoples. The auxiliary ranks were now supplied by foreign experts—cavalry from the Numidian deserts or the Ligurian hills, slingers from the Balearic Islands, and presently archers from Crete. Having thus professionalised his army Marius proceeded to abolish all distinctions in the ranks. All the men of the line now had a uniform equipment supplied by the state, and instead of a bewildering variety of insignia all the legionaries now fought under that emblem destined to be carried in victory to the four corners of Europe—the silver eagle. The eagle was the standard of the legion and it was regarded as sacred. In camp it rested in a special shrine and terrible was the disgrace attaching to its loss in battle. Hitherto legions had been gathered for each campaign and disbanded at its close. Now a legion had a permanent existence, a fixed number, a tradition and an *esprit de corps* of its own. It was now a larger unit of 6000 men; for while the maniples or company of 120 men still remained, the maniples were grouped into cohorts or battalions, which now became the regular tactical unit, and ten cohorts formed the legion.”—J. C. Stobart, *Grandeur that was Rome*, pp. 96-98.—See also *ROME: Republic: B.C. 118-90, to B.C. 88-78*.

9. Roman army under Cæsar.—Battle formation.—Military service a privilege.—Organization of legions.—Induction of mercenaries.—Consequent degeneration.—Branches and armament.—“The legion with which the Romans vanquished the Grecian phalanx, and which gallantly took the fearful punishment inflicted on it by Hannibal, again and again facing destruction with unflinching courage, until the Carthaginians, exhausted by attrition, were forced to abandon Italy, was a very different body of men from the enthusiastic legion which Cæsar led victorious to the four quarters of the then known world. [See *LEGION, ROMAN*.] . . . Cæsar’s array in line of battle did not differ as greatly from Hannibal’s phalanx in the later battles of this [Second Punic] war, as it did from the legion of Marcellus or Nero. At Asculum, Herdonio and Zama, Hannibal’s army was set up in two or three lines of legionary phalanxes, so to speak. Adopting the quincunx or checkerwise formation by maniples as the typical idea of the legion of the Second Punic War, Cæsar’s army, during all his campaigns, was set up more like Hannibal’s phalanx, and at times very nearly approached it. . . . The old numerical force of the legion, say four thousand to six thousand heavy infantry and three hundred heavy cavalry as the normal strength, was retained; but the light troops, now all raised from the conquered provinces, were largely increased, both foot and horse, and were no longer an integral part of the legion. The horse grew in importance and effectiveness, for the Roman horseman had imitated the better models of light cavalry which his many wars in every land, from Iberia to the distant Orient, had afforded him. This improvement was traceable in the heavy cavalry in a lesser degree. From about one-tenth of the numerical force of the foot, the horse grew to the proportion of one-seventh or at times more. [See also *EQUESTRIAN ORDER*.] The number of legions in a consular army was no longer four, but ran up to any given number, even to ten, not counting the auxiliaries, horse or foot. Elephants and ballistic machines came into common use. A legion in the field had thirty small catapults and ballistas, each served by ten men. . . . The Gallic cavalry was superior to the foot, as it

contained the nobles. This arm was their delight. They took pride in their horses and sought noble breeds. Tilting was a frequent sport, and at banquets duels to the death were not unknown. . . . It is rather strange that Cæsar, throughout his campaigns in Gaul, relied all but exclusively on native horse; and stranger still, that he left the command of this horse to native leaders. His reasons for the last were probably mainly political; but the plan was not always followed by good results, and was constantly attended by danger. The Gallic horse, however, proved for his purposes much better than the Roman. They were an exceptional body of men."—T. A. Dodge, *Cæsar*, pp. 1-8, 57, 67.—See also *ROME: Republic: B. C. 69-63, to B. C. 45-44; GAUL: B. C. 58-51.*

10. Cæsar's strategy.—Numerical strength of formations.—Army equipment and administration.—Distribution of authority.—Soldiers' pay.—March and transport service.—Battle tactics.—Weakness in cavalry.—"Cæsar as a rule was numerically weaker than the enemy, but he was not so vastly overmatched as was Alexander, nor can the opposition to him be in any sense compared to what Hannibal encountered during his entire military life. Cæsar was far stronger than his enemies in everything but numbers, especially in self-confidence and power of work. His legionaries would bear anything and could do anything. They were very Yankees for ingenuity. Cæsar did not willingly mix the allies with his legions; he employed the native foot mostly as bowmen and slingers. He worked his army habitually well concentrated. If he divided his forces it was but for a short time, soon again to concentrate. This is an almost uniform test of military capacity. But Cæsar sought to attack the enemy before the latter had concentrated, and generally made good use of such a chance. Nimbleness of movement stood in the stead of numbers. He understood how, as Napoleon phrases it, '*se multiplier par la vitesse*' [to multiply himself by speed]. . . . The Roman soldier as to arms, equipment and minor tactics, was to all intents and purposes the same as he had been in the time of Hannibal. . . . But in character, quality and discipline, he was no longer the splendid citizen-soldier of that day. He was a professional if a Roman; a mercenary if a foreigner; and as such he was exactly what his commander made him. A similar change had obtained in the officers. The six tribunes of a legion were no longer appointed for their military qualifications or long service, but claimed their rank on the score of political or social standing, or of friendship for the chief. . . . It seems odd, with all that has been written about Roman tactics and organization from Polybius to Vegetius and Onosander, that the exact structure of Cæsar's legion, cohort, maniple and century cannot be given. . . . The allied legions of old times had all disappeared. A legion no longer meant one Roman and one allied legion, or ten thousand men. It meant simply a body of ten cohorts. In place of the allied legions there was a larger force than theretofore of light troops armed like legionaries, but less heavily, and considerably more bowmen and slingers. The light troops had a leather jerkin but no armor, and carried the round shield (*parma*) instead of the cylindrical *scutum*. The bowmen and slingers wore no armor at all. The six tribunes were divided into sets of two. Each set commanded the legion for two months, the two tribunes alternating daily, after the odd Roman fashion, which only among them could work without destroying all idea of discipline. The four

tribunes off duty acted much as quartermasters, commissaries or aides-de-camp do in modern times. All of them served mounted. To be sure that each legion should not suffer from the divided command, a legate was put in supreme supervisory control. Later Cæsar put him in actual command, and under him the two tribunes on duty probably acted as chief of staff and adjutant general of a modern brigade. The general staff of Cæsar's army comprised:—Legates, assigned by the Senate to the consul, and deriving their authority from him. They were the general officers. Cæsar had one for each of his legions. This was the first time their duty had been made definite. Quæstors, who superintended the business of a province or of an army. The quæstor was a sort of quartermaster-general. *Contubernales* and *comites pratorii*, who were volunteer aides, or if numerous a sort of gentleman bodyguard. The *Cohors pratoria*, consisting of lictors, secretaries, marshals, spies, servants and orderlies. *Speculatores* (scouts), who acted as vanguard and flankers on the march,—each legion had ten,—and who were generally sent out to reconnoitre. We must conclude that these had placed under them such details as the immediate circumstances called for. The *Body-guard*, sometimes a small cavalry detachment, but principally *evocati*,—veterans past duty years who remained voluntarily in service. Though footmen, they had horses and servants, were highly honored, served near the general, and were put into places of trust. *Fabri*, or engineers, under a *præfectus fabrorum*, of whom mention has already been made. They were used to repair weapons, construct bridges, siege-mounds and towers, and generally do the engineering work of the army. Cæsar had some very able engineers, *antesignani*, thought by some historians to have been a select body of a few men from each cohort, for service in delicate cases requiring skill and experience. They carried no baggage, and from them were often selected the centurions. But it is not improbable that the *antesignani* were actually what their name designates; that in each maniple they formed the first two ranks, to protect the ensign, which was carried in the second rank; and that they were thus a quarter or a fifth of the entire body. Some events, as at Ilerda, lead up to this belief. The pay of Cæsar's legionaries was two hundred and twenty-five *denarii* (forty dollars) a year. This was about the pay of a day-laborer. His rations and clothing were deducted from his pay, but booty and largesses greatly increased it. . . .

"The day's march (*iter*) was reckoned from camp to camp. A day of rest was customary after every three or four marches. Each night, or whenever a stop was made, the camp was fortified. . . . The legions usually fought with their camp in their rear. If they came across the enemy on the march, they stopped, half the men fortified a camp, while the others protected them, placed the baggage in it and then fought,—provided, indeed, they could so long fend off the enemy. The ordinary day's march was from fifteen to eighteen miles, theoretically supposed to be done in five summer hours, nearly seven of ours, generally from early morning to noon, there being thus enough time left for camping. . . . The average Roman march was no greater than that of modern days. . . . A vanguard (*primum agmen*) was usual, and consisted of the bulk of the cavalry and light troops, scouts, staff-officers and camp men supported by some cohorts without baggage. The main body followed. A guard brought up the rear. The duty of the van was to attack

and hold the enemy, if met, so as to enable the main body to form; to reconnoitre the front and advance flanks; to select and stake out a camp. The cavalry Cæsar sometimes kept with the main body when he did not deem it reliable, or when one of the flanks had to be protected from danger of attack. Light troops alone were used as vanguard when the cavalry was on other duty. The rearguard (*agmen extremum*) in marches towards the enemy had no duties except to keep order at the tail of the column and pick up stragglers. . . . Out of presence of the enemy, the train of each legion accompanied it for greater convenience; in his presence, the train was kept together in one body. When moving on the enemy, the bulk—say three quarters—of the main army was in front, then the train, then the remainder as baggage and rearguard. In battle order the legions were not intended to march any distance. This order was used only in the immediate vicinity of the enemy. . . . On the march the legionary had his helmet hanging on his chest, his shield in a case, and his plumes, and other insignia of rank or corps, wrapped up. If suddenly attacked the men must lay down their baggage, prepare and put on their badges and get ready their weapons. . . . The marches in retreat were conducted on reverse principles, with similar precautions. The baggage went with the vanguard, followed by the bulk of the army; then came a strong rearguard. The marches in squares were made through an enemy's territory, or in times of insurrection, or when the enemy was on every side. Sometimes the square was composed of the whole army; sometimes each legion marched in square. On every front of such a square, cavalry, bowmen and slingers were thrown out as skirmishers. The baggage was in the centre of the one large square, or that of the legion in the centre of each legionary square. Flank marches were made in battle order, with baggage on the side opposite the enemy, or between the lines if there were more than one. Such marches were not usually made for any great distance. In the open field the legions so marching were protected by flankers. In a valley a stream might serve to protect the column. . . . Bridges were as quickly built as today. The absence of pontoon-trains was no apparent hindrance. They were built of boats picked up along the river, as often as on piles; whichever was at the moment handier. . . . Bridge-heads usually protected both ends of a bridge. . . . The soldiery was brave and well disciplined, but the Roman army was not independent of terrain. The work of the skirmishers, slingers and bowmen, of the auxiliaries, and of the veteran *antesignani* did not always chime in with that of the legions. The two kinds of infantry would sometimes clash, owing to their different formation. The cavalry was often inefficient, and had to be strengthened by bodies of light infantry placed in the intervals of the *turmæ*. This infantry, when the shock with the enemy's horse came, could inflict serious damage on it. It helped to steady the movements of the *turmæ*, while protected at the same time from being run down by the enemy's cavalry. This mixing cavalry and foot is one of the most ancient of devices. In a modified form it has survived to our day. The Roman cavalry was serviceable, but at its very best it was not cavalry, such as were Alexander's Companions or the squadrons of Seidlitz [under Frederick the Great]. The real battle was fought out by the legions. In fact, the legions could be independent of any other troops. Cavalry could attack cavalry; it could cut up broken in-

fantry; but unbroken cohorts could not be successfully attacked by cavalry except in flank. By a front attack, steady infantry could drive cavalry in every instance. During battle, cavalry was useful only against the enemy's squadrons. The cavalry and skirmishers were chiefly of use in outpost and reconnoitring duties and in pursuit. In actual battle, the cavalry was not much employed. Since Alexander's day, it will be seen, cavalry had degenerated. The cohorts were all-sufficient. When cavalry and light troops were not on hand, the legions found no difficulty in doing all the work themselves. Still they relied on the cavalry and light troops, if present, to protect their flanks while fighting. In case there was grave danger of a flank attack, especially on the right, a fourth line was more than once made by Cæsar, the duty of which it was to stand near and defend the threatened quarter. . . . [Cæsar] was his army. The whole body was instinct with his purpose. From low to high all worked on his own method. He controlled its every mood and act. He was the mainspring and balance-wheel alike. . . . The Romans were never able in the use of mounted men. Pompey's cavalry at Pharsalus was massed in one heavy body on one wing and should have gained the victory; but it was badly organized and commanded. Cæsar's small corps was employed to better advantage. Cæsar's Gallic and German horse—of which at times he had large bodies—was, in its way, efficient. Occasionally as many as four thousand men rode in one column. There had been an improvement in the Roman cavalry since the Punic Wars, principally due to the employment for that arm of the natives of countries which made a speciality of cavalry. But on the whole, Cæsar's cavalry was defective. It did not act the legitimate part of cavalry. It was often mixed with foot. Nothing in Cæsar's battles even faintly approaches the magnificent use of cavalry by Alexander or Hannibal." —T. A. Dodge, *Cæsar*, pp. 345, 352, 357-360, 370-374, 376-377, 552, 617, 749.

11. Roman army reforms under Augustus.—Restriction of privileges.—Changes in weapons.—Artillery and transport.—Increase of pay.—Decline of discipline and morale.—“From the history of the army of Julius Cæsar we have seen that it was the genius of the captain and not the personal qualities of the rank and file which won his splendid victories. When Cæsar Augustus became sole ruler of Rome, military matters were not long in being put on a new footing. The ancient army of the republic had been a burgesmilitia, and it is only necessary to recall the events of the Second Punic War to show that, rather than the ability of any one leader, it was the steadfastness of the Senate and army—for the army was the people—that saved Rome from annihilation by Hannibal. During the civil broils of Rome, professional soldiers and mercenaries had gradually crept in until they formed the bulk of the rank and file; and these had prepared the way for the standing army which was now to form a part of the equipment of the empire, in peace and war alike. Augustus went to work in a systematic way. From the forty-five legions and fifteen thousand cavalry remaining over from the civil wars, the slaves, freedmen and all of that ilk were discharged. Some one hundred and twenty thousand volunteers and veterans were settled in twenty-eight colonies on the lands in Italy donated to them. The remainder, mostly Roman citizens, were consolidated into twenty-five legions and a number of bodies of auxiliaries. These new legions and the cavalry attached to

them were quartered in permanent camps, principally on the Rhine, Danube and Euphrates, to hold head against the inroads of foreign hordes. These troops were thus removed from the temptations of too great proximity of the capital or larger cities. Auxiliaries were raised in large numbers for service in their respective provinces. For the protection of Italy there were raised ten prætorian cohorts, of one thousand men each. This was the famous body-guard of the emperor. Three of these cohorts formed the garrison of Rome; the seven others those of the principal near-by cities. The sum total of all this standing force has been estimated at three hundred thousand men. The soldier's oath had in early days been to the republic; from the time of Marius down it had been taken individually to the general who was raising legions to hold his province or to make war upon the neighboring nations; now that the emperor was the state, it ran: 'In the name of the Emperor I swear unconditionally to obey him, never to leave the ensign, nor spare my life for Emperor and State.' The term of service varied from twelve to twenty years, and every third year a careful levy was held to fill the service gaps. The excessive privileges which the soldiers had enjoyed during the civil wars and gradually claimed as a condition of military life, were restricted, and a special fund, under the emperor's sole control, was created from which to pay, clothe and ration the troops. Thus was the power of the Roman emperor as firmly grounded on the army as the power of the republic had been grounded on the burgess-soldier; and while the exceptional personal qualities of Augustus made this reorganization a benefit to Rome, the army, under later and less worthy rulers, became a curse. The ten prætorian cohorts were all drawn in to Rome by his successor, and from thence on remained there, and by their corruption and tyranny grew to be the terror of the land. . . . Though their abuses were somewhat reformed by Septimius Severus, the gulf between people and army had grown apace. The army was largely German,—the Roman Republic was fast drifting to its fall. The ancient arms and equipment of the legionary were not changed until the second century, though the use of the sword was steadily decreasing in favor of the spear. As the material of the arms-bearing class decreased, the latter weapon grew lighter. As the discipline and character of the rank and file waned, whatever intervals between cohorts were still left decreased, and in the third century, under Caracalla and Alexander Severus, an organization like the Grecian phalanx was adopted, though but temporarily. The general tendency was to make all weapons lighter, for the man himself had ceased to be the well-trained, strong and able citizen of old. The legions were no longer expected to close with the foe, and the men carried additional jactile weapons, rather than those of hand-to-hand conflict. Cavalry was still, as of old, heavy, with man and horse in armor; or light, using only darts for weapons. Artillery began to accompany the legions. This it will be remembered was no new thing. Alexander in the prime of his power had employed field artillery; in their decline the Greeks had employed it in line of battle to protect their foot. The same thing now occurred with the Romans. At first this purported to be only for use on the walls of the permanent camps. But later, in the third century, the onager or smaller ballista was transported on a two-ox cart, and the hand-ballista on a one-horse wagon. Each was served by eleven men. They could cast stones and darts three to four hundred paces. They

were placed in line of battle, between the legions, to save these from too sudden or close contact with the enemy. Elephants again appeared, and trained wild beasts and dogs were occasionally used against the enemy. These artificial aids exhibit the declining value of the legions. The strength of the legions grew to be somewhat greater, at the normal from six to seven thousand men. Armies rarely numbered more than eight or ten legions. Flags replaced other ensigns, sometimes cut into dragon-shape; and the bust or likeness of the emperor took the place of the eagle. To the old military horns was added a peculiar flute. A number of changes, owing largely to the new enemies encountered as well as the less good material of the legions, gradually took place. . . . Trajan introduced still another system. The ten cohorts of the legion were placed in one line. The first had nine hundred and sixty chosen men in ten centuries and two hundred and forty cavalry. The others had four hundred and eighty men in six centuries. Arrian says the men stood in eight, Vegetius in six ranks. The front ranks were of the heavier and older legionaries; the rear ranks of the younger and lighter. Each man occupied three feet in width, and the ranks were six feet apart from back to breast. Light troops stood behind the legionaries. The cohorts stood in order from one to ten with very small, next to no, intervals, and these were filled by horizontal-fire engines. Behind the line were engines of high trajectory which could fire above the line. Behind the flanks were special troops, such as the prætorians, and cavalry and bowmen were on the flanks. This formation had its advantages against barbarian nations, such as the Dacians, Parthians and Germans. It suited either the offensive or defensive, any kind of ground, and could be used against cavalry or infantry. It had certain features of the old class ordering of the legion. . . . Josephus narrates how Vespasian and Titus disposed their armies. In the former's march from Syria to Galilee in 67 A. D., the column was as follows: the light troops (bowmen and slingers) sustained by a small body of heavy foot and some horsemen, in the van; following them the mechanics (*fabri*) like our pioneers, to repair bridges and roads; then the officers' baggage with cavalry, the emperor and staff, the military engines; then the bulk of the army,—the legions in a column of sixes; next the army-train. Last came the mercenaries, mixed with legionaries and cavalry to steady them. Up to the third century the Roman armies marched rapidly; the speed and distances then decreased markedly, owing in part to the less good material, in part to the greater amount of baggage and enginery. . . . The farther the Roman army grew away from its old self-reliance the more it was sought to supplement this by enginery and defensive tactics of various useless sorts. The assault with naked weapon was now rarely seen. Distance weapons were preferred. Instead of the Roman soldier being more than a match for the barbarian so soon as he closed with his man, the reverse was now the case. The bulky German could laugh in earnest at the Roman legionary. Under able emperors this was not so apparent; but before the end of the third century the old-fashioned Roman organization, bravery and reliability had vanished, as had happened in Greece five hundred years before. In the same measure as the evidences of the ancient Roman gallantry in war, there disappeared from the legions the sense of discipline, order and good conduct. Cæsar Augustus had somewhat reëstablished the old Roman military virtues; but it was only for a time. The pay of the troops arose as their value

decreased, and largesses became enormous. Under Domitian the foot soldier is said to have received four gold pieces (about twelve dollars) a month, the centurion eight, the mounted man or praetorian twelve; and the deductions for arms, equipment and rations were given up. . . . Occasionally a vigorous emperor or an energetic general improved these conditions, but only during his period of control. The tendency was downward. Augustus had brought back military gymnastics and drill; and under Vespasian, Titus and Antoninus these were encouraged; but in the third century they again disappeared. The drill-marches which Augustus compelled the legions to make three times a month, with baggage—sometimes doubled—and over all kinds of country, were forgotten; the army manœuvres which were then conducted on as large a scale as to-day [1892] in Germany or France became onerous and were dropped; and the splendid public works, especially military roads, were no longer built. The troops mutinied against such labors. So far as military science and study were concerned, they were less practical and more pedantic. Though the empire produced numberless writers on military matters, there were none to approach Polybius or Cæsar. They admirably wrote up details, but they failed to give the soul of the matter.”—T. A. Dodge, *Cæsar*, pp. 768-775. —“Augustus from the very beginning of his power did his best to reduce the military element in the state. During the civil wars, and indeed for fifty years before they began, the troops had made and unmade consuls, there had been constant mutinies and blackmail in the army. Cæsar’s own first consulship had been obtained in this way. A centurion had marched into the senate-house and cried, ‘If you will not make him consul, *this*’—and he tapped the hilt of his sword—‘*this shall*.’ But now the older discipline was revived. Agrippa in particular was a stern disciplinarian of the old school. The soldiers were flattered no longer. No more legionary coins were issued. For an honour a legion was allowed to call itself *Augusta*, for a punishment the title was revoked. The highest military distinction, the triumph, was gradually reserved for the princeps and the members of his house alone. Even when the title of *Imperator* was earned by a victorious general it was transferred to him. But it was his aim to see that no private citizen should have the opportunity of securing the high military honours. Agrippa might have been dangerous and accordingly he was brought into the family by marriage with Cæsar’s daughter. But for the rest the conduct of important operations was almost always confided to one of the young princes—to Tiberius, or Drusus, or Germanicus. And they were always victorious. When Quintilius Varus, a general of humbler birth, was allowed to lead a great army he conveniently pointed the moral by a signal failure. No senatorial governor might now levy troops or declare war on his own account. The only hand that the senate still had in military affairs was that a ‘*senatus consultum*’ was generally asked for a new levy of troops. This was probably because it concerned the state treasury, but partly also because it served to shift an unpleasant responsibility off the shoulders of the princeps. It is not likely that Augustus had forgone the right to levy. It still remained the legal duty of every Roman citizen to serve in the army. But since the days of Marius that duty had become obsolete, no one wanted the city riff-raff in the legions. Soldiering had become a profession, and there was never now any general levy of the kind involved in modern conscription. There must have been some com-

pulsion upon the upper classes to serve as officers, for Suetonius tells of a Roman knight who was sold into slavery because he had chopped off his son’s thumbs in order to evade military service. There had been a ‘*City Legion*’ fighting at Actium, but the army was now mainly recruited from Italy and the imperial provinces. Allied princes like Herod the Great had their own militias, but were also liable to be asked for contributions of trained auxiliaries to the imperial army. From the provinces troops were demanded in proportion to their warlike activity. The Dutch horsemen were famous, and the Batavians supplied large contributions of cavalry. The only people in the East who were enrolled in the legions were the Galatians, who were, of course, Gauls by ancestry. Augustus himself had a bodyguard of German slaves. As a rule only freemen were enrolled in the legions, but at the crisis of the great Pannonian and German revolts, the duty was laid upon rich citizens of equipping and maintaining for six months a certain number of freedmen and slaves who were promised their liberty and citizenship at the end of six months. These would probably consist very largely of gladiators. This fact is evidence of serious military weakness in the Roman Empire. Although there were over four million full Roman citizens, there were only about 140,000 men in the ranks of the legions, and as there was a very long period of service, twenty-five years and more, it follows that only a small number of recruits would be wanted every year. It seems a dangerously small army to hold such vast frontiers. Augustus was successful in reducing the enormous rate of pay which had prevailed during the civil wars. After the death of Augustus the troops mutinied and demanded an increase of their pay to a denarius (less than a franc) a day. Augustus established a special military chest to provide pensions for his veterans in place of the farms which they were still accustomed to expect. How greatly—how dangerously—Augustus had reduced the size of the army may be seen from the fact that there were at least fifty legions during the civil wars, and only twenty-five at the death of Augustus. These troops were for the most part stationed along the northern and eastern frontiers. . . . To these must be added the 9000 men of the praetorian guard, who enjoyed shorter service (sixteen years) and double pay. The praetorians had to be genuine Italians, and when inside the walls of Rome wore civilian dress. There were also three ‘*urban cohorts*’ as police—a new and most salutary invention—and a ‘*cohort of watchmen*’ for the prevention of fire. Obviously with a service of twenty-five years there could be no reserve. But some of the veterans of the praetorian guard were used as paymasters or engineers. There were also colonies of time-expired soldiers planted as garrisons in dangerous country. The legions themselves were stationed in great fortified camps along the frontiers of their various provinces. There were thus huge spaces of country totally without military forces. For warfare on the shores of the Black Sea troops had to be summoned from Syria. There was no such thing as a readily mobilised striking force in Italy. This was an inconvenience and a danger, but Augustus did not mean to organise a military monarchy. Professor Gardhausen has a clever comparison of the problems before the Roman army with those that face the British Empire. The problems were remarkably similar, for greater speed of transport counteracts the greater distances. Both peoples made great use of the system of drilling native troops and expecting provinces to guard themselves. But the

Romans would have been saved much trouble if they had been able to adopt our [British] system of a compact and highly trained expeditionary force backed by a citizen army for home defence. To be sure, the Romans now lived in a state of peace far more profound than any that the world has enjoyed before or since. Their wars were of their own making. Within the circle of the armed frontiers Pax Romana reigned supreme. The Roman citizens hung up their swords for ever."—J. C. Stobart, *Grandeur that was Rome*, pp 183-186.—See also PALATINI; *ROME: Empire*: 363-379.

12. Introduction.—Origin of modern armies.—Conflicting theories.—The history of modern armies and navies has its roots in the most distant past, but a continuous development of the military institutions of the present cannot be traced back beyond the latter part of the Middle Ages. Naturally, the military history of all peoples is not equally interesting even to the most careful student and it seems best to focus the attention of the non-technical and non-military reader upon the evolution of the modern military establishments in the leading nations, such as France, Germany, Great Britain and the United States, with some slight description of the Belgian, Chinese, Italian, Japanese, Russian, Swiss, Turkish and sundry other military organizations. The armies of the smaller states are nearly all more or less modeled upon those of the larger nations, with certain modifications. It is not easily possible to fix the precise date of the appearance of the first modern army. Some would unhesitatingly begin with the wars of the French Revolution and the Napoleonic era. According to some authorities, the first standing army of modern times was that maintained by Charles VII of France in 1445. Long before that, however, between 872 and 901 A.D. King Alfred of England formed a militia raised by conscription, while a 'commission of array' authorized the raising of a militia under Henry I in 1122 and again under Henry II in 1176, also in England. Others would prefer to begin with Frederick the Great in the middle of the eighteenth century. Still other historians have referred to the army of Louis XIV, as organized by the great war minister Louvois, as the first modern standing army; while to the Swedish army of Gustavus Adolphus in the Thirty Years' War has been assigned this same honor. In the account which follows no attempt is made to settle this question which is still debated by the expert military historians, but rather to indicate the leading steps in military development as they apply to army organization and equipment from the Middle Ages to the World War.

Historical material relating to Ordnance, Trench Warfare, Grenades, Liquid Fire, Poison Gas, Rifles and Revolvers, Tanks, Machine Guns, Aviation, Warships, Submarines, Torpedoes, Feudalism, Long-bow, etc., will be found under their respective heads; while military history proper must be looked for under the countries principally involved. The Napoleonic campaigns, for example, will be treated for the most part under France; the Peninsular War, however, will appear under Spain, and the Russian campaign of 1812 under Russia. The World War for obvious reasons is dealt with separately and under its own title.

13. Transition from Roman to medieval institutions.—Evolution of military efficiency.—Teutonic barbarians.—Hundred Years' War.—Swiss mercenaries.—Bravery of knights.—"When we leave the discussion of the military art of the later Romans, and pass on to investigate that of the Teutonic kingdoms which were built upon the ruins of the Western Empire, we are

stepping from a region of comparative light into one of doubt and obscurity. . . . We can for some centuries do little more than give the history of military institutions, arms, and armour, with an occasional side-light on tactics. Often the contemporary chronicles will be of less use to us than stray notices in national codes or songs, the quaint drawings of illuminated manuscripts, or the mouldering fragments found in the warrior's barrow. It is fortunate that the general characteristics of the period render its military history very simple. By the sixth century the last survivals of Roman military skill had disappeared in the West. No traces remained of it but the clumsily-patched walls of the great cities. Of strategy there could be little in an age when men strove to win their ends by hard fighting rather than by skilful operations or the utilising of extraneous advantages. Tactics were stereotyped by the national organisations of the various peoples. The true interest of the centuries of the early Middle Ages lies in the gradual evolution of new forms of military efficiency, which end in the establishment of a military caste as the chief power in war, and in the decay among most races of the old system which made the tribe arrayed in arms the normal fighting force. Intimately connected with this change was an alteration in arms and equipment, which transformed the outward appearance of war in a manner not less complete. The period of transition may be considered to end in the eleventh century, when the feudal knight had established his superiority over all descriptions of troops pitted against him, from the Magyar horse-bowmen of the East to the Danish axemen of the North. The fight of Hastings [1066], the last notable attempt of unaided infantry to withstand cavalry in Western Europe for two hundred years, serves to mark the termination of the epoch.

"The Teutonic kingdoms which were founded in the fifth century within the limits of the Western Empire were some of them established by races accustomed to fight on horseback, some by races accustomed to fight on foot. All the tribes which had their original habitat in the plains beyond the Danube and north of the Euxine seem to have learned horsemanship; such were the Goths, both Eastern and Western, the Lombards, Gepidae, and Heruli. The races, on the other hand, which had started from the marshes of the Lower Rhine or the moors of North Germany and Scandinavia were essentially foot-soldiers; the Franks, Saxons, Angles, and Northmen were none of them accustomed to fight on horseback. The sharp division between these two groups of peoples is all the more curious because many tribes in each group had been in close contact with the Romans for several centuries, and it might have been expected that all would have learned a similar lesson from the empire. Such, however, was not the case: the Franks of the fifth century, though their ancestors the Chamavi and Chatti had been for four hundred years serving the Romans as auxiliaries when they were not fighting them as enemies, seem singularly uninfluenced by their mighty neighbours; while the Goths under similar conditions had profoundly modified their armament and customs. In the days of the breaking-up of the Western Empire the Franks seem no more advanced than races like the Saxons and Angles, whose relations with Rome had begun late and continued comparatively slight. To a certain extent this must have come from the fact that the emperors had been wont to encourage each band of auxiliaries to keep to its own national arms and equipment. In the fourth and fifth centuries, as Mommsen observes, each Teutonic corps of mer-

MEDIEVAL SIEGE OPERATIONS

(From an old lithograph)

cenaries seems to have been valued more, in proportion as it had assimilated itself less to the Roman model. In spite of this, it is astonishing to find the Franks of Chlodovech still destitute of all body armour and wholly unaccustomed to fight on horseback. . . . Evidently the Roman teaching had taken no hold on the bulk of the race, and its methods of fighting had remained unaltered."—C. Oman, *History of the art of war*, pp. 41-42.—See also *COMITATUS*; *FRANKS*: 500-708.—"The king, like all the other princes, for the purpose of making war took into his service companies of adventurers; he gave them money (*solde*), and from that they were called soldiers. Each captain recruited and commanded his band, but the king sent into the garrisons commissioners charged with making the companies show themselves, and who had orders to pay the captain only after the review. With these bands, and the knights who had come as volunteers, the kings carried on the Hundred Years' War. Into these bands, at first composed solely of gendarmes, that is, men fully accoutred (with lance and iron armor), were gradually introduced men wearing a jacket of cloth and armed with bow, cross-bow, or knife. Towards the end of the Hundred Years' War it was the custom that each man armed as a knight should take with him three or four of these lightly armed horsemen; the gendarme and his companions were called 'une lance garnie.' Charles VII. forbade any one except the king to have these armed men in his pay; he alone was to have soldiers. Then from among the bands, at that time filling all France, he took 1,500 lances, which were organized into fifteen companies of 100 lances each, and he sent them to garrison the towns which he designated. All the other adventurers were to disperse; those who continued to make war on their own account were to be hung as brigands. From that time only the king had the right to keep soldiers. His army was chiefly composed of cavalry: the artillery and the foot-soldiers were united under the grand master of the cross-bowmen. When the king had need of infantry he took into his pay companies of Swiss armed with long pikes, Genoese cross-bowmen, Gascons, and later bands of lansquenets (German foot-soldiers). For a century there were hardly any Frenchmen except in the cavalry; almost all the foot soldiers were foreigners. The attempts to form a corps of French francs-archers (tax-free archers) did not succeed; those francs-archers were not soldiers by profession and did not know how to drill. But the king was not afraid to employ foreigners; the army paid by him obeyed him only."—C. Seignobos, *History of mediæval and of modern civilization*, pp. 183-184.—"During the crusades the Christians had made the acquaintance of the cross-bow; this was a bow mounted on a stock and stretched by means of a spring or small crank. It threw a short arrow with sufficient force to pierce through a man at two hundred paces. The cross-bow was used in the châteaux and castles for defence against attack, and there were formed, especially in Italy, bands of cross-bowmen by profession who put themselves in the service of the princes. The most renowned were the Genoese cross-bowmen. The bow, which has never entirely ceased to be used, was not, for a long time, considered very formidable. But in the fourteenth century there appeared in the army of the King of England regular troops of archers with large bows of yew, two metres high, which could shoot six times a minute and kill a man at two hundred metres' distance; the most famous archers were from Wales. Cross-bowmen and archers fought on foot and without iron armour. None of them were

noble, the larger number were adventurers, mercenaries (like the Genoese); the English archers were peasants, farmers or small land-owners. The king had ordered them to practice archery and summoned them to fight. The peasants in the mountains around Lake Lucerne, especially those of the Canton Schwitz, were in the last years of the thirteenth century, well known for their agility and vigor. They became celebrated in the fourteenth century when they had several times surprised and massacred the Austrian knights who had come to subjugate them; the name of Swiss was then given to all their allies. At the end of the fourteenth century the Swiss confederates carried a pike much longer than the lance of the knights; they fought on foot, in closed column, rushing upon the enemy with their lances six metres in length without breaking their ranks. After their victories over the Duke of Burgundy they passed for the best troops in Europe, and all the princes wanted to have them in their pay. About the same time the lansquenets (*landsknecht*, a country knave) began to be spoken of in Germany. They too carried the long pike which defended them better than an armor. They were united in bands, chose a captain and swore obedience to him. Each band took along with it women, children and carts to transport the baggage and booty; it had its own flag, and formed a small society. When the lansquenet committed a crime it was the band which sat in judgment; and if he was condemned it executed him by making him pass between the rows of pikes. When the lansquenet wanted to be married he led his wife into the 'circle of his companions.' It was the band assembled around the flag which decided what prince they should serve. For the adventurers, Swiss or lansquenets, war was a profession; they would not fight except for money; 'No money, no Swiss.' But they fought well, and earned their wages faithfully. Often the prince made them wait some years for their pay and did not even support them. At such times the band lived by pillaging the country. During the early centuries of the Middle Ages there were no soldiers but the knights. Then the cities sent their armed citizens to war. They fought on foot and were called sergeants. These artisans, badly drilled and disciplined, equipped each in his own fashion, were nothing but a militia. The soldiers by profession were always knights, and it was not admitted that a man-at-arms could fight in any other way but on horseback. The cavalry alone really formed the army. However, from the fourteenth century, every time that these knights came in collision with the foot-soldiers, who were regularly organized, it was the knights who were beaten; beaten by the English archers (even by inferior numbers) at Crécy, at Poitiers and at Agincourt; beaten by the Swiss at Morgarten, Sempach, Granson, Moret; beaten by the janizaries at Nicopolis and Varna; beaten by the bourgeois at Ghent and Bruges. We are ready to believe that the knights gave way only before bullets and balls. But two centuries before artillery had become formidable the English with the bow, the janizaries with the yataghan, and the Swiss with the pike, were quite sufficient to conquer the knights. The men of that time could not comprehend how the foot-soldiers could be triumphant over that brilliant corps of knights formed of the most noble, the most courageous and the most experienced men. However, nothing is more easy of explanation. The knights taken separately were very brave soldiers, but they made a detestable army. In covering themselves with an armor that was strong enough to save them from the risk of

being killed, each one had thought only of protecting himself. The armor did indeed prevent them from being killed, but it did not prevent them from being dismounted, and in a battle a man on the ground under his horse was little better than a dead man. The knights were equipped as if they were to fight alone; that is precisely the reason why they manoeuvred so poorly when all together. Each was in the way of his neighbor. These heavy masses required a level and firm ground for their manoeuvres to take a start; a ditch, a hill, a marsh stopped them, and the moment they were crowded together they could neither advance nor retreat. In order to operate in common, discipline also failed them. Accustomed to fight in small bands, they did not know how to organize themselves into an army. Every seignior coming with his knights intended to fight according to his fancy. The general could not command obedience. At Crécy the archers in the service of the King of France were at the head of the army, the knights eager for the fray rushed upon and massacred them, 'Now come, kill those ribald fellows who bar our way.' Already so weak through their unmanageable equipment and lack of discipline, the knights staked their honor in operating in a most disadvantageous fashion. Having played at war in their tournaments they had become accustomed to the rules of the game, and continued to observe them in war. A battle was an opportunity for giving some fine blows with the lance, and they insisted on giving them according to the rules in fighting, as if in the closed field against an enemy, who had been warned and was at least equal in numbers. In 1346 the King of England, finding himself at Poissy, deprived of supplies and on the point of being taken, Philip IV. drew himself out of this embarrassing situation by sending in a cartel in due form, proposing that he should choose the day and a place for the battle; Edward profited by this opportunity and decamped. The Knights of the Star had sworn never to retreat more than four arpents (this was the space needed for room to move). Gui de Nesle, surprised with his hundred knights, allowed his whole troop to be massacred rather than to retreat. Thus the bravery of the knights was turned against them. They had forgotten that war is a business, not a game, and that bravery is only a factor, for the purpose is to conquer."—*Ibid.*, pp. 190-204.—See also below: 15; CHIVALRY; CRUSADES: Military aspect; FEUDALISM.

14. Saracen armies.—Military science.—Conquest and plunder.—"To deal with the Saracen, the most formidable enemy of the empire, the greatest care and skill were required. 'Of all barbarous nations,' says Leo [Emperor of the East, 717-740], 'they are the best advised and most prudent in their military operations.' The commander who has to meet with them will need all his tactical and strategical ability, the troops must be well disciplined and courageous, if the 'barbarous and blaspheming Saracen' is to be driven back in rout through the 'clissuras' of Taurus. The Arabs whom Khaled and Amru had led in the seventh century to the conquest of Syria and Egypt had owed their victory neither to the superiority of their arms nor to the excellence of their organisation. The fanatical courage of the fatalist had enabled them to face better-armed and better-disciplined troops, as it nerved the Soudanese ten years ago to face the breachloaders of our own [British] infantry. We . . . cannot wonder that the troops of Heraclius, armed only with pike and sword, were swept away before the wild hordes of the early Caliphs. It is greatly to the credit of the East-Roman troops and the house of Heraclius that Asia Minor

did not suffer the same fate as Persia and Spain. But when the first flush of fanaticism had passed by, and the Saracens had settled down in their new homes, they did not disdain to learn a lesson from the nations they had defeated. Accordingly, the Byzantine army served as a model for the forces of the Caliphs. 'They have copied the Romans,' says Leo, 'in most of their military practices, both in arms and in strategy.' Like the Imperial generals, they placed their confidence in their mailed lancers: they were no longer the naked hordes of the sixth century, but wore helms, shirts of chain-mail, and greaves. But the Saracen and his charger were alike at a disadvantage in the onset: horse for horse and man for man the Byzantines were heavier, and could ride the Orientals down when the final shock came. By the tenth century the Saracens had an art of war of their own. Some of their military works have survived, though none, it appears, date back to the times contemporary with Leo. They had advanced very considerably in poliorcetics [besieging] and fortification; they had learned how to lay out and entrench their camps, and how to place pickets and vedettes. But they never raised a large standing army, or fully learned the merits of drill and organisation. The royal bodyguards were their only regular troops; the rest of the army consisted of the war-bands of chiefs, miscellaneous bands of mercenary adventurers, or the general levies of tribes and districts. Two things rendered the Saracens of the tenth century dangerous foes,—their numbers and their extraordinary powers of locomotion. When an inroad into Asia Minor was on foot, the powers of fanaticism and greed united to draw together every unquiet spirit from Egypt to Khorassan. The wild horsemen of the East poured out in myriads from the gates of Tarsus and Adana to harry the rich uplands of the Anatolic, Armeniac, and Cappadocian themes [Byzantine administrative districts]. 'They are no regular host, but a mixed multitude of volunteers; the rich man serves from pride of race, the poor man from hope of plunder. They say that God, "who scattereth the armies of those that delight in war," is pleased by their expeditions, and has promised victory to them. Those who stay at home, both men and women, aid in arming their poorer neighbours, and think that they are performing a good work thereby. So mere untrained plunderers and experienced warriors ride side by side in their hosts.' Once clear of the passes of Taurus, the great horde of Saracen horsemen cut itself loose from its communications, and rode far and wide through Cappadocia and Phrygia, burning the open towns, harrying the countryside, and lading their beasts of burden with the plunder of a region which was in those days one of the richest in the world. It was only exceptionally that the invaders were aiming at serious conquests and halted to besiege a fortified town. The memory of the awful failures of the two great hosts that perished before Constantinople in 673 and 718 seems to have been deeply impressed in the minds of the Mohammedan rulers and generals. The two last attempts at getting a footing beyond the Taurus were those of Haroun-al-Raschid in 806, and of Al-Motassem in 838. Each, after taking one considerable town, found such a long and difficult task before him that he gave up his project and retired. The armies of their successors, even when counted by scores of thousands, were aiming at nothing more than vast plundering raids. When the Saracens had passed the defiles of Taurus, they pushed on for some days at an almost incredible speed, for their baggage was all laid on camels or sumpter beasts, and their foot-soldiery were either provided with horses of some

sort or taken up on the cruppers of the cavalry. They made for the district that they had marked out for plunder, and trusted to arrive in such haste that the natives would not have had time to gather in their property and take shelter within

for business or pleasure; the heyday of chivalry was the period during which cavalry was in the ascendant [see CHIVALRY], and its decline was chiefly due to that development of the art of war which gave the issue of battles to infantry and

walled towns."—C. W. Oman, *History of the art of war in the Middle Ages*, pp. 206-208.

15. Chivalry.—Cavalry versus infantry.—Knights in armor.—Crusaders.—Condottieri.—Seutage.—Feudalism.—Mercenaries.—“Warfare was the principal occupation of the knight, whether

artillery rather than cavalry, and made the conduct of campaigns and sieges a matter of calculation rather than of personal prowess. It is therefore necessary to give a short sketch of military history during the chivalric period, *i.e.* from the 10th to the 15th or 16th century. The cavalry period,

however, dates from a time far anterior to chivalry. . . . At Adrianople [A.D. 378] the imperial infantry, no longer able, by the use of superior armour, discipline, and individual skill and courage, to keep the Gothic cavalry at a distance, but driven in upon itself and huddled together in a helpless mass, was destroyed by the Gothic cavalry breaking in upon its flank. Where cavalry can be brought into the field in sufficient numbers, and the opposing infantry are not well provided with archers, slingers or javelin men, they can ride infantry down, unless, as in the Macedonian or the Swiss phalanx, the front of pikes is too deep to be broken through. But cavalry is useful for attack, not for defence. 'The horse,' it has been said, 'is the weapon;' the impact of a mass of men and horses at full speed is what tells. Wounded horses encumber and endanger a defensive position. The main use of cavalry, then, is not to hold but to gain a position; and when infantry have to resist cavalry, it must be done by the employment of archery (or musketry) to weaken the attack whilst it is being delivered, and before it can be driven home. A modern instance of the weakness of cavalry for defence is that of the Russian horse at Balaklava [Crimean War, 1854], which broke up under the charge of the English heavy brigade. The lesson of mediæval warfare, learnt and forgotten on innumerable fields, was the right use of archers and infantry against cavalry, but the feudal pride of the man-at-arms was proof against conviction until horse and foot bowed before the power of artillery. [See FEUDALISM: Organization.] The Franks who overran the Gaulish provinces fought on foot, armed with spear, sword, and battle axe, the formidable *francisca* or tomahawk, more effective when thrown than at close quarters. By degrees the Franks adopted the use of the horse and of body-armour. The shirt of mail (*brunia*, the A.S. *byrnie*) was worn by all cavalry from the 6th century onward, and the Franks became more and more a nation of horsemen. [See also FRANKS: 500-768.] But at Poitiers (732) the old tactics prevailed, and the Moslem light horse were met and routed, not by counter charges of cavalry, but by a solid phalanx of infantry and dismounted cavalry, built up 'like a wall, or as if frozen together into a belt of ice;' dismounted cavalry standing by the side of the infantry. The Danish raiders, arriving suddenly and departing as suddenly, taught the menaced nation how little trust was to be placed in national levies, ill armed, undisciplined, slow to muster, and soon dispersed. [See also SCANDINAVIAN STATES: 8th-9th centuries.] Before the English Ealdorman could get the men of the shire together, or the Frankish lord collect his dependants, the Dane had come up the river, beached his keels, seized all the horses in the neighbourhood, burnt villages, manors and abbeys, and was gone again with his plunder and his captives. The Danes, when they had advanced from raiding to the maintenance of dyked and stockaded forts, and from forts to settlements in tracts of land, being the best soldiers of their time, and having an unusual aptitude for the adoption of new ideas, beat the Franks at their own weapons. To meet the Frankish cavalry, the Scandinavian settlers in Gaul learnt to fight on horseback; and by the beginning of the 11th century the Norman cavalry was the best in Europe. [See FEUDALISM: Continental growth.] The English made little use of cavalry before the Conquest. The 'hard hand-play' of Ashdown (871) Ethandun (878) and Brunanburh (937) was a combat of axes and short swords (*seaxe*) hewing down the shield-wall, behind which stood the chiefs, dismounted. The

same simple tactics were followed at Stamford Bridge and Hastings (1066), where Harold and Gurth fought on foot. Whilst the shield-wall formation, whether in line, ring, or triangle, remained unbroken, the cavalry were at a disadvantage; for the horse will not easily face a double or triple hedge of pikes; the squares at Waterloo [1815] are a modern instance. If the cavalry could force an entrance, as at Stamford Bridge and at Hastings, the infantry were at their mercy. The varieties of battles are infinite; in some the infantry largely outnumber the cavalry, in some the proportion is reversed; some are combats of cavalry alone, in others archers and slingers decide the day. Horse prevailed over foot in the cavalry period, because that arm was highly organised, and generals gave little attention to the handling of infantry; the importance of infantry was increased with the development of archery. [See LONGBOW.] . . . Mediæval warfare thus organized itself as cavalry; and battles were mainly decided by charges of knights in mail slaughtering hosts of infantry; or were contests of cavalry alone, whether in the field or in the streets of a town. The battle of Bouvines [1214], was 'a huge scramble and scuffle of men and horses'; 'a vast tourney,' diversified like a Homeric fight by 'an infinite number of single combats.' The battle of Val ès Dunes (1047) was 'little more than a fierce combat of horse surging backwards and forwards over the slopes of the upland on which it was fought.' In fact, the description of a mediæval battle is the description of feats of arms done by the captains. A battle was a tournament on a grander and more dangerous scale, in which, besides the chance of death and wounds, the knight ran the risk of being butchered by the 'ribauds' [low retainers] who despatched the wounded after the mailed cavalry had swept by, or thrown into a dungeon where rats and mice (as Du Guesclin said) were more plentiful than song-birds. . . . We pause for a moment to consider what a magnificent military engine, within its limits, the mounted knight or man-at-arms must have been. None but the heaviest horses could carry riders weighted from head to foot with chain armour, and bearing shield, lance, sword, and sometimes axe and mace. Such a horse and man weighed many hundreds of pounds, and the shock of a body of them charging together was irresistible. When arrived at close quarters, the knight was a skilled fighter, trained all his life in horsemanship and the use of arms. He was one of an exclusive class, raised above all others; he was animated, within his own class, by a spirit of the keenest personal rivalry; love and war combined to exalt his courage; and he was often the servant of God fighting the battle of the Cross against the infidel, and confident of salvation if he fell. Although throughout the Middle Ages there was no school of military science, contact with the East was not without its effect upon the art of war. In military organization, as in all the arts of life, the Byzantines of the 11th century were far ahead of the Western nations. [See TURKEY: 1063-1073.] They had preserved the Roman tradition of castrametation; they had siege trains, and even ambulances and surgeons; they arranged their forces in battle so as to support and assist each other; and the whole art of building, attacking and defending castles was brought back from the East into Europe, where as yet it hardly existed. The Crusades provided a new school of war. The soldiers of the Cross had everything to learn. Effective discipline was almost unknown among them; combination of forces in subordination to a general in chief, and support of one arm by another, if dreamed of by a few cap-

tains, were liable to be disconcerted by any obstinate or hot-headed lord of a few hundred men-at-arms. Mediæval nobles were as jealous of each other, and as unwilling to obey a common leader, as the Grecian chiefs who fought against Xerxes. They were as quarrelsome as dogs, as impracticable as field-deputies, as punctilious as ambassadors. The Templars would fight nowhere but on the right wing, and in like manner the Knights of Saint John claimed the left. A count disdained to serve under a baron, a duke under a count, a German under a Frenchman or Englishman. The Flemish knights at Bouvines refused to charge a body of infantry because they were not gentlemen, and so lost the battle. The memoirs of Villehardouin and Joinville, as well as those of Froissart and Monstrelet, are full of the records of the pride and ill-temper which endangered the greatest objects of the campaigns they describe. The want of discipline, as well as the short term of feudal service in the field, led to the gradual substitution of paid troops for cavalry in all the armies of Europe. When to this indiscipline we add a total ignorance of geographical knowledge, (the sole cause of the double failure of Lewis IX), defective commissariat and means of transport, ignorant contempt of strategy and inexperience in siege operations, we wonder that the Crusaders should have prevailed at all. The lesson to be learnt from the Crusades was that to win battles it was necessary to combine infantry and cavalry in the line of battle, and to support both, by a strong force of archers, on foot or on horseback. [See also CRUSADES: Military aspect.] But lessons of victory and defeat alike seem to have been lost on the mediæval generals. They came back from the Holy Land for the most part as ignorant as they went. Only two, Richard I and Edward I, both men of great military ability, seem to have profited by their experience as Crusaders; and each of them showed his ability by applying his experience to new conditions. . . . With the end of the French wars of Edward III we come upon an unexpected obstacle in the way of the English conquests. Just as the French were improving body-armour so as to be able to repel the English arrows, the supply of English archery began to run short. Such a supply could only be found in perfection in a national levy; and the place of the levy was beginning to be taken by mercenary troops, either 'free companies,' or troops furnished by 'indenture,' *i. e.*, contract: a form of military taxation more convenient to the king and less burdensome to the subject than the personal levy. The battles of the Wars of the Roses were fought by infantry; some of whom were raised by royal commission or parliamentary vote, some hired, some came as retainers of the great lords; and 'villainous saltpetre' at last put an end to the superiority of the 'gentle' class. The short and uncertain service of feudal barons suited neither the immediate convenience of a king of France or England, nor the establishment of his power. The great wars of the fourteenth century created a class of soldiers ready to sell their services to any cause. But before this, sovereigns in all countries had been aware of the convenience and advantage of mercenaries. Henry II struck a blow at feudalism by accepting scutage [tax or levy] in lieu of service. Philip the Fair had a considerable standing army in his pay. Whilst declaring the universal obligation of military service, he accepted money and substitutes in lieu of personal attendance. The king's *ost*, furnished in part by feudal vassals subject to the *ban*, was also made up by paid bodies of infantry, crossbowmen and men-at-arms, or *gendarmes*, the latter denoting, not the

chivalry of France, but light and heavy cavalry armed in the same manner as the knights, and serving for fixed pay. (Note.—Each *gendarme* was attended by two archers and two horsemen. This complement of five men—later seven—was known as a *lance* or a *man-at-arms*, and this nomenclature was applied to the chivalry also.) Charles VII had a force of 1500 *gendarmes*, each of whom served with six horses. Louis XI employed mercenaries from all countries, and from his time the place of the seigniorial levies is taken by a royal army. *Compagnies d'ordonnance*, Free Companies, *Landsknechts*, are so many names for armies to be bought in the market. The contractor, commonly known in Italy by the name of *condottiere* (q. v.) made war his trade and managed it on business principles. His men were well clothed, armed, and fed, and received regular pay. They were trained in all the latest developments of war, and could meet the old-fashioned chivalry on their own ground and bewilder them with new inventions in archery, artillery, and infantry. No warlike sovereign could dispense with the Free Companies. They took the place held by the Templars and Hospitaliers in the Holy Wars, and like them were preferred to the feudal levies as being better troops and more obedient to orders. But what a downfall in sentiment! At the siege of Padua (1509) Bayard refused to let the gentlemen of France fight side by side with Landsknechts, who had no distinction of birth, no rule of honour, no patriotism, no principle except to fulfil the terms of a bargain, no idea of pleasure except the excitement of a fight and the license of free quarters, or the sack of a town. Hallam instances one of these mercenaries who marched about Italy without a master to pay him or a cause to defend, levying black-mail wherever he went. Werner, a German Landsknecht, had engraved on his cuirass 'Enemy of God, pity and mercy.' The 'Great Company' of 1353 consisted of 20,000 men, horse and foot, whose only business was to plunder; and the city of Florence, which refused to submit to their exactions, could only meet them with hired troops like themselves. Sir John Hawkwood (d. 1393) whose monument adorns the Cathedral of Florence, was one of the most eminent as well as the most respectable of these soldiers of fortune, whose dreary track of bloodshed and devastation seared the face of Europe, till they came to their worst notoriety under Mansfeld, Wallenstein, and Tilly in the Thirty Years' War. The actual profession of *condottiere* was too unnatural to be permanent; but the ill example of buying trained soldiers, instead of bearing arms, fell in with the convenience of princes and subjects, systematised, and at the same time dishonoured war, and put an end to chivalry as a factor in military affairs. In chivalry, any knight might serve under what captain he chose and do what deeds he chose—now he must take his chance, as we should say, with his regiment, and 'not run risks'—a *bourgeois* conception of war. . . . The knight of the Middle Ages spent a good part of his time in fighting the battles of his lord, whether in the larger operations of war, or in the petty disputes between castle and castle. The more perfectly the feudal system was developed, or (in other words) the greater the number of independent or nearly independent princes, the more licence was there of private war. Thus there was more private war in Germany than in France, in France than in Italy. As a general rule, castles were more abundant in mountainous districts than in the plain. The reason is twofold. It was more easy, in the first place, to set up impregnable fastnesses in the hills than in the plain, where they

could be surrounded and starved out—the only method, except treachery, of taking a castle with walls twenty feet thick and towers fifty feet high; a fact always to be borne in mind in mediæval warfare—and in the second place, civic life is opposed to war: the interests of a town are peaceful in the main, and the feuds of Montagues and Capulets, Orsinis and Colonnas, so common in Italian cities, belong to a date when the civic spirit had decayed, and given place to the spirit of family pride and chivalry, which is incompatible with it. In England, before the Conquest, the habits of the nation were opposed to war. Both Danes and Normans found the English an easy conquest, because they wanted, not courage and arms, but organisation. The English had no disciplined militia or armed nobility. They built few castles, and such as they had were of timber; and when the Norman kings built castles of stone, they kept the custody of them in their own hands. Stephen and John, the first from weakness, the second because he was the enemy of his subjects, lost the control of the royal castles, and permitted the erection of others: and the spirit of chivalry broke out at once in private war. The beginning of Henry III's reign was occupied by the reduction of castles into the hands of Hubert de Burgh, the king's minister. When Henry's misrule made the Baronage his enemies, the Barons' War was a struggle for the possession of castles: and it was so understood by both parties. The King's party, having once regained the castles, was able to rule temperately, and without resistance. The strong government of Edward I put an end for ever to private war and knight-errantry. Scutage, invented by Henry I and organized by Henry II, *i. e.* the substitution of money payment for feudal service in person, and the later engaging of a mercenary army by 'indenture' or agreement with a feudal lord for the services of his dependants, worked the same way, and tended both to increase the royal power, and to keep the English a peaceful nation. The home force, the native militia or *fyrð*, (*q. v.*) was principally employed in border warfare, and the armies which fought in France and in the Holy Land were chiefly composed of paid soldiers, though they contained also bodies of feudal cavalry, supplied by the chivalry of England. It follows from this that the lords and knights of England had not that constant practice in war which made the feudal cavalry of Europe so formidable; and as practice in war was that which gave its reality to chivalry, the perfection, or extravagance, of chivalry is to be found in France rather than in this country [England].—F. W. Cornish, *Chivalry*, pp. 68-72, 74-76, 80-85.

16. **Thirty Years' War.—Recruitment.—Armament.—Fortifications.—Methods of warfare.—Rights of belligerents and non-combatants.—German and French armies.—Louvois, war minister.**—"The [European] princes preserved, until the seventeenth century, the custom of taking bands of mercenaries into their pay; they dealt directly with the colonel or the captain, who had taken it upon himself to muster into service these men, and to support them for a certain amount of money. It was with these bands of mercenaries that the Thirty Years' War was carried on. The soldiers were for the most part not the subjects of the prince whom they served, and without any scruples they went over to the service of another, even to the enemy. The army was a set of adventurers from every country, Germans, Croats, Irish, Walloons, held in service through their pay only. The army had no uniform; each soldier

dressed as he pleased; to be able to recognize each other in a battle it was necessary to adopt a common sign: at the battle of Breitenfeld the imperial army had a white ribbon on the arm and on the hat, the Swedes had a green branch. It was difficult to make these bands manœuvre together, even to make them obey. In 1647 the Weymarians in the pay of the King of France (for so were called the bands that had formerly served under Bernard of Saxe-Weimar) refused to start on the campaign; Turenne ordered the French cavalry to charge on them. Often after a defeat the generals could not find their army; the soldiers had disbanded. The governments felt the need of having more trustworthy armies, and adopted the custom of maintaining on a war footing, even in times of peace, the troops which they would need in case of war. In place of the bands which they used to hire only during a time of war, each state supported a permanent army, formed of regiments which kept their organization in time of peace. This army was the property of the prince; he not only appointed the colonel, but all the other officers; the soldiers were enlisted especially for his service, and wore his uniform. (In France the uniform was introduced by Louvois.) There was a regular organization, each regiment was divided into a fixed number of companies, and each company had to have a fixed number of men. The army was composed of soldiers, who enlisted voluntarily, but as the armies increased in size and number recruiting became more difficult. Each government had special officers, the recruiting-sergeants, who went about looking for vigorous young men, persuading them to enlist. These sergeants were sent into the towns of the country, and even to foreign countries, to the petty states where there were no standing armies. In order to procure the men the recruiting officers often employed trickery; they staid at a tavern, invited the young men to come and drink with them, boasted of the advantages of a soldier's profession, made them drunk, and forced them to accept a small sum of money, which was the earnest money of the bargain; from the moment that a man had accepted the king's money he was enrolled and could not withdraw. The soldiers led a miserable life; they were badly lodged, badly fed and badly treated. The officers always carried a cane in order to be able to strike a soldier during the drill; a good, sound beating was the usual punishment. The soldier did not receive sufficient pay to support himself and his family; it was necessary for him to have some supplementary business in the town, such as laborer, street porter or messenger. There was, besides, no hope of advancement, for the officers were nobles or wealthy bourgeois; the only prospect for an old or an infirm soldier was to beg for his daily bread; the government gave no retiring pension. The construction of the Invalides was regarded as an act of generosity on the part of Louis XIV. With such a system many soldiers were tempted to desert. In Prussia, surveillance and severe punishment were necessary in order to keep them. As soon as a desertion was noted a cannon was fired, and guards met to go in pursuit. If the deserter was taken he was made to pass between two lines of soldiers, each one armed with a stick, with which they gave him a blow as he passed; the blood flowed in streams and the skin fell in strips; at the third offence the deserter was hung. This profession was in little demand; the army found its recruits chiefly among vagabonds; it was a disgrace to be a soldier; sometimes a gentleman was condemned to serve as a soldier, in punishment for a crime. Soon the governments

could not find enough men to recruit the armies. From the end of the seventeenth century they tried to procure them, as they procured their money, by compulsory levies. The King of Sweden, Gustavus Adolphus, had already imposed upon his subjects the obligation to serve in his army. Several states organized a compulsory service in the eighteenth century. Louis XIV., near the end of his reign, created a militia service, which was continued down to the Revolution; every year, in each parish, they drew lots as to who should go into the army, but it was only the poor people who drew; the bourgeois, their domestics and the rich peasants were exempt. At the time of the Thirty Years' War [1618-1648] there still remained in the armies bodies of mounted men clothed in iron armor and carrying lances, just as in the Middle Ages; these men at arms had fought at Rocroy. But the cavalry was composed of an entirely new body; the cuirassiers, who still wore the cuirass; the carbiniers; the dragoons, who were only foot soldiers mounted on horseback; the hussars, dressed in Turkish fashion and mounted on swift horses. Their arms were a sword and firearms, especially the long pistol, which has retained the name of cavalry pistol. After the Thirty Years' War the corps clothed in full armor were abandoned. Neither did the old infantry survive this war. The corps of foot soldiers was composed of two kinds of men, the pikemen, armed like the former lansquenets, with a long pike; the musketeers, armed with a sword and a musket. The very heavy musket was lighted with tinder; a forked rest was necessary to support it while one took aim, and a fuse had to be lighted in order to make it go off. After the musketeer had fired he was disarmed, and had to seek shelter behind the pikemen. During the Thirty Years' War they did away with the forked rest, and replaced the tinder with flint. Then was invented the bayonet, which fastened into the gun-barrel and served as a pike. The soldier armed with the gun and bayonet could fight at long range or in close quarters without being disarmed. The pikemen became useless, and were abandoned; all foot soldiers were armed in the same way. Picked soldiers carried grenades, which they threw, with the fuse lighted, into the ranks of the enemy; these grenadiers marched with the infantry. The bayonet fastened inside of the gun-barrel had still the defect of taking too much time, and of preventing the bearer from shooting. At the battle of Killcrankie (1688), the English soldiers, after they had fired, were adjusting their bayonets when the Scotch Highlanders rushed upon them, and put them to rout before they had finished the operation. At the close of the seventeenth century this defect was remedied by the invention of a bayonet with a socket, which is fixed around the barrel of the gun. The cavalry, which had been more rapidly perfected, had the advantage during the whole of the seventeenth century; it was the cavalry which decided almost all the battles of the Thirty Years' War; again in 1602 at Steinkirk, it was the cavalry of the king's own which put the enemy to flight. It was then admitted that in the open country a corps of infantry could not withstand a body of cavalry. The artillery was changed also. In place of long, irregular pieces, they had cannon of a regular calibre, which threw iron balls. Toward the close of the seventeenth century howitzers and mortars for throwing bombs were invented. They began to support a special personnel of artillery to man these weapons; in France this was the Royal Artillery regiment. In order to be able to resist the artillery the whole system of fortifications had to be

changed. The high stone walls served as a target for the artillery, which demolished them piece by piece, and the higher they were the more easily was this done. The dominant fortifications were given up in the seventeenth century, and an entirely opposite system was adopted. Instead of raising a rampart they tried to conceal it in such a manner that it would be difficult for the cannon balls to reach it. A low and thick rampart was built, and this was covered by a ridge of earth, on top of which was a layer of thick turf, the 'scarp' or 'escarp,' into which the balls plunged without destroying anything. The rampart was surrounded by a moat, but this moat is no longer beneath at the foot of the wall, as in the ancient fortified châteaux; it is on the same level, formed by one side of the rampart itself, and the bank or talus of the same height which forms the other side is called the 'counterscarp,' and slopes away so gently to the surrounding country that it conceals the rampart. The enemy perceived only the line of the counterscarp, and behind it the bank of earth which is the scarp, while they were themselves exposed to the shots from the cannon in the place sheltered by the talus. The towers at the corners of the town were also replaced by bastions, which were also concealed by earthworks. Such was the system of razed fortifications which Vauban applied to all the fortified places in France. Against this new method of defence a new mode of attack was contrived. The besiegers dug long and deep ditches, the trenches, and made their advance under cover until near enough to make an assault on the rampart. During this time they threw bombs into the town, setting on fire the houses, arsenals and barracks, obliging the garrison to take refuge in the casemates, which were under the rampart.

"The operations in the Thirty Years' War were all carried on with small armies; Tilly said that an army should not exceed 40,000 men. But a corps of 40,000 men represented more than 100,000 persons. As there were neither supply stores nor ambulances, the soldiers carried along with them women, children, servants and carts for their utensils and their booty. As soon as the governments took it upon themselves to provide for the needs of soldiers on a campaign, the army train was reduced, but it has been impossible to suppress it entirely. The army did not go on a campaign until the spring months; it was necessary to have green grain, and meadows with sufficient growth to feed the horses. The object of the campaign was usually to seize the fortified places; the army went off to camp before a place, and opened trenches there. Almost all the wars of the reign of Louis XIV. were sieges; they did not give battle save for the relief of a besieged place, or to repulse the army sent to aid in its defence. Grand invasions were rare; almost always war was confined to frontier provinces. Therefore it was rarely decisive. Operations ceased at the end of autumn, the campaign ended, the soldiers constructed barracks, where they passed the winter; this was called going into winter quarters. A war rarely ended with one campaign; it usually lasted several years, until one of the powers ran short of money. The armies fought for the sake of the profession and without national hatred. The officers of one camp were treated by those of the others with the respect that gentlemen owe to each other; often they were acquainted and visited each other. In times of peace the soldiers looked upon each other as brothers in arms, who were doing their duty in the service of different masters. The prisoners were honorably treated and were often released on parole. During the Thirty Years' War the old custom of demanding a ransom

for prisoners was still observed. In the eighteenth century the government took upon itself the burden of redeeming the prisoners or of exchanging them. But the usages of war were still severe for the people of the countries which were invaded. The right to defend their own village was not recognized, neither dare they commit any hostile act, for which the punishment was death. When Louis XIV. entered Holland he issued this proclamation: 'Those who do not wish to submit, and who may attempt resistance to His Majesty's forces by cutting their dikes, will be punished with the utmost severity.' At Créquy, Louvois wrote: 'His Majesty, having considered that the places belonging to M. de Lorraine are inadequately provisioned, that they cannot hope for any succor and that, therefore, it is a temerity in those who are defending them which merits exemplary punishment, His Majesty has resolved that all the knights, soldiers, militia and people of Lorraine who shall have contributed to the defence of the place, shall be sent to the galleys, unless they redeem themselves at 100 écus each.' In 1744 the Austrian generals who invaded Alsace declared that if the inhabitants resisted they would be hung, 'after being forced to cut off their own noses and ears.' It was admitted that when a place was taken by assault it belonged to the soldiers, and they were free to pillage and massacre at will. It was admitted that the enemy had the right to live at the expense of the country invaded. The government did not furnish food nor forage for its troops; they went foraging themselves, and made requisitions for their supplies. Often they levied contributions on the bourgeois; this was a resource upon which they counted, and they called it the 'necessaries of war.' If the inhabitants did not deliver what was exacted from them their homes were burned over their heads. Marshal de Luxembourg wrote in 1672: 'Never have attacks of fever been as regular as our custom of burning out every two days those who are fools enough to oblige us to do it.' That was almost a recognized law. When Turenne began to burn the villages of the Palatinate, this prince wrote to him: 'It seems to me that in a strict sense we are only burning the places which refused to make the contributions demanded.' Louvois went still farther; he ordered the devastation of all the states of the Elector Palatine, although Louis XIV. was not at war with him, so that the enemy could not find anything there to live upon. An order was given to the inhabitants to evacuate their houses; 500,000 persons found themselves without resources; all the towns and villages were burned, the country was ravaged and the castle of Heidelberg was mined and blown up. In view of the principles avowed by the governments it is easy to imagine what the soldiers were accustomed to do. The undisciplined armies were full of marauders who scattered through the country for the purpose of pillage. Sometimes an example was made of them, a band was captured and they were hung on trees (it was a soldier's privilege to be hung only on a tree, or on a military gibbet). But rarely did the inhabitant succeed in obtaining justice; the chiefs did not like to take the part of a stranger against one of their own soldiers. The most popular generals, Wallenstein, Turenne (the father of his soldiers), were very hard on the people. The soldiers knew that they could indulge in every liberty. Not content with pillaging they often tortured simply for their own amusement. . . . By the end of the war the greater number of the peasants were dead, from massacre or from suffering in the woods; all the villages had been

burned; four-fifths of the population of Germany had perished. There were in 1618, before the war, as many inhabitants and as many head of cattle as there were in 1848; it took more than two centuries to repair the disasters of that war in Germany.

"The French army had become disorganized during the long wars, and through the Fronde. Letailier and his son Louvois, who succeeded each other as Secretaries of War, tried to restore the military strength. They made no great general reform. Their work consisted in a great number of rules in detail, made for the most part in the years 1668, 1675, 1680. In France, as in the other European countries, there was no really permanent army; a few regiments only remained under arms in time of peace. When war began, the government dealt with colonels or captains, who took it upon themselves to enroll, arm, equip, and support a regiment or a company. The State paid them the money which they were to give to their men. To raise a regiment was an operation similar to a labor contract. These army contracts were interested in spending as little as possible; they let the soldier live at the expense of the country where they were carrying on the war, and furnished him none of the things that he needed. In order to lessen the expense they sought to have as few soldiers as possible under arms. To prevent the inspectors from discovering the fraud, the officers, on the days of review, were accustomed to fill up the regiments with people dressed as soldiers (and called *Passevolants*). They profited by the first combat in which the regiment was engaged, to count as dead all the soldiers that were lacking on the roster. Louvois wished to put the army under the direction of the government. He could not suppress the custom of giving, and even of selling brevets; nor could he take away from the officers the right themselves to form companies. But he exacted that every officer should do regular duty, and that every regiment should be complete. He also put war commissioners in surveillance of the army. He wished that the troops should always be in condition to take the field, and he organized a perfect system to supply them with provisions. 'The administration,' said he, 'cannot be improvised like a victory.' He established military stores in the frontier provinces, organized the forage routes through which the soldiers had to pass. At each stop they were lodged in the house of some inhabitant, who was to furnish them with fire, light, and a sum of five pounds a day for each company. This was called indemnity. He established hospitals and ambulances. He persuaded the king to build the *Hôtel des Invalides* for wounded and infirm soldiers. Louvois was before all things else an administrator. He was the creator of the commissary department. This regular system permitted a large army to be kept permanently on a war footing. Under the reign of Louis XIV. armies ready for action became much more numerous, and when peace was signed the regiments preserved their organizations. The 1st of January, 1678, the military force numbered 210,000 foot, 47,000 cavalry, and 9,500 dragoons."—C. Seignobos, *History of medieval and modern civilization*, pp. 375-385, 417-418.

17. Evolution of battle formation.—From Marlborough to Frederick the Great.—From pike to bayonet.—Development of artillery mobility.—Reforms of de Gribeauval.—General du Teil and his pupil Bonaparte.—Strategy and tactics at Marengo.—"War as an art reaches its apogee, in modern times, with the eighteenth cen-

tury. Marlborough marks the beginning, Frederick the middle, Bonaparte the close of the epoch. Nowadays, in western Europe at all events, war is no longer an art; it is rather an economic function. The nation is armed and crowded to the frontier while an economic adjustment of vast proportions supplies its thousand needs, and attempts to maintain some sort of equilibrium behind. A hundred years ago, things were very different. The eighteenth-century army, as an instrument in the hands of its general, may be compared to the eighteenth-century orchestra. Starting on a basis of string instruments, the woods were gradually developed from the time of Montaverde to Mozart, while with Beethoven, at the close of the century, the brass comes into its own, and the three great parts of the orchestra, amply developed, give the composer ample means for deploying the resources of his art. A somewhat similar evolution took place with the three great arms of the modern army: infantry, cavalry, artillery. Infantry, before the eighteenth century, was normally made up in varying proportions of pikemen and musketeers. The pikemen held off the cavalry, or charged an enemy in position. The musketeers held the opposing cavalry at distance or occupied woods, ditches and flank positions, and tended to develop a direct attack by fire. At the turn of the century a shortened pike shaft was stuck into the muzzle of a musket and then developed into a socket bayonet, so that the pikeman and musketeer were amalgamated. A unit of say 300 pikemen and 300 musketeers was converted by this invention into a unit of 600 pikemen and 600 musketeers. In other words, the value of infantry was numerically doubled. In Marlborough's campaigns during the Wars of the Spanish Succession [1701-1714], cavalry and infantry were of about equal value in the shock of battle, and the use of cavalry in the front line is distinctive of this great master of the art of war and of his epoch. But infantry was rapidly acquiring the predominance it has since retained on the battlefield. Material improvements in the musket made the arm more effective. And the increasing rigor of drill and precision in manœuvring, especially in Prussia, soon relegated cavalry to a secondary, though still highly important part. The artillery arm was as yet of little account for field operations. Frederick the Great brought the infantry arm to a point it has not since surpassed. It could maintain tactical cohesion under a terrific fire, on the widest front, and in complicated formations. No infantry ever equaled it in its power of forcing a decision of the combat by manœuvring against a given point and under the most violent conditions. To understand this better it may be as well to clear away a misunderstanding widespread among popular lecturers as to the relation between improved armaments and destruction of life in battle. As a general proposition it may be laid down that the less destructive the weapon the greater will be the loss of life; and the history of war gives ample confirmation to the theory. Arm two groups of six men with knives, and tell them to get a decision: the loss of life will inevitably be heavy, and the decision rapid. Arm the same groups each with a quick firing gun: the loss of life will in nine cases out of ten be smaller, and the decision may be long postponed. With weak arms the decision must be sought at short range and a system of discipline and tactics must be evolved that will meet this necessity. With powerful weapons the emphasis changes; it becomes increasingly necessary to protect human life

instead of risking it; tactics are modified, distances are increased, and loss decreases correspondingly. The illusion is widespread, nevertheless, that modern weapons cause greater loss of life than those used in earlier days. This illusion proceeds from various causes. The incident of a local surprise where the modern weapon does its destructive work, is extended to represent the norm of the whole shock between two armies, which it does not. The illusion also proceeds from ignoring the relation of tactics to armaments and from the magnifying effect of the modern press. The fact remains that a blunderbuss, in the evolution of war, is a more effective weapon than a high-power, small-bore rifle, because the former was used at ten feet, where the latter is used at a thousand yards. The musket in Frederick's day was already capable of discharging several shots a minute, but it lacked power and accuracy. Although it might range a good deal beyond 200 yards, yet that distance was generally regarded as the practical limit of the field of fire within which the decision could be reached. Every twenty yards advance within that distance was a distinct gain in fire power. The ultimate aim of the commander was to obtain so close a position and to deliver so smashing a discharge as to break the opposing line at one blow. Such was the 'perfect volley' on the plains of Abraham in 1759. If volleys could be delivered either by units or by the whole line, as at Leuthen [1757], from an enfilading position, so much the better. . . . Frederick generally strove for a pitched battle, or quick results. The size of his army, the nature of his manœuvres, and the character of the ground in the country he fought over, all helped to make central control of the army and direct supervision by the general possible. Infantry though broken up into battalions, and even on occasion into larger groups, was handled as a whole. The subordinate generals and officers were more concerned with maintaining alignments and relative positions and directions than with utilizing broken ground, which was avoided, or exercising any initiative. The preoccupation of the military art was tactical in the strictest sense. Soon after the close of the Seven Years' War [1756-1763] came important modifications in the artillery arm, which hitherto had lagged far behind the others. These reforms took place in France, and the officer whose name is most closely associated with them was [General J. B. V.] de Gribeauval [1715-1780]. He succeeded in reducing the weight of the gun, thereby increasing its mobility and rendering it capable of following infantry over broken ground. He gave it greater muzzle velocity, while reducing the charge; in fact, almost made a new weapon of it. At the same time he and others were experimenting with grape, which became more destructive. These changes brought the artillery arm up to the level of the other two, and by disarranging the balance then existing brought about a change in theoretical tactics; in fact, in the whole theory of war. General du Teil was teaching these theories at the artillery school at Auxonne at the time when the French Revolution broke out, and young Bonaparte, as sub-lieutenant of artillery, was quartered there and became one of his favorite students. The new theory ran along the following lines: Guns can now follow the infantry fight and shift position rapidly. They can also deliver a greater volume of fire at increased ranges. That being so, if operations are being conducted in country broken by natural obstacles, numerous positions can be found where a few guns supported by detachments of the other arms, can hold at bay

large numbers of deployed infantry. Again, if one could concentrate, by good use of ground, the fire of a number of guns on a given point of the enemy's line, then a breach might be made, much as in the attack of a fortress, and a victory won. Napoleon acted on this theory in the great grape shot attacks of his later campaigns; and even before Napoleon, Carnot [1753-1823] adopted the theory of the new school by breaking up his armies into divisions of the three arms, self-sustaining because of the increased value and radius of fire. Every increase of the power of the defensive has presented the recurring problem: how, then, is a decision to be got? Napoleon found an answer. If the shock was to be less easy to force, less decisive, spread over more ground and more time, then could not tactics be supplemented by strategy? Could not an army be so handled as to obtain an advantage which might prove decisive even before the tactical shock occurred? 'Marengo illustrates admirably the strategic conception that overcomes tactical disability. Between the two armies that met on that field there was no comparison in point of discipline and of maneuvering power in terms of minor tactics. The French army was wretchedly inadequate to the business in hand. A large proportion of the infantry was green. Some of the men had not even received muskets, while many had had muskets dealt out to them on the march through Switzerland and were only just beginning to get correct notions as to which end should be pointed at the enemy. As soon as Austrians and French were fairly deployed face to face the result, tactically, was not in doubt for an instant. And it was only because the Austrians, superior also in numbers, carelessly blundered after apparently winning an easy victory, only because Desaix and Kellermann struck an unexpected, clever, and lucky blow, that [Baron M. von] Melas did not camp on the battlefield. But the remarkable thing was that all this mattered very little, because Bonaparte had got a decisive strategic result before he even attempted to get a tactical one.'—R. M. Johnston, *What could Napoleon accomplish to-day?* (Nineteenth Century, Dec., 1914.) "We thus have a development of armaments, and a new theory of war to mark the close of the century. But this was not all, for the same epoch witnessed a large increase in the size of armies together with a lowering of the efficiency of the infantry arm. . . . We may say that under the new conditions Bonaparte showed a genius for war that raised him at the close of his first campaign to the select company of the great captains. War still remained an art. From his saddle the commander could still follow the evolutions of his army on the field, could control all its divisions, could ring the changes on all the combinations of horse, foot, and guns. If the infantry was less steady, it was quicker in its movements; if the cavalry was less regular, it had more initiative; while the guns were constantly gaining in importance. 'There is no natural order of battle,' declared Napoleon. But out of the newborn confusion and scurry the Corsican's logical mind could always evoke the massed blow or circling swoop that presaged the flight of the enemy."—R. M. Johnston, *Arms and the race*, pp. 22-28, 30-35, 37-38.

18. Transition period.—Nationalization of armies.—Army finance.—Necker's *Compte Rendu*.—French Revolution.—Hired professional armies.—Commission purchase.—European and American theories.—Sea and land power.—"At the epoch, not so very remote, of the

Declaration of American Independence, armies were viewed differently from to-day. With some reservations as to the British army, every armed force was regarded as an essential prerogative and instrument of a monarch. It belonged to him in a personal and exclusive sense, as an unquestioned privilege. It was therefore, in the last analysis, the foundation of the established order of things in Europe; incidentally, it was an instrument for territorial acquisition. But, as the public saw things, the constant factor was tacitly accepted, while its incident appeared the chief matter. Autocratic monarchy was reckoned a divine ordinance and hardly worth discussing, while interest centered in military activities provoked by far less important matters, ranging all the way from the point of honor of the sovereign to the economic advantage of the nation as a whole. Take the Bourbons in 1781, the year of Yorktown and of Necker's *Compte Rendu*. Up to that time it had never occurred to any one in France that the Bourbon accounts or the Bourbon army concerned any one hut the monarch. His tax-raised revenue was his own and beyond the range of investigation in the same sense as the income of any private individual. And from this revenue he maintained, at what was thought of as his personal expense, just what number of soldiers he saw fit. Even though financial chaos and bankruptcy threatened, even though the American war was costing enormous sums, no criticism was offered until in that year, 1781. Necker, on being dismissed from office, issued his epoch-making *Compte Rendu*. It was a halting, incomplete, inaccurate attempt to state the financial situation of the kingdom. The question was now raised: Is finance royal or national? The Estates General replied eight years later by a decree that pledged the national credit for the national debt. No finances, no army. The nationalization of the one inevitably resulted in the nationalization of the other. The French army, long unpaid and in the hands of a kindly and unenergetic monarch, failed to maintain the old order in July, 1789, and a year later found itself under a new allegiance: to the Nation, the Law, and the King. This was perhaps the decisive act of the French Revolution. But the public missed its full significance, still accustomed to the superficial view that an army was for the most part concerned with external war, whether of ambition or of economic interest. The army of the Bourbons was fairly representative of the European armies of that time. The King of Prussia, the Emperor, the King of Sardinia, the Republic of Venice, the King of Spain, the Russian Tsar, all maintained armies of the same general type. And as these armies were thought of in their personal relations to a sovereign, it followed that a soldier's qualification was almost wholly disconnected with the place of his birth. A soldier was a professional man who served wherever he found good pay and conditions; and a Swiss infantryman might hesitate as to whether to enlist with the King of France, the King of Naples, or the Pope, very much as a German chemist might hesitate to-day as to whether to seek a job in Lancashire, in Massachusetts, or in Normandy. Switzerland bred as good soldiers as were to be found in Europe; they could command high pay in any capital. Hesse was turned into the most productive of soldier farms by her thrifty electors, who took to the lucrative business of battalion contractors. As the army of Louis XVI marched on Paris in July, 1789, its heads of columns were not French: they were formed by such regiments as Nassau, Royal-Etranger, Esterhazy, Diesbach, Royal-Allemand,

Reinach, Royal-Cravate; while the general in command was a Swiss. The Duke of Brunswick's columns in 1792 were not appreciably foreign, and were viewed by the people of Paris much as their monarch's army had been viewed three years earlier. It must not be supposed, however, that eighteenth-century armies in Continental Europe were purely professional and non-national. It is merely a matter of emphasis. For if one were considering the question in close detail, it would be necessary to dwell on the militia organizations that were called on to play a part occasionally, as in France and Prussia. Again, levies of an even more primitive description, such as those of the Hungarian horse, tended to give war at times a more national character. But these were not the outstanding facts. Speaking broadly, an army belonged to its monarch, and the soldier was a professional expert, and often, non-national. Just as the army belonged to the monarch, so did the regiment belong to its colonel, and the company to its captain. But here we come to a matter in which variation was great among the different armies. Improvements were being made in this system which was, on the whole, a pernicious survival from the seventeenth century. It will be stated, therefore, in a purely formal sense, and more to give an impression of the views of the epoch than to cover conditions existing at any one place and time. A regiment or a company was a benefice in very much the same sense as a bishopric or deanery. The king paid the colonel so much for his regiment; the colonel paid the captain so much for his company. At each of these steps profit was made; in fact, the whole business of war and army management was full of petty fees and profits, so that the term professional soldier was, even in that sense, entirely justified. The emoluments, like in most professions, went to those nearest the top of the ladder; so that it paid to buy a position higher up, and a complicated system of purchase of commissions crept in, which in the English army survived to within half a century of our own time. Under these conditions a commission as an officer was naturally enough a privilege reserved to men of rank. As the king owned the army, so did the aristocracy monopolize the commissions. In France, four quarterings of nobility were necessary for holding officers' rank; and an able soldier but a plebian like Jourdan might distinguish himself pre-eminently, as he did in the trenches at Yorktown, and yet remain a sergeant. Under the Republic, the same man might rise to command a great national army and win one of the decisive victories of European history; as Jourdan did at Fleurus in 1794. At the time of the War of the Spanish Succession the Hohenzollerns were not above contracting out their army, under the command of Crown Prince Frederick William, to the Allies. The Elector of Hesse, on a smaller scale, went into the same sort of business. As late as 1855 we find England attempting to hire the Sardinian army. On a smaller scale, colonels are military contractors. They supply the king with a regiment. It is made up of professional soldiers; and is recruited by other professional soldiers who drift in, or by new recruits who soon learn to conform with the high standard they see all about them. War decimates these regiments; but it also ravages the country and turns peasants to soldiering, who come in as recruits. The expansion of armies for war emergencies was a slow process and not at all comparable with the modern system founded by Scharnhorst. Larger sums were made available with which to

enter into more contracts with suppliers of troops. Old and new hands were attracted by the prospect of fighting, and especially of the incidents of fighting. . . .

"Turning to England we note differences. The army was broken in the monarch's hand as early as the middle of the seventeenth century. And the struggle of the Commonwealth against the Crown was maintained by the same iron stock which in that epoch succeeded in colonizing New England. When the Stuarts were driven out, the question of the army took on a new aspect. The sovereigns that followed were far more disposed to follow constitutional courses. England had become involved in continental wars with Holland, with Spain, with France. She struggled for commercial advantages, and the control of the sea; she resisted the planting of a strong power among the inlets and havens that faced the Thames from Antwerp to Dunkirk. Such a policy required an army, and therefore England reluctantly, suspiciously, entrusted William III and his successors with the forces that appeared to be called for by the passing circumstances. Although the British monarchs of the eighteenth century maintained an army similar in many ways to those of the Continental States, there were at bottom important differences. Financial control reposed in the House of Commons from the year 1689. The King's power had already in large measure passed to the Cabinet. Yet the army was viewed with jealousy, and the militia, successor of the older train-bands that had fought for the Commonwealth, was viewed as the national as opposed to the royal force. The Tory country gentlemen, none too zealous on behalf of the Hanoverian dynasty, officered the militia. It was not an efficient force even after some training as at the time of the Seven Years' War and at the time of Napoleon; but it long continued immensely popular as the hypothetical bulwark of the British constitution against a hypothetical tyrant. These ideas evoked a natural echo from America. When the colonists revolted from the mother country nothing proved more distasteful for them than to carry their decision to its logical conclusion, the formation of an army. The armed farmers of Lexington were well enough, but when it became necessary to supplement their well-meant but untutored and sporadic efforts by the formation of regular Continental troops, enthusiasm waned fast. . . . At the close of the war and during the period that followed, American sentiment towards the army reflected pretty closely the conditions that surrounded armies in Europe. It was natural, in fact inevitable, that a standing army should be thought of as an engine of tyranny, and more or less useless for any other purpose. Had not the English sovereigns from Charles I to George III, for a century and a half, employed armed force to assert their will against their subjects? Was not an army by the nature of military command an aristocratic institution? As a result of these wholly justified prejudices the United States proved on the whole ungrateful in the treatment awarded to the brave men who gave their blood for independence. Although Washington plainly declared and frequently repeated that the militia had actually done more harm than good to the cause, the second clause of the Constitution was drawn as follows: 'A well regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed.' It is needless to point out that this maintained the English distinction between the constitutional and the royal force. . . . The land

army, then, was viewed as an instrument of tyranny; the sea army was a different case. And the sea army was perhaps the more potent factor in the intercourse of nations. 'Admiral Mahan has laid down in terms that are perhaps too sweeping an argument for the supremacy of sea power over land power. It is true to say that the factor represented by sea power had been much neglected by historians before he so brilliantly called attention to it. But it is also true to say that the decisiveness of sea power has not been quite so constant as he claims, and that it must vary in every conflict with the general situation of the combatants. . . . Now from the beginning of the seventeenth century to the present day England has maintained a sea militarism of an extreme character. For it has during most of this time rejected equality with its opponents and attempted, with general success, to maintain superiority and supremacy. Yet this sea power, that for a century and a half dominated all the world and created the greatest empire yet seen, never provoked the fears and jealousy that were felt for the eighteenth-century army. For a fleet arises from commerce. Its home is the ocean. It neither helps the despot nor threatens the citizen. And in the attitude of the American citizen of the present day towards fleets and armies, these old eighteenth-century ideas and prejudices are still [1915] quite apparent.'—R. M. Johnston, *Arms and the race*, pp. 3-19, 21.

19. **General staff.**—Creation by Napoleon.—Improvements by Scharnhorst and the Prussians.—Modern staffs: France, Germany, Great Britain, Italy, Japan, Russia, United States.—Perhaps the most interesting single development of modern military organization is the general staff. In the small, compact armies of the days of Cromwell and Marlborough the commander needed about him little more than orderlies and aides-de-camp, though the offices of major-general and quartermaster-general had already appeared. The duty of the former was to draw up the army on the field of battle according to orders, while the latter was charged with reconnoitring and selecting sites for camps. As late as Frederick the Great, 1740-1786, the quartermaster-general's staff, which was principally busied with military engineering, was the nearest approach to a modern staff. However, by the time of Napoleon, when large, mobile armies had appeared, the complexity of administration of the field forces became too great for one mind. In response to this need arose the general staff, with Marshal Berthier at its head bearing the title of major-general and chef d'état-major—"despatching the orders of the emperor." This system persisted in France till the re-organization of the French army after the Franco-German War but a different though parallel development was taking place in Prussia during the same period. Soon after Jena, 1806, the Prussian staff came under the direction of Scharnhorst and it took on new functions which foreshadowed the great work of Moltke a generation later. The functions of a general staff are now generally agreed upon in all armies though nations differ somewhat in the distribution of powers between the war department and the staff. Also, there are in some countries special bodies which have duties analogous to the German general staff. The following sections treat of the general staffs of the principal military powers at the time of the World War.

FRANCE.—"The general staff of the French Army is [1915] one of the seven main divisions of the war department. Military matters, unless they concern more than one department of the National Govern-

ment, are directed by the superior military council, which consists of the minister of war, the chief of staff, and 10 major-generals. The superior military council exercises control over the general staff. One of the major-generals of the superior military council is assistant chief of staff; others are assigned in time of peace to command armies in time of war, and have with them the three general-staff officers to be on their staffs in the field. These prospective army commanders have, in time of peace, supervision of the troops that would be under their command in war. They prepare and direct the maneuvers and staff rides for the training of these troops and generally see to their preparation for war. They are army inspectors. The chief of staff is the head of the war department general staff, and deals with the larger questions. Other general-staff matters are under the assistant chief of staff. The work of the war department general staff is performed by three groups, each under a general officer.

"First group: 1. The bureau of military operations and general training of the army. 2. The bureau charged with the study of the organization and tactics of foreign armies. 3. The bureau of railways and lines of communication. Second group: 1. Bureau of organization and mobilization of the army. 2. The African section. 3. The historical section. Third group: 1. The section of the personnel of the general staff. 2. Routine service section of the general staff. 3. The administrative section: The chief of staff, assistant chief of staff, and the chief of the first group are major-generals. The chiefs of the second and third groups are brigadier-generals. In addition the following general staff officers were authorized by law before the present war: Thirty colonels, 40 lieutenant-colonels, 170 majors, and 400 captains; total 640. General staff officers were assigned as follows: War Department general staff, 132; staff with troops, 480; additional staff officers with the war department general staff, 47; with troops, 216. The general staff is larger now."—*General staffs of certain belligerent powers* (Army College, Washington, Nov., 1915, War Department Document no. 514, pp. 6-7.)

GERMANY.—"The general staff of Germany consists [1915] of the war department general staff (called the great general staff) and the general staff officers on duty with the troops. The officers of the war department general staff performed, in peace, the following duties: One general, chief of staff, directly under the Emperor, and has charge of the war academy and the land survey; 1 lieutenant-general, assistant chief of staff, chief of division; 4 major-generals, heads of four divisions; 11 colonels, chiefs of sections; 6 lieutenant-colonels, four of them are chiefs of sections; 37 majors, duty with sections and committees; 52 captains and 1 lieutenant performing various general staff duties; total, 113. This part of the general staff is organized into 9 sections and the historical and geographical departments. It has complete charge of the mapping of the country and of the maps of Germany and other countries. The general staff officers on duty with the troops are under the orders of their commanders, but special work may be assigned to them by the chief of staff. Before the . . . [World] war the general staff of Germany consisted of 1 general, 2 lieutenant-generals, 6 major-generals, 23 colonels, 21 lieutenant-colonels, 116 majors, 130 captains, and 1 lieutenant, total 300. Additional officers performing general staff duties were: Three colonels, 13 lieutenant-colonels, 44 majors, 36 captains, and 132 lieutenants; total attached officers, 228, total

number of officers performing general staff duties, 537."—*Ibid.*, p. 8.

GREAT BRITAIN.—"The general staff at the War Office has the following duties: To advise on the strategical distribution of the army; to supervise the education of the officers and the training and preparation of the army for war; to study military plans for offense and defense; to collect military information, and to direct the general policy in army matters. The general staff with troops has the following duties: To assist the officers on whose staffs they serve in promoting military efficiency, and to aid them in carrying out the general policy in army matters. The general staff at the war office, known as department of chief of general staff at army headquarters, was divided into three branches: Military operations, staff duties, and military training. A major-general was in charge of each. General staff officers in this department: Three major-generals, 6 colonels, 21 lieutenant-colonels and majors, and 27 captains. Total, 57. The general staff officers with troops were: One major-general, 6 brigadier-generals, 16 colonels, 54 lieutenant-colonels and majors, 12 captains, and 25 brigade majors. Total, 114. Besides the 171 general staff officers other officers were attached to the general staff to perform general-staff duties. Great Britain was short of officers, and the general staff was somewhat depleted at the beginning of the . . . [World] war. The British press . . . attributed grave errors of the war to this lack of an adequate general staff."—*Ibid.*, pp. 8-9.

ITALY.—"The latest information found at the War College shows the chief of the general staff of Italy was intrusted with the preparation, in time of peace, and execution, in time of war, of all military operations, but under the minister of war; and that the general staff consisted of 260 officers. The war department general staff, called the great general staff, consisted of three sections: The central section, the section for military operations, and the section for railways and communications. The central section supervised the work of the others. The section for military operations was divided into five subsections, and the section for railways and communications was divided into three subsections. The general staff officers on duty with troops performed duties that are performed in the United States by general staff officers and by adjutants general."—*Ibid.*, p. 9.

JAPAN.—"The general staff has charge of the national defense and the employment of the military forces of the Empire. The chief of staff is directly under the Emperor and assists in the business of the imperial personal staff. All things relating to national defense and strategy are in his province. Furthermore, he has under his supervision all staff officers of the army and their training. Directly under his jurisdiction are: (1) General staff headquarters; (2) the land survey department; (3) the army staff college; and (4) the military attachés at embassies and legations. A vice chief of staff assists the chief and supervises the business of general staff headquarters. The subjects dealt with by the general staff are: 1. Defense of the Empire and plans of mobilization. 2. Statistics of foreign armies. 3. Communications and transportation of troops. 4. Geodesy and topography. 5. Historical work. The work of the war department general staff, designated the great general staff, is performed in 5 divisions divided into 10 sections. One of the divisions is designated 'general affairs'; the others are numbered 1, 2, 3, and 4. The chief of staff is a general; the vice chief of staff, a lieutenant general; the chief of each division is a major general, and the chief of each section is a colonel. The general staff

office at Tokyo consists of 1 general, 1 lieutenant-general, 5 major-generals, 10 colonels, 8 lieutenant-colonels, 21 majors, and 33 captains. Total, 79. In connection with these are 72 other officers, making a total of 151 officers performing war department general staff duties May 1, 1915. They were assisted by 44 warrant and noncommissioned officers and 5 civilians. Under the chief of staff, the land survey department consists of 35 officers, 161 warrant and noncommissioned officers, and 135 civilians; the army staff college consists of 58 officers, 15 warrant and noncommissioned officers, and 14 civilians. The exact number of general staff officers serving with troops in the Japanese Army is not stated in the reports received at the War College. It is understood that the strength, organization, and duties of the Japanese general staff are about the same as in other good, modern armies. The organization of the Japanese general staff is not fixed by law. It depends on the orders of the Emperor and usually changes slightly from year to year."—*Ibid.*, pp. 9-10.

RUSSIA.—"The latest figures on this organization, found at the War College, show the general staff of Russia consisted of 734 officers. The general staff of that country was organized on modern lines in 1906. The chief of the general staff was part of the war ministry. In 1914 the headquarters directorate of the general staff consisted of the following six branches: The quartermaster general's branch, consisting of seven sections; organization and administrative branch, seven sections and two subsections; mobilization branch, four sections; military communications branch, eight sections; topographical branch, three sections; aviation branch, two sections. The Russian Army, like other modern armies, has general staff officers serving with troops."—*Ibid.*, p. 10.

UNITED STATES.—"The important military event of the year [1903] affecting the regular army has been the reorganization of the system of military control under the General Staff Act approved February 14, 1903. This Act abolished the separate office of General Commanding the Army, provided for a military Chief of Staff to the President, who, acting under the directions of the President, or of the Secretary of War representing him, should have supervision not only of all troops of the line but of the special staff and supply departments which had theretofore reported directly to the Secretary of War; and it created for the assistance of the Chief of Staff a corps of forty-four officers, who were relieved from all other duties. The function of this new corps is described by the statute in the following words: 'Sec. 2. That the duties of the General Staff Corps shall be to prepare plans for the national defence and for the mobilization of the military forces in time of war; to investigate and report upon all questions affecting the efficiency of the army and its state of preparation for military operations; to render professional aid and assistance to the Secretary of War and to general officers and other superior commanders, and to act as their agents in informing and coördinating the action of all the different officers who are subject, under the terms of this Act, to the supervision of the Chief of Staff; and to perform such other military duties not otherwise assigned by law as may be from time to time prescribed by the President.' . . . It was obvious that this radical change in the administration of military affairs, and the adjustment of the new machinery to the old machinery which had been in operation for many years, would require a vast number of details to be worked out experimentally and upon full consideration by all the officers whose duties were affected. A board

was accordingly convened in March to recommend selections for the new corps. It consisted of Generals Young, Chaffee, John C. Bates, Carter, Bliss, and Randolph, and Major Henry A. Greene, as recorder. The board was required under oath to recommend forty-two officers for detail upon their merits as exhibited by their military records. The order which convened the board also provided that vacancies occurring in the General Staff Corps, after its organization, should be filled upon the recommendation of a permanent board consisting of the Chief of Staff and the three senior officers of the General Staff Corps on duty at the War Department, operating in a similar manner. . . . Upon the report of this board its recommendations were approved without change, and the officers selected were ordered to Washington to report to General Young, who was to be the first Chief of Staff. They were then organized as an experimental or provisional General Staff, and directed to work out a permanent organization and distribution of duties for the General Staff Corps, a draft of new regulations, and a revision of the old regulations made necessary by the new departure. This work was done upon full consultation with the chiefs of bureaus and taking the opinions of general officers commanding departments, and was accompanied by reference to the provisional staff organization of many tasks and problems to be worked out which were appropriate for General Staff action, in order that they might become familiar with their work, and test by experiment the best methods of accomplishing it. In this way when the act took effect on the fifteenth of August the General Staff was ready to enter upon the discharge of its duties with a fully considered organization, distribution of duties and regulations, and a considerable familiarity with the new duties which its members were to perform. The regulations which govern the operation of the new corps were adopted on the third of August. They divide the corps into the War Department General Staff and the General Staff serving with troops (that is to say, in time of peace with the generals commanding geographical departments), and they prescribe the duties and relations of each of the two classes. The tenth article of the regulations relating to the Chief of Staff states explicitly the new theory of control inaugurated by the General Staff Act. It will be remembered that our old plan of army administration was that there should be a General Commanding the Army in peace as well as in war, responsible for the efficiency, discipline, and conduct of the troops, but having no control over finances or the departments of supply and transportation; and that there should be a Secretary of War controlling the finances and the money-spending bureaus, but not commanding the army or responsible for the conduct of purely military affairs; and it will be remembered that the result of attempting to work upon that theory of dual and separate responsibility was almost constant discord and a consequent reduction of efficiency. The new theory is stated by the regulation. . . . 'It will be perceived that we are here providing for civilian control over the military arm, but for civilian control to be exercised through a single military expert of high rank, who is provided with an adequate corps of professional assistants to aid him in the performance of his duties, and who is bound to use all his professional skill and knowledge in giving effect to the purposes and general directions of his civilian superior, or make way for another expert who will do so.' . . . The general plan contemplates that every subject requiring investigation and study shall be worked out first by the officers assigned to

the appropriate division and section of the staff, and, when of sufficient importance, shall then be considered by a general staff council composed of the three general officers of the corps and the heads of the three divisions, and shall then be acted upon by the Chief of Staff, or laid before the Secretary of War by him with his recommendation. . . . Much of the work upon which the General Staff has been employed is of a confidential nature, not to be exhibited in a report which is to become a public document. Most of the work involves questions which require investigation and the collection of data; or involves several supply and construction departments, and therefore could not properly be determined by any one such department; or calls for expert opinion upon military policy or needs. . . .

"Following the same line of policy which led to the organization of the General Staff, the Secretaries of War and the Navy entered into an arrangement, with the approval of the President, which was published to the army in General Orders No. 107. [It included a statement to the effect that] 'The Department of War and the Department of the Navy have agreed upon the formation of a joint board to be composed of four officers of the Army and four officers of the Navy, to hold stated sessions and such extraordinary sessions as shall appear advisable for the purpose of conferring upon, discussing, and reaching common conclusions regarding all matters calling for the cooperation of the two services. Any matters which seem to either Department to call for such consideration may be referred by that Department to the board thus formed. All reports of the board shall be made in duplicate, one to each Department. All reports and proceedings of the board shall be confidential. The senior member of the board present will preside at its meetings and the junior member of the board present will act as its recorder. . . . [Signed] Elihu Root, *Secretary of War*, William H. Moody, *Secretary of the Navy*.' [Extract from the Report of the Secretary of War for 1903.] 'The common understanding and mutual assistance between the two services, which it is within the power of this board to bring about, may be made to cover a wide range of subjects of great public importance, including the parts to be taken by the military and naval forces, respectively, in case of military operations on the seaboard and on navigable lakes and rivers; artillery defense of naval stations and naval defensive aid to seacoast fortifications; the exchange of information obtained by one branch of the service and useful for both; the manufacture or purchase of cannon, projectiles, explosives, small arms, ammunition, and munitions of war generally available for both services; the purchase and transportation of supplies; the transportation of men upon changes of station; the study and discussion of joint military and naval problems. In all these, and in many other respects, much greater efficiency, at much less cost, can be obtained by cooperation and mutual understanding than by separate services working in entire independence of each other.'—E. Root, *Military and colonial policy of the United States*, pp. 426-432.

"In regard to the United States General Staff, the act of Congress . . . creating it established its status and duties on lines entirely in accord with the approved practice in European armies, and, so far as known, the experiences of the . . . [World] war have proved the soundness of this action: Actual experience, however, has shown conclusively that the personnel originally provided for our General Staff was too limited for the compre-

hensive duties required of it, even for our small Army. A further bar to progress was imposed by the act of Congress approved August 24, 1912, whereby the already meager personnel was reduced by one general officer and eight captains. Under the present law it consists of 2 general officers, one of whom is Chief of Staff, 4 colonels, 6 lieutenant colonels, 12 majors, and 12 captains (or first-lieutenants); total, 36. In addition, the Chief of Coast Artillery and the Chief of the Division of Militia Affairs are also members of the General Staff, *ex officio*. The permanent station of these latter officers is in Washington, but the specific duties for which their offices were created to perform occupy their full attention and, properly speaking, are not duties pertaining to the General Staff any more than are those of the Chief of Engineers, Chief Signal Officer, or other bureau chiefs. As a matter of fact, they only do General Staff work when temporarily acting for the Chief of Staff and his senior assistant during the absence of those officers, and this duty is in addition to their normal functions. At the present time [November, 1915] the War Department General Staff consists of 2 general officers, 2 colonels, 5 lieutenant colonels, 9 majors, and 11 captains, total 29, leaving for service with troops 2 colonels, 1 lieutenant colonel, 3 majors, and 1 captain, total 7. Because of this insufficient personnel the General Staff has been unable to undertake some of its most important functions. For example, no historical section can be established, and until this is done the scientific military history of our various wars can not be written. Our lack of a definite military policy was largely due to the fact that we are without such histories and have consequently not learned the lessons to be derived from our own experience in war. We can not utilize to its full extent the important information gathered abroad, because we can not assign officers to the exclusive duty of reading and digesting these reports, due to the requirements of the daily routine General Staff work pertaining to the Army, which must be first attended to. For the same reasons we can not properly attend to the work of preparing monographs and maps pertaining to foreign countries, matters which should be always kept up to date. One thing which prevents even our meager General Staff from rendering such efficient service as it might is the continual change of status of General Staff officers before the full detail of four years has expired. This is partly due to the fact that the present law does not provide for the retention of officers who are promoted. This defect could be remedied by providing that an officer promoted should serve out the balance of his detail in the next higher grade, the vacancy in the grade from which he was promoted not being filled until the completion of his term. This would not change the total number of officers on the General Staff detail and would greatly benefit the service by permitting continuity of work by men thoroughly trained to it."—*General staffs of certain belligerent powers (Army College, Washington, War Department Document no. 514, pp. 11-12)*.—"General Orders, No. 31 . . . [Feb. 16, 1918] created five sections of the General Staff, assigned to each its functions, and so directed that subordinate commands should conform in principle to Staff organization . . . There was a Chief of Staff and a deputy chief of staff. The duties of the former corresponded to those usually exercised by that office. The deputy chief of staff was at first the channel through which papers passed intended for the Chief of Staff, and final action of the commanding general, Services of Supply, but as these papers

increased in volume this system was changed and the deputy chief of staff was engaged chiefly in questions of classification and assignment of personnel with special reference to reclassified personnel from Blois [France]."—*Organization of the services of supply (American Expeditionary Forces, Monograph no. 7)*.

20. Mobilization.—Nature of operation.—British system.—Continental system.—Prussia in War of 1866.—Germany in 1914.—Concentration.—In the preceding pages frequent allusion has been made to mobilization or the making available for actual fighting of the armed forces of a belligerent. Strictly speaking there are two separate processes in what is popularly known as mobilization. There is mobilization proper which means the assembling of the men and materials of war in their prearranged places within the country, and then there is concentration whereby they are delivered to the frontier or fighting front as organized armies ready for battle. The account given here by General O'Ryan describes the scheme of mobilization as employed by the great military nations on the outbreak of the World War, with reference also to the peculiar methods used by Great Britain and the United States. "The wars of the last half century have shown that a nation cannot depend upon her standing army alone for defense. It can serve only as a first line to delay operations until the manhood of the nation can be organized into armies and moved to the threatened points. This involves two operations; first the companies must be enlisted to full strength and assembled into regiments, and, second, the regiments must be transported to the place assigned them at the front. This places them as part of a definite division, corps, and army. The mobilization is greatly facilitated if skeleton organizations have been provided in time of peace and if trained men are available to fill up the companies. All that they then need to fit them for war is a short period of training to enable them to gain team work. This is the object of the great reserve systems of all the leading countries of the world except the United States. When war is imminent an order is issued for mobilization on a war footing. The first efforts are directed to raising the active army to full strength and dispatching it to the front, and only when its mobilization is well started, is that of the first line of reserves commenced. The successive lines of reserves are in turn taken up; as one perfect unit is worth much more than two unformed ones, each line is fully provided for before the next is called. The protection afforded Great Britain by her navy has relieved her of the necessity of such vast development of reserve military strength as is found on the continent. Her regular army and reserves include only a small percentage of her young men of fighting age. Her territorials might be considered as corresponding to the landwehr, or second reserve, of the continental systems. For the bulk of her fighters in a great war she has to depend upon newly organized volunteers. As these would be worse than useless unless trained in the elementary principles of field service, her war policy must provide for a delay of six months or more before her full military strength can be brought to bear. [In the British system] on the proclamation of the king commanding the mobilization of the British army, all of the reserves are at once summoned to the colors to fill up the fighting arms to war strength. The supply service is manned by the special reserves. The reserve (third) battalion of each regiment takes the stations from which the two active battalions are moved and forms the depot battalion.

They make good the losses of the two battalions at the front and train the newly enlisted recruits. The extra reserve battalions form fourth battalions for the regiments and are at once available for field service. The mobilization proclamation calls the Territorials into active service, and provides a force of 315,000. These men have learned the rudiments of military training in their armory drills and in the two weeks of annual camp, but time and training are needed to fit them for the arduous duties of campaign. The British system provides for a six months' training period for this purpose. This system makes about four fifths of the regular army at home stations available for early service at the front. As the home army totals 180,000 and the army reserve 150,000, Great Britain's 'quick striking' force is about 260,000 men. The value of the Territorials is also realized in advance of the six months' training period in two ways. Members of the Territorials who have had experience in the regular army or in a campaign are permitted to transfer to the regulars or volunteers. Still more important, the Territorials may be sent to garrison outlying stations of the Empire, releasing the garrisons of regulars for service at the front. Since all of the above sources provide only about 800,000 men, Great Britain is forced to have recourse to newly recruited volunteer organizations in order to form the armies needed for a great war. These are entirely recruits, except for a sprinkling of officers of some experience. A long training period is needed to work them into shape. The Territorials, special reserves, and volunteers are assembled in great camps, as at Aldershot, where every effort is made to hasten their training. At the same time the administrative and supply reserves are organized and gradually gotten into smooth running order for discharging the immense task of controlling and supplying such numbers of men. The essential feature in which the British or the American mobilization differs from that of a continental nation is that the greater part of the organization has to be carried out after the war has already started. Time is necessary to properly coordinate the many departments of work and excessive haste means only waste and weakness. The full development of military strength by this system demands as a prerequisite the delay by some means of the enemy's invasion for a six months' period. For the nations on the continent of Europe the onset of an enemy's army must be met with little delay; indeed quick striking power is more important than military resources in gaining victories. This is well shown in the Seven Weeks' War of Prussia and Mecklenburg against Austria, Bavaria, Hanover, and Saxony in 1866. The underlying cause was the desire of Prussia to oust Austria from the German Confederation and to inherit her hegemony. Prussia's population was in round numbers 19,000,000 while that of Austria was 35,000,000; including the allies on both sides the populations were 23,000,000 against 49,000,000. But against the superior resources of the Allies, Prussia had her wonderful rapidity of mobilization and concentration due to the careful planning of her Minister of War, von Moltke. War was declared by Austria on June 17 and her armies moved north in the effort to take advantage of the salient of Bohemia and Moravia for an advance on Berlin. The Prussians concentrated in three armies near Gorlitz and Glatz in Silesia and Torgau just north of the Saxon border. So carefully had von Moltke followed the Austrian movements that he was able to hasten the final Prussian concentration by keeping the armies separated until the very day of the great battle. On July 3 the three Prus-

sian armies, united on the battlefield of Königgrätz [Sadowa], and so decisively defeated the Austrian regular army that the defense of Vienna against the Prussian advance was hopeless. On July 26 hostilities were suspended and the preliminaries of peace were signed. In less than seven weeks Prussia by the 'quick striking power' of her military system had overthrown Austria and her allies in spite of their apparent superiority in military strength and resources. The Prussian system has since been copied by all of the Continental Powers, and may be taken as a sample of all. The basic principle is that every man must have a definite assignment for war, that his equipment must be stored waiting for him, that he must report at a definite place to join his company and to be outfitted, and above all that every plan be checked up every year and revised so as to be always up-to-date. The . . . German system may be taken as typical. . . . [The following describes the German mobilization scheme up to the World War.] At the district headquarters are kept complete lists of every man in the district of military age, 17 to 45, including his age, reserve assignment, occupation, residence, and every item of military value. The men who are to be called to fill up the active army to war strength are on one roll, those for each reserve company on another, those for each landwehr company on yet another, and similarly for the Ersatz reserves and the Landsturm. Notices are made out for every man; the method of notification whether by wire or messenger is selected; even the route by which the man is to proceed to the designated assembly point is exactly laid down. Nothing is left to chance. Every detail is covered. To provide for natural changes the whole system is revised annually. The district headquarters is largely a record and administrative bureau that starts the mobilization going. The work is then taken up and carried on by the reserve officers called into service. . . . Each officer has his assignment, has to learn by heart his duties for each of the eight days assigned to mobilization, and is tested at definite intervals on his ability to do his part. The reservists are collected in groups near their homes and under a sergeant proceed to their company station. Here they are issued the equipments held in store for them and are put through drills to get them back into training. Wagons and company equipage are drawn from the store-rooms, draft animals are commandeered, and the organization stands ready to move to the front; that is, has completed its mobilization. In order to obtain the enormous amount of transportation required for an army in the field the landwehr district officer keeps a record of every animal and vehicle in his district. A special bounty is given to owners of horses and automobiles that answer military requirements. A yearly assessment of value is made and part of the mobilization includes summoning the owners to deliver their animals and vehicles at designated points. It is readily seen that the resources of the district are strained to the limit to secure the rapid despatch of the active army to the front. The reserve divisions follow close behind. At the same time the youths and the Ersatz reserves are called into the depots to be ready to maintain the fighting strength of the fighting armies. The successive classes of reserves are notified to be ready and are called out, each as the mobilization of the preceding class is effected. The reason for the successive calls spread over many days, is apparent. . . . When the troops are trained and fully equipped with arms, ammunition and a smooth working supply service, they are ready to take care of themselves in the field. They can be moved

about as needed; that is, they are mobilized. The next step is to bring together the scattered regiments into divisions and corps, and the concentration of these in armies at the front. Where the troops are trained and the working of the division organization has been tested in frequent maneuvers, the two steps above outlined can be combined and the regiments can be moved direct to their places at the front, the divisions, corps and armies being assembled all at the same time. The concentration is necessarily a period of vulnerability. To protect their armies while the commanding general is making sure of having them well in hand, the leading continental powers have constructed extensive border fortifications. Where the corps are not sufficiently organized and trained for field service the concentration is carried only as far as division or corps camps where the newly organized regiments are broken in and the men are taught to shoot, march and take care of themselves in campaign. Such were the great camps of the Army of the Potomac organized under McClellan in the winter of 1861-1862 and the camps of the various corps in 1898. . . . The concentration of the armies on the border is planned by the General Staff of the country. The problem is so enormous that it cannot be realized until one begins to take count of the details. The first need is rail or water transportation. One hundred and fifty separate trains are required to transport the men, animals, guns, wagons and necessary baggage of an army corps. A single track railroad can handle only about fifty trains a day in one direction, so more than three days single track service is required for every corps transported. And after arrival, a steady supply of food, ammunition and recruits must be forwarded to maintain the fighting strength of the army. This great rail problem is the simplest part of the transportation and supply, for it is definite and can be planned ahead of time. The difficult part comes after leaving boat or train, when the armies have to spread out over broken country and the enormous supplies have to be forwarded by wagons and automobiles. So much is the strategic planning of concentration dependent upon rail lines that both France and Germany have in the last generation spent large sums in building connecting links so that the commercial rail lines would serve the military demands. . . . The units must be kept together in the concentration; the trains required for an infantry regiment must follow closely behind each other. Time schedules are made out for every move: from barracks to the station; entraining; start of train; meal stops; arrival at destination; detraining; march to camp or cantonment. Train schedules are prearranged, providing for rapid forwarding of trains in the ruling direction, and for the prompt return of empties. An enormous amount of detailed work is necessary in order to provide for the maximum use of all rolling stock and the minimum delay in movement of troops. On the outbreak of war all the railroads of the continental nations are put under military control. Until the active armies have been moved to the front, the entire service is devoted to this end. Thereafter the supply trains have right of way, but it is possible also to carry some commercial traffic. When the reserve armies have completed this mobilization, the railroads are again, during this movement to the front, monopolized by the military service. There are then successive periods of entire stoppage of ordinary traffic followed by periods of limited commercial service. In the concentration of corps to form armies there is a limit to the number of men that can be controlled by one commanding general. He must carry in his head the

location and duties of each superior unit of his command, through the constantly changing conditions of the campaign."—J. F. O'Ryan and W. D. Alexander, *Modern army in action*, pp. 70-84.

21. *Army administration.—Professional versus civilian control.—German and British systems at outbreak of World War.*—"An army or a battleship is an integral part of a nation, composed of human beings, subjected to the same necessities and animated by the same desires as the human beings in the nation itself. Now, an army or a battleship in order to carry out its purposes, must be divided into various branches; each of these branches must be divided into divisions, and each of these divisions must be divided into sub-divisions; and every branch, division, and sub-division must be placed under a responsible head or chief. Furthermore, all the branches and divisions and sub-divisions must be so coordinated that they can be combined together and made to form one coherent organization, under one man at its head. With these ideas in mind, it is easy to see how the analytical German mind analyzed the multitudinous problems into their component parts, and then synthesized or constructed the means whereby the problem would be solved. And we can see also that, being permeated, as the Germans hereditarily were, with the military instinct, it was not hard for them to make what might almost be called an army out of the whole German nation. It may seem that the explanations just attempted are somewhat labored and far-fetched. Possibly they are; but we cannot deny that the whole structure of the German government, and the whole structure of the German nation, show the evidence of careful analysis and able synthesis, and that the structure of the German nation is essentially military. Possibly the most obvious sign of its military character is the training through which everyone is put for whatever vocation he is to fill, and the insistence that every man at the head of every organization, large or small, must be fitted by training to perform its duties well, and must have given evidence of his ability by previous work of the same character. Possibly it may seem foolish to suggest that Germany is alone in having experts at the head of the departments of the government; and yet, the naked fact stands out, clear and plain, that Germany is the only great country that has ever accomplished or very seriously attempted it. Possibly ancient Rome and modern Japan have come the nearest to Germany in this particular. In the other great countries of the world, the army and the navy are the only organizations in which it is seriously attempted to restrict the leadership of the various branches and divisions of the government to men skilled in their duties; and in many countries political influences prevent this in even the army and navy. . . . War was declared on the 1st of August, and Germany was ready; not only in 'the last button of the gaiters,' but in everything; especially in the things most difficult to be ready in—that is, strategic plans, both general and detailed. But the world was unprepared, except one organization—the British navy. Why the world was unprepared may be explained on the same grounds as can be explained the unpreparedness of many nations that in the past were forced to rush into war unprepared. The explanation is simply that the nations had not had the strategic insight necessary to discern the danger, and therefore lacked the wisdom to prepare. . . . Of all the departments of the British government, the only department ready was the navy. The army was not ready; and no one in England who had paid any attention to national matters expected

that she would be ready, in case the thing happened that did happen. That the army did well after the emergency had arisen, the applause of the whole world testifies. But the glory it achieved was at the cost of sacrifices that should not have been necessary, and that have made England endure unutterable remorse. The navy was wonderfully ready, though not so ready as the German. . . . The unreadiness of the British navy, as compared with the German, seems to have no other explanation than the fact that, somewhat less than a hundred years before the war, the politicians had become so strong in Great Britain, and had been able to impress the people so thoroughly with the idea that 'the military should be subordinate to the civil authority,' that they adopted the practice of putting untrained civilians at the head of the army and the navy. They made the people believe (and possibly made themselves believe) that it was not necessary to have men at the head of the army and the navy who were thoroughly acquainted with the army and the navy; giving out the idea that untrained ministers could direct the army and navy successfully, provided they were men of superior intelligence; and that whatever professional knowledge they might lack they could easily get from professional advisers. They neglected to point out that the 'professional advisers' could be ignored, that a minister untrained in technical matters would not be competent to make the best selection of professional advisers, and that the scheme actually promoted irresponsibility. For the minister could always shift the blame for any miscarriage to his professional advisers; and these professional advisers would be perfectly safe, because they were responsible only to the minister himself! They also failed to point out that ministers, untrained in the profession of arms, might appoint assistants whose qualifications were the tact and suavity of the courtier, rather than the force and austerity of the warrior. No evidence that would be accepted in a court of law has ever been given which would establish the reasonableness of the proposition that untrained men can manage great professional organizations with real success. Certain it is that managing an army or a navy is a business, in the same sense as that in which managing a factory can be said to be a business, or keeping a shop or conducting a hotel, or administering a railroad; and virtually all of these businesses are conducted by men who know them intimately. . . . It is a principle fundamental to the efficient handling of every organization that the man at its head should have been specially trained for his task."—B. A. Fiske, *Art of fighting*, pp. 293-295, 303-306.

22. Modern organization on the battlefield.—One commander-in-chief essential.—Delegation of duties.—Limited vision in first line.—"Although armies in the field have now increased to a size that would have staggered the imagination of any of the great military leaders of past ages, and although the scientific side of war has brought into use many weapons of a type hitherto regarded as outside the pale of humanity, there are many of the old principles of warfare that have remained unchanged. The ability to manœuvre is of as much importance as ever, and the necessity of maintaining the mobility of the forward troops remains the same. As in the past, the aim of the Commander is, to out-manœuvre his enemy, to place him at a disadvantage as regards position and by his dispositions compel him to abandon his own plans to counter those of his adversary. The masses which are employed for this purpose must be under efficient control, otherwise they would be of little value; and, what is of greater importance, they

must be employed upon definite plans. One of the most important, if not the most important, of the old principles of war which have remained unchanged is that which declares that an army to be successful must operate under the direction of one controlling master mind. This is a maxim which has never been broken, with results which make discussion of the matter possible. On the contrary, history gives us several excellent examples of a divided policy being employed in operations in the field, and all have met with disaster, except where the error was recognized in time to prevent mishap. At first glance, it would seem impossible for any one man to control the millions which now represent our field forces; and when one considers the diversity of conditions—take the distance over which the troops will be extended, and the huge mass of material which must be provided—it would seem to be a superhuman task. We are fortunate in being able to say in this case that the impossible has been achieved. . . . Every unit, and every portion of each unit, was stated to be under the control of a Headquarters. Now this fact was especially emphasized because of the close relationship which these Headquarters have with the policy which we have just named, that every part of the force must be under efficient control. The latter part of our previous statement—namely, that there must be but one controlling mind—needs a little more explanation. The problems of warfare which confront the Commander-in-Chief are different from those which confront the smaller units. The farther back one goes, the broader will be the perspective view of the fight, and the Commander of the whole force will see a number of enemy masses operating like huge pieces on a gigantic chessboard. He does not see the small details, but he does see, from the information which he gathers in many ways, the concentration or distribution of the large bodies of enemy troops. His attention being directed towards them, he devises ways of countering the effect of those movements, and so he manipulates his own masses in accordance with his own plans, seeking to force his enemy to depart from his original purpose to offset threats here and attacks elsewhere. His view is a broad one, and the pieces with which he plays are large in proportion. To study the problems which present themselves, it is necessary to devote much time and effort to the elucidation of the fragments of information which are constantly arriving, whilst at the same time each development in the situation will have some effect upon his own plans. Under these circumstances, the Commander-in-Chief cannot be harassed by numerous visitors, no matter what their military position may be. To eliminate any danger of this, he deals only with his own staff and the Commanders of the huge masses to which we have already referred—in our forces, the armies. The armies are the pieces with which the Commander-in-Chief deals, and as they are limited, so the persons approaching him are limited in number. Now when the Commander-in-Chief has made up his mind upon a certain course, he communicates his instructions to the Army Commanders, telling them as much as he thinks necessary of his plans. To each army would be allotted a special duty, the task being defined from the broad point of view of the Commander-in-Chief. Whether each would be told of the operations of the other would depend upon whether it was advisable or necessary to disclose so much. Where they are to work in unison, each must understand the operations of the other, and must be told accordingly. In this way the Commander-in-Chief is enabled to keep his plans secret, or at least the number of persons who will be acquainted with his

purpose will be limited. An advantage gained is, that any explanations which may be necessary may be communicated direct to those who must undertake the duty of putting the plans into effect. Each Army Commander in turn views the task allotted to him as a whole, and considers the enemy force in mass confronting him from a little closer view. He probably sees several masses of smaller size than those viewed by the Commander-in-Chief, which have a distribution varying according to the purpose for which they are being used; but having received his own orders, he must put them into actual being, and in doing so he will consider the enemy forces which immediately affect him. He in turn deals with the Corps Commanders, and the same system of communicating instructions is followed as in his own case. The operations are divided amongst the corps, each having its own duties to perform, and each receiving the necessary information to enable them to do so. The corps divide their duties among the divisions under their command, still passing on the task designed by the Chief Command, and so this process is transmitted down until the small units who perform the task receive their orders. Such a system would appear to offer disastrous delay, unless one realizes that it is impossible to employ the huge masses of men which make up the armies unless they are deployed over a broad front, supporting arms brought into position behind the Infantry, and by a gradual development the battle brought into one organized effort. Each unit in the chain knows its particular duty, the work of the smaller formations and units being supervised by the man on the spot, who has all the advantages of a knowledge of the ground, situation, and developments. The whole machine is put into action, and each cogwheel fulfils its duty in relation to all the other parts; whilst the hand that sets the engines going is that of the Chief Commander in the Field. From the review we have made of the system, therefore, we see that one grand plan is first prepared, the operations are split up amongst the forces, each receives its own task, every link in the chain being overseered by one who is responsible for the particular part, so that the one impulse which actuates the whole force is that which originated in the mind of the Commander-in-Chief. From this conclusion we see that the organization which we have previously discussed has a definite purpose in regard to the command of the forces, and the series of groups which we have termed 'formations' provide successive Commanders with pieces with which they play the game of war. From what has been said anent the broader views of the higher commands, it must not be supposed that they do not consider the smaller commands at all. On the contrary, they show a deep interest in them, and have an undisputed right to pass opinion upon anything that may concern them; but in operations of war small features of ground, local weather conditions, unexpected resistance from enemy forces, or failure on the part of some one unit or on the part of an enemy unit, may change the whole situation within a few moments. Opportunities may present themselves, or difficulties may occur, which offer advantages or present obstacles which only the man on the spot can be conversant with, and it is therefore better to leave each of the lower commands free to carry out their particular tasks in their own way, making their dispositions according to the local conditions. It must be remembered that in warfare the soldier in the line only sees what is going on on his own very limited front. When things appear to be bad for him, they may be quite satisfactory in the broader view, because the plan is going forward as intended. If there happened

to be no higher command to weigh up the cold facts, a decimated battalion might withdraw, and quite honourably at that, at a moment when their pressure, although weak, may be the means of pinning a superior force to a position, and offering other more lucky units elsewhere an opening which will turn the tide of battle in our favour. It is inevitable that some units must suffer, and the hardship of the campaign often seems greater because the soldier does not understand where his action has helped the victory forward."—G. R. N. Collins, *Military organization and administration*, pp. 30-35.

23. Austria-Hungary.—Army of diverse races in former empire.—"The armed forces of Austria-Hungary were organized mainly on the German system, with certain exceptions due to the nature of the Dual Monarchy. There was an Imperial army; two Landwehrs, one for Austria and one for Hungary; and a general Landsturm, or levy-in-mass. There were fifteen army corps, on a territorial basis, each corps containing two infantry divisions of two brigades each, one cavalry brigade, one artillery brigade, and various corps troops. In war a Landwehr division was added to each of the regular corps. On a peace footing the strength of the army was about 350,000 officers and men, and on a war basis it would reach some figure in the neighbourhood of 2,000,000, exclusive of the Landsturm, for which no figures were given. In a defensive war *à outrance* the country could probably count on putting some 4,000,000 men, trained and untrained, into the field. The Austrian army was not a military machine which approached the calibre of the German. Austria had had no Bismarck or Moltke, not even a Gneisenau, in her recent history. Since the Archduke Charles she had had no commander of the first rank, and her campaigns from Austerlitz onward had been mainly records of defeat. Solferino and Sadowa were not encouragements to recruiting like Gravelotte and Sedan. The result was that, while her military caste was dominant and assured and many of her constituent peoples of excellent fighting quality, there was no strong popular enthusiasm for her army and no great brain-power in its direction. [In 1914] Austria was faced with a special difficulty. Under her rule were many races who had affinities beyond her borders. It would have been impossible to send her Galician troops against Russian Poland, or her Croats and Serbs against the armies of the Southern Slavs. In a war such as the present [World War] she was, therefore, bound to distribute her army corps not on purely military but on political grounds. Her Tirolese must go north of the Carpathians; her Galicians to the Italian frontier. It is obvious that such a necessity must grievously complicate her whole problem of mobilization at the outset, and of transport and reinforcements in the later stages."—J. Buchan, *Nelson's history of the war*, v. 1, pp. 54-55.

24. Belgium.—National defense problems.—Controversies during reign of Leopold II.—Conscription opposed.—Reconstruction of fortifications.—"One son per family" enlistment.—Abolition of substitutes.—Unpreparedness at outbreak of World War.—"The organization of national defence had been the subject of very special consideration as early as the first years of the reign of Leopold II (1865-1909). It continued to be for him a matter of the first importance, and he never ceased to press it upon the attention of parliament. The development at the gates of Belgium of the formidable German Empire inspired him with a lively apprehension, which he

showed by the insistence with which he urged the defence of the line of the Meuse. He succeeded in obtaining this from the chambers in 1887, at a time when relations between France and Germany were strained as a result of the Boulangist agitation, but he failed to secure the increase of the standing army necessitated by such an extension of the defensive system. At all times, and particularly on the occasion of any patriotic manifestation, he made such an increase the subject of pressing recommendations, one of the most sensational occasions being the speech which he delivered at Bruges in 1887, at the time of the unveiling of the monument to Breydel and de Coninc, the heroes of 1302. 'The Lion of Flanders,' he said, 'ought not to sleep. The noble heritage of which you are justly proud will exist and will grow unceasingly by the constant cultivation of virile sentiments and by keeping the sacred fire of patriotism alive. All liberty is born and dies with independence. That is the lesson written on every page of our history.' The anti-militarists, numerous in the ranks of the Catholic party, appealed to the guarantee of Belgian neutrality by the powers. Wiser heads pointed out that this guarantee was essentially precarious, and rested in effect upon an understanding between the powers; once the equilibrium was disturbed, Belgian neutrality would be seriously menaced. Leopold II did not cease to recommend with unflagging zeal the military question to the care of parliament. He gave indirect support to the campaign against substitution which General Brassine undertook in 1897 during his short term of office. But the majority of the Right was unflinchingly hostile to any increase in military expenditure. The *Jeune Droite* alone showed itself inclined to join the majority of the Left in strengthening the national defences. The propaganda undertaken by Brialmont in favour of universal service, and encouraged by the king, failed owing to the inertia of the ministry, which was anxious to maintain the union of the various groups of the Right. The government was at the mercy of Woeste, the leader of the old Right, and attempted to increase the effectiveness of the army by offering various advantages to volunteers. It passed a law to this effect; in two years the volunteers tripled in number, but then their numbers declined rapidly. Despite the failure of the voluntary system, ministers who succeeded to office did not dare to attempt military reform. In the course of the celebration of the seventy-fifth anniversary of national independence (1905), the king did not hesitate to insist on the urgent need for the reconstruction of the fortifications of Antwerp, the basis of the defensive system. This reconstruction involved an expenditure of more than a hundred millions. It was voted in the following year and completed soon afterwards by a reform of the artillery. From that time army reform became absolutely necessary; it was essential to raise the effectives to a number which should be in accord with the importance of the fortresses which were to be defended. At this time, under the voluntary system, the number of men with the colours had fallen from 42,000 in 1901 to 36,000 in 1907. The chamber appointed a commission which recognized the failure of voluntary service, but showed great difference of opinion as to the system which should be introduced. Finally Schollaert, Prime Minister in 1909, evolved a mixed system, that of one son per family, which was a step towards universal service. His scheme was adopted, thanks to the union in this matter of

the *Jeune Droite* with the parties of the Left, and thanks in part also to the influence of the king. Leopold II, on his death-bed, secured by his personal intervention a favourable vote in the Senate after that in the chamber. Always the foremost of patriots, he had the supreme satisfaction of leaving Belgium strongly armed and capable of arming herself still better in face of external peril. The reform of 1909 definitely abolished substitution, and was thus of considerable social importance. All citizens who were in the position determined by the law were in future on the same footing as far as concerned their duty to their fatherland. In 1913 the chambers increased the contingent [see WAR, PREPARATION FOR: 1909-1913], with the result that the army would have amounted in 1918 to 350,000 men, half of whom would have composed the field army. Before this measure came into effect, Belgium was called upon to face the most formidable military power in the world. For purely strategic reasons, Prussia without hesitation violated that neutrality which she had been the first officially to propose in 1831. But little Belgium was able to show that she was not ripe for slavery, and to justify the words used by Leopold II in his inaugural speech, 'I have always regarded the future of Belgium with the confidence which is inspired by a nation free, honourable, and brave, which wills its independence, which has known how to conquer it and to show itself worthy of it, and will know how to guard it.'—H. Vander Linden, *Belgium*, pp. 338-341.—'Belgium had twice the population of Switzerland, almost one-eighth of the population of Germany, and a commerce that ranked higher than that of great powers like Italy, Austria, or Russia. She had other advantages in the compactness of her population, her developed railroad system, her supplies of coal and iron, her open sea frontier. She possessed, in addition, a narrow front of some military value facing Germany, the line of the Meuse between Liège and Givet. In other words, her situation as compared with Switzerland was immensely more favorable for organizing a national defense. . . . The Belgian army, costing rather more than half again as much as the Swiss, roughly thirteen millions of dollars to eight, was much less efficient. It stood on paper at about 48,000 men, though this number was not actually reached, and the efficiency of its infantry was ranked low. A few show regiments of the royal guard, and the scientific attainments of the technical corps were good; the rest almost negligible. There was a reserve of about the same numbers, and a *garde civique* of no military value. Had Belgium been equipped with a system half as effective as the Swiss, she could have matched man for man with Germany on the Liège-Givet line, and quicker, up to half a million of men or more. As it was her small forces proved useless—notwithstanding the exaggerated views so widely disseminated as to what took place at Liège and afterwards.'—R. M. Johnston, *Arms and the race*, pp. 85, 89-90.—'Belgium's problem was purely defensive, and one answer to it was her fortifications. . . . The old Belgian army was organized on the basis of conscription with paid substitution, which virtually produced a force of professional volunteers. By the reforms of 1909 and 1913 the principle of a 'nation in arms' was introduced; the term of service was put at thirteen years, and the strength on mobilization was fixed at 150,000 for the field army, 130,000 for the fortress garrisons, and a reserve of 60,000—a total of 340,000 men. Unfortunately, these reforms

were not completed by 1914, and the total available was only 203,000, which, on the assumption that the fortress garrisons could not be reduced, left only 133,000 for the field. To bring the field force up to the required standard, it was found necessary to call upon the Civic Guard, one of the last survivors of the old National Guards of Europe. Belgium was, therefore, able to put in the field six divisions of infantry and one of cavalry. A division was formed of three 'mixed brigades,' each consisting of six battalions and three batteries. The artillery was good, but the equipment, especially of the infantry, left something to be desired, and no field uniform had been adopted. The Belgian soldier went into battle in the same garb that he wore in peace time on parade."—J. Buchan, *Nelson's history of the war*, v. 1, pp. 65-66.

25. China.—A peaceful, non-military nation.—Change of sentiment towards soldiers.—Defective organization of pre-Republican army.—Venality of commanders.—Chinese bravery.—Lack of medical aid.—Reasons for unpreparedness.—Chino-Japanese War.—New Republican army.—"The Empire of China, in many of its features, is the most remarkable country of the globe, and one of the most extensive, comprising nearly one and one-half millions of square miles, peopled by more than 400,000,000 of the human race, all speaking the same language, and governed by the same laws. 'The homogeneous character of the nation has no parallel in the history of the world.' The empire has existed longer than any other, authentic history going back at least to 3000 B. C., according to the Shou-king, one of their sacred books, and begins with the reign of Yao. While the contemporary empires of antiquity, Chaldaea, Assyria, the Hittite, and others, have been all swept away, that of China remains, a powerful state to-day. It sprang into being, as far as authentic records prove, highly civilized, with its peculiar language, its literature, philosophy, and industrial arts. . . . The native Chinese were never a conquering race, and most of their wars were defensive or civil, though there have been some successful military leaders, whose deeds have been recorded on the page of history. A long series of dynasties of different lengths has ruled the country during its unparalleled longevity, affording a succession of emperors who, for number, surpass those of any other country."—S. M. Burnham, *Struggles of the nations*, v. 1, p. 147.

"A double change occurred in China at some period of her history not definitely marked; the 'gentleman,' ceasing to be identified as a soldier, became a literatus, and the trader, ceasing to be regarded as a kind of general enemy, whose business was to extort undue gains from his fellow-beings, became a respectable, though not perhaps a highly respected, member of society. It would be most interesting to trace the beginnings and the progress of this revolution of ideas, and to discover how and when it came to pass that education inspired contempt for a military career; that military posts were abandoned to men lacking moral endowment for study, and that the dregs of society alone constituted a proper recruiting ground for professional fighters. History, however, offers little clue to these questions. In Japan no such change occurred. There the soldier retained his pride of place; scholarship ranked merely as a polite accomplishment; contempt for pecuniary gain in any shape headed the list of gentlemanlike characteristics, and the tradesman,

himself producing nothing and living solely by raising prices for others, remained always a despised individual, nor ever developed a commercial conscience."—F. Brinkley, *China*, v. 10, pp. 133-134.—"The Board of War [Ping-po] has a narrower range of duties than might be supposed, for it exercises no authority over the Twenty-four Banners (to be presently spoken of) and very little over the provincial troops. These two sections, together with bodies of 'braves' or irregulars, raised from time to time as occasion requires and disbanded when the need for them ceases, constitute the army of China, about which it will be convenient to speak here in some detail. The twenty-four Banners are divided into two groups of eight and sixteen respectively, the former consisting of pure Manchus, the latter of Mongols and Chinese descended from the men that aided the Manchu dynasty to conquer China. They are supposed to number about a quarter of a million men, and they furnish guards for the Palace as well as garrisons for important cities and fortresses. Their nominal pay is four taels (about twelve shillings) per month. The Tartar garrisons in great cities, like Canton, Fouchou, Hangchow, etc., are under a general of their own nationality and form a special caste, said to be in many cases little better than honourable prisoners confined within the limits of the city walls. They are supported out of the local revenues, but a special contribution is exacted from all the provinces for the maintenance of Banner-men in Peking. The Tartar general in a city nominally outranks even the viceroy within whose jurisdiction his command lies. The provincial troops, or Green Banners, as they are called, are an uncertain quantity. Chinese returns put them at 650,000 in round numbers, but by some authorities they are supposed not to exceed 400,000. The discrepancy is mainly due to the fact that official figures cannot be trusted in such matters. A commanding officer may draw pay and allowances for a thousand men, but not more than five or six hundred may be actually enrolled. A soldier of the provincial forces gets nominally three taels (nine shillings) per month, out of which he must buy his own rations. It is generally believed that the men do not receive nearly so much, a large percentage being appropriated by the officers, but beyond the established fact that the private's pay is often in arrears, nothing can be said with assurance on this subject. The men's uniform is very sensible,—a loose tunic falling over loose trousers drawn close round the ankles, and cloth boots with thick paper soles. The garments are of cotton; the tunic blue, brown, or yellow with facings of a different colour; the trousers generally blue, and on the breast or back a large circle enclosing ideographs that show the corps to which the wearer belongs. This uniform costs four taels (twelve shillings), and twenty taels are allowed for the purchase of a cavalry horse. Altogether the annual appropriations for the army now aggregate some forty million taels (seven millions sterling approximately), though less than a moiety of that amount used to suffice before contact with Occidental civilisation imposed upon China the duty of squandering her resources upon machines for slaughtering human beings. . . . It is frequently asserted as a historical fact that they ceased to be soldiers after a brief period of national existence—brief in comparison with the long life of the Empire. The lust of battle is declared to be unknown to them, and never to have been known to them. On the other hand, the most hostile critic cannot deny that their physique is ex-

cellent, and that civilian members of the population have frequently shown themselves possessed of courage and coolness in a marked degree. Mr. E. H. Parker, one of the most eminent sinologists of the era, who passed twenty-five years in China, says: 'I have found my Chinese followers in all provinces invariably true and stanch to me in times of danger, and I should not hesitate to lead a Chinese force, properly armed and brought into shape under my own supervision, against any European troops in existence. The Chinese have not the fighting instinct—that is to say, they do not relish coming to blows "just for the fun of the thing"—but they are not afraid of death, and they have no little honest pride, gratitude for kindness, and sympathy with brave and disinterested leaders such as Gordon. For all these reasons I do not hesitate to "stick up" for the poor Chinaman and to assert that he has in him the makings of a soldier.' . . . Assuredly it is not accurate to describe the whole Chinese army as 'simply a rabble, provided with bags of rice, gay flags, umbrellas, fans and (quite a secondary matter) rusty guns, jingalls, spears, heavy swords, and (very occasionally) fairly good rifles and cartridges of a date always behind the time.' Such a description may have wide applicability, but it must be qualified to the extent of admitting that there are sections of the army to-day [1900] which leave little if anything to be desired in the matter of equipment. . . . Here it is apposite to quote some of the statements made by British officers with reference to their experiences during China's first foreign war in 1830-1842:—'The Chinese showed more courage than skill. The English sailors pronounced both their guns and their powder to be excellent.' (Engagement of November 3, 1839, off Chuen-pi.) The English officers described the Chinese defence of the Bogue Forts on January 7, 1841, as 'obstinate and honourable.' 'The batteries [at Amoy, 1841] were admirably constructed and, manned by Europeans, no force could have stood before them. They were never completely silenced by the ships' guns and, it is believed, they never would have been. Let the Chinese be trained, and well found with European implements and munitions, and depend upon it they will prove themselves no contemptible foe.' 'Many of the Chinese, seeing our new advance into the battery, quickly turned and a very smart affair followed. They assembled in great numbers close to some brass guns and then fought like Turks. . . . Their conduct, in fact, was noble. Nothing could have surpassed it.' (Tinghai, 1841.) 'The main body of the Chinese was routed without much difficulty, but 300 desperate men shut themselves up in a walled enclosure and made an obstinate resistance. They held out until three-quarters of them were slain, when the survivors, fifty wounded men, accepted the quarter offered them from the first.' (Chefoo, 1841.) 'The Chinese were the worst equipped and the most innocent of military knowledge in the long list of Asiatic foes with whom the British had come into contact. Often they were no better than a badly armed moh, and even the Manchus had no more formidable weapons than their bows and spears. Yet not once did these badly armed and ignorant men evince cowardice. The English commanders always testified to their gallantry, even when hopeless, and to their devotion to duty when most other people would have thought only of their personal safety. Their defeat under all the circumstances was inevitable, but they knew how to save their reputation for courage and to prove beyond the shadow of a doubt that men who

would fight so manfully when victory was practically impossible could never be permanently conquered, and only needed the proper arms and knowledge to hold their own against Europeans.' . . . [Among the factors of demoralization cited] one is that a Chinese army does not include any medical staff or hospital corps. Where a man falls, there he lies, condemned, as he supposes, to die a lingering death of agony, and hopeless of succour unless he can crawl off and find charitable shelter in some remote hamlet. Brave men going into action seldom pause to think how things will fare with them should they fall wounded, but the bravest man can scarcely escape demoralisation when he sees his comrades left to perish like dogs, and when he expects that such must be his own fate unless he escapes unscathed. That he should learn to dread wounds and to shrink from them seems inevitable under such circumstances. The second factor of demoralisation, evidently the more powerful factor of the two, is said to be the want of good officers. It is scarcely too much to affirm that the Chinese army is altogether without officers. A Chinese officer does not lead his men into battle; he follows them; and the example he sets them is, not to face danger, but to fly from it. Therein lies the cardinal difference between China and Japan from a military point of view. The whole heart of the Japanese officer is in his profession. In time of peace he devotes himself with unflagging zeal to the instruction and organisation of his men. He has no purpose in life except to perfect himself in his own duties and to train his men for the efficient discharge of theirs. In war he shares their hardships; sets them an example of heroic bravery and is always at their head in moments of peril. The Chinese officer, on the contrary, seems to have no pride of 'cloth.' He regards his post mainly as a source of plunder, and himself as the possessor of an opportunity to get rich. Intelligent enough to know that defeat is inevitable for troops such as he commands, he prepares for the contingency by holding himself always in readiness to run away. Such, at least, is the modern appreciation of his *morale* and his methods, and if it be a correct appreciation, the conclusion is plain that no army could fight stoutly under such leadership. But, on the other hand, it will be at once objected that these defects also—absence of medical organisation and want of good officers—are not of modern development: they existed always in doubtless much the same degree as they exist now, yet they did not formerly prevent displays of conspicuous bravery. Altered methods of warfare resulting from the use of arms of precision and long range—the loose formation, the necessity for highly intelligent recourse to cover, the futility of direct frontal attack and need of flanking movements—are all calculated to accentuate the consequences of bad training and defective leadership. But all these analyses expose nothing that is radical, nothing that is irremediable, and though it would appear that, other things being equal, the Chinaman, being deficient in the fighting instinct, is never likely to make as fine a soldier as the Turk, the Japanese, the Teuton, or the Anglo-Saxon, there is certainly no visible reason why with good training, good equipment, good leadership, and a good cause, he should not be able to hold his own for defensive purposes. But it is hard to carry imagination to the extent of picturing him as a successor of the Huns and the Goths, or of seeing his units combine to form that wave of yellow peril which, according to some eminent publicists, may yet sweep over Asia and Europe from the

East."—F. Brinkley, *China*, v. 10, pp. 57-63, 70-75.

"The more easily intelligible truth seems to be that China has not reconciled herself to making a permanent effort altogether disproportionate to the emergencies of her ordinary situation. . . . Her idea of land forces and sea forces is that they need only to be sufficient for the everyday purposes of administration. Anything more would be wasteful. To be perpetually prepared for a great crisis, though great crises do not occur once in a century, is, in her opinion, foolish squandering of energy and resources. It is probably from that point of view that the civilisation of the Occident presents to her its most deterrent aspect. The States of the West exhaust themselves to maintain great armaments which may never justify their existence. They subject themselves to a perpetually painful strain for the sake of minimising the danger of an occasional hurt. There ought to be some way of avoiding such an irrational rule of life; and China appears to be still searching for that way in the face of a series of most convincing proofs that her national existence depends on abandoning the search, and frankly following the unlovely, uncivilised and illogical example of the Occident. It must be remembered, too, that a heavy burden would have to be imposed on the people in order to equip the country with powerful armaments. They are the most lightly taxed people in the world, yet no people rebel so fiercely against any increase of imposts. That appears to be the one thing against which their patience is not proof."—F. Brinkley, *China*, v. 12, pp. 100-110.—"Before the war with China I had closely examined the military organization of that country, and had discovered that there were some 50,000 men under Li-Hung Chang who were reported to be very well equipped and trained by German officers. Besides this organized army there were supposed to be between 900,000 and 1,000,000 troops in China. Of these, however, only those in the northern provinces were available for action against our armies, about 300,000 men. I therefore ever contemplated that, in case of any emergency leading to war with China, it should be so arranged that 50,000 men of the Japanese army should be devoted to meet the army of Li-Hung Chang, while the other 150,000 could deal with the 300,000 untrained troops available in Pe-Chili and the other northern provinces. I discovered also a great weakness in the army of Li-Hung Chang, and one which I could appreciate from its resemblance to a weakness which had been encountered at the time of the restoration in the Imperial army of Japan, which consisted of the feudal retainers under different feudal lords. This weakness was that Li-Hung Chang, besides drawing a considerable portion of his soldiers from his own native place, also obtained his officers there. Thus, when anything happened to an officer in his army, he could not be replaced from amongst the troops under the command of the other generals. Thus it was necessary to send to Li-Hung Chang's native province for all new officers. I also learnt of another Chinese custom which was universal throughout the whole army, and which made a great difference between the reported strength and the actual strength in the field. The Chinese army was divided into yeas, or battalions, which were supposed to consist of 500 men. In reality, however, they rarely ever consisted of more than 300 or 350 men. The commander of the yeas, or camp, was in this way enabled to pocket the pay of 200 or 150 of his soldiers from the Government grants. Even as late as the Boxer disturbances [1900],

when the Allied Forces were in North China, this state of corruption in the Chinese army did not seem to be known clearly to the world, although it was vital as creating an important difference between the paper and actual strength of the Chinese forces. It was owing to the accurate knowledge which I had obtained as to the condition of affairs in North China that it was possible so to lay the plans of the campaign as to surely and safely bring about the complete victory of our forces."—Field-Marshal Prince A. Yamagata, *Growth of the army* (A. Stead, ed., *Japan by the Japanese*, pp. 107-108).—The modern army of the Chinese republic was created by an imperial decree in January, 1905, and in October, 1907. By the latter instrument it was ordained that a force of thirty-six divisions should be raised in the provinces by 1912 on a principle of modified conscription. Each division was to number about 10,000 effectives, comprising two brigades of infantry, one regiment of cavalry, one regiment of artillery and nine batteries, one transport battalion and a sapper battalion, besides medical and other units. This new army is called the *Lu Chun*; it was intended to supersede the former provincial militia, out of which a force of civil police was organized. During 1920 the army was estimated to number about 1,500,000.

26. France.—Musketeers.—Royal army destroyed by the Revolution.—Reforms in Napoleonic era.—Creation of new army after Franco-German War.—Condition at outbreak of World War.—German military critic's review.—Comparison with German army.—The famous body of musketeers, immortalized in the romances of Dumas, originally belonged to the spearmen or pikemen. During the second half of the 16th century there was on an average one musketeer to every three pikemen, and to these the name of *mousquetaires* was first applied. From about 1560 there were musketeers in all European armies; their weapons were so heavy that each musketeer required a valet to carry it on the march. These valets were abolished by Charles IX. In 1600 Henry IV created a company of gentlemen armed with carbines for his guard; they were called the *carabins du roi*. In 1622, Louis XIII, having armed this company with muskets, restored the name of musketeers. The company was abolished in 1646, but reestablished in 1657 by Louis XIV, who fixed the regulation that none but "gentlemen" (*gens de condition*) should be accepted in its ranks. In 1660 Mazarin presented his personal guard—also composed of musketeers—to the king (Louis XIV), who in 1664 formed them into a company organized on the model of the first company. From that period there existed two companies of musketeers, distinguished according to the color of their horses—the grey or white, and the black, musketeers. Each was composed of 250 men. The musketeer paid for his own equipment, the king contributing only the sleeveless coat (*soubreveste*) or cassock, and a musket for the city (Paris) and a lighter weapon for use in the field. The color of the *soubreveste* was a kind of Dalmatian blue, embroidered with gold or silver, according to the particular company, and adorned in front and on the back with a black velvet cross *fleury*. When the king accompanied his army, the two musketeer companies were in close attendance. The flag of the first company emblazoned a bomb falling upon a town and bearing the legend *Quo ruit, et lethum*; that of the second depicted a sheaf of twelve feathered darts, pointed downwards, with the device, *Alterius Jovis altera tela*. Under Louis XIV the two companies also served

the purpose of a military school for the young nobility. Shortly after his appointment as minister for war in 1775, the Comte de Saint-Germain, for reasons of economy, suppressed the musketeer companies; they were revived in 1789, but disbanded again in 1792. They reappeared in 1814, but were finally abolished in 1815. The French army of today took its rise from the old royal army of Louis XIV created by Louvois (1641-1691), the first modern war minister. This royal army had a brilliant career in the second half of the seventeenth century and was in its day as much a model military organization of Europe as that of Prussia and Germany were to be at a later time. The French Revolution destroyed this army along with the other institutions of the *ancien régime*, and in its place arose the armies of the republic [see FRANCE: 1789 (June)] under their

LAZARE CARNOT

master builder, Lazare Carnot (1753-1823), who became the Louvois of the new creations. The *levée en masse* of 1793 produced the requisite number of men while a long period of war permitted the development and perfection of the military machine. Warlike enthusiasm had failed in the early days of the revolution to maintain a steady flow of recruits and the methods of the Terror could not be a permanent substitute. In 1798 conscription was established by law and so permitted a systematic utilization of the manpower of the country. It was upon these foundations that Napoleon built and the *grande armée* was the result. Among the notable innovations effected during the revolutionary and Napoleonic era were the development of mass tactics for all arms, infantry, cavalry and artillery; the creation and perfecting of the army corps (*corps d'armée*) as a complete army in itself; the improvement in communicating military intelligence through new signaling devices such as the heliograph; and especially the creation of the general staff (*état-*

major). This period, which is so brilliant in many ways in the achievement of generalship and war organization, was not signalized, as one might expect, by improvements in the mechanical instruments of warfare. In rejecting Fulton's steamboat, Napoleon neglected a first-class opportunity of utilizing a great invention and in general the progress in armament and equipment was surprisingly slow. However, in its main outlines, the French army under the First Empire became essentially modern [see also FRANCE: 1805 (March-December); 1812-1813 (December-March); 1814; GERMANY: 1813 (August-October)], though the later developments are to be studied best in the system evolved by Prussia and Germany. During the Restoration, 1815-1830, the French army decayed, but under the Second Empire, 1852-1870, there was an enthusiastic cult of Napoleonic traditions. Nevertheless, the Franco-German War of 1870-1871 so enhanced the military prestige of Germany that the army of the Third Republic was built up along the lines of Gneisenau and Scharnhorst quite as much as those of Napoleon. The following account, written by a descendant of one of Napoleon's greatest marshals, describes this development in detail:

"Immediately after the proclamation of the Republic our armies were prisoners or besieged and the enemy a short distance only from the capital. . . . When the war was over and peace had been signed the National Assembly comprehended the necessity to remold completely our military organization or rather to place it on the footing of an army capable of accomplishing its task. The ideas of revenge that developed rapidly made it possible to find in public opinion the solid foundation necessary for the accomplishment of such a difficult matter; and if the very first thoughts of Thiers and Gambetta, who were the leaders of the National Assembly, were to protect the country against a repetition of the disasters of invasion, the hope of regaining Alsace and Lorraine from the enemy made them accept unhesitatingly the necessary sacrifices. We lacked everything in 1870—troops, divisional organization, artillery, fortifications and general staff. From the moment when the peace treaty was signed the work was begun. But though the country was willing to make every effort demanded to assure the national defense, the government felt the danger of too great publicity to its plans, from the point of view of foreign policy, in the presence of an enemy who openly declared his determination to crush us for many years. . . . The recruiting law of 1872 was a compromise between the system of the nation under arms and the professional army. This was true in greater or less degree of the three subsequent recruiting laws. Although the law imposed the principle of universal obligatory service, established the categories of the active army, the reserve army, and the territorial force and fixed the duration of active service at five years, still a portion, determined by lot, served only six months; another portion was permitted to volunteer for a year; and finally, the sons of widows, ecclesiastics and members of the teaching profession were relieved from all service. [See WAR, PREPARATION FOR: 1872.] This system made it possible for us to have the large number of troops that were so sorely lacking in 1870. This law was supplemented the following year, 1873, by the law on the organization of the army from which was to result the establishment of regional army corps. In this manner the territorial organization in time of peace fitted in with the organization of the army to be mobilized in case of war. This mobilization was thereby as-

NAPOLEON BONAPARTE

From Snuffbox Portrait by Delaroche

sured and the disorder that marked the mobilization in 1870 was provided against. In 1875 the army law fixed the status of officers. A great source of weakness for the inadequate and badly organized army of 1870 was the insufficiency of staff officers. . . . The valor of the soldiers was remarkable, their training perfect and their steadiness and morale incomparable. But they were almost invariably sent into badly-planned battles where the officers had been surprised by the enemy and lacked the precise information necessary to defeat the enemy. And moreover, many actions begun under most unfavorable conditions could have been carried through to victory if the staff officers had been well enough versed in their profession to manoeuvre their troops and had not allowed some units to remain inactive while others were uselessly destroyed. In order to prevent a like danger there was founded in 1876 the War College, to provide us with the staff officers indispensable to a modern army. . . . In 1874 the infantry was supplied with a new rifle well designed and particularly durable. In 1914, forty years later, we were very fortunate to have a large reserve supply of these rifles. In 1877 the artillery was equipped with 'de Bange' guns which provided a series of calibers systematically worked out to meet all the needs of the field of battle. The special qualities of these guns were so notable that it was possible to employ them without too great disadvantage against the powerful German artillery at the end of 1914 and during the long months following. As for the employment of this army in time of war it is plain that under the influence of recent defeat it was planned to be principally defensive. Séré de Rivièrè undertook to assure the protection of the national territory and of the capital, seriously threatened because of its geographical situation. For this purpose he planned his very complete system of first and second lines of defence along our north and northeast borders, with intentional open spaces to permit manoeuvring through these lines, and to the rear up to the central fortification composed of the entrenched camp of Paris. The execution of this plan, based on truly prophetic vision, was undertaken immediately after our disasters and resolutely carried through. Furthermore, the security of the country did not rest only on the stones of our fortresses but also on the army of campaign and manoeuvre. The concentration of our troops was carefully prepared for as well as the arrangements for strategic transportation. A high railroad commission was newly established whose studies and records were always kept up to the minute and in 1914 made it possible to mobilize and concentrate our troops without any difficulty or serious accident. Finally, the creation of the geographic service completed the equipment of our armies. . . . But the progress of science did not allow the country to relax its efforts. Twelve years after the adoption of the '74' rifle the appearance of repeating rifles obliged us to transform the weapons of our infantry. The troops received the Lebel rifle, model '86.' At the same time the discovery of a new explosive, melinite, was calculated to bring about for the artillery somewhat later, after considerable developments, the transformation of our fortifications by the necessary adoption of the concealed cupola. Shortly after, by the active initiative of M. Freycinet, a series of regulations of the highest importance for our military staff was adopted. There was first the decree of 1888 which created the general staff of the army; the substitution of this body for the general staff of the ministry assured a greater stability and a greater continuity of

views. At the same time the High War Council was created with the duty to give its advice in all great questions of interest to the national defense. Its vice-president was the commanding general of the French armies. The later decrees (notably those issued by M. Messimy) merely developed the principles then established. On the other hand the internal organization of the army, as far as its officers were concerned, was assured by the decree creating classification commissions. In the year following (1889) it became necessary to revise the law of 1872 on the recruiting of the army. In spite of the political situation still troubled by incessant strife in parliament, the government succeeded in having a new law passed constituting the three years service but incorporating the entire contingent. . . . While the principle of obligatory service was confirmed by the suppression of exemptions and substitutions, it is true that too many dispensations were granted to such classes as those who supported families or who had certain educational qualifications, limiting their service to a single year; this was one of the principal defects of the law. But interest in the complete assurance of the national defense remained keen. After 1891 considerable development was given to manoeuvres on a large scale, in which as many as four army corps participated, and to manoeuvres by squadrons. Some years later in 1897, the artillery in its turn was modernized following the adoption of the cannon of 75 millimeters. This was a serious burden for the country but every one knows how well it paid. . . . In 1899 the French army was increased in power by the law providing for the colonial army. . . . That law permitted the organization of native colonial troops who played such an important rôle in the world war. Moroccans, negroes, Annamites were able to stand beside the children of the attacked metropolis and the very indignation of the Germans against the use of these troops in Europe demonstrates to us what an invaluable reinforcement they were and again may be for us. At the same time the colonial army is an admirable training school for officers of all ranks. Unfortunately the adoption of the last-mentioned law coincided almost exactly with a relaxation of our effort that almost resulted fatally for us. From about 1900 the party in power ceased to believe in the possibility of a war and in the need of having a strong army. . . . Finally a . . . serious blow was dealt to our military organization by the passage of a new recruiting law in 1905. . . . That law established the two years' service without exception or dispensation. No provision was made to compensate by judicious organization for the weakening of the army by the loss of a third of its numbers. It was simply a question of relaxation of military duty. The length of the periods of training for men in the reserve was shortened at the same time as that of the men in active service. . . . Without doubt serious lacks were revealed at the beginning of the war. We had no heavy artillery, very few machine guns and our high command was surprised by the German strategy. But in spite of all these imperfections, the French Army, in the first weeks of the war, almost alone saved the country and the whole world from German domination. Then the army learned to adapt itself to war conditions."—A. Lannes de Montebello, *Third Republic and the national defense* (*Journal des Débats*, Nov. 10, 1920).—The French army, as is usual with a nation whose last great campaign ended in defeat, had been the subject of many experiments in the past forty years. The law which governed it in its present [1914] form was

only one year old; which meant that the service was not yet properly standardized, and many of those with the colours were the products of superseded statutes, just as in Britain the term of enlistment laid down in 1902 only ceased to work in 1914. The [French] law of 1913, like its predecessor of 1905, was framed to reduce the disparity of France as against the rapidly increasing manpower of Germany. [See FRANCE: 1913-1914; WAR, PREPARATION FOR: 1913.] Unlike Germany, she called practically her whole able-bodied male population to arms. A Frenchman found fit for service joined the colours at the age of twenty, spent three years in the Regular Army, eleven in the Regular Reserve, seven in the Territorial Army, and did not leave the service till he had attained the age of forty-eight. On mobilization the Regular Army, which had a peace strength of 673,000 men, was practically doubled by the incorporation of men from the Regular Reserve. The remaining reservists were organized in reserve units similar to the regular, and out of the Territorial Army special units were formed corresponding to the regulars, and the remainder kept as a last reserve at the *dépôts*. Roughly speaking, the system gave France a month or so after the beginning of war 4,000,000 trained men, of whom we might allot 700,000 to the Regular Army, 700,000 to that portion of the Regular Reserve required to put that army on a war footing, 700,000 to the balance of the Regular Reserve, 700,000 to the embodied Territorial Army, 700,000 to the Territorial *dépôt* reserve, and 700,000 to the Territorial surplus. This gave a first line army of about 1,500,000, a second line of about 500,000, and a reserve of some 2,000,000. The internal organization of the French force corresponded closely to that of Germany. There were twenty army corps on a territorial basis, nineteen located in France and one in Algeria. An army corps had two divisions, a division two brigades, a brigade two regiments, a regiment three battalions each of 1,000 men. In addition, there was in each corps a battalion of chasseurs, a cavalry brigade, and a special force of corps artillery, not allocated to the divisions, and numbering twelve batteries. Apart from the corps there were eight independent cavalry divisions, each division comprising six regiments, divided into two or three brigades. There was also a special class of African troops. . . . The white African infantry consisted of four regiments of Zouaves, each of five battalions, the white cavalry of six regiments of Chasseurs d'Afrique, the force whose famous charge all but redeemed the calamity of Sedan. The native African infantry were the six regiments of Algerian Rifles or Turcos, the heroes of Solferino; the native cavalry the four regiments of Spahis; and there was in addition a division of Tirailleurs Senegalais, negro troops from the Niger region. . . . The army of France, though inferior in man-power to the German, ranked easily second among the forces of the world. Her North African possessions gave her a magnificent training-ground, and many of her troops had had actual experience of war. If Germany's inspiration was Moltke and 1870, France's was the Wars of the Revolution; and in many points, like the heavy loads carried by the infantry and the belief in rapid and cumulative attack, her views were those of the Grande Armée. The French infantry retained all their historic dash and *élan*, and were probably the best marchers in Europe. The French General Staff, too, had not been behind Germany in that 'fundamental brain work' which was rightly regarded as the basis of success. Some of the best military literature of modern times had been produced by French officers,

and France had of late years shown a remarkable aptitude for military inventions. In one respect she differed greatly from her neighbour. She had no militant caste to draw upon for her officers. The highest posts in her service were open to any one who could pass the requisite examinations and show the requisite talent. A democracy has its drawbacks in war, and a republic cannot give, perhaps, that freedom from political interference and that continuity of policy which are desirable in a military machine. But the lack of this mechanical perfection had its compensations. If the discipline appeared less rigorous, there was a far greater *camaraderie* between men and officers, as any one who has marched with a French regiment will bear witness. In a defensive war for national existence this spirit of fraternity might be more potent in battle than any barrack-yard precision."—J. Buchan, *Nelson's history of the war*, v. 1, pp. 55-56, 58-59.—"France had already in time of peace drawn upon her national strength to the utmost limits, and had considerably lowered her standard of military fitness. Hence it resulted that the total war-strength of the country, which comprised only thirty-nine and a half million inhabitants, was not only equal to that of the German Empire, with its close upon sixty-seven million inhabitants, but, at the beginning of the war, even exceeded it. Stegemann considers that the estimate of the strength of the French Army in August, 1914, at one and a half million is, if anything, below the mark. The total fighting strength gradually accumulated by the French, he estimates at five and a half millions, in connection with which it has to be considered that France called up a considerable black army, numbering in all 700,000 men. The war-preparedness of the French Army had been continually increased, with a view always to the *revanche*. In 1913 France reverted to the three years' term of service, and called up the classes of two years simultaneously. By this means, the peace-strengths of the corps were notably increased, an advantage at the beginning of the war which should not be underestimated. According to Stegemann, however, the same degree of preparedness for war did not extend throughout the whole army. In this respect, the territorial divisions left something to be desired, and 'defects of organization were already revealed at the calling up of the reserves.' As regards the efficiency of the army, the same writer pronounces the following judgment: 'The French Army, which was intended for an offensive movement on a large scale, had, to be sure, after its augmentation in the course of the last few years, accepted the offensive theory in principle, but was, in fact, by its very nature, unprepared for far-reaching movements and encounters in unknown territory. It was much more adapted for the *offensive defensive*. [See WORLD WAR: 1915: II. Western front: f, 2, i.] The latter affords the French opportunity for displaying their ingenuity in the erection of strong points of support, for winning small territorial gains by the independent action of the subordinate command, and for constantly renewing the morale and courage of the troops by dint of minor successes. Their lack of mobile heavy howitzers, such as we possessed from the outset, was partially made up for in the case of the French, by their extremely skilful use of their field-artillery. If they were not equal to the Germans in a war of movement, they showed themselves from the outset masters in the art of rearguard tactics. As a result of the heightened self-confidence which was infused into their ranks after the Battle of the Marne, they became more and more worthy of respect as opponents, though they were more skilful in the technique than in the

actual tactics of fighting. The close proximity of their sources of supplies, due to the fact that they were fighting in their own country, was very much in their favour, and enabled them to make full use of their abundant technical resources, in particular of their long-range heavy artillery. Since they had free access to the sea, they had at their disposal an almost unlimited supply of munitions.' Individually, the French infantry were not equal to the German. [The French] General Cherfils commented regretfully on this fact when he wrote: 'The German is a true soldier. Discipline has become part of his flesh and blood. That is his greatest source of strength.' The General extols that uniformity of training which penetrated into the lowest ranks of the German Army. 'The opponents of a long term of active military service and of thorough preparation in time of peace should consider the following facts: A militia army with an abridged term of training may perform heroic deeds, the regiments may exhibit a high standard of cohesion, but such an army will lose all its strength if circumstances compel it to break up its principal units and to blend these together.' Although the whole French nation had passed through the school of arms, the steadiness and cohesion in the formations was, in contrast with ours [the German], not so firm but that it was seriously impaired as a result of the numerous new formations and the continual bringing up of new levies." —Baron von Freytag-Loringhoven, *Nation trained in arms*, pp. 15-19.

27. Germany.—Creation of army by Great Elector of Brandenburg.—Beginnings of Prussian military system.—Wars of the seventeenth century.—Frederick the Great.—"No factor has been more fateful, both for good and evil, in the history of modern Germany, than the Prussian army. Its development runs parallel, step by step, with the development of the Prussian state, of which it is both a cause and a result. In its history there are two decisive epochs. The first is the establishment and maintenance by the Great Elector of a *miles perpetuus*, or 'standing army.' This was a permanent, active field army kept on foot in time of peace as well as war, and was composed of well-disciplined and well-trained professional, paid soldiers in the direct service and control of the sovereign. Being an army of paid professionals, as distinct from a civilian militia, it was necessarily limited in numbers by the revenues available for its support, and was in fact relatively small in comparison with the total population—a great contrast to modern armies based on the principle of universal military service. It may be compared in many respects with the English army of the eighteenth and nineteenth centuries or with the regular army of the United States. It was the outgrowth of the danger threatening Prussia from the aggressive plans of Charles Gustavus of Sweden during the first Northern War. The second decisive epoch was the great liberalizing and nationalizing reform movement of Stein and Scharnhorst at the opening of the nineteenth century, which resulted in the establishment of a national Prussian army based on the principle of universal military service. It was the outgrowth of Napoleon's conquest of Prussia and of his boomerang-like decree which attempted to limit the Prussian army to 42,000 men. . . . The military situation in the Electorate of Brandenburg was one of the first questions with which the Great Elector had to deal. Shortly before his accession his father's minister, Schwarzenberg, had made a desperate effort to recruit 25,000 mercenaries in the name of the Emperor and

the Elector, with which to drive out the Swedes. But the force which Schwarzenberg actually got together numbered scarcely 5000, and represented the worst scum of the earth. They were recruited under the old regimental mercenary system, in which the colonel received a lump sum for raising and equipping a regiment, which he regarded as his own private property. . . . Moreover, this pitiful little army of Schwarzenberg's was too small to expel the Swedes and too defiant and too disorderly to be of any real benefit to the Elector. . . . The population of Brandenburg complained bitterly that the soldier within the gates was far more terrible than the Swede without. They begged the Elector to disband the unruly *soldateska*. And the Elector himself summed up the situation in April, 1641, by writing: 'We find that our military forces have cost the country a great deal and done much wanton damage. The enemy could not have done worse. We do not see that we have had, or are likely to have, the least benefit from their services. Therefore we have resolved to keep only what is necessary as a garrison for our fortresses.' He therefore speedily made a truce with the Swedes, and thereupon began the disbandment of this old, disorderly army of regimental mercenaries which he had inherited. By a reduction of the infantry from thirty-nine to sixteen companies it was possible to dismiss a great many officers, who were the most insolent, the most hated, and the most expensive part of the army. From the men in the ranks were dropped the undesirable and the unfit. . . . Those who were retained in service numbered scarcely enough to man the garrisons, but they formed a tiny nucleus for a new and relatively well-disciplined army. It was composed so far as possible of the Great Elector's own subjects, so that it might have a little feeling that it was fighting for the defense of home and country. It was sufficiently well paid so that it did not have to resort to the plunder and oppression of the people whom it was supposed to defend. Though it had to protect the scattered fortresses in all the Elector's lands it numbered less than 3000 men for several years, because none of the Estates would consent to raise money for the support of any larger force, and the Elector had as yet almost no other revenues of his own available for military purposes. In the last years of the Thirty Years' War, to be sure, he managed to increase his army to nearly 8000 men. . . . This little force of 8000 men, which was the outgrowth of the last years of the Thirty Years' War, has been spoken of by nearly all writers on Prussian history as the beginning of the standing army. But a closer examination of the situation after the peace of Westphalia does not support this view. After the provisions of the great peace had been carried out in 1650, and after the failure of the Great Elector's ill-starred attack on the Duke of Neuburg in 1651, commonly known as the 'cow war at Düsseldorf,' he was again forced to follow the example of all his predecessors and most of his contemporaries in disbanding his army as soon as the war was over. He was forced to do so both by the insistence of his Estates and more especially by his lack of any resources of his own with which to support any considerable body of troops. . . . All that he could afford to retain, aside from his modest military escort of 63 horse guards and 202 life guards, were the troops absolutely necessary to garrison the fortresses. . . . Altogether the total garrison forces amounted to a Lilliputian army of just 3007 men. . . . It was in no true sense a standing army, *i. e.*, a permanent active field army, with an assured means of support, kept on foot in times of peace as well as of war. The true

beginnings of the Prussian standing army are to be found, not in the Thirty Years' War, but half a dozen years later in connection with the Northern War, 1655-1660. There is another mistake, also, which is common to most Prussian writers, who wish to attribute to the Great Elector a greater vision of the future than he actually enjoyed. It is the mistake of saying that he deliberately planned to create a standing army in the interests of centralization of power and absolutism. He did not do so. His first measures, when the Northern War became imminent, show that he did not intend to recruit a permanent army, but only the customary temporary force to be kept on foot during the continuance of danger. . . . Through [the] unavoidable necessities [of the Northern War] he created in time of war a standing army which he and his successors never wholly disbanded in time of peace. . . . At the critical moment of an impending war between his two Swedish and Polish neighbors, the Great Elector had for the defense of his neutrality and his lands nothing but the handful of garrison troops scattered . . . among his isolated fortresses. How should he form an army to meet the threatened danger? . . . In his need for troops, as the Northern War grew more threatening, he finally decided to turn to a committee of the Brandenburg Estates and ask for a grant of money sufficient to recruit, equip, and maintain 3000 new troops. To strengthen his request he called attention to a recent decree of the Imperial Diet, which allowed any prince to proceed by military execution against subjects who refused to contribute to the defense of the Empire. Though his language was conciliatory, it was firm, and left no doubt that he intended to act on the principle, 'that the military force of a country must be organized in accordance with the danger and necessity.' In other words, necessity knows no law, *Not kennt kein Gebot*, and he himself of course was to be the judge of the necessity. The Estates shrewdly pointed out, what appears to be the fact, that the Imperial Decree cited did not technically apply in this case, for it was East Prussia, not Brandenburg, which was in danger from the Northern War, and East Prussia, strictly speaking, was not a part of the Empire. Moreover, the Brandenburg Estates took the attitude that they were under no obligation to defend East Prussia. Let East Prussia look after its own safety. However, after delay and haggling, they consented to provide small sums for raising a part of the foot-soldiers that the Elector requested. In July the advancing tide of war and 'necessity' compelled him to request urgently equipment of 3000 additional men. . . . But this time the Estates refused, characteristically preferring 'to trust in God and wait patiently upon events.' The Elector therefore proceeded to the extreme step of collecting a land tax of 180,000 Thaler by military execution. . . . It was with these means that the Great Elector was in part able to raise the army with which he won a year later his first great field victory, the three-days' battle of Warsaw (July 28-30, 1656). In this battle, for the first time, troops from Brandenburg, Prussia, and Cleves-Mark fought side by side under a single flag and a single leader for a single, common purpose—the strengthening of the dynastic power of the Hohenzollern family. This new army of nearly 10,000, which strikingly embodied the new Brandenburg-Prussian estate, had borne gloriously its first baptism of fire. During the remaining years of the Northern War, Brandenburg was forced to contribute on an average nearly 500,000 *Th.* [Thaler] a year for the support of the new army. In East Prussia, Cleves, and his other provinces the Great

Elector exerted an equally heavy financial pressure in ways which cannot here be described, but which called forth loud and bitter protests from the Estates. With the revenues which he thus raised he was able to recruit and equip in the course of the Northern War an efficient field army of over 27,000 men, not including the 4000 men serving in the garrisons. With this army he not only successfully repelled invasion in the latter part of the war, but was able at last, with the aid of duplicity, to shake off the hated Polish overlordship in East Prussia and to secure the recognition of his own sovereignty there. The Great Elector's excuse for imposing such taxes and creating such an army had been the 'unavoidable necessity' caused by a war not of his own making. When the war was over and the peace of Oliva had been signed, the Estates in each of his lands expected that he would follow the example of his predecessors in disbanding his forces until they were reduced again to the scanty garrison and body-guard troops customary before the Northern War. But the Great Elector now had no such intentions. 'I have become convinced,' he wrote, 'that I owe the preservation of my position and my territory to God, and next to God, to my army.' . . . He had realized in the Northern War how dangerous 'unpreparedness' is when one's neighbors are full of military activities. He saw that his subjects had become somewhat accustomed to the payment of military taxes. He saw that the time had come for maintaining by policy in time of peace, as a *standing army*, a part of the force which he had raised by necessity in time of war, as an active fighting army. Therefore, while disbanding more than half his forces, he still retained after the Northern War about 12,000 men, 5200 of whom were assigned to make more generous provision of defense of the garrisons, and the rest of whom were distinctly retained as a permanent field army. This is the true origin of the Prussian standing army. In reducing his standing army to a peace footing after the Northern War the Great Elector still had to observe the utmost economy, for his lands were poor and he had not yet developed a large source of revenue for military purposes. Thus, the artillery, which on account of its large equipment in horses was one of the most expensive, though smallest, parts of the army, was wholly given up. The guns and gunners were redistributed again among the fortresses. This continued to be the practice throughout the Great Elector's reign. Only in time of war were the guns brought out again from the fortresses and mounted to form a temporary artillery division. The Great Elector also reduced the number of officers, but not proportionally with the rest of the army. A large number of officers, instead of being dismissed altogether, were kept in his service by paying them 'waiting money' (*Wartegeld*). They had no soldiers under them and no duties in time of peace. They were, in a sense, on temporary leave of absence. But if war broke out, they were bound by the terms of their 'waiting money' to be ready to recruit new regiments or to take command of old troops, according as the Elector should direct. Thus the Great Elector assured for himself an adequate number of good, experienced, and trusted officers without the burden of actually supporting a correspondingly large number of common soldiers. In time of peace also the Great Elector, with characteristic thrift, found means of turning his standing army to profitable uses. Soldiers were employed in digging the famous Frederick William canal connecting the Elbe with the Oder. In 1663 soldiers were conveniently used in transforming the Tiergarten into a pleasant park and suburb for

Berlin. In the same year, when the Turks again became dangerous and the Emperor begged for help, the Great Elector was able to lend him 2000 troops—on condition that the Emperor should pay all the costs of their support. The Estates, however, were by no means reconciled to his retention of even a small standing army, and they did not believe that the rumors of war at all justified his continued forced collection of military taxes which had not been constitutionally granted. They protested loudly, but in vain. . . . His triumph over the Estates in East Prussia, in the course of which the leaders of the opposition, Roth and Kallckstein, were kidnapped and imprisoned, is well known. In Brandenburg, when a deputation of the Estates presented a list of grievances in 1666 he expressed

lands over a very wide front from the Rhine to the Memel, Frederick William steadily increased his standing army until it reached in 1678 the maximum number of over 45,000 men, including all branches of the service. This number was beyond his own means of support. It was only through the fortunate circumstances that he was able to secure considerable subsidies from his neighbors—303,800 *Th.* [Thaler] from Spain, 770,622 from the Dutch, and nearly a million from the Holy Roman Empire—that he was able to keep on foot a standing army of this size. After the French-Swedish War had been brought to an end by peace in 1679, Frederick William again reduced his forces by somewhat more than one-half, just as he had done after the close of the Northern War, but he still retained a very

FREDERICK THE GREAT
(After painting by Carl Seiler)

himself sharply. . . . At the same time the Elector began to devise, and eventually put into operation, a number of new military taxes which he hoped would afford him a steady revenue for the standing army, and yet which would not bear with such a direct and irritating pressure on the people as the old land-tax (*Kontribution*). The new taxes would also have the great advantage that their collection and administration would be mainly in the hands of the Elector's own personal officials, could be centralized at Berlin, and could be made in time more or less uniform for all his territories. . . . In order to secure means for building up a navy, the Elector levied after 1686 a tax (*Chargensteuer*) which somewhat resembled in principle the 'first fruits' of the medieval church; every official on receiving a new office had to pay over to the government half the first year's salary. . . .

"During the wars with Louis XIV. and the Swedes (1672-1679), when he had to defend his

respectable standing army of about 18,000 men. This remained the average size of the army until the outbreak of the war which followed Louis XIV.'s invasion of the Palatinate, when it was increased again to 30,000. It made Brandenburg-Prussia, next to Austria, the strongest power in Germany and a highly prized ally in the War of the Spanish Succession. The indirect effects of the standing army were perhaps even more important than the direct. As the army was one of the first institutions which embodied the unity and efficiency of the whole Brandenburg-Prussian state, in contrast with the weakness and corner-grocery attitude of the separate provinces, so the organs of financial administration which were developed for the army's support . . . soon came to form a centralized and efficient administrative service. This rapidly supplanted the various lax and decentralized agencies which had been managed by the Estates. The absolutistic officials of the Elector gradually took the place

of the particularistic agents of the Estates. In many cases the Elector shrewdly adopted and transformed their agents into officials of his own. And the curious thing is that within a generation many of the families which had been loudest in their protests against the Great Elector's attacks on their so-called liberties were the very ones who made the most loyal and efficient members of the new Prussian bureaucracy."—S. B. Fay, *Beginnings of the Prussian army (American Historical Review, July, 1917, pp. 703, 766-777)*.—See also GERMANY: 1701-1740.—Frederick the Great also was particularly concerned "to increase and improve the army with which the very existence of the Prussian kingdom was so closely bound up. To increase it was his first object, and by 1756 it mustered 155,000 men. Garrison duty absorbed 27,000 of these; for the repairing and strengthening of many fortresses, especially in the newly-acquired Silesia, had made a considerable increase in the garrison-battalions necessary. The rest, 126 battalions and 210 squadrons, formed a highly efficient field army, which an iron discipline, a careful training on the parade-ground and in the manœuvres and camps of exercises which were held every year had made a force even more formidable than that which Frederick William had bequeathed to his son. In staff work, in organization, in preparations for mobilisation, great improvements had been made. No efforts had been spared to collect vast reserves of clothing, weapons, provisions and military stores of every kind. But it may be doubted whether it was not even more to the King and commander than to the soldiers that these years were so useful. There was not the same room for improvement in the Prussian army as there was in its commander. Frederick had learnt a good deal about the art of war on the battlefields of Bohemia and Silesia, and he devoted the peace to a careful study of the profession of arms. It was now that he devised and worked out the system of attacking in oblique order, which was to win so conspicuous a triumph at Leuthen. Many of the greatest qualities of a general he already possessed, resolution, decision, a readiness to take risks, promptitude, tenacity, unbounded self-confidence; but it was in handling large masses of men in the manœuvres that he learnt to really understand his weapon, on the drill-ground that he was able to test and improve his system of tactics, in peace that he prepared for war."—C. T. Atkinson, *History of Germany, 1715-1815, pp. 104-105*.

28. Germany.—Army reconstruction after Jena.—Scharnhorst, Gneisenau and Clausewitz.—Work of von Roon and Moltke.—Wars of 1866 and 1870.—Subsequent reorganization.—"On October 14th, 1806, Napoleon defeated the Prussian army at Jena. Murat's relentless pursuit to the shores of the Baltic captured or scattered all who had escaped the rout. Nothing was left of the army, which had lived for fifty years on the fame of Frederick the Great, except the garrisons of a few fortresses. In the following winter the defeat of Prussia's ally, the Czar, at Friedland, completed the humiliation of the House of Hohenzollern. By the Treaty of Tilsit Prussia became a tributary of the French Empire. And with a view to making this subjection permanent an article of the treaty provided that the Prussian standing army should be reduced to 42,000 men. Thanks, however, to the clear-sighted action of a group of patriotic men this disaster became the starting point of a new epoch of national progress for Prussia. To the reorganisation of the country after Jena must be traced the making of the German army of to-day, and indeed the origin of the military systems of all

the great powers of Continental Europe. The military reorganisation of the kingdom was the work of Scharnhorst and Gneisenau. . . . Scharnhorst was the author of the plan of reorganisation adopted in 1807. Its central idea was to make the little army of 42,000 men, which Prussia was allowed to keep with the colours, not a standing army in the old sense, but a training school through which a large number of men could be passed, who would then form a reserve that could be called up for service when the day came for a national uprising against the French domination in Germany. Short service was therefore introduced. The plan worked so successfully that in 1813, when Prussia joined the coalition against Napoleon, which ended in his downfall, the army of 42,000 men was at once expanded to over 120,000 by calling up to the colours old soldiers and a large reserve of trained men formed since 1807. . . . After the downfall of Napoleon, it was Gneisenau who carried on and perpetuated Scharnhorst's work of reorganisation. A third great soldier, Clausewitz, who had fought in the Prussian and Russian armies in most of the campaigns of the Revolution and the Empire from Valmy to Waterloo, gave the Prussian army, in his writings, a practical theory of war on which it has acted ever since. Clausewitz was one of the first professors of the school of war founded by Scharnhorst in 1810 for the higher training of selected officers, and he was its director from 1818 to 1830. This school, now known as the *Kriegs Akademie* (War Academy) is the German Staff College. Its teaching staff is made up not only of soldiers, but also of civilian experts. Thus, for instance, Karl Ritter, one of the founders of modern scientific geography, was a professor of the War Academy for thirty-nine years, and during this time organised the remarkably efficient map department of the General Staff. The basis of the new army organisation was universal obligation to military service. This does not mean that every man served in the army, but that on reaching the age of twenty every man had to present himself at the recruiting centre of his district, and the army authorities enlisted as many men as were required to make up the annual contingent. The recruits thus enrolled served for three or four years. They were then passed into the reserve, and were liable to be called up on a declaration of war to bring up the first line of the army to war strength. After completing his reserve service, the Prussian soldier belonged for some years more to a second line army, known as the *Landwehr* (the 'guards of the land'). The *Landwehr*, though primarily intended for home defence, could be employed for active service beyond the frontier, and were counted upon to form the garrisons and guard the line of communication of the active army. After being dismissed from the *Landwehr*, the Prussian soldier passed into the *Landsturm* (the 'rising of the country,' the '*levée en masse*'). This force was the third line. They could be called to arms for the defence of Prussia in a great emergency, and it was laid down that in this case they would not wear uniforms, but only badges. For some sixty years, the Prussian army was the only one in Europe organised on the system of short service and large reserves. Every other army was formed of long-service soldiers, and it was the fashion to talk of the Prussian army as a kind of militia, largely composed of half-trained men who could not stand up against professional soldiers. A second cardinal principle of the new Prussian system was the localisation of the army, and its permanent organisation in territorial army corps. Napoleon had organised the Grand Army in a number of corps, each usually com-

manded by one of his marshals. But these corps were formed by from time to time assigning a certain number of regiments to one or other of these commands, and the composition of the corps varied in each new war. The Prussian army corps was a little army complete in infantry, cavalry and artillery, recruited and permanently stationed in one or other of the provinces of the kingdom. The localisation was carried even further. Each regiment was raised in, and permanently connected with, a town or a group of villages. The result was that in every battalion and company, in every squadron and battery, the men were neighbours and kinsfolk. It was a kind of adaptation of the old tribal system to modern war, and it had the great advantage that it rendered mobilisation a fairly simple business. The men who were to fight side by side gathered in their village, went into the nearest town, where they found their friends and neighbours beside whom they were to serve, put on once more the uniform of the regiment in which they had received their training, and found themselves under a colonel and a general whom they had often seen at the head of the troops at local reviews and route marches. The ideal of the whole organisation was that the nation should be ready in the event of war to bring its whole manhood into the field. But during the first half of the nineteenth century this ideal was far from being realised. The armies of all the powers of the Continent were kept at a figure far below that of the later years of the century, and Prussia did not possess the resources or feel the necessity to train any large proportion of the men who were each year liable to service. There was a partial mobilisation of the Prussian army in 1850, during the war between Napoleon III and Austria. Prince William of Prussia, afterwards the King and the first of the new German Emperors, was then acting as regent of the kingdom on account of the illness of Frederic William IV. He had devoted his whole life to military affairs, and as a young man had fought against Napoleon in the campaign of 1814. He was disappointed at finding that the mobilisation took a considerable time, and did not give the numbers which had been anticipated. The fact was that during long years of peace with small numbers called up each year to the colours, the military system of the country had fallen far below the ideals of its founders. On January 2nd, 1861, Frederic William died, and the Crown Prince became King of Prussia. He had already formed a scheme for reorganising the army, increasing its effective strength, and making the process of mobilisation more rapid and workmanlike. He meant to make Prussia the leading military power of Germany. In carrying out this work he was assisted by three remarkable men, Von Bismarck, as head of the Ministry, Von Roon, as Minister of War, and Von Moltke, as Chief of the General Staff. . . . The reorganisation of the army was carried out on the lines which the King had laid down with the help of Von Roon and Von Moltke. The latter had been Chief of the General Staff since King William became regent in 1858. He had made it a centre of information on which he based plans for mobilisation and concentration in the event of a quarrel with any of Prussia's neighbours. At the same time he directed the instruction of the officers and the training of the army, and he gathered around him a singularly able group of war leaders, who were thoroughly familiar with his ideas and could be trusted to act on their own initiative in the spirit of the military doctrine he had taught them. The remarkable thing is that except for a brief and disastrous campaign with the Turkish

army in Western Asia, he had never taken part in actual operations in the field, but he had made a close study of the great campaign, and under his direction the Prussian army manœuvres became a real school of war at a time when in other armies such manœuvres were either non-existent or were mere theatrical displays. . . . Attention was chiefly attracted to the fact that the infantry was armed with a rather clumsy kind of breechloader adopted in 1855. The Prussian army was then the only one in Europe which possessed such a weapon, and conservative military opinion in other countries set little value on it. It was said that it was too complicated, liable to get out of order, and certain to lead to useless waste of ammunition, which might leave whole battalions without a shot to fire when the crisis of the fight arrived. . . . The three wars of 1864, 1866 and 1870 had proved the value of the military tradition inaugurated by Scharnhorst

ALBRECHT THEODOR EMIL,
COUNT VON ROON

and Gneisenau, provided with a doctrine of war by Clausewitz and perfected in practical working by Von Moltke. The Emperor William I. had lived through the whole of this evolution and had done much to guide it. The new Germany had been made by the sword. To use Bismarck's phrase it had been built up 'with blood and iron,' and the result of the process had been the creation of an armed nation that had put more than a million fighting men in the field. It was recognised that the position thus won could be held only by maintaining and perfecting the organisation that had made such results possible."—A. H. Atteridge, *German army in war*, pp. 11-13, 15-19, 23.—See also GERMANY: 1861-1866.

"The extraordinary quickness and completeness of the German victory [1870] was due almost wholly to the superior training in strategy of the German officers. Henderson says: 'Even the French generals of divisions and brigades had had more actual experience [in war] than those who led the German army corps. Compared with the German rank and file, a great part of their non-commissioned officers and men were veterans, and veterans who had seen

much service. Their chief officers were practically familiar with the methods of moving, supplying, and manœuvring large masses of troops; their marshals were valiant and successful soldiers. And yet, the history of modern warfare records no defeats so swift and complete as those of Königgrätz [1866] and Sedan [1870]. The great host of Austria was shattered in seven weeks; the French imperial army was destroyed in seven weeks and three days; and to all intents and purposes the resistance they had offered was not much more effective than that of a respectable militia. But both the Austrian and the French armies were organized and trained under the old system. Courage, experience, and professional pride they possessed in abundance. Man for man in all virile qualities, neither officers nor men were inferior to their foes. But one thing their generals lacked, and that was education for war. Strategy was almost a sealed book to them.' Also: 'Moltke committed no mistake. Long before war had been declared, every possible precaution had been made. And these included much more than arrangements for rapid mobilization, the assembly of superior numbers completely organized, and the establishment of magazines. The enemy's numbers, armaments, readiness, and efficiency had been submitted to a most searching examination. Every possible movement that might be made, however unlikely, had been foreseen; every possible danger that might arise, however remote, discussed and guarded against.' . . . The unprecedented despatch with which this war and the war with Austria were settled, the long period of time during which the causes operated that brought on the wars, the facts that the armies had had nothing to do with bringing on the wars, and that the wars had been brought on by the people themselves, bring to our minds the analogy so often pointed out between the usefulness of surgery and the usefulness of war. In both cases, causes that are harmful to healthful living bring about an unhealthful condition, and in both cases this unhealthful condition is removed (or the attempt is made to remove it) by means that are very painful and very bloody, and that leave the patient in a weakened condition for a considerable time thereafter. If this analogy be at all correct, we are forced to admit that any means that can quicken the surgical operation in one case, or the progress of war in the other case, must be beneficial. There seems no reasonable doubt that *Moltke did more to shorten wars than did any other man in history*. It is true that the shortening of the wars has been paid for by long and laborious and expensive periods of preparation. Whether the shortening of wars is worth the cost or not, we have no exact means of determining; but those people who inveigh against the 'burden of militarism' should, in all fairness, realize that, without that burden, the world would be in the position that it was in when protracted wars like the Hundred Years' War and the Thirty Years' War cursed the human race.—B. A. Fiske, *Art of fighting*, pp. 260-271.

29. Germany.—Reorganization after 1871.—Continuous increase.—Terms of service.—Training of officers.—Drill, weapons and tactics.—Model adopted by other nations.—German militarism and World War.—“Thus, at the outbreak of the [World War] . . . the first line of the German army was formed of twenty-five army corps, namely, the Prussian Guards Corps, the twenty-one German Corps, and the three Bavarian Army Corps. Taking the fighting force of a German Army Corps at 40,000 men, this would give a first line of a million, without counting the cavalry divisions. The first great increase of the

German army was made by the new military law of 1880. The preamble of the law set forth that the military reforms introduced into neighbouring states made an expansion of the army necessary. 'Germany, with an immense frontier, which is also that of three great and four smaller powers, must be ever ready to defend her freedom and security.' It would therefore be necessary to increase the number of units in the army and the annual contingents of trained men. There was a further increase in 1887, and in 1890 new army corps were formed and the peace strength of the army was raised to nearly half a million. Three years later the Government announced a further increase, declaring that the time was come when all men really fit for service would have to be employed in the army. Hitherto the recruit on joining had served for three years with the colours. It was now decided to reduce the period of training to two years for all branches of the service, except the cavalry and the batteries of horse artillery attached to it. The two years' service would mean that year after year a larger number of men would be passed into the reserve of the army. The peace strength was raised to over 500,550 men, and it was estimated that after the new law had been a few years in operation, the available reserves would be about four millions. Under the system thus established, a man, on joining the army at the age of twenty, served for two years with the colours, or for three years, if he was allotted to the cavalry, or four if he was allotted to the horse artillery. His years of service with the colours were a time of strenuous and unceasing training. He had to be made into a soldier before being dismissed to the Reserve. The total period of service in the first line was seven years. . . . At the age of twenty-seven, the German soldier passed out of the first line army. Then until the age of thirty-nine, he belonged to the second line army, or Landwehr. Originally a territorial army of home defence force, the Landwehr is liable to be called out for service beyond the frontiers, either in the actual fighting line, or for the work of guarding the lines of communication and supplying garrisons to captured fortresses. . . . After the first five years the Landwehr man is not called out to service, except in time of actual war. For seven years of his life, from the age of thirty-two to thirty-nine, he is in the second levy of the Landwehr. His name is kept on regular lists in which the men are allotted to the units into which they are to be formed on mobilisation. Nothing is left to be improvised at the last moment. . . . The reservists join the battalions, squadrons and batteries of the first line army, and these move away to the frontier. Hundreds of thousands of reservists are available who are not required to bring these first line units up to war strength. There are [1015] more of them than need be kept in the depôts to make up the first losses in the field. This surplus of reservists, with the men of the first levy of the Landwehr, are available to form at once a number of reserve corps and divisions for the first fighting line. In the . . . [World War] it is said that during the first weeks every army corps in the German army was thus duplicated by a reserve corps, so that in all fifty army corps, or over two millions of fighting men were immediately available for the battle line. The second levy of the Landwehr supplies another army which can be used for the line of communications, garrison duty and the like, or which, after a brief period of training, can supply complete units to the fighting line. But this does not exhaust the forces that become available in the second stage

of mobilisation. There are over 600,000 men who, in any given year, are awaiting the call to the colours as recruits. Instead of having to appeal to them to enlist, the War Office by signing an order can bring this huge army of recruits into the depôts and barracks. . . . After passing out of the Landwehr at the age of thirty-nine the German soldier has completed his full term of service in the first and second line of the army, but for six years more, that is until he reaches the age of forty-five, he belongs to a third line, the Landsturm. This is a home defence force, and includes theoretically not only these trained men, but all the untrained men of the *Ersatz Reserve* up to the age of forty-five. Practically, however, the Landsturm, who are called out for service, are the trained men. . . . The Landsturm is supposed to be only a home defence force, but in the . . . [World War] Landsturm units have been used for garrison work beyond the frontiers. After the passing of the Army Bill of 1893, General von der Goltz wrote that under the organisation it introduced, and by the establishment of the two years' colour service for the greater part of the army, 'Germany had arrived as nearly as the circumstances of the time would permit at the desired object, namely, to bring into the ranks every man capable of serving in the army.' . . . The number of army corps was increased to twenty-five. Those stationed on the eastern and western frontiers of the empire were kept nearly on a war footing. The strength of the army on a peace footing rose to nearly three-quarters of a million, and in every unit the number of officers was increased, so as to provide a larger reserve of leaders for the new units which would be formed on a declaration of war. . . .

"So far we have spoken only of the recruiting of the rank and file of the army. If millions of men are to be placed in this field for war, there must be tens of thousands of officers and non-commissioned officers to lead them. The non-commissioned officers are provided, partly by promotion in the ordinary course, and partly from a special class. These latter are young men who, without waiting to be called up at the age of twenty, join the army at the age of eighteen, in order to qualify for such promotion. They have thus two years of longer service, and are given special facilities for qualifying, and many of them are allowed to prolong their army service during part of the years in which they would ordinarily be in the Reserve. There is a second class of special enlistment provided for from the very beginning of the Prussian army system in 1814. The Royal Decree, which established universal liability service, with a view to avoiding serious interruption in the professional career of men of the more educated classes, allowed those who could produce certain certificates of education, or a preliminary degree of a university, to volunteer for one year of service in the army under special conditions [Einjährig Freiwilliger]. At the end of the year they would have to satisfy the military authorities that they had so far profited by their training as to be capable of doing the work of a non-commissioned officer or a company officer. They then passed into the reserve, thus, under the old system, saving two years of service with the colours, and returned to their professional work. This class . . . [supplied] a reserve of non-commissioned officers and officers for the first line army and the Landwehr. The officers of the army are recruited partly from military schools or cadet corps, partly by the promotion of educated young men who join the regiments with a view to training for a

commission. . . . After leaving the army numbers of officers keep their names on the reserve list for the first line or are posted to units of the Landwehr or Landsturm. Staff officers belong to a special class trained for staff duties, and usually serving with a regiment only for the purpose of obtaining practical experience of the working of this or that special arm of the service. In Prussia and all the German states there . . . [were] a large number of families which in each generation . . . [gave] most of their sons commission ranks for the army. And in military history, from the wars of Frederick the Great down to the . . . [World War], one finds the same name recurring in the higher command. . . . In an army in which most of the men in the ranks serve for only two years, the permanent element is supplied by the officers and those non-commissioned officers who prolong their term of service. On them it depends to carry on the military tradition. The first line of the army in times of peace is a vast school of war with this permanent body of teachers. Each autumn half their pupils go away and are replaced by the new recruits. The course of instruction is a short one, so the work is carried on at high pressure. It has often been said that the German army is too much of a machine, that the whole system is so rigid that men and officers are deprived of all initiative. . . . The old Prussian army of Frederick the Great was certainly one of the most rigid of machines ever created for the purpose of making each individual in its ranks a mere passive unit in the hands of the higher command. . . . The work of the drill ground was everything. Unthinking mechanical obedience was the cardinal virtue for the soldier, only a general or a colonel need trouble to do any thinking. The Prussian drill book was, after Frederick's victories, supposed to be the sum of military knowledge. It became the drill book of both the British and the French army in the years before the Great Revolution. But the progress of war and battle methods from Napoleon's days to our own, the introduction of new weapons and tactics, and the wide extension of the battle front, have made mere drill book and barrack yard work only the introduction to a soldier's training. The company officer, the sergeant, and even the private soldier has now to think, and often decide for himself what is best to be done. The important point is that this thinking should be intelligent, and inspired by a common tradition, so that co-operation with others is possible, and officers and men can understand what orders mean without every detail being explained, and when and where the strict letter of these orders may be departed from. . . . It is to the German army that we also owe what is now recognized as a necessary working rule in every army of the world, namely, that the higher commander must tell his officers not how they are to perform a certain operation, but in the most general terms what is the task assigned to them, leaving it to them to select the proper measures for accomplishing it. Thus, in the war of 1870, Von Moltke's orders to the commanders of army corps took up only a few lines of writing, merely conveying brief information as to the position of the enemy and the point on which the corps concerned was to move. The general commanding the army corps similarly assigned an object to his divisional commanders, leaving it to them to issue their special orders to their subordinates, and in the same way the battalion commander left it to his captains to choose for themselves the way in which their company should work once they had been given a general direction as to what was to

be done. There was thus the widest room for initiative, and in the higher commands the principle was everywhere accepted that whatever orders had been given, once fighting began the troops engaged must be supported at all costs by all those who were in reach of the scene of action. In such a system of command, there is nothing rigid and initiative is a necessity. . . . This much must be granted—it was the success of the Prussian army in 1870 that changed the military methods of all Europe. . . . But British study of German methods became more and more independent and practical. Nevertheless, even in recent years, we have been making new reforms of lines originally struck out by the soldiers of Germany. Lord Haldane's re-organisation of the army was to a great extent thus inspired. The . . . change made almost on the eve of the war—the organisation of the battalion into four companies instead of eight—was a direct copying of the German model. Every army in Europe has, in fact, based much of its progress in the last forty years on German teaching and experience, and even the army of Japan was re-organised by German officers on the methods which had secured success for the German arms in the wars of nearly half a century ago."—A. H. Atteridge, *German army in war*, pp. 28-36, 38-39.

"German militarism, which our enemies first decried and then by degrees themselves adopted, did not, prior to the World War, embrace our whole nation, since universal military service, in its literal sense, in reality existed only in law. If, however, the essence of militarism is to be sought in the military organization of the nation, then indeed it had been established among us for the last hundred years. The rigorous discipline with which it was accompanied was transferred automatically to numerous branches of industry, and proved beneficial to their work. Compulsory education also contributed to this result. There is some truth in the saying that the Prussian school-master won the Battle of Königgrätz. The immense improvement since that date in the education of the whole German people has also borne fruit in the World War. 'It was only,' writes Stegemann, [Geschichte des Krieges] 'the spirit of the army and the complete devotion of the whole nation to the service of the Fatherland which enabled Germany to enter upon such a war, and to engage in it so energetically and organize it so thoroughly that it became the expression of the full and arduous life, the purposeful activity, of the whole people, and raised the nation above itself.' . . . The training of the General Staff in the German Army was thoroughly practical; it was based upon a close association with the troops. The training of the latter culminated in manœuvres organized on a warlike scale. The rigorous demands which these manœuvres made upon the men have bred up that hard fighting race which has stood the test of the World War. It was by means of these large-scale manœuvres that the army was educated for a war of movement, and it is the war of movement which, wherever we have been able to resort to it, has procured us the greatest successes. The army did not rest on its laurels of 1870-71, but with unremitting industry pursued its work year in year out. It was in the army that the wish expressed by Treitschke in respect of the defeat of the year 1806—that this defeat should be 'as ineffaceable from the memory of all future generations as a personal injury, an admonition upon all to vigilance, humility, and loyalty'—found its fulfilment. The achievements of our army in the World War were the fruit of the spirit of the German people; but they were only

rendered possible by means of the previous peacetraining under the superintendence of the All-Highest War Lord, a training continued year by year and extending from the careful drilling of the individual soldier to the instruction of the large units. Only upon the basis of such a training was it possible to increase the army during the war in accordance with the demands of the world-conflict. The first new formations did not prove equal to the test. It became necessary to send to the Front, where they were, moreover, exposed to peculiarly difficult conditions, the new Reserve Corps, the formation of which had been decreed in the middle of August, 1914. Hardly ever have troops—or, at any rate, the bulk of them—exhibited such high qualities of spirit and will as did these new regiments, but three-fourths of them were war-volunteers, enlisted—except for a certain number of older men—from the youth of all classes, including a large number of graduates from the universities. Moreover, the few men among these troops who had already served in the army were elder members of the Landwehr and the Landsturm. Subsequently, the firmness of the new formation was enhanced, wherever possible, by including in them a considerable proportion of men possessing actual experience of war. The new corps who were put into the line at the Yser in the autumn of 1914 lacked, above all, experienced officers and non-commissioned officers. The reserve battalions were no longer able to furnish the latter in sufficient numbers. There had been heavy losses among the officers of the active army and the younger reserve officers during the first battles; the few who were left had to remain at their posts before the enemy. Hence it became necessary to have recourse to the older half-pay officers and reserve officers, who had long since abandoned any form of military exercise, and whose physical efficiency was in the majority of cases no longer up to the mark. Hence that confident leadership in battle, which is so particularly necessary in the case of young troops, was not fully ensured. Only gradually, in the course of the war, after the improvement of their officers' corps, were these new troops brought to the level of the old corps. . . . The fact that, in the German national army, the qualities requisite for every task that had to be performed were present where they were needed testified to its excellent organization and training. The work of a century now, at the hour of supreme danger, proved its worth. As a result of this work, moreover, the army constantly proved adequate to the new tasks which fell to its share, and, despite the very great demands upon the national strength, never sank to the level of a loose militia. Such would inevitably have been the fate of a national army which had been less well disciplined in time of peace. Such an army would not have been capable of defying for years the assault of an enemy superior in numbers, at the same time preserving to the end the strength to attack whenever the opportunity arose, and to pursue a victorious and irresistible offensive across the mountains of the Roumanian frontier and the Alps. Yet much would have been easier, and the arduous struggle would have been shortened, if our peace-preparation had been still more comprehensive, above all, if, before the war, we had actually enlisted all those liable for service. . . . Only the human ramparts in the West and the East secured for us the time in which to bring our technical war-equipment to the highest level of efficiency. Every war engenders new developments in this sphere, every war brings surprises, but we ought to make it our endeavour to limit the possibility of such surprises as far as

lies in our power."—Baron von Freytag-Loringhoven, *Nation trained in arms*, pp. 2-8, 13-15.—See also GERMANY: 1890-1914: Growth of the army; 1918 (November-December).

30. Great Britain.—Origin of standing army.—Feudal levies.—Employment of mercenaries.—Civil War.—Cromwell's "Ironsides."—"The British Army as a standing force dates from the Restoration of Charles II. in 1660. Before that date the organization of the Forces was much less systematic, although based on certain well-known principles. [See HOUSE CARLS.] Of these one only need be dealt with, as it is the sole survivor. It is the undoubted prerogative of the sovereign to call on all males capable of bearing arms, between the ages of 15 and 60, to come out when summoned for the defence of the realm. This general levy was—and is—available for a double purpose. As a civil force it was known as the *posse comitatus*, which the sheriff could call on to arrest criminals and suppress riots. As a military force it was called out, under the sheriff or some other officer of the Crown, to defend the realm in civil war or against foreign foes. The force was liable to serve only in the kingdom, and, except against an invader, only in its own county. Sometimes it was summoned in all the counties; at other times in particular counties only. The general levy was repeatedly called out by the Norman and Angevin kings (1066 to 1216) for the suppression of internal rebellion, or for border warfare against the Welsh and Scots. It was, however, plainly unsuitable for warfare beyond the seas, as service in it could be enforced for only 40 days. In the time of Edward VI., 'lieutenants' were appointed in the counties to array or lead, or both; and after the reign of Mary such 'lieutenants,' now commonly known as Lords Lieutenant, were usually appointed for these purposes. Even before the Norman Conquest the general levy took long to raise, and was difficult to keep together, especially when operating outside the boundary of its own petty kingdom. Hence the old English kings relied more on their military dependents, to whom they had granted land on condition of military service. These were known by the name of *Thegns*. The Norman Conquest altered all this by substituting a wholly feudalized military aristocracy for the semi-feudal thegnhood, the whole of England being divided by William I. into military fiefs held from the Crown. Some were small, others large, and the latter, the direct holders from the Sovereign, were subdivided into smaller fiefs or knights-fees dependent upon themselves. The holder of a military fief might therefore be either a tenant-in-chief holding directly from the Crown, or a sub-tenant holding under some great earl or baron. All alike were bound to attend the king at their own expense on horseback and in armour with their retainers, who might be either mounted or on foot. Though the earlier Monarchs successfully demanded service abroad as well as service at home, the former obligation was always a doubtful exercise of the prerogative, and as time passed the feudal tenants displayed increasing reluctance to serve out of the kingdom, and at length refused to do so. Personal service formed the basis of both the feudal and the general levy, but the obligation to serve in the latter rested on every man as a citizen, or, as it was termed, 'on every man within the allegiance of the King.' But from the time of Henry II. service by deputy, or payment in lieu of personal service under feudal obligations, was allowed. In the case of the general levy the practice arose of calling out only a certain quota from each county to serve in person, while those not so called on

were required to supply all arms and victuals, and defray the expenses of, those who served in person. Closely connected with the general levy was the Crown's prerogative of Purveyance, which enabled the Crown to enforce the supply of carriages, carpenters, smiths, and other artificers, as well as of victuals, for military purposes. Both the feudal and the general levy, when called out for war, were summoned by writs from the Crown, to which the name of Commissions of Array was given in the reign of Edward I. While perfectly legal for raising a force for service within the realm, they were illegal when used to raise troops for foreign service. For they threw on the counties the burden of finding soldiers for foreign wars, and paying their expenses, thus taxing them without consent of Parliament. By a series of Acts, therefore, beginning in 1327, it was provided that men should not be required to serve out of their counties except in the case of invasion; that men-at-arms, hoblars, and archers chosen to serve out of England should be paid by the Crown after leaving their counties; and that no man should be constrained to find men-at-arms, hoblars, or archers, unless bound by feudal service or under the authority of Parliament. During the Wars of the Roses troops were raised in the most irregular manner, and the practice of impressing men was introduced and became so common, that it was assumed to be the right of the Crown. Under the Tudors these irregularities were continued, and certain Acts passed which enforced the provision of equipment, and made archery compulsory. Penalties were also enforced for not attending musters of Commissions of Array authorized to levy the best men for the wars, and these assumed that the right to impress was one of the prerogatives of the Crown. Most of these acts were repealed under James I., but the liability to serve in the general levy continued, and was enforced by means of Commissions of Array which gradually developed into a rather different form under the title of Commissions of Musters. These commissions directed the Commissioners to register and muster all persons liable to provide horses, arms, or soldiers, and to select a convenient number of such persons to serve in person at the charge of their counties for the service and defence of the Crown. These were to be sorted into bands and trained and exercised at the charge of the different parishes in the county. This system of training appears to have assumed at the end of the sixteenth and beginning of the seventeenth century a quasi-permanent form under lieutenants of counties or other commissioners, and the bands trained under them became known as Trained or Train Bands, and were mustered annually. At the same time there existed, side by side with the trained bands and in more or less connexion with them, voluntary bodies, such as the Honourable Artillery Company in London and others elsewhere, which, doubtless, owed their origin to the fact of its being thought honourable to possess military acquirements. Under Charles I. commissions of musters were used for the purpose of exacting contributions in money and arms from the counties. These exactions were complained of in Parliament, and, together with the trial of persons by martial law in time of peace and the practice of billeting, were, in 1628, declared to be illegal by the Petition of Right. In the Long Parliament in 1640 the King, though at first claiming the power of impressment as the ancient and undoubted prerogative of the Crown, assented to an Act declaring it illegal except in case of those bound by the tenure of their lands. The Parliaments of Charles I., while protesting against the exactions enforced by

the lieutenants of counties and the illegality of impressment, did not complain of the mustering of the trained bands; and the value of the trained bands or militia, as they now began to be called, and the necessity for exercising them and providing them with arms and ammunition, were recognized on many occasions by Parliament. But objection was taken to the command of the militia being under the control of the Crown exercised through the lieutenants of counties, and this question was one of the principal matters in dispute at the time of the rupture between Charles I. and his Parliament. Certain other means than those described were also made use of to raise troops. Thus by two statutes passed in the reign of Henry VII., holders of offices, pensions, lordships, or lands from the Crown were made liable to serve at home or abroad on pain of forfeiture. Sometimes criminals were pardoned or debtors released on condition of serving as soldiers, and this custom was maintained even in the earlier years of the last century. Lastly, as early as 1066, mercenaries formed part of the forces of the Crown. The distinction, however, between these troops and those raised under the feudal or general levy was often not a wide one, as men raised under the latter were induced to serve beyond the seas, or for more than 40 days (their legal period of service) by payment. The mercenaries were usually raised by contract between the King and some person of position, who was able by his influence or wealth to obtain soldiers. The men so obtained were at first chiefly foreigners, and as their employment in England was not only strongly objected to, but was rendered unnecessary by the liability of the inhabitants of the realm to service at home, they were almost entirely employed on foreign service. After the raising of men compulsorily under Commissions of Array was restrained by Parliament, the practice of raising troops by contract became more common, and in the early part of the reign of Henry V., and subsequently, the larger part of the forces of the Crown were thus obtained. At first the men were enlisted to serve the officer who raised them, but after 1491, if not before, they were enlisted to serve the King. The method employed was by contract with an individual, sometimes for a sum of money, sometimes on condition of the contractor having the appointment of the officers of the force raised. Enlistment was strictly for service in the particular regiment with which the recruiting officer was connected."—*The Times* (London) *Book of the army*, pp. 1-7.—"At the outset of the war many of the nobles raised regiments from among their own tenants, and the armies were of picturesque look, each regiment having its own uniform. The Guards of Lord Essex adopted the buff leather coat, which afterward became the uniform of the whole Roundhead army. Hampden's regiment was in green; the London trained bands in bright scarlet. Other regiments were clad in blue or gray. In the Cavalier army there were foot-guards in white and foot-guards in red; and among their horde the Life Guards of the King—composed of lords and gentlemen who had no separate commands—wore plumed casques over their long curled locks, embroidered lace collars over their glittering cuirasses, gay scarfs, gilded sword-belts, and great boots of soft leather doubled down below the knee. The history of the English Civil War, like the history of the American Revolutionary War and the American Civil War, teaches two lessons. First, it shows that the average citizen of a civilized community requires months of training before he can be turned into a good soldier, and that raw levies—no matter how patriotic—are, under normal conditions, helpless before smaller

armies of trained and veteran troops, and cannot strike a finishing blow even when pitted against troops of their own stamp. In the second place it teaches a lesson, which at first sight seems contradictory of the first, but is in reality not in the least so; namely, that there is nothing sacrosanct in the trade of the soldier. It is a trade which can be learned without special difficulty by any man who is brave and intelligent, who realizes the necessity of obedience, and who is already gifted with physical hardihood and is accustomed to the use of the horse and of weapons, to enduring fatigue and exposure, and to acting on his own responsibility, taking care of himself in the open. Cromwell's troops were not regulars, like the professional soldiers of the Thirty Years' War; they were volunteers. After two or three years' service they became the finest troops that Europe could then show; just as by 1864 the volunteers of Grant and Lee had reached a grade of perfection which made them, for their own work, superior to any other of the armies then in existence. Under modern conditions, in a great civilized state, the regular army is composed of officers who have as a rule been carefully trained to their work; who possess remarkably fine physique, and who are accustomed to the command of men and to taking the lead in emergencies; and the enlisted men have likewise been picked out with great care as to their bodily development; have been drilled until they handle themselves, their horses, and their weapons admirably, can cook for themselves, and are trained to the endurance of hardship and exposure under the conditions of march and battle. An ordinary volunteer or militia regiment from an ordinary civilized community, on the other hand, no matter how enthusiastic or patriotic, or how intelligent, is officered by lawyers, merchants, business men, or their sons, and contains in its ranks clerks, mechanics, or farmers' lads of varying physique, who have to be laboriously taught how to shoot and how to ride, and, above all, how to cook and to take care of themselves and make themselves comfortable in the open, especially when tired out by long marches, and when the weather is bad. At the outset such a regiment is, of course, utterly inferior to a veteran regular regiment, but after it has been in active service in the field for a year or two, so that its weak men have been weeded out, and its strong men have learned their duties—which can be learned far more rapidly in time of war than in time of peace—it becomes equal to any regiment. . . . None of the men on the Parliamentary side who had received their training in the Continental armies amounted to much. On the Royalist side the only professional soldier who made his mark was Rupert; and Rupert, after a year or two, was decisively beaten by Cromwell—a greater natural military genius, who, although a civilian till after forty, showed an astonishing aptitude in grasping the essentials of his new profession. His only military rival in the war was Montrose, who was also not a professional soldier. The war had not opened well for the Parliamentary side, and their especial weakness was evidently in cavalry—the arm by which decisive battles in the open field were won. Cromwell, with unerring eye, saw the weakness and started to remedy it. It is about this time that his famous conversation with Hampden took place. Said Cromwell: 'Your troops are most of them old decayed serving-men and tapsters, and such kind of fellows; and their troops are gentlemen's sons, younger sons, and persons of quality; do you think that the spirits of such base, mean fellows will ever be able to encounter gentlemen that have honor and courage and resolution in them? . . .

You must get men of a spirit; and take it not ill what I say—I know you will not—of a spirit that is likely to go on as far as gentlemen will go, or else you will be beaten still. . . . I raised such men as had the fear of God before them, as made some conscience of what they did, and from that day forward they were never beaten.' The famous Presbyterian clergyman, Baxter, who was by no means friendly to Cromwell, described his special care to get religious men into his troop; men of greater intelligence than common soldiers, who enlisted, not for the money, but from an earnest sense of public duty. Naturally, said Baxter, these troopers 'having more than ordinary wit and resolution had more than ordinary success.' By another writer of the time, Cromwell's horse are described as 'freeholders and freeholders' sons, who upon matter of conscience engaged in this quarrel; and

without regard to creed or caste, it speedily became known that under him anyone would have a fair show according to his merits."—T. Roosevelt, *Oliver Cromwell*, pp. 63-66, 68-69, 73-75.—See also *ENGLAND: 1643* (May).

31. Great Britain.—Reforms after Restoration.—New model army.—Famous regiments.—In Marlborough's time.—Development under Wellington.—Problem of a trained reserve.—"After the Restoration in 1660, considerable changes took place in the military system of the country. Knight service with the feudal levy and its incidents, including escutage, were finally abolished and the organization of the general levy, of which the trained bands formed part in the form of the militia, was completed under the authority of Parliament. At the same time the foundation of the present standing army was laid. Before this time

CROMWELL'S "IRONSIDES" BEFORE THE BATTLE OF DUNBAR

(After painting by Andrew C. Gow)

thus being well-armed within by the satisfaction of their own consciences, and without by good iron arms, they would as one man stand firmly and charge desperately.' Cromwell at once distinguished himself among his contemporaries, alike by the absolute obedience he rendered to his superiors, and by the incessant, unwearied activity with which he drilled his men in the use of their weapons and horses. He was speedily promoted to a colonelcy. In a news-letter of the time his regiment was described as composed of 'brave men; well disciplined. No man swears but he pays his twelvenpence; if he be drunk he is set in the stocks or worse; if one calls the other Roundhead, he is cashiered; inso-much that the counties where they come leap for joy of them, and come in and join with them. How happy were it if all the forces were thus disciplined!' Cromwell suppressed all plundering with an iron hand. An eminently practical man, not in the least a theoretical democrat, but imbued with that essence of democracy which prompts a man to recognize his fellows for what they really are,

there had been no such force; armies for particular wars had, indeed, been raised and paid for by Parliament, but were disbanded after their conclusion. A few troops were, it is true, maintained in certain garrisons, and small corps of sergeants-at-arms, yeomen of the guard, and gentlemen pensioners existed, though these were intended rather as personal attendants on the King than for operations in the field. The only other corps of a permanent character were the trained bands, the Honourable Artillery Company of London, and similar associations, which were, in fact, either part of the general levy or voluntary associations, and an actual standing army was unknown. The troops raised by the Parliament during the Civil War were disbanded under Acts of Parliament passed on the Restoration in 1660, but under a section in those Acts, Charles II. was enabled not only to keep up the garrisons in certain fortified places, but also to maintain two regiments of horse and six of foot as guards for the Royal Person, which thus formed the beginning of the modern British Army. These

regiments were maintained during his reign and that of his successor, James II., and their numbers were gradually increased, not merely on the occurrence or in anticipation of foreign war, but on other occasions. Their maintenance, however, formed the subject of frequent remonstrances in Parliament, and the increase of their numbers by James II. was one of the causes which led to the Revolution of 1688."—*The Times (London) Book of the army*, pp. 9-10.—"The English Army, in 1702, was based upon the two bodies of English who fought on opposite sides, for French or for Spanish, at Dunkirk Dunes. The Duke of York's royalists became the First Foot Guards, afterwards the Grenadier Guards, at the Restoration. The victorious Cromwellian soldiers became the Coldstream Guards, so called because when General Monk marched from Scotland with them he made his last halt at the border town of Coldstream. Charles II's bodyguard which returned with him to England became the Life Guards. The Scots in the

named also after their Colonels—Leven's, Angus's, Wyndham's, Lumley's, Galway's, for example, to mention only a few from 'Tristram Shandy.' Now suddenly for the new war old regiments had to be brought up to strength and new ones formed. Three pounds a piece levy money (two pounds of it to the man) was paid for recruits, three times the usual price. The Colonel was responsible, but Colonels give patents to Lieutenant-Colonels, and they to Lieutenants, and they again to Corporals. It was no easy task to get the numbers. The ordinary method was to attract men by a march with drums beating and an announcement of the ceremony beforehand. Farquhar, who himself served in Holland, opens his *Recruiting Officer (1706)* with a recruiting speech by Sergeant Kite. Says he: 'If any gentlemen soldiers, or others, have a mind to serve his majesty and pull down the French King: if any prentices have severe masters, and children have undutiful parents: if any servants have too little wages, or any husband too much

BRITISH HUSSARS, 1685 TO 1915, IN THEIR RESPECTIVE UNIFORMS

French service, 'a regiment of Scottish mercenaries renowned throughout Christendom, during four centuries past, for soldierly conduct, conspicuous bravery, and staunch fidelity,' came to England as the Royal Scots: the age of the regiment, and the claim based on it for precedence, earned it the nickname of 'Pontius Pilate's Guards.' The Horse Guards or The Blues were a Cromwellian Cavalry regiment re-enlisted in 1661 by the Earl of Oxford. The foot regiments raised for Tangier in the same year afterwards had the name of the 'Queen's,' while the horse are now the First Royal Dragoons. The English in the Dutch service who came back when England declared war against Holland in 1665, were called The Buffs from the colour of their facings. The Scots Greys date from 1681. The First to the Sixth Dragoon Guards were raised in James II's first year, together with nine regiments of foot, which included the Royal Fusiliers. In 1686 a Scottish regiment raised at the Restoration came south as the Scots Guards. For William III's wars in Ireland and the Netherlands many more regiments still existing were raised from time to time, numbered as they arrived, the Fifteenth, Sixteenth, Seventeenth of the Line, and so on, but

wife; let him repair to the noble Sergeant Kite at the sign of the Raven in that good town of Shrewsbury, and they shall receive present relief and entertainment.' But recruiting by beat of drum is as honest and unexceptionable as any other form of trading and advertising, and the man who thus volunteered had £2 paid him as levy-money, or twice that of the man taken against his will. There were more disagreeable methods. When an Act of Parliament, (1694) insists upon 3,000 men enlisting in Scotland and the counties and boroughs have to contribute in proportion, the chances are that someone goes against his will. By another Act (7 and 8 William III) a thousand men every year were to be sent in from Scotland. A sheriff had the power to seize men and choose among them by throwing dice, so long as they were idle, loose and vagabond men without lawful calling or visible means of subsistence and without families, or young able-bodied men without families who earn their living by daily wages or are hired for a term, but not menial or domestic servants. After 1702 debtors owing not more than £100 could escape prison, and criminals the scaffold, if they were willing to enter the army. Or an insolvent debtor

who would be set free if he could procure a recruit. After 1703 anyone not a voter who had no lawful calling or visible means of subsistence might be snapped up by the Justices of the Peace and rewarded with £1 as levy-money; but in 1704, between June 1st and October 15th, harvesters with certificates from parson and churchwarden of their parish were specially excepted, or they would all have been taken, or have been lost to the farmer by going into hiding, or have mulcted him with extravagant demands. Three pounds a man was payable to the parish for relieving the soldiers' poor relatives. It was possible, too, for Army officers to obtain men from the naval press-gangs. Pressing for the navy being allowed, the pressers could, if they wished, send the men required over to the Netherlands. Officers needing recruits could also be supplied by crimps who contrived to get men to accept or seem to accept the shilling while they were drunk, or not looking, or under a threat."—E. Thomas, *Life of the Duke of Marlborough*, pp. 98-101.—Throughout the eighteenth century the British army preserved the same general form and organization that it had under Marlborough in the War of the Spanish Succession. Recruitment was for the most part on a voluntary basis, though impressment was retained for the navy until the nineteenth century by means of the "press-gang." Down till 1783, the method of raising troops during time of peace was on the basis of a contract between the government and the colonel of the regiment. Commissions in the regiments were purchasable (until 1871) and it was difficult though not impossible for men to rise from the ranks. Until 1847 terms of enlistment were commonly for life, but in an emergency the term was sometimes fixed at two or three years. In 1806, the policy of permitting short-term enlistments was adopted for war time and has been retained ever since, although, until the World War, the crown forces were always regarded as a "professional army" and re-enlistment was encouraged. There was little that was distinctive in the equipment of the British army during the long interval between Marlborough and Wellington, though its tactics often differed from those of the continental armies. The "thin red line" became famous in the Peninsular War and the column formation in charging which was so characteristic of the armies on the continent was never a feature of the British. Furthermore, although Wellington adopted the divisional organization which was perfected by Napoleon, he never combined the divisions into permanent corps after the fashion of his great antagonist. This peculiarity of the British army has been perpetuated right down to the World War, and the expeditionary force which was sent over to Belgium and France in August-September, 1914, had no larger unit than the division until after it had reached the theater of war. Lacking any system of compulsory military service in time of peace Great Britain, like the United States, was always confronted with the problem of securing and maintaining a trained reserve. The solution attempted in both countries was much the same and consisted in the formation of a militia or national guard. In 1803, under threat of invasion by the First Consul, Bonaparte, a General Militia was embodied, which furnished over 100,000 men to the army between the years 1803-1813, and thus became a mere feeder to the regular forces. For home defence a Local Militia was organized by Lord Castlereagh in 1808, but after Waterloo all these military institutions languished.

32. Great Britain.—Lord Haldane's reforms.—Creation of territorial force.—Strength in

1914.—German military critic on British army in the World War.—Five million volunteers.—The problem of a reserve was met by Lord Haldane, secretary of state for War, in 1908, when he created the "Territorial Force," a body corresponding roughly to the American National Guard. The Territorials were given a definite place in the national military organization and took the place of the old volunteer units which had pursued a varied and rather haphazard career ever since the war scare of 1801. Side by side with the Territorials, who are infantry, and their predecessors the Volunteers, there grew up a body of reserve cavalry known as Yeomanry. These were first organized by the Elder Pitt (Lord Chatham) in 1761, and under the name of Imperial Yeomanry did good service as late as the South African War, 1899-1902. Since 1908, under their old name, they have become a part of the Territorial Force. "Lord Haldane's scheme provided an Expeditionary Force of voluntary recruits, who served seven years with the colours and five in the Army Reserve; a Special Reserve, which took the place of the old Militia, and which in peace acted as a feeder for the Regular Army, and in war might provide reserve battalions; and a Territorial Force, replacing the old Yeomanry and Volunteers, with an organization similar to that of the Regular Army. The aim of such a scheme was to provide a small striking force of professional soldiers, who should be ready at any moment to serve in our little frontier wars, and behind it a volunteer citizen army, capable of rapid expansion and intensive training in time of war, which was destined solely for home defence. Critics might differ as to the details of the two forces, but it was pretty generally admitted that this type of system met Britain's needs. We did not require an army on a continental scale; our navy was our chief weapon for defence and offence. To take the Regular Army first. This was organized as a force of six infantry divisions and one of cavalry. The infantry were divided between the stations at home and abroad, with the exception of the Guards, who in peace time were not employed on foreign service, and whose term was three years with the colours and nine in the Reserve. The Army Reserve consisted of those who had completed their service with the colours, and had not yet completed the term for which they had enlisted. The Special Reserve acted in peace time mainly as a feeder for the Regulars, many joining it as a preliminary to the Line; the period of enlistment was for six years, and all ranks were liable for foreign service in war. In the Territorial Force the term of service was four years, re-engagement being allowed, and the training was considerably higher than in most of the classes of the continental Territorial forces. The Territorial Reserve, which was part of Lord Haldane's scheme, had made little progress, and consisted mainly of officers who had left their regiments but wished to rejoin on mobilization. Lastly came the National Reserve, made up of old soldiers, many beyond the age limit, who were registered in part for general service, in part for home service alone, and in part merely for purposes of training and administration. It will be seen that the British army presented features analogous to all the classes of continental military systems. [See also WAR, PREPARATION FOR: 1000: Imperial defense conference.] . . . On the outbreak of war [in 1914] our Expeditionary Force consisted of six divisions of infantry, one cavalry division, and one or more cavalry brigades with no divisional attachment, besides the usual complement of what are called 'army troops,' to be used for general purposes—a total of some 100,000 men. The total regular

strength with the British colours reached in round figures 250,000; the Army Reserve numbered 145,000; the Special Reserve 81,000; the Territorial Force had a peace establishment of 316,500, but it was short of this by some 50,000; and the National Reserve had reached the creditable level of 200,000. But these figures were no index to the potential fighting strength of Britain. We had never been called on to exert ourselves in recruiting, and the first shock of war sent young men flocking to the colours. Happily, the protection of our navy gave us the breathing space necessary to allow of the improvisation of an army. The first 100,000 recruits asked for appeared in a day or two; the second army of half a million was raised with little difficulty; and the nation accepted with equanimity Mr. Churchill's statement that within a year we must be able to put a million men into the field. It seemed a reasonable estimate, taking the analogy of continental countries, that Britain, with her colonies and dependencies, could within three years send 4,000,000 men to the theatre of war. Small as our striking force was by comparison with our neighbours—a mere spearhead to the shaft which was the man-power of Britain—it was not to be compared with any continental army of the same size. Our troops were without question the most professional in the world. The training of our Regulars, both in duration and thoroughness, was far beyond anything known in the short-service German army. The fact that we had had usually to fight our wars in desert and ill-provided countries had compelled us to bring our transport and commissariat arrangements to the highest point of perfection. The same held true of our engineering and medical services. It is also to be remembered that a very large proportion of both men and officers had had actual experience of war. Most officers over thirty had gone through the trying South African campaign, which was an excellent training in initiative; the senior commanders had Indian and Egyptian wars as well in their recollection. This field experience is no small ingredient in the *morale* of an army. A man who has already led or followed successfully under fire has learned something which no textbook or staff college or manoeuvres can teach. In Carnot's famous words, 'It is not pirouetting up and down a barrack yard, but active service that makes an old soldier.'—J. Buchan, *Nelson's history of the war, v. 1, pp. 61-65*.—'At the beginning of the war, England had at her disposition a field-army of 160,000 men in the home-country and in the colonies, exclusive of India, as well as reserve and garrison troops to the number of 127,000 men. It had been arranged that, under the protection of the force, the insufficiently trained territorial army, numbering 300,000 men, should complete their training in the space of six months. In India, the regular English troops numbered 77,000 men [see INDIA: 1902-1907], and there was a native army of 214,000 men. By degrees, the English field-army was augmented by considerable fighting forces from the colonies—Canadians, Indians, New Zealanders, and Australians. Nevertheless, the raising of the army to a force numbering millions was accomplished within the home-country itself. Lord Kitchener built up twelve divisions out of the six regular divisions existing before the war, and twenty-eight divisions out of the fourteen very imperfectly organized territorial divisions, thus doubling the army. These divisions were supplemented by the thirty so-called Kitchener divisions. By July, 1915, the army had been increased by more than two million volunteers. Nevertheless, the growing need of men resulting from the unforeseen extension of

the war made it necessary, in January, 1916, to introduce universal military service. [See also ENGLAND: 1916-1917.] A contemporary author writes: 'In the eyes of all those who have studied the history of England during the last three centuries, the introduction of universal military service will appear as something so outside the customary course of events as almost to possess the significance of a revolution. The English people had always exhibited a deep-rooted aversion, not only to military service, but also to the establishment and maintenance of a large army. This aversion was not the fruit of any reflection. It is a deeply rooted sentiment, an expression of the English temper, a peculiarity of the national consciousness. The Englishman can only conceive independence in the form of personal freedom. In view of this, it is exceedingly noteworthy that such a revolution should have been accomplished so easily, and, in fact, by universal consent, in the space of barely eighteen months. That this was possible is due to the fact that the men, whose task it was to guide the nation through the tremendous vicissitudes in which Europe is plunged at present [1917], had the good sense not to force the issue, but to allow events to develop to a logical conclusion. Consequently, the revolution came about as an integral part of the national development. It has been asserted that, at the beginning of the struggle, Lord Kitchener was urged by some to introduce universal military service forthwith. He emphatically declined to do so, and he was right. At that time the English people, great as was the danger with which they were confronted, had formed no notion of its true extent, and had not reached any clear understanding of the task that had to be accomplished. Hence this nation, which clings so tenaciously to its comfort and its prejudices, would not have understood why, short of irresistible necessity, it should abandon a system which was in such complete harmony with its traditions and so excellently suited to its habits. Kitchener preferred to allow the nation to come slowly to a realization of the truth, in the meantime continually increasing the number of recruits, until it was obvious to everyone how inadequate was a system which, with quite a few exceptions, had placed the whole nation upon a war-footing. The fact that, at the call of the government, over five million English came forward voluntarily for the defence of their country, before a single man had been compulsorily enlisted in the army, sheds imperishable glory on the name of Lord Kitchener and is a just source of pride to the English people.' In the matter of the training of the new troops, no less than in that of the constitutional innovations, England took her time. The long war of entrenchments afforded the possibility for this. First in the home-country, then behind the Front in France, the newly-formed divisions were subjected to a thorough training, before they were put into the line. It was not until the spring of 1916 that the English were able to take over extensive sections of the Front which had hitherto been held by the French, and even then they could not in all respects be classed as fully efficient fighting troops.'—Baron von Freytag-Loringhoven, *Nation trained in arms, pp. 20-24*.—See also ENGLAND: 1915 (Oct. 21).

33. **India.**—Ancient Hindu army.—Mahmoud of Ghuznee.—His invasions of India.—Maharatta warriors.—Conflicts with British.—Sikh wars.—'The vast region in Southern Asia known as India has a great antiquity, having been settled probably as early as 2000 B. C., by Hindoos, descended from the Aryan race with the exception of the hill tribes, numbering some millions, said to be of Tartar

origin. The population of India at the present time is not homogeneous, but composed of a large number of distinct nations differing in language, customs, and religion. The Hindoos have never been a conquering race, like the Assyrians or the Romans; they have been 'dreamers rather than actors' in the historical drama of the world. They are deficient in those characteristics essential to the highest development of national greatness,—energy and a love of liberty. Though not an aggressive, warlike people, they have been repeatedly subjected to the invasions of more ambitious nations, and the entire history of India affords a series of struggles for national existence, either with foreign enemies, or with the hill tribes in their own territory. The accounts of the early wars, as related by native writers, contain, doubtless, much that is mythical, but the fact that most of these struggles did occur, is proved by the remains of castles and fortifications seen in many Indian villages at the present day. No nation, however peacefully inclined, is secure without proper defences, and an armament ready for instant use. The ancient Hindoos, understanding this, maintained an efficient army, comprising cavalry, infantry, chariots, and elephants; in modern times they have adopted European tactics. They are more humane in their wars than any other Asiatic nation, and more carefully respect the rights of their vanquished foes. The Indian cavalry of the present day are remarkably skilful in their manœuvres, and their charge, front and flank at the same time, is said to be magnificent and terrible in the highest degree. The early history of India combines fact and fiction, and some of her heroes existed only in the imagination of the poets. . . . Among all the great conquerors the world has ever known, Mahmoud of Ghuznee, 967-1030 A. D., holds a first rank. He early developed a warlike nature, and won his first victories when a youth in his father's army. With a small force of 3,000 disciplined Mamelukes, he established his claim to his paternal estates against a rival brother, and assumed the government of Koristan, taking the title of sultan, being the first who ever bore it. Having conquered most of the kingdoms of Western Asia, he formed the plan of an invasion of India, and with an army of only 10,000 horse, he left Ghuznee, his capital, for the bold and hazardous enterprise of conquering India, and was met on the border of the Punjab by the Rajah of Lahore, when the first battle of Peshawer [Peshawur] was fought, in which the Indian prince was totally defeated and taken prisoner. . . . Mahmoud invaded Indian a second time, repeating his earlier success, and in a third excursion the Rajah of Lahore was defeated in a second battle of Peshawer. In the meantime, his own dominions were invaded by Tartars under Elik Kahn, who was driven back beyond the Oxus, but being reinforced by 50,000 allies, he recrossed the river and engaged Mahmoud, when the severe battle of the Oxus was fought, 1006, in which the Tartars were defeated. During the conflict, five hundred elephants were brought into the field, that caused terrible destruction among the soldiers of Elik Khan, breaking their lines and trampling them under their feet. Mahmoud was now left free to make a fourth irruption into India, in 1008. A confederacy of Hindoo princes, formed to repel the invaders, advanced to the Punjab, but they were soon defeated and scattered. Mahmoud made the fifth successful expedition in 1010, and during the next year he penetrated to Cashmere, without, however, securing any important results. His next blow was aimed at the very heart of India. He began his march with a force of 100,000 horse and

20,000 foot, and having crossed seven large rivers, he arrived at the capital of Canouj, which capitulated, and the Rajah formed an alliance with the conquerors. Mahmoud's twelfth attempt upon India was aimed at the rich temple of Somnat, in Guzerat. To reach it, a desert of three hundred and fifty miles must be crossed, an undertaking requiring 'skill, energy, prudence, and perseverance of no ordinary kind.' The march was accomplished in safety, but on reaching the place, Mahmoud found the temple manned at every point. A furious contest began; the Mussulmans were repulsed on the first and second days, and on the third were compelled to leave the assault and meet the allied native princes in open field. The battle was very severe; at first the Hindoos had the advantage, but at a critical moment Mahmoud sprang upon his horse, and, cheering his men, rushed with irresistible fury upon the enemy, and 5,000 of them were left on the field. Somnat was won, and the temple was despoiled of its valuable treasures. The last expedition of this famous conqueror to the East was made in 1027, for the purpose of chastising a body of marauders, when a great and decisive battle was gained over the outlaws. His last military achievement was the conquest of Persia. His capacity as a soldier and conqueror was of the highest order, and his ability for governing was evident from the good order that prevailed in his dominions during his absence on his campaigns; but, like many other conquerors, he failed to consolidate his vast empire, and it fell to pieces after his death. . . . Mohammed, who assumed the government in 1328, was the most accomplished prince of his age, but his military schemes were utterly impracticable, and, of course, failed. His vast army sent to conquer Persia dispersed for want of pay, and carried ruin everywhere. He next decided to attempt the conquest of China, and sent a force of from 100,000 to 300,000 across the Himalayas, only to be destroyed by the Chinese on the frontiers, so that in the course of a few days scarcely a soldier was left 'to tell the tale.'—S. M. Burnham, *Struggles of the nations*, v. 1, pp. 114-115, 117-120.—During the seventeenth century "the Mahrattas formed bands for plunder, and carried destruction everywhere in the Deccan, and then invaded Malwar and Guzerat. Aurungzebe prosecuted his wars in the Deccan for more than twenty years, capturing nearly every Mahratta fort after long and bloody sieges; that of Jinji lasting three years. The tactics of these warriors, requiring them to disperse quickly when hard pressed, and then rally as suddenly, enabled them to recover easily from a defeat, and renew the struggle."—*Ibid.*, p. 126.—In their struggle against the troops of the British East India Company during the latter half of the eighteenth century, "the restless Mahrattas, though checked, were not subdued, and kept the English army on the alert. These warlike tribes occupying a part of the Deccan, with their capital at Tagra, make a conspicuous figure in the modern history of India. Their military tactics are peculiar. When on the march, they present a disorderly crowd of infantry and cavalry mingled with elephants, camels, oxen, and other domestic animals, and accompanied by their women and children; yet strange to say, though ignoring every requirement of a well-disciplined army, they are seldom surprised by an enemy. In their encampments they display better order; their tents are generally white, and the pavilions of their chiefs are fitted up with great magnificence. Like the Tartars, they lay waste the regions through which they pass, and their course may be always traced by the ruin they leave behind. Their favor-

ite method of attack is the cavalry charge, in which they are almost irresistible. Their horses are trained to bound forward, stop, or wheel at full speed, by the slightest pressure of the rider's foot. The common soldier sleeps on the ground with his spear by his side, and the bridle of his horse on his arm, ready to mount at a moment's warning. When charged by the enemy, they disperse at once, and lead him into an ambush, when they fall upon him, cut off the stragglers, and capture his convoys. A defeat to them is 'like a blow on the water, which offers no resistance and retains no impression.' When they lose a battle, they disperse, and unite again at some other place. This turbulent race, which the Mongols could never subdue, was brought into a hostile attitude to Great Britain. The Mahrattas were giving trouble in the Carnatic, and a force of English and Indian troops were sent to chastise them, but it proved to be only a temporary check, and in 1778 they assumed an openly hostile attitude. An army was sent from the Ganges over land to the Gulf of Cambay, a distance of one thousand miles, under the command of Colonel Goddard, thus proving to the natives the resources of the English more effectually than any battles could have done. He captured several strong fortresses, and dispersed an army of Mahrattas, after a struggle of two years, and, later, they are found the allies of the English in their wars with Tipoo; but no reliance could be placed upon their constancy; they were ready to join any military expedition where there was any prospect of plunder. . . . The Sikhs, a kind of Hindoo deists who became fanatical warriors, were originally a religious order founded by Nanik, who lived 1469-1539. Govind, their chief, in 1675, organized them into a religious and military commonwealth, with every man a soldier, who always went armed. They overran the Punjab, laying waste the country, committing all manner of cruelties, killing the inhabitants without regard to age or sex, extending their ravages to Lahore and even to Delhi. Though severely defeated by the Mongols, they were not utterly subdued, and gave the English in India a good deal of trouble, resulting in two desperate wars, the first in 1845-1846, and the second in 1848-1849. The last war put an end to the national independence of the Sikhs, and the Punjab, their country, was annexed to the British Empire in India."—*Ibid.*, pp. 133-135, 138.—See also: INDIA: 1845-1840.

34. Italy.—Creation of national army by Machiavelli.—Italy in World War.—“The political sagacity and the patriotism for which Machiavelli has been admired are nowhere more conspicuous than in the discernment which suggested . . . [the creation of a national army], and in the indefatigable zeal with which he strove to carry it into effect. Pondering upon the causes of Italian weakness when confronted with nations like the French, and comparing contemporary with ancient history, Machiavelli came to the conclusion that the universal employment of mercenary troops was the chief secret of the insecurity of Italy. He therefore conceived a plan for establishing a national militia, and for placing the whole male population at the service of the state in times of war. He had to begin cautiously in bringing this scheme before the public; for the stronghold of the mercenary system was the sloth and luxury of the burghers. At first he induced the *Dieci di libertà e pace*, or war office, to require the service of one man per house throughout the Florentine dominion; but at the same time he caused a census to be taken of all men capable of bearing arms. His next step was to carry a law by which the permanent militia of the

state was fixed at 10,000. Then in 1503, having prepared the way by these preliminary measures, he addressed the Council of the Burghers in a set oration, unfolding the principles of his proposed reform, and appealing not only to their patriotism but also to their sense of self-preservation. It was his aim to prove that mercenary arms must be exchanged for a national militia, if freedom and independence were to be maintained. The Florentines allowed themselves to be convinced, and, on the recommendation of Machiavelli, they voted in 1506 a new magistracy, called the *Nove dell' Ordinanza e Milizia*, for the formation of companies, the discipline of soldiers, and the maintenance of the militia in a state of readiness for active service. Machiavelli became the secretary of this board; and much of his time was spent thenceforth in the levying of troops and the practical development of his system. It requires an intimate familiarity with the Italian military system of the fourteenth and fifteenth centuries to understand the importance of this reform. We are so accustomed to the systems of Militia, Conscription, and Landwehr, by means of which military service has been nationalised among the modern races, that we need to tax our imagination before we can place ourselves at the point of view of men to whom Machiavelli's measure was a novelty of genius. It must be admitted that the new militia proved ineffectual in the hour of need. To revive the martial spirit of a nation, enervated by tyranny and given over to commerce, merely by a stroke of genius, was beyond the force of even Machiavelli."—J. A. Symonds, *Renaissance in Italy*, pp. 245-247.—“Italy, in order to protect herself from foreign aggression, from the earliest days of her existence felt the necessity of having a strong army. After her entrance into the Triple Alliance she further increased her effectives, and voted large credits for military purposes, which caused serious financial embarrassment. Though the army budget was subsequently reduced, the Italian General Staff has always been directed by intelligent and efficient officers, whose spirit of initiative has kept the Italian forces in the vanguard of development in all branches of military science. Italy was the country first to train troops for mountain warfare, and her corps of *Alpini* were imitated by both France and Austria; as were her *Bersaglieri*, the first *chasseurs à pied* or light infantry in Europe. Aviation was actively encouraged as an essential branch of the service from the very earliest days of its practical usefulness, and dirigibles were first used in modern warfare by the Italians during the Tripolitan campaign. Italy was one of the first countries to adopt an ‘invisible’ field uniform. Though hampered by lack of funds, her armies have been kept up to a high standard of efficiency and discipline. Service in the Italian army is compulsory, beginning with the age of 20; the men remaining 10 years with the colours. Active service, formerly 3 years in the infantry and 5 years in the cavalry, was reduced to 2 years, while those paying £48 and passing an examination were required to serve only one year. The peace footing of the Italian army was 14,000 officers and 255,000 men, while the nominal war footing was 1,215,000. The actual war footing, however, was 41,692 officers and 3,433,150 men in 1913. Concerned with her position as a naval Power, and owing to the great length of her coast-line, Italy, when she entered upon the period of colonial expansion, made a great effort to bring her navy up to a high standard. She embarked upon a daring programme of naval construction; and set the example of building monster ships, armed with monster guns, the precursors of the modern Dreadnoughts. As the result

of great enterprise and efforts, by 1893 Italy had reached the position of third naval Power in the world, ranking immediately after Great Britain and France. But, owing to financial difficulties, her ambitious policy of naval expansion had to be abandoned, so that one by one the United States, Germany, and Japan passed her, and the Italian navy now [1917] ranks sixth."—W. K. Wallace, *Greater Italy*, pp. 154-155.—"The [modern] Italian military units mainly retain their old nomenclature, as such and such a regiment or other command—of Genoa, Milan, Turin, Venice, Florence, Naples, Palermo, etc., but under the system adopted in later years, while Liguria, Lombardy, Tuscany, Calabria, Sicily, Sardinia, etc., are still commemorated in the names of the Regiments or Battalions that shed lustre on them in the past, these commands are composed of troops representative of every region in Italy, the intention being to give the troops the feeling of being national and representative not of a province or city however renowned, but of Italy: Mother and Patria of all. Within these general lines there are certain corps which have a special prestige, as demanding certain qualifications for admission, such as the Cavalry, the Bersaglieri, the Alpini, the Arditi, the Granatieri, etc. The *Genio*, or Engineers, were everywhere, and were expected to do and did everything that was necessary to assist, facilitate, and contribute to the support of all the rest. They not only constructed the systems of trenches, they ran graded roads up impossible mountains; built bridges over rushing rivers and bottomless ravines; cut tunnels and corridors through the rock mountains; swung telefericas (cable railways) from mountain peaks across deep valleys; tunnelled and blew off mountain tops which resisted assault, and performed work everywhere and always, without which the Titanic achievements of the Italian army would have been impossible. This age has always regarded the ancient Romans as the great road-builders of History. Future ages gazing on the remains of this war will say that the Italians surpassed all others, even their ancestors, in this Titanic accomplishment."—Thomas Nelson Page, *Italy and the World War*, pp. 264-265.

35. Japan.—Samurai: Military aristocracy.—Feudal armies.—Beginning of Shogunate.—Liability to service.—Professional soldiers.—Adoption of conscription.—Military administration.—Education of officers and troops.—Organization of modern army.—In World War.—"The existence of this insular empire was first made known to the European world by Marco Polo, who heard of it when at the court of Kublai Khan, of China, in 1298; but the Portuguese, in 1545, were the first of the Western nations to visit Japan, and were soon followed by Dutch, Spanish, and English navigators, all eager to trade with the newly discovered country. It is claimed that the Ainos were the aboriginal inhabitants, whose features, expression, and aspect are European, rather than Asiatic. They are a peaceful race, and know nothing of the art of war. . . . The Japanese are a different race from the Chinese, with a different civilization, and, as a rule, cultivated in mind and manners, and cherish an intense love of knowledge. The modern Japanese are 'inquisitive, progressive, ready to accept new ideas, and improve upon what they learn.' There are two great divisions of the population,—the military and the agricultural, or soldiers and farmers; the former constitute the aristocracy. The highest type of the Japanese man is the Samurai or the two-sworded, a class that for centuries has monopolized the profession of arms,

learning, and all literary achievements, in Japan. . . . The military tactics of the Japanese were at first copied from the Chinese, but, more recently, European strategy has been adopted. The warrior of the feudal age of Japan was armed much as his European brother of a similar though earlier period; but owing to the nature of the ground, cavalry are seldom used, infantry being the chief dependence. Kites, supposed to be of modern use in war, were employed of sufficient size to carry a soldier for the purpose of making observations, thus anticipating the modern balloon used for the same object. Regular assaults and sieges were conducted much in the same way as by other nations. The soldier, if in danger of falling into the hands of the enemy, generally committed suicide, death on the battlefield being considered highly meritorious. . . . The term Shogun means general, and was applied to the commander-in-chief before the dual system of government existed. In a great naval battle fought in 1185, between the rival families of Taira and Minamoto, the latter, under the command of Yoritomo, won a great victory, when the Mikado appointed him to a high office, with the title of Great General, or the Shogun, by way of eminence."—S. M. Burnham, *Struggles of the nations*, v. 1, pp. 152-153, 155.—See also JAPAN: 1150-1190.—"At the time of the foundation of the Japanese Empire the political institutions of the country were so simple that civil and military affairs were one. All adult males in the realm were liable to be called upon for service in the army, with the Emperor as Commander-in-Chief. Early in the Middle Ages, however, we begin to find traces of a line of demarcation between civil and military affairs, and soon this line becomes distinct, the army having regular generals and captains serving under the direction of a central office. This office next established the 'Left and Right Horse' Departments, which had the custody of horses contributed as tribute from the various provinces. For each province was organized a military corps, in which was enrolled every third male adult of the district, all of whom were liable to be called upon for service. Still later, when the military power passed into the hands of the Genji and the Heike clans, a class of professional soldiers made its appearance. The leaders and their retainers both trained their sons in their own profession, which thereby became hereditary, thus evolving the feudal system, which retained its strength until modern times. Powerful barons, entrenched in strongholds throughout the various districts of the country, gradually encroached upon the territory round about them, until at last they had brought these districts under their arbitrary sway, detaching them from direct control of the Imperial Court. The professional soldiers enjoyed hereditary pensions, were bound to their masters by the relationship of liege lords and retainers, and were largely instrumental in bringing the system of feudalism to the high state of organization which it attained during the Tokugawa Regency. With the Restoration and the reinstatement of the Imperial régime the system ceased to exist, being superseded by modern local administrative institutions, which swept away the evils engendered by the old and arbitrary rule of feudalism. The hereditary pensions of the professional warrior class were commuted by recourse to public loans, and the warriors were left to find other occupations. The ranks of the army thus left vacant were filled by male adults of every class, drawn by conscription. The most noticeable feature of this splendid revolutionary achievement lay in the fact that it was accomplished without heavy cost in bloodshed, or in the other national disasters usually

incidental to such sweeping changes, and reflects great credit upon the patriotism of the whole people as well as upon the tremendous influence and statesmanlike qualities of the Imperial Court. At the beginning of the new era administrative affairs were divided into seven departments, one of which took entire charge of military and naval affairs. This division was later designated the National Defence Office, to be superseded in turn by a system of military and naval Commissioners, who took charge of the Military and Naval Office, Fortification Office, Warship Office, Arms and Weapon Office, and Home Office. The Military College and Military Hospital were also attached to this Board of Commissioners. In the second year of the Restoration the post of Commissioner was abolished and the Military and Naval Department established, with jurisdiction over military and naval education, finance and discipline. An arsenal was attached to this department one year later, and during the following year two military garrisons were organized, as was also the Army Medical Corps. During this fourth year the department was subjected to thorough readjustment, and the line of demarcation between military and naval administration distinctly drawn. According to this arrangement the department was subdivided into the Army and Navy sections, the former to include the Education Office, Army Medical Office, Courts-Martial, Arsenal and Magazine, Staff Offices, 'Three Services' headquarters, and the three garrisons of Tokyo, Osaka, and Chinsei. This principle of the separation of the two branches of the service was completed in the following year, when the War and the Navy offices were formally separated and the former divided into the offices of Personnel, Education and Surgeon, Arsenal and Magazine, Imperial Household Guards, and Courts-Martial. The Non-commissioned School established that year was attached to the Education Office. In the sixth year the number of garrisons was increased to six—those of Tokyo, Sendai, Nagoya, Osaka, Hiroshima, and Kumamoto. In the seventh year the Remount Section and the Staff Board were created, while in the following year the offices of Arsenal and Magazines were superseded by the Central Arsenal and the Branch Arsenal, the latter located in Osaka. In the ninth year the Ordnance Council was organized, and in the eleventh year the Staff Board was superseded by the Central Staff Board and the Inspection Headquarters. These changes and progressions of organization are given in detail to show the exceptional spirit of elasticity which prevailed, making it possible to adopt from year to year such reforms, however drastic, as seemed called for by the logic of events, without the interference of bureaucratic red-tape or prejudice against change. During the next twenty years the Tokyo Gendarmerie was created, the Staff College was established, the Colonial Board was attached to the War Office, which had succeeded the Board, the Engineering Council was formed, the various schools enlarged and their scope increased, and the Military Paymasters' School and the Military Supply Office brought into being. In the twenty-eighth year of the Restoration (1895), under the Governor-General of Formosa, several military offices, as well as a Telegraph Construction Office and Lighthouse Office, were adopted for that country, as was also the Wei-hai-wei Office of Occupation. In 1898 the Supreme Council of War to the Emperor was established, and in the following year the Non-commissioned School ceased to exist. . . .

"In the army, as in every other branch of occupation throughout Japan, the matter of education is considered of paramount importance, and no

effort has been spared to provide the most practical and most modern methods which could be found, either at home or in foreign countries. To this end no less than fourteen colleges and schools, or departments of colleges, have been established. The Staff College is provided to enable young officers of distinguished ability to study the higher branches of military science, and such other branches of knowledge as are deemed essential to those wishing to conduct investigations relating to military affairs. The Artillery and Engineering School answers the same purpose for Sub-lieutenants of Artillery and Engineering. The Officers' School is attended by cadets of various corps for preparation for the duties of subordinate officers. The term of study is one year. The annual attendance is about 450. The Military Training School is devoted principally to students sent from the Infantry Corps for training in tactics, shooting, fencing, and gymnastics. The term of attendance is from two to seven months, the number of pupils irregular, and determined from year to year according to the demands of the time. The Central Military Preparatory School is attended by graduates of the Local Military Preparatory Schools, and gives a general education as well as the preliminary instruction necessary for military cadets. The term is for two years, with an average enrolment of about 300 students. The Local Military Preparatory Schools provide a general education and military primary work to youths wishing to become officers. They are six in number, and are regularly connected with the central institution of the same name. Each admits about fifty students each year for a term of three years. The Military Riding School collects from the different Cavalry corps such students as wish to take a course in riding and tactics. The term extends over about eleven months, with an attendance which has not been definitely fixed. The Military Field Artillery Shooting School is maintained for the benefit of students from the Field Artillery Corps, the term being from two to three months, with an attendance to be decided from time to time as circumstances direct. The Military Paymasters' School trains men for the post of paymaster, the applicants being admitted from among Lieutenants and Sub-lieutenants who have passed the examination, and also from the colleges of law of the Imperial Universities and from the higher commercial schools. The courses are divided into one of two years and one of six months, with an attendance varying from year to year as the authorities deem expedient. The Military Surgery School includes surgeons of the Army Medical Corps, and licensed medical practitioners and pharmacists who wish to become military surgeons on active service. First-class students are taught for four months, second class for one year. The Military Veterinary Surgeon-School includes veterinary surgeons of the Military Veterinary Surgeons Corps who require training, and also the farrier foremen of the various corps, the latter being instructed in the science of farriery. The course extends from three to nine months. The Military Gunnery and Mechanics' Work School trains those who wish to become foreman smiths, foreman saddlers, foreman gunsmiths, foreman wood mechanics, and foreman of casting work. The course may be one or two years. The Military Band School takes prospective bandsmen through a course of training lasting about one year."—Field-Marshal Marquis Oyama, *Army to-day* (A. Stead, ed., *Japan by the Japanese*, pp. 112-115, 117-119).—"In 1871 the system of conscription may be said to have first been introduced into Japan. Anterior to that date the organization of the Imperial army had been for many cen-

turies based upon the principles of the feudal system. Some thousand years ago, however, feudalism was unknown in the history of the empire, which was divided into *ken* (prefecture) and *gun* (counties), and there was no class distinction of *shi* (feudal vassals) and *no* (farmers). They were all equally liable to military service. By recalling this old system of administration, and at the same time introducing the advanced principles of conscription as adopted in Europe, a new army system closely resembling conscription was organized. In the feudal times the Imperial army consisted of 400,000 families of *shizoku*, or the followers of the feudal lords (daimyos), who each kept as many retainers as his finances would permit. A large number of non-combatants, such as surgeons and treasurers, were included. Such was the standing army of those times. If, however, we allow for two or three male members—such, perhaps, as brothers—in the families, feudal Japan would possibly have 800,000 to 1,200,000 *shi*. The new system—that of quasi-conscription—was first experimentally put into force in the five provinces of Tamashiro, Yamato, Kawachu, Izumi, and Settsu; and it was only in 1873 that the law of conscription, in its proper sense, was promulgated and had its full force throughout the empire. The Imperial scheme was at first to organize a standing army of 400,000 men, which would constitute twelve *shidan* (divisions) or six army corps; but in practice it was only found possible to create a small army of 40,000 on a peace footing and 75,000 on a war footing. In this year (1873) the military academy was established, and several French officers were invited and entrusted with the care of the military education. . . . In 1883 the army was reconstructed and increased to 200,000 men, which were to make six *shidan* of national forces and one *shidan* of the Imperial bodyguard. Even after this reorganization the strength of the standing army was still far short of what was first intended in 1873—400,000 men. This was owing to the fact that the national funds had to be distributed among various urgent requirements. The construction of forts for coast defence, the extension of military education, the establishment of arsenals—one in Tokyo and another in Osaka—and also of powder factories, claimed considerable sums of the money available. In 1896 the Imperial army again underwent a change after the Chino-Japanese War. At last, by this reorganization, the military strength, as at first projected in 1871, was realized, after a long and patience-trying period. The standing army now numbers 500,000 men, who are formed into twelve *shidan* (divisions) of mixed command and one division of the Imperial Bodyguard. Returning to the time when the system of conscription was first introduced, it must be remembered that it was one of the vital portions of the works undertaken after the Restoration. It meant that the 400,000 families of the *shizoku* had to abandon their hereditary rights and duties as soldiers, together with their hereditary fees, given in rice. Certain sums were allotted to them from the national finances in proportion to the amount of fees which they used to receive. All the daimyos, or feudal lords, had also to give up their dominions; their castles and fortifications were placed under the care of the War Department. It was the abolition of the long-existing feudalism in Japan—a great revolution. The most influential class of the people under this system were the *shizoku*, and the people who suffered most in honour and in interest under the new régime were the *shizoku*. As a consequence of this, in 1874 the *shizoku* of Hizen broke forth in rebellion—known as the Saga affair—and in 1876

Maibara, an ex-retainer of the daimyo Mori, revolted against the Government with many followers. In the same year many of the *shizoku* of Chikuzen also rose in insurrection. Fortunately, however, all these rebellions were suppressed before they assumed important dimensions. In 1877, however, there broke forth a war of rebellion in Satsuma. It was the last of its kind and the greatest in magnitude. It was of a most serious nature. Many of the rebels were the veteran soldiers of the Restoration. Nevertheless, the Imperial army proved victorious after many severe engagements. All these rebellions were vindications of the efficacy of the conscript army, and the Chino-Japanese War of 1894-95 was a crowning triumph for the system. After the war the army of 200,000 was at once increased to some 500,000 although such a sudden augmentation was generally considered to be impossible."—Field-Marshal Prince A. Yamagata, *Growth of the army* (A. Stead, ed., *Japan by the Japanese*, pp. 105-107).—The modern Japanese army is largely modeled on the German. At the outbreak of the World War Japan had twice the military power which she had when she began the war with Russia in 1904; she had since then made a specialty of artillery, particularly the heavy guns. For the siege of Tsing-tau (Kiao-Chau) in 1914 the Japanese organized a special siege force under the command of Lieutenant-General Kamio, consisting of a division of infantry, and three additional brigades—a corps of siege artillery, a flying detachment, and detachments of engineers and marine artillery. Japan has universal conscription for service in the army and navy, beginning with the age of twenty and ending at forty.—See also WORLD WAR: 1914 V. Japan: a.

36. Poland.—Sixteenth century army.—Foreign mercenaries.—“The historian Dlugosz gives us reason to conclude that Poland had possessed infantry troops as early as in the beginning of the fifteenth century, but this body of men—a small one, numbering not more than 2,000—was only armed with pikes. Batory [king of Poland, 1575-1586] provided a more modern armament—muskets, swords, and battle-axes—and trebled the strength of his infantry by calling out the peasants on the crown lands. Those who enlisted of their own free-will were forgiven all they owed. The volunteers were many, and distinguished themselves by their bravery: some of them performed prodigies of valour. Besides these men, the King had a body of Hungarian infantry, some 5,000 strong, another of Polish infantry equipped in the Hungarian style, and consisting of the serving-men attached to the army, and a third recruited among the nobility. These he reinforced by divers bodies of auxiliaries belonging to the same arm of the service—Germans, who formed themselves into huge squares, Scotsmen, and Cossacks. Into his cavalry he introduced German and Polish arquebus-men. The total number of troops, including the Lithuanian contingent, does not seem to have exceeded 20,000 men. It is worth remarking that in this war, certain separatist tendencies notwithstanding, Lithuania, or at all events the nobility of the country, which was still half Russian and half Orthodox, was heart and soul with Batory. This fact is acknowledged by the Russian historians themselves. . . . The sister nation gave all she could—a few thousand horsemen, who proved most invaluable, during the winter season especially, when, better able to endure the terrible climate and less distant from their own homes, they made up, to some extent, for the dispersal of the main army. This consisted of a mere handful of men, but it was the first, as to composition and quality, in any Slav country. The

proportion of foreigners it contained was very large, but in the sixteenth century this was by no means an exceptional case. At the Battle of Dreux (December 19, 1562) Guise had over 12,000 Germans, Swiss, and Spaniards in his army, as against 6,000 Frenchmen, and in his enemy's camp the state of things was similar. The Poles' weak point, in this and all the succeeding campaigns, was to be their enemy's strong one—artillery. In vain did Batory engage cannon-founders in Germany and even in Italy, and beg the Elector of Saxony to send siege-guns and ammunition; he never could get enough ordnance together, and his artillerymen, of whom he only had seventy-three in 1580, shrank, in the following year, to twenty."—M. Waliszewski, *Ivan the Terrible*, pp. 304-305.

37. Russia.—Army of Ivan the Terrible.—Motley composition.—Tactics.—Courage and endurance.—Artillery.—“In this country, where the feudal system was unknown, the military organization of the period was, nevertheless, essentially feudal in all its features. In France, naught of such an organization remained, save the *ban et l'arrière-ban*—a small matter, some 2,000 or 3,000 men, little or nothing in presence of the regular and permanent forces, the real army of modern times. In Russia, Ivan was only beginning to form this new type of contingent, by giving it a nucleus in the shape of the corps called the *Strieltsy*, a name which appears for the first time in the course of the decisive campaign of 1552 against Kazan. The *Strieltsy* were arquebus-men (*strielat*, to fire), recruited from the free class, on a life engagement. Most of them were married men, and they ultimately formed a separate body in which the profession of arms was hereditary. They were armed and equipped in the European fashion, and each received a rouble to build himself a house, another rouble of yearly pay, uniform, powder, and some measures of flour and *kacha*. These arrangements having proved insufficient, the Government ended by giving land, and allowing the *Strieltsy* to pursue divers trades, subject to the performance of their military duties. This led to their being confused with the ‘men who served.’ At the close of Ivan's reign they numbered 12,000 men, 7,500 of whom garrisoned Moscow, and formed, with the town Cossacks, the first body of infantry the Russian Tsars ever possessed. A permanent corps of artillerymen, divided into gunners (*pouchkari*), fort artillerymen (*zainchichiki*), grenadiers (*granat-chiki*), and artificers, and a special corps of arquebus-men (*pistchalniki*), was organized at the same time. All this did not constitute an army. The bulk of the force consisted of the ‘men who served,’ and of what was called the *rat*, the germ of another military force. In war-time two things were done. All or part of the ‘men who served’ were called out, on the one hand, and on the other, levies were ordered, such and such a town or diocese being obliged to furnish so many foot soldiers or mounted men, recruited outside the military class. This constituted the *rat* or *possokha*; and for one campaign alone—that undertaken to recover Polotsk from the Poles—Ivan was to collect 80,000 of these *possochniki*. They were not disciplined troops, as may well be imagined, nor calculated to cut any very brilliant figure on a battlefield. As a rule, therefore, they were employed in digging earthworks or preparing war material. The Muscovite Government, indeed, permitted its taxpayers to pay a money indemnity of two roubles instead of each man due, and even preferred this plan. It was simply a form of taxation. Mobilized by circulars sent by the War Office, or *Razriad*, to the provincial *voievodes*, and specifying the number of

men to be called out, the points on which they were to be concentrated, and the nature of their armament, the ‘men who served,’ boiars, boiars' sons, and courtiers (*dvorianie*), were divided, from Ivan IV.'s time onward, into five regiments—the great regiment, the vanguard, the right hand, the left hand, and the rearguard. When the Tsar was present, a sixth regiment, called ‘the Sovereign's regiment,’ was added. The first regiment consisted of three, and the others of two divisions, subdivided into ‘hundreds’ (*sotnias*). Each regiment was commanded by a *voievode*, each division by a lieutenant who ranked as a *voievode*, and each *sotnia* by a *dvorianine* of the first class. In the Tsar's absence, the whole body was under the orders of a Court *voievode*, the *magister militarum* of the Romans, the *generalissimo* of the present day, who was surrounded by a numerous staff, which included *shorchtchiki*, whose business was to bring the troops together; *okladtchiki*, who had to divide them; *posylnyie lioodi*, or aides-de-camp; *stanovchtchiki*, or engineers; foreign artisans, employed in siege works, provosts, medical men, and priests. How many men did all this come to? We have no data for the year 1552, but in 1556 the full numbers of the vanguard regiment did not bring it up to 1,500 horsemen. In 1578, in the campaign against Lithuania, the army, though increased by the presence of a Tartar contingent, only numbered 39,681 fighting men in all, made up as follows:

Russian and Circassian Princes.....	212
Moscow boiars and boiars' sons.....	9,200
‘Men who served’ from Novgorod and Iou-riev	1,109
Tartars and Mordvians.....	6,461
Court <i>Strieltsy</i>	2,000
<i>Strieltsy</i> and Cossacks from the provinces..	13,119
<i>Possokha</i> from the northern provinces....	7,580
	<hr/>
	39,681

“Part of the available forces had probably been left to guard the frontier, while every boiar, on the other hand, took at least two *ratniki*, or fatigue men, with him, and some brought fifty or more. One traveller of this period, Clement Adams, mentions 90,000 as the total number of men available for the Tsar's service, but adds that he only called out a third of these on his campaigns, being obliged to leave the other two-thirds to guard the fortified places. There is a striking agreement between this calculation and that furnished by the rosters for the year 1578. Apart from the *Strieltsy* of the special corps and the *possokha*, all these troops were mounted. Their armament was of the most varied description. In Ivan's time, the curved Turkish sword and the bow were the favourite arms with most Russians. Only a few substituted pistols or long muskets. An axe hanging at the warrior's saddle-bow, a dagger, and now and then a lance, made up the campaigning equipment. Cuirasses were very little patronized. A few great lords wore them, and of very splendid make, out of vanity, and covered their heads with ‘sallets’ or ‘morions.’ There were no spurs—the whip supplied their place. The horseman held his bridle and his bow in his left hand, and clasped his sword and whip with his right. When he shot he dropped the sword and whip, both of which were fastened to a strap. The moment the enemy came within range every arrow flew at once, and, however much or little the adversary's onslaught were checked, the whole body of troops beat a retreat without awaiting the shock of battle. Thus it came about that this cavalry never learnt to stand in the open country

against the Polish squadrons, which had been taught to charge right home. Its chief merits were its endurance and its extreme mobility. On their unshod horses, most of them undersized, and all clumsily accoutred, these Russian soldiers covered huge distances, and unflinchingly endured the greatest fatigues and the most extreme privations. Clement Adams and Chancellor show them camping out in the snow, lighting a tiny fire, content with such poor nourishment as a handful of flour mixed with boiling water, and lying down to sleep with no covering but their cloaks, and without even a stone for a pillow. The second of these two English travellers wonders how many of the warriors of his own country, prouder than most men of their valour, would have been able to hold out, even for a month, against these troops, and comes to the conclusion that if these men realized their own strength nobody in the world would be able to stand against them. But endurance is not everything in war. Ivan's undrilled and undisciplined soldiers did not possess the very elements of their art. The only tactics they knew consisted in surprising the enemy, overwhelming him with a force two or three times larger than his own, and deafening him with their yells and the discordant clangour of their trumpets and cymbals. Brave in their own way—as brave as they were temperate—they were seldom known to sue for mercy, even if they were worn out and on the brink of giving way. But they broke up very easily. They were useless in the service of any skilled strategy, and they were just as useless for siege operations, such as those which awaited Ivan under the walls of Kazan. In cases of defence their superiority was evident. Once shut up and cut off from all chance of taking to their heels in flight, they were extraordinarily tenacious, bore cold and hunger without a murmur, died in their thousands on the earthworks and wooden defences they perpetually repaired, and never gave in till the very last extremity. Hence the constant use in the Muscovite armies of portable defences, shields made of planks, with holes bored for the musket-barrels—these were called *khoudai gorody* ('towns on the march')—and hence, also, the precocious development of a very powerful artillery service. The first cannon the country had ever possessed were of foreign make, but, even in Ivan III.'s time, foreign workmen were casting them in Russia. A gun produced by this home factory, and bearing the date of the year 1485, is still preserved in the St. Petersburg arsenal. Under Ivan IV., the war material thus collected included all the European improvements in ballistics—serpentes (here called *zmei*), falconets (*sokolniki*), and mortars of various calibres, amongst which were classed the *haufnizy* (from the German word *haufnitz*), the *haubitzen* of a more modern type, and the *volkomietki* (from *volk*, wolf, and *mietat*, to launch). No Christian Prince of the period, according to Fletcher, possessed such a quantity of ordnance, and in 1557, Jankinson speaks with wonder of the Russian gunners' drill, in which he saw them vie with each other laying their guns with extraordinary swiftness and skill."—K. Waliszewski, *Ivan the Terrible*, pp. 159-163.

38. Russia.—Cossacks.—Army of hardy plainsmen.—Absorption into imperial army.—“In order to secure the military aid of the Cossacks, the Polish kings were forced to allow them to establish lists or ‘Registers’ of ‘Free Soldiers’ to whom claim of serfage was relinquished by the feudal lords. These latter, however, always claimed possession of the lands occupied by the Cossacks and their right to liberty as a caste was never recognized. This . . . was the cause of the great

uprising ending in the separation of the Cossack Ukraine from the Polish crown. . . . The Cossack warriors of the Polish Ukraine, though clinging tenaciously to their liberties and denying any right on the part of an alien government to claim their services, often entered the feudal military companies of the Polish nobles as volunteers or paid men-at-arms, while farther to the eastward, their kindred entered the service of the Tsar. . . . After the more or less voluntary submission of the ‘Free Cossacks of the Don’ the Russian Tsars soon began to make use of their matchless skill in frontier warfare. An arrangement mutually favorable was now perfected and the Cossacks became the basis of a system of defensive militia policing the steppes against the Crimean Tartars. Although the Muscovite peasants were brave and (above all) docile foot soldiers, their usefulness as cavalry was limited. Previous to the time when Cossacks were enrolled for this purpose, it had been found necessary—in order to defend the open frontiers of Muscovy—to mobilize every year a force of about 65,000 men. Owing to the fact that the rendezvous chosen lay on the banks of the river Oka, this was called the annual ‘bank service.’ In the early days this duty had been performed by the feudal levies of the great *boyars*, whose serf and peasant troops attended the annual musters unwillingly and often at great inconvenience to themselves during the harvest season (a time therefore usually chosen by the Tartars for their raids). As early as 1571 a Russian *boyar*, Prince Borotinsky, began to employ a system of mixed Cossack and militia patrols which appears to have differed but little from the military colonies of *stanitsi* of the later Cossack ‘armies.’ During the seasons less favorable to the Tartar raids a protective service alone was maintained. This was called the ‘Watch and Post Service’ and consisted of Cossacks living in rude blockhouses linked together by small fortified camps. This first line of defense was intended, however, rather to impede the march of the Tartar raiders—and to give warning of their sudden coming—than to attempt any serious resistance. Mobile outposts composed of squads of two, four or six horsemen, to each of which was assigned a regular ‘ride’ of about a day’s journey, joined together the Cossack encampments or settlements which were generally set upon high places from whence an outlook could be kept across the plains. In each of these encampments horses stood ready saddled, so that upon the appearance of suspicious signs—the distant black dots in the yellow waste, denoting the scouts of the enemy, or the inevitable clouds of dust raised by the hoofs of their horses—the news could be immediately communicated to the nearest fortified town. . . .

“The early military organization and strategy of these Dnieper Cossacks was probably but little different from that of the Tartar levies. By the end of the sixteenth century, however, not only the garrisons of the *sitch* [camp] but also the troops and militia stationed in the agricultural settlements along the upper Dnieper, had developed a characteristic system of military service. In the Hetman Bogdan Kostchinskoi, whose power was recognized by a majority of the free Cossacks settled along the Polish frontiers, King Stephen Bathory found a leader capable of bringing order and discipline out of the anarchy which had previously existed. Upon Bogdan he formally conferred the dignity of ‘Hetman of the Ukraine’ and at the same time presented him with splendid regalia composed of the Asiatic symbols recognized by the Cossacks as those of supreme authority, namely: the *boudava* or baton of the commander-in-chief; the *buntchuk* or

horse-tail standard similar to that carried before the conquering generals of Genghis Khan. To these were added the tokens conferred on Polish frontier officials—a great seal of office and the standards that distinguished the mercenaries employed by the kings of Poland. In the agricultural settlements or *stanitsi* of the Ukraine the Cossack levies were divided into regiments or *polki*. These, in turn, were subdivided into companies of one hundred men called *sotnia*, an organization which has persisted in the Cossack forces of the present day. Although a general of artillery, or *obozni* and a secretary, or *pisari* were nominated by the Polish king to assist the hetman (and at the same time to oversee the more technical details of military organization) the warlike customs of the Cossacks were not interfered with and their peculiar methods of fighting and discipline were generally maintained. . . . In considering the history of the Ukraine, a distinction must be made between the agricultural Cossack settlements of the Upper Dnieper and the outposts or garrisons of the *Za-Porogi* to which the former were tributary. . . . The military capabilities and peculiar organization of the Zaporogian Cossacks was a source of considerable interest and inquiry among contemporary military authorities. Many writers of the eighteenth century—wholly ignorant of their real condition—compared these famous frontier troops to military orders of chivalry such as the Knights of the Sword in Lithuania, or even the Knights of Malta. Others compared them to the 'Free Archers' of Charles the Seventh, or the 'military colonies' of Sparta and of the early Grecian states. As Lesur points out, a more reasonable and modern parallel is to be found in that strange republic of *filibusters* who almost contemporaneously established their piratical state among the islands of the West Indies. If this comparison does some injustice to the Zaporogians (to whom must be allowed the merit of holding in check, at a critical time, the ravages of the Mussulman invaders) it will appear more reasonable if viewed in the light of the intolerable nuisance to which their pretensions gave rise at a later date."—W. P. Cresson, *Cossacks, Their history and country*, pp. 16-19, 24-25, 27-28.—"The old tradition that pictures the Cossack troops as a levy of wild horsemen, only useful for the purpose of partisan warfare, in no way represents the actual state of their military capabilities. Besides living from childhood in a military atmosphere their officers are drilled with especial severity for their long period of duty. Under the old régime, while special military institutions existed for Cossack officers, they were subjected to the same educational requirements as the cadets graduating from regular military schools. Moreover, no amount of training could take the place of the marvellous *esprit de corps*—an almost instinctive 'clan' feeling—existing in every Cossack regiment. The introduction of universal military service in 1874, and the enactment of laws by which every male Russian was called upon to take up his share in the burden of state defence, removed many of the differences existing between the Cossacks and their peasant or *moujik* neighbours. But in spite of the important change thus realized the military traditions of the Cossack race remained unchanged and the imperial government continued to treat them as a distinct body in the community. Each Cossack was still required to furnish his own horse, uniform and weapons, and the only changes made in the old conditions of Cossack service had in view placing the Cossack armies in a position enabling them to co-operate with the regular troops of Russian line. Nearly all the Cossack troops engaged in

the heroic struggle which the Russian army made on the side of the Allies during the opening years of the World War, were cavalry formations. The levy of the united Cossack armies just before the war constituted a minimum of 144 cavalry regiments, 830 *sotnia* or 'hundreds' and a quota of light Cossack artillery, accompanying the infantry tactics, their services were useful even in trench warfare, but it was as scouts and raiders that the traditional Cossack qualities gained for these troops such well-deserved reputation. For military purposes all male Cossacks are divided into two general categories, active and reserve. . . . Cossack military service begins at eighteen years and is continued as follows: three years in the preparatory class; twelve years in the line; five years in the reserve. The 'line' category, in view of the long service required, is divided into three divisions, only the first of which serves constantly with the colours, while the other two are allowed to remain near their homes subject to 'the call to arms.' . . . With the negligible exception of twenty infantry 'hundreds' and a greatly reduced quota of light Cossack artillery, nearly all the Cossack troops serve as cavalry, or 'dismounted cavalry.' In addition to the regular Cossack troops the [former] imperial armies included a division of cavalry, armed and drilled according to Cossack methods, but exclusively recruited among the war-like tribes of the Tcherkess, Abkhazes, Lesghians, Daghestani, etc. These wild horsemen, who compose the celebrated 'Dikki Division' or 'Wild Division,' enjoy not only a great reputation for reckless bravery but also for the excesses which they are reputed to commit in enemy territory. Few, if any, of these troops are Cossacks, and only the similarity of dress and equipment causes them to be confused with the latter. On the other hand a bitter rivalry exists between them and the true Cossack troops against whom their ancestors were so long engaged in frontier feuds and skirmishes."—*Ibid.*, pp. 201-204.

39. *Russia*.—Imperial army since Crimean War.—Slackness of discipline.—Man-power.—Preparedness for World War.—"In order to understand the conduct of the Russian national army in the World War, it is necessary to take a brief survey of the past history of the Russian Army. After the Crimean War a complete departure was made from the form of training which had prevailed in the Russian Army under Nicholas I. Formality and stiffness in the bearing of the individual soldier as well as of the unit as a whole was done away with entirely, as being out of harmony with the national character, though this change undoubtedly involved the sacrifice of some indispensable aids to discipline. It was believed that the inborn submissiveness of the Russian soldier rendered the rigid discipline of the drill-master entirely superfluous, and it was overlooked that this lowering of the requirements from the unit in respect of outward appearance and uniformity necessarily involved a serious relaxation of its inward cohesion, and that where there was no careful training of the individual soldier, the practice of even the simplest movements by the unit as a whole must take up so much time that the training for war would necessarily prove too short. The recruit was just as willing, but the old subordination disappeared more and more, and moreover could not be made up for by a lofty and instinctive sense of duty, as in the case of a nation of old civilization. Finally, in the year 1874, with the introduction of universal military service, the army acquired an entirely different character. In place of the old soldiers,

with their long term of service, who looked upon their regiment as their home, we now find men who belonged to the service only for a few years. The change from an army of professional soldiers to an army based upon the principle of universal military service, took place, of course, only by degrees, so that, when the Balkan [Russo-Turkish] War of 1877-78 broke out, universal military service had still not become fully effective. . . . Far too many of the conditions which at one time contributed to the efficiency of the Russian troops, ceased to exist after the middle of the nineteenth century; they could not, indeed, any longer exist. An important fact, moreover, was that the war in the Far East [1904-1905] was thoroughly unpopular both with the officers and the men. They had no clear conception of what they were fighting for, and looked upon the war as something in the nature of an unsuccessful colonial enterprise. Hence the disaster to the Russian arms was not felt in any way as a disgrace. Kuropatkin repeatedly emphasizes the fact that in this respect the Russians were far inferior to the Japanese, who were inspired by a lofty national ambition, and that an army which is based on the principle of universal military service must be supported by general public opinion. He writes: 'In a collision between two nations, material weapons count for less than spiritual forces. Where the spirit of the nation and army is of higher worth, where there is revealed a more self-sacrificing devotion to the Fatherland, there is the greater likelihood of victory.' Such a likelihood of victory appeared on the outbreak of the World War to lie on the side of the Russians, both in virtue of their huge numbers and of the undoubted popularity of the war, at any rate at the beginning; and that all the more, since the experiences gained during the Manchurian campaign had not been disregarded. In the ten years' interval between the Peace of Portsmouth [1905] and the outbreak of the World War, much had been done to promote the war-preparedness of the Russian Army. But though individual improvements were effected, it was impossible to infuse a new spirit into a national army of gigantic size within the space of ten years, more especially in view of the low standard of culture and the apathetic temperament of the Russian people. The excellent passive qualities of the Russian soldier—his patience, his capacity of resistance to weather conditions and the impressions of the conflict—were equally revealed in the World War; and the huge Russian Army was an obedient tool in the hands of its leaders when, instructed by the failure of their defensive tactics in Eastern Asia they embarked on a reckless offensive. Only from a nation like the Russian could such an immense human sacrifice have been exacted. Owing to its insensibility to losses and defeats, as well as to the moral effects of retreat, the Russian Army maintained its cohesion even in the most difficult situations. Nevertheless, the unwieldy character of the Russian masses showed itself just as it had done in previous wars. In spite of the popular notion of the inexhaustible supply of the Russian reserves, the number of thoroughly trained men who could be sent to the Front grew less and less as time went on, so that the efficiency of the army steadily declined; although it cannot be denied that great pains were taken to profit by the experiences of the war, and that the Russian Army still remained a redoubtable adversary. The achievements of the Russians in respect of organization, both before and during the war, are very striking. Of course, in passing any judgment

upon Russia, it ought not to be forgotten that months before the order was given for its actual mobilization, the Russian Army had been brought to a high level of preparedness. Only as a result of this fact was it enabled to overcome the difficulties consequent upon the vast extent of the empire. This is at once evident if we consider that a total of two million combatants, equipped with abundant and excellent artillery, entered the field of battle in August, 1914, that in the late autumn of the same year the Russian Army was estimated at five million, and that the total number of men called under arms must have been not less than twelve million. . . . In any case, the World War has revealed very clearly that only a strongly united, well-trained national army is equal to great military achievements; such achievements cannot be performed by troops of the character of a militia. Past history teaches the same lesson."—Baron von Freytag-Loringhoven, *Nation trained in arms*, pp. 28-29, 37-41, 44.—See also RUSSIA: 1914 (August): Status of army; RUSSIA, SOVIET CONSTITUTION OF.

40. Serbia.—A military state.—Serbia, "with a population of only some 3,000,000 . . . was yet the type of state which in war could organize herself far more effectively than many richer and more populous communities. Her race of peasant proprietors, habituated to bare living and accustomed to arms, made excellent fighting material. She had a system of national service, each man serving with the colours from eighteen months to two years between the ages of twenty-one and forty-five, and her Landsturm included those between seventeen and twenty-one and forty-five and fifty. Her experiences in the Balkan War (1912-1913) had made her army a veteran one, and her General Staff had shown itself brilliant both in initiative and defence. Her weakness was her poverty; she was behindhand in the equipment of various arms, and her commissariat and medical arrangements were rudimentary. These drawbacks, however, were largely counteracted by the fighting spirit of her people, and their tolerance of hardships which to a Western European are unthinkable. In an extreme national crisis, such as the present (1914), she could probably count on a fighting strength of some half-million men."—J. Buchan, *Nelson's history of the war*, v. 1, pp. 66-67.—In the early stages of the World War the Serbian army gave such an excellent account of itself against the Austrian enemy that it seemed for a while as if the smaller nation were more than a match for the Dual Monarchy.

41. Switzerland.—Cheap but efficient national army.—Fighting qualities.—Training and organization.—"This little republic, the center of Europe, has for some years possessed the perfect model of a national army. The policy of the nation was easy to frame in relation with its surroundings. North, south, east and west lay neighbors so powerful as to preclude any territorial ambition. On the other hand, these neighbors presented a threat along every mile of frontier. So the Swiss decided on a policy of national defense. And defense to be bearable, with a small people and relatively poor country, had to be inexpensive; while on the other hand to stand any chance of success it had to place large masses in the field. To carry out this policy Switzerland gives preliminary military instruction in her schools, and at twenty years of age calls on every man, mentally, physically, and morally fit, to train for sixty days. (Ninety days in the artillery and other special services.) Thereafter he trains eleven days a year until he reaches the age of thirty-two

when he is turned over to the reserve, which holds him till he is forty-eight. The framework for this militia army, armament, equipment, officers' corps, technical services, munitions of war, are maintained in a highly organized state so that mobilization of the Swiss army can be effected within a few days of the call to arms. On first assembling it is not to be supposed that the Swiss infantry would equal the quality of the German or French. But a very few weeks' experience in the field, added to their early training with the rifle, would probably turn these hardy and liberty-loving mountaineers, of splendid fighting qualities and tradition, into an army formidable enough under modern standards to put up a strong resistance in defensive positions. The authorities give varying numbers for the Swiss army. Their first line is placed at from 150,000 to 250,000 men. The reserve may be reckoned at almost as many more. An army such as that, concentrated on a front near the line Bienne-Zurich would prove more than an embarrassment to any French or German army that should venture to cross lots through Bâle [Basel] and the northwestern corner of Switzerland. It is the virtual guarantee of the independence of a brave people, who have too much sense to put their faith in international guarantees of neutrality, and enough spirit to be willing to face the military issue instead of feebly evading it."—R. M. Johnston, *Arms and the race*, pp. 82-85.—"The army of Switzerland may be termed without exaggeration the most efficient militia force in existence to-day. The first clause of Article 18 of the Federal Constitution says: 'Every Swiss is bound to perform military service.' At stated dates every year, all young men who have come of age go before an examining board, consisting of military officers and physicians. They are subjected to an examination in the rudiments of learning, and are tested to see if they come up to the rather easy requirements in physical condition, demanded of Swiss recruits. Those who have successfully sustained these tests are drafted into the different branches of the service, according to their special aptitudes, and are sent to recruiting schools scattered over the country,—the infantry for a term of forty-five days, the artillery for fifty-five, the cavalry for sixty, and the engineers for fifty. On the other hand, the recruits who are unable to pass their examinations in the rudiments of learning are obliged to attend special recruits' schools, while those who are found to be physically incapacitated pay an annual tax of exemption. So severe are the regulations in this regard that even Swiss citizens living in foreign countries are required to pay this tax. Upon issuing from the recruiting schools, the young men, now trained to be regular soldiers, join the active army, the *Elite* as it is called in French, the *Auszug* in German, until they are thirty-two years old, being required to join the ranks every other year for regular drills,—the cavalry every year on account of the greater amount of training demanded by that branch of the service. The soldier then passes from the *Elite* into the *Landwehr*, until he is forty-four, and finally enters the *Landsturm*, which comprises all men capable of bearing arms, between the ages of seventeen and fifty, who are not in the *Elite* or the *Landwehr*. . . . It is one of the peculiar features of the Swiss military establishment that every soldier keeps his outfit at home, ready for immediate use when the summons may come. The third clause of Article 18 of the constitution provides that: 'Each soldier shall receive without expense his first equipment, clothing, and arms. The weapon remains in the

hands of the soldier, under conditions which shall be prescribed by federal legislation.' Rigid inspections of arms are held annually in each district, and if repairs are made necessary by any carelessness on the part of the soldier, they are executed at his own expense. . . . As one might expect of a citizen army, the uniforms are simple, but serviceable. The headdress for all arms is a kind of low shako (in German *Käppi*, in French *képi*), made of stiff felt, with fore-and-aft peaks. It is adorned with a colored worsted pompon, or cockade, to denote the wearer's particular branch of the service. Dark-blue tunics and dark-gray trousers are the rule, except green tunics for sharpshooters and cavalry, and complete light-blue uniforms for surgeons. In fact this latter uniform is the only brilliant one in the Swiss army. The rank of the officers is indicated by the number of narrow lace bands on the headdress, and of stars on the shoulder-straps. During active service all officers and men wear the Federal badge on the left arm, a broad red ribbon bearing a white cross. True to their deep-rooted Federal instinct, the Swiss do not admit a commander-in-chief in times of peace, but content themselves with a general staff composed of three colonels, sixteen lieutenant-colonels or majors, and thirty-five captains. In case of war, however, a general would immediately be elected by the Federal Assembly to take supreme command. Military law is administered by a special judiciary staff, in accordance with an elaborate law passed on the 28th of June, 1889. Among the most interesting subjects connected with the Swiss army are the regulations in regard to pensions. Short and simple as is the constitutional enactment upon this subject, it is worthy of serious attention. The second clause of Article 18 says: 'Soldiers who lose their lives or suffer permanent injury to their health in consequence of Federal service are entitled to aid from the Republic for themselves or their families, in case of need.' Observe these words, '*in case of need*'; they speak volumes. . . . If one were asked to designate the particular quality which distinguishes the Swiss army from all others, one would point to the comparative absence of class distinctions within the ranks. This model militia is as democratic as an efficient army can be. When the drill is over, the officer and the private may be seen plowing in the fields together, or working in the same factory. They are real brothers in arms."—W. D. McCrackan, *Rise of the Swiss republic*, pp. 368-370.

42. Turkey.—Corps of Janissaries.—Recruited from Christian subjects.—Discipline and organization.—Fantastic costumes.—Native cavalry and infantry.—Tatar auxiliaries.—Modern army at outbreak of World War.—"The Sultan's armies [in the sixteenth century] comprised five principal branches—first and foremost the janissaries, then the feudal troops, the *spahis* and *piadés*, thirdly the artillery, fourthly the irregular troops, *acabs*, *akinjis* and the rest, and lastly the Tartar auxiliaries. All of them are interesting and picturesque, but none so much as the janissaries, that wonderful corps of which an eminent writer has said that 'it was one of the most remarkable bodies the world has ever seen, and goes far to explain the character of the early Ottoman Empire—that wild brilliancy and vigour in which no ordinary ideas of humanity, morality or economy find a place.' Tradition places the foundation of the corps in the reign of Sultan Orkhan, who succeeded Sultan Osman (founder of the Ottoman nation) and flourished 200 years before the capture of Constantinople. Several causes combined to

bring it to birth. The Ottomans were hopelessly unable—both from their lack of assimilative power and the rapidity of their progress—to digest their conquests in Europe and Asia, and the numbers and strength of their subject populations became a serious problem. Conversion to Islam was an obvious remedy and in seeking methods of encouraging this they hit on the janissary system. It was a brilliant solution from their own point of view, for it killed three birds at least with a single stone. It formed a deadly inducement to Christian parents to abandon their faith for the sake of their children; where this failed, it lessened the danger from the Christian element by removing the pick of each generation, and it provided ideal material for the Turkish armies. Its invention is credited by Turkish historians to one 'Black Khalil,' the Vizir of Sultan Orkhan, who suggested to his master that he should levy an annual tribute of one thousand children, selected at discretion, from the Christians under his power. [See also TURKEY: 1326-1350.] The scheme was adopted and the boys were reft from their homes with the same ruthlessness as the victims of the Minotaur, and forcibly initiated, by the customary rites, into Islam. The initiation was performed by a notable holy man, Hajji Bektash (founder of the Bektashi order of Dervishes which still flourishes in Turkey), who, we are told, blessed the neophytes by stretching his flowing sleeve above the head of their leader lying prostrate before him on the ground and pronouncing the following words: 'Let these youths be called the Yeni Cheri (meaning the 'New Armies' and corrupted by European lips to 'Janissaries'); let their countenance ever be bright, their hands victorious and their swords clean, and whithersoever they go, may they return always with a white face!' The corps adopted the peculiar mystic tenets taught by the Hajji and for centuries after preserved the memory of their baptismal day by wearing a piece of stuff, shaped like a miniature sleeve, attached to the peak of their caps. The janissaries were forbidden to marry, and passed their lives under a system of military discipline of the sternest imaginable nature. To quote from Sir Charles Eliot, 'they were thus a military religious order composed of men selected for physical and mental excellence, divorced more completely than any monk from all worldly ties of birth, marriage or profession, and encouraged to give their vigour full and unscrupulous play subject to no law save that of unquestioning obedience to their superior officers.' The system produced, indeed, a *corps d'élite* of incomparable fighters, and any fears which their founders may have entertained as to the standard of loyalty to be looked for from a body of forced converts were speedily dispelled when the young converts proved themselves capable of even fiercer acts of tyranny and oppression towards their own Christian relations than the natural-born sons of the Prophet. In this way the Turks organized the first regular standing army which Europe had known since Roman times, and developed it steadily until, by the time of Suleyman I, the corps reached a strength of 40,000. . . . On leaving school he (the embryo janissary) was posted to an *orta* or company, in which he usually remained for the rest of his life. This was a self-contained unit organized on such communistic lines as could not fail to win the approbation of the most uncompromising modern bolshevik. All pay and expenses were pooled, and contributions were levied from each member of the company to form a common purse which provided pensions for the sick and funds for general purposes. The principle

of equality was carried so far that when issues of stores or equipment took place the distribution was made at night to prevent any possibility of favouritism. One writer asserts, though one hesitates to believe it, that even the armour captured from Christian troops (the Turks made none themselves and only used what they obtained in this manner) was deliberately parcelled out at haphazard, so that a janissary in the ranks could often be seen wearing an assortment of ill-fitting pieces, the original property of half-a-dozen Christians of varying girth and stature. The supreme instance of the democratic foundation of the corps lay in the fact that the Sultan, though like the Czar, he was 'father' to every janissary, himself held the rank of a common private and drew his weekly pay accordingly. A curious feature among the janissaries was the regimental 'stew-pot.' These great cauldrons played a vital part in the life of the regiment; they were venerated as we venerate a regiment's colours, and were carried at the head of the column of all occasions, while a regiment which lost its cauldron in battle was disgraced eternally. The cooks held a proud and important position in the corps and the prestige of the kitchen may be gauged by the strange title given to company commanders, namely *chorbaji* or 'soup-man.' The janissary's hierarchy was a simple one. At the head was the Agha of the corps, who was accounted the third greatest man in the Empire. Under him were the commanders of *buluks* and *jema'ats* (the latter including the cavalry), distinguishable from each other only by the colour of their boots, red and yellow respectively. These units were subdivided into the *ortas* mentioned above, each of which was distinguished by an individual crest, such as for instance an anchor, embroidered on its standard, painted above the barracks and frequently tattooed on the persons of its members. The janissaries were divided also into various 'arms,' archers (*sulaks*), fusiliers (*tufankjis*), gunners (*topjis*), camelry, etc., besides non-combatant branches such as the foresters. Side by side with the spirit of democracy there existed an iron discipline within the corps. On the first occasion that a batch of new janissaries entered the palace they filed past the Agha, each holding on to the coat-tails of the man in front. The Agha gave every one as he passed a hearty smack in the face and a twitch of the ears and received in return a reverential salute from the victim as a token of loyal obedience. Absolute obedience to his superiors was indeed the first article of the janissary's charter which consisted—like another famous document—of fourteen points. The remaining thirteen were: (2) perfect harmony within the corps, (3) abstention from all things unbecoming a brave man, (4) adherence to the precepts of Hajji Bektash, (5) right to be recruited only in the established way, (6) in the case of men condemned to death for any misdeed, privilege of private execution by night and of a *coup de canon* at the moment when the body was thrown into the sea, (7) immunity from punishment by anyone except officers of the corps, (8) promotion by seniority, (9) pension for old age, (10) obligation to shave the chin, (11) celibacy, (12) prohibition to sleep outside barracks or (13) to follow a trade, (14) liability in peace time to take part in manoeuvres from June to November. The janissary's uniform was of dark blue cloth, plainly cut and comparatively free from ornamentation. Its simplicity was compensated for by the elaborate magnificence of their headdress. This consisted of a white felt hat shaped after the fashion affected by Marlborough's Grenadiers, richly embroidered round the base and

resolving itself behind into the sleeve-like appendage which commemorated their religious initiation; to the front was attached a gilt sheath encrusted with bastard stones and into this was stuck—if the wearer was a veteran soldier—a prodigious Bird-of-Paradise plume which fell in a magnificent curve down his back and reached nearly to the

and ferocious moustaches. Of the functions of the janissaries one of the chief was to police the country, and under the great Sultans they were such efficient guardians of the peace that travelers reported the roads in Turkey to be as safe or safer than in any Christian country. Especially in the reign of Murad IV—the most bloodthirsty

JANISSARIES OF TURKEY

level of his knees. When stationed at Constantinople the janissaries carried silver-tipped batons some six feet long with which they performed summary execution on anyone found breaking the laws. A feature which distinguished them from the bearded Turks was their shaven chins. This was supposed to impart a fierceness of expression unattainable by the wearer of a beard, and the effect was further enhanced by the cultivation of long

monster who ever donned the cloak and mantle of Osman—the punishment of crime was so drastic and so sure that people said, as in days of Charlemagne, that a woman could carry a basket of jewels in safety from one end of the empire to the other. A foreigner of distinction, on entering the Turkish dominions, was given a small body-guard of janissaries (a custom which survived until the beginning of the recent [World] war in

the privilege accorded to diplomatic and consular representatives to have a fixed number of armed *cavasses* attached to their persons), and a delightful sketch of one of these guards has come down to us in the memoirs of an old ambassador to the Porte, written in the middle of the sixteenth century. 'The Janizaries,' he says, 'came to me by couples. When they were admitted into my dining-room they bowed their heads and made obeisance, and presently they ran hastily to me and touched either my garment or my hand, as if they would have kissed it; and then forced upon me a bundle or nosegay of narcissuses, and presently retired backwards with equal speed to the door, that so they might not turn their backs on me, for that is accounted undecent by the rules of their order. At the door they bowed their heads again and wishing me all happiness, departed. The truth is, unless I had been told before they were Janizaries, I should have thought them to be some kind of Turkish monks, or Fellows of some College or other amongst them; yet these are the Janizaries that carry such terror with them wheresoever they go.'

"As time went on the original strictness of the order became relaxed, and when celibacy ceased to be enforced the old method of recruiting from among the children of the Christian *raiahs* gave way to the custom of enlisting the sons of ex-janissaries. In these later days, under a series of weak and dissolute Sultans, the janissaries followed in the footsteps of the Turkish Guards of the Bagdad Caliphs and the Mamelukes in Egypt though they never, like these, actually usurped the throne itself. Even in Suleyman's time the janissaries extorted higher pay by threats of mutiny or worse, and in the reigns of the next few Sultans their power grew to such an extent that no Vizir could be appointed without their sanction. By the middle of the seventeenth century they had become absolute arbiters of the Sultan's fate and had been guilty three times over of the supreme sacrilege of assassinating their own Caliph, besides deposing three others. Affairs by the end of the century had reached such a pass that an English traveller of the period writes of them, 'the mortallest corruption of this Order hath set in of late yeares; knowing their owne strength and growne saucy with familiarity at Court they have proceeded to such insolency as hath flesh'd them in the blood of their Sovereigns and have learnt that damnable Secret of making and unmaking their King at their pleasure whereby the Foundation of all Monarchy, that is the due awe towards the Blood Royall, is so irreparably decayed in them that, like the lost State of Innocence, it can never be restored.' They had a peculiar method of their own for expressing their discontent with the Government of the moment. When the huge bowls of rice which formed their daily rations were set out in the seraglio courtyard . . . the *Orta Bashis*, instead of quietly carrying them to their messes, turned them upside down on the ground. This was a pretty sure omen of riot and bloodshed and woe betide the reigning Sultan when it happened. Not till early in the nineteenth century did Turkey free herself from the incubus of these insolent tyrants, when that passionate reformer Mahmud II abolished the corps for good and all [in 1826] by the simple expedient of a wholesale massacre. [See also TURKEY: 1826.] The *spahis* and *piadés*, who, unlike the janissaries, were trueborn Turks, originated under much the same system as our own [English] feudal troops. The Sultans, as they extended their conquests in Europe, parcelled out a large proportion of the conquered land into fiefs, or *timars*, which they

gave to their followers in recognition of special services in the field. The 'timariot' held his land on much the same terms as a Norman baron, being bound to accompany his liege-lord whenever he went to war, and to bring with him a quota of armed retainers proportionate to the size of his holding. The military equipment of a spahi riding to the wars has been detailed by an old English writer, whose description reminds one of nothing so much as John Tenniel's picture of the Red Knight. It reads as follows:—'First the girdle stuck with three or four pistols, then on each side a knife as long as a man's arm with another of a foot long for ordinary purposes tuck't into his coat; an arquebus on his shoulder, and on his thigh a scymitar; on one side of the saddle a petronnelle, on the other a straight sword and, hanging by it, either a little axe or a Hungarian mace, or both. On his back bows and arrows.' Truly a portentous outfit! The *piadés* need no particular description as they were recruited and served under practically the same conditions as the *spahis*, the difference being that they were foot soldiers. Of the artillery also there is not very much to say. Originally the Turks borrowed this arm from their Christian enemies, and for centuries the arsenals on the Bosphorus were under the charge of renegades. They developed it rapidly, however, as they did all instruments of war, and soon outpaced the original inventors, so that by the fifteenth century they were better equipped with heavy artillery than any of their rivals. The size of some of the guns was enormous. At the siege of Constantinople [1453] when guns were sent to the Bosphorus from Adrianople—then the capital of the Turks in Europe—teams of 150 yoke of oxen were used to haul single pieces. The batteries placed to guard the Narrows at the Dardanelles were notorious. An English diplomat who visited them on his way to Constantinople in 1827 declares that one of the cannon was a 2-foot calibre and threw a solid stone projectile weighing a quarter of a ton. No unworthy ancestor, forsooth, of the monstrous 'Asiatic Annie' of evil memory. A considerable part of the Turkish army was made up of irregular troops. The chief of these were the *azabs* and *akinjis*, who, as cavalry and infantry respectively, played the rôle of 'shock troops' and were mercilessly sacrificed in action in order to prepare the ground for a charge by the invincible janissaries. Another and very extraordinary corps were the volunteers known as *delis* (*anglicé*, 'Mad-caps'), who, under the influence of religious fanaticism, used to offer themselves for any particularly desperate enterprise, and of whom it was said that not a single one had ever shown his back to the enemy, whatever the odds. The dress worn by these 'Mad-caps' was of an outrageous design, intended, like the masks of the old Chinese warriors, to strike fear into the heart of the enemy. It consisted of a dolman and breeches made of a lion or bear skin with the hair turned outwards, and a bonnet of leopard's skin with a pair of eagle's wings sewn on in such a way as to stand upright on either side. Another pair of wings projected from their shields, so that the whole effect was that of a moving mass of fur and feathers—even their horses being covered with the skins of various wild animals. Their usual weapons were a scimitar, a club and a long pike. The Tartar auxiliaries—the last of the five elements composing the Turkish armies—came from the Crimea and the northern shores of the Black Sea. The Tartars were hereditary allies of the Turks to whom they are related by religion, race and language. The Tartar *Khans*, heirs-presumptive to

the throne of Turkey in the event of the Ottoman dynasty becoming extinguished, were therefore bound to assist the Sultans with troops in all their campaigns against Christian nations. The bond was made doubly secure by the retention of the reigning *Khan's* eldest son at the Sultan's court, where he lived as a permanent hostage for his father's loyalty. Hordes of Tartar cavalry accompanied the Turkish armies when they marched into Europe, and acted as scouts and skirmishers on the flanks. They were wild, undisciplined horsemen who spent their whole lives in the saddle and whose food was mare's milk, caviare and meat 'cooked' by being placed in slabs under their horses' girths till it was bruised to a suitable state of tenderness. In enemy country they advanced in loose order ahead, and on the wings of, the regular army where they ambushed bodies of the enemy and pillaged and murdered with complete impartiality the inhabitants of the country and any unfortunate stragglers from the ranks of their own allies. Their services were paid by a free licence to loot and to them fell the lion's share of the plunder."—G. E. Hubbard, *Day of the Crescent*, pp. 39-49.—After the annihilation of the Janissaries in 1826 the Turkish army began to lose its Oriental complexion and gradually assumed an Occidental character. The light, gaudy costumes gave place to a more uniform and serviceable garb. French, German, Italian, and British instructors were introduced at various times to impart Western methods of drill and the handling of improved weapons, while numerous ex-soldiers and officers from European armies entered the Turkish service. From 1835 to 1839 Captain (afterwards Field-Marshal) von Moltke, the famous German strategist, was lent by his government to assist in the task of reorganizing the Turkish army. From the accession of the Emperor William II up to 1914 the principal instructors of the Turks had been Germans, while for a time a British naval mission attempted to place the Turkish navy on a business footing. At the outbreak of the World War "the Turkish army was based nominally on a universal conscription, but in practice only the Mussulman population was drawn upon; not all of that, indeed, for the Arabs were more usually opposed to than incorporated in the Turkish ranks. [See also *WORLD WAR: 1914: IV. Turkey: g.*] The conscript served for twenty years—nine in the first line (Nizam), nine in the Active Reserve (Redif), and two in the Territorial Militia (Mustafiz). The major unit was the army corps of three divisions, each division embracing ten battalions. The artillery, which had suffered severely in the Balkan wars [1912-1913], was patchy and largely out of date, though in recent months [1914] Germany and Austria had strengthened it with a number of heavy batteries. The peace strength of the army was, roughly, 17,000 officers and 250,000 men, and in war some total like 800,000 might have been looked for, provided equipment was forthcoming. . . . The Turkish infantryman had for many years a high reputation as a soldier—especially, as he showed at Plevna, in a stubborn defensive. His physique was good, his nerves steady, and his power of endurance incredible. But in recent wars his fame had suffered a certain eclipse. He had been badly led and badly armed, the commissariat and transport had been rudimentary, and successive defeats were believed to have shaken his *moral*. The truth seems to be that Turkey had fallen between two stools. Her ill-provided levies in the past had fought desperately under brilliant officers, because they were inspired by a simple

trust in their religion and their leaders and a genuine patriotic devotion. An attempt had been made to engraft upon this tradition the mechanical perfection of the German system. But the Turk is not meant by Providence to be a soldier of the German type, and the seed of Marshal von der Goltz and General Liman von Sanders was sown in barren soil. The consequence was a machine without precision and without motive power. The Turk had been at his best when he fought for Islam and the Padishah; but Islam was inconspicuous in the ideals of the new Committee [of Union and Progress], the old Padishah [Abdul Hamid II] was somewhere in exile, and the new one too patently a cypher. In addition, he could have little confidence in men who had already led him to disaster, and who had caused him to endure needless and horrible privations. A perfect machine is a mighty thing, but an imperfect machine is so much scrap iron. The Turkish soldier was now an incomplete German, which is like a gun lacking a breech-block. It is impossible to withhold our sympathy from a brave race going out to battle in a cause which they neither liked nor understood, from an army in the grip of an unfamiliar and imperfect machine, from a nation sacrificed to a muddled *Weltpolitik*. Disaster loomed large in its horoscope, but courage never failed it; and the time was to come when the machine went to pieces, and, amid the snows of the Caucasus or the sands of the desert, the children of Osman, fighting once more in the old fashion, died without fear or complaint."—J. Buchan, *Nelson's history of the war*, v. 5, pp. 103, 105-106.

43. **United States.**—Citizen volunteers.—Small professional army.—Expansion in Civil War.—Land grant colleges.—Training of reserves.—"It has been the historic history of this country to depend upon a voluntary army of citizens, called out at the outbreak of war, to defend it in case of any serious conflict. The development of the art of war during the last half-century has been such as to make radical changes in this policy necessary if it is to be successful. Hitherto we have relied upon training and equipping our volunteers after the outbreak of war. In our previous wars we have escaped disaster under this method largely on account of conditions which will in all probability never occur again. In the Civil War we were fighting against an enemy who was as unprepared as ourselves. Each side trained the other as the conflict proceeded. In the War of 1812 we were fighting a nation which was almost wholly absorbed in a great European war and which spent very little attention upon us. Yet in that war we called out, from first to last, 527,000 men to defend us against an enemy which never had a force of 16,000 men in the field at any one time, and whose total forces throughout the war aggregated only about 54,000 altogether. We were defeated in most of our battles, and we lost our capitol at Washington after a force of 5,400 untrained Americans had run away from less than 1,500 British on suffering a loss of only eight killed. . . . Modern war is fought with weapons which require time to construct and training to use to an extent hitherto unknown. . . . The training, equipment and discipline of the modern army is much more complicated than that of fifty years ago and requires very much greater time and expert knowledge. The conditions surrounding the raising and equipment of a force of citizen soldiery have therefore completely changed since the Civil War. To attempt to organize such a force of volunteers in the way in which we did

it then would be to invite disaster against practically any army of modern Europe."—H. L. Stimson, *National Security League Document no. 2, 1915*.—The regular army of the United States was established by act of Congress in 1790 and was from the beginning a small professional force recruited by voluntary enlistment. Men were attracted by a higher pay and better rations than in any other army and its chief duty of garrisoning Indian posts on the western frontier furnished plenty of excitement for adventurous spirits. As a part of the military system of the country the regular army was intended to form a solid nucleus of seasoned troops around which could be built a large force for war time. Also, it was to be a training school for officers and a reserve police force in case of domestic disturbances. As a matter of fact, the first case of this kind, the Whiskey Rebellion in western Pennsylvania, was handled by the militia of the neighboring states called out by the president. The army, which by the act of 1790 only numbered some twelve hundred men, was kept small throughout the first century of our national existence. The wars against England and Mexico and the great Civil War caused enormous though temporary expansion of the national armies but without seriously affecting the military system as a whole. It may even be said that Civil War caused a neglect of the regular army. Great numbers of its best officers were drawn off to command volunteer units and recruits preferred the volunteer service because of the high bounties offered. When the draft was resorted to in 1863 the vast number of men taken into the ranks was embodied into the volunteer organizations and not into the regular army. All told there were nearly 3,600,000 men in the Federal and Confederate armies but as soon as the war was over they went back quickly into civil life. The regular army reorganized by the law of July, 1866, was composed of forty-five regiments of infantry, ten of cavalry, and five of artillery with a total effective of a little over 50,000 men. During the next ten years the army dwindled to 25,000 men and remained around that figure till the war with Spain in 1898. The Spanish-American War resulted immediately in an increase of the standing army of the United States, and the legislation of Roosevelt's first administration gave the country a permanent force of about 100,000 men. Most important, however, was the reform of the military administration, particularly the creation in 1903 of a General Staff. These conditions remained until the World War led to the creation of a national army in 1917. (See *WORLD WAR: 1917: VIII, United States and the war: 2; 1, 4; 1, 8; 1, 9; 1, 10; U. S. A.: 1018* [August].) In attempting to create a reserve of trained soldiers the United States had a problem similar to that which was partially solved by the Haldane reforms in Great Britain. (See above: 32.) The organized militia of the country was left to be maintained by the several states (see *NATIONAL GUARD, UNITED STATES*), but the difficulty of training officers in time of peace was never really met. The most serious and promising attempt to do this was made through subsidizing educational institutions and by the Plattsburg idea. "When in 1862 Congress passed the first Morrill Act granting to the several states public lands with which to establish agricultural and mechanical colleges and providing that these colleges should include 'instruction in military science' in the curriculum, this country recognized for the first time the vital importance of training as a part of the equipment of a volunteer army. The Civil War was then

near its height. There had been serious defeats at Bull Run and elsewhere in the early campaigns for the unorganized and poorly trained Union volunteers. There had been thousands of volunteers in 1860 and '61 eager to go to the front, but without officers to train them. This condition the Morrill Act sought in some way to remedy and to take thought for in the future. 'These colleges, founded in every State,' said Representative Morrill, the author of the bill, 'will to some extent guard against the sheer ignorance of military art which shrouded the country, and especially the North, at the time when the tocsin of war sounded at Fort Sumter.' After the army and the militia, these colleges were to constitute an integral part of the national defense. . . . As a result of this act and of a second and revised act in 1890, . . . the cadets of the civil institutions of the country are a definite part of the present scheme of national military education. The system of training for the duties of soldiering which is maintained in these 'land-grant' colleges is not, however, a part of the work of the regular Army or of the State militia. . . . These departments have a peculiar and distinct purpose. Their purpose is to train officers for an emergency volunteer army. It is for the purpose of training college men in leadership for the defense as well as for the peaceful upbuilding of their country that courses in military science and tactics are made obligatory in all 'land-grant' colleges and many other collegiate institutions. The regular instruction in the armory and on the drill-ground at the colleges during the winter months has about the same relation to the summer student camps and the business men's camp maintained by the War Department at various points over the country that the regular sessions of these colleges bear to the summer schools and the 'short courses' which they provide for special classes of students. During the regular session the student carries his regular school work along with his military training. In the camps and at the barracks attention is concentrated for the time on military training, and by dint of constant drilling the 'rookies' at the camps are turned out in five or six weeks with a training approximately the same, or perhaps a little more complete, than that of the regularly enrolled college student who has attended his four hours of drill a week after school hours. The standard of instruction put before both the college student and the camper is that of 'what every officer must know.' . . . The course . . . consists of training in the school of the soldier, of the squad and of the company, the manual-of-arms, the fundamental principles of rifle shooting, of first aid, and camp hygiene, while it likewise includes such things as the preparation of military papers, the making of maps, maneuvers, and signaling of all kinds. None of the higher strategy such as is contained in the curriculum at West Point is taught. About one-third of the instruction is theoretical. After the first few months, as little drilling is done as possible. Commandants try to place before their students the intellectual aspects of the game of war, as well as the necessity of physical fitness of individuals for it. . . . For the purposes of drill, the students furnish their own uniforms. . . . The colleges themselves provide the armories and drill-grounds, and for the rest every need is supplied by the Federal Government itself. . . . In all of the colleges embraced in the scheme of military education over which the War Department has control, the obligation to take the instruction offered rests either upon the whole student body or upon specially designated

classes. In the larger institutions . . . drill is only required of the two lower classes. Cadet officers in these institutions are, however, chosen almost uniformly from the upper classes. For the time consumed from their college work they are usually paid an honorarium which, though small, is oftentimes an aid toward the paying of college expenses. . . . Obligation to take military training results in large numbers of cadets at some institutions. . . . The University of Illinois had drilling, during the fall of 1915, two thousand one hundred and forty students. Other large institutions of the Middle West, where the State Universities are predominant, furnish scarcely less surprising figures."—W. Rushton, *Training student soldiers* (*Review of Reviews*, Feb., 1916).

44. United States.—Reorganization during World War.—Creation of a national army.—Training camps.—Army equipment. See WORLD WAR: VIII. United States and the war: i; also Miscellaneous auxiliary services: VI. Military and naval equipment.

45. United States.—Reorganization after World War.—Vocational and general educational training.—"The germ of the educational army was planted as far back as the National Defense act of 1916, but the onrush of the war prevented its growth (except as emergency education was sledged into the millions who were summoned to the colors in 1917 and 1918) in order to make them fit to fight. The trying experience of those days, when it was found impossible to scrape up enough technicians to man the army services, and 25 per cent. of the draft men were discovered to be illiterate and thus unprepared even for the straight combat ranks of a modern army, soon made . . . converts to education within the army. . . . When the reorganization of the regular army began in 1919 the General Staff, in the light of its experience during the war, incorporated education into its plans just as much as it did military organization and equipment. General W. G. Haan, who as Chief of the War Plans Division was charged with the groundwork of the educational system, took it up as an urgent military consideration. He had found in France that even in the combat lines 52 per cent. of the enlisted men needed some sort of specialized training to be the best soldiers, and that every soldier under the conditions of modern warfare needs to be literate and trained to think and act on his own initiative. . . . The General Staff called in civilian advisers to assist in Washington and at all corps, area and division headquarters, and the army . . . plunged into the new field of adult education on a big scale. . . . To meet the new method an entire system of vocational and general educational manuals has had to be prepared laboriously by the army—worked out from start to finish on the problem basis. The magnitude of this task may be comprehended when it is known that the army trains for 117 different trades and provides general education from the illiterate stage up to the equivalent of the twelfth grade. . . . The teaching force consists of 600 officers, 1500 enlisted men and 1500 civilians, including many women. Of course the local commandant, is supreme in local matters and he has a wide range of authority in adapting the schools within his jurisdiction to local and emergency conditions and military necessity. At the bottom of the educational army are the recruit educational centers, to which are assigned native recruits who are illiterate and foreigners who are illiterate or, being literate, are unfamiliar with English. . . . It takes from three to five months

to put a man through a recruit educational center. And it is not until then that he is assigned to a regular military unit and enters the general educational or vocational courses. . . . The farms of the agricultural courses at Camp Grant in Illinois and Camp Travis in Texas pay their way now. The automotive schools, the electrical schools, the shoemaking, saddlery, vulcanizing, painting, and so forth, everywhere produce while they teach. A hundred thousand men in the army technical schools would mean \$30,000,000 worth of labor annually, which if adequately capitalized and provided with plant and machinery might enable the army to be entirely self-sufficient from uniforms to cannon. . . . It would take a hulky book to give an adequate account of this new thing in armies—so new that the definition no longer fits—an institution of popular education and industrial training quite as much as of military efficiency, that is making sane-minded sound-bodied, efficient citizens out of the rawest and sometimes the most unpromising material."—T. M. Knappen, *Army as a school* (*American Review of Reviews*, June, 1921).—See also WAR DEPARTMENT, UNITED STATES.

MILL, Henry (1683-1771), English engineer. See **INVENTIONS**: 10th century: Typewriter.

MILL, John Stuart (1806-1873), English philosopher and economist. "He shared the eighteenth century's enthusiasm for progress and enlightenment and with it believed in the supreme efficacy of education, holding that there is no natural impulse which it cannot transform or destroy, and that human character will change with men's ideas. In order to bring about reforms, knowledge is necessary, knowledge of the right ends and knowledge of the means of realizing them. But in order to reach knowledge, correct methods must be employed, and to the study of these Mill addressed himself in his *Logic*. The wonderful progress of the natural sciences suggested an examination of scientific methods and their application in the mental or moral sciences: in psychology, ethics, economics, politics, and history. . . . Mill's entire logical theory is based on the laws of association."—F. Thilly, *History of philosophy*, pp. 518-519.

MILLENNIAL YEAR.—"It has often been stated that in the tenth century there was a universal belief that the end of the world was to happen in the year 1000. This representation has recently been subjected to a critical scrutiny by Eiken, Le Roy, and Orsi, and found to be an unwarrantable exaggeration. It would be still less applicable to any century earlier or later than the tenth. A conviction of the impending destruction of the world, however, was not uncommon at

almost any period of the middle age. It is frequently found expressed."—R. Flint, *History of the philosophy of history: France, etc.*, pp. 101-102.

MILLIGAN CASE.—A man by the name of Milligan was arrested at his home in Indiana in 1864 by the military commander of that district, charged with conspiracy against the United States, tried by a military commission and sentenced to be hanged. He applied for a civil trial by a Federal court, and his appeal was carried to the United States Supreme Court. It was decided that there could not be a substitution of the military for the civil court in a district or state in which the civil courts had not been suspended, provided the accused were not a member of the military or naval forces of the United States. Four of the justices dissented from the decision. See **WAR POWERS OF THE UNITED STATES**: Martial law.

MINNEAPOLIS, largest city in the state of Minnesota, on the Mississippi at the Falls of St. Anthony. It is the largest flour and lumber market in the world. In 1920 the population was 380,582. The falls and site of the city came into the possession of the United States under the treaty made by Lieutenant Zebulon Pike with the Sioux Indians in 1807.

1819.—Fort Snelling built. See MINNESOTA: 1805-1867.

1856-1872.—Growth.—Minneapolis was incorporated as a town in 1856, as a city in 1867. "The rapid development of a great milling centre at the Falls of St. Anthony opened a market for the spring wheat, which could not otherwise have been grown. The Minnesota crop of fifteen million of bushels in 1870 was to be doubled in 1875. The patent milling process gave to Minneapolis an advantage soon apparent in the multiplication not only of flour mills, but of industries ancillary thereto. The manufacture of lumber out of logs from the pineries of the upper Mississippi and its tributaries, which had been her leading industry, now took a second but still important place. The city of Saint Anthony's Falls had suffered by the migration of many of her most capable men of affairs to 'the west side,' where Minneapolis sprang into being as by magic when the military reservation was reduced in the middle of the fifties. The new city soon outstripped the old in population, in manufacturing, and in merchandizing. At length it became apparent that there was no propriety in the maintenance of separate municipal organizations at the falls. By virtue of an act of the legislature, approved February 28, 1872, the older city lost its name and became the east division of Minneapolis, which thus enlarged might some day become the rival of Minnesota's capital city in wealth and numbers, if not in political importance."—W. W. Folwell, *Minnesota, the north star state*, p. 275.

1879-1917.—Importance of water power.—The city owes its growth and prosperity largely to the water power supplied by the falls which has been greatly increased in volume by dams built in 1879 and 1807, and has been still further increased by the Mississippi dam built by the Federal government, and opened in 1917.

1917-1919.—Socialist mayor.—Centralized administration.—In 1917, Minneapolis had a socialist mayor—Van Lear—who was elected on a non-partisan ticket. The support of public opinion was greatly weakened, however, by the mayor's pacifism. "On July 1, 1919, a law of the Minnesota legislature, applicable to Minneapolis, and providing for the establishment of a board of public welfare, in which is centralized the administration of all health, charitable and correctional affairs, went into effect. The board consists of seven members, one of whom is the mayor, *ex officio*. Four are appointed by the mayor and confirmed by the council; the other two are aldermen chosen by the council. The mayor's appointees serve for four years, one appointed annually. The council representatives are elected biennially. All serve without pay."—E. D. Graper and H. J. Carman, *Political Science Quarterly*, 1920, *Supplement*, p. 78.

1920-1922.—Charter revision.—"In Minneapolis, the voters adopted a new charter, November, 1920, which, though not changing the previously existing form of government, gives to the voters of the city the power to change that form in the future without the sanction of the state legislature. A well planned movement has been set on foot to utilize this power and adopt a new charter changing the form of government. A large citizens' committee, representing over two hundred civic organizations, has been formed to conduct a campaign of investigation and education for the new charter."—G. L. Schramm, *Notes on municipal affairs (American Political Science Review, Feb., 1922, p. 89)*.

MINNESOTA: Location.—Derivation of name.—Minnesota, nicknamed the "Gopher," or "North Star" state, is one of the north central states of the union. It is bounded on the north by the Canadian provinces of Ontario and Manitoba; east by Lake Superior and Wisconsin; south by Iowa; and on the west by the Dakotas. It has an area of 84,682 square miles of which 3,824 square miles are water, exclusive of Lake Superior; and a population, 1920, of 2,387,125. "During a hundred and sixty years, up to the time of the organization of Minnesota Territory, in 1849, the name St. Pierre, or St. Peter, had been generally applied to this river [Minnesota] by French and English explorers and writers. The aboriginal Sioux name 'Minnesota' means sky-tinted water (Minne, water, and sota, somewhat clouded). . . . This name was proposed by General Sibley and by Hon. Morgan Martin, of Wisconsin in the years 1846 to 1848, as the name of the new Territory, thus following the example of Wisconsin in the adoption of the title of a large stream within its borders. During the next few years after the selection of the Territorial name Minnesota, it displaced the name St. Peter as applied in common usage by the white people to the river whose euphonious ancient Dakota title will continue to be borne by the river and the State probably long after the Dakota language shall cease to be spoken."—W. Upham, *Explorations and surveys of the Minnesota and Red rivers (Mississippi Valley Historical Society Proceedings, 1913-1914)*.

Resources.—Minnesota is largely an agricultural state. In 1920, it contained 178,478 farms with a total area of 30,221,758 acres of which 21,481,710 acres were improved land given over to the production of cereals. In 1921, the live-stock industry had a total of 6,844,011 head, and a wool-clip that amounted to 3,536,000 pounds. In its output of iron ore Minnesota far outranks all the other states and contributes considerably more than half of the iron ore produced and marketed in the United States. In 1921, the national forest area was 1,947,857 acres.—See also U. S. A.: Economic map.

Aboriginal inhabitants. See SIOUAN FAMILY.

1652-1847.—First explorers.—Early trading ports.—Grant by France to Great Britain.—Cession to the United States by Great Britain.—Ordinance of 1787.—Territorial changes.—"Until a very few years ago it has been generally accepted as a fact that Louis Hennepin, a Franciscan priest of the Recollect Order, was the first white man who entered the present boundaries of Minnesota; but a recent discovery has developed

the fact that there has reposed in the archives of the Bodleian Library and British Museum for more than two hundred years manuscript accounts of voyages made as far back as 1652 by two Frenchmen, named respectively Radison and Groselliers, proving that they traveled among the North American Indians from the last named date to the year 1684, during which time they visited what is now Minnesota. It is also a well authenticated fact that Du Luth anticipated Hennepin at least one year, and visited Mille Lacs in 1679, and there, on the southwest side of the lake, found a large Sioux town, called Kathio, from which point he wrote to Frontenac, on the second day of July, 1679, that he had caused his majesty's arms to be planted in Kathio, where no Frenchman had ever been. [Du Luth also built a port on the north shore of Lake Superior.] Hennepin did not arrive until 1680. . . . It should be remembered that the French sovereignty over the Northwest ceased in 1763, when, by a treaty made in Versailles, between the French and the English, all the lands embraced in what is now Minnesota were ceded by the French to England, so [Jonathan] Carver came as an Englishman into English territory."—C. E. Flandrau, *History of Minnesota and tales of the frontier*, pp. 3, 9.—The first explorer of the Minnesota River was M. Le Sueur, who, in the autumn of 1700, sailed up the river to the mouth of the Blue Earth, near which he built a post, or fort, in which the winter was spent. In the spring of 1701, Le Sueur left the post [on Prairie island] in charge of thirteen men, and, taking with him a quantity of 'blue earth,' returned to the Mississippi, down which he floated to a French port on the Gulf of Mexico, whence he had set out in April, 1700. . . . Jonathan Carver, the first American explorer to visit the Northwest, was on his way up the Mississippi. He followed the river from the mouth of the Wisconsin to the mouth of the Elk, some distance above the Falls of St. Anthony, returned to the mouth of the Minnesota, which he ascended to the Cottonwood, where he spent the winter of 1766-67, among the Indians. In the early spring, Carver returned to the present site of St. Paul, accompanied by a large number of Indians, who treated him as a distinguished guest. Carver's journey was made more than fifty years before Ft. Snelling was built, and when the nearest English settlements were hundreds of miles away. . . . The first post on Minnesota soil was erected by Le Sueur in 1695. It stood on Isle Pelee, [an] . . . island in the Mississippi, not far above Lake Pepin. . . . Later, other posts were established by the French at convenient points, and the trade was extended over the vast region now included in Minnesota, and far beyond. . . . [Verendrye, who in 1731 began to traverse the streams and lakes of the northern boundary, was the founder of the fur trade in the northern part of Minnesota.] The fur trade was very profitable, and for many years the French held it in their own hands. But as early as 1761, when the French power in America was rapidly waning, the English began to secure the trade of the Northwest; and after the Treaty of Versailles in 1763, they came into possession of all the posts. . . . To the American Fur Company, organized by John Jacob Astor, in 1809, the Northwestern Company transferred its posts south of the Canada line. Thereafter, the trade in Minnesota passed into the hands of the American Company. In 1816, Congress passed a law excluding foreigners from the Indian trade; . . . [Minnesota] was included in Louisiana district in 1803 [see LOUISIANA: 1708-1803], in Louisiana territory in 1805, in Missouri territory in 1812, in Michigan

territory in 1834, in Wisconsin territory in 1836, in Iowa territory in 1838. Minnesota east of the Mississippi became a part of Indiana territory in 1800, when that territory was created; a part of Michigan territory in 1805; a part of Illinois territory in 1809. When, in 1819, Illinois became a state with its present boundaries, this region again became a part of Michigan, under whose jurisdiction it remained until 1836, when Wisconsin territory was formed. . . . Although successively under the jurisdiction of the several territories named above, the whole region now included in Minnesota was without permanent civilized inhabitants, and no movement was made to institute local government until 1819, the year that the military post at Ft. Snelling was established. That year Minnesota, east of the Mississippi, then a part of Michigan, was organized as Crawford county. . . . In 1840 the legislature of Wisconsin created St. Croix county out of Crawford county, but the reorganization did not take place until 1847."—S. Niles, *History and civil government of Minnesota*, pp. 36-37, 46-48, 63. See WISCONSIN: 1805-1848.

1805-1867.—First Indian treaty.—Fort Snelling established.—Swiss settlements.—Later Indian treaties.—Immigration.—Fur trade.—"In 1805, the Government sent its first commissioner, Lieut. Zebulon M. Pike, to explore the Upper Mississippi; to deal with British traders, who were violating the laws of the United States; and to form alliances with the Indians. . . . He reached the mouth of the Minnesota late in September, and at once held a council [Sept. 23, 1805] with a large band of Sioux headed by Little Crow. In this council he acquired by treaty, for military uses by the United States a tract nine miles square, extending on both sides of the Mississippi from the Minnesota river to about a mile above the falls of St. Anthony. In 1817 this tract was again examined by Major Stephen H. Long, and in 1819 to 1823 a fort was established at the junction of the Minnesota with the Mississippi. It was called Fort St. Anthony by its first commandant, Lieut. Col. Henry Leavenworth, but was named Fort Snelling in 1824, by Gen. Winfield Scott. May 10, 1823, the first steam boat [the *Virginia*] came up the Mississippi to the fort. . . . In 1827, a party of Swiss . . . came to Ft. Snelling, where they were . . . allowed to settle on the 'Reservation.' . . . Here they opened farms, and having brought cattle with them, soon became prosperous farmers, the first in Minnesota. . . . Prior to the year 1837, not an acre of land in Minnesota was open to settlement. Save the military reservations, every foot of it belonged to the Indians. On the 20th of July of that year, Gov. Henry Dodge, of Wisconsin, made a treaty with the Chippewas at Ft. Snelling, whereby they ceded to the United States all the lands on the St. Croix River and its tributaries; and on the 29th of September following, Joel R. Poinsett made a treaty with a delegation of Sioux chiefs at Washington, by which they ceded to the United States all their lands east of the Mississippi, with all the islands in the same. . . . In 1851, important treaties were made with the Sioux and the Chippewas, whereby vast tracts of land came into possession of the United States. A year later, these treaties were ratified by the senate of the United States, with amendments which were accepted by the Indians, and on the 4th of February, 1853, President Fillmore issued his proclamation accepting, ratifying, and confirming the treaties as amended. The tracts of land acquired by the two treaties contained over 28,000,000 acres in Minnesota, and included all the possessions of the Sioux, save the two reservations on the Minnesota

river. . . Although the government lands thus obtained were not open to settlement until surveyed, immigration set in from all the Eastern states and from over the sea. . . The summers of 1854, '55, '56 saw the boats ascending the Mississippi crowded with passengers seeking homes and fortunes in the 'New England of the West,' while the chief roads into the territory were thronged with the covered wagons of pioneers, who built their claim shanties by lake and stream or by the sheltering grove, and, later, on the broad prairies, farther and farther from timber. . . With the influx of population came a period of town-site speculation, which was at its height in 1855, '56; but it was suddenly checked by the Ink-pa-du-ta massacre and the financial panic of 1857, which brought immigration to a stand still. . . A third treaty of 1851 . . . was not ratified at that time, but was renewed twelve years later, and on May 5, 1864, was confirmed by proclamation of President Lincoln."—S. Niles, *History of civil government of Minnesota*, pp. 38-39, 54-55, 58-60.—"The first legitimate business of the territory was the fur trade, and the carrying business resulting therefrom. . . When St. Paul became of some importance in 1849 the terminus and supply depot was removed to that point, and the trade rapidly increased in magnitude, and made St. Paul one of the largest fur markets in America, second only to St. Louis, the trade of which city consisted mostly of buffalo robes, which was always regarded as a distinct branch of the business, in contrast with that of fine furs. . . The extent and value of this trade can better be understood by a statement of the increase of the number of carts engaged in it between 1844 and 1858. In the first year mentioned six carts performed all the required service, and in 1858 six hundred carts came from Pembina to St. Paul. After the year 1858 the number of carts engaged in the traffic fell off, as a steamer had been put in operation on the Red river. . . In 1867, when the St. Paul & Pacific Railroad reached St. Cloud, the caravans of carts ceased their annual visits to St. Paul. St. Cloud then became the terminus of the traffic, until the increase of freight lines and the completion of the Northern Pacific Railroad to the Red river drove these most primitive of all transportation vehicles out of business. Another cause of the decrease in the fur trade was the imposition of a duty of twenty-five per cent on all dressed skins, which included buffalo robes, and from that time on robes that formerly came to St. Paul from the British possessions were diverted to Montreal. The extent and value of this trade to Minnesota, which was then in its infancy, can easily be judged by a brief statement of its growth. In 1844 it amounted to \$1,400 and in 1863 to \$250,000."—C. E. Flandrau, *History of Minnesota and tales of the frontier*, pp. 75-77.

1849.—Petition for organization of Minnesota Territory.—Act of Congress providing for territorial government.—First legislature.—With the admission of Wisconsin to statehood, in May, 1848, the part of her former territory west of the St. Croix river was left without a government, as was also the large area west of the Mississippi which had been formerly included in Iowa territory. Therefore a convention of the people of these areas, held in Stillwater on Aug. 20, 1848, petitioned Congress for the organization of a new territory, to be named Minnesota. "Congress, on March 3rd, 1849, passed an act providing for the territorial government of Minnesota. The Territory of Minnesota extended west beyond the boundary of the present State, and included parts

of both North and South Dakota. The promoters of the interests of Minnesota also desired and attained the incorporation of a part of the Northwest Territory with that larger tract of the Louisiana Purchase to form the new territory. . . . When Minnesota was organized as a territory in 1849, its boundaries were fixed in the Enabling Act and extended on the west to the Missouri river. The territory at that time was little more than a wilderness; and the Indian title to the lands upon the west bank of the Mississippi, from Iowa to lake Itasca, had not been extinguished."—S. M. Davis, *Admission of Minnesota to the Union (Minnesota Historical Society Collections, v. 9, p. 545)*.—"The officers of the territory were appointed by the President of the United States; and on the first day of June, Alexander Ramsey, of Pennsylvania, who was appointed governor, issued his proclamation declaring the territory organized with the following officers: Alexander Ramsey, governor; Charles K. Smith, secretary; Aaron Goodrich, chief justice; David Cooper and Bradley B. Meeker, associate justices; Joshua L. Taylor, marshal; Henry L. Moss, attorney-general. The Governor divided the territory into three judicial districts, and in the month of August court was held at Stillwater, at St. Anthony, and at Mendota. On the 7th of July the territory was divided into seven council districts, and an election by ballot was ordered to be held on the first day of August in the several districts, for the choice of nine councillors and eighteen representatives, to constitute a legislative assembly; also to choose one delegate to represent the people in congress. . . . On the 3d of September, 1849, the first legislature convened in the Central House, St. Paul. David Olmsted, of Long Prairie, was chosen president of the council, and Joseph W. Furber, of Cottage Grove, speaker of the house."—S. Niles, *History and civil government of Minnesota*, pp. 64-65, 67.

1849-1894.—Railroad development.—"Between 1849 and 1858, the territorial legislature chartered no fewer than twenty-seven railroad companies. Congress gave immense tracts of land to regularly organized companies, and the territory prepared to add to these tracts a large portion of the land set aside by Congress for the benefit of the state, as soon as it should gain admission to the Union. But the hard times occasioned by the panic, and the delay in admission of the state, hindered action until 1858. . . . Ten sections of land for each mile of railroad [amounting to 5,000,000 acres] were allowed by Act of Congress and the territorial legislature, on March third and May twenty-second, 1857, respectively."—E. D. Parsons, *Story of Minnesota*, pp. 136-137.—"Immediately certain scheming companies sought to get control of this land, and during an extra session of the legislature an act was passed giving it to them; but it was soon discovered that the companies that obtained the lands had neither money nor credit to carry on the proposed work. To further their scheme, the companies sought additional aid, and the legislature of 1858 passed an act submitting to the people an amendment to the constitution, providing for a loan of the public credit, amounting to \$5,000,000 to be paid on the completion of a certain number of miles of road. Regardless of the warning of prominent citizens, the amendment was carried by an overwhelming majority. But the scheme proved an utter failure. After bonds to the amount of \$2,275,000 had been issued, the state had not a mile of completed road, and only 250 miles of graded road. By foreclosure proceedings, settlement was, by an act of the legislature, submitted to a vote of the people, but it was voted down by

a large majority."—S. Niles, *History and civil government of Minnesota*, pp. 72-73.—"In 1860 Governor Ramsey declared the grants and privileges of the companies forfeited, and despite a court order offered them for sale. The state bid them in for one thousand dollars, and found itself with a few miles of grade and a heavy obligation of bonds. . . . The period from 1880 to 1890 was one of great activity, and 2,310 miles of road were put in operation. On the 30th of June, 1894, Minnesota had 5,912.42 miles of completed railroad. Of 16,111,001 acres of land given to our railroads, 12,151,527 acres were given by the general government, and 3,959,474 acres by the state. Of this vast amount, 10,216,000 acres have been patented by the state to railroads within its borders."—*Ibid.*, pp. 73-74.

1849-1899.—Establishment of school system.—University enactment.—School and traveling libraries.—"On the first day of November, 1849, the last day of the session, an act to establish and maintain common schools was passed and became a law. . . . [In 1881] an act for the encouragement of higher education was passed, and the city high school became a state high school with state aid. . . . From 1862 to 1867 the secretary of state was *ex-officio* superintendent. The legislature of 1867 created the office of state superintendent, and, since that date, we have had a department of public instruction. In 1893 provision was made for the appointment of a state inspector of high schools, and two years later for an inspector of graded schools, making the system of school supervision complete for all grades of public schools. . . . The organic act of the territory, and also the act authorizing the formation of a state government, set apart sections 16 and 36 in every township, about 3,000,000 acres in all, for the support of public schools. The constitution of the state provides for the sale of these lands and for the safe investment of the funds arising therefrom."—S. Niles, *History and civil government of Minnesota*, pp. 85, 86, 91.—"The University is the crown of the entire school system. It was established by legislative enactment as early as 1851, but was re-organized in 1860, 1864, and 1868. In the first year mentioned, Congress granted to the Territory two townships of land for the use and support of a university. A school was organized in 1851, which was continued until 1854; two years later the title passed out of the hands of the regents. It was in 1854 that the present site was secured. The old stone building was completed in 1858, but the vicissitudes of the University were so great that finally, in 1864, the legislature appointed a committee, consisting of John S. Pillsbury, John Nichols, and O. C. Merriman, to pay the debts and sell the building and lands. Through the tact and energy of these men the University was saved. . . . The act of 1868 created a governing body of nine regents and established five collegiate departments. Dr. William W. Folwell was chosen president in 1860. . . . The crowning act of the legislature in rounding out and completing the educational system of the State was the creation of travelling libraries. By an act passed in 1899 a commission of five persons was created, consisting of the president of the University, the superintendent of public instruction, the secretary of the Minnesota Historical Society, and two members appointed by the governor for six years. The board is to buy books and provide for their circulation throughout the State. The legislature appropriated \$5000 annually for this purpose. It will thus be seen that Minnesota has a remarkably well-developed system of public education."—F. L. McVey, *Government of Minnesota*, pp. 141, 156-157.

1854-1855.—Genesis of Republican party in Minnesota.—"The demand for the organization of a new anti-slavery party following the passage of the Kansas-Nebraska bill in May, 1854, was most urgent in the region of the old northwest. . . . Minnesota was slow in joining the movement. Settlers were pouring into the territory in large numbers, and people were too much occupied in establishing themselves in their new homes to evince much concern over national politics. The majority of the voters belonged to the Democratic Party, but in the territorial elections the various elements divided on the basis of local or personal rather than national issues. On July 4, 1854, a small group of men in and around St. Anthony, who called themselves 'friends of freedom,' and who had been prominently affiliated with the Democratic and Whig parties, met informally at the schoolhouse. . . . A territorial committee . . . was appointed to call a meeting, at such time and place as should seem proper, of the people of Minnesota who were opposed to the further extension of slavery and who were likewise resolved to get rid of the corruption existing in territorial and national politics by the creation of a new political party. Several months elapsed before the committee took any action in the matter. It was not until March 1, 1855, that the first printed notice of a 'Republican convention' to be held at St. Anthony, March 29 and 30, appeared. . . . The convention approved a set of fourteen resolutions embodying the principles of the Territorial Republican Party, authorized the issuance of an address to the people, and appointed a territorial central committee of seven to call a convention at St. Paul which should perfect a permanent organization of the party and nominate a delegate to Congress. . . . The date was set for 'Wednesday, the 25th of July next.' . . . Delegates to the convention to the number of 123 were selected, but only 94 were in attendance at the sessions on July 25. . . . The platform adopted reaffirmed the principles laid down by the St. Anthony convention, and pledged the party to the enactment of a prohibitory liquor statute."—Minnesota Historical Society, *History Bulletin*, v. 2, pp. 24-26.

1856-1862.—Admission as state.—Beginning of state government.—Ramsey, war governor.—"On December 24th, 1856, there was a bill introduced into Congress by Henry M. Rice, delegate from the Territory of Minnesota, authorizing the people of that territory to form a constitution. The bill was referred to the Committee on Territory, of which Galusha A. Grow of Pennsylvania was chairman. A substitute bill which afterwards became the Enabling Act, defined the boundaries of the proposed state as they now exist. This act changed the boundaries somewhat from those provided by the bill of Mr. Rice. . . . The bill was brought to vote with very little debate, and was passed by 97 in favor to 75 against it. In the Senate the debate was more prolonged. . . . It is worthy of notice that the principles laid down in the Ordinance of 1787 dominated all of the state papers relating to the admission of Minnesota to the Union. The provisions of that ordinance are clearly to be found in the organic act for the establishment of the territorial government, passed March 3rd, 1849, as also in the act authorizing the state government, passed February 26th, 1857, and finally they were embodied in the constitution of the state itself. . . . The main articles of the Ordinance of 1787 . . . [are] article one, referring to religious belief; article two, forming the bill of rights of the people; and article three, relating to education and good government. It is also noteworthy that these same provisions,

which related to all the Northwest Territory under the Ordinance of 1787, have passed over to, and have been dominant in, the constitutions and governments of almost all the states that have been carved out of the Louisiana Purchase. . . . [Improving the] enduring character of the principles laid down in the ordinance itself. . . . Thus the Ordinance of 1787 became a protecting aegis which extended its authority and power far beyond the limits to which it originally applied. This is clearly seen in the state of Minnesota, which formed a connecting link binding parts of the two great cessions into a single commonwealth; but, if further proof were required, it would be discovered in the constitutions of nearly every state between the Mississippi and the Pacific."—S. M. Davis, *Admission of Minnesota to the Union* (*Minnesota Historical Society Collections*, v. 9, pp. 546-548).—"The enabling act which permitted the framing of a state constitution for Minnesota also provided for the election of officers for the prospective state. Accordingly, when the constitution was ratified, October 13, 1857, a general election was held throughout the state. The candidates for governor were Henry H. Sibley, who was supported by the Democrats, and Alexander Ramsey, who led the forces of the newly organized Republican party. The contest was very close, and . . . the victory of the Democrats was finally conceded. . . . It was expected that Congress would admit Minnesota to statehood soon after its sessions opened in December, so the members elected to the state legislature assembled in St. Paul on December 2, 1857, and proceeded to organize. [Minnesota was admitted as a state May 11, 1858.] . . . Governor Sibley's administration was one of steady, conscientious effort for organization and adjustment, but it was somewhat overshadowed by the financial troubles of the times. . . . In the campaign of 1859, Alexander Ramsey again headed the Republican ticket and defeated his Democratic opponent, George L. Becker, by a decisive majority. No other governor in the history of the state has contributed so much to the upbuilding of her institutions and finances. . . . During his second year as governor, civil warfare spread its menace through the land and Alexander Ramsey thus became Minnesota's 'war governor.' . . . In the elections of 1862, the people of Minnesota gave proof of their confidence in Governor Ramsey by electing him for a second term. Within a few months, the state legislature chose him as United States senator, a position previously held by Henry M. Rice. Henry A. Swift, the lieutenant-governor, took Mr. Ramsey's place as chief executive."—M. V. Carney, *Minnesota, the star of the north*, pp. 213-215.

1856-1872.—Rise of Minneapolis. See MINNEAPOLIS: 1856-1872.

1860-1880.—First export of grain.—Boom in flour making.—"The manufacture of flour received a mighty impulse in the later seventies, by the introduction of the 'middlings purifier' and the 'rolls.' In the earlier days much of the good of the wheat had gone to make an inferior flour. . . . In 1860 a Frenchman, N. La Croix, . . . invented a bolting process that saved this value to the flour. He was known as 'the shaking miller.' In 1870 he moved to Minneapolis and gave the benefit of his idea to George H. Christian, who installed the shakers in the mills which he controlled. The result was a boom in flour making and in wheat growing; in the latter, because the new process made it possible to produce as good flour from spring wheat as from winter wheat. Then came the roller process as a substitute for grinding stones, and the trade was still more stimulated, until in

1876 the prices of the so-called patent flour were given in the Chicago reports, and in 1879 the exportation of Minnesota flour, was begun. . . . From 1880 on, the production of flour rapidly increased, mills springing up in villages all over the state; and Minneapolis soon doubled her output."—E. D. Parsons, *Story of Minnesota*, pp. 231-233.

ALSO IN: W. W. Folwell, *Minnesota, the north star state*, p. 275.

1861-1865.—Part played in Civil War.—"Governor Alexander Ramsey was in Washington on April 14, 1861, the day the Confederate colors were flown over the ruins of Fort Sumter in Charleston harbor. . . . Early that Sunday morning he hastened to the War Department to make a tender of one thousand Minnesota men for the national cause. The offer was put in writing at the request of Secretary Cameron. . . . Minnesota's tender of a regiment was doubtless the first recorded. It was so promptly accepted that on the next day Governor Ramsey could so telegraph to St. Paul. . . . The First Minnesota was the only one which served its whole term east of the Alleghanies. The Fourth and Eighth reached salt water in the last months of the war. All the other Minnesota troops remained in the West. . . . The whole number of men furnished by Minnesota was 22,016."—W. W. Folwell, *Minnesota, the north star state*, p. 178.

1862-1864.—Great Sioux outbreak. See U. S. A.: 1862-1864.

1862-1876.—Homestead entries.—Panic of 1873.—Grasshopper plague.—"The homestead act of 1862 contributed not a little to the extension of settlements in the state. . . . In the three years following, 9520 homestead entries were made in Minnesota, thirty-six per cent. of the whole number."—W. W. Folwell, *Minnesota, the north star state*, pp. 252, 254.—"In 1864 the legislature provided for further settlement of the state, by making the secretary of state, commissioner of immigration; by organizing a committee in each county to assist him; and by appropriating at various times \$20,000 for advertisements. Several times the legislature went to the aid of the settlers. In 1868 it gave the destitute people of the southwest counties \$8000; in 1869 the sum of \$5000 was appropriated for the flood victims of the Red River Valley."—E. D. Parsons, *Story of Minnesota*, p. 210.—"In 1873, came another financial crash, bringing public enterprises to a stand, checking the growth of all the towns, and greatly discouraging farmers, who had been active in the development of the country. In the midst of the general gloom came the Rocky Mountain locusts (1873-1876). Of this visitation, Governor Davis spoke as follows: 'The whole country west of Blue Earth county and south of the Minnesota river was laid waste. The agents of destruction moved in clouds which darkened the sun and descended like rain upon the soil. The growth of thousands of acres would be destroyed within a few hours, and the locusts would then rise and seek new fields. The regions laid waste were inhabited by people who generally had no resources except from their crops, and though men, women, and children turned out to fight the pests, the counties and the state itself, through its legislature, were obliged to come to the relief of the stricken farmers.'"—S. Niles, *History and civil government of Minnesota*, p. 61.

1868.—Granger movement.—"One of the great forces which have stimulated agricultural education as well as economic discussion and ultimate legislative action in American farming circles, was

the widely extended and long enduring organization known as the Patrons of Husbandry—or more popularly as the 'Granger Movement.' This was especially and distinctly of Minnesota origin. The idea of a national agricultural order originated with Mr. Oliver H. Kelly, a native of Boston, who moved to Minnesota in 1849. . . . The first active grange in Minnesota was the North Star Grange, which was organized in St. Paul, September 2, 1868. . . . The farmers of Minnesota were at this time far more interested in protection against middlemen, corporations and monopolies than in any plan for social or educational improvement. They had lost interest in the old agricultural societies and were ready for something new. The 'Farmers' Union,' published in Minneapolis by Mr. C. A. Nimmo, largely in the interest of a mutual fire insurance company of which Mr. Nimmo was the manager, pronounced Kelly's plan of organization the most perfect that had ever been proposed and recommended it heartily to the farmers of the state. One effective argument for organization was the cooperative feature, whereby farmers would be enabled to purchase machinery, nursery stock, groceries, and other necessities without the expensive services of retailers and commission men. The success in the field of insurance was pointed out as a proof of the practicability of cooperation and the farmers were urged to apply this principle in other fields. . . . By February 20, 1869, six new granges had been added to the list, and on February 23, 1869, the Minnesota State Grange was duly organized. When the Minnesota State Grange met in June, 1870, there were sixty-six subordinate granges in the United States, of which fifty were in Minnesota. . . . These were the modest beginnings of a movement which had a tremendous and an enduring influence on the educational interests, the economic conditions, the agricultural development, the legislation and the jurisprudence of the country. . . . In most of its early aspects, Minnesota was the storm-center, and its political manifestations were noteworthy. It made and unmade politicians. . . . [In the political campaign of 1875, the Granger influence controlled the dominant Republican majority, though by a narrow margin.] From 1873 forward for a series of years, the Patrons of Husbandry continued to flourish as an order, to accomplish a great work in the education of the farming classes, and to exercise a potent influence on national affairs, political as well as economic."—H. A. Castle, *Minnesota: Its story and biography*, pp. 302-304.—See also U. S. A.: 1866-1877.

ALSO IN: E. V. Robinson, *Early economic conditions and the development of agriculture in Minnesota*.

1877-1888.—Progressive legislation.—In 1877, the constitution was amended by providing for biennial instead of annual sessions of the legislature. "The legislature of 1883 enlarged the powers of the state board of health. . . . It had been the policy of the state to intrust the care of her penal and charitable institutions to separate boards of citizens serving without pay. To secure uniformity of administration and to enable these separate bodies to profit from one another's experiences, a state board of charities and corrections was authorized by law in 1883. . . . Following Governor Hubbard's earnest advice, the legislature of 1885 established 'The State Public School' for neglected children, which under wise management by different officials has rescued from lives of crime or dependence many hundreds of homeless waifs. The reformatory for youthful de-

linquents and the Soldiers' Home, commended by him to the legislature, were established under the succeeding administration. . . . Another measure successfully pressed upon the legislature by Governor Hubbard was that of public state grain inspection. The precarious and conflicting grades fixed by individual and associated buyers were the source of incessant dissatisfaction and complaint. Chapter 144 of the General Laws of Minnesota, 1885, established that system of inspection and grading since known and approved on both sides of the Atlantic. A warehouse receipt for a certain quantity of grain of a certain Minnesota grade became a definite asset. Because grain inspection necessarily involved the regulation and control of elevators, which in turn were closely related to railroads, the law placed the control of the system in the hands of the Board of Railroad Commissioners. The title of the board was changed to Board of Railroad and Warehouse Commissioners, and its powers were much extended and fortified. Annual sessions of the legislature had ceased with that of 1879, but elections continued to be held annually till 1886, from which year all United States, state, and county officers have been elected in the even-numbered years. All state and county terms of office begin on January 1; the fiscal year begins August 1."—W. W. Folwell, *Minnesota, the north star state*, pp. 334-337.—In 1888, the state agricultural experiment station, and the school of agriculture were reorganized.

1883-1890.—Amendments to state constitution.—The Constitution of 1857 remained unamended until 1883 when several amendments were passed in a period of a few years. "They may be enumerated:—1. 1883, an amendment fixing January 1 as the beginning of the official year of the state, on which day all officers chosen at the previous election enter upon their duties. 2. 1886, an amendment authorizing loans upon interest from the permanent school fund of the state to counties and school districts, to be used in the erection of county and school buildings. . . . 3. Of the same year, an amendment forbidding the enactment of any special law in all cases where a general law can be made applicable, and specifically inhibiting special legislation in fifteen cases. . . . 4. 1888, an amendment limiting the sessions of the legislature to ninety legislative days, and forbidding the introduction of any new bill during the last twenty days, unless upon recommendation of the governor in a special message. 5. Of the same year, an amendment declaring any combination to monopolize markets for food products, or to interfere with the freedom of such markets, to be a criminal conspiracy, punishable as the legislature may provide. . . . 6. 1890, an amendment authorizing the legislature to provide that an agreement of ten jurors in a civil action shall be a sufficient verdict."—W. W. Folwell, *Minnesota, the north star state*, pp. 345-346.

1884-1916.—Development of iron industry.—Transportation.—"Reports concerning the existence of iron ore in northeastern Minnesota had been spread about in a casual way for several years by Indians, hunters, and lumbermen, before anyone became interested enough to try to work the deposits. . . . About 1867, great excitement was roused. . . . by reports of discoveries of gold in the neighborhood of Gunflint Lake. Hundreds of amateur prospectors set out to search for the precious metal, but they spent their time and money without results. The excitement was soon quieted, and the disappointed gold-seekers turned to other lines of work. There was one man,

however, who did not lose interest in the forbidding wilderness of northern Minnesota. This was George R. Stuntz of Duluth. He returned from his gold expedition, taking to his employer some specimens of iron ore from the region near the present town of Tower. He was certain that untold wealth lay hidden in the northern woods and so insistent was he that finally he persuaded his employer, George C. Stone, to organize a company to begin mining operations. It was necessary to secure eastern capital, and this was furnished mainly by Charlemagne Tower, a lawyer and capitalist of Philadelphia. Before Mr. Tower invested his money, however, he sent a geologist to make an examination of the region. The report sent to him assured him that it was 'safe to predict the development there of an iron district of immense value and importance.' . . . A mining company was soon organized, and a force of men was sent into the wilderness to begin operations. Work was begun on the Vermilion Range, more than a hundred miles from Duluth. The Soudan Mine near Soudan was the first mine opened. . . . Mr. Stone was elected to the state legislature and was able to persuade the body to give a liberal grant of state lands to aid in constructing the Duluth and Iron Range Railroad from Two Harbors to Lake Vermilion. This road was finished in 1884 and the first shipment of ore was made in that year. . . . The Mountain Iron Mine was discovered late in 1890. . . . In quick succession other bodies of ore were discovered, showing such an enormous tonnage that the explorers feared the price of ore would be lowered to such an extent that there would be no profit in working the deposits. In 1892, railroad connection with Duluth was established. In that year about 4,000 tons of ore were shipped. Within a few years, careful explorations were made over all the land in the region of the Mesabi Range. . . . The deposits have an average depth of 200 feet, but in some places are 500 feet deep. Their width varies from one-half mile to two miles. In most parts of the range these deposits lie under an 'overburden' or covering of gravel and boulders which is, on the average, about 50 feet deep. . . . The most recent development of iron mining in Minnesota has been on the Cuyuna Range, about one hundred miles southwest of Duluth. Its area has not yet been fully determined, but it is believed to extend across Crow Wing County on the southwest. Mines have been opened at Crosby, Ironton, and Brainerd, the first shipment being made in 1911. . . . Nowhere else in the world are there such extensive and valuable deposits of iron ore as in Minnesota. No state or nation equals our commonwealth in the annual production of this most useful metal, and about five-eighths of the total output of iron ore in the United States is mined here. Shipments for the season of 1916 approximated 45,000,000 tons, thus bringing the total output of the state, since the opening of the first mines, up to more than 450,000,000 tons. . . . Recent improvements in the process of smelting have reduced the amount of coal needed to smelt a given quantity of ore, and the steady increase of population and industry in the western parts of the United States and Canada make it desirable to manufacture steel as closely as possible to these new markets. The United States Steel Corporation at once took advantage of these conditions and erected a \$20,000,000 plant just west of Duluth, where, in 1915, the manufactures of steel was begun."—M. V. Carney, *Minnesota, the star of the north*, pp. 206-208, 210-211.—"An act of Congress of 1873 expressly excepted Minnesota

from the operation of the mining laws of the United States, leaving all her mineral lands open to settlement or purchase in legal subdivisions, like agricultural or timbered lands, thus virtually giving to lucky speculators these priceless ore deposits."—W. W. Folwell, *Minnesota, the north star state*, p. 360.—"In the northern part of the state are many sections of land which have been reserved as school or swamp lands and which are still in the possession of the state. In 1889 the legislature provided for the leasing, for a period of fifty years, of all such lands which contained minerals. A royalty or tax of twenty-five cents for every ton of ore taken from the mines is paid to the state by mining corporations which have leased them. The school fund is thus increased each year by several hundreds of thousands of dollars."—M. V. Carney, *Minnesota, the star of the north*, p. 211.—"Transportation is the key to modern industrial supremacy. To the eastward this Minnesota country has the Great Lakes waterway through the Soo Canal. South to the great valley flows the Mississippi River. For deepening and improving the navigable channel of the Mississippi from the Gulf to the 'Twin Cities,' the Government is now [1914] spending \$30,000,000. A three-million-dollar lock and dam is being completed between St. Paul and Minneapolis; and both cities are voting funds for municipal docks and wharves. But between the head of Lake Superior and the Mississippi at St. Paul there is no water route. To connect the two is the problem. The Minnesota prophets point to the St. Croix River, which rises on the ranges within twenty miles of Duluth-Superior harbor and flows into the Mississippi a few miles below Minneapolis. The United States Government's engineers report that the most feasible route for uniting Lake Superior with the Mississippi is via the canalized St. Croix. . . . Plans for such canalization have been approved engineeringly feasible by three governmental preliminary surveys. . . . Through a state commission created by the legislature, Minnesota is now presenting data to the Federal Government, showing a volume of available coal, grain, flour, oil cake, lumber, iron, and steel tonnage, that would tax the capacity of any canal the Government might care to build, without regard to the through business between the lakes and the Gulf, or between New York and the Mississippi Valley, via the lakes and the Erie Barge Canal. Whether this dream come true or not, the building of the new steel plant and the coal companies' new docks at Duluth are the signs of the beginning of an industrial era in the iron country."—F. N. Stacey, *Pittsburg moving west* (*World's Work*, Jan., 1914).

1889.—Railroad Rate Case. See SUPREME COURT: 1882-1808.

1889-1905.—Legislation.—Australian ballot.—Primary law.—"The Australian ballot system, established in 1889 for cities of 10,000 inhabitants or more, extended to operate throughout the state in 1891, was recodified in 1893. The legislature of 1890 passed a law providing for 'primary elections' to replace nominations by party caucuses and conventions. The act is not operative in towns, villages, and small cities, and does not apply to state officers. . . . The legislature of 1890 created a state forestry board, which has already outlined a policy and begun the immense work of re-forestation despoiled areas. Another act, that of 1905, provides for a forest commissioner, and to that office has been appointed General C. C. An-

draws, who for many years has been the apostle of forest preservation and replanting in Minnesota."—W. W. Folwell, *Minnesota, the north star state*, pp. 342, 358, 360.—"By an act of Legislature of 1901 a Board of Control was created consisting of three members to be appointed by the Governor, whose duties are prescribed by law. It has general supervision over the State Hospitals and Asylums for the Insane, the School for Feeble Minded and Colony for Epileptics at Faribault, the State Training School, the State Reformatory and the State Prison, and financial supervision of the State Public School at Owatonna, of the School for the Blind and School for the Deaf at Faribault."—L. F. Hubbard and R. I. Holcombe, *Minnesota in three centuries*, v. 3, pp. 496-497.—"In 1903 the State Art Society was created by the legislature. Its chief business is giving exhibitions of paintings in various towns, to stimulate the love of the beautiful among all the people."—E. D. Parsons, *Story of Minnesota*, p. 287.—"The legislature of 1905 adopted a new codification of the general laws of the state, which had been prepared by a commission of which Daniel Fish, Esq., was the working member."—W. W. Folwell, *Minnesota, the north star state*, p. 344.—"Among the measures that have been won for the people, the primary law stands out prominently. Enacted in 1905, it provided first only for the nomination of legislative candidates; but subsequent amendments have made it apply to all state offices."—E. D. Parsons, *Story of Minnesota*, p. 281.

1891.—Creation of Itasca park.—Inter-state park.—"April 20, 1891, the Legislative act creating Itasca Park, the first distinctive State park, went into effect. The tract comprised 19,702 acres about the head and source of the Mississippi, and 8,823 acres of this area were owned by individuals. The government survey of the region embracing the park was made by General James H. Baker, in 1875. The real author of the scheme for Itasca Park was the late Jacob V. Brower, of St. Cloud, although the Minnesota Historical Society largely aided in its accomplishment, and the Legislature has made regular annual appropriations of \$5,000 for the general care and improvement of this splendid and picturesque resort. The creation of Itasca Park was a pioneer movement in Minnesota along the lines of forest preservation and the protections of streams. The State is following the lead of certain Eastern states in the matter of reforestry, but leading them in the preservation of the natural timber tracts. It is estimated that the amount of fine white pine timber in Itasca Park alone exceeds 40,000,000 feet. The second State park created in Minnesota, and which was the first inter-state park in the United States, is the Inter-State Park Dalles of the St. Croix, at St. Croix Falls, Wisconsin, and Taylor's Falls, Minnesota. This is an important historical locality."—L. F. Hubbard and R. I. Holcombe, *Minnesota in three centuries*, v. 3, pp. 408-490.

1894-1910.—Forest fires.—"On Sept. 1, 1894, there was a most extensive and disastrous fire in Pine county. Four hundred square miles of territory were burned over by a forest fire, the towns of Hinckley and Sandstone were totally destroyed, and four hundred people burned. The money loss was estimated at \$1,000,000. . . . Shortly after the Hinckley fire a state convention was held at the Commercial Club in St. Paul, to devise legislation to accomplish this desirable end [fire prevention], which resulted in the passage of an act, at the session of the legislature in 1895, entitled, 'An act for the preservation of forests of this state, and for the prevention and suppression of

forest and prairie fires.' Under this act the state auditor was made the forest commissioner of the state, with authority to appoint a chief fire warden."—C. E. Flandrau, *History of Minnesota and tales of the frontier*, pp. 223-224.—The fire of 1894 "was greatly surpassed in financial loss, though with loss of but thirty lives, by the fires of 1908 and 1910, when Chisholm, Baudette, and Spooner were wiped out. In all a total of more than a million acres were burned over during these years, and property to the value of nearly twenty-five million dollars was destroyed."—E. D. Parsons, *Story of Minnesota*, p. 260.

1895.—Arbitration board created. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1886-1920.

1896.—Constitutional amendments.—Use of referendum.—Several constitutional amendments were submitted to the voters of the State and adopted; among them one requiring citizenship of the United States for three months and residence in the State for six months before permitting a new-comer to vote; another vesting the pardoning power in a Board of Pardons; another empowering cities to frame their own charters, subject to the State laws. At the same time, the referendum was brought into practical use, by the submission of several legislative acts to the popular vote. One of the acts thus submitted, providing for the holding of a constitutional convention, was rejected.

1898.—Outbreak of Pillager Indians. See INDIANS, AMERICAN: 1898.

1898-1899.—Part played in Spanish-American War.—Indian troubles.—"At the outbreak of the war with Spain in April, 1898, Minnesota was first of the states to respond to the call of the President for volunteers. . . . Before the close of the month three regiments,—Twelfth, Thirteenth, and Fourteenth,—mostly recruited from the national guard, were assembled at St. Paul. They were mustered into the United States service May 7 and 8. The Thirteenth Regiment, commanded by Colonel Charles McCormick Reeve, was dispatched to the Philippine Islands and participated in the capture of Manila, August 13, 1898. It performed provost guard duty in that city till the spring of 1899, and formed part of Lawton's expedition to the interior. The regiment was mustered out in San Francisco in September [1899]. . . . A detachment of the Fourteenth Minnesota saw some service, . . . in its own state. The Pilager band of Chippeway Indians on Leech Lake had long been complaining of injustice done them in the matter of the pine on their reservation which they had been persuaded to sell. The prices paid them were ridiculously low, and the charges for appraisal and inspection as ridiculously high. Parties holding permits to cut 'dead and down timber,' cut live trees standing convenient. Repeated protests to the government had brought no redress. The deputy United States marshal, Sheehan (he of Fort Ridgely), undertook to arrest a chief who had given show of misbehavior. He resisted arrest, and a number of his braves rallied and stood off the marshal's posse. A company of sixty United States infantry was sent from Fort Snelling, which was later reinforced by two hundred men commanded by Major M. C. Wilkinson and supervised by General Bacon. On October 5 the troops were landed on the peninsula known as Sugar Point, and a sharp little conflict followed which cost the lives of Major Wilkinson, Sergeant William Butler, and two privates. . . . After repeated councils, at which the United States commissioner of Indian affairs was present, eight chiefs

surrendered to the marshal, and the war ended."—W. W. Folwell, *Minnesota, the north star state*, pp. 350-352.

1898-1906.—Amendments to constitution.—The amendments passed during this period may be enumerated as follows: "9. In the year 1906 a so-called 'wide open' tax amendment, repealing a large part of Article IX as formerly standing. It declares that 'the power of taxation shall never be surrendered, suspended, nor contracted away.' After exemptions of the ordinary kind, it leaves the legislature free to levy taxes according to its discretion, requiring only that they shall be uniform upon the same class of subjects. 10. 1898, an amendment granting suffrage to women of full age in school and library measures absolutely, and not merely allowing the legislature to extend the privilege. 11. In the same year, an amendment requiring a majority of all the votes cast at the election to ratify an amendment to the constitution. Up to that year a majority of the electors voting on the particular amendment was sufficient to ratify. 12. In the same year, an amendment creating a state highway commission and a road and bridge fund and authorizing a special tax therefor. 13. Also in 1898, an amendment authorizing cities and villages to adopt charters for their own government, to be drafted by a board of freeholders appointed by district judges; commonly called a 'home-rule' amendment. An affirmative vote of four-sevenths of the electors is necessary to adopt. In Minneapolis on four occasions, large majorities have favored 'home-rule' amendment. An affirmative vote of four sevenths of the electors is necessary to adopt. . . . 14. 1904, an amendment authorizing the investment of the permanent school and university funds in the bonds of counties, towns, cities, villages, and school districts under prescribed conditions."—W. W. Folwell, *Minnesota, the north star state*, pp. 347-348.

1899.—Origin of direct primaries. See PRIMARIES IN THE UNITED STATES: Origin.

1901-1906.—Attempted consolidation of Northern Pacific and Great Northern railroads. See RAILROADS: 1001-1905; TRUSTS: United States: 1901-1906.

1902-1914.—Society of Equity.—Equity convention.—"A legitimate outgrowth and perhaps the lineal successor of the Granger movement is the Society of Equity which originated in Indiana about 1902, and had a steady growth for several years, especially in the southern states where it developed much successful handling of cotton, tobacco, etc., on the coöperative plan. The Equity Co-operative Exchange which is now a permanent fixture in St. Paul is an organization of farmers created to handle farm products at terminal markets. . . . It is but natural that this co-operative movement should receive its first impetus in the Great Northwest where there are now many hundreds of farmers' elevators and tens of thousands of grain raisers, stockholders in co-operative companies, eager to grasp the possibilities of high-frequency currents in such a movement as the Equity Exchange offers. No city has taken hold of the significance of this growing spirit as has St. Paul. . . . A monster 'Equity Convention' or Farmers' Congress was held in St. Paul, December 8 to 15, 1914, attended by perhaps three thousand delegates from nine Northwestern states, at which practical steps were taken for perfecting the organization and extending its operations. Thus the educational work and the business propositions inaugurated by the Patrons of Husbandry half a century ago, are taken up by a new generation with a wider outlook, with enlarged resources,

and with the benefit of illuminating experiences."—H. A. Castle, *Minnesota: Its story and biography*, pp. 305-306.

ALSO IN: E. V. Robinson, *Early economic conditions and the development of agriculture in Minnesota*.

1904-1921.—Administration of Governor Johnson.—Later governors.—"When politicians began to rally their forces for the elections of 1904, there was gloom and discouragement in the Democratic camp. They had been badly defeated in the state elections of 1902. . . . The Democratic leaders evidently concluded that their only chance for success lay in enlisting the Scandinavian vote, and after much effort they persuaded John A. Johnson, a newspaper editor in St. Peter, to accept the nomination for governor on their ticket. . . . He was elected governor by a plurality of more than 7,000 votes, in spite of the fact that Republican candidates were elected to all other important state offices by overwhelming majorities. . . . Even some of Governor Johnson's supporters were doubtful of his ability to handle the problems which were sure to confront him, but as he quietly disposed of each issue which came up, the confidence and admiration of the entire state grew steadily. . . . He secured legislation leading to the appointment of a permanent tax commission. . . . During the summer of 1907, a strike occurred among the iron miners of northern Minnesota, and the operating companies demanded that state troops should be sent at once to prevent violence and to guard their property. Instead, Governor Johnson went personally to the iron ranges and by conferences with both owners and workers made it plain that, as chief executive of the state, he would not tolerate violence on the part of the strikers, nor would he allow the use of state troops to prevent the workers from making a lawful demand for better working conditions. A compromise was effected, and work was resumed without further threats of violence. The people of the state showed popular approval of his policies by reëlecting him in 1906 and again in 1908. His fame spread far beyond the limits of Minnesota. . . . As early as 1907, political leaders in the Democratic party were looking toward Governor Johnson as a possible candidate for the presidential nomination in 1908. . . . The Minnesota delegation supported him loyally in the Democratic national convention of 1908, but was not able to secure his nomination. . . . Governor Johnson's strength was so overtaxed by steady travel and lecture work in the summer of 1900 that a surgical operation performed upon him in September proved fatal. Never has the death of any person in Minnesota caused such general and widespread sorrow as his. . . . Adolph O. Eberhart, the lieutenant-governor, immediately succeeded to the governorship. Although he was of the Republican party, he announced that he would carry out the policies of his predecessor. He became a candidate to succeed himself and was elected in 1910 and in 1912. . . . In the election of 1914, the successful candidate was Winfield Scott Hammond, the nominee of the Democratic party. . . . At the close of his first year in office, Governor Hammond died suddenly while on a business trip in Louisiana, and for a second time Minnesota mourned the death of her chief executive. . . . Shortly after Governor Hammond's death, the lieutenant-governor, J. A. A. Burnquist, took the oath of office and became the chief executive of the state. In 1916 he became a candidate to succeed himself and was elected by a total number of votes far in excess of the votes for the Republican presi-

dential electors. [He held office until 1921.]—M. V. Carney, *Minnesota, the star of the north*, pp. 220-224.

1908.—Growth of coöperative movement. See COÖPERATION: United States.

1911-1918.—Legislation.—Prohibition movement.—In 1911, the legislative acts provided for the abolition of capital punishment; for parole and indeterminate sentence; and for vocational education. The proposed constitutional amendment for the election of United States senators by direct vote of the people was ratified. This action was taken following the lead of Oregon and anticipating the federal amendment. In 1912, the Sixteenth Federal Amendment (income tax), and the Seventeenth Federal Amendment (direct election of United States senators), were passed. In 1913, the legislative enactments were the Workmen's Compensation, Mothers' pension, and presidential primary election laws. A minimum wage commission was created to carry out the minimum wage law of 1913; this law was declared constitutional by Supreme Court decision in 1917. "The first legislation passed in the interests of prohibition was enacted in 1913, in the local option law permitting villages, towns, and cities, of less than 10,000 inhabitants to vote on the question of prohibiting the sale of liquor within their limits. This was followed by the county option law, passed in 1915, by which the citizens of a county could, if they desired, vote as a unit upon the question of prohibition. . . . Before January 1, 1917, 57 of the 86 counties of the state were 'dry' territory. . . . In 1917 the legislature passed a law providing that in the general election to be held in November, 1918, an amendment to the state constitution, prohibiting the manufacture, sale, gift, or transportation of all intoxicating liquors shall be voted upon."—M. V. Carney, *Minnesota, the star of the north*, pp. 229-230.—The Prohibition Amendment received a majority of 16,000 votes but was defeated because a constitutional requirement provides that proposed amendments must receive a majority of all the votes cast and not a majority of all the votes cast for prohibition; the amendment lacked 705 votes. In 1917, the laws relating to labor and labor disputes were amended. It was made a felony to advocate "criminal syndicalism."

1913.—Railroad rate case. See RAILROADS: 1910-1916. U. S. A.: 1913 (June).

1915.—Allotment system. See BUDGET: Allotment system.

1916.—James J. Hill.—Services to agriculture.—On May 29, 1916, occurred the death of James J. Hill. "His services to agriculture do not yield in magnitude or value to those he rendered elsewhere. They have a double relation to his life, because, as he saw it, the farm and the railroad were partners. It was from that conception that the St. Paul, Minneapolis and Manitoba was born. The wheels of the Red River carts and the busy gophers brought to the surface soil specimens with a promise of inexhaustible richness. This would attract people. People would need railroads. Railroads bringing people, people creating more railroads, so he visioned the everlasting cycle. Therefore he believed that he was helping the farm when he improved the railroad, and helping the railroad when he showed how to make the farm more prosperous. He always insisted that the lowest freight rates should be those on farm products. He made it relatively cheaper for the farmer of the Northwest to reach his market than for any other in the country. He said over and over to the farmers that they and the railroad were

in the same boat; that if the farm did not prosper there could be no business, and nothing for the railroad to carry. Therefore he focused his attention from a very early day on increasing the number of farmers and the net acre product of the farm. . . . Under his direction the Great Northern entered the agronomic field, ran demonstration trains, conducted demonstration plots on farms, analyzed soils, for which purpose Mr. Hill gave the use of the greenhouses attached to his residence, scattered all over the Northwest truths about fertilization and soil conservation and the possibilities of production."—J. G. Pyle, *Career of James J. Hill (Minnesota History Bulletin, v. 11, pp. 319-320)*.

1918-1921.—Part played in World War.—Forest fire.—Industrial commission.—During the World War the state furnished 90,116 men, or 2.64 per cent of the entire Expeditionary Forces. The most disastrous forest fire in the history of the state occurred in 1918. It burned over 770,500 acres, caused 432 deaths, and destroyed about \$25,000,000 worth of property. In 1919, the Nineteenth Federal Amendment (woman suffrage), was ratified. The state machinery for the supervision of labor was reorganized in 1921. An industrial commission of three members, appointed by the governor, superseded the single commissioner previously controlling the Department of Labor. In 1921 Jacob A. O. Preus became governor.

MINORCA, second largest of the Balearic islands, about twenty-seven miles northeast of Majorca. The capital is Port Mahon. See BALEARIC ISLANDS.

13th century.—Conquest by King James of Aragon. See SPAIN: 1212-1238.

1708.—Acquisition by England.—In 1708, during the War of the Spanish Succession, Port Mahon and the whole island of Minorca were taken by an English expedition from Barcelona, under General Stanhope, who afterwards received a title from his conquest, becoming Viscount Stanhope of Mahon. Port Mahon was then considered the best harbor in the Mediterranean and its importance to England was rated above that of Gibraltar.—Lord Mahon, *History of England: Reign of Queen Anne, ch. 10*.—See also SPAIN: 1707-1710.—At the Peace of Utrecht Minorca was ceded to Great Britain and remained under the British flag during the greater part of the 18th century. See UTRECHT: 1712-1714.

1756.—Taken by the French.—At the outbreak of the Seven Years War, in 1756, there was great dread in England of an immediate French invasion; and "the Government so thoroughly lost heart as to request the King to garrison England with Hanoverian troops. This dread was kept alive by a simulated collection of French troops in the north. But, under cover of this threat, a fleet was being collected at Toulon, with the real design of capturing Minorca. The ministry were

at last roused to this danger, and Byng was despatched with ten sail of the line to prevent it. Three days after he set sail the Duke de Richelieu, with 6,000 men, slipped across into the island, and compelled General Blakeney, who was somewhat old and infirm, to withdraw into the castle of St. Philip, which was at once besieged. On the 19th of May—much too late to prevent the landing of Richelieu—Byng arrived within view of St. Philip, which was still in the possession of the English. The French Admiral, La Galissonnière, sailed out to cover the siege, and Byng, who apparently felt himself unequally matched—although West, his second in command, behaved with gallantry and success—called a council of war, and withdrew. Blakeney, who had defended his position with great bravery, had to surrender. The failure of Byng, and the general weakness and incapacity of the ministry, roused the temper of the people to rage; and Newcastle, trembling for himself, threw all the blame upon the Admiral, hoping by this means to satisfy the popular cry. . . . A court martial held upon that officer had been bound by strict instructions, and had found itself obliged to bring in a verdict of guilty, though without casting any imputation on the personal courage of the Admiral. On his accession to power Pitt was courageous enough, although he rested on the popular favour, to do his best to get Byng pardoned, and urged on the King that the House of Commons seemed to wish the sentence to be mitigated. The King is said to have answered in words that fairly describe Pitt's position, 'Sir, you have taught me to look for the sense of my subjects in another place than the House of Commons.' The sentence was carried out, and Byng was shot on the quarter-deck of the *Monarque* at Portsmouth (March 14, 1757).—J. F. Bright, *History of England, period 3*, pp. 1021-1022.

MINYI.—"The race [among the Greeks] which . . . first issues forth with a history of its own from the dark background of the Pelasgian people is that of the Minyi. The cycle of their heroes includes Iason and Euneus, his son, who trades with Phœnicians and with Greeks. . . . The myths of the Argo were developed in the greatest completeness on the Pagasæan gulf, in the seats of the Minyi; and they are the first with whom a perceptible movement of the Pelasgian tribes beyond the sea—in other words, a Greek history in Europe—begins. The Minyi spread both by land and sea. They migrated southwards into the fertile fields of Bœotia, and settled on the southern side of the Copeic valley by the sea. . . . After leaving the low southern coast they founded a new city at the western extremity of the Bœotian valley. There a long mountain ridge juts out from the direction of Parnassus, and round its farthest projection flows in a semicircle the Cephissus. At the lower edge of the height lies the village of Skipu. Ascending from its huts, one passes over primitive lines of wall to the peak of the mountain, only approachable by a rocky staircase of a hundred steps, and forming the summit of a castle. This is the second city of the Minyi Bœotia, called Orchomenus: like the first, the most ancient walled royal seat which can be proved to have existed in Hellas, occupying a proud and commanding position over the valley by the sea. Only a little above the dirty huts of clay rises out of the depths of the soil the mighty block of marble, more than twenty feet high, which covered the entrance of a round building. The ancients called it the treasury of Minyas, in the vaults of which the ancient kings were believed to have hoarded the superfluity of their treasures of gold and silver, and in these remains endeavoured to recall to themselves the glory of Orchomenus sung by Homer."—E. Curtius, *History of Greece, v. 1, bk. 1, ch. 3*.—See also BŒOTIA; GREECE: Migrations of Hellenic tribes, etc.

MIQUELON, tiny island, which with St. Pierre forms the last remains of the French colonies in North America. "Lying close to the south coast of Newfoundland, they [Miquelon and St. Pierre] are separated from each other by a channel 5 or 6 kilometers wide. Miquelon itself is composed of two islands, the northern or Grande Miquelon and the southern or Petite Miquelon. The two islands are united by a belt of sand."—*Islands of St. Pierre and Miquelon* (*Scottish Geographic Magazine, June, 1903, p. 207*).

MIR.—The mir as it existed in the old Russia of the Romanovs was generally described as a commune whose bond was unity of government and of possession of land. It was the "mutual obligation of all the inhabitants to pay taxes and fur-

nish recruits to the army. Every male living . . . [had] a claim to a share in the land, this right belonging to him from the time of his birth, though during his minority his father occupied for him. When a person [died], . . . his share reverted to the community. The forests and the pasture lands, however, with the hunting and fishing, were never divided, though the arable land and meadow lands were divided by lot."—H. de B. Gibbons, *Economic and industrial progress*, p. 281. —"Sometimes the mir is a single village. In this case the economic administration adapts itself exactly to the civil. Again, it may happen that a large village is divided into many rural communes. Then each commune has its special economic administration, whilst the civil and police administration is common to all. Sometimes, lastly, a number of villages only have one mir. Thus the size of the mir may vary from 20 or 30 to some thousands of 'dvors.' . . . The 'dvor,' or court, is the economic unit: it contains one or several houses, and one or several married couples lodge in it. The 'dvor' has only one hedge and one gate in common for its inmates. . . . With the Great Russians the mir regulates even the ground that the houses stand on; the mir has the right to shift about the 'dvors.' . . . Besides land, the communes have property of another kind: fish-lakes, communal mills, a communal herd for the improvement of oxen and horses; finally, storehouses, intended for the distribution to the peasants of seeds for the fields or food for their families. The enjoyment of all these various things must be distributed among the members of the commune. . . . The Russian mir is not an elementary unit. It is made up of several primordial cells—of small circles that form in perfect freedom. The mir only asks that the circles (osmaks) are equal as to labour-power. . . . When the village has any work to do, any property to distribute, the administration or the assembly of the commune generally does not concern itself with individuals, but with the 'osmak.' . . . Each village has an administration; it is represented by a mayor (selski starosta), chosen by the mir. But this administration has to do only with affairs determined upon in principle by the communal assembly. The starosta has no right of initiating any measures of importance. Such questions (partition of the land, new taxes, leases of communal property, etc.) are only adjudicated and decided by the assembly of the mir. All the peasants living in the village come to the assembly, even the women. If, for example, the wife, by the death of her husband, is the head of the family, at the assembly she has the right to vote. . . . The peasants meet very frequently."—L. Tikhomirov, *Russia, political and social*, v. 1, bk. 3, ch. 2, with foot-note, ch. 1.—"It [the mir] has been in existence in Russia from time immemorial, and the existence of these peasant republics has rightly been described as 'the first and surest sign of Russian nationality.' Although it possesses many admirable features, it is not a social condition which could ever be conducive to progress in agriculture; indeed, to the student of economic history, it can hardly appear otherwise than in the light of a survival from a primitive condition of society. Hence one is not surprised to find that Russian agriculture shows practically no progress during the nineteenth century, and certainly not during the first half of it."—H. de B. Gibbons, *Economic and industrial progress*, p. 281. —See also RUSSIA: 16th century; Industrial development; SUFFRAGE, MANHOOD: Russia: 1100-1905.

MIRACLES: Non-Christian traditional miracles.—Primitive practices.—Miracles in ethnic religions.—In Old Testament.—"Magic or thaumaturgic miracle belongs to a quite primitive stage of thought, but many of the actions attributed to the shaman are reproduced in the miracles ascribed to Lao-tee, Buddha, Muhammed, or to ethnic and [medieval] Christian saints. . . . Miracles occur plentifully in religions at a higher level than those of savagery, and are freely ascribed to the great ethnic teachers and to saintly persons or ascetics in these religions. Asceticism and austerity are, in fact, sometimes a necessity as well as a guarantee of miracle, as they are also in the case of Christian saints. . . . In most of these religions miracles are commonly attributed to saints, sages, and ascetics. They bear a similar character in widely distant regions and under different creeds, and often run on parallel lines. Here again these miracles bear a curious likeness to many which are ascribed to Christian saints, Taoist, Zoroastrian, Buddhist, Hindu, and Muhammedan all believe in the possibility of the miraculous in the case of gifted persons. . . . Healing miracles were . . . wrought by gods, heroes, or famous persons [or by their images and relics and at their tombs]. . . . Roughly speaking, the miracles of the Old Testament fall into two groups, those connected with Moses and Joshua, and those connected with Elijah and Elisha."—J. A. MacCulloch, *Miracles* (J. Hastings, ed., *Encyclopaedia of religion and ethics*, v. 8, pp. 677-679).

1st century.—Miracles of Jesus and the apostles.—Belief in miracles, not only in those worked by Christ and by His apostles, but also in His miraculous advent, has always been a fundamental doctrine of the great body of the Christian church. "Saint Luke was an intellectual and educated man, with a keen sense of and desire for historical accuracy; leading us as he tells us to seek information from those who 'from the beginning were eye-witnesses.' Now Saint Luke not only records many of the miracles of Christ, including His resurrection, but in the Acts he recounts other miracles wrought through faith in His name; which would doubtless also have been made matter of conscientious enquiry. 'Many wonders and signs,' he says, 'were done by the apostles.' The simplicity and directness of these narratives does not suggest superstitious credulity; the occurrences in question are not even emphasized; they are merely stated like any other facts. And what of St. Paul himself? Emotional, enthusiastic, mystic he may be, but none the less a keenly intellectual thinker. . . . [St. Paul] speaks of the continuation of miracles in the Church as a fact with which his hearers were perfectly familiar. 'To one is given

through the spirit the word of wisdom . . . to another gifts of healing, in the one spirit, and to another working of miracles.' . . . Here then we have one of the master minds of human history, together with his intellectual educated friend, speaking of facts within their own experience, and to an audience with whom that experience had obviously been shared. And certain of these facts they represent as exceptional, differing from the daily order of events, striking, wonderful, miraculous and due to the particular action of God. . . . In a word, the Christian religion was first preached and accepted by men who profoundly believed in miracles; and it has been handed down by the ages by men who held that primitive belief to be true. It has always been presented as an historical religion, that is to say, founded upon events which happened, and contemplating others yet to come."—J. R. Illingworth, *Gospel miracles*, pp. 182-183.—Saint Paul "speaks as though the working of miracles was generally recognized to be a fundamental feature of early Christianity. In his list of significant persons within the church, apostles stand first, prophets second, teachers third; in his list of important activities the gradation arranged in the descending scale runs, miracles . . . gifts of hearings, helps, guides, varieties of tongues. The leading personalities in the community would, of course, display the most important activities, hence the appropriateness of citing as evidence of his apostolic authority the 'miracles' which were wrought in connection with his preaching in Corinth. He often refers to the dynamic display . . . which attended his work generally. . . . What was true of the Pauline communities need not necessarily have been true of others. Yet it is equally unsafe to conclude offhand that the Pauline churches were essentially distinctive in these fundamental matters. . . . If Paul's churches differed from those founded by other leaders, his converts naturally would be fearful lest they should inherit only an inferior place in the new kingdom. . . . Thus miracles seem to have been generally accepted as the supreme test of validity for the pillar apostles and their communities." S. J. Case, *Evolution of early Christianity*, pp. 147-148, 150-151.

Early attacks by opponents of Christian religion.—"A rigid monotheistic religion like the Jewish left but one way of escape from the authority of miracles, which once were acknowledged to be such . . . namely, that the works wrought by him were wrought from beneath: 'This fellow doth not cast out devils but by Beelzebub, the prince of the devils.' . . . This accusation brought against the miracles of Christ, that they were done by the power of an evil magic, the heathen also sometimes use; but evidently having borrowed this weapon from the armory of the Jewish adversaries of the faith. . . . It was [with them] little more than a stone which they found conveniently at hand to sling. . . . These two classes of assailants of the Christian miracles, the Jewish and the heathen, allowed the miracles themselves to stand unquestioned as facts, but either challenged their source, or denied the consequences drawn from them by the Church"—R. C. Trench, *Notes on the miracles of Our Lord*, pp. 63, 66, 70.

Post-Apostolic Age to modern times.—**Acceptance of miracles in Patristic period.**—**Profusion during Middle Ages.**—**Influence of modern thought.**—**Modern scepticism and the Oxford movement.**—"S. Augustine, in one of his earlier works, had said that 'miracles were not allowed to continue to his own time, lest the mind should always look for visible evidence of truth,

and lest Mankind, which at first had been kindled into devotion by the novelty of miracles should be chilled into indifference by their frequency.' But he revised his statement in his *Retractions*; and said, 'Though it be true that at the present time men do not speak with tongues when they receive the Holy Ghost by the laying on of hands, as they did in the Apostolic times; and though the sick are not healed by the shadow of Christian preachers passing by, as they were in the days of the Apostles (Acts v.15); yet the assertion is not to be so accepted as if we were to believe that no miracles are now wrought in the name of Christ.' . . . Augustine also asserts that miracles were wrought in his own Episcopal city, Hippo, so late as 425 A.D., in the presence of the relics of the first Martyr, Saint Stephen. Passages are often quoted from Saint Chrysostom as if he had thought that miracles had entirely ceased in his age. And yet he says that miracles are wrought sometimes at the tombs of Martyrs. These statements are, it seems, to be reconciled by the supposition that miracles were not wrought in his age so frequently as in Apostolic times, nor in the same manner."—C. Wordsworth, *Church history from 381, v. 3*, pp. 155-156.—"In the writings of the Fathers, and especially those of the fourth and fifth centuries, we find . . . [miracles] not only spoken as existing in profusion, but as being directed to the most various ends. . . . They were the sign of great and saintly virtue, securing universal respect for those who had attained a high degree of sanctity, or assisting, them in the performance of their more austere devotions. If we pass from the Fathers into the middle ages, we find ourselves in an atmosphere that was dense and charged with the supernatural. The demand for miracles was almost boundless, and the supply was equal to the demand. Men of extraordinary sanctity seemed naturally and habitually to obtain the power of performing them, and their lives are crowded with their achievements, which were attested by the highest sanction of the Church. Nothing could be more common than for a holy man to be lifted up from the floor in the midst of his devotions, or to be visited by the Virgin or by an angel. . . . Those who know how thoroughly the supernatural element pervades the old lives of the saints, may form some notion of the multitude of miracles that were related and generally believed, from the fact that M. Guizot has estimated the number of these lives, accumulated in the Bollandist Collection, at about 25,000. [See also MEDICAL SCIENCE: Medieval: 12th-15th centuries.] . . . Whenever a saint was canonized, it was necessary to prove that he had worked miracles; but except on those occasions miraculous accounts seem never to have been questioned. The most educated, as well as the most ignorant, habitually resorted to the supernatural as the simplest explanation of every difficulty. . . . The line of demarcation between the miraculous and the non-miraculous age, was generally drawn at about the period when the most eminent of the Fathers had passed away. As this was not very long after Christianity had obtained a complete command of the civil power, many plausible arguments could be urged in support of the view, which appears, in England at least, to have been universal. When Locke was writing his famous 'Letters on Toleration,' he was led to a consideration of the Patristic miracles. . . . After this time, the subject of the miracles of the Fathers seems to have slept until public attention was called to it by the well-known work of Middleton . . . Great questions . . . were evoked in 1748, by this Doctor of Divinity, and they were sufficient for

many years to attract the attention of the ablest enquirers in England. Among the laity, the work of Middleton seems to have met with great acceptance. Among the clergy its impetuous, uncompromising, and sceptical tone naturally excited much alarm, and the University of Oxford signalled itself in opposition; but it is a remarkable sign of the times that the Fathers found no abler defenders than Church and Dodwell."—W. E. H. Lecky, *Rationalism in Europe*, pp. 156-159, 160, 172.—"The pantheistic deniers of the miracles, . . . [refused to believe] that any miracle was possible since it was contrary to the idea of God. For these opponents of the truth Spinoza may be said, in modern times, to bear the word, the objection is so well connected with his name . . . Atheism . . . [his system] is not, nor is it even a material, however it may be a formal pantheism. . . . It would profit little to enter in detail on the special charges which Spinoza brings against the miracle. . . . They are but the application to a particular point of the same charges which he brings against all revelation. . . . While Spinoza rested his objection to the miracles on the ground that the everlasting laws of the universe left no room for such. . . . Hume . . . started his objection in . . . a different shape, namely, [by the question] . . . Are miracles [subjectively] credible? He is, in fact, the sceptic, which . . . Spinoza [as a doubter] is as far as possible from being. . . . Another [and later] scheme for getting rid of the miraculous element in the miracle, one often united with Spinoza's *a priori* argument against it . . . has been this. These works, it is said, were *relative* miracles,—miracles, in other words, for those in regard for whom they were first done—as when a savage believes that a telescope, has the power of bringing the far, instantaneously near,—but no miracles in themselves, being but in fact the anticipation of discoveries in the kingdom of nature, the works of one who, having penetrated deeper into her mysteries than those around him, could therefore wield powers which were unknown and bring about results which were inexplicable to them. . . . Schlieirmacher endeavours so to guard this view as that it shall not appear an entire denial of the miracles. . . . These facts [he argues], which seem exceptional, were deeply laid in the first constitution of the law; and now, at this turning point in the providence of God, . . . did at [the bidding of his Son] emerge. . . . We see in this scheme the attempt to reconcile and atone between revelation and science, which was the main purpose of all Schlieirmacher's writings. . . . The rise of rationalism . . . may be looked on as an escape from the conclusions of mere Deists concerning Christ's Person and His Word, upon the part of some who . . . were not prepared to give up the last lingering vestige of their respect for Holy Scripture. . . . But what if it could be shown that Christ never professed to do any miracles, nor the sacred historians to record any? . . . [This] attempt was certainly a bold one. To suffer the sacred text to stand, and yet to find no miracles in it, did appear a hopeless task. For this, it must be always remembered, altogether distinguishes this system from later mythic theories, that it does accept the New Testament as entirely historic; its great assertion being that the Evangelists did not intend to relate miracles. . . . This school, which many had already tried here and there, but which first appeared full blown and consistently carried through in the commentary of Dr. Paulus, published in 1800, did not long survive its first vigour. It perished under blows received from many and the

most diverse quarters. . . . When men arose who did not shrink [from totally denying the authority of the Scriptures] there was nothing to binder them from at once . . . [conceding] that the Evangelists did at any rate intend to record supernatural facts. . . . The historic-critical . . . [assault upon miracles] declares that the records of them are so full of contradictions, psychological and other improbabilities, that upon close handling they crumble to pieces, and are unable to maintain their ground as history. Among the English Deists . . . Woolston especially addressed himself in this way to the undermining the historic credit of these narratives. . . . There is always [he maintains] in every story something else that might have happened besides the thing that did happen. It is after this taking to pieces of the narrative . . . that he proceeds, as a sort of salvo, to say that it may very well stand in its spirit, as an allegory and symbol of something else. . . . Not very different is Strauss's . . . method of proceeding. He wields the same weapons of destructive criticism, thinking to show how each history will crumble at his touch."—R. C. Trench, *Notes on the miracles of Our Lord*, pp. 63, 65, 66, 70, 72, 80, 81, 83-86, 91.—"Farmer, reproducing an old notion of Lightfoot, Webster, and Semler, and anticipating in this respect the current of German rationalism, attempted to explain the diabolical possessions of Scripture by the ordinary phenomena of epilepsy. Warburton and Douglas, with probably most of the ablest of the clergy, abandoning the Patristic miracles, proceeded to establish the peculiar character and evidence of the miracles recorded by the Evangelists; and the general adoption of this tone may be said to have ushered in a new phase in the history of miracles. . . . In the Tractarian movement the subject of modern miracles can scarcely be said to have exercised a perceptible influence. . . . What little influence they had was chiefly an influence of repulsion; what little was written in their favor was written for the most part in the tone of an apology, as if to attenuate a difficulty rather than to establish a creed. . . . Generation after generation the province of the miraculous has contracted, and the circle of scepticism has expanded. . . . The countless miracles that were once associated with every holy relic and with every village shrine have rapidly and silently disappeared. . . . In the present day Christianity is regarded as a system which courts the strictest investigation, and which, among many other functions, was designed to vivify and stimulate all the energies of man."—W. E. H. Lecky, *History of rationalism*, v. 1, pp. 173, 180, 194, 195.—"Deists reject miracles, for they deny the Providence of God. Agnostics, also, and Positivists reject them: Comte regarded miracles as the fruit of the theological imagination. Modern Pantheism has no place for the miracles. . . . Erroneous definitions of the supernatural lead to erroneous definitions of the miracle. Thus (a) Bushnell defines the natural to be what is necessary, the supernatural to be what is free; therefore the material world is what we call nature, the world of man's life is supernatural. . . . (b) The natural supernaturalism proposed by Carlyle, Theodore Parker, Prof. Pfleiderer, and, more recently, Prof. Everett . . . [and Profs. Bowne, and Hastings]. The natural and the supernatural are in reality one: the natural is its aspect to man, the supernatural is its aspect to God. [According to] the 'Immediate theory,' . . . God acts immediately without second causes, or . . . second causes, or laws of nature, must be defined as the regular methods of God's acting. . . . The relative theory

of miracles . . . [presents nature] as a vast mechanism wound up in the beginning and containing in itself the capacity to deviate at stated times its ordinary course. The theory is ingenious, but it makes the miracle a natural event. It admits the assumption of opponents of miracles, viz., that physical effects must have physical causes, but this assumption is contradicted by common facts of experience, e.g., will acts on matter. . . . Hence a miracle never happened in fact, and is only a name to cover our ignorance. Thus Matthew Arnold could claim that all Biblical miracles will disappear with the progress of science (Lit. and Bible) and M. Müller that 'the miraculous is reduced to mere seeming.' . . . The advocates of this theory assume that miracles are an appeal to ignorance. . . . Others explain higher law as a moral law, or law of the spirit. Thus the miracles of Christ are understood as illustrations of a higher, grander, more comprehensive law than men had yet known, the incoming of a new life, of higher forces acting according to higher laws as manifestations of the spirit in the higher stages of its development. The criticism of this theory is that miracles would cease to be miracles: they would not be extraordinary, for they would take place under the same conditions. To bring miracles under a law not yet understood is to deny their existence."—J. T. Driscoll, *Miracles* (*Catholic encyclopedia*, v. 10, 1011, p. 340).—"In the past this debate was carried on chiefly between religion and irreligion, but now it is going on to some extent among believers themselves. . . . As for the Sadducees, I have spent much time with them and doubt if they can be convinced, and I am not even sure that they wish to be convinced. . . . We are not in a machine world, but in God's world. . . . And in such a world it is permitted to see visions and dream dreams, and to keep the soul open to the heavenly vision. To some Sadducees this will always be a stumbling block, to others foolishness, and life must answer them. Perhaps it may still be true that some things are revealed to babes which are hidden from the wise and prudent. But if the Sadducee will continue this discussion, he should learn that philosophy has progressed since his traditional arguments were fashioned, so that they are now largely obsolete. . . . It might also be well for him to master the difference between science, as the fruitful study of the order of experience, to which we owe so much, and 'Science,' that product of crude dogmatism and great question begging term of the half-educated and hearsay thinker."—B. P. Bowne, *Concerning miracles* (*Harvard Theological Review*, Apr., 1910, pp. 164-166).

Modern attitude of Christian philosophy.—"Twenty-five years ago . . . it was the age of triumphant science. . . . Men stood under the spell and glamour of the great magician whose wonder-working wand had unlocked so many doors. In view of the achievements of the past no obstacle seemed adamant, no secret impenetrable. To men of this temper miracle had little interest. It was a synonym for all that was superstitious and out of date. The man who attempted to defend miracle stamped himself at once as an advocate of outworn dogma—a Canute committed to the hopeless task of bidding the tide stand still. It was not so much that his hearers did not believe in miracles, though that was true of large circles of intelligent persons, as that they were no longer interested in them. . . . [But] change has come over the spirit of our dream. The confidence, so much in evidence

among the scientists of the last generation, is less noticeable today. . . . We are more modest than we were; readier to confess that the exceptional dies hard, and that there are elements which enter into the explanation of even the simplest things of which we are not yet—of which indeed we may perhaps never become—masters. And with this insight our mood has changed. The phenomena that explain the miracle-faith have reasserted their claim upon our attention."—W. A. Brown, *Permanent significance of miracle for religion* (*Harvard Theological Review*, July, 1915).—"The principle of Christianity has come to self-consciousness, and it is therefore capable of being held without that mixture of illusion which was inevitable at an earlier age. In the process of its own history, it has been working itself free of the alien elements which were mingled with it at first; and now, as I believe, it exists in many minds as a simple faith in God and man, in God's revelation of Himself in man, and man's capacity to become the further manifestation of God and to work His work—a faith which does not need any extraneous support from vision or miracle."—E. Caird, *Evolution of religion*, v. 2, pp. 316-317.—"The particular phase of modern thought which underlies and colors the critical reconstruction of the gospel history is the opinion that miracles have been discredited forever, with the consequence that if Christianity is to be preserved to the world, it must be disencumbered of its miraculous element. But, this view of miracles is in no way entitled to call itself modern, in any exclusive sense; as if, for instance, it were the latest conclusion, on which all thinking men were agreed. The latest important attack upon miracles is not really being made to-day. It was made when some of the leading men of science were materialists, and were attempting to account for things by a process of purely material evolution, which left no room for God, immortality or freedom. And those who nowadays hold miracles suspect represent a survival of this opinion which is already somewhat out of date; while the philosophy which made it logical has been generally abandoned. . . . New properties of matter have been discovered which considerably modify the somewhat crude conceptions of it that were current fifty years ago; we see energy behind atoms, and energy is suggestive of will. Facts have been observed in biology and still more in psychology, which seem to indicate, in the opinion of many scientific men, the operation of guiding intelligence behind the physical order. . . . There is certainly, at the present moment, greater readiness to grant that 'there are more things in heaven and earth than are dreamed of in our philosophy.'"—J. R. Illingworth, *Gospel miracles*, pp. 164-167.—"It is the naturalistic principle that miracles cannot happen, not the Christian principle that they can happen and are to be admitted when the evidence for their happening is sufficient—which stands condemned by the application of historical principles to the Gospels. . . . The time of our Lord's earthly life was so unique in its character as to make it thinkable that the existence of true miracles might have been limited by God's providence to those few years. But our Lord's own words, assured His Church that, so far from such a limitation being intended, it was ordained that miracles of a similar kind should attend the subsequent course of her history and become a sign by which she could be recognized and accredited. . . . It is well-known that a profusion of reputed miracles, constituting the class which we usually call ecclesiastical miracles, confront us

in every age of the Church's history."—S. F. Smith, *Contemporary miracles* (*The Month*, Dec., 1914).

MISCHNA.—Rabbi Jehuda, the patriarch at Tiberias, was the author (about 104) of "a new constitution to the Jewish people. He embodied in the celebrated Mischna, or Code of Traditional Law, all the authorized interpretations of the Mosaic Law, the traditions, the decisions of the learned, and the precedents of the courts or schools. . . . The sources from which the Mischna was derived may give a fair view of the nature of the Rabbinical authority, and the manner in which it had superseded the original Mosaic Constitution. The Mischna was grounded, 1. On the Written Law of Moses. 2. On the Oral Law, received by Moses on Mount Sinai, and handed down, it was said, by uninterrupted tradition. 3. The decisions or

maxims of the Wise Men. 4. Opinions of particular individuals, on which the schools were divided, and which still remained open. 5. Ancient usages and customs. The distribution of the Mischna affords a curious exemplification of the intimate manner in which the religious and civil duties of the Jews were interwoven, and of the authority assumed by the Law over every transaction of life. The Mischna commenced with rules for prayer, thanksgiving, ablutions; it is impossible to conceive the minuteness or subtlety of these rules, and the fine distinctions drawn by the Rabbins. It was a question whether a man who ate figs, grapes, and pomegranates, was to say one or three graces; . . . whether he should sweep the house and then wash his hands, or wash his hands and then sweep the house. But there are nobler words."—H. H. Milman, *History of the Jews*, bk. 19.—See also TALMUD.

MISSIONS, Christian: 1st-4th centuries.—First historical period of Christian missions.—"Broadly speaking, the first three centuries of the Christian movement were characterized by a great enthusiasm for the dissemination of the faith. The Christian passion was evangelism, the telling of the message of redemption. Before the end of this period the gospel had been preached everywhere in the basin of the Mediterranean and in the western parts of the ancient Asiatic empires. [See also CHRISTIANITY: 100-300: Church organization.] The spread of the influence and teachings of Jesus was, however, in the earliest period, owing in but small part to men whom we should call missionaries. It was the achievement of men of every trade and occupation and of every order in society. Soldiers, scholars, travelers, even slaves, carried to the farthest limits of the empire that secret of the inner life, that new attitude toward the world, which in their experience constituted

salvation. The means of communication in the empire facilitated such a movement. Other oriental religions had spread in much the same way. Something like a uniformity of law, language, and civilization obtained at that time within the limits of the empire in a manner which has had no parallel in the world until our own day."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 6-7.—"It must not be thought, however, that this growth was attained without the severest opposition. The execution of Stephen and the persecutions led by Saul were but the forerunners of a long and pitiless attempt to root out this 'pestilent superstition.' . . . But after each baptism of fire the friends of Christ rose undismayed and boldly testified to His name in the very face of their relentless foes. . . . No wonder that with such witnesses for Christ during the ten great persecutions which ravaged the early Church, beginning with that of Nero in 64 A. D., and ending with the Diocletian persecution in 303, the Church not only lived, but grew and waxed strong. . . . At last the natural consummation of so wonderful a development was reached, and in A. D. 313, by the imperial edict of Constantine, Christianity was recognized as the official religion of the Roman world and took its place in history as a great world religion. Such was the marvelous change in three centuries from the faith of slaves to that of kings. . . . [But] the purity and simplicity of the early faith began to abate and heresies and crudities of thought to arise within the Church itself. Thus the battle of the Church was no longer waged alone with heathenism without, but also with heathenism within, and the great Patristic controversies that lasted for many years diverted the attention of the church from the task of propagating the gospel to that of defining and defending the faith once delivered to the saints."—A. D. Mason, *Outlines of missionary history*, pp. 16-20.

4th-7th centuries.—First era of arrest.—"The decline of the Roman Empire, the invasions of the barbarians, the natural development of the church as a great institution, caused the church in some sense to take the place of the decaying empire. The demoralization of the ancient world, the necessity of training the new northern peoples who had seized upon its mastery, set the church which was not an organized and self-conscious hierarchy a new task. That task was no longer the enlargement of the boundaries of nominal Christendom beyond the basin of the Mediterranean. It was that of the Christianization both of the peoples of the ancient civilization and of the new elements which were found in such strange admixture in all the lands which bordered upon the inland sea. It was the problem of making a really Christian world out of those areas to which Christianity in name at least had been carried before the decline of the empire had begun. Meantime the church had changed its own idea as to what constituted a Christian world. It was not therefore altogether a contradiction that the missionary period of the early church ended abruptly almost at the moment when the church attained a position of outward power and influence. That the church was able in the interval between the middle of the fourth and the middle of the seventh centuries to Christianize the world even in the measure that it did and after the pattern that it chose was a very great achievement. That it was itself in startling degree secularized and assimilated to that world was an inevitable consequence. It was, however, a consequence of which Christians were almost wholly unaware."—E. C. Moore, *Spread of Christianity*

in the modern world, pp. 7-8.—Moreover, a few names do stand out to represent individual missionary effort in the church during this time of no great united undertaking. "This condition developed two widely differing classes of Christian champions, the one of which contended against the philosophies of the non-Christian thinkers and the false doctrines which sprang quickly up among the professed friends of Christ; and the others, leaving such contests to the Church at home, and to such mighty apologists and theologians as Athanasius, Jerome, Chrysostom, Augustine, and others, fared forth to distant lands and unfamiliar peoples to plant the faith in which they themselves trusted. Among these missionaries of the early Church we first note Ulfilas . . . [who] was born 311 A. D., and came from Christian parents who had been captured and enslaved during one of the many incursions made by the Goths into Asia Minor about the middle of the third century . . . [and who] returned as a missionary to his own people (341) and labored among the Goths north of the Danube River. [See also CHRISTIANITY: 238-400; GOTHs: 341-381.] His particular distinction comes from the fact that he 'was one of the first missionaries to give not only Christianity but letters to a whole people. The Goths were without books or writing. In order that they might have the Scriptures, Ulfilas invented for them an alphabet, using a modification of the Greek letters with the addition of some characters to represent Gothic sounds for which the Greeks had no signs. He translated the whole Bible, except the Books of Kings, omitting these because he feared that they would tend to feed the warlike passions of the Goths. Only his translation of the New Testament, however, has come down to us, the best extant copy of which is now in the University of Upsala, Sweden. . . . An early missionary to the Gauls, who left the most permanent impress on the inhabitants of the land that we now know as France, was Martin, Bishop of Tours (316-400). He did not introduce Christianity among the Franks, as many, including such noted men as Irenæus and Pothinus and Benignus, friends and disciples of Polycarp, had long before carried the gospel to these savage tribes. But his character and work were such that he finally established Christianity over a wide area of Gaul where it had been hitherto but imperfectly known or received. He was a soldier under Constantine before he became a Christian, which no doubt accounts for the manner in which he waged war against heathenism, organizing his monks into a sort of army, not, however, to fight with men, but to cut down sacred trees, destroy idols and temples, and thus to remove the traces of paganism from those communities which his preaching and instruction had led to embrace Christianity. . . . It certainly is somewhat strange that the name which popularly stands for that of the typical Irishman was not the name of any Irishman at all, but of a Scotchman, whose zeal for Christianity led him to brave captivity and toils that he might plant the banner of the cross amid the wild tribesmen of ancient Erin. Succat, or Patricius (to use the Latin form of the name, from which we get our familiar name Patrick), was born in Dumbartonshire, Scotland, near the present city of Glasgow, in the latter part of the fifth century (403). . . . Obedient to . . . [a] heavenly vision, Patrick left his native land and . . . sailing north, he entered Strangford Lough, in County Down, and in a barn near where is now Downpatrick, the first Christian Church in Ireland was gathered. Beginning about the year 525 he 'did the work

of an evangelist' with rare zeal and discretion, founding churches, schools, and monasteries, and preaching the gospel throughout the length and breadth of that wild and savage land. [See also CHRISTIANITY: 5th-9th centuries; IRELAND: 432.] . . . If Ireland was evangelized by a Scotchman, Scotland was later repaid for her gift by the labors among her people of the eminent Irish missionary Columba. He was of royal lineage, from one of the numerous families of Celtic chieftains, and was born about 521. . . . The extent of his work and that of the 'graduates' of his 'missionary training school,' is indicated by the fact that, 'during Columba's lifetime the gospel was generally accepted by the whole of the Western Picts; by the population of the Hebrides, whose numbers were probably but small, but among whom missionary work must have been carried on with immense difficulty; and by many in the Orkney, Shetland, and Faroe Islands. [See also CHRISTIANITY: 597-800.] . . . Germany, inhabited by rude tribes whose earlier civilization and Christianity had been almost wholly obliterated by the waves of barbaric invasion from the North and East that swept over it during the second and third centuries, was resown with the gospel seed, not, as would have been natural, by its nearest Christian neighbors, the Frankish Church, but by heralds from more distant lands. Severinus Fridold, or Fridolin, and others did much to re-lay the ruined foundations of religion among the Germanic tribes."—A. D. Mason, *Outlines of missionary history*, pp. 21-28.

7th-11th centuries.—Second missionary period.—"When, toward the end of the sixth century, the Christian propaganda was resumed, it had for its aim the conversion of the races of Northern and Western Europe, which had lain outside of the ancient Roman Empire or only nominally within it. The emissaries of the gospel went out from three centers. Southern Russia and the Balkan Peninsula were evangelized from Constantinople. Germany and the low Countries, northern Gaul and Britain, ultimately also Denmark and Norway and Sweden received most of their emissaries from Rome. [See also CHRISTIANITY: 9th-10th centuries.] A portion of this area was, however, the field of devout labor on the part also of Celtic monks [several of whom have been already referred to], who represented a British Christianity antedating the dissolution of the ancient province of Britain. The conversion of the Northern European races to Christianity brought gains to Christendom which in some measure offset the tremendous losses suffered through the conquest of the old seats of Christian faith and civilization in Northern Africa, in Syria and Asia Minor, in Persia, and in the valley of the Euphrates by the forces of Islam. It completed that occidentalizing of Christianity which had been in progress ever since the western journeys of St. Paul. . . . In striking contrast with the method of the earlier era the men engaged in this grand mission to the Northern European races were almost invariably ecclesiastics. They were the agents of a highly organized institution of religion. They were priests, indeed in large part they were monks. . . . They became practically everywhere teachers of the elements of culture, exponents in these new fields of an old and high civilization. They became the founders of a world-order. In large part they determined the political and economic, the intellectual and social and moral characteristics which are familiar to us as those of Europe in the Middle Ages. They preserved and transmitted a learning which was fundamentally Hellenic.

They perpetuated the power and order which mankind owed to the Roman genius for organization. They gave to much of the life of the Middle Ages the ecclesiastical cast which it never lost until the Renaissance."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 8-10.—"Turning . . . to England, we note that the great pioneer missionary to this land was Augustine, who, with his band of forty Benedictine monks, was sent by Pope Gregory to re-evangelize a people whose ancestors had once been evangelized but later had relapsed into heathenism through the weakness of the Church and the growing influence of pagan tribes. [See also CHRISTIANITY: 337-476.] . . . So well did they succeed that within a year after the landing of the missionaries, Ethelbert was baptized and, according to the method of the times, the nation followed their ruler in the acceptance of the new faith. . . . [Of apostles to the Germanic tribes at this period] three names stand out most conspicuously, Columbanus, Willibrord, and Winfrid or Boniface. These were all from the British Church, and their zeal and devotion bear witness to the high state of culture and piety in these islands. . . . Of all these Anglo-Saxon missionaries, Winfrid or Boniface was the most distinguished (755). . . . He converted, organized, and reorganized the German Churches into the one Church of Rome. [See also CHRISTIANITY: 496-800.] The heathen Allemani, Hessians, Bavarians, Saxons, and Franks of the various tribes heard the gospel from him and turned to Christ in great numbers.' 'It is said that in the course of about twenty years he baptized about 100,000 of the pagan inhabitants of Germany. Although this number is probably much exaggerated and, although such wholesale baptisms were not an un-mixed good, yet it is evident that it was by his zeal, combined with a singular faculty for organization, that Germany became a professedly Christian land.' . . . While this work was going on in Central Europe, there were those who penetrated beyond the rivers and forests of France and Germany and Holland to the remoter regions of Denmark and Sweden and even to far-away Greenland. In Denmark and Sweden the pioneer missionary was Anskar (822). [See CHRISTIANITY: 9th-10th centuries.] . . . Similar work was done in Pomerania by Otto, who astonished the splendor-loving Russians by the impressiveness of his services and the magnificence of the long line of his richly dressed retinue. It is said of this missionary that 'he did little public preaching, but a great many Christlike deeds,' which perhaps was not a bad example for his successors in other lands and ages. 'Lief the Lucky' was a son of the Norseman Eric the Red, the reputed discoverer and colonizer of Greenland. Visiting the king of Norway, who was a Christian, Lief was easily led to embrace the faith, and then determined to return to Greenland and Christianize the colonists from Iceland, who had settled there. . . . On reaching Greenland he established a Christian Church in his father's colony which continued for four hundred years or until the colony was finally abandoned. During all this time of missionary activity on the part of the Western or Roman Church, the Eastern Church or that portion of Christendom which acknowledged the Patriarch of Constantinople as their head, was not moved to any great display of missionary zeal. Perhaps their most noted achievement was in the mission of two Greek priests from Thessalonica, the brothers Cyril and Methodius, by name. Their special work was among the Bulgarians, and the story is that their savage king Bagoris was converted by seeing a

picture of the Last Judgment, which Methodius, who was skilled in painting, had depicted upon the wall of the palace. The brother missionaries also did a work more lasting than the conversion of a barbaric king. They found the Slavonic race without a written language and constructed for it an alphabet based on the Greek. Having made letters for the Slavs, they gave them a literature. They translated the whole Bible into Slavonian and created a liturgy in that tongue. . . . Such are a few examples of the early missionaries and of the character of the work whereby they laid the foundation of the religion which in most of their mission fields has persisted to the present day."—A. D. Mason, *Outlines of missionary history*, pp. 26-35.

11th-16th centuries.—Second era of arrest.—"Meantime, there came again a long period of suspension of advance. This too, at times, appeared as retrogression. There were centuries when there was no material enlargement of the area of nominal Christianity. There was only the vital process of assimilation of, and of assimilation to, the races which had already been included within its area. The crusades were wars which had indeed, in one way, a religious cast. They had their origin in a sense of indignation at the thought of that which the Moslem in his advance had wrested from Christendom. . . . The crusaders were the farthest removed from conceiving themselves as missionaries of a faith. They had no idea of seeking the conversion of the followers of the Prophet. They had no desire to win them to the spirit of Christianity or to give them the culture and civilization of Europe. . . . Without doubt the crusades did their part to build up that wall between East and West, between Mohammedan and Christian, which we feel to be so nearly unsurmountable even in our own day. There was built up a wall of separation between East and West such as the ancient world had known nothing of and which we are only now beginning to break down."—E. C. Moore, *West and East*, pp. 87-89.—"Although the Crusades did very little directly for the Christianization of the Mohammedans, there were those in that age who desired ardently to bring to their knowledge and acceptance the truth as it is in Christ. Among these stand out prominently Raymond Lull, the first to urge the supreme need of special training for the evangelization of Moslems, and to exemplify his contention by his own life of toil and martyrdom; John of Damascus (760) and Peter the Venerable (1115), who first studied Islam with sympathy and advocated the employment of spiritual weapons only against the Moslem and for this purpose prepared translations of the Scriptures and other religious works; and Francis Xavier who . . . [wrote] a work . . . to prove to Moslems the superiority of Christianity."—A. D. Mason, *Outlines of missionary history*, p. 43.

17th-19th centuries.—Beginning and spread of modern missions.—Jesuit zeal.—Early Protestant missions.—"With the Renaissance came again, at least to the western church, a great awakening. Since that day the European world has been making itself felt all over the non-Christian world in the manner we are endeavouring to describe. The Roman Church, but particularly the Jesuits, followed in zeal for the faith the earliest adventurers who sought the advantage of Asiatic and American trade. The fierceness of the Reformation struggle may account for the fact that the Protestants found their place in the modern missionary movement at a much later date. They have wrought with an enthusiasm which has at least

done what it could to atone for the delay. This time the area of territorial expansion of Christendom has not been an inland sea with margins of three continents. Nor, again, has it been the whole of one continent, Europe, as it was in the case of the mediæval missions. This time it has been practically the whole world. It is a matter of indifference now whether we travel toward the West to meet the East or the reverse. With the political, commercial, and educational expansion of Christendom has come also the advance of the Christian propaganda into every inhabited land. We are leaving no more worlds to conquer. There are no spaces left for a fourth enlargement parallel to the third which we are recounting."—E. C. Moore, *West and East*, p. 90.—See also CHRISTIANITY: 16th century: Counter Reformation.—"We are . . . [first] chiefly concerned with the Jesuits as a missionary order, and in this respect their progress was rapid and influential. In this work 'they outstripped all the older orders of the Church. In the Portuguese colonies of India the successes of Francis Xavier are well known. The results of their missions in China were even more extraordinary, as typified by the labors and successes of Matteo Ricci and Johann von Scholl, as they also were in Japan and in North and Central America. Their establishments in South America, as in Brazil, in Paraguay, and Uruguay, on the Pacific Coast in California, and in the Philippines, were missions of civilization as much as of religion.' . . . In the United States and Canada the Jesuit missions seem to have been of an higher order than in many other places. Beginning at Quebec in 1625, their missionaries exhibited great bravery and devotion, penetrating the wilderness, preaching to and teaching the most fierce and bloodthirsty Indian tribes, and often falling victims to the passions of savages. The names of Jogues, Breboeuf, Marquette, LaSalle, and others stand out as those of hardy explorers and pioneers and devoted Christian missionaries who without a murmur gave their strength and life for their Indian converts, and the annals of the Jesuit missionaries in Canada and the United States are, as a whole, a bright chapter in the history of this order."—A. D. Mason, *Outlines of missionary history*, pp. 49-50.—See also JESUITS: 1542-1649; 1761-1769; CHINA: 1294-1736; JAPAN: 1542-1593.—"In the great outburst of missionary enthusiasm which followed the spread of the Pietist movement and had its first signal illustration in the work of the Moravian communities, one may say that the absence of ecclesiastic authority and responsibility was almost the universal trait. There was no central religious authority among Protestants. Such developed organizations as existed among them were at the first almost invariably hostile to the missionary movement. Pietists were not looked upon with favor among the Lutherans. Those Independents who, with certain members of other dissenting bodies, formed the London Missionary society in 1795 were not the representatives of the dissenting churches as such. The establishment of the Church Missionary Society was something like an active rebellion within the Anglican church, so different were the views which obtained among these evangelical enthusiasts from the views which were held in authoritative circles in the Establishment at that time. The first missionary societies were not as a rule representative of any denomination. They were groups of men and women from various sects drawn together by their interest in this particular cause, a cause in which their denominations were frequently not interested. . . . It must be re-

membered that in very similar fashion Wesley had felt called upon to inaugurate, in 1738, what we should now call his great home missionary movement for the neglected among the population of the new towns and the declining rural districts in England and among the miners in Wales. Although he was a clergyman of the Church of England, he yet found himself opposed by the Church. The movement which he had intended to be a reform within that church ended in the complete separation of the Wesleyans from that church. Yet the church has since sought to accomplish many of the purposes which Wesley's eager spirit set before itself. [See also METHODIST CHURCH: 1729-1791.] Similarly the great missionary societies, most of them, have in the course of the nineteenth century been appropriated by the churches when these at last came to realize by significance of the cause which at first they had opposed. Most of the missionary societies were originally chartered corporations. They were not ecclesiastical bodies nor even the servants of such bodies."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 47-48.—See also CHRISTIANITY: 18th-20th centuries.

Africa.—"For more than fifteen hundred years Christianity in Africa, except as expressed by the corrupt Coptic and Abyssinian Churches, was almost dead. . . . In the eighteenth century a number of explorations were made chiefly by English and French, but it was not until the nineteenth century that the real exploration of the continent was attempted on any large scale. . . . The Roman Catholics, as everywhere . . . followed their explorers with the offer of Christianity to the peoples who were thus discovered. Soon after the Portuguese discovery of the Congo (in 1484), Dominicans and Jesuits hastened thither, but were unable to counter-act successfully the exploitation of the natives by the Portuguese traders, and their converts gradually again became heathen in everything but name. . . . The first systematic attempt . . . of the modern missionary movement in Africa was that of the Moravian, George Schmidt, who landed in Capetown in 1737."—A. D. Mason, *Outlines of missionary history*, pp. 49-50.—"The problem with which Christian missions is confronted in the continent of Africa differs materially from that which is presented in any other large section of the mission field. The majority of the inhabitants of this continent are more backward, and from a social and intellectual point of view less developed than are those of any other continent. . . . The missionary problem in Africa is complicated by the fact that here, to a greater extent than in any other continent, Mohammedan missionaries are to be found side by side with those who represent the Christian faith. Up to the present time Islam has hardly penetrated south of the equator, and it rests with the Christian Church to say whether in the near future the wave of Mohammedan propaganda shall be checked in its southward course, as it has been checked in Uganda, or whether the pagan tribes in Central Africa near and to the south of the equator are to become Moslems."—C. H. Robinson, *History of Christian missions*, pp. 277-279.—North African missions will be considered under the mission fields of the Near East. The pioneer of East African missions was John Ludwig Krapf who went out before the middle of the nineteenth century under the Church Missionary Society to Abyssinia and settled later in Mombasa. The names of Mackay of Uganda and of John Mackenzie, the missionary statesman, have been conspicuous in this field. "The history of South Africa is interwoven with that of East and Central Africa because

the first Christian pioneers worked north from South Africa, which they entered by the way of the Dutch settlement of Cape Colony. The names which inevitably recur to mind in connection with this northward trend of missionary effort in Africa are those of Robert Moffat and David Livingstone, with the scarcely less famous one of Henry M. Stanley, who, though not technically a missionary, did as much as any man to open Africa to the heralds of the cross and to plant civilization in the place of barbarism."—A. D. Mason, *Outlines of Missionary history*, p. 173.—In South Africa missionary work has been carried on under the auspices of the London Missionary Society, the Berlin Missionary Society, the Moravians, the Free Church of Scotland, the Dutch Reformed, Methodist, Congregational, African Methodist (of America), and other churches. South Africa has several Roman Catholic missions, chiefly French. "From the Christian standpoint the least hopeful prospect at the present time is in West Central Africa. Here, . . . partly in consequence of the enervating climate and partly owing to the degradation caused by centuries of intercourse with European slave-traders and gin-importers, the tribes who live on or near the coast are found to be appallingly deficient in moral stamina and strength of character. One result is that Christian missionaries are heavily handicapped when competing with the representatives of Islam, the demands made by which are much less exacting than are those of Christianity. If the Christian faith is ever to become the religion of West Africa and to stay the progress of Islam, this result will be achieved not so much by the development of the Christian communities which are now to be found on the coast, as by the conversion of the Hausas and of one or two other races in the interior, who possess a strength of character which is not to be discovered amongst the peoples in the coastal districts."—C. H. Robinson, *History of Christian missions*, p. 279.—Missions in West Africa are conducted by the Church Missionary Society, English Wesleyans, Baptists, Congregationalists, Presbyterians, and the Dutch Reformed Church (of America). In Central Africa are Baptist and Presbyterian missions, and others under Protestant churches. There are Roman Catholic missions, most of them French, in both West and Central Africa.—See also AFRICA: Modern European occupation: Chronology: 1834; 1835; 1842, and after; CHURCH OF ENGLAND: 20th century; MADAGASCAR: 1894-1899; PHILOLOGY: 24; UGANDA.

China.—"There has been debate as to the possibility of gnostic Christian influence upon northern Buddhism. . . . There is a monumental evidence that Nestorian Christian communities were established at Hsianfu in the province of Shensi after 635 A. D. There are references in Chinese documents of about the year 845 which speak of bodies of Chinese Christians using the Syrian rite. After the council of Lyons in 1245, Franciscans, responding to an appeal of Innocent IV for the conversion of the Mongols, attempted to reach China. John of Monte Corvino arrived at Peking in 1294. We hear of a bishop of this Franciscan mission executed near Peking in 1362. A Jew from Kaifeng told Ricci shortly after the beginning of the seventeenth century that Christianity had disappeared from the northern provinces after bitter persecution not more than sixty years before the time at which he spoke. Francis Xavier never reached the mainland of China, which had long been the goal of his ambition. He died in 1552 off the coast of Kwangtung province. . . . Thirty years after Xavier's death an Italian nobleman, a Jesuit priest, Matteo Ricci, who had been born in the year Xavier died,

came to the neighborhood of Canton accompanying an embassy from Macao. Ingratiating himself with the provincial rulers he was allowed to remain. Ricci's methods were long followed by missionaries to China. [See JESUITS: 1542-1649.] For seven years he dressed as a Buddhist priest and to the end of his life as one of the Chinese literati. He assured the Chinese that the faith which he preached was the development of the highest principles of Buddhism. He permitted his converts to continue the worship of ancestors. He had knowledge of geography, astronomy and mathematics, which greatly interested the learned men of China. . . . The name of no European of the seventeenth or eighteenth century was so well known in China. . . . Reports of the success of the Jesuit mission in China reached Europe and aroused the envy of rival orders. Dominicans came in 1631 and the Franciscans re-entered the empire in 1633. Almost

organizations within the Church. The R. C. missions have for many years supported orphanages in different parts of China for the care of destitute children. . . . The R. C. priests for the most part live simple, self-denying lives, and live and die amongst their converts. On the other hand, their bishops claimed the rank and dignity of mandarins. This claim, and the further claim to interfere in Chinese lawsuits wherever a R. C. Christian was concerned, often gave rise to hostility and persecution on the part of Chinese officials. . . . At the close of the Boxer riots, in which 54 R. C. missionaries lost their lives, the R. C. missionaries claimed £1,500,000 from the Chinese Government as an indemnity. . . . The *Chinese Mission* of the Russian Orthodox Church was the result of the capture of some Russians, one of whom was a priest, by a Chinese force at the end of the seventeenth century. . . . Of the 700 Christians at-

PRESBYTERIAN CHURCH AND MISSION, CHEFOO, CHINA

immediately the representatives of these orders began to protest against the methods employed by the Jesuits in their work. Both in China and at Rome they assailed the position which the Jesuits had taken with reference to ancestor worship. The controversy was long and bitter. The hostility of the two groups of Christians, the one to the other, did much to create prejudice against the mission cause."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 177-170.—"The revival of Roman Catholic missions in China dates from 1830. These missions are now to be found in every province in China and on the borders of Tibet, and in 1850 the number of baptized Christians was estimated at 330,000. . . . According to *Die Katholischen Missionen* of June, 1913, the total number of converts connected with R. C. missions in China was 1,421,258, in addition to 448,220 catechumens. The three tasks which are put forward as being most pressing are: the development of education; the securing of a more powerful political unity and influence; and the formation of strong religious

tached to the mission in 1000, 400 are said to have been killed during the Boxer insurrection. The work has since been resumed and has a Russian Bishop as its head."—C. H. Robinson, *History of Christian missions*, pp. 210-212.—"Many causes combined to bring the hatred of all the influences of Christendom and Christianity to expression in the Boxer uprising of 1000. This event is the turning-point in the modern history of China. Before we speak of it, however, we may seek to describe the Christian propaganda during the century which followed the coming of Robert Morrison to Canton in 1807. . . . Morrison was the first Protestant missionary to China. . . . He was appointed by the London Missionary Society in 1804. Such was the hostility of the Chinese to the English apropos of the trade in opium that he was obliged to sail in an American vessel from New York. . . . He rightly felt the power of the appeal to the Chinese through their literary class. . . . He had been interested in the beginnings of medical work. . . . Seven years after his arrival in Canton

he baptized his first convert, one of his language teachers. Morrison died in 1834, having seen, so far as we know, ten Chinese baptized in the Christian faith. . . . The London Missionary Society was represented by several distinguished men during this early period. . . . When one considers the number of men of mark whose lives were given to the cause of Protestant missions in China in the years from 1807 to 1850, the date of the outbreak of the Tai-ping Rebellion, it seems strange to say that it is doubtful if at the latter date there were a hundred converts to Christianity in China. Almost half a century had passed in the bare laying of foundations. . . . The ravages of the Tai-ping Rebellion . . . created conditions of such appalling misery and destitution that missionaries who would give themselves to works of mercy were assured of welcome. There arose in the China Inland Mission a new missionary instrumentality adapted to this situation. The founder, Hudson Taylor, an Englishman, had been in China under the Chinese Evangelization Society since 1853. . . . The mission soon became international as well as interdenominational. . . . The great strength of the China Inland Mission has been in pioneering. . . . In few countries have the pioneer missionaries waited so long for visible results of their labors. This fact is the more significant because the progress of Christianity in China during very recent years seems likely to surpass the gain in any large non-Christian country. Even in 1877 the total number of Protestant converts was reckoned at but thirteen thousand. Protestant missionaries had been seventy years in the country. The Church Missionary Society, which had come to China in 1850, worked in Foochow for ten years without a single convert. . . . The truth was that the leading classes among the Chinese were not yet widely touched. Leadership in China was everywhere in the hands of the intellectuals. The literati bred in the old classical culture were profoundly conservative. Public office was everywhere held on the basis of examinations in the ancient literature. The official class was therefore bound to the existing system. Foreign learning was feared when it was not despised. Those who sought it were esteemed to have turned against their country and allied themselves with the hated foreigner. In these circumstances it is a matter for wonder that the schools and colleges established by the missions succeeded as well as they did. . . . The mind of the nation was hostile and there was much suspicion. . . . There were warnings that the popular mind was turning to the thought of the destruction of all foreigners in the country. [See CHINA: 1805 (August); 1808 (May); 1800.] . . . Suddenly, in June, 1900, with almost unexampled fury the storm broke. [See CHINA: 1900.] . . . In this uprising one hundred and thirty-five Protestant missionaries, men and women, had been killed, and fifty-eight children in their families. Thirty-five Roman Catholic priests and nine sisters fell a sacrifice. The total number of foreigners of all occupations who perished is not accurately known. . . . The heaviest blow fell, however, on the Chinese Christians. . . . The recovery of the Christian cause in China after the catastrophe of 1900 was extraordinarily rapid. . . . The *China Mission Year Book* for 1918 gives 268,652 as the number of Protestant communicant members, and the total Chinese constituency as 526,108. The Roman church had, in 1918, 1,409 foreign priests, 006 Chinese priests, 1,956,205 communicants. There is difficulty in comparison of these figures as between the two great branches of the church because of the difference of the custom of the churches in reference to communicant mem-

bership. But it may be safely said that there is one Christian communicant for about one hundred and twenty-five of the Chinese population. . . . Union colleges and universities, like those at Peking, Foochow, and Nanking, have come into being. Union theological schools exist. Union preparatory schools, like that at Tungchau, make the colleges a fact and not merely a name. . . . Union of medical colleges like that which has been brought about at Peking and again at Shanghai was a great gain. The taking over of this work by a corporation of unlimited resources, like the China Medical Board of the Rockefeller Foundation, constitutes an inestimable benefit."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 185-204.—"The movement in favour of the phonetic script designed by the Chinese themselves on the initiation of the Chinese government is growing. The . . . [missions] Committee on Phonetic . . . which is working in conjunction with the Government, was able to report in April [1920] a circulation of over sixteen million pages of phonetic literature during the preceding year. . . . A hopeful feature is the completion of the General Missionary Survey, which . . . will be presented at a National Christian Conference to be held at Shanghai in 1921. . . . German missions, debarred from their former fields, are expanding work in China."—G. A. G. and E. G. K. H., *Missionary survey of the year 1920* (*International Review of Missions*, Jan., 1921).

India.—"India was the first Asiatic country in which Christian missionary work was organized after that revival of the spirit of missions which culminated in the establishment of the Society of Jesus. There is a legend to the effect that the apostle Thomas preached the gospel in Southern India. His tomb is shown today at Mylapore. The tradition is not of very ancient origin. The name 'India' was used by early Christian writers for several different countries. We are perhaps on firm ground if we connect the beginnings of Christianity in India with the wanderings of Nestorian exiles. References in Marco Polo, John of Monte Corvino, and Sir John Mandeville prove the presence of Christians in India in considerable numbers before the coming of the Portuguese. In 1500 Cabral brought to Calicut monks, Franciscans and Dominicans, who were to conduct mission work under the patronage of the king of Portugal. In 1534 Goa was constituted a bishopric. Its constituency was mainly of Europeans and of men of mixed race. In 1599 the Portuguese endeavored to force so-called Syrian Christians into obedience to the See of Rome. In 1816 the English Church Missionary Society sent a 'mission to help' to revive the Syrian church in India. The man to whom, however, the personal leadership in work for India was to fall was Francis Xavier. [See JESUITS: 1542-1649.] He arrived at Goa in 1542. . . . There is . . . no Christian missionary concerning whom it is more just to acknowledge his personal devotion and his power to inspire others, while at the same time we realize that he was the child of his own time. . . . In 1703 the papacy repudiated . . . [certain] practices of the Jesuits, especially condemning the refusal of the communion to pariahs. There is record of measurable success of the Jesuit missions in Northern India . . . especially at the court of the Mogul Emperor Akbar. Three princes of the royal blood are supposed to have been baptized at Lahore in 1670. Yet despite much labor and self-denial the testimony of the Abbé Dubois in 1823 was to the effect that Roman Catholic missionary work in the part of India of which he had knowledge was relatively a failure. The attitude of the natives was such as to render

the prosecution of the work almost hopeless. The suspension of the Society of Jesus in 1773 had everywhere injured their work. The missionary work of the Roman church at the beginning of the nineteenth century deeply needed, as it also received, a revival and renewal parallel in many ways to that which affected the Protestant bodies at the same time. . . . The British East India Company, especially in its earlier years, permitted chaplains sent out under its auspices to consider also the religious welfare of Indians with whom they came in contact. The Company had not yet taken up the attitude of hostility to missions which it later assumed. It was the Danish government which first took direct responsibility for Protestant missionary work in India. . . . The most distinguished of . . . [the thus protected] German Pietist missionaries . . . was Schwartz. . . . It would be a mistake to suppose that during all the time of this remarkable expansion of their trade and territory the British people had had no care for the maintenance of the means of grace and the extension of the knowledge of the gospel in the lands which were gradually being subjected to the crown. From the time of Cranmer different movements for colonization had recognized in principle, at least, the necessity of Christian missions. The Society for the Promotion of Christian Knowledge was organized in 1698, the Society for the Propagation of the Gospel in Foreign Parts, in 1701. This society gave a subvention to the Danish-Tamil mission in 1705. Throughout the latter part of that century it sent chaplains to India, who were allowed to do a certain measure of missionary work. Until the beginning of the nineteenth century, however, the interest of the Church of England in such work in India was not great. It was the Church Missionary Society, a chartered body, which represented the evangelical revival of the spirit of missions. It was founded in 1799. The bishops declined to ordain its candidates and it was not until 1819 that this difficulty was removed. It ought to be said that the field which the Church Missionary Society at first had in mind was Africa. Its founders were, many of them, agitators against slavery and the slave trade. Its first missionary went to India in 1813 after the opening of India to such work under the revised charter of the Company. . . . In 1793, however, there had come to Bengal William Carey, a cobbler of Paulersbury, Northamptonshire, who had been sent out by the newly founded Baptist Missionary Society of Great Britain in 1792. Carey was the impersonation of the new impulse which was now to make itself felt among the people of Great Britain as it had done in the Pietist Moravian communities in Germany. . . . He was one of the most modern of missionaries. To a far greater extent than any of his predecessors he realized the comparative futility of scattered missions and the impossibility of converting India by the work of European traveling preachers. By concentrating the greater part of his activities within a narrow circle and by spending his time upon the education and training of Indian teachers he inaugurated a new method of missionary work the importance of which it is still impossible to exaggerate. . . . The impersonation of another movement in Indian missions which has been very fruitful was Alexander Duff. Duff was the first missionary sent out to India by the Established Church of Scotland. . . . He realized the necessity of reaching the higher classes. He proposed to provide schools for youth of the higher castes of Northern India in which, through the medium of the English language, a liberal education in all subjects was to be offered to those

who were willing to receive Christian instruction at the hands of missionaries thoroughly competent in educational matters. . . . Duff and his compeers exerted the greatest influence upon the whole government system of education in India exactly in the period of its most rapid and significant expansion. . . . The first missionaries of the American Board, Nott and Hall, also went to India. . . . The present work of the Board in the Indian Empire thus dates from 1810. . . . The withdrawal of a part of the Presbyterian constituencies from co-operation with the American Board in 1837 had been already forecast by the establishment, under the Presbyterian name of American missions in the United Provinces and the Punjab. Judson, who had brought into being the Baptist Society, opened the work in Burma, which was not yet subject to Great Britain. He was a man who might well be measured by the standards of Carey. On the whole the American work in India in the period before the Mutiny [1857] was mainly on evangelistic lines. . . . Missions . . . suffered severely during the rebellion. Few of the northern stations . . . escaped destruction."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 100-112, 114-116, 122.—"Missionary work was resumed in India under the protection of Portugal in the sixteenth century, and during the space of two hundred and fifty years made good progress. But persecutions, colonial wars, the unfortunate dispute about the Malabar Rites, the suppression of the Society of Jesus, the after results of the French Revolution and the Portuguese Padraodo worked such terrible havoc that in the beginning of the nineteenth century, there was nothing left but ruins upon which the indefatigable pioneers of the Catholic Church had to commence a work of reconstruction. . . . Pope Gregory XVI (1830-1846) began to provide for the neglected missions in India. Hitherto only missionaries of Portuguese origin had been admitted. . . . India was henceforth to be opened to all Roman Catholic missionaries irrespective of nationality, Religious Order or Missionary Society. . . . The pride of the Portuguese Government was deeply wounded, and . . . [certain] archbishops placed themselves at the head of [the] . . . anti-papal movement which led to the Goanese Schism, 1836-1845. . . . In 1857 Pius IX concluded a Concordat between the Holy See and the Portuguese Government which put an end to the Goanese Schism, though there still remained a great many difficulties. . . . The first thirty years of the missions in India, 1830-1860, was a period of reconstruction, and from that moment onward a new era and a second spring begins to dawn, and a remarkable progress manifests itself. . . . Pope Leo XIII . . . on September 1, 1886, . . . established the Catholic Hierarchy in India, . . . eight Archbishops . . . to which was added Simla in 1900 and twenty Bishops. . . . The Catholic Church in India with Ceylon numbers 2,633,000 members against 318,000 . . . Greeks and Syrians and against 1,620,000 Protestants . . . and thus the majority of Christians in India belong to the Roman communion."—D. Maternus, *Progress of the Catholic church in India (Catholic Missions, Sept., 1916, pp. 201-204)*.—Chief among the problems of all Christian missions in India during the late nineteenth and twentieth centuries have been those of caste prejudice and political disturbance. Unique features of the work in this mission field are mass movements for conversion among many of the lower castes and "zenana work" or personal visitation of the high class Hindu women by women missionaries. Fifty thousand zenanas in India are said to be open to the visits of the Christian mis-

sionary. Steps have been taken in south India toward church reunion.

Islands of the Pacific.—"The London Missionary Society originated work among the Australian aborigines at Lake Macquarie in 1825, but the tribes among whom this work was prosecuted had practically become extinct before 1861. Gossner of the Berlin Society spent his life at Moreton and Keppel Bay. The migratory habits of the tribes and the influence of vicious whites broke up the work. The Moravians had at one time twenty-six stations on the Australian continent. The government aided them in maintaining reservations and schools. The Australian churches of various denominations have now inherited this task. The Bushmen do not adapt themselves to the life on the reservations and the number of those who have been Christianized is exceedingly small. . . . Christian work upon New Zealand has a very different history. The natives are of Malay origin and superior both mentally and physically to any others of the inhabitants of the Pacific Islands. Samuel Marsden, a clergyman of the Church of England . . . persuaded the Church Missionary Society to undertake a mission in New Zealand. [See NEW ZEALAND: 1815-1840.] The work was inaugurated in 1814. . . . [George] Selwyn spent twenty-seven years in Australasia, and when finally induced in 1868 by the Archbishop of Canterbury to accept the bishopric of Litchfield it was with the hope that with his remaining years he might render his greatest service of all by enabling the Church of England, the British government and people, to see its opportunity through missions for the Christianization of the world. . . . Labor conditions and the influx of foreigners in more recent years have affected the Maoris unfavorably. There are thought to be still some forty thousand Maoris, of whom half are Christian adherents."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 307-309.—"John Coleridge Patteson became the . . . bishop of Melanesia through the influence of Selwyn's preaching. Other names of devoted missionaries in the New Hebrides are John Geddis and John Paton. An even older work had been begun in the Hervey Islands where John Williams of the London Missionary Society labored in 1823 after a few years' preliminary work in the Society Islands. Later he established a permanent work in the Samoan Islands. It was in 1819 that the first mission was sent to Hawaii by the American Board. By 1880 the church on one of the islands of the group had become self supporting and carried on mission work abroad. Fiji Island missions have been among the most permanent and successful of the missions in this wide field. In the Philippines the work so far attempted by Protestants has been almost entirely among the Roman Catholic population of the islands. Besides there are thousands of non-Christian natives such as the Igorrotes, the Moros, the Chinese and others who have yet been scarcely touched."—A. D. Mason, *Outlines of missionary history*, p. 215.—"In 1898, when the Philippine Islands were annexed by the U. S. A., the country was for the first time opened to missionary work other than that connected with the R. C. Church. In 1901 the Protestant Episcopal Church of America organized missionary work in the islands, and Dr. C. H. Brent was appointed as the first Anglican Bishop. . . . In 1901 there also arrived representatives of the American Methodist Episcopal Church, the Baptists, the United Brethren, the Congregationalists, the Disciples of Christ and the Presbyterians. These missions . . . arranged to start in different areas."—C. H. Robinson, *History of Christian missions*, pp. 266-267.—

"There were over two thousand adult Protestant Christians in the Philippine Islands within five years after the landing of the first Protestant missionary."—A. J. Brown, *New era in the Philippines*.—See also PHILIPPINE ISLANDS: 1564-1572; 1900: Spanish friars.

Japan.—"It was on August 15, 1549, feast of the Assumption, that Francis Xavier, accompanied by two missionaries and three newly converted Japanese, landed at Kagoshima. . . . The first period of evangelization of Japan extends from 1549 till about 1640. [See JAPAN: 1542-1593.] As to the Christian population, at a given time, in the year 1605 there were 750,000 Christians. . . . In 1587 there were 113 members of the Society of Jesus working in Japan. . . . In 1613, on the eve of the edict of banishment, some 165 apostolic workers were employed in the task of cultivating this large field; 130 were Jesuits (half of whom were priests); 5 secular priests, and about 30 religious of the three orders of St. Augustin, St. Dominic, and St. Francis of Assisi. . . . The most formidable opposition came from Shintoism; its altar is the throne of the Cæsar—God; now Christianity threatens to rob him of his altar and of his dominion over souls. . . . The twenty-six faithful who were crucified at Nagasaki on the 5th of February, 1597, inaugurated the era of martyrdom in Japan. Ieyasu, after having subdued all his opponents, declared a war of extermination to Christianity by his edict of 1614. . . . Let us now examine the famous edict of Ieyasu. 'Japan is the home of the Gods and of Buddha. The faction of the 'Bateren' (a corruption of the Spanish word padre, father) is in opposition with this order of things. The hordes of Christianity have come to Japan in order to spread a perverse law and destroy the true doctrine, so as to be able to change the government established in Japan and to take a hold of the country.' Here a new grievance is put forward against Christianity: it endangers the country. Yet through all the years the missionaries have passed in Japan, history records not a single instance where these men or their followers had entered into a plot opposed to the independence of the country. . . . The Japanese historians, with hardly an exception, have given credence to this fable . . . unable to appreciate and understand the priest's self denial, nor the attachment the faithful show to the father of their souls. . . . In 1624 the persecution spread through the whole empire. . . . The Dutch Protestants [merchants] testify as to the horror of the tortures. . . . Some one hundred and forty religious had laid down their lives. . . . As to the faithful, it is not easy to say how many suffered death. . . . Takegoshi, a great and impartial Japanese historian of these times, says that the persecution in Japan made over 250,000 victims. . . . Jemitsu's [grandson of Ieyasu] hatred for Christianity knew of no respite; in 1636 he published a Draconian law punishing with death any Japanese who would wish to leave the country or who, after having dwelt some time in a foreign land, would return to these shores; he went even so far as to destroy all high-sea-going junks. In 1640, four Portuguese ambassadors with a suite of seventy-four men had come to Nagasaki. They were summoned before Jemitsu and ordered to apostatize. On their refusal they were condemned to death; thirteen sailors only were excepted from the massacre, and were sent back to Macao with the warning: 'As long as the sun warms the earth, let no Christian be so daring as to enter Japan! Let it be known to all, that were it the Spanish King, nay, the God of the Christians or the great Shaka himself, he would not have broken this law

without suffering the penalty of death.' Japan had thus entered into its savage seclusion which was to last over two hundred years."—L. Gracy, *Early days of the faith in Japan* (*Catholic Missions*, June, 1915, pp. 122-125).—"The resurrection of the Christian Church in Japan dates from 1859. In the previous year, as the result of treaties made between America, England, France and Japan, foreigners were permitted to reside at certain selected Japanese ports. In the very year that these treaties were signed, 80 Japanese Christians were discovered at Nagasaki, 10 of whom were tortured to death. The honour of sending the first missionaries to take advantage of the signing of the treaties belongs to America. On May 2, 1859, before the treaties came into force, the Rev. J. Liggins, of the Protestant Episcopal Church . . . arrived at Nagasaki. Within a year Dr. Hepburn of the American Presbyterian Board, Dr. Verbeck of the Dutch Reformed Church of America, and (in 1860) a representative of the American Baptists' Society were settled at Nagasaki, or at other treaty ports. In September, 1859, M. Girard, a Roman priest, arrived at Yedo. . . . During the next five years the Roman missionaries got into touch with a number of Christian communities, whose members were variously estimated at from twenty to fifty thousand, which still retained the sacrament of baptism and observed in secret Sundays and other Christian festivals. . . . The open avowal of their Christian faith soon brought persecution upon the Japanese Christians. Between 1867 and 1870, 4,000 who had refused to recant were arrested in Nagasaki and its neighbourhood. These were deported from their native villages and were placed in different provinces, where they were subjected to very harsh treatment, under which many of them died. By the end of 1872 these exiles began to be more kindly treated, and in the following year the persecution of Christians fell into abeyance. . . . In 1868 the revolution occurred in Japan, which restored the supreme power to the Emperor and inaugurated the modern Japanese system of government. Although the change in the form of government was not immediately followed by a cessation of persecution, it facilitated the residence of foreigners in Japan and indirectly paved the way for the spread of Christian missions. The first English missionary to commence work in Japan . . . reached Nagasaki in 1869. . . . The missions that were established in different parts of Japan continued to progress, despite considerable persecution, until the year 1873, when the attitude of the Japanese Government towards Christianity underwent a change. On February 10 the Government ordered the removal of the notice-boards which contained the prohibition of Christianity. . . . In 1873 the number of foreign missionaries in Japan, in addition to those connected with the R. C. and Greek missions, had risen to 87, of whom 79 hailed from America or Canada. The only English societies then represented were the C. M. S. [Church Missionary Society] and the S. P. G. [Society for the Propagation of the Gospel.] . . . Greater progress has been made in Japan than in any other non-Christian land in the formation of churches that are self-governed and are to a large extent independent of help received from foreign missionary societies. The total number of Christians in Japan is about 200,000, of whom half belong to the Roman and Russian missions. Of the other half, at least three-quarters are members of one of the four Japanese Churches which have absorbed the converts connected with the various English and American missionary societies. . . . The Protestant missions, with very few exceptions, have united in a general body called the Federated

Missions of Japan. . . . The Anglican missions have not become a corporate part of this Federation, but many of their representatives have given it their cordial support. . . . Special mention should be made of the work that is being done in many parts of Japan by the Y. M. C. A., which has 50 student associations. . . . The Y. W. C. A. is also doing excellent work amongst Japanese women. . . . Four leper asylums . . . are supported by Christian Missions in Japan. . . . Of the missionary colleges which have been established in Japan, the Doshisha College has perhaps exerted the widest influence. Its founder was Joseph Neesima. . . . The Jesuit College in Tokyo was recognized by the Japanese Government in 1913 as a university. . . . The Mission of the 'Orthodox' Church to Japan is one of the most romantic and most successful missions of modern times. Its founder, Père Nicolai, began his work at Hakodate in 1861. . . . A special feature of the work of Père Nicolai, or Archbishop Nicolai as he afterwards became, was his reliance upon Japanese workers for the conduct and development of his mission. He never had but six Europeans as members of his staff. . . . A new departure has recently been made by this mission in view of training boys who may hereafter serve as priests in Japan. Several Russian boys are being educated in the theological seminary of the mission along with Japanese boys. The Russian boys share the life of the Japanese boys in every detail. Those who are responsible for the control of the policy of the mission believe that the effect will be to produce Russian priests possessed of a better insight into Japanese character than any which Occidentals have hitherto obtained. The experiment that is being made is one of extraordinary interest. The total number of adherents of the Russian mission is about 33,000 (1914). . . . [Yet notwithstanding the fact that progress in the Christian ranks has been great from a numerical standpoint] there is probably no country in the world at the present time in which so large a proportion of the educated section of the population would call themselves 'agnostics' as is the case in Japan. . . . The cession of the island [of Formosa] to Japan in 1905 has been followed by its opening up to Western civilization and has facilitated the extension of missionary enterprise."—C. H. Robinson, *History of Christian missions*, pp. 224-246.

Korea.—"The story of Christian missions in Corea is full of romance and of inspiration. In no other country has the persecution of Christians been so intense, and in no other has Christianity within recent years made such rapid advance. . . . In 1784 a son of a Corean ambassador to Peking was baptized by the Franciscan Mission in Peking. On his return to Corea he began to preach and to baptize, but persecution almost immediately broke out and the first convert was induced to renounce his new faith. Many, however, of those whom he had helped to convert were tortured to death rather than recant, and, despite increasing persecution, the number of Christians continued to grow. . . . It is doubtful whether any Christians in the old Roman Empire suffered as did the Corean Christians during the first seventy years of the nineteenth century. [See also KOREA: Early history.] Renewed efforts were made to exterminate the Christians in 1815, 1819 and 1827. . . . At the close of 1838 the number of Christians was reckoned at 6000. In the following year another cruel persecution occurred. . . . By 1850 the number of Christians was reckoned at 16,700. In 1805 the anti-Christian party in the State persuaded the Regent to sanction the extermination of the Christians, and the Bishop and seven European mis-

sionaries were put to death with cruel tortures. In the course of a few weeks Christianity was well-nigh exterminated. . . . In 1870 a few Korean ports were opened to Japanese trade, but it was not till 1882 that, by a treaty made with the U. S. A., the country was practically opened to foreigners. Missionary work was commenced by American Presbyterians and by the American Episcopal Methodists in 1884. An Anglican Mission, with Bishop Corie as its leader, started work in 1890. At this time the number of converts unconnected with the Roman missions did not exceed 100. During the following ten years they multiplied by 10. . . . So rapidly did Christianity spread that when the annexation of the country was proclaimed by Japan in 1910 there were in all 453 missionaries, of whom 50 were French, 90 British and 306 hailed from America. Although the honour of having started the Christian Church in Corea and of ministering to it during nearly a century of continuous persecution belongs to the Roman missions, these do not at the present time minister to half the Christian population. . . . In 1913 the number of baptized Christians connected with the Anglican and Protestant missions numbered 75,000 and the number of Christian adherents 185,000. . . . The number of Christians connected with R. C. [Roman Catholic] missions in 1913 was 80,657."—*Ibid.*, pp. 247-251.

Latin America.—"The papal bull which assigned the West to Spain as it gave the East to Portugal contemplated conquests for the cross and gains for the church as well as increase of territory and of revenue for the crowns of the nations concerned. There is unfortunately no doubt as to the violence and perfidy with which the conquest of the islands and later of Mexico and Peru was carried out. On the other hand, there is evidence of humane and devout remonstrance on behalf of the helpless peoples as well as of the self-sacrifice of priests and members of the orders who sought their welfare. . . . The Spanish mission work was at first under the jurisdiction of the see of Seville. A bishopric of Hispaniola (San Domingo) was established in 1512. There was a bishopric at Santiago de Cuba in 1522 and one at the city of Mexico in 1530. . . . The figure of Bartholomew las Casas stands out in relief against a dark background. He was born in Seville in 1474. . . . He lived to the age of ninety-two and won for himself the title of Universal Protector of the Indians. . . . The first Franciscan mission arrived in the city of Mexico in 1524. . . . The Jesuits were established in Mexico in 1572, devoting themselves to the education both of whites and of natives. [See also JESUITS: 1542-1640.] . . . It was . . . the subjection of Spain and Portugal to Napoleon after the Peninsular War which emphasized to the South American colonies the necessity of caring for their own interests. The struggle for independence lasted from 1810 to 1826."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 285-288

Near East.—"Remnants of the early Christian church . . . and the subdivisions which with lapse of time these have undergone are to be found in Ottoman territory today. In a general way they fall under the popular designation of the Greek church, in contrast to the Roman church as this developed after the great schism. . . . These little outlying Christian peoples with their churches met the full fury of the onrush of Islam. . . . It was little that the Crusaders ever did for the relief of Eastern Christendom. The bitterness with which the two halves of Christendom hated one another had something to do with that. The provincialism of Europe, its ignorance of all matters pertaining

to the East, had more. . . . It will be evident that the problem of missions in the Ottoman Empire was very different from that which has been met in any country of which we have thus far spoken. . . . The plan was to leave ecclesiastical and theological questions on one side. It was to work for the inner transformation of the ancient Christian churches and by no means to set up bodies of mission adherents beside them or to add to the number of warring Christian sects. . . . Latins have been present in the empire, especially in Palestine, in appreciable numbers since the time of the Crusades. Yet the suspicion and hatred between the Latin and oriental churches had been such that one could hardly speak of a religious influence of these devout groups of scholars or of monks and nuns upon the Christians of the land. . . . The monks and nuns have done hospital and orphanage work and some school work. Exactly the thing which was needed, however, aid to the oriental churches in the realization of themselves, seemed to lie outside of the Roman power."—E. C. Moore, *Spread of Christianity in the modern world*, pp. 214-219.—"In 1820 the American Board of Commissioners for Foreign Missions [Congregational] . . . began to send missionaries to various parts of the Turkish Empire, their primary object being to evangelize Moslems and Jews. In course of time the missionaries came to realize that the unsatisfactory lives of many of the Christians belonging to the Oriental Churches rendered their task of influencing Moslems a hopeless one, and they were led by the force of circumstances to devote a large portion of their time and attention to the education of the Greek and Armenian Christians, amongst whom they were living. The Robert Noble College, which they established in Constantinople, and the schools and colleges at Smyrna, Tarsus, Aintab, and other centres, have had a wide-reaching influence upon the pupils who have attended them, and who have included a considerable number of Moslems. Although the work . . . has not resulted in the conversion of any appreciable number of Moslems, it has indirectly prepared the way for the missionary work which will become possible under the new political conditions that have lately arisen. . . . In 1870 the Presbyterians of America organized a separate mission. . . . The chief educational centre in Syria is the Protestant College at Beyrout (1865), which, though not under the control of the Presbyterian mission, serves as its chief educational centre."—C. H. Robinson, *History of Christian missions*, pp. 269-270.—"Mission work in Palestine . . . began with the work of Fiske and Parsons, of the American Board, in Jerusalem, but the history of Protestant Churches in the cradle land of Christianity is generally included under that of the missions in Syria, of which Palestine is politically a part. 'Within the limits of what may be designated as 'The Holy Land' Christian sentiment has led to the establishment of almost innumerable forms of work, sixteen different societies with thirty-seven mission stations manned by foreign workers for a population of a million and a quarter, resulting, as missionary reports show, in an entanglement of interests, a foolish and harmful overlapping of fields of work, rivalries and cross purposes, which, when joined to the complex situation resulting from the presence of the warring factions of the Oriental Churches, make this field perhaps the most difficult in the world. It should be pointed out that the work of the Church Missionary Society is easily the most extensive and wisely planned. . . . (World Missionary Conference, v. 3, p. 236)."—A. D. Mason, *Outlines of missionary history*, pp. 155-156.—"Missionary work in Arabia is still in an initial stage,

and there is urgent need of additional missions and missionaries in this long-neglected land. . . . [The only American Protestant work there is under control of the Dutch Reformed Church.] After the separation between the Christians of the East and the West the Persian Church began to display considerable missionary activity in the regions which lay farther to the East. . . . A Nestorian patriarch ruled the Church during the reigns of seven Mogul kings, but after this Christianity almost disappeared. . . . As a result of the visit of Dr. Joseph Wolff (a converted Jew) in 1827, the A. B. C. F. M. opened a mission in 1834 amongst the Nestorian Christians. This mission was transferred in 1871 to the Presbyterian Board, which has also undertaken work amongst Kurds and Mohammedans in Northern and Western Persia. . . . In 1912 an Anglican bishop for Persia was appointed. A considerable and slowly increasing number of converts from Islam have been obtained.—C. H. Robinson, *History of Christian missions*, pp. 271-273.—“In Egypt, next to Palestine the most hallowed of Bible lands, the Christian missionary faces not only Mohammedanism, but some of the more corrupt forms of Christianity as represented by the Coptic and Abyssinian Churches. . . . The American United Presbyterian Mission is the best established mission in Egypt. It began its work in 1854 and is still doing excellent service among the Copts and the Moslems. . . . The Church Missionary Society also has a strong mission to Moslems in Egypt.”—A. D. Mason, *Outlines of missionary history*, pp. 157-158.—“Since the World War whole areas of this mission field have been in upheaval. In many Mohammedan countries the status of missionary institutions is undermined due to the political confusion. In the meantime, the American University in Cairo is expanding. Many of the Protestant churches of America including the Presbyterian, Congregationalist, Methodist, Baptist, and Protestant Episcopal now have missions in South America and Mexico. “Governments have frequently been favorable to the entrance of the Protestants. Indeed in all these countries, as also in the Philippines, there are considerable elements which have long since broken with the Roman church besides those who never had any such relation. Closer contacts with South America in the immediate future will assuredly bring expansion of religious work.”—E. C. Moore, *Spread of Christianity in the modern world*, p. 289.—“Since the World War, the South American Missionary Society, a Protestant organization, has launched a plan for providing hostels in various mission centers where Indian Christians may be trained as evangelists to their own people.

North America: Indians.—Negroes and immigrants.—The work of the early Jesuit missionaries to North America has been touched upon. “The real history of the great Jesuit missions in North America begins after the treaty of St. Germain in 1632. The most famous centers were that on Cape Breton Island for the Miami Indians and that at Tadousac for the tribes of the lower St. Lawrence. [See also JESUITS: 1542-1640.] For the mission among the Algonquins, Sillery was the point of departure. The Algonquins were, however, almost exterminated in wars with the hostile tribes. Beyond Montreal was the mission to the Nipissings and the great Huron mission, the scene of the most arduous and continued labors of the Fathers among the Wyandottes and other tribes. Then there were the Ottawa missions, which represented effort to Christianize the Chippeways and the Crees. Farther south were the centers for the work among the Miamis and the Illinois. . . . The great figures in the Ottawa Mission are without doubt the fathers Marquette and Hennepin. . . . Canada fell to Eng-

land and Louisiana to Spain after 1763. Then came the dissolution of the Society of Jesus [Jesuits] in 1773. Before the restoration of the Society by Pius VII in 1814 the whole face of America had changed. The record of the Jesuit missionaries is a chapter of American history full of personal devotion. . . . [Yet] both the Spanish and the French missions failed because, although in different ways and for different reasons, they were unable to establish stable religious communities of the natives to whose representatives in due time the management of affairs could be passed over. . . . [Turning to Protestant missions] it is not too much to say that the Pilgrim Fathers, devout men as they were, were not consumed with solicitude for the salvation of the souls of the red Indians. . . . Yet there were . . . those among the Puritans who took a very different view. John Eliot . . . who came to Boston in 1631, was the first to devote himself to the task of preaching the gospel to the Indians. . . . In 1649 the Long Parliament incorporated the Society for the Propagation of the Gospel in New England, which henceforth supported and directed the work inaugurated by Eliot. . . . King Philip's War dealt a staggering blow to the missionary enterprise. . . . Jonathan Edwards, after his retirement from Northampton, devoted himself in part to work among the Indians at Stockbridge. . . . He labored also among the tribes on the Delaware River in Pennsylvania and New Jersey. . . . But the great work of the eighteenth century in this regard was done by the Moravians. . . . The heroic personality was David Zeisberger. . . . His most successful settlements were in Ohio. [See MORAVIAN, OR BOHEMIAN, BRETHREN: Saxony and America.] Zeisberger left in manuscript grammars and lexicons which are almost our only source of knowledge of several of the Indian languages, widely spread in the eighteenth century, which are now extinct. Similar work was done by Moravians in several of the islands of the Dutch and Danish and British West Indies. . . . After 1781 Congress began to provide for the education of Indian youth . . . and after 1783 began a system of reservation of public lands for the Indians. . . . The public conscience was spasmodically aroused. . . . The career of Marcus Whitman was one of perfect devotion to the Kayuse Indians in what is now the state of Washington. He with his family and ten other persons were murdered by these Indians in 1847. . . . Stephen Riggs spent forty-five years in active and successful work among the Dakotas and Sioux.”—E. C. Moore, *Spread of Christianity in the modern world*, pp. 205-207, 300-305.—Among other apostles to the American Indians have been Bishops Whipple and Hare of the Protestant Episcopal Church of America and William Duncan, whose civic community on Annette island met with noteworthy economic success. Moravian and Friends' missions are among Protestant agencies working with Indians, and there are churches and schools conducted by the Presbyterians, Methodists, and other denominations. The Roman Catholic church has a number of organizations whose purpose is the spread of its faith among Indians. The Eskimo Indians of Alaska have also afforded a field for Christian evangelization. The Greek Catholic church sent its missionaries at an early day, during the Russian occupation, and there are still Greek churches in existence. After the transfer to the United States, missionaries from almost every denomination entered Alaska, Sheldon Jackson being the most famous of them. At present (1921), most of the missions are under the control of the Episcopalians, Congregationalists, Presbyterians or Roman Catholics. (See also ENCA-

TION: Modern developments: 20th century: General: United States: North American Indians; CALIFORNIA: 1543-1781; OREGON: 1840-1842; TEXAS: 1690-1806.) "Early missionaries to the negro race in America were confronted by the reluctance of slave owners to allow their slaves to receive any kind of education. This difficulty, however, was not too great to prevent the nominal Christianization of the race, though missionary efforts have naturally been attended with a larger measure of success since the emancipation of the negroes in 1863. Many independent and self-sustaining Protestant churches have been formed by the negroes. The Roman Catholic church reported in January, 1921, between 150,000 and 175,000 Catholic negroes in their various dio-

ceses, vicariates apostolic, and missions of St Joseph's society in the United States out of a negro population of 7,127,965."—*Report of Roman Catholic Commission of mission work among negroes and Indians*, p. 12.—See also EDUCATION: Modern developments: 20th century: General education: United States: Religious bodies, etc.—The attempt to evangelize the non-Christian immigrants, especially the Chinese and Japanese settlers along the Pacific slope is recognized by most of the local missionary societies as an important part of mission propaganda. Very few attempts are being made to reach those from India, however, except by the agents of the American Bible Society. North American missions also include work among European immigrants to Amer-

ica, the mountaineers of the southern states and the Mormons, most of whom are the concern of the American home missions' societies.

Statistics of Protestant missions in all fields.—The statistics of the Protestant missions are shown in the preceding table.

Statistics of Roman Catholic missions.—The statistics of the Roman Catholic missions are given in the accompanying table.

Statistics of the Russian Orthodox church missions.—"The Russian Missionary Society of the Orthodox Church to non-Christians is divided as follows: 1. Nine Siberian missions. 2. Several Missionary Institutions, chiefly schools in sixteen dioceses in European Russia among the foreign population. 3. Two Foreign missions, one to Japan and the other to North America. The Society had, in 1908, 400 missionaries in 126 districts and 700 schools with 1,000 pupils; in North America its adherents were estimated at about 10,000. No comprehensive summaries of the work of the Siberian and European Russian missions are avail-

able; the Japanese mission comprised 265 church parishes with 30,712 Christians."—J. S. Dennis, H. P. Beach, and C. H. Fahs, ed., *World atlas of Christian missions*, pp. 129-130.—The "Christian Movement for the Japanese Empire" (1915) reports 34,782 Christians of the Russian Orthodox church in the 265 parishes of the mission in Japan.

MISSISSIPPI, sometimes called the "Bayou," "Eagle," or "Magnolia" state, is one of the south central states of the United States. It is bounded, north, by Tennessee; east, by Alabama; south, by the Gulf of Mexico and Louisiana; and west, by Louisiana, from which it is separated by the Pearl and Mississippi rivers, and by Arkansas, from which it is also separated by the Mississippi. The state has an area of 46,865 square miles, 303 square miles being water; and a population, 1,020, of 1,790,618.

Resources.—Mississippi is preëminently an agricultural state. In 1921, the farms numbered 272,101, with an area of 18,253,579 acres of which 9,325,677 acres were improved land. The leading crops were cereals, forage, potatoes, and cotton.

1540.—Spanish explorations.—“Nearly three-quarters of a century before English colonies were planted at Jamestown and Plymouth, the hardy and adventurous Spaniards were exploring the region which now constitutes the State of Mississippi. The coming of De Soto and his soldiery marks the beginning of Mississippi history.”—D. Rowland, ed., *Mississippi*, v. 1, p. vii.—See also FLORIDA: 1528-1542; SOTO, HERNANDO.

1629.—Embraced in grant to Sir Robert Heath. See AMERICA: 1629.

1663.—Embraced in the Carolina grant to Monk, Chesterfield, and others. See NORTH CAROLINA: 1663-1670.

1699-1710.—Founding of first European settlement.—Pierre le Moyne d'Iberville founded in 1699 the first European settlement in the state at Fort Maurepas (Old Biloxi). The site proved undesirable, and in 1702 the colony was transferred to Twenty-seven Mile Bluff on the Mobile river; after the violent spring freshets in 1710, it was moved to the site of the present city of Mobile.

1712-1729.—Founding of New Biloxi.—Mississippi river ascended by Iberville and Brienville.—Friendly relations with Indians.—Massacre at Natchez. See LOUISIANA: 1608-1712; 1690-1763; 1710-1750.

1732.—Mostly embraced in the new province of Georgia. See GEORGIA: 1732-1730.

1733.—Colony at war with Chickasaws. See LOUISIANA: 1710-1750.

1763.—Partly embraced in West Florida, ceded to Great Britain. See SEVEN YEARS' WAR: Treaties; NORTHWEST TERRITORY OF UNITED STATES: 1763.

1779-1781.—Reconquest of West Florida by Spaniards. See FLORIDA: 1770-1781.

1779-1813.—Spanish domination of lower Mississippi valley and the Floridas. See LOUISIANA: 1770-1797; 1785-1800; 1798-1803.

1783.—Mostly covered by English cession to the United States. See U.S.A.: 1783 (September).

1783-1787.—Boundary dispute with Spain. See FLORIDA: 1783-1787.

1798-1804.—Territory constituted and organized.—Establishment of a legislative assembly.—“The territory heretofore surrendered by the Spanish authorities, and lying north of the 31st degree of latitude, with the consent and approbation of the State of Georgia, was erected into a territory of the United States by act of Congress, approved April 7th, 1798, entitled ‘an act for the amicable settlement of limits with the State of Georgia, and authorizing the establishment of a government in the Mississippi Territory.’ The territory comprised in the new organization, or the original Mississippi Territory, embraced that portion of country between the Spanish line of demarkation and a line drawn due east from the mouth of the Yazoo to the Chattahoochy River. The Mississippi river was its western limit and the Chattahoochy its eastern. The organization of a territorial government by the United States was in no wise to impair the rights of Georgia to the soil, which was left open for future negotiation between the State of Georgia and the United States.” In 1802 the State of Georgia ceded to the United States all her claim to lands south of the

State of Tennessee, stipulating to receive \$1,250,000 “out of the first net proceeds of lands lying in said ceded territory.” In 1804 “the whole of the extensive territory ceded by Georgia, lying north of the Mississippi Territory, and south of Tennessee, was . . . annexed to the Mississippi Territory, and was subsequently included within its limits and jurisdiction. The boundaries of the Mississippi Territory, consequently, were the 31st degree on the south, and the 35th degree on the north, extending from the Mississippi River to the western limits of Georgia, and comprised the whole territory now embraced in the States of Alabama and Mississippi, excepting the small Florida District between the Pearl and Perdido Rivers. Four fifths of this extensive territory were in the possession of the four great southern Indian confederacies, the Choctas, the Chickasas, the Creeks, and the Cherokees, comprising an aggregate of about 75,000 souls, and at least 10,000 warriors. The only portions of this territory to which the Indian title had been extinguished was a narrow strip from 15 to 50 miles in width, on the east side of the Mississippi, and about 70 miles in length, and a small district on the Tombigby.”—J. W. Monette, *Discovery and settlement of the valley of the Mississippi*, v. 2, bk. 5, ch. 13.—“The act which created the Territory of Mississippi provided for a government similar in form to that of the Northwest Territory. The President was authorized to appoint a governor for a term of three years, a secretary for a term of four years, and three judges for a term of ‘good behavior.’ The governor and judges, or any three of them, were authorized to adopt and publish in the district such laws of the original States as were necessary and best suited to the district, and report them to Congress from time to time. The governor was directed to appoint and commission all military officers below the rank of general officers and such magistrates and other civil officers as might be necessary before the organization of the general assembly. . . . This form of the government was to last until the population of the Territory should number ‘five thousand free male inhabitants of full age,’ when a second grade of territorial government should be organized. . . . Winthrop Sargent, a native of Massachusetts and a former secretary of the Territory northwest of the Ohio, was the first governor of the Territory of Mississippi. . . . On April 2, 1790, Governor Sargent divided the Territory into two counties, which he named Adams and Pickering after the President and the Secretary of State. These were the first counties to be organized in the State of Mississippi. . . . It will be remembered that the governor and the three judges, or any three of them, were authorized to frame for the Territory laws like those of the States then belonging to the Union. These officials went beyond the limits of their authority, however, and made laws that were in many cases against not only the spirit of our institutions, but the Constitution of the United States. . . . Most of these laws were afterwards annulled by Congress. . . . [The first legislative act bears the date of February 28, 1799, and is entitled “a law establishing militia.” It does not purport to be taken from or based upon the law or code of any other state. In all, thirty-nine laws were enacted by the governor and judges of the Mississippi Territory, all violating the technical letter of the ordinance, but having the tacit approval of Congress.] These unjust laws increased the opposition to the governor until a general committee, chosen by the people, prepared a memorial, telling of their troubles and praying that Congress would advance the country to the

second grade of territorial government. Congress condemned the governor's system of unjust fees, and, contrary to the ordinance of 1787, advanced the country to the second grade of territorial government by permitting the people to have a legislature before the population had reached the prescribed number of 'five thousand free male inhabitants of full age.' . . . By an act, approved May 10, 1800, Congress provided for the establishment of a general assembly, or legislature, consisting of the governor, a legislative council, and a house of representatives. The legislative council was to consist of five members chosen for a period of five years. They were to be selected by Congress from a list of names, nominated by the house of representatives of the Territory. The number of representatives in the assembly was limited to nine—four each from Adams and Pickering counties and one from the newly created county of Washington—until the number of free male inhabitants of full age in the Territory should amount to five thousand. After that time there should be one representative for every five hundred free male inhabitants, until the total number should amount to twenty-five when the number and proportion of representatives should be regulated by the legislature. The council and house of representatives were authorized to elect by joint ballot a delegate to Congress, who was to have the right of debating, but not of voting, in that body. The governor was given power to veto legislative acts, and no provision was made for overriding his veto. The act of Congress also provided for the first meeting of the general assembly on September 22, 1800, and for annual meetings thereafter, unless called together oftener by the governor."—F. L. Riley, *School history of Mississippi*, pp. 94-98.

1801-1811.—Administration of territorial governors. — First Choctaw cession. — Requirements for voting.—"In 1801 President Jefferson appointed William Charles Cole Claiborne to succeed Winthrop Sargent as governor of the Territory of Mississippi. . . . In his administration Indian titles to large tracts of land were extinguished, the militia was well organized, lawlessness was put down, and the limits of the Territory were increased. Governor Claiborne was one of the commissioners to receive Louisiana from the French government, and was later appointed governor of the newly acquired territory of Orleans (October 1, 1804). From the time of his departure from Mississippi (December 2, 1803) to the arrival of Governor Williams in January, 1805, Cato West, secretary of the Territory, served as governor. . . . Robert Williams, of North Carolina, and Cowles Mead . . . a native of Virginia, were then appointed governor and secretary, respectively, of the Mississippi Territory. . . . The principal event of his term as governor was the arrest and trial of Aaron Burr. The administration of Governor Williams ended with his removal by President Madison, in March, 1800. . . . Although great efforts had been made by Governor Sargent to organize the militia, the Territory was found to be entirely defenceless upon the arrival of his successor. The legislature, following Governor Claiborne's advice, passed a law which resulted in the organization of military companies in every county of the Territory. . . . In 1802, the militia of the Territory numbered about two thousand, and was well organized. . . . By a treaty made shortly after Governor Claiborne's arrival in the Territory, the Choctaws gave to the United States all the lands

in the old Natchez District which had been ceded to England in 1777. In 1805 the Choctaws ceded to the United States a strip of land north of the thirty-first degree and east of the Natchez District. This grant is marked 'First Choctaw Cession' . . . In 1802 the legislature of the Territory removed the seat of the territorial government to the town of Washington, six miles east of Natchez, the first capital. . . . By an act of Congress, approved January 9, 1808, the requirements for voting were changed so that it could be exercised by any white male person in the Territory above the age of twenty-one who had lived therein for one year, or had been a citizen of the United States, and who owned fifty acres of land or a town lot valued at one hundred dollars. It authorized the general assembly of the Territory to apportion the representatives of the counties according to the population, but provided that, until there should be six thousand white inhabitants of full age in the Territory, the number of representatives should not be more than twelve nor less than ten. This act also took from the general assembly the power to elect the delegates to Congress, and gave it to the citizens of the Territory that were qualified to vote. . . . Governor Williams' grew more unpopular daily, until he was finally removed by President Madison (March, 1809). David Holmes was then appointed governor of the Territory. . . . His term of public service in Mississippi embraced eighteen of the most eventful years in the early history of the Territory and State. The fact that, after having served as governor to the end of the territorial period, he was elected by the people to be the first governor of the State of Mississippi shows the tact and ability with which he discharged his duties. . . . In his administration as territorial governor the limits of Mississippi were extended to the Gulf coast."—F. L. Riley, *School history of Mississippi*, pp. 99-102, 106-108.

1802.—Incorporation of Jefferson College.—Jefferson College, the first school established in the state, was incorporated in 1802. It is now Jefferson Military College, located near Natchez.

1803.—Portion acquired by Louisiana Purchase. See LOUISIANA: 1798-1803; U.S.A.: 1803: Louisiana Purchase.

1812-1813.—Spanish West Florida annexed to Mississippi territory and possession taken. See FLORIDA: 1811-1813.

1813-1814.—Creek War. See U.S.A.: 1813-1814 (August-April).

1817.—Constitution as a state and admission into the Union.—The sixth and seventh of the new states added to the original Union of thirteen were Indiana and Mississippi. "These last almost simultaneously found representation in the Fifteenth Congress; and of them Indiana, not without an internal struggle, held steadfastly to the fundamental Ordinance of 1787 under which it was settled, having adopted its free State constitution in June, 1816; Mississippi, which followed on the slave side, agreeing upon a constitution, in August, 1817, which the new Congress, at its earliest opportunity [Dec. 10, 1817] after assembling, pronounced republican in form, and satisfactory."—J. Schouler, *History of the United States*, v. 3, p. 100.—At the same time, the part of Mississippi Territory which forms the present state of Alabama was detached and erected into the Territory of Alabama. See ALABAMA: 1817-1810.—"The constitution provided that the government should consist of three distinct departments—the executive, the legislative, and the judicial—and that 'no person, or collection of per-

sons, being of one of these departments' should 'exercise any power properly belonging to either of the others.' All State officials and voters for the same were required to be citizens of the United States. Any person who denied the being of God, or a future state of rewards and punishments, was not allowed to hold the office of governor or lieutenant-governor, or be a member of either branch of the general assembly. The legislature was also given power to pass a law forbidding those who engage in dueling to hold office. Ministers of the Gospel were not permitted to hold the office of governor or to become members of the legislature. The governor and lieutenant-governor were elected by the people for a term of two years. They were required to be at least thirty years of age, to have been citizens of the United States for twenty years and inhabitants of the State for five years, and to have owned for twelve months previous to their election 600 acres of land or real estate to the value of \$2,000. The governor was given power to veto acts of the legislature and to pardon criminals. The lieutenant-governor was authorized to preside over the Senate, and to discharge the duties of governor whenever a vacancy occurred in that office. The other State officials were elected by the legislature. The legislative department was composed of a house of representatives and a senate, elected by the qualified voters of the State for a term of one and three years, respectively. The members of this branch of the government were also required to own a certain amount of land, and to have lived in the State a certain length of time preceding their election. The judges of the supreme and superior courts were chosen by the legislature for a term of 'good behavior,' or until they had arrived at the age of sixty-five. All free white male persons, twenty-one years of age or upwards, who had lived in the State one year and in the voting precinct six months, and belonged to the militia—unless they had been excused therefrom or had paid a State or county tax—were allowed to vote for all officers elected by the people. The legislature was authorized to regulate the slave trade and to pass laws defining the rights and duties of masters of slaves. This constitution was not submitted to a vote of the people for ratification, but went into effect on August 15, 1817, the day it was signed. . . . The constitution provided for the meeting of the legislature at Natchez on the first Monday in October, 1817, but, owing to a yellow fever panic in that place about the middle of September, the governor called the legislature together at the town of Washington. After the governor had been sworn into office and the United States Senators elected, the legislature adjourned. Two months later it met again in Natchez."—F. L. Riley, *School history of Mississippi*, pp. 145-146, 149.

1818-1886.—Development of public school system.—"Chickasaw School Lands."—"Shortly after the formation of the State government (1818) the county courts of the different counties were given control over these lands within their respective borders, with the authority to lease them. A legislative act of 1824 authorized the election of trustees in each township to preserve the school lands, to lease them, and to apply the fund arising therefrom to the building of schoolhouses and the employment of teachers. Upon the recommendation of Governor Poindexter the legislature established (1821) a 'literary fund' for the free education of poor children, and authorized the lending of it to individuals or the investment of it in bank stocks within the State. This fund was raised by setting aside the moneys obtained from fines and forfei-

tures 'not otherwise appropriated.' By the latter part of the year 1836 it amounted to over thirty thousand dollars, but the greater part of it was invested in bank stocks and lost. . . . By an act of Congress, passed in 1803, the sixteenth section of public land in each township was reserved for the support of schools within the township. In violation of this act the United States made a treaty with the Chickasaw Indians (1834), which required that the lands held by these Indians should be sold for the benefit of the tribe. In July . . . [1836] Congress granted the State the same number of sections to be chosen out of any public land that remained unsold within either of the land districts adjoining the Chickasaw counties. The lands thus selected are known as the 'Chickasaw School Lands,' and include 174,550 acres. By an act of the legislature of 1848 they were leased for a term of ninety-nine years. The fund thus secured (\$816,615) is known as the 'Chickasaw School Fund.' It was borrowed by the State and the interest upon it is still used for the support of the schools in the sixteen Chickasaw counties and in the counties of Tallahatchie, Webster, and Yalobusha. . . . In March of the same year [1840] the legislature passed the first statute in Mississippi for a uniform and general system of common schools. The bill provided for the levying of a special tax for public school purposes in those townships in which a majority of the heads of families were favorable thereto. . . . [In 1846 the public school system was established and in 1848 the University of Mississippi was opened.] In his last message to the legislature, January 3, 1848, Governor Brown stated that the common school law had not fulfilled the expectation of its friends. He therefore recommended that it be immediately repealed, and that 'an act more in accordance with the suggestions' contained in his message of two years previous be substituted. But instead of following this recommendation the legislature passed four other acts, which provided for as many different schemes of educational management in thirty-five counties of the State, and left the rest of the counties under the application of the old law. Each succeeding legislature increased the number of special acts, thus rendering the public school system more complicated and less effective year by year. This development reached a climax in the legislature of 1850-1860, which passed no less than twenty-six different acts of this nature. 'Under such management,' says Mayes, 'the schools drifted along to the period of the War between the States, doing some good, more in some localities than in others, of course, but in all crippled, in many paralyzed, by the want of a uniform and vigorous policy.' . . . One of the acts of the legislature of 1870 was the establishment of a free school system for the benefit of both white and colored children. . . . [In 1880 the state agricultural and mechanical college was opened.] The session of the legislature of 1886 enacted a law which greatly improved the public school system of the State and increased its power for good. . . . When the carpet-bag government was overthrown in 1876, the public school system was left undisturbed, 'except in the way of some economic reforms.'"—F. L. Riley, *School history of Mississippi*, pp. 172, 208, 245-246, 305, 335.

1818-1890.—State banks.—Repudiations.—The Bank of Mississippi, which had been incorporated by the territory in 1800, was rechartered by the state in 1818. It was guaranteed a monopoly until 1840, but in 1830, despite the pledge, the Planters' Bank was established with two-thirds of its \$3,000,000 capital subscribed by the state. The next few

years saw a wild era of speculation in the state, and charters were granted to a great many new banks and to railroad corporations with banking privileges. In 1838 the Union Bank was incorporated with a capital of \$15,500,000, of which \$5,000,000 was subscribed by the state and raised on bonds sold to Nicholas Biddle, president of the United States Bank of Pennsylvania. A financial panic had already begun at the time of the founding of the bank, and it was bound to meet with failure. Governor A. G. McNutt (1801-1848) began an agitation for repudiation, which became the main issue of the gubernatorial campaign of 1841. The 'repudiators' were represented by the Democratic candidate Tilghman M. Tucker (1802-1859), the 'anti-repudiators' by the Whig candidate, David O. Shattuck. The Democrats won, the bonds were formally repudiated in 1842, and, though the High Court of Appeals of the state decided in 1853 that the state could not be absolved from its obligation, the decision was disregarded. In the same year Planters' Bank bonds were repudiated also; and both acts of repudiation were upheld by the constitution of 1800. Some \$7,000,000 were thus saved the state, but the consequent loss of public confidence probably offset any advantage gained.

1820-1839.—Second Choctaw cession.—Revision of state laws.—Impeachment of judges.—Indian treaties.—“The limits of the State, as prescribed by the act of Congress in 1816, embraced a large part of Indian territory on which white people were not allowed to settle, and over which the State government had no control. The ‘Old Natchez District,’ the ‘Coast Addition,’ and the ‘First Choctaw Cession,’ were the only parts of the State that were organized into counties, and hence were represented in the constitutional convention of 1817. The second Choctaw cession was made by a treaty drawn up at Doak’s Stand in Madison county on October 18, 1820. . . . By an act of the legislature (1821) Governor Poindexter was asked to revise the laws of the State. In May, 1822, his code was completed, and in the following June it was adopted by the legislature. The value of his service is shown by the fact that much of this code still exists in our system of laws. . . . Walter Leake, a native of Virginia, was elected governor of Mississippi in 1821. . . . In his term of office *Poindexter’s Code* was adopted, the capital of the State was located at Jackson, and a contest arose between the legislature and the supreme court. . . . In 1821 the legislature selected the town of Monticello as the capital of the State. On the day after the act was passed it was repealed. Three commissioners were then appointed to locate within twenty miles of the center of the entire State two sections of land which had been given for a capital two years previous by the general government. This commission was instructed to lay off the future capital, which the act declared should be called ‘Jackson’ in honor of Major-General Andrew Jackson. . . . In 1825 the supreme court of Mississippi declared an act passed by the legislature a year previous to be unconstitutional. The house of representatives thereupon made the judges to appear before it and show cause why they should not be removed from office for daring to pass upon the constitutionality of an act of the legislature. The matter was referred to a special committee of the house, which acquitted the judges of any wrong motives, but stated that it knew of no power that the supreme court had to declare any law unconstitutional. One of the judges then resigned. . . . Only a few years had passed after the second Choctaw cession, when the white people of the State began to urge the national government to

make another treaty with the Choctaws. At a great council of these Indians (1828) they refused to sell the land they still owned. . . . Two acts were passed in Governor Brandon’s terms of office for the purpose of limiting the power of the Indians and of hastening their removal from the State. The first of these acts (1829) made the white people, living in the Chickasaw and Choctaw nations, subject to the laws of the State. It did not affect, however, the tribal organization and the laws of the Indians, since they were especially exempted from its application. By an act of the year following, the government of the Indians was abolished, citizenship was granted them, and the laws of the State were extended over them. . . . In 1830 the ‘mingoes, chiefs, captains, and warriors’ of the Choctaw nation assembled at Dancing Rabbit Creek, and agreed to a treaty by which they granted to the United States all the remaining lands they held east of the Mississippi. . . . On October 22, 1832, the United States made with the Chickasaw nation, at their council-house on Pontotoc Creek, a treaty which destroyed the remaining Indian titles to lands within the borders of the State. This gave the State the land now embraced in about twenty counties. The terms of the treaty were the same as those of the last treaty with the Choctaw nation, except that the Chickasaws retained the right to decide when they would move. Many of them left the State in 1835, and by the end of the year 1830 the rest had moved to their new lands west of the Choctaw nation in the Indian Territory.”—F. L. Rowley, *School history of Mississippi*, pp. 151-153, 154-157, 187-188.

ALSO IN: D. Rowland, *Mississippi*, v. 2, pp. 797-821.

1831-1869.—Railroad building.—Constitutional changes.—“In 1831, three years after the building of the first railway in the United States, the people of Woodville organized a company to build a railroad from that place to St. Francisville. It was the first railroad in the State. In the same year a company was formed for the purpose of building a railroad from Vicksburg to Jackson. . . . In the period between 1831 and 1841 little was done in the way of building railroads except on paper. Although twenty-two railroad companies had been organized in this decade, the railway facilities of the State were summed up in 1840 in the following sentence: ‘For several years we have had a railroad from Vicksburg to Jackson.’ It is interesting to note that the fare in this road was at that time six cents a mile. In 1857 work was being done on five roads within the State, and in the year following almost twenty millions of dollars had been invested in these enterprises. In 1860 the railroad mileage of the State was estimated at 860. . . .

“The fifteen years immediately following the formation of the first constitution of Mississippi produced many changes in the political ideas of the American people. . . . A large majority of the States had done away with the old requirements for voting. The people of Mississippi saw this and became dissatisfied with the high requirements of their first constitution for voting and holding office. [See SUFFRAGE, MANHOOD: United States: 1864-1021.] This constitution had also placed the choice of the judges in the hands of the legislature. . . . There was also much dissatisfaction over the fact that the judges of the supreme court practically held office for life. These and other objections to the constitution of 1817 caused the legislature, in December, 1831, to take steps for the formation of a new constitution. . . . Delegates from the twenty-six counties of the State met in Jackson on September 10, 1832. . . . The con-

vention completed its work on October 28th. . . . The new constitution went into effect without being voted on by the people for adoption or rejection. . . . Probably the most important change introduced by the constitution of 1832 was the requirement that all officers, both State and county, should be chosen by the people. Another change, scarcely less important, forbade the election of any officer in the State for life or for a term of good behavior. By a third change citizens were no longer required to own property in order to vote or to hold office. By another provision ministers of the Gospel were allowed to become members of the legislature and to hold the office of governor. Provision was made for a 'High Court of Errors and Appeals,' for a superior court, and for probate courts. The office of lieutenant-governor was done away with, the president of the senate being authorized to act as governor in case of a vacancy in that office. The bringing of slaves into the State as merchandise or for sale was forbidden, and imprisonment for debt, after the surrender of the debtor's property for the benefit of his creditors, was prohibited except in case of fraud. The legislature was authorized to meet in regular session every two years instead of every year. . . . The 'High Court of Errors and Appeals' consisted of three judges, elected for a term of six years, one of whom was to be chief justice. . . . The constitution of 1832 provided that Jackson should be continued as the capital of the State, at least until 1850."—F. L. Riley, *School history of Mississippi*, pp. 169, 176-179, 240-241.—"Six amendments were adopted before 1860: (1) giving the legislature power to regulate or prohibit the introduction of slaves into the State, adopted 1844-46; (2) regarding county board of police, adopted 1850-52; (3) abolishing the superior court of chancery, adopted 1854-56; (4) extending terms of office to January, 1858, adopted 1854-56; (5) changing the general elections to the first Monday of October, session of legislature to first Monday of November, biennially, and further regulating terms of office; (6) abrogating the preceding, so far as it related to terms of legislators. The result was very confusing."—D. Rowland, ed., *Mississippi*, v. 1, p. 549.

1850.—Represented at Nashville convention. See U. S. A.: 1850 (June).

1851.—Secession proposals by state Democrats.—Defeat.—The compromise measures of Congress, enacted in 1850, led to the adoption by the Democratic party in 1851 of a platform favoring secession. Jefferson Davis was nominated for governor. The Whigs nominated United States Senator Foote, and declared their attachment to the Union. The Union party was victorious in the elections, and the slavery question remained in the background until 1856, when it was raised again by those who feared the election of Fremont to the national presidency.

1859.—Legislative enactments to prevent insurrection.—"In 1850 John Brown made a desperate, though unsuccessful attempt to arouse the slaves of Virginia to an insurrection. . . . In order to suppress in Mississippi all attempts like that made by Brown in Virginia, the legislature of 1850 appropriated \$150,000 for the purchase of military supplies, and passed an act to regulate the militia and volunteer systems of the State. . . . The constitution of 1832 was retained by the State during her connection with the Confederacy. The words, 'Confederate States,' were substituted for the expression, 'United States,' wherever the latter occurred in that document."—F. L. Riley, *School history of Mississippi*, pp. 218-219, 225.

1865-1869.—Repeal of ordinances of 1861.—Extension of civil and political rights to the negro.—"The Mississippi Convention, which met in Jackson August 14, 1865, was the first in the Southern States to be held in accordance with the President's plan of reconstruction. The Ordinance of Secession was declared null and void, and the other ordinances passed by the convention of 1861 were repealed. All legislative acts that had been passed since January 9, 1861, with two or three exceptions, were ratified and confirmed. An ordinance was adopted, making it the duty of the legislature at the next session to provide by law for the protection and security of the persons and property of freedmen, and to guard them and the State against the evils that might arise from their sudden emancipation. United States Senators and representatives were also chosen by this body, but were refused admission to their seats in Congress. The convention adjourned August 24th. . . . The freedom of the negro now being an established fact, it remained to extend to them the civil and political rights incident to that freedom. As the testimony of freedmen was not at that time allowed in the courts, the United States military authorities had adopted the practice of removing all cases in which freedmen were involved from the civil courts to military tribunals under the control of the Freedmen's Bureau. [See U. S. A.: 1865-1866: Creation of Freedmen's Bureau.] In September, Governor Sharkey, by proclamation, extended to them the right to testify in all cases in which the rights of freedmen were involved. Shortly afterwards the legislature conferred upon them the right to hold real estate and to sue in the courts. In 1869 they were made jurors by Governor Ames. . . . The legislature, chosen on October 2d, met at Jackson on October 16th. . . . It devolved upon the legislature to secure to the freedmen the political and civil rights to which they were now entitled. . . . The legislature made its first error by refusing to ratify the Fourteenth Amendment after the convention had almost unanimously decreed the abolition of slavery. A stringent law was enacted to regulate the relation of master and apprentice, as it related to freedmen. Another required all freedmen to have employment by the 1st of January. Another prohibited them from renting and leasing land except in incorporated towns and cities. These measures have come down

to us under the name of the 'Black Code' of 1865 [see BLACK CODES]."—F. L. Riley, *School history of Mississippi*, pp. 286-289.—"A very valuable section [of the constitution] was ratified by special vote in 1869: 'The credit of the State shall not be pledged or loaned in aid of any person, association or corporation, nor shall the State hereafter become a stockholder in any corporation.' It was forbidden to create or extend any corporate body with the privilege of issuing paper to circulate as money. Counties, cities and towns were forbidden to take stock in any corporation except by a two-thirds vote of the electors; lotteries were forbidden; taxation was required to be equal and uniform and property of corporations 'shall be subject to taxation the same as that of individuals.' Regarding county organization the county board of police was succeeded by the 'board of supervisors.'"—D. Rowland, ed., *Mississippi*, v. 1, p. 551.

1866.—Beginning of operation of Black Code.—The Mississippi Black Code, passed in 1865, "withheld from the freedmen the right to own or lease land except in incorporated towns, and provided for 'apprenticing' negro children whose parents were unwilling or unable to support them, preference being given in such cases to former masters, who were given power to use 'moderate corporal chastisement.' Any negro over eighteen years of age who should be found on the 2d of January, 1866, or thereafter, without lawful employment or business was made subject to fine and to imprisonment at the discretion of the court, and to being hired out in case he did not pay such fine. . . . Intermarriage between the races was forbidden under heavy penalties, that prescribed by Mississippi being life imprisonment."—P. L. Harworth, *United States in our own times*, pp. 17-18.—See also U. S. A.: 1865 (May-July); (July-December); 1865-1866 (December-April); 1868-1876.

1867-1870.—Part of Fourth Military District.—By the Reconstruction Act of March 2, 1867, Mississippi and Arkansas were included in the Fourth Military District. Commanders were General E. O. C. Ord, 1867; Alvan C. Gillem, 1868-1869; and Adelbert Ames, 1869-1870.

1868-1879.—Black and Tan convention.—Constitution of 1868.—Readmission of state.—"The important event of General Gillem's short administration was the session of the constitutional convention. It assembled at Jackson January 6, 1868, in accordance with a military order issued by General Ord. In personnel, it was the most remarkable assemblage ever held in the State. There were one hundred members, seventeen of whom were colored. The majority of the latter had been slaves up to the close of the war. . . . There were nineteen ex-Union soldiers in the convention, three of whom had been brigadier-generals. There were nineteen Democrats and thirty native white Republicans, the latter commonly called 'scalawags.' The few honest, patriotic men in the convention could accomplish nothing, as the influence of political adventurers dominated that assembly. . . . Perhaps less than a dozen who voted for these measures were owners of real estate in Mississippi. Congress was memorialized to declare all the civil offices of the State vacant, so that they might be filled with men of 'known loyalty,' by which . . . was meant Republicans. . . . This convention inserted in the constitution which it formed, a clause that would have deprived thousands of the white citizens of Mississippi of the right to vote or hold office. The Democratic members then resigned. . . . It was determined to submit the new constitution to the qualified electors of the State, and a

committee of five was appointed to receive and determine the results. . . . The white people were active in their efforts to defeat the constitution, knowing that if they failed they could scarcely live in comfort under its diabolical provisions. The freedmen were organized into 'loyal leagues' and drilled by their white leaders. They were sworn to vote against their late masters who, it was alleged, only wanted an opportunity to put them back into slavery. Be it said to their honor, many negroes voted with the white people against the constitution, and by their help it was rejected. . . . July 10th General Gillem announced that 55,231 votes had been cast for the constitution and 63,860 against it; that four of the five members of Congress elected were Democrats; and that Humphreys had defeated Eggleston for governor by a majority of eight thousand. The Radicals, however, secured a small majority in the legislature. As the constitution was rejected, the legislature did not meet to give the party an opportunity to profit by its success. . . . On June 4, 1868, General Gillem was succeeded by General Irwin McDowell, who commanded the district until July 4th, when General Gillem was reinstated. McDowell's brief reign was marked by the removal of Governor Humphreys and Attorney-General Hooker, it being alleged that they were an obstacle to the reconstruction acts. Brevet Major-General Adelbert Ames was appointed provisional governor in the place of Governor Humphreys. A military officer was detailed to perform the duties of attorney-general. On February 9th following, the Secretary of State was removed. General Ames proceeded to Jackson and informed Governor Humphreys of his appointment, and requested that the executive office be vacated as soon as possible. The governor replied that the attempt to remove him was a usurpation of the civil government of Mississippi, and that he would not surrender the archives until a legally qualified successor was chosen. On the following day a detail of soldiers took possession of the Statehouse and forcibly ejected the governor against his dignified protest. . . . The constitution as adopted in 1868 made several changes in the fundamental law of the State. It created a public school system and established the office of State superintendent of education. It reestablished the office of lieutenant-governor and extended the terms of State officers to four years. It provided that all judges should be appointed by the governor and confirmed by the senate. The old county probate courts were abolished and a system of chancery courts established. The High Court of Errors and Appeals was changed to the Supreme Court and the terms of its judges were fixed at nine years. The old county boards of police were abolished, and boards of supervisors established instead. . . . The legislature chosen in 1869 met in Jackson, January 11, 1870. It ratified the Fourteenth and Fifteenth Amendments and elected United States Senators. . . . As the State had met the demands of Congress by adopting a new constitution and by ratifying, through the legislature, the new amendments to the Federal constitution, her representatives were admitted to seats in that body, February 24, 1870."—F. L. Riley, *School history of Mississippi*, pp. 205-208, 300.—"Three amendments to the constitution were proposed by the legislature and adopted at the general election in 1875: (1) to prohibit the payment of the Union and Planters' bank bonds; (2) to require the payment for forfeited lands, fines and liquor licenses in United States money; to be applied to the support of schools; (3) to permit

a reduction of the number of chancery judges. These were inserted in the constitution by resolution of January 18, 1876. Another amendment was submitted in 1879 for biennial elections, and was overwhelmingly defeated. Only 13,000 votes, out of 122,000 votes, were cast for it."—D. Rowland, ed., *Mississippi*, v. 1, p. 551.

1876.—Impeachment of state officers.—"The legislature chosen in November met at Jackson, January 4, 1876. It was composed of thirty-seven senators and one hundred and sixteen representatives. There were but twenty-one colored members in this body. Politically all the members were Democratic except about thirty. In his message Governor Ames declared that the legislature had been elected by fraud and violence, and that it was therefore an illegal body. . . . It had been the general understanding that in the event of Democratic success at the polls in November, Governor Ames and several other State officers would be impeached and removed from office. . . . Soon after the reading of the governor's message General Featherston, a representative from Holly Springs, offered a resolution for the appointment of a committee to learn whether there were good grounds for the impeachment of the governor, a thorough investigation was made. . . . February 22d the committee reported resolutions in favor of impeachment and removal of the governor for official misconduct on eleven separate and distinct charges. . . . On the 13th of March Lieutenant-Governor Davis denied the five articles of impeachment against him, was tried before the senate, convicted, and removed from office. . . . Cardoza, the superintendent of education, was charged with official malfeasance in twelve instances. While the impeachment was impending he asked permission to resign and have the proceedings dismissed. His request was granted, and on the 22d of February his resignation was accepted by an almost unanimous vote. On March 16th the trial of Governor Ames began before the senate sitting as a high court of impeachment. . . . One week later he expressed a desire to resign should the articles of impeachment be dismissed. The house at once adopted a resolution dismissing the articles of impeachment, and on the same day he resigned his office and left the State. . . . Upon the resignation of Governor Ames and the removal of Lieutenant-Governor Davis, Colonel John M. Stone succeeded to the office of governor."—F. L. Riley, *School history of Mississippi*, pp. 321-323, 326.

1880-1890.—"Mississippi Plan."—Agitation for a new constitution.—"In the decade of 1880 to 1890 it became apparent that the 'Mississippi plan' of dealing with black majorities would, unless checked, pollute the very sources of representative government. [The "Mississippi Plan" was a term used to denote the general Southern method of dealing with the Negro vote—involving intimidation and nullifying franchise laws.] Symptoms of the diseased political condition grew so acute that the demand for suffrage restriction to effect an electorate under which there could be white supremacy through honest elections became quite imperative. The agitation for a Constitutional Convention was revived, and grew very urgent. Responding to this sentiment the Legislature, in 1886, adopted a resolution calling such a Convention, which was vetoed by Governor Lowry. In 1888 another resolution was adopted, one inviting discussion of the question in the ensuing campaign for the election of a Legislature and State officers. A Constitutional Convention was therefore made a direct issue in the canvass of

1889. Ex-Governor Stone, a candidate for Governor, declared he would approve a bill for a Convention if passed. [Governor Stone was elected and a constitutional convention was duly assembled.]—J. S. McNeilly, *War and reconstruction in Mississippi* (*Mississippi Historical Society*, v. 2, p. 532).

1886-1906.—Board of control.—"An act of 1886 conferred upon the Railroad commissioners . . . the duties of a board of control of the penitentiary, . . . after legislation looking to the termination of the leasing system and the resumption of direct control of convicts by the State. The penitentiary was at that time leased to the Gulf & Ship Island Railroad Company, W. H. Hardy, president, but the board cancelled the lease December 3, 1888, on the ground of non-compliance with contract. . . . Consequently the board took charge of the convicts December 4. . . . In January, 1889, the board rented . . . farms, near Jackson, formerly worked by convict labor. . . . Good financial results were obtained the first year, all expenses were paid, and over \$22,000 remained in the treasury. . . . The governor and attorney-general were added to the membership of the Board of Control in 1892. In 1893 the board reported that in five years \$111,000 had been paid into the State treasury as the net earnings of convicts. The legislature having made no enactment, the convicts were being mainly leased to planters. In 1894 'planting contracts' were made, public sentiment permitting no more leasing. In the same year there was begun the purchase of State farms. . . . The Board of Control continued in the management of these farms and the convicts. The legislature of 1906 changed the management of convict affairs by providing for the appointment by the Governor of a board of three trustees and a superintendent, the change to go into effect January 1, 1907."—D. Rowland, ed., *Mississippi*, v. 1, pp. 258-259.

1889.—Lynchings. See LYNCH LAW: Origin.

1890-1892.—New state constitution.—Qualification of suffrage.—A new state constitution, framed and put in force in 1890 by a constitutional convention, without submission to the people, established a qualification of the suffrage which heavily diminished the negro vote by its effect. "In accordance with an act of the legislature ratified February 5, 1890, the fourth constitutional convention in the history of the State met in Jackson, August 12, 1890. . . . The most important features of the constitution of 1890 related to the requirements for voting and the method of conducting elections. Another important clause made provision for the educational needs of the State. Certain officers were made ineligible to succeed themselves. Decided restrictions were laid upon corporate legislation, yet liberal terms were granted to new factories. The constitution also placed restrictions upon the leasing of convicts, and provided for the purchase of State farms at the discretion of the legislature. . . . The new State constitution made provision for the appointment of three commissioners 'to draft such general laws as are contemplated by the constitution, and such other general laws as shall be necessary and proper to put into operation the provisions thereof, and as may be appropriate to conform the general statutes of the State to the constitution.'"—F. L. Riley, *School history of Mississippi*, pp. 339-340, 343-344.—"A provision was inserted into the constitution to the effect that all persons permitted to register 'shall be able to read any section of the Constitution of the State; or he shall be able to understand the same when read to him,

or to give a reasonable interpretation thereof.' As the registration officers were practically all white men, it was easy for them, when they deemed it desirable, to enforce a very high standard in the case of negroes and to lower the bars for illiterate whites."—P. L. Haworth, *United States in our own times*, pp. 95.—In 1892, the supreme court of the state affirmed the validity of the constitution, which had been challenged on two grounds, namely: that it had not been submitted to the vote of the people, and that it was in conflict with the Fourteenth Amendment of the constitution of the United States.

1900-1906.—Primary election law.—Other legislation.—"In his inaugural address (1900) Governor Longino urged the enactment of a 'uniform compulsory primary election law.' . . . In his message of 1902 the governor quoted the clause of the constitution of 1890, 'The legislature shall enact laws to secure fairness in party primary elections, conventions and other methods of nominating party candidates.' . . . The existing statutes were embraced in the code of 1892. The legislature of 1902 repealed the same except two sections, and adopted senate bill No. 1, now known as the primary election law, amended in 1904. It requires that 'all nominations for State, district, county and county district officers made by the different parties of the State shall hereafter be made by primary elections,' which shall be governed by the election law in force at the time of such primary elections, with some exceptions provided. . . . A State convention shall be held by each political party in 1904 and every four years thereafter, to select a State executive committee, delegates to the national convention, and to nominate presidential electors, each county to have a representation in the convention equal to twice its representation in the house of representatives, the delegates to be selected by county delegate conventions in each county, the representation in which is also regulated. . . . 'No persons shall be eligible to participate in primary elections unless they are qualified electors, intend to support the nominations in which they participate, have participated with the political party holding the primary within the two years preceding, and are not excluded from such primary by regulations of the party State executive committee.' . . . Among the important laws of 1904 were those establishing two new, agricultural experiment stations,—one in the northwest and one in the delta; creating a text book commission to select a uniform series of school books; making September 1 a legal holiday; authorizing the boards of levee commissioners to issue \$1,500,000 in bonds; protecting wild birds other than game birds; requiring 'equal but separate accommodations for white and colored races' on street cars; authorizing a new code of laws; creating the county of Lamar from parts of Marion and Pearl River; creating a commission to build a new institution for the deaf and dumb; creating a permanent capitol commission; and a stringent vagrancy law. At the congressional election of 1904 a constitutional amendment was adopted, striking out the requirement of a decennial State census. . . . Much of the time of this legislature [1906] was given to the adoption of the new code of laws, prepared under the act of 1904."—R. Rowland, ed., *Mississippi*, v. 2, pp. 481-482, 853.

1908-1918.—Financial difficulties.—Need of strict legislation regarding banks.—Law guaranteeing deposits.—"From 1907 to 1914 there were no less than one hundred bank failures in the State of Mississippi. . . . Beginning in 1908

each year showed more and more agitation throughout the state in favor of strict legislation regulating banks. . . . One thing was quite apparent; no such thing as real centralized supervision existed. The State Banking Department had neither the authority nor the administrative machinery necessary for the proper supervision of the banking business of the state. Before the meeting of the legislature in January 1914, much had been said of the guaranty of deposits system then existing in a few states. . . . During January and February [1914] while the legislature was in session fourteen state banks failed, involving an aggregate loss of no less than three hundred thousand dollars to depositors. . . . Early in this session the proposition for a law regulating banking was received; therefore, with much attention a bill was soon formulated and started on its journey. As is always the case in such matters, the bill was beset with many formidable obstacles, but a law was enacted, which, with a few amendments passed in 1916 and 1918, stands at the present time."—D. Rowland, ed., *Publications of the Mississippi Historical Society*, v. 3, p. 165.

1908-1922.—Legislation.—Part played in World War.—Governatorial changes.—In 1908, county agricultural high schools were established. By a legislative enactment of 1910 the legislature was elected for four years to meet in regular session biennially. In 1912 a bureau of vital statistics was created, a child labor law passed, Greek letter and similar secret fraternities forbidden, and the judiciary (circuit and chancery) was made elective. In 1914, a state department of banking was created. In 1915, the Torrens system for perfecting land titles went into effect. In 1916, a uniform negotiable-instrument law was enacted, the supreme court was made elective (the court to consist of six judges and permitted to sit in two divisions for the consideration of cases, the term of the supreme court judges to be for six years, the circuit and chancery for four years. In 1916, the initiative and referendum were embodied in the constitution by amendment. (See INITIATIVE AND REFERENDUM: Development in the United States.) During the World War Mississippi furnished 54,295 men or 1.44 of the total Expeditionary Forces. About 24,066 were negroes. In 1920, a compulsory school attendance law was enacted, and a five-million-dollar bond issue was authorized to provide buildings for the state's charitable institutions and institutions of higher learning. The governors for the period, 1908-1922, were: Edmund F. Noel, 1908-1912; Earl Leroy Brewer, 1912-1916; Theodore G. Bilbo, 1916-1920; and L. M. Russell, 1920.

MISSISSIPPI BUBBLE, or Mississippi scheme. See FRANCE: 1717-1720; LOUISIANA: 1717-1718.

MISSISSIPPI RIVER, principal river of the North American continent, and the main artery of the river system which drains the greater part of the United States. The total length of the river from the source near Lake Itasca to its mouth in the Gulf of Mexico is about 2,400 miles. The Mississippi and its tributaries have more than 15,000 miles of navigable waterways and drain an area of about 1,250,000 square miles. Owing to the nature of the river bed its channel is constantly changing, and vast sums of money have been spent on works to sustain its banks, chiefly by dykes known as levees. The first levee was begun in 1717 when the engineer Le Blond de la

Tour erected one to protect the city of New Orleans.

1519.—Discovery of the mouth by Pineda, for Garay. See AMERICA: 1519-1525.

1528-1542.—Crossed by Cabeça de Vaca, and by Hernando de Soto.—Descended by survivors of De Soto's company. See FLORIDA: 1528-1542.

1673.—Discovery by Joliet and Marquette. See CANADA: 1634-1673.

1682.—Exploration to the mouth by La Salle. See CANADA: 1669-1687.

1712.—Called the River St. Louis by the French. See LOUISIANA: 1698-1712.

1783-1803.—Right of navigation disputed between Spain and the United States. See FLORIDA: 1783-1787; LOUISIANA: 1785-1800; 1798-1803; U. S. A.: 1784-1788.

1849-1913.—Floods.—On May 12, 1849, a flood in New Orleans spread over 160 squares and submerged 1,600 buildings. On February 22, 1882, the valley of the Mississippi was flooded, and the loss of life and property was so great that the governor of Mississippi made an appeal for public help. In March and April of 1890 the levees of the Mississippi river gave way in many places and large areas of land in Louisiana and Mississippi were flooded. The worst crevasse was caused by the giving way of the Morgansea, near Bayou Sara, which had been built by the federal and state governments at a cost of about \$250,000. In extent of area and loss of property these floods were the most remarkable in the history of the continent. The total area under water on April 10 was about 15,800 square miles, containing about 39,500 farms, whose value was close upon \$65,000,000. The loss of life was small. Congress gave relief to the extent of \$200,000, besides appropriating \$2,583,300 for the improvement of the Mississippi. From March to June, 1912, levees on the Mississippi between Cape Girardeau, Missouri, and the head of the Passes, in Louisiana, gave way under pressure of a record breaking flood, rendering nearly 400,000 persons homeless, and damaging property to an estimated extent of \$50,000,000. Congress appropriated \$1,500,000 for the repair of levees, and the president ordered army relief work. In 1913, two floods passed Cairo, the first in January and the second in April, the latter exceeding all previous records from Cairo to the Gulf of Mexico. At Beulah, Mississippi, a crevasse attained a width of 1,000 feet.

1861-1863.—Battles and sieges of Civil War. See U. S. A.: 1861 (September-November: On the Mississippi); 1862 (March-April: On the Mississippi); (April: On the Mississippi); (May-July: On the Mississippi); (June: On the Mississippi); (December: On the Mississippi); 1863 (January-April: On the Mississippi); (April-July: On the Mississippi); (May-July: On the Mississippi); (July: On the Mississippi).

1875-1879.—South Pass channel.—Mississippi Commission created.—In 1875 Congress authorized a deep channel through the South Pass of the river mouth. "President Johnson in 1866 recommended appropriations for the reconstruction of the Mississippi embankments; but little was done until a succession of overflows led Congress in 1879 to provide a commission consisting of three engineers from the army, three civilians, and a representative of the coast survey to form plans to 'correct, permanently locate, and deepen the channel, and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods; and promote and facilitate commerce, trade, and the postal service.' This 'Mississippi River commis-

sion' was sustained for a number of years, and made careful surveys and many suggestions."—E. E. Sparks, *National development*, pp. 313-314.

1900.—Chicago drainage canal opened. See CHICAGO: 1900.

1903.—Channel kept open.—A scheme was put in operation to maintain the river channel at a depth of at least nine feet and a width of 250 feet. Constant work by dredges, during low water seasons, has kept the desired channel open since 1903.

1917.—Flood bill and appropriation by Congress.—"Few pieces of legislation in recent years have marked a more important development in national internal policy [than the Ransdell-Humphres Flood bill signed by the president, 1917]. For in this bill the federal government has committed itself for the first time to an interest in the control and prevention of floods—to stream regulation in its largest sense—and has provided, under the 'welfare clause' of the constitution, the foundation for a legislative and administrative system that is certain to become one of the important national governmental activities of the United States. . . . [On] December 4, 1912, President Taft . . . said, referring to the devastation in the Mississippi valley: 'Under the welfare clause of the constitution, shall we spend for that great section of the country \$40,000,000 or \$50,000,000, in order to make the levees of that river a system which will prevent destruction? . . . Under the constitution we can expend money from the treasury of the United States for the general welfare, and that would seem to include the avoidance of danger if it affects so large a part of the country that it may be said to affect the whole country.' It was, therefore, an event of first importance when both houses of Congress passed and the President approved a bill appropriating \$45,000,000 for controlling the floods of the Mississippi river and continuing its improvement from the head of the passes to the mouth of the Ohio river."—M. Knowles, *Bridling the Mississippi* (*Survey*, Mar. 24, 1917).

1922.—Completion of levees.—"The Mississippi levees are now completed to standard height and width for about 500 miles. The whole length of the levee line has been built up to a level that will withstand the normal floods. . . . To protect the levees from erosion by rain they are sodded with Bermuda grass. They are protected against the wash of waves by a layer of 4 inches of concrete, or by a board protection. . . . Methods of revetment which have been developed as a protection against bank erosion . . . [are] the willow mattress, the articulated concrete mat, and the solid concrete mat. . . . The present program is the appropriation of \$45,000,000, to be available in annual installments of \$10,000,000, these moneys to cover the control of the Mississippi and also of the Sacramento River, California."—J. B. Walker, *Curbing the Mississippi* (*Scientific American*, Aug., 1922).

MISSOURI, sometimes called the "Ozark," or "Iron Mountain," state, is a north-central state of the United States lying almost midway between the two oceans, the Gulf of Mexico and Canada. It has an area of 69,420 square miles of which 693 square miles are water; and a population, 1920, of 3,404,055. Missouri was originally "Upper Louisiana," the vague frontiers of the French dominions that centered in New Orleans. For at least a century before its emergence in history as part of the Louisiana Purchase it was the center of a great fur-trade and the lure of exploring parties.

Resources.—In 1920, Missouri had 263,004 farms with an area of 34,774,679 acres of which 24,832,966 acres were improved land. The chief crops are cereals, potatoes, flax, cotton, and orchard fruits. The live-stock industry had an approximate total of 8,997,000 head; and a wool-clip of 8,296,000 pounds. The principal mineral products are lead, zinc, and coal; in the production of lead and zinc, Missouri leads all the other states. The productive coal-fields have an area of about 14,000 square miles with an annual output of about 5,133,020 tons. See U.S.A.; Economic map.

1700-1800.—Fur trade.—Enormous profits.—"The French-Canadian inhabitants of the country before the acquisition of Louisiana, were all practically engaged in the fur trade in one way or another. Piernas in 1769 says in his report: 'The sole and universal trade consists in furs.' French fur traders visited the Missouri and Osages in 1689. Penetrating from Quebec and Montreal into the far interior in search of furs, in early days, these voyageurs, and 'coureurs des bois,' dazzled the savages in their villages with the glittering trinkets in their packs, no less than by the knives, awls, hatchets, kettles, gaudy calico ribbons, gay red blankets and other European commodities. . . . The profits of the traders were usually large. An average profit of one hundred percent on goods sent out, by no means represented the whole gain, because the merchandise going out was valued at its selling price current at the post where they were purchased. For instance, red cloth might sell at Ste. Genevieve or St. Louis or New Madrid at four shillings, or one dollar, per yard, including freight, although actually it cost the merchant at the post not more than one half that sum, yet this cloth when sold to the Indian would bring two dollars or even more. On the other hand, the beaver skins or furs with which the Indian paid for such cloth, would be valued at perhaps two dollars at the post, but they would fetch in London, five or ten times as much. Stoddard estimated the value of the fur trade of upper Louisiana for fifteen successive years before the cession, amounted to about \$200,000 per annum and that this trade annually yielded the traders a profit of over \$55,000, which he justly observes to be a large sum considering the scanty population."—L. Houck, *History of Missouri*, v. 2, pp. 243, 248.

1719-1732.—First development of lead mines by the French. See LOUISIANA: 1710-1750.

1762-1803.—Upper and lower administrative divisions.—Administration of justice.—Duties of the commandant.—"Prior to 1762 France had held legal title to Louisiana, but since the settlements made in that part now included in the State of Missouri had been few, the French law need not

receive consideration here. From 1762 to 1800 Spain held legal title to Louisiana. By the Treaty of San Ildefonso, October 1, 1800, Louisiana was retroceded by Spain to France, but Spain remained in actual possession almost up to the time of transfer to the United States in 1803. [See LOUISIANA: 1798-1803.] During a period of thirty-four years the Spanish law of Upper Louisiana governed the people within the present limits of Missouri. Nor were these laws less binding after the cession of 1803, except as they were expressly annulled, superseded, or amended. However, for our purposes, the provisions of the Spanish laws of Upper Louisiana may be disregarded. The English system of jurisprudence gradually superseded that of the Continent in Upper Louisiana, and today the organic law of Missouri rests on an Anglo-American basis beginning with the act of Congress of October 31, 1803. . . . Under Spanish rule, the Province of Louisiana was divided into a lower and an upper district for the purpose of facilitating governmental administration. There were several reasons for this division, the more important being the great distance separating the two centers of settlement near the mouth of the Mississippi and that of the Missouri. Also, the population around New Orleans, which was the seat of government of Lower Louisiana, was greater and represented a higher stage of development than we find in Upper Louisiana. The Governor-General at New Orleans exercised direct jurisdiction over Lower Louisiana and appellate jurisdiction over the upper district; and a Lieutenant-Governor at St. Louis exercised direct jurisdiction over Upper Louisiana."—F. C. Shoemaker, *Missouri's struggle for statehood*, pp. 9-11.—The lieutenant-governor "was appointed by the governor general at New Orleans and was subordinate to him. Under the lieutenant governor and appointed by him were commandants of the various military posts throughout the province. The commandant of New Madrid was, however, exempt from the authority of the lieutenant governor. The commandants in turn appointed the syndics for the remote settlements of their districts and the dependencies of the posts. The syndics and most of the commandants received no pay for their services. . . . In the administration of laws the process was very simple and direct. Cases that fell within the jurisdiction of the commandants were quickly tried by them or by the syndics who acted for them. After hearing the statements of both parties to a suit, the commandant or the syndic would give his decision, which was usually accepted as final. However, an appeal might be taken to the lieutenant governor and from him to the governor general, but this was seldom done. . . . In criminal matters either the lieutenant governor would go to the place where the crime was committed and try the case, or the commandant would try it, his decision, however, being subject to an appeal to the lieutenant governor, and from him to the governor general. The law also provided for still further appeals, the last tribunal being the Council of the Indies in Spain, but it was seldom that appeals of any sort were taken. In addition to these judicial functions the commandant exercised extensive administrative and military authority. He maintained peace and order, examined passports, which every traveler was compelled to have, passed upon requests of prospective settlers for permission to take up their residence in the district, and punished slaves. He had the rank and military duties of captain."—E. M. Violette, *History of Missouri*, pp. 52-54.

1765.—Northern part included in territory ceded by France to Spain.—England makes peace with Indians. See ILLINOIS: 1765.

1766-1770.—Early exploration and settlement.—Ste. Genevieve and St. Louis, first settlements.—“As far as we know, Ste. Genevieve and St. Louis [see St. Louis] were the only existing settlements in what is now Missouri [in 1769], . . . unless the garrison in the fort built in 1767 by that government at the mouth of the Missouri River be called a settlement. In 1766 the Spanish government sent D'Ulloa to New Orleans to take control of the newly acquired territory. . . . While in New Orleans he [D'Ulloa] sent a body of men under Captain Rui up the Mississippi to establish two forts at the mouth of the Missouri, one on the north bank and one on the south. The reason assigned by D'Ulloa for projecting these forts was to keep the English, who were then holding territory on the east side of the Mississippi, from attempting to ascend the Missouri and establishing settlements there. It was later found advisable to erect only one of these forts, the one on the south bank. To this fort was given the . . . name of 'El Principe de Asturias—Senor Don Carlos,' in honor of Charles, Prince of the Asturias and heir apparent to the throne of Spain. A block house was, however, built on the north side of the mouth of the river, to which was given the name of 'Don Carlos Tercero el Rey,' in honor of Charles III, King of Spain. But by this time these two settlements [Ste. Genevieve and St. Louis] had grown considerably, their population numbering between 900 and 1000. The chief cause for this growth had been the emigration of the French from their settlements in the Illinois country.”—E. M. Violette, *History of Missouri*, pp. 17-18.—See also ILLINOIS: 1765-1774.

1769-1799.—Spanish régime in Upper Louisiana.—“Don Pedro Piernas, who was in command of the Spanish companies when Ulloa landed, succeeded Rui as commander on the Missouri. He came to the fort in 1769. But a few days after he assumed command, he was ordered to surrender the possessions to St. Ange, who was thus officially placed by Spanish authority in command of the upper Louisiana. . . . After Piernas returned to New Orleans, he was re-appointed by O'Reilly, lieutenant-governor 'for the villages of San Luis, Santa Genevieve, and the whole district of the Misuri River, and the part of the Yllineses' belonging to the Province of Louisiana, and this appointment was afterwards, by royal cedula, approved. . . . Don Francisco Cruzat succeeded Piernas as lieutenant-governor, but only remained in office a short time, being superseded on account of sending agents without first obtaining orders to the English possessions to negotiate with the Indians there for the liberation of some captive Missouris and Piorias. Fernando de Leyba was appointed his successor. . . . The celebrated attack of the English and Indians on St. Louis was made while de Leyba was lieutenant-governor. . . . Shortly after the attack on St. Louis, de Leyba died, and Cruzat was reappointed. He fortified St. Louis by surrounding the town with a stockade and erecting several towers. Impressed with the rapid growth of the settlements on the east side of the river, an effort was made by the Spaniards to induce Canadians to immigrate into the country. Liberal offers were made to French, Spanish, Italian, and German Catholic settlers. Such immigrants were offered free land and in

addition enough 'maize in the ear' for the first year, 'an axe, a hoe, a scythe or sickle, a spade, two hens, a cock, and a pig of two months, and with which they can easily found and establish a household which will provide them with a living, or may even make their fortune.' But these inducements did not secure the desired immigration. Cruzat, also in order to promote the cultivation of hemp, recommended the introduction of negro slaves, and the government decided to make provision to supply the settlers 'with negroes in such manner as may be practicable.' During his administration Cruzat promulgated a number of general ordinances for upper Louisiana, as well as ordinances relating more particularly to the municipal affairs of St. Louis. . . . In 1787 Perez followed Cruzat, and he without delay reported that the fortifications of St. Louis needed repairs. While Perez was lieutenant-governor, Colonel George Morgan with some of his adventurers visited him, with letters from Gardoqui. Morgan then supposed that he had received a vast grant and was authorized to establish a colony on the west bank of the river near the mouth of the Ohio. He was well received by Perez and supplied with guides and provisions to make a careful examination of the country from St. Louis south, and finally established the capital of his supposed principality at New Madrid, then known as L'Anse a la Graisse. He at once began his surveys, but his scheme was rudely shattered by the machinations of Wilkinson and the orders of Governor-General Miro. . . . Zenon Trudeau was the next lieutenant-governor of upper Louisiana. . . . The most significant event during Trudeau's administration was the arrival of Pedro Vial dit Manitou overland from Santa Fé. He was commissioned by the Spanish authorities of Mexico to trace out a route to St. Louis, and this task he successfully accomplished. . . . In 1799 Don Carlos de Hault de Lassus, Commandant of New Madrid, was appointed successor of Trudeau and New Madrid was attached to upper Louisiana. Before this time New Madrid was a separate sub-delegation under command of Foucher, Portelle, and De Lassus. De Lassus remained lieutenant-governor of upper Louisiana until the cession of the country.”—L. Houck, *Spanish régime in Missouri*, v. 1, pp. xv, xviii-xxiv.

1803.—Embraced in Louisiana Purchase. See LOUISIANA: 1798-1803.

1803-1812.—Earliest attempts to govern Missouri or “Upper Louisiana” as American territory.—“At the time of the cession the population of Upper Louisiana was over ten thousand, of which over one-half were Americans. Not only did Spanish law give place to English law, . . . but even Spanish and French influence as represented by the population had already greatly diminished and was soon to become a negligible quantity as far as legislation was concerned. Excepting some of the large Spanish land grantees and a part of the American settlers, especially those around Cape Girardeau and Mine a Breton, the inhabitants of Upper Louisiana neither rejoiced nor were they even reconciled either at the time when the treaty of cession became known or later when the actual transfer was made. . . . The first organic law of American origin that applied to Louisiana was passed at the first session of the Eighth Congress of the United States on October 31, 1803, and provided a temporary government for the new district [which lasted until 1812]. This act empowered the President of the United States to take possession of Louisiana, and placed under his direction all military, civil and judicial powers

that had been exercised by the officials of the existing government. This great power was lodged in his hands until Congress made other regulations. . . . This law was not unfavorably received by the French inhabitants of Louisiana. . . . Under this law Captain Amos Stoddard was appointed the first American civil commandant of Upper Louisiana. The seat of Government remained at St. Louis, and little change in governmental administration was introduced. This was in accordance with the policy of the Washington officials, who wisely tried to pacify the fears of the inhabitants. Congress did not wait long, however, in making provisions for the government of Louisiana."—F. C. Shoemaker, *Missouri's struggle for statehood*, pp. 11, 14-15.—"On the 26th of March, 1804 . . . President Jefferson approved of the act of Congress by which Louisiana was divided into two parts, and all north of the 33d parallel of north latitude was formed into a district, and styled the District of Louisiana. For judicial and administrative purposes this district, or upper Louisiana . . . was attached to the territory of Indiana, and in October of that year the governor and judges of that territory prepared a series of ordinances, and inaugurated the new government within the district, thereby relieving Major Stoddard from the anomalous position which he had hitherto held of first civil commandant of upper Louisiana, under the appointment of Governor Claiborne, of Mississippi, with all the powers and prerogatives of Spanish lieutenant-governor. [See LOUISIANA: 1803-1804.] . . . No mention is made in the act of the land grants of the French and Spanish commandants, nor is there any reference to the removal of the Indians to the west side of the Mississippi. . . . During the preceding autumn [1804], the intention of the general government was made manifest by a treaty in which the Sacs and Foxes had relinquished some three million acres of land situated immediately north of the Missouri and in the angle formed by the junction of that stream with the Mississippi. In regard to the land grants, . . . it was not until April, 1814, that an act was passed confirming all claims made 'by virtue of incomplete French or Spanish grants or concessions, or any warrant, or order of survey which was granted prior to the 10th of March, 1804,' the day on which the United States took formal possession of upper Louisiana. . . . [The act of 1805 did not] allow the citizens of the newly formed territory to choose their own officers, frame their own laws, or do much else that a self-governing community is usually supposed to do; but it gave them officers whose field of duty was limited to the territory; and, theoretically, it made of that territory a sort of preparatory school, in which the inhabitants were to take their first lessons in the science of self-government, though, practically, except in the introduction of the trial by jury, it made but few changes either in the laws or in the manner in which they were administered."—L. Carr, *Missouri a bone of contention*, pp. 82, 85.

Also in: C. H. McClure, *History of Missouri*, p. 1.

1804-1805.—Exploration of territory. See U. S. A.: 1804-1805: Expedition of Lewis and Clark.

1812-1813.—Region about New Madrid devastated by earthquakes.—Between 1812-1813 a great part of the land near New Madrid was sunk in a terrible earthquake. Such large openings were formed in the earth that a number of lakes came into existence along the Mississippi river. Reelfoot lake developed during this earthquake. It is

so deep that boats easily pass over tops of submerged trees.

1812-1815.—War of 1812.—Trouble with Indians.—Manufacture of munitions.—"The greatest danger to which Missourians who had settled along the Mississippi River were exposed during the war [of 1812] came from the Indians living east of that river, who had been stirred up by English agents. In fact, these agents had been active in stirring up the Indians even before the war broke out. Roving bands of savages who had been furnished with arms by these English agents had crossed the Mississippi and engaged in horse stealing and other marauding. After the war was declared, the Sacs and Foxes who lived along the Rock River in Illinois were induced to make war against the settlers in Missouri, and throughout the war they proved the most troublesome of all the Indians engaged in it. . . . The situation, however, was very serious and called forth energetic efforts on the part of the territorial governor of Missouri. The militia was ordered out, and forts and stations were established and garrisoned. . . . A volunteer force of about 1,400 men was sent up the Mississippi under General Howard in September, 1813, to attack the Illinois Sacs and Foxes. . . . He was unable to bring them into open battle, but he burned several of their villages and destroyed many of their stores of corn, and thus put a check upon their attacks. The situation became so serious in the Boone's Lick country, because of the frequent Indian raids, that General Henry Dodge, who was in command of the militia of the territory, was ordered in September, 1814, to take a body of 350 mounted rangers and go to the relief of the settlers in that region. With Dodge's command there were forty or fifty of the friendly Shawnees and Delawares from the Cape Girardeau District. On reaching what is now Saline County, Dodge was able, through his Indian allies, to locate the hostile Miamis and shortly afterward to effect their capture. The Miamis, 153 in all, surrendered, and were promised that their lives should be spared. . . . Peace with the Indians was ultimately secured at a conference held at Portage des Sioux in the St. Charles District in June, 1815. . . . [There is also] another part that Missouri played in the War of 1812. It was from Missouri that large quantities of munitions of war were obtained for the armies of the United States in this war. The lead industry in Missouri was an old one when this war broke out and had had much to do with the early development of Missouri. But just prior to the beginning of the war a big improvement was made in the manufacture of bullets in Missouri, which made the lead industry very important in that war. Heretofore, the making of bullets in Missouri had been by the hand mold process, and hence the output was limited. But about 1800 John Nicholas Maclot, a political exile from France, made his way to the lead regions of Missouri and discovered that Herculaneum offered certain facilities for the erection of a shot tower. Just below the town was a high and overhanging cliff, and he saw that about all that was needed was to erect on the edge of this cliff a place where the lead could be melted and then dropped into some sort of receptacle at the base. He immediately acted upon his discovery and, after erecting a tower, advertised that he was ready to manufacture buckshot and bullets at a reasonable price. It was from this shot tower that ammunition was sent in large quantities to the armies of the United States in the War of 1812, and the victory

of New Orleans in 1815 is said to have been won with the bullets that had been manufactured there."—E. M. Violette, *History of Missouri*, pp. 68-69, 72-73.

1812-1816.—Progress toward statehood.—Attainment of representative government.—"The last of the measures to which we find it necessary to refer at this time was the act of Congress of June 4, 1812, by which, on the 12th of the December following, [Upper] Louisiana was to be advanced from the first to the second grade of territories, and its name changed to Missouri. It was time that this change should come, for the territory had a population of over twenty thousand, exclusive of Indians. This was four times as many as were necessary, under the law for the government of the Northwest Territory, to entitle them to the promotion, and they had begun to grow restive under a mode of treatment which discriminated unfavorably between them and their neighbors on the other side of the Mississippi. By the terms of this act, the territorial affairs were to be administered by a governor appointed by the President, and a general assembly consisting of a house of representatives elected by the people, and a legislative council of nine members, chosen by the President from a list of eighteen returned to him by the territorial house of representatives."

—L. Carr, *Missouri a bone of contention*, p. 115. —"Population kept increasing rapidly in Missouri. Lawrence county was established by the Territorial Legislature January 15, 1815, and just a little over a year later Howard county, the 'mother of counties' and one of the empire counties of Missouri, was erected by act of January 23, 1816. On January 21, 1816, on motion of Mr. Easton in the House of Representatives, the Committee on the Judiciary was instructed to inquire if any, and what, alterations were necessary to be made in the act entitled 'An act providing for the government of the Territory of Missouri' approved June 4, 1812.' This committee on March 6, 1816, reported a bill to alter certain parts of the act of 1812, which without any amendment finally became the organic act of Congress of April 29, 1816, by which Missouri became a territory of the highest grade. . . . The year following this law of Congress of 1816, which made Missouri a territory of the highest rank, saw the inhabitants here petitioning Congress for that greatest of all boons—the privilege of statehood."—F. C. Shoemaker, *Missouri's struggle for statehood*, pp. 35-36.

1812-1820.—Iowa included in Missouri territory before formation of state. See IOWA: 1673-1834.

1812-1836.—Territorial changes.—Platte purchase.—"The Territory of Missouri, organized in 1812, included all of the Louisiana Purchase except the State of Louisiana. All of the white people lived in what is now Missouri and Arkansas. In 1819 the Territory of Arkansas was set off [see ARKANSAS: 1819-1836] and in 1820 the State of Missouri was formed. The shape of Missouri in 1820 was the same as it is to-day with one important exception. Instead of the Missouri river north of Kansas City being the western boundary, a line was run directly north. This excluded from Missouri what are to-day the counties of Atchison, Nodaway, Holt, Andrew, Platte, and Buchanan. This tract of rich land was held by the Sac, Fox, and Iowa Indians. It was called the Platte country. The United States government purchased this from the Indians in 1836 and gave it to Missouri. This was called the Platte Purchase, and by it, Missouri's boundary was

completed."—F. C. Shoemaker, *History of Missouri and Missourians*, p. 17.

1819-1820.—Missouri question in Congress.—Ominous character.—Missouri Enabling Act.—Extensive boundaries of state.—Electoral qualifications for constitutional convention.—"It is hardly an exaggeration to say that seldom in the history of this nation since the adoption of the Constitution has there been a purely domestic question, except of course the Civil War of 1861-65, that has so stirred the country from border to border, as the famous Missouri Question. [See U. S. A.: 1818-1821.] . . . The Missouri Enabling Act was approved by President Monroe on March 6, 1820. . . . The act of March 6, 1820, consisted of eight sections. The first section empowered the inhabitants of Missouri Territory, under such rules and regulations as were later set forth, to form a constitution and state government and to assume such name as they wished. It also declared that such state when formed should be admitted into the Union on an equal footing with the original states in all respects. . . . Section two defined the boundaries of the new state, which were the same as those set forth in article I of the Missouri Constitution of 1820. . . . The third section of the Enabling Act provided for the election of representatives to a constitutional convention. The electors included 'all free white male citizens of the United States, who shall have arrived at the age of twenty-one years, and have resided in said territory three months' previous to the day of election, and all other persons qualified to vote for representatives to the General Assembly of the said territory.' This is one of the lowest qualifications for an elector that has ever obtained in Missouri. It is recalled that the act of Congress of June 4, 1812, relating to Missouri, provided that electors of representatives to the Territory Legislature were required to have resided in the territory twelve months before the election, and to have paid a territorial county tax assessment made at least six months before the election. The qualifications of electors as set forth in the Constitution of 1820 omitted the tax requirement, but required a residence of one year in the State and three months in the county or district."—F. C. Shoemaker, *Missouri's struggle for statehood*, pp. 36, 62, 65-68.

ALSO IN: W. B. Stevens, *Missouri's centennial* (*Missouri Historical Review*, Apr.-July, 1917, pp. 249-257).

1820.—Constitutional convention.—Sanction of slavery.—"The delegates met in convention in St. Louis in June, 1820. . . . David Barton was elected president, and William G. Pettus secretary of the convention. On the 10th day of July following, after a session of a little over a month, . . . the work of the convention was finished by the adoption of a constitution for the new state. The constitution adopted . . . was not submitted to a vote of the people for ratification, but went into effect of its own motion, superseding the territorial government, and provided for the election of a governor and a lieutenant-governor, members of the first general assembly, a representative to Congress, and the election of United States senators. The constitution thus adopted . . . remained in force for many years and as has been well said was 'a marvel of moderation and political sagacity,' framed as it was in a period of great political excitement. As was to be expected, slavery was sanctioned, but at the time it was thought that if no attempt had been made by congressional action to prohibit slavery, and the matter quietly left to the people, that slavery

would have been excluded from the new state. . . . Power was denied the General Assembly to emancipate slaves without the consent of the owners, without making full compensation, and the right of emigrants coming to Missouri in good faith with their slaves was guaranteed. Power was given to enact laws to prevent slaves from being brought into the state 'for the purpose of speculation,' or which had been imported 'into the United States contrary to law.' . . . In criminal cases slaves were secured 'and impartial trial by jury.' . . . A provision was incorporated in the constitution providing that 'no bishop, priest, clergyman, or teacher of any religious persuasion, denomination, society or sect' should be eligible to either house of the General Assembly, or appointed to any office of profit, 'except the office of justice of the peace.' The constitution expressly provided that 'schools and means of education shall forever be encouraged in this state' and that in each township schools should be established as soon as practicable and necessary 'and where the poor shall be taught gratis.'—L. Houck, *History of Missouri*, v. 3, pp. 243, 251.

Also IN: F. C. Shoemaker, *Missouri's struggle for statehood*, pp. 250-252.—W. B. Stevens, *Travail of Missouri for statehood* (*Missouri Historical Review*, Oct., 1920, pp. 19-28).—E. M. Violette, *History of Missouri*, pp. 118-124.

1820-1821.—Compromise concerning slavery.—Admission into Union. See U.S.A.: 1818-1821.

1821-1846.—Senator Benton and origin of "Manifest Destiny idea."—In 1821 Thomas H. Benton entered the United States Senate, representing Missouri, and soon became the leader in Missouri politics. "Missouri had lost all connection with the seacoast, and though, through her great river towns, swarming with raftsmen and flatboatmen, she drove her main and most thriving trade with the other Mississippi cities, yet her restless and adventure-loving citizens were already seeking other outlets for their activity, and were establishing trade relations with the Mexicans. . . . Missouri was thrust out beyond the Mississippi into the vast plains-country of the Far West, and, except on the river-front, was completely isolated, being flanked on every side by great stretches of level wilderness, inhabited by roaming tribes of warlike Indians. Thus for the first time the borders began to number in their ranks plainsmen as well as backwoodsmen. . . . Among such people Benton's views and habits of thought became more markedly Western and ultra-American than ever, especially in regard to our encroachments upon the territory of neighboring powers. The general feeling in the West upon this last subject afterwards crystallized into what became known as the 'Manifest Destiny' idea, which, reduced to its simplest terms, was: that it was our manifest destiny to swallow up the land of all adjoining nations who were too weak to withstand us; a theory that forthwith obtained immense popularity among all statesmen of easy international morality. . . . Benton, greatly to the credit of his foresight, and largely in consequence of his strong nationalist feeling, thoroughly appreciated the importance of our geographical extensions. He was the great champion of the West and of western development, and a furious partisan of every movement in the direction of the enlargement of our western boundaries. . . . He was keenly alive to the need of our having a free chance to spread towards the northwest; he very early grasped the idea that in that direction we ought to have room for continental development. . . . Benton felt that

all the unoccupied land to the northwest was by right our heritage, and he was willing to do battle for it if necessary."—T. Roosevelt, *Thomas H. Benton* (*American Statesmen Series*, v. 23, pp. 35-37, 233-234, 236).

1830-1840.—Temporary home of Mormons. See MORMONISM: 1830-1846.

1846-1848.—War with Mexico.—Missourians in "Army of the West."—"The war between the United States and Mexico in 1846-48 was very popular in Missouri. . . . On hearing of the outbreak of hostilities between the United States and Mexico in the region between the Rio Grande and Nueces rivers in April, 1846, Missourians began to get themselves ready to take part in the war, and when a call came from General Gaines, . . . for volunteers to go to the assistance of General

THOMAS HART BENTON

Taylor on the border between Texas and Mexico, a regiment of 650 men was quickly raised in Missouri and started down the Mississippi on its way to the seat of war; but these men were destined never to see any actual service, for General Gaines' action was disavowed at Washington, and all the troops that came at his call from Missouri and other states were discharged and sent home at the end of three months. . . . Congress passed an Act in May, 1846, authorizing the President to call into the field 50,000 volunteers, who were designed to operate against Mexico at three points. Taylor was to penetrate directly into the heart of the country with the Army of the South; Wool was to operate against Chihuahua with the Army of the Center; and Kearny was to march from Santa Fe with the Army of the West. . . . The Army of the West was made up largely of Missourians."—E. M. Violette, *History of Missouri*, pp. 151-153.

pp. 545-560).—L. Carr, *Missouri, a bone of contention*, ch. 10.—J. T. Hughes, *Doniphan's expedition*.

1850-1860.—Slavery in Missouri.—Difference between Missouri slavery and that of southern plantations.—“The number of slaves in Missouri was never large. In 1803 there were between two and three thousand slaves, and in 1860 there were 114,931 slaves and 3572 free negroes. . . . Although Missouri was a slave state, its system of slavery differed in many ways from that which prevailed in the Southern states. There were few great plantations of ‘the Mississippi type with its white overseer and gangs of driven blacks’ cultivating a staple crop. Except in the Missouri River counties where hemp was the staple, the farmers of Missouri were usually engaged in general farming. . . . Hence the slaves on most of the Missouri farms were employed as general field hands and were not put under the ‘task system’ as in the South, where cotton was the great staple. Inasmuch as this was the case, the number of slaves held by a given master was not often large. ‘Very few masters had one hundred slaves and not many had fifty.’ While the number of slaves owned by one master varied from a single slave to four hundred, most of the masters had less than five slaves each. Many of the single slaves were household or personal servants. This was true in both the towns and the country. Slaves were employed at times as hands on the river boats and in the lead mines, and they were also used in general work about the towns.”—E. M. Violette, *History of Missouri*, pp. 287-290.

ALSO IN: C. H. McClure, *History of Missouri*, pt. 3.

1851-1874.—Development of railroads.—“The first railway construction work in Missouri was on the Pacific Railroad, which started July 4th, 1851, in St. Louis. . . . Work on the Hannibal & St. Joseph Railroad commenced in 1853. . . . In November, 1853, the final route of what was then called the Southwest Branch of the Pacific Railroad was located from Franklin, thirty-seven miles from St. Louis, through the valley of the Gasconade to Springfield, and thence to Newton county, a total distance of three hundred and twenty miles from St. Louis. The route of the North Missouri Railroad was determined October 16, 1854, and the road was to be built from St. Louis to St. Charles, and thence to a junction with the Hannibal & St. Joseph in Macon county, and from there to the north boundary line of the state, a total distance of two hundred and twenty-eight miles. The first division of this road was open for business in August, 1855, and was found to have cost \$52,000.00 per mile. . . . The route of the St. Louis & Iron Mountain was located September 8, 1853, from St. Louis to Pilot Knob, a distance of eighty-six miles. In prescribing the conditions under which this road should be operated, through Jefferson Barracks, the Secretary of War, Jefferson Davis, in October, 1853, stipulated that the trains should be by horse power alone, unless the route should be deflected from the Arsenal. . . . By the fall of 1855, the Pacific Railroad was almost completed to Jefferson City; the North Missouri had completed its first division from St. Louis to St. Charles; and the Hannibal & St. Joseph had about one hundred miles in process of construction. . . . The Pacific Railroad was completed to Sedalia in 1861, but it stopped here for about two years. This road was completed into Independence in December 19, 1865, and, as it had been operated into Kansas City from Independence prior to that time, on

September 20, 1865, the first passenger train passed over the whole line of the road. . . . The Southwest Branch was completed from Franklin to Rolla on December 22, 1860, and about the same time the Cairo & Fulton had twenty-six and a half miles in operation, and, by the close of the Civil war, the Platte County Railroad had fifty-seven and a half miles in operation between Savannah and Weston.”—E. J. White, *Century of transportation in Missouri (Missouri Historical Review, Oct., 1920)*.—“By 1870, St. Louis had rail connection with New Orleans, Mobile, Nashville, Atlanta and Charleston, as well as Des Moines, Omaha and other points. Kansas City, by this time, had also become a railroad center in both state and interstate traffic. Congress on July 25, 1866, passed an act authorizing the construction of bridges over the Mississippi at St. Louis and over the Missouri at Kansas City. The Burlington bridge at Kansas City was completed July 3, 1869, and was the occasion for a memorable celebration. The Wabash bridge over the Missouri at St. Charles was completed in 1871. The Eads bridge over the Mississippi at St. Louis was completed in June, 1874, and thus St. Louis and Kansas City were connected by rail with the outside world, and the boundaries of Missouri on both the east and west could be crossed, and these barriers of waters were overcome.”—E. J. White, *Century of transportation in Missouri (Missouri Historical Review, Oct., 1920)*.

1860-1861.—Secession struggle.—Opinions of governor Stewart.—Special position of Missouri in secession question.—“In the midst of the great excitement that was caused by these momentous events [the first movements of the Civil War] the General Assembly of Missouri met at Jefferson City on the last day of December, 1860. At the presidential election Lincoln had received in the entire State barely seventeen thousand of the one hundred and sixty-five thousand votes which were cast, and most of these were given to him by the German inhabitants of the State. . . . The outgoing Governor, Robert M. Stewart, transmitted his message to the two Houses on the 3d of January. . . . The right of secession he not only denied, but he denied it utterly; . . . Missouri . . . had no right to secede. For she belonged to the United States by right of purchase—had been bought by the Federal Government, and paid for out of its treasury. Whatever other States might do, it was her plain duty, and her interest, too, to remain within the Union. His message . . . expressed in great measure the sentiments of a majority of the people of Missouri, at that time. . . . Governor Jackson [who succeeded Stewart], true to his Southern birth and sympathy with the South, insisted with equal earnestness that she [Missouri] should stand by her sister slave-holding States, and share their destiny. . . . The matter was brought more formally before the General Assembly, on the 28th, [1861] by Mr. Vest (the Patrick Henry of resistance in Missouri), who then reported from the Committee on Federal Relations a preamble and resolutions [expressing abhorrence towards the doctrine of coercion]. . . . The State Convention met at Jef-

erson City on the last day of February [and] . . . reassembled at St. Louis on the 4th of March. . . . On the 9th the Committee on Federal Relations made a long report through its chairman, Judge Gamble [which said in part:] . . . 'The true position for Missouri to assume is that of a State whose interests are bound up in the maintenance of the Union, and whose kind feelings and strong sympathies are with the people of the Southern States, with whom we are connected by the ties of friendship and blood. . . . We cannot follow them, we cannot give up the Union, but we will do all in our power to induce them to again take their places with us in the family from which they have attempted to separate themselves.'—T. L. Snead, *Fight for Missouri*, pp. 12-14, 16, 50, 79.—'The [secession] Convention was fully informed how matters stood in St. Louis, for on the 20th of March Isidore Bush stated, on behalf of 'the thousands of German citizens whom I have the honor to represent,' that 'should a conflict be inevitable, your German fellow citizens will stand by the Government and by the Union.' Unusual pressure must have been brought on the majority of the Committee for Federal Relations, for on March 18 Judge Gamble reported a resolution to send seven delegates to the Border State Convention called by Virginia. This concession to the conditional Union men was a most dangerous measure, which might have created a Border States combination, hostile to the Free Soil policy, the expressed will of the nation. . . . J. B. Henderson's Committee on Luther J. Glenn's Secession proposition from Georgia . . . took up the phases of Secession in their ethical, political, commercial and strategical relations, and proved beyond all doubt that the interests of Missouri are and must be with the Union. This report exercised a great influence upon the wavering and undecided in and out of the Convention. Defeated amendments proposed to Judge Gamble's report bore evidence that at least two-thirds of the members of the Convention were now unconditional Union men. . . . After an animated debate, the report and resolutions presented by Judge Gamble's Committee were adopted by a very decided majority, and the convention adjourned, subject to the call of a majority of the Committee selected for that purpose.'—R. J. Rombauer, *Union cause (St. Louis, 1861, p. 172)*.

1861.—Baffling of Secessionists.—Blair, Lyon and Home Guards of St. Louis.—Capture of Camp Jackson.—Battle of Boonville.—Loyal state government organized.—The seizure of arsenals and arms by the secessionists of the Atlantic and Gulf states "naturally directed the attention of the leaders of the different political parties in Missouri to the arsenal in St. Louis, and set them to work planning how they might get control of the 40,000 muskets and other munitions of war which it was known to contain. . . . Satisfied that movements were on foot among irresponsible parties, Unionist as well as Secessionist, to take possession of this post, General D. M. Frost, of the Missouri state militia, . . . is said to have called Governor Jackson's attention to the necessity of 'looking after' it. . . . Jackson . . . did not hesitate to give Frost authority to seize the arsenal. . . . Frost, however, was not the only person in St. Louis who had his eyes fixed upon the arsenal and its contents. Frank Blair . . . was already busily engaged in organizing the bands which, supplied with guns from this very store-

house, enabled him, some four months later, to lay such a heavy hand upon Missouri. . . . [Blair's work of recruiting and drilling] went on steadily, and as a consequence, when the moment came for action, Blair was able to appear at the decisive point with a well-armed force, ten times as numerous as that which his opponents could bring against him. In the mean time the federal government awoke from its lethargy, and began to concentrate troops in St. Louis for the protection of its property. . . . By the 18th of February, the day of the election of delegates to the convention which pronounced so decidedly against secession, there were between four and five hundred men behind the arsenal walls. . . . General Harney, who was in command of the department and presumably familiar with its condition, under date of February 19, notified the authorities at Washington that there was no danger of an attack, and never had been. . . . Such was not the opinion of Captain Nathaniel Lyon, who had arrived at the arsenal on the 6th of February, and who was destined, in the short space of the coming six months, to write his name indelibly in the history of the State. . . . Under the stimulating influence of two such spirits as Blair and . . . [Lyon] the work of preparation went bravely on. By the middle of April, four regiments had been enlisted, and Lyon, who was now in command of the arsenal, though not of the department, proceeded to arm them in accordance with an order which Blair had procured from Washington. Backed by this force, Blair felt strong enough to set up an opposition to the state government, and accordingly, when Jackson refused to furnish the quota of troops assigned to Missouri under President Lincoln's call of April 15, 1861 [see U.S.A.: 1861 (April)], he telegraphed to Washington that if an order to muster the men into the service was sent to Captain Lyon 'the requisition would be filled in two days.' The order was duly forwarded, and five regiments having been sworn in instead of four, as called for, Blair was offered the command. This he declined, and, on his recommendation, Lyon was elected in his place. On the 7th and 8th of May another brigade was organized. . . . This made ten regiments of volunteers, besides several companies of regulars and a battery of artillery, that were now ready for service; and as General Harney, whose relatives and associates were suspected of disloyalty, had been ordered to Washington to explain his position, Lyon was virtually in command of the department. . . . Jackson, . . . though possessed of but little actual power, was unwilling to give up the contest without an effort. He did not accept the decision of the February election as final. . . . Repairing to St. Louis, as soon as the adjournment of the General Assembly had left him free, he began at once, in conjunction with certain leading secessionists, to concert measures for arming the militia of the State. . . . To this end, the seizure of the arsenal was held to be a prerequisite, and General Frost was preparing a memorial showing how this could best be done, when the surrender of Fort Sumter and the President's consequent call for troops hurried Jackson into a position of antagonism to the federal government. . . . He sent messengers to the Confederate authorities at Montgomery, Alabama, asking them to supply him with the guns that were needed for the proposed attack on the arsenal; and he summoned the General Assembly to meet at Jefferson City on the 2d of May, to deliberate upon such measures as might be deemed necessary for placing the State in a position to defend herself. He also ordered, as he was author-

ized to do under the law, the commanders of the several military districts to hold regular yearly encampments for the purpose of instructing their men in drill and discipline. . . . Practically its effect was limited to the first or Frost's brigade, as that was the only one that had been organized under the law. On the 3d of May, this little band, numbering less than 700 men, pitched their tents in a wooded valley in the outskirts of the city of St. Louis, and named it Camp Jackson, in honor of the governor. . . . Putting his troops in motion early in the morning of the 10th of May, he [Lyon] surrounded Camp Jackson and demanded its surrender. As Frost could make no defense against the overwhelming odds brought against him, he was of course obliged to comply; and his men, having been disarmed, were marched to the arsenal, where they were paroled. . . . After the surrender, and whilst the prisoners were standing in line, waiting for the order to march, a crowd of men, women and children collected and began to abuse the home guards, attacking them with stones and other missiles. It is even said that several shots were fired at them, but this lacks confirmation. According to Frost, who was at the head of the column of prisoners, the first intimation of firing was given by a single shot, followed almost immediately by volley firing. . . . When the fusillade was checked, it was found that 28 persons had been killed or mortally wounded, among whom were three of the prisoners, two women, and one child. . . . Judging this action by the reasons assigned for it, and by its effect throughout the State, it must be pronounced a blunder. So far from intimidating the secessionists, it served only to exasperate them; and it drove not a few Union men, among them General Sterling Price, into the ranks of the opposition and ultimately into the Confederate army."—L. Carr, *Missouri*, ch. 14.—When news of the capture of Camp Jackson reached Jefferson City, where the legislature was in session, Governor Jackson at once ordered a bridge on the railroad from St. Louis to be destroyed, and the legislature made haste to pass several bills in the interest of the rebellion, including one which placed the whole military power of the State in the hands of the Governor. Armed with this authority, Jackson proceeded to organize the Militia of Missouri as a secession army. Meantime Captain Lyon had been superseded in command by the arrival at St. Louis of General Harney, and the latter introduced a total change of policy at once. He was trapped into an agreement with Governor Jackson and Sterling Price, now general-in-chief of the Missouri forces, which tied his hands, while the cunning rebel leaders were rapidly placing the State in active insurrection. But the eyes of the authorities at Washington were opened by Blair; Harney was soon displaced and Lyon restored to command. This occurred May 30th. On the 15th of June Lyon took possession of the capital of the State, Jefferson City, the Governor and other State officers taking flight to Boonville, where their forces were being gathered. Lyon promptly followed, routing and dispersing them at Boonville on the 17th. The State Convention which had taken a recess in March was now called together by a committee that had been empowered to do so before the convention separated, and a provisional State government was organized (July 31) with a loyal governor, Hamilton R. Gamble, at its head.—Based on J. G. Nicolay, *Outbreak of the Rebellion*, ch. 10.

1862-1865.—Abolition of slavery.—Tentative approaches to emancipation.—Complete emancipation.—"The slow progress of the war, the abolition of slavery in the District of Columbia (April 16, 1862), and the offer by Congress of financial aid to the loyal States adopting a policy of compensated emancipation, greatly strengthened the anti-slavery element in Missouri. By the close of 1862 the leaders of the Conservatives were united with the Radicals in the conviction that slavery must go; and Governor Gamble embodied this view in his message of December, 1862, to the legislature. . . . The Conservatives in the legislature, acting on the recommendation of the governor, wished to reconvene the existing convention to initiate emancipation, while the Radicals sought to secure the election of an entirely new convention. It was the Conservative policy which triumphed; and the majority of the convention, when it met, dealt with the subject in an eminently conservative way. . . . 'The institution of slavery in Missouri would have remained untouched for the period of seven years, with, of course, the contingent possibility of a change of public sentiment and a repeal of the ordinance before any right to freedom could accrue.' . . . The Radical agitation for emancipation went on more vigorously than ever; and it now received the form of an organized protest against the whole Conservative rule of the State and the Federal policy which supported it. To embody this protest, a mass convention was called to meet at Jefferson City September 2. Governor Gamble's administration, while it had reflected the consensus of Union opinion in July, 1861, was too lukewarm for the Radical Union opinion which had since developed. The fifth resolution adopted by the convention arraigns the provisional government as 'untrue to the people' of the State, the following being the chief counts in the indictment: the use of the forces of the State to maintain slavery; the disarmament of loyalists and the establishment of the 'enrolled militia,' many of whom are characterized as 'known and avowed disloyalists,' and a refusal to cooperate with the General Government, particularly in the execution of orders levying assessments against disloyalists. . . . A committee . . . [was] appointed to lay their grievances before the President. . . . He was obliged to refuse the more important demands. . . . 'It is my duty to hear all,' he said; 'but at last I must, within my sphere, judge what to do and what to forbear.' His own sympathies, however, were with the Radicals, because of the integrity and sincerity of their politi-

cal views. 'I believe, after all,' he remarked to his secretary, Mr. Hay, some weeks later, 'those Missouri Radicals will carry their State, and I do not object to it. They are nearer to me than the other side in thought and sentiment, though bitterly hostile personally. They are the unhandiest fellows in the world to deal with; but, after all, their faces are set Zionwards.' . . . In January, 1864, occurred the death of Governor Gamble, the most conspicuous leader of the Conservatives. This materially weakened the party, and as the Presidential election of that year came on the Conservatives as an organization practically went to pieces. . . . For the first time since the beginning of the war State officers were chosen at this election, and the entire Radical ticket, with Governor Fletcher at its head, was elected by a similar majority. In the elections to the general assembly the Radicals secured a majority of the senate and three-fourths of the lower house. Finally, at this election it was decided that a new constitutional convention be called, whose first duty, it was well understood, would be to pass an immediate emancipation ordinance, and of the delegates chosen to this body three-fourths were taken from the Radical party. The work of the convention of 1865 was of great political importance. . . . By a decree of January 11 slavery was abolished, immediately and without compensation; and so was closed the second chapter in the history of the contest. But, as in the former case, a new chapter was forthwith opened by the insertion, in the constitution adopted by the convention, of the most radical disfranchising provisions. No person was to be allowed to vote at any election in the State who had 'ever given aid, comfort, countenance, or support to any persons engaged in' hostilities to the United States, or had ever 'by word or deed manifested his adherence to the cause of such enemies, or his desire for their triumph over the arms of the United States, or his sympathy with those engaged in exciting or carrying on rebellion.' In the vote on the ratification of the constitution itself these provisions were by anticipation to apply; but even so, its adoption was procured by a majority of less than 2,000 votes."—S. B. Harding, *Missouri party struggles in the Civil War period (Annual Report of American Historical Association, 1900, pp. 99-102)*.—See also BORDER STATES.

1865-1874.—Radicals in power.—Political alignments.—Defeat of measure to enfranchise negroes.—"The Radicals were successful in the elections of 1866 and 1868. But the 'election of 1868 marks the high tide of their success.' . . . All during the time the Radicals were in power they had to confront a very active opposition. The constitution of 1865 had no sooner been adopted than there arose protests against its 'iniquities,' and an agitation was begun in favor of amending at least the test oath sections. Even some of the Radicals mildly advocated certain

immediate amendments, but the real agitation was carried on by two other parties, the Conservative Unionists and the Democrats. The Conservative Unionist party was definitely organized in Missouri early in 1866—chiefly under the leadership of Frank P. Blair. The Democratic party was being brought together in a fashion under such men as Lewis Bogy and John S. Phelps, the latter having served in the Union army. As both of these parties realized that it would be futile to act apart in their opposition to the Radicals, the Democrats were induced to support the Conservative Unionists in the campaign of 1866. But notwithstanding this political combination the Radicals won the day, easily electing seven out of the nine Congressmen and carrying the legislature two to one. . . . From the defeat which the Conservative Unionist party suffered in 1866 it never recovered, and by the time the campaign of 1868 occurred its place as a party in opposition to the Radicals had been taken by the Democrats, who had meanwhile been well reorganized and had entered the political field with their own candidates. . . . To their support came a great many of the Conservative Unionists and the old line Whigs. But they were not yet strong enough to overcome the Radicals, especially since the latter had been able to add to the strength of their political defense through the new registry act of 1868. McClurg, the Radical candidate for governor, was elected over Phelps by a majority of more than 10,000, and Grant carried the State over Seymour in the Presidential race by a majority of more than 25,000. The Radicals also elected six of the nine Congressmen and also a majority of the members of the legislature. The surprising feature of the election of 1868 was the defeat of the State constitutional amendment enfranchising the negro in Missouri. This amendment was submitted by the legislature, but it was defeated by the people by more than 19,000 votes, the opposition coming from the Democrats, who voted solidly against it, and from a goodly number of Republicans also. The question of enfranchising the negroes had been an important issue in the State ever since they had been freed in 1865, but it was not submitted to the people in the form of a constitutional amendment more than once. Before it could be submitted again, the fifteenth Amendment to the Constitution of the United States, which conferred suffrage upon the negro practically everywhere in the country, was ratified and put into force, and thus the issue was settled without any further contest in the State."—E. M. Violette, *History of Missouri, pp. 416-419*.

ALSO IN: *Letters of Edward Bates and the Blairs (Missouri Historical Review, Jan., 1917)*.—H. C. McDougal, *Decade of Missouri politics, 1860-1870 (Missouri Historical Review, Jan., 1909)*.

1865-1920.—Progress of education.—"The General Assembly in 1830 passed what was known as the Geyer Act. In reality this made provision for a complete state [school] system, and it should be stated that Missouri's school system . . . may be said to have had its origin in the content of this legislation. The provisions of this act provided for the constitution of the common school fund of the State, county school funds and township funds. . . . The law required that the distribution of moneys should be based on the number of white children between the ages of eight and sixteen years. This remained the school age until the second constitution was adopted in 1865, when the age limits were changed so as to include all persons between five and twenty-one years.

The constitution of 1875 required the State to provide gratuitous instruction for all persons between six and twenty years of age. The first one of these laws made provision only for white children. The constitution of 1865 especially provides for separate schools for the children of African descent; so does the constitution of 1875. The laws enacted in 1839 also made provision for a state university with limitations. Consequently we have a state system mapped out. However, it should be called a 'paper system' for it was really never put into operation. . . . The constitution of 1865 had a very elaborate article on education. . . . Under State Superintendent Parker a very elaborate school code was provided and presented to the General Assembly. . . . The constitution of 1875 was such as to allow the provisions of the new laws enacted in 1874 to remain in force or to be re-enacted. . . . Since the constitution of 1875 was adopted, . . . the General Assembly has enacted a good many statutes concerning education. In 1870 the law providing for normal schools was adopted. In 1903 the General Assembly passed a law providing for the inspection of high schools, thru which the high schools obtained a legal status. . . . Teachers' institutes were made mandatory under the Wolfe laws, which were passed in 1890 and some form of county teachers' association has been compulsory since that time. In 1905 a compulsory attendance law was enacted, requiring all school children between the ages of eight and fourteen to attend not less than three-fourths of the school term. In 1890 the General Assembly passed the first important consolidation law. In 1909 the General Assembly passed the special state aid law for weak districts. At various times this law has been amended until now it is possible for weak districts to secure \$200.00 directly from the state funds. Another very important law was passed by the General Assembly in 1909 which made provision for state-wide county supervision. The county superintendent's office had been abolished in 1872 and the State Legislature had passed a local option county supervision law. However, from 1872 until 1909 only twenty-two counties had availed themselves of the option. The new law made it mandatory for each county to select a county superintendent and gave a state subsidy of \$400.00 to help his salary. The General Assembly in 1913 enacted several very important pieces of legislation. At this time the teacher-training law for high schools was passed. . . . The principle of giving subsidies for special purposes in high schools and to enable certain communities to have high schools was established by the High School Aid Law. The free text book law and the school board convention law were enacted at this time. In 1917 a law was passed for the promotion of vocational education. This act was passed in order that the state might avail itself of the privileges and benefits of the Federal Vocational Educational Law, known as the Smith-Hughes Act. . . . The secondary schools of Missouri would be classified broadly as academies and high schools. Very early the academies were organized thruout the State. . . . There were also organized many female seminaries, some of them being opened as early as 1820. . . . A number of the female seminaries are now the junior colleges of the state, of which there are at the present time sixteen. [Of the universities and colleges in the state St. Louis University was the first to be incorporated. This incorporation took place in 1832.] . . . At the present time [1920] there are three hundred and two first class high schools, one hundred and sixteen second class and one hundred and eighty-eight

third class, making a grand total of six hundred and six fully classified high schools in the State. . . . The most important development about the high school has been the democratized curriculum. . . . The normal schools of the State were organized in 1870. They were established under the authority of an act of the legislature in March, 1870. At this time two schools were established, one at Kirksville and one at Warrensburg. In 1873 a third school was established at Cape Girardeau and in 1905 two additional schools were established—one at Springfield and one at Maryville. These schools are under the control and management of boards of regents, appointed by the governor for a term of six years. During the existence of these schools more than 145,000 students have been enrolled in them and more than 23,000 licenses to teach have been issued by them."—C. A. Phillips, *Century of education in Missouri* (*Missouri Historical Review*, Jan., 1921).

1874-1875.—New constitution.—Some of its provisions.—"At the election of 1874 a convention to frame a new constitution was voted for. . . . [This convention] met in the Capitol May 5, 1875. . . . A thorough revision of the entire organic law of the State was made. The best provisions of the preceding constitutions were retained, but an entire new constitution was framed. It has from time to time been amended, notably in increasing the number of judges of the Supreme Court from five to seven, in increasing the number of courts of appeals from one to three, in giving county courts power to levy a tax of twenty-five cents on the hundred dollars' valuation to be used exclusively for improving public roads, in authorizing counties by vote of the people to issue bonds for building permanent roads, and in authorizing a prosecuting attorney to institute prosecutions in all felony cases by his information instead of solely upon indictment by a grand jury. . . . It prohibits the Legislature from imposing a debt upon the State in excess of two hundred and fifty thousand dollars unless it has first submitted to the people the act by which the debt is to be incurred and two-thirds of the voters at a special election ratify the act. . . . But it also provides that the Constitution might be amended by a majority of the qualified voters, and in late years two amendments, one authorizing the Legislature to enact a law directing the issuance of sixty millions of state bonds to be used in constructing permanent roads, and the other authorizing it to enact a law directing the issuance of fifteen million dollars of state bonds to be used as a reward or bonus to Missouri soldiers in the World War, were adopted. By that course the consent of only a majority, and not two-thirds, of the qualified voters is necessary to authorize a state debt; but in no case can a large state debt be incurred until the proposition is first submitted to the people and their approval obtained. It prohibits counties, cities and school districts from creating debts for any purpose except upon the consent of two-thirds of the qualified voters, and even with such consent it permits them to incur debts only for the purpose of erecting some sort of public improvements, such as school houses, jails, court houses, permanent roads, waterworks and light plants. It fixed maximum rates of taxation to pay current expenses, which neither the Legislature, county court nor city councils can exceed. The purpose of these various provisions was to compel the State and all its subdivisions

to practice economy and conduct their affairs on a cash basis. But they have been persistently assailed by certain persons, who claim they hamper and even prevent necessary public enterprise. On the other hand, it is asserted that they are the most valuable features of the Constitution, and are necessary to prevent waste and extravagance. Whether the Constitution should contain maximum limits upon taxation will always be a live issue in our politics. Upon the final vote in the Convention on the adoption of this Constitution, not a vote was recorded against it, and on the thirtieth of October it was adopted by the people, there being ninety-one thousand votes for it and only fourteen thousand five hundred against it. It went into effect November 30, 1875, and marked a new era in the State's history."—P. S. Rader, *History of Missouri*, pp. 189-191.

1874-1920.—Supremacy of Democratic party.—Brief lapses in authority.—“For more than 20 years after the victory of 1874 the Democrats enjoyed an unbroken series of victories at the polls in Missouri over their regular opponents, the Republicans. In 1894, owing to the Republican landslide that swept over the whole country, the Democrats suffered their first defeat, . . . the Republicans electing not only the state superintendent of schools, a supreme court justice, and the railroad and warehouse commissioner, but also a majority of the members of the house of representatives. In 1904 they elected the entire State ticket except the governor, and in 1908 they elected the governor. The Presidential election in both of these years was carried by the Republicans. With these exceptions the Democrats have remained in power in Missouri from 1874 down to the present time [1920].”—E. M. Violette, *History of Missouri*, p. 420.

1889.—Industrial arbitration board created. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1886-1920.

1899.—Destructive tornado.—A destructive tornado in northern Missouri, in April, did much damage in the towns of Kirksville and Newtown. Over fifty persons were killed.

1904.—Louisiana Purchase Exposition. See ST. LOUIS: 1904.

1904-1922.—Political character of the state.—Effect on legislation.—“The two important features of this period from 1904 to 1922 are the independence of the individual voter and the doubtful political character of Missouri. . . . During this period Missouri elected five governors, three of whom were Democrats and two Republicans. Missouri voted for five presidents, and three times she cast her vote for a Republican and two times for a Democrat. This indicates a doubtful state politically. Again, Missouri in 1904 elected a Democratic governor, and a Republican lieutenant-governor, legislature, and State officers; in 1908, a Republican governor, lieutenant-governor, and House of Representatives, and a Democratic Senate and State officers; in 1912, and in 1910, a Democratic governor, State officers, and legislature, except a Republican state auditor in 1916; in 1920, a Republican governor, state officers, and legislature; in 1906 and 1914, a Democratic state superintendent of schools, and in 1910 and 1918, a Republican state superintendent of schools. . . . The campaign of 1908 was one vigorously waged between the two old parties. The Republican candidate was Herbert S. Hadley of Kansas City. He had been elected attorney-general of Missouri in 1904. While holding this office he had made a state and national reputation in his prosecution of trusts, especially the Standard Oil Company. His

record elected him governor by a plurality of 16,000, but he did not receive a majority. . . . The Republican candidate for lieutenant-governor was finally declared elected by a very small plurality. . . . The state officers elected were Democrats, the Senate was Democratic, but the House of Representatives was Republican. This bipartisan character of the State government made it difficult to obtain important legislation. Much of the legislation was regulative or inspectional in character. These departments, commissions, and boards were created: a game and fish department, a food and drug commissioner, a department for inspection of petroleum oils, a board of public accountancy, a board of examination of nurses, a hotel inspection department, and a board of pharmacy. A court of appeals, the third in the state, was established at Springfield; a state industrial home for negro girls was provided for by law; a state poultry experiment station was established at Mountain Grove; a birth and death registration law was passed, and a state capitol commission was created. The State capitol burned in 1911, and the people authorized the issuance of \$3,500,000.00 in bonds to build and furnish a new capitol.”—F. C. Shoemaker, *History of Missouri and Missourians*, pp. 106-198.

1908.—Initiative and referendum adopted. See INITIATIVE AND REFERENDUM: Development in the United States.

1912-1914.—Campaign for single tax.—Resistance of farmers.—Failure of campaign.—Attempt to destroy initiative and referendum.—“The single taxers of Missouri, by initiative petition, submitted to the voters of the state at the election of November, 1912, a proposed constitutional amendment prescribing for the state a tax system embodying a considerable measure of the single tax. The transition to the proposed system was to be gradual. The amendment provided for the immediate exemption from taxation of bonds issued by the state of Missouri or its local units; for the exemption of personal property from state and local taxation, the abolition of poll and license taxes (excepting licenses imposed for purposes of restriction or regulation, and the exemption from state and local taxation of improvements on homesteads to the value of \$3,000, these provisions to take effect beginning with 1914; and for the exemption from all taxes, state and local, of one-fourth of the value of ‘all improvements in or on lands’ in the years 1914 and 1915, one-half in 1916 and 1917, three-fourths in 1918 and 1919, and the whole in 1920 and thereafter. The amendment also provided specifically that land, with which was classed ‘all franchises for public service utilities,’ should never be exempt from taxation, and contained a proviso that ‘nothing in this Amendment shall be construed as limiting or denying the power of the State to tax any form of franchise, privilege or inheritance.’ Existing limitations upon the tax rate were to be repealed. Another amendment proposed the creation of a permanent tax commission of the type found in many other states. . . . Seldom has the proposal of a law stirred up such bitter opposition as did this single tax measure. Its opponents formed several organizations to fight it. . . . The platforms of the two older parties condemned the amendment, and the Progressive candidate for governor declared against it. The State Federation of Labor was practically the only non-single tax organization to support it. But the real opposition came from the farmers. They formed an organization and raised \$50,000 at the first meeting. They believed thoroughly that the single tax was a measure designed to

lighten the taxes of the rich city man by adding to those of the already heavily-burdened agriculturist. They resented, too, the fact that the campaign was largely supported from without the state by means of the Fels Fund money. . . . There was no doubt as to the decisiveness of the verdict of the Missouri electorate. The amendment received 87,000 votes, fourteen and a half per cent of the total, while 508,000 were polled against it. . . . A sequel to the single tax fight was an attempt made in 1914 to secure an amendment to the constitution of Missouri which would prevent a popular vote upon any measure relating to taxation. . . . It was proposed to amend that part of the constitution relating to the initiative and referendum. . . . However, the so-called 'anti-single tax amendment' was beaten decisively, 138,000 votes being cast for it, and 334,000 against it."—A. N. Young, *Single tax movement in the United States*, pp. 191, 193, 197.

1912-1920.—**Legislation.**—"In 1912 the Republican party split. . . . In Missouri the Republicans nominated J. C. McKinley for governor, the Progressives, Albert D. Nortoni, and the Democrats, Elliott W. Major. The Democratic candidate was elected by a plurality of 119,000, which was the next to the largest plurality ever received by a Missouri governor. . . . The important laws passed during his term were, first, those providing State aid to small high schools and weak common schools, and second, an act creating the state public service commission to control rates and service of telephone, railroad, street railway, light, and gas companies. A state board of pardon and paroles, a state highway department, a land reclamation department, a commission for the blind, and a children's code commission, were established. In 1913 the Seventeenth amendment to the United States Constitution was adopted providing for the election of United States senators by direct vote of the people. The State began to take a new interest in better highways at this time. . . . [In the 1916 campaign] the Democratic candidate for governor was Frederick D. Gardner of St. Louis. The Republican candidate was Judge Henry Lamm of Sedalia. The Democrats carried the State. . . . The Legislature was also Democratic. . . . Governor Gardner received a plurality of 2,000. . . . He became interested in the high interest rates charged farmers for money they borrowed and proposed a state farmer's land bank. This proposal, combined with a well conducted campaign on the basis of a business man for governor, secured for Governor Gardner both his nomination and his election. . . . The first two years of Governor Gardner's administration were largely filled with war activities throughout the State. . . . Legislative acts aside from war legislation provided for the creation of a state tax commission, a state prison board, abolition of the contract system in the penitentiary, a statewide mother's pension law [see below: 1913-1919], and a local tax levy for county hospitals. . . . The 1918 election gave the Republicans control of the House of Representatives in Missouri. They also elected the state superintendent of public schools. . . . The campaign of 1920 was waged on the issues growing out of the world war. Some of these were political as the League of Nations, others were economic as the high prices, which reached the highest level since 1864. The war closed in November 1918 and a post war boom began in 1919 and continued until the fall of 1920. . . . The election of 1920 resulted in a victory for the Republicans never equalled in the nation or in the State. Both houses of Congress

and the presidency went Republican, and Missouri, for the first time in fifty years, elected a Republican Legislature in both houses. All the state offices were Republican and Governor Hyde of Trenton, the Republican candidate, was elected by a majority of 57,000 and a plurality of 141,000. . . . At this election a number of amendments to the constitution were adopted. One permitted Kansas City to frame a new charter, one permitted road districts to vote increased taxes for roads, and another authorized the state to issue \$6,000,000 of road bonds. An amendment was adopted authorizing pensions for the blind, and another authorized a bond issue of \$1,000,000 for creating a soldiers' settlement fund. A 'bone dry' enforcement prohibition act passed by the 1919 Legislature was approved on a referendum vote and an initiative measure providing for a vote on holding a State constitutional convention carried."—F. C. Shoemaker, *History of Missouri and Missourians*, pp. 199, 201, 203, 205-206.

1913-1919.—**Child welfare legislation.**—**State-wide juvenile courts established.**—**Mothers' pension law.**—**Adoption of children made court proceeding.**—"The state-wide mothers' pension law, very comprehensive in its provisions, was passed in 1917. This law is one of the few laws of the kind in the country which enables the unmarried mother to receive a pension. Efforts have been made by social workers to persuade the state to establish a state school for dependent children, but owing to the cost of such an institution it was decided to work for a Children's Bureau connected with the State Board of Charities. This effort succeeded in 1913 and the Bureau began to operate with the prospect of excellent success when a curtailment of appropriations rendered the Bureau inactive. . . . Among recent reforms, however, may be mentioned the adoption law of 1917, which abolishes the old method and substitutes in its place a plan whereby an investigation by the juvenile court and a court decree are preliminary to the actual adoption of children. . . . For a number of years the state had but six juvenile courts, but in 1913 a new measure was enacted providing for such courts throughout the state. The jurisdiction of juvenile delinquents was placed in the probate court and a number of juvenile courts were established. The constitutionality of the law was tested and the supreme court finally declared the law invalid. As a consequence, new legislation became necessary and this was enacted in 1917. In the majority of cities, probation officers have in recent years been appointed and the methods and program of the juvenile court are being instituted. Jackson county and the city of St. Louis have made local provision for the care of the minor juvenile delinquents and the three state institutions are providing institutional care for delinquents throughout the remainder of the state. Until the advent of juvenile courts, comparatively small children were being sent from the counties to these institutions, but the development of a system of probation has lessened the tendency to do this. Furthermore, in 1910, neglected children were prohibited by law from being sent to the state institutions. . . . Increased protection is being afforded young girls through the changes effected in the age of consent which was raised in 1913 to fifteen years. . . . In order that the child welfare legislation of the state might be properly co-ordinated an attempt was made by the social workers to secure an appointment of a Children's Code Commission. Such a commission consisting of members of the State Legislature was authorized in 1915, but no appropria-

tions being available for the carrying on of the work, the attempt failed. Subsequently, a voluntary commission of twenty-three citizens was appointed by the Governor. This commission studied the laws of the state and the conditions relating to child welfare and presented a report to the Legislature of 1917 embodying its conclusions. Over forty bills were advocated, but only ten of these were enacted into law. In 1917 a second Children's Code Commission was appointed in a similar way and this group extended the investigations and the work of the previous commission. It reported forty-one bills of which twenty were enacted into law.—G. B. Mangold, *Social reform in Missouri during the last century* (*Missouri Historical Review*, Oct., 1920).

1917-1918.—Part played in World War.—Missouri "furnished to the land forces of the nation after the declaration of war, 128,000 civilian soldiers including all branches of the service, to the marine corps 3,400, and to the navy 6,910, a total of 138,310. . . . The entire National Guard was mobilized on the state rifle range near Nevada on August 5, 1917. . . . On September 28th the troops entrained for Camp Doniphan, Oklahoma, and were there consolidated with the Kansas National Guard, the combined National Guard of Missouri and Kansas constituting the 35th Division, this state furnishing about two-thirds and Kansas one-third of its strength."—H. C. Clark, *Missourians in service* (*Missouri Historical Review*, Oct., 1919).

1919.—Presidential Suffrage Bill passed.—Susan B. Anthony amendment ratified.—"The Fiftieth General Assembly has not only passed the Presidential Suffrage bill giving to Missouri women the right to vote for Presidential electors, but in a special session, July, 1919, it ratified the Susan B. Anthony Amendment to the Federal Constitution which declares that the right to vote shall not be denied to anyone because of sex. . . . Missouri [was] the eleventh state to grant Presidential suffrage to its women and the eleventh state to ratify the Federal Amendment."—E. N. Blair, *Foreword to history of woman suffrage movement in Missouri* (*Missouri Historical Review*, Apr.-July, 1920).

1921.—Budget system.—Missouri has created a department of budget which in addition to the compilation of the budget has the duties of the former tax commissioner, and supervision over purchasing and printing. The department is divided into two bureaus: a bureau of purchase, and a bureau of taxation and estimate. The department head is appointed by the governor subject to the approval of the senate.

MITHRADATES THE GREAT (Mithridates) (c. 134-63 B.C.), king of Pontus, c. 121-63 B.C. Received an excellent Greek education; cultivated arts and sciences; subdued tribes on northern coast of Euxine; waged three wars with the Romans by whom he was considered the most formidable opponent in the East. See BACTRIA; BOSPORUS, CIMMERIAN: The city and kingdom; CYZICUS: B.C. 74; MITHRADATIC WARS; RHODES, ISLAND OF: B.C. 88.

MITHRADATIC WARS.—A somewhat vaguely defined part of eastern Asia Minor, between Armenia, Phrygia, Cilicia and the Euxine, was called Cappadocia in times anterior to 363 B.C. Like its neighbors, it had fallen under the rule of the Persians and formed a province of their empire, ruled by hereditary satraps. In the year above named, the then reigning satrap, Ariobarzanes, rebelled and made himself king of the northern coast district of Cappadocia, while the southern and inland part was retained under Persian rule. The kingdom founded by Ariobarzanes took the name of Pontus, from the sea on which it bordered. It was reduced to submission by Alexander the Great, but regained independence during the wars between Alexander's successors (see MACEDONIA: B.C. 310-301; SELEUCIDÆ: B.C. 281-224), and extended its limits towards the west and south. The kingdom of Pontus, however, only rose to importance in history under the powerful sovereignty of Mithradates V who took the title of Eupator and is often called Mithradates the Great. He ascended the throne while a child, 120 B.C., but received notwithstanding, a wonderful education and training. At the age of twenty (112 B.C.) he entered upon a career of conquest, which was intended to strengthen his power for the struggle with Rome, which he saw to be inevitable. Within a period of about seven years he extended his dominions around the nearly complete circuit of the Euxine, through Armenia, Colchis, and along the northern coasts westward to the Crimea and the Dniester; while at the same time he formed alliances with the barbarous tribes on the Danube, with which he hoped to threaten Italy.—Based on G. Rawlinson, *Manual of ancient history*, bk. 4, period 3, pt. 4—"He rivalled Hannibal in his unquenchable hatred to Rome. This hatred had its origin in the revocation of a district of Phrygia which the Senate had granted to his father. . . . To his banner clustered a quarter of a million of the fierce warriors of the Caucasus and the Scythian steppes and of his own Hellenized Pontic soldiers; Greek captains. In whom he had a confidence unshaken by disaster—Archelaus, Neoptolemus, Dorilaus—gave tactical strength to his forces. He was allied, too, with the Armenian king, Tigranes; and he now turned his thoughts to Numidia, Syria, and Egypt with the intention of forming a coalition against his foe on the Tiber. A coin has been found which

commemorated an alliance proposed between the Pontic king and the Italian rebels. . . . The imperious folly of M'. Aquilius, the Roman envoy in the East, precipitated the intentions of the king; instead of contending for the principedom of Bithynia and Cappadocia, he suddenly appealed to the disaffected in the Roman province. The fierce white fire of Asiatic hate shot out simultaneously through the length and breadth of the country [88 B.C.]; and the awful news came to distracted Rome that 80,000 Italians had fallen victims to the vengeance of the provincials. Terror-stricken publicani were chased from Adramyttium and Ephesus into the sea, their only refuge, and there cut down by their pursuers; the Mæander was rolling along the corpses of the Italians of Tralles; in Caria the refined cruelty of the oppressed people was butchering the children before the eyes of father and mother, then the mother before the eyes of her husband, and giving to the man death as the crown and the relief of his torture. . . . Asia was lost to Rome; only Rhodes, which had retained her independence, remained faithful to her great ally. The Pontic fleet, under Archelaus, appeared at Delos, and carried thence 2,000 talents to Athens, offering to that imperial city the government of her ancient tributary. This politic measure awakened hopes of independence in Greece. Aristion, an Epicurean philosopher, seized the reins of power in Athens, and Archelaus repaired the crumbling battlements of the Piræus. The wave of eastern conquest was rolling on towards Italy itself. The proconsul Sulla marched to Brundisium, and, undeterred by the ominous news that his consular colleague, Q. Rufus, had been murdered in Picenum, or by the sinister attitude of the new consul Cinna, he crossed over to Greece with five legions to stem the advancing wave. History knows no more magnificent illustration of cool, self-restrained, determination than the action of Sulla during these three years." He left Rome to his enemies, the fierce faction of Marius, who were prompt to seize the city and to fill it with "wailing for the dead, or with the more terrible silence which followed a complete massacre. [See *ROME: Republic: B. C. 88-78*]. . . . The news of this carnival of democracy reached the camp of Sulla along with innumerable noble fugitives who had escaped the Marian terror. The proconsul was unmoved; with unexampled self-confidence he began to assume that he and his constituted Rome, while the Forum and Curia were filled with lawless anarchists, who would soon have to be dealt with. He carried Athens by assault, and slew the whole population, with their tyrant Aristion [see *ATHENS: B. C. 87-86*], but he counted it among the favours of the goddess of Fortune that he, man of culture as he was, was able to save the immemorial buildings of the city from the fate of Syracuse or Corinth. Archelaus, in Piræus, offered the most heroic resistance. . . . With the spring Sulla heard of the approach of the main army from Pontus, under the command of Taxiles, 120,000 men, and ninety scythed chariots, were pouring over Mount Eta to overwhelm him. With wonderful rapidity he marched northwards through friendly Thebes, and drew up his little army on a slope near Chæronea, digging trenches on his left and right to save his flank from being turned. He showed himself every inch a general, he compelled the enemy to meet him on this ground of his own choice, and the day did not close before 110,000 of the enemy were captured or slain, and the camp of Archelaus, who had hastened from Athens to take the command, was

carried by assault. We have before us still, in the pages of Plutarch, Sulla's own memoirs. If we may believe him, he lost only fifteen men in the battle. By this brilliant engagement he had restored Greece to her allegiance, and, what was even better, the disaster aroused all the savagery of Mithradates, the Greek vanished in the oriental despot. Suspicious and ruthless, he ordered his nearest friends to be assassinated; he transported all the population of Chios to the mainland, and by his violence and exaction stirred Ephesus, Sardes, Tralles, and many other cities, to renounce his control, and to return to the Roman government. Still, he did not suspect Archelaus, but appointed him, together with Dorilaus, to lead a new army into Greece. The new army appeared in Bœotia, and encamped by the Copiac Lake, near Orchomenos. Before the raw levies could become familiar with the sight of the legions, Sulla assaulted the camp [85 B.C.], and rallied his wavering men by leading them in person with the cry, 'Go, tell them in Rome that you left your general in the trenches of Orchomenos;' the self-consciousness was sublime, for nothing would have pleased the people in Rome better; his victory was complete, and Archelaus escaped alone in a boat to Calchis. [See *GREECE: B. C. 146-A. D. 180.*] As the conqueror returned from the battlefield to reorganize Greece, he learnt that the Senate had deposed him from command, declared him an outlaw, and appointed as his successor the consul L. Valerius Flaccus. The disorganization of the republic seemed to have reached a climax. Flaccus conducted his army straight to the Bosphorus without venturing to approach the rebel proconsul Sulla; while Mithradates, who began to wish for peace, preferred to negotiate with his conqueror rather than with the consul of the republic. To complete this complication of anarchy, Flaccus was murdered, and superseded in the command by his own legate, C. Flavius Fimbria; this choice of their general by the legions themselves might seem significant if anything could be significant or connected in such a chaos. But Sulla now crossed into Asia, and concluded peace with Mithradates on these conditions: The king was to relinquish all his conquests, surrender deserters, restore the people of Chios, pay 2,000 talents, and give up seventy of his ships. Fimbria . . . remained to be dealt with. It was not a difficult matter: the two Roman armies confronted one another at Thyatira, and the Fimbrians streamed over to Sulla. After all, the legionaries, who had long ceased to be citizens, were soldiers first and politicians after; they worshipped the felicity of the great general; and the democratic general had not yet appeared who could bind his men to him by a spell stronger than Sulla's. Fimbria persuaded a slave to thrust him through with his sword. His enemies were vanquished in Asia, but in Rome Cinna was again consul (85 B.C.), and his colleague, Cn. Papirius Carbo, out-Cinnaed Cinna. Yet Sulla was in no hurry. He spent more than a year in reorganizing the disordered province. . . . He even allowed Cinna and Carbo, who began to prepare for war with him (84 B.C.), to be re-elected to the consulship; but when the more cautious party in the Senate entered into negotiations with him, and offered him a safe conduct to Italy, he showed in a word what he took to be the nature of the situation by saying that he was not in need of their safe conduct, but he was coming to secure them."—R. F. Horton, *History of the Romans*, ch. 26.—Plutarch, *Sulla*.—After a second and a third war with Rome (see *ROME: Republic: B. C. 78-63; 69-63*),

Mithradates was finally (65 B. C.) driven from his old dominions into the Crimean kingdom of Bosphorus, where he ended his life in despair two years later. The kingdom of Pontus was absorbed in the Roman empire. The southern part of Cappadocia held some rank as an independent kingdom until 17 A. D., when it was likewise reduced to the state of a Roman province.—See also AMISUS; CYZICUS: B. C. 74; POMPEIUS, GNAEUS MAGNUS; In the East.

MITHRAISM.—"Mithra was an old Aryan sun-god. His cult was a survival of those heathen elements of Persia which Zoroaster had been unable to suppress. As it developed on Persian soil, it took on the dualistic tendencies of later Zoroastrianism—the belief in Ahriman, and in angels and demons, together with the idea of perpetual strife between the good and the evil. By the time the cult reached the West it had been deeply penetrated by Babylonian sidereal conceptions, as well as its systems of conjuration. Mithraism also brought from Persia the general features of Zoroastrian eschatology. Its devotees believed in a very real heaven and hell. It developed a rich liturgy, with initiations, sacraments, and love-feasts. It recognized in an emphatic way the evil of the world with which men were impressed in the early centuries of our era, and offered a plausible explanation of it; it confronted the individual with the alternative of a happy heaven or an endless hell, and it offered mystic means of grace by which heaven could be secured. Moreover, the cult was very adaptable. In Babylonia, Mithra was Shamash under another name; in Rome he was Jupiter; in Syria, Baal. Wherever it spread it adapted itself to the local surroundings and absorbed the important features of the local cult. The introduction of Mithraism into Rome dates from her conquests of Asia Minor and Mesopotamia. Though there is said to have been a congregation of Mithra's votaries in Rome in the time of Pompey in 67 B. C., the real diffusion of his mysteries began with the Flavians in the last quarter of the first century A. D. Mithraism became more important under the Antonines in the second century, and still more so under the Severi in the third. At the beginning of the fourth century Mithra seemed on the point of eclipsing all rivals, for in 307 A. D. Diocletian, Galerius, and Licinius met at Carnuntum on the banks of the Danube and dedicated a sanctuary to Mithra, 'the protector of their empire.' Indeed, when Constantine accepted the sign of the cross, as told in the well-known legend, it is doubtful whether he was able to distinguish between the cross of the Galilean and the wheel-like sun disk, the symbol of Mithra. Of all the mystery-religions the cult of Mithra was the purest and most austere. It contained no impure ceremonies and nothing ethically repulsive. It exceeded the others in moral elevation, and was well calculated to gratify the imagination, appeal to the heart, and stimulate the moral instincts."—G. A. Barton, *Religions of the world*, pp. 283-284.—See also RELIGION: B. C. 750-A. D. 30.

MITLA, or Mictlan, a ruin about thirty miles from Oaxaca city in southern Mexico. Mitla is an Aztec word meaning "place of the dead." It was the burial city of the Zapotec kings and priests. The ruins of Mitla, sacred Zapotec city, "are distinguished by many peculiarities which render them almost unique. Here the quadrangular arrangement of building round courts attains its most definite

form. In two cases one of these buildings, on the east side, is a pyramid, and therefore presumably approached, as usual, from the west. The rest consists of long low buildings upon terraces, opening as a rule only upon the court which they surround, though in two cases one such building gives access at the back to another court, entirely enclosed by similar buildings, which has no other entrance. The material is rubble, faced with trachyte blocks set in mortar; the wall-surfaces are broken by sunk panels filled with the mosaic geometrical ornament which gives this site a character of its own. . . . Each block constituting the mosaic bears on its face in relief some detail entering into the design, but the blocks are not uniform, and each therefore was cut and fitted to its particular place, a method entailing enormous labour, especially when it is realized that over eighty thousand were employed in the ornamentation of one quadrangle alone. . . . Large masses of stone were used in construction, such as lintels from ten to twenty feet long and weighing from ten to fifteen tons, as well as cylindrical pillars used to support the roof in the broader buildings."—T. A. Joyce, *Mexican archaeology*, pp. 177-178.—See also ZAPOTEC.

MLAVA, or Mlawa, town in Poland, formerly in Russia, about fifty miles south of Königsberg. It was the scene of heavy fighting between the Germans and Russians during the World War, and was captured by the former in September, 1914. See WORLD WAR: 1915: III. Eastern front: h, 1.

MNESICLES, Greek architect. Built the Propylæa of the Acropolis, which was begun about 437 B. C. See ACROPOLIS OF ATHENS.

MNOITAE, serfs of ancient Crete. See ÆGEAN CIVILIZATION: Minoan Age: B. C. 1200-750.

MOABITES, MOABITE STONE.—As related in Genesis, 19:37, Moab was the son of Lot's eldest daughter and the ancient people called Moabites were descended from him. They occupied at an early time the rich table-land or highlands on the east side of the Dead sea; but the Amorites drove them out of the richer northern part of this territory into its southern half, where they occupied a very narrow domain, but one easily defended. [See CHRISTIANITY: Map of Sinaitic peninsula.] This occurred shortly before the coming of the Israelites into Canaan. Between the Moabites and the Israelites, after the settlement of the latter, there was frequent war, but sometimes relations both peaceful and friendly. David finally subjugated their nation, in a war of peculiar atrocity. After the division of the kingdoms, Moab was subject to Israel, but revolted on the death of Ahab and was nearly destroyed in the horrible war which followed. The Biblical account of this war is given in ii Kings, 3. It is strangely supplemented and filled out by a Moabite record—the famous Moabite Stone—found and deciphered within recent times, under the following circumstance. Dr. Klein, a German missionary, travelling in 1869 in what was formerly the "Land of Moab," discovered a stone of black basalt bearing a long inscription in Phœnician characters. He copied a small part of it and made his discovery known. The Prussian gov-

ernment opened negotiations for the purchase of the stone, and M. Clermont-Ganneau, of the French consulate at Jerusalem, made efforts likewise to secure it for his own country. Meantime, very fortunately, the latter sent men to take impressions—squeezes, as they are called—of the inscription, which was imperfectly done. But these imperfect squeezes proved invaluable; for the Arabs, finding the stone to be a covetable thing, and fearing that it was to be taken from them, crumbled it into fragments with the aid of fire and water. Most of the pieces were subsequently recovered, and were put together by the help of M. Clermont-Ganneau's squeezes, so that an important part of the inscription was deciphered in the end. It was found to be a record by Mesha, king of Moab, of the war with Israel referred to above.—A. H. Sayce, *Fresh light from the ancient monuments*, ch. 4.—The Moabites appear to have recovered from the blow, but not much of their subsequent history is known.—Based on G. Grove, *Dictionary of the Bible*.—See also AMALEKITES; AMMONITES; JEWS; Conquest of Canaan; Early Hebrew history; Israel under the judges.

MODOCS (Klamaths): Their California and Oregon neighbors.—"The principal tribes occupying this region [of Northern California from Rogue River on the north to the Eel River, south] are the Klamaths, who live on the head waters of the river and on the shores of the lake of that name; the Modocs, on Lower Klamath Lake and along Lost River; the Shastas, to the south-west of the Lakes; the Pitt River Indians; the Eurocs, on the Klamath River between Weitspek and the coast; the Cahrocs, on the Klamath River from a short distance above the junction of the Trinity to the Klamath Mountains; the Hoopahs [or Hupas, a tribe of the Athapascan family] in Hoopah Valley on the Trinity near its junction with the Klamath; numerous tribes on the coast from Eel River and Humboldt Bay north, such as the Weeyots, Wallies, Tolewahs, etc., and the Rogue River Indians, on and about the river of that name. The Northern Californians are in every way superior to the central and southern tribes."—H. H. Bancroft, *Native races of the Pacific states*, v. 1, ch. 4.—"On the Klamath there live three distinct tribes, called the Yú-rok, Ká-rok, and Mó-dok, which names are said to mean, respectively, 'down the river,' 'up the river,' and 'head of the river.' . . . The Károk are probably the finest tribe in California. . . . Hoopa Valley, on the Lower Trinity, is the home of [the Hú-pá]. Next after the Ká-rok they are the finest race in all that region, and they even excel them in their statecraft, and in the singular influence, or perhaps brute force, which they exercise over the vicinal tribes. They are the Romans of Northern California in their valor and their wide-reaching dominions; they are the French in the extended diffusion of their language. [The Modocs] on the whole . . . are rather a cloddish, indolent, ordinarily good-natured race, but treacherous at bottom, sullen when angered, notorious for keeping Punic faith. But their bravery nobody can impeach or deny; their heroic and long defense of their stronghold against the appliances of modern civilized warfare, including that arm so awful to savages—the artillery—was almost the only feature that lent respectability to their wretched tragedy of the Lava Beds [1873]."—S. Powers, *Tribes of California (Contributions to North American ethnology, v. 3, ch. 1, 7, 27)*.—See also U.S.A.: 1866-1876.—"The home of the Klamath tribe of southwestern Oregon lies upon the eastern slope of the southern extremity of the Cascade Range, and very nearly coincides with what we may call the head waters of the Klamath River, the main course of which lies in Northern California. . . . The main seat of the Modoc people was the valley of Lost River, the shores of Tule and of Little Klamath Lake. . . . The two main bodies forming the Klamath people are: (1) the Klamath Lake Indians; (2) the Modoc Indians. The Klamath Lake Indians number more than twice as many as the Modoc Indians. They speak the northern dialect and form the northern chieftaincy. . . . The Klamath people possess no historic traditions going further back in time than a century, for the simple reason that there was a strict law prohibiting the mention of the person or

acts of a deceased individual by using his name. . . . Our present knowledge does not allow us to connect the Klamath language genealogically with any of the other languages compared, but . . . it stands as a linguistic family for itself."—A. S. Gatschet, *Klamath Indians (Contributions to North American ethnology, v. 2, pt. 1)*.—In Major Powell's linguistic classification, the Klamath and Modoc dialects are embraced in a family called the Lutuanian Family, derived from a Pit river word signifying "lake"; the Yuroks in a family called the Weitspekan; and the Pit river Indian dialects are provisionally set apart in a distinct family named the Palaihnihan Family.—Based on J. W. Powell, *Seventh annual report, Bureau of ethnology, pp. 89, 97*.

MOE, Jørgen (1813-1880), Norwegian poet and theologian. See SCANDINAVIAN LITERATURE: 1814-1900.

MOERIS, Lake.—"On the west of Egypt there is an oasis of cultivable land, the Fayum, buried in the midst of the desert, and attached by a sort of isthmus to the country watered by the Nile. In the centre of this oasis is a large plateau about the same level as the valley of the Nile; to the west, however, a considerable depression of the land produces a valley occupied by a natural lake more than ten leagues in length, the 'Birket Kerun.' In the centre of this plateau Amenemhe [twelfth dynasty] undertook the formation of an artificial lake with an area of ten millions of square metres. If the rise of the Nile was insufficient, the water was led into the lake and stored up for use, not only in the Fayum, but over the whole of the left bank of the Nile as far as the sea. If too large an inundation threatened the dykes, the vast reservoir of the artificial lake remained open, and when the lake itself overflowed, the surplus waters were led by a canal into the Birket Kerun. The two names given in Egypt to this admirable work of Amenemhe III. deserve to be recorded. Of one, Meri, that is 'the Lake,' par excellence, the Greeks have made Moeris, a name erroneously applied by them to a king; whilst the other, P-iom, 'the Sea,' has become, in the mouth of the Arabs, the name of the entire province, Fayum."—M. Mariette (Lenormant's *Manual of ancient history of the East, bk. 3, ch. 2*).

MÆSIA, or Mæsia.—"After the Danube had received the waters of the Teyss [Theiss] and the Save, it acquired, at least among the Greeks, the name of Ister. It formerly divided Mæsia and Dacia, the latter of which, as we have already seen, was a conquest of Trajan, and the only province beyond the river. . . . On the right hand of the Danube, Mæsia, . . . during the middle ages, was broken—into the barbarian kingdoms of Servia and Bulgaria."—E. Gibbon, *History of the decline and fall of the Roman empire, ch. I*.—See also BALKAN STATES: Geographical position; ROMÉ: Empire: B. C. 31-A. D. 14.

MOGONTIACUM.—"The two headquarters of the [Roman] army of the Rhine were always Vetera, near Wesel, and Mogontiacum, the modern Mentz. . . . Mogontiacum or Mentz, [was] from the time of Drusus down to the end of Rome the stronghold out of which the Romans sallied to attack Germany from Gaul, as it is at the present day the true barrier of Germany against France. Here the Romans, even after they had abandoned their rule in the region of the upper Rhine, generally retained not merely the tête-de-pont on the other bank, the 'castellum Mogontiacense' (Castel), but also that plain of the Main itself, in their possession; and in this region a Roman civilisation might establish itself. The land originally belonged to the Chatti, and a Chattan tribe, the Mattiaci, remained settled here even under Roman rule."—T. Mommsen, *History of Rome, bk. 8, ch. 4*.

MOGUL EMPIRE, Mohammedan Tatar empire in India founded by Baber in 1526. Under a succession of rulers it remained powerful until the death of Aurung-Zeb in 1707, when it was split up and the power passed to the Marhattas and the British. The last nominal ruler died in 1857.

MOHAMMEDANISM.—This great Oriental religion, founded by Mohammed, is estimated to number considerably over 200,000,000 "followers of the Prophet." Its origin dates from the year 622 A. D. The sources for the life of the Prophet appear to be very numerous, but critical inspection restricts them considerably. It is strange that so remarkable a personage should have lacked a contemporary biographer, some friend or admirer who aspired to the honor of recording events and collecting material until the time arrived when a large circle would welcome an exhaustive memoir conveying the truth about him. If the idea did not occur to an Arab, because no Arab had till then composed a biography or other prose monument, there were converts from the Jewish and Christian communities to whom models for such a performance must have been familiar. That no such memoir was attempted agrees with a tradition according to which the Koran tolerated no

written literature besides itself. Letters might be written and contracts, but a book would constitute a possible rival to God's book, and it was not permissible to write one. The contents of the Prophet's letters were afterwards cited, not from originals jealously guarded, but from some traditionalist's memory. These are, till the last years of his life, few, obscure and meagre. Collections which would have been of unique value to the historian, such as the correspondence of the Prophet with his agent at Medina before the Flight, have perished without leaving a trace. Towards the end of his life Mohammed carried on a diplomatic correspondence with the aid of official secretaries, of which rather more has come to our knowledge. What was done in lieu of compiling biographies was to remember casual sayings, or, long after the events, to get persons who had been present to narrate them. When the Prophet had delivered an oracle he ordinarily thought no more about it. There is no evidence that he kept any sort of record of his revelations; indeed, there is good evidence that he kept none. After his death the Koran had to be collected; it did not exist as a whole. "The generation which knew Mohammed was devoid of the historic sense and left no record of his doings and sayings except the one which is furnished in the imperfect collection of his sporadic utterances known as the Koran. . . . Out of the late and untrustworthy traditions, we can supplement the Koran by some details—but only enough to sketch his life in general outlines. He was born of humble parentage in Mecca and in all probability in the year 570 A. D. There is an isolated tradition that his real name was Kutam. Mohammed (or better Muhammad, 'the praised one' or 'blessed' appears to be an epithet given to him. His father's name was Abdallah (servant of Allah), though the second element may have been a substitute for the name of some Arab god; and his mother is said to have been Amina ('the faithful one'). At a tender age Mohammed was left an orphan, the care of whom devolved first on his grandfather, Abd el-Muttalib, and after the death of the latter upon his maternal uncle, Abu Talib. Of his early years we know nothing till as a young man he entered the service of a rich widow, Khadijah, and as her agent entered upon mercantile pursuits. He subsequently married the widow, though she was considerably older, and had a large family—three sons and four daughters. The sons appear to have died before reaching manhood. We next hear of him as a preacher, exhorting the people of Mecca to cast aside the traditional worship of gods and to recognize Allah as the one god of the universe. This, the burden of his message, is repeated in many keys and in endless variations throughout his public career. 'There is no god but Allah' becomes the inspiration of his life, while the corollary 'Mohammed is the messenger of Allah' merely emphasizes his position as the mouthpiece of Allah, sent to proclaim him to his own people, as at other times messengers had been sent to other peoples—notably to Jews and Christians. [See **RELIGION: 622**.] He appears to have been about forty years old when he first made his public appearance. The twenty-two years of his career as a 'warner' . . . are divided into two almost equal periods. The first twelve are spent in Mecca, where he succeeds in gathering a small circle of followers about him, but also arouses considerable opposition by his denunciation of established customs."—M. Jastrow, Jr., *Religions of the past and present*, p. 213.—"Slowly and gradually he makes converts in his native city; his good wife Khadijah, his faithful servant Zeyd, are the first to recognize

his mission; his young cousin, the noble Ali, the brave and generous and injured model of Arabian chivalry, declares himself his convert and Vizier; the prudent, moderate and bountiful Abu-Bekr acknowledges the pretensions of the daring innovator. Through mockery and persecution the Prophet keeps unflinchingly in his path; no threats, no injuries, hinder him from still preaching to his people the unity and the righteousness of God, and exhorting to a far purer and better morality than had ever been set before them. He claims no temporal power, no spiritual domination; he asks but for simple toleration, for free permission to win men by persuasion into the way of truth. . . . As yet at least his hands were not stained with blood, nor his inner life with lust."—E. A. Freeman, *History and conquests of the Saracens, lect. 2*.—After ten years of preaching at Mecca, and of a private circulation and repetition of the successive Suras or chapters of the Koran, as the prophet delivered them, Mohammed had gained but a small following, while the opposition to his doctrines and pretensions had gained strength. But in 620 (being then fifty years of age) he gained the ear of a company of pilgrims from Medina and won them to his faith. Returning home, they spread the gospel of Islam among their neighbors, and the disciples at Medina were soon strong enough in numbers to offer protection to their prophet and to his persecuted followers in Mecca. As the result of two pledges, famous in Mohammedan history, which were given by the men of Medina to Mohammed, in secret meetings at the hill of Acaba, a general emigration of the adherents of the new faith from Mecca to Medina took place in the spring of the year 622. Mohammed and his closest friend, Abu Bekr, having remained with their families until the last, escaped the rage of the Koreish, or Coreish, only by a secret flight and a concealment for three days in a cave on Mount Thaur, near Mecca. Their departure from the cave of Thaur, according to the most accepted reckoning, was on June 20, 622. This is the date of the Hegira, or flight, or emigration of Mohammed from Mecca to Medina. The Mohammedan era of the Hegira, "though referring 'par excellence' to the flight of the Prophet, . . . is also applicable to all his followers who emigrated to Medina prior to the capture of Mecca; and they are hence called Muhājirin, i. e., the Emigrants, or Refugees. We have seen that they commenced to emigrate from the beginning of Moharram (the first month of the Hegira era) two months before." The title of the Muhājirin, or Refugees, soon became an illustrious one, as did that of the Ansar, or Allies, of Medina, who received and protected them. At Medina Mohammed found himself strongly sustained. Before the year of his flight ended, he opened hostilities against the city which had rejected him, by attacking its Syrian caravans. The attacks were followed up and the traffic of Mecca greatly interfered with, until January, 624, when the famous battle of Bedr, or Badr, was fought, and the first great victory of the sword of Islam achieved. The 300 warriors of Bedr formed "the peerage of Islam." From this time the ascendancy of Mohammed was rapidly gained, and assumed a political as well as a religious character. His authority was established at Medina and his influence spread among the neighboring tribes. Nor was his cause more than temporarily depressed by a sharp defeat which he sustained, January, 625, in battle with the Koreish at Ohod. Two years later Medina was attacked and besieged by a great force of the Koreish and other tribes of Arabs and Jews, against the latter of whom Mohammed, after

vainly courting their adhesion and recognition, had turned with relentless hostility. The siege failed and the retreat of the enemy was hastened by a timely storm. In the next year Mohammed extorted from the Koreish a treaty, known as the Truce of Hodeibia, which suspended hostilities for ten years and permitted the prophet and his followers to visit Mecca for three days in the following year. The pilgrimage to Mecca was made in the holy month, February, 629, and in 630 Mohammed found adherents enough within the city and outside of it to deliver the coveted shrine and capital of Arabia into his hands. Alleging a breach of the treaty of peace, he marched against the city with an army of 10,000 men, and it was surrendered to him by his obstinate opponent, Abu Sohān, who acknowledged, at last, the divine commission of Mohammed and became a disciple. The idols in the Kaaba were thrown down and the ancient temple dedicated to the worship of the one God. (See KAABA.) The conquest of Mecca was followed within no long time by the submission of the whole Arabic peninsula. The most obstinate in resisting were the great Bedouin tribe of the Hawazin, in the hill country, southeast of Mecca, with their kindred, the Bani Thackif. These were crushed in the important battle of Honein, and their strong city of Tayif was afterwards taken. Before Mohammed died, on June 8, 632, he was the prince as well as the prophet of Arabia, and his armies, passing the Syrian borders, had already encountered the Romans, though not gloriously, in a battle fought at Muta, not far from the Dead sea.—Based on W. Muir, *Life of Mahomet*.

"The last year of Mohammed's life was spent in [Medina]. . . . He settled the organisation of the provinces and tribal communities which had adopted Islam and become the component parts of the Moslem federation. In fact, though the faith had not penetrated among the Arab races settled in Syria and Mesopotamia, most of whom were Christians, the whole of Arabia now followed the Islamic faith. Officers were sent to the provinces and to the various tribes for the purpose of teaching the people the duties of Islam, administering justice, and collecting the tithes or *zakat*."—Ameer Ali, *Spirit of Islam*, p. 115.—After the death of Mohammed the men of Medina elected Abu Bekr as his successor. "He was one of the earliest converts to Islam, a rich and prosperous man. Devoted to the Prophet, he had been his companion in the flight from Mecca, his wise supporter at the battle of Badr, his substitute as Imam at the public prayers during his last illness. At this time, though Islam was strong in Mecca and Medina, its hold on many of the Arab tribes was weak and some were already in revolt. No man was better fitted than Abu Bakr to rule in times so critical. He was gentle, yet strong; he had a profound respect for the memory of the Prophet and an intimate acquaintance with his plans, whilst his faith in the ultimate prosperity of Islam was absolute. Muhammad had said:—'In Arabia there shall be no second creed,' so Abu Bakr at once took action against all the malcontents. Museilama, a claimant of the Khaliphate, was beaten in the battle of Yemana. Abu Bakr saw that to get peace at home he must have war abroad; so he said:—'When a people leaveth off to fight in the name of the Lord, the Lord casteth off that people.' The Arabs were to go forth and conquer. Abu Bakr died in 634 A. D., but in the two short years of his reign, he put down with a firm hand rebellions at home and diverted the warlike spirit of the Bedouins from internal tumult to external war.

The desire for plunder suspended for a time the animosity of tribal feuds. Abu Bakr thus saved Islam from disruption."—E. Sell, *Islam: Its rise and progress*, pp. 53-54.—See also ABU BEKR; HISTORY: 21.

Moslem orthodoxy.—Faith and practical religion.—Authority and sufficiency of the Koran.—Observances.—Sects.—"The sumptuary prohibitions of Mohammed may be divided into two classes, *qualitative* and *quantitative*. The prohibition against excess in eating and drinking and others of the like import belong to the latter class. They were called forth in part by the peculiar semi-barbarous epicureanism which was coming into fashion among the Arabs from their intercourse with the demoralised Syrians and Persians, and in part by circumstances of which only glimpses are afforded us in the Koran. The absolute prohibition of swine's flesh, which may be classed under the head of qualitative prohibitions, arose, as is evident, from hygienic reasons and this prohibition must remain unchanged as long as the nature of the animal and the diseases engendered by the eating of the flesh remain as at present. The prohibition against dancing was directed against the orgiastic dances with which the heathen Arabs used to celebrate the Syro-Phœnician worship of their Ashtoreth, Moloch and Baal."—Ameer Ali, *Spirit of Islam*, p. 187.—"The religion founded by Mahomet is called Islam, a word meaning 'the entire surrender of the will to God'; its professors are called Mussulmans—'those who have surrendered themselves,' or 'Believers,' as opposed to the 'Rejectors' of the Divine messengers, who are named 'Kafirs,' or 'Mushrikîn,' that is, 'those who associate, are companions or sharers with the Deity.' Islam is sometimes divided under the two heads of Faith and Practical Religion. I. Faith (Iman) includes a belief in one God, omnipotent, omniscient, all-merciful, the author of all good; and in Mahomet as his prophet, expressed in the formula 'There is no God but God, and Mahomet is the Prophet of God.' It includes, also, a belief in the authority and sufficiency of the Koran, in angels, genii, and the devil, in the immortality of the soul, the resurrection, the day of judgment and in God's absolute decree for good and evil. II. Practical religion (Din) consists of five observances: (1) Recital of the formula of Belief, (2) Prayer with Ablution, (3) Fasting, (4) Almsgiving, (5) the Pilgrimage. . . . The standard of Moslem orthodoxy is essentially the Koran and to it primary reference is made; but . . . some more extended and discriminating code became necessary. The deficiency was supplied by the compilation of the 'Sunnah,' or Traditional Law, which is built upon the sayings and practices of Mahomet, and, in the opinion of the orthodox, is invested with the force of law, and with some of the authority of inspiration. . . . In cases where both the Koran and the Sunnah afford no exact precept, the 'Rule of Faith' in their dogmatic belief, as well as the decisions of their secular courts, is based upon the teaching of one of the four great Imams, or founders of the orthodox sects, according as one or another of these prevails in any particular country. . . . The great Sunni sect is divided among the orthodox schools mentioned above, and is so called from its reception of the 'Sunnah,' as having authority concurrent with and supplementary to the Koran. [See SUNNITES.] In this respect it differs essentially from the Shias, or partisans of the house of Ali [the nephew of Mohammed and husband of his daughter Fatima] who, adhering to their own traditions, reject the authority of the 'Sunnah.' [See SHITES.] These two sects, moreover, have certain observ-

ances and matters of belief peculiar to themselves, the chief of which is the Shia doctrine, that the sovereign Imam, or temporal and spiritual lordship over the faithful, was by divine right vested in Ali and in his descendants, through Hasan and Hosen, the children of Fatima, the daughter of the prophet. And thus the Persian Shias add to the formula of belief the confession, 'Ali is the Caliph of God.' In Persia the Shia doctrines prevail, and formerly so intense was sectarian hatred that the Sunni Mahometans paid a higher capitation tax there than the infidels. In Turkey the great majority are Sunni. In India the Shias number about one in twenty. The Shias, who reject this name, and call themselves Adliyah, or the 'Society of the Just,' are subdivided into a great variety of minor sects; but these . . . are united in asserting that the first three Caliphs, Abu Bekr, Omar, and Othman were usurpers, who had possessed themselves of the rightful and inalienable inheritance of Ali."—J. W. H. Stobart, *Islam and its founder*, ch. 10.—"The twelve Imams, or pontiffs, of the Persian creed, are Ali, Hassan, Hosen, and the lineal descendants of Hosen to the ninth generation. Without arms, or treasures, or subjects, they successively enjoyed the veneration of the people and provoked the jealousy of the reigning caliphs. . . . The twelfth and last of the Imams, conspicuous by the title of Mahadi [see MAHADI], or the Guide, surpassed the solitude and sanctity of his predecessors. He concealed himself in a cavern near Bagdad: the time and place of his death are unknown; and his votaries pretend that he still lives and will appear before the day of judgment."—E. Gibbon, *History of the decline and fall of the Roman empire*, ch. 50.—See also ETHICS: 5th-15th centuries; RELIGION: 622; ULEMA.—"Almost all the Mohammedan inhabitants of the Ottoman dominions and of Africa are Sunnites. They are divided into four Mezhebs, or principal sects, viz. the Hanafi, the Shafai, the Maliki, and the Hanabali. These sects differ on points of ritual, and as regards the interpretation of certain portions of the Mohammedan law. The Turks in Egypt belong to the Hanafite sect. Most of the Egyptians belong to the Shafai, but some few to the Maliki sect. Beneath these four main divisions are a number of Tarikas, or minor sects, which were called into existence at a later period of Islamism than the Mezhebs. They have generally been created, and are still being created, by persons noted for their piety and asceticism, who have, for the most part, recommended some special form of prayer or of ceremonial as being particularly efficacious. Some of the Tarikas have risen to considerable importance. Thus, the Wahabi sect caused at one time great political disturbance by reason both of the number and of the aggressive spirit of the sectarians. [See WAHHABIS.] The Sheikh El Mirghani also founded a large Tarika in the Eastern Soudan. The Sheikh El Senoussi is the head of one of the most important Tarikas which now exist. It has been estimated that his followers number no fewer than 3,000,000, who are scattered widely over the whole of Northern Africa. They are especially numerous in Wadai. In Egypt, the followers of Senoussi are also fairly numerous."—Lord Cromer, *Modern Egypt*, v. 2, p. 37.—See also AHMADIYA; ALMOHADES; ASSASSINS; AS-TURIAS; RELIGION: Ethnic and Catholic religions.

MOHOCKS.—After the Stuart restoration it became the fashion in London for dissolute young men to form themselves in clubs and associations for committing all sorts of excesses in the public streets. "These Clubs took various slang designations. At the Restoration they were 'Mums,' and 'Tityre-tus.' They were succeeded by the 'Hectors' and 'Scourers.' . . . Then came the 'Nickers,' whose delight it was to smash windows with showers of half-pence; next were the 'Ilawkabites;' and lastly the 'Mohocks.' These last were described in the 'Spectator,' No. 324, as a set of men who . . . took care to drink themselves to a pitch beyond reason or humanity, and then made a general sally, and attacked all who were in the streets. Some were knocked down, others stabbed, and others cut and carbonadoed. . . . They had special barbarities which they executed upon their prisoners. 'Tipping the lion' was squeezing the nose flat to the face and boring out the eyes with their fingers. 'Dancing-masters' were those who taught their scholars to cut capers by running swords through their legs. The 'Tumblers' set women on their heads. The 'Sweaters' worked in parties of half-a-dozen, surrounding their victims with the points of their swords. . . . Another savage diversion of the Mohocks was their thrusting women into barrels, and

rolling them down Snow or Ludgate Hill. . . . At length the villainies of the Mohocks were attempted to be put down by a Royal proclamation, issued on the 18th of March, 1712: this, however, had very little effect, for we soon find Swift exclaiming: 'They go on still and cut people's faces every night.' . . . The Mohocks held together until nearly the end of the reign of George I."—J. Timbs, *Clubs and club life in London*, pp. 33-38.

MOLTKE, Helmuth Johannes Ludwig, Count von (1848-1916), German general. Served as a lieutenant in the Franco-German War; became aide-camp to the emperor, 1891; chief of general staff, 1906-1914. See WORLD WAR: Diplomatic background: 4.

MOLTKE, Helmuth Karl Bernhard, Count von (1800-1891), German field marshal. Invited by the sultan of Turkey to undertake the reorganization of the Turkish army, 1835; directed the Schleswig-Holstein campaign, 1864, the Seven Weeks' War against Austria, 1866, and the Franco-German War, 1870-1871. See MILITARY ORGANIZATION: 20; 28; FRANCE: 1870: (July-August); (August-September); GERMANY: 1866; TURKEY: 1831-1840.

MOLUCCAS.—The general name of the Moluccas, or Spice islands, covers an extensive group between Celebes and New Guinea, the more important of which are Gilolo or Halmahera, Buru, Ceram or Serang, Ternate, Banda, and Amboyna. Nutmeg, clove and cardamom are the products which made the islands famous long before their whereabouts were discovered by the Portuguese in 1511. The Portuguese were expelled by the natives in 1583; but the Dutch came on the scene in 1613 and mastered the entire dominions of the sultans of Ternate and Tidore, who had been rulers of the whole group, as well as of Mindanao and northwestern New Guinea. The Dutch destroyed the spice trees in most of the islands, to limit and control the production, making Banda the seat of nutmeg culture and Amboyna that of the clove. From time to time the islands have been visited by earthquakes. In January, 1898, Amboyna, in the Molucca Islands, was almost destroyed. About 50 persons were killed and 200 injured. November 2, 1899, the island of Ceram was visited by an earthquake and a tidal wave. Many towns were destroyed, and 5,000 people killed.—See also MALAY ARCHIPELAGO: 1500; AMERICA: 1510-1524.

MONACO, Prince Albert of. See ALBERT, PRINCE OF MONACO.

MONACO.—Monaco, the smallest independent state in Europe, having an area of only eight square miles, is on the Mediterranean, about nine miles east of Nice, surrounded by French territory. It has been a principality of the Grimaldi family since 968. In 1792 the reigning prince was dispossessed by the French revolution, but in 1814 the principality was reconstituted, and placed under the protection of the King of Sardinia by the Treaty of Vienna in 1815. In 1861 the Sardinian garrison was removed and the protectorate ended. Until 1911 the Prince of Monaco was an absolute monarch. But in that year a constitution was promulgated, which provides for a national assembly elected by universal suffrage. Monaco is most famed for Monte Carlo, the greatest gambling center in Europe. The population of the principality in 1913 was 22,956.

MONAPIA, Roman name of the Isle of Man.

MONARCHY.—"If the supreme governing authority is vested in a single person, however numerous his subordinates, the form of government is said to be monarchical. Popular usage, however, considers any government having a hereditary executive to be a monarchy, even though its legislative department rests upon a popular basis. In short, popular usage makes the test the nature of the executive tenure and the tenure of the titular executive at that. Thus most of the governments of Europe are commonly styled monarchies, when in reality only the executive part of the government is constituted on the monarchical principle. The modern term 'monarchy,' as Sidgwick observes, is largely used to denote governments in which only a share of power is left to the single individual called the monarch. . . . In the typical monarchies, so called, of Europe, there is an hereditary chief of state and a legislative body, containing usually both aristocratic and democratic elements. Only in certain absolute states of Asia and Africa do we find anything approaching pure monarchical government, that is, one in which the ruling power is vested in the hands of a single person. [See CHINA: 1662-1838; 1915-1916.] On the basis of the source or tenure of the executive, monarchies may be classified as hereditary or elective, or they may be a combination of both. All of the monarchies of the present day are hereditary, though there have been many exceptions in the past. The early Roman kings were elective, as were the kings of the ancient monarchy of Poland. The head of the Holy Roman Empire, as is well known, was chosen by a small college of electors, though usually from the same family. Under the Treaty of Berlin, of 1878, the reigning prince of Bulgaria owed his throne to election. In general, it may be said that the installation of dynasties in newly formed states usually takes place through election, though the crown thereafter is generally transmitted according to certain rules of hereditary succession. It may also be stated as a general proposition that in the early history of states kings were generally chosen or in some way accepted in the first instance, though the hereditary feature was so strong that the elective principle was gradually pushed into the background. Speak-

ing of the election of the early English kings, Stubbs observes that 'the king was in theory always elected and the fact of election was stated in the coronation service throughout the Middle Ages in accordance with the most ancient precedent.' 'But, he adds, 'it is no less true that the succession was by constitutional practice restricted to one family, and that the rule of hereditary succession was never, except in great emergencies and in most trying times, set aside.' In a sense, of course, the English monarchy is still elective, since Parliament claims and exercises the right to regulate the law of succession at its pleasure. [See ENGLAND: 959-975; 1471-1485; 1687.] Again, monarchy may be either of the absolute type, in which case the monarch is sovereign, and state and government, legally and politically speaking, are identical, or it may be constitutional or limited in form. In the former case the monarch is bound by no will except his own; in the latter case he is bound by the prescriptions of a constitution which he has sworn to support, and hence the royal office is nothing but an organ of government. No examples of the former type of monarchy, as has been said, are found to-day outside of Asia and Africa. All of the so-called monarchies of continental Europe now have written constitutions, framed either by national assemblies representing the people, or granted by ruling sovereigns and accepted by the people. Monarchies may of course be still further subdivided, but little or nothing would be gained by extending the classification beyond hereditary and elective, absolute and limited types."—J. W. Garner, *Introduction to political science*, pp. 169-174.—See also ABSOLUTISM; ADMINISTRATIVE LAW; ARISTOCRACY; DEMOCRACY: In the Middle Ages; EUROPE: Modern: Era of benevolent despots; SOCIAL COMPACT.

MONASH, Sir John (1865-), Australian general. See WORLD WAR: 1918: II. Western front: c, 29.

MONASTERY.—"The very word monastery is a misnomer: the word is a Greek word, and means the dwelling-place of a solitary person, living in seclusion. . . . In the 13th century . . . a monastery meant what we now understand it to mean—viz., the abode of a society of men or women who lived together in common—who were supposed to partake of common meals; to sleep together in one common dormitory; to attend certain services together in their common church; to transact certain business or pursue certain employments in the sight and hearing of each other in the common cloister; and, when the end came, to be laid side by side in the common graveyard, where in theory none but members of the order could find a resting-place for their bones. When I say 'societies of men and women' I am again reminded that the other term, 'convent,' has somehow got to be used commonly in a mistaken sense. People use the word as if it signified a religious house tenanted exclusively by women. The truth is that a convent is nothing more than a Latin name for an association of persons who have come together with a view to live for a common object and to submit to certain rules in the ordering of their daily lives. The monastery was the common dwelling-place; the convent was the society of persons inhabiting it; and the ordinary formula used when a body of monks or nuns execute any corporate act—such as buying or selling land—by any legal instrument is, 'The Prior and Convent of the Monastery of the Holy Trinity at Norwich'; 'the Abbot and Convent of the Monastery of St. Peter's, Westminster'; 'the Abbess and Convent of the Monastery of St. Mary and St. Bernard

at Lacock,' and so on. . . . A monastery in theory then was, as it was called, a Religious House. It was supposed to be the home of people whose lives were passed in the worship of God, and in taking care of their own souls, and making themselves fit for a better world than this hereafter. . . . The church of a monastery was the heart of the place. It was not that the church was built for the monastery, but the monastery existed for the church. . . . Almost as essential to the idea of a monastery as the church was the cloister or great quadrangle, inclosed on all sides by the high walls of the monastic buildings. . . . All round this quadrangle ran a covered arcade, whose roof, leaning against the high walls, was supported on the inner side by an open trellis work in stone—often exhibiting great beauty of design and workmanship—through which light and air was admitted into the arcade. . . . The cloister was really the living place of the monks. Here they pursued their daily avocations, here they taught their school. . . . 'But surely a monk always lived in a cell, didn't he?' The sooner we get rid of that delusion the better. Be it understood that until Henry II. founded the Carthusian Abbey of Witham, in 1178, there was no such thing known in England as a monk's cell, as we understand the term. It was a peculiarity of the Carthusian order, and when it was first introduced it was regarded as a startling novelty for any privacy or anything approaching solitude to be tolerated in a monastery. The Carthusian system never found much favour in England. . . . At the time of the Norman Conquest it may be said that all English monks were professedly under one and the same Rule—the famous Benedictine Rule. The Rule of a monastery was the constitution or code of laws, which regulated the discipline of the house, and the Rule of St. Benedict dates back as far as the 6th century, though it was not introduced into England for more than 100 years after it had been adopted elsewhere. . . . About 150 years before the Conquest, a great reformation had been attempted of the French monasteries, . . . the reformers breaking away from the old Benedictines and subjecting themselves to a new and improved Rule. These first reformers were called Cluniac monks, from the great Abbey of Clugni, in Burgundy, in which the new order of things had begun. The first English house of reformed or Cluniac monks was founded at Lewes, in Sussex, 11 years after the Conquest. . . . The constitution of every convent, great or small, was monarchical. The head of the house was almost an absolute sovereign, and was called the Abbot. His dominions often extended, even in England, over a very wide tract of country, and sometimes over several minor monasteries which were called Cells. . . . The heads of these cells or subject houses were called Priors. An Abbey was a monastery which was independent. A priory was a monastery which in theory or in fact was subject to an abbey. All the Cluniac monasteries in England were thus said to be alien priories, because they were mere cells of the great Abbey of Clugni in France, to which each priory paid heavy tribute."—A. MONASTICISM: Primitive forms.—Under Buddhism and Brahmanism.—Other pre-Christian developments.—Early Christian: 4th-6th centuries.—“It has long been known that monachism was rife in the east, some ages previous to its adoption in Europe; but the history of its origin was involved in the same obscurity as the source of the mighty streams upon the banks of which the first ascetics commenced the practice of their austerities. . . . It is not in my power to pass the veil that shrouds from observation the origin we wish to trace; but we are able, now, to make nearer approaches towards it than were possible before the history of Buddhism was known. That Gotama Budha [c. 6th century B.C.] effected a great change in the social polity and religious institutions of the inhabitants of India cannot be denied; but how much of the system that bears his name was originally propounded by himself, or how much of that which he really propounded was the product of his own unaided intellect, will remain an unanswered problem to the end of time. . . . We may, however, collect from these venerated documents that there were both recluses and societies, communities, or schools, previous to the age of Gotama. But the recluses were not in communities, nor did the communities practise the austerities of the recluse. The originality of Gotama's system of discipline appears to have consisted in the more perfect combination of the two classes into one order, so that in this respect he rather resembled the Pachomius than the Anthony of the west. In the legends of the Buddhists there are numerous allusions to other societies, consisting of men and women who were leagued together for some common purpose; but in those instances in which religion is concerned there appears to be little more than the usual bond between the master and his disciple; and whenever we see evidences of a closer union the character of the association appears to be collegiate and not cœnobite, philosophical and not religious. The tirttakas were the most formidable rivals of Gotama; but we are not sufficiently acquainted with the facts of their history to decide in what degree their discipline approached to the regularity of a monastic order. Further researches may cause these conclusions to be modified. But if it be so, if it be proved that there were other monastic orders in existence, and that Gotama was not the institutor of the system, it will place in a more striking view the greatness of his genius, in having established an order that has long survived all contemporaneous systems; and that now, more than two thousand years after its promulgation, exercises a potent influence over many millions of the human race, in regions at a considerable distance from the source of its dis-

semination. . . . The practice of austerities is so interwoven with Brahmanism, under all the phases it has assumed, that we cannot realise its existence apart from the principles of the ascetic. . . . The practice of asceticism is supposed by the Brahmans to have commenced at a very early period; and . . . [to lead] to the possession of an energy the most mighty. The Hindu ascetics of more recent times are in many instances those who have fulfilled their supposed destiny as men, and then retire into the wilderness, that instead of assuming another form at their death they may be prepared for re-absorption in the supreme essence. In abstaining from animal food the Brahmans are stricter than the Buddhists; but the followers of Gotama never knowingly take life, and therefore regard the pasuyajna or aswamedha, a sacrifice supposed by the Brahmans to be highly efficacious, with great abhorrence. . . .

“It has been noticed, relative to the Greeks, that ‘the century between 650 and 500 B. C. appears to have been remarkable for the first diffusion and potent influence of distinct religious brotherhoods, mystic rites, and expiatory ceremonies, none of which find any recognition in the Homeric epic.’ This was precisely the age of Gotama; and the coincidence is striking. The Greeks were as free from the ascetic element as any people we can name, but even among them there was one nation that was apart from the rest; and if we examine the causes of its idiosyncrasy we shall see that they arose from the more powerful development of this principle. . . . But the Spartan annihilated self that he might become a patriot; the Buddhist ascetic, that he might become non-existent. . . . The vow of the Nazarite was the only ascetic custom of which we have any notice in the sacred Scriptures, as existing among the children of Israel; and, as in the case of blood-revenge, the regulations given by Moses may have been intended rather to restrain the pernicious effects of a custom already established, than to introduce a new principle among the people of God. It was a sacrifice of the whole man, body and mind, to the Lord. . . . The first order of recluses, for the knowledge of whose practices we have to go exclusively to the records of extra-Indian literature, is that of the Essenes. The Pharisees were more nearly allied to the Brahmans of India, whilst the Sadducees partook of the scepticism of the Buddhists, and the Essenes of their asceticism. The Essenes gave themselves up to a contemplative mode of life, avoided the ordinary pleasures of existence, and repudiated marriage; they despised riches, and had one common fund; commerce was avoided; they took their meals in common, each person having a loaf of bread set before him, with a single plate of one kind of food, and they drank only water; their garments were not renewed until worn out; they abstained from conversation on ordinary topics, endeavoured to maintain a perfect tranquillity of mind upon all occasions, and were unmoved amidst the most cruel tortures; a noviciate of three years was required before any one could enter into the order, after which they took an oath that they would obey the commands of the elders, and conceal nothing from the community; they had villages of their own, or when in cities lived apart from the rest of mankind; and they rejected sacrifices, offering only gifts of self-consecration at the temple. Like other communities of a similar kind, they were frequently joined by those who were suffering from remorse of conscience, by those who were disgusted with the vanities of the world, and by the aged. Near Alexandria, on

the shores of lake Moeris, resided an order of recluses called Therapeutæ, who are supposed to have been a branch of the Essenes; but this opinion is controverted. They were shut up in separate cells, lived on bread and water, and ate only in the evening."—R. S. Hardy, *Eastern monachism*, pp. 346-348, 351, 353-355.

"Thus monasticism was not the product of Christianity; it was the inheritance of the Church. . . . The Essenes, the Therapeutæ, and other Oriental mystics, were as truly the precursors of Christian asceticism in the desert or in the cloister, as Elijah and St. John the Baptist. The Neoplatonism of Alexandria, extolling the passionless man above him who regulates his passions, sanctioned and systematized this craving after a life of utter abstraction from external things, this abhorrence of all contact with what is material as a defilement. Doubtless the cherished remembrance of the martyrs and confessors, who in the preceding centuries of the Christian era had triumphed over many a sanguinary persecution, gave a fresh impulse in the fourth century to this propensity

by the monks in the Thebaid, of the marvellous exploits of Anthony, who was still alive, of the immense foundations which Pacome was at that time forming upon the banks of the higher Nile. He had brought with him two of the most austere of these monks. . . . The narratives of Athanasius . . . roused the hearts and imaginations of the Romans, and especially of the Roman women. The name of monk, to which popular prejudice seems already to have attached a kind of ignominy, became immediately an honoured and envied title. The impression produced at first by the exhortations of the illustrious exile, was extended and strengthened during the two other visits which he made to the Eternal City. Some time afterwards, on the death of St. Anthony, Athanasius, at the request of his disciples, wrote the life of the patriarch of the Thebaid; and this biography, circulating through all the West, immediately acquired there the popularity of a legend, and the authority of a confession of faith. . . . Under this narrative form, says St. Gregory of Nazianzus, he promulgated the laws of monastic life. The town

MONASTERY OF XEROPOTAMU AT MOUNT ATHOS

Said to have been founded in the time of Empress Pulcheria, 5th century

to asceticism, stimulating the devout to vie with their forefathers in the faith by their voluntary endurance of self-inflicted austerities. . . . From the beginning of the fourth century to the close of the fifth, from Antony the hermit to Benedict of Monte Casino, is the age of undisciplined impulse of enthusiasm not as yet regulated by experience."—G. Smith, *Christian monasticism, introduction*.—"The monastic stream, which had been born in the deserts of Egypt, divided itself into two great arms. The one spread in the East, at first inundated everything, then concentrated and lost itself there. The other escaped into the West, and spread itself by a thousand channels over an entire world which had to be covered and fertilised." Athanasius, who was driven twice by persecution to take refuge among the hermits in the Thebaid, Egypt, and who was three times exiled by an imperial order to the West, "became thus the natural link between the Fathers of the desert and those vast regions which their successors were to conquer and transform. . . . It was in 340 that he came for the first time to Rome, in order to escape the violence of the Arians, and invoke the protection of Pope Julius. . . . He spread in Rome the first report of the life led

and environs of Rome were soon full of monasteries, rapidly occupied by men distinguished alike by birth, fortune and knowledge, who lived there in charity, sanctity, and freedom. From Rome the new institution, already distinguished by the name of religion, or religious life, par excellence, extended itself over all Italy. It was planted at the foot of the Alps by the influence of a great bishop, Eusebius of Vercelli. . . . From the continent the new institution rapidly gained the isles of the Mediterranean, and even the rugged rocks of the Gargon and of Capraja, where the monks, voluntarily exiled from the world, went to take the place of the criminals and political victims whom the emperors had been accustomed to banish thither. . . . Most of the great leaders of the cenobitical institution had, since St. Pacome, made out, under the name of Rule, instructions and constitutions for the use of their immediate disciples; but none of these works had acquired an extensive or lasting sway. In the East, it is true, the rule of St. Basil had prevailed in a multitude of monasteries, yet notwithstanding Cassianus, in visiting Egypt, Palestine, and Mesopotamia, found there almost as many different rules as there were monasteries. In the West the di-

versity was still more strange. Each man made for himself his own rule and discipline, taking his authority from the writings or example of the Eastern Fathers. The Gauls especially exclaimed against the extreme rigour of the fasts and abstinences, which might be suitable under a fervid sky like that of Egypt or Syria, but which could not be endured by what they already called Gallican weakness; and even in the initial fervour of the monasteries of the Jura, they had succeeded in imposing a necessary medium upon their chiefs. Here it was the changing will of an abbot; there a written rule; elsewhere, the traditions of the elders, which determined the order of conventual life. In some houses various rules were practised at the same time, according to the inclination of the inhabitants of each cell, and were changed according to the times and places. They passed thus from excessive austerity to laxness, and conversely, according to the liking of each. Uncertainty and instability were everywhere. . . . A general arrangement was precisely what was most wanting in monastic life. There were an immense number of monks; there had been among them saints and illustrious men; but to speak truly, the monastic order had still no existence. Even where the rule of St. Basil had acquired the necessary degree of establishment and authority—that is to say, in a considerable portion of the East—the gift of fertility was denied to it. . . . In the West also, towards the end of the fifth century, the cenobitical institution seemed to have fallen into the torpor and sterility of the East. After St. Jerome, who died in 420, and St. Augustine, who died in 430, after the Fathers of Lerins, whose splendour paled towards 450, there was a kind of eclipse. . . . Except in Ireland and Gaul, where, in most of the provinces, some new foundations rose, a general interruption was observable in the extension of the institution. . . . If this eclipse had lasted, the history of the monks of the West would only have been, like that of the Eastern monks, a sublime but brief passage in the annals of the Church, instead of being their longest and best-filled page. This was not to be: but to keep the promises which the monastic order had made to the Church and to the new-born Christendom, it needed, at the beginning of the sixth century, a new and energetic impulse, such as would concentrate and discipline so many scattered, irregular, and intermittent forces; a uniform and universally accepted rule; a legislator inspired by the fertile and glorious past, to establish and govern the future. God provided for that necessity by sending St. Benedict into the world.”—Count de Montalembert, *Monks of the west*, v. 1, pp. 381-387, 512-515.

Women and monasticism.—“Passing from the ground of tradition to that of history . . . the convent was looked upon with favour by women of newly converted barbarian races, and they availed themselves of the protection which the Christian religion held out to them. . . . The representatives of Christianity, profiting by a surviving love of independence among womankind, turned the energies of women into new channels, and giving scope to their activity in new directions, secured their help in the cause of peaceful progress. The outward conditions of life were such that the woman who joined the convent made her decision once for all. But provided she agreed to forego the claims of family and sex, an honourable independence was secured to her, and she was brought into contact with the highest aims of her age. At a period when monasteries, placed in the remote and uncultivated districts, radiated peace

and civilisation throughout the neighbourhood, many women devoted themselves to managing settlements which in the standard they attained, vied in excellence with the settlements managed by men. At the outset many married women left their husbands for the purpose of founding and governing convents; sometimes they founded convents the management of which they left to others, and themselves retired to them later in life. The prestige and advantages enjoyed by the heads of religious settlements were such that kings and queens frequently installed their daughters as abbesses in preference to seeking for them matrimonial alliances, and these princesses were joined by many daughters of the most influential families, who gladly availed themselves of the opportunity of embracing the religious vocation. Through their close contact with high-born women, convents maintained a high tone in manners, morals, and general behaviour, and grew into important educational centres, the beneficent influence of which was generally recognised.

“The career open to the inmates of convents both in England and on the continent was greater than any other ever thrown open to women in the course of modern European history; abilities might raise the nun to the rank of abbess, a position of substantial authority. [See also *WOMAN'S RIGHTS*: 300-1400.] In the Kentish charter the names of the abbesses as representatives of religion follow those of the bishops. In Saxony it fell to an abbess to act as representative of the emperor during his absence. As independent landowners, who held their property of and from king and emperor, the abbess took rank with the lords temporal and spiritual in the right of jurisdiction which they exercised, and in the right of being represented in Parliament or at the Imperial Diet as the case might be. While fulfilling the duties which devolved on them in virtue of their station, abbesses did not neglect their opportunities of keeping in touch with culture and of widening their mental horizon. In Anglo-Saxon England men who attained to distinction received their training in settlements governed by women. Histories and a chronicle of unique value were inspired by and drafted under the auspices of Saxon abbesses. For nuns Ealdhelm wrote his most famous treatises, and several valuable contemporary biographies, such as those of Sturm and of Robert of Fontevraud, were written at the express desire of nuns. And while eager in encouraging productiveness in others, they were not slow in trying to develop their own literary powers. In the 6th century Radegund was writing epistles in verse under the tuition of an exiled Latin poet; to an Anglo-Saxon nun whose name is not recorded we owe one of the earliest and most interesting accounts extant of a journey to Palestine. In the 8th century the nun Lioba was trying her hand at Latin verse in a convent in Thanet; in the 10th century the nun Hrotsvith in Saxony was composing Latin dramas on the model of Terence. The contributions of nuns to literature as well as incidental remarks show that the curriculum of study in the nunnery was as liberal as that accepted by monks, and embraced all available writing, whether by Christian or profane authors. . . . The fact that a considerable number of women's houses after the monastic revival of the 11th and 12th centuries were founded largely at the instigation of men, proves that the usefulness of these institutions was generally recognised. While devoted to reading and study which pre-eminently constituted the religious vocation, nuns during their leisure hours cultivated art in several of its

branches. Spinning and weaving were necessarily practised in all settlements during many centuries, for the inmates of these settlements made the clothes which they wore. . . . The painstaking industry, which goes far in the production of such work, was reflected in the activity of women as scribes and illuminators, and the names of several nuns who were famous for their writing have been handed down to posterity. In the twofold domain of learning and art the climax of productiveness was reached in the person of Hærad, in whom a wide range of intellectual interests and a keen appreciation of study combined with considerable artistic skill and a certain amount of originality. Side by side with literary and artistic pursuits nuns were active in the cause of philanthropy. Several women who had the sufferings of their fellows at heart are numbered among the saints; and under the auspices of Hildegard a book was compiled on the uses of natural products in health and disease, which forms a landmark in the history of mediæval medicine. [See MEDICAL SCIENCE: Mediæval: 10th-12th centuries.] . . . Consequent upon the spread of the feudal system of land tenure, which in the interest of an improved military organisation reserved the holding of property for men, women forfeited their chance of founding and endowing independent monasteries, and the houses founded after the monastic revival never attained a position comparable with that of those dating from the earlier period. As monasteries were theoretically safe against infringement of their privileges by prince or bishop owing to their connection with Rome, the relation of the Pope to temporal rulers and to the greater ecclesiastics directly affected them, and when the power of the Pope was relaxed they were at the mercy of prince and bishop. . . . A considerable number of women's convents were interfered with by churchmen, who on the plea of instituting reforms took advantage of their position to appropriate the convent property. A change of a different kind which affected the convent in its educational and intellectual standing was the growth of university centres, and the increased facilities afforded to the student of visiting different centres in succession. . . . Some of the progressive monasteries of men lessened the loss they felt by securing a house at the university to which they sent their more promising pupils, but the tone at the mediæval university was such that one cannot wonder that no attempt was made in this direction by the convents of women. As a natural result their intellectual standard for a time remained stationary, and then, especially in the smaller and remoter settlements, it fell. This led to a want of interest in intellectual acquirements among nuns, and it was accompanied by a growing indifference in the outside world to the intellectual acquirements of women generally. . . . The change which had come over the convent life of women cramped rather than stimulated their intellectual vitality, and the system of which they made part was apparently beyond their control. The author of 'Holy Maidenhood' in the 13th century called the nun the free woman, and contrasted her with the wife who in his eyes was the slave. But Erasmus at the beginning of the 16th century urged that the woman who joined the convent by doing so became a slave, while she who remained outside was truly free. Erasmus also insisted on the fact that there was no reason why a woman should enter a convent, as she might as well stay in the world and remain unmarried if she so preferred. In point of fact social conditions had so far changed that society no longer called to the Church for protection of its daughters. For a time the convent

ranked high as an educational establishment; then this use began to pass away also, and it was largely on account of the provision religious houses made for unmarried women that they still continued in favour with a portion of the community. . . . Study now ran along a narrow groove, for the monastic reformers favoured devotional study only. The nuns, who were impressed by the excellence of the reformers' motives, and prevented by circumstance from forming opinions of their own in the matter, showed an increasing readiness to adopt their views. The friars led the way in this direction by cutting off the nuns, given into their care, from the management of outside affairs; they were followed by the order of Sion, and by the congregations of Bursfeld and Windesheim, all of which alike urged that the primary duty of a nun was sanctification of self."—

SAINT BENEDICT

L. Eckenstein, *Woman under monasticism*, pp. 477-482.

6th century.—Rule of St. Benedict.—Its results.—“The life of St. Benedict of Nursia forms the turning point in the history of Monasticism. Before Benedict's time Monasticism, though showing itself to be no exotic incapable of transplantation to other climes, had been essentially a plant of Eastern growth. After his life the Monasticism of East and West became so diverse in character, that henceforth they may be regarded as two different systems. . . . Benedict with a few companions journeyed to Monte Cassino on the border of the still wild Abruzzi. There he . . . built . . . what was destined to become the most illustrious monastery of Christendom. . . . To this monastery he gave in 520 . . . his famous *Rule*. His object he tells us was ‘to form a school of divine servitude, in which, we trust, nothing too heavy or rigorous will be established.’ . . . The old individualism, with its private ventures in asceticism,

gave place to rule and system. . . . Benedict systematized labour as the rule of all monastic life. . . . Benedict's success in linking on Monasticism with labour was the first step in a long evolution upon whose details we cannot dwell, but whose main features demand attention. The first change, common both to East and West, had been that from monachism to cenobitism, from the hermit to the brethren of the common life. The value of this change, especially when in the West it received the inspiration given to it by Benedict's *Rule*, we have already noticed. But the change itself would have been of little value, at any rate viewed from the standpoint of social development, had it not been accompanied by the glorification and systematization of toil. With this addition the change lay at the root of all that was best and most progressive in Monasticism. Instead of the dervish of Eastern fancy, we have a colony of workers. Instead of the hermit crushed by the horror and loneliness of Nature in her most terrible aspects, we have the organized community, in its beginnings as anxious as the hermit to escape the haunts of men, but whose axes and spades cleared the densest jungles, drained pestilent swamps, and by the alchemy of industry turned the sands into waving gold, and planted centres of culture in the hearts of forests. This change, invaluable as it was from the standpoint of the history of civilization, proved fatal in the long run to the principles of Monasticism, at any rate as first enunciated. For Monasticism was founded upon renunciation; but renunciation became impossible for a Monasticism whose remunerative toil forced upon it a wealth from which there seemed no escape. . . . First we have the burning enthusiast, seeking salvation in a more perfect renunciation, plunging into the wilderness that he may find a solitude where he may pray alone. There his reputation for renunciation draws to himself others of like mind, who place themselves under his direction. Or if he is already a monk, by profession a renunciant, in reality an inmate of some lordly abbey rich in its vineyards and granaries, we see him, pricked to the heart by the memory of the poverty of Christ, setting off to found some new convent where he may carry out in stricter fashion the primitive *Rule*, with the good seed no longer choked by the multitude of riches. In a few years his humble abode becomes too strait for the multitude who have sought out this Jacob's ladder with its vision of the angels. Wealth pours in; the rude huts of wattle and mud give place to the stately abbey; the humble church becomes the soaring minster. By their care and toil the desert blossoms as the rose, the fats overflow, while serfs and hinds, attracted by the security and greater freedom which the Church affords, built up outside its walls the town which perpetuates its name. The first dreams of poverty are once more forgotten; all things are ripe for some new saint to make a new effort towards that primitive renunciation, the dream and despair of Monasticism during the long centuries of its existence. For eight hundred years the ebb and flow of the monastic tide centred round this rock of offence. For eight hundred years after Benedict men tried to achieve the impossible, to attain simplicity and poverty by renunciation, through means of an organization that must inevitably produce wealth. To this conflict of ideal and actuality we owe the various congregations, orders, and reforms the mere names of which would demand a volume in themselves, for whose history the reader must seek in the great works that the devotion of the Orders has

produced."—H. B. Workman, *Evolution of the monastic ideal*, pp. 219-220, 223-224.—See also BENEDICTINE ORDERS; EINSIEDELN, ABBEY OF.

9th-13th centuries.—Attempted reform of Benedict of Aniane.—Degeneracy of monasticism.—Founding of Carthusians and Camaldules.—Reform orders of Cluny, Cîteaux, Clairvaux and Prémontré.—“The first of the great Benedictine reforms originated with Benedict of Aniane, ‘the second founder’ of Western Monasticism. . . . Under Benedict’s influence the Council sought, in the stricter enforcement of the *Rule* of Monte Cassino, the lost ideal of renunciation. Four years later he passed away (11 Feb., 821). In his efforts to secure reformation Benedict of Aniane made one fatal mistake: he sought a renunciation which should express itself in rigid uniformity. Meat, drink, the cut of the dress, the order of services, were to be exactly alike, the products of an almost mechanical mill. Even prayer and praise did not escape his machinery. Offices were multiplied until they became almost continuous. The issue could not be in any doubt. . . . The mechanical can never be anything else than short-lived. . . . Within a century of Benedict of Aniane’s reforms, matters were worse than ever; the renunciation, discipline, and ideal of Monasticism lost. . . . In many places the old monasteries had disappeared—burnt, destroyed, or appropriated. In others the ancient rule had given place to the law which seems to come uppermost in times of insecurity: ‘Let us eat and drink, for tomorrow we die.’”—H. B. Workman, *Evolution of the monastic ideal*, p. 226.—“In the tenth century, the bishops and abbots were usually the sons of lords; the priests and monks were sons of peasants, who, without any inclination, took orders in obedience to their parents or for the purpose of enjoying the wealth of the church. They brought into the church the manners of the laymen, they passed their time in hunting, drinking, gaming, and fighting. The abbots squandered the wealth of the convents in order to maintain a band of adventurers. Many married and bequeathed their children to the church; in Normandy priests have their curacies as dowry to their daughters. Many did not know how to read and had forgotten how to say mass. The greater number had bought their livings from the laity, and had sold them again to other ecclesiastics: this traffic in holy things was called simony. The clergy became gross, ignorant, and covetous, like the laity; it was said that the church was infected with the ‘spirit of the century.’ . . . These scandals caused great horror to those ecclesiastics who had remained faithful to the spirit of the church, and they urged the most zealous to lay new foundations. Some left this corrupt world and fled to the desert, Saint Bruno coming from the north of France, buried himself in the wild mountain regions of Dauphiny, and with a few companions founded the order of the Carthusians (Chartreux hermits who live in a chartre or cell). [See CARTHUSIAN ORDER.] An Italian seignior, Saint Romualdo, founded in the same manner, an order in the mountains of Tuscany, called the ‘Camaldules.’ Others wished to put an end to the scandals by making the clergy come back under the regulations: They began by re-establishing severe discipline in a convent, which afterward served as a model for reforming the others. The great centres of reform were Cluny, the oldest, where the reform took place in the eleventh century; Cîteaux, founded in 1094, both in Burgundy; Clairvaux founded in 1115; Prémontré founded in 1120. It was not a question of

replacing the ancient regulations of Saint Benedict, on the contrary, of restoring them to vigor by the practice of labor, obedience, and especially poverty, which the convents invaded by the spirit of the century had ceased to do. The founder of Clairvaux, Saint Bernard, forbade his monks to wear furs, cowls, or to use bed-clothes, he wanted no luxury even in the churches; he only permitted a cross of painted wood, an iron candelabra, and copper censers. The monks, after the reform, all remained Benedictines. But to arrest the progress of the disorders too easily introduced into an independent monastery, it was decided that the reformed convents should keep the direction of all convents founded or reformed by them. Thus Cluny, Cîteaux, and Prémontré became heads of the order; the convents of that order were no longer abbeys, but priories, all obeyed the same abbot, and sent delegates to the general assemblies of the order. The orders increased rapidly in numbers and in power; in the twelfth century, Cluny had more than 400 monks and had charge of 2,000 convents; Cîteaux had 1,800 convents scattered throughout Europe. Then began a rivalry between the black friars of Cluny and the white friars of Cîteaux (the Cistercians). It was these reformed monks who obliged the rest of the clergy to reform their manners; they energetically supported the pope and brought all Christians, laity and clergy, to submit to his authority. Gregory VII., the great papal reformer and ruler, was a monk of Cluny; Saint Bernard, the great doctor of the twelfth century, was a Cistercian."—C. Seignobos, *History of mediæval and modern civilization*, pp. 91-93.—"The Cluniac reform in its turn proved inefficient; nor is the cause far to seek. [See CLUNY.] The whole burden of discipline of the united order rested upon the abbot of Cluny. He was the 'general' of the order—to use the later term associated with the Jesuits and Salvation Army—the absolute ruler of the whole system, and of the thousands of monks whom it embraced, every one of whom was only professed by his permission. . . . If he fell into evil ways, this over-centralized system made the result the more appalling. By the beginning of the twelfth century, Cluny had followed the common round, and showed signs of falling from its high estate. . . . The revival by the Cistercians of the primitive discipline is . . . of less importance than their polity. The Cistercians represent the fourth development of the Monastic ideal. [See CISTERCIAN ORDER.] The Cluniacs had fallen because they had centralized authority in the abbot of Cluny. With the Cistercians each foundation was an independent abbey, and not a subject priory of its parent. . . . Independent almost from the first of all episcopal authority, the Cistercians bound themselves to the pope by oaths of direct obedience. They were thus the first of the militant spiritual orders, whose object was to bring the world under the government of Rome, nor is it without value in this connection to note that the Templars were supposed to have received their constitution from Bernard. But this very fact of papal dependence marks the real fall of Monasticism. When the monk became the auxiliary of Rome, with the control of its organization centred in the pope, it was plain to all that Monasticism had outlived its first purpose. She no longer held up an ideal of renunciation higher than that of the Church, to some extent even outside the Church: the ideal had become materialized as a tool in the hands of the Church to be used for their common aggrandizement. . . . Benedict's conception of the

monastery as separate families of renunciants had given place to the idea of an organized international corporation with its head centre in Rome seeking the dominion of the nations of the world. And this the new nations were determined not to allow. There was another aspect of the rise of the Cistercians in which we see the germs of the final form that Monasticism assumed. By the transfer of the order to the control of the pope we see that the centre of emphasis in renunciation was being slowly changed. Hitherto 'poverty' had been supreme, but the experience of centuries had shown that poverty as an ideal defeated itself. But 'obedience' had in it latent possibilities as yet little exploited."—H. B. Workman, *Evolution of the monastic ideal*, pp. 236-237, 243-245.—See also AUSTIN CANONS; BEGUINES; CAMALDOLITES; CARMELITE FRIARS; CLAIRVAUX; PREMONSTRATENSIAN ORDER; RECOLLECTS; SERVITES; THEATINES; TRAPPISTS.

11th-13th centuries.—Revival of canons.—Militant orders.—"The attempt of Hildebrand to impose the principles of Monasticism upon the whole body of the secular clergy as apart from its hierarchy does not stand alone. It was the last and most successful of a series of efforts in this direction, for the most part dealing with 'canons.' For the origins of this movement we must go back to Eusebius of Vercellæ, . . . who a few years after his appointment as bishop made the clerics of his cathedral live together according to a rule (363). When St. Augustine returned from Italy in 388, though he does not seem to have known of the work of Eusebius, he established a similar community at Tagaste, and on his becoming Bishop of Hippo (396) he introduced the custom into several sees of Africa. The usage was part of a larger movement which was slowly driving the clergy into a separate caste of the community, with a different dress, different method of trimming the hair (tonsure), different civil status, in a word, with altogether different habits of life from the laity. But such differentiation was of slow growth. Neither in dress, tonsure, nor community life was the change rapidly effected. . . . At the close of the eighth century efforts were made to bring the 'canons' into line with the monastic ideal. . . . From the first the attempt was doomed to failure. Mild as was . . . [the] *Rule* it was too severe to be acceptable to the seculars. . . . In the eleventh century, as part of the general revival of discipline, Ivo of Chartres . . . attempted once more, about the year 1078, to bring cathedrals and collegiate churches under monastic discipline. . . . A stricter rule was introduced, drawn in part from the works of St. Augustine, in part from spurious writings attributed to him. The Austin Canons, as they were thus called—Canons Regular of St. Augustine, to give them their fuller title—differed from monks by being also clerics, with singular powers of adapting themselves to work of any sort, whether pastoral in the churches they served, educational, or philanthropic, as in the hospitals attached to their houses; also by their greater simplicity and elasticity of organization. . . . Nothing is more remarkable than the elasticity of the so-called *Austin Rule*, and the variety of service to which it led. We have an illustration of this in the rise of the military orders, nominally, at least, enrolled under this *Rule*. When, in 1110, Hugues de Payens and eight French knights devoted themselves to the task of keeping the roads to Jerusalem clear of robbers, and thus established the famous Templars [see TEMPLARS], or when in the previous year Raymond du Puy reorganized

the 'Poor Brethren of the Hospital of St. John at Jerusalem,' they opened out a new conception of holiness. [See HOSPITALLERS OF SAINT JOHN OF JERUSALEM.] Their idea was to unite under the banner of the Cross the two strongest impulses of the age, the impulse to fight and the impulse to watch and pray. Hitherto in Europe the two motives had been at variance, the knight and the monk had nothing in common. Henceforth, under the pressure of the Paynim, they become one; feudalism passes into the service of the Church. . . . The establishment and growth of these military orders is of considerable importance in any study of the development of the monastic ideal. They form the middle stage in a slow but organic process. In the original conceptions of Monasticism, if a man would serve God he must quit the world. . . . With the military orders, to serve God was to fight the world."—*Ibid.*, pp. 253-259, 266.—"The life of Bernard forms an appropriate introduction to a consideration of the Military Religious Orders. Although weary with labor and the weight of years, he traveled over Europe preaching the second crusade. 'To kill or to be killed for Christ's sake is alike righteous and alike safe,' this was his message to the world. In spite of the opposition of court advisers, Bernard induced Louis VII and Conrad of Germany to take the crusader's vow. He gave the Knights Templars a new rule and kindled afresh a zeal for the knighthood. Although the members of the Military Orders were not monks in the strict sense of the word, yet they were soldier-monks, and as such deserve to be mentioned here. At the basis of all monastic orders, as has been pointed out, were the three vows of obedience, celibacy and poverty. Certain orders, by adding to these rules other obligations, or by laying special stress on one of the three ancient vows, produced new and distinct types of monastic character and life. The Knights of the Hospital assumed as their peculiar work the care of the sick. The Begging Friars, as will be seen later, were distinguished by the importance which they attached to the rule of poverty; the Jesuits, by exalting the law of unquestioning obedience. In view of the warlike character of the Middle Ages it is strange the soldier-monk did not appear earlier than he did. The abbots, in many cases, were feudal lords with immense possessions which needed protection like secular property, but as this could not be secured by the arts of peace, we find traces of the union of the soldier and the monk before the distinct orders professing that character. The immediate cause of such organizations was the crusades. There were numerous societies of this character, some of them so far removed from the monastic type as scarcely to be ranked with monastic institutions. One list mentions two hundred and seven of these Orders of Knighthood, comprising many varieties in theory and practice. The most important were three,—the Knights of the Hospital, or the Knights of St. John; the Knights Templars; and the Teutonic Knights. The Hospitalers wore black mantles with white crosses, the Templars white mantles with red crosses, and the Teutonic Knights white mantles with black crosses. The mantles were in fact the robe of the monk adorned with a cross. The whole system was really a marriage of monasticism and chivalry, as Gibbon says: 'The firmest bulwark of Jerusalem was founded in the Knights of the Hospital and of the Temple, that strange association of monastic and military life. The flower of the nobility of Europe aspired to wear the cross and profess the vows of these

orders; their spirit and discipline were immortal.' A passage in the *Alexiad* quoted in Walter Scott's 'Robert of Paris' reads: 'As for the multitude of those who advanced toward the great city let it be enough to say, that they were as the stars in the heaven or as the sand of the seashore. They were in the words of Homer, as many as the leaves and flowers of spring.' This figurative description is almost literally true. Europe poured her men and her wealth into the East. No one but an eye-witness can conceive of the vast amount of suffering endured by those fanatical multitudes as they roamed the streets of Jerusalem looking for shelter, or lay starving by the roadside on a bed of grass. . . . 'The horrible fate of the Templars,' says Allen, 'was taken by many as a beginning and omen of the destruction that would soon pass upon all the hated religious orders. And so this final burst of enthusiasm and splendor in the religious life was among the prognostics of a state of things in which monasticism must fade quite away.' Wondrous changes have taken place in those dark and troubled years since Benedict began his labors at Monte Cassino, in 529. The monk has prayed alone in the mountains, and converted the barbarian in the forest. He has preached the crusades in magnificent cathedrals, and crossed stormy seas in his frail bark. He has made the schools famous by his literary achievements, and taught children the alphabet in the woodland cell. He has been good and bad, proud and humble, rich and poor, arrogant and gentle. He has met the shock of lances on his prancing steed, and trudged barefoot from town to town. He has copied manuscripts in the lonely Scottish isle, and bathed the fevered brow of the pilgrim in the hospital at Jerusalem. He has dug ditches, and governed the world as the pope of the Church. He has held the plow in the furrow, and thwarted the devices of the king. He has befriended the poor, and imposed penance upon princes. He has imitated the poverty and purity of Jesus, and aped the pomp and vice of kings. He has dwelt solitary on cold mountains, subsisting on bread, roots and water, and he has surrounded himself with menials ready to gratify every luxurious wish, amid the splendor of palatial cloisters. Still there are new types and phases of monasticism yet to appear. The monk has other tasks to undertake, for the world is not yet sufficiently wearied of his presence to destroy his cloister and banish him from the land."—T. A. W. Wishart, *Short history of monks and monasteries*, pp. 197-199.

13th century.—Coming of friars.—Poverty and service.—Decay.—"With the opening years of the thirteenth century Monasticism, which had once more passed into a period of decay and death—the old fires burning out, the old usefulness gone—entered upon the greatest revolution it had as yet experienced. Without changing its basal principle of poverty, celibacy, and obedience it sought to work out its ideals, no longer by shunning men, but by seeking them, following, in this matter, but with greater completeness, the lead already given by the Austin canons, with their attention to education, parish duties, the care of the sick and needy, the building of bridges and the like. The coming of the friars, under the inspiration of St. Dominic and St. Francis, was the rise, in fact, of a new conception of Monasticism so completely different that friars were forbidden to enter within the walls of any monastery. Hitherto the highest religious life had identified itself with a retreat from the world, the retiring like St. Bruno to some Grande Chartreuse, where in a rarer air, far from its noise and

whirl, men could save their souls and rule into their characters the fine lines. But the friars were essentially an order of social labourers. . . . 'Live,' said the monk, 'as if you were alone in this world with God'; and it was from the following out of this advice that, as we have seen, the chief difficulties of Monasticism arose. 'Live,' said both St. Francis and St. Dominic, 'as if you only existed for the sake of others.' Their whole lives were illustrations of this doctrine. . . . The reader should note that, as usual, this revival of monastic piety was the reaction from the despair of the preceding age. . . . The coming of the friars was an effort to reform Monasticism on a democratic basis. For the moment it seemed as if democracy would accomplish what the saint and the statesman had failed to complete. The friars swept all before them; in bishopric, parish, and university, their ideal reigned supreme, while the uneasiness of the older monasteries at the rapid spread of their rival showed itself in many ways very early in their career. . . . The founding of this order . . . to-day far exceeding in its numbers every other fraternity, was the beginning of a social revolution, the depth of which was hidden from our older historians. For centuries the laity had had little place in the organization of the Church. Now Europe was filled with a host of earnest laymen, bound together in social service and church work, most of whom earned their own living, like St. Paul, by the labour of their hands. . . . For five hundred years that success, though not without its vicissitudes, has been continued. To-day the Franciscan order is still the most numerous in the world. But upon the history of the friars, their times of decay and reform, the civil war between the Franciscans over 'evangelical poverty,' we cannot dwell. We must content ourselves in conclusion, in accordance with our limits and aims, in pointing out the contradiction the success involved between the ideal and the real—a contradiction more striking, it is true, in the case of the Dominicans than the Franciscans, if only because of the greater nobility of St. Francis' ideal. . . . A movement which in its origin was anti-monastic added another to the long family of monkish orders."—H. B. Workman, *Evolution of the monastic ideal*, pp. 271-273, 298-299, 314.—"So the Franciscans were mendicants, and became preachers; the Dominicans were preachers and became mendicants. The two orders greatly resembled each other. Both were organized in the same way, with a general, who was directly obedient to the pope; but the Dominicans addressed themselves rather to the lords, while the Franciscans turned to the common people. Both spread with unheard of rapidity. About 1277 there were 417 convents of Dominicans; in 1260 there were 1808 convents of Franciscans, each convent had at least twelve members. As they relied on God, who was 'their granary and their cellar,' they could accept as many brothers as presented themselves. 'To those who came to them was given a gown and a cord, and for the rest, they were entrusted to the care of Providence.' The ancient monks had lived out of the world, the mendicant monks mingled in society. The people allowed them to preach, confess, and bury, and the faithful hastened to them, abandoning the ordinary priest. This was an important evolution, which strengthened still more the authority of the pope."—C. Seignobos, *History of mediæval and modern civilization*, p. 101.—See also DOMINICAN FRIARS; FRANCISCAN FRIARS; CAPUCHINS.

1279.—POWER of monasteries in England.—Statute of Mortmain. See ENGLAND: 1279.

16th-19th centuries.—Monasteries.—New religious orders.—Society of Jesus, 1540.—Its suppression.—During the Reformation, and the period immediately following, there was developed a new sort of religious order, called Regular Clerks. Of these, by far the most important is the Jesuit order, or Society of Jesus, founded in 1540. There are, besides, the Theatines, founded 1524, the Barnabites, founded 1530, and others less important. Besides the Regular Clerks there are "religious congregations," differing from the former chiefly in the matter of vows. Of these, the principal congregations are the Passionists, founded 1725, and the Redemptorists, founded 1740, both devoted to giving missions and retreats. In addition to the religious congregations there are a number of "secular congregations," groups of secular priests living together under temporary vows. During the period between the Reformation and the French Revolution, marked by the growth of new orders, the old orders continued, with many notable re-

SAINT DOMINIC

vivals and reforms among them. "As the Renaissance of the eleventh century had given rise to Cluny and Cîteaux, and that of the thirteenth to the mendicant friars, so this renaissance of piety produced a new religious order. This was the 'Society of Jesus,' founded by Ignatius Loyola, in order to combat the growing heresies of the Protestants. 'The world,' said the founder, 'must be represented as two armies in battle array, one serving under God, the other under Satan.' The Protestants are with Satan, the Society of Jesus is fighting in the army of God, for the greatest glory of God. It is organized like the ancient mendicant orders, in convents, apportioned into provinces, each under a superior; the general governs the whole society, and is in the service of the pope. But the organization is more severely ruled than are the other orders. The Jesuits, besides the three vows usually taken by the monks, take the vow of obedience to the pope. The great innovation, which has made the Jesuits so powerful, is the organization of a system of spiritual exercises, a method of training the soldier of Christ in the faith and in obedience. These exercises, 'by which they

learn how to vanquish self,' have in view the detachment from the things of this world, for the novice who is about to enter the Society, and to prepare him to become a good soldier of the faith. . . . Of all the means employed by the Jesuits in order to control the laity, the two most powerful were education and confession. In the towns where they had been able to establish themselves the Jesuits founded colleges, where they received the children of the nobles and of the rich bourgeoisie. These colleges which the Jesuits called the 'fortresses of the faith,' were to labor in training men of the world and Catholics. The pupils were accustomed to the exercises of devotion, especially 'those which impiety had sought to destroy' (that is, which the Protestants had set aside), processions, pilgrimages, the worship of relics. But they were also taught politeness and the fine manners unknown in the schools of the Middle Ages; it was desired that they should be able to appear and speak with elegance. The Jesuits taught their pupils as if they were to be gentlemen, who would never have to work in order to gain their daily bread; they were taught nothing but Latin and mathematics. The instruction was modelled on the famous plan of study (*ratio studiorum*), which for two centuries has prevailed in the education of youth. It was the Jesuits who thought of dividing pupils into classes, of giving prizes to the best pupils, of publishing special editions of the ancient authors for use in the classes (whence the name *classics*), of having Latin exercises, verses and orations written by the pupils. When Napoleon created the University of France, the Jesuit system had been adopted in all the French colleges, although the purpose of the instruction was quite different; Latin and mathematics were at that time, and have since remained, the foundation of a course of study. The Jesuits, being greatly sought after for confessors, have brought to perfection the art of confessing, and of directing the conscience. They had to continually decide upon the confessions made by their penitents, so as to suit the penance to the enormity of the offence. They have to study the cases, which may be presented, investigate what actions must be regarded as sins and in what measure, decide whether a sin belongs to the species of venial (pardonable) sins or of mortal sins. For example, a judge has to decide in a suit where the two parties appear to him to have equally just claims; one of the two parties gives him a sum of money, and the judge pronounces judgment in his favor; has the judge committed a sin? Those who studied cases of conscience were called *casuists*; the greater number were Spaniards. In this manner the science of *casuistry* was devised, for which the Jesuits have so often been upbraided by their enemies. The Jesuits were distinguished from the ancient orders of monks by their gentle and polished manners; they made themselves loved especially in the upper classes; and as they had the strongest organization and the most effective methods, they soon became, and have remained for three centuries, the most powerful religious order in the church, and the one most formidable to the Protestants."—C. Seignobos, *History of mediæval and modern civilization*, pp. 306, 308-311.—See also JESUITS; EUROPE: Renaissance and Reformation; Catholic reformation; PAPACY: 1534-1540; MISSIONS, CHRISTIAN: North America.

"Monasticism . . . was not judged and condemned at the Reformation period on its fundamental principles, or on account of the faults of its members, but because there was a wave of revolt against the ancient system of government in Church and State; because there was an outburst of mental

and spiritual liberalism; and because the rulers of the time lusted after the temporal possessions of the monasteries. . . . In 1523 Magdeburg, Weimar, Rostock, Stettin, Danzig, and Riga expelled the monks and nuns from their houses. In 1526 the Landgrave of Hesse confiscated all the monasteries in his dominions by the advice of Luther. . . . In 1527 Gustavus Vasa . . . confiscated the property of the Church, suppressing the religious corporations, and appropriating their property to the State, or bestowing it upon the nobility. . . . A similar course was adopted in Denmark in 1534; in Norway in 1537; and in Iceland in 1550. In England the lesser monasteries were seized in 1535 by Henry VIII.; and in 1539 the great abbeys were plundered and destroyed. [See ENGLAND: 1535-1539.] In Scotland in 1559 the preaching of John Knox stirred up the people, and a raid was made upon the monasteries in Perth, and those in other parts of the kingdom were soon after sacked and confiscated one after the other. In 1791 a decree of the Directory abolished all corporations civil and religious in France, and declared all their property to belong to the State. Eighty-two abbeys and 255 convents for women, besides colleges and other establishments, were suppressed, and their revenues, reckoned at 95,000,000 livres, were appropriated by the Government. In 1790 Joseph II. abolished the Mendicant Orders in the countries under his rule, and soon after, by his own autocratic will, and in opposition to the wishes of his people, he closed 624 monasteries. In 1830 after the Revolution in France, a fresh attack was made upon Monasticism, and it is said that 300 were suppressed in different parts of Europe between 1830 and 1835. In 1834 the Crown seized upon the possessions of 500 monasteries in Portugal, and a contemporary writer speaks of 'the tears of the people who had always found there succour in their illness and bread in their old age.' In 1835 the monasteries in Spain were confiscated. In 1847 many religious houses were abolished in Switzerland. In 1859 the revolutionary government of Mexico, under the presidency of Juarez, confiscated the whole of the Church property of the country, suppressing 150 monasteries and convents, and turning out 2000 nuns and 1700 monks. The value of the Church endowments thus secularized was estimated at £100,000,000, and was probably more; yet two years after this enormous sum had been appropriated by the State, the Public Treasury was absolutely empty. In 1875 Prussia decreed the suppression of all Orders except those devoted to sick-nursing. In 1887 this law was abrogated, as it had been found to be most unpopular, and Religious Orders of all kinds were sanctioned. In 1866 the Kingdom of Sardinia practically destroyed the monastic system in its dominions; and finally, in 1872, the Government of United Italy at Rome decreed the suppression of the convents throughout the whole country, without regard to the historical interest of many ancient foundations, the religious needs of some remote districts, and the cruel results that the step inflicted upon many helpless women; and in spite of the indignant protests of men of all shades of religious opinion, and of every civilized European nation."—F. C. Woodhouse, *Monasticism, ancient and modern*, pp. 265-269.—See also FRANCE: 1900-1904; CIVIL CONSTITUTION OF THE CLERGY IN FRANCE.

19th-20th centuries.—Survival in Roman church.—Revival in Church of England.—"Notwithstanding its wholesale suppression, Monasticism still exists. 'Monasticism increases most rapidly in France in spite of State opposition and the spread of atheism.' . . . There are in France at the present

time about 1200 male and female congregations, comprising about 160,000 'religious,' of whom 6000 only are of the 'contemplative' orders. As regards the missionary associations, M. Louvet, in *Les Missions Catholiques au XIX^e Siècle*, says that there are 13,300 missionary priests, 4500 brothers, and 42,000 sisters at work abroad, and about 10,000 native sisters. Mr. J. A. Froude says—"Among other strange phenomena of this waning century, we see once more rising among us, as if by enchantment, the religious orders of the Middle Ages: Benedictines, Carmelites, Dominicans, houses of monks and nuns, to which American and English ladies and gentlemen are once more gathering as of old, flying no longer from a world of violence or profligacy, but from a world of emptiness and spiritual death. . . . In England, where the past is obscured by sentimental passion; in America, where there is no past, and where the lessons of the old world are supposed to have no application; in France, where the entire nation is swimming in a sea of anarchy, and the vessel of the State is shattered, and the drowning wretches cling to each floating plank which the waves drift within their reach, conventual institutions are springing up as mushrooms after an autumn rain.' . . . In Italy, where the religious houses were ruthlessly suppressed by Victor Emmanuel's Government in 1871, there are still some that remain, being either too poor to tempt pillage, or too popular to be altogether destroyed, or which have been restored under another name. For instance, the Franciscans hought back their church and buildings at Tre Fontane, near Rome, and were recognized by the Government as an 'Agricultural Society.' The friars have planted eucalyptus in great numbers round their premises, and the result has been that the air and the soil are so purified that it is now possible for the brothers to sleep in their house, without fear of malarial fever, which no one had ventured to do for many years. 'There is still a body of nearly a score of friars at Camaldoli who have part of the convent buildings. The Government has taken all their vast possessions, but has allowed the Order to go on and to recruit itself, as far as they are able to maintain themselves by their own resources, which are said to be considerable, as they have many friends. . . . At La Verne, the Franciscans have been let alone, and are quite masters of the situation. . . . In Switzerland, Germany, and Austria, several of the religious orders are flourishing; and where monks are banished, Sisters of Mercy go about in their habits, and carry on the traditions of the religious life in one or more of its characteristics. A very large Carthusian convent has been huilt at Parkminster, in the Parish of Cowfold, Sussex, with a fine church, and was completed and opened in 1886. There are thirty-six monks. This was founded when the religious orders were for the most part driven from France, and when it was feared that the Grande Chartreuse would be confiscated, from which many relies were brought hither. The Grande Chartreuse was, however, spared, because the French revenue would have lost the profits derived from the manufacture and sale of the liqueur at the abbey. Most of the other Orders, both for men and women, are represented in different places in the United Kingdom, and are found to be adapted to the requirements of our own time, and are constantly supplied with applicants for admission. Some monasteries are said to have been secretly set up in England in the seventeenth century. James II. brought many monks to England. Mr. Wild established a branch of La Trappe at Lulworth in the eighteenth century, which received some orphans of the mur-

dered French nobility. In 1831 a Roman Catholic landowner gave some acres of barren ground for the establishment of a Cistercian monastery on his estates in Leicestershire. A few monks and lay brothers came from Ireland, and settled themselves in such poor hovels as they could build for themselves. Gradually the nave of the church has been erected, and considerable buildings for the monks, for guests, and for farm purposes. The Cistercian Rule is followed in all its strictness. . . . Among the modern forms of Monasticism that have flourished in the Roman Church . . . is . . . the Society of the 'Christian Brothers.' The founder of this most successful institution was Jean Baptiste de la Salle, who was horn of a family of ancient and honourable lineage at Rheims, in 1651. . . . In the United States of America the growth of Monasticism is rapid and extensive."—F. C. Woodhouse, *Monasticism, ancient and modern*, pp. 276, 281, 289. —In the United States "Mission work is . . . carried on by various orders, such as the Franciscan, Jesuit, Redemptorist, Vicentian, Dominican, Oblate, and Passionist Fathers. The Paulist Fathers have as their peculiar province the conduct of missions with the view of converting non-Catholics, but other orders carry on evangelistic or revival services which are called missions. . . . There are also certain orders of sisters or nuns who devote their entire time to work . . . among the Indians and Negroes. . . . Many of the religious orders, both men and women, do a great deal of foreign missionary work. . . . Among the orders especially interested in foreign work are the Franciscan and Jesuit Fathers. . . . Among [educational projects] conducted by the orders are certain institutions such as Georgetown University, at Washington; Fordham University in New York City; College of the Holy Cross, Worcester, Mass., under Jesuit supervision; St. John's University, at Collegeville, Minn.; St. Vincent's Seminary and College, near Pittsburgh; St. Benedict's College, Newark, N. J., and others under the care of the Benedictine Fathers; St. John's Theological Seminary and College, at Brooklyn; Niagara University, at Niagara Falls, N. Y., under the care of the Vicentian Fathers; Gethsemane College in Kentucky, under the care of the Trappist Fathers (Order of Reformed Cistercians). The schools of the Christian Brothers are for the most part identified with churches, rather than incorporated as separate institutions. They have, however, a number of colleges. . . . The sisterhoods are also active in educational work. Trinity College for Women at Washington, D. C., under the care of the Sisters of Notre Dame de Namur, ranks with the best colleges. There are also schools under the care of the Sisters of Charity of St. Vincent de Paul, the Franciscan, Benedictine and Dominican Sisters, Sisters of the Sacred Heart, Sisters of Mercy, the Ursuline and Visitation Nuns and others. . . . [Among philanthropic orders are] The Little Sisters of the Poor who provide homes for aged people of both sexes, regardless of creed or nationality, and at the end of 1916 were conducting 53 homes, with about 9,000 inmates, and the Alexian Brothers who make a specialty of conducting hospitals and insane asylums. The order of the Brothers of the Poor of St. Francis Seraphicus . . . and the Brothers of the Holy Infancy and Youth of Jesus . . . make a specialty of looking after boys. The chief work, however, is in the conduct of hospitals, sanitariums, infant asylums, orphan asylums, homes for the aged, homes for the deaf, homes for the blind, insane asylums, retreats for incurable, cancer, etc., in all parts of the country. There are also a considerable number of organizations engaged in specific

work; thus, the Daughters of Charity of St. Vincent de Paul conduct a Leper Home, at Carrville, La.; the Sisters of Our Lady of Charity of the Good Shepherd devote their entire time to the reformation of girls, and conduct industrial schools for girls exposed to dangers of various kinds; the Little Sisters of the Assumption, the Sisters of Notre Dame de Bon Secours, the Company of Mary, and others, nurse sick poor in their own homes, accepting no remuneration. Other orders of sisters conduct catechism classes in rural districts and immigrant settlements, visit the sick and poor in their homes, and give religious instruction to women and children in penal institutions and almshouses, etc."—United States Census, *Religious bodies*, 1916, pt. 1, pp. 649, 651-652.—Protestant Episcopal Orders include "the Order of Christian Helpers, Order of the Sisters of Bethany, Order of the Holy Cross, the Society of the Mission Priests of St. John the Evangelist and many others."—*Ibid.*, p. 615.—"The attempt to trace . . . growing interest [of monasticism in the Church of England] begins with the suppression of the monasteries under Henry VIII. . . . The very Act which suppressed the lesser monasteries paid tribute to the greater. In its preamble it directed that the members of the smaller institutions be distributed among the 'great and honorable monasteries of the realm, where, thanks be to God, religion is right well kept and preserved.' These words must not be taken too seriously, but they do have a significance. Granted that they were intended to cajole Henry's future victims, they indicate also a popular sentiment in many quarters against the total abolition of the monasteries. Even Latimer desired to retain some of their practical features. . . . The Pilgrimage of Grace incorporated among other grievances a plea for a restoration of the monasteries. How effective the partition of the property of the abbeys proved in silencing the demand for the restoration of the religious houses is shown in the reaction under Mary. When this queen desired to restore the papal supremacy, Parliament made the confirmation of the titles of the occupants of monastic estates part of the Act. Mary, however, succeeded in restoring a number of convents and monastic orders. . . . The thoroughness with which Elizabeth suppressed monasticism is shown by the condition of the English Benedictines. After Feckenham's death only one monk of this Order was left in England. . . . There was no propaganda to restore monastic institutions in the reign of Elizabeth. Antiquaries might praise them in safety of the past, but it was left to the seventeenth century to attempt their revival in the Anglican Church. . . . Throughout the seventeenth century this sentiment in favor of monasticism found expression in the writings of antiquaries and church leaders. Moreover, actual attempts to revive the conventual life were made. . . . But in the religious chill and social activity of the eighteenth century, even the idea perished. In 1701 the English soil seemed less favorable to monasteries than at any time since their destruction. . . . From the close of the Napoleonic Wars to the beginning of the Oxford Movement, the revival of religious orders in England . . . aroused considerable interest. There was much opposition to celibacy, vows, asceticism, the distinctively monastic elements. But the social utility of modified orders had gained a rather wide recognition, especially among the High Church party. Perhaps most important of all was the great enthusiasm aroused in a few leaders, particularly Southey. Some progress is evident, when a man of his influence will say, 'It is not speaking too strongly to assert that the

establishment of Protestant nunneries, upon a wise plan and liberal scale, would be the greatest benefit that could possibly be conferred upon these kingdoms.' Not only did he desire them, he expected them within thirty years. It was very fitting, therefore, that the first Anglican Sisterhood should have been proposed as a memorial to Robert Southey after his death in 1843. . . . The social movements of the first thirty years of the nineteenth century prepared the soil; Pusey and the Tractarians set out the monastic plant. . . . The *British Critic*, Newman and Pusey may be said to represent fairly the advanced Tractarianism of this period. Hence it is seen that this party desired the revival of monasteries very similar to, if not identical with, the old Roman institutions. . . . In 1844 we have Southey's social arguments retained, but many of these purely monastic elements added. Moreover, these conventual communities were advocated not merely for women, as in Southey's articles, but for both sexes. This introduction of the purely monastic element and this extension of application to both men and women were the contribution of the Oxford party, or rather of the extremists of that group. The advocates of monasticism among the Oxford School desired religious orders of both sexes. If a comparison of emphases were to be made, the arguments of the last chapter seemed to aim more at monasteries than at nunneries. In fact the greatest of the Oxford leaders endeavored to establish a 'monastery' as early as 1840. Nevertheless religious orders of women were successfully started almost two decades before those of men. . . . In spite of the bitter attacks, these communities have grown at a remarkable rate. Some prominent church authorities have estimated that there are twice as many Sisters in Anglican Religious Orders to-day as there were before the suppression under Henry VIII. . . . With the broad social appeal, linked to the religious interest in the minds of the promoters, the Sisterhoods have become a great factor in the history of the English Church during the last century [19th]. . . . Before 1845 [male monastic orders] . . . rather than the Sisterhoods were emphasized; and in fact Newman actually put his ideas into practice [at Littlemore]. . . . This attempt was soon cut short by the secession of the members to the Roman faith. . . . For almost two decades after Newman left Littlemore for Rome, the Church of England heard little of monasteries. The sad memory of that event and the bright promises of the Sisterhood movement served to turn attention elsewhere. In the sixties, however, the Sisterhoods being firmly established, the minds of the High Church wing were turned again toward monastic orders of men. The arguments of Froude, Newman, Neale and other advocates of earlier years were echoed in substance if not in form; and to these some new reasons were added. . . . The mention of Pusey, Sellon, Neale, Ignatius, and others recalls the great opposition which the early Orders encountered. No such martyrdom, however, hallows the names of the recent monastic leaders. The purely contemplative life has not yet apparently won many supporters, but the revival of the 'active' and the 'mixed' types of Community life has long since passed through the period of bitter pamphleteering and violent abuse. Two issues have been prominent in the discussions of the communities since their revival. The first was the question of vows. Almost every prelate of England during the last fifty years has been forced to express himself as to his view of vows, their legality and advisability. . . . In some cases, the vows are solemn; in some they are simple; while in others, no explicit vow is taken

and only an 'intention' is expressed. But in all cases, the professing candidate at least feels that it is a service for life. . . . The other question of importance has been the relation of these monastic orders to the Church and the episcopacy. This subject was discussed at considerable length in the Canterbury Convocation of 1862, and the bishops commended the Sisterhoods to the prayers of the Church. In July, 1875, a committee of the Lower House of Canterbury Convocation was appointed to consider the rise and progress of Sisterhoods and Brotherhoods. The report, which was presented in May, 1878, called forth strong resolutions expressing thankfulness for their work and approval of the episcopal recognition accorded to them. The wide sympathy for this revival was shown again in the same Convocation of 1889. . . . Monasticism . . . now [written in 1917] . . . binds together in the conventual life more than thirty communities of men and women, with numerous branch Houses throughout England and the British Empire."—R. W. Sockman, *Revival of the conventual life in the church of England in the nineteenth century*, pp. 6-10, 24, 58, 59, 92, 103, 104, 154, 156, 157, 161, 198, 199.—See also CATHEDRAL: English, Scottish and Irish.

MONASTIR, or Bitolia, ancient Greek city of Heraclea Lyncestis, Serbia, in the Niji mountains and dominating the valley of the Upper Chirna. [See BALKAN STATES: Map.] As the nucleus for roads which lead to Adrianople, Uskubé, Saloniki, and Durazzo it has an important strategic position. In the fourteenth century the city was occupied by the Turks who began to use it as military headquarters early in the nineteenth century. Monastir figured in the Turkish revolution of 1908 [see TURKEY: 1908]; four years later it surrendered to the Serbians in the Balkan War and was ceded to Serbia in 1913 by the Treaties of London and Bucharest. In 1915 it was captured by the Bulgarians in the World War and a year later retaken by the Allied army.—See also SERBIA: 1909-1913.

MONEY AND BANKING

Nature and origin of money.—Essential qualities of good money.—Early use of gold and silver.—“When the division of labour has been once thoroughly established, it is but a very small part of a man's wants which the produce of his own labour can supply. He supplies the far greater part of them by exchanging that surplus part of the produce of his own labour, which is over and above his own consumption, for such parts of the produce of other men's labour as he has occasion for. Every man thus lives by exchanging, or becomes in some measure a merchant, and the society itself grows to be what is properly a commercial society. But when the division of labour first began to take place, this power of exchanging must frequently have been very much clogged and embarrassed in its operations. One man, we shall suppose, has more of a certain commodity than he himself has occasion for, while another has less. The former consequently would be glad to dispose of, and the latter to purchase, a part of this superfluity. But if this latter should chance to have nothing that the former stands in need of, no exchange can be made between them. The butcher has more meat in his shop than he himself can consume, and the brewer and the baker would each of them be

willing to purchase a part of it. But they have nothing to offer in exchange, except the different productions of their respective trades, and the butcher is already provided with all the bread and beer which he has immediate occasion for. No exchange can, in this case, be made between them. . . . In order to avoid the inconveniency of such situations, every prudent man in every period of society, after the first establishment of the division of labour, must naturally have endeavoured to manage his affairs in such a manner, as to have at all times by him, besides the peculiar produce of his own industry, a certain quantity of some one commodity or other, such as he imagined few people would be likely to refuse in exchange for the produce of their industry. Many different commodities, it is probable, were successively both thought of and employed for this purpose. In the rude ages of society, cattle are said to have been the common instrument of commerce; and, though they must have been a most inconvenient one, yet in old times we find things were frequently valued according to the number of cattle which had been given in exchange for them. The armour of Diomedes, says Homer, cost only nine oxen; but that of Glaucus cost an hundred oxen. Salt is said to be the common instrument of commerce

and exchange in Abyssinia; a species of shells in some parts of the coast of India; dried cod at Newfoundland; tobacco in Virginia; sugar in some of our West India colonies; hides or dressed leather in some other countries; and there is at this day [1775] a village in Scotland where it is not uncommon, I am told, for a workman to carry nails instead of money to the baker's shop or the alehouse. In all countries, however, men seem at last to have been determined by irresistible reasons to give the preference, for this employment, to metals above every other commodity."—A. Smith, *Wealth of nations*, v. 1, bk. 1, ch. 4.—"As a result of experiment, all civilised countries have now come to the use of the metals as money, and all of the more important commercial countries have fixed upon gold as their standard and relegated other metals to a subordinate position in their monetary systems. The reasons for the preference for gold become clear from a consideration of the qualities which should be possessed by a good money. Economists quite generally agree that the commodity selected to serve as money should have the following qualities (1) value, (2) durability, (3) portability, (4) homogeneity, (5) divisibility, (6) cognisability, and (7) stability of value. That the commodity which is to serve as the intermediary between valuable things must itself have value is obvious. Durability is important because after each exchange transaction the medium of exchange must remain for a longer or shorter time in the possession of the seller. Unless it is durable, it will depreciate during this interval to the seller's loss. This consideration precludes the use of perishable articles as money and accounts for the world's preference for the precious metals, which are as durable, when alloyed with copper, as anything known to man. Portability is indispensable to the convenience of a medium of exchange. Other things being equal, the commodity which compresses the greatest value in the smallest bulk is the most economical medium of exchange for large transactions. In this respect gold is superior to silver and this accounts in part for the preference for it of leading commercial nations. Homogeneity and divisibility are related qualities, since together they insure that the commodity used as money may be divided and subdivided without loss in value. These qualities also distinguish the metals. Cognisability is important as it renders difficult the circulation of counterfeit money. One objection to silver is the resemblance to it of the baser metals lead and tin. The last quality, stability of value, is essential in connection with the function which the monetary unit performs as a standard of deferred payments. In the absence of such stability creditors and debtors have no guarantee that the contract between them calling for the payment of a certain sum of money at a future date will involve the return of a value equivalent to that loaned. If the value of money rises in the interval the debtor will be injured, if it falls the creditor will receive less than he anticipated. Either event must discourage transactions involving such an uncertain element, and it is for this reason that the importance of stability of value in the commodity which is to serve as money can hardly be exaggerated. As regards this quality also the precious metals have a marked superiority over most other things. The demand for them is very elastic because they serve such a variety of different purposes. They are highly prized as ornaments, they are used in watch-cases, family plate, etc., as badges of social position; they serve important industrial uses in connection with dentistry, etc., and finally they are now so widely

used as money that the monetary demand for them is large. On the side of supply the conditions are equally favourable to stability of value. Because they are precious and at the same time durable, the greater part of the total quantity produced, at least in modern times, has been preserved and is still available to satisfy current needs. In proportion to the total stock (estimated in the case of gold at \$10,000,000,000) the addition to the supply due to production each year is insignificant. The supply is thus practically constant over short periods and is little affected by variations in the annual output of the world's mines. Elasticity of demand and constancy of supply, the conditions favourable to stability of value, are thus presented by the precious metals as by no other commodities. As regards these characteristics there is, perhaps, little to choose between gold and silver. The world's preference for the former must be explained chiefly by its higher value in proportion to its bulk and its readier cognisability."—H. R. Seager, *Introduction to economics*, pp. 305-306.—"That metals were used for the purpose of money much later than the commodities above mentioned, and the precious metals in turn later than the non-precious metals, cannot by any means be shown to be universally true. Rather is gold in some countries to be obtained by the exercise of so little skill, and both gold and silver satisfy a want so live and general, and one so early felt, that they are to be met with as an instrument of exchange in very early times. In the case of isolated races, much depends on the nature of the metals with which the geologic constitution of the country has furnished them. In general, however, the above law is found to prevail here. The higher the development of a people becomes, the more frequent is the occurrence of large payments; and to effect these, the more costly a metal is, the better, of course, it is adapted to effect such payments. Besides, only rich nations are able to possess the costly metals in a quantity absolutely great. Among the Jews, gold as money dates only from the time of David. King Pheidon, of Argos, it is said, introduced silver money into Greece, about the middle of the eighth century before Christ. Gold came into use at a much later period. The Romans struck silver money, for the first time, in 209 before Christ, and, in 207, the first gold coins. Among modern nations, Venice (1285) and Florence seem to have been the first to have coined gold in any quantity."—W. Roscher, *Principles of political economy*, v. 1, bk. 2, ch. 3, sect. 117-119.—See also COMMERCE: Primitive: Result of use of money.

ANCIENT

Egypt and Babylonia.—"Money seems to us now so obvious a convenience, and so much a necessity of commerce, that it appears almost inconceivable that a people who created the Sphinx and the Pyramids, the temples of Ipsamboul and Karnac, should have been entirely ignorant of coins. Yet it appears from the statements of Herodotus, and the evidence of the monuments themselves, that this was really the case. As regards the commercial and banking systems of ancient Egypt, we are almost entirely without information. Their standard of value seems to have been the 'outen' or 'ten' of copper (0.4-0.6 grammes), which circulated like the *æs rude* of the Romans by weight, and in the form of bricks, being measured by the balance. It was obtained from the mines of Mount Sinai, which were worked as early as the fourth dynasty. Gold and

silver appear to have been also used, though less frequently. Like copper, they were sometimes in the form of bricks, but generally in rings, resembling the ring money of the ancient Celts, which is said to have been employed in Ireland down to the 12th century, and still holds its own in the interior of Africa. This approximated very nearly to the possession of money, but it wanted what the Roman lawyers called 'the law' and 'the form.' Neither the weight nor the pureness was guaranteed by any public authority. Such a state of things seems to us very inconvenient, but after all it is not very different from that which prevails in China even at the present day. The first money struck in Egypt, and that for the use rather of the Greek and Phœnician merchants than of the natives, was by the Satrap Aryandes. In ancient Babylonia and Assyria, as in Egypt, the precious metals, and especially silver, circulated as uncoined ingots. They were readily taken indeed, but taken by weight and verified by the balance like any other merchandise. The excavations in Assyria and Babylon, which have thrown so much light upon ancient history, have afforded us some interesting information as to the commercial arrangements of these countries, and we now possess a considerable number of receipts, contracts, and other records relating to loans of silver on personal securities at fixed rates of interest; loans on landed or house property; sales of land, in one case with a plan; sales of slaves, &c. These were engraved on tablets of clay, which were then burnt. M. Lenormant divides these most interesting documents into five principal types:—1. Simple obligations. 2. Obligations with a penal clause in case of non-fulfilment. One he gives which had 79 days to run. 3. Obligations with the guarantee of a third party. 4. Obligations payable to a third person. 5. Drafts drawn upon one place, payable in another. . . . These Assyrian drafts were negotiable, but from the nature of things could not pass by endorsement, because, when the clay was once baked, nothing new could be added, and under these circumstances the name of the payee was frequently omitted. It seems to follow that they must have been regularly advised. It is certainly remarkable that such instruments, and especially letters of credit, should have preceded the use of coins. The earliest banking firm of which we have any account is said to be that of Egibi and Company, for our knowledge of whom we are indebted to Mr. Boscawen, Mr. Pinches, and Mr. Hilton Price. Several documents and records belonging to this family are in the British Museum. They are on clay tablets, and were discovered in an earthenware jar found in the neighbourhood of Hiffah, a few miles from Babylon. The house is said to have acted as a sort of national bank of Babylon: the founder of the house, Egibi, probably lived in the reign of Sennacherib, about 700 B.C. This family has been traced during a century and a half, and through five generations, down to the reign of Darius. At the same time, the tablets hitherto translated scarcely seem to me to prove that the firm acted as bankers, in our sense of the word."—J. Lubbock, *History of money (Nineteenth Century, Nov., 1879)*.—"We have an enormous number of the documents of this firm, beginning with Nebuchadnezzar the Great, and going on for some five generations or so to the time of Darius. The tablets are dated month after month and year after year, and thus they afford us a sure method of fixing the chronology of that very uncertain period of history. There is a small contract tablet in the Museum at Zürich, discovered by Dr. Op-

pert, dated in the 5th year of Pacorus, king of Persia, who reigned about the time of Domitian. There is a little doubt about the reading of one of the characters in the name, but if it is correct, it will prove that the use of cuneiform did not fall into disuse until after the Christian Era. . . . Some have tried to show that Egibi is the Babylonian form of Jacob, which would lead one to suspect the family to have been Jews; but this is not certain at present."—E. A. W. Budge, *Babylonian life and history, p. 115*.—"It is in the development of trade, and especially of banking, rather than in manufactures, that Babylonia and Chaldæa were in advance of all the rest of the world. The most cautious Assyriologists are the least confident in their renderings of the numerous contract tablets from which, if they were accurately interpreted, we should certainly be able to reconstruct the laws and usages of the world's first great market place. . . . The following account of Babylonian usages is derived from the text of M. Revillout's work. . . . It is confirmed in essentials by the later work of Meissner, who has translated over one hundred deeds of the age of Hammurabi and his successors. In Chaldæa every kind of commodity, from land to money, circulated with a freedom that is unknown to modern commerce; every value was negotiable, and there was no limit to the number and variety of the agreements that might be entered into. . . . Brick tablets did not lend themselves readily to 'bookkeeping,' as no further entry could be made after baking, while the first entry was not secure unless baked at once. Each brick recorded one transaction, and was kept by the party interested till the contract was completed, and the destruction of the tablet was equivalent to a receipt. Babylonian law allowed debts to be paid by assigning another person's debt to the creditor; a debt was property, and could be assigned without reference to the debtor, so that any formal acknowledgment of indebtedness could be treated like a negotiable bill—a fact which speaks volumes for the commercial honesty of the people. A separate tablet was, of course, required to record the original debt, or rather to say that So-and-so's debt to Such-an-one has been by him sold to a third party. Such third party could again either assign his claim to a bank for a consideration, or if the last debtor had a credit at the bank, the creditor could be paid out of that, a sort of forecast of the modern clearing-house system. The debtor who pays before the term agreed on has to receive a formal surrender of the creditor's claim, or a transfer of it to himself. The Babylonian regarded money and credit as synonymous, and the phrase, 'Money of Such-an-one upon So-and-so,' is used as equivalent to A's credit with B. . . . In ancient Babylonia, as in modern China, the normal effect of a loan was supposed to be beneficial to the borrower. In Egypt, judging from the form of the deeds, the idea was that the creditor asserted a claim upon the debtor, or the debtor acknowledged a liability to the man from whom he had borrowed. In Babylonia the personal question is scarcely considered; one person owes money to another—that is the commonest thing in the world—such loans are in a chronic state of being incurred and paid off; one man's debt is another man's credit, and credit being the soul of commerce, the loan is considered rather as a part of the floating negotiable capital of the country than as a burden on the shoulders of one particular debtor."—E. J. Simcox, *Primitive civilizations, v. 1, pp. 320-322*.—See also TALENT.

China.—"Not only did the Chinese possess coins

at a very early period, but they were also the inventors of bank notes. Some writers regard bank notes as having originated about 110 B. C., in the reign of the Emperor Ou-ti. At this time the Court was in want of money, and to raise it Klaproth tells us that the prime minister hit upon the following device. When any princess or courtiers entered the imperial presence, it was customary to cover the face with a piece of skin. It was first decreed then, that for this purpose the skin of certain white deer kept in one of the royal parks should alone be permitted, and then these pieces of skin were sold for a high price. But although they appear to have passed from one noble to another, they do not seem ever to have entered into general circulation. It was therefore very different from the Russian skin money. In

united to form a bank of issue which emitted paper money in series, some payable every three years. The earliest mention, in European literature, of paper, or rather cotton, money appears to be by Rubruquis, a monk, who was sent by St. Louis, in the year 1252, to the Court of the Mongol Prince Mangu-Khan, but he merely mentions the fact of its existence. Marco Polo, who resided from 1275 to 1284 at the court of Kublai-Khan, . . . gives us a longer and interesting account of the note system, which he greatly admired, and he concludes by saying, 'Now you have heard the ways and means whereby the great Khan may have, and, in fact, has, more treasure than all the kings in the world. You know all about it, and the reason why.' But this apparent facility of creating money led, in the East, as it has elsewhere, to great abuses. Sir John Mandeville, who was in Tartary shortly afterwards, in 1322, tells us that the 'Emperour may dispenden als moche as he wile with outen estymacioum. For he despendeth not, ne maketh no money, but of lether emprented, or of papyre. . . . For there and beyonde hem thei make no money, nouthur of gold nor of sylver. And therefore he may despende ynow and outrageously.' The great Khan seems to have been himself of the same opinion. He appears to have 'despent outrageously,' and the value of the paper money again fell to a very small fraction of its nominal amount, causing great discontent and misery, until about the middle of the sixteenth century, under the Mandchu dynasty, it was abolished, and appears to have been so completely forgotten, that the Jesuit father, Gabriel de Magaillans, who resided at Peking about 1668, observes that there is no recollection of paper money having ever existed in the manner described by Marco Polo; though two centuries later it was again in use. It must be observed, however, that these Chinese bank notes differed from ours in one essential—namely, they were not payable at sight. Western notes, even when not payable at all, have generally purported to be exchangeable at the will of the holder, but this principle the Chinese did not adopt, and their notes were only payable at certain specified periods."—J. Lubbock, *History of money (Nineteenth Century, Nov., 1879)*.

ALSO IN: W. Vissering, *Chinese currency*.

Coinage in its beginnings.—"Many centuries before the invention of the art of coining, gold and silver in the East, and bronze in the West, in bullion form, had already supplanted barter, the most primitive of all methods of buying and selling, when among pastoral peoples the ox and the sheep were the ordinary mediums of exchange. The very word 'pecunia' is an evidence of this practice in Italy at a period which is probably recent in comparison with the time when values were estimated in cattle in Greece and the East. 'So far as we have any knowledge,' says Herodotus, 'the Lydians were the first nation to introduce the use of gold and silver coin.' This statement of the father of history must not, however, be accepted as finally settling the vexed question as to who were the inventors of coined money, for Strabo, Aelian, and the Parian Chronicle, all agree in adopting the more commonly received tradition, that Pheidon, King of Argos, first struck silver coins in the island of Aegina. These two apparently contradictory assertions modern research tends to reconcile with one another. The one embodies the Asiatic, the other the European tradition; and the truth of the matter is that gold was first coined by the Lydians in Asia Minor, in the seventh century before our era; and that sil-

this case the notes were 'used instead of the skins from which they were cut, the skins themselves being too bulky and heavy to be constantly carried backward and forward. Only a little piece was cut off to figure as a token of possession of the whole skin. The ownership was proved when the piece fitted in the hole.' True bank notes are said to have been invented about 800 A. D., in the reign of Hiantsong, of the dynasty of Thang, and were called 'feytsien,' or flying money. It is curious, however, though not surprising, to find that the temptation to over-issue led to the same results in China as in the West. The value of the notes fell, until at length it took 11,000 min, or £3,000, to buy a cake of rice, and the use of notes appears to have been abandoned. Subsequently the issue was revived, and Tchang-yang (960-990 A. D.) seems to have been the first private person who issued notes. Somewhat later, under the Emperor Tching-tsong (907-1022), this invention was largely extended. Sixteen of the richest firms

ver was first struck in European Greece about the same time. The earliest coins are simply bullets of metal, oval or bean-shaped, bearing on one side the signet of the state or of the community responsible for the purity of the metal and the exactness of the weight. Coins were at first stamped on one side only, the reverse showing merely the impress of the square-headed spike or anvil on which, after being weighed, the bullet of hot metal was placed with a pair of tongs and there held while a second workman adjusted upon it the engraved die. This done, a third man with a heavy hammer would come down upon it with all his might, and the coin would be produced, bearing on its face or obverse the seal of the issuer, and on the reverse only the mark of the anvil spike, an incuse square. This simple process was after a time improved upon by adding a second engraved die beneath the metal bullet, so that a single blow of the sledge-hammer would provide the coin with a type, as it is called, in relief on both sides. The presence of the unengraved incuse square may therefore be accepted as an indication of high antiquity, and nearly all Greek coins which are later than the age of the Persian wars bear a type on both sides. . . . Greek coin-types may be divided into two distinct classes: (a) Mythological or religious representations, and (b) portraits of historical persons. From the earliest times down to the age of Alexander the Great the types of Greek coins are almost exclusively religious. However strange this may seem at first, it is not difficult to explain. It must be borne in mind that when the enterprising and commercial Lydians first lighted upon the happy idea of stamping metal for general circulation, a guarantee of just weight and purity of metal would be the one condition required. . . . What more binding guarantee could be found than the invocation of one or other of those divinities most honoured and most dreaded in the district in which the coin was intended to circulate? There is even good reason to think that the earliest coins were actually struck within the precincts of the temples, and under the direct auspices of the priests; for in times of general insecurity by sea and land, the temples alone remained sacred and inviolate."—B. V. Head, *Greek coins* (S. Lane-Poole, ed., *Coins and medals*, ch. 2).

Early banking.—"The banker's calling is both new and old. As a distinct branch of commerce, and a separate agent in the advancement of civilisation, its history hardly extends over 300 years; but, in a rude and undeveloped sort of way, it has existed during some dozens of centuries. It began almost with the beginning of society. No sooner had men learnt to adopt a portable and artificial equivalent for their commodities, and thus to buy and sell and get gain more easily, than the more careful of them began to gather up their money in little heaps, or in great heaps, if they were fortunate enough. These heaps were, by the Romans, called *montes*—mounds, or banks,—and henceforth every money-maker was a primitive banker. The prudent farmers and shopkeepers in the out-of-the-way villages, who now lock up their savings in strong boxes, or conceal them in places where they are least likely to be found by thieves, show us how the richest and most enterprising men of far-off times, whether in Anglo-Saxon or mediæval Britain, ancient Greece and Rome, China or Judæa, made banks for themselves before the great advantages of joint-stock heaping up of money were discovered. When and in what precise way that discovery was made antiquarians have yet to decide. . . . Perhaps

Jews and Greeks set the example to the modern world. Every rich Athenian had his treasurer or money-keeper, and whenever any particular treasurer proved himself a good accountant and safe banker, it is easy to understand how, from having one master, he came to have several, until he was able to change his condition of slavery for the humble rank of a freedman, and then to use his freedom to such good purpose that he became an influential member of the community. Having many people's money entrusted to his care, he received good payment for his responsible duty, and he quickly learned to increase his wealth by lending out his own savings, if not his employers' capital, at the highest rate of interest that he could obtain. The Greek bankers were chiefly famous as money-lenders, and interest at thirty-six per cent. per annum was not considered unusually exorbitant among them. For their charges they were often blamed by spendthrifts, satirists, and others. 'It is said,' complains Plutarch, 'that hares bring forth and nourish their young at the same time that they conceive again; but the debts of these scoundrels and savages bring forth before they conceive, for they give and immediately demand again; they take away their money at the same time as they put it out; they place at interest what they receive as interest. The Messenians have a proverb: "There is a Pylos before Pylos, and yet another Pylos still." So of the usurers it may be said, "There is a profit before profit, and yet another profit still;" and then, forsooth, they laugh at philosophers, who say that nothing can come out of nothing!' The Greek bankers and money-lenders, those of Delos and Delphi especially, are reported to have used the temples as treasure-houses, and to have taken the priests into partnership in their money-making. Some arrangement of that sort seems to have existed among the Jews, and to have aroused the anger of Jesus when he went into the Temple of Jerusalem, 'and overthrew the tables of the money-changers, and said unto them, It is written, My house shall be called the house of prayer; but ye have made it a den of thieves.' Bankers' or money-changers' tables were famous institutions all over the civilised world of the ancients. Livy tells how, in 308 B.C., if not before, they were to be found in the Roman Forum, and later Latin authors make frequent allusions to banking transactions of all sorts. They talk of deposits and securities, bills of exchange and drafts to order, cheques and bankers' books, as glibly as a modern merchant. But these things were nearly forgotten during the dark ages, until the Jews, true to the money-making propensities that characterised them while they still had a country of their own, set the fashion of money-making and of banking in all the countries of Europe through which they were dispersed."—H. R. F. Bourne, *Romance of trade*, ch. 4.

Greece.—"Oriental contact first stirred the 'auri sacra fames' in the Greek mind. That this was so the Greek language itself tells plainly. For 'chrusos,' gold, is a Semitic loan-word, closely related to the Hebrew 'charuz,' but taken immediately, there can be no reasonable doubt, from the Phœnician. The restless treasure-seekers from Tyre were, indeed, as the Græco-Semitic term metal intimates, the original subterranean explorers of the Balkan peninsula. As early, probably, as the 15th century B.C. they 'dugged out ribs of gold' on the islands of Thasos and Siphnos, and on the Thracian mainland at Mount Pangæum; and the fables of the Golden Fleece, and of Arimasian wars with gold-guarding griffins, prove

the hold won by the 'precious bane' over the popular imagination. Asia Minor was, however, the chief source of prehistoric supply, the native mines lying long neglected after the Phœnicians had been driven from the scene. Midas was a typical king in a land where the mountains were gold-granulated, and the rivers ran over sands of gold. And it was in fact from Phrygia that Pelops was traditionally reported to have brought the treasures which made Mycenæ the golden city of the Achæan world. The Epic affluence in gold was not wholly fictitious. From the sepulchres of Mycenæ alone about one hundred pounds Troy weight of the metal have been disinterred; freely at command even in the lowest stratum of the successive habitations at Hissarlik, it was lavishly stored, and highly wrought in the picturesquely-named 'treasure of Priam'; and has been found, in plates and pearls, beneath twenty metres of volcanic debris, in the Cycladic islands Thera and Therapia. This plentifulness contrasts strangely with the extreme scarcity of gold in historic Greece. It persisted, however, mainly owing to the vicinity of the auriferous Ural Mountains, in the Milesian colony of Panticapæum, near Kertch, where graves have been opened containing corpses shining 'like images' in a complete clothing of gold-leaf, and equipped with ample supplies of golden vessels and ornaments. Silver was, at the outset, a still rarer substance than gold. Not that there is really less of it. . . . But it occurs less obviously, and is less easy to obtain pure. Accordingly, in some very early Egyptian inscriptions, silver, by heading the list of metals, claims a supremacy over them which proved short-lived. It terminated for ever with the scarcity that had produced it, when the Phœnicians began to pour the flood of Spanish silver into the markets and treasure-chambers of the East. Armenia constituted another tolerably copious source of supply; and it was in this quarter that Homer located the 'birth-place of silver.'—A. M. Clerke, *Familiar studies in Homer*, ch. 10.—"Taken as a whole the Greek money is excellent; pure in metal and exact in weight, its real corresponding to its nominal value. Nothing better has been done in this way among the most civilized and best governed nations of modern times. There is, indeed, always a certain recognized limit, which keeps the actual weight of the money slightly below its theoretical weight; and this fact recurs with such regularity that it may be regarded as a rule. We must conclude, therefore, that it was under this form that Greek civilization allowed to the coiner of money the right of seigniorage, or the benefit legitimately due to him to cover the expenses of the coinage, and in exchange for the service rendered by him to the public in providing them with money, by which they were saved the trouble of perpetual weighing. This allowance, however, is always kept within very narrow limits, and is never more than the excess of the natural value of the coined money over that of metal in ingots. . . . Of course, the general and predominant fact of the excellence of the Greek money in the time of Hellenic independence is subject, like all human things, to some exceptions. There were a few cities which yielded to the delusive bait of an unlawful advantage, debasing the quality of their coins without foreseeing that the consequences of this unfair operation would react against themselves. But these exceptions are very rare."—F. Lenormant, *Money in ancient Greece and Rome* (*Contemporary Review*, Feb., 1870).—"The quantity, particularly of gold. . . . was, in the earlier historical periods, according to unexceptionable

testimony, extremely small. In the time of Cræsus, according to Theopompus, gold was not to be found for sale in any of the Greek States. The Spartans, needing some for a votive offering, wished to purchase a quantity from Cræsus; manifestly because he was the nearest person from whom it could be obtained. . . . Even during the period from the seventieth to the eightieth Olympiads, (B. C. 500-400,) pure gold was a rarity. When Hiero of Syracuse wished to send a tripod and a statue of the Goddess of Victory, made of pure gold, to the Delphian Apollo, he could not procure the requisite quantity of metal until his agents applied to the Corinthian Architiles, who, as was related by the above-mentioned Theopompus and Phanius of Eresus, had long been in the practice of purchasing gold in small quantities, and hoarding it. Greece proper itself did not possess many mines of precious metals. The most important of the few which it possessed were the Attic silver mines of Laurion. These were at first very productive. . . . Asia and Africa furnished incomparably a larger quantity of the precious metals than was procured in Greece and the other European countries. . . . Colchis, Lydia, and Phrygia, were distinguished for their abundance of gold. Some derive the tradition of the golden fleece from the gold washings in Colchis. Who has not heard of the riches of Midas, and Gyges, and Cræsus, the gold mines of the mountains Tmolus and Sipylus, the gold-sand of the Pactolus? . . . From the very productive gold mines of India, together with its rivers flowing with gold, among which in particular the Ganges may be classed, arose the fable of the gold-digging ants. From these annual revenues the royal treasure was formed. By this a great quantity of precious metal was kept from circulation. It was manifestly their principle to coin only as much gold and silver as was necessary for the purposes of trade, and for the expenditures of the State. In Greece, also, great quantities were kept from circulation, and accumulated in treasuries. There were locked up in the citadel of Athens 0,700 talents of coined silver, besides the gold and silver vessels and utensils. The Delphian god possessed a great number of the most valuable articles. . . . The magnificent expenditures of Pericles upon public edifices and structures, for works of the plastic arts, for theatrical exhibitions, and in carrying on wars, distributed what Athens had collected, into many hands. The temple-robbing Phocians coined from the treasures at Delphi ten thousand talents in gold and silver; and this large sum was consumed by war. Philip of Macedonia, in fine, carried on his wars as much with gold as with arms. Thus a large amount of money came into circulation in the period between the commencement of the Persian wars and the age of Demosthenes. The precious metals, therefore, must of necessity have depreciated in value, as they did at a later period, when Constantine the Great caused money to be coined from the precious articles found in the heathen temples. But what a quantity of gold and silver flowed through Alexander's conquest of Asia into the western countries! Allowing that his historians exaggerate, the main point, however, remains certain. . . . Alexander's successors not only collected immense sums, but by their wars again put them into circulation. . . . The enormous taxes which were raised in the Macedonian kingdoms, the revelry and extravagant liberality of the kings, which passed all bounds, indicate the existence of an immense amount of ready money."—A. Boeckh, *Public economy of the Athenians*, bk. 1, ch. 3.—See also

TALENT; CAPITALISM: In antiquity; ORACLES.

Phœnicia.—"Nearly all the silver in common use for trade throughout the East was brought into the market by the Phœnicians. The silver mines were few and distant; the trade was thus a monopoly, worth keeping so by the most savage treatment of suspected rivals, and, as a monopoly, so lucrative that, but for the long and costly voyage between Spain and Syria, the merchant would have seemed to get his profit for nothing. . . . The use of silver money, though it did not originate with the Phœnicians, was no doubt promoted by their widespread dealings. The coins were always of known weight, and standing in a well-known relation to the bars used for large transactions."—E. J. Simcox, *Primitive civilisations*, v. 1, p. 400.—"It is a curious fact that coinage in Phœnicia, one of the most commercial of ancient countries, should have been late in origin, and apparently not very plentiful. There are, in fact, no coins of earlier period than the third century which we can with certainty attribute to the great cities of Tyre and Sidon. Some modern writers, however, consider that many of the coins generally classed under Persia—notably those bearing the types of a chariot, a galley, and an owl respectively—were issued by those cities in the 5th and 4th centuries B. C. But it is certain, in any case, that the Phœnicians were far behind the Greeks in the art of moneying. With the invasion of Persia by Alexander the Great came a great change; and all the ancient landmarks of Asiatic government and order were swept away. During the life of Alexander the Great the coins bearing his name and his types circulated throughout Asia; and after his death the same range of currency was attained by the money of the early Seleucid Kings of Syria—Seleucus I., Antiochus I., and Antiochus II., who virtually succeeded to the dominions of the Persian Kings, and tried in many respects to carry on their policy. Of these monarchs we possess a splendid series of coins."—S. Lane-Poole, ed., *Coins and medals*, ch. 6.—See also PHŒNICIA: B. C. 850-538.

Jews.—"It would seem that, until the middle of the second century B. C., the Jews either weighed out gold and silver for the price of goods, or else used the money usually current in Syria, that of Persia, Phœnicia, Athens, and the Seleucidae. Simon the Maccabee was the first to issue the Jewish shekel as a coin, and we learn from the Book of Maccabees that the privilege of striking was expressly granted him by King Antiochus VII. of Syria. We possess shekels of years 1-5 of the deliverance of Zion; the types are a chalice and a triple flower. The kings who succeeded Simon, down to Antigonus, confined themselves to the issue of copper money, with Hebrew legends and with types calculated not to shock the susceptible feelings of their people, to whom the representation of a living thing was abominable—such types as a lily, a palm, a star, or an anchor. When the Herodian family came in, several violations of this rule appear."—S. Lane-Poole, ed., *Coins and medals*, ch. 6.

Rome.—"In Rome the generic terms for money seem to have been successively, pecunia, as, nummus, and moneta. . . . Moneta . . . is derived from the name of the temple in which, or in a building to or next to which the money of Rome was coined after the defeat of Pyrrhus, B. C. 275, more probably after the capture of Tarentum by the Romans, B. C. 272. It probably did not come into use until after the era of Scipio, and then was

only used occasionally until the period of the Empire, when it and its derivatives became more common. Nummus, nevertheless, continued to hold its ground until towards the decline of the Empire, when it went entirely out of use, and moneta and its derivatives usurped its place, which it has continued to hold ever since. Moneta is therefore substantially a term of the Dark Ages. . . . The idea associated with moneta is coins, whose value was derived mainly from that of the material of which they were composed; whilst the idea associated with nummus is a system of symbols whose value was derived from legal limitation. From the fact that our language sprang from the Dark Ages, we have no generic word for money other than moneta, which only relates to one kind of money. For a similar reason, the comparative newness of the English tongue, we have no word for a piece of money except coin, which, properly speaking, only relates to one kind of piece, namely, that which is struck by the cuneus."—A. Del Mar, *History of money in ancient countries*, ch. 28.—The extent and energy of the Roman traffic, in the great age of the republic, during the third and second centuries before Christ, "may be traced most distinctly by means of coins and monetary relations. The Roman denarius kept pace with the Roman legions. . . . The Sicilian mints—last of all that of Syracuse in 542—were closed or at any rate restricted to small money in consequence of the Roman conquest; and . . . in Sicily and Sardinia the denarius obtained legal circulation at least side by side with the older silver currency and probably very soon became the exclusive legal tender. With equal if not greater rapidity the Roman silver coinage penetrated into Spain, where the great silver-mines existed and there was virtually no earlier national coinage; at a very early period the Spanish towns even began to coin after the Roman standard. On the whole, as Carthage coined only to a very limited extent, there existed not a single important mint in addition to that of Rome in the region of the western Mediterranean, with the exception of the mint of Massilia and perhaps also of those of the Illyrian Greeks at Apollonia and Epidamnus. Accordingly, when the Romans began to establish themselves in the region of the Po, these mints were [about 225] subjected to the Roman standard in such a way, that, while they retained the right of coining silver, they uniformly—and the Massiliots in particular—were led to adjust their drachma to the weight of the Roman three-quarter denarius, which the Roman government on its part began to coin, primarily for the use of upper Italy, under the name of the 'piece of Victory' (victoriatus). This new system, based on the Roman, prevailed throughout the Massiliot, Upper Italian, and Illyrian territories; and these coins even penetrated into the barbarian lands on the north, those of Massilia, for instance, into the Alpine districts along the whole basin of the Rhone, and those of Illyria as far as the modern Transylvania. The eastern half of the Mediterranean was not yet reached by the Roman money, as it had not yet fallen under the direct sovereignty of Rome; but its place was filled by gold, the true and natural medium for international and transmarine commerce. It is true that the Roman government, in conformity with its strictly conservative character, adhered—with the exception of a temporary coinage of gold occasioned by the financial embarrassment during the Hannibalic war—steadfastly to the rule of coining silver only in addition to the national-Italian copper; but commerce had already assumed such dimensions, that

it was able in the absence of money to conduct its transactions with gold by weight. Of the sum in cash, which lay in the Roman treasury in 597, scarcely a sixth was coined or uncoined silver, five-sixths consisted of gold in bars, and beyond doubt the precious metals were found in all the chests of the larger Roman capitalists in substantially similar proportions. Already therefore gold held the first place in great transactions; and, as may be inferred from this fact, the preponderance of traffic was maintained with foreign lands, and particularly with the East, which since the times of Philip and Alexander the Great had adopted a gold currency. The whole gain from these immense transactions of the Roman capitalists flowed in the long run to Rome. . . . The moneyed superiority of Rome as compared with the rest of the civilized world was, accordingly, quite as decided as its political and military ascendancy. Rome in this respect stood towards other countries somewhat as the England of the present day stands towards the continent."—T. Mommsen, *History of Rome*, v. 2, bk. 3, ch. 12.—In the later years of the Roman republic the coinage became debased and uncertain. "Cæsar restored the public credit by issuing good money, such as had not been seen in Rome for a length of time, money of pure metal and exact weight; with scarcely any admixture of plated pieces, money which could circulate for its real value, and this measure became one of the principal sources of his popularity. Augustus followed his example, but at the same time took away from the Senate the right of coining gold and silver, reserving this exclusively to the imperial authority, which was to exercise it absolutely without control. From this time we find the theory that the value of money is arbitrary, and depends solely on the will of the sovereign who issues it, more and more widely and tenaciously held. . . . The faith placed in the official impress fostered the temptation to abuse it. . . . In less than a century the change of the money of the State into imperial money, and the theory that its value arose from its bearing the effigy of the sovereign, produced a system of adulteration of specie, which went on growing to the very close of the Empire, and which the successors of Augustus utilized largely for the indulgence of their passions and their prodigality."—F. Lenormant, *Money in ancient Greece and Rome* (*Contemporary Review*, Feb., 1879).—"Into Italy banking had penetrated from Greece, and transmitted through the cities of Magna Græcia had become fairly implanted in Rome before the period of the Second Punic War. . . . But, even if a private person, a Roman banker was too important an individual to be free from governmental control. In imperial times the bankers of the capital were supervised by the city præfect, of the provinces by the governors; and they were very possibly required to take out some kind of a state license. Their original business was the exchange of foreign moneys, and until the imperial coinage had practically superseded every other in the Empire, there must have been good profit in exchanging Macedonian gold pieces for Roman denarii and the like. Close, however, on the heels of mere money-changing, came the writing of bills of exchange—a custom again borrowed from Greece; a banker in Rome would receive a sum to be paid in Athens, and would issue a bill to be paid by some Athenian banking correspondent—a process involving, of course, the changing into foreign money as well as the mere transfer of the sum. The *argentarius* also served as a general receiver of deposits, sometimes without in-

terest merely for the convenience and security of the owner, and payable against check, or, as was common, against interest, in which case the banker was permitted to invest it for his own advantage and make what profit he could. If he failed, the law protected the depositor, whose claims had to be satisfied before the other creditors of the bankrupt. In addition to these deposits and payments against check, bankers also did a general lending business, to whomsoever they thought solvent, and here, no doubt, came in the major part of their profits."—W. S. Davis, *Influence of wealth in imperial Rome*, pp. 73-74.—"The monetary system instituted by Augustus, comprising eight denominations . . . formed the basis of the Roman coinage down to the time of Gallienus. . . . We now pass on to notice the changes that occurred in the course of this period of over two and a half centuries and the various attempts, made from time to time, to readjust the coinage in order to stave off the inevitable disintegration of the system. These changes are mainly of three kinds: (1) the addition of new denominations or new forms of existing denominations, the duration of their currency being in some cases limited to a few years, while in others it is extended to nearly a century; (2) the temporary or permanent discontinuance of certain denominations; (3) the tendency towards depreciation, which is especially conspicuous in the third century, by the reduction in the weight of the gold and bronze and by the increase of the alloy in the silver. It may be stated generally that throughout this period gold and silver *quinarii* appear to have been issued somewhat irregularly and never in very large quantities. This also applies to some extent to the smaller denominations of orichalcum and copper. . . . During the first nine years of Nero's reign a somewhat unusual state of affairs prevailed in connexion with the Roman mint, inasmuch as the issue of gold and silver, which since the time of Augustus had belonged exclusively to the imperial mint, was now relegated to the senatorial. It seems probable, moreover, that no coins of orichalcum or copper were issued prior to the year 60 A. D.; and it is not until after the reform of 63 A. D. that the great Neronian coinage in these metals really begins. . . . Between 60 and 63 A. D. there appears to have been a limited output of copper *asses*, *semisses*, and *quadrantes* and possibly a few *dupondii*. But as time went on the need of a regular and more plentiful supply of orichalcum and copper became daily more pressing. Thus the senatorial mint was again confronted with the problem of how to deal with the fluctuating value of orichalcum in relation to the other metals without upsetting the traditional imperial system. The solution hit upon by Nero's mint-masters was to issue coins of all denominations, from the *sestertius* downwards, in orichalcum, adding to those already in common use the *as*, *semis*, and *quadrans*. . . . The monetary reform of 63 A. D. was an undertaking of a bold and elaborate character, and Nero's reformed coinage has been not inaptly described by M. Soutzo as the most important monetary system of antiquity. Certainly it presented the most complete gradation of denominational values ever current at the same time. In its practical result, however, it is impossible to regard it as other than an interesting experiment. Meritorious as it undoubtedly was in theory, it came to an abrupt termination at Nero's death, and no attempt to revive it in its entirety was made by any of his successors in the Principate. . . . The reign of Galba is remarkable amongst other things for the

prolific output of coins from the imperial and senatorial mints. . . . The elaborate brass and copper system, introduced in 63 A. D., disappears, and Galba's coinage returns to a modified form of the Augustan system, consisting of only three denominations, viz. *sestertius*, *dupondius*, and *as*. . . . Thus the coinage of the Empire settled down to the form that became stereotyped under the régime of the Flavians and Antonines, and, in spite of the growing corruption that eventually undermined both the fabric and credit of the currency, this form lasted in theory down to the time of Gallienus. . . . Never in the whole course of Roman history was the coinage plunged into so wild a state of confusion as during the disastrous reign of Gallienus. Thus the final collapse of the Augustan system was inevitable. The gold was issued regardless of any weight standard. The debased silver 'Antoninianus' degenerated into a mere apology of plated copper, in which form it lingered until the first year of Aurelian. The senatorial bronze, which constituted the basis of the Augustan system, after having lost almost every vestige of its former dignity, terminated abruptly, since the introduction of worthless plated coins made the continuance of bronze impossible. . . . The attempts at revival that occurred during the third century were . . . merely evanescent. However, Aurelian's unpretentious 'reform' . . . at any rate achieved a result of some importance by the institution of a new plated denomination of definitely fixed value, which . . . so far proved successful in arresting the tendency to further debasement of the coinage. Aurelian's scheme, however . . . proved altogether too inadequate, and so it fell to Diocletian to grapple seriously with the problem of the currency. . . . There is no question that Diocletian aimed at arbitrarily establishing a universal monetary standard; but although the two main factors of his system, namely the *folles* and *denarius*, were current throughout every province of the Empire, it by no means follows that the exchange value of the coins was uniform. Further, the appearance of coins of intermediate sizes affords unmistakable evidence that the prescribed coinage was either inadequate or unsuitable for local requirements. Hence it is not altogether surprising to find that, in order to bring the coinage more into harmony with traditional money values or local usages, certain alterations were made in Diocletian's symmetrical and highly artificial system, which inevitably reduced it to a state of confusion."—E. A. Sydenham, *Roman monetary system*, pt. 2 (*Numismatic Chronicle*, 4th series, v. 10, 1910).—See also CAPITALISM: In antiquity.

MEDIEVAL

Introductory.—Standard of currency.—Infrequent use of money.—"During the Middle Ages, gold became so scarce that silver was practically the only coinage, and so the European nations were on a silver standard. The fall in the value of silver about the fifteenth century and on created a demand for coins of greater value on small bulk, and as there was a greater production of gold at this time, the use of gold coins together with the silver became more common. . . . Under the feudal system society was organized on a basis on which was required very little exchange of products, and most of what exchange existed was done on a barter basis. Taxes and payments to the lord of the manor were made in produce. The royal court was maintained not from money taxes collected, but from the produce

of the crown lands which the king received as the lord of the manor. Wars were conducted without the use of money; the soldiers were equipped from their own resources and were sustained from the forage of the country traversed in campaigns."—E. D. Howard, *Money and banking*, pp. 49, 154-155.

Coinage and banking of early Middle Ages.—"As regards the monetary system of the Middle Ages, the precious metals, when uncoined, were weighed by the pound and half pound or mark, for which different standards were in use, the most generally recognised being those of Troyes and Cologne. Of coined money there existed a perplexing variety, which made it almost impossible to ascertain the relative value, not only of different coins, but of the same coin of different issues. This resulted from the emperor or king conferring the right of coinage upon various lords, spiritual and temporal, from whom it was ultimately acquired by individual towns. The management was in most cases entrusted to a company, temporary or permanent, inspected by an official, the coin-tester, originally appointed by the sovereign, but afterwards by the company, and confirmed by the king or bishop. The house where the process of coining was performed was called the mint, and the company who held the rights of coinage in fee was known as the Mint House Company, or simply the House Company. Very generally the office was held by the Corporation of Goldsmiths. The want of perfect supervision led to great debasement of the currency, especially in Germany and France; but in England and Italy the standard was tolerably well maintained. Payments in silver were much more common than in gold. Before the Crusades the only gold coins known in Europe were the Byzantine solides, the Italian tari, and Moorish maurabotini. The solidi, which were originally of 23 to 23½ carat gold, but subsequently very much deteriorated, were reckoned as equal to twelve silver denars. They passed current in Southern and Eastern Europe, Hungary, Germany, Poland, and Prussia. . . . Solde, sol, and sou are only repeated transformations of the name of the coin, which have been accompanied by still greater changes in its value. The tari or tarentini derived its name from the Italian town where it was originally struck. It was less generally known than the solides, and was equal to one-fourth the latter in value. The maurabotini or sarazens were only of 15 carats gold. The name survives in the Spanish maravedi, which, however, like the sou, is now made of copper instead of gold. In the thirteenth century augustals, florentines, and ducats, or zecchins (sequins), were coined in Italy. The first-mentioned, the weight of which was half an ounce, were named in honour of Frederick II., who was Roman Cæsar and Augustus in 1252. The florentines, also known as gigliati, or lilies, from the arms of Florence, which they bore on one side, with the effigy of John the Baptist on the reverse, were of fine gold and lighter than the solidi, about 64 being reckoned equal to the mark. The ducats or zecchins were of Venetian origin, receiving their first name from the Duca or Doge, and the other from the Zecca or Mint House. They were somewhat less in value than the florentines, 66 or 67 being counted to the fine mark. Nearly equivalent in value to these Italian coins were the gold guilders coined in the fourteenth century in Hungary and the Rhine regions. The Rhenish guilder was of 22½ or 23 carats fine, and in weight 1/66 of a mark of Cologne. The silver guilder was of later production, and the

name is now used as equivalent to florin. . . . In silver payments, the metal being usually nearly pure, it was common to compute by weight, coins and uncoined bullion being alike put into the scale, as is still the case in some Eastern countries. Hence the origin of the pound, livre, or mark. The most widely diffused silver coin was the denarius, which was, as in ancient Roman times, the $\frac{11}{240}$ of a pound. The name pending or pennig, by which the denarius was known among the old Teutonic nations, seems to be connected with pendere, to weigh out or pay; as the other ancient Teutonic coin, the sceat, was with sceoton, to pay, a word which is preserved in the modern phrases 'scot free,' 'pay your scot.' . . . Half-pennies and farthings were not known in the earliest times, but the penny was deeply indented by two cross lines, which enabled it to be broken into quarters or farthings (feordings or fourthings). From the indented cross the denarius was known in Germany as the kreutzer. . . . With such a diversity of coinage, it was necessary to settle any mercantile transaction in the currency of the place. Not only would sellers have refused to accept money whose value was unknown to them, but in many places they were forbidden to do so by law. Merchants attending foreign markets therefore brought with them a quantity of fine silver and gold in bars, which they exchanged on the spot for the current coin of the place, to be used in settling their transactions; the balance remaining on hand they re-exchanged for bullion before leaving. The business of money-changing, which thus arose, was a very lucrative one, and was originally mostly in the hands of Italian merchants, chiefly Lombards and Florentines. In Italy the money-changers formed a guild, members of which settled in the Netherlands, England, Cologne, and the Mediterranean ports. In these different towns and countries they kept up a close connection with each other and with Italy, and at an early period (before the thirteenth century) commenced the practice of assignments, i. e., receiving money in one place, to be paid by an order upon their correspondents in another, thus saving the merchant who travelled from country to country the expense and risk of transporting specie. In the thirteenth century this branch of business was in extensive use at Barcelona, and in 1307 the tribute of 'Peter's pence' was sent from England to the Pope through the Lombard exchangers. From 5 to 6 per cent., or more, was charged upon the transaction, and the profitable nature of the business soon led many wealthy and even noble Italian families to employ their money in this way. They established a member of their firm in each of the great centres of trade to receive and pay on their account. In Florence alone (about 1350) there are said to have been eighty such houses. Among these the Frescobaldi, Bardi, and Peruzzi are well-known names; but the chief place was taken by the famous Florentine house of the Medici, who had banking houses established in sixteen of the chief cities of Europe and the Levant. In the north of Europe, before long, similar arrangements were established by the merchants of the Hanseatic League. . . . Assignments of this kind were drawn out in the form of letters, requesting the person by whom the money was due to pay it over to another party, named in the bill, on account of the writer, specifying also the time within which and the firm in which the payment was to be made. They were thus known as letters, billets, or bills of exchange, and appear in Italy as early as the thirteenth and fourteenth centuries. Among the earliest examples

in existence are a letter of exchange, dated at Milan in 1325, payable within five months at Lucca; one dated at Bruges, 1304, and payable at Barcelona; and another, dated at Bologna, 1381, payable in Venice. . . . 'The first writers who treat of bills are Italians: the Italian language furnishes the technical terms for drafts, remittances, currency, sight, usance, and discount, used in most of the languages of Europe.' . . . Of other branches of banking the germs also appeared in the Middle Ages. Venice seems to have been the first city to possess something answering to a deposit bank. The merchants here united in forming a common treasury, where they deposited sums of money, upon which they gave assignments or orders for payment to their creditors, and to which similar assignments due to themselves were paid and added on to the amount at their credit. The taula di cambi (exchange counter) of Barcelona was a similar institution, as also the bank of St. George, at Genoa."—J. Yeats, *Growth and vicissitudes of commerce, appendix F.*—See also below: 12th-17th centuries; 14th-15th centuries. The name "Lombards" was frequently given, during the Middle Ages to all the Italian merchants and money-lenders—from Florence, Venice, Genoa, and elsewhere—who were engaged throughout Europe in banking and trade.—See also COMMERCE: Medieval: 7th-13th centuries; JEWS: England: 11th century.

12th-14th centuries.—Florentine banking.—"The business of money-changing seemed thoroughly at home here, and it is not surprising that the invention of bills of exchange, which we first meet with in 1100 in the relations between England and Italy, should be ascribed to Florence. The money trade seems to have flourished as early as the twelfth century, towards the end of which a Marquis of Ferrara raised money on his lands from the Florentines. In 1204 we find the money-changers as one of the corporations. In 1228, and probably from the beginning of the century, several Florentines were settled in London as changers to King Henry III.; and here, as in France, they conducted the money transactions of the Papal chair in conjunction with the Siennese. Their oldest known statute, which established rules for the whole conduct of trade (Statuto dell' Università della Mercatanzia) drawn up by a commission consisting of five members of the great guilds, is dated 1280. Their guild-hall was in the Via Calimaruza, opposite that of the Calimala, and was later included in the buildings of the post-office, on the site of which, after the post-office had been removed to what was formerly the mint, a building was lately erected, similar in architecture to the Palazzo of the Signoria, which stands opposite. Their coat of arms displayed gold coins laid one beside another on a red field. At the end of the thirteenth century their activity, especially in France and England, was extraordinarily great. But if wealth surpassing all previous conception was attained, it not seldom involved loss of repute, and those who pursued the calling ran the risk of immense losses from fiscal measures to the carrying out of which they themselves contributed, as well as those which were caused by insolvency or dishonesty. . . . The names of Tuscans and Lombards, and that of Cahorsiens in France, no longer indicated the origin, but the trade of the money-changers, who drew down the ancient hatred upon themselves. . . . France possessed at this time the greatest attraction for the Florentine money-makers, although they were sometimes severely oppressed, which is sufficient proof that their winnings were

still greater than their occasional losses. . . . The Florentine money market suffered the severest blow from England. At the end of the twelfth century there were already Florentine houses of exchange in London, and if Pisans, Genoese, and Venetians managed the trade by sea in the times of the Crusades, it was the Florentines mostly who looked after financial affairs in connection with the Papal chair, as we have seen. Numerous banks appeared about the middle of the thirteenth century, among which the Frescobaldi, a family of ancient nobility, and as such attainted by the prosecutions against it, took the lead, and were referred to the custom-house of the country for re-imbusement of the loans made to the kings Edward I. and II. Later, the two great trading companies of the Bardi and Peruzzi came into notice, and with their money Edward III. began the French war against Philip of Valois. But even in the first year of this war, which began with an unsuccessful attack upon Flanders, the king suspended the payments to the creditors of the State by a decree of May 6, 1339. The advances made by the Bardi amounted to 180,000 marks sterling, those of the Peruzzi to above 135,000, according to Giovanni Villani, who knew only too well about these things, since he was ruined by them himself to the extent of 'a sum of more than 1,355,000 gold florins, equivalent to the value of a kingdom.' Bonifazio Peruzzi, the head of the house, hastened to London, where he died of grief in the following year. The blow fell on the whole city. . . . Both houses began at once to liquidate, and the prevailing disturbance contributed not a little to the early success of the ambitious plans of the Duke of Athens. The real bankruptcy ensued, however, in January 1346, when new losses had occurred in Sicily. . . . The banks of the Acciaiuoli, Bonaccorsi, Cocchi, Antellesi, Corsini, da Uzzano, Perendoli, and many smaller ones, as well as numerous private persons, were involved in the ruin. 'The immense loans to foreign sovereigns,' adds Villani, 'drew down ruin upon our city, the like of which it had never known.' There was a complete lack of cash. Estates in the city found no purchasers at a third of their former value. . . . The famine and pestilence of 1347 and 1348, the oppressions of the mercenary bands and the heavy expenses caused by them, the cost of the war against Pope Gregory XI., and finally the tumult of the Ciompi, left Florence no peace for a long time. . . . At the beginning of the fifteenth century industry was again flourishing in all its branches in Florence, financial operations were extended, and foreign countries filled with Florentine banks and mercantile houses. . . . In London the most important firms had their representatives, Bruges was the chief place for Flanders, and we shall see how these connections lasted to the time of the greatest splendour of the Medici. France is frequently mentioned. The official representatives of the Florentine nation resided in the capital, while numerous houses established themselves in Lyons, in Avignon (since the removal of the Papal chair to this town), in Nismes, Narbonne, Carcassonne, Marseilles, &c. . . . The house of the Peruzzi alone had sixteen counting-houses in the fourteenth century, from London to Cyprus."—A. von Reumont, *Lorenzo de' Medici*, v. 1, bk. 1, ch. 4.—"The three principal branches of industry which enriched the Florentines were—banking, the manufacture of cloth, and the dyeing of it, and the manufacture of silk. The three most important guilds of the seven 'arti maggiori' were those which represented these three industries. Perhaps the most impor-

tant in the amount of its gains, as well as that which first rose to a high degree of importance, was the 'Arte del Cambio,' or banking. The earliest banking operations seem to have arisen from the need of the Roman court to find some means of causing the dues to which it laid claim in distant parts of Europe to be collected and transmitted to Rome. When the Papal Court was removed to Avignon, its residence there occasioned a greatly increased sending backwards and forwards of money between Italy and that city. And of all this banking business, the largest and most profitable portion was in the hands of Florentine citizens, whether resident in Florence or in the various commercial cities of Europe. We find Florentines engaged in lending money at interest to sovereign princes as early as the first quarter of the twelfth century."—T. A. Trollope, *History of the commonwealth of Florence*, v. 2, bk. 4, ch. 1. —See also CAPITALISM: 12th-16th centuries.

12th-17th centuries.—Bank of Venice.—Genoa.—Origin of Bank of St. George.—"In 1171 we find the foundation of the Bank of the Republic of Venice. Venice in those days was at war and needed money. The merchants of Venice were called upon to deposit their gold with the bank, and were given credit for gold so deposited on the books of the bank. These credits were transferable in the names of other people, both in full or in part, and soon a system of transferring credit was established which was used by all merchants in their business transactions. This continued for 500 years!"—A. O. Corbin *Golden horde*, pp. 75-76.—"The Bank of St. George, its constitution, its building, and its history, forms one of the most interesting relics of mediæval commercial activity. Those old grey walls, as seen still in Genoa, begrimed with dirt and fast falling into decay, are the cradle of modern commerce, modern banking schemes, and modern wealth. . . . This Bank of St. George is indeed a most singular political phenomenon. Elsewhere than in Genoa we search in vain for a parallel for the existence of a body of citizens distinct from the government—with their own laws, magistrates, and independent authority—a state within a state, a republic within a republic. All dealings with the government were voluntary on the part of the bank. . . . But, far from working without harmony, we always find the greatest unanimity of feeling between these two forms of republics within the same city walls. The government of Genoa always respected the liberties of the bank, and the bank always did its best to assist the government when in pecuniary distress. . . . To define an exact origin for the bank is difficult; it owed its existence to the natural development of commercial enterprise rather than to the genius of any one man, or the shrewdness of any particular period in Genoese history. The Crusades, and the necessary preparation of galleys, brought into Genoa the idea of advancing capital for a term of years as a loan to the government on the security of the taxes and public revenues; but in those cases the profits were quickly realized, and the debts soon cancelled by the monarchs who incurred them. However, the expeditions against the Saracens and the Moors were otherwise, and were undertaken at some risk to Genoa herself. . . . Now large sums of money were advanced, the profits on which were not spontaneous; it was more an investment of capital for a longer term of years, which was secured by the public revenues, but the profits of which depended on the success of the expedition. In 1148 was the first formal debt incurred by the government, and to meet the occasion the same system was adopted which continued in vogue,

subject only to regulations and improvements which were found necessary as time went on, until the days of the French Revolution. The creditors nominated from amongst themselves a council of administration to watch over the common interests, and to them the government conceded a certain number of the custom duties for a term of years until the debt should be extinguished. This council of administration elected their own consuls, after the fashion of the Republic governors. Every hundred francs was termed a share (*hogo*) and every creditor a shareholder (*luogatorio*). . . . Each separate loan was termed a 'compera,' and these loans were collectively known as the 'compere of St. George,' which in later years became the celebrated bank. Each loan generally took the name of the object for which it was raised, or the name of the saint on whose day the contract was signed; and when an advance of money was required, it was done by public auction in the streets, when the auctioneer sold the investment to the ever ready merchants, who collected outside the 'loggia,' or other prominent position chosen for the sale. In a loud voice was proclaimed the name and object of the loan, and the tax which was to be handed over to the purchasers to secure its repayment. So numerous did these loans become by 1252, that it was found necessary to unite them under one head, with a chancellor and other minor officials to watch over them. And as time went on, so great was the credit of Genoa, and so easy was this system found for raising money, that the people began to grow alarmed at the extent of the liabilities. So, in 1302, commissioners were appointed at a great assembly, two hundred and seventy-one articles and regulations were drawn up to give additional security to investors, and henceforth no future loan could be effected without the sanction of the consuls and the confirmation of the greater council of the shareholders. . . . During the days of the first doge, Simone Boccanegra, great changes were to be effected in the working system of the 'compere of St. George.' To this date many have assigned the origin of the Bank of St. George, but it will be seen only to be a further consolidation of the same system, which had already been at work two centuries. . . . In 1330 . . . at the popular revolution, all the old books were burnt, and a new commission appointed to regulate the 'compere.' . . . Instead . . . of being the origin of the bank, it was only another step in the growing wish for consolidation, which the expanding tendency of the 'compere' rendered necessary; which consolidation took final effect in 1407, when the Bank was thoroughly organized on the same footing which lasted till the end. Every year and every event tended towards this system of blending the loans together, to which fact is due the extensive power which the directors of the bank eventually wielded, when all interests and all petty disputes were merged together in one. . . . As time went on, and the French governor, Boucicault, weighed on the treasury the burden of fresh fortifications, and an expensive war; when Corsican troubles, and the Turks in the East, caused the advance of money to be frequent an assembly of all the shareholders in all the loans decided that an entire reorganization of the public debts should take place. Nine men were elected to draw up a new scheme, in 1407, and by their instrumentality all the shares were united; the interest for all was to be seven per cent., and fresh officials were appointed to superintend the now thoroughly constituted and re-named 'Bank of St. George.' And at length we behold this celebrated bank. Its credit never failed, and no anxiety was ever felt by any shareholder about his

annual income, until the days of the French Revolution. . . . This Bank of St. George was essentially one of the times, and not one which could have existed on modern ideas of credit; for it was a bank which would only issue paper for the coin in its actual possession, and would hardly suit the dictates of modern commerce. It was not a bank for borrowers but for capitalists, who required enormous security for immense sums until they could employ them themselves. . . . One of the most interesting features in connection with the dealings of the bank with the Genoese government, and a conclusive proof of the perfect accord which existed between them, was the cession from time to time of various colonies and provinces to the directors of the bank when the government felt itself too weak and too poor to maintain them. In this manner were the colonies in the Black Sea made over to the bank when the Turkish difficulties arose. Corsica and Cyprus, also towns on the Riviera, such as Sarzana, Ventimiglia, Levanto, found themselves at various times under the direct sovereignty of the bank."—J. T. Bent, *Genoa*, ch. 11.—See also GENOA: 1407-1448.

14th-15th centuries.—Barcelona.—Its claim to first bank of deposit.—"One of the most important cities on the Mediterranean in the Fourteenth Century was Barcelona in Spain. . . . Previous to the year 1349 the drapers of Barcelona, probably among its most opulent and substantial citizens, had evidently carried on the business of banking and exchanging money, very much as the rich merchants of Venice and Florence had done, and as the goldsmiths at a later period did in London; for, by an order of the King of Aragon, the Barcelonian drapers were in 1349 obliged to give security before being allowed to undertake such business. In 1401 the magistrates of Barcelona established a bank of exchange and deposit, called *Taula de cambi* (Table of exchange), secured by the funds of the city, with the intention of extending the accommodation afforded by it to foreigners as well as citizens. . . . It appears from records still extant that foreign bills of exchange were habitually negotiated at the Bank of Barcelona, and that assistance was given to manufacturers in the purchase of raw material, such as English wool, etc. By all accounts, therefore, the Bank of Barcelona financed and facilitated business much more in the manner of the bank of the present day than did any other public institution of the Renaissance period. Spanish writers claim that it was the very first establishment of its kind in Europe, while Hallam remarks that 'The earliest bank of deposit instituted for the accommodation of private merchants is said to have been that of Barcelona in 1401.' The creditors of Genoa were at that time not yet incorporated as a banking company."—W. H. Bayles and F. Allaben, *History of the origin and development of banks and banking and of banks and banking in the City of New York* (*Journal of American History*, July-Sept., 1920).

MODERN

16th-17th centuries.—Monetary effects of the discovery of America.—"From 1402, the year of the discovery of the New World, to 1500, it is doubtful whether [the mines of Mexico and Peru] . . . yielded on an average a prey of more than 1,500,000 francs (£60,000) a year. From 1500 to 1545, if we add to the treasure produced from the mines the amount of plunder found in the capital of the Montezumas, Tenochtitlan (now the city of Mexico), as well as in the temples and palaces of the kingdom of the Incas, the gold and silver drawn

from America did not exceed an average of sixteen million francs (£6,400,000) a year. From 1545, the scene changes. In one of the gloomiest deserts on the face of the globe, in the midst of the rugged and inhospitable mountain scenery of Upper Peru, chance revealed to a poor Indian, who was guarding a flock of llamas, a mine of silver of incomparable richness. A crowd of miners was instantly attracted by the report of the rich deposits of ore spread over the sides of this mountain of Potosi—a name which for euphony the European nations have since changed to Potosi. The exportation of the precious metals from America to Europe now rose rapidly to an amount which equalled, weight for weight, sixty millions of francs (£2,400,000) of our day, and it afterwards rose even to upwards of eighty millions. At that time such a mass of gold and silver represented a far greater amount of riches than at present. Under the influence of so extraordinary a supply, the value of these precious metals declined in Europe, in comparison with every other production of human industry, just as would be the case with iron or lead, if mines were discovered which yielded those metals in superabundance, as compared with their present consumption, and at a much less cost of labour than previously, just in fact as occurs in the case of manufactures of every kind, whenever, by improved processes, or from natural causes of a novel kind, they can be produced in unusual quantities, and at a great reduction of cost. This fall in the value of gold and silver, in comparison with all other productions, revealed itself by the increased quantity of coined metal which it was necessary to give in exchange for the generality of other articles. And it was thus that the working of the mines of America had necessarily for effect a general rise of prices, in other words, it made all other commodities dearer. The fall in the value of the precious metals, or that which means the same thing, the general rise of prices, does not appear to have been very great, out of Spain, till after the middle of the 16th century. Shortly after the commencement of the 17th century, the effects of the productiveness of the new mines and of the diminished cost of working them were realised in all parts of Europe. For the silver, which had been extracted in greater proportion than the gold, and on more favourable terms, the fall in value had been in the proportion of 1 to 3. In transactions where previously one pound of silver, or a coin containing a given quantity of this metal, had sufficed, henceforth three were required. . . . After having been arrested for awhile in this downward course, and even after having witnessed for a time a tendency to an upward movement, the fall in the value of the precious metals, and the corresponding rise in prices, resumed their course, under the influence of the same causes, until towards the end of the 18th century, without however manifesting their influence so widely or intensely as had been witnessed after the first development of the great American mines. We find, as the result, that during the first half of the 19th century, the value of silver fell to about the sixth of what it was before the discovery of America, when compared with the price of corn."—M. Chevalier, *On the probable fall in the value of gold* (tr. by Cobden), *sect. 1, ch. 1*.—See also EUROPE: Modern; Expansion, etc.

1558-1603.—England: Currency reforms under Elizabeth. See ENGLAND: 1558-1603: Age of Elizabeth: Industrial regulations, etc.

16th-19th centuries.—Banks of Amsterdam, Hamburg and Nuremberg.—"The Bank of Amsterdam was established in 1609 to meet the needs of the merchants of that city, which had become

the center of the international trade of Europe, and to correct the disorders of private banking, especially those growing out of the accumulation of promiscuous and light weight coins received in the extensive foreign trade of the Dutch. The Bank of Amsterdam accepted all kinds of specie on deposit, crediting the depositors with its real value in standard coin. These deposits could be withdrawn at will or transferred on the bank's books from one person to another. The credits given for these deposits of coin or bullion came to be known as 'bank money' and commanded a premium over the debased and mutilated coins in circulation. . . . For generations this bank money constituted the basis of the large foreign exchange of Amsterdam. With the establishment of 'giro' or transfer banks at Hamburg in 1619, and at Nuremberg in 1621, these written orders came to be used in much the same way as the modern check and were widely employed. These early transfer banks did not make loans or incur any liability beyond the coin and bullion deposits."—J. T. Holdsworth, *Money and banking*, pp. 123-124.—See also BANK OF AMSTERDAM.

17th century.—Indian money used in American colonies.—Sea shells, strung or embroidered on belts and garments, formed the "wampum" which was the money of the North American Indians (see WAMPUM). "Tradition gives to the Narragansetts the honor of inventing these valued articles, valuable both for use and exchange. This tribe was one of the most powerful, and it is asserted that their commercial use of wampum gave them their best opportunities of wealth. The Long Island Indians manufactured the beads in large quantities and then were forced to pay them away in tribute to the Mohawks and the fiercer tribes of the interior. Furs were readily exchanged for these trinkets, which carried a permanent value, through the constancy of the Indian desire for them. The holder of wampum always compelled trade to come to him. After the use of wampum was established in colonial life, contracts were made payable at will in wampum, beaver, or silver. . . . The use began in New England in 1627. It was a legal tender until 1661, and for more than three quarters of a century the wampum was current in small transactions. For more than a century, indeed, this currency entered into the intercourse of Indian and colonist. . . . Labor is a chief factor in civilized society and the labor of the Indian was made available through wampum. As Winthrop shows, 10,000 beaver skins annually came to the Dutch from the Great Lake. The chase was the primitive form of Indian industry and furs were the most conspicuous feature of foreign trade, as gold is to-day, but wampum played a much larger part in the vital trade of the time. Wampum, or the things it represented, carried deer meat and Indian corn to the New England men. Corn and pork went for fish; fish went for West India rum, molasses, and the silver which Europe coveted. West India products, or the direct exchange of fish with the Catholic countries of Europe, brought back the goods needed to replenish and extend colonial industries and trade. . . . As long as the natives were active and furs were plenty, there appears to have been no difficulty in passing any quantity of wampum in common with other currencies. The Bay annulled its statutes, making the beads a legal tender in 1661. Rhode Island and Connecticut followed this example soon after. . . . New York continued the beads in circulation longer than the regular use prevailed in New England. In 1693 they were recognized in the definite rates of the Brooklyn ferry. They continued to be circulated

in the more remote districts of New England through the century, and even into the beginning of the eighteenth."—W. B. Weeden, *Indian money as a factor in New England civilization*, pp. 5-30.—See also LOUISIANA: 1699-1763.

17th century.—Colonial coinage in America.—“The earliest coinage for America is said to have been executed in 1612, when the Virginia Company was endeavoring to establish a Colony on the Summer Islands (the Bermudas). This coin was of the denomination of a shilling and was struck in brass.” The “pine-tree” money of Massachusetts “was instituted by the Colonial Assembly in 1652, after the fall of Charles I. . . . This coinage was not discontinued until 1686; yet they appear to have continued the use of the same date, the shillings, sixpences, and threepences all bearing the date 1652, while the twopenny pieces are all dated 1662. . . . After the suppression of their mint, the Colony of Massachusetts issued no more coins until after the establishment of the Confederacy. . . . The silver coins of Lord Baltimore, Lord Proprietor of Maryland, were the shilling, sixpence, and fourpence, or groat.”—J. R. Snowden, *Description of ancient and modern coins*, pp. 85-87.—See PINE TREE MONEY.

17th-18th centuries.—Bank of Sweden (the Riksbank).—“The first bank of issue was the Bank of Sweden, founded as a private institution in 1656, but converted into a public bank in 1668.”—J. T. Holdsworth, *Money and banking*, p. 124.

17th-18th centuries.—Banking in Great Britain.—Origin and influence of Bank of England.—“In the reign of William old men were still living who could remember the days when there was not a single banking house in the city of London. So late as the time of the Restoration every trader had his own strong box in his own house, and, when an acceptance was presented to him, told down the crowns and Caroluses on his own counter. But the increase of wealth had produced its natural effect, the subdivision of labour. Before the end of the reign of Charles II. a new mode of paying and receiving money had come into fashion among the merchants of the capital. A class of agents arose, whose office was to keep the cash of the commercial houses. This new branch of business naturally fell into the hands of the goldsmiths, who were accustomed to traffic largely in the precious metals, and who had vaults in which great masses of bullion could lie secure from fire and from robbers. It was at the shops of the goldsmiths of Lombard Street that all the payments in coin were made. Other traders gave and received nothing but paper. This great change did not take place without much opposition and clamour. . . . No sooner had banking become a separate and important trade, than men began to discuss with earnestness the question whether it would be expedient to erect a national bank. . . . Two public banks had long been renowned throughout Europe, the Bank of Saint George at Genoa, and the Bank of Amsterdam. . . . Why should not the Bank of London be as great and as durable as the Banks of Genoa and Amsterdam? Before the end of the reign of Charles II. several plans were proposed, examined, attacked and defended. Some pamphleteers maintained that a national bank ought to be under the direction of the King. Others thought that the management ought to be entrusted to the Lord Mayor, Alderman and Common Council of the capital. After the Revolution the subject was discussed with an animation before unknown. . . . A crowd of plans, some of which resemble the fancies of a child or the dreams of a man in a fever, were pressed on

the government. Pre-eminently conspicuous among the political mountebanks, whose busy faces were seen every day in the lobby of the House of Commons, were John Briscoe and Hugh Chamberlayne, two projectors worthy to have been members of that Academy which Gulliver found at Lagado. These men affirmed that the one cure for every distemper of the State was a Land Bank. A Land Bank would work for England miracles such as had never been wrought for Israel. . . . These blessed effects the Land Bank was to produce simply by issuing enormous quantities of notes on landed security. The doctrine of the projectors was that every person who had real property ought to have, besides the property, paper money to the full value of that property. Thus, if his estate was worth two thousand pounds, he ought to have his estate and two thousand pounds in paper money. Both Briscoe and Chamberlayne treated with the greatest contempt the notion that there could be an over-issue of paper as long as there was, for every ten pound note, a piece of land in the country worth ten pounds. . . . All the projectors of this busy time, however, were not so absurd as Chamberlayne. One among them, William Paterson, was an ingenious, though not always a judicious speculator. Of his early life little is known except that he was a native of Scotland, and that he had been in the West Indies. . . . This man submitted to the government, in 1691, a plan of a national bank; and his plan was favourably received both by statesmen and by merchants. But years passed away; and nothing was done, till, in the spring of 1694, it became absolutely necessary to find some new mode of defraying the charges of the war. Then at length the scheme devised by the poor and obscure Scottish adventurer was taken up in earnest by Montague [Charles Montague, then one of the lords of the treasury and subsequently chancellor of the exchequer]. With Montague was closely allied Michael Godfrey. . . . Michael was one of the ablest, most upright and most opulent of the merchant princes of London. . . . By these two distinguished men Paterson's scheme was fathered. Montague undertook to manage the House of Commons, Godfrey to manage the City. An approving vote was obtained from the Committee of Ways and Means; and a bill, the title of which gave occasion to many sarcasms, was laid on the table. It was indeed not easy to guess that a bill, which purported only to impose a new duty on tonnage for the benefit of such persons as should advance money towards carrying on the war, was really a bill creating the greatest commercial institution that the world had ever seen. The plan was that £1,200,000 should be borrowed by the government on what was then considered as the moderate interest of eight per cent. In order to induce capitalists to advance the money promptly on terms so favourable to the public, the subscribers were to be incorporated by the name of the Governor and the Company of the Bank of England. The corporation was to have no exclusive privilege, and was to be restricted from trading in any thing but bills of exchange, bullion and forfeited pledges. As soon as the plan became generally known, a paper war broke out. . . . All the goldsmiths and pawnbrokers set up a howl of rage. Some discontented Tories predicted ruin to the monarchy. . . . Some discontented Whigs, on the other hand, predicted ruin to our liberties. . . . The power of the purse, the one great security for all the rights of Englishmen, will be transferred from the House of Commons to the Governor and Directors of the new Company. This last consideration was really of some weight, and was al-

lowed to be so by the authors of the bill. A clause was therefore most properly inserted which inhibited the Bank from advancing money to the Crown without authority from Parliament. Every infraction of this salutary rule was to be punished by forfeiture of three times the sum advanced; and it was provided that the King should not have power to remit any part of the penalty. The plan, thus amended, received the sanction of the Commons more easily than might have been expected from the violence of the adverse clamour. In truth, the Parliament was under duress. Money must be had, and could in no other way be had so easily. . . . The bill, however, was not safe when it had reached the Upper House," but it was passed, and received the royal assent. "In the City the success of Montague's plan was complete. It was then at

faults of the country, rendered an inestimable service to his party. During several generations the Bank of England was emphatically a Whig body. It was Whig, not accidentally, but necessarily. It must have instantly stopped payment if it had ceased to receive the interest on the sum which it had advanced to the government; and of that interest James would not have paid one farthing."—T. B. Macaulay, *History of England*, ch. 20.—"For a long time the Bank of England was the focus of London Liberalism, and in that capacity rendered to the States inestimable services. In return for these substantial benefits the Bank of England received from the Government, either at first or afterwards, three most important privileges First. The Bank of England had the exclusive possession of the Government balances. In its first

BANK OF ENGLAND, LONDON

Taylor's first extension, Threadneedle Street

least as difficult to raise a million at eight per cent. as it would now be to raise forty millions at four per cent. It had been supposed that contributions would drop in very slowly; and a considerable time had therefore been allowed by the Act. This indulgence was not needed. So popular was the new investment that on the day on which the books were opened £300,000 were subscribed; £300,000 more were subscribed during the next 48 hours; and, in ten days, to the delight of all the friends of the government, it was announced that the list was full. The whole sum which the Corporation was bound to lend to the State was paid into the Exchequer before the first instalment was due. Somers gladly put the Great Seal to a charter framed in conformity with the terms prescribed by Parliament; and the Bank of England commenced its operations in the house of the Company of Grocers. . . . It soon appeared that Montague had, by skilfully availing himself of the financial dif-

period . . . the Bank gave credit to the Government, but afterwards it derived credit from the Government. There is a natural tendency in men to follow the example of the Government under which they live. The Government is the largest, most important, and most conspicuous entity with which the mass of any people are acquainted; its range of knowledge must always be infinitely greater than the average of their knowledge, and therefore, unless there is a conspicuous warning to the contrary, most men are inclined to think their Government right, and, when they can, to do what it does. Especially in money matters a man might fairly reason—"If the Government is right in trusting the Bank of England with the great balance of the nation, I cannot be wrong in trusting it with my little balance." Second. The Bank of England had, till lately, the monopoly of limited liability in England. The common law of England knows nothing of any such principle. It is only

possible by Royal Charter or Statute Law. And by neither of these was any real bank . . . permitted with limited liability in England till within these few years. . . . Thirdly. The Bank of England had the privilege of being the sole joint stock company permitted to issue bank notes in England. Private London bankers did indeed issue notes down to the middle of the last century, but no joint stock company could do so. The explanatory clause of the Act of 1742 sounds most curiously to our modern ears. . . . 'It is the true intent and meaning of the said Act that no other bank shall be created, established, or allowed by Parliament, and that it shall not be lawful for any body politic or corporate whatsoever created or to be created, or for any other persons whatsoever united or to be united in covenants or partnership exceeding the number of six persons in that part of Great Britain called England, to borrow, owe, or take up any sum or sums of money on their bills or notes payable on demand or at any less time than six months from the borrowing thereof during the continuance of such said privilege to the said governor and company, who are hereby declared to be and remain a corporation with the privilege of exclusive banking, as before recited.' To our modern ears these words seem to mean more than they did. The term banking was then applied only to the issue of notes and the taking up of money on bills on demand. Our present system of deposit banking, in which no bills or promissory notes are issued, was not then known on a great scale, and was not called banking. But its effect was very important. It in time gave the Bank of England the monopoly of the note issue of the Metropolis. It had at that time no branches, and so it did not compete for the country circulation. But in the Metropolis, where it did compete, it was completely victorious. No company but the Bank of England could issue notes, and unincorporated individuals gradually gave way, and ceased to do so. Up to 1844 London private bankers might have issued notes if they pleased, but almost a hundred years ago they were forced out of the field. The Bank of England had so long had a practical monopoly of the circulation, that it is commonly believed always to have had a legal monopoly. And the practical effect of the clause went further: it was believed to make the Bank of England the only joint stock company that could receive deposits, as well as the only company that could issue notes. The gift of 'exclusive banking' to the Bank of England was read in its most natural modern sense: it was thought to prohibit any other banking company from carrying on our present system of banking. After joint stock banking was permitted in the country, people began to inquire why it should not exist in the Metropolis too? And then it was seen that the words I have quoted only forbid the issue of negotiable instruments, and not the receiving of money when no such instrument is given. Upon this construction, the London and Westminster Bank and all our older joint stock banks were founded. But till they began, the Bank of England had among companies not only the exclusive privilege of note issue, but that of deposit banking too. It was in every sense the only banking company in London. With so many advantages over all competitors, it is quite natural that the Bank of England should have far out-stripped them all. . . . All the other bankers grouped themselves round it, and lodged their reserve with it. Thus our one-reserve system of banking was not deliberately founded upon definite reasons; it was the gradual consequence of many singular events, and of an accumulation of legal privileges on a single bank

which has now been altered, and which no one would now defend. . . . For more than a century after its creation (notwithstanding occasional errors) the Bank of England, in the main, acted with judgment and with caution. Its business was but small as we should now reckon, but for the most part it conducted that business with prudence and discretion. In 1696, it had been involved in the most serious difficulties, and had been obliged to refuse to pay some of its notes. For a long period it was in wholesome dread of public opinion, and the necessity of retaining public confidence made it cautious. But the English Government removed that necessity. In 1797, Mr. Pitt feared that he might not be able to obtain sufficient specie for foreign payments, in consequence of the low state of the Bank reserve, and he therefore required the Bank not to pay in cash. He removed the preservative apprehension which is the best security of all Banks. For this reason the period under which the Bank of England did not pay gold for its notes—the period from 1797 to 1819—is always called the period of the Bank 'restriction.' As the Bank during that period did not perform, and was not compelled by law to perform, its contract of paying its notes in cash, it might apparently have been well called the period of Bank license. But the word 'restriction' was quite right, and was the only proper word as a description of the policy of 1797. [See ENGLAND: 1797.] Mr. Pitt did not say that the Bank of England need not pay its notes in specie; he 'restricted' them from doing so; he said that they must not. In consequence, from 1797 to 1844 (when a new era begins), there never was a proper caution on the part of the Bank directors. At heart they considered that the Bank of England had a kind of charmed life, and that it was above the ordinary banking anxiety to pay its way. And this feeling was very natural."—W. Bagehot, *Lombard street*, ch. 3-4.—See also BANK OF ENGLAND; BANK OF IRELAND; CAPITALISM: 18th century: England; NETHERLANDS: 1640-1665.

17th-18th centuries.—Early paper issues and banks in American colonies.—"Previous to the Revolutionary War paper money was issued to a greater or less extent by each one of the thirteen colonies. The first issue was by Massachusetts in 1690, to aid in fitting out the expedition against Canada. Similar issues had been made by New Hampshire, Rhode Island, Connecticut, New York, and New Jersey, previous to the year 1711. South Carolina began to emit bills in 1712, Pennsylvania in 1723, Maryland in 1734, Delaware in 1730, Virginia in 1755, and Georgia in 1760. Originally the issues were authorized to meet the necessities of the colonial treasuries. In Massachusetts, in 1715, as a remedy for the prevailing embarrassment of trade, a land bank was proposed with the right to issue circulating notes secured by land. . . . The plan for the land bank was defeated, but the issue of paper money by the treasury was authorized to the extent of £50,000, to be loaned on good mortgages in sums of not more than £500, nor less than £50, to one person. The rate of interest was five per cent., payable with one-fifth of the principal annually. . . . In 1733 an issue of bills to the amount of £110,000 was made by the merchants of Boston, which were to be redeemed at the end of ten years, in silver, at the rate of 10 shillings per ounce. In 1730, the commercial and financial embarrassment still continuing, another land bank was started in Massachusetts. . . . A specie bank was also formed in 1739, by Edward Hutchinson and others, which

issued bills to the amount of £120,000, redeemable in fifteen years in silver, at 20 shillings per ounce, or gold pro rata. The payment of these notes was guaranteed by wealthy and responsible merchants. These notes, and those of a similar issue in 1733, were largely hoarded and did not pass generally into circulation. In 1740 Parliament passed a bill to extend the act of 1720, known as the bubble act, to the American colonies, with the intention of breaking up all companies formed for the purpose of issuing paper money. Under this act both the land bank and the specie bank were forced to liquidate their affairs, though not without some resistance on the part of the former. . . . The paper money of the colonies, whether issued by them or by the loan banks, depreciated almost without exception as the amounts in circulation increased. . . . The emission of bills by the colonies and the banks was not regarded with favor by the mother country, and the provincial governors were as a general thing opposed to these issues. They were consequently frequently embroiled with their legislatures."—J. J. Knox, *United States notes*, pp. 1-5.—See also U. S. A.: 1765: Stamp Act.

1703-1915.—Austria.—First bank.—Bank of the City of Vienna.—National bank of Austria.—Relations with the government.—Austro-Hungarian bank.—"The first important banking institution in Austria seems to have been created at Vienna by a decree of June 16, 1703, with a capital of 7,000,000 florins (\$3,500,000). It was created for the purpose of rescuing the government from the evils of a debased currency which even then existed, but was authorized to receive the deposits of individuals, like the similar establishments of Venice, Hamburg, and Amsterdam. It was essentially a governmental institution and was formed, like the Bank of Venice, for the funding of the public debt, which was to be accomplished by an annual levy upon the receipts of the Treasury for the security and retirement of the mandates or *asogni* which the new establishment was authorized to issue. The experiment was not successful. The government was unable in the involved state of the finances to make the annual payments to which it was pledged and the mandates issued by the bank were received very reluctantly into the monetary circulation. The government finally turned the institution over to the City of Vienna and it took the name of the Bank of the City of Vienna. The transformation did not save it. The bank suspended operations in drafts on private account in order to devote its entire resources to refunding, but the expected means for this work failed and the bank went into liquidation at the expense of its depositors and shareholders. No further attempt was made to establish a national bank for over a century. . . . The distrust and business paralysis caused by these repeated paper issues [of the Napoleonic period] and the necessity of raising money to carry on the government led to the creation of the National Bank of Austria. . . . A party of capitalists was formed after some delay and the statutes of the National Bank of Austria received the Imperial approval on July 15, 1817. The bank was accorded for twenty-five years the exclusive privilege of note issues, was exempted from the stamp taxes, and was authorized to accept deposits and discount commercial paper. . . . The uprising in Hungary in 1848, the Crimean War, and the Italian struggle which resulted in Austrian defeat at Magenta and Solferino, imposed new charges upon the Austrian government and did much to upset the work of the bank during the thirty years of peace from 1816 to 1846. The bank had proceeded so rapidly with the conversion

of the government paper money as to endanger its own security and alarming runs were threatened in 1831, and again in 1840, which were only averted by the help of the government and in the latter case by a loan of coin from the private banks of Vienna. The charter of the bank expired in 1842, but the Emperor signed a patent renewing its privileges, with some modifications, until December 31, 1866. . . . The bank at the end of the year 1847 possessed a metallic reserve of 70,240,000 florins (\$35,000,000) and maintained a circulation of 213,000 florins. The outbreak of the revolution in Hungary brought the bill-holders in crowds to the bank for the redemption of the notes and the coin reserve shrunk in a few days to 35,023,030 florins. The directors were seized with panic and secured from the government the decree of June 20, 1848, authorizing the bank to suspend specie payments and giving forced legal tender character to its notes. . . . The credit of the bank began to sink with that of the government and the depreciation of the bills in the middle of 1849 to about half their nominal value alarmed the administration and led to a solemn declaration that no more loans should be demanded from the bank and that the existing debt should be adjusted and consolidated. The history of the thirteen years from 1848 to 1861 is the history of the disregard of this pledge and of repeated loans negotiated through the bank in spite of continual efforts to refund the debt and reduce its proportions. . . . The attempt to resume specie payments seemed upon the eve of success in 1850. A monetary convention was concluded January 24, 1857, with the view to securing a uniform currency throughout Germany, by which the contracting parties, of which Austria was one, were to issue no more legal tender paper after January 1, 1859, which was not redeemable in coin on demand. An Imperial ordinance of April 30, 1858, prepared the way for resumption by providing that after November 1st of the same year one-third of the new bills should be covered by coin or bullion and that the other two-thirds should be represented in the assets of the bank by securities or commercial paper. An arrangement was also concluded between the government and the bank for the retirement of 100,000,000 florins in small notes by the pledge of the domains of the State. War with Italy upset these carefully laid plans and on April 29, 1859, the bank was again released from the obligation of coin redemption, and the government appealed to it for a loan of 200,000,000 florins. This was met, to two-thirds of its face value, by the issue of bank-notes entirely in denominations of five florins (\$2.50). . . . The approach of the termination of the privileges of the bank led to an earnest discussion, which resulted in the law of December 27, 1862, remodelling the charter of the institution and its relations with the government. The government proposed the renewal of the charter until 1890; the finance committee of the elective chamber proposed 1880. The subject was referred to a mixed committee of both chambers, which finally fixed the limit at December 31, 1876. The privileges of the bank were broadened from time to time until 1877, when the law of December 20th, terminating the commercial treaties, provided also that the ministry should conclude an arrangement with the bank extending its privileges until March 20, 1878. A subsequent act made the limit May 31, 1878, and one month later the National Bank of Austria was fused with the Austro-Hungarian Bank. . . . The officials of the bank regarded their interest as fully protected in both Austria and Hungary by the law of 1862, but the bank soon found its rights in Hungary called in

question and sought a new arrangement which would place them beyond attack. The Hungarian Diet passed a vote early in 1870, promising recognition to the bank until the expiration of its privileges in 1870, if the bank would consent to a payment to Hungary in the same proportion as that made to Austria, and if it would establish at Buda-Pesth an independent directorate for Hungary. The bank was willing to make a payment of 4,500,000 florins, but this was not acceptable to the Hungarian cabinet and the privileges of the bank approached expiration without an agreement. The Imperial government then brought forward a plan for terminating the existence of the National Bank of Austria and substituting in its place a new institution to be known as the Austro-Hungarian Bank [already referred to]. The proposition became law and the new institution was established for a term beginning July 1, 1878, and ending December 31, 1887. The charter was afterwards renewed for a period of ten years ending on December 31, 1897. The new bank succeeded to all the transactions of the old and a directorate was established at Buda-Pesth and a sum of 50,000,000 florins (\$25,000,000) set aside for discounts and advances in Hungary. . . . The number of branches of the Austro-Hungarian Bank had risen in 1907 to 46 in Austria and 33 in Hungary, outside the principal establishments at Vienna and Buda-Pesth. The bank at Buda-Pesth has been rapidly gaining in recent years [written in 1915] in volume of business over the bank at Vienna, and the development of Hungary from a purely agricultural to an industrial country has created a jealousy which is among the causes threatening to the perpetuation of the bank in its dual form."—C. A. Conant, *History of modern banks of issue*, pp. 220, 223-229, 232-233, 248.

1768-1904.—Russia.—Attempts to reduce burden of paper money.—Bank of Russia.—"Paper money was introduced into Russia as early as 1768, and was welcomed at first because of its greater convenience than the copper money of which it was the representative. The pretext was maintained for a time that the paper was simply the coined certificate for the copper, and the notes, which were known as *assignats*, were at a slight premium. Bureaus were established at St. Petersburg, Moscow, and in the provinces for the redemption of the paper, which may be considered forerunners of the Bank of Russia. . . . The four most serious efforts to rescue the monetary system of the country from the mire of irredeemable paper were made in 1817, 1830, 1860, and 1881. The first attempt was made by means of loans placed both abroad and at home, of which a part of the proceeds was to be applied to the retirement of the paper circulation. . . . The government made the second effort to reduce the volume of paper money by a decree of July 1, 1830, that the paper roubles should be valued at three and a half to a rouble of silver and that a new form of paper should be substituted in this proportion. The new paper was to be known as bills of credit and was to be redeemable in silver and secured by the public domain. The exchange of the *assignats* for the new bills was ordered to take place on June 1, 1843, and a pledge was given to the business community for the credit of the new paper by depositing in the citadel of St. Petersburg in December, 1844, a metallic reserve of 70,464,245 roubles (\$54,000,000), which was to be under the control of twenty-four members of the stock exchange. . . . The third attempt to extricate the Empire from the evils of a debased monetary standard was connected with the estab-

lishment of the Bank of Russia in substantially the form in which it existed from 1860 to 1894. The statutes of the bank were established by a decree of May 26, 1860, and the reserves of several older banking establishments were turned into its coffers and it assumed their engagements. The original capital was 15,000,000 roubles (\$12,700,000) and the declared object of the bank was to consolidate the credit circulation and the floating debt of the Empire. . . . The bank was entrusted in 1862 with the mission of buying lands for the peasants and was aided by the deposit of the Treasury funds free of interest. . . . A supplementary issue of 96,000,000 roubles in 1879, with the famine and arrest of exports, caused a crisis in 1880 which reduced the revenues of the government and the railway receipts, in spite of high paper prices, and caused the rapid fall of the coin value of the rouble. The change of ministry which resulted from the crisis brought into power M. Abasa, who at once announced a plan for reimbursing the debt of the government to the bank. A ukase of January 1, 1881, ordered that the Treasury pay to the bank without delay a sum sufficient to reduce to 400,000,000 roubles the debt to the bank on account of disbursements for the government; that the remainder of the debt (400,000,000 roubles) be funded by annual payments of 50,000,000 roubles by the Treasury to the bank; that bills of credit be destroyed to the extent of their accumulation in the hands of the bank and with due regard to the needs of the circulation. . . . The statutes of the Bank of Russia were submitted to a complete revision in 1894 and an effort was made to make the bank of greater assistance than before in the promotion of industry and commerce. . . . A more serious test of the stability of the monetary system came with the Russo-Japanese War in 1904. . . . The Bank of Russia raised its discount rate early in 1904 from four and a half to five and a half per cent., but announced that, without encouraging speculation, it would extend generous accommodation to solvent borrowers and would re-discount freely for the private banks."—C. A. Conant, *History of modern banks of issue*, pp. 251-257, 260, 271.—See also RUSSIA: 1017-1020: Bolshevik finance; RUSSIA, SOVIET CONSTITUTION OF.

1775-1780.—Continental currency of American Revolution.—"The colonies . . . went into the Revolutionary War, many of them with paper already in circulation, all of them making issues for the expenses of military preparations. The Continental Congress, having no power to tax, and its members being accustomed to paper issues as the ordinary form of public finance, began to issue bills on the faith of the 'Continent,' Franklin earnestly approving. The first issue was for 300,000 Spanish dollars, redeemable in gold or silver, in three years, ordered in May and issued in August, 1775. Paper for nine million dollars was issued before any depreciation began. The issues of the separate colonies must have affected it, but the popular enthusiasm went for something. Pelatiah Webster, almost alone as it seems, insisted on taxation, but a member of Congress indignantly asked if he was to help tax the people when they could go to the printing-office and get a cartload of money. In 1776, when the depreciation began, Congress took harsh measures to try to sustain the bills. Committees of safety also took measures to punish those who 'forestalled' or 'engrossed,' these being the terms for speculators who bought up for a rise."—W. G. Sumner, *History of American currency*, pp. 43-44.—"During the summer of

1780 this wretched 'Continental' currency fell into contempt. As Washington said, it took a wagon-load of money to buy a wagon-load of provisions. At the end of the year 1778, the paper dollar was worth sixteen cents in the northern states and twelve cents in the south. Early in 1780 its value had fallen to two cents, and before the end of the year it took ten paper dollars to make a cent. In October, Indian corn sold wholesale in Boston for \$150 a busbel, butter was \$12 a pound, tea \$90, sugar \$10, beef \$8, coffee \$12, and a barrel of flour cost \$1,575. Samuel Adams paid \$2,000 for a hat and suit of clothes. The money soon ceased to circulate, debts could not be collected, and there was a general prostration of credit. To say that a thing was 'worth a Continental' became the strongest possible expression of contempt."—J. Fiske, *American Revolution*, v. 2, ch. 13.—Before the close of the year 1780, the Continental currency had ceased to circulate. Attempts were subsequently made to have it funded or redeemed, but without success. "During the Revolutionary period metallic money remained in the confusion of the colonial period. Various foreign coins circulated side by side, as the English guinea, crown, and shilling; the French guinea, pistole, and crown; the Spanish pistole; and the johannes, half-johannes, and moidore; and unequal values were given in different parts of the Union to coins of the same intrinsic worth, thus affording opportunity for clipping and fraudulent change. Various units of account were employed in different sections of the country, which tended to obscure a clear understanding of the economic conditions of the several States. The Articles of Confederation when they went into effect in 1781 did not contribute much to remove the complications, for, though Congress had power to regulate the alloy and value of coins struck either by its authority or by that of the State, the right to coin money was still retained by the State."—D. R. Dewey, *Financial history of the United States*, p. 101.—See also U. S. A.: 1780 (January-April).

1780-1784.—**Pennsylvania Bank, Bank of North America and Bank of New York.**—"The Pennsylvania Bank, which was organized in Philadelphia during the Revolutionary War, was founded for the purpose of facilitating the operations of the Government in transporting supplies for the army. It began its useful work in 1780, and continued in existence until after the close of the war; finally closing its affairs toward the end of the year 1784. But the need was felt of a national bank which should not only aid the Government on a large scale by its money and credit, but should extend facilities to individuals, and thereby benefit the community as well as the state. Through the influence and exertion of Robert Morris, then Superintendent of Finance for the United States, the Bank of North America, at Philadelphia, was organized with a capital of \$400,000. [See also BANK OF NORTH AMERICA.] It was incorporated by Congress in December, 1781, and by the State of Pennsylvania a few months afterward. Its success was immediate and complete. It not only rendered valuable and timely aid to the United States Government and to the State of Pennsylvania, but it greatly assisted in restoring confidence and credit to the commercial community, and afforded facilities to private enterprise that were especially welcome. . . . The success of the Bank of North America, and the advantages which the citizens of Philadelphia enjoyed from the facilities it offered them, naturally suggested the founding

of a similar enterprise in the city of New York." The Bank of New York was accordingly founded in 1784.—H. W. Domett, *History of the Bank of New York*, ch. 1.—See also U. S. A.: 1784.

ALSO IN: W. G. Sumner, *Financier and the finances of the American Revolution*, v. 2, ch. 17. 1782-1792.—**Establishment of the United States mint.**—"Several reports had been made on the subject of coinage. The first was by Robert Morris, January 15, 1782. . . . The subject of coinage was exhaustively considered by Hamilton in a report submitted to Congress in May, 1791, in which he stood for a unit expressed in both gold and silver. While gold was to be preferred to silver for certain reasons, he held that it was not safe to abridge the quantity of circulating medium by annulling the use of silver. He recommended that the mint ratio between gold and silver be 1 to 15,—a proportion corresponding to the bullion values at that time,—and proposed that the monetary unit consist of 24¾ grains of pure or 37¼ grains of pure silver, the amount of silver corresponding as nearly as could be determined with that of the Spanish dollar in actual circulation, 'each answering to a dollar in the money of account.' In accordance with this plan Hamilton recommended the coinage of ten dollar and one dollar gold pieces, one dollar and ten cent silver pieces, and one cent and one-half cent copper pieces. There is nothing whatever in Hamilton's report which countenances silver monometallism; gold as well as silver was recognized as an actual standard of value at the time, and Hamilton's efforts were directed to determining a ratio between gold and silver which should bring uniformity out of disorder occasioned by the silver coinage then current. The Mint Act of April 2, 1792, substantially followed the suggestions of Hamilton, omitting, however, any provision for the coinage of a gold dollar. . . . Because there was no distinct provision for the coinage of a gold dollar, it has been hastily concluded by advocates of silver coinage that the original unit of value was the silver dollar. The error has resulted from not observing that there are different kinds of units. The word unit as employed in the Mint Act refers to a unit of numbers, and not, as crudely interpreted, to a unit of value. The act of 1792 has indeed been given greater prominence than it deserves, for the currency question at that time did not arouse much interest. There was more discussion in Congress over the expense of establishing and maintaining a mint than there was over the ratio or the choice of metals."—D. R. Dewey, *Financial history of the United States*, p. 103.—See also U. S. A.: 1789-1792; RHODE ISLAND: 1783-1790.

1782-1904.—**Spain.—Growth of Bank of Spain.**—**Effect of Spanish-American War.**—"Spain had banks of deposit during her period of prosperity in the Middle Ages, some of which, like that at Barcelona, attained considerable celebrity. These institutions disappeared with the decadence of Spanish commerce and it remained for the modern age to witness a new development of banking. An attempt was made in the eighteenth century to establish institutions of credit, and the Bank of San Carlos, which was founded in 1782 at Madrid, was still in operation when the monopoly of the issue of circulating notes was given to the Bank of Spain in 1874. The Bank of Spain was founded in 1820, under the name of the Bank of San Fernando, but did not enjoy any special privileges outside of Madrid and the places where it had branches until 1856. It was at first a government bank and its name was changed at the time of

the new legislation to the Bank of Spain, but even after 1856 the right to incorporate other banks of issue remained in the hands of the government. Such banks had been established prior to 1856 by the consent of the public authorities in much the same manner as departmental banks might have been established in France before 1840. The legislation of January 8, 1856, was simply a first step in the direction of monopoly, like the similar legislation of France and Germany. This law prescribed that there should be not more than one bank of issue in any commercial city. The general provisions regarding the new banks limited their issues to three times their capital, obliged them to keep a coin reserve of at least one-third of their circulation, and fixed the minimum denomination of the notes at one hundred reals (\$5). The liberality of these provisions was impaired by leaving to the government the nomination of the governor of the Bank of Spain and of royal commissioners to manage the independent banks. The Bank of Spain had created up to 1863 only two branches, at Valencia and at Alicante, and there were independent banks at Cadiz, Barcelona, Seville, Malaga, Corunna, Santander, and Valladolid. The capital of the independent banks was not large, but in this respect it was commensurate with the volume of business in Spain. . . . The charter of the Bank of Spain was extended in 1856 for twenty-five years and was renewed in 1874 for thirty years. The law of March 10, 1874, conferred upon the bank the exclusive privilege of issuing notes and increased the capital from 132,000,000 reals (\$6,600,000) to 100,000,000 pesetas (\$20,000,000). All the existing provincial banks, then numbering eighteen, were ordered to liquidate their circulation and transfer it to the Bank of Spain. The bank is not a state institution and the state does not participate in its profits, but it had the authority, under the law of 1874, to require advances by the bank to the amount of 125,000,000 pesetas (\$25,000,000) upon the deposit of proper guarantees. The notes of the bank were made legal tender and limited to five times the capital. The capital was increased soon after the Act of 1874 to 150,000,000 pesetas (\$30,000,000), which carried the limit of circulation to 750,000,000 pesetas (\$150,000,000). The necessities of the Treasury led to a new revision of the charter by the law of July 14, 1891, and the extension of the privilege of the bank until December 31, 1921. The new charter authorizes the issue of notes to the amount of 1,500,000,000 pesetas (\$300,000,000) against a cash reserve of one-third, of which at least half is required to be kept in gold. . . . The fate of the bank has come to be bound up more and more with that of the state and it has been only by the bank's help that the Treasury was able to meet its engagements. The Treasury budget showed a persistent deficit, and a floating debt was incurred from 1885 to 1893 of 333,000,000 pesetas (\$66,000,000). . . . The commercial operations of the bank through its fifty-eight branches became subordinate to the issue of paper notes to cover advances to the state. . . . The recent history of the Bank of Spain is colored by the results of the war with the United States in 1898 and the efforts since made to restore order to Spanish finances. When war broke out, the Spanish government had already practically exhausted the credit of the country and of the bank. . . . Appeal was again made by the Treasury to the Bank of Spain, and the circulation was forced upward to 1,459,505,000 pesetas on February 11, 1899, after peace had been made with the United States, but while many war expenses were still

unpaid. During the war Paris exchange rose for a time above one hundred per cent.—a depreciation of fifty per cent. on the notes of the bank. . . . Contrary to the policy of other great state banks, the Bank of Spain did not co-operate heartily with the government in seeking to restore stability of exchange."—C. A. Conant, *History of modern banks of issue*, pp. 312-315.

1789-1796.—*Assignats of French Revolution*.—"The financial embarrassments of the government in 1789 were extreme. Many taxes had ceased to be productive; the confiscated estates not only yielded no revenue but caused a large expense, and, as a measure of resource, the finance committee of the Assembly reported in favor of issues based upon the confiscated lands. But the bitter experience of France through the Mississippi schemes of John Law, 1719-21 [see FRANCE: 1717-1719; LOUISIANA: 1717-1718], made the Assembly and the nation hesitate. . . . Necker, the Minister, stood firm in his opposition to the issue of paper money, even as a measure of resource; but the steady pressure of fiscal exigencies, together with the influence of the fervid orators of the Assembly, gained a continually increasing support to the proposition of the committee. [See FRANCE: 1774-1788.] . . . The leaders of the Assembly were secretly actuated by a political purpose, viz., by widely distributing the titles to the confiscated lands (for such the paper money in effect was) to commit the thrifty middle class of France to the principles and measures of the revolution. . . . Oratory, the force of fiscal necessities, the half-confessed political design, prevailed at last over the warnings of experience; and a decree passed the Assembly authorizing an issue of notes to the value of four hundred million francs, on the security of the public lands. To emphasize this security the title of 'assignats' was applied to the paper. . . . The issue was made; the assignats went into circulation; and soon came the inevitable demand for more. . . . The decree for a further issue of eight hundred millions passed, September, 1790. Though the opponents of the issue had lost heart and voice, they still polled 423 votes against 508. To conciliate a minority still so large, contraction was provided for by requiring that the paper when paid into the Treasury should be burned, and the decree contained a solemn declaration that in no case should the amount exceed twelve hundred millions. June 10, 1791, the Assembly, against feeble resistance, violated this pledge and authorized a further issue of six hundred millions. Under the operation of Gresham's Law [see GRESHAM'S LAW], specie now began to disappear from circulation. . . . And now came the collapse of French industry. . . . 'Everything that tariffs and custom-houses could do was done. Still the great manufactories of Normandy were closed; those of the rest of the kingdom speedily followed, and vast numbers of workmen, in all parts of the country, were thrown out of employment. . . . In the spring of 1791 no one knew whether a piece of paper money, representing 100 francs, would, a month later, have a purchasing power of 100 francs, or 60 francs, or 80, or 60. The result was that capitalists declined to embark their means in business. Enterprise received a mortal blow. Demand for labor was still further diminished. The business of France dwindled into a mere living from hand to mouth.' . . . Towards the end of 1794 there had been issued 7,000 millions in assignats; by May, 1795, 10,000 millions; by the end of July, 16,000 millions; by the beginning of 1796, 45,000 millions, of which 36,000 millions were in actual circulation.

M. Bresson gives the following table of depreciation: 24 livres in coin were worth in assignats April 1, 1795, 238; May 1, 209; June 1, 439; July 1, 808; Aug. 1, 807; Sept. 1, 1,101; Oct. 1, 1,205; Nov. 1, 2,588; Dec. 1, 3,575; Jan. 1, 1796, 4,658; Feb. 1, 5,337. At the last 'an assignat professing to be worth 100 francs was commonly exchanged for 5 sous 6 deniers: in other words, a paper note professing to be worth £4 sterling passed current for less than 3d. in money.' The downward course of the assignats had unquestionably been accelerated by the extensive counterfeiting of the paper in Belgium, Switzerland, and England. . . . Now appears that last resort of finance under a depreciating paper: an issue under new names and new devices. . . . Territorial Mandates were ordered to be issued for assignats at 30:1, the mandates to be directly exchangeable for land,

minority, opposed the plan as unconstitutional, on the ground that the power of creating banks or any corporate body had not, been expressly delegated to Congress, and was therefore not possessed by it. Washington's cabinet was divided; Jefferson opposing the measure as not within the implied powers, because it was an expediency and not a paramount necessity. Later he used stronger language, and denounced the institution as 'one of the most deadly hostility existing against the principles and form of our Constitution,' nor did he ever abandon these views. There is the authority of Mr. Gallatin for saying that Jefferson 'died a decided enemy to our banking system generally, and specially to a bank of the United States.' But Hamilton's views prevailed. Washington, who in the weary years of war had seen the imperative necessity of some national organi-

Chartered, 1791

at the will of the holder, on demand. . . . For a brief time after the first limited emission, the mandates rose as high as 80 per cent. of their nominal value; but soon additional issues sent them down even more rapidly than the assignats had fallen."—F. A. Walker, *Money*, pt. 2, ch. 16.

1790-1816.—First Bank of the United States.—On the organization of the government of the United States, under its federal constitution, in 1789 and 1790, the lead in constructive statesmanship was taken, as is well known, by Alexander Hamilton. His plan "included a financial institution to develop the national resources, strengthen the public credit, aid the Treasury Department in its administration, and provide a secure and sound circulating medium for the people. On December 13, 1790, he sent into Congress a report on the subject of a national bank. [See U.S.A.: 1789-1792.] The Republican party, then in the

zation of the finances, after mature deliberation approved the plan, and on February 25, 1791, the Bank of the United States was incorporated. The capital stock was limited to twenty-five thousand shares of four hundred dollars each, or ten millions of dollars, payable one fourth in gold and silver, and three fourths in public securities bearing an interest of six and three per cent. The stock was immediately subscribed for, the government taking five thousand shares, two millions of dollars, under the right reserved in the charter. The subscription of the United States was paid in ten equal annual instalments. A large proportion of the stock was held abroad, and the shares soon rose above par. . . . Authority was given the bank to establish offices of discount and deposit within the United States. The chief bank was placed in Philadelphia and branches were established in eight cities, with capitals in proportion to their commercial importance. In 1800 the stockholders of the Bank of the United States me-

morialized the government for a renewal of their charter, which would expire on March 4, 1811; and on March 9, 1809, Mr. Gallatin sent in a report in which he reviewed the operations of the bank from its organization. Of the government shares, five million dollars at par, two thousand four hundred and ninety-three shares were sold in 1796 and 1797 at an advance of 25 per cent., two hundred and eighty-seven in 1797 at an advance of twenty per cent., and the remaining 2,220 shares in 1802, at an advance of 45 per cent., making together, exclusive of the dividends, a profit of \$671,080 to the United States. Eighteen thousand shares of the bank stock were held abroad, and seven thousand shares, or a little more than one fourth part of the capital, in the United States. A table of all the dividends made by the bank showed that they had on the average been at the rate of $8\frac{3}{8}$ (precisely $8\frac{3}{31}$) per cent. a year, which proved that the bank had not in any considerable degree used the public deposits for the purpose of extending its discounts. From a general view of the debits and credits, as presented, it appeared that the affairs of the Bank of the United States, considered as a moneyed institution, had been wisely and skilfully managed. The advantages derived by the government Mr. Gallatin stated to be, 1, safe-keeping of the public moneys; 2, transmission of the public moneys; 3, collection of the revenue; 4, loans. The strongest objection to the renewal of the charter lay in the great portion of the bank stock held by foreigners. Not on account of any influence over the institution, since they had no vote; but because of the high rate of interest payable by America to foreign countries. . . . Congress refused to prolong its existence and the institution was dissolved. Fortunately for the country, it wound up its affairs with such deliberation and prudence as to allow of the interposition of other bank credits in lieu of those withdrawn, and thus prevented a serious shock to the interests of the community. In the twenty years of its existence from 1791 to 1811 its management was irreproachable. The immediate effect of the refusal of Congress to recharter the Bank of the United States was to bring the Treasury to the verge of bankruptcy. The interference of Parish, Girard, and Astor alone saved the credit of the government. . . . Another immediate effect of the dissolution of the bank was the withdrawal from the country of the foreign capital invested in the bank, more than seven millions of dollars. This amount was remitted, in the twelve months preceding the war, in specie. Specie was at that time a product foreign to the United States, and by no means easy to obtain. . . . The notes of the Bank of the United States, payable on demand in gold and silver at the counters of the bank, or any of its branches, were, by its charter, receivable in all payments to the United States; but this quality was also stripped from them on March 19, 1812, by a repeal of the act according to it. To these disturbances of the financial equilibrium of the country was added the necessary withdrawal of fifteen millions of bank credit and its transfer to other institutions. This gave an extraordinary impulse to the establishment of local banks, each eager for a share of the profits. The capital of the country, instead of being concentrated, was dissipated. Between January 1, 1811, and 1815, one hundred and twenty new banks were chartered, and forty millions of dollars were added to the banking capital. To realize profits, the issues of paper were pushed to the extreme of possible circulation. Meanwhile New England kept aloof from the nation. The

specie in the vaults of the banks of Massachusetts rose from \$1,706,000 on June 1, 1811, to \$7,320,000 on June 1, 1814. . . . The suspension of the banks was precipitated by the capture of Washington. It began in Baltimore, which was threatened by the British, and was at once followed in Philadelphia and New York. Before the end of September all the banks south and west of New England had suspended specie payment. . . . The depression of the local currencies ranged from seven to twenty-five per cent. . . . In November the Treasury Department found itself involved in the common disaster. The refusal of the banks, in which the public moneys were deposited, to pay their notes or the drafts upon them in specie deprived the government of its gold and silver; and their refusal, likewise, of credit and circulation to the issues of banks in other States deprived the government also of the only means it possessed for transferring its funds to pay the dividends on the debt and discharge the treasury notes. . . . On October 14, 1814, Alexander J. Dallas, Mr. Gallatin's old friend, who had been appointed Secretary of the Treasury on the 6th of the same month, in a report of a plan to support the public credit, proposed the incorporation of a national bank. A bill was passed by Congress, but returned to it by Madison with his veto on January 15, 1815. . . . Mr. Dallas again, as a last resort, insisted on a bank as the only means by which the currency of the country could be restored to a sound condition. In December, 1815, Dallas reported to the Committee of the House of Representatives on the national currency, of which John C. Calhoun was chairman, a plan for a national bank, and on March 3, 1816, the second Bank of the United States was chartered by Congress. The capital was thirty-five millions, of which the government held seven millions in seventy thousand shares of one hundred dollars each. Mr. Madison approved the bill. . . . The second national bank of the United States was located at Philadelphia, and chartered for twenty years." —J. A. Stevens, *Albert Gallatin*, ch. 6.

1793-1920.—France.—Early banks of issue.—Bank of France.—Napoleon's influence.—Bank's growth in mid-century.—Franco-German War.—Extension of charter.—“From 1793 to the latter part of 1796, banking can hardly be said to have existed in France. The government tolerated no issue of paper except its own; the Caisse d'Escompte, which for many years before had been the only public bank, had been suppressed, and the times were too disturbed for private banking to flourish. With the disappearance from circulation of the *assignats*, and of their successors, the *mandats territoriaux*, the issue of notes appears to have become a matter of common right, to be undertaken by anybody who could gain the confidence of the public; and accordingly a bank of issue called the Caisse des Comptes Courants was organized in Paris in the last half of 1796, and began its operations with fair success. Two others of some importance were established by the year 1800, besides some smaller ones of which little is now known; and in Rouen a bank of discount and issue was in active business as early as 1798. It is clear that, with the return of orderly government and the revival of credit, the need of banks began to press. Under these circumstances the Bank of France was also established in Paris in 1800, with the encouragement of the government and even with the First Consul as one of its stockholders, but still upon a footing not essentially different from that of its neighbors. Its capital of 30,000,000 francs was the largest

yet proposed, and the difficulty of raising it led to a fusion with the Caisse des Comptes Courants, but no monopoly was created. One public bureau, holding a large amount of funds, was required to invest them in shares of the new bank, and large deposits were made in it by the government; still, although favored, the Bank of France stood legally upon an equality with the rest and nothing more. So far it might be said that the field was open in France for a wide and free diffusion of banking facilities, and that by the new establishment the government pointed out the way for its citizens. In 1803, however, Napoleon announced a complete change of policy, and the Bank of France was endowed with the exclusive privilege of issue in Paris until September 24, 1818, and its capital was raised to 45,000,000 francs. All other issues of notes were at once withdrawn, one of the rival banks in Paris was absorbed by the rising monopoly, and another assumed for a time the humble place of intermediary between the great bank and its less important customers. No provincial bank could thereafter be established except by authority of the government. Under this arrangement, and notwithstanding the provision that no notes should be issued in Paris for less than 500 francs, the circulation of the Bank rapidly increased with its expanding discounts. . . . Although the Bank of France still chose its own officers and enjoyed a nominal independence, it was now becoming involved in the bold operations of the French Treasury. Complications thus arising reduced the cash in the Bank, in the latter part of 1805, so far that it was found necessary to limit the redemption of notes to 600,000 francs daily, until such time as specie could be collected in sufficient quantity for complete resumption. The result of this crisis, however, was not to separate the Bank from the government, but to connect them still more closely; and in the spring of 1806 a measure was therefore adopted which definitely settled the character of the Bank as a public institution, but without any alteration in the essential principles of its organization as a bank. By the doubling of its capital and the extension of its privilege to 1843, (Note.—In 1840 the privilege was extended to 1867, in 1857 to 1897, and in 1897 to the end of 1920) not only its preëminence in the financial affairs of France, but its absolute importance in the European world, was assured, so far as depended on legislation. At the same time the direction of the Bank, hitherto confided to a board of regents chosen by the stockholders, was transferred to a governor and two sub-governors, to be nominated by the chief of the state. Under a government not inclined to use power for its own ends, this species of control might easily have become a mere trusteeship on the part of the state; under an emperor like Napoleon it made the bank an engine of the state,—a private corporation, indeed, as regards the legal ownership of its property, but a public office as regards the actual employment of the property. Successive governments in France have used this opportunity in different ways as the case has seemed to require; but such as Napoleon made the Bank, in pursuance of the law of 1806, it has remained ever since,—an institution subject to the control, and often available for the needs, of the government of the day. In the closing years of the Empire this subjection of the Bank to the government caused a great increase of transactions with the Treasury, which became more and more compromising and finally far exceeded in amount the advances made to the commercial public. When, therefore, France was invaded by

the allies in the winter of 1813-14, a run by the note-holders began, caused, it is probable, chiefly by the fact that the Bank appeared to have no independent existence of its own, and it again became necessary for three months to limit the amount of the daily redemption of notes to 500,000 francs. Full payment was resumed in April, 1814, but the settlement of the affairs of the Bank was pushed on both sides, until its loans were reduced to less than 3,000,000 francs and its circulation had fallen from 95,000,000 francs to 15,700,000. The enlarged capital of the Bank had been found, even in the latter years of Napoleon's reign, to be greater than could be used with profit, and the Bank had therefore, as early as 1812, made large purchases of its own stock. These were continued in 1816, until the capital was reduced to 67,900,000 francs, at which point it remained until 1848. By the decree of 1808 the Bank had been authorized to establish branches (*comptoirs d'escompte*), subject to approval by the government, plainly with the design of centralizing the banking interests of the Empire under the lead of the great Bank in Paris. Under this decree the establishment of branches in Lyons and Lille was undertaken, although with little success, and one was set in operation at Rouen. The Bourbon government in 1817 and 1818 closed these branches and established independent banks at Rouen, Nantes, and Bordeaux, giving to them the right of emission, and thus reversing the policy of Napoleon. The government of July, following a similar course for a time, established independent banks at Lyons, Marseilles, Lille, Havre, Toulouse, and Orleans, and also authorized the Bank of France to open branches in fifteen other provincial towns and cities, with the monopoly of issue for every place in which a branch was established. . . . The revolution of 1848 found in existence . . . the Bank of France, with its fifteen branches, and also nine independent banks of issue. No system of exchanges or of redemption at a common center had been adopted by the latter; even the branches of the great Bank redeemed each other's notes only at pleasure; so that France felt all the inconveniences of having many issues of notes with but local credit. The suspension of specie payment and the legal-tender power given to the notes of the Bank of France, and to those of the independent banks alike, added to the confusion, and in the spring of 1848 the provisional government finally cut the knot, by making all the independent banks branches of the Bank of France. Their shareholders, in exchange for their old stock, received shares in the Bank, and the capital of the latter was thus raised to 91,250,000 francs. At the same time the issue of notes of 100 francs was authorized and the total issue of the Bank was limited to 452,000,000 francs. Political and socialist agitation had destroyed all commercial confidence and a rapid liquidation went on; the discounts of the Bank fell off, specie flowed in, and in June specie payment was practically resumed, and the legal-tender provision might perhaps have been abrogated with safety, had the Bank been left to itself. The Treasury, however, was embarrassed, the Bank saw few opportunities of using its resources profitably, and advances to a considerable amount were therefore made by it to the government. Partly as a consequence of these advances the limit of the note circulation was raised in December, 1849, to 525,000,000 francs; and the suspension of specie payment was not ended and the legal-tender power of the notes destroyed, until August 6, 1850. By these means, aided by its

own great prudence, the Bank not only passed through the gloomy years from 1848 to 1852 without serious loss, but continued when affairs were at their worst to earn a modest profit for its stockholders. Moreover, its monopoly of note issue had been reestablished in practically the form in which it had been projected by Napoleon, and all subsequent legislation has tended to strengthen the existing system. A great expansion of the business of the Bank began in 1852. The *coup d'état*, which opened the way for a restoration of imperial government, at all events removed political uncertainty. Commercial confidence thereupon revived, and the discounts and advances made by the Bank rapidly increased, and in 1853 touched a higher point than was ever before known. In view of the general expansion it is not surprising that in 1857 the government determined to double the capital of the Bank, raising it to 182,500,000 francs, at which it now [1917] stands. In return for the extension of its charter to 1897 the Bank was required to make a permanent three per cent. loan of 100,000,000 francs to the government, the entire amount derived from the issue of new stock which was taken by the shareholders at a premium. Perhaps the most important of the new features of the charter was the provision made as to the rate of discount. For the greater part of its existence the Bank had striven to maintain the uniform rate of four per cent. The statutes of 1808 had fixed at three months the maximum length of the paper to be admitted to discount, but in periods of difficulty the Bank had sometimes lowered this limit to seventy-five, sixty, and even forty-five days. In 1854, however, and for some years after, it tried a variable rate of discount, but then found itself hampered by a law passed in 1807, which made six per cent. the limit of legally chargeable interest. The charter of 1857 freed the Bank by special exemption from this restriction, allowing it to charge such rate as it might find advisable, with the provision, however, that the profits earned by charging a rate above six per cent. should not be divided but carried to a permanent surplus. The charter of 1857 also authorized the issue of notes as small as fifty francs, and the government was empowered after 1867 to require the opening of a branch in every department [of France]. The Bank was reluctant, but before 1860 sixty-five branches had been authorized. The republican government in 1873 again applied the spur, and in 1880 all the required branches had been authorized, although a few were not brought into operation until as late as 1882. Since that time the number of communities directly served by the Bank has been further increased, in part upon the initiative of the Bank, but in some measure in response to requirements imposed when its charter was revised in 1807 and again in 1911. In 1911 there were 142 branches and a great number of auxiliary offices, making in all 583 '*places bancaires*.' . . . The first incorporated banks of discount and deposit were established during the period of rapid economic advance which marked the early years of the régime of the third Napoleon. The number of deposit banks in France has, however, at no time been large, and since the last decade of the nineteenth century four large credit institutions operating numerous branches have virtually monopolized the entire field. The considerable though declining number of private banking firms find it increasingly difficult to hold their own in competition with the credit banks. . . . With the opening of the Franco-German war in July, 1870, the Bank of France entered upon

the most remarkable period of its existence,—that in which its vicissitudes were most startling and critical, its services to the country most distinguished, and the success of its management most brilliant. Three weeks before the breaking out of hostilities the Bank of France had in its vaults a reserve of cash almost equal to its notes, and amounting to nearly two thirds of all its cash liabilities. The approach of war caused a heavy pressure upon the Bank for loans, and both notes and specie were drawn from it in large amounts, and began to find their way either into private boards or into foreign hands. . . . On the 12th of August, then, four weeks from the beginning of the war, a law was passed, as a government measure, and with but one dissenting vote in each house, authorizing the Bank to refuse payment of its notes in specie, and for the second time in its history making its notes a legal tender for debts public and private. . . . On the next day, August 13th, was passed the first of the measures establishing a moratorium which postponed all commercial debts for one month, and then, by successive extensions of time, until July, 1871, without other burden to the debtor than liability for interest until the final payment. And finally, on the 14th of August, the limit of issues by the Bank was raised to 2,400,000,000 francs, on the ground that for the Bank to continue its discounts it must have a wider margin than was allowed by the law of the 12th. This completed the series of measures under the authority of which the Bank was administered during the war. The state had at the outbreak of the war obtained a small advance from the Bank, and called for others soon after the suspension. During the siege of Paris the branch of the Bank of Tours became the agency by which considerable advances were made to the provisional government at Tours, while the Bank itself was in like manner aiding the government in Paris. When the war with the Commune succeeded that with Germany, these advances had risen in all to 761,000,000 francs, besides a loan of 210,000,000 francs to the city of Paris. The Bank resisted with great difficulty the efforts of the Commune to use its resources in defense of the city, and for several weeks escape from open pillage, or from demands not to be distinguished from it, seemed hopeless. The prudence of the managers, the devotion of their subordinates, and the steady support of one or two members of the revolutionary body itself, carried the Bank safely through the most dangerous episode of its history, and enabled it, upon the suppression of the Commune, once more to give its aid freely to the government. In July, 1871, the loans thus made to the state amounted in all to 1,425,000,000 francs, and the government now happily found itself in such a position that it could cease drawing from this source. . . . The term for which the law of 1857 continued the exclusive privileges of the Bank of France—or, to use the customary phrase, 'extended the charter'—ended with the year 1897. A bill providing for a further extension was presented by the government in 1880 and reported by a committee in the Chamber of Deputies in 1891. The complete change which thirty years had wrought in the political, social, and financial conditions of the question caused the debate to take a wide range, and the project was still before the Chamber at its dissolution in 1893. The measure returned with some modification in 1896, and finally became a law November 17, 1897, extending the charter to the close of 1920, but reserving to the legislature the power to terminate it with the year 1912

by a law to that effect adopted in 1911. The changes of 1897 and also of 1911 were mainly designed to secure for the government a large share in the profits of the Bank, and the wider diffusion of its branches and agencies throughout the country. No important alteration was made in the general structure of the Bank or in its administrative organization."—C. F. Dunbar, *Theory and history of banking*, pp. 167-181.—See also BANK OF FRANCE; FRANCE: 1774-1788; 1909-1910; 1918-1920.

1806-1910.—Italy.—Rise of Banca Nazionale.—Banks in Rome.—In Naples.—Forced currency.—Bank of Italy.—Codification of banking laws.—"The Sardinian Government in the year 1844 sanctioned the foundation in Genoa of a discount and deposit bank having the privilege of issuing notes, and a similar institution in Turin was chartered in 1847. Each was to have a capital of 4,000,000 lire. Royal decrees of 1849 and 1850 authorized the consolidation of the two banks into a single institution called the Banca Nazionale, with its seat in Genoa, with a capital of 8,000,000 lire, a monopoly of the issue of bank notes, and a chartered term of existence of thirty years. In 1852 the capital was increased to 32,000,000 lire and the bank proceeded to establish branches. In 1859 the institution extended its operations to the newly liberated Lombardy. A new bank act was sanctioned by royal decree of October 1, 1859, and the capital was increased to 40,000,000 lire. In 1861 two banks of issue, the Banca di Parma and the Banca di Bologna (or *Banca della Quattro Legazioni*) were incorporated with it. At the same time new branches and subbranches were opened in the Neapolitan and Sicilian provinces, and the institution assumed the title of Banca Nazionale nel Regno (National Bank in the Kingdom). In 1865 its capital was increased to 100,000,000 lire. A branch was at this time established in the new capital of Italy, Florence, and later subbranches were opened in other cities of Tuscany. The same thing was done in 1866-7 in the newly liberated Venetian provinces, and the institution absorbed another bank of issue, the Stabilimento Mercantile Veneto, at Venice. Finally, in 1871 headquarters were established at the new capital, Rome, and in 1872 the bank was authorized to increase its capital to 200,000,000 lire, of which only 150,000,000 lire was paid in. Thus the little Sardinian bank, by the absorption of all other banks of issue in upper Italy and the establishment of branches and subbranches in many important places throughout the country, rose to the position of the leading credit institution in the kingdom. From 1885 it carried on a great mortgage business, a feature of which was the issue of debentures. . . . A bank was established at Rome as early as 1833. After a rather inactive existence it was superseded in pursuance of a papal decree of 1850 by a larger institution, the Bank of the Pontifical States (*Banca dello Stato Pontificio*), which had branches at Bologna and Ancona. Its capital was to amount to 1,000,000 scudi (\$5,375,000 Italian lire), but only 600,000 scudi was paid in when it was opened. . . . Its charter was to terminate in 1881. The two branches were abolished in 1857 and were superseded by the Bank of the Four Legations (*Banca della Quattro Legazioni*, which was merged in 1861 in the Banca Nazionale nel

Regno. The administration of the Banca dello Stato Pontificio was anything but a model one, so that in 1866 the papal government was compelled to offer its security for the bank notes. At the close of 1869 the circulation was 30,700,000 Italian lire and the reserve 10,900,000 lire. When Rome became the capital of the Kingdom of Italy, in 1870, the notes of the bank were declared a legal tender in the province of Rome, and the institution was reconstituted under the name of the Roman Bank (*Banca Romana*). It renounced its monopoly in consideration of a payment of 2,000,000 lire, other banks being permitted to establish branches at Rome. In 1874 it was authorized to increase its capital to 15,000,000 lire, which was all paid in. The Government at the same time ceased to guarantee the security of the notes. This bank did not make use of the privilege of establishing branches. . . .

"From the second half of the sixteenth century there were large pawn banks in the Kingdom of Naples. At the time of the French Revolution the Bourbon Government seized their property in order to make use of the funds for carrying on the war against France. The French Government sought, by means of a law enacted in 1806, to retain one of the old banks—that of San Giacomo—for the service of the court and the Government and to establish a bank for the business of the people, and in 1808 it proceeded to create a single institution in place of the two—the Bank of the Two Sicilies. The necessary capital, however, was not forthcoming. Nothing came of a further attempt in 1809, but the restored Bourbon Government succeeded in bringing into existence, by decree of December 12, 1816, the Bank of the Two Sicilies. This was a dual establishment—a court bank for the service of the Government, and a people's bank, which took deposits and loaned money on pledges. . . . The characteristic business of the Bank of the Two Sicilies, the feature that made it popular, was the deposit business (*servizio apodissario*). . . . The Italian Government reorganized the Bank of the Two Sicilies, by a series of decrees between 1860 and 1866. The institution, which was renamed the Bank of Naples, was deprived of its character as a state bank and was transformed into an independent credit corporation, having its own administration under the supervision of the Government. . . . The act of April 30, 1874, conferred upon the Bank of Naples the character of an actual bank of issue, although it carried on the business also of a pawn office, a savings bank, and a mortgage bank. Subsequently an agricultural credit department was added. . . . In 1843 the Neapolitan Government had established a court bank at Palermo and another at Messina. They were dependencies of the Bank of Naples, which, at that time, as we have seen, was styled the Bank of the Two Sicilies. The revolution of 1848 severed the connection, and after the restoration of the Bourbon dynasty, in 1840, the separation of the Sicilian court banks from the Bank of the King's Domain in Sicily (*Banco Regio dei reali Domini al di là del Faro*). The institution was a bank of deposit for the Government and for the people. It had the same arrangements as the Bank of Naples in the matter of certificates or credit and cash orders, which were a legal tender. . . . In 1858 two newly established discount banks at Palermo and Messina were affiliated with the Banco Regio. The events of 1860 affected these institutions in a most serious manner, a large part of their property being taken for the purposes of war. The gradual restoration of the funds enabled them to resume banking

operations, and in 1867 they were transformed into the existing Bank of Sicily (*Banco di Sicilia*), which is a public corporation and no longer a state institution. In 1872 the bank was authorized to establish branches. In 1870 the Bank of Sicily began to issue actual bank notes in the shape of certificates of credit for a specific sum, drawn on the cashier and transferable without indorsement. The act of April 30, 1874, consummated the conversion of the institution into an actual bank of issue, and in the same year a fund of 12,000,000 lire was assigned to it for its bank-note circulation. In 1871 the bank instituted a realty credit department and in 1888 an agricultural credit department. . . .

"A royal decree of May 1, 1866, rendered the notes of the Banca Nazionale nel Regno a forced currency. This institution at the same time made a loan of 250,000,000 lire to the Government for the war that was to be waged against Austria. The other banks of issue (the Bank of Naples, the Bank of Sicily, and the two Tuscan banks) were authorized to continue the issue of certificates of credit, cash orders, cash certificates, and bank notes, and these instruments were to remain a legal tender. . . . They continued, however, to be redeemable in coin or the notes of the Banca Nazionale. Thus arose in the history of Italian banking the oft-recurring distinction between forced currency and legal-tender currency. The Banca Nazionale nel Regno had thus acquired an exceptional status, which it deserved to have, inasmuch as it had extended its network of branches and subbranches over the entire Kingdom. At the close of 1873 it had 790,000,000 lire in circulation on account of the Government (the indebtedness of the State to the bank having reached this sum) and 353,300,000 lire on its own account, and it had in addition loaned 30,500,000 lire to the other institutions, which had immobilized that amount of coin in their vaults. The aggregate amount of outstanding bank notes without forced circulation (including the notes of the Banca Romana, which had been incorporated in the Italian banking system in 1871), certificates of credit, and cash orders was at that time 733,300,000 lire. . . . The necessity of doing away with this abuse [a considerable volume of legally unauthorized small notes in circulation], a certain hostility in political and banking circles, as well as among business men, toward the privileges of the Banca Nazionale, and the need of regulating the issues of the Bank of Naples and of the Bank of Sicily on the same basis as the issues of the other institutions, brought about the legislation of April 30, 1874. This placed the Banca Nazionale and the five other banks on an equality as regards privileges and duties. All the six institutions were organized into an association (*consorzio*), which had to put at the disposal of the Government, in place of the previous advances of the Banca Nazionale, 1,000,000,000 lire in so-called 'association notes' issued in denominations ranging from 50 centesimi to 1,000 lire. . . . The legislation of 1881, with the provisions discontinuing forced currency, dissolved the association of the banks of issue. The coin obtained by means of a loan was used for withdrawing the association notes from circulation. . . . The forced currency was discontinued in 1883. The law of 1881 provided that the reserve against bank note circulation should consist exclusively of coin. In pursuance of a royal decree of 1883 at least two-thirds of it had to be in gold. As a matter of fact, the treasury notes were placed on a par with gold and silver, as they were re-

deemable in coin at any time on presentation at the main treasury of the Kingdom. The continuance of the legal-tender quality of the notes of the six banks of issue was extended by numerous successive enactments. The privilege of issuing notes which . . . was to terminate at the close of 1889, was prolonged by a law of 1891 to the close of 1892. . . . The Italian system of banks of issue [in 1893] was a curious mixture of monopoly and plurality, which had all the disadvantages and none of the advantages of these systems. The competition of the six banks that had the exclusive privilege of issuing notes—institutions representing every grade of economic capacity—had led to an excessive issue of paper currency for the promotion of building speculation in the large cities (especially in the capital and in Naples), for the support of industrial undertakings of an artificial nature and necessarily doomed to failure, as well as of ill-managed credit institutions, and for the purpose of influencing legislation by the lavish use of money. The institution which was economically and morally most corrupt was the Banca Romana, which, ill conducted under the papal administration, had not had a sound existence under the national Government, and was the veritable poison of Italian credit. Its rottenness was fully revealed at the beginning of 1893 by an inquiry instituted at the instance of the Chamber of Deputies. Its suppression was inevitable, and as the condition of the other institutions was not a favorable one, Parliament had to make up its mind to the discussion of a rather radical reform, which was embodied in the act of August 10, 1893. This act provided for the fusion of the Banca Nazionale Toscana and the Banca Toscana di credito with the Banca Nazionale. The institution thus constituted took the name of the Bank of Italy. The affairs of the Banca Romana were to be wound up, and so there were left but three banks of issue—the Bank of Italy, the Bank of Naples, and the Bank of Sicily. The laws of 1894 and 1895 declared the two latter banks to be public autonomous credit institutions under the supervision of the Government, intrusted the liquidation of the affairs of the Banca Romana to the Bank of Italy, and amended the law of 1893 in important respects. In spite, however, of further statutory enactments (1895-96), the banks were unable to improve their condition materially. . . . The principal aim of the fresh legislation of 1897 and 1898 was to remove the dangerous consequences of this untenable condition [due to bad assets] and to remedy it as fast and as far as possible. The previously initiated liquidation of the mortgage institutions connected with the three banks of issue was definitely sanctioned, and arrangements were made for effecting it with the least possible loss to the banks and the creditors. Every facility was afforded, also, for the liquidation, or, as it was termed, 'mobilization,' of the 'immobilized assets' that figured on the balance sheets, especially in the way of accommodations on the part of the fiscal administration and extensions in the matter of payments. In order to secure and facilitate the application of the new legislative injunctions, energetic men were placed at the head of the institutions. The Government undertook the task of codifying most of the laws relating to the banks of issue, and the result was the legal code bearing the date of October 6, 1900. The duration of the legal-tender quality of the bank notes was extended year by year, and the lawmaker made constant use of the opportunities thus afforded in order to furnish fresh facilities to the

banks for healing the wounds of the past. In the years 1899-1903 further improvements were made in the statutes of the Bank of Italy and the provisions relating to the other two banks. . . . In spite of the progress . . . made, the moment had not yet arrived, in the opinion of [the] . . . legislators, for removing the forced currency of the bank notes, and by the act of December 29, 1907, its duration was extended to the close of 1908. On the occasion of the enactment of this law important measures were framed (among them one raising the normal maximum of bank-note circulation) in order to make the legal provisions conform more closely to the present condition of the banks of issue and the economic and financial state of the country. These measures were embodied in the act of December 31, 1907. By the act of December 24, 1908, the duration of the forced currency of the bank notes was extended to the close of 1909, and by the act of December 26, 1909, to the close of 1910. A fresh revision of the statutes of the banks took place in 1908 and 1909; the act of July 15, 1909, embodied provisions regarding interest-bearing deposits, and finally all the laws on the banks of issue (with exception of the act of August 8, 1895, Appendix Q.T.) were codified by the act of February 3, 1910."—C. F. Ferraris, *Italian banks of issue*, pp. 207-209, 211-219, 221-225.—See also DEBTS, PUBLIC; Italy.

1813-1908.—Denmark.—State bank.—National Danish bank.—"The National Danish Bank was founded in 1818 and has a capital of 26,752,400 crowns (\$7,000,000). The bank was the successor of the State Bank (*Rigsbanken*), which had been created by the government in 1813 to restore order to the demoralized financial system of the country. A decree of July 4, 1818, transferred the privileges of the old bank to the new for a term of ninety years. The government was free at the end of this period, in 1908, to extend the privileges or revoke them. . . . The bank assumed the obligations of the State Bank and was unable to pay dividends until 1845. The dividends since that time have averaged about seven per cent. A decree of 1873 fixed the limit of circulation not fully covered by specie at 27,000,000 crowns, but this was increased by a decree of November 5, 1877, to 30,000,000 crowns. . . . By a decree of 1886 net balances in favor of the bank at the Bank of Norway and the Royal Bank of Sweden might be counted as a part of the legal reserve."—C. A. Conant, *History of modern banks of issue*, p. 290.

1814-1919.—Netherlands.—Bank of the Netherlands.—"The Bank of the Netherlands (*de Nederlandsche Bank*) was authorized by the government in 1814, after it became evident that the Bank of Amsterdam could not be revived. The privilege of the Bank was twice renewed for twenty-five years, carrying its charter to March 31, 1880. The next renewal was nominally only for fifteen years, until March 31, 1904, but an extension of ten years was to be tacitly assumed unless the abrogation of the privilege was decreed by the state. A further extension to 1919 was made by a law of December 31, 1903, when some changes were made in the share of the state in the bank's profits. The law of December 22, 1863, left open the possibility of establishing other banks of issue by special law, but the Bank of the Netherlands has been in fact the only bank of issue in Holland since its establishment. The capital of the bank was originally 5,000,000 florins (\$2,000,000) and has been increased from time to time to 10,000,000, 15,000,000, and 20,000,000

florins (\$8,000,000). The bank is not a public institution, but the state subscribed in 1863 for one thousand shares at 115, which were sold on June 1, 1864, at 190."—C. A. Conant, *History of modern banks of issue*, pp. 289-290.—In 1918 the charter of the Bank of the Netherlands was prolonged for an additional fifteen years.

1816-1918.—Norway.—Bank of Norway.—"The Bank of Norway (*Norges Bank*) was founded June 14, 1816, with its head office at Dronheim and branches in leading towns of the province. Its capital was raised by a tax upon landed property and the land-holders became shareholders in the bank according to their respective payments. . . . The attempt to float a paper currency upon land values resulted in failure and the notes of the bank in 1822 could be exchanged at Hamburg at the rate of only \$187.50 for \$100 in silver. The Storting was compelled to pass a law reducing the value of the notes by providing that 190 in paper should be redeemed in the proportion of 100 in silver. The value of the notes gradually rose and the bank was put upon a sounder basis."—C. A. Conant, *History of modern banks of issue*, pp. 206-207.—The assets of the Bank of Norway for the year 1918 totaled 564,256,238 kroner. Its deposits amounted to 127,055,382 kroner.

1817-1833.—Second Bank of the United States and the war upon it.—"On the 1st of January, 1817, the bank opened for business, with the country on the brink of a great monetary crisis, but 'too late to prevent the crash which followed.' The management of the bank during the first two years of its existence was far from satisfactory. It aggravated the troubles of the financial situation instead of relieving them. Specie payments were nominally resumed in 1817, but the insidious canker of inflation had eaten its way into the arteries of business, and in the crisis of 1819 came another suspension that lasted for two years. . . . It was only by a desperate effort that the bank finally weathered the storm brought on by its own mismanagement and that of the State Banks. [See KENTUCKY: 1818-1829; MISSISSIPPI: 1818-1890.] After the recovery, a period of several years of prosperity followed, and the management of the bank was thoroughly reorganized and sound. From this time on until the great 'Bank War' its affairs seem to have been conducted with a view to performing its duty to the government as well as to its individual stockholders, and it rendered such aid to the public, directly, and indirectly, as entitled it to respect and fair treatment on the part of the servants of the people. . . . But the bank controversy was not yet over. It was about to be revived, and to become a prominent issue in a period of our national politics more distinguished for the bitterness of its personal animosities than perhaps any other in our annals. . . . As already said, the ten years following the revulsion of 1810-25 were years of almost unbroken prosperity. . . . The question of the continuance of the bank was not under discussion. In fact, scarcely any mention of the subject was made until President Jackson referred to it in his message of December, 1829. In this message he reopened the question of the constitutionality of the bank, but the committee to which this portion of the message was referred in the House of Representatives made a report favorable to the institution. There seems no reason to doubt the honesty of Jackson's opinion that [the charter of] the bank was unconstitutional, and at first he probably had no feeling in the matter except that which sprang from his

convictions on this point. Certain events, however, increased his hostility to the bank, and strengthened his resolution to destroy it."—D. Kinley, *Independent treasury of the United States*, ch. 1.—The question of the rechartering of the bank was made an issue in the presidential campaign of 1832, by Henry Clay. "Its disinterested friends in both parties strongly dissuaded Biddle [president of the bank] from allowing the question of recharter to be brought into the campaign. Clay's advisers tried to dissuade him. The bank, however, could not oppose the public man on whom it depended most, and the party leaders deferred at last to their chief. Jackson never was more dictatorial and obstinate than Clay was at this juncture." Pending the election, a bill to renew the charter of the bank was passed through both houses of Congress. The president promptly vetoed it. "The national republican convention met at Baltimore, December 12, 1831. It . . . issued an address, in which the bank question was put forward. It was declared that the President is fully and three times over pledged to the people to negative any bill that may be passed for rechartering the bank, and there is little doubt that the additional influence which he would acquire by a reelection would be employed to carry through Congress the extraordinary substitute which he has repeatedly proposed.' The appeal, therefore, was to defeat Jackson in order to save the bank. . . . Such a challenge as that could have but one effect on Jackson. It called every faculty he possessed into activity to compass the destruction of the bank. Instead of retiring from the position he had taken, the moment there was a fight to be fought, he did what he did at New Orleans. He moved his lines up to the last point he could command on the side towards the enemy. . . . The proceedings seemed to prove just what the anti-bank men had asserted: that the bank was a great monster, which aimed to control elections, and to set up and put down Presidents. The campaign of 1832 was a struggle between the popularity of the bank and the popularity of Jackson."—W. G. Sumner, *Andrew Jackson*, ch. 11.—Jackson was overwhelmingly elected, and, feeling convinced that his war upon the bank had received the approval of the people, he determined to remove the public deposits from its keeping on his own responsibility. "With this view he removed (in the spring of 1833) the Secretary of the Treasury, who would not consent to remove the deposits, and appointed William J. Duane, of Pennsylvania, in his place. He proved to be no more compliant than his predecessor. After many attempts to persuade him, the President announced to the Cabinet his final decision that the deposits must be removed. The reasons given were that the law gave the Secretary, not Congress, control of the deposits, that it was improper to leave them longer in a bank whose charter would so soon expire, that the Bank's funds had been largely used for political purposes, that its inability to pay all its depositors had been shown by its efforts to procure an extension of time from its creditors in Europe, and that its four government directors had been systematically kept from knowledge of its management. Secretary Duane refused either to remove the deposits or to resign his office, and pronounced the proposed removal unnecessary, unwise, vindictive, arbitrary, and unjust. He was at once removed from office, and Roger B. Taney, of Maryland, appointed in his place. The necessary Orders for Removal were given by Secretary Taney. It was not strictly a removal, for all previous deposits were left in the

Bank, to be drawn upon until exhausted. It was rather a cessation. The deposits were afterwards made in various State banks, and the Bank of the United States was compelled to call in its loans. The commercial distress which followed in consequence probably strengthened the President in the end by giving a convincing proof of the Bank's power as an antagonist to the Government."—A. Johnston, *History of American politics*, ch. 13.—See also U.S.A.: 1833-1836; 1835-1837.

1821-1915.—Portugal.—Bank of Portugal.—"Portugal has a single bank of issue, whose monopoly in this respect dates only from 1888, but whose origin goes back to the Bank of Lisbon in 1821. This institution was authorized by a decree of November 10, 1840, to unite with the National Surety Company (*Companhia Confianca Nacional*) to form the Bank of Portugal. The last extension of the charter continued the bank for forty years, from 1888 to 1928, and conferred upon it the monopoly of the issue of legal-tender notes in the realm of Portugal and the neighboring islands. Seven other banks,—five at Oporto, one at Braga, and one at Guimarães,—had the power to issue notes for circulation within their respective districts, which were not received by public depositaries. An arrangement of July 8, 1801, authorized the Bank of Portugal to unify the circulation and substitute its own notes for those of the other banks. The bank is managed [1915] by a governor appointed by the Treasury for three years and a board of ten directors chosen by the shareholders. The Bank of Portugal has been from the beginning little more than a gigantic paper-money machine for meeting the necessities of the state. This was the case with the Bank of Lisbon, which issued 20,000,000 milrêis (\$21,600,000) to take up the government notes."—C. A. Conant, *History of modern banks of issue*, p. 320.

1822-1919.—Belgium.—Competing banks.—National Bank of Belgium.—Belgium and the Latin Union.—"Monopoly of note issue has existed in Belgium only since 1850. The oldest institution issuing bank-notes was the General Society for the Promotion of National Industry (*Société Générale pour favoriser l'industrie Nationale*). This society was founded in 1822 principally as a bank of circulation and discounts, but it became little by little a great institution of finance interested in promoting investments. . . . The Bank of Belgium was founded February 24, 1835, and the management of the public funds was taken away from the old institution and given to the new. The methods of the new bank had the same defects as those of the old, however, in attempting to make long time loans on commercial paper, while issuing circulating notes payable on demand. The result was a crisis in 1838, when confidence was impaired by the fear of war over the provinces of Limbourg and Luxembourg. There was a violent contraction of credit at Brussels, and the Bank of Belgium found itself without cash to meet its obligations. The older institution, which was somewhat stronger, and was not regarded as so largely a creature of the existing government, took advantage of the opportunity to crush its rival and on December 4, 1838, presented 1,000,000 francs (\$200,000) to the Bank of Belgium for redemption. They followed this up on December 10th. by the presentation of 1,200,000 francs and on December 15th. by the presentation of 300,000 francs more. The bank was forced to suspend and to appeal to the government for assistance. A loan of 4,000,000 francs (\$800,000) was voted, of which 2,000,000 francs

were applied to the payment of bills and commercial obligations of the bank, and 1,400,000 francs to meeting the demands of depositors in the savings branches which had been established. The manner in which the existing institutions mixed up the business of banks of issue and deposit with that of operations for long terms created a strong feeling in favor of a bank devoted exclusively to commercial banking. The Bank of Belgium was again embarrassed in 1842 and was compelled to surrender the privilege of keeping the public monies. . . . The year 1849 had hardly begun . . . when the President of the Council of Ministers, M. Frère-Orban, brought forward a plan for the National Bank of Belgium (*Banque Nationale de Belgique*). The charter of the bank was granted by the law of May 5, 1850, fixing the capital at 25,000,000 francs (\$5,000,000), divided into shares of 1,000 francs each, and giving the bank its franchise for twenty-five years. . . . The National Bank found itself face to face with strong competitors in the two older banking institutions, but gradually gained in strength and credit up to 1870, when it was subjected to one of the severest tests ever put upon a banking institution. It was not distrust of the bank, but the political events accompanying the Franco-Prussian War which caused the stress. . . . Belgium was led to propose the formation of the Latin Union in 1865 because of the difficulty of maintaining the double standard under the oscillations in the price of gold and silver. The French system of decimal coinage was adopted by the law of June 5, 1832, but silver was made the standard and no provision was made for gold coinage. . . . The fall in the value of silver after 1867 dragged Belgium into new difficulties, against which the convention of the Latin Union afforded her no protection. . . . The renewal of the charter of the National Bank which was enacted in 1872 extended the life of the institution to January 1, 1903, and the capital was increased to 50,000,000 francs (\$10,000,000). . . . In the revision of the charter in 1900 the tendencies toward State socialism which had become strong in Belgium had free play. The privileges of the bank were indeed extended to January 1, 1929, but only under provisions which turned over a large part of its profits to the public Treasury."—C. A. Conant, *History of modern banks of issue*, pp. 277-279, 281-284.—On October 30, 1919, the National Bank had in reserve gold to the amount of £10,642,000; silver, £1,006,000; total bullion, £11,708,000.

1830-1917.—**Bank of England and private banks.**—"The peculiarities of this position, [close relation to the government], which sometimes lead to an erroneous classification of the Bank of England as a government bank, have been much emphasized by the manner in which the other constituents of the English banking system have developed in recent years. The private banking houses have steadily declined in number. The advantages of joint-stock organization and limited liability have led in many cases to their absorption or conversion into companies of larger capital, and have hindered the opening of new private banks, even if establishments of such a decaying type could any longer command the credit once given to them in the English financial world. On the other hand, the joint-stock and limited companies have grown rapidly in the last two generations, both in relative and in absolute importance. (Note.—In May, 1800, there were 104 joint-stock banks in England and Wales, with nearly two thousand branches. In May, 1917, there were only 35 joint-stock banks, but with

more than six thousand branches. . . .) They have felt the strong modern tendency to concentration and by consolidations have greatly diminished their number, but with a vast increase, not only of individual, but of aggregate importance. At the same time, by the establishment of branches they have everywhere brought themselves into close contact with the general commercial life of the country, so that most of the banking of English trade and commerce is now carried on by their agency. The Bank of England, on the other hand, having established eleven branches before the year 1830, has gone no farther in that direction. (Note.—The location of its branches has undergone some changes.)"—C. F. Dunbar, *Theory and history of banking*, pp. 162-163.—See also ENGLAND: 1820-1827.

1836-1907.—**Switzerland.—Cantonal and private banks.—Associated banks.—Swiss national bank.**—"Banking in Switzerland had its earliest development at Basle and Geneva, which were long noted for the skill and wealth of their bankers, but banks of issue were not established in either city until 1845. The first Swiss bank of issue was established at St. Gall in 1830. The cantonal bank of Vaud and the Bank of Basle were established in 1845, the Bank of Commerce at Geneva in 1846, and the Bank of Geneva in 1848. The incorporation of banks of issue rapidly spread among those cantons which contained a considerable number of merchants, and in 1863 eighteen banks had been established, with forty-two agencies or branches. The aggregate circulation of these banks on December 31, 1862, was 18,468,122 francs (\$3,600,000), the cash reserve was 19,380,922 francs and the current accounts, representing deposits 49,166,405 francs (\$9,800,000). Eleven of these eighteen banks were established with the help of the cantonal governments and the remainder were established by private funds. The Swiss banks preserved until 1875 a purely local existence and their operations and circulation rarely extended beyond the limits of the canton in which they were established, but the growing needs of commerce invited co-operation and the extension of banking facilities. Some of the banks began to extend their branches into other cantons and others made conventions with each other for the mutual acceptance of their bills. It was at this stage in the development of Swiss banking that the Federal constitution was revised and authority to legislate regarding banks confided to the Federal government. . . . The law of 1875 required the Swiss banks to maintain a cash reserve equal to forty per cent. of their notes in circulation and forbade any one bank to issue circulation in excess of 12,000,000 francs (\$2,400,000). Each bank was required to accept the notes of other banks and to redeem them in coin. The number of banks at the end of 1873 was twenty-eight and their circulation was 47,606,000 francs (\$9,400,000), against which there was a cash reserve of 14,892,796 francs. The Act of 1875 was superseded by that of March 8, 1881, which limited the circulation to double the paid-up and unimpaired capital (*capital versé et réellement existant*) of the banks and required banks of issue to have a capital of at least 500,000 francs. The requirement of a forty per cent. cash reserve was maintained, to be distinct and independent of the other reserves of the bank and kept in a separate account. . . . The Swiss banking system as embodied in the law of 1881 was a system of free banking under government supervision. The Federal Assembly reserved the right to fix the aggregate of the Swiss circulation and to apportion it

among the banks, but this right was exercised only for the purpose of compelling the banks to conform to certain uniform requirements. Twenty-six of the Swiss banks entered into a clearing arrangement by authority of a law of June 19, 1882, for the mutual exchange of notes. These banks were known as 'The Associated Banks' (*Banques Concordataires*), and their notes circulated throughout Switzerland and were received by public depositaries. . . . The law of 1881 was followed by a new series of agreements, which again worked well for a few years, only to again fall into disuse. . . . A new agreement was entered into by twenty-eight banks on June 3, 1893, 'with the end of protecting the metallic reserves of the country.' Under this agreement authority was given to a committee representing five leading banks to fix a uniform rate of discount, below which none of the contracting banks should discount paper having less than ten days to run. Even with the best of spirit on the part of the banks of issue, they could make head with difficulty against the competition of the private banks, and while some of the latter were drawn into an agreement in 1894, they soon denounced it or found means of evading its requirements. Modifications were made in the agreement at the general assembly of banks of issue October 9, 1900, but they were found too burdensome and were abolished the next year. In the meantime a special convention on June 9, 1900, gave to a central committee the power to reduce the volume of circulation when it judged that market conditions required it. . . . After various proposals to amend the law of 1881, an amendment was adopted to Article 39 of the constitution, October 28, 1891, authorizing the Confederation to create a central bank under its control. Out of this vote grew the project of 1896, which authorized a central bank with a capital of 25,000,000 francs, to be provided two-fifths by the cantons and the remainder by the Confederation. It was upon this provision, for creating a state-owned bank rather than a joint-stock bank with private ownership, that the campaign principally turned when the project was submitted to the people by the referendum. The French cantons opposed to the state socialism of the Germans rolled up immense majorities against the project and it was defeated by a vote of 255,984 against 193,764. . . . A project of law submitted by the Federal Council to the parliamentary committee on March 24, 1899, was abandoned June 28, 1901, because of disagreement over the location of the head office of the bank. But efforts to reach agreement were not relaxed and finally, after many delays, the law of October 6, 1905, created the Swiss National Bank. Efforts to secure a referendum failed to bring together more than 28,137 signatures out of 30,000 required, and on June 20, 1907, the bank entered upon its functions. The principal task of the Swiss National Bank was declared in its second article to be 'to serve in Switzerland as regulator of the money market, to facilitate operations of payment, and to provide for the employment of circulating capital.' . . . Although barely established when the crisis of 1907 in America reacted upon European markets, it weathered the storm with a rate of discount lower than the maximum of many other European banks."—C. A. Conant, *History of modern banks of issue*, pp. 302-306, 308-309, 311.—See also SWITZERLAND: 1021.

1837-1841.—Wild cat banks of Michigan.—"Michigan became a State in January, 1837. Almost the first act of her State legislature was the passage of a general banking law under which any ten or more freeholders of any country might

organize themselves into a corporation for the transaction of banking business. Of the nominal capital of a bank only ten per cent. in specie was required to be paid when subscriptions to the stock were made, and twenty per cent. additional in specie when the bank began business. For the further security of the notes which were to be issued as currency, the stockholders were to give first mortgages upon real estate, to be estimated at its cash value by at least three county officers, the mortgages to be filed with the auditor-general of the State. A bank commissioner was appointed to superintend the organization of the banks, and to attest the legality of their proceedings to the auditor-general, who, upon receiving such attestation, was to deliver to the banks circulating notes amounting to two and a half times the capital certified to as having been paid in. This law was passed in obedience to a popular cry that the banking business had become an 'odious monopoly' that ought to be broken up. Its design was to 'introduce free competition into what was considered a profitable branch of business heretofore monopolized by a few favored corporations.' Anybody was to be given fair opportunities for entering the business on equal terms with everybody else. The act was passed in March, 1837, and the legislature adjourned till November 9 following. Before the latter date arrived, in fact before any banks had been organized under the law, a financial panic seized the whole country. An era of wild speculation reached a climax, the banks in all the principal cities of the country suspended specie payments, and State legislatures were called together to devise remedies to meet the situation. That of Michigan was convened in special session in June, and its remedy for the case of Michigan was to leave the general banking law in force, and to add to it full authority for banks organized under it to begin the business of issuing bills in a state of suspension—that is, to flood the State with an irredeemable currency, based upon thirty per cent. of specie and seventy per cent. of land mortgage bonds."—*Cheap-money experiments* (*Century Magazine*, Nov., 1891).—"Wild lands that had been recently bought of the government at one dollar and twenty-five cents an acre were now valued at ten or twenty times that amount, and lots in villages that still existed only on paper had a worth for banking purposes only limited by the conscience of the officer who was to take the securities. Any ten freeholders of a county must be poor indeed if they could not give sufficient security to answer the purpose of the general banking law. The requirement of the payment of thirty per cent. of the capital stock in specie was more difficult to be complied with. But as the payment was to be made to the bank itself, the difficulty was gotten over in various ingenious ways, which the author of the general banking law could hardly have anticipated. In some cases, stock notes in terms payable in specie, or the certificates of individuals which stated—untruly—that the maker held a specified sum of specie for the bank, were counted as specie itself; in others, a small sum of specie was paid in and taken out, and the process repeated over and over until the aggregate of payments equaled the sum required; in still others, the specie with which one bank was organized was passed from town to town and made to answer the purposes of several. By the first day of January, 1838, articles of association for twenty-one banks had been filed, making, with the banks before in existence, an average of one to less than five thousand people. Some of them were absolutely without capital, and some were

organized by scheming men in New York and elsewhere, who took the bills away with them to circulate abroad, putting out none at home. For some, locations as inaccessible as possible were selected, that the bills might not come back to plague the managers. The bank commissioners say in their report for 1838, of their journey for inspection: 'The singular spectacle was presented of the officers of the State seeking for banks in situations the most inaccessible and remote from trade, and finding at every step an increase of labor by the discovery of new and unknown organizations. Before they [the organizers] could be arrested the mischief was done: large issues were in circulation and no adequate remedy for the evil.' One bank was found housed in a saw-mill, and it was said with pardonable exaggeration in one of the public papers, 'Every village plat with a house, or even without a house, if it had a hollow stump to serve as a vault, was the site of a bank.' . . . The governor, when he delivered his annual message in January, 1838, still had confidence in the general banking law, which he said 'offered to all persons the privilege of banking under certain guards and restrictions,' and he declared that 'the principles upon which this law is based are certainly correct, destroying as they do the odious feature of a banking monopoly, and giving equal rights to all classes of the community.' . . . The aggregate amount of private indebtedness had by this time become enormous, and the pressure for payment was serious and disquieting. . . . The people must have relief; and what relief could be so certain or so speedy as more banks and more money? More banks therefore continued to be organized, and the paper current flowed out among the people in increasing volume. . . . At the beginning of 1839 the bank commissioners estimated that there were a million dollars of bills of insolvent banks in the hands of individuals and unavailable. Yet the governor, in his annual message delivered in January, found it a 'source of unfeigned gratification to be able to congratulate [the legislature] on the prosperous condition to which our rising commonwealth has attained.' . . . Then came stay laws, and laws to compel creditors to take lands at a valuation. They were doubtful in point of utility, and more than doubtful in point of morality and constitutionality. The federal bankrupt act of 1841 first brought substantial relief: it brought almost no dividends to creditors, but it relieved debtors from their crushing burdens and permitted them, sobered and in their right minds, to enter once more the fields of industry and activity. The extraordinary history of the attempt to break up an 'odious monopoly' in banking by making everybody a banker, and to create prosperity by unlimited issues of paper currency, was brought at length to a fit conclusion."—T. M. Cooley, *Michigan*, ch. 13.—See also WILD CAT BANKS.

1838.—Free banking law of New York.—"On April 18th, 1838, the monopoly of banking under special charters, was brought to a close in the State of New York, by the passage of the act 'to authorize the business of Banking.' Under this law Associations for Banking purposes and Individual Bankers, were authorized to carry on the business of Banking, by establishing offices of deposit, discount and circulation. Subsequently a separate Department was organized at Albany, called 'The Bank Department,' with a Superintendent, who was charged with the supervision of all the banks in the State. Under this law institutions could be organized simply as banks of 'discount and deposit,' and might also add the issu-

ing of a paper currency to circulate as money. At first the law provided that State and United States stocks for one-half, and bonds and mortgages for the other half, might be deposited as security for the circulating notes to be issued by Banks and individual Bankers. Upon a fair trial, however, it was found that when a bank failed, and the Bank Department was called upon to redeem the circulating notes of such bank, the mortgages could not be made available in time to meet the demand. . . . By an amendment of the law the receiving of mortgages as security for circulating notes was discontinued."—E. G. Spaulding, *One hundred years of progress in the business of banking*, p. 48.

1844.—English Bank Charter Act.—"By an act of parliament passed in 1838, conferring certain privileges on the Bank of England, it was provided that the charter granted to that body should expire in 1855, but the power was reserved to the legislature, on giving six months' notice, to revise the charter ten years earlier. Availing themselves of this option, the government proposed a measure for regulating the entire monetary system of the country."—W. C. Taylor, *Life and times of Sir Robert Peel*, v. 3, ch. 7.—"The growth of commerce, and in particular the establishment of numerous joint-stock banks had given a dangerous impulse to issues of paper money, which were not then restricted by law. Even the Bank of England did not observe any fixed proportion between the amount of notes which it issued and the amount of bullion which it kept in reserve. When introducing this subject to the House of Commons, Peel remarked that within the last twenty years there had been four periods when a contraction of issues had been necessary in order to maintain the convertibility of paper, and that in none of these had the Bank of England acted with vigour equal to the emergency. In the latest of these periods, from June of 1838 to June of 1839, the amount of bullion in the Bank had fallen to little more than £4,000,000, whilst the total of paper in circulation had risen to little less than £30,000,000. . . . Peel was not the first to devise the methods which he adopted. Mr. Jones Loyd, afterwards Lord Overstone, who impressed the learned with his tracts and the vulgar with his riches, had advised the principal changes in the law relating to the issue of paper money which Peel effected by the Bank Charter Act. These changes were three in number. The first was to separate totally the two departments of the Bank of England, the banking department and the issue department. The banking department was left to be managed as best the wisdom of the directors could devise for the profit of the shareholders. The issue department was placed under regulations which deprived the Bank of any discretion in its management, and may almost be said to have made it a department of the State. The second innovation was to limit the issue of paper by the Bank of England to an amount proportioned to the value of its assets. The Bank was allowed to issue notes to the amount of £14,000,000 against Government securities in its possession. The Government owed the Bank a debt of £11,000,000, besides which the Bank held Exchequer Bills. But the amount over £14,000,000 which the Bank could issue was not henceforward, to be more than the equivalent of the bullion in its possession. By this means it was made certain that the Bank would be able to give coin for any of its notes which might be presented to it. The third innovation was to limit the issues of the country banks. The power of issuing notes was denied to any private or

joint-stock banks founded after the date of the Act. It was recognized in those banks which already possessed it, but limited to a total sum of £8,500,000, the average quantity of such notes which had been in circulation during the years immediately preceding. It was provided that if any of the banks which retained this privilege should cease to exist or to issue notes, the Bank of England should be entitled to increase its note circulation by a sum equal to two-thirds of the amount of the former issues of the bank which ceased to issue paper. The Bank of England was required in this contingency to augment the reserve fund. By Acts passed in the succeeding year, the principles of the English Bank Charter Act were applied to Scotland and Ireland, with such modifications as the peculiar circumstances of those kingdoms required. The Bank Charter Act has ever since been the subject of voluminous and contradictory criticism, both by political economists and by men of business."—F. C. Montague, *Life of Sir Robert Peel*, ch. 8.

1848-1893.—Production of the precious metals in the last half of the nineteenth century.—"The total (estimated) stock of gold in the world in 1848, was £560,000,000. As for the annual production, it had varied considerably since the beginning of the century [from £3,000,000 to £8,000,000]. Such was the state of things immediately preceding 1848. In that year the Californian discoveries took place, and these were followed by the discoveries in Australia in 1851. [See CALIFORNIA: 1848-1849; AUSTRALIA: 1830-1855.] For these three years the annual average production is set down by the Economist at £9,000,000, but from this date the production suddenly rose to, for 1852, £27,000,000, and continued to rise till 1856, when it attained its maximum of £32,250,000. At this stage a decline in the returns occurred, the lowest point reached being in 1860, when they fell to £18,683,000, but from this they rose again, and for the last ten years [before 1873] have maintained an average of about £20,500,000; the returns for the year 1871 being £20,811,000. The total amount of gold added to the world's stock by this twenty years' production has been about £500,000,000, an amount nearly equal to that existing in the world at the date of the discoveries: in other words, the stock of gold in the world has been nearly doubled since that time."—J. E. Cairnes, *Essays in political economy*, pp. 160-161.—"The yearly average of gold production in the twenty-five years from 1851-75, was \$127,000,000. The yearly average product of silver for the same period was \$51,000,000. The average annual product of gold for the fifteen years from 1876 to 1890 declined to \$108,000,000; a minus of 15 per cent. The average annual product of silver for the same period increased to \$116,000,000; a plus of 127 per cent. There is the whole silver question."—L. R. Ehrich, *Question of silver*, p. 21.—"We have heard a great deal in later years about the surreptitious demonetization of silver in 1873. There was, however, vastly too much criticism wasted on the act of 1873; for the real demonetization of silver in the United States was accomplished in 1853. It was not the result of accident; it was a carefully considered plan, deliberately carried into legislation in 1853, twenty years before its nominal demonetization by the act of 1873. . . . In 1853 the single standard was gold. This was a situation which no one rebelled against. Indeed, no one seemed to regard it as anything else than good fortune (except so far as the sub-

sidary coins had disappeared). . . . In the debates it was proposed that, as the cause of the change in the relative values of gold and silver was the increased product of gold, the proper remedy should be to increase the quantity of gold in the gold coins. . . . There was no discussion as to how a readjustment of the ratio between the two metals might be reached, for it was already decided that only one metal was to be retained. This decision, consequently, carried us to a point where the ratio between the two metals was not of the slightest concern. And so it remained. The United States had no thought about the ratios between gold and silver thereafter until the extraordinary fall in the value of silver in 1876. . . . In the provisions of the act of 1853 nothing whatever was said as to the silver dollar-piece. It had entirely disappeared from circulation years before, and acquiescence in its absence was everywhere found. No attempt whatever was thereafter made to change the legal ratio, in order that both metals might again be brought into concurrent circulation. Having enough gold, the country did not care for silver. . . . In 1873 we find a simple legal recognition of that which had been the immediate result of the act of 1853, and which had been an admitted fact in the history of our coinage during the preceding twenty years. In 1853 it had been agreed to accept the situation by which we had come to have gold for large payments, and to relegate silver to a limited service in the subsidiary coins. The act of 1873, however, dropped the dollar piece out of the list of silver coins. In discontinuing the coinage of the silver dollar, the act of 1873 thereby simply recognized a fact which had been obvious to everybody since 1849. It did not introduce anything new, or begin a new policy. Whatever is to be said about the demonetization of silver as a fact must center in the act of 1853. Silver was not driven out of circulation by the act of 1873, which omitted the dollar of 412½ grains, since it had not been in circulation for more than twenty-five years. . . . The act of February 12, 1873, is known as the act which demonetized the silver dollar. Important consequences have been attached to it, and it has even been absurdly charged that the law was the cause of the commercial crisis of September, 1873. As if a law which made no changes in the actual metallic standard in use, and which had been in use thus for more than twenty years, had produced a financial disaster in seven months! To any one who knows of the influence of credit and speculation, or who has followed the course of our foreign trade since the Civil War, such a theory is too absurd to receive more than passing mention. To the year 1873 there had been coined of 412½-grain dollars for purposes of circulation, only \$1,430,457, and these were coined before 1806."—J. L. Laughlin, *History of bimetalism in the United States*, pt. 1, pp. 80-82, 92-93.—See also BIMETALISM.—"The Coinage Act of 1873, by which the coinage of the silver dollar was discontinued, became a law on February 12th of that year. The act of February 28, 1878, which passed Congress by a two-thirds vote over the veto of President Hayes, again provided for the coinage of a silver dollar of 412.5 grains, the silver bullion to be purchased at the market price by the Government, and the amount so purchased and coined not to be less than two millions of dollars per month. During the debate on this bill the charge was repeatedly made, in and out of Congress, that the previous act of 1873, discontinuing the free coinage of the silver dollar, was passed surreptitiously. This statement has no

foundation in fact. The report of the writer, who was then Deputy Comptroller of the Currency, transmitted to Congress in 1870 by the Secretary, three times distinctly stated that the bill accompanying it proposed to discontinue the issue of the silver dollar-piece. Various experts, to whom it had been submitted, approved this feature of the bill, and their opinions were printed by order of Congress.—J. J. Knox, *United States notes, ch. 10*.—"The bill of 1878, generally spoken of as the 'Bland' bill, directed the secretary of the treasury to purchase not less than two million nor more than four million dollars' worth of silver bullion per month, to coin it into silver dollars, said silver dollars to be full legal tender at 'their nominal value.' Also, that the holder of ten or more of these silver dollars could exchange them for silver certificates, said certificates being 'receivable for customs, taxes, and all public dues.' The bill was pushed and passed by the efforts, principally, of the greenback inflationists and the representatives of the silver States. . . . Since 1878 [to 1891], 405,000,000 silver dollars have been coined. Of these 348,000,000 are still [1891] lying in the treasury vaults. No comment is needed. The Bland-Allison act did not hold up silver. In 1879 it was worth \$1.12 an ounce, in 1880 \$1.14, '81 \$1.13, '82 \$1.13, '83 \$1.11, '86 99 cents, until in '89 it reached 93½ cents an ounce. That is, in 1889 the commercial ratio was 22:1 and the coin value of the Bland-Allison silver dollar was 72 cents. In March, 1890, a bill was reported to the House by the committee of 'coinage, weights and measures,' based on a plan proposed by Secretary Windom. . . . The bill passed the House. The Senate passed it with an amendment making provision for free and unlimited coinage. It finally went to a conference committee which reported the bill that became a law, July 14, 1890. This bill directs the secretary of the treasury to purchase four and one-half million ounces of silver a month at the market price, to give legal tender treasury notes therefor, said notes being redeemable in gold or silver coin at the option of the government, 'it being the established policy of the United States to maintain the two metals on a parity with each other upon the present legal ratio.' It was believed that this bill would raise the price of silver."—L. R. Ehrich, *Question of silver*, pp. 21-25.—In December, 1891, the value of silver in the dollar was quoted to be actually 73 cents.—See also U. S. A.: 1873; 1878; 1890-1893.—In the summer of 1893, a financial crisis, produced in the judgment of the best informed by the operation of the silver-purchase law of 1890 (known commonly as the Sherman Act) became so serious that President Cleveland called a special session of Congress to deal with it. In his message to Congress, at the opening of its session, the President said: "With plenteous crops, with abundant promise of remunerative production and manufacture, with unusual invitation to safe investment, and with satisfactory assurance to business enterprise, suddenly financial fear and distrust have sprung up on every side. Numerous moneyed institutions have suspended because abundant assets were not immediately available to meet the demands of the frightened depositors. Surviving corporations and individuals are content to keep in hand the money they are usually anxious to loan, and those engaged in legitimate business are surprised to find that the securities they offer for loans, though heretofore satisfactory, are no longer accepted. Values supposed to be fixed are fast becoming conjectural, and loss and failure have involved every branch of business. I believe these things

are principally chargeable to congressional legislation touching the purchase and coinage of silver by the General Government. This legislation is embodied in a statute passed on the 14th day of July, 1890, which was the culmination of much agitation on the subject involved, and which may be considered a truce, after a long struggle between the advocates of free silver coinage and those intending to be more conservative." A bill to repeal the act of July 14, 1890 (the Sherman law, so called), was passed by both houses and received the president's signature, November 1, 1893.—See also U. S. A.: 1890-1893.

1853-1874.—Latin union and silver question.—"The gold discoveries of California and Australia were directly the cause of the Latin Union. . . . In 1853, when the subsidiary silver of the United States had disappeared before the cheapened gold, we reduced the quantity of silver in the small coins sufficiently to keep them dollar for dollar below the value of gold. Switzerland followed this example of the United States in her law of January 31, 1860; but, instead of distinctly reducing the weight of pure silver in her small coins, she accomplished the same end by lowering the fineness of standard for these coins to 800 thousandths fine. . . . Meanwhile France and Italy had a higher standard for their coins than Switzerland, and as the neighboring states, which had the franc system of coinage in common, found each other's coins in circulation within their own limits, it was clear that the cheaper Swiss coins, according to Gresham's law, must drive out the dearer French and Italian coins, which contained more pure silver, but which passed current at the same nominal value. The Swiss coins of 800 thousandths fine began to pass the French frontier and to displace the French coins of a similar denomination; and the French coins were exported, melted, and recoinced in Switzerland at a profit. This, of course, brought forth a decree in France (April 14, 1864), which prohibited the receipt of these Swiss coins at the public offices of France, the customs-offices, etc., and they were consequently refused in common trade among individuals. Belgium also, as well as Switzerland, began to think it necessary to deal with the questions affecting her silver small coins, which were leaving that country for the same reason that they were leaving Switzerland. Belgium then undertook to make overtures to France, in order that some concerted action might be undertaken by the four countries using the franc system—Italy, Belgium, France, and Switzerland—to remedy the evil to which all were exposed by the disappearance of their silver coin needed in every-day transactions. The discoveries of gold had forced a reconsideration of their coinage systems. In consequence of these overtures, a conference of delegates representing the Latin states just mentioned assembled in Paris, November 20, 1865. . . . Delegates from the countries of the Latin Union at Paris, January 30, 1874, . . . agreed to a treaty supplementary to that originally formed in 1865, and determined on withdrawing from individuals the full power of free coinage by limiting to a moderate sum the amount of silver five-franc pieces which should be coined by each state of the Union during the year 1874. The date of this suspension of coinage by the Latin Union is regarded by all authorities as of great import in regard to the value of silver."—J. L. Laughlin, *History of bimetalism in the United States*, pt. 2, pp. 146-148, 155-156.

1861-1864.—Legal-tender notes, or greenbacks, and national banking system, of American

Civil War.—"In January, 1861, the paper currency of the United States was furnished by 1,600 private corporations, organized under thirty-four different State laws. The circulation of the banks amounted to \$202,000,000, of which only about \$50,000,000 were issued in the States which in April, 1861, undertook to set up an independent government. About \$150,000,000 were in circulation in the loyal States, including West Virginia. When Congress met in extraordinary session on the 4th of July, the three-months volunteers, who had hastened to the defence of the capital, were confronting the rebel army on the line of the Potomac, and the first great battle at Bull Run was impending. President Lincoln called upon Congress to provide for the enlistment of 400,000 men, and Secretary Chase submitted estimates for probable expenditures amounting to \$318,000,000. The treasury was empty, and the expenses of the government were rapidly approaching a million dollars a day. The ordinary expenses of the government, during the year ending on the 30th of June, 1861, had been \$62,000,000, and even this sum had not been supplied by the revenue, which amounted to only \$41,000,000. The rest had been borrowed. It was now necessary to provide for an expenditure increased fivefold, and amounting to eight times the income of the country. Secretary Chase advised that \$80,000,000 be provided by taxation, and \$240,000,000 by loans; and that, in anticipation of revenue, provision be made for the issue of \$50,000,000 of treasury notes, redeemable on demand in coin. 'The greatest care will, however, be requisite,' he said, 'to prevent the degradation of such issues into an irredeemable paper currency, than which no more certainly fatal expedient for impoverishing the masses and discrediting the government of any country can well be devised.' The desired authority was granted by Congress. The Secretary was authorized to borrow, on the credit of the United States, not exceeding \$250,000,000, and, 'as a part of the above loan,' to issue an exchange for coin, or pay for salaries or other dues from the United States, not over \$50,000,000 of treasury notes, bearing no interest, but payable on demand at Philadelphia, New York, or Boston. The act does not say, 'payable in coin,' for nobody had then imagined that any other form of payment was possible. Congress adjourned on the 6th of August, after passing an act to provide an increased revenue from imports, and laying a direct tax of \$20,000,000 upon the States, and a tax of 3 per cent upon the excess of all private incomes above \$800. The Secretary immediately invited the banks of Philadelphia, New York, and Boston to assist in the negotiation of the proposed loans, and they loyally responded. On the 10th of August they took \$50,000,000 of three years 7-30 bonds at par; on the 1st of October, \$50,000,000 more of the same securities at par; and on the 16th of November, \$50,000,000 of twenty years 6 per cents., at a rate making the interest equivalent to 7 per cent. These advances relieved the temporary necessities of the treasury, and, when Congress reassembled in December, Secretary Chase was prepared to recommend a permanent financial policy. The solid basis of this policy was to be taxation. . . . It was estimated, a revenue of \$90,000,000 would be needed; and to secure that sum, the Secretary advised that the duties on tea, coffee, and sugar be increased; that a direct tax of \$20,000,000 be assessed on the States; that the income tax be modified so as to produce \$10,000,000, and that duties be laid on liquors, tobacco, carriages, legacies, bank-notes, bills payable, and conveyances. For the extraordinary expenses of

the war it was necessary to depend upon loans, and the authority to be granted for this purpose the Secretary left 'to the better judgment of Congress,' only suggesting that the rate of interest should be regulated by law, and that the time had come when the government might properly claim a part, at least, of the advantage of the paper circulation, then constituting a loan without interest from the people to the banks. There were two ways, Secretary Chase said, in which this advantage might be secured: 1. By increasing the issue of United States notes, and taxing the bank-notes out of existence. 2. By providing a national currency, to be issued by the banks but secured by the pledge of United States bonds. The former plan the Secretary did not recommend, regarding the hazard of a depreciating and finally worthless currency as far outweighing the probable benefits of the measure. . . . Congress had hardly begun to consider these recommendations, when the situation was completely changed by the suspension of specie payments, on the 28th of December, by the banks of New York, followed by the suspension of the other banks in the country, and compelling the treasury also to suspend. This suspension was the result of a panic occasioned by the shadow of war with England. . . . To provide for the pressing wants of the treasury, Congress, on the 12th of February, 1862, authorized the issue of \$10,000,000 more of demand notes. Before the end of the session further issues were provided for, making the aggregate of United States notes \$300,000,000, besides fractional currency. There was a long debate upon the propriety of making these notes a legal tender for private debts, and it seemed for a time that the measure would be defeated by this dispute. [The bill authorizing the issue of legal tender notes known afterwards as 'Greenbacks' was prepared by the Hon. E. G. Spaulding, who subsequently wrote the history of the measure.] Secretary Chase finally advised the concession of this point; nevertheless, 55 votes in the House of Representatives . . . were recorded against the provision making the notes a tender for private debts. Congress also empowered the Secretary to borrow \$500,000,000 on 5-20 year 6 per cent. bonds, besides a temporary loan of \$100,000,000, and provided that the interest on the bonds should be paid in coin, and that the customs should be collected in coin for that purpose. Nothing was said about the principal, for it was taken for granted that specie payments would be resumed before the payment of the principal of the debt would be undertaken. . . . Congress had thus adopted the plan which the Secretary of the Treasury did not recommend, and neglected the proposition which he preferred. . . . When Congress met in December, 1862, the magnitude of the war had become fully apparent. . . . The enormous demands upon the treasury . . . had exhausted the resources provided by Congress. The disbursements in November amounted to \$50,847,077—two millions a day. Unpaid requisitions had accumulated amounting to \$46,000,000. The total receipts for the year then current, ending June 30, 1863, were estimated at \$511,000,000; the expenditures at \$788,000,000; leaving \$277,000,000 to be provided for. There were only two ways to obtain this sum—by a fresh issue of United States notes, or by new interest-bearing loans. But the gold premium had advanced in October to 34; the notes were already at a discount of 25 per cent. The consequences of an addition of \$277,000,000 to the volume of currency, the Secretary said, would be 'inflation of prices, increase of expenditures, augmentation

of debt, and, ultimately, disastrous defeat of the very purposes sought to be obtained by it.' He therefore recommended an increase in the amount authorized to be borrowed on the 5-20 bonds. . . . In order to create a market for the bonds, he again recommended the creation of banking associations under a national law requiring them to secure their circulation by a deposit of government bonds. The suggestion thus renewed was not received with favor by Congress. . . . On the 7th of January Mr. Hooper offered again his bill to provide a national currency, secured by a pledge of United States bonds, but the next day Mr. Stevens, of Pennsylvania, submitted the bill with an adverse report from the committee on ways and means. On the 14th of January Mr. Stevens reported a resolution authorizing the Secretary of the Treasury to issue \$100,000,000 more of United States notes for the immediate payment of the army and navy. The resolution passed the House at once, and the Senate the next day. . . . On the 19th of January President Lincoln sent a special message to the House, announcing that he had signed the joint resolution authorizing a new issue of United States notes, but adding that he considered it his duty to express his sincere regret that it had been found necessary to add such a sum to an already redundant currency, while the suspended banks were still left free to increase their circulation at will. He warned Congress that such a policy must soon produce disastrous consequences, and the warning was effective. On the 25th of January Senator Sherman offered a bill to provide a national currency, differing in some respects from Mr. Hooper's in the House. The bill passed the Senate on the 12th of February, 23 to 21, and the House on the 20th, 78 to 64. . . . It was signed by the President on the 25th of February, 1863."—H. W. Richardson, *National banks, ch. 2*.—"One immediate effect of the Legal Tender Act was to destroy our credit abroad. Stocks were sent home for sale, and, as Bagehot shows, Lombard Street was closed to a nation which had adopted legal tender paper money. . . . By August all specie had disappeared from circulation, and postage-stamps and private note-issues took its place. In July a bill was passed for issuing stamps as fractional currency, but in March 1863, another act was passed providing for an issue of 50,000,000 in notes for fractional parts of a dollar—not legal tender. For many years the actual issue was only 30,000,000, the amount of silver fractional coins in circulation in the North, east of the Rocky Mountains, when the war broke out. . . . Gold rose to 200-220 or above, making the paper worth 45 or 50 cts., at which point the 5 per cent. ten-forties floated. The amount sold up to October 31st, 1865, was \$172,770,100. Mr. Spaulding reckons up the paper issues which acted more or less as currency, on January 30th, 1864, at \$1,125,877,034; 812,000,000 bore no interest."—W. G. Sumner, *History of American currency, pp. 204-208*

1863-1914.—Development of national banking system in the United States.—"The national banking system owes its existence to the Civil War. Although in the majority of the States the banks incorporated under State authority were badly organized and insecure, and although even such as were on a solid foundation could enjoy little more than local credit, the current of opinion before the war was by no means favorable to any consolidation of banking interests. . . . But in 1863 a system of national banks was established with widespread, although not unanimous, consent, and without solid opposition, except

for some existing interests threatened or alarmed by the change. For effecting the revolution thus brought about in little more than three years, the favoring conditions were the unusual assumption of powers by the United States government then becoming habitual under the pressure of a struggle for existence, and the imperious necessity of finding a market for United States bonds for the supply of a Treasury drained by war. In the great borrowing operations of 1861 the Secretary of the Treasury had sold a large amount of securities to the banks of the Eastern and Middle States, but the banks had found themselves embarrassed by the impossibility of using their own notes or their credit in any form in transactions with the government, and both banks and Treasury had been compelled to suspend specie payments at the end of the year. The Secretary had already laid before Congress his plan for the strengthening of bank circulation by a national system of secured bank issues, urging its adoption chiefly as a reformatory measure which might give to the country a solid currency, preferable, in his opinion, to an increase of government notes which must always involve 'the risk of a depreciated, depreciating, and finally worthless paper money.' Events moved rapidly, and the first resort to legal-tender government notes was authorized by Congress, with the acquiescence of the Secretary, in less than two months after the suspension. The bank proposition, which, considered simply as a reform, would then have had small prospect of success, began to gain ground as affording a possible escape from the final flood of legal-tender paper which seemed to threaten. When the Secretary again urged his plan upon the attention of Congress, it had acquired new significance in its bearing upon the finances of the government. Immediate relief to the Treasury by the sale of bonds to the banks to be used as security for their issues was not to be expected, for the organization of banks under the proposed system could not be effected without much delay, and many of the strong banks which the Secretary hoped to see converted into national banks already owned bonds in large amounts. Indeed the Secretary contented himself with saying that 'in a very few years' the proposed national banks would require bonds to the amount of \$250,000,000, and in fact the war was over before their deposits of bonds had risen much above \$100,000,000. But the banks were looked upon as important agencies for the government in placing new loans, and their circulation as a medium needed for use in default of specie and likely to facilitate the return to specie payments. In short as the national bank system slowly passed through its successive stages of development from 1863 to 1865, its importance as affording in itself a market for United States bonds pretty well disappeared, and its importance as a valuable part of the commercial organization and as the source of a paper currency of remarkable credit and security came to be more and more fully recognized. The act authorizing a system of national banks was passed in February, 1863, but in many points of detail it proved to be so unsatisfactory and incomplete that only 134 banks were organized under it in the next nine months, and the number had risen to [almost] . . . 450 in sixteen months. A revised act, making important changes, was therefore passed in June, 1864, and ample provision having been made, under which banks chartered by the States could be reorganized as national banks, the extension of the new system went on rapidly. Its adoption was further stimulated by an act laying a tax of ten per cent. on

all notes of State banks paid out by any bank after July 1, 1866. The certainty of the practical exclusion of all State banks from the field of circulation caused the speedy reorganization of the greater part of them as national banks; and thus the national system, numbering 1634 banks on July 1, 1866, at once assumed the preëminence which it has since maintained. . . . The fundamental defects in the banking system of the United States, in particular the absence of adequate lending power and inability to make effective use of the cash reserves of the banks, were disclosed not only during the serious crises of 1873, 1893, and 1907, but also on frequent occasions of more moderate financial strain. But the need of radical change in the banking arrangements of the country was not clearly recognized until after the crisis of 1907. The attention of bankers as well as of the public was for many years absorbed by the more urgent needs of monetary reform—after 1873, the resumption of specie payments, and after 1893, the repeal of the silver purchase law [see U.S.A.: 1800-1893] secured at once, and the establishment of the gold standard upon a firm basis which was finally accomplished with the passage of the Currency Act of 1900. Difficulties due to monetary causes were entirely absent in the crisis of 1907, and consequently the unsatisfactory state of the banking machinery and practice of the country at length became clearly evident. As a temporary measure, pending more thoroughgoing legislation, an act [Emergency Currency Act] was passed in 1908 empowering the banks to issue bank-notes secured by bonds other than United States bonds and by commercial paper, but subject to taxation sufficiently onerous to prevent issue except in emergencies and to insure speedy retirement. These notes proved of great service during the crisis which came in August, 1914, with the outbreak of the European War. Somewhat more than \$300,000,000 of the notes were issued and, although Clearing House loan certificates were also used, the suspension of currency payments was avoided. As a means of overcoming the most serious of the difficulties encountered in previous crises, the notes proved an effective device, but it was rightly believed that the banking legislation of the country was antiquated and that many and, in some directions, very fundamental changes must be made if the banks were to be placed in position to render the greatest possible service to the community in normal times as well as in emergencies. This view of the situation found expression in the Federal Reserve Act of December 23, 1913, a measure which gave the necessary legal authority for incomparably greater changes in the banking structure and practice of the country than followed the passage of the National Banking Act fifty years before."—C. F. Dunbar, *Theory and history of banking*, pp. 220-223, 247-248.—See also U.S.A.: 1895 (January-February); 1895-1896 (December-February); 1896 (June-November); 1896-1898; 1898 (July 1); 1900 (March-December).

1867-1893. — **International bimetallism.**—**Four conferences.**—"Four international conferences and a number of others of less importance have considered the questions involved in it [bimetallism]. . . . The first of these conferences was held in Paris in 1867 and was the result of a plan formulated by the delegates of the states of the Latin Union at their meeting in 1865 to promote international uniformity of action on monetary matters. The most significant fact connected with this conference was the declaration of all the states which participated, except Holland, in favour of the gold standard.

Other proposals aimed at the establishment of an international unit of value. In February, 1868, the English government appointed a commission to consider the proposals of this conference, but the outcome of its deliberations was unfavourable to any change in the English system, though it expressed a strong appreciation of the advantages to be derived from legislation looking towards uniformity of international action. . . . Germany adopted the gold standard in 1871-73, and her action was followed by the Scandinavian countries, Denmark, and Holland. France and the other states of the Latin Union discontinued the free coinage of five-franc pieces in 1874, and the United States dropped the silver dollar from the list of authorized coins in 1873. The next conference was the direct result of the fall in the value of silver which became so marked in 1876 and which affected important interests in most countries. In the United States the silver producers of the West saw their profits threatened; in England the exchanges with India were upset, the business of the cotton-manufacturers of Lancashire injured, and investments checked; in India the increased cost of making the annual payments due in England threatened a deficit in the finances; and in France and the other states of the Latin Union a gold famine was imminent. In March, 1876, the English government appointed a commission to investigate the situation, and the Congress of the United States took similar action in August of the same year. The former committee made no proposals by way of remedy, but presented a full statement of the situation, while the committee of Congress reported in favour of the rehabilitation of silver, and started the movement which culminated in the Bland Act. One clause of this authorized the President to invite the various nations to an international conference on the subject, and the outcome was a second meeting of delegates in Paris, August 10, 1878. The attitude of the representatives of the various states towards bimetallism indicated a considerable change of opinion since 1867, but a wide diversity of interests and the impossibility of an international agreement for the rehabilitation of silver at this time. The delegates of the United States strongly favoured the free coinage of silver by all the nations at a ratio to be agreed upon. Those of Belgium, Switzerland, and Norway strongly opposed such action, and the English delegate stated that England would not consent to a modification of her system. Germany was not represented at all, and France maintained a waiting attitude. The conference adjourned after declaring that in view of the wide differences of opinion expressed it was useless to discuss the question of an international ratio, and that each nation must be left free to treat silver as it might think best. The advocates of bimetallism were naturally encouraged over the trend of opinion in their direction since the conference of 1867, and carried on a vigorous agitation, especially in the United States, France, and Germany. This fact, together with the continuous decline in the value of silver, resulted in a third conference, called, on the joint invitation of France and the United States, April 19, 1881. This time the advocates of bimetallism were very much more numerous, including, besides the delegates of the United States, those of France, Italy, Austria, the Netherlands, and British India. The representatives of England and Germany, however, stated positively that the best that could be hoped from their governments was possible action with a view to increasing the use of silver as money, in case an international agreement for

free coinage were made by the other nations, and the delegates of Belgium, Switzerland, Greece, and the Scandinavian countries declared against bimetalism. Therefore, in spite of additions to the forces working for bimetalism, an international agreement seemed as far away as ever. This conference adjourned to meet again April 12, 1882, but it was not reassembled until 1893. Agitation in favour of bimetalism was continued during the eleven years, an international league having been formed for that purpose. A conference of bimetalists was held at Cologne in October, 1882, which advised Germany to retain the silver she already possessed, and to substitute it in her circulating medium for small gold coins and paper below the denomination of ten marks. It also urged the Bank of England to make use of its right to keep a part of its reserve in silver. A royal commission on the depression of trade, appointed in England in 1886, reported in 1888, one-half of its members favouring and the other half opposing bimetalism. In connection with the Paris Exposition of 1889 a monetary conference was held, which closed, however, without any practical recommendation. In this conference England was not represented. The Brussels Conference of 1893 was called on the invitation of the United States, and the opinions there expressed indicate that the cause of bimetalism had rapidly lost ground since the last meeting in 1881. Even the President's invitation was couched in language which was not hopeful. It declared the purpose of the conference to be a consideration of 'what measures, if any, could be taken to increase the use of silver in the currency system of nations.' Though the delegates of the United States presented a scheme of international bimetalism, they learned at the beginning that it would be useless to push it to the front, and accordingly most of the time of the conference was devoted to a discussion of two or three plans submitted for an increase in the use of silver for monetary purposes by substituting it for small gold coins and paper of low denominations at that time based on gold. Even these plans, however, were rejected. The delegates of Germany, Austria and Russia came to the conference instructed by their respective governments not to vote or to express an opinion, and, though uninstructed, those of Roumania, Portugal, Turkey, and Greece took the same attitude. The representatives of France declared that their government would not consent to the free coinage of silver unless the other nations would do likewise, and England's attitude was not materially changed. The conference, therefore, adjourned without any practical result so far as the purpose which called the delegates together was concerned, but not without leaving upon the minds of most people who watched its deliberations the conviction that the cause of international bimetalism was lost."—W. A. Scott, *Money and banking*, pp. 342-346.—See also BIMETALISM.

1869.—Black Friday.—"During the [Civil] war gold had swollen in value to 285, when the promise of the nation to pay a dollar on demand was only worth thirty-five cents. Thence it had gradually sunk. . . . All our purchases from foreign nations, all duties on those purchases, and all sales of domestic produce to other nations are payable in gold. There is therefore a large and legitimate business in the purchase and sale of gold, especially in New York, the financial centre of the nation. But a much larger business of a gambling nature had gradually grown up around that which was legitimate. . . . These gambling operations were based on the rise and fall of gold,

and these in turn depended on successful or unsuccessful battles, or on events in foreign nations that could be neither foreseen nor guarded against. The transactions were therefore essentially gambling. . . . So large was the amount of this speculative business, gathering up all the gold-betting of the nation in a single room, that it more than equalled the legitimate purchase and sale of gold. There were large and wealthy firms who made this their chief business; and prominent among them was the firm of Smith, Gould, Martin & Co., four gentlemen under one partnership name, all wealthy and all accustomed to this business for years. Their joint wealth and business skill made them a power in Wall street. The leading mind of the firm, though not the first named, was Mr. Jay Gould, President of the Erie Railway, joint owner, with Colonel James Fisk Jr., of two lines of steamboats, and largely interested in a number of railroads and other valuable properties. Mr. Gould looked upon gold, railroads, and steamboats as the gilded dice wherewith to gamble. . . . During the spring of 1869 he was a buyer of gold. There was perhaps fifteen millions of that rare currency in New York outside the Sub-Treasury; and he had bought half that amount, paying therefor a bonus of a little more than two millions of dollars. As fast as he had purchased the precious metal he had loaned it out to those who needed it for the payment of duties, and who hoped to repurchase it at a lower rate. And so, though the owner of seven millions, he had none of it in hand; he merely possessed the written acknowledgment of certain leading merchants and brokers that they owed him that amount of specie, which they would repay with interest on demand. Having this amount obtainable at any moment, Mr. Gould had the mercantile community at his mercy. But there was some hundred millions of gold in the Treasury, more or less, and the President of the United States or the Secretary of the Treasury might at any time throw it on the market. On this point it was very desirable to ascertain the opinion of President Grant; more desirable to have constant access to his private ear." In various ways, argumentative influences were brought to bear on President Grant and the Secretary of the Treasury, Mr. Boutwell, to persuade them that it was desirable for the country, while the crops were being moved, to hold up the price of gold. One important channel for such influences was supplied by the President's brother-in-law, a retired New York merchant, named Corbin, who was drawn into the speculation and given a share in Gould's gold purchases. By strenuous exertions, Gould and his associates pushed up the price till "in May it stood at 144 $\frac{7}{8}$; but as soon as they ceased to buy, the price began to recede until in the latter part of June it again stood at 136. The others were then frightened and sold out. 'All these other fellows deserted me like rats from a ship,' said Gould. But for him to sell out then would involve a heavy loss, and he preferred a gain. He therefore called upon his friend and partner Fisk to enter the financial arena. It is but justice to Mr. Fisk to say that for some time he declined; he clearly saw that the whole tendency of gold was downward. But when Gould made the proposition more palatable by suggesting corruption, Fisk immediately swallowed the bait. . . . He . . . entered the market and purchased twelve millions. There is an old adage that there is honor among thieves. This appears not to be true on the Gold Exchange. All Mr. Gould's statements to his own partner were false,

except those relating to Corbin and Butterfield. And Mr. Corbin did his best. He not only talked and wrote to the President himself; not only wrote for the New York 'Times,' but when General Grant visited him in New York, he sent Gould to see him so often that the President, unaware of the financial trap set for him, rebuked the door servant for giving Mr. Gould such ready access. But it is worthy of note that neither Corbin, Gould, nor Fisk ever spoke to the President of their personal interest in the matter. They were only patriots urging a certain course of conduct for the good of the country. These speculations as to the advantage to the country of a higher price of gold seem to have had some effect on the Presidential mind; for early in September he wrote to Mr. Boutwell, then at his Massachusetts home, giving his opinion of the financial condition of the country, and suggesting that it would not be wise to lower the price of gold by sales from the Treasury while the crops were moving to the seaboard. Mr. Boutwell therefore telegraphed to the Assistant Secretary at Washington only to sell gold sufficient to buy bonds for the sinking fund. Through Mr. Corbin or in some other way this letter came to the knowledge of the conspirators; for they at once began to purchase and the price began to rise. . . . On the 13th of September, gold, swelling and falling like the tide, stood at 135½. The clique then commenced their largest purchases, and within nine days had bought enough to hold sixty-six millions—nearly every cent of it fictitious, and only included in promises to pay. On the evening of Wednesday, September 22, the price was 140½; but it had taken the purchase of thirty or forty millions to put it up that five cents. Could it be forced five cents higher, and all sold, the profits would be over ten millions of dollars! It was a stake worth playing for. But the whole mercantile community was opposed to them; bountiful harvests were strong arguments against them; and more than all else, there stood the Sub-Treasury of the United States, with its hundred millions of dollars in its vaults, ready at any time to cast its plethora of wealth on their unfortunate heads. . . . Corbin, while assuring Gould that there was no danger of any Government sale, and yet himself greatly in trepidation, addressed a letter to General Grant urging him not to interfere with the warfare then raging between the bulls and the bears, nor to allow the Secretary of the Treasury to do so. . . . The letter would probably have had some effect, but unfortunately the ring overdid their business in the way in which they sent it." The letter was conveyed by a private messenger. The messenger, "Mr. Chapin, delivered his letter, asked General Grant if there was any reply, and being told there was none, started for his home, first telegraphing to his employer, 'Letter delivered all right.' It was a most unfortunate telegraphic message he sent back. He swears that his meaning was that the letter was delivered all right; and so the despatch reads. But the gold gamblers, blinded by the greatness of the stake at risk, interpreted the 'all right' of the message as an answer to the contents of Mr. Corbin's letter—that the President thought the letter all right; and on the strength of that reading Fisk rushed into the market and made numerous purchases of gold. But that very letter, which was intended to be their governmental safeguard, led to their ruin. Carried by special messenger for a day and a half, its urgency that the Administration should sell no gold, coupled with frequent assertions in the newspapers that Mr. Corbin was a great bull

in gold, excited General Grant's suspicions. He feared that Corbin was not actuated by patriotic motives alone in this secret correspondence. At the President's suggestion, therefore, Mrs. Grant wrote to her sister, Mrs. Corbin, telling her that rumors had reached them that Mr. Corbin was connected with speculators in New York, and that she hoped if this was so he would at once disengage himself from them; that the President was much distressed at such rumors. On the receipt of this letter, Mr. Corbin was greatly excited." Corbin showed the letter to Gould, and got himself let out of the game, so that he might be able to say to President Grant that he had no interest in gold; but Fisk was not told of the President's suspicions. "On the evening of Wednesday, September 21, it was determined to close the corner within two days." A desperate attack on the market began next morning. Gold opened that day at 139½; it closed at 144. The next day was "Friday, September 24, commonly called Black Friday, either from the black mark it caused on the characters of dealers in gold, or, as is more probable, from the ruin it brought to both sides. The Gold Room was crowded for two hours before the time of business. . . . Fisk was there, gloating over the prospect of great gains from others' ruin. His brokers were there, noisy and betting on the rapid rise of gold and the success of the corner. All alike were greatly excited, palpitating between hope and fear, and not knowing what an hour might bring forth. . . . Gold closed on Thursday at 144; Speyers [principal broker of the conspirators] commenced his work on Friday by offering 145, one per cent. higher than the last purchase. Receiving no response, he offered to buy at 146, 147, 148, and 149 respectively, but without takers. Then 150 was offered, and half a million was sold him by Mr. James Brown, who had quietly organized a band of prominent merchants who were determined to meet the gold gamblers on their own ground. . . . Amid the most tremendous confusion the voices of the excited brokers could be heard slowly bidding up the value of their artificial metal. Higher and higher rose the tide of speculation; from 156 to 159 there was no offer whatever; amid deep silence Speyers called out 'Any part of five millions for 160.' 'One million taken at 160,' was the quiet response of James Brown. Further offers were made by the brokers of the clique all the way from 160 to 163½. But Mr. Brown preferred to grapple the enemy by the throat, and he sold Speyers five millions more, making seven millions of gold sold that hour for which Speyers agreed to pay eleven millions in currency. Such figures almost stagger one to read of them! But Speyers continued to buy till before noon he had purchased nearly sixty millions. . . . As the price rose cent by cent, men's hearts were moved within them as the trees are shaken by the swelling of the wind. But when the first million was taken at 160 a great load was removed, and when the second million was sold there was such a burst of gladness, such a roar of multitudinous voices as that room. tumultuous as it had always been, never heard before. Everybody instantly began to sell, desiring to get rid of all their gold before it had tumbled too deep. And just as the precious metal was beginning to flow over the precipice, the news was flashed into the room that Government had telegraphed to sell four millions. Instantly the end was reached; gold fell to 140, and then down, down, down, to 133. There were no purchasers at any price. . . . The gold ring had that day bought sixty millions of gold, paying or

rather agreeing to pay therefor ninety-six millions of dollars in currency!" But Gould, Fisk & Co., who owned several venal New York judges, placed injunctions and other legal obstacles in the way of a settlement of claims against themselves. "Of course these judicious and judicial orders put an end to all business except that which was favorable to Fisk and Gould. They continued to settle with all parties who owed them money; they were judicially enjoined from settling with those to whom, if their own brokers may be believed, they were indebted, and they have not yet settled with them. . . . As the settlements between the brokers employed by the ring and their victims were all made in private, there is no means of knowing the total result. But it is the opinion of Mr. James B. Hodskin, Chairman of the Arbitration Committee of the Exchange, and therefore better acquainted with its business than any one else, that the two days' profits of the clique from the operations they acknowledged and settled for were not less than twelve millions of dollars; and that the losses on those transactions which they refused to acknowledge were not less than twenty millions. The New York 'Tribune' a day or two afterward put the gains of the clique at eleven million dollars. Some months after 'Black Friday' had passed away, Congress ordered an investigation into its causes. . . . For two or three days the whole business of New York stood still awaiting the result of the corner. . . . In good-will with all the world, with grand harvests, with full markets on both sides the Atlantic, came a panic that affected all business. Foreign trade came to a stand-still. The East would not send to Europe; the West could not ship to New York. Young men saw millions of dollars made in a few days by dishonesty; they beheld larger profits result from fraud than from long lives of honesty. Old men saw their best-laid plans frustrated by the operations of gamblers. Our national credit was affected by it. Europe was told that our principal places of business were nests of gamblers, and that it was possible for a small clique, aided by our banking institutions, to get possession of all the gold there was in the land; and that when one firm had gone through business transactions to the amount of over one hundred millions of dollars, the courts of the United States would compel the completion of those bargains which resulted in a profit, while those that ended in a loss were forbidden. For two or three months the sale of bonds in Europe was affected by the transactions of that day; and not until the present generation of business men has passed away will the evil influence of Black Friday be entirely lost."—W. R. Hooper, *Black Friday* (*Galaxy*, Dec., 1871).

1871-1914.—Currency and banking reforms in Germany.—Bank of Prussia made into bank of the empire.—Independent banks.—"When the . . . German Empire was established in 1871, the reform of the legislation upon currency and banking was felt to be a pressing necessity. In their coinage some German states had ranged themselves under the thaler system and others under the gulden, but in all there was a mass of old coin in circulation of obsolete denominations. The silver standard had been adhered to by all. Every member of the North German confederation, except the cities Hamburg, Lübeck, and Bremen, and the principality of Lippe, was issuing paper currency for the supply of its own wants. And finally thirty-three banks of issue, with capitals ranging from 1,200,000 marks to 35,000,000, had been established, each upon such basis as the state or city

establishing it found good, some holding perpetual charters, some incorporated for terms of years, and some holding only rights revocable at pleasure. These banks differed materially as to the limit of their authorized issues, and were under different obligations as to the holding of reserve. . . . The law of December 1871, provided for unity of coinage and prepared the way for the subsequent introduction of the gold standard by the act of July, 1873. Another law of April, 1874, provided for the extinction of the paper currency issued by the several German states, by creating a currency of imperial treasury notes (*Reichskassenscheine*), convertible into gold upon demand at the Treasury, but not a legal tender, and authorizing the distribution of the notes to the several states, to be used by them in taking up their local issues. Of the imperial paper 120,000,000 marks were distributed to the states in the ratio of population, and 55,000,000 more were advanced in amounts as required, and with this aid twenty local issues, amounting in the aggregate to rather more than 180,000,000 marks, were extinguished. And finally by a law of March, 1875, the banks of issue were brought under a common system, and the reform may be said to have been completed. The new system required the establishment of a central bank to be under the immediate supervision and direction of the imperial government, and the subjection of all other banks of issue to a uniform set of regulations and also to imperial supervision. To secure the first of these two objects, advantage was taken of the peculiar position of the Bank of Prussia. Originally established as a government bank, with a capital of 2,000,000 thalers supplied by the state, this bank had been enlarged by the admission of private stockholders until its capital had risen to 20,000,000 thalers, but without the surrender by the state of its power of control or of its disproportionate share of the profits. As a part of the new system, the Bank of Prussia now became the Bank of the Empire (*Reichsbank*). The Prussian government was paid for its share of the capital and surplus, and also received 15,000,000 marks for its interest in the goodwill of the establishment; and the capital was then raised by subscription to 120,000,000 marks, the whole of which was thus placed in private hands. The imperial government reserved to itself a direct power of control through the imperial chancellor and also by the appointment of the board of direction, giving to the shareholders the election of a committee charged with certain duties of consultation. Government control is therefore far greater than that exercised over the Reserve banks in the United States and somewhat more complete than in the case of the Bank of France. The Bank was required to receive and make payments, and to conduct other financial operations for the imperial treasury, without compensation, and also to manage free of cost the receipts and payments of the several states of the Empire. It was thus made in everything except its ownership a national bank on a large scale, although not the largest, and had its privileges secured to it for fifteen years. Certain general regulations adapted the thirty-two existing independent banks of issue to the new system. The exclusive right of issuing bank-notes was then given to them and to the Reichsbank, with a provision for transferring to the latter any right of issue which may be surrendered by any of the others. No limit was fixed for the aggregate circulation, but the possible aggregate of notes which could be issued without being covered by cash in hand was fixed at 385,000,000 marks. . . . Every bank is re-

quired to report its condition at four fixed dates in every month; and any excess of notes, shown by any such report, above the allowed limit and not covered by cash, is then taxed of one per cent. . . . In 1909 the limit on untaxed notes was raised to 550,000,000 marks and it was further provided that for the last week of each quarter the untaxed limit should be 750,000,000 marks. This interesting modification of the law was designed to enable the Bank to meet the heavy requirements for cash which came at the end of each quarter of the year when in Germany, to a greater extent than in most other countries, a great variety of obligations are payable. Under these new arrangements and also owing to some slackening in the activity of trade, the frequency and the amount of taxed issues of notes were greatly reduced though not entirely eliminated during the years immediately following the revision of the charter of the Reichsbank in 1909. The act of 1909 also made the notes of the Reichsbank a legal tender. . . . Upon the outbreak of the European War in 1914, the redemption of Reichsbank notes was immediately discontinued, and every effort was made to substitute the notes for the coin in circulation. The making the notes a legal tender in 1909 was unquestionably a wise measure paving the way for the monetary arrangements which were to be adopted if the country should engage in a great war. It was expected when the system was established in 1875 that the Reichsbank would ultimately absorb the issues of all the other banks, either through the relinquishment of these rights by the banks or in consequence of the intervention of the imperial government, but the seven independent banks which continued to exercise that privilege after 1893 did not appear likely to give up their issues. The Bank of Frankfort alone excepted, they were all outside Prussia, each in one of the other states of the Empire, (note—the banks of Saxony, Bavaria, Baden, South Germany [Hesse], Würtemberg, and Brunswick) holding a sort of territorial position, and sustained by the same influences which in so many other directions oppose the complete unification of the Empire. Their aggregate note-issue was small in comparison with that of the Reichsbank, amounting to less than 200,000,000 marks, and their operations did not affect seriously its leading position among German banks. At the renewal of the charter of the Reichsbank in 1899, however, these banks were subjected to an entirely novel measure of restriction which at once led three of them to relinquish the privilege of issue. They were forbidden to discount at a rate lower than that of the Reichsbank when its rate is as high as four per cent., and were allowed to discount but one fourth of one per cent. below its rate when it is under four per cent.”—C. F. Dunbar, *Theory and history of banking*, pp. 199-203, 211-213.—See also CAPITALISM: 18th-19th centuries; DEUTSCHE BANK; DRESDENER BANK; DISCONTO-GESELLSCHAFT.

1874-1890.—Resumption of specie payment in the United States.—“The political consequences of the panic [of 1873] were seen in the autumn of 1874, when the congressional elections, for the first time since 1860, went against the Republican party. Under the pressure of political necessity, [inspired in part by the vigorous tone of Grant’s veto and by the positive demands of Bristow, who succeeded Richardson as secretary of the treasury], a bill was enacted for the resumption of specie payments by the expiring Congress, January 14, 1876, while the Republicans still held power to rally to its support sufficient votes for its passage. The measure was loaded with a variety of pro-

visions: (1) A system of free banking; . . . (2) the retirement of greenbacks equal to 80 per cent. of the amount of new national bank-notes issued, until the greenback circulation should be reduced to \$300,000,000, after which no further reduction of the greenbacks was to take place. It was argued that this check would prevent either expansion or contraction of the currency, as nearly 20 per cent. of the notes were already held as bank reserves; (3) the withdrawal of paper fractional currency and substitution of silver coin; (4) removal of the charge for coinage of gold; (5) resumption of specie payments on January 1, 1879: for this purpose the treasury was authorized to use the surplus specie in the treasury; and, if necessary, to sell bonds, of the classes authorized under the act of July 14, 1870, in order to obtain additional gold. The legal-tender quality of both greenbacks and national bank-notes remained unchanged. . . . The act remained practically inoperative so far as the proposition for immediate resumption was concerned. Secretary Bristow in 1875-1876 did not favor the policy of accumulating gold in a reserve, as he deprecated the loss of interest on the specie so withdrawn; and he feared the serious opposition of the financial world, particularly of Germany, which was at that time abandoning silver for gold monometallism. . . . When Hayes became president, March, 1877, John Sherman of Ohio was appointed secretary of the treasury. . . . He had held an important part in framing the resumption act, and immediately upon taking office undertook more decided measures to carry it out. Sherman relied almost solely upon building up a gold reserve through the sale of bonds for coin. From Congress he realized that he would get no added support; rather there was danger that he would be prevented from doing anything at all, for in 1877 the inflationists were in control of both Houses of Congress, and again made a determined effort to repeal the resumption act. Such a measure was passed by the House of Representatives and failed in the Senate only through disagreement on details. The monetary system was also threatened with the free coinage of silver. Surrounded by embarrassments it was inevitable that Sherman should find difficulty in selling bonds: European financiers, alarmed by the greenback and silver coinage agitations, movements to be subsequently described, expected American finances to be deranged, and returned a considerable block of bonds which competed with the new issue. In spite of all obstacles, Sherman persisted in the policy of gold accumulation. He concluded that 40 per cent. of the notes was the smallest safe reserve of gold; on this basis \$138,000,000 in coin was necessary. On January 1, 1879, the treasury had gathered together \$133,000,000 of coin over and above all matured liabilities. To do this \$95,500,000 of bonds were sold, the balance being met from surplus revenue. Slowly but gradually the value of the notes approached parity with gold, and on December 17, 1878, a fortnight before the date set, paper currency was quoted at par. . . . In the actual carrying out of resumption, it is to be observed that there was no contraction whatever in the paper currency; no destruction of treasury notes took place; very little paper money was presented for gold, and whatever came in was paid out again by the treasury for immediate use. Under the original resumption act of 1875, authority was given for the cancellation of \$82,000,000 legal tender (dependent upon issue of new bank-notes), which would have reduced the total volume to \$300,000,000. Some contended that under the resumption

act of 1875 there could be no reissue of the greenbacks when once received into the treasury. The inflationist successes of 1877-1878 settled this uncertainty once for all, since Congress, May 31, 1878, ordered that there be no further destruction of greenbacks. The amount then outstanding was \$346,681,000, a slight reduction from the \$382,000,000 outstanding in January, 1875. . . . It was also enacted in 1878 that all notes when received into the treasury shall be 'reissued and paid out again and kept in circulation,' and the constitutional doubts as to the right to do this were . . . removed by the Supreme Court. The burden of redemption in gold was thus made perpetual, although no automatic process was devised which would promise an ever-ready stock of gold for exchange. Fortunately, on account of the commercial prosperity which was reflected in large treasury surpluses, the burden of keeping up the gold reserve was lightly felt during the next ten years. When, however, a new supply of treasury notes was added by the act of 1890, without any added provision for the gold reserve, and revenues showed a deficit instead of a surplus, the weakness of the arrangement was disclosed."—D. R. Dewey, *Financial history of the United States*, pp. 372-377. See also GREENBACK PARTY; U. S. A.: 1878; 1890-1893; SUPREME COURT: 1867-1884.

1896-1913.—Period of inflation in the United States.—"From 1896 to 1913 the United States, like all other gold standard countries, went through a period of inflation. In those 17 years the country's stock of monetary gold increased 212 per cent.; the amount of money in circulation, 123 per cent.; and bank deposits, subject to check, 201 per cent. There is evidence of substantial increase during the same period both in the rate of money and deposit turnover. . . . Here was an expansion of currency and circulating credit far in excess of the growth in the physical volume of business—an expansion due chiefly to the great increase in the world's gold production, an increase of which the United States received a continually growing share. Under such circumstances a great rise in the country's price level was to be expected. What took place is familiar to all. Our American wholesale price level rose about 50 per cent. during the 17 years from 1896 to 1913, representing an average annual increase of about 2.4 per cent., measured geometrically."—H. R. Seager, *Inflation and high prices (Proceedings of the Academy of Political Science, v. 9, pp. 1-2)*.

20th century.—China.—Cash.—Silver.—Tael unit.—Foreign dollars.—Provincial silver coinage.—The currency of modern China cannot be called a system. It is a number of systems. There is cash coinage; the currency of silver bullion based on the tael unit; silver coins, the dollars of foreign and provincial mintage; and minor silver coins, fractional parts of the dollar circulating independently of the unit and with no limitations upon their legal-tender quality. The currency may be regarded as on a bimetallic basis, with the copper cash and the silver tael as the units, but

this is not to be understood as the bimetalism of the West requiring free coinage of two metals, gold and silver, both legal tender and with a fixed ratio between the units of coinage. The two metals in the Chinese currency are independent of each other and circulate without a fixed exchange ratio. The cash is a standard coin; the tael is an uncoined unit of weight. The standard weight of cash, according to one authority, should be 57 grains of the metal of which it is made,—copper, with as much spelter or zinc (sometimes lead) as the copper will take up. Counterfeiting practices are so common that they have been one of the chief causes of frequent price inflations in local markets and counterfeit coins are usually accepted without question. The lack of uniformity in weight and size of cash coins may be accounted for by concurrent circulation of issues of many reigns of the Manchu dynasty with the survivals of issues of preceding centuries; by the crude method of coining which rendered uniformity impossible, particularly when the cash mints were not under the control and management of one central authority; and by the circulating of counterfeit coins. Until recently the cash has always been cast in moulds which made counterfeiting quite easy. The establishment of the silver currency has been gradual. Even today in the interior regions cash is almost the sole currency. Silver was first introduced as currency in commerce during the paper currency régime, though without the sanction of the government. It is impossible to determine the date of this innovation even approximately. Since the establishment of the Manchu dynasty most large transactions and treasury operations have been conducted in silver. A great deal of the silver stock in China came from foreign commerce. Direct foreign trade with Western countries began at Canton in 1516, first with the Portuguese. During the early years the tea and silk trades brought into China a steady importation of silver. It is estimated (H. B. Morse) that during the 18th century the imports of goods never equalled the exports of tea and silk, but that instead the imports never amounted to one-fifth of the exports, the balance always being paid in silver. From statistical evidence it appears that China has been a regular silver-importing country and has exported a considerable amount of her gold. The tael, the silver currency, is decimally divided into mace, candareens, etc., and is a measure of weight as well as a money of account. Lack of government regulation has allowed the tael to become very irregular in weight and, also, the purity of silver bullion is liable to variation. Hence commercial usage recognises several degrees of fineness in the bullion in every important market, and the weighing and testing of bullion involves inaccuracy as well as loss of time. Only in recent years has the Chinese government attempted to coin silver. Coast trade first brought dollars to China, the Portuguese and Spaniards having brought them early in the 17th century, and later the East India Company imported them to buy tea and silk. Early trade relations were almost exclusively through Canton and, by edict issued in 1757, that port was made the sole trading-post, and remained so until after the Opium War. The Spanish dollar was the most popular one but after considerable circulation it was diminished by fraud, such as filing, paring and drilling the coin, and the circulation of these led to a precautionary measure in the "chopped dollar." The merchant into whose hands foreign coins came, having lost confidence in them, chopped them with an impressed idea-

gram thereby giving them his guarantee of genuineness. When this was repeated by succeeding bankers the coins became defaced and resembled a sort of disc. The coin most popular in later years has been the Mexican dollar. The American trade dollar was declared lawful money promptly on its appearance, but most of these went to the melting pot, being heavier than the Mexican coin. This was first begun and a mint established at Canton in 1887 not as part of a national currency system, but as a convenience for provincial trade. Before the close of the century several mints had been established in the province, all making coins of different weight and quality of silver, and all without direct control of the Board of Revenue. The addition of these provincial dollars to the circulation further confused currency conditions. Moreover, the silver mints, finding a popular demand for fractional coins, issued enormous quantities of these minor pieces, greatly disproportionate to the output of the dollar pieces, with the result that fractional silver coins depreciated in terms of the dollar unit and have since been fluctuating in local markets and circulating without reference to the standard coin. A system of coins adjusted to trade convenience, but with fixed relation to a unit of value, would encourage internal commerce and trade, stimulate foreign commerce and remove the confusion and inconvenience of the present hampering currency. Monetary reform in establishing one system would do away with the weighing and testing and calculating, and the conversion of one kind of currency for another, each of which stands in no definite ratio to the other but fluctuates just as the law of supply and demand or the speculators make it.—Based on W. P. Wei, *Currency problem in China (Studies in history, economics and public law)*, pp. 30-51.—See also U.S.A.: 1907-1917.

1901-1909.—United States.—Review of decade.—Phenomena from beginning of "the great trade boom" to collapse of 1907, and after.—Process of recovery.—On December 31, 1908, the *New York Evening Post* gave a review of the sequence of phenomena in financial and commercial affairs that could be traced through "the series of years since the great trade boom began which collapsed in 1907," and thence to the close of 1908. By permission of the proprietors of the *Evening Post* a considerable part of that review is quoted here. While it relates more especially to conditions and events in the United States, it affords substantially a summary of the financial history of the world from 1901 to 1908, both inclusive:

"1901.—This was preëminently the 'boom year'—much more legitimately so, as events have proved, than 1905 or 1906, when overstrained capital resources gave an atmosphere of unreality to what seemed altogether real in the days of abundant capital in 1901. It is first to be said of 1901 that a probably unexampled surplus of ready capital in the United States, and a certainly unprecedented foreign credit balance—due to our amazing surplus of exports over imports—happened to coincide with a period of European trade reaction which released foreign capital from foreign industries and left it free for use in America. Presuming the foregoing influences, the six main causes for the phenomena of 1901 were: (1) The series of enormous company amalgamations, beginning with the billion-dollar Steel incorporation, and culminating in the purchase of the British steamship lines at wildly extravagant prices; these operations being based on issues of securities in unprecedented quantity; (2) Formation of 'underwriting syndicates' to float these securities, one of

those syndicates receiving a bonus of \$50,000,000 for one year's use of \$25,000,000, and all of them using freely for their purposes the surpluses of life insurance companies and the deposits of trust companies; (3) Acquisition of control of great railway companies by powerful millionaires, through purchase of stock of these railways in the open market, often at extravagant prices; the purchase-money being obtained through issue of bonds by railways already under control of the purchasers; (4) Wild speculation by the public; (5) Sudden fright of Europe at our excesses, withdrawal of its capital, and consequent severe reaction in our markets; (6) The failure of the corn crop, which in the summer applied a further check to this speculation, but which was itself offset by a wheat crop larger than any harvested in this country before or since, and sold at the highest average price since 1897.

"1902.—This year was one both of reaction and of further expansion; it was both a legitimate sequel to 1901 and a legitimate forerunner of 1903. . . . Its salient phenomena were these: (1) Abundant harvests; (2) Overstraining of bank resources by financial 'deals' and Stock Exchange speculation, exhausting the bank surplus in September; (3) Enormous increase in imports and decrease in agricultural exports, along with Europe's withdrawal of its capital; (4) Rapid advance in cost of raw material and labor; (5) Struggle of capitalists to so entrench themselves in control of corporate enterprises that they could not be dislodged.

"1903.—The year which followed was an entirely logical sequel. Its controlling factors were: (1) Forced liquidation by individuals and syndicates who were tied up in new securities at a time when the investing public withdrew from the market; (2) Inability of great corporations to sell bonds, and their resort to notes at a high interest rate; (3) Abundant grain crops, but an inadequate cotton crop, with great speculation, and famine prices; (4) Rapid fall in the price of steel and iron; (5) Severe contraction in profits of industrial combinations, with reduced dividends in some, reorganization of capital in others, and bankruptcy in still others.

"1904.—For obvious reasons, 1904 is an interesting year to compare with 1908. Both were in a sense 'after-panic years,' though the strain of 1903, and the resultant financial and commercial reaction of 1904, were trifles compared with those of the past two years. It will be seen that 1904, which did in fact usher in another great boom in trade, paralleled closely in some respects the history of 1908, but in others diverged very widely from it. Its dominant influences were: (1) A huge surplus reserve at the New York banks, reaching in August a height only four times exceeded in the country's history, and as a result a 1 per cent call money market during two-thirds of the year; (2) The largest gold export movement in the history of the country; (3) A midsummer recovery on the Stock Exchange, with large investment buying; (4) A Presidential campaign, which hardly affected business; (5) Substantial, but not very rapid, trade revivals, without any of the extravagant optimism of 1908; (6) Famine prices for cotton during half the year, followed by a new crop unparalleled in history, and by a heavy fall in prices; (7) Virtual disappearance of our export trade in wheat, with the smallest harvest since 1900, the highest prices since 1808, and the smallest shipment to Europe since 1872. The Russian war, which began in February, affected our markets only indirectly.

"1905.—This year's history is better understood

to-day than it has been before. The testimony of the whole financial and commercial world now is, that the exploiting of capital in trade and speculation, which eventually brought about the recent panic, and the abnormal enhancement of cost of living, which lifted the average price of commodities as much in two years as it had risen in the eight preceding years, began in the middle of 1905. These were the salient incidents of the financial year: (1) Rapid and vigorous trade revival, with industry and production probably more active than at any previous period, and with profits and dividends enhanced; (2) Exposure of the use of life insurance funds by promoting and speculating millionaires, an exposure which ended in legislation preventing such use of them in future speculations; (3) World-wide money stringency, with the New York bank surplus twice exhausted, London's bank position the weakest since 1890, and Berlin's the weakest since 1897; (4) Excited stock speculation for the rise, in this country and in Germany, which in New York almost wholly disregarded the abnormal strain on money.

"1906.—Neither the \$400,000,000 loss at San Francisco in April, nor the Treasury's efforts to relieve an overstrained New York money market in September, was a fundamental cause for the events of 1906. They were a true sequel to 1905, and may be summarized as follows: (1) Enormous volume of trade, the whole world over, with rapid rise in price of goods, but equally rapid rise in cost of raw material and labor; (2) Grain harvests, as a whole, never paralleled in volume, and wheat crop second only to 1901; (3) Wild speculation by all classes of the community, particularly in land, mining shares, and Stock Exchange securities, but not as a rule in produce, the wealthiest capitalists in the country entering into stock speculation in the late summer, and using most unscrupulously their power over company finance to help along their purposes; (4) Overstrained bank resources as a result, with five deficits at New York, occurring in spring, autumn, and winter, two of these deficits being the largest since 1893; (5) Abnormally high money rates all the year, with the highest September rate for call loans ever reached in New York, and the highest rate for time loans and merchants' paper reached at that time of year since 1872; (6) Sudden decision by Europe that American credit was unlimited, and the consequent placing of foreign capital unrestrictedly at our disposal; (7) Struggle between London and New York for possession of new gold arriving in London, resulting in our import of \$40,000,000 gold from Europe in the spring, and \$45,000,000 in the autumn, and leading to a rise of the Bank of England rate to 6 per cent. for the first time since the Boer war panic, and to an energetic effort on the Bank's part to stop the wholesale equipping of the American speculation with London bank money.

"1907.—The panic year's story may be told without further introduction, summing up thus its characteristic events: (1) Withdrawal by Europe of the capital loaned to us in 1906, leading, early in the year, to \$32,000,000 gold exports to Europe, of which \$25,000,000 went to France; (2) Partial withdrawal of their capital from Wall Street by interior markets, which were said to have had \$400,000,000 outstanding in New York during 1906; (3) Distress of the immensely wealthy capitalists who had tied themselves up in the Wall Street speculation of 1906, their forced liquidation on an enormous scale, and consequent demoralized Stock Exchange markets in March

and August; (4) Very abnormal crop weather throughout the spring and over nearly all the world, with a resultant shortage of the whole world's wheat crop, the deficit of supplies below expected requirements being probably the largest since 1890; (5) Revelation of unsound banking practices at New York in October; leading to the failure of the Knickerbocker Trust, a formidable run on the banks, adoption of Clearing House certificates in all the larger cities and issue of emergency credit currency in many; to restriction of cash payments to depositors throughout the country, to a premium on currency, to complete demoralization of interior exchange, and to insolvency of several large industrial companies and numerous banks—neither, however, reaching the number which shortly followed the panic of 1893; (6) Import of \$100,000,000 gold from Europe during November and December, most of it bought at a premium and some of it engaged with sight sterling at 4.91; (7) As a result, large inroads on the Bank of England's gold reserve, rise in the bank rate from 4½ to 7 per cent., rapid advance of all continental bank rates, and loan of large sums of gold by the Bank of France to the Bank of England; (8) Precarious position of financial Germany throughout the year, important failures at Hamburg, minor financial panics in Holland, Egypt, Italy, and Chili, many of them before our own; (9) Intervention of our Treasury, which wisely placed all its surplus on deposit with the banks in October, and most unwisely undertook to issue \$150,000,000 bonds and notes in November to provide basis for new bank-note circulation; (10) Recovery in markets late in November, with slow return of the bank situation to normal, the currency premium at New York lasting longer than in either 1893 or 1873; (11) Discharge of laborers from employment all over the country, and the beginning of severe trade reaction—all this in spite of the largest annual gold output in the history of the world.

"1908.—Now comes the present remarkable after-panic year, of which the salient phenomena may be thus summed up: (1) Spasmodic and irregular recovery in trade activity, starting from a very low level, with merchants rushing in suddenly with orders—in February, in July, and in November—when their shelves were almost depleted, these buying impulses ceasing as suddenly as they had begun, leaving trade stagnation again; (2) Slow increase in consumption of merchandise, here and abroad, the ratio being below 30 per cent. of normal at the beginning of the year, and 60 to 75 per cent. on the average at its close; (3) Sudden shrinkage of our international commerce, merchandise trade in eleven months falling \$478,000,000 from 1907, a decline of 15 per cent., of which \$326,000,000 was imports and \$152,000,000 exports, experience of European nations being similar; (4) Enormous increase in the unemployed, leading, at the Atlantic ports, to an emigration 250,000 larger than immigration; (5) Severe contraction of railway earnings, resulting in twenty-four railway insolvencies, involving the largest capital of any receiverships since those of 1893, and causing many dividend reductions, but followed, after the middle of the year, by such enormous reduction in expenses that, in some cases, autumn net earnings actually increased over 1907; (6) Sudden rush of currency into the banks, as a result, first of removal of restrictions on depositors and next of idle trade, with resultant change from a \$20,000,000 New York bank deficit at the end of 1907 to a surplus of \$40,000,000 at the end of January and of \$66,000,000 on June 27—the lat-

ter being second only to the \$111,000,000 maximum of 1894; (7) As a consequence, abnormally low rates for money, call loans going at 2 per cent. before the end of January, at 1 per cent. in eighteen weeks of the present year, and at less than 1 per cent. in three weeks; (8) Export of \$73,000,000 gold, the largest (except for 1904) since 1895, and net export of \$45,000,000, the largest in thirteen years; (9) In spite of the above recited facts, a constant spirit of optimism throughout the year, expressing itself, first in the organization of 'Prosperity Leagues' which held conventions and proclaimed that if people would only decide to be prosperous, they would be prosperous, and second by a series of extravagant speculative movements on the Stock Exchange, in the course of which it was declared in February, in July, and in November, that we were not only destined to get back into the boom of 1906, but that we were there already; (10) A wheat harvest which in midsummer promised to be the second largest on record, but which turned out only of average volume, the quality and price for this and other cereals, however, being so good as to enhance very greatly the wealth of the agricultural West; (11) A Presidential election, the result of which the markets and all experienced people foresaw from the beginning, but of which it was alleged, for two weeks in November, that its outcome had totally changed for the better the entire aspect of American business affairs."—See also U.S.A.: 1908 (April-November).

1909.—The following, from the *New York Evening Post* of December 31, 1909, continues the review: The noteworthy characteristics of "the year which ends to-day, . . . so far as they can now be discerned, have been as follows: (1) Rapid industrial recovery, beginning with the steel trade's reduction of prices, leading in September to the largest monthly output of iron and steel in the history of the country, and to heavy demand from consumers, but contrasting singularly with the copper market, where signs of overproduction were visible throughout the year; (2) Very rapid increase in cost of necessaries of life, affecting chiefly food, clothing, and rent, leading in the autumn to bitter complaint and to numerous strikes for higher wages, notably on the railways; (3) Along with reviving trade, a speculation of great magnitude on the Stock Exchange, ascribed to the initiative of very powerful finance houses, and converging in a most peculiar way on United States Steel common shares, whose dividend was twice advanced, notwithstanding the fact that quarterly earnings had not recovered to the magnitude of 1906 or 1907, when the dividend had been maintained at the old rate; (4) Largely as a result of the tying-up of capital in this speculation, severe autumn strain on bank reserves, turning a New York surplus of \$34,000,000 on July 10 into one of only \$1,600,000 on October 2, driving Wall Street to probably unprecedented borrowings from interior banks and from London, which latter market, under the influence of the Bank of England, threw back great amounts of these New York loans during October; (5) Call money rates kept down by such expedients, 6 per cent. being the maximum up to the two closing days of December; (6) A wheat corner in June, in the course of which the New York cash price rose to \$1.51 in June, the highest price since the Leiter corner of 1898, followed by a new wheat crop unsurpassed in magnitude except for 1901, yet with high prices continued in later autumn, despite an abundant crop in Europe also; (7) A very short crop of cotton, driving the price from

9½ cents a pound, early in the year, to 16 cents in December, the latter being the highest December price since paper inflation days, and less than one cent below the highest price in the corner of 1904; (8) Import of foreign merchandise wholly unparalleled for magnitude in our history, causing, in June, July, and August, an excess of imports over exports for the first time since 1897, and resulting, in the eleven first months of the year, in a total excess of exports over imports \$340,000,000 less than in 1908, and very much the smallest of any year since 1897; (9) As a partial consequence, the largest export of gold of any year in the country's history, and the largest net export except for 1894, and the paper money days. The prolonged tariff debate in Congress, which high financial authority declared would hold back financial activity, but which gave no evidence of doing so, can hardly be classed as a fundamental influence of the year. Whether Mr. Harriman's death in September, with the resultant realignment of forces in high finance, deserves to be so classed, is a question which can hardly be passed upon as yet."

1907-1916.—Trust companies in the United States.—A special committee appointed in 1907 by Charles E. Hughes, then governor of New York, reported in December of that year their deliberations as to what changes, if any, are advisable in the law of the State relating to the incorporation, conduct and supervision of banks and trust companies, but it was not until 1911 that any agreements were reached between these institutions and the New York Clearing House. A satisfactory settlement was first definitely indicated at a dinner of six hundred bankers given at the Waldorf-Astoria Hotel, New York, May 6, 1911. Three days later the Clearing House almost unanimously voted to accept as a full member any trust company capitalized at \$1,000,000 or more, requiring that such company carry the 15 per cent. reserve required by law, and that it maintain a 10 per cent. deposit with a member bank. Twenty-nine trust companies out of a total forty-three were eligible under the capitalization requirement, and eighteen of these became members of the N. Y. Clearing House. The total deposits of the bank and trust company members of the New York Clearing House on June 30, 1916, was nearly \$3,500,000,000, of which approximately one-half represented the holdings of the trust companies. Mergers and absorptions from 1903 and 1916 reduced by concentration the number of trust companies in Greater New York from forty-seven to twenty-nine. Comptroller Knox reported a total of 42 trust companies in the United States in 1875; and 120 in 1889; the *American Bank Reporter* listed 569 trust companies with a total of \$662,000,000 resources in 1895; the *Bankers Encyclopedia* showed 509 trust companies in 1896; the United States Mortgage and Trust Company's annual publication, *Trust Companies of the United States*, shows the remarkable increase from 1903 to 1916, giving a total of 912 trust companies holding total resources of \$2,010,000,000 in 1903, and a total of 1777 trust companies with an aggregate of \$6,328,000,000 in 1915. These figures represent a constant and steady advance in growth with the exception of a very slight decline after the panic of 1907.—Based on E. T. B. Perine, *Story of the trust companies*, pp. 295-298.

1908.—United States Emergency Currency Act.—A temporary measure known as the Emergency Currency Act, providing for cases of currency stringency similar to the experience of 1907,

was passed by Congress in May, 1908. See above: 1863-1914.

1912-1913.—Federal reserve system.—Federal reserve districts.—Plan of organization.—Gold standard.—Foreign exchange.—“The federal reserve act of 1913 is one of the most important pieces of financial legislation enacted in modern times. . . . Our old American banking system had many substantial merits. It was reasonably safe, it yielded good profits, it was adaptable to the local needs of widely varying communities, and it developed the check and clearing system to a degree of perfection found in few if any other countries. Along with these meritorious features, however, it contained a number of very serious defects, the chief of [which were] . . . decentralization, . . . inelasticity of credit, . . . cumbersome exchange and transfer system, [and] . . . defective organization as regards relationship with the federal treasury.”—E. W. Kemmerer, *A B C of the federal reserve system*, pp. 1-8.—“The Aldrich Vreeland Act of 1908 was the cover under which preparations were made for a thorough revision of our currency system. . . . The preliminary draft of the Federal Reserve Act was formed by a subcommittee of the House Banking and Currency Committee, under the chairmanship of Carter Glass, in the winter of 1912-1913. The expert of this committee, and afterward Secretary of the Federal Reserve Board, H. Parker Willis, had probably more influence than any other man in shaping the measure in its formative legislative period. . . . The statesmanship by which President Wilson, with the aid of Democratic leaders, put their party behind an epoch-making constructive measure and passed it on December 23, 1913, is a monumental event in our political career.”—J. L. Laughlin, *Political history of federal reserve bank*, pp. 143-150.—See also U.S.A.: 1913 (April-December).—“The federal reserve act does not destroy our American system of small independent banks . . . [but] continues these thousands of independent banks with all their essential functions, [and] . . . federates them into a unified system, democratic in organization and nationwide in its field of operation. . . . There are twelve federal reserve banks, each of which operates in one of the federal reserve districts into which the country is divided. In determining the boundaries of these districts the authorities were required to have ‘regard to the convenience and customary course of business,’ to make each district large enough to provide the minimum capital of \$4,000,000 required by law, and to make none so large as to dominate the others, thereby endangering the federal principle which the law sought to establish. . . . The fact that the number of banks and the amount of banking capital in different sections of the country vary so widely explains the great differences in the geographic sizes of the federal reserve districts. . . . All national banks are required to be members of the system, and state banks and trust companies (which conform to certain standards as to size and character of business) are encouraged to join; . . . state institutions . . . have lately been joining in ever increasing numbers. Member banks are required to subscribe to the capital stock of the federal reserve bank in their district to an amount equal to six per cent of the member bank’s capital and surplus. . . . [Each of the federal reserve district groups was originally required to contain approximately the same number of banks, but by the amendment of September 26, 1918, this requirement was discontinued.] In order to prevent the large banks from dominating

the small ones . . . and to assure the small banks of representation on the board of directors, . . . all the member banks in a . . . district are [divided into three groups, big banks, little banks, and middle-sized banks]. . . . Each group elects two directors, one of whom, called a Class A director, is a banker and represents the stock-holding banks, while the other, called a Class B director, is a business man or farmer and represents the business community. . . . [Three Class C directors, one of whom is designated chairman of the board and is known as federal reserve agent, are appointed by the central authorities at Washington.] The board thus consists of nine directors, who hold office for three years (the term of office of one director of each class terminating each year). . . . [The whole system is under] the central board at Washington, known as the federal reserve board. This consists of seven members, including the Secretary of the Treasury, and the Comptroller of the Currency . . . and five members appointed by the President of the United States with the advice and consent of the Senate; . . . at least two of these five members . . . must be ‘experienced in banking or finance.’ . . . The board is assisted by a federal advisory council consisting of twelve members appointed respectively by the boards of directors of the twelve federal reserve banks. The advisory council meets with the federal reserve board at least four times each year, and oftener if called by the board. . . . In matters of general policy the federal reserve board is given large powers and is the directing head of the system.”—E. W. Kemmerer, *A B C of the federal reserve system*, pp. 28-34.—“No change is made in regard to any of the following forms of money: gold, gold certificates, silver, silver certificates, and United States notes. Indeed all past questions touching the standard were definitely settled by a remarkable amendment in the House, now embodied in Sec. 26 of the new act, which emphasized the maintenance of the gold standard. . . . It was the act of 1913 rather than the act of 1900 that practically established the gold standard. Likewise, the only provision affecting the greenbacks is that (Sec. 7) which devotes the net earnings from reserve banks accruing to the United States ‘to supplement the gold reserve held against outstanding United States notes,’ or to reduce the bonded indebtedness at the discretion of the Secretary of the Treasury. The direct purpose of the new act is to replace the national bank notes within a period of twenty years or more, by federal reserve notes.”—J. L. Laughlin, *Political history of federal reserve bank*, pp. 237-238.—See also below: 1913-1919.—“Under the new act ‘any member bank may accept drafts or bills of exchange upon it and growing out of transactions involving the importation or exportation of goods having not more than six months sight to run; but no bank shall accept such bills to an amount equal at any time in the aggregate to more than one-half its paid-up capital stock and surplus.’ (Sec. 13).”—*Ibid.*, p. 272.—Federal reserve banks have established agencies and branches abroad with the Bank of England, Banque de France, Bank of Italy, Bank of Japan, National Bank of Sweden, Bank of Norway and the National Bank of the Philippines.

1913-1919.—Federal reserve system.—District centralization of bank reserves.—Mobilization of reserves.—Gold settlement fund.—“The federal reserve act as originally passed provided for the gradual withdrawal of legal reserve money from deposit in the banks of reserve and central

reserve cities. All such deposited legal reserves were to be withdrawn by the end of a three-year period beginning with the date of the inauguration of the federal reserve system. Accordingly, after November 16, 1917, all legal reserve money of member banks, the law required to be held 'in the vaults of the member banks or in the federal reserve bank, or in both, at the option of the member bank' (section 19 of Act). In conformity with this requirement the percentage of the legal reserves of member banks kept on deposit in the banks of reserve and central reserve cities declined very much by the summer of 1917. On June 21, 1917, an amendment was passed to the federal reserve act requiring every bank, banking association or trust company belonging to the federal reserve system to maintain its entire legal reserve in the form of a deposit at the federal reserve bank of its district. . . . This divorcing of the legal reserves of nearly 8,000 commercial banks from the speculative and capital loans of the stock market—mainly that of Wall Street—is one of the big achievements of the federal reserve system. . . . On March 1, 1918, the twelve federal reserve banks held deposited reserves of other banks to the amount of \$1,442 millions. . . . The federal reserve banks, of course, do not keep on hand all the reserve money deposited by member banks. Like other banks, they invest it. The law, however, requires them to keep a reserve of thirty-five per cent against deposits, and it is their established policy to maintain reserves much larger than this normal legal minimum. A corollary to the district centralization of reserves is their mobilization. Reserve money must not only be piped into a few large reservoirs, but these large reservoirs must be piped together, and there must be a pumping engine of sufficient power to force the reserves promptly and in large quantities to any place desired. The federal reserve system creates this machinery."—E. W. Kemmerer, *A B C of the federal reserve system*, pp. 35-39.—"Unnoticed by the great mass of the people, the federal reserve banks have introduced a smoothness and simplicity in handling huge financial transactions that would have been incredible under the old system. [Witness the \$4,000,000,000 taxes collected by the federal government in a few weeks in the summer of 1918, also the handling of the various Liberty Loans.] . . . Under the federal reserve system these huge financial transactions have been largely accomplished by bookkeeping entries. Various officers of the federal reserve banks, and very specially the central office of the Federal Reserve Board at Washington, have developed a marvelous *finesse* in balancing debits and credits. This has involved a study in advance of the probable demands to be made on banks in various localities, the effort to route collection items through them in such a way as to give them funds which would break the shock of the heavy withdrawals, providing in advance to rediscount paper for them, and suggesting to the Treasury the best places where government deposits might be made to offset heavy drafts. It has also involved the policy of rediscounting on the part of one federal reserve bank for another in such a way as to keep their gold reserve ratios approximately equal. The Treasury systems of preceding great loans and heavy tax payments by marketing short term Treasury certificates maturing on dates when tax or liberty loan payments were due, and receivable by the Treasury for such payments, has in itself been a factor of the first magnitude for reducing financial friction."—B. M. Anderson, *Effects of the war on money, credit and banking in France*

and the United States, pp. 170-171.—See also U. S. A.: 1917-1919: Taxation and expenditures.—The gold settlement fund was planned early in 1914 and established in June, 1915. It was designed to lessen the necessity of the physical transfers of gold from one federal reserve bank to another. "Each federal reserve bank . . . [is required] to forward to the treasury or the nearest sub-treasury of the United States . . . \$1,000,000 in gold or gold certificates, and in addition an amount at least equal to its indebtedness to all federal reserve banks. . . . Each federal reserve bank is required to maintain a balance in the fund of not less than \$1,000,000. As a matter of fact all the banks carry balances very many times as large as this minimum. . . . By means of [the gold settlement] fund, . . . these banks are now enabled to make telegraphic transfers of funds to . . . [any member bank, without charge; and] to inaugurate a system of federal reserve exchange drafts, [according to which] . . . a member bank may draw special drafts on its federal reserve bank for amounts not exceeding \$5,000, which are receivable for immediate availability at any other federal reserve bank. [On September 12, 1919, the gold settlement fund amounted in round numbers to \$538,000,000.]"—E. W. Kemmerer, *A B C of the federal reserve system*, pp. 76-77.—"On July 1, 1918, daily settlements between the federal reserve banks were inaugurated, reducing the amount of gold that has to be transferred from one to another at any given date, and making it possible for the Federal Reserve Board at Washington to keep in constant touch with the reserve situation of each bank and to keep reserve percentages equalized by constant rediscounting. Daily settlements do not necessarily mean daily shipments of gold to and from Washington. 'Suspense accounts' kept by the various federal reserve banks with the gold settlement fund, obviate this. It would be hard to give too much praise to the efficiency and initiative of the men who have worked out this wonderful system of substituting book transfers for the large cash shipments which the old system involved."—B. M. Anderson, *Effects of the war on money, credit and banking in France and the United States*, p. 171.

See also INDEPENDENT TREASURY.

1913-1920.—World War and inflation.—Stability of American dollar.—Proposed legislation.—Question of England's return to gold standard.—"The forces that pushed up the price level during the period 1890 to 1913 were still operating when the European war broke out. They presumably would have continued to push up prices for some time had there been no war, and they exerted an upward pressure on the price level during the war itself. While the world's annual gold production declined somewhat during the later years of the war, the amounts produced none the less continued to be large, as compared with the average for any considerable number of previous years, and they were being poured into a reservoir of gold whose level had been for many years a rising one. . . . It is impossible to determine to what extent, if any, some of the organic changes made in our banking system during the last six years should be attributed to war causes. An important instance is the federal reserve amendment of June 21, 1917, providing for a further reduction in legal reserves of member banks and discounting entirely all cash-in-vault legal reserve requirements for these banks. . . . Important reductions in legal reserve requirements were made by our federal reserve legislation prior to the outbreak of the war in Europe and with no reference to such a contingency. Our banking sys-

tem had been cumbersome and our use of reserves exceedingly wasteful. . . . The remedying of these evils through the federal reserve system made possible and desirable the release from reserves of large quantities of money with corresponding reductions in reserve ratios. Under normal conditions this release would have resulted in heavy net exportations of gold. . . . In 1913 the most important item in our paper money circulation was the gold certificate which was backed dollar for dollar by gold and of which the circulation amounted to almost exactly one billion dollars. The new federal reserve note called for a legal minimum gold reserve of 40 per cent. Even before our entrance into the war, the federal reserve bank had adopted the policy of withholding gold certificates from circulation and putting in their places federal reserve notes. This policy strengthened the gold position of the federal reserve banks and put into circulation a more elastic form of paper money. It none the less was a cause of inflation; for it substituted in active circulation, a form of paper money requiring a 40 per cent. legal reserve for one requiring 100 per cent. . . . A billion dollars of gold certificates, if withdrawn from circulation and used as a 40 per cent. reserve for federal reserve notes, would permit a net currency expansion of \$1,500 millions. Under normal conditions the effect of such a policy on prices would have been small for the policy would have forced gold out of the country and thereby the resulting inflation would have been spread out rather thinly over the gold standard countries of the entire world. . . . Prior to our own entrance as a belligerent in the war, the largest flood of gold that has ever come to any country within the same length of time in the world's history, came to us. The four months, August to November, 1914, witnessed a net exportation of gold of 85.7 millions, chiefly in response to Europe's demands upon us for the liquidation of our floating indebtedness to her. In December, however, the tide turned and from August 1, 1914, to April 1, 1917, our total net importation of gold amounted to \$1,109 millions. During this same period exports exceeded our merchandise imports by \$6,053 millions—an average of \$189.3 millions a month, as compared with an average of \$46.5 millions a month for the fiscal years 1912, 1913 and 1914. The huge supplies of gold that we received during the first thirty-two months of the war were dammed up in the country by the gold embargo which the government maintained from September 7, 1917, to June 10, 1919. During the approximate period of the embargo the total authorized exports of gold were \$111.6 millions, but, as we have already seen, the gold exports were almost entirely offset by the gold imports of the same period. For approximately the period since the armistice, November 1, 1918, to March 10, 1920, we have had a net exportation of gold of 387 millions. Our stock of monetary gold decreased from \$3,080 millions on November 1, 1918, to \$2,721 millions on March 1, 1920. The war causes of inflation,—the increased supply of monetary gold in the United States, the reduction in legal reserve requirements of member banks in the federal reserve system, the slackening of production,—all created vast potentialities of currency and deposit credit expansion of which the country availed itself, largely to buy the bonds which the government floated for financing the war. Bond buyers usually did not curtail other expenditures; they consumed goods as before, banks loaned as before, but no more goods were thereby created. Under the pressure of the increased purchasing power in the forms of circulating bank deposits and federal reserve notes thus thrown on the mar-

ket to be used in competition for the pre-existing supply of goods, the price level was rapidly forced upward. . . . Our heavy net exportations of goods to Europe during the war resulted in large receipts of European securities. These securities in substantial quantities were hypothecated at our banks and served as a basis for further currency and credit expansion. It was some time before the potentialities for credit expansion which were being created in the manner above described made themselves felt in a rising price level. There was no appreciable increase in general prices from the outbreak of the war until the fall of 1916. From that time until the armistice the general tendency of the price level was strongly upward. There was a slight reaction at the time of the armistice, but since February, 1919, the upward movement has again been pronounced and is continuing to this day. At the present time [1920] our price level, as measured by the Bureau of Labor Statistics Index Numbers, is approximately 150 per cent. higher than it was in July, 1914, or in the fall of 1915. There is always a lag between the time of currency and credit expansion and the rise in the price level—a lag which is largely responsible for the scarcity of goods of nearly every kind at current prices. . . . We won our independence nearly a century and a half ago in a war financed predominantly by paper money inflation, we maintained the Union a half a century ago by a war financed extensively by paper money inflation, we have just preserved our political heritage by a war financed in the United States largely by deposit currency inflation.”—E. W. Kemmerer, *Causes and progress of inflation (Proceedings of the Academy of Political Science, June, 1920)*.—“Among the arguments which have been offered against the employment of loans and bank credit in financing the war has been the contention that such a policy, leading to an expansion of bank credit, would force up prices—an argument commonly cast in the mould of the quantity theory, though not necessarily involving quantity theory reasoning. To the astonishment of most adherents of the quantity theory, the period since the great expansion of bank credit growing out of liberty loans has not been the period of rapidly rising prices. . . . Commodity prices had their great rise between December 1916 and June 1917, . . . [since when] the average of commodity prices has been fairly stable in the United States. . . . From June 1917 to the middle of 1918 stock and bond prices have had on the whole a steadily downward course. . . . Those writers who see nothing but ‘inflation’ in expanding bank credit during periods of stress, emergency and rapid transition, fail wholly to take account of the essential functions of the bank credit. Bank credit expands when transitions are to be accomplished. An enormous volume of new bank credit has been required to finance the shifting of industry from peace occupations to war occupations, to finance the huge receipts and disbursements of the Treasury, to ease the tension of tax payments, to enable business men to liquidate slow assets while changing the character of their production and meeting the burden of taxes and loans. Expansion of bank credit is necessitated by the ‘hoarding’ of deposits by business men who feel the necessity of keeping an unusually liquid position in times of stress and uncertainty. It is hard to understand what the ‘inflationist’ theory would have banks do in a great emergency. It is certain that if banks refused to expand their credits in time of stress, we should have demoralization and chaos. . . . There is a school of economists who have seen the whole cause of rising prices in the policy of the govern-

ments in borrowing instead of taxing, and in the policy of the banks in lending to the governments or to the holders of government war securities. This process [is] called 'inflation,' . . . and to writers of this school, the terms 'rising prices' and 'depreciation of money' have been synonymous and the fundamental causation has been sought in monetary and banking phenomena. To the present writer it seems perfectly clear that the fundamental causation involved lies in the field of production and consumption and in the fields of public policy and social psychology, and that so far at least as the United States are concerned, the phenomena of money and banking have been largely secondary and derived, adjusting themselves to, rather than causing, the more fundamental factors. . . . The fundamental explanation lies on the surface. Fifty to sixty million men, an enormous proportion of the labor force of the civilized world, have been taken out of industry and put to work in the most destructive kind of consumption of the products of industry. Another and larger number of men have been divested from the production of goods for ordinary civilian consumption to the production of munitions and army supplies, to the production of shipping . . . etc. . . . In these facts we have an adequate explanation of the rise in commodity prices without ascribing it to the stupidity of the fiscal policy of the Treasury, without assigning it to the stupidity of the banks and without attributing it to monetary depreciation. Outside the United States monetary depreciation has been substantial in many countries and very great indeed in some. There has been a collapse in the volume of Russian money which has sent prices to unheard of heights. The same is true in Austria, Germany and Italy, in less degree and to no small extent in France. . . . In all of these countries the paper money has depreciated, to greater or less degree, below the value of its nominal gold equivalent. The extent to which money depreciation is a factor in Great Britain, however, can not be so great, while in Canada [it] . . . is probably very slight. . . . Before one can assert that there has been a general rise in prices, one must take account not only of commodity prices, but also of stocks and bonds, real estate and other long time income bonds. . . . Under ordinary conditions, a marked rise in commodity prices may be taken as an index of a fall in the value of money. . . . In the midst of these changes, gold has remained fairly stable. . . . Price changes in different parts of the world seem to have had no close connection with the actual movements of gold. Gold came to the United States and prices rose in the United States, but gold left England and France, and prices rose in those countries even more. The effort to work out any definite correlation between gold and prices on the basis of 'normal laws' in these wholly abnormal times appears to the present writer to be futile."—B. M. Anderson, *Effects of the war on money, credit and banking in France and United States*, pp. 184-185, 196-204.—"Summarizing the evidence as to inflation during the period 1913 to 1919, we find that for those six years the physical volume of business increased approximately 0.6 per cent., the monetary circulation 71 per cent., and bank deposits 120 per cent. The percentage of actual cash reserve held against deposits meanwhile declined from an average of 11.7 in 1913 to 6.6 in 1919. There was contemporaneously a large decline in the ratio of gold to the country's total cash and to its total supply of exchange media."—E. K. Kemmerer, *High prices and deflation*, p. 20.—In 1910 "the gold standard was generally accepted and was supposed to be in force. This was not true in

Europe, for gold had been abandoned through dire necessity; and the countries of Europe had to mortgage, not merely one hundred and twenty days, but many years for future production. Gold as a worldwide medium of exchange had ceased to function. Gold continued, however, to be the 'common denominator,' the standard while the gold price of currency was driven down. At the same time, the production of goods fell off, lowering the credit total; and demand for goods increased violently, raising prices in terms of gold. Of course a huge volume of cheap credit francs and credit pounds and credit lire appeared. . . . How, then, did we [United States] avoid a panic in 1920? Demand fell off, liquidation went ahead, all the symptoms of panic were there, but no panic. Because, blindly perhaps, we have set an automatic meter upon our credit dollar which keeps it at a steady price measure in gold."—K. C. McIntosh, *Everybody's money (Outlook, Dec. 13, 1922, pp. 681-683)*.—In view of inflation considerations everywhere "there has been introduced in the House of Representatives and referred to the Committee on Banking and Currency a bill which attempts to stabilize the purchasing power of money, having in view what is known as the quantity theory. This bill expresses the views of Professor Irving Fisher, of Yale University, one of the foremost economists of this country."—T. A. Goldsborough, *Proposed legislation to stabilize the dollar (Proceedings of the Academy of Political Science, Jan., 1923)*.—"The failure in the four years that have elapsed since the war to find any solution of the European problem is due to the persistent attempt to deal with essentially international financial problems by strict adherence to traditional national policies. The conclusion that is forced upon me, therefore, is that the first hundred years of attempted price stabilization are likely to prove the most difficult."—H. G. Moulton, *Prospects for stable money abroad (Proceedings of the Academy of Political Science, Jan., 1923)*.—"Discussing the approach of sterling to the par of exchange, and noting that London would be in a position to draw gold from the United States as soon as sterling should reach a point slightly above parity, the annual report of Barclay's Bank of London proceeds to discuss the resultant situation. It indicates that the real test would be, not the quotation of \$4.86½ for the pound sterling but the removal of all restrictions on trading in and export of gold from London. The bank's report goes on to say that 'before it would be safe for us to return to a free gold market, we should have to consider very carefully what would be the effect. So long as we continue to grant foreign loans—and it is, I think, admitted that it is desirable that we should do so—we are in effect in the position of giving long credit, while on the other hand, whatever we buy from abroad is more or less paid for in cash. Exports resulting from such loans would not provide the immediate resources needed to pay for the imports which they necessarily entail. There would therefore be a danger of our favorable trade balance being negated, and if a free gold market had been restored, the tendency would be for gold to leave this country. Such a position, if it is coupled with that of a free gold market, requires strong reserves. Otherwise we might soon lose that which we had gained. It seems to me that not only would it be necessary to strengthen our reserves against currency, but also possibly to create additional gold reserves to be held by the Treasury or by the Bank of England, before it would be safe for us to return to a free gold market. This strengthening of reserves

would serve to tide over a time of difficulty, such as might occur, and would help to make it certain that there never should be any question of our having to fall back upon prohibition of the export of gold, once we had resumed a free gold market, but even so, until our trade position is restored, and is again well balanced, there must be a great uncertainty as to our ability to return to free gold.”—*New York Times*, Feb. 14, 1923.

1914-1916.—Immediate effects of World War on world finance and banking, particularly on the Bank of England.—CLOSING OF STOCK EXCHANGES.—“When Austria, on Thursday, July 23 [1914], sent her note to Serbia, making acceptance within forty-eight hours of every one of a series of insolent demands, an ultimatum, prices on the Vienna stock exchange, already very low, declined with something like panicky violence. . . . On Monday, the 27th, the Vienna stock exchange closed its doors. . . . It was not until Friday, July 31, that the German Government sent its ultimatum to Russia and France, followed by actual war next day. But on the 27th the Brussels stock exchange had formally suspended business; on the 28th the Paris Bourse shut down; on the 29th the exchanges at Saint Petersburg [Petrograd] and Amsterdam closed their doors; and on the same day Berlin itself forbade all further dealings on credit, limiting stock-market operations wholly to cash transactions. During all this seven-day period, sales of securities by Berlin on every foreign market (notably New York) seemed to be limited only by the supply available to sell and the capacity of brokers to execute the orders. Private cables told of the published recommendation, by some of the largest German banks, for their clients to sell at once what they could of their investments. British consols fell from 75 to 69½, and all other international securities fell with them. On August 5, the German army having in the meantime invaded Belgium, England declared a state of war with Germany. At London, the world’s financial centre, financial crisis did not wait for this action by the British Government. It was Germany’s ultimatums of July 31 which made the war inevitable. The first financial result at London was the closing of the stock exchange on that day for an indefinite period. The obvious reason for this sudden action was that markets of every belligerent state on the Continent, realizing the urgent need for ready capital in the coming economic crisis, were selling in London what foreign securities they held—in quantities running high up in the millions of sterling, and at any price obtainable. Government bonds of the South American states, of Russia, Japan, and China, railway stocks of the United States and Canada, were being thrown on London’s market by the Continent as declines running in many cases from 10 to 30 per cent within a very few days, the declines becoming more violent every day. On Lombard Street [London’s financial center] these securities are pledged in immense amounts as security against loans obtained from banks. Although probably less than usual was outstanding in these so-called ‘stock-exchange loans’ when the war began, the subsequent report of a Lombard Street bankers’ committee reckoned the total at \$400,000,000. Much longer continuance of such a decline in prices would have reduced the borrowers to bankruptcy, because they could not keep the

security up to the face value of their loans, and would have crippled the banks because they could not collect the loans. Back of this stood the further fact that London could not allow Berlin, whose own stock exchange had already virtually suspended operations, to accumulate sinews of war by raising cash on the English market. These various possible results could be averted only by closing the stock exchange entirely; for only through the machinery of such an organized exchange could the huge mass of securities thus offered find a market. London’s example was promptly followed by every other stock exchange in the world which had not already closed. New York’s shut down an hour after London’s, though most reluctantly and in spite of the previous night’s formal decision to the contrary. Nothing was more certain than that the closing at London, with New York still open for business, would converge on the American market the whole violence of the Continent’s forced sale of securities with equally heavy selling by London itself. This closing of the stock exchange was in its way a dramatic testimony to the magnitude of the financial crisis; for at London no such action had ever before been taken—not even during the Napoleonic wars. The Paris Bourse had closed down for several months during the Prussian invasion of 1870 and the New York Stock Exchange for ten days in the panic of 1873; but even with those markets it was a very temporary incident of bygone history, whose repetition no one had predicted. This unprecedented action at London, however, was only the beginning for a series of events which equally marked new precedent.”—A. D. Noyes, *Financial chapters of the war*, pp. 29-33.—See also STOCK EXCHANGE: 1914-1918.

RUN ON BANK OF ENGLAND.—FIRST REMEDIES.—“The two events which would probably have seemed to the financial world most inconceivable, only a week or two before, would have been a run on the Bank of England and a breakdown of public confidence in the English currency. It is true, the history of other countries had proved that when great wars break out, a run on the banks will usually be started by people who want to turn their bank-notes or government paper into gold, and hoard the gold. The teaching of experience, as well as instinct, warns holders of paper money that its value may be heavily depreciated through increased issues of such paper for war expenses, whether by the government or the banks. The run on the Bank of France in 1870, leading to its suspension of gold payments on the currency, and the concerted refusal of the New York banks in December, 1861, to pay out gold to customers any longer, were noteworthy modern instances. In 1797, when the long war between England and France began, the Bank of England itself suspended specie payments; that is to say, it ceased to guarantee redemption of its notes in gold, and did not resume such full and free redemption during the twenty-four succeeding years. In August, 1914, almost the first financial act by official Germany was a similar suspension of gold payments. *On Saturday, August 1, a run began on the Bank of England. . . . There were two traditional measures of protection for the Bank of England in such emergencies. . . . Both had been utilized in preceding London panics. The bank may advance its official rate for loans; an action which in ordinary times, by forcing up also the rate bid for money by the general London market, will cause a transfer of capital to London from other markets whose rate had remained unchanged, and, along with such transfer of capital, will start import of gold. The governors of the bank may also, with the British Government’s per-

mission, suspend the Bank Act which requires the bank to issue no new notes, unless specifically secured by the same amount of gold on hand in the institution's vaults. . . . Neither expedient could adequately have met the situation of 1914. Yet the bank supplied the first expedient at once. On July 30 its official discount rate was 3 per cent; it was raised to 4 that day, to 8 on the 31st, and to 10 on the 1st of August. The 10 per cent rate was the highest ever fixed by the Bank of England; it had never been approximated since the great London money panic of 1866. At the same time the government authorized suspension of the Bank Act—a step taken since the act was passed in 1844 only on two occasions, in the panics of 1857 and 1866. The bank did not make use of the government's authorization in August, 1914, nor did it retain for more than a few days its 10 per cent discount rate. That rate was reduced on August 6 to 6 per cent, and on August 8 to 5—at which it remained during practically the whole of the two succeeding years."—*Ibid.*, pp. 33-34, 37-38.—See also BANK OF ENGLAND.

FINANCIAL PROTECTIVE MEASURES IN ENGLAND.—“The protective measures taken by the banks and government in England were four in number. All of them were unprecedented in the history of English finance. Each of them amounted to confession that the existing credit system had broken down. None of them would have been considered, two or three weeks before, as a conceivable occurrence in London's financial history. First, the government declared the two days following ‘bank holiday,’ Monday, August 3, to be special legal holidays; which meant that depositors could not draw money from the banks during that three-day period, and that payment of maturing notes and bills could not be required until Thursday. For London this was a startling innovation. Its only precedent was the similar declaration of ‘special holidays,’ during our panic of 1907, by the legislatures of California, Nevada, and Oklahoma—an action taken to avert the threatened bank runs of the period, and discussed in Europe, at the time, as illustrating the primitive methods and impulsive action of our Western communities. But the London ‘special holidays’ of August, 1914, were designed not only to prevent a run on the banks, or to give the financial community as a whole a chance to recover its wits. The three-day respite was instantly utilized for the second protective measure; preparation of an ‘emergency currency’ to be issued under government auspices. This was something which had never been done before in English history. But a moment's reflection had convinced both statesmen and financiers that neither a 10 per cent Bank of England rate, nor permission for the bank to issue notes not ‘covered’ with gold in the institution's vaults, would meet the situation. No bid for money could be high enough to draw gold from foreign markets whose banks had already suspended gold payments. No additional issue of £5 notes, the lowest denomination permitted to the Bank of England, would prevent the drawing out of gold. We have seen how the people of England, during the three-day holiday, were unable to make small payments with Bank of England notes. The ‘change’ for such payments would have been gold, and gold was already being hoarded. What the treasury did, then, as the second of the protective expedients, was to issue, in denominations of 10 and 20 shillings, legal-tender paper currency. These so-called ‘currency notes’ were issued through the Bank of England to other banks, which pledged against the notes an equivalent amount of commercial paper, British Government securities, or credits with the

Bank of England. At the end of August, \$125,500,000 of this new currency was in circulation; at the end of 1914, \$192,300,000; at the end of 1915, \$515,600,000; and it increased more than \$134,000,000 in the next eight months. As for the economic character and economic results of this remarkable experiment, for the present it need only be said that the hurried issue of this currency in the ‘war panic’ ended the run on the banks, that it provided the requisite small money for the people, and that it apparently stopped the hoarding of gold. It is highly interesting to observe that these emergency paper issues, although an absolute innovation in English financial history, closely resembled in some respects our own old national bank currency secured by United States Government bonds, in others the so-called ‘Aldrich-Vreeland emergency currency,’ authorized by our law of 1908 and based on securities and commercial assets. It was an irony of circumstance that English financial opinion had heartily disapproved of both of these American systems; each of which has in fact been now superseded by the new Federal Reserve system. The menace of a general ‘bank run’ being thus averted, there arose the problem of dealing with a sudden and general demand of creditors for payment of money owing to them. When the Balkan War of 1912 broke out, the business communities of western Europe were interested and considerably annoyed by receiving, from the chambers of commerce in Bulgaria and Serbia, formal announcement that, since all the business men were at the front and since their earning capacity was therefore interrupted, a ‘moratorium’ on debts had therefore been proclaimed. The debts, whether owed to home or foreign creditors, were not repudiated; but, no matter when their payment properly fell due, they would not be paid until after the war. The great financial markets of the world looked upon that announcement much as it did on the news of the ‘special holidays’ in our Western States in November, 1907. But in the one case as in the other, London had to follow in 1914 the example of these other humble financial markets. This was the third expedient to meet the crisis. On Thursday, August 6, a royal proclamation declared that all payments due on August 4, or falling due on September 4 under a contract drawn before August 4, ‘shall be deemed to be due and payable on a day one calendar month after the day on which the payment originally became due.’ This ‘moratorium’ (the word now became familiar in European high finance) was expressly stated not to apply to wages and salaries, or to indebtedness below £5, or to rates and taxes, or to interest and dividends on securities, or to government payments, or to bank-notes, or to ocean freights, or to indebtedness due by individuals, firms, or institutions doing business outside the British Islands. With some alterations and amendments, the original proclamation was twice extended, carrying the date of the moratorium forward to November 4, 1914. By that time—and, indeed, in the case of most institutions by September—panic conditions had so far disappeared that business houses with maturing obligations relinquished the privileges of the proclamation voluntarily. Meantime, however, although the threatened chapter of bankruptcy was averted, the machinery of financial London, as of financial Europe generally and of financial America, came almost to a halt. When payment of indebtedness due to a business house is arbitrarily postponed by law, the creditor might protect himself by demanding similar postponement of what he owed to some one else. But such a condition of things would certainly not encourage him to em-

bark on other business undertakings. His eye would be fixed almost exclusively on the problem of disentangling himself from his embarrassing and humiliating position. It was instantly perceived that long continuance of that situation would very possibly cause paralysis to England's home trade and foreign commerce. Nor, indeed, was this the only danger. The moratorium, applying as it did to 'all payments due on August 4,' covered indebtedness of English firms to foreign creditors. It was a matter of far more serious concern to London's prestige as the money centre of the world that financial England should suspend payments to the foreign markets, than that payments of Englishmen to Englishmen should be deferred. We shall presently meet, in our narrative, some very tangible and very grave results of this international moratorium. As it stood it distinctly menaced London's economic position, and the next and fourth expedient adopted was directed to avert the imminent calamity. The problem was how to untie the hands of bankers and banking-houses who, unable to collect and use the huge sums owed to them in connection with their foreign business, could not stir. The moratorium had averted the immediate consequences, because the bankers were relieved from paying the equally great sums which they themselves owed at home. But this only shifted the burden to the shoulders of other houses; and moreover the moratorium, as we have seen, ran only for a month at first, and even its prolongations were known to be purely temporary. It could not be extended throughout the war; yet its final termination would leave these banking-houses with their home liabilities as pressing as on August 1, with the stock exchange still closed against sale of their securities and with their foreign assets equally beyond their reach. The result inevitably was that the great lending firms and institutions dared not increase their loans. They had their own position to fortify, and the market in which the drafts were discounted for the conducting of England's foreign trade began to shrink alarmingly. It was then, on August 13, that a very bold and remarkable step was taken. The government announced that the Bank of England was prepared to take over from these international bankers all the 'approved bills of exchange' for which they were liable on transactions prior to August 4. The bank would provide the funds requisite to pay off these bills at maturity. The bankers would still remain ultimately responsible for payment, and that liability may cut a figure in London's financial history after the war. Furthermore, to stimulate earlier repayment by the bankers, the rate of interest charged by the Bank of England for its services was to be 2 per cent above the official bank rate; and, although that official rate had been reduced from 10 per cent to 5, even that change left the rate for 'rediscount' very heavy. But the Bank of England agreed not to claim repayment from the bankers for a period of one year after the close of the war, and the government of Great Britain 'agreed to guarantee the Bank of England from any loss it may incur' in discounting such bills of exchange, 'either home or foreign, bank or trade, accepted prior to August 4, 1914.' The chancellor of the exchequer subsequently stated to Parliament that between \$1,500,000,000 and \$2,500,000,000 of such bills were believed to have been outstanding when the war began, and that of this total \$600,000,000 had been taken over by the Bank of England. As was to be expected, this arrangement had some extraordinary results in the operations of the Bank of England. Wholly apart from advances made by the bank to the government, its loan account rose from \$236,-

500,000 on July 30 to \$609,100,000 as early as September 3. On July 29, 1915, it reached its maximum of \$960,900,000. From that time forward, chiefly because the 'moratorium bills' were being so rapidly paid off from the accruing resources of the banking-houses, the Bank of England's huge loan account was gradually and progressively reduced. By the first week of June, 1916, it was down to the lowest total since the war began."—*Ibid.*, pp. 43-51. —See also ENGLAND: 1914-1918: Taxation policy.

ALSO IN: F. L. McVey, *Financial history of Great Britain, 1914-1918*.

MORATORIUMS IN OTHER COUNTRIES.—"The story of England's action in the war crisis sufficiently indicates the experience of the whole financial world. . . . No state other than England adopted the extraordinarily sweeping plan for assumption of bankers' non-collectible debts by the central banking institution. But almost every belligerent, and with them so financially powerful a neutral state as Holland, resorted in some way or another, temporarily or permanently, to an 'emergency currency.' Germany did not officially declare a moratorium on debts, though the government intervened to render the action of the courts sufficiently lenient to achieve the same ends. France extended its moratorium even to rents, with inevitable complications. Practically all of the moratoriums expired officially, early in 1915. But nothing could better illustrate the world-wide scope of the financial shock which came with the outbreak of the war, than the array of countries and markets which resorted to this postponement of payments through government decree. It was not only the European belligerents which had recourse to it. A formal moratorium was proclaimed at once in Denmark, in Italy, in Norway, in Egypt, in Greece, in Portugal, in Rumania, in Sweden (where it continued with certain limitations up to the autumn of 1915). Holland decreed special measures for extension of time to debtors. That Argentina, New Zealand, Paraguay, Nicaragua, Peru, and South Africa should have suspended such settlements from July, 1914, up to a date frequently fixed well into 1915, was a demonstration, partly, no doubt, of the enormous shock precipitated by the London panic, but chiefly of the extent to which the European War itself had deranged the entire economic system of the world."—*Ibid.*, pp. 51-52.

1915. — Pan-American financial conference. See PAN-AMERICAN FINANCIAL CONFERENCE.

1916-1922.—New developments in American banking.—Coöperative enterprises.—Farm Loan Act, 1916.—Labor banks.—"Although co-operation has made immense strides in agricultural America in recent years, the establishment of the 4,108 co-operative national farm loan associations, serving practically every farm community and section of the country, outstretches any previous achievement in this direction. . . . For many years prior to the establishment of the Federal Farm Loan system, it was apparent that, unless more means was provided to supply money for agricultural purposes, on a long-term, amortization plan, and at low interest, agricultural development in the United States would not only cease, but the whole industry would degenerate. . . . Practically alone of all industrial leaders, the farmer was the only one who did not control the money he produced, and was forced under the prevailing system of finance, which was in the hands of outside interests, to pay what was asked. With this mill-stone about his neck, the farmer struggled on for the generation after the Civil War, farming becoming less and less profitable, and more and more discouraging, until in 1916, after every conceivable plan had been con-

sidered, Congress borrowed from Europe a plan which had proven successful there, and attempted to so modify it as to meet the need of the American farmer. This plan, so modified, is known as the Federal Farm Loan Act, approved July 17, 1916. . . . Farmers of Europe, because of their superior loan organizations, have for a generation been able to borrow money upon the same basis as commerce, business and industry; during the same period our American farmers have paid nearly twice as much, and then have been only inadequately financed. . . . Of the 7,613 National Banks, book records of 1,247 showed extortionate rates charged farmers for loans. Those same banks, while charging the city merchant, manufacturer, store-keeper, railroad operator and promoter anywhere from 4 to 6 per cent interest, were at the same time charging the farmers they served anywhere from 18 to 60 per cent interest. The highest rates charged farmers were found in Texas, Oklahoma, North Dakota, Georgia and Alabama, although 12 per cent was considered very moderate in the Rocky Mountain section. . . . During the period of the war, when the government was selling war bonds, Farm Loan Bonds, bearing greater interest and enjoying greater confidence with investors, sold at higher prices, and Secretary McAdoo recommended in 1918 that Congress authorize the Secretary of the Treasury to purchase \$200,000,000 of these farm bonds, to keep them out of the market, and give Liberty Bonds the right of way. This was authorized. . . . There is a small minority of politicians . . . who would have the government continue to dominate the farmers' banking system until these bonds have been completely repaid. As they are for a term of 20 years, this would mean the farmer would be deprived for a period of sixteen years of property rights on his banking system, since his bank directors would be selected for him by a politically-appointed board." —E. W. Gage, *Farmer as a banker* (*Forum*, Sept., 1922).—In November, 1920, the Brotherhood of Locomotive Engineers opened the Brotherhood of Locomotive Engineers' Coöperative National Bank in Cleveland, Ohio. Advocates of similar labor banks point out their feasibility as an aid to the building of homes and factories, the acquisition of land and the launching of business establishments. "Especially is it emphasized that small credit agencies are used in Italy, Czecho-Slovakia and Germany, joining together in central co-operative banks in the large cities. . . . Besides the Cleveland bank of the railroad Brotherhood and a branch (formerly known as the Nottingham Savings and Banking Company) in a working people's section of Cleveland, the Engineers' Coöperative Bank has a subsidiary called the People's Bank at Hammond, Ind., and labor unions have succeeded in establishing four other banks—the Mount Vernon Savings Bank in Washington, D. C., belonging to the machinists; the Trade Union Savings of Seattle; the Finnish Neutral Savings of Superior, Wis.; the Amalgamated Clothing Workers' Institution in Chicago. [The Amalgamated Bank of New York was opened on April 14, 1923.] Similar institutions are planned for St. Louis, Birmingham, Philadelphia, Pittsburgh, Cincinnati, Dallas, and other cities farther West. . . . While few of these have adopted the profit-sharing principles of the Cleveland Coöperative Bank, the idea of placing depositors on a partnership footing with stockholders, and distributing a share of profits made on use of their money to the depositors had already been widely discussed in banking circles. The National City Bank, of New York, in its monthly survey of business conditions issued August 1 [1922], says that

establishment of such banks is welcome because it will disabuse critics of capital and banking. 'If they encourage the practice of thrift, teach the value of private wealth to the community, and help to inculcate respect for property rights, as may be expected, bankers generally will rejoice in the progress of the movement.'—*Profit-sharing for bank depositors* (*Review of Reviews*, 1922, p. 324).

1917-1920.—Bolshevik finances in Russia. See RUSSIA: 1917-1920; RUSSIA, SOVIET CONSTITUTION OF.

1919-1922.—America's post-war financial supremacy. — Germany's exhaustion. — Debtor countries.—"The end of the war found the credit systems of the European nations undermined. America, because of her strong economic position, became a creditor nation—not only supplying materials, but also food to the starving people; New York became the financial center and the American dollar the arbiter of world money exchanges. For example: During the year 1919 the exports of the United States to Europe amounted to over \$5,187,000,000, while the off-setting imports were about \$750,000,000. The inevitable result of this coupled with enormous loans to some of the European governments as a result of the war, was a severe depreciation in foreign exchange measured with the American dollar. Britain's pound sterling, normally worth \$4.8665, fell in January, 1920, to the unprecedented low record of \$3.19, German marks, normally worth about 23.8 cents, fell as low as 1.05 cents, while French francs, normally worth about 5.18½ per \$1.00, suffered a sympathetic decline to the low record of 13.38 and 14 per dollar." —T. J. Kavanaugh, *Bank credit methods and practice*, pp. 21-22.—"Germany stands today on the verge of a precipice, and it is even doubtful whether any plan, however vigorously executed, can save her from going over. The country is exhausted economically, financially, physically, socially, and spiritually. During the war the nation lived on the fat of its ribs. Since the Armistice everything has been going out and nothing coming in. German business men do their actual trading in Germany, but their financial operations are conducted in foreign countries whenever possible. A German buys material in England, pays with a cheque on Zurich or Amsterdam, sells his goods for as many marks as he can, and buys foreign exchange that his money may remain in Germany no longer than is necessary. Sometimes, if a wholesale dealer, he is paid in foreign exchange, and in that case no part of the money transfer takes place in Germany. This is but an instance of what is going on, but it is illuminative. In 1921-22 Germany imported two billion gold marks' worth of food to feed the people. These imports in 1922-23 must amount to three billion, as there was a shortage of three million tons in the bread-stuffs harvest of 1922. . . . There is more involved in this matter than the stabilization of the mark; that is one very important factor in the situation, but it is only one. The international financiers are chiefly concerned with matters of exchange. They have large interests in Germany, and are large holders of German currency abroad. To restore to their holdings an element of tangible value is what they are striving for. . . . With marks as they are today statistics cease to have much value, and comparisons are impossible. If the total business of the German banks is calculated upon the purchasing value of the mark it will be found that the exchanges represent a turnover of about one-fourth the business done in 1913; which in itself is proof of the decreased amount of total trade done

by Germany, both domestic and foreign."—J. D. Whelpley, *Politics and realities* (*Fortnightly Review*, Dec., 1922, pp. 1043-1046).—See also GERMANY: 1922 (July-August).—"Government finance at the present time is characterized by the extraordinary complexity of the international obligations, and the enormous increase in the scale of Government spending. . . . It seems probable that in 1922-23 considerable international payments will have to be made. These payments will be a new factor adding to the instability of exchange rates and prices. They will add to the impoverishment and increase the revenue difficulties of the debtor states, and in the first instance it seems possible that they will add to the trading difficulties of the creditor countries. Until some settlement of the international payments is arrived at, any real solution of the exchange problem, or of the internal finances of the most heavily involved states, seems impossible. Even, however, if the international position were modified tomorrow by some such measure as an agreement to cancel interallied debts, the problem of enormously increased budgets would remain for most countries. Many governments have as yet made no serious attempt to meet expenditure out of taxation, and are financing post-war, as they financed war, expenses out of borrowing and inflation. The most extreme instance is probably Russia, where, in the four months, December, 1921, to April, 1922, the Bolshevik Government issued notes to six and a half times the volume of the previous currency, with the result that at the end of that period the value of the paper money had fallen to about one-twentieth of its value at the beginning of December. This extreme case shows the price chaos which results from great inflation, and shows further that such a policy must ultimately defeat its own ends as a method of getting revenue, for the value of the Russian paper money was decreasing progressively faster than the increase in its volume, and the Government had to issue more and more currency in order to get control of the same volume of purchasing power. Even where a more moderate policy is adopted, any borrowing must mean a postponement of a final settlement and an addition to future difficulties, while where it leads to any further inflation it is accompanied by the immediate disadvantages of fluctuating prices both at home and abroad. In Great Britain a more stringent attempt has been made since the war to balance the budget, meet current expenditures out of taxation, get back to a saner monetary policy and even to reduce the accumulations of debt. In the financial year, 1921-22, something like £88,000,000 was applied to the redemption of debt, and the country raised a revenue equal to five and a half times its last pre-war budget. The heavy rates of tax necessary to raise the revenue were a great burden, and in the budget of 1922 the Government abandoned the immediate attempt to reduce its capital liabilities and (with some economies in expenditure) the budget estimates were considerably reduced. As a result some reductions of taxation were made, the most important of which was the reduction of the Income Tax rates by a sixth. Even with these allowances the budget for 1922-23 was nearly four and a half times as large as the last pre-war budget."—M. E. Robinson, *Public finance*, pp. 157-159.—At the forty-eighth annual convention of the American Bankers' Association meeting in New York City, October 2-6, 1922, the British banker, Mr. Reginald McKenna, asked his American colleagues "to treat England's debt to the United States as certain to be provided for." His conclusions, presenting a comprehensive view of the

financial status of the world to-day and summarized by the New York World are reprinted by the Literary Digest: "First, that England can pay interest and sinking fund, because she still possesses foreign securities with which to pay. England can pay, she will pay. Second, that the other debtor countries, including France and Italy, do not have foreign securities with which to pay their debts. They could pay only by exporting more goods than they import; and since the world is not prepared to take a great surplus of French and Italian exports, hope of payment from these countries must be definitely postponed, and nothing expected ultimately, except what can be paid by the export of goods. Third, that Germany can pay now only with the foreign balances which she still possesses. But these balances could only be used for reparations if individual Germans would sell them to their Government. This consent can only be obtained by offering them a profit, which in turn can only be done by improving the mark."—*Allied debt as a peace club* (*Literary Digest*, Oct. 21, 1922, p. 13).

MONGE, Gaspard (1746-1818), French mathematician, founder of descriptive geometry. Elected to the Academy of Science at Paris, 1780; minister of marine, 1792-1793; appointed senator, 1805; one of the founders of the École Polytechnique; accompanied Napoleon on his Egyptian campaign, 1798. Some of his works are: "Traité élémentaire de la statique," 1788; "Géométrie descriptive," 1795; "Application de l'analyse à la géométrie des surfaces du premier et deuxième degré," 1795. See FRANCE: 1792 (August); (September-November).

MONGOLIA: Country and people.—Origin of name.—Earliest history.—From an obscure and uncertain beginning the word Mongol has gone on increasing in significance and spreading geographically during more than ten centuries until it has filled the whole earth with its presence. From

the time when men used it at first until our day this word has been known in three senses especially. In the first sense it refers to some small groups of hunters and herdsmen living north of the great Gobi desert; in the second it denotes certain peoples in Asia and Eastern Europe; in the third and most recent, a world wide extension has been given it. In this third and the broad sense the word Mongol has been made to include in one category all yellow skinned nations, or peoples, including those too with a reddish-brown or dark tinge in the yellow, having also straight hair, always black, and dark eyes of various degrees of intensity. [See INDIANS, AMERICAN; ORIGINS; PACIFIC OCEAN; PEOPLE; MALAY, MALAYSIAN, OR BROWN, RACE.] In this sense the word Mongol co-ordinates vast numbers of people, immense groups of men who are like one another in some traits, and widely dissimilar in others. It embraces the Chinese, the Koreans, the Japanese [see JAPAN: Inhabitants and their origin], the Manchus, the original Mongols with their near relatives the Tartar, or Turkish tribes which hold Central Asia, or most of it. Moving westward from China this term covers the Tibetans and with them all the non-Aryan nations and tribes until we reach India and Persia. In India whose most striking history in modern ages is Mongol, nearly all populations save Aryans and Semites are classified with Mongols. [See INDIA: People.] In Persia where the dynasty is Mongol that race is preponderant in places and important throughout the whole kingdom, though in a minority. In Asia Minor the Mongol is master, for the Turk is still sovereign, and will be till a great rearrangement is effected. Five groups of Mongols have made themselves famous in Europe: the Huns with their mighty chief Attila [see EUROPE: Roman civilization: 'Fall of Rome'], the Bulgars, the Magyars, the Turks or Osmanli, and the Mongol invaders of Russia. . . . In Africa there have been and are still Mongol people. The Mamelukes and their forces at Cairo were in their time remarkable, and Turkish dominion exists till the present, at least theoretically, in Egypt and west of it. Not restricted to the Eastern hemisphere the word Mongol is still further used to include aboriginal man in America. . . . In the first, that is the original and narrowest sense of the word it applies to those Mongols alone who during twelve centuries or longer have inhabited the country just south of Lake Baikal, and north of the great Gobi desert. It is from these Mongols proper that the name has at last been extended to the whole yellow race in both hemispheres."—J. Curtin, *Mongols: A history*, pp. 1-2. —"The name Mongol (according to Schmidt) is derived from the word Mong, meaning brave, daring, bold, an etymology which is acquiesced in by Dr. Schott. Ssanang Setzen says it was first given to the race in the time of Jingis Khan, but it is of much older date than his time, as we know from the Chinese accounts. . . . They point further, as the statements of Raschid do, to the Mongols having at first been merely one tribe of a great confederacy, whose name was probably extended to the whole when the prowess of the Imperial House which governed it gained the supremacy. We learn lastly from them that the generic name by which the race was known in early times to the Chinese was Shi wei, the Mongols having, in fact, been a tribe of the Shi wei. . . . The Shi wei were known to the Chinese from the 7th century; they then consisted of various detached hordes, subject to the Thu kiu, or Turks. . . . After the fall of the Yuan-Yuan, the Turks, by whom they were overthrown, acquired the supreme control of Eastern Asia. [See ASIA: Earliest history.] They had, under the name

of Hiong nu, been masters of the Mongolian desert and its border land from a very early period, and under their new name of Turks they merely reconquered a position from which they had been driven some centuries before. Everywhere in Mongol history we find evidence of their presence, the titles Khakan, Khan, Bigui or Beg, Terkhan, &c., are common to both races, while the same names occur among Mongol and Turkish chiefs. . . . This fact of the former predominance of Turkish influence in further Asia supports the traditions collected by Raschid, Abulghazi, &c., . . . which trace the race of Mongol Khans up to the old royal race of the Turks."—H. H. Howorth, *History of the Mongols*, pt. 1, pp. 27-32.—"Here [in the eastern portion of Asia known as the desert of Gobi], from time immemorial, the Mongols, a people nearly akin to the Turks in language and physiognomy, had made their home, leading a miserable nomadic life in the midst of a wild and barren country, unrecognised by their neighbours, and their very name unknown centuries after their kinsmen, the Turks, had been exercising an all-powerful influence over the destinies of Western Asia."—A. Vambéry, *History of Bokhara*, ch. 8.—"Mongolia extends for 1,500 miles along the northern frontier of China [see CHINA: Map], and as its eastern border is coterminous with Manchuria, a few words regarding the Mongols may not be out of place in these notes. The race is said to come with the Manchus from a common Tartar stock, but, except in colour and features, there is little resemblance between the two races. The Mongol is essentially a nomad, hating towns and houses. He prefers to wander about the steppes, pitching his 'yourt,' or felt tent, wherever water and pasture are for the time most plentiful. As the nature of the country they inhabit prohibits agriculture, the art is unknown among his people, who are entirely engaged in tending their flocks and herds, ponies, and camels. They are mere children in the hands of the Chinese, who can outwit them as easily as a member of the 'confidence trick' fraternity outwits a rustic from the shires. . . . A small portion of their territory is rented by the Chinese on the west of the Provinces of Kirin and Fêng-tien, of which it has now become an integral part. Kuan-cheng-tzu was originally in Mongolia, and so are all the towns and villages to the west of the palisade, of which the principal are Mai-mai-kai (Fêng-hua), Ch'ang-tu, and Cheng-chia-tun. Mongolia is the great breeding land for horses and cattle. At first sight when travelling through the country one is astonished at the enormous size of the troops of ponies; but when one considers that this territory supplies Siberia, China, and Manchuria with animals, it is easy to see that the supply is not greater than the demand. . . . The Mongols are governed by their hereditary Princes, Chinese authority being maintained by Imperial Residents at Ching-hai, in Western Mongolia (Ko-ko-nor), and at Urga, in the north."—*Notes of Colonel Browne* (Great Britain, *Parliamentary Publications*, China, 1800, No. 1, pp. 34-37).—"The representative of Chinese authority in Mongolia (before the secession of the country and the proclamation of its independence in 1011) resided at Urga, Uliassutai, and Knobdo. Courts for deciding disputes between Chinese were called *tsargucheya*. The *chisa* or council was another court to which were referred questions arising between Mongols belonging to different principalities. The declaration of independence and secession from China has led to the abolition of Chinese officials. The administrative organisation of the country has, however, in its main features remained the same. . . . It is very difficult to arrive at the exact number of people

living in Mongolia. The Mongols, being nomads, are constantly moving. The Government, however, estimates that the population of Outer Mongolia consists of 500,000 Mongols and 200,000 Chinese settlers. The Russian population in Outer Mongolia reaches 5000, and there are about 3000 settlers in the district of Altai. The population of Inner Mongolia is much higher. The Inner Mongolians are more developed, more virile, and more progressive. Some hundreds of families have recently fled to Outer Mongolia, fearing Chinese military measures. These fugitives, more especially the Chahars, who come from the district north of Kalgan, are not welcomed by their northern brothers. Mongolia is divided geographically and politically into two great sections, Inner and Outer Mongolia. The former skirts the northern boundary of China, and for the most part its princes own allegiance to the Chinese Republic. Outer Mongolia, or Halhar, on the other hand, is

JENGHIZ KHAN

the centre of the Hu-tuk-tu's sphere of influence. It consists of four big principalities:—Tse tsen Khan, subdivided into 23 petty principalities; Tu She tu Khan, subdivided into 19 petty principalities; Jassaktu Khan, subdivided into 23 petty principalities; [and] Sain Noin Khan, subdivided into 24 petty principalities,—making 89 petty principalities in all. In the Tse tsen Khan principality is a stretch of land called 'Daringangar,' formerly used as Imperial pastures for cattle. The latter were sent as tribute to the Manchu Royal Family in Peking. Since the passing of the Manchus, the Mongols have ceased to pay this tribute, and claim the land as belonging to Halhar. In the north-west extremity of Mongolia is the disputed district of Uriankhai, which the Mongols wish the Russians to recognise as forming part of Mongolia. On the east side of this territory is Lake Kossogol, where there is a commercial town, Darhait, the centre of the cattle trade between Irkutsk and Uriankhai, where many Russian settlers live. There is another Russian colony at Hathy, farther south. A Russian Frontier Com-

missioner resides at a town on the River Usu, a confluent of the Yenisei. The Mongols have asked for reciprocity in trade, and to be allowed to open Consulates in Siberia. . . . On the north-east of Mongolia is another district, that of Hulumbuiya or Barga, which forms part of the Chinese province of Heilung Kiang (N. W. Manchuria). This district is claimed by the Mongols to belong to Outer Mongolia, as they allege that the population inhabiting that area has always been Mongolian. Mongolia's boundary to the north reaches as far as Siberia; in the west it is hedged in by Russian Turkestan, Dzungaria, that home of Chinese exiles, and Sinkiang or Chinese Turkestan; to the east the great Khingan Mountains gradually sloping towards the sea divide Mongolia from Manchuria, and the north of China fills up the gap on her southern boundary. This great upland of Mongolia, averaging 3000 feet above sea-level, is girdled by snow-capped mountains; within are fertile valleys, large rivers, rich mineral-bearing tracts, grassy steppes and sandy wastes."—H. G. C. Perry-Ayscough and R. B. Otter-Barry, *With the Russians in Mongolia*, pp. 52-57.

1153-1227.—Conquests of Jenghiz Khan.—“Jingiz-Khan [or Jenghiz, or Zingis], whose original name was Tamujin, the son of a Tatar chief, was born in the year 1153. In 1202, at the age of 40, he had defeated or propitiated all his enemies, and in 1205 was proclaimed, by a great assembly, Khakan or Emperor of Tartary. His capital, a vast assemblage of tents, was at Kara-Korum, in a distant part of Chinese Tartary; and from thence he sent forth mighty armies to conquer the world. This extraordinary man, who could neither read nor write, established laws for the regulation of social life and for the chase; and adopted a religion of pure Theism. His army was divided into Tumans of 10,000 men, Hazarehs of 1,000, Sedehs of 100, and Dehehs of 10, each under a Tatar officer, and they were armed with bows and arrows, swords, and iron maces. Having brought the whole of Tartary under his sway, he conquered China, while his sons, Oktai and Jagatai, were sent [1218] with a vast army against Khuwarizm [whose prince had provoked the attack by murdering a large number of merchants who were under the protection by Jenghiz]. The country was conquered, though bravely defended by the king's son, Jalalu-'d-Din; 100,000 people were put to the sword, the rest sold as slaves. . . . The sons of Jingiz-Khan then returned in triumph to their father; but the brave young prince, Jalalu-'d-Din, still held out against the conquerors of his country. This opposition roused Jengiz-Khan to fury; Balk was attacked for having harboured the fugitive prince in 1221, and, having surrendered, the people were all put to death. Nishapur shared the same fate, and a horrible massacre of all the inhabitants took place.” Jalalu-'d-Din, pursued to the banks of the Indus and defeated in a desperate battle fought there, swam the river on horseback, in the face of the enemy, and escaped into India. (See CHINA: 1205-1234.) “The Mongol hordes then overran Kandahar and Multan, Azerbaijan and Irak; Fars was only saved by the submission of its Ata-beg, and two Mongol generals marched round the Caspian Sea. Jengiz-Khan returned to Tartary in A. D. 1222, but in these terrible campaigns he lost no less than 200,000

men. As soon as the great conqueror had retired out of Persia, the indefatigable Jalalu'd-Din recrossed the Indus with 4,000 followers, and passing through Shiraz and Isfaham drove the Mongols out of Tabriz. But he was defeated by them in 1220; and though he kept up the war in Azerbaijan for a short time longer, he was at length utterly routed, and flying into Kurdistan was killed in the house of a friend there, four years afterwards. . . . Jingiz-Khan died in the year 1227."—C. R. Markham, *History of Persia*, ch. 7.—In 1224 Jenghiz "divided his gigantic empire amongst his sons as follows: China and Mongolia were given to Oktai, whom he nominated as his successor; Tchagbatai received a part of the Uiguric passes as far as Kharezmi, including Turkestan and Transoxania; Djudi had died in the meantime, so Batu was made lord of Kharezmi, Deshti-Kiptchak of the pass of Derbend and Tuli was placed over Khurasan, Persia, and India."—A. Vámbéry, *History of Bokhara*, ch. 8.—"Popularly he [Jenghiz Khan] is mentioned with Attila and with Timur as one of the 'Scourges of God.' . . . But he was far more than a conqueror. . . . In every detail of social and political economy he was a creator; his laws and his administrative rules are equally admirable and astounding to the student. . . . He may fairly claim to have conquered the greatest area of the world's surface that was ever subdued by one hand. . . . Jingis organised a system of intelligence and espionage by which he generally knew well the internal condition of the country he was about to attack. He intrigued with the discontented and seduced them by fair promises. . . . The Mongols ravaged and laid waste the country all round the bigger towns, and they generally tried to entice a portion of the garrison into an ambushade. They built regular siege-works armed with catapults; the captives and peasants were forced to take part in the assault; the attack never ceased night or day; relief of troops keeping the garrison in perpetual terror. They employed Chinese and Persians to make their war engines. . . . They rarely abandoned the siege of a place altogether, and would sometimes continue a blockade for years. They were bound by no oath, and, however solemn their promise to the inhabitants who would surrender, it was broken, and a general massacre ensued. It was their policy to leave behind them no body of people, however submissive, who might inconvenience their communications. . . . His [Jenghiz'] creed was to sweep away all cities, as the haunts of slaves and of luxury; that his herds might freely feed upon grass whose green was free from dusty feet. It does make one hide one's face in terror to read that from 1211 to 1223, 18,470,000 human beings perished in China and Tangut alone, at the hands of Jingis and his followers."—H. H. Howorth, *History of the Mongols*, pt. 1, pp. 49, 108-113.—"He [Jenghiz Khan] was . . . a military genius of the very first order, and it may be questioned whether either Cæsar or Napoleon can, as commanders, be placed on a par with him. The manner in which he moved large bodies of men over vast distances without an apparent effort, the judgment he showed in the conduct of several wars in countries far apart from each other, his strategy in unknown regions, always on the alert yet never allowing hesitation or over-caution to interfere with his enterprises, the sieges which he brought to a successful termination, his brilliant victories . . . all combined, make up the picture of a career to which Europe can offer nothing that will surpass, if indeed she has anything to bear comparison with it."—D. C. Boulger,

History of China, v. 1, ch. 21.—See also KHORASAN; BOKHARA: 1219; SAMARKHAND: 1221; MERV; BALKH; KHUAREZM.

1202.—Overthrow of the Keraït, or kingdom of Prester John. See PRESTER JOHN, KINGDOM OF.

1206-1500.—Final national unity.—Summarized account of events of period.—As we have seen "the history of the Mongols becomes of importance, in its effect on the world, at the beginning of the thirteenth century, between the years 1206 and 1227, when the son of a petty chieftain named Temuchin brought all the Mongol tribes under his authority, formed them into one nation, and proclaimed himself Grand Sovereign of Mongolia with the title of Jenghis Khan. . . . By the end of the thirteenth century, authority had been delegated to so many Khans that the empire itself broke up into several principalities. The Mongol yoke still remained over Russia until 1380, when the Golden Horde were defeated at the battle of Kalba by the Russians under the command of the Grand Duke Dimitri, surnamed Donskoi, in memory of this successful battle;—and so at last the Russians had freed themselves from these Mongols. About the end of the fourteenth century the Mongols were expelled from the throne of China by the Ming dynasty, and the Mongol tribes then occupied a large tract of country in what is now known as Mongolia, Siberia, and Russia. But these nomad tribes were now well on the wane. There was no cohesion amongst them, and each wandering tribe was ruled by its own Khan, only owning very nominal allegiance to the chief Khan. Constant internecine war had weakened them, and, although their country was large and formed the dividing country between Russia and China, neither China nor Russia had much to fear from them."—H. A. C. Perry-Ayscough and R. B. Otter-Barry, *With the Russians in Mongolia*, pp. 46-48.

1229-1294.—Conquests of the successors of Jenghiz Khan.—"Okkodai [or Ogotai or Oktai], the son and successor of Chinghiz, followed up the subjugation of China, extinguished the Kin finally in 1234 and consolidated with his empire all the provinces north of the Great Kiang. . . . After establishing his power over so much of China as we have said, Okkodai raised a vast army and set it in motion towards the west. One portion was directed against Armenia, Georgia [see ARMENIA: 908-1083; CAUCASUS: 1080-1303] and Asia Minor, whilst another great host under Batu, the nephew of the Great Khan, conquered the countries north of Caucasus, overran Russia making it tributary, and still continued to carry fire and slaughter westward. [See KIEV: 1240.] One great detachment under a lieutenant of Batu's entered Poland, burned Cracow, found Breslau in ashes and abandoned by its people, and defeated with great slaughter at Wahlstadt near Lignitz (April 9, 1241) the troops of Poland, Moravia and Silesia, who had gathered under Duke Henry of the latter province to make head against this astounding flood of heathen. [See LIGNITZ, BATTLE OF.] Batu himself [and his great general Subutai] with the main body of his army was ravaging Hungary [see HUNGARY: 1301; POLAND: 1241]. . . . Pesth was now taken and burnt and all its people put to the sword. The rumours of the Tartars and their frightful devastations had scattered fear through Europe, which the defeat at Lignitz raised to a climax. Indeed weak and disunited Christendom seemed to lie at the foot of the barbarians. The Pope to be sure proclaimed crusade, and wrote circular letters, but the enmity between him and the Emperor Frederic II. was

allowed to prevent any co-operation, and neither of them responded by anything better than words to the earnest calls for help which came from the King of Hungary. No human aid merited thanks when Europe was relieved by hearing that the Tartar host had suddenly retreated eastward. The Great Khan Okkodai was dead [1241] in the depths of Asia, and a courier had come to recall the army from Europe. In 1255 a new wave of conquest rolled westward from Mongolia, this time directed against the Ismaelians or 'Assassins' on the south of the Caspian, and then successively against the Khalif of Baghdad [see also BAGDAD: 1258] and Syria. The conclusion of this expedition under Hulagu may be considered to mark the climax of the Mongol power. Mangu Khan, the emperor then reigning, and who died on a campaign in China in 1259, was the last who exercised a sovereignty so nearly universal. His successor Kublai extended indeed largely the frontiers of the Mongol power in China [see CHINA: 1259-1264], which he brought entirely under the yoke, besides gaining conquests rather nominal than real on its southern and southeastern borders, but he ruled effectively only in the eastern regions of the great empire, which had now broken up into four: (1) The immediate Empire of the Great Khan, seated eventually at Khanbalik or Peking, embraced China, Corea, Mongolia, and Manchuria, Tibet, and claims at least over Tunking and countries on the Ava frontier; (2), the Chagatai Khanate, or Middle Empire of the Tartars, with its capital at Almalik, included the modern Dsungaria, part of Chinese Turkestan, Transoxiana, and Afghanistan; (3), the Empire of Kipchak, or the Northern Tartars, founded on the conquests of Batu, and with its chief seat at Sarai, on the Wolga, covered a large part of Russia, the country north of Caucasus, Khwarizm, and a part of the modern Siberia; (4), Persia, with its capital eventually at Tabriz, embraced Georgia, Armenia, Azerbaijan and part of Asia minor, all Persia, Arabian Irak, and Khorasan."—H. Yule, *Cathay and the way thither: Preliminary essay*, v. 1, sect. 92-94.

ALSO IN: H. H. Howorth, *History of the Mongols*, ch. 4-5.

1238-1391.—Kipchak empire.—Golden horde.—"It was under Touthi [or Juchi], son of Tschingis, that the great migration of the Monguls effected an abiding settlement in Russia. . . . Touthi, with half a million of Monguls, entered Europe close by the Sea of Azof. On the banks of the river Kalka he encountered the united forces of the Russian princes. The death of Touthi for awhile arrested the progress of the Tatar arms. But in 1236, Batu, the son of Touthi, took the command, and all the principalities and cities of Russia, with the exception of Novogorod, were desolated by fire and sword and occupied by the enemy. For two centuries Russia was held caged, cribbed, confined by this encampment or horde; the Golden Horde of the Deshti Kipzak, or Steppe of the Hollow Tree. Between the Wolga and the Don, and beyond the Wolga, spreads this limitless region the Deshti Kipzak. It was occupied in the first instance, most probably, by Hun-Turks, who first attracted and then were absorbed by fresh immigrants. From this region an empire took its name. By the river Akhtuba, a branch of the lower Wolga, at Great Serai, Batu erected his golden tent; and here it was he received the Russian princes whom he had reduced to vassalage. Here he entertained a king of Armenia; and here, too, he received the ambassadors of S. Louis. . . . With the exception of Novogorod, which had

joined the Hanseatic League in 1276, and rose rapidly in commercial prosperity, all Russia continued to endure, till the extinction of the house of Batu, a degrading and hopeless bondage. When the direct race came to an end, the collateral branches became involved in very serious conflicts; and in 1380, Temnik-Mami was overthrown near the river Don by Demetrius IV., who, with the victory, won a title of honour, Donski, which outlasted the benefits of the victory; although it is from this conflict that Russian writers date the commencement of their freedom. . . . After an existence of more than 250 years the Golden Horde was finally dissolved in 1480. Already, in 1468, the khanate of Kusan [or Kazan] was conquered and absorbed by the Grand Duke Ivan; and, after the extinction of the horde, Europeans for the first time exacted tribute of the Tatar, and ambassadors found their way unobstructed to Moscow. But the breaking up of the Golden Horde did not carry with it the collapse of all Tatar power in Russia. Rather the effect was to create a concentration of all their residuary resources in the Crimea."—C. I. Black, *Proselytes of Ishmael*, pt. 3, ch. 4.—"The Mongol word yurt meant originally the domestic fireplace, and, according to Von Hammer, the word is identical with the German herde and the English hearth, and thence came in a secondary sense to mean house or home, the chief's house being known as Ulugh Yurt or the Great House. An assemblage of several yurts formed an ordu or orda, equivalent to the German hort and the English horde, which really means a camp. The chief camp where the ruler of the nation lived was called the Sir Orda, i. e., the Golden Horde. . . . It came about that eventually the whole nation was known as the Golden Horde." The power of the Golden Horde was broken by the conquests of Timour (1389-1391). It was finally broken into several fragments, the chief of which, the Khanates of Kazan, of Astrakhan, and of Krim, or the Crimea, maintained a long struggle with Russia, and were successively overpowered and absorbed in the empire of the Muscovite.—H. H. Howorth, *History of the Mongols*, pt. 2, p. 1.—See also above: 1229-1264; KIPCHAKS; RUSSIA: 1237-1480.

1616-1691.—Ching dynasty.—Internecine wars.—"The Ming dynasty, in China, was driven out in 1616-43 by the Manchu Tartars. These Manchus founded the 'Ching dynasty,' which held sway over China and her three dominions, Tibet, Manchuria, and Mongolia, until recent times. After the Mongols' expulsion from China the nomad tribes were ruled by their individual Khans. They owed nominal allegiance to their chief Khan; and before the death of the last of these princes, Dayam Tsuen Khan in 1543, directions were left

Maps prepared specially for the NEW LARNED
under direction of the editors and publishers.

by him that Mongolia was to be divided into nine parts, according to the number of his sons. A period now ensued during which the country was split up, and suffered severely from internecine strife. The princes were at enmity with one another, and sought for support in China. Thus it came to pass that on the establishment of the Manchu dynasty the princes of Southern or Inner Mongolia acknowledged the suzerainty of China and became tributaries to the Son of Heaven. By the middle of the seventeenth century the whole of Southern Mongolia, the Ordos country, Alashan and Kokonor were in subjection to the Manchus. Northern Mongolia or Halhar alone remained independent, her four princes refusing to do obeisance to China. At this time Northern Mongolia was continually at war with the tribes of Dzungaria. Towards the end of the seventeenth century these tribes combined under the leadership of an ambitious and warlike Prince—Galdan Boshoktu Khan—and defeated the Halhar princes of Northern Mongolia. The latter were now forced to apply for help to the Manchu Government of China. In 1691, at a gathering of Mongol princes held at Dolonor, the Emperor of China, Kang Hsi, confirmed their internal privileges and their rights to hereditary authority, receiving in return an acknowledgment of the suzerainty of the Manchu dynasty. Having obtained this acknowledgment, the Manchu Government turned its attention to the enthralment of the Mongols. To this end they strengthened and developed the system of appanages, whereby controlling authorities were multiplied and subdivided to an enormous extent; dissension amongst the princes was also encouraged.”—H. G. C. Perry-Ayscough and R. B. Otter-Barry, *With the Russians in Mongolia*, pp. 40-50.—“During 1689 K'ang Hsi [one of the greatest of the Ching emperors] addressed several communications . . . to Galdan, asking him to evacuate the Khalkha country and to restore it to the rightful owners. This request only brought forth a counter demand from Galdan that China should surrender to him the Tshetu Khan. . . . To back up his demand Galdan even made inroads into Inner Mongolia, defeated the frontier guards, and clamoured for war at the very doors of China. . . . K'ang Hsi . . . promptly dispatched two armies to check the advance of the enemy; one led by Prince Yü. . . . A third army, led by the Emperor, King Kung, who engaged the enemy first, failed to check Galdan's advance. . . . The division of Prince Yü was next engaged, and on Sept. 3, 1690, a great battle was fought at Ulangputung. . . . Before nightfall, the rout of the enemy was complete.”—Li Ung Bing, *Outlines of Chinese history*, pp. 386-387.

1697-1724.—**Death of Galdan.—Chinese conquests.**—“In the beginning of 1697, the Emperor [K'ang Hsi] once more made a trip to the west. . . . Before his plans were carried out word came that Galdan, forsaken by all his friends, had ended his life by suicide. When his remains were produced by an agent of Ts'ewang . . . K'ang Hsi was ready to return to Peking, their enemy having disappeared. . . . [A few years previous, Galdan], having sufficiently recovered from the effects of his last defeat, was once more ready to measure his strength with K'ang Hsi. . . . Towards the fall of . . . [1694] he returned with a fresh army of 30,000 men and entrenched himself on the bank of the Kerulun River. . . . Since he was unwilling to come south to receive his punishment, K'ang Hsi was prepared to give it to him where he was. In the spring of 1695 a grand

army marched in three sections; the Emperor taking command in person of the central division. . . . It was then rumored that a regiment of Cossacks armed with rifles was coming to the aid of Galdan; but K'ang Hsi, undaunted by such reports, continued his advance in the direction of the Kerulum. . . . To his great surprise and disappointment, not a single tent was seen on the bank of the river where he had expected to meet his foe. Galdan had fled. . . . [After the death of Galdan] the Khalkhas . . . returned to their native country, which, as a result of the war, had been extended to the Altai Mountains. . . . The encounters with Galdan had terminated in the establishment of China's authority over the Khalkhas. . . . The remote cause of the third war with Dzungar was a rebellion that broke out in Kokonor in 1723. . . . The Kokonor Mongols had been permitted to retain their tribal government. . . . Now that the great Emperor K'ang Hsi was no more, Tantsin believed that he had nothing further to fear from China, and hastened to launch his ambitious plan of entirely extinguishing the authority of China and restoring the independence of Kokonor. He convened at Ghahan . . . a conference of his fellow Daijis, and told them to acknowledge him as their master instead of the Chinese Emperor. Two of them refused to do so and a civil strife ensued. Having been defeated, the dissenters left the country to announce the news to the Chinese Emperor. . . . In a few months the rebellion assumed . . . alarming proportions. General Yoh . . . with 5,000 men, made a bold move which broke up the centre of the trouble . . . in the neighborhood of the Chadam River. Thousands of the rebels . . . were glad to lay down their arms and submit.”—Li Ung Bing, *Outlines of Chinese history*, pp. 388, 389-390, 415-416.—See also CHINA: 1662-1838.

1750-1911.—**Spread and decay of Buddhism.**—After the death of the Mongolian chief, Tsenning, in 1745 “all the elements of disorder were let loose.” Upon the death of Tsenning's son Dardsha, disputes arose over the supremacy and they appealed to the Emperor at Peking, who sent an army to establish one of the disputants, Amursana, as ruler over the Mongols under the protection of the Chinese Empire (1750-1753). During this period the Mongolians had some well established schools, and a new university for the study of the teaching of Buddha. “The Manchus have . . . made intelligent use of Buddhism as a political lever, and the Emperor reserves to himself the right to sanction the transmigration of ‘Souls.’”—E. H. Parker, *China, past and present*, p. 92.—At the time when the Buddhist patriarchs first established themselves in Thibet, that country was in immediate contact with Christianity. Nothing was easier than to induce many of the various sects to admire and adopt the rights of the Christian religion. The strength of Buddhism in both China and Mongolia gradually has been sapped and undermined, not only by Confucianism, but by both Mohammedanism and Christianity, so that while Buddhism is far stronger in Mongolia and Japan, than in China, the Nestorian Christianity and Buddhism are probably the parents of the present Lamaism (1911).—Based on G. Huth, *Geschichte des Buddhismus in der Mongolei*, p. 330.—In 1011, Buddhism “appears to be too far gone to be resuscitated. Debased with popular superstition and loaded down with idol worshipers, even missionaries sent to China by Japanese Buddhists will fail to breathe into it the breath of life. Quite otherwise is it with Confucianism.”—E. A. Ross, *Changing Chinese*, p. 265.

1911.—Effects of Chinese revolution.—Mongolia remained a province of China until 1911, when she applied to Russia to assist in establishing her independence. At this time the revolution broke out in China and the Mongols took advantage of it to force the Chinese officials and troops to leave the Khalkhan district and return home. The Mongolian Hutuktu was proclaimed ruler.

1912-1913.—Convention and protocol.—The Russian envoy and the Cabinet of the Hutuktu signed a convention and protocol at Urga, November 3. The Russian government promised its assistance in the maintenance of Mongolian autonomy, the establishment of a national army, the prevention of Chinese colonization and the entrance of Chinese troops. The Mongolian sovereign and government assured to Russian subjects and commerce special rights and privileges.

1913.—Mongol-Tibetan agreement.—Russian-Chinese agreement.—In January the sovereigns of Tibet and of Mongolia each approved the independent state under the jurisdiction of the other, and agreed to the establishment of Buddhism. "In the autumn it was reported that, in consequence of China's failure to preserve order in West Mongolia, Russia had occupied Tchuguchak and Kobdo with Cossacks. In October fresh demands were made upon China, and in November the settlement of these was embodied in an Agreement and extending them by the recognition of the Russo-Mongol Convention of November, 1912, and by defining Urga, Uliasutai and Kobdo as the territories included in Outer Mongolia."—*Annual Register*, 1913, p. 114.—In the agreement between Russia and China, Russia recognized Outer Mongolia as part of Chinese territory under Chinese suzerainty, and China recognized the autonomy of Outer Mongolia. China agreed not to send troops into this region; Russia agreed to restrict her troops to consular guards, to refrain from colonization or intervention in administrative affairs, and to allow Chinese representatives in the state.

1914.—Railways and telegraphs.—Establishment of banking system.—In an agreement drawn up in September, Russia recognized Mongolia's right to build her own territorial railways, but all plans were to be decided upon in conference with Russia. The Russian government must be consulted before concessions could be granted, so that no railways might be established "prejudicial to Russian economic and strategic interests." Russia's cooperation was promised in finding the necessary capital. In September the Russian Administration of Posts and Telegraphs was granted a concession for the construction of a telegraph line in Mongolia. In the fall of 1913 Russia had granted Mongolia a war loan of two million rubles, the advance to be secured on revenues in certain districts near Kobdo. In December, 1914, a Mongolian bank was established with a capital fixed at one million rubles. It was arranged that the directorate should be in Petrograd, with branches at Urga, Uliarsutai and Kobdo; the Mongolian government is to receive 15 per cent of the net annual profits, with the right to purchase the bank fifty years from the date of commencement of operations.

1915.—Establishment of legal currency.—Japanese demands.—In March, the Russian government granted to the Siberian Trading Bank the right to issue, in Mongolia, money coined in the Russian mint. In the demands made upon China in 1915, Japan requested exclusive mining rights, the right to settle, cultivate, and purchase land, and partial control of railway building, all in eastern

Mongolia. The situation thus complicated is still (1921) in a transitory state.

1919.—Chinese cancellation of agreements.—In November, 1919, China declared the Russian-Chinese and Russian-Mongol agreements null and void, and cancelled the independence of Mongolia.

1921.—Independence proclaimed.—On February 25, 1921, Baron Ungern von Sternberg, heading the anti-Bolshevist invasion of the territory, forced the local ruler, or Hutuktu, to declare the independence of outer Mongolia. The Hutuktu was crowned king of Mongolia. "The new Chinese government in 1920 held the Living Buddha under arrest in his palace but at the beginning of 1921 Baron Ungern crossed the sacred Bogdo-Ol and approached the palace from the rear. Tibetan riders shot the Chinese sentries with bow and arrow and afterwards the Mongols penetrated into the palace and stole their 'God' who immediately stirred up all Mongolia and awakened the hopes of the Asiatic peoples and tribes."—F. Ossendowski, *Beasts, men and gods*, p. 294.—Since the capture and execution of Ungern by the Soviet authorities on September 15, 1921, China has instituted negotiations to restore the allegiance of Outer Mongolia.

MONOTHELITE CONTROVERSY.—"The Council of Chalcedon having decided that our Lord possessed two natures, united but not confused, the Eutychian error condemned by it is supposed to have been virtually reproduced by the Monothelites, who maintained that the two natures were so united as to have but one will. This heresy is ascribed to Heraclius, the Greek emperor, who adopted it as a political project for reconciling and reclaiming the Monophysites to the Church, and thus to the empire. The Armenians as a body had held, for a long time, the Monophysite (a form of the Eutychian) heresy, and were then in danger of breaking their allegiance to the emperor, as they had done to the Church; and it was chiefly to prevent the threatened rupture that Heraclius made a secret compromise with some of their principal men. . . . Neither . . . the strenuous efforts of the Greek emperors Heraclius and Constans, nor the concession of Honorius the Roman pontiff to the soundness of the Monothelite doctrine, could introduce it into the Church. Heraclius published in A. D. 630 an *Ethesis*, or a formula, in which Monothelitism was covertly introduced. The sixth general council, held in Constantinople A. D. 680, condemned both the heresy and Honorius, the Roman Pontiff who had countenanced it. 'The doctrine of the Monothelites, thus condemned and exploded by the Council of Constantinople, found a place of refuge among the Mardaites, a people who inhabited the mountains of Libanus and Anti-Libanus, and who, about the conclusion of this century, received the name of Maronites from John Maro, their first bishop—a name which they still retain.' . . . In the time of the Crusaders, the Maronites united with them in their wars against the Saracens, and subsequently (A. D. 1182) in their faith. After the evacuation of Syria by the Crusaders, the Maronites, as their former allies, had to bear the vengeance of the Saracenic kings; and for a long time they defended themselves as they could, sometimes inflicting serious injury on the Moslem army,

and at others suffering the revengeful fury of their enemies. They ultimately submitted to the rule of their Mohammedan masters. . . . The Maronites now . . . are entirely free from the Monothelite heresy, which they doubtless followed in their earlier history; nor, indeed, does there appear a single vestige of it in their histories, theological books, or liturgies. Their faith in the person of Christ and in all the articles of religion is now, as it has been for a long time past, in exact uniformity with the doctrines of the Roman Church."—J. Wortabet, *Researches into the religions of Syria*, pp. 103-111, with footnote.

MONROE DOCTRINE: Text and comment on status.—Landmarks leading to declaration.—International situation in 1823.—"On the part of the United States, President Monroe, in his annual message to Congress of December 2, 1823, declared as follows: 'The American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by European powers. . . . We should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered and shall not interfere. But with the governments who have declared their independence and maintained it, and whose independence we have, on great consideration and on just principles, acknowledged, we could not view any interposition for the purpose of oppressing them or controlling, in any other manner, their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition toward the United States.' . . . This is the statement formally asserting what is now known as the Monroe Doctrine. Whatever may be said as to its extent in growth since its enunciation by Monroe, its present necessity, or the advisability of its geographical restriction, it must be said that its assertion by President Monroe as a policy was both timely and effective. The recognition of the Latin-American states by the United States had taken place the previous year and was

followed by Great Britain in 1825. It can be seen that the Monroe Doctrine, accepted and approved by Great Britain as a proper policy in its original wording, is not and never has been international law. It is also neither municipal nor constitutional law, but is a declaration of the national policy of the United States which has been adhered to and followed in the main with respect to European powers. It has varied greatly in its definition and interpretation in the relations of the United States with the other powers of the continent who are generally known as the Latin-American states."—C. H. Stockton, *Outline of international law*, pp. 46-47.—"The Doctrine proclaimed by James Monroe in his presidential Message of December 2, 1823, may be roughly described as a prohibition by the United States of European interference with the political arrangements of the New World. For such a prohibition it is easier to find analogy than exact parallel. Modern Europe, it may be maintained, has its Monroe Doctrine against the Turk, just as ancient Hellas had its Monroe Doctrine against the barbarian. Apart, however, from the fact that nations have been wont to condemn classes of acts as dangerous to themselves, it might at first sight seem that the principles of the Monroe Doctrine were independent of the past. In the sense that the words of 1823 were not the outcome of a series of approximations by the President of the United States to the doctrine which they express, this view indeed appears to be the true one. But we must not lose sight of the fact that for forty years the United States had been hastening towards the position that they assumed in 1823, while in their progress it is possible to distinguish several landmarks on the road to the Monroe Doctrine. . . . Standing midway between the achievement of independence by the United States and the swelling declaration of 1823, the acquisition of Louisiana forms a landmark on the road to the Monroe Doctrine. In common with the growth of internal communication, it promoted the national cohesion of the Federation suddenly called upon to rule an empire. Among its more tangible results were titles, though doubtful ones, to the Oregon district and to the western portion of Florida. The former, indeed, could present no immediate attractions to the United States, but the maritime value of the Floridas, now cut off from the great mass of Spanish dominions, had not failed to arouse their attention. The tide of circumstances ran strongly in their favour. In 1809, when the Presidency of Madison began, Spain found herself so paralyzed in Europe that she could hardly lift a finger to prevent her New World dominions from throwing off her yoke. Great Britain, whose representative at Washington could say to the Secretary of State with the approval of his Government, 'Such are the ties by which His Majesty is bound to Spain that he cannot see with indifference any attack upon her interest in America,' was forbidden by her strained relations with the United States from maintaining by diplomacy, and by her struggle with Napoleon from maintaining by force that guarantee of Spanish possessions to which Spain appealed. The United States, therefore, enjoyed perfect freedom of action in their dealings with West Florida, and a curious prototype of the Monroe Doctrine was the result. . . . In a confidential message recommending to Congress the policy of taking temporary possession of West Florida, the President had advised 'A declaration that the United States could not see, without serious iniquity, any part of a neighbouring territory in which they have, in different respects, so deep and just a concern, pass

from the hands of Spain into those of any other foreign power.' . . . The Floridas, burdensome to Spain, were in 1819 assigned by treaty to the Republic; and in 1821, after a thousand perils, the treaty received the ratification of King Ferdinand. The scale of political power in North America thus turned decisively in favour of the United States. Their increasing importance was attested by their relations with foreign powers. In deference rather to internal faction than to Spain, they renounced the unsubstantial claim to Texas, but Great Britain shrank from opposing their preparations to make settlements within the area drained by the Columbia River—a territory which she regarded as her own. While their northern neighbour showed herself thus little disposed to resist them, the provinces on their south-western frontier passed from the sway of Spain to a state of precarious and unaggressive independence. Thus potent in their own continent, therefore, the United States gained credit with the world outside. Cuba, the Ionian Islands, and even Greece, were ready to welcome their interference. Humoured, if not feared, by Great Britain, courted by Spain, by France, by the Holy Alliance, and by the South Americans, with unity at home and a generation of unprecedented progress to look back upon, their faith in their destiny increased, and the Monroe Doctrine expressed it. . . . Although an augmented territory and, still more, a swelling spirit of self-confidence were required before Americans could utter the words of 1823, it must not be supposed that the Monroe Doctrine was called forth by internal considerations alone. It must rather be regarded as the product of complex circumstances existing in America, North and South, and in Europe. To investigate its origin, then, we must define the national factors which were at work, and examine the contact between them by which the result in question was produced. The United States, indeed, gave the Doctrine birth, but writers and statesmen have often ascribed its paternity to Great Britain. The former opposed it chiefly to the Holy Alliance; the latter, it is probable, to France. Spain and Spanish America were the parties to the quarrel which it was designed to bring to a close. . . . The events of 1815 left France a monarchy, England pledged to its preservation, and the United States at peace with both. In the New World, Louis XVIII had few apparent interests. The ambition of his ministers, however, caused the United States some uneasiness, in particular lest Cuba might be ceded to France by Spain. . . . The presidential message of 1823, in so far as it warned France to go no farther, was a boon to the Old World devised in the interests of the New. Though the peril from the power actually under arms was perhaps more real, greater danger of an extension to the New World of the political system of the Old seemed to the United States to come from the Holy Alliance. This league of European sovereigns under the hegemony of the Czar, though less capable than France of determining a policy, seemed infinitely more capable of putting it into execution. Originally conceived of by Alexander, perhaps, as a society for the realisation of Christian principles of government, it had degenerated into an association of autocrats to stifle every aspiration after constitutional freedom. Of this association, to which the sovereigns of Russia, Austria, Prussia, France, Spain, Naples and Sardinia had fully pledged themselves, the Austrian Chancellor, Metternich, was the centre and the soul. Castlereagh he had esteemed his second self—devoted to him in heart and spirit. Canning he was bound to regard with more distrust, but he clung to the hope that England might be induced

to continue that policy of general acquiescence in the acts of the Holy Alliance which she had not yet finally abjured. The United States, on the other hand, had repulsed the persistent overtures of the Czar to accede to the Holy Alliance. Their government had come to regard it as 'a mere hypocritical fraud,' while they knew that Alexander and Metternich regarded the Republic as 'a standing refutation of their doctrines.' When it is added that Monroe and his advisers believed both that Great Britain might be induced to return to her allegiance, and that the object of the European league was the overthrow of liberty, first in South and then in North America, the relation of the Holy Alliance to the words of 1823 becomes clearer. The danger to America from the Holy Alliance, or from France, or from both powers seemed to be made imminent by the events of 1823 in the Peninsula. The intervention of France in Spain, opposed by Canning in Paris, London, and Madrid with an eloquence lacking nothing but success, was sanctioned, though not dictated, by the Holy Allies. . . . The fall of Cadiz seemed an ill omen for the liberties of America. . . . France, though Chateaubriand was anything but mercenary, might seek indemnity in the New World; and the state of the young republics promised her little difficulty in finding it. As the informal agent of the Holy Alliance, therefore, she had brought about a state of things in Spain which revived European interest in Spanish America. . . . Such was, in brief, the position of the United States, Great Britain, France, the Holy Alliance and Spain in the international situation out of which the Monroe Doctrine arose. To describe this situation is to become conscious of an influence which, though vague, was felt on all sides—the influence of Spanish America. . . . The policy pursued by Great Britain with regard to the revolted colonies during the period anterior to the Monroe Doctrine seems to have been opportunistic. The forces impelling her to action long rested in equilibrium. In South, as in North America, British commerce was the lode-star of the British statesman. . . . The United States, on the other hand, seemed to have pursued a more disinterested policy. They had in fact exposed themselves to the charge of being too hasty in recognizing some of the new communities. . . . Hence at the time when it becomes necessary to study in detail the actual composition of the President's message, the Administration had for six years pursued a policy of peace and patriotism. Standing absolutely aloof from the quarrels of the Old World, they had shown in the questions of Florida, of Cuba, of the north-west, and of America south of their own borders, that they would pursue their own interests regardless of European dictation. Their relations with Great Britain, relations which had improved into something approaching concert, had been governed by the same determination. While their intercourse with the individual powers of the European continent had been friendly, the collective principles of the Holy Alliance stood in marked contrast to their own. The battle-ground of conflicting opinions was South America, and the cry of the United States was the Message of Monroe."—W. F. Reddaway, *Monroe Doctrine*, pp. 3, 7-12, 17-21, 25, 43-44.—See also U.S.A.: 1823; LATIN AMERICA: 1823; ENTANGLING ALLIANCES.

1827-1867.—Early history of enforcement.—Relation to Cuba.—Polk doctrine.—Action of United States in Mexico.—As early as 1827, European powers were warned that the United States would not tolerate the acquisition of Cuba by any other nation. Van Buren, when secretary of state, repeated the warning. In 1840, it was rumored that

Great Britain was going to wrest Cuba from Spain and Forsyth explicitly stated that the United States would use her "military and naval resources" to prevent such actions. "In 1845, . . . President Polk declared that the United States would not permit any European intervention on the North American continent. This, as Professor Coolidge has brought out, pushed the theory further than it has been carried out in practise, although it restricted the original idea by leaving South America out of account. A few years later, while we [the United States] were engaged in civil war, Napoleon III attempted to set up a European monarch in Mexico. Scarcely had we recovered, however, from the throes of our conflict, when Mr. Seward took up with the French government the necessity for the withdrawal of the French troops [1866] from Maximilian's support. Here we were acting strongly in accordance with the best traditions of the Monroe Doctrine."—H. Bingham, *Monroe Doctrine*, pp. 7-8.

1870-1895.—Santo Domingo episode.—Venezuela dispute.—In 1870 President Grant made his contribution to the history of the Monroe Doctrine when in relation to the disposition of the island of Santo Domingo he declared that no territory on this continent should be subject to transfer to a European power. President Cleveland's bold declaration in 1895 during the Venezuelan boundary dispute with Great Britain, viz.: that it would be the "duty of the United States to resist by every means in its power, as a wilful aggression upon its rights and interests, the appropriation by Great Britain of any lands or the exercises of governmental jurisdiction over any territory which after investigation we have determined of right belongs to Venezuela," is another notable instance of recognition of the doctrine. The Venezuelan incident resulted in the adoption officially of the Monroe Doctrine by Congress when it endorsed the executive policy and in its acceptance by Great Britain. "According to the *London Times*, Great Britain admitted 'that in respect of South American Republics the United States may not only intervene in disputes, but may entirely supersede the original disputant and assume exclusive control of the negotiations.'"—P. L. Haworth, *United States in our own times*, p. 222.—See also U.S.A.: 1805 (December).

1898-1899.—Spanish-American War and imperialism.—Conditions in Cuba, in 1808, were, according to President McKinley, "a constant menace to our peace and . . . an enormous expense." This was the chief reason for the Spanish-American War (see U.S.A.: 1808, and after), although not the only one. The American people were determined to drive Spain from the West Indies. Cuba was only ninety miles off the coast of Florida. "The ultimate result of the Spanish-American war, together with the enormous advantages obtained by the United States through the treaty concluded with the government of Madrid, naturally produced a vivid impression throughout the American continent, and especially among the republics of Spanish origin. The public press of England, and of France, also did much toward the excitement of passions and ill will which became evident in Latin-America on all sides. Economists, statesmen, and writers, of every sort, systematically emphasized this giant step taken by the yankee mammoth in its policy of absorption and enslavement of all of the other weaker peoples of America."—D. de Abranches, *Brazil and the Monroe Doctrine*, p. 53.

1899.—Considered at first Hague peace conference.—"The entire plan for the tribunal and its use is voluntary, so far as sovereign States are con-

cerned. The only seeming exceptions to this rule are contained in Article 1, which provides that the Signatory Powers agree to employ their efforts for securing the pacific regulation of international differences; and Article 27, which says that the Signatory Powers consider it to be a duty, in the case where an acute conflict threatens to break out between two or more of them, to remind those latter that the permanent court is open to them. The obligation thus imposed is not legal or diplomatic in its nature. These articles merely express a general moral duty for the performance of which each State is accountable only to itself. In order, however, to make assurance doubly sure and to leave no doubt whatever of the meaning of the Convention, as affecting the United States of America, the Commission made the following declaration in the full session of the Conference, held July 25:—"The Delegation of the United States of America, in signing the Convention regulating the peaceful adjustment of international differences, as proposed by the International Peace Conference, make the following declaration:—Nothing contained in this Convention shall be so construed as to require the United States of America to depart from its traditional policy of not intruding upon, interfering with, or entangling itself in the political questions or policy of internal administration of any foreign State; nor shall anything contained in the said Convention be construed to imply a relinquishment by the United States of America of its traditional attitude toward purely American questions.' Under the reserve of this declaration the United States delegates signed the Arbitration Convention itself. Article 8 of the Convention, providing for a special form of Mediation, was proposed individually by Mr. Holls of the United States Commission. . . . It is hoped that in particular crises, when the other means provided by the Convention for keeping or restoring peace have failed, it may prove to have real and practical value. It is certain that, by the Continental States of Europe, it has been exceedingly well received."—*General Report of the American Commission.*

"Objection has been made to [the International Court of Arbitration] on the ground that submission to it is purely voluntary and that no executive authority has been provided to carry out its decrees. The answer to all such objections is simply that the power of enlightened public opinion is relied upon to be amply sufficient for the purpose of insuring obedience to every just mandate of this Court. In the case of the United States of America the judgments of the Court, according to the decisions now in force, will have a peculiarly binding force. An agreement to submit a case to the Court cannot be made by the United States, except by way of a treaty, which, when ratified by the Senate, becomes the supreme law of the land. In the case of *La Ninfa, Whitelaw v. The United States* (75 Fed. Rep., 513), it was decided by the United States Circuit Court of Appeals in California that by virtue of the treaty the judgment of the Court of Arbitration provided for by the terms of the treaty has all the force of a federal statute, and it is itself the supreme law of the land, binding upon every individual citizen of the United States, including all federal and State authorities. For us, at least, the International Court of Arbitration at The Hague will, if this view prevails, in reality be the highest possible tribunal, with an authority binding even on our own United States Supreme Court. Article 27 aims, in a measure, to supply the deficiency of the provision for obligatory arbitration, in that it declares it to be the duty of all Signatory powers to remind any one or more of them-

selves, in case of a threatened dispute, that the permanent Court of Arbitration is open to them. What particular effect this particular article will have must be left to the future. Without modification or reservation the article, when ratified by the United States, would have constituted a complete abandonment of the time-honored Monroe Doctrine. Accordingly the representatives of the United States declined to sign the treaty, except under a reservation or declaration, which was solemnly accepted by the Peace Conference, thus materially modifying the jurisdiction of the Court [see above]. . . . By this declaration the Monroe Doctrine was not only self-guarded, but it was stated and vindicated more emphatically than ever before in our history, and the people of this country are, therefore, in a position to cordially support the International Court of Arbitration, without the fear that the Court itself, or the fact of its establishment, may ever be used against this country, or to the embarrassment of its diplomacy and traditional policy."—F. W. Holls, *International court of arbitration at The Hague (Paper read before the New York State Bar Association, Jan. 15, 1901)*.—See also HAGUE CONFERENCES: 1899.

20th century.—Expansion.—Economic character.—"The Monroe Doctrine continued in the twentieth century to be, speaking broadly, the cornerstone of American international policy. None the less, uncertainty concerning the Doctrine's meaning and scope steadily grew. Some writers and publicists urged that the Doctrine no longer squared with the facts of the international situation—that it was obsolete and should be deliberately abandoned. Some who took this view thought that prevention of European and Asiatic encroachment in the western hemisphere should be undertaken by the United States only in conjunction with three of the southern nations which had become strongest and most progressive, the 'A B C powers,' Argentina, Brazil, and Chile. But most people were unwilling to admit that the Doctrine was outgrown. The most common notion was rather that, while the pronouncement of President Monroe in 1823 had no bearing in the twentieth century, there was none the less a Doctrine of Permanent Interest which underlay American foreign policy from Washington to Wilson, that from this Doctrine the United States derived the self-imposed task of preventing foreign aggression in the western hemisphere; that the exact content and significance of the Doctrine were variable, taking color from new situations as they arose; and that the Doctrine might as well be labelled with the name of Monroe as any other. That the Doctrine was still alive was proved not alone by frequent allusions in speeches and state papers, but by forceful reassertions and by definite acts."—F. A. Ogg, *National progress (American Nation Series)*, pp. 279-280.—As its history suggests, "the principle laid down by Monroe has been elaborated and expanded to meet new conditions in the official utterances of later Presidents, including Polk, Grant, Hayes, Harrison, Cleveland and Roosevelt. In the words and actions of the last two Presidents mentioned, the Monroe Doctrine assumed a more positive and aggressive tone and, in the twentieth century, it came to be known as the policy of the 'Big Stick' or the exercise of international police power. Finally, President Wilson, in an address to the Senate on the terms of a possible cessation of the Great War proposed that "the nations should with one accord adopt the doctrine of President Monroe as the doctrine of the world.' The Monroe Doctrine . . . was thus the exclusive product of executive initiative in foreign policy and did not receive official recognition by

Congress until seventy-three years after its original promulgation by the President. . . . It is to be noted . . . that both Santo Domingo and Haiti have been transformed into quasi-protectorates of the United States through the positive and aggressive application of the Monroe Doctrine carried out on the initiative of the President during the administrations of Roosevelt and Wilson. . . . In going beyond a mere display of force to the actual exercise thereof the President usually conforms his action to the rules of international law, which recognize the right of a nation, under certain circumstances, to resort to non-amicable measures of redress short of war, such as reprisals, pacific blockade, and other forms of non-belligerent interposition. In the case of the *Paquette Habana*, the Supreme Court declared that 'international law is part of our law, and must be ascertained and administered by the courts of justice of appropriate jurisdiction, as often as questions of right depending upon it are duly presented for their determination. For this purpose, where there is no treaty, and no controlling executive or legislative act or judicial decision, resort must be had to the customs and usages of civilized nations.' This is the rule which must be regarded as applying when the President, as commander-in-chief, directs the movements of our forces in non-amicable measures short of war. Action of this kind has usually been taken in Latin-America rather than in Europe or Asia, and in recent years it has been so frequent as to have become a main factor in developing a new and more sweeping interpretation of the Monroe Doctrine. The explanation lies largely, of course, in our proximity to the Latin-American world, in the lack of order and stable government there, in our acquisition of islands in the Caribbean, and in our construction of and interest in the Panama Canal. . . . Where we have a treaty with a foreign country authorizing us to do so, the President, by virtue of his power to see that the laws (including treaties, which are a part of the supreme law of the land) are executed, may, as commander-in-chief, send military or naval forces to that country to maintain peace and order, irrespective of whether American interests are directly involved. This is not war, nor necessarily a preliminary of war; rather, it is intended as a measure for the prevention of war, as was notably true in a number of instances in which the United States landed forces in Latin-American countries. Such action has often been considered necessary in order to avoid armed intervention by European powers in the affairs of such countries in violation of the Monroe Doctrine. As we have seen, the peculiar relations with and interests in Latin America which are construed to give us a right of intervention, have now in several instances, e.g., Cuba, Panama, and Haiti, been regularized by treaty provision."—J. M. Mathews, *Conduct of American foreign relations*, pp. 5-6, 11-12, 274, 291-292.

1901-1903.—Interpretation relative to German claims against Venezuela.—Recognition by Germany. See VENEZUELA: 1901; U.S.A.: 1902-1903.

1904-1905.—Case of Santo Domingo. See SANTO DOMINGO: 1904-1907; DOLLAR DIPLOMACY.

1905.—Roosevelt's endorsement and interpretation of the doctrine.—"President Roosevelt, in 1905, undertook to maintain in Santo Domingo, by the use of our naval forces, a diplomatic situation pending action upon a treaty by the Senate, which, in fact, failed of ratification. In 1903 he maintained a naval force in the neighborhood of Panama pending the outcome of a successful revolution therein against Colombia, and the result was rati-

fied by the treaty of the following year with Panama in which the United States promised to guarantee and maintain the independence of that republic. This is an example of the use of the 'big stick.' The landing of forces in Latin-American countries was, in several instances, justified by President Roosevelt under the doctrine of an 'international police power,' which is a positive interpretation of the Monroe Doctrine."—J. M. Mathews, *Conduct of American foreign relations*, pp. 292-293.—President Roosevelt's theory of the Monroe Doctrine is embodied in his message to Congress in December, 1905: "One of the most effective instruments for peace is the Monroe Doctrine as it has been and is being gradually developed by this Nation and accepted by other nations. No other policy could have been as efficient in promoting peace in the Western Hemisphere and in giving to each nation thereon the chance to develop along its own lines. If we had refused to apply the Doctrine to changing conditions it would now be completely outworn, would not meet any of the needs of the present day, and indeed would probably by this time have sunk into complete oblivion. It is useful at home, and is meeting recognition abroad, because we have adapted our application of it to meet the growing and changing needs of the hemisphere. When we announce a policy, such as the Monroe Doctrine, we thereby commit ourselves to the consequences of the policy, and those consequences from time to time alter. It is out of the question to claim a right and yet shirk the responsibility for its exercise. Not only we, but all American Republics who are benefited by the existence of the Doctrine, must recognize the obligations each nation is under as regards foreign peoples no less than its duty to insist upon its own rights. That our rights and interests are deeply concerned in the maintenance of the Doctrine is so clear as hardly to need argument. This is especially true in view of the construction of the Panama Canal. As a mere matter of self-defence we must exercise a close watch over the approaches to this canal; and this means that we must be thoroughly alive to our interests in the Caribbean Sea. There are certain essential points which must never be forgotten as regards the Monroe Doctrine. In the first place, we must as a nation make it evident that we do not intend to treat it in any shape or way as an excuse for aggrandizement on our part at the expense of the republics to the south. We must recognize the fact that in some South American countries there has been much suspicion lest we should interpret the Monroe Doctrine as in some way inimical to their interests, and we must try to convince all the other nations of the continent once and for all that no just and orderly government has anything to fear from us. There are certain republics to the south of us which have already reached such a point of stability, order, and prosperity that they themselves, though as yet hardly consciously, are among the guarantors of this Doctrine. These republics we now meet not only on a basis of entire equality, but in a spirit of frank and respectful friendship, which we hope is mutual. If all the republics to the south of us will only grow as those to which I allude have already grown, all need for us to be the especial champions of the Doctrine will disappear, for no stable and growing American Republic wishes to see some great non-American military power acquire territory in its neighborhood. All that this country desires is that the other republics on this Continent shall be happy and prosperous; and they cannot be happy and prosperous unless they maintain order within their boundaries and behave with

a just regard for their obligations toward outsiders. It must be understood that under no circumstances will the United States use the Monroe Doctrine as a cloak for territorial aggression. We desire peace with all the world, but perhaps most of all with the other peoples of the American Continent. There are of course limits to the wrongs which any self-respecting nation can endure. It is always possible that wrong actions toward this Nation, or toward citizens of this Nation, in some State unable to keep order among its own people, unable to secure justice from outsiders, and unwilling to do justice to those outsiders who treat it well, may result in our having to take action to protect our rights; but such action will not be taken with a view to territorial aggression, and it will be taken at all only with extreme reluctance and when it has become evident that every other resource has been exhausted. Moreover, we must make it evident that we do not intend to permit the Monroe Doctrine to be used by any nation on this continent as a shield to protect it from the consequences of its own misdeeds against foreign nations. If a republic to the south of us commits a tort against a foreign nation, such as an outrage against a citizen of that nation, then the Monroe Doctrine does not force us to interfere to prevent punishment of the tort, save to see that the punishment does not assume the form of territorial occupation in any shape. The case is more difficult when it refers to a contractual obligation. Our own government has always refused to enforce such contractual obligations on behalf of its citizens by an appeal to arms. It is much to be wished that all foreign governments would take the same view. But they do not; and in consequence we are liable at any time to be brought face to face with disagreeable alternatives. On the one hand, this country would certainly decline to go to war to prevent a foreign government from collecting a just debt; on the other hand, it is very inadvisable to permit any foreign power to take possession, even temporarily, of the custom-houses of an American Republic in order to enforce the payment of its obligations; for such temporary occupation might turn into a permanent occupation. The only escape from these alternatives may at any time be that we must ourselves undertake to bring about some arrangement by which so much as possible of a just obligation shall be paid. It is far better that this country should put through such an arrangement, rather than allow any foreign country to undertake it. To do so insures the defaulting republic from having to pay debts of an improper character under duress, while it also insures honest creditors of the republic from being passed by in the interest of dishonest or grasping creditors. Moreover, for the United States to take such a position offers the only possible way of insuring us against a clash with some foreign power. The position is, therefore, in the interest of peace as well as in the interest of justice. It is of benefit to our people; it is of benefit to foreign peoples; and most of all it is really of benefit to the people of the country concerned. This brings me to what should be one of the fundamental objects of the Monroe Doctrine. We must ourselves in good faith try to help upward toward peace and order those of our sister republics which need such help. Just as there has been a gradual growth of the ethical element in the relations of one individual to another, so we are, even though slowly, more and more coming to recognize the duty of bearing one another's burdens, not only as individuals, but also as among nations."—T. Roosevelt, *Message at the beginning of the 1st session of the 59th Congress, Dec. 5, 1905 (Presiden-*

tial Addresses and State Papers, v. 4, Collier edition, pp. 602-606).

1906.—Stated as an all-America doctrine by Secretary Root, at the Third International Conference of American Republics, at Rio de Janeiro, in 1906. See AMERICAN REPUBLICS, INTERNATIONAL UNION OF: 1906.

1911-1914.—Application to foreign investments.—"In 1911 the creditors of an American company holding a tract of land on the Mexican coast, in the vicinity of Magdalena Bay, sought from the Taft Administration permission to sell their rights to a Japanese fishing company. There was no evidence that the Tokio government was in any way concerned; but assent was withheld, and on August 2, 1912, the Senate passed, by a vote of 51 to 4, a resolution introduced by Senator Lodge, as follows: 'That when any harbor or other place in the American continents is so situated that the occupation thereof for naval or military purposes might threaten the communication or the safety of the United States, the government of the United States could not see, without grave concern, the possession of such harbor or other place by any corporation or association which has such a relation to another government, not American, as to give that government practical power of control for naval or military purposes.' [See U.S.A.: 1912 (July).] There could be no doubt that one branch of Congress, at all events, believed in the Doctrine of Permanent Interest. Furthermore, when in 1913 an English house, S. Pearson and Son, Ltd., which had vast holdings of oil-producing lands in Mexico, sought an extensive oil concession in Colombia, it was turned from its purpose chiefly by adverse opinion in the United States. In both cases the fear was that alien business interests might prove an entering wedge for political interference or domination. These two episodes very well illustrate the principal change which the so-called Monroe Doctrine underwent in the first decade and a half of the century. Previously, the Doctrine was wholly political. It aimed to prevent foreign interference with the American governmental systems and the extension of foreign sovereignty to American soil. Purely economic engagements and operations were unknown to it. But the United States was gradually forced to recognize that the investment of foreign capital in a backward country may easily lead to economic absorption, and that economic absorption is likely to result in open or disguised political control. Latin America bristles with opportunities for such manipulation. Hence the new Doctrine is economic as well as political. Concretely applied, it means two things: (1) European and Asiatic peoples are to be discouraged from acquiring lands and other vested interests in America on such a scale as to suggest political control; (2) weaker states whose financial looseness might tempt creditor nations to intervene in their affairs are to be brought under American protection and put in a position to meet their obligations fully and promptly."—F. A. Ogg, *National progress (American Nation Series, v. 27, pp. 280-283, 279-282).*

Relation to World War.—American neutrality.—"The outbreak of the World War in 1914 left America shocked, incredulous, and impatient. With our traditional ignorance and indifference regarding world affairs, we had come to regard a great European conflict as no longer probable. We resented the war as a wicked and unwarranted interference with the peace and happiness of the world. As a people we denounced the invasion of Belgium, anathematized Germany for her part in the beginning of the struggle, clung tenaciously to

our theory of isolation, and accepted the government's traditional policy of neutrality. President Wilson's proclamation (of neutrality) was received with widespread approval. It is true it was subsequently made the subject of much *ex post facto* criticism by those upon whom hind sight had conferred superior vision. But at the time the policy of neutrality was the inevitable product of our American policy, our customary attitude toward European conflicts, our peace-loving traditions, and our blind, naive confidence in the safety and permanence of our isolation. Any other policy would have been almost inconceivable and at that time would have encountered tremendous opposition. . . . The wanton violation of American rights was the immediate and legal cause for our abandonment of neutrality and isolation and our entering the world conflict. But back of these matters were more fundamental considerations that were slowly taking form in the American mind. While we had honestly and effectively observed the legal obligations of our neutrality, our sympathy was increasingly for the allies. The sinister character of German diplomacy, her worship of brutal, arbitrary power, her savage methods of warfare, her absolute disdain of every consideration of honor, decency, and law, together with her gigantic military power, began to impress the American mind, that despite our 'splendid isolation,' such a power, if victorious, would menace not only the freedom of Europe but the democracies of the world. For there was dawning in American consciousness the understanding that the war was not merely a conflict between the contending nations but a life and death struggle between the democracies of Europe and the forces of autocratic power. At last America realized that her isolation had disappeared, that she was a part of the civilization of the world, and that she dared not evade its obligations. As our statesmen of 1823 realized that the independence and security of the newly founded republics of this hemisphere were essential to our 'peace and safety,' so today America has found that her future is inseparably linked with the destinies of democracy and the civilization of the world. Inventive genius has annihilated space and time and the Atlantic no longer affords to the democracy of the Americas effective barriers against the wars, intrigues, and autocracies of Europe. We clung desperately to the idea of isolation, but we found it a delusive hope. We found ourselves merged into a new world order where aloofness was neither possible nor worthy. We found ourselves confronted with new world problems that challenged our statesmanship and tested our devotion to the cause of liberty."—A. B. Hall, *Monroe Doctrine and the Great War*, pp. 127-130.

Relation to Covenant of League of Nations.—**New world conditions.**—"This proposed covenant [of the League of Nations] encountered much hostile opposition based, among other things, upon its alleged conflict with the Monroe Doctrine. . . . These critics contend that our adherence to the League of Nations would involve the impairment or abandonment of the Monroe Doctrine in two respects. In the first place it would violate our policy of isolation and involve us in an entangling alliance. In the second place it would sacrifice the Monroe Doctrine itself or at least our freedom of action in its enforcement. In considering the first objection it should be observed that the Doctrine of Isolation with its opposition to entangling alliances cannot properly be said to be a part of the Monroe Doctrine. [See ENTANGLING ALLIANCES.] It received its most authoritative expression in Washington's *Farewell*

Address, but those who now rely upon it seem to ignore that Washington did not regard it as an eternal maxim but rather a temporary measure 'to gain time to our country to settle and mature its yet recent institutions, and to progress without interruption to that degree of strength and consistency which is necessary to give it, humanly speaking, the command of its own fortunes.' The Doctrine of Isolation was adopted as the best means, under the then existing circumstances, to safeguard the young republic during the period of its infancy. While Monroe sought to gain strength for his doctrine by emphasizing our policy of isolation, the two policies were independent both in their origin and nature. Nevertheless we may well inquire if our becoming a member of the League of Nations would involve a dangerous or unwarranted departure from our policy of isolation. When that policy was formulated we were a weak and struggling republic, with a long and undefended coast line. The isolation of the New World from autocracies and conflicts of the Old was an undisputed fact. Engrossed in the conquest and development of a great continent, we had little cause for conflict with the interests of Europe. The Atlantic seemed a sufficient barrier against European powers. Our isolation seemed complete. But today the conditions that made the policy of isolation essential to our defense have disappeared. Modern science has annihilated space and time. America has long since passed the stage of self-sufficiency. Our commerce is found upon every sea. Our competition is felt in every market. Our politicians still render lip service to the policy, but our statesmen, in dealing with actual problems, have ignored it. It is considerably over half a century since Perry's expedition to Japan announced to the world American aggressive interest in the Eastern Hemisphere. We have participated in many European conferences dealing with non-American affairs. We have acquired islands in the Far Pacific. When European powers contemplated interference with Chinese integrity, America played a conspicuous part because her interests were involved. We have played a worthy part in the two Hague conferences. When the peace of Europe was threatened over the Moroccan question we sent representatives to the conference at Algeciras, and there is authority for the statement that America played more than a passing rôle, although the question at issue was largely the maintenance of the European balance. It is true that the Senate attached to its ratification of the treaty there adopted, a declaration that the sole purpose of America's participation was the protection of our citizens and commerce, the desire to aid in the removal of friction that might menace the peace between the powers concerned and 'without purpose to depart from the traditional American foreign policy which forbids participation by the United States in the settlement of political questions which are entirely European in their scope.' There can be little doubt, however, that the motives of President Roosevelt and Secretary of State Root were essentially political, that they recognized that our isolation had disappeared, that a general European war would affect the most fundamental interests of America, and that it was the part of vision, courage, and common sense to recognize the patent facts, and to grapple with the European problem in order that America might be spared the menace of a European war. The absolute soundness of this view has been amply demonstrated in the World War. In spite of our vaunted isolation, the peaceful aspirations of our people, and the marvelous patience

of our President, our most sacred interests were vitally affected and our entrance into the tragic conflict became inevitable. America should now know that she can no longer view with idle equanimity the devastating quarrels of Europe, for great European wars have now become our own. With these facts in mind, the American proponents of the League of Nations contend that they are merely following the vital interests of America, wherever they may lead, in the hope that at least some wars may be averted and that America may be spared the repetition of the recent tragedy. They have ample precedent in the examples cited above, and the same spirit of national self-defense that prompted Washington to take advantage of the facts of isolation to safeguard, temporarily, the interest of America, would seem to demand, with equal force, the departure from that doctrine when the facts of isolation have disappeared and our vital interests have become so intimately concerned with the quarrels of Europe. Washington wanted isolation to spare America the scourge of war. Because of modern conditions, the same object can only be attained by international organization. . . . It is true that under Article X, it [would become] . . . the duty of the United States to respect and preserve the integrity of the members of the league, she being the sole judge of the nature and extent of the obligation. The difference, however, between this mutual undertaking for self-protection and an entangling alliance would appear obvious. It would seem therefore that so much of the case against the League of Nations as rests upon the Doctrine of Isolation is not persuasive or convincing. . . . As former President Taft has so wisely observed, the recent war has demonstrated that the 'so-called policy against entangling alliances' is 'inconsistent with the needs of this nation and the needs of the world to secure the peaceful future of both.'—A. B. Hall, *Monroe Doctrine and the Great War*, pp. 135-142.—See also U. S. A.: 1919 (July-September): Discussion over League of Nations; DOLLAR DIPLOMACY.

Application by Japan to Asia.—“With the outbreak of the European war in 1914, Japan, as one of the allies, prepared to besiege Tsing-tao, capital of Kiao-Chau, a province leased by Germany, official notice being given to the United States that the province would be returned to China. This was not done and it was soon learned that Japan was pushing an unfavorable treaty upon the Chinese. The proposed treaty included twenty-one demands, so sweeping in extent, that, if granted, it meant vassalage for China. They provided for a thorough domination of China's economic and political affairs. The proposal, finally backed up by an ultimatum, aroused the indignation of China and caused grave concern to the United States as well as to Japan's allies. China was forced to accept the treaty, being powerless to resist. Defenders of Japan's policy relied much upon Japan's Monroe Doctrine for Asia, which it was asserted, was the mere application of the same principles to Asia that the United States had applied to the Americas. Japan did not cease all of this time to insist that she did not propose to interfere with Chinese integrity, the 'Open-Door' or the treaty rights of any other power. It was argued that since Japan respected the Monroe Doctrine of America, that we should respect the Monroe Doctrine of Japan. The argument did not find popular response in America, where Japan's attitude created undisguised suspicion and hostility. It has been argued that it is to American advantage to support the policy of

Japan and thus drive from China the competition of Europe, for it is with the latter that we have the strongest contest for Oriental trade. Furthermore, such an attitude would make for harmony and understanding between the two peoples. To this it is answered that if we drive European powers from China and gain the friendship of Japan, we force these powers to seek their markets in Latin America, thus increasing the strain upon the Monroe Doctrine and gaining the ill-will of European friends. Moreover, it is argued that Japan's attempt to defend her policy by the analogy to the Monroe Doctrine is not accurate or fair. It is a policy of aggression and not defense; it tends to destroy the integrity of China rather than to preserve it; and finally, despite assertions to the contrary, it seeks exclusive rights for Japan rather than equal opportunities for all. When these things are considered together with the relative size and population of Japan and China, it is not surprising that the new Monroe Doctrine for Asia has aroused suspicion and resentment in America and in the world. Late in 1917 there was an exchange of identical notes between the representatives of Japan and the United States, commonly referred to as the Ishii-Lansing agreement, by which the spirit of suspicion and hostility between the two countries was sought to be removed and a basis of mutual sympathy and understanding achieved. The notes recognized the special interest of Japan in China, 'particularly in the part to which her possessions are contiguous,' but also declared for the preservation of Chinese integrity and independence, and stated their adherence 'to the principle of the so-called "Open Door" or equal opportunity for commerce and industry in China.' This agreement, on its face, seems to accord with the traditional ideals and principles of American policy, and if carried out in that spirit will be a source of helpfulness for China and afford a sound basis for mutual understanding between America and Japan."—A. B. Hall, *Monroe Doctrine and the Great War*, pp. 92-94.

Latin American doctrines.—Calvo.—Drago.—Comparison with Monroe Doctrine.—Views for and against American practice.—“Attempts of European powers to collect by force debts from Venezuela, and also Roosevelt's statements that the coercion of a Latin-American state was not contrary to the Monroe Doctrine provided that such punishment did not result in the acquisition of territory by a non-American power, evoked a significant response from Argentina's secretary of foreign affairs, Luis M. Drago. As the view which he then expressed was largely a re-statement of the Calvo Doctrine, that doctrine should . . . be described. Many years earlier [1867] Carlos Calvo, a noted Argentine publicist, had in his work on international law declared that the recovery of debts and the collection of private claims did not justify armed intervention by governments. He also denied the responsibility of states for injuries that had been suffered by aliens during internal dissensions or revolts. Calvo accordingly protested against the use of force by European nations to collect private claims or debts in Latin America. On December 29, 1902, in a note to Martin Garcia Mérou, the Argentine minister in Washington, Secretary Drago enunciated his doctrines . . . Drago's note was . . . a protest of the Argentine government against forcible intervention by European powers to collect debts that had been incurred by a Latin-American nation."—W. S. Robertson, *History of Latin-American nations*, p. 552. “If the Calvo Doctrine is sound, it binds the United States; but our government

has never committed itself to this principle. In the Pan-American Congress of 1800 all the representatives, except those of the United States, voted for a declaration that foreigners should have the same status as citizens and the same legal protection for life and property, and no more. The United States delegates argued that it was the practice of governments to back up claims for unpaid public bonds and for forced loans and other oppressive acts of actual governments. The Latin-American states naturally favor Calvo's Doctrine, and at the Pan-American Congress of 1906 at Rio unanimously voted to—'Consider the point of inviting the Second Peace Conference at The Hague, to consider the question of the compulsory collection of public debts, and, in general, tending to diminish among nations conflicts having an exclusively pecuniary origin.' . . . The Drago Doctrine differs in many respects from the Calvo Doctrine. It is not simply the opinion of a text writer but an official proposal from one of the most responsible Latin-American States. It does not object to diplomatic action, but to the use of forcible measures, such as were at that moment in preparation against a Latin-American State. Another difference is that the Calvo Doctrine remains to this day a suggestion, while the Drago Doctrine has been approved by the United States and by the Hague Convention as a general principle of international law. After the Venezuelan trouble was all over President Roosevelt (February 15, 1905) said to the Senate: 'Except for arbitrary wrong, done or sanctioned by superior authority, to persons or to vested property rights, the United States government, following its traditional usage in such cases, aims to go no further than the mere use of its good offices, a measure which frequently proves ineffective. On the other hand, there are governments which do sometimes take energetic action for the protection of their subjects in the enforcement of merely contractual claims, and thereupon American concessionaires, supported by powerful influences, make loud appeal to the United States government in similar cases for similar action. . . . Thus the attempted solution of the complex problem by the ordinary methods of diplomacy reacts injuriously upon the United States Government itself, and in a measure paralyzes the action of the Executive in the direction of a sound and consistent policy.' At the Pan-American Conference at Rio in 1906, the United States delegates were instructed in favor of the Drago Doctrine by Secretary Root: 'It has long been the established policy of the United States not to use its armed forces for the collection of ordinary contract debts due to its citizens by other governments. We have not considered the use of force for such a purpose consistent with that respect for the independent sovereignty of other members of the family of nations which is the most important principle of international law and the chief protection of weak nations against the oppression of the strong. It seems to us that the practice is injurious in its general effect upon the relations of nations and upon the welfare of weak and disordered States, whose development ought to be encouraged in the interest of civilization; that it offers frequent temptation to bullying and oppression and to unnecessary and unjustifiable warfare.' The delegates were further instructed however, to push for a reference of the whole question to the Second Hague Convention, where it was presented and defended by the representatives of the United States. The Drago Doctrine if strictly interpreted might lead to the same results as the Calvo Doctrine; for if a delinquent power

could not be coerced it might indefinitely refuse any kind of settlement. In the Hague Convention, therefore, a way was sought which would at least compel debtor States to show cause for refusing to pay their creditors. Dr. Drago was himself present and took part in the discussion, and the conference finally came together (by a vote of 30 in favor and 5 absentions) in the following statement, which became a part of the Hague Conventions of 1907: 'The contracting Powers agree not to have recourse to armed force for the recovery of contract debts claimed from the Government of one country by the Government of another country as being due to its nationals. This undertaking is, however, not applicable when the debtor State refuses or neglects to reply to an offer of arbitration, or, after accepting the offer, prevents any "Compromise" from being agreed on, or, after the arbitration, fails to submit to the award.' The Hague Convention hoped by its action to make the Drago Doctrine a part of international law which would apply at all times all over the world; and it set up an international arbitration tribunal to which disputes could be submitted so as to carry out the second of the votes.

To test the new arbitral machinery and to lead the Latin-American States into the way of peaceful adjustment of their debts, the United States in 1902 brought before the Hague Tribunal the 'Pious Fund' case, which was a long-standing controversy with Mexico over a beneficiary fund for use in California. There was no danger of an invasion of Mexico on that issue, but it was a convenience to have the court decide in favor of the United States. In 1910, a less artificial case was made—the claim of the Orinoco Steamship Company against Venezuela. The point was that this American corporation had been deprived of its concession for exclusive trade in certain rivers, for which damages it claimed \$1,200,000 and eventually the court awarded \$92,000. The difficulty with the Drago Doctrine is that it settles nothing except that military expeditions shall not be undertaken for small reasons. As the Doctrine was finally stated in the Hague Conference, any European power has a right to demand arbitration of disputes over contract debts. It may also use diplomatic pressure; may combine with other powers to remonstrate and to threaten; and then, if arbitration is not forthcoming, it may still,—for all of Drago or the Hague Conference,—send ships, land troops, and hold a piece of territory until it gets satisfaction. The Drago Doctrine is only a lightning rod which carries off the electricity which may happen to strike within a limited area. It does nothing to prevent thunder-storms. The real protection of Latin-American states from being assailed for comparatively light causes which do not involve the life and limb of aliens, is still outside of international law. Is the American Doctrine, as interpreted by Roosevelt in his messages on the Venezuela affair of 1902, such a protector? So long as there is no agreement between the Latin-American states that they will stand by each other in such controversies, their hope must be in the sincerity and good will of the United States; still further, they are dependent on our power to carry out the promises contained in the declarations of Presidents and Secretaries of State. Further, the Calvo-Drago-Monroe Doctrine, when all dovetailed together, covers only a small portion of the possible sources of trouble. It does not offer a solution of revolutionary conditions such as those of Mexico. It does not affect the vast field of

international difficulties caused by the presence of aliens in such revolutionary countries. The principle that a regular government shall not be responsible for the acts of a revolutionary body is a good one; people who deliberately place themselves in a revolution area must expect troubles. Yet what is to be done where there is a succession of revolutions and dictators?"—A. B. Hart, *Monroe Doctrine: An interpretation*, pp. 264-268.—See also DRAGO DOCTRINE.—"No doubt one of the chief impediments to the development and preservation of relations of amity and intimacy between the United States and the other independent nations of this hemisphere is the want of information as to the conditions which actually exist in the various countries and the consequent prevalence of erroneous impressions in regard to those conditions. As a result of the fact that the countries to the south of the United States have not all a common origin, and that, while all but one formerly belonged to Spain, the largest of them all, Brazil, was once a colony of Portugal, it has become the fashion to group them indiscriminately as 'Latin America.' The employment of this phrase, although it may be necessary, has tended to confirm two radically erroneous impressions, one being that all the countries called Latin are really Latin; and the other, that all the countries called Latin are alike. . . . They exhibit as between themselves differences more pronounced than those that exist between the United States and some of them. . . . As a result of the misapprehensions . . . little has been understood in the United States of the causes of the internal disorders by which some of the American republics have been afflicted. Regarding all Latin-American countries as one, a tendency has existed to assume that government in all of them is equally unstable. . . . [To illustrate the attitude which Brazil, for instance, took toward accepting the American doctrine one might note that] the Third International American Conference, which sat at Rio de Janeiro [July 23 to August 27, 1906] was held in what is known as the Monroe Palace, named in honor of the enunciator of the famous American policy. Brazil was one of the first, perhaps the first, of the American nations to applaud that doctrine [Monroe Doctrine]. . . . So far as the Monroe Doctrine is held to guard the political system of this hemisphere against external subversion or attack, the American nations cordially accept it and look to the United States as its author and mainstay. In this sense it is eulogized by the statesmen of Latin America. In closing the Fourth International American Conference in 1910, one of Argentina's great orators, who, as Minister of Foreign Affairs, presided as honorary president at the final session, paid an eloquent tribute to American solidarity and to the United States as the proponent of the Monroe Doctrine. 'In this year,' said Dr. Rodriguez Larreta, 'the majority of our republics complete a century of independent life. We can now say, with Washington, "America for humanity," because we are sovereign nations and the place we occupy in the world we owe to the strength of our own arms and our blood heroically shed. But let my last words be to send a message of acknowledgment to the great nation which initiated these conferences, which preceded us in the struggle for independence, which afforded us the example of a fruitful people organized as a republican nation, which, on a day memorable in history, declared "America for Americans," and covered as with a shield our hard-won independence.' In this sense the Monroe Doctrine is received in South America with

sentiments of the most friendly and cordial concurrence. But there is another sense in which the other independent nations, and especially such powerful states as Argentina, Brazil, and Chile, find themselves unable to accept it. This sense, which is said to represent the view of the 'man in the street,' has been editorially expressed in these terms: 'Whatever its interest at stake or wrong suffered in Latin America, we sternly enjoin every European power to keep its hands off of what we make our international business and what we decree must be the business of nobody else.' In other words, the United States is said in effect to have decreed that other American countries are so far subject to its control that non-American powers cannot even demand from them the redress of grievances. Of this view it is to be observed that it must, in the first place, arouse resentment in the independent countries of America, since it places them all in the subordinate position of protectorates, subject to external dictation. And it must, in the second place, provoke the opposition of non-American powers, since they find it difficult to admit that they cannot conduct their affairs directly with states which are professedly, and in law and in fact, independent. Considered in its practical aspects the conception appears to be equally superficial and extravagant. The area of the United States embraces less than three million square miles; and within these limits the national and local governments combined often have difficulty in preserving order and insuring the protection of foreigners, although the territory is within their exclusive legal control. The countries of Latin America comprise an area of more than eight million square miles, or almost three times as much; and over these more than eight million square miles the United States exercises no governmental control. And yet, within the vast area, it is asserted that the protection of aliens and the redress of their grievances is a matter that concerns the United States alone, to the exclusion of any and all of the governments on whose diplomatic protection such aliens would normally rely. The responsibility thus proposed to be thrust upon the United States is unexampled. Examined historically, the assumption that the American nations are in effect protectorates, with which non-American powers have been denied the right to conduct relations directly, is equally unjustified."—J. B. Moore, *Principles of American diplomacy*, pp. 408-410, 415-417.—"All the American republics are in accord as to the necessity of maintaining the essential articles of the Monroe Doctrine and although the United States has thus far been its sole defender, there could now be found Latin American States powerful enough to maintain it if the United States should refuse to do so. The Monroe Doctrine is, then, not simply a North American doctrine: it is, in so far as President Monroe's declaration is concerned, an all-American pronouncement and the Three Americas would vigorously protest any violation of its precepts."—J. Warshaw, *New Latin America*, p. 151.—"On the other hand, to save themselves from Yankee imperialism the American democracies would almost accept a German alliance, or the aid of Japanese arms; everywhere the Americans of the North are feared. In the Antilles and in Central America hostility against the Anglo-Saxon invaders assumes the character of a Latin crusade. Do the United States deserve this hatred? . . . The Monroe doctrine has undergone an essential transformation; it has passed successively from the defensive to intervention and thence to the offensive. From a theory which condemned any change of political

régime among the new democracies under European pressure, and which forbade all acquisitions of territory, or the transfer of power from a weak to a strong nation, there arose the Polk doctrine, which, in 1845, decreed the annexation of Texas for fear of foreign intervention. In 1870 President Grant demanded the seizure of San Domingo as a measure of national protection, a new corollary of the Monroe doctrine. President Johnson was anxious to see his country in possession of Cuba in the name of the 'laws of political gravitation which throw small States into the gullets of the great powers.' In 1895 Secretary of State Olney, at the time of the trouble between England and Venezuela, declared that the United States were in fact sovereign in America. From Monroe to Olney the defensive doctrine has gradually changed to a moral tutelage. If theories change, frontiers change no less. The northern Republic has been the beneficiary of an incessant territorial expansion: . . . in 1845 and 1850, [it acquired] Texas; the Mexican provinces in 1848 and 1852. . . . In the same year Porto Rico, the Philippines, Guam, and one of the Marianne Islands, passed, by the Treaty of Paris, into the hands of the United States. They obtained the Samoan Islands in 1800, wished to buy the Danish West Indies in 1002, and planted their imperialistic standard at Panama in 1903. Interventions have become more frequent with the expansion of frontiers. The United States have recently intervened in the territory of Acre, there to found a republic of rubber gatherers; at Panama, there to develop a province and construct a canal; in Cuba, under cover of the Platt amendment, to maintain order in the interior; in San Domingo, to support the civilising revolutions and overthrow the tyrants; in Venezuela, and in Central America, to enforce upon these nations, torn by intestine disorders, the political and financial tutelage of the imperial democracy. In Guatemala and Honduras the loans concluded with the monarchs of North American finance have reduced the people to a new slavery. Supervision of the customs and the dispatch of pacificatory squadrons to defend the interests of the Anglo-Saxons have enforced peace and tranquillity: such are the means employed. . . . Chicago merchants and Wall Street financiers created the Meat Trust in the Argentine. The United States offer millions for the purpose of converting into Yankee loans the moneys raised in London during the last century by the Latin American States; they wish to obtain a monopoly of credit. It has even been announced, although the news hardly appears probable, that a North American syndicate wished to buy enormous belts of land in Guatemala, where the English tongue is the obligatory language. The fortification of the Panama Canal, and the possible acquisition of the Galapagos Islands in the Pacific, are fresh manifestations of imperialistic progress. The Monroe doctrine takes an aggressive form with Mr. Roosevelt, the politician of the 'big stick,' an intervention *à outrance*."—F. G. Calderon, *Latin America*, pp. 298, 302-304.—"Naturally a patriotic Latin American, reading these lines [see above quotation from F. Garcia Calderon], is filled with fear and foreboding, and treats Senor Calderon's deduction that 'The Monroe Doctrine has undergone an essential transformation; it has passed successively from the defensive to intervention and thence to the offensive' as an irrefragable logical sequence. The intention of President Wilson to expand the Monroe Doctrine to Pan American Doctrine in which Latin America should have equal privileges and an equal responsibility with the United States

is regarded as the well-meaning but futile attempt of a large-minded American statesman to counteract, like King Canute, an irresistible current. The action of the U.S. in the recent Panama-Costa Rica controversy and President Harding's reaffirmation of the Monroe Doctrine are taken as far more typical of our true attitude toward Latin America."—J. Warshaw, *New Latin America*, p. 138.

MONS, capital of the province of Hainault, Belgium, on the Trouille. It was originally built on the site of a Roman camp. (See NETHERLANDS: Map.) The present town was founded in the eighth century by the Countess Waudru, or Waltrudis, afterwards made its patron saint. As the residence of the counts of Hainault, Mons was strongly fortified and was several times the object of attack and capture in the wars of the sixteenth, seventeenth and eighteenth centuries. Its fortifications were removed in the nineteenth century, and it was as an open town that it was taken by the Germans in 1914, and held until the last day of the World War when it was retaken by the Allies.

MONTANA: Geographical location.—Origin of the name.—"Montana lies between the 104th and the 110th meridians of longitude west of Greenwich and between the 45th and 49th parallels of north latitude. The western boundary follows the Coeur d'Alene and Bitter Root mountains and is irregular; in the southwest corner the line dips below the 45th parallel and follows the main range of the Rocky Mountains; the northern boundary is along the 49th parallel and the eastern boundary the 104th degree of longitude. It is bounded on the north by the Canadian provinces of Saskatchewan, Alberta, and British Columbia; on the south

by Wyoming and Idaho; on the west by Idaho and on the east by North Dakota and South Dakota."—*Resources and opportunities of Montana* (Department of Agriculture and Publicity).—The name Montana is said to be derived through the Spanish from the Latin "montanus," meaning mountainous.

Resources. See U. S. A.: Economic map.

Aboriginal inhabitants. See FLATHEADS; HIDATSA; SHOSHONEAN FAMILY.

1743.—**Exploration by Verendrye**.—In 1731 Sieur de la Verendrye, a French soldier and adventurer, secured aid from Charles de Beaulharnois, then governor of Canada, in equipping an expedition for exploration in the far western country. Verendrye was accompanied by his two sons, the younger of whom carried on the work of the expedition after the death of his father and the murder of his brother by hostile Sioux Indians. Following along Lake Superior, the Lake of the Woods, the Assiniboine and Missouri rivers, the explorers after years of hardship reached the Rockies. "It was on the first of January, 1743, when Verendrye reached the Shining Mountains. The point at which the ascent was made was near the present city of Helena, where the party discovered Prickly Pear River, and learned of the Bitterroot. They described Bear's Tooth Mountain near Helena, and in other ways left ample evidence of their visit."—H. H. Bancroft, *Works*, v. 21, p. 600.

1803.—**Embraced in the Louisiana Purchase**. See LOUISIANA: 1798-1803.

1804-1806.—**Lewis and Clark expedition**.—About sixty years after Verendrye's discoveries the party commanded by Lewis and Clark, which had been sent to explore the Louisiana Purchase, reached the territory of the present state of Montana. During 1805 they were guided across the state to the head waters of the Columbia river by the Snake Indian woman, Sacajaweah.—See also U. S. A.: 1804-1805; Expedition of Lewis and Clark.

1809-1852.—**Trading Posts on the upper Yellowstone**.—**Missions among Indians**.—**American Fur Company fort**.—Further exploration of the territory was carried on by American fur traders, who established their posts for trade with the Indians along the upper branches of the Yellowstone river. The celebrated trader, Manuel Lisa, was one of the earliest explorers of the region. He was joined by men like John Colter, the first white man to set foot within the territory of Yellowstone National Park, who had been a soldier in the expedition of Lewis and Clark. By 1830 the individual trader and trapper was largely superseded by the agents of the great fur companies. The American Fur Company, organized by John Jacob Astor in 1816, established posts in Montana between 1820 and 1840. The Rocky Mountain Fur company, founded in 1822 by Gen. W. H. Ashley, also entered the region. Father Peter John de Smet, the eminent Jesuit, established missions among the Flathead Indians in the valley of the Bitterroot, 1840-1841. Five years later the American Fur company erected Fort Benton in order to protect its scattered trading posts in the vicinity of the Teton river.

1848.—**Partly in the Oregon Territory**. See OREGON: 1846-1855.

1852-1864.—**Discovery of gold**.—**Early gold rush**.—"The presence of gold in the mountains of Montana was first noticed as far back as 1852. Later, in 1858, the Stuart Brothers, James and Granville, founders of Montana, discovered gold in the Deer Lodge Valley; but they were destitute of equipments, and so constantly exposed to the hostility of the Blackfeet, that they went to Fort Bridger in the southwest corner of Wyoming, and

did not return until late in 1860. It was in 1860 and 1861 that the rich mines on the Salmon and Boise Rivers were discovered. In 1862 the tide of discovery swept across the mountains into Montana. The rich mines on Pioneer Creek, the Big Prickly Pear, the Big Hole River, North Boulder Creek, and at Bannock, and other points, became known. Although there were scarcely a thousand people in Montana in the winter of 1862-3 the news of the great discoveries marshaled a host of immigrants ready to enter the territory in the following spring. These were largely re-enforced by adventurers from both the Northern and Southern States, who sought in these remote regions exemption from the tributes and levies of war. The immigrants were welcomed in the spring of 1863 by the news of the discovery of Alder Gulch, the richest of all gold placers. The work of prospecting, already being pushed with vigor, was stimulated to an extraordinary degree by this magnificent discovery. Prospecting parties scoured the country in all directions, often with loss of life through the Indians, but rarely, after the first two or three years, with any substantial success. . . . The most important of them occurred in August and September, 1863. It was led by Walter W. DeLacy, an engineer and surveyor of some distinction in the early history of Montana. The party at one time numbered forty-two men, although this number did not continue constant throughout the expedition. Its sole object was to 'prospect' the country. Evidently nothing in the line of topographical reconnaissance was thought of, for Captain DeLacy says 'there was not a telescope, and hardly a watch in the whole party.' . . . In 1864, a party of seventy-three men, under James Stuart, passed from Deer Lodge, Montana, to the Yellowstone Valley, and thence around the east base of the Absaroka range into the valley of the Shoshone river. The object of this expedition was to punish the Indians for outrages of the previous year, and also to prospect the country for gold. At the Shoshone Stuart was compelled to return home. The party then separated into groups that gradually worked their way back to the Montana settlements. One of these small parties went as far south as the Sweetwater River, then crossed to the Green and Snake Rivers, and re-crossed the Continental Divide at Two-Ocean Pass."—H. M. Chittenden, *Yellowstone National Park*, pp. 62-63, 67.

1864-1876.—Territorial government created.—Capital changed to Helena.—Yellowstone National Park.—In 1864 Montana, which in 1863 had been a part of Idaho Territory, received its territorial organization. (See DAKOTA TERRITORY: 1862-1865.) Virginia city was made the capital of the territory and continued so until 1874, when a change was made in favor of Helena. During this period in the territory's history numerous bands of gold seekers traversed the region now included in Yellowstone National Park. The wonders of nature were not entirely appreciated by expeditions intent on discovering gold, nevertheless it was clear to many that steps should be taken to protect the beauties of the district from private greed and mercenary vandalism. The origin of the project of a nationally controlled park seems to have been the Washburn expedition of 1870. "The subject was discussed by the party at the first camp after leaving the geyser regions near the junctions of the Firehold and Gibbon Rivers. The date was September 10, 1870. The members of the party were sitting around the camp-fire after supper, conversing about what they had seen, and picturing to themselves the important pleasure resort which so

wonderful a region must soon become. The natural impulse to turn the fruits of discovery to the personal profit of the discoverer made its appearance, and it was suggested that it would be a 'profitable speculation' to take up land around the various objects of interest. The conversation had not proceeded far on these lines when one of the party, Cornelius Hedges, interposed and said that private ownership of that region or any part of it, ought never to be countenanced; but that it ought to be set apart by the government and forever held to the unrestricted use of the people. This higher view of the subject found immediate acceptance with the other members of the party. It was agreed that the project should be at once set afoot and pushed vigorously to a finish. As soon as the party reached Helena, a series of articles appeared in the daily papers of that City describing the late expedition, and in one of them, written by Mr Hedges and published in the *Helena Herald* November 8, 1870, occurs what is believed to be the first public reference to the Park project."—H. M. Chittenden, *Yellowstone National Park*, pp. 89-90. On March 1, 1872, President Grant signed the bill which set aside a tract of land near the headwaters of the Yellowstone river as a public park. Most of the reservation was situated in Wyoming, but the great interest in the district had centered in Montana.

1876.—Sioux War.—Custer's last battle.—Crushing of Sioux and Cheyennes.—In 1876 the United States government determined to compel the war-like Dakotas, Sioux and Cheyennes to settle down upon reservations allotted to them and remain under control of Indian agents. The effort of the army to enforce this policy against certain wild and recalcitrant tribes in Montana and Wyoming led to the Sioux War. "Sitting Bull (Tatanka-e-Yotanka) in North Dakota and Montana, and Crazy Horse (Tashunka-Uitco) on Powder river, Wyoming, were the principal leaders of the hostile and renegade bands of Sioux who roamed over what General Sherman then termed 'an almost totally unknown region, comprising an area of 90,000 square miles.' The hostile camps contained eight or ten separate bands, each having a chief of its own. Authority was exercised by a council of chiefs. No one chief was endowed with supreme authority, but Sitting Bull, an Uncapapa Sioux, was accepted as the leader of all his bands. He was a shrewd 'medicine man,' a prophet, seer and statesman among the tribes of the Sioux, but never in any sense a war chief—he never appeared on the field of battle during the Sioux war of 1876, nor at any other time. In the spring of that year, General Sheridan sent three widely separated columns of troops against the hostiles. The first column, under General George Crook, consisted of fifteen companies of cavalry and five companies of infantry (total, 1,040) and marched from the south. The second column, under General Alfred H. Terry, was composed of the famous 7th Regiment of U. S. Cavalry, twelve companies or 'troops' (about 600 men), six companies of infantry, a battery of gatling guns, and forty Indian scouts. This column moved westward from Fort Abraham Lincoln, North Dakota. The third column, under General John Gibbon, consisted of four companies of cavalry and six companies of infantry (450 men in all), and marched eastward down the Yellowstone from Fort Ellis, Montana, and united with General Terry's column on the Yellowstone at the mouth of the Big Horn river, June 21, 1876. All commanders in the field, including General Sheridan himself, believed the hostiles numbered not to exceed 1,000 warriors.

General Sheridan in his official report says: 'Up to the moment of Custer's attack no information was had, public or private, to justify the belief that there were in Sitting Bull's camp more than 500 to 800 warriors.' But hundreds upon hundreds of available fighting men from the various reservations were daily slipping away and stealthily joining the big village of Tatonka-e-Yotanka, until there were opposed to the troops between 4,000 and 5,000 well armed warriors. These were armed with the best and latest models of breech-loading and magazine rifles, most of them Winchesters, and with plenty of ammunition. . . . It is a grave misnomer to call it 'The Custer Massacre.' Its place in real history is far more important. It was the last great stand of the hostile Indians of North America against advancing civilization. After this battle their power was forever broken, and the Indians knew it. Custer and his men died not in vain. Never again were the war-like Sioux and Cheyennes able to gather together such a for-

GEORGE ARMSTRONG CUSTER

midable force as fought Custer on the Little Big Horn. The assembled tribes of hostiles then saw it was useless to further resist the white man's westward advance, and broke up into small bands, which soon after surrendered. Custer's costly work and sacrifice were well rendered, and have been of lasting benefit to American civilization."—W. S. Brackett, *Custer's last battle (Historical Society of Montana Contributions, v. 4)*.—See also U.S.A.: 1866-1876.

1883-1888.—Growth in population.—Northern Pacific railroad.—Constitutional Convention.—The gold seekers of the sixties and the cattle-men of the seventies contributed greatly to the increase in population which the territory experienced. This was further augmented when the Northern Pacific railroad was completed in 1883 and the territory possessed transcontinental service. Such was the prosperity of the region that in 1880 Congress authorized the election of a convention to draw up a constitution preparatory to admission into the union.

1889.—Admission as a state. See U.S.A.: 1889-1890.

1890-1900.—Agricultural and industrial prosperity.—Mining production.—The census reports for 1900 revealed the unusual prosperity of the state

during the preceding decade. The acreage under cultivation was increased six-fold and the value of farm property rose from \$48,000,000 to \$117,000,000. A well-equipped agricultural college and experimental station at Bozeman caused a noticeable improvement in horticultural and agricultural methods. The chief industry in the state during the period was mining and metallurgic treatment of copper, lead, gold and silver ores. In all that related to the industry, including pumping and hoisting machinery, blast furnace and reverberatory smelting converter and electrolytic work, the discovery and application of new methods, the state was in advance of most others. The annual mineral production of Montana in 1900 was \$60,000,000. This output included gold, silver and lead as well as copper.

1895.—Industrial arbitration board created. See ARBITRATION AND CONCILIATION, INDUSTRIAL: United States: 1886-1920.

1906.—Initiative and referendum adopted. See INITIATIVE AND REFERENDUM: Development in the United States.

1907-1917.—Labor disturbances.—Railway construction.—Legislative activities.—Labor disturbances in the Butte copper district came to a climax in 1914, when a group of "insurgent" union miners attacked a parade of 500 miners belonging to the same union, Butte Local No. 1, Western Federation of Miners. While the trouble was ostensibly between two factions in the same union, the insurgents claimed that it arose out of the domination of the union's policy by officials of the Anaconda Copper Company. It was claimed that the company had acquiesced in the closed-shop principle, but had secured complete control of the miner's union. The outbreak on June 13, 1914, resulted in the dynamiting of the union hall and the organization of a new union, known as the Butte Mine Worker's Union. (See also INDUSTRIAL WORKERS OF THE WORLD: Recent tendencies.) The new organization only succeeded in disrupting the old and in the ensuing helplessness of the Western Federation of Miners the company succeeded in forcing the open-shop principle. The mines operated on a non-union basis until June 11, 1917, when a general strike occurred in the Butte district. The immediate occasion was a disaster in one of the mines in which 150 miners lost their lives. The real cause of the walk-out, however, was the grievance against the "rustling" card system then used by the Anaconda company. Coming as it did during the opening months of America's participation in the World War, the strike threatened seriously to disrupt industry. The gravity of the situation compelled a compromise which enabled production to continue on a normal basis. Two events in 1909 and 1910 contributed to the further economic development of Montana. In the former year the Chicago, Milwaukee and Puget Sound railway completed its mileage across the state and opened up new means of transportation to the middle west. In 1910 the Flathead reservation was thrown open by executive proclamation to settlement and all available lands were quickly taken up. The year 1911 stands out prominently in the legislative history of the state. The legislature of that year passed the following significant measures: a drastic white slave law, an act establishing juvenile courts, and an act granting permission to cities to establish the commission form of government. On January 31, 1911, the legislature ratified the Sixteenth Federal Amendment. Two years later, February 7, 1913, the Seventeenth Amendment was ratified by a legislature which enacted a primary election law and a blue sky law regulating the sale of securities. In 1914

Montana voters approved an amendment to the state constitution providing for woman suffrage. (See **SUFFRAGE, WOMAN**: United States: 1851-1920.) The state won the distinction in 1916 of sending the first woman representative to Congress. Miss Jeanette Rankin took her seat in the Congress which was called upon to declare war against Germany. Her influence and vote were exerted against entering the war. Women secured further recognition in the state in 1917 when an eight hour law was passed to apply to the labor of women in numerous occupations.

1917-1918.—Part played in World War.—**Legislation**.—Montana's response to the military needs of the country resulted in her furnishing 36,293 men or almost 1 per cent of the whole force. During the war it was found necessary to pass certain emergency legislation regulating the purchase and sale of foodstuffs. The law aimed to prevent monopoly in any commodity and attempted to regulate prices so as to prevent exorbitant profiteering. In 1918 the Non-partisan League invaded the state, and obtained sufficient influence to elect a number of members to the state legislature.

1918.—**General strike at Billings**. See **LABOR STRIKES AND BOYCOTTS**: 1917-1918: General strike.

1918.—**Reclamation of lands by irrigation**.—**Yellowstone project**. See **CONSERVATION OF NATURAL RESOURCES**: United States: 1918.

1918-1920.—**Mineral production**.—**Importance of mineral wealth**.—During 1918 the amount of silver mined in Montana amounted to 15,341,000 ounces which was the largest produced in any of the states. Her nearest competitors were Nevada and Utah. Besides silver the state produced, in 1917, according to the report on mineral resources of the United States geological survey, \$3,517,253 worth of gold, \$74,028,283 of copper, \$18,720,716 worth of zinc, and \$1,887,805 worth of lead. The total mineral production of the state was valued at \$123,733,415, which comprised about three per cent of the total production of the United States. For the calendar year 1917 the state ranked second among the several states in the production of silver and copper, and third in the production of zinc.

MONTANI, citizens of the ancient Palatine city. See **QUIRINAL**.

MONTANISTS.—A name given to the followers of Montanus, who appeared in the second century, among the Christians of Phrygia, claiming that the Holy Spirit, the Paraclete, "had, by divine appointment, descended upon him for the purpose of foretelling things of the greatest moment that were about to happen, and promulgating a better and more perfect discipline of life and morals. . . . This sect continued to flourish down to the 5th century."—J. L. von Mosheim, *Historical commentaries, 2nd century, sect. 66*.

MONTENEGRIN VESPERS (1703). See **MONTENEGRO**: 1389-1868.

MONTENEGRO: Geographical description.—"Montenegro lies between latitudes 41° 50' and 43° 35' north and between longitudes 18° 20' and 20° 45' east, and has an approximate area of 5,600 square miles. The neighbouring states are Serbia on the northeast and east, Albania on the south, and the Austro-Hungarian territories of Bosnia, Herzegovina, and Dalmatia on the north and west. Montenegro has an Adriatic seaboard of about 28 miles. The boundary, which is intricate and in parts artificial, was fixed by the Treaty of Bucarest (1913). The mountain of Lovchen (5,771 ft.), which is included in Montenegro, overlooks the Bocche di Cattaro and completely commands Cattaro and its harbour, the frontier approaching within a mile of the town. The additions of 1913 include a substantial portion of the Sanjak of Novibazar, the long-disputed districts of Plava and Gusinye, the Metoya plain as far east as the White Drin, and the district northwest of the Hotit inlet on the lake of Scutari. The heart of Montenegro is the Black Mountain, which gives its name to the whole country. This is the Plateau east of the Gulf of Cattaro, on which stands the capital Tzetyne (Cetinje)."—*Montenegro (Handbook prepared under the direction of the Historical Section of the [British] Foreign Office, no. 10, p. 1)*.—See also **BALKAN**

STATES: Geographical position; also Map.—“Montenegro is an extremely curious instance of the way in which favourable geographical conditions may aid a small people to achieve a fame and a place in the world quite out of proportion to their numbers. The Black Mountain is the one place where a South Slavonic community maintained themselves in independence, sometimes seeing their territory overrun by the Turks, but never acknowledging Turkish authority *de jure* from the time of the Turkish Conquest of the 15th century down to the Treaty of Berlin. Montenegro could not have done that but for her geographical structure. She is a high mass of limestone; you cannot call it a plateau, because it is seamed by many valleys, and rises into many sharp mountain-peaks. Still, it is a mountain mass, the average height of which is rather more than 2,000 feet above the sea, with summits reaching 5,000. It is bare limestone, so that there is hardly anything grown on it, only grass—and very good grass—in spots, with little patches of corn and potatoes, and it has scarcely any water. Its upland is covered with snow in winter, while in summer the invaders have to carry their water with them, a serious difficulty when there were no roads, and active mountaineers fired from behind every rock, a difficulty which becomes more serious the larger the invading force. Consequently it is one of the most impracticable regions imaginable for an invading army. It is owing to those circumstances that this handful of people—because the Montenegrins of the 17th century did not number more than 40,000 or 50,000—have maintained their independence. That they did maintain it is a fact most important in the history of the Balkan Peninsula.”—J. Bryce, *Relations of history and geography (Contemporary Review, Mar., 1886)*.

B. C. 3rd century—A. D. 1356.—Early history.—“The district which corresponds most nearly to Montenegro of the present day comes first into notice when the Romans attacked Queen Teuta and drove her back beyond the modern Podgorica in the third century B. C. From this time onwards Roman influence made itself felt strongly in the Prævalitana, an outlying province of Illyria, and the city of Dioclea—whose ruins still exist in the neighbourhood of Podgorica, and which was to play such an important part in the germ state of Crnagora, or the ‘Land of the Black Mountain’—rose into being. Diocletian, the famous divider of the Roman Empire, was born there, and the city became the capital of the district to which it gave the name. The triumvirs placed the border-line of the Eastern and Western divisions at Skodra, or Scutari, as the Europeans call it. Under the early empire, the land was perpetually changing from East to West, but when the Western division fell under the weight of barbarian invasions in 476 A. D., it was finally incorporated in the East. This was a momentous decision, for the manners and habits of the people still remain tinged with Eastern life, and in the ninth century it secured their adhesion to the Eastern Church, which influences their policy to the present time. The principality of Dioclea, or Zeta, as it soon became called, was one of the confederate Serb states formed by Heraclius in 622 A. D., to act as a buffer state against the inroads of the Avars. Each state was ruled by a Zupan or Prince who owed allegiance to the Grand Zupan, the head of the heptarchy. But the confederation was very loose, the rival chieftains fighting amongst one another for the supremacy, for the Serb race has ever been noted for its lack of unity and corresponding love of freedom. The famous Bulgarian Czar

Samuel, *circa* 980, . . . found that he was powerless to conquer the warlike John Vladimir of the Zeta; and again, nearly a century later, in 1050, we find the Zeta Zupa so powerful that their Prince assumes the title of King of Serbia, and is confirmed in his right by Gregory VII. . . . Dissensions then broke out again, and for the next hundred years the land owned the sway of the Greek Empire. The two most celebrated Serb kings—Stefan Nemanja (1143) and Stefan Dusan (1330-1350)—both ascended to the head of the confederation from the principality of the Zeta. . . . Montenegro had all this time been steadily growing, and on the accession of Dusan to Serbia, the district of the Zeta fell to the Balsic, who proved themselves to be a strong and competent race of rulers. They increased their territories to such an extent that, at the time of the battle of Kossovo, they could boast to ruling over all the land from Ragusa to the mouth of the Drin, including the present West Montenegro and Southern Hercegovina, with Skodra as the capital.”—R. Wyon and G. Prance, *Land of the Black Mountain*, pp. 15-17.

1389-1868.—Independence.—Prince bishops.—Congress of Paris.—War with Turkey.—Accession of Nicholas.—“After the overthrow of the great Servian Empire on the field of Kossovo, Montenegro became entirely independent of outside suzerainty, and from the year 1389 . . . [was] the only Balkan state which . . . successfully defied the invasions of the Turk. The Balsic engaged themselves in several fruitless wars with Venice, by which they lost Skodra, so that, when their line died out and the succession fell to Stefan Crnoievic (the name Crnoievic, Black Prince, is supposed by some to be the origin of the name Crnagora or Black Mountain), a new capital must perforce be built, at the northern end of the lake, called Zabljak. Stefan Crnoievic allied himself with Skenderbeg, the King of Albania, and within twelve years is said to have fought over fifty battles with the Turks who, in their impotent rage, poured army after army into the land, but entirely failed to break the courage of this brave little people. His people gave him the title of Voivoda of the Zeta, but the limits of his principality seem to have been very undefined. The position of his son Ivan was, however, of greater danger, . . . [for after the kingdom of Hungary fell before the Turk, in 1444, the Balkan states] were overrun in quick succession. In 1484 Ivan found himself obliged to burn his capital of Zabljak, and retire into the more inaccessible mountain fastnesses of the Katunska, the district round Cetinje. Cetinje itself was chosen by Ivan as his new centre, and though hardly pressed, he inflicted many severe defeats upon the Turks. Arrived in his new capital, he called his braves together, . . . [and in answer to his appeal] this little band of warriors, and they could not have numbered more than eight thousand fighting men, swore to resist this almighty foe to death—not to attack, but to resist. . . . Later history bears out fully how nobly the descendants of these mountain warriors have kept to their oath. . . . In their need they applied to Venice for help, quoting the great assistance that they were rendering her in occupying the Turks; but the Queen of Cities, who was at that moment occupied in patching up a treaty with the Sultan, turned a deaf ear to their entreaties. . . . Ivan, after several great victories, was left to end his days in peace. He spent his years well in strengthening the land, both in the arts of war and peace. In Obod, which is close to Rijeka, he erected a printing press, some twenty

years after Caxton had set up his in Westminster, and though it was afterwards burnt by the Turks, still the remembrance of it remains right glorious in Montenegrin memory. [In 1510] the last Crnoievic relinquished his home for Venice. . . . But before leaving he laid down the lines for a powerful régime. A Prince-Bishop, or Vladika, was placed at the head of affairs, but, to help him in his difficult task, there was created a second office, that of Civil Governor, who was to hold a subordinate position. This office was abolished in 1832 by Peter II., on the treachery of the Civil Governor Radonic, who was found to have intrigued with the Austrians. From 1616 to 1696 the Vladikas were elective, . . . but as time went on it became necessary for political reasons to change the system of government from election to heredity. [As the prince-bishop could not marry], the succession went from uncle to nephew and the choice fell on the Lord of Njegusi Danilo Petrovic, whose reign (1690-1735) is chiefly memorable for the Montenegrin Vespers of the Turks and Turkish renegades who had rendered so much assistance to Kiuprili Pasha in one of his terrible invasions. [In reprisal Danilo Petrovic, on Christmas Eve of 1703 ordered the slaughter of every Mussulman who refused to become a Christian, and this massacre is known as the Montenegrin Vespers.] But a crushing defeat of the Turks in 1706 gave the land peace for thirty years. In 1767 an adventurer named Stefan Mali sprang himself upon the land. He claimed to be the murdered Peter III of Russia, and easily imposed himself upon the gullible Montenegrins. But he had the interests of Montenegro sincerely at heart, and proved an excellent ruler. His imposture was exposed by Catherine II., but owing to the weakness of the Petrovic heir, the people determined to keep him as their ruler. He fell a victim to the assassin's knife at the instigation of the Pasha of Scutari. His successor, Peter Petrovic, the famous St. Peter of Montenegrin history, was a firm and courageous ruler, who made his influence felt throughout the courts of Europe. Austria, Russia, and England did not scruple to avail themselves of his help and then, as seems to be the Montenegrin fate, left him in the lurch. He defied the armies of the great Napoleon, who came to fear him and his warlike clan inasmuch that he was even offered terms of friendship. But the proud mountaineer would have none of it. He now turned his hand, under the influence of Russia, which was then very real, to the consolidation of the land, and slept in peace with his fathers. His successor, Peter II., [1833] carried on the struggle with the Turks, who proposed an increase of territory and a Turkish title in return for the acknowledgment of suzerainty. 'As long as my people defend me,' was the proud answer, 'I need no Turkish title to my throne; if they desert me, such a title would avail me little.' War was the effect of this retort, but the Turks gained nothing by it, and peace was soon made. The danger of the power of Austria came now to be fully recognised. After the Napoleonic wars, Austria had retained Cattaro and Spizza, and trouble now broke out over some land near Budua. The Montenegrins fell upon the Austrians, and fierce conflicts ensued, but Peter, who had gained an extraordinary hold over his subjects, forbade them to continue. Hostilities, however, continued in a desultory fashion for some time. Peter was followed by Danilo II., [1851] a weak ruler, but his reign is famous for two events—the cessation of the spiritual authority of the Prince-Bishop to an Archbishop and the 'Great Charter' of Montenegro. Danilo's reforms, however, led

the Turk again to attack his invincible foe, only again to end in great disaster."—R. Wyon and G. Prance, *Land of the Black mountain*, pp. 17-22. —"When the Sultan's representative declared to the plenipotentiaries of the powers in the Paris conference (March 26, 1856) that the Porte regarded Montenegro as an integral part of the Ottoman empire, the Montenegrin ruler exhibited solicitous surprise and mild indignation. Prince Danilo at once protested to the powers, that the claim set forth by the Sultan's government was indefensible, and that Montenegro had a better claim to half of Albania and all of Herzegovina than Turkey had to Montenegro. At the same time he addressed a note to the European powers calling attention to the successful struggles of the Montenegrin people during four hundred and sixty-six years to hold their territory and maintain their liberty. He also asked for the diplomatic recognition of the independence of Montenegro, the extension of the frontiers toward Albania and Herzegovina, the definite settlement of the boundary towards Turkey and the annexation to the principality of the port of Antivari. Early the next year Prince Danilo visited Paris and presented his case to Emperor Napoleon III; but on his return to Montenegro he received a proposition from the ambassadors of the great powers at Constantinople that as an offset for access to the sea, and some other unimportant concessions from the Sultan, Montenegro should recognize the supremacy of the Porte. The prince was ready to follow the advice of the powers, but the Montenegrins refused to acknowledge the suzerainty of the Sultan. Meanwhile a Turkish force, which was sent ostensibly to restore order on the frontier of Herzegovina, undertook to occupy the valley of Grahovo ("the Marathon of Montenegro"), which was then in the possession of the Montenegrins. The Turks were at once attacked and those of their number who escaped from the valley left behind them fourteen guns, their war supplies, and several thousand dead. The presence of Turkish troops in territory held by Montenegro at the time of the Congress of Paris (1856) placed the Porte in a very unfavorable position, considering the virtual promise by the Turkish government at that time to maintain the *status quo* in that province. With a view of preventing future conflicts such as that in the valley of Grahovo, France invited the powers to join in a conference for the purpose of considering the whole situation in relation to Montenegro. The result was that the ambassadors at Constantinople of Austria, France, Great Britain, Prussia and Russia held a meeting with the Turkish authorities (November, 1858), and it was agreed to send, in the following spring, a boundary commission of engineers to assist in placing posts that should fix the territorial limits of Albania, Herzegovina and Montenegro. The boundaries were to be fixed in strict accordance with the lines on a map previously prepared by the representatives of these powers. Despite the protests of Turkey, a Montenegrin was made a member of this international boundary commission soon after its work had begun. This commission reported the outcome of its labors in March, 1860, and the Constantinople ambassadors, who originated this international body, then held another conference at the Turkish capital and agreed that if any further controversies likely to trouble the peace of the Montenegrin frontier should arise, the questions at issue must be referred to the consuls of these powers at Scutari (Albania). It was also agreed that the Montenegrin prince was authorized to send a representa-

tive, in case the consuls at Scutari should have occasion to consider such questions. During the summer of 1860 Prince Danilo went down to the hamlet of Persano for the baths, and while walking on the promenade at Cattaro with Princess Darinka, he was shot by an exiled Montenegrin. Without delay, and in conformity with a decree of the Assembly passed in 1855, Princess Darinka proclaimed Nicholas Petrovic, a nephew of Danilo, the prince of Montenegro (Nicholas I). . . . The next year (1861), an insurrection in the sister Servian province of Herzegovina called to the neighborhood of Montenegro a large Turkish force under Omer Pasha. The success of the insurgents during the fall of 1861 so awakened the enthusiasm and quickened the sympathies of the Montenegrins, that the Turkish general professed to be alarmed, and proclaimed the blockade of their country. In keeping with the urgent request of the powers, Prince Nicholas assumed a neutral attitude, and even allowed the Ottomans to pass through his province with provisions for a needy Turkish garrison in Herzegovina. During the winter reinforcements were sent to Omer Pasha. When spring opened, Turkey (March, 1862) informed the other parties to the treaty of Paris (1856) that Montenegro was in a state of revolt, and then sent to the Montenegrin capital a declaration of war. The Montenegrins made a valiant resistance against the invading Ottomans, but this time they were no match for the Turkish force sent against them. Realizing after a time that their capital was in danger, they bowed to the inevitable and promised to comply with the demands of the Turkish ultimatum, which was issued from Scutari (August 31, 1862). The internal administration of Montenegro was left as it had been before the invasion. But the prince was obliged to agree that his warrior-father—Mirko—[who had commanded at Grahovo] should be exiled, and that the road from Herzegovina to Scutari passing through the interior of his country should be kept open to commerce by Turkish troops. . . . [All] dignitaries in Montenegro, it was likewise agreed, would enter into a written agreement that the people of the conquered province would not make hostile excursions beyond their frontiers, and that in case of an uprising in neighboring districts, they would not afford either moral or material assistance. Furthermore, without a Turkish passport, no family was to be allowed to enter Montenegro; but the right of leasing land outside the province for agricultural purposes was accorded to the Montenegrins. Moreover, while the importation of war supplies was strictly prohibited, the port of Antivari was opened to them for the export and import of merchandise, free of duty. Russia earnestly advised intervention in order to prevent the above conditions being imposed upon Montenegro. England, however, contended that the guaranteeing powers could not show any possible justification for intervening. Turkey had been admitted, it was contended, as an independent state to participate in the advantages and duties of the European System (Concert), and Lord Russell argued that therefore the Sultan had the right to impose upon the prince of Montenegro such conditions of peace as would be likely to deter that people from future aggressions. There was no formal intervention in this connection by the treaty powers. Nevertheless, the most offensive stipulations in the terms of peace were never enforced against Montenegro. The Porte soon withdrew the demand for the exile of Mirko and eventually abandoned the idea of establishing guard-houses along the route through the interior of the province. During their fourteen years of

peace, following the war of 1862, the Montenegrins entered upon a new life in the matter of schools and military organization. Up to this time, almost no attention had been given there to education, and the soldier's preparation had consisted in unbounded patriotism and the art of shooting, supplemented now and then by experience on the field of battle. In connection with Prince Nicholas' visit to Paris, St. Petersburg, Berlin and Vienna (1868-9), a new start was made in Montenegro in establishing schools for elementary instruction, and in providing the male population between the ages of seventeen and sixty with modern guns and with some military training. In 1868 Prince Nicholas promulgated a new constitution, which, at least, made it convenient for him when he so desired, to leave with the senate the care of a considerable part of the internal affairs. Three years later, under the direction of a professor from Odessa, there was a laudable effort also to bring the laws of the principality more into harmony with other European systems."—W. S. Murray *Making of the Balkan states*, pp. 40, 86-90.

1874-1880.—**Turkish War and the Treaty of Berlin.**—"In the summer of 1874, a scuffle had taken place at Podgoritsa between Turks and Montenegrins, and an investigation having been decided on, Prince Nicholas of Montenegro demanded that it should be held on Montenegrin territory instead of Turkish, in order to affirm the independence of the principality with regard to Turkey. The Ambassadors of the Powers at Constantinople had, on the instigation of General Ignatieff, the Russian Ambassador, interviewed the Grand Vizier in order to hasten the solution of the difficulty. General Ignatieff, who needed little urging, had received most energetic instructions from the Emperor, who was personally interested in the cause of the Montenegrin prince. . . . During the month of July, 1875, troubles broke out in Herzegovina. The Orthodox and Slavonic populations were of opinion that the hour had struck for their deliverance and that they should now force the hand of their great chief, friend and protector, the White Czar. Pan-Slavonic committees began to take decisive steps."—G. Hanotaux, *Contemporary France*, v. 4, pp. 59, 62.—"The Montenegrins could not be restrained at the outbreak of the Hercegovinian revolt, and flocked to the standards of their brothers. The Porte's remonstrances were met with a curt demand for the cession of Hercegovina, and Prince Nicolas published at the same time an offensive and defensive alliance with Servia. Immediately after this (1876) he declared war. Success followed his arms everywhere. A short armistice was concluded, but nothing further came of it, and the war proceeded. The Prince in person stormed the town of Niksic. Podgorica and its fertile plain fell into the hands of the conquerors, and then in quick succession Antivari and Dulcigno were forced to yield. He was about to commence the siege of Scutari when news came of the armistice between Russia and Turkey."—R. Wyon and G. France, *Land of the Black mountain*, p. 24.—See also BALKAN STATES: 1878; BERLIN, CONGRESS OF; TURKEY: 1878.—"In accordance with the decisions arrived at by the Congress of Berlin, Prince Nicholas . . . evacuated Dulcigno and the region of the Bojana, and was preparing to receive the districts of Plava and Gusinje, which had been added to his dominions, when they were occupied by the forces of the [Balkan] League. In consequence of the remonstrances addressed to the Porte by Montenegro, and urged by Russia, Mehemed Ali Pasha was sent to restore order; but his assassination by the Albanians fur-

nished the Turkish government with a pretext for refusing to yield up the debatable land (April 18th, 1880). Meanwhile, . . . it was decided that Montenegro should forego its claim to Plava and to the smaller, but more fertile and strategically more important part of Gusinje, and should obtain, instead, the region which derives its name from the river Sem—the Serbian Cijevna—and which includes Podgorica, as well as Fundina, Zabliak, and Spuz. . . . Not long after, the terms of the treaty were modified so as to include Dulcigno, the inhabitants of which, though they belonged mainly to the Albanian race, were desirous of being united with the principality, within the Montenegrin territory. . . . [But] it was only after a special ambassador had been sent by the British government to Constantinople, and a naval demonstration had been made by the Great Powers, that Dulcigno was surrendered by Dervish Pasha, on the 27th of November. . . . Some of the districts that have been added are rich in the products of the soil, and have contributed towards augmenting the wealth of the country, which was previously at a very low ebb.”—F. S. Stevenson, *History of Montenegro*, pp. 201-203

1898-1916. — Principality modernized. — The changed aspect of Montenegro by the close of the nineteenth century is brought out in the following contemporary account. “The accession of territory obtained under the Berlin Treaty has already begun to alter the character of the country. The area of the Principality has been almost doubled, and fertile valleys, tracts of rich woodland and a strip of sea-coast have been added to the realm of Prince Nikolas. Montenegro is now something more than the rocky eyrie of a warlike clan, and the problem of its commercial development constantly occupies the mind of its ruler. The state of transition is reflected in the aspect of the capital. A tiny hamlet in 1878, Tzetzinye now bears witness to the growth of civilisation and to the beneficent influence of a paternal despotism. . . . Nikolas I., ‘Prince and Gospodar of free Tzrnogora and the Berda,’ is the most picturesque and remarkable figure in the South Slavonic world. . . . Any attempt to describe Prince Nikolas’ work as an administrator and a reformer would lead me too far. . . . The suppression of the vendetta is one of the greatest of the Prince’s achievements. . . . Crime is now rare in the Principality, except in the frontier districts, where acts of homicide are regarded as justifiable, and indeed laudable, if perpetrated in payment of old scores, or if the victim is an Albanian from over the border. . . . The construction of roads is viewed with some apprehension by the more conservative Montenegrins, who fear that their mountain stronghold may lose its inaccessible character. But the Prince is determined to keep abreast of the march of civilisation. Nine post-offices and thirteen telegraph stations have been established. The latter, which are much used by the people, will play an important part in the next mobilization of the Montenegrin army. Hitherto the forces of the Principality have been called together by stentorian couriers who shouted from the tops of the mountains.”—J. D. Bouchier, *Montenegro and her prince* (*Fortnightly Review*, Dec., 1898).—“The history of Montenegro . . . [from] the completion of her territory in 1880 . . . [to 1910 was] very different from that of the other two Slav States. Prince Nicholas . . . had to solve the problem of converting an Homeric society of fighters into a modern commercial and agricultural community. With the exception of an occasional brush upon the Albanian frontier, his warriors . . . kept the

peace. From Turkey he . . . had nothing more to fear; indeed his relations with the Sultan became excellent; while Austria-Hungary he . . . wisely . . . abstained from attacking. None the less, he . . . instituted for defence a standing army based on compulsory service. Admirable roads now traverse and connect the old with the new and more fertile Montenegro, which was the result of the Berlin Treaty and the subsequent arrangements. . . . Socially and politically alike, . . . [Prince Nicholas] gained importance by the splendid marriages of his daughters, notably by that of Princess Elena in 1896 with the Prince of Naples, now King Victor Emmanuel III. This Italian connexion, though not popular in Italy, . . . made Montenegro much better known in Europe and . . . stimulated Italian commercial enterprise on the eastern shore of the Adriatic. A series of picturesque anniversaries—the 400th of

NICHOLAS I

the foundation of the first Slavonic printing-press, the bicentenary of the Petrovich dynasty, and the Jubilee of the battle of Grahovo . . . [drew] attention to the stirring annals of ‘the smallest among peoples,’ while in August, 1910, the Prince celebrated his fifty years of rule. Nor has Prince Nicholas, while active as a diplomatist and statesman, ceased to enrich Servian literature. One of his two dramas, the ‘Empress of the Balkans,’ possesses special interest, since, under the thin disguise of an historical play, it contains his opinions on Balkan politics.”—W. Miller, *Ottoman empire and the Balkan peninsula* (*Cambridge modern history*, v. 12, ch. 14, pp. 413-414).—In 1904 a customs tariff was established by law. The measure, however, reserved to the Prince the right of monopoly in any article. The law was amended and simplified in 1905. Since 1906 it has had its own coinage, based on the silver unit, called a perper. As a natural corollary, a bank was founded. “As the older men have not enjoyed in their youth the advantages of an education which is

now placed within the reach of all, lecturers are sent round the country, and on Sundays, in wild and cut-off districts, a man can be seen lecturing to a group of rough mountaineers who are listening intently. Government lecturers [who are sent around the country] teach the shepherds how to safeguard their sheep and cattle from disease; the lowland peasants are initiated into the mysteries of vine-growing (every Montenegrin family must plant a vine and attend to it) and tobacco-planting, and general information is given to all. . . . Law is administered by district courts for the more serious cases, with a Supreme Court of Appeal at Cetinje. There are no lawyers or costs; each man brings his own case and witnesses in civil matters, and criminals are dealt with summarily—that is to say, his district captain sends him in chains to Podgorica, where he receives his final sentence. The smaller district captains and 'kmets,' or mayors, have a limited amount of jurisdiction, and can inflict punishments, either in fines or short terms of imprisonment. They also settle all minor cases of dispute. . . . Against only one class of offender . . . [did] Prince Nicolas exercise his autocratic powers, *i.e.* the political offender, with whom he . . . [was] relentless. Such men . . . [were] thrown into prison, interred in dark cells without trial, and . . . [might] languish till death set them free. In this respect the Prince . . . [was] harsh, and according to Western ideas barbaric. . . . The smallness of the prison at Podgorica shows more forcibly than anything else the remarkable lack of crime in the land. . . . The government . . . [was] autocratic. A senate, composed of the different ministers, . . . [existed] in Cetinje, but all powers . . . [were] jealously held by the Prince."—R. Wyon and G. Prance, *Land of the Black mountain*, pp. 27-29.

1899.—At first Hague conference. See HAGUE CONFERENCES: 1890; Constitution.

1905-1908.—Constitution granted by Nicholas.—Cabinet crisis.—Effect of Austrian annexation of Bosnia-Herzegovina.—"In 1905 [Prince Nicholas] issued two edicts, announcing the grant of parliamentary institutions and liberty of the press. The example of Russia, the growing desire of those young Montenegrins who had been educated at Belgrade to have a share in the government of their country, and the reflection that the change, if inevitable, had better been made in his own lifetime . . . doubtless influenced so shrewd a ruler as Prince Nicholas in his decision. . . . The Constitution of 1905 . . . was borrowed from Serbian sources, especially the Serbian constitution of 1880. The prince continued to represent the State in all its foreign relations; primogeniture in the male line was declared to be the law of the succession to the throne; the Senate was preserved; the country was divided into departments . . . districts . . . and communes; . . . the Orthodox Church was proclaimed autocephalous, and all other cults free; a free press and free compulsory education, a Council of State of six, and a Court of Accounts of three members formed parts of the charter. A National Assembly (*Narodna Skupština*), partly elected by universal suffrage, and partly composed of *ex officio* nominees of the Prince, was to meet annually on October 31. This body, the term of which was four years, was composed of sixty-two members elected by the fifty-six districts and the six towns, and of fourteen nominated or *ex officio* members, viz. the Metropolitan, the Roman Catholic Archbishop of Antivari, the Mohammedan Mufti, the six Councillors of State, the presidents of the Grand Tribunal and of the Court of Accounts,

and the three brigadiers. . . . The first general election under the new constitution was held in November, 1905. On December 19, the first Montenegrin Parliament met; the old ministers who had so long executed their master's edicts resigned, and a Ministry of younger men took their places."—*Montenegro (Handbook prepared under the direction of the historical section of the [British] Foreign Office, no. 19, pp. 30, 38, 30-31)*.—"Until the appointment of M. Tomanovich as Premier in 1907 Cabinet crises were frequent; a group of socialists has made its appearance; the country has been divided into factions; and an overcentralized bureaucracy, which became unpopular, was created in place of the Prince's personal government. Already, at the general election of 1907, feeling ran so high that the office of a Radical journal was wrecked; the Radicals refused to take part in the voting, and all the deputies elected were consequently Conservatives. Then came the discovery of bombs alleged to have come from Serbia. Montenegrin ex-Ministers were prosecuted; the Democratic ex-Premier, M. Radovich, was sent to prison at Podgoritz; and accusations were made against the Serbian Government of complicity in a plot against Prince Nicholas, probably hatched by Austria. These events led to a rupture between the two sister-States. . . . The annexation of Bosnia and Herzegovina in 1908 aroused violent resentment in Montenegro, which was eager for a fight. Prince Nicholas announced that, if the Austrian annexation were allowed, he would consider himself released from the restrictions imposed by Article 29 of the Berlin Treaty upon the Bay of Antivari. Early in 1909, however, as the reward of his acquiescence in the annexation, that article was considerably modified. The clause prohibiting Montenegro from having either ships or flag of war was suppressed; the port of Antivari was no longer closed to the war-ships of other nations, although it was to retain its purely commercial character; and the rest of this article was entirely cancelled. Thus Montenegro might thenceforth erect fortifications between the lake of Scutari and the coast; her maritime and sanitary police was no longer entrusted to Austrian boats, nor was she forced to adopt the Dalmatian maritime code. Still the Bay of Antivari was dominated by the guns of Spizza; and an Austrian fleet could enter it."—*Ibid.*, pp. 31-32.

1907.—At second Hague conference. See HAGUE CONFERENCES: 1907.

1910.—Principality proclaimed a kingdom.—State of the nation.—Communications.—Schools.—Journalism.—"In 1910, in accordance with a petition from the Skupshtina . . . the Principality was erected into a Kingdom. King Nicholas was the first ruler of Serbian race to occupy the throne for half a century. The jubilee of the fiftieth anniversary of his reign took place on August 15, 16, and 17, 1910. Delegates from all parts of Europe joined in the festivities, and all the Slav countries were represented. At the same time, the complete freedom of the port of Antivari and of the littoral of Montenegro [was celebrated], the restrictions contained in the Treaty of Berlin having been abolished in 1908, as a consequence of the crisis of Bosnia-Herzegovina. . . . The lack of modern means of communication was a hindrance to the development of industry. Accordingly, a railway was constructed—from Antivari to Virpazar (38 kilometres)—which joined the littoral of Montenegro to the interior, and in 1906 a Convention was signed, on June 13/26, between the Montenegrin Government and an Italo-Montenegrin Syndicate, with a view to extending this rail-

way to the ports of Virpazar, Plavnitz, Rjeka, and Scutari. This Convention contemplated the construction and use of the open port of Antivari, . . . together with the free zone annexed to it, which was created in order to develop those branches of industry likely to increase the revenue of the port and country, [and also] . . . the construction of a narrow-gauge railway from Antivari to the Lake of Scutari, and the establishment there of a steamship company. . . . In the interior of the country, on the most important roads, the postal service was carried on by means of motor-cars: [or mail coaches]. . . . A road practicable for carriages was completed between Sentari and Medua (50 kilometres).”—A. Devine, *Montenegro in history, politics and war*, pp. 46-47.—“There is now no district, however wild and cut off it may be, without its school, attendance at which is purely voluntary. Right well have the people availed themselves of this chance of education, and a sliding scale of school fees permits even the poorest peasant to send his son as well as his more wealthy brother. The teachers have a seminary, at Cetinje, which they must first attend, and a gymnasium on the German and Austrian system can be visited, for those boys who wish to extend their education to an European standard. The same boys usually visit some Russian University, occasionally Vienna or Belgrade, and return to their native land as doctors, engineers, or lawyers, and supply the learned professions.”—R. Wyon and G. Prance, *Land of the Black mountain*, pp. 25-26.—See also EDUCATION: Modern developments: 20th century: General education: Serbia.

1912-1913.—Balkan wars.—“The incidents which led up to the . . . [first Balkan] war are too fresh in men's minds to require more than a passing notice. An intolerable situation had been created for Montenegro by the Turkish repression of the revolt in Northern Albania, and especially of the Malissori rising, with the result that the little kingdom was compelled to harbour refugees, to resist raids, and to incur, in time of nominal peace, the risks and expenditure usually associated with hostile operations. Although the actual declaration of war was not promulgated by King Nicholas until October, 1912, the whole of the Southern and Eastern borderland had been for nearly two years in a condition hardly distinguishable from a state of warfare.”—F. S. Stevenson, *History of Montenegro*, pp. 211-212.—See also BALKAN STATES: 1912: War, etc.; 1912: First Balkan War; 1912: Balkan League; 1913; SERBIA: 1909-1913; TURKEY: 1912-1913.

1913.—Treaty of Bucharest.—Sandjak of Novi-Bazar divided with Serbia. See SERBIA: 1909-1913.

1914.—Map showing extent of territory as compared with that of 1878. See BALKAN STATES: 1913.

1914-1915.—State of education.—“In the academic year 1914-15 the total number of elementary schools was 211, with 366 teachers. The number of scholars was 18,195, of whom 15,796 were boys and 2,380 girls. The pupils in the various towns numbered 4,675 boys and 1,381 girls; in the villages they were 12,231 boys and 1,010 girls. . . . There was also a ‘Normal School’ and a Lycée; the former being a school for young men wishing to become schoolmasters or priests, and the latter a school on the same lines as our English public schools. The first classes of the Lycée were opened in 1880, and since then the French language has been taught. German was not taught. Four secondary schools were es-

tablished at Podgoritz, Niksitch, Berane, and Plevlia respectively, and a second ‘Normal School’ was founded at Petch.”—A. Devine, *Montenegro in history, politics and war*, p. 50.—See also EDUCATION: Modern developments: 20th century: General education: Serbia.

1914-1918.—World War.—Austrian invasion.—“On July 11, 1914, M. Pachitch, the Serbian Premier, asked the Montenegrin Government for its opinion concerning the Austrian ultimatum, and the answer ran as follows: ‘It is difficult to decide what answer must be given to Austria. Our judgment would be to follow the advice of Russia, but, in any case Montenegro, on this occasion as in the past, shares with Serbia the good or the evil. Serbia's fate is also our fate.’ [supplemented by the assurance, that] . . . Serbia may rely on the brotherly and unconditional support of Montenegro, in this moment, on which depends the fate of the Serbian nation, as well as on any other occasion.’ On the following day, July 12, 1914, . . . the Crown Prince Alexander of Serbia wired to his grandfather, King Nicholas, thanking him ‘for Montenegro's espousal of the cause of Serbia in defence of the Serbian nation.’ King Nicholas answered: ‘My Montenegrins and myself are already on the frontiers, ready to die in the defence of our national independence.’ . . . It is, of course, quite clear that Montenegro was anything but ready for war. All things were lacking—food-stuffs, guns, and munitions; but the country put her dignity and her sentiment of solidarity before all else.”—A. Devine, *Montenegro in history, politics and war*, pp. 64-66.—“Montenegro did not hesitate one moment to help the Serbian people, although she was quite exhausted and deprived of all supplies after two horrible Balkan wars. For one year and a half she fought in this war against Austro-Germans, and several times she had splendid successes; especially in the Autumn of 1915 she protected the retreat of the Serbian Army through her own land and Albania to the shore of the Adriatic Sea, rendering thereby a great service to Serbia and the Allies. Meanwhile after the Balkan catastrophe and the invasion of Serbian territory by the enemy, Montenegrin troops remained in a desperate situation, and, finding it impossible to effect a retreat, they were encircled and overwhelmed from all sides by much stronger forces of Austro-Germans. In such circumstances they were captured, when help from the Allies could not reach them.”—P. Dobretchitch, *Manifesto (New York Times Current History, Mar., 1919)*.—See also ALBANIA: 1915-1917; WORLD WAR: 1915: V. Balkans: b, 4.

1915.—Claims to Adriatic coast recognized by Treaty of London. See LONDON, TREATY OR PACT OF.

1915-1916 (October-January).—Occupation by Austrians.—“Austria's capture of Mt. Lion was one of the miracles of the war. Do you know its precipitous, almost over-hanging cliffs? Have you seen this bastion of Montenegro? It rises perpendicularly for 7,000 feet from the sea. Yet one winter day, on January 10, 1916, it was captured almost without casualties. The Austro-Hungarian Reserve Division, which made the frontal attack, lost altogether seventy old men.”—R. Roda, *King “Nikita” of Montenegro (Living Age, Apr. 23, 1921)*.—See also WORLD WAR: 1916: V. Balkan theater: a.—“Italy did not go to Montenegro's aid in time to save this key to Adriatic power from falling into Francis Joseph's hands because by doing so Russia's ends would alone have been served. To rescue King Nicholas from Austria would have thrown him back into his

long-accustomed place upon the bosom of Russia, although one of his lovely daughters is the Queen of Italy. And Russia's rivalry in the Adriatic is no more welcome to Italy than is Austria's. . . . Rome was rudely shaken in its 'maladie de grandeur' as it recognized that its Adriatic dream might never more return, since that enemy mountain fortress at Mount Lovchen, frowning down upon Austria's Cattaro fleet, was the one necessary link in the whole chain which tied Austria's men-of-war to their harbor of safety, leaving Italy free to roam the Adriatic at will, to fortify Avlona, protect Durazzo from the Serbians, equally an enemy there, and close the path into the Mediterranean to every ship but her own."—R. Insley-Casper (*New York World*, Jan. 23, 1916).—When the country was occupied by the Austrians, Nicholas fled to France, and left one of his sons to capitulate to Austria. Another son was sent to Vienna, an action which brought Nicholas into great disfavor with his people, who supposed that by so doing he was seeking favor with the enemy. (See *WORLD WAR: 1916: V. Balkan theater: e.*) A movement had already been started for the union of Serbia and Montenegro, and the party which sought unification, under the leadership of A. Radovich, the premier, now openly attempted to force King Nicholas to abdicate. The original proposals called for the abdication of both Nicholas and Peter of Serbia, his son-in-law, so that the two realms might unite under the rule of their grandson, Prince Alexander of Serbia.

1918-1921.—Deposition of King Nicholas.—Montenegro merged in Jugo-Slav kingdom.—Death of Nicholas.—“For the first time Montenegro, that had withstood Napoleon's arms, was conquered by the overwhelming German invasion of the Great War. When that devastating tide ebbed back, the country was torn by confused party strife with a result puzzling to Europe, which had understood King Nicholas to be a most popular prince. But it appears that a party of young Liberals had been growing up dissatisfied with his paternal government; there were suspicions against him, or his heir, Danilo, of being too willing to compromise with the enemy, and of having too well feathered the family nest. The rival parties, White and Green, . . . [would have come] to bloodshed but for the intervention of a French detachment garrisoning their country, when at the end of 1918 the Skupchina, assembled at Podgoritz, voted the deposition of their aged king and unconditional incorporation of Montenegro with Serbia.”—A. R. H. Moncrieff, *New world of to-day*, v. 2, pp. 80-81.—“In the closing stages of the war two elements claimed to speak for the Montenegrins: King Nicholas and the Montenegrin Committee. The King professed enthusiasm for united Yugo-slavia, but insisted that it should take the form of a confederation, in which his own kingdom should retain its separate identity under his own dynasty, and he consistently demanded separate representation for his Government at the Inter-Allied preliminary Conference and at the Peace Conference. The Montenegrin Committee, which was organized by M. Andrija Radovic, ex-Premier of Montenegro,

claimed that Montenegro's historic rôle as the refuge of those Serbs who would not submit to foreign government, was now wholly unnecessary, and that Montenegrin feeling was already swallowed in a wider Serbian patriotism. They stood for the Manifesto of Cortu, with its absorption of Montenegro in the new kingdom. They also represented King Nicholas as having played a double game, himself apparently adhering to the Entente, while his son, Prince Mirko, lived at Vienna with a view to preserving the dynasty if the Central Empires proved victorious. When the Montenegrins rose against the Austrian occupation in September and October 1918, a temporary national Government, hostile to King Nicholas, was set up. The arrival of small detachments of the Serbian Army (chiefly Yugo-slavs and Montenegrins) strengthened the authority of this Government. Two members of the Montenegrin Committee, MM. Radovic and Spassojevic, arrived in November and proceeded at once to organize a response to the Geneva Conference's invitation for an expression of opinion from Montenegro. On the 26th November a 'National Assembly' met at Podgorica and voted the union of the country with Serbia and the deposition of King Nicholas and the Petrovic dynasty. . . . The Prince Regent, . . . on the 16th December, . . . signified his acceptance, which was embodied by the Assembly in an Act passed on that day. . . . It is probable that the Assembly at Podgorica was most irregularly elected, and contained only partisans of union. On the other hand, if any considerable particularist opposition had existed in Montenegro, the fact that only unionist opinion was articulate cannot be explained by the pressure of the very small Serbian military forces. There seems to be no doubt that the Montenegrins, as a whole, desire to form part of united Yugo-slavia, but that they cannot in a moment forget their particularist tradition. . . . Theoretically the Allied and Associated Powers had not recognized the deposition of King Nicholas. France and Great Britain both stopped paying their subsidies to him in November 1920, the latter's diplomatic representation ceasing at his court after the 24th August. . . . In Great Britain a number of parliamentary representatives took up the case of Montenegro. . . . Lord Crawford on the 29th November 1920 stated that independent reports had already been presented on the condition of Montenegro since the Armistice by two British officials who had visited the country. 'His Majesty's Government were reluctant to accept the decision of the Podgorica Assembly as definite and decided to await the result of the elections to the Constituent Assembly.' A third official, the Assistant Commissioner at the Klagenfurt plebiscite, was then despatched 'to visit Montenegro in order that he might be present while the people are actually voting,' and 'judge properly as to the correctness of the official returns.' The result was that out of ten deputies in Old Montenegro 4 voted Communist and 1 Republican, the other 5 were Democrat or Radical but all favoured some form of union in the Yugo-slav state. King Nicholas's partisans could not agree on a candidate. Over 67 per cent. of the electors voted. This election was considered decisive, and on the 30th December 1920 France withdrew her diplomatic representative from King Nicholas (who died 1st March 1921); Great Britain cancelled the exequaturs of Montenegrin consuls (17th March). The future of Montenegro, therefore, was to lie in Yugo-slavia.”—A. W. V. Temperley, *History of the peace conference of Paris*, v. 4, pp. 201-204.

1920.—Bureaucratic government.—Improved communication.—Influence of emigration.—“In Montenegro, theory and practice are far apart, and the chief result of the Constitution so far has been to create a very highly centralized bureaucracy, and to foment party strife. Before 1914, the whole of the north and the new district of the east, which includes the important towns of Ipek and Jakova, were without motor roads, and almost entirely without carriage and cart roads. Podgoritsa alone was well supplied with motor roads, which connected it with the sea through Cattaro and Antivari, and with the interior of the country as far as Nikshich and Kolashin. Improvements undertaken with the support of the Government loan of 1910 were resumed after the Balkan War, and communications were pushed forward between Jakova and Ipek, and between Ipek and Old Montenegro. . . . [After] the outbreak of the European War the work . . . [was] taken in hand by the Austrian Government, and the roads are now kept in good repair and much used by motor traffic. . . . Another influence which tended to modernize Montenegro was that of the emigrants who returned from the United States. This was a comparatively new feature in the social life of the Black Mountain, whose sons, if they emigrated, usually went, till recently, to some other part of the Near East. It was calculated that there were before the war some 30,000 Montenegrins in America; and their country was thus drained of its young men. These emigrants, on their return, like the ‘intellectuals’ whom the Government sent to study abroad, were apt to become discontented with their highland home. . . . Commercially Montenegro became almost an Italian colony, run by one man of business. Italians managed the tobacco monopoly; they conducted, under the Montenegrin flag, the navigation on the lake of Scutari; they controlled the Marconi station at the haven of Antivari.”—*Montenegro (Handbook prepared under the direction of the historical section of the [British] Foreign Office, no. 19, pp. 38-39, 31).*

MONTREAU, town in France, fifty-one miles southeast of Paris. John, duke of Burgundy, was assassinated here in 1419. See FRANCE: 1415-1419.

MONTREY, California, town about 125 miles south of San Francisco. It was settled by the Spaniards, and by Franciscan friars during the Spanish occupation of California. In 1846 the American fleet took possession of it. See CALIFORNIA: 1769-1770; 1846-1847.

MONTREY, Mexico, capital of Nuevo Leon and about 50 miles northeast of Saltillo. (See MEXICO: Map.) In 1846 it was besieged by the Americans. See MEXICO: 1846-1847.

Battle of (1846). See MEXICO: 1846-1847.

MONTREY, Pennsylvania, Battle of. See U. S. A.: 1863 (June-July: Pennsylvania).

MONTES, Ismael (1861-), Bolivian statesman. President of Bolivia, representative at the Paris peace conference, 1910. See ACRE DISPUTES; VERSAILLES, TREATY OF: Conditions of peace.

MONTESQUIEU, Charles de Secondat, Baron de la Brede et de (1689-1755), French author and political philosopher. Councilor of the Parlement of Bordeaux, 1714, and president, 1716-1728; elected to the French Academy, 1728.

Influence on French Revolution. See FRANCE: 1789: Survey of France, etc.: Literary forerunners.

Declaration of rights of man. See ADMINISTRATIVE LAW: Definition.

As philosopher and historian. See FRENCH LITERATURE: 1700-1800; HISTORY: 25.

MONTESSORI, Marie (1870-), Italian educator. See EDUCATION: Modern developments: 20th century: New ideas, etc.

MONTVERDE, or Montverdi, Claudio (1567-1643), Italian composer. Most important representative of the *stile rappresentativo*, pioneer in the movement that led to modern opera, and a rebel against the limited and arbitrary musical rules of his day; *maestro di cappella* to the duke of Mantua, 1601-1612; engaged in a similar capacity at St. Marks, Venice, 1613-1643. See MUSIC: Modern: 1607-1734.

MONTVIDEO, capital of Uruguay, on the estuary of the Rio de la Plata. (See LATIN AMERICA: Map.) The population in 1920 was 361,050. The shallow estuary on which it is situated has been sheltered by break-waters and deepened, and now provides a good harbor. Meat packing is the chief industry of the city.

Founding of city. See ARGENTINA: 1580-1777.

1807.—Siege and capture by British.—Abandoned. See URUGUAY: 1806-1815.

1868.—Insurrection.—Death of Flores. See URUGUAY: 1821-1905.

MONTEZ, Lola (1818-1861), assumed name of Maria Dolores Eliza Rosanna Gilbert, an adventuress. Created countess of Landsfield by King Louis I of Bavaria, 1847; forced to flee the country during the Revolution of 1848. See GERMANY: 1848 (March).

MONTEZUMA II, or Motecuhzoma (1469-1520), Aztec emperor of Mexico. Conquered by Cortés, 1519-1520. See MEXICO: 1325-1502; 1510 (February-April); (October); 1510-1520; 1520 (June-July); 1325-1502.

MONTFAUCON, Bernard de (1655-1741), French scholar and antiquary. See HISTORY: 25.

MONTFAUCON, village about twelve miles northwest of Verdun, France. It was taken by the Germans in August, 1914, and re-taken by the Americans in their Meuse-Argonne offensive, September, 1918. See WORLD WAR: 1918: II. Western front: u.

MONTFERRAT, Boniface, Marquis of (d. 1207), Italian soldier and crusader. See CRUSADES: 1201-1203; ATHENS: 1205-1308; BYZANTINE EMPIRE: 1204-1205.

MONTFERRAT, former duchy in northern Italy. It was allied against Florence and Milan from 1451-1454, and was ceded to Savoy in 1703. See MILAN: 1447-1454; ITALY: 1701-1713.

MONTFORT, Amauri, Count of (1102-1241), French soldier. See ALBIGENES: 1217-1220.

MONTFORT, John, Count of, French soldier. See BRITANNY: 1341-1365.

MONTFORT, Simon IV, Count of (c. 1160-1218), French crusader. See ALBIGENES: 1200, to 1217-1220; ARAGON.

MONTFORT, Simon de, Earl of Leicester (c. 1208-1265), English general and statesman. Son of Simon IV of Montfort. See ENGLAND: 1210-1272; OXFORD, PROVISIONS OF; PARLIAMENT, ENGLISH: 1215-1343; SUFFRAGE, MANHOOD: British empire: 500-1205.

MONTGOLFIER, Étienne Jacques (1743-1700), French inventor. See AVIATION: Development of balloons and dirigibles: 1783-1784.

MONTGOLFIER, Joseph Michel (1740-1810), French inventor. See AVIATION: Development of balloons and dirigibles: 1783-1784.

MONTGOMERY, Richard (1736-1775), American general of Irish birth. Served in British army, 1756-1772; entered the Continental army, 1775; commanded the assault on the city of Quebec and was killed, 1775. See CANADA: 1775-1776; U.S.A.: 1775 (May-August); SOUTH CAROLINA: 1759-1761.

MONTPENSIER, Antoine Marie Philippe, Louis d'Orléans, Duke of (1824-1890), fifth son of Louis Philippe. See FRANCE: 1842-1848.

MONTREAL, largest city in Canada, on the island of Montreal, at the junction of the Ottawa and St. Lawrence rivers, a thousand miles from the open sea. The population in 1921 was 607,063. Originally, Montreal grew up on the river bank, but has gradually stretched backward across broad, flat terraces to the foot, and round the sides of Mount Royal which towers above it to a height of 760 feet. The summit of this mountain has been turned into a park of great beauty. The city has many large factories, and the largest import and export trade in Canada, and is the chief port of entry for the Dominion during the months when navigation is open. The widening of the river channel enables ships of thirty foot draught to come up to the harbor but the limitations of the canals prevent vessels of more than fourteen foot draught from passing farther up the stream.

1535.—Discovery.—Naming of island. See AMERICA: 1534-1535.

1542-1648.—Jesuit missions. See JESUITS: 1542-1649.

1611.—Founding of city by Champlain. See CANADA: 1611.

1642-1657.—Foundation of mission by company of Notre Dame of Montreal.—Seminary of St. Sulpice.—“Nearly thirty years after, [Champlain's attempt to make a settlement at Montreal] the Company of Notre Dame of Montreal was formed in France, and a large sum of money contributed in order to establish a religious settlement in place of a mere trading-post. The idea arose simultaneously in the minds of a tax-collector in Anjou, named de la Dauversière, and one Jean Jacques Olier, a young priest, afterwards known as founder of the Seminary of St. Sulpice. The story of how these two men found each other out and together developed the plan is surrounded by the semi-mysterious, semi-miraculous details peculiar to the times. Their plans, however, matured sufficiently to send out to Canada an expedition of some forty men and four women, including amongst them that devout young nun Jeanne Mance. . . . The expedition was placed under the command of Paul de Chomedey, Sieur de Maisonneuve, and arrived at Quebec in 1641. Montreal at this time belonged to Lauzon, one of the Company of the Hundred Associates. . . . who had been induced to transfer his title to the new Company, subject to certain conditions anent the fur trade. The little band was received at Quebec with a studious courtesy that barely covered, however, a persistent antagonism on the part of the Jesuits. . . . In spite of opposition from both the Church and the Governor, Montmagny, who looked on Maisonneuve as a rival, Maisonneuve and his followers started up the river on May 8th, and on the 18th landed. . . . A year after the landing, a reinforcement arrived that brought news of the magnificent gift of 42,000 livres from Madame de Bullion (a wealthy French lady), for the erection and maintenance of a hospital. All work on clearing and tilling the land was neglected until this hospital was built, and, although apparently unneeded at the time, it proved more than useful during long years of struggles with the Indians. Jeanne Mance took charge of it, and devoted her life, not only to nursing the sick Frenchmen, but also to nursing and converting the sick Indians. In 1657 the Seminary of St. Sulpice was founded [see also CANADA: 1637-1657], and six years later became virtual proprietors of the island, the remnant of the Company of Notre Dame de Montréal being so reduced in both zeal and purse that they begged the priests of the Seminary to take their charge off their hands. So valuable did this charge become in after years that to-day the Seminary is the wealthiest religious institution on the continent.”—N. M. Hinshelwood, *Montreal and vicinity*, pp. 7-10.

1657-1689.—Indian attacks.—Heroes of the Long Sault.—Growth of the town.—Regulation of prices.—Importance of colony.—The early opposition to the mission had been partly due to the recognition of the hazardous nature of the attempt to establish such an institution in the wilderness, a thousand miles from assistance. Fortunately, for a short time, the Indians were ignorant of what was afoot. But, as soon as they learned of the existence of the settlement they commenced a series of assaults upon the fort. For twenty years it was never free from fear of attack, and its inhabitants had so many hair-breath escapes that they seemed to bear charmed lives. “On one occasion, when the savages had made elaborate plans for a combined effort to sweep down and totally destroy the white population, the bravery of a few devoted Montreal men, under Dollard, saved the country, although at the cost of all their lives. Adam Daulac, or Dol-

lard, was a young French officer, aged twenty-five. . . . [This youth invited sixteen other young men to join him in an attack on the Iroquois, who had wintered in the forests of the Ottawa valley with the intention of attacking as soon as the spring was advanced. Dollard and his band (who before they set out received the last sacrament of the church as men who went to their death), traveled through the woods probably as far as the Long Sault, and there successfully held off a force of Iroquois and Mohawks, estimated at about 800 men. The friendly Indians who had been with them deserted; but the French kept the Indians at bay for eight days. Then, weak with hunger and watching, they fell before a massed attack. Not one returned alive; but their work was well done. The Iroquois did not need much imagination to foresee the result of an attack against a people, seventeen of whom had inflicted such punishment on eight hundred of their best warriors, and slipped away through the woods the way they came.] Several streets were now being laid out and substantial stone houses erected, the town proper lying between the river and what is now Notre Dame street. The character of the town was rapidly changing, and, later on, when Maisonneuve was removed by Mézy (the governor-general of New France) and immediately reappointed, the autocracy of the Seminary was largely curtailed, as by this step the governor of Montreal took his appointment from the State instead of the seigneurs. . . . In 1667 there was a population of seven hundred and sixty-six; a police force was organized at the head of which were five of the principal inhabitants; many new houses were erected, notably the large stone warehouse 'Le Hangard' built by the inhabitants at their own expense. . . . Here the public market was established; market-days which have remained unaltered ever since, being Tuesdays and Fridays. . . . Prices were constantly fixed by the Governor or intendant; and speculation, particularly in wheat, was absolutely forbidden. When the intendant learned in 1670 that certain unscrupulous persons had bought up the crop with a view of cornering the scanty market, an ordinance was forthwith issued that no one should buy wheat save for his own consumption; and the price was fixed at three livres, two sous the minot (bushel). In order to further the importance of Quebec, an attempt was made by de Lauzon, the Governor, and repeated later by de Mezy, to prevent Montreal from trading directly with France and to confine her trade to the channel of Quebec; but in each case it was successfully opposed. All trade and even intercourse with foreigners was strictly prohibited, but it was impossible to carry out the ordinances, and Dutch and English goods were common throughout Canada, where they were highly prized by both French and Indians. In 1672 the streets of Montreal were regularly laid out. . . . A few years later, the town was surrounded by a wooden palisade fifteen feet in height pierced by four gates. . . . These defences were erected in 1685; and in 1689 the population had increased to two thousand souls, and Montreal had become an important factor in the colony. . . . Perhaps at no time in its history was Montreal in a more prosperous condition than just after it had completed its fiftieth year. . . . The great annual fair was then an established institution, and among other measures taken to insure just competition and exclude foreign interference we find the inhabitants passing the following resolutions in 1675:—1. That all foreign merchants are prohibited from trading in Mon-

treal. . . 2. That during the fair no one should have barter with the Indians save in open market, nor should any one understanding their language speak to them save through an interpreter, nor attempt to draw any Indian aside for the purpose of trading, under pain of punishment."—*Official guide to Montreal (Twelfth International Geological Congress, July and August, 1913, pp. 10, 12, 13, 19, 22, 27, 29).*

1689.—Destructive attack by the Iroquois. See CANADA: 1640-1700.

1690.—Threatened by English colonists. See CANADA: 1689-1690.

1700-1722.—Trade regulations.—Trade with English colonies.—Establishment of exchange.—Postal service.—Growth of population.—Fortifications.—"Cultivation was beginning to make headway, but it was hazardous to attempt innovations; thus in 1700 when grapes were grown about Montreal, and a wine produced of such tolerable quality, that it was fast becoming popular, and it was feared the export from the Mother Country might be interfered with, orders were at once issued by the King to root up the vines. Wheat, however, was successfully grown and sent over to France in small quantities. About this time an attempt was made by certain merchants in the West Indies to open up a trade with Canada, sending sugar, brandy, spices, etc., in return for timber, fish and salt beef, provided the King would allow them to touch at Boston in order to exchange their products for horses, of which there was a great need in the Islands; but, although the King was quite willing that their trade should be carried on with New France, he could not approve of any intercourse with the English plantations, and so the matter was dropped. A trade with the West Indies was, however, slowly carried on and in 1776 about 30,000 minots of wheat were exported. In 1717 an important concession was made by the King in the establishment of a Bourse or Exchange, both in Quebec and Montreal, a favor long desired by the inhabitants and prayed for with an earnestness which evidences their appreciation of so great a concession. . . . Soon after the establishment of the public Exchange, we find a regular postal service was formed between Quebec and Montreal (1721).—a monopoly, as a matter of course, and that for twenty years. . . . The population of Montreal had now increased to about three thousand souls, and in order to accommodate the present and provide for future inhabitants, the defences of wood were about this time replaced by a stone wall."—*Official guide to Montreal (Twelfth International Geological Congress, July and August, 1913, pp. 31-33).*—"A great peace was concluded at Montreal, in the year 1700-1701, between the Iroquois on the one side and the Hurons, Ottawas, Abenakis and Algonquins on the other. The fortifications were, however, continued, and, by 1722, the city was surrounded by a stone wall, with bastions and regular works."—*Illustrated Montreal—Metropolis of Canada, p. 32.*

1717-1765.—Montreal fair.—Loss of prosperity.—Grievances of citizens.—First English governor.—"Early in the eighteenth century the manufacture of coarse wool and linen was started, and cloth for the priests and pupils was woven fully equal to the French goods. A certain quantity of timber and wheat was exported, but the staple trade was in fur. A great annual fair was established in Montreal, partly to prevent . . . [the] wholesale taking to the woods by the young men [which had already begun]. . . . In the market-place, between St. Paul street and the river, booths were

set up, and merchants from Quebec and the whole of Montreal would turn out to get a share of the profits that were to be made. . . . Several causes were now at work that were conspiring to impair Montreal's prosperity. Louis the Fourteenth, in his prodigal generosity to his colony, would never refuse a request for help, and, in addition to giving money to churches, missions, hospitals, etc., he established funds for helping poor people and subsidized nearly every branch of trade. In consequence, the colonists instead of depending on themselves, looked to him for support on every occasion. The fisheries—at which the New England colonies were coining money—were neglected, and the population, from the Intendant downward, developed into a class of deceitful mendicants. Then the Church festivals were so numerous that less than ninety working-days were left during the entire season, and, as a climax, a paper currency was put into circulation by successive governors and intendants that proved valueless. . . . Another grievance the merchants had, and that was the prohibition of meeting together for discussing their affairs. The first bourse or exchange was only permitted in Montreal in 1717. The beaver trade helped along the ruin, the wholesale slaughter of the animal so glutting the market that the skins were unsaleable to the dealers in France; consequently, bills of exchange given in Montreal for the purchases were unpaid, with attendant loss and confusion throughout the town. . . . In 1758 came the news of the departure from England of a great expedition for the conquest of Canada. . . . [The city, however, was spared the horrors of a siege.] . . . After the capitulation by Vaudreuil, General Amherst, as commander-in-chief, appointed General Thomas Gage first Governor of the district of Montreal. Although it would have been difficult to find a more arduous position, he appears to have given satisfaction to all sections of the population. . . . The following year saw the final deportation of the French military, accompanied by many of the Canadian noblesse and merchants, who refused to swear allegiance to King George. . . . The population at this time was about five thousand, and the people quickly realized that the exchange of the ruling power was all to their advantage. The Church was glad to welcome any change by which order was enforced and the old system of corruption abolished; their religious hold on the colony being too strong to occasion any anxiety from an influx of Protestants. (In 1765 the Protestants in Montreal only numbered one hundred and thirty-six.)—N. M. Hinshelwood, *Montreal and vicinity*, pp. 14-15, 19, 23-24.

1759.—Surrender of city and of all Canada to the English. See CANADA: 1759: Passing of New France.

1775-1776.—Taken by Americans and recovered by the British. See CANADA: 1775-1776.

1776-1809.—American occupation.—Franklin's mission.—First newspaper.—Steam navigation on the St. Lawrence.—“During the brief period that Montreal remained under Continental domination, it was the centre of an active propaganda undertaken with a view of inducing all classes of Canadians to throw in their lot with the revolted colonies. . . . A garrison was left in the town by the Continentals, and on April 20th, 1776, Benjamin Franklin, Samuel Chase and the Rev. Charles Carroll, a Jesuit priest, arrived . . . to try and induce the Canadians to send delegates to Congress. . . . June 3rd, 1778, saw the issue of the first newspaper printed in Montreal, the ‘Gazette,’ its publisher being Joseph Fleury de Mesplet, the

printer brought to Montreal by Benjamin Franklin to assist in the circulation of revolutionary literature. . . . The year 1809 stands out conspicuously in the history of Montreal, as witnessing the inauguration of steam navigation on the St. Lawrence by the ‘Accommodation,’ built in Montreal by Mr. John Molson [the second steamboat built in America], and which on November 3, 1809, started on her maiden voyage to Quebec.”—E. J. Chambers, ed., *Book of Montreal*, pp. 38-39.

1812-1813.—Expeditions of American forces against the city.—“November, 1812, was one of the most exciting months that the city and district of Montreal has ever passed through. The United States army, destined for the capture of the city, under the command of General Dearborn, was concentrated in the northern part of New York State, its advanced outposts less than fifty miles away”—*Illustrated Montreal*, p. 40.—It was compelled to fall back, and a double attack, made in the following October was also repulsed. See U. S. A.: 1813 (October-November).

1817-1821.—Foundation of Bank of Montreal and McGill University.—“In 1817, the Bank of Montreal was founded with a capital of £87,000, by a number of merchants. . . . An institution that has grown to be almost of a national character was established in 1821. Eight years previous to that date there died in Montreal an old Scotch fur-trader—James McGill. By his will he bequeathed, in trust, sixty-four acres of land and ten thousand pounds to the Royal Institution for the advancement of Learning. The famous McGill University was the result.”—N. M. Hinshelwood, *Montreal and vicinity*, p. 28.

1825.—Lachine canal opened. See CANALS: American: Lachine.

1825-1852.—Incorporation of city.—City government.—Election riot.—Cholera epidemic.—Political agitation.—Board of Trade.—Destruction by fire.—“In 1825 Montreal was visited by a serious fire . . . [which burned a large section of the town]. The year 1832 marks an important event in the municipal history of the city—its incorporation. . . . Up to 1832 the provincial authorities levied and distributed the taxes in the cities as well as in the rural districts, leaving the minor details of administration in the hands of the local justices. In 1832 Acts were passed to temporarily incorporate the cities of Quebec and Montreal. These charters expired naturally in 1836, and were not renewed until 1840, when, considerably amended, they were proclaimed as permanent charters. The offices of mayor and aldermen were not made elective until 1842, being filled previous to that date by the Governor General. . . . This was altogether a strenuous period in the history of Montreal. Public spirit was developing in a somewhat crude and violent form, and one of the events of 1832 was an election riot, which the troops were called out to quell, and which resulted in the killing of three rioters and the wounding of two. The same year Montreal was ravaged by the Asiatic cholera, 4,500 people being attacked with the disease between the tenth of June and the end of September, and 2,000 of these cases terminating fatally. There was a second, and the last, visitation of the same dreaded disease in 1834. Meantime the discontent of the population over the paternal—despotic—irresponsible system of government was rapidly drifting towards open rebellion.” L. J. Papineau, the great tribune of the French Canadian people, and his chief lieutenants in the campaign against the officialdom of the day, made Montreal, by their residence in the city, the head centre of the agita-

ENTRY OF MOHAMMED INTO MECCA
(After painting by Andreas Müller)

tion in the Lower Province. . . . A period of keen political agitation, which developed very ugly racial strife in the district of Montreal, succeeded the suppression of the rebellion; but gradually the spirit of commercialism asserted itself, and business began once more to expand. In 1841 the bill was passed incorporating the Montreal Board of Trade, which was organized in 1840. . . . [In 1850] two disastrous conflagrations occurred. . . . After a lapse of two years the city . . . [was again visited by fire]. June 7, 1852, the St. Paul Street district, from St. Sulpice to St. Peter Street, was swept by the flames, [and] the most . . . [destructive] of all the fires which have visited Montreal occurred in July the same year. . . . By this conflagration no less than 1,100 buildings were destroyed. These fires drew attention to the absolute necessity of regulating the class of buildings allowed in the city. The result was the drafting of a very stringent by-law, which has contributed largely to the substantial appearance of the city from an architectural point of view.—E. J. Chambers, *Book of Montreal*, pp. 44, 46-47, 49.

1849.—Burning of Parliament buildings.—Annexation manifesto. — “When the Rebellion Losses Bill was passed, in 1840, by which those who had taken part in the rebellion of '37 were to be compensated for the losses they had sustained, the more loyal citizens were so enraged that they arose in a mob and burnt the Parliament House. . . . Some lives were lost, and the removal of the seat of government from Montreal followed.”—N. M. Hinshelwood, *Montreal and vicinity*, p. 32.—The outburst was owing, in great part, to depression caused by losses due to the repeal of the British corn laws, and the consequent abolition of the preferential tariff on grain in favor of Canada. The prosperity of the city seemed to be passing away, and in this same year of 1840 nearly 1,000 “Montreal merchants of both political parties issued a manifesto urging . . . ‘a friendly and peaceful separation from British connection, and a union upon equitable terms with the great North American confederacy of Sovereign states.’”—W. L. Grant, *History of Canada*, p. 234.—The manifesto excited little interest outside of Montreal, and, with returning prosperity, the feeling died away.

1860-1901.—Victoria Bridge.—St. Albans raiders.—Street railway.—Great fire.—Throughout the early history of the province of Quebec there was no communication between the northern and southern sections, except by boat. This drawback was remedied, however, by the opening of the Victoria tubular bridge “across the St. Lawrence on August 25th, 1860. The bridge held first place amongst the engineering works of the world for many years. . . . [But] as traffic increased and new districts were opened up, the single track that crossed the river proved insufficient for the demands made upon it, and, in 1898, the old tube was replaced by a modern open-work steel bridge, with double tracks and roadways. . . . In the latter part of 1864 Montreal was greatly interested in the trial of the St. Albans raiders. A certain Bennet H. Young, who had come to Canada as a political refugee from the States, where he had taken active part in the civil war between the Confederate States and the North, organized a band of men, and, on the 10th October, raided the town of St. Albans, Vermont. . . . After ‘commandeering’ over two hundred thousand dollars from the latter and firing a number of shots in the streets, the band took horses and rode for the Canadian frontier again. Their arrest followed, and extradition was demanded by the

United States. . . . After long arguments, the raiders were discharged, it being decided that they had acted as belligerents in a foreign state, and consequently the laws of a neutral country had no jurisdiction to order their extradition. . . . This same year [1864] the first street car appeared in Montreal, the City Passenger Railway instituting a service of cars over about ten miles of track. Horse traction was the motive power, and the company continued operations until 1892, when it was taken over by the Montreal Street Railway, who, after obtaining a thirty years’ franchise from the city, inaugurated the electric trolley system. . . . It will be many years before the memory of the great fire in January, 1901, fades from the minds of those who fought it or looked on. The damage amounted to nearly five million dollars, and included the total destruction of the Board of Trade building and several blocks of offices and warehouses.”—N. M. Hinshelwood, *Montreal and vicinity*, pp. 33, 35-36, 41.

MONTROSE, James Graham, 1st Marquess of (1612-1650), Scottish statesman and soldier. One of the signers of the Scottish Covenant, 1638; first opposed and later upheld the royal cause in the civil war; aided Charles II during the Scottish rising and was defeated, 1650; surrendered by the McLeods to the Parliamentary party and executed, March, 1650. See SCOTLAND: 1638-1640; 1644-1645; 1650 (March-July).

MONTS, Pierre du Guast, Comte de (1560-1611), French colonist. See CANADA: 1603-1605; NOVA SCOTIA: 1604.

MONTSERRAT, one of the group of the Leeward islands, in the West Indies. “This island, discovered by Columbus in 1493, was named by him after a famous mountain in Spain where is situated the monastery in which Ignatius Loyola conceived the project of founding the Society of Jesus. It is situated 27 miles from Antigua . . . and is about eleven miles in length and seven in the broadest part. Its total area is 32½ square miles. [In 1911, the population was 12,106.] It is of volcanic formation and very rugged and mountainous. . . . The history of Montserrat is less eventful than that of several of its neighbours. It was settled by colonists—most of whom were Irish and Roman Catholics—from St. Kitts under Sir Thomas Warner. In 1664 the island was captured by the French; but it was restored four years later to England, in whose possession it remained until 1782, when it was again taken by the French. It was, however, ceded to England in the following year by the Treaty of Versailles.”—A. E. Aspinwall, *British West Indies*, p. 30.

1492-1669.—Persecution and final expulsion from Spain.—Deadly effect upon that country.—“After the reduction . . . of the last Mohammedan kingdom in Spain, the great object of the Spaniards became to convert those whom they had conquered [in violation of the treaty made on the surrender of Granada]. . . . By torturing some, by burning others, and by threatening all, they at length succeeded; and we are assured that, after the year 1526, there was no Mohammedan in Spain, who had not been converted to Christianity. [See SPAIN: 1524-1526.] Immense numbers of them were baptized by force; but being baptized, it was held that they belonged to the Church, and were amenable to her discipline. That discipline was administered by the Inquisition, which, during the rest of the 16th century, subjected these new Christians, or Moriscoes, as they were now called, to the most barbarous treatment. The genuineness of their forced conversions was doubted; it therefore became the business of the Church to inquire into their sincerity. The civil government lent its aid; and among other enactments, an edict was issued by Philip II, in 1566, ordering the Moriscoes

to abandon everything which by the slightest possibility could remind them of their former religion. They were commanded, under severe penalties, to learn Spanish, and to give up all their Arabic books. They were forbidden to read their native language, or to write it, or even to speak it in their own houses. Their ceremonies and their very games were strictly prohibited. They were to indulge in no amusements which had been practised by their fathers; neither were they to wear such clothes as they had been accustomed to. Their women were to go unveiled; and, as bathing was a heathenish custom, all public baths were to be destroyed, and even all baths in private houses. By these and similar measures, these unhappy people were at length goaded into rebellion; and in 1568 they took the desperate step of measuring their force against that of the whole Spanish monarchy. The result could hardly be doubted; but the Moriscoes maddened by their sufferings, and fighting for their all, protracted the contest till 1571, when the insurrection was finally put down. By this unsuccessful effort they were greatly reduced in numbers and in strength; and during the remaining 27 years of the reign of Philip II. we hear comparatively little of them. Notwithstanding an occasional outbreak, the old animosities were subsiding, and in the course of time would probably have disappeared. At all events, there was no pretence for violence on the part of the Spaniards, since it was absurd to suppose that the Moriscoes, weakened in every way, humbled, broken, and scattered through the kingdom, could, even if they desired it, effect anything against the resources of the executive government. But, after the death of Philip II., that movement began . . . which, contrary to the course of affairs in other nations, secured to the Spanish clergy in the 17th century, more power than they had possessed in the 16th. The consequences of this were immediately apparent. The clergy did not think that the steps taken by Philip II. against the Moriscoes were sufficiently decisive. . . . Under his successor, the clergy . . . gained fresh strength, and they soon felt themselves sufficiently powerful to begin another and final crusade against the miserable remains of the Moorish nation. The Archbishop of Valencia was the first to take the field. In 1602, this eminent prelate presented a memorial to Philip III. against the Moriscoes; and finding that his views were cordially supported by the clergy, and not discouraged by the crown, he followed up the blow by another memorial having the same object. . . . He declared that the Armada, which Philip II. sent against England in 1588, had been destroyed, because God would not allow even that pious enterprise to succeed, while those who undertook it, left heretics undisturbed at home. For the same reason, the late expedition to Algiers had failed; it being evidently the will of Heaven that nothing should prosper while Spain was inhabited by apostates. He, therefore, exhorted the king to exile all the Moriscoes, except some whom he might condemn to work in the galleys, and others who could become slaves, and labour in the mines of America. This, he added, would make the reign of Philip glorious to all posterity, and would raise his fame far above that of his predecessors, who in this matter had neglected their obvious duty. . . . That they should all be slain, instead of being banished, was the desire of a powerful party in the Church, who thought that such signal punishment would work good by striking terror into the heretics of every nation. Bleda, the celebrated Dominican, one of the most influential men of his time, wished this to be done, and to be done thoroughly. He said, that, for the sake of example,

every Morisco in Spain should have his throat cut, because it was impossible to tell which of them were Christians at heart, and it was enough to leave the matter to God, who knew his own, and who would reward in the next world those who were really Catholics. . . . The religious scruples of Philip III. forbade him to struggle with the Church; and his minister Lerma would not risk his own authority by even the show of opposition. In 1609 he announced to the king, that the expulsion of the Moriscos had become necessary. 'The resolution,' replied Philip, 'is a great one; let it be executed.' And executed it was, with unflinching barbarity. About 1,000,000 of the most industrious inhabitants of Spain were hunted out like wild beasts, because the sincerity of their religious opinions was doubtful. Many were slain, as they approached the coast; others were beaten and plundered; and the majority, in the most wretched plight, sailed for Africa. During the passage, the crew, in many of the ships, rose upon them, butchered the men, ravished the women, and threw the children into the sea. Those who escaped this fate, landed on the coast of Barbary, where they were attacked by the Bedouins, and many of them put to the sword. Others made their way into the desert, and perished from famine. Of the number of lives actually sacrificed, we have no authentic account; but it is said, on very good authority, that in one expedition, in which 140,000 were carried to Africa, upwards of 100,000 suffered death in its most frightful forms within a few months after their expulsion from Spain. Now, for the first time, the Church was really triumphant. For the first time there was not a heretic to be seen between the Pyrenees and the Straits of Gibraltar. All were orthodox, and all were loyal. Every inhabitant of that great country obeyed the Church, and feared the king. And from this happy combination, it was believed that the prosperity and grandeur of Spain were sure to follow. . . . The effects upon the material prosperity of Spain may be stated in a few words. From nearly every part of the country, large bodies of industrious agriculturists and expert artificers were suddenly withdrawn. The best system of husbandry then known, were practised by the Moriscos, who tilled and irrigated with indefatigable labour. The cultivation of rice, cotton, and sugar, and the manufacture of silk and paper were almost confined to them. By their expulsion all this was destroyed at a blow, and most of it was destroyed for ever. For the Spanish Christians considered such pursuits beneath their dignity. In their judgment, war and religion were the only two avocations worthy of being followed. To fight for the king, or to enter the Church was honourable; but everything else was mean and sordid. When, therefore, the Moriscos were thrust out of Spain, there was no one to fill their place; arts and manufactures either degenerated, or were entirely lost, and immense regions of arable land were left uncultivated. . . . Whole districts were suddenly deserted, and down to the present day have never been re peopled. These solitudes gave refuge to smugglers and brigands, who succeeded the industrious inhabitants formerly occupying them; and it is said that from the expulsion of the Moriscos is to be dated the existence of those organized bands of robbers, which after this period, became the scourge of Spain, and which no subsequent government has been able entirely to extirpate. To these disastrous consequences, others were added, of a different, and, if possible, of a still more serious kind. The victory gained by the Church increased both her power and her reputation. . . . The greatest

men, with hardly an exception, became ecclesiastics, and all temporal considerations, all views of earthly policy, were despised and set at naught. No one inquired; no one doubted; no one presumed to ask if all this was right. The minds of men succumbed and were prostrate. While every other country was advancing, Spain alone was receding. Every other country was making some addition to knowledge, creating some art, or enlarging some science, Spain numbed into a death-like torpor, spellbound and entranced by the accursed superstition which preyed on her strength, presented to Europe a solitary instance of constant decay."—H. MOQUELUMNAN FAMILY.—"Derivation: From the river and hill of the same name in Calaveras County, California. . . . It was not until 1856 that the distinctness of the linguistic family was fully set forth by Latham. Under the head of Moquelumne, this author gathers several vocabularies representing different languages and dialects of the same stock. These are the Talatui of Hale, the Tuolumne from Schoolcraft, the Sonoma dialects as represented by the Tshokoyem vocabulary, the Chocuyem and Youkiousme paternosters, and the Olamentke of Kostromitonov in Bæer's Beiträge. . . . The Moquelumnan family occupies the territory bounded on the north by the Cosumne River, on the south by the Fresno River, on the east by the Sierra Nevada, and on the west by the San Joaquin River, with the exception of a strip on the east bank occupied by the Cholovone. A part of this family occupies also a territory bounded on the south by San Francisco Bay."—J. W. Powell, *Seventh Annual Report, Bureau of Ethnology*, pp. 92-93.

MORAVIA: Physical features.—Industries and resources.—"Moravia is a mountainous plateau sloping from north to south and surrounded on three sides by mountain ranges. In the north it is separated from Silesia by the Sudetic moun-

tains; in the east from Austria and Hungary by the Carpathian and the White mountains, and in the west from Bohemia by the Moravian-Bohemian highland. Branches of these mountains intersect the whole country and give it a very irregular surface. Almost the whole of Moravia, belongs to the Morava (March) river basin, which forms a part of the Danube system. The Morava traverses the entire length of the margravate—a distance of one hundred and forty miles—and receives numerous tributaries from the border-mountain regions. . . . Only a small part of the Morava is navigable. The total area of the margravate is 8,580 square miles, ninety-seven per cent. of which is productive. Wheat is grown in great quantities; also flax, hemp, vegetables, and orchard fruits. In recent times the sugar beet has been extensively cultivated on the large estates. Minerals are abundant, and the quantities of coal and iron favour industry. Moravia has an excellent clay for chinaware and vast tracts of productive forest land. There are also large deposits of lignite, copper, graphite, and sulphur. The land unfortunately is largely in the hands of a few proprietors, and the small size of the peasant farms forces their owners, as in Bohemia, to engage in home industries. The products that are made in the homes, chiefly during the winter months, are woodwares and textiles. The woollen industry of the country is very old, and some progress has been made . . . in the weaving of cotton and linen fabrics.”—W. S. Monroe, *Bohemia and the Cechs*, pp. 449-450.

People and their early history.—“Three-fourths of the inhabitants of Moravia belong to the Slavic race—Cechs, Horaks, Hanaks, and Slovaks—and the balance are Germans, Jews, and Vlachs. The country was settled at a very early period by Slavic tribes of the same ethnic stock as the first settlers of Bohemia. But the Moravians unified the scattered tribes within their borders and established a strong form of imperial government several decades in advance of the Bohemians.”—W. S. Monroe, *Bohemia and the Cechs*, p. 451.—See also **BOHEMIA**: Its people, etc.

6th-8th centuries.—**Early history.**—About the sixth century, the Slavs, who had been pressing into Central Europe, occupied the territory between the Elbe and the Vistula, southward to Pusterthal. Within this region, toward the west, three Slav powers, Bohemia, Moravia and Silesia, arose at an early date. Of the three, Moravia is the first to appear out of the mists which cloud the history of Central Europe down to the end of the early Middle Ages, a mist which hides from view the struggles during which the Celts disappeared before the Teutons, and the Teutons in turn were driven out by the Slavs. In the seventh century the Slavs appear to have been subject to the Avars, who were then in possession of the Danube plain, but, tradition says, under the leadership of a Frankish merchant, named Samo, the Slavs shook off the rule of their overlords. Samo was chosen king, or duke, of the freed territory, and the new kingdom, which extended through the present Moravia and Bohemia, bade fair to become all powerful in Germany. This kingdom was forced by Charlemagne to accept his supremacy in 789, when he led a campaign against it to put an end to incursions into German territory.

9th century.—**Wars between Moimir and Louis the German.**—**Conversion to Christianity.**—**Kingdom of Svatopluk.**—After the treaty of Verdun, 843, Louis the German claimed suzerainty over greater Moravia, as part of his kingdom of

Germany, by virtue of the conditions imposed upon it by his grandfather, Charlemagne. The duke, Moimir, had no intention of submitting tamely to this demand, and in 846 he began a war of resistance, which, however, did not last long, for, a few years later, Moimir appears to have been slain either by his nephew Rostislav, or at Rostislav's instigation. Some say that Moimir had been deposed by Louis, who made Rostislav (also called Rostiz) duke on promise of submission. But, whether or not this prince was aided by the German king, he apparently had no intention of keeping his promise of allegiance, if indeed he had understood what allegiance implied. He endeavored to establish the independence of his kingdom, and for this purpose fortified his frontiers, and then declared war on Louis, who commenced a series of invasions which continued, with varying success, from 885 to 968. Up to this time the Moravians had been pagan. Some writers state that one of the conditions made by Louis was that they should accept Christianity, and that the wars were partly caused by their refusal to do so at the hands of the Germans, who sought to enslave them. Others say that German, Greek and Italian missionaries were all working in the duchy at this time and that Rostislav appealed in person to Pope Nicholas I, asking him to decide upon teachers for the distracted country. Nicholas, however, refused to intervene, and Rostislav then turned to Michael III of Greece with the same request. However, this may be, it is a matter of certainty that in 864 two missionaries, Cyril (or Constantine) and Methodius of Thessalonica arrived in Moravia and began their labours, which resulted in the conversion of the people to Christianity. (See also **CHRISTIANITY**: 9th century: Conversion of Moravia.) “Unwelcome as Christianity had seemed to the Moravians, when presented to them as a demand of Frankish invaders, and taught in an unknown tongue, its lessons came with a very different force when urged by pious and peaceable monks, recommended by friendly kinsmen, and expounded in a language intelligible to the converts. [See also **SLAVS**: 9th-10th centuries.] Rostislav no doubt quickly perceived that the new teaching might form a valuable link in the alliance of the Slavs against their enemies. He appealed to the Emperor of the East to send Cyril and Methodius to Moravia; and, when they arrived at the town of Devina, Rostislav and his followers went out to welcome them. . . . But troubles very soon began for the new-comers. The German party in Moravia were resentful at the introduction into the churches of what they considered a barbarous language; and they saw danger to their power, both in the adoption of a ritual which was understood by the people, and in the assertion of an episcopal authority which claimed to be independent of the German bishops. Nor was it only by foreigners that the influence of Cyril and Methodius was endangered; an opposition was roused even among the Moravians themselves. Svatopluk, the nephew and rival of Rostislav, seems to have accepted some kind of nominal Christianity, but unaccompanied by any change of life, or even by any great reverence for the externals of worship; and he opposed the new apostles of the Slavs with the greatest fierceness. . . . According to one story he had already attempted to poison Rostislav, and having failed in that purpose he conspired with the Emperor Louis against him, made him prisoner, and sent him off to the Imperial Court to be tried. Louis threw Rostislav into prison, and put out his eyes. But Svatopluk, though he suc-

ceeded in seizing the Dukedom, did not long retain the confidence of the Emperor or the German party. He, in his turn, was deposed and thrown into prison. Then the Moravians rose against the Franks, under a man named Slavomir, who, according to one story, was a pupil of Methodius. The Emperor thereupon set Svatopluk free, and sent him at the head of an army to suppress the new rising. Svatopluk betrayed his soldiers to his countrymen, destroyed the German army, and once more became Duke of Moravia. . . . [The independence of Moravia was recognized by the Treaty of Forcheim, signed in 874, but] there still remained the real subjects of dispute. These were the lawfulness of the Slavonic ritual, and the position of Methodius as Archbishop of Moravia. Svatopluk had thrown himself with eagerness into the cause of Methodius's opponents, and joined in the denunciation of the Slavonic ritual, declaring that it degraded worship by connecting it with a barbarous dialect. . . . [Cyril died in 869 at Rome, where the brothers had gone to obtain the consent of the Pope to the use of the liturgy in the Slavonic tongue. Methodius was consecrated bishop by the pope; but, in spite of this, and of the fact that in 880 Pope John VIII gave him protection and upheld his authority, the German clergy continued to oppose Methodius almost to the time of his death in 885. This is an important point, because in those days especially, it was inevitable that the religious struggle should have great effect upon the political state of the country.] Pope John seems clearly to have understood that the opposition to Methodius arose rather from prejudice of race than from ecclesiastical principle; and he recognised this fact in the Bull which sanctioned the Slavonic ritual. For in this document he expressly required that all the clergy in the diocese of Moravia and Pannonia, whether Slav or of whatever race they might be, should be submissive to the archbishop. A very noteworthy modification was subjoined to this decision which seemed to stamp a popular and democratic character on the Slavonic movement. 'If Svatopluk,' said the Pope, 'and the members of his Court desire to use the Latin ritual, they may do so still.' An even more crushing blow to the hopes of the enemies of Methodius was given in a second decision of the Pope . . . [who] expressly recommended Svatopluk to choose his next bishop with the advice and consent of Methodius. . . . The relations between Methodius and Svatopluk, always hostile, would now have probably culminated in the death or exile of the archbishop, but that a quarrel broke out between Svatopluk and Arnulf [duke of Pannonia]; and the desire of Svatopluk to overthrow Arnulf's influence in Pannonia naturally hindered his action against Methodius. For the few remaining years of the archbishop's life, he was able to carry on his work, both moral and religious, with much less opposition; but when, after his death, his friends attempted to get his pupil Gorazd appointed as successor in the archbishopric. . . . [Svatopluk was stirred up against Gorazd] but in spite of the opposition of dukes and Germans, the Slavonic ritual held its own in Moravia, and Svatopluk's son Mojmir became its champion. . . . Svatopluk, the cruel and unscrupulous persecutor of Methodius and his followers, might, from the ordinary nationalist point of view, have been looked upon as the establisher of Slavonic greatness, the champion of Moravian independence, and even the protector of Bohemia and Moravia against a cruel and barbarous invader. Under his rule Moravia had become the centre of a

great Slavonic alliance extending eastwards to Bulgaria and northwards to Magdeburg. The exact relations between the dukedom of Moravia and the other States referred to may be difficult to define; but the whole story of his relations with Bohemia shows that Svatopluk exercised an authority there which was, at least, equal to that maintained by the German Emperor over many of the states subject to him. [See BOHEMIA: 9th-13th centuries.] . . . Such a position, in the then condition of Europe, could not but excite rivalry and jealousy among the neighbouring princes; and Arnulf, the Duke of Pannonia, who had aspired to the throne of the Frankish Empire, was particularly jealous of a man whose power, as he considered, had been largely due to the patronage which Arnulf had granted to him. The exact merits of the numerous quarrels between these princes it is impossible to estimate accurately; but it is clear that, as Svatopluk gained power, he became more and more resolved to throw off the authority which Arnulf found difficult to assert. At last Arnulf, having lost hope of maintaining his authority by his own force, and perhaps suspecting that Pannonia would itself fall a prey to his rival, resolved to call in a new ally to his assistance."—C. E. Maurice, *Bohemia*, pp. 10-11, 14-19.—"At one time . . . [Svatopluk] was the most powerful monarch of the Slavs; Rome was in treaty with him, Bohemia gravitated towards the orbit of Moravia, while Moravia held the empire in check. . . . At this time [891] the kingdom of Svatopluk . . . included, besides Moravia and the present Austrian Silesia, the subject country of Bohemia, the Slav tribes on the Elbe and the Vistula as far as the neighbourhood of Magdeburg, part of Western Galicia, the country of the Slovaks, and Lower Pannonia." But Svatopluk was ruined by war with his neighbor, Arnulf, duke of Pannonia. The latter "entered into an alliance with Braclav, a Slovene prince, sought the aid of the king of the Bulgarians, and, what was of far graver importance, summoned to his help the Magyars, who had just settled themselves on the Lower Danube. Swabians, Bavarians, Franks, Magyars, and Slovenes rushed simultaneously upon Moravia. Overwhelmed by numbers, Svatopluk made no attempt at resistance; he shut up his troops in fortresses, and abandoned the open country to the enemy, who ravaged it for four whole weeks. Then hostilities ceased; but no durable peace could exist between the two adversaries. War began again in the following year [894], when death freed Arnulf from Svatopluk. . . . At his death he left three sons; he chose the eldest, Mojmir II, as his heir, and assigned appanages to each of the others. On his death-bed he begged them to live at peace with one another, but his advice was not followed."—L. Leger, *History of Austro-Hungary*, ch. 4.—"The ruin of the Moravian dukedom speedily followed. According to one tradition, Wiching, Svatopluk's German bishop, was used by Arnulf to stir up division between the sons of Svatopluk. If so, he must undoubtedly have used his influence in favour of the younger Svatopluk, and against Mojmir, the champion of the Slavonic ritual. But, whatever the cause of division, the fact of the civil war is undoubted; and all the enemies of the country took advantage of it. In 896 the Hungarians again invaded Moravia, and this time with much greater success."—C. E. Maurice, *Bohemia*, p. 21.

10th-14th centuries.—Struggle for independence.—Under rule of Bohemia.—Created a margravate of the empire.—The struggle for the security and independence of Moravia was con-

tinued for a few years after the death of Svato-pluk; but the Magyar invaders were encouraged by the German monarchs, and aided by the dissensions and mismanagement of Svato-pluk's sons. In 900 the Bavarians together with the Czechs, invaded Moravia. In 901 a peace, which is said to have "in no way limited the constitutional independence" of the country, was made with the emperor who endeavored to assist Mojmir. But the Magyars, far more deadly foes, continued their attacks. In 907 Mojmir was killed in battle and with his death greater Moravia completely disappeared. Moravia now seems to have fallen under the supremacy of Bohemia, which had meanwhile been growing stronger, and consequently she became involved in the wars between the Czech kingdom, Poland, and Hungary, all of whom disputed for her possession. About the year 1000 she was conquered by Boleslav I of Poland, and during the confused period which follows, we catch only a few glimpses of the troubled state of the country, which was divided at various times in order to provide appanages for the younger sons of the kings of Bohemia. At one time in the twelfth century we read of three duchies. At the end of that century Conrad Otto, a Moravian prince, united their rule in his own person, and became sufficiently strong to threaten Bohemia. Frederick Barbarossa, however, intervened, and decreed (1197) that Conrad Otto should govern Moravia as a margravate, under the suzerainty of the empire. Nevertheless, Moravia was generally speaking more or less under Bohemian overlordship. John, the blind king of Bohemia, who fell at Crécy, made his son Charles margrave of Moravia in 1333. Charles, after his father's death, either as king of Bohemia, or as emperor, gave the margravate first to his brother John Henry, and afterwards to his brother Wenzel, duke of Luxembourg; in 1355, with the consent of the Diet, the margravate was declared an integral and inalienable part of Bohemia.—See also BOHEMIA: 1355.

1241.—Battle of Liegnitz against Mongols. See LIEGNITZ.

1526.—Rule of Austria.—After the battle of Mohacs, Moravia, with all the other Bohemian possessions, fell to Ferdinand of Austria, and was thenceforth ruled by the House of Austria.

1618-1620.—Participation in Bohemian revolt. See GERMANY: 1618-1620.

1618-1648.—Thirty Years' War.—In the early part of the Thirty Years' War, the Moravian Diet was influenced by Charles of Zerotin, a Moravian noble, to follow a moderate policy, and gave Ferdinand the right to send troops through the country. The treasury of the estates, and part of the army were taken to Vienna by Wallenstein, who was himself a Moravian. But, when Thurn entered Moravia with 8,000 men, a directorate was established, and the other part of the army went over to Bohemia. Again in 1619 the Diet was divided on the subject of the resolution to depose Ferdinand, although ultimately the resolution was carried. Later the Estates renounced resistance on the promise that their religious liberties would be preserved to them. The promise was of no avail, however; Ferdinand fell back on the plea that the Pope had authority over him in matters of conscience. The towns were subjected to large levies; members of the Brethren were compelled to flee to Hungary, and the constitution was revised on the same lines as that of Bohemia. Moreover, in 1627, all Protestants were ordered to sell their estates, and leave the country under pain of severe punishment. No Protestant could inherit; marriages between Protestants and Roman Catholics were not

recognized; and provision was made to take the education of children out of the hands of Protestant parents. At the close of hostilities (see GERMANY: 1640-1645) the population was a fraction of what it had formerly been; the country was reduced to want, and did not again rise to anything like the importance it had previously enjoyed.

1742-1758.—Invasions by Frederick the Great.—In 1742 Frederick entered Moravia in conjunction with a body of Saxon troops, but the campaign was rendered fruitless by the obstinacy of the Saxon commanders. (See also AUSTRIA: 1742 [January-May].) During the Seven Years' War the Moravians, as well as the Bohemians, remained loyal to Maria Theresa. During his occupation of the country Frederick found extreme difficulty in obtaining supplies and information, a circumstance which contributed to the defeat of his attempt to reduce the fortress of Olmutz. At the close of the war, Moravia was attached to Austrian Silesia.

1849.—Separation from Bohemia.—In 1849 Moravia was again made a distinct province, or independent crownland, with a legislature consisting of forty-nine members in the House of Deputies, and a provincial Diet of 151 members.

1918.—Part of Czecho-Slovakia.—In 1918, Moravia joined with Bohemia, Silesia and Slovakia in the formation of the new republic of Czecho-Slovakia. The boundaries of the old margravate are now those of the electoral area and administrative district of the new republic.—See also CZECHO-SLOVAKIA: Territory.

Saxony and America.—Indian missions.—Recognition by Church of England.—"In 1722, and in the seven following years, a considerable number of these 'Brethren,' led by Christian David, who were persecuted in their homes, were received by Count Zinzendorf on his estate at Berthelsdorf in Saxony. They founded a village called Herrnhut, or 'the Watch of the Lord.' There they were joined by Christians from other places in Germany, and, after some time Zinzendorf took up his abode among them, and became their principal guide and pastor. . . . In 1737, he consecrated himself wholly to the service of God in connection with the Moravian settlement, and was ordained a bishop. . . . Zinzendorf had before been received into the Lutheran ministry. The peculiar fervor which characterized his religious work, and certain particulars in his teaching, caused the Saxon Government, which was wedded to the traditional ways of Lutheranism, to exclude him from Saxony for about ten years (1736-1747). He prosecuted his religious labors in Frankfurt, journeyed through Holland and England, made a voyage to the West Indies, and, in 1741, another voyage to America. New branches of the Moravian body he planted in the countries which he visited. . . . It was a church within a church that Zinzendorf aimed to establish. It was far from his purpose to found a sect antagonistic to the national churches in the midst of which the Moravian societies arose. . . . With a religious life remarkable as combining warm emotion with a quiet and serene type of feeling, the community of Zinzendorf connected a missionary zeal not equalled at that time in any other Protestant communion. Although few in number, they sent their gospel messengers to all quarters of the globe."—G. P. Fisher, *History of the Christian Church*, pp. 506-507.—The first settlement of the Moravians in America was planted in Georgia, in

1735. (See GEORGIA: 1738-1743.) "But Oglethorpe's border war with the Spaniards compelled him to call every man in his colony to arms, and the Moravians, rather than forsake their principles [of non-resistance, and dependence upon prayer], abandoned their lands and escaped to Pennsylvania [1740]. Here some of their brethren were already fixed. Among the refugees was the young David Zeisberger, the future head of the Ohio missions. Bethlehem on the Lehigh became, and is yet, the centre in America of their double system of missions and education. [See also MISSIONS, CHRISTIAN: North America.] They bought lands, laid out villages and farms, built houses, shops, and mills, but everywhere, and first of all, houses of prayer, in thankfulness for the peace and prosperity at length found. The first mission established by Zinzendorf in the colonies was in 1741, among the Mohican Indians, near the borders of New York and Connecticut. The bigoted people and authorities of the neighborhood by outrages and persecution drove them off, so that they were forced to take refuge on the Lehigh. The brethren established them in a new colony twenty miles above Bethlehem, to which they gave the name of Gnadenhütten (Tents of Grace). The prosperity of the Mohicans attracted the attention and visits of the Indians beyond. The nearest were the Delawares, between whom and the Mohicans there were strong ties of affinity, as branches of the old Lenni Lenape stock. Relations were thus formed between the Moravians and the Delawares. And by the fraternization between the Delawares and Shawanees . . . and their gradual emigration to the West to escape the encroachments of Penn's people, it occurred that the Moravian missionaries, Zeisberger foremost, accompanied their Delaware and Mohican converts to the Susquehanna in 1765, and again, when driven from there by the cession at Fort Stanwix, journeyed with them across the Alleghenies to Goshgoshink, a town established by the unconverted Delawares far up the Alleghany River." In 1770, having gained some important converts among the Delawares of the Wolf clan, at Kuskuskee, on Big Beaver Creek, they transferred themselves to that place, naming it Friedenstadt. But there they were opposed with such hostility by warriors and white traders that they determined "to plunge a step further into the wilderness, and go to the head chief of the Delawares at Gepelmukpechenk (Stillwater, or Tuscarawi) on the Muskingum. It was near this village that Christian Frederick Post, the brave, enterprising pioneer of the Moravians, had established himself in 1761, with the approbation of the chiefs. . . . By marriage with an Indian wife he had forfeited his regular standing with the congregation. His intimate acquaintance with the Indians, and their languages and customs, so far gained upon them that in 1762 he was permitted to take Heckewelder to share his cabin and establish a school for the Indian children. But in the autumn the threatened outburst of Pontiac's war had compelled them to flee. . . . [Early in 1772 the Moravian colony] was invited by the council at Tuscarawi, the Wyandots west of them approving it, to come with all their Indian brethren from the Alleghany and Susquehanna, and settle on the Muskingum (as the Tuscarawas was then called), and upon any lands that they might choose. . . . [The invitation was accepted.] The pioneer party, in the removal from the Beaver to Ohio, consisted of Zeisberger and five Indian families, 28 persons, who arrived at this beautiful ground May 3, 1772. . . . The site was at the large spring, and appropriately it was named for it Shoenbrun. In August arrived the Missionaries Ettwein and

Heckewelder, with the main body of Christian Indians who had been invited from the Alleghany and the Susquehanna, about 250 in number. . . . This, and further accessions from the east in September, made it advisable to divide the colony into two villages. The second [named Gnadenhütten] was established ten miles below Shoenbrun. . . . In April, 1773, the remnants of the mission on the Beaver joined their brethren in Ohio. The whole body of the Moravian Indians . . . was now united and at rest under the shelter of the unconverted but . . . tolerant Delaware warriors. . . . The population of the Moravian villages at the close of 1775 was 414 persons. . . . The calamity of the Moravians was the war of the American Revolution. It developed the dangerous fact that their villages . . . were close upon the direct line between Pittsburgh and Detroit, the outposts of the two contending forces." The peaceful settlement became an object of hostility to the meaner spirits on both sides. In September, 1781, by order of the British commander at Detroit, they were expelled from their settlement, robbed of all their possessions, and sent to Sandusky. In the following February, a half-starved party of them, numbering 96, who had ventured back to their ravaged homes, for the purpose of gleaning the corn left standing in the fields, were massacred by a brutal American force, from the Ohio. "So perished the Moravian missions on the Muskingum. Not that the pious founders ceased their labors, or that these consecrated scenes knew them no more. But their Indian communities, the germ of their work, the sign of what was to be accomplished by them in the great Indian problem, were scattered and gone. Zeisberger, at their head, labored with the remnants of their congregation for years in Canada. They then transferred themselves temporarily to settlements on the Sandusky, the Huron, and the Cuyahoga rivers. At last he and Heckewelder, with the survivors of these wanderings, went back to their lands on the Tuscarawas."—R. King, *Ohio*, ch. 6. —"The settlement of many families of the Brethren in the British Colonies of North America, soon after their emigration from Moravia, led to an application to Parliament for protection, and for relief from laws and services contrary to their religious scruples. In 1747, an Act was passed in their favor (20 George II. cap. xlv.) for extending the privileges of natural-born subjects to the Moravian Brethren and other Foreign Protestants who should make affirmation of allegiance, &c. and should scruple to take the oaths; but their case was more particularly brought to the notice of Parliament in 1749, when upon application to be relieved from taking oaths generally, and bearing arms; their doctrine, discipline, character, and history, were scrupulously examined before Committees of both Houses. An Act was passed, with the unanimous consent of the Episcopal Bench, in that year (22 George II. cap. xxx.) conceding to the Brethren in England, as well as America, the privileges they sought, and fully acknowledging them as 'An Ancient Protestant Episcopal Church, which had been countenanced and relieved by the Kings of England His Majesty's Predecessors.'—London Association in Aid of Missions of the United Brethren, *Brief narrative of the origin and progress of the Church of the United Brethren (commonly called Moravians) and of its recognition by the church and government of England (pamphlet)*, p. 8.

MORE, Sir Thomas (1487-1535), English statesman, jurist and author. Knighted, 1521; speaker of the House of Commons, 1523; lord chancellor, 1529-1532; executed for refusal to take oath of supremacy, 1535. See **ENGLAND**: 1529-1535; **ENGLISH LITERATURE**: 1530-1660.

MOREA: Origin of name.—"The Morea must . . . have come into general use, as the name of the peninsula [of the Peloponnesus] among the Greeks, after the Latin conquest [of 1204-1205], even allowing that the term was used among foreigners before the arrival of the Franks. . . . The name Morea was, however, at first applied only to the western coast of the Peloponnesus, or perhaps more particularly to Elis, which the epitome of Strabo points out as a district exclusively Scлавonian, and which, to this day, preserves a number of Scлавonian names. . . . Originally the word appears to be the same geographical denomination which the Scлавonians of the north had given to a mountain district of Thrace in the chain of Mount Rhodope. In the 14th century the name of this province is written by the Emperor Cantacuzenos, who must have been well acquainted with it personally, Morrha. Even as late as the 14th century, the Morea is mentioned in official documents relating to the Frank principality as a province of the Peloponnesus, though the name was then commonly applied to the whole peninsula."—G. Finlay, *History of Greece from its conquest by the Crusaders*, ch. 1, sect. 4.

MORGANATIC MARRIAGES. — When a member of a royal family married a woman of a rank inferior to his own, the marriage, though ecclesiastically and legally a perfect marriage, was called a "morganatic marriage." The wife did not acquire, nor the children inherit, the rank of the husband and father. Neither did the children succeed to the father's position nor to such property as is attached to that position. The origin of the name is found in an old German custom, and applies properly to German houses only. "Besides the dowry which was given before the marriage ceremony had been performed, it was customary [among some of the ancient German peoples] for the husband to make his wife a present on the morning after the first night. This was called the 'morgengabe,' or morning gift, the presenting of which, where no previous ceremony had been observed, constituted a particular kind of connexion called matrimonium morganaticum, or 'morganatic marriage.' As the liberality of the husband was apt to be excessive, we find the amount limited by the Langobardian laws to one fourth of the bridegroom's substance."—W. C. Perry, *Franks*, ch. 10.

MORMONISM: 1805-1830.—Joseph Smith and the Book of Mormon.—Non-polygamous branch.—“Joseph Smith, the Mormon prophet and founder of the Church, first saw light at Sharon, Windsor County, Vermont, on December 23rd, 1805, the fourth of a family of seven sons and three daughters. The family claimed to be of Scottish descent, but had settled in America a hundred years before Joseph was born. . . . Opponents of the Mormons say the prophet's parents were poor, illiterate, and superstitious. Mormons hold that they were devout, honest, and in straitened circumstances owing to the treachery of a trusted friend. . . . When Joseph was ten years old his parents left Vermont for County Wayne, New York, and four years later they moved to Manchester, in the same county, where Joseph led the life of an ordinary farm-hand, learning agriculture, and apparently conducting himself neither better nor worse than his fellow workers. . . . At any rate, he seems to have had in his composition many of the elements which go to make up the visionary and the dreamer. Opposed to the mass of testimony assailing his character is the story, accepted by all good Mormons, of the early life of their prophet, supported in turn by ‘witnesses.’ The most important parts of this narrative have been supplied by Joseph himself.”—S. Martin, *Mystery of Mormonism*, pp. 22-24.—“When Joseph Smith was about fourteen years of age his father's family moved from Palmyra, N. Y., to Manchester, N. Y. About this time there was evinced a great deal of sectarian revival activity to make converts and add to the Church ‘such as should be saved.’ Joseph, a lad of sensitive nature, was naturally influenced by the emotionalism around him. His mother and three brothers and a sister had just joined the Presbyterian Church, but Joseph, though so young, was much perturbed about the different sects of the professed children of God. Why these divisions? Surely God cannot be the author of this confusion, he reasoned. If God has a Church in the Faith it will not be split up into factions. . . . Not far from his home was a beautiful grove,

the foliage of which was dense enough to give him the seclusion he desired for private devotion. Here, on the morning of a clear spring day, he retired for definite prayer and communion with God, if such things were possible. Let me now quote from the article of B. H. Roberts in the *Americana Magazine* on the ‘History of the Mormon Church.’ And now something strange happened. The youth had just begun timidly to express the desire of his heart in words, when he was seized upon by an invisible power that overcame him; his tongue was bound so that he could not speak. . . . At this moment of dreadful alarm he saw a pillar of light exactly over his head which shone

JOSEPH SMITH (1805-1844)

out above the brightness of the sun. . . . As soon as the light appeared, the youth found himself freed from the power of the enemy that had held him bound. As the light rested upon him, he beheld within it two personages, exactly resembling each other in form and features, standing above him in the air, one of these, calling Joseph by name, and pointing to the other, said: “This is my Beloved Son, hear him.” . . . When he came entirely to himself he found that he was lying on his back, looking up to heaven. With the passing of the vision he was left without strength; but soon recovering from his weakness he returned home. . . . It is upon the assumed truth of this vision and subsequent revelations alleged to have been made to Joseph Smith, that the Mormon Church, The Church of Jesus Christ of Latter-Day Saints, definitely, positively, unflinchingly takes its stand. Its leaders do not beg the issue, dodge it, or question it. . . . [Some years later] praying to God for forgiveness, one night, another vision appeared to him. This time it was the angel Moroni, who . . . revealed that ‘there was a book written upon gold plates, giving an account of the former inhabitants of this continent, and the source from which they sprang. He also said that the fullness of the everlasting gospel was contained in it’ and that with the book would be found two stones in silver bowls—the Urim and

Thummim—which would enable him to translate the book. Again and yet again Moroni appeared to him with the same revelation, and on a fourth occasion he commanded Joseph to tell everything he had heard to his father. He did so, and then further obeying the commands of Moroni, he went to the hill where the sacred book was said to be. It was near to Manchester, Ontario county, New York, and is known as the hill Cumorah. Here, in a stone box, the plates, etc., were found, but he was not allowed to remove them. Instead, each year for four years, he was required to visit the place, after which he was to take away the plates. Accordingly, on September 22, 1827, he went for that purpose, and secured them. The news led to strenuous efforts on the part of enemies to get them away from him, and to frustrate these efforts he decided to move into Pennsylvania. A friend, Martin Harris, advanced him \$50.00 for this purpose, and it was this same Harris that afterwards wrote part of the translation of the book, at Joseph's dictation. But when about one hundred and sixteen pages had been written, Harris' desire to show the manuscript overcame Joseph's reluctance, and after many pledges, Harris was allowed to take the manuscript away. Violating his pledges, those to whom he wrongfully showed the writings stole them from him. To frustrate the evil designs of these thieves Joseph received a revelation in which the Lord rebuked him and forbade him attempting to retranslate that which had been written, but instructed him to translate from the 'Smaller Plates of Nephi,' which contained a fuller history for the period covered by the first translation, which had been made from Mormon's abridgment of the 'Larger Plates of Nephi.' At the same time a new scribe, in the person of Oliver Cowdery, was sent to Joseph. Persecutions also began to be showered upon Joseph and his discovery of the plates denounced as a fraud. 'Revelations' now came speedily one after another, . . . guided Joseph in his relations with his family and followers, the organization of the Church, the publication of the Book of Mormon (which took place in 1830), and the public ministry of the newly organized church. At this time the spirit of persecution began to rage against the Mormons more furiously than hitherto it had done."—G. W. James, *Utah, the land of blossoming valleys*, pp. 47-52.—It is believed by many that the groundwork of the Book of Mormon was supplied by an ingenious romance, written about 1814 by the Rev. Solomon Spalding, a Presbyterian minister of some learning and literary ability, then living at New Salem (now Conneaut), Ohio. This romance, which was entitled "The Manuscript Found," purported to narrate the history of a migration of the lost ten tribes of Israel to America. It was never published; but members of Mr. Spalding's family, and other persons, who read it or heard it read, in manuscript, claimed confidently, after the appearance of the Book of Mormon, that the main body of the narrative and the notable names introduced in it were identical with those of the latter. Some circumstances, moreover, seemed to indicate a probability that Mr. Spalding's manuscript, being left during several weeks with a publisher named Patterson, at Pittsburg, came there into the hands of one Sidney Rigdon, a young printer, who appeared subsequently as one of the leading missionaries of Mormonism, and who is believed to have visited Joseph Smith, at Palmyra, before the Book of Mormon came to light. On the other hand, Mormon believers have, latterly, made much of

the fact that a manuscript romance without title, by Solomon Spalding, was found, not many years since, in the Sandwich islands, by President Fairchild of Oberlin College, Ohio, and proved to bear no resemblance to the Book of Mormon. Spalding is said, however, to have written several romances, and, if so, nothing is proved by this discovery.—Based on T. Gregg, *Prophet of Palmyra*, ch. 1-11, 41-45.

"Like the Mormons of Utah, the . . . (Reorganized) Church of Jesus Christ of Latter-Day Saints, sometimes called Nonpolygamous Mormons, trace their origin back to the movement begun by Joseph Smith in 1830. They claim to represent this movement and to be true to the principles and doctrines proclaimed by him, and insist that those who followed Brigham Young were led away from the truth into error. They deny that the revelation concerning polygamy which was communicated to the church in Salt Lake City in 1852 by Brigham Young was genuine, and declare that the true successor to Joseph Smith in the presidency of the church was not Brigham Young, but Joseph Smith's eldest son, Joseph. . . . [Their] headquarters are at Lamoni, Ia."—H. K. Carroll, *Religious forces of the United States*, pp. 170-171.

1830-1846.—First Hegira to Kirtland, Ohio, the second to Missouri, the third to Nauvoo, Illinois.—Danites.—Building of the city and its temple.—Hostility of Gentiles.—Slaying of the prophet.—Immediately after the publication of the Book the Church was duly organized at Manchester. On April 6, 1830, six members were ordained elders—Joseph Smith, Sr., Joseph Smith, Jr., Hyrum Smith, Samuel Smith, Oliver Cowdery and Joseph Knight. The first conference was held at Fayette, Seneca county, in June. A special 'revelation' at this time made Smith's wife 'the Elect Lady and Daughter of God,' with the high-sounding title of 'Electa Cyria.' . . . Another revelation was to the effect that Palmyra was not the gathering-place of the Saints, after all, but that they should proceed to Kirtland, in Ohio. Consequently, the early part of 1831 saw them colonized in that place, the move being known as 'The First Hegira.' Still another revelation (on the 6th of June) stated that some point in Missouri was the reliable spot. Smith immediately selected a tract in Jackson county, near Independence. By 1833 the few Mormons who had moved thither were so persecuted that they went into Clay county, and thence, in 1838, into Caldwell county, naming their settlement 'Far West.' The main body of the Mormons, however, remained in Kirtland from 1831 till they were forced to join their Western brethren in 1838. Brigham Young, another native of Vermont, joined at Kirtland in 1832, and was ordained an elder. The conference of elders on May 3, 1833, repudiated the name of Mormons and adopted that of 'Latter-Day Saints.' The first presidency consisted of Smith, Rigdon, and Frederick G. Williams. In May, 1835, the Twelve Apostles—among them Brigham Young, Heber C. Kimball and Orson Hyde—left on a mission for proselytes. . . . The Mormons were driven from Missouri by Governor Boggs's 'Extraordinary Order,' which caused them to gain sympathy as having

been persecuted in a slave State. They moved to Hancock county, Illinois, in 1840, and built up Nauvoo [on the Mississippi river, fourteen miles above Keokuk] by a charter with most unusual privileges."—F. G. Mather, *Early days of Mormonism* (*Lippincott's Magazine*, Aug., 1880).

ALSO IN: R. J. Britton, *Early days on the Grand river, and the Mormon war*.

In the midst of the troubles of Smith and his followers in Missouri, and before their removal to Nauvoo, there arose among them "the mysterious and much dreaded band that finally took the name of Danites, or sons of Dan, concerning which so much has been said while so little is known, some of the Mormons even denying its existence. But of this there is no question. Says Burton: 'The Danite band, a name of fear in the Mississippi Valley, is said by anti-Mormons to consist of men between the ages of 17 and 49. They were originally termed Daughters of Gideon, Destroying Angels—the gentiles say devils—and, finally, Sons of Dan, or Danites, from one of whom was prophesied he should be a serpent in the path. They were organized about 1837 under D. W. Patten, popularly called Captain Farnot, for the purpose of dealing as avengers of blood with gentiles; in fact they formed a kind of death society, desperadoes, thugs, hashshashiyun—in plain English, assassins in the name of the Lord. The Mormons declare categorically the whole and every particular to be the calumnious invention of the impostor and arch apostate, Mr. John C. Bennett. John Hyde, a seceder, states that the Danite band, or the United Brothers of Gideon, was organized on the 4th of July, 1838, and was placed under the command of the apostle David Patten, who for the purpose assumed the name of Captain Farnot. It is the opinion of some that the Danite band, or Destroying Angels as again they are called, was organized at the recommendation of the governor of Missouri as a means of self-defence against persecutions in that State.'—H. H. Bancroft, *History of the Pacific States*, v. 21, pp. 124-126.—'The Mormons first attracted national notice about the time they quitted Missouri to escape persecution and took refuge in Illinois. In that free State a tract of land was granted them and a charter too carelessly liberal in terms. The whole body, already numbering about 15,000, gathered into a new city of their own, which their prophet, in obedience to a revelation, named Nauvoo; here a body of militia was formed under the name of the Nauvoo legion; and Joe Smith, as mayor, military commander, and supreme head of the Church, exerted an authority almost despotic. The wilderness blossomed and rejoiced, and on a lofty height of this holy city was begun a grotesque temple, built of limestone, with huge monolithic pillars which displayed carvings of moons and suns. . . . Nauvoo was well laid out, with wide streets which sloped towards well-cultivated farms; all was thrift and sobriety, no spirituous liquors were drunk, and the colonists here, as in their former settlements, furnished the pattern of insect industry. The wonderful proselyting work of this new sect abroad had already begun, and recruits came over from the overplus toilers in the British factory towns. . . . But there was something in the methods of this sect, not to speak of the jealousy they excited by their prosperity, which bred them trouble here as everywhere else where they came in contact with American commonplace life. It was whispered that the hierarchy of impostors grew rich upon the toils of their simple followers. Polygamy had not yet received the

sanction of a divine revelation; and yet the first step towards it was practised in the theory of 'sealing wives' spiritually, which Smith had begun in some mysterious way that it baffled the gentile to discover. Sheriffs, too, were forbidden to serve civil process in Nauvoo without the written permission of its mayor. All these strange scandals of heathenish pranks, and more, besides, stirred up the neighboring gentiles, plain Illinois back-woodsmen; and the more so that, besides his 3,000 militia, the Mormon prophet controlled 6,000 votes, which, in the close Presidential canvass of 1844, might have been enough to decide the election. Joe Smith, indeed, whose Church nominated him for President, showed a fatal but thoroughly American disposition at this time to carry his power into politics. This king of plain speech, who dressed as a journeyman carpenter, suppressed a newspaper which was set up by seceding Mormons. When complaint was made he resisted Illinois process and proclaimed martial law; the citizens of the surrounding towns armed for a fight. Joe Smith was arrested and thrown into

BRIGHAM YOUNG.

jail at Carthage with his brother Hiram. The rumor spreading that the governor was disposed to release these prisoners, a disorderly band gathered at the jail and shot them [June 27, 1844]. Thus perished Smith, the Mormon founder. His death at first created terror and confusion among his followers, but Brigham Young, his successor, proved a man of great force and sagacity. The exasperated gentiles clamored loudly to expel these religious fanatics from Illinois as they had been expelled from Missouri; and finally, to prevent a civil war, the governor of the State took forcible possession of the holy city, with its unfinished temple, while the Mormon charter of Nauvoo was repealed by the legislature. The Mormons now determined [1846] upon the course which was most suited to their growth, and left American pioneer society to found their New Jerusalem on more enduring foundations west of the Rocky Mountains."—J. Schouler, *History of the United States*, v. 4, pp. 547-549.

1846-1848.—Gentile attack on Nauvoo.—Exodus of "the Saints" into wilderness of the West.—Their settlement on Great Salt lake.—"During the winter of 1845-'6 the Mormons made the most prodigious preparations for removal. All the houses in Nauvoo, and even the temple, were converted into work-shops; and before spring more than 12,000 wagons were in readiness. The people from all parts of the country flocked to Nauvoo to purchase houses and farms, which were sold extremely low, lower than the prices at a sheriff's sale, for money, wagons, horses, oxen, cattle, and other articles of personal property which might be needed by the Mormons in their exodus into the wilderness. By the middle of May it was estimated that 16,000 Mormons had crossed the Mississippi and taken up their line of march with their personal property, their wives and little ones, westward across the continent to Oregon or California; leaving behind them in Nauvoo a small remnant of 1,000 souls, being those who were unable to sell their property, or who having no property to sell were unable to get away. The twelve apostles went first with about 2,000 of their followers. Indictments had been found against nine of them in the circuit court of the United States for the district of Illinois at its December term, 1845, for counterfeiting the current coin of the United States. The United States Marshal had applied to me [the writer being at that time Governor of Illinois] for a militia force to arrest them; but in pursuance of the amnesty agreed on for old offences, believing that the arrest of the accused would prevent the removal of the Mormons, and that if arrested there was not the least chance that any of them would ever be convicted, I declined the application unless regularly called upon by the President of the United States according to law. . . . It was notorious that none of them could be convicted; for they always commanded evidence and witnesses enough to make a conviction impossible."—T. Ford, *History of Illinois*, ch. 13.—"The Saints who had as yet been unable to leave Nauvoo continued to labour assiduously at the completion of the temple, so as to accomplish one of the most solemn prophecies of their well-beloved martyr. The sacred edifice was ultimately entirely finished, at the end of April, 1846, after having cost the Saints more than a million dollars. It was consecrated with great pomp on the 1st and 2nd of May, 1846. . . . The day after the consecration of the temple had been celebrated, the Mormons withdrew from the building all the sacred articles which adorned it, and satisfied with having done their duty in accomplishing, though to no purpose otherwise, a Divine command, they crossed the Mississippi to rejoin those who had gone before them. Nauvoo was abandoned. There remained within its deserted walls but some hundred families, whom the want of means and the inability to sell their effects had not allowed as yet to start upon the road to emigration. The presence of those who were thus detained, together with the bruit caused by the ceremony of dedication, raised the murmurs of the gentiles, and seemed to keep alive their animosity and alarm. Their eager desire to be entirely rid of the Mormons made them extremely sensitive to every idle story respecting the projects of the latter to return. They imagined that the Saints had only left in detachments to seek recruits among the red-skins, meaning to come

back with sufficient force once more to take possession of their property in Illinois. These apprehensions rose to such a pitch that the anti-Mormons plunged into fresh acts of illegality and barbarism. . . . On the 10th of September, 1846, an army of 1,000 men, possessing six pieces of artillery, started to begin the attack under the direction of a person named Carlin, and of the Reverend Mr. Brockman. Nauvoo had only 300 men to oppose to this force, and but five small cannon, made from the iron of an old steamboat. The fire opened on the afternoon of the 10th, and continued on the 11th, 12th and 13th of September." Every attack of the besiegers was repulsed, until they consented to terms under which the remnant of the Mormons was to evacuate the town at the end of five days. "The Mormons had only three men killed and a few wounded during the whole affair; the loss of their enemies is unknown, but it would seem that it was heavy. It was agreed that a committee of five persons should remain at Nauvoo to attend to the interests of the exiles, and on the 17th of September, while the enemy, to the number of 1,625, entered the city to plunder, the remnant of the Mormons crossed the Mississippi to follow 'the track of Israel towards the west.' . . . About the end of June, 1846, the first column of the emigrants arrived on the banks of the Missouri, a little above the point of confluence of this immense river with the Platte, in the country of the Pottawatamies, where it stopped to await the detachments in its rear. This spot, now known by the name of Council Bluffs, was christened Kanessville by the Mormons. . . . At this place, in the course of July, the federal government made an appeal to the patriotism of the Mormons, and asked them to furnish a contingent of 500 men for the Mexican war. Did the government wish to favour the Saints by affording them an opportunity of making money by taking service, or did it merely wish to test their fidelity? This we cannot decide. . . . The Saints generally regarded this levy as a species of persecution; however . . . they furnished a battalion of 520 men, and received \$20,000 for equipment from the war department." The headquarters of the emigration remained at Kanessville through the winter of 1846-1847, waiting for the brethren who had been left behind. There were several encampments, however, some of them about 200 miles in advance. The shelters contrived were of every kind—huts, tents, and caves dug in the earth. The suffering was considerable and many deaths occurred. The Indians of the region were Pottawatamies and Omahas, both hostile to the United States and therefore friendly to the Mormons, whom they looked upon as persecuted foes of the American nation. Brigham Young, the successor of Joseph Smith, had determined to lead his followers beyond the frontiers of the Louisiana Purchase, and therefore out of reach of persecution. "On the 14th of April [1847], Brigham Young and eight apostles, at the head of 143 picked men and 70 carts laden with grain and agricultural implements, started in search of Eden in the far-west. [Early in June they reached Fort Laramie, and there established a ferry, at which nine men were left to help the emigrants. (See also IOWA: 1846.)] . . . The 23rd of July, 1847, Orson Pratt, escorted by a small advance guard, was the first to reach the Great Salt Lake. He was joined the following day by Brigham Young and the main body of the pioneers. That day, the 24th of July, was destined to be afterwards celebrated by the Mormons as the anniversary of their deliverance. . . . Brig-

ham Young declared, by divine inspiration, that they were to establish themselves upon the borders of the Salt Lake, in this region, which was nobody's property, and wherein consequently his people could follow their religion without drawing upon themselves the hatred of any neighbours. He spent several weeks in ascertaining the nature of the country, and then fixed upon a site for the holy city. . . . When he had thus laid the foundations of his future empire, he set off on his return to Council Bluffs, leaving on the borders of the Salt Lake the greater portion of the companions who had followed him in his distant search. During the summer, a convoy of 566 wagons, laden with large quantities of grain, left Kaneshville and followed upon the tracks of the pioneers. . . . On their arrival at the spot indicated by the president of the Church, they set to work without a moment's repose. Land was tilled, trees and hedges planted, and grain sown before the coming frost." The main body of the emigrants, led by Brigham Young, moved from the banks of the Missouri about May 1, 1848, and arrived at the Salt lake the following autumn.—J. Remy and J. Brenchley, *Journey to Great-Salt-Lake City*, v. 1, bk. 2, ch. 4.—"On the afternoon of the 22d [August, 1847] a conference was held, at which it was resolved that the place should be called the City of the Great Salt Lake. The term 'Great' was retained for several years, until changed by legislative enactment. It was so named in contradistinction to Little Salt Lake, a term applied to a body of water some 200 miles to the south."—H. H. Bancroft, *History of the Pacific states*, v. 21, ch. 10.

1847-1920.—Later history.—Immigration fund.—Introduction of polygamy.—"In 1840 the so-called Perpetual Immigrating Fund Company was organized for the purpose of helping converts to Mormonism in Europe and the United States who had not the means to come to Utah; and hundreds of thousands of dollars of Church money were expended at an early day to bring immigrants across the oceans, plains and mountains. From 1860 to 1868 wagons were annually sent to the Missouri river after the poor. Each wagon, as a rule, was hauled by four yoke of cattle, or from two to four span of horses or mules. . . . About five hundred teams, partly mule teams and partly ox teams, were sent by the Church to the terminus of the Union Pacific Railroad up to 1868 to help the poor migrating saints to the valleys of Utah."—R. C. Webb, *Real Mormonism*, p. 134.—"The Book of Mormon, published in 1830, was as orthodox and conventional in its utterances on the marital relation and the punishments of God to man that should be visited upon their violators as were the sacred books and creeds of any of the Christian churches. . . . How then, came this ancient, this oriental, this Old Testament, this Mahommedan doctrine of polygamy to be promulgated—added to the other weighty doctrines the Mormon Church had placed upon its shoulders? History is perfectly clear about it. The prophet Joseph Smith had been dead eight years. The exodus from Nauvoo had taken place. The saints had established their new home in Salt Lake City. There had been, and were, rumors secretly passed about among the leaders that Joseph had believed, and some said, had lived, the doctrine of polygamy, yet few were prepared for the open promulgation of the doctrine, until on the 29th

day of August, 1852, Brigham Young announced in the Tabernacle that a 'Revelation on Plural Marriage' had been made to the prophet, Joseph Smith, at Nauvoo, and there written by him, July 12, 1843. The revelation was then read by Thomas Bullock, one of the elders of the Church."—G. W. James, *Utah, the land of blossoming valleys*, pp. 119, 120.—The doctrine of polygamy "aroused great discussion throughout the country, and resulted in various acts of Congress forbidding plural marriages. In 1890 President Woodruff issued a manifesto calling on all the Saints to 'refrain from contracting any marriages forbidden by the laws of the land.' Since that time such marriages have been prohibited by the church, although there have been cases where those already contracted have not been annulled. . . . The comparative isolation of the new location gave less occasion for such disturbances as had hitherto accompanied the history of the church, and permitted a more normal development of the community life. Active proselyting was carried on, and the number of converts increased rapidly. Brigham Young died in 1877, and was succeeded by John Taylor, who held the office of president for ten years. His successors in office have been Wilford Woodruff, Lorenzo Snow, and Joseph F. Smith."—United States Census, *Religious bodies*, 1916, pt. 2, pp. 334-335.—The census of 1916 reported 462,329 members of both organizations (polygamous and non-polygamous) in the United States.—See also U.S.A.: 1894-1895; UTAH: 1846, and after.

1922.—Colonies and missions.—Mormon colonies of importance are to be found in Mexico and Canada, as well as in the states of Arizona, Wyoming, Idaho, Colorado, New Mexico, Nevada, California, and a few others. In the middle and latter part of the nineteenth century the church did much to quiet its missionary activities in foreign countries, but many hundreds of converts were made. At first, all converts were expected to migrate to Utah, and a large fund was provided to aid them on their way to "the land of promise." In England and Holland especially, the number of people who undertook the journey reached into thousands, most of them women and girls. When the doctrine of polygamy was made public, active steps were taken in many countries to prevent the emigration of their people, especially the girls. Work had been begun in Liverpool in 1837, and a large body may still be found there, but emigrations were stopped. In Ireland and Scotland public opinion was against the missionaries, although a few converts were made; the book of Mormon, was translated into Italian in 1852; in Scandinavian countries the missionaries met with success until the governments took steps to prevent their entrance; in Germany all were expelled in 1852. The policy of the missionary leaders had to change after 1887, when the perpetual immigration fund ended, and the federal government forbade assisted immigration. Since that time, converts have not been urged to move to Utah, but churches are established, when possible, in their own countries.

Salt Lake City.—O. F. Whitney, *History of Utah*.

Coöperative polity.—"Nothing could be more eloquent of the industry and perseverance of the pioneers of Utah than the manner in which travelers, from 1850 to the present time, in describing their impressions of the state, have used the Biblical phrase, 'made the desert blossom as the rose.' What were the economic forces which brought about this transformation—the methods used, the underlying social causes? Too little consideration has been accorded these questions. . . . 'Is it not worth while,' asks Professor Ely, . . . 'to pass over the religious controversies connected with Mormonism and their outcome and examine into the achievements and manner of life of the Mormons, so far as these things relate to economic and social matters?' Within the limits thus laid out, one phase of such activities of the people of Utah stands out as more important and significant than the others—namely, their practice of coöperation. Not only did coöperation enter vitally into the economic life of the first settlers, but it has had a most far-reaching effect on their subsequent commercial and industrial affairs. . . . The coöperation practised among the Mormons is found to be of three kinds, each distinct from the other, but each a logical development of the preceding type. They are: first, a period of informal but nevertheless highly effective and efficient coöperation, extending from 1847 to 1868; second, the foundation and growth of coöperative stores from 1868 to approximately 1890; and third, the development of a system of coöperative industrial enterprises, beginning in 1890 and continuing until the present time. . . . Three elements have stood out as the underlying causes: first, the physiographic conditions; second, the religious organization of the Mormons; and third, Brigham Young. Mention has already been made of the arid conditions in Utah which led the pioneers to evolve irrigation. This was, of course, only the inevitable response to environmental influence, a natural functioning of the stern law of necessity. The irrigation system grew up because it had to; and coöperation came into being because it was found to be the sole means of furnishing the canals which irrigation required. But the mere physical conditions could not alone have been responsible for the coöperative system which arose. Other parts of the arid West have since been reclaimed without bringing forth such a method. The existence of coöperation in early Utah and its absence in neighboring states when physical conditions were identical must be accounted for by a difference in social structure. In near-by states the colonists acted individually and were not connected with each other by any particular interest, while in Utah there existed a compact social body closely united by common ties and easily capable of being used as a vehicle to cope with general needs. This common bond was the peculiar church organization and religion of the Mormon people. . . . If the Mormon leaders are to be given a measure of credit for instituting coöperation, by far the most of it is due to Brigham Young. He it was who perceived the ability of the Mormon people to become coöperators and rendered that ability concretely tangible. Shrewd, forceful, energetic, and far-sighted, he was preëminently fitted to lead his pioneer people. . . . And now, finally, what shall be said of the present condition of Mormon coöperation? . . . The Mormons in their colonizing schemes provide their irrigation systems in substantially the same manner as in pioneer times, by uniting endeavor. The numerous small

retail stores are yet performing much the same role of commercial usefulness as at first. And it can hardly be denied that the Mormon industrial and commercial system, which largely originated in their coöperative schemes, has made them a prosperous and independent people. It is natural that the Mormons, viewing their attempts at coöperation in the light of economic results, are not disposed to be dissatisfied with them."—H. Gardner, *Coöperation among the Mormons* (*Quarterly Journal of Economics*, May, 1917).—"One of the main industries inaugurated under the guidance of the Church was the founding of co-operative stores in nearly all the settlements of the saints. Thus in 1869 the great Zion's Co-operative Mercantile Institution was founded in Salt Lake City and for many years it was known as the parent store, supplying scores of co-operative stores established in the different settlements in the Rocky Mountains."—R. C. Webb, *Real Mormonism*, p. 133.

MORNY, Charles Auguste Louis Joseph, Duc de (1811-1865), French political leader. See FRANCE: 1851: Plot of the coup d'état.

MORO, province in the southern part of the Philippine islands. See PHILIPPINE ISLANDS: 1903-1913.

MOROCCO, Ancient. See MAURITANIA.

MOROCCO: Geographic description.—Area.—**Population.**—**Government.**—Maroc, or Morocco, the name given by Europeans to the empire of the Moorish Sultan as a whole, is not so applied by the natives of the country. According to them, the Maroc or country of Marrakech, the Marruccos of the Spaniards, is only one of three States submissive to the authority of the Sultan-Shereef. At the north the kingdom of Fez, at the southwest the oasis of Tafilet, make up his real empire. Beyond these, vast territories occupied by numerous independent tribes, stretch over the space that is marked on our maps with the name Morocco. Its inhabitants have no common name for it as a whole. Their country, indicated in a general manner, with no precise delimitation, is the Maghreb el-Aksa,—that is to say, "The Extreme West."—Based on E. Reclus, *Nouvelle géographie universelle*, v. 11, p. 653.—See also AFRICA: Map.—"Politically the Moorish Empire is in principle one, but is divided into three parts—the so-called zones. First, there is the tiny international zone of Tangier, at the north-west corner. Then there is the Spanish zone, mostly on the north, but including also a small portion of the extreme south. The remainder is the French zone [the French Protectorate]. . . . Strange as is this political situation of the country, the physical and ethnological story which the map depicts is no less paradoxical. As it is separated by seas from Europe, and joined by land to Africa, we are apt to regard Morocco as belonging to the African continent, and its peoples as Africans, or, at any rate, as Asiatic immigrants. The real African continent, however, begins at the Atlas Mountains only, and Morocco north thereof is really a part of Europe, detached at some remote age, but European in its elements and features. . . . The same may be said of the inhabitants. A small proportion—probably less than 5 per cent.—are negroes, or partly of negro descent, . . . but the rest, whether Arabs or Berbers or Jews, belong to the Caucasian branch of the human race. Moreover, year by year it is becoming more and more clear that the Arab invasion itself—which gave all north-west Africa so Asiatic a colour—was the work of comparatively small numbers of people, and that the immense majority of the inhabitants

of Morocco, even of those who speak Arabic, are really Arabized Berbers and not of pure Arab origin."—J. M. MacLeod, *Achievements of France in Morocco* (*Geographical Journal*, Aug., 1918).—"The area of Morocco is about 231,500 square miles . . . and the estimated population is 6 millions, of whom nearly 5½ millions are in the French Protectorate. . . . There are about 88,000 Europeans, of whom half are French, one-fifth are Spanish, and about a thousand are British. The largest city is Fez, the northern capital, with over 100,000 people. Of nearly equal size is Marrakesh (Morocco), the southern capital, while the port of Casablanca, the centre from which French influence has developed, is third, with a population of over 80,000, including nearly 40,000 Europeans. Rabat, on the west coast, and Meknes, which are also native capitals, have each nearly 40,000 people, and the Sultan is at present (1921) in residence at Rabat."—E. G. R. Taylor, *Business man's geography*, pp. 341-342.—"The Sherifian Empire is a theocratic state. The Sultan, as 'Descendant of the Prophet', enjoys absolute power; his religious authority is one with his political authority, as the religious law is not distinguished from the civil law. The Sultan governs with the aid of his ministers, or viziers, at the head of whom is the Grand Vizier, charged with internal affairs. The entire administration of the country proceeds from the court of notables who assemble every morning in the Sultan's palace, each sitting in his little *benika*, or audience chamber, opening off the principal court. This administration has been preserved in its original form by the French authorities. The Sultan retains all his prerogatives; he exercises his office with all its traditional apparatus. The personnel of the palace, the sherifian family, and the royal *barem* are maintained by a civil list of 3,500,000 pesetas. The viziers also continue their functions according to past custom. But certain of the old offices of the *Makhzan* have become obsolete; for example that of the Vizier of Foreign Affairs. His seat is now filled by the French Resident General, the sole intermediary between the Sultan and foreign powers. Furthermore, several technical departments have been created—such as those of Public Works, Public Lands, Finance, Agriculture, and Postal Service. These are entrusted to French functionaries, who thus in reality serve as sherifian ministers. Administration of the towns remains with the pashas, delegated by the Sultan, and those of the tribes with the *kuids*."—A. de Tarde, *Work of France in Morocco* (*Geographical Review*, July, 1919).

647-1860. — Arab conquest. — Conquests in Spain.—Attacks by Spaniards and Portuguese.—Filali dynasty.—The tide of Mohammedan conquest, sweeping across North Africa (see CALIPHATE: 647-700), burst upon Morocco in 698. "Eleven years were required to overcome the stubborn resistance of the Berbers, who, however, when once conquered, submitted with a good grace and embraced the new creed with a facility entirely in accordance with the adaptive nature they still exhibit. Mingled bands of Moors and Arabs passed over into Spain, under Tarik and Moossa, and by the defeat of Roderic at the battle of Guadalete, in 711, the foundation of their Spanish empire was laid [see SPAIN: 711-713], on which was afterwards raised the magnificent fabric of the Western Khalifate. This is not the place to dwell on the glories of their dominion. . . . Suffice it to say, that a reflection of this glory extended to Morocco, where the libraries and universities of Fez and Morocco City told of the learning in-

duced by wise men, Moorish and Christian alike, who pursued their studies without fear of interruption on the score of religious belief. The Moors in the days of their greatness, be it observed, were far more liberal-minded than the Spanish Catholics afterwards showed themselves, and allowed Christians to practise their own religion in their own places of worship—in striking contrast to the fanaticism of their descendants in Morocco at the present day. . . . The intervals of repose under the rule of powerful and enlightened monarchs, during which the above-mentioned institutions flourished, were nevertheless comparatively rare, and the general history of Morocco during the Moorish dominion in Spain seems to have been one monotonous record of strife between contending tribes and dynasties. Early in the tenth century, the Berbers got the mastery of the Arabs, who never afterwards appear in the history of the country except under the general name of Moors. Various principalities were formed [11-13th centuries (see ALMORAVIDES; ALMOHADES)], of which the chief were Fez, Morocco, and Tafflet, though now and again, and especially under the Marin dynasty, in the 13th century, the two former were consolidated into one kingdom. In the 15th century the successes of the Spaniards caused the centre of Moorish power to shift from Spain to Morocco. In the declining days of the Hispano-Moorish empire, and after its final extinction, the Spaniards and Portuguese revenged themselves on their conquerors by attacking the coast-towns of Morocco, many of which they captured. It is not improbable that they would eventually have possessed themselves of the entire country, but for the disastrous defeat of King Sebastian in 1578, at the battle of the Three Kings, on the banks of the Wad El Ma Hassen, near Alcazar [see PORTUGAL: 1570-1580]. This was the turning-point in Moorish history, and an African Creasy would have to rank the conflict at Alcazar among the decisive battles of the continent. With the rout and slaughter of the Portuguese fled the last chance of civilizing the country, which from that period gradually relapsed into a state of isolated barbarism."—H. E. M. Stutfield, *El Mughreb*, ch. 16.—In 1664, the Filali dynasty, which still keeps a shadowy hold on the throne, was founded by Rashid II, a reputed descendant of the prophet. Ottoman power in Morocco disappeared, and the sultans, or sherifs, established the form of rule which, in appearance at least, is still maintained. The early rulers of this dynasty were excessively bloodthirsty, especially Ismail, brother of Rashid, who reigned from 1672 to 1677. Ismail's death was followed by a period of turmoil, during which sultans were set up and pulled down by the black troops known as Bokharis. At length, in 1757, Mohammed XVI, a grandson of Ismail, succeeded Abd-Allah, and reigned wisely and well for over thirty years. After his death a period of misrule again followed and lasted until Suleiman, one of his sons, gained power. During the reign of Suleiman, piracy was abolished, and although Abd-ur-Rahman, his successor, tried to revive it in 1830, he was unsuccessful in the attempt. "For a period following the battle of Trafalgar British influence was paramount in Morocco, notwithstanding that in 1826-7 the British blockaded the Moorish coast, but the conquest of Algeria by the French caused a great impression in Morocco, and the Sultan did all in his power to assist the famous Abdulkader in his resistance to the French invaders. In revenge Marshal Bugeaud seized the town of Oujda, near the Algerian frontier, in 1844, and

subsequently routed the Moorish army on the banks of the Isly. At the same time, and for the same reason, a French fleet under the command of the Prince de Joinville bombarded Tangier and Mogador. Again, in 1851, after a series of diplomatic incidents, the French bombarded Sallee. It was with Spain that the next trouble arose. There had been serious incidents on the boundaries of Spain's 'presidios' on the north coast of Morocco, and the Sultan—Mulai Abderrahman [or Abd-ur-Rahman]—was either unwilling or unable to put an end to Native aggression. At last the situation became unbearable. The Spaniards, in 1859, invaded the Tetuan districts from Ceuta. It took their army of 40,000 men six months to reach Tetuan (25 miles). The treaty of Oued Ras (1860) [made with Mohammed XVII, the successor to Abd-ur-Rahman] followed, by which Spain received an indemnity of £4,000,000, as well as a rectification of the boundaries of the 'presidios.'—W. B. Harris, and W. Cozens-Hardy, *Modern Morocco*, p. 27.

1799-1856.—Commercial treaties.—Exterritoriality.—"Trade in Morocco had not always laboured under the disadvantages which existed in 1855. So far back as 1725 Sultan Mulai Abdallah encouraged commerce by imposing a system of moderate duties, free of all monopolies and contracts—and with regard to the garrison of Gibraltar and the British fleet, frequently granted supplies free of all duties. In 1801 Great Britain entered into a commercial Treaty with Morocco—renewed in 1845—but without any express stipulations as to duties; the Treaty merely confirming to Great Britain all privileges granted to Spain in a Treaty made between that country and Morocco in 1799. Contrary, however, to the spirit of this Treaty a system had gradually arisen of monopolies, confiscation of products, high duties, and a constant alteration of tariffs, and the prohibition of articles of export without any cogent reason for such prohibition being given. A serious decline in commerce since 1801 had therefore ensued. . . . [John Drummond Hay, at that time British representative, succeeded in making a treaty which was ratified by the Sultan in December, 1856. By this treaty Great Britain received the right to appoint consuls to Morocco; British subjects were given the right to reside there with freedom from taxes, forced loans, and from search unless with the consent of the consul.] All criminal causes and all civil differences between British subjects were to be decided by the Consul without any interference on the part of the Moorish authorities. In cases between a Moor and a British subject, the matter was to be referred to the authorities of the country to which the defendant belonged; if a Moor, the trial was to take place before the Kadi, the British Consul being present; if a British subject, before the Consul, the Governor or Kadi being present. The Consul-General and the Moorish Minister for Foreign Affairs were constituted judges in the last resort—as a Court of Appeal. Provision was also made in case of war between the two Powers for the security and protection of the interests of their subjects. The commercial advantages gained were, amongst others, the abolition of monopolies . . . on most articles of trade, and the right to export, under fixed and more reasonable duties, most of the products of the Empire. . . . By an article in

the new Treaty, the Sultan was also bound to repress and punish piracy, and to aid Her Majesty's Government in their efforts to do the same. This convention was hailed with much satisfaction by British merchants, and was eventually adopted by all other nations."—F. W. de Winton, ed., *Memoir of Sir John Drummond Hay*, pp. 167, 182-183.

1873-1894.—Reign of Mulai Hassan.—Tribal warfare.—"In 1873 Mulai Hassan, one of . . . [the sons of Mohammed XVII] succeeded. It took him 10 years to consolidate his kingdom and to obtain undisputed possession of the country. Even after that period he was constantly engaged upon military expeditions in parts of the country that had thrown off his yoke. In 1893 he crossed the Atlas from Fez and visited Taflet, but by a long series of delays, brought about by difficulties with the tribes and by a shortage of transport, his return was retarded until midwinter had set in. In re-crossing the Atlas to Marrakesh, in keen frosts and deep snows, his army suffered terrible privations. Men and animals died by scores from exposure, from accidents on the mountain tracks, and from lack of food. The whole road was strewn with carcasses and abandoned material, and the Berber tribes inhabiting these inhospitable regions at an altitude of 8,000 ft. above the sea secured a vast haul of booty. Mulai Hassan never recovered. A few months later he set out from Marrakesh for the Tadla districts and died in his camp (1894). He was succeeded by his young son, Mulai Abdul Aziz."—W. B. Harris and W. Cozens-Hardy, *Modern Morocco*, p. 28.

1894.—War with Spain. See SPAIN: 1885-1896.

1895-1906.—Gradual extension of French-Algerian boundary into Moroccan territory.—"A treaty—March 13, 1895—was negotiated between Great Britain and Morocco under which, in order to complete the unchallenged encircling of Moorish empire by France, the British Government agree to the purchase by the Moorish government of the property of the Northwest African Company at Terfaya, better known as Cape Juby. This treaty recognized the land between Wad Graa and Bojador as belonging to Morocco. . . . [By this time nothing appeared more certain than the ultimate acquisition of Morocco by France], at first under a directorate and later under annexation by the French Republic. In preparation therefore France diligently subsidized tribes on its border, gave its aid and countenance to the most conspicuous of Moslem ecclesiastical potentates in north Africa, the Sheriff of Wazan, and educated his sons in Algeria, giving them commissions in the Algerian service in the expectation of furnishing a pretender. They suffered from the usual effect of a European education on Moslem youth, but when a pretender appeared 10 years ago in the mountains bordering on Algeria, Bouhamara, who so narrowly escaped seizing power in Morocco and was executed this year at Fez, his payments were made in freshly minted French gold for arms and supplies which mysteriously appeared. . . . [Germany began early to interfere.] German scientific journals teemed with papers upon the country, which rapidly made them the chief source of opinion upon a subject which had long been exclusively held by French and English explorers. France on the other hand steadily continued to extend its frontier, occupied in 1901 Igli and Tuat, holding one of the great

caravan routes out of Morocco to the southeast, and in 1903 an agreement between France, Spain and England provided for a Moorish debt, of which ten million pesetas was yielded to Spain, fifty million francs to France, and England made a party to the transaction under which France was to have the right to collect Moorish customs in case there was a default in the interest, which was reasonably certain. There instantly followed over the entire Moorish empire a series of outbreaks which made roads even two days' journey out of Tangiers dangerous and closed much of south Morocco to European travelers, though German merchants still passed to and fro on the coast between Morocco City or Fez without challenge. For two years longer these opposing theories of the position of Morocco continued. Germany, by one accident and another, asserted its independence of all agreements among the three powers which had so long monopolised the diplomatic relations of Morocco, and France continued to act as the French foreign minister declared, as a country which had 'particular' and exclusive rights in the empire."—T. Williams, *Diplomatic relations of Morocco (Journal of Race Development, Oct., 1914)*.—The boundary between Algiers and Morocco had not been settled since the treaty of 1845. But, in the interim, France had been steadily pushing southward, and had brought under her influence a sparsely settled district of some thousands of square miles. In 1906 the railway had reached Beni Ounif, a short distance from Fig hig. At this time Charles Jonart, governor-general of Algiers, learned that emissaries from Fez were telling the frontier tribes that Germany would assist them to force out the French from the territories which they were occupying. Taking with him General Lyautey, Jonart immediately set out on a ceremonious visit to the tribes on the southern border. He received the formal submission of the chiefs, and before his return visited officially the great Zaouia, or religious center of Kenadsa toward the west.

1901-1904.—French diplomacy in Morocco.—"France's ancient influence over Morocco had disappeared with much else amid the disasters of 1870. In the two concluding years of last century it began to revive, and in the opening years of the present one an ambitious and impetuous Minister sought to galvanise it into strenuous activity. In March 1901 M. Delcassé sent a vigorous remonstrance to the Sultan in respect to the attacks he alleged French convoys on the Algerian-Moroccan frontier were subjected to by tribes owing allegiance to the Sultan. The latter replied that he had often suggested a delimitation of the frontier and was prepared to play his part in carrying it out in conjunction with the French authorities in Algiers. In April a squabble, whose origin appears to have been purely personal, occurred on Moroccan territory between a Moor and a Frenchman called Pouzet. M. Pouzet was killed. Thereupon the French Minister at Tangier threatened to send for two French battleships. In June 'compensation' for the affair was paid, and the Sultan despatched an embassy to Paris, where an arrangement was signed accentuating the close neighbourhood . . . of the two Powers and the need for 'consolidating the links of friendship between the two Governments,' on a basis of 'respect for the integrity of the Shereefian empire,' and M. Delcassé wrote to the French Minister at Tangier: 'You should make the Sultan feel that it depends upon himself to possess in us friends the most sincere, the most anxious to uphold the integrity of his power, the most able to preserve him, if necessary, from certain dangers. Our loyalty, as well as our interests,

are a guarantee to him that we shall not encroach upon it.' But while M. Delcassé was writing 'integrity' and 'loyalty,' in Paris they were talking 'Protectorate,' and Prince Radolin was closely questioning the Marquis de Noailles (France's Ambassador in Berlin) on the point. German watchfulness had, in fact, been aroused, and M. Delcassé clearly realised at that time that it must be reckoned with. He had large ideas, and he straightway sought to put them into effect. The years 1901 and 1902 witnessed a brisk exchange of communications between Paris, Berlin and Madrid, all based upon the division of Morocco into spheres of influence which should reconcile the interests of the three Powers. An agreement in that sense was on the point of being concluded in November 1902 when Spain, probably acting under British diplomatic pressure, withdrew at the last moment. What ensued during the next twelve months is still a closely kept secret. That the steering-gear of French diplomacy had in that interval completely altered the course of the French Ship of State became apparent with the publication of the Anglo-French Convention of the 8th of April 1904. Its text was not communicated to Germany by M. Delcassé for three weeks on the pretext of an ambassadorial indisposition. M. Delcassé had, in homely language, left Germany on the shelf, and the seeds of a growing estrangement between that Power and Britain, destined to bring forth a plentiful harvest, had been sown in fruitful ground."—E. D. Morel, *National interest in the Franco-German dispute (Nineteenth Century and After, Nov., 1911)*.

1903.—State of affairs in Moorish sultanate.—Abd el Aziz, the young sultan.—"Regarded as a Moorish ruler and leader, the late Sultan, Mulai Hassan, was a strong man, almost, perhaps, a great man. . . . Mulai Hassan had a companion of his right hand: Ba Hamed [Bahamed], the Grand Wazeer. In them Morocco could boast the possession of two strong men; crude, narrow of vision, even brutal and merciless, if judged by European standards, yet genuinely strong men. The greater of them died, and his subordinate successfully hid the fact (though the Court was journeying at the time) from all Morocco, masquerading as one in close attendance upon a Sultan whose corpse, as a fact, was tied in its litter, until city walls were reached, preparations made, and the succession of the youth Abd el Aziz assured. Be it remembered that Ba Hamed, the survivor, was a strong man in his own right. Young Abd el Aziz [who succeeded his father in 1894] was docile perforce, and Ba Hamed ruled, without pity, with greed, and quite unhampered by what Europe calls honour or justice."—A. J. Dawson, *Morocco, the Moors and the powers (Fortnightly Review, Feb., 1903)*.—"The political importance of Morocco may be said to have begun in 1900, when the young Sultan, Mulai Abdul Aziz, released by death from the tutelage of his powerful grand vizier, Bou Ahmed [or Bahamed] took the reins of government into his own hands. Up till this period the Makhzen (Moorish Government) had offered a firm and impenetrable front to all European attempts to obtain influence or territory at the expense of the country, and Morocco still possessed its integrity, threatened, perhaps, but as yet intact. With the death of Bou Ahmed things changed. The stern, cruel man who had put down rebellion and practised every form of barbarity and extortion, gave place to the pleasure-loving youth, Mulai Abdul Aziz. The viziers, seeing their opportunity to govern Morocco on their own lines, with a natural profit to themselves, set to work to turn the thoughts of their

lord and master to trivial things. It was not difficult. Photographers, firework-makers, and a dozen other professionals of all kinds flocked to the court. Meanwhile a semblance of more serious things was being maintained, for the British Government had proposed to the Sultan the introduction of reforms. In 1901 a Moorish special ambassador was sent to London and Berlin, and another to Paris. The former achieved nothing, except to interest the public in his personality, the latter settled in a more or less unsatisfactory way the question of the Algerian frontier with Morocco. Mulai Abdul Aziz had now been some six years in the southern capital, but he reached Fez early in 1902, and at once took in hand the proposed reforms. He was genuine in his endeavours, but had no one to assist him, except in his wild extravagances. For a time things seemed to be going well, and in October the Sultan decided to leave the northern capital for Rabat. While on the journey news reached him of the revolt of the Berber tribes, and he hurried back to Fez with his army. Bou Hamara had been proclaimed Sultan, and ruled all the country east of Fez. An army hastily sent against him suffered a colossal defeat on December 22, but the rebels refrained from attacking the capital. During the whole of 1903 the rebellion continued with varying successes and failures. At times the Sultan seemed inclined to energy, but always fell back under the influence of his purveyors of European goods, on which he spent large fortunes, only thereby increasing the spirit of unrest in the country. All idea of reform had meanwhile been abandoned."—W. B. Harris and W. Cozens-Hardy, *Modern Morocco*, pp. 29-30.

1903-1904.—Appearance of the Mahdi, Bu Hamara, as a leader of insurrection.—In 1903 there appeared in Morocco one of the prophetic pretenders called Mahdis, of whom so many have arisen in the Moslem world, to take advantage of occasions of religious excitement, and to lead a rising of wild tribes. This Moorish Mahdi, known as Bu Hamara, was helped to a leadership of insurrection by an incident which greatly stirred the religious temper of tribes wherever known. An English missionary was killed at Fez, and the murderer, flying to a sanctuary of special sanctity, was pursued thereto by the sultan's guards, and slain within the sacred bounds. Against this sacrilege, committed to satisfy hated Christians, Bu Hamara roused the country, preaching extermination of all Christians within it. The insecure throne of Abd el Aziz was made more insecure, English influence in Morocco was shaken, the French frontiers east and south were endangered, and Bu Hamara's revolt appears to have had much to do with the producing of all that followed,—in the Anglo-French agreement of 1904, the Algeiras conference, the dethronement of Abd el Aziz, etc.

1904.—Declarations of England and France concerning Morocco in agreements of the Entente of 1904. See FRANCE: 1904-1906; ENTENTE CORDIALE.

1904-1909.—Exploits of El Raisuli.—Kidnapping and ransoming of Perdicaris and Varley.—Capture and ransom of Kaid Sir Harry MacLean.—One of the chiefs in that mountainous strip of northern Morocco, nearly parallel to the Mediterranean, which is called "The Riff," played a startlingly troublesome part in Moroccan history for four or five years. His name was Mulai Ahmed ben Mohammed, but he was commonly designated in all news-mentions of his doings by his title,—El Raisuli, chieftain of a clan. The first exploit which made this title familiar to all the world was in May, 1904, when he kidnapped, from their resi-

dence near Tangier, a naturalized American and an Englishman, Mr. Ion Perdicaris and his stepson, Mr. Varley, carrying them into the mountains and holding them captive until he had extorted a ransom of \$70,000, despite the utmost efforts of France, Great Britain, and the United States, with the aid of the Sultan, to obtain their release on less humiliating terms. In 1906, encouraged by the success of Raisuli the tribes became active in hostility. "The bandit Raisuli had become more powerful than ever, and the Shereefian troops were never sent against him. It was even suspected that the Moroccan Government was using him as a means to stir up trouble, and thus check to some extent the advance of the Europeans. . . . French marines landing to obtain fresh water were fired upon; an outbreak against the Jews was staged at Mogador; and the French government was constantly in receipt of reports concerning the unchecked hostilities of the Moroccan tribes along the Algerian frontier. By the first of November, the [Algeiras] Act had not yet been ratified by all the Powers; France, Spain and Switzerland had not yet decided upon their officers for the police; the bandit Raisuli had complete control of the village of Arzila in the vicinity of Tangier, after having killed some of the guards and chased out the others; the false prophet Bu-Hamara was as powerful as ever, and a new contestant for the throne had come forth in the person of Hafid, the brother of Abdul Aziz. . . . [Toward the end of the year the French sent a naval expedition to Tangier] after notifying Spain and asking her cooperation. . . . Notice was also sent to the Powers that the expedition was being sent with no intention of disembarking unless such troubles should arise as would render an immediate policing imperative. . . . The arrival of the naval expedition finally aroused the Sultan to action, and he forthwith despatched his minister of war in personal command of an improvised army, with orders to place the city of Tangier under 'the shadow of security,' and to permit the execution of the reforms of Algeiras. Raisuli seemed little disturbed, and even attempted to arrest a Frenchman while the Sultan's troops were on the march. . . . Meantime Raisuli had left Tangier and fortified himself at Linat. The Sultan's troops decided to follow him, but when they arrived Raisuli had departed."

—G. H. Stuart, *French foreign policy*, pp. 228-232.

—His successes failed to satisfy the audacious brigand, and in July, 1907, he laid hands on another important hostage, this time a British officer, Sir Harry MacLean, who had been long in the service of the sultan of Morocco, as military adviser, with the title of Kaid. Kaid MacLean ventured to visit the brigand in his mountain retreat for some negotiation, and was detained in pawn. Raisuli held this notable captive until the following February, and released him then on receipt of \$25,000, cash down, with a pledge of \$75,000 more at the end of three years, if he gave no fresh trouble within that time. Meanwhile, he and twenty-eight of his family were to be under British protection. Before this transaction was closed a new sultan had won the Moroccan throne (as will be explained below) and he thought it wiser to employ the energies of Raisuli officially than to try to maintain a contest of authority with so unmanageable a subject. Accordingly, in February, 1909, Raisuli was appointed governor of twelve tribes in Northern Morocco, and became one of the most respectable representatives of government in the last of the Barbary states.

1905-1906.—German hostility to Anglo-French agreement.—Kaiser's speech at Tangier.—International Conference at Algeiras.—Resulting

act.—“Early in 1905 Germany intervened for the first time in Morocco affairs, protesting that as she was not a party to the agreement of the previous year her attitude toward Morocco was not affected thereby. [See also GERMANY: 1905-1906.] On March 31 the German Emperor landed in Tangier and visited the German Legation, where he was met by the Sultan's delegates. He stated that he would allow no attempt on the integrity of Morocco, and proffered financial aid on behalf of the German Government. His visit was followed by a German special mission to the Sultan. In May there were French, British, German and Spanish Special Missions at Fez. The British Mission was under instructions to aid France's policy, and actively supported the French Minister. Germany meanwhile had proposed an International Conference on the Morocco question, though outwardly the idea was supposed to have originated with the Sultan. . . . On July 10 M. Rouvier announced that the French Government had accepted the idea of a Conference. . . . A programme for a scheme of reform to be proposed was drawn up by the Powers, and accepted by Morocco in October. The Conference met in January, 1906, and the Act of Algeiras was signed on April 7. The state of the country rendered its being immediately put into action impossible. Rebellion existed on every side. Outrages took place, and Europeans were attacked in various parts of the country.”—W. B. Harris and W. Cozens-Hardy, *Modern Morocco*, pp. 30-31.—See also FRANCE: 1904-1906; U. S. A.: 1905-1906.

1907.—Protest against French rule.—Becomes cause of friction between Germany and France. See FRANCE: 1906-1909: Presidency of Armand Fallières.

1907-1909.—Mob-murder of Dr. Mauchamp.—Conflict at Casablanca.—Campaign against the tribes.—Dethronement of Sultan Abd-el-Aziz.—Friction between France and Germany.—Settlement by arbitration at The Hague.—“The Sultan, relying upon the lack of unity visible in the international action, became indifferent to French demands. . . . As Abdul Aziz became more dilatory, his subjects became more openly hostile. On March 8, at Fez, the capital of Morocco, a French engineer was attacked by the populace and very seriously injured before he succeeded in making his escape. On March 10, Dr. Mauchamp, an eminent French surgeon, in charge of the French dispensary in Marrakesh, was murdered by a mob. . . . A cruiser was despatched to Tangier, and on March 25, the Council of Ministers decided that Algerian troops [under General Lyautey] should occupy Oudja on the Moroccan frontier, until suitable reparation had been made. When it was learned that the Governor of Marrakesh had made no attempt either to send assistance to Dr. Mauchamp, although he had warning of the excitement of the populace, or to apprehend those guilty of the outrage when the murder was reported, France demanded his dismissal and imprisonment, in addition to an indemnity to the victim's family. The excellent record that Dr. Mauchamp had achieved, and the unselfish nature of his work, made his murder seem the more outrageous. . . . [On July 31, 1907, an outbreak occurred in Casablanca] in which nine Europeans were massacred, three French, three Italians, two Spaniards, and one unidentified. Again France was forced to send a squadron, and this time it was accompanied by a landing force under General Drude, with orders to seize the city and its suburbs, reestablish order and remain until the police should be organized. Spain was asked to cooperate with an equal contingent. When the forces attempted to land they were treacherously

attacked and six were wounded, one an officer. The war-ships in the harbor [French and Spanish] thereupon bombarded the town, sparing as far as possible, the European houses. Before the town was completely invested the French troops suffered fourteen casualties. The French then turned their attention to the organization of the police, but when assurances were demanded from the Moroccan Minister of War that these officers would be safe from assassination at the hands of their own soldiers, he would not give it. Thereupon the two governments decided that a temporary police must be organized from their own effectives, and the Powers signatory of the Act were notified to this effect. To complicate the situation, Mouley-Hafid, the elder brother of the Sultan, now raised the banner of a Holy War and some of the western tribes immediately enrolled under his banner. Before the end of August he was proclaimed Sultan in Marrakesh, the ancient capital of Morocco, thus giving him an excellent strategical position to work from. Abdul Aziz, becoming worried at the progress of the revolt, removed his court to Rabat, where he might be able to call upon the warships of the Powers in case of an emergency.”—G. H. Stuart, *French foreign policy*, pp. 233-234, 236-237.—“The news of these events increased the anarchy elsewhere, and Mulai Hafid was proclaimed in other parts of the country and in Fez. . . . In August Mulai Abdul Aziz set out for Marrakesh, but his forces were defeated, largely by the treachery of his own troops, as he was nearing the southern capital. Immediately after the receipt of this news Mulai Hafid was proclaimed at Tangier. He undertook in letters to the foreign representatives to abide by treaties and to keep to the terms of the Act of Algeiras. He also accepted responsibility for the debts of the Makhzen, except in reference to such as were the personal debts of his predecessor. During this whole period there was constant friction between the French and Germans. [See also U. S. A.: 1905-1906; ENGLAND: 1912.] . . . In November [1908] Mulai Abdul Aziz abdicated, ceding the throne to his brother, Mulai Hafid, whose position, however, was no sinecure, as he had to face at one and the same time the tribes who had put him on the throne on the understanding that he would carry out an anti-European policy, and the Powers of Europe by whose treaties he had undertaken to abide.”—W. B. Harris and W. Cozens-Hardy, *Modern Morocco*, p. 32.—The direction of government was assumed formally by Mulai Hafid. His authority had soon become established so fully that the German government addressed a note to the Powers proposing an immediate recognition of it. France and Spain objected, insisting that Mulai Hafid must confirm existing treaties, accept responsibility for the debts of the previous régime, give pledges of indemnity for the Casablanca outbreak, disavow the “Holy War” which he had countenanced and which had given him his success, and take effective measures for securing the safety of foreigners in the Empire. Their objection was approved generally; Germany assented to the requirements proposed, and it was not until Mulai Hafid had satisfied them that he obtained recognition as the legitimate sovereign of Morocco. This was given in the following note, handed to his representative on the 5th of January, 1909, by the *doyen* of the Diplomatic Body at Tangier:

“The signatory Governments of the Act of Algeiras have received the letter which Mulai Hafid sent to them through the agency of the Diplomatic Body at Tangier in reply to their *communiqué* of November 18. The Governments

represented in Morocco received with satisfaction this reply, in which they saw a proof that the explanations which they formulated in their Note of November 18, in the interest of the relations of friendship and confidence which they desire to maintain with the sovereign authority of the Shereefian Empire, are in accordance with the views of Mulai Hafid. In consequence the signatory Powers of the Act of Algeciras have decided to recognize his Majesty Mulai Hafid as legitimate Sultan of Morocco, and have charged the *doyen* of the Diplomatic Body at Tangier to notify their recognition of him to the representatives of his Majesty in that town."

Before this settlement was reached an incident had occurred at Casablanca on September 15th, 1908, which irritated the chronic sensitiveness of feeling between Germany and France. Five or six soldiers of the Foreign Legion in French service at Casablanca, including three Germans, deserted, and the German consulate attempts to protect the Germans when their arrest was undertaken by French gendarmes. There was some struggle, but the arrest was accomplished, and the demand of the consul for the release of the three Germans was refused. Germany demanded satisfaction for the treatment of her consul. France maintained that satisfaction was due to herself for the interference of the consul with her military rights; but offered to submit the affair to The Hague Tribunal for arbitration. Germany was willing to arbitrate the questions involved if France would first express regret for the official conduct on her side of the matter. France in reply suggested expressions of regret by both parties; and on these terms, supposedly vindicating national dignity on each side, the case went to The Hague. The Court of Arbitration held its first meeting on the 1st of May, 1909, and announced its judgment on the 22d of the same month. As summarized in an English despatch from The Hague, the opinion of the Court was as follows:

"The Court considered that in this case there was a conflict of jurisdiction between the Consular and the military authority of two foreign Powers, the one Power exercising full Consular authority over her subjects, who happened to be soldiers in the Foreign Legion of the other Power. The latter Power had effected the military occupation of a certain territory, and in consequence exercised full authority over that territory. As it was impossible to decide this conflict by any absolute ruling, which might indicate in a general way the precedence of either jurisdiction, the Court considered that the question must be determined by the particular circumstances of any given case. In this case the jurisdiction of the occupying force had precedence because the persons in question did not leave the territory occupied by that force. The Court decided that the Secretary of the German Consulate at Casablanca wrongly and through a grave and manifest error tried to embark in a German steamer deserters of the French Foreign Legion, who were not of German nationality. The German Consul and the other officials of the Consulate were not responsible for that fact; the Consul, however, in signing the safe conduct, which was laid before him, committed an unintentional error. The German Consulate in the circumstances obtaining at that time was not entitled to grant its protection even to deserters of German nationality; the legal error, however, which was committed in this connexion by the officials of the Consulate could not be reckoned either as an intentional or as an unintentional error. The French military authorities

were wrong in not respecting, as far as possible, the *de facto* protection exercised over those deserters in the name of the German Consulate. The circumstances did not justify either menace by revolver on the part of the French soldiers, or the blows given to the Moroccan soldier of the Consulate."

This proved satisfactory to all concerned, and the Casablanca incident was happily closed.

A more important adjustment of matters between Germany and France, aiming at a general clearing of causes of friction in their relations, so far as concerned Morocco, had preceded the Casablanca arbitration by nearly three months. All Europe had been surprised and delighted on the 9th of February, 1909, by the announcement of a Franco-German agreement, just concluded, in the following words:

"The Government of the French Republic and the German Imperial Government, actuated by an equal desire to facilitate the execution of the Act of Algeciras, have agreed to define the significance which they attach to its clauses with a view to avoiding any cause of misunderstanding between them in the future. Consequently, the Government of the French Republic, wholly attached to the maintenance of the integrity and of the independence of the Shereefian Empire, decided to safeguard economic equality there, and accordingly not to impede German commercial and industrial interests, and the German Imperial Government, pursuing only economic interests in Morocco, recognizing at the same time that the special political interests of France are closely bound up in that country with the consolidation of order and of internal peace, and resolved not to impede those interests, declare that they will not prosecute or encourage any measure calculated to create in their favour or in favour of any Power whatsoever an economic privilege, and that they will endeavour to associate their nationals in business for which these may be able to obtain contracts (*l'entreprise*)."

This most important agreement resulted from negotiations that were said to have been opened by a suggestion from the German foreign secretary, Baron von Schön. Its importance to Europe was hardly exaggerated by the *Paris Matin*, when it said: "It is a great and happy event, the importance of which need not be emphasized. . . . This close of the Moroccan quarrel may, if such be the desire, mark a date of capital importance in the history of Europe. In fact, as Prince Bülow has said and repeated, Morocco was only a pretext. If therefore it has become an object of agreement, it is not merely because it has been recognized that the local problem was not insoluble, but also because the general situation has changed or because the 'opportunity' no longer exists."

1909.—Struggle with pretenders.—Spanish War with tribes of the Riff.—Success of Mulai Hafid against his rivals.—French operations in and around Moorish empire.—French Mauretania.—French demands.—France and Spain were now strengthened in the execution of their Algeciras commission, by a harmonious backing in Europe, and the native government in Morocco had acquired, seemingly, a capable man at its head. "Early in 1909 French, Spanish, and British Special Missions were in Fez. Mulai Hafid at first created a good impression. He was a strong man, and evidently desirous of doing well, but the task proved too difficult. . . . About this time a new loan was raised in Paris to meet the actual military necessities of the situation, for the re-

billion of Bou Hamara was still proceeding. In August, however, this Pretender was caught, and after being exhibited in a small cage, was barbarously put to death. Such of his adherents as were captured were also atrociously treated. . . . The German mining claims attracted a considerable amount of attention at this period. Mulai Hafid had given the firm of Mannesmann Brothers a concession for mining rights, which after long negotiations the German authorities were forced to abandon, as the matter of such concessions and mining rights in general could only be decided by the Powers signatory of the Act of Algeciras. Meanwhile the Spaniards were actively engaged in fighting on the Rif coast, in the neighbourhood of Melilla. In the month of July alone the Spaniards lost 90 officers and 1,000 rank and file. The fighting continued till the winter rains put an end to movements of troops."—W. B. Harris, and W. Cozens-Hardy, *Modern Morocco*, p. 33.—See also SPAIN: 1909.—The war had been bitterly unpopular among large classes in Spain, and the feeling had been manifested in destructive rioting at Barcelona and elsewhere. What France had been doing meanwhile, in and around Morocco, has been told by a writer in *The Atlantic Monthly*:

"During the year [May, 1908, to May, 1909] the French army under General d'Amade, continued occupying Casablanca, and the fertile Chaouïa (Shawia) region. It has forced peace, law, and order, and open markets on the inhabitants, to their great advantage. . . . Meanwhile the interior of Morocco has been chiefly occupied in the unmaking and making of Sultans. . . . The real success of France is along the entire land-frontier of Morocco. For its whole length this is now also the frontier of French territory,—Algiers to the east, the Sahara with its line of French posts to the south, and so on to the Atlantic Ocean through the new French civil territory of 'Mauritanie.' . . . France absolutely refused to allow any question concerning this land-frontier to be brought up at the Conference of Algeciras."—S. Dewey, *Year in France (Atlantic Monthly, Aug., 1909)*.—The Moroccan government was now being sharply pressed by France with demands over which negotiation had proceeded hitherto very slowly. Pichon, the French minister for foreign affairs, made a statement on the subject to the chamber of deputies on November 23d, 1909, to the following effect: "On August 14 the representatives of the Sultan received a note summing up the conditions imposed by the French Government. These conditions were the evacuation of the Shawia region on condition of the organization by the Maghzen of a force; the evacuation of Casablanca when the French Government felt convinced that the organization of the Shawia police had become sufficiently effective; the organization of the police service on the Algero-Moroccan frontier; the payment of the Maghzen's debts and the reimbursement of the costs of the French military expeditions. The Maghzen owed at present £3,200,000, more than £400,000 of which was due to private creditors. The French Government would allow the Moroccan Government to raise a loan in France in order to facilitate the payment of its debts. . . . The French conditions had been acknowledged to be very moderate by all who had had cognisance of them. Germany had recently informed the Maghzen that it was high time to contract a loan. M. Pichon dwelt on the loyalty with which the Franco-German Agreement had been observed by the Berlin Government. Nevertheless the adhe-

sion of the Moroccan Government had not yet been obtained. That Government had admitted the principle of the loan of 80,000,000f. and that of the indemnity of 70,000,000f. for the French military expedition, but there was disagreement still in regard to the guarantees required for the realization of that operation. Mulai Hafid, moreover, demanded the immediate evacuation of the Shawia and of Casablanca. On November 6 M. Pichon informed the Sultan's envoys that it was futile to continue the *pourparlers* if France did not obtain a satisfactory reply. It would not be without danger for the Moroccan Government to persevere in its attitude." A little later it was made known that the sultan had yielded to the terms prescribed by the French government and was to obtain the loan which would help toward the payment of his debts.

1910-1911.—Tribal revolts.—"It was not till March, 1910, that Mulai Hafid agreed to carry out the terms of the Franco-Moorish agreements, signed by his predecessor, when, in a new arrangement, full satisfaction was given. . . . A few months later his dealings with Europeans and his treatment of the tribes led to fresh revolts, and in the spring of 1911 the anarchy was once more complete. Fez was attacked, and the Sultan's troops, part of which were encamped a day's distance from the capital, were threatened with annihilation. They succeeded, however, in fighting their way back to the city. Three thousand French troops left Casablanca for Fez on April 27, and others overtook them, until in the middle of May the force consisted of nearly 8,000 men. The capital was reached and relieved on May 21. In June, Spain landed a force of Laraiche, and Alcazar was occupied."—W. B. Harris and W. Cozens-Hardy, *Modern Morocco*, pp. 33-34.

1911.—German violation of Algeciras Treaty. See GERMANY: 1911: MOROCCO crisis.

1911-1912.—Agreement between France and Spain.—"The special interests and rights of Spain in Morocco had been recognized and protected by France in treaties with Spain in 1902, 1904, 1905, and in 1906, and France had kept her ally informed of the progress of the late negotiations with Germany. At length, after a detailed conference with England during most of November upon the future status of Tangier and the precise lines of delimitation for the French and Spanish territorial claims in Morocco, the French engaged the Spanish authorities, on December 7, in a series of confidential negotiations on the question, at which the British Minister to Spain was present. A great many intricate and delicate problems were involved; but they were centered about three main issues: the nature and extent of the Sultan's control over the Spanish sphere of the empire; the construction and control of the proposed railway from Tangier to Fez (part of which would have to pass through the Spanish zone); and the collection of customs and control of the public debt belonging to that portion of the Sultan's dominions under Spanish protection. The 'conversations' were prolonged to an unexpected and extraordinary degree, owing to the varied character of the questions at issue and peculiar difficulties that arose in the path of the negotiators; and the definite agreements were not reached until October 25, 1912. In these, it was provided that Spain, while retaining the control of the customs within its zone, should pay an annual sum approximating \$100,000 toward the interest and amortization of the Moroccan debt; that the boundary question should be settled by certain minor transfers of land—for a portion of the Rif coun-

try, Spain being given a good-sized piece of territory adjoining her colony of Rio de Oro on the north—and by a commission of delimitation to mark the precise frontiers; that the international position of Tangier should be settled by a special commission; that the Spanish zone should be administered by a Spanish High Commission, assisted by a Khalifa Resident at Tetuan and appointed by the Sultan from two persons nominated by Spain; and that the Tangier-Fez Railway should be built by a single company, of whose capital stock the French shall have fifty-six per cent, the Spanish thirty-six per cent, and other countries, if they desire, eight per cent. The attainment of this happy solution was received with great satisfaction by the leading statesmen and people of the two interested nations, and with considerable relief by the European states, some of whom had feared an open rupture more than once during the negotiations. The credit for their successful termination is due to the tact and breadth of view displayed by M. Geoffroy, the French Minister to Spain, and to the sincerity and conciliatoriness of Señor Canalejas, the Spanish Premier.”—N. D. Harris, *Intervention and colonization in Africa*, pp. 280, 281.

1911-1914.—Assaults on Europeans.—French intervention.—Agreement between France and Germany.—Establishment of French protectorate.—“In June, 1911, we read of outrages committed by the Fez garrison and of remorseless reprisals made upon neighbouring villages as soon as the siege was raised. Mulai Hafid had sent his own troops, under the command of French officers, and these committed wholesale destruction of life, expropriation of property, and nameless assaults, until stopped by General Moinier as soon as he understood what was being done. It is hardly to be wondered that the Moors felt resentment at the arrival of an infidel army which lent itself—even if but for a short time—to the designs of their hated officials. Of course Mulai Hafid and his immediate advisers denied stoutly all possibility of there being a savage re-establishment of the Sultan’s power; yet their acts were totally opposed to the spirit in which France sent succour and in which General Moinier conducted the relief operations. . . . Following quickly upon France’s action in sending troops into Morocco came Germany’s in sending a warship [the *Panther*] to Agadir, an open roadstead moderately protected by headlands and five hundred miles south of the Straits of Gibraltar. [See also ITALY: 1911.] Germany’s contention was that the possible occupation of Morocco by France was a breach of the Algeiras Act and restored to all Powers signatory to that Act freedom of action. There were German firms interested south of Morocco, and if Agadir were opened it would be a natural outlet of the Sus district. It seemed for a time as if the five European Powers,—France, Germany, Great Britain, Spain, and Russia as the ally of France,—would be required to enter into further negotiations to restore peace in Morocco; and if this necessity was evaded, nevertheless conditions indicate something of what is to be seen in at least one part of Africa to-day and no one will say they are satisfactory. The French Government had decided to re-enforce the French troops at Casablanca (Dar-el-Beida, about midway between the Straits of Gibraltar and Agadir), and drew up an agreement with the Maghzen for the purpose of supplying the Sultan with financial means to establish a serviceable army of five thousand troops, to be drilled and commanded by French officers, and to assist in the

upkeep of the balance. There was to be an issue of two successive loans through the agency of the Morocco State Bank. France intimated to the Sherrefian (the chief magistrates) her willingness to renounce temporarily the annual installments of the war indemnity due her. It is hardly surprising that all of this was construed by Germany as inimical to her position; nor is it astonishing that Great Britain threw her influence into the scale with France, because the total maritime trade of Morocco for the year 1909 (the latest for which statistics are readily available) amounted to £4,600,000, an increase of £800,000 over the previous year: but Great Britain’s share in this trade increased proportionately more than did that of any other European Power. France showed an increase of £90,000, Great Britain £430,000.”—J. K. Goodrich, *Africa of to-day*, pp. 35, 37, 38.—The *Panther* incident “ended in the Franco-German treaties of November 4 (1911). By the first of these treaties Germany acknowledged France’s claim to establish a Protectorate over Morocco, provided the rights of the subjects of other Powers were not interfered with. . . . These treaties freed France’s hands in Morocco, and it was decided to declare the Protectorate over that country without delay. For this purpose Monsieur Regnault, French Minister at Tangier, proceeded with a Special Mission to Fez, where he arrived on March 24, 1912. On the 30th a treaty was signed by which Morocco became a French Protectorate, on the principles of French collaboration with the Moorish authorities; the reorganization of the finances of the country; the appointment of a French Resident-General, and that the French Government should be charged with the diplomatic relations of Morocco. On April 17 a massacre of French officers took place at Fez, brought about by certain military restrictions upon the Native troops, and owing not a little to the unrest of the general situation. The Jews’ quarter was pillaged and largely burnt. Reinforcements of French forces arrived from Meknès, and after two or three days’ panic in Fez tranquillity was restored. . . . General Lyautey reached Fez on May 26, when renewed fighting took place in that region. . . . Meanwhile this crisis in the north had given the excuse for a rising in the south, and a certain Mahommed Hiba, a son of the Sherref and sorcerer, Mal Ainin—who had recently died—raised a revolution and obtained possession of Marrakesh, where he imprisoned the French Consul and eight of his compatriots. An expedition was ordered to proceed against Marrakesh, and the French troops entered the city, after little fighting, at the end of August. The French prisoners were safe and well. El Hiba escaped in disguise. . . . Mulai Hafid had abdicated in August [1912], his younger half-brother, Mulai Yussef, succeeding. . . . The first six months of 1913 were spent in fighting—French mobile columns acting with great courage and swiftness, subdued one tribal rising after another—and by June the occupied parts of the Protectorate were at peace. The early part of 1914 saw the peaceful occupation of the French Protectorate territory proceeding apace.”—W. B. Harris and W. Cozens-Hardy, *Modern Morocco*, pp. 34-36.

1912-1919.—Work of General Lyautey.—Progress under French control.—Part in World War.—“General Lyautey, who had already made his name as a most able officer and administrator, was sent by the French Government as the first Resident-General under the new Protectorate treaty. A happier choice could not have been

made. . . [He] saw that the only way to restore peace and security in Morocco was by the institution of a great programme of public works and the introduction of justice. His personality appealed to the Moors, over whom he at once obtained a great influence. At his recommendation the French Government advanced a sum of £12,000,000 for public works in Morocco. Roads, harbour improvements, railroads, and all manner of works were immediately undertaken, and a great number of Natives were employed. Peace in the more accessible regions of Morocco was quickly assured by this admirable policy."—W. B. Harris and W. Cozens-Hardy, *Modern Morocco*, pp. 34, 36.—"At the time when France took up the work of political and economic organization everything remained to be done—restoration of the disordered administration; establishment of the bases of economic development; installation of medical, educational, and other service; reform of the land

ciple of 'one major port, several secondary ports.' Choice of the chief port fell on Casablanca. Thither European commerce was directed for the most part, and interests acquired there were already considerable; furthermore it is the natural outlet for the rich regions of the Shawia (Fr., Chaouia) and Tadra."—A. de Tarde, *Work of France in Morocco* (*Geographical Review*, July, 1910).—"The outbreak of war found the French zone in Morocco in a state of increasing organisation. Public works were being pushed forward on every side. . . Morocco was in a strangely anomalous position. The whole of the south was under the French Protectorate, and therefore became a belligerent State, but as to the Spanish zone Spain was neutral, and her protected zone must remain neutral too, while almost as perplexing was the situation of the small Tangier zone on the Straits of Gibraltar. . . The Germans were immediately expelled from the French Pro-

MOORISH SOLDIERS

On the lookout for Spanish advance against their mountain stronghold

system. At the same time peace had to be assured and a rebellious population pacified by the combined application of force and persuasion. The task was immense in itself. It was rendered still more difficult by the course of external events. When the protectorate treaty was signed Morocco was submerged in anarchy. The power of the Sultan was on the wane; most of the country with the exception of Fez, Meknes, and the coast was in rebellion against him. After affixing his seal to the treaty Sultan Mulai Hafid abdicated, and the Makhzan (Moroccan government) nominated his brother, Mulai Yusef, as his successor. . . . One of the first measures in establishing the protectorate was the drawing up of a scheme of economic policy, including a program for public works. Though the pacified area was then of small extent, the program was large in scope, for it looked to the future and, moreover, the order was to move quickly. The problem of the ports, the economic keys to the country, naturally demanded first attention. To avoid dissipation of efforts and resources there was adopted the prin-

tectorate. The representatives of Germany and Austria, who resided at Tangier, were put on board a French warship and conveyed to Italy, and their compatriots expelled to Spain. The French Government considered that the situation in Morocco must be sacrificed to the needs of France. A telegram was sent to the Resident-General stating that all his available troops would be required in France, and ordering him to abandon the interior of Morocco and to retire all his forces and all the civilian population to the coast towns. General Lyautey in reply promised that all the troops required in France should be sent, but refused to abandon one inch of territory. He foresaw the difficulties and dangers of such a policy—and the disastrous effect it would have upon the future position of France in Morocco. He sent the troops to France, and so far from having abandoned any territory the extent pacified by France . . . [was] largely increased during the war."—W. B. Harris and W. Cozens-Hardy, *Modern Morocco*, pp. 36-37.—Moreover, 30,000 Moors were enlisted for the French army in Europe, and

an equal number in the labor corps, while the country furnished a large quantity of supplies for the troops.

1919.—Austria and Germany renounce claims enjoyed through Algeiras Act and Franco-German agreements. See ST. GERMAIN, TREATY OF: Part IV: Section 1; VERSAILLES, TREATY OF: Part IV: Section 5.

1919.—Outbreak in the Rif against Spain.—“In February, March and April of 1919 the Andjera tribesmen, who had much to complain of Raisuli and were never identified with the Jebala proper, submitted to the Sultan's Khalifa at Tetuan. Their territory was successfully occupied, with slight casualties, by troops from Ceuta, cleverly supported by a feint from Laraiche. In April the submission of part of the Beni Hosmar country to the east of Tetuan was assured, that of the great and important tribe of Beni Said, likewise bordering on the Rif, having already taken place. About the same time the Jebel Hebib men to the southwest of Andjera came in from the Jebala. In May the great M'talsa tribe to the south-east of Melilla, one of the most formidable in the Rif, admitted Spanish occupation, and

Treaty of Sèvres. See SÈVRES, TREATY OF (1920): Part III: Political clauses: Morocco, etc.

1921-1923.—War in the Rif.—Moroccan republic.—“A revolt, in 1921, of the tribes in the Melila region, proved to be much more serious than was at first apprehended, and spread rapidly through the entire Rif region. The Spanish troops were defeated at Anual on July 21, and General Fernandez Silvestre, the second in command in Africa, who had made a rash expedition across the desert to the scene of action, was reported to have committed suicide; Nador and Zeluán, within a short distance of the important seaport of Melila, were lost to the tribesmen, who were able with artillery to command the approach to the town; General Navarro and his forces were forced to surrender at Arruit, and after most cruel treatment the captives were sent prisoners to Axdir off the coast of Alhucemas. Heavy reinforcements were at once sent to the seat of war, and operations were commenced from Melila. The battle of Melila was fought in September, and won by the Spaniards; Mount Gurugu and Mount Arruit, whose heights dominate the town, were taken by assault, and at the close of the year all the territory which

GREAT MOROCCAN FORTRESS AT MELILLA

towards the end of the same month the Spanish troops advanced their lines in the Benibut Yahi country, next to M'talsa, and from Laraiche against the Beni Aros and Beni Gorfet, operating a junction between the Ceuta and Tetuan divisions. On July 12-13, Raisuli, realizing that he was being cut off from the coast, attacked but was badly defeated, several key positions on Jebel Zemsem in the Wad Ras country being occupied. Immediately afterwards, at the beginning of August, took place the submission of the Gomara tribe to the Shereefian Khalifa at Tetuan, a fact equivalent in importance to that of the M'talsa a few months previously in the Rif. The close of September (30th) and first days of October (6th) witnessed the taking of El Fondak of Ain Yedida, Raisuli's principal position, by combined columns operating simultaneously from the Tetuan, Ceuta, and Laraiche districts. Raisuli's power was broken by this defeat, and soon the greater part of the Beni Mesauar and all Wad Ras was occupied, the road from Tetuan to Tangier being definitely cleared. . . . [The Spanish] aims have been favoured by the influx and establishment of a considerable number of civilian colonists, some 180,000 in all."—A. Merry Del Val, *Spanish zones in Morocco* (*Geographical Journal*, Jan.-June, 1920).

1920.—French protectorate recognized by

had been lost was recovered. The Spanish government announced that it had concluded an agreement with the Sultan by which the Gurugu heights were to be included in the military zone in order to relieve the town from the danger of attack. Meantime, Raisuli had been making trouble in the west, where he occupied Tazarut, and it was not until September, 1922, that he retired from this stronghold. Little was done during 1922 to pacify the country, in spite of the large army of occupation, which in the early part of the year numbered 150,000 of all arms. The Spanish government announced its intention to allow the Moors a greater share in the government, but nothing was attempted in this direction. On the other hand, the Moors claimed that they had been driven to war by religious animosity and bad treatment, and declared that they were more capable of governing themselves than the Spaniards were. *La Presse* this evening [September 3, 1923] says: "There exists in Spanish Morocco an independent Government which directs resistance against Spain. . . . This Government calls itself "the Moroccan Republic of the Rif," and has an Agent General in London. . . . The Riffians' revolting against Spanish authority are not merely a few native tribes that refuse to submit to the Spanish protectorate, but citizens of a rich country which is

organized and administered, possessing an established Government whose chief has already several times negotiated on equal terms with Spain. . . . The Moroccan Republic of the Riff was created in 1920. Prior to that date the chief of state was the Supreme Sheik, always chosen from among the members of the family of the Abd-el-Krim. . . . Every Riffian reaching the age of 21 gets a vote. There is a Chamber with fifty-five members, the executive Government and nine responsible Ministers. The Prime Minister is Abd-el-Krim. . . . The Spaniards say this Government exists only in the imagination of a handful of ambitious rebels."—*New York Times*, Sept. 4, 1923.

1922.—Political and economic state of country.—In 1922, there was "no strong Nationalist party. . . . In Fez the atmosphere was, indeed, unfriendly, but at Marrakesh [the people] . . . were on excellent terms with the French, who appeared to manage them with admirable tact and kindness. Had there been strong anti-French feeling it is clear that advantage would have been taken of the withdrawal of most of the regular troops and artillery for a general rising, whereas the country remained quiet and obedient. . . . To the east and south-east of Fez, and also some distance to the east of Marrakesh, there are large districts of difficult mountainous country in the Middle Atlas which are still unsubdued. But the French, who work out their operations with the skill and experience gained in the Great War, are rapidly subduing the stubborn tribesmen. . . . The position of the Sultan under the French protectorate is one of great importance. It was open to the conquerors to set up a mere dummy or else a sultan who would associate himself with the new-comers and aid them in their far-reaching reforms. Sultan Yusuf falls under the latter category. Elected in 1912 after the abdication of his brother, at a time when the tribes were in a state of revolt and El-Hiba, a pretender for power with the support of a strong party in the South, he has shown himself a worthy occupant of the throne, placing the valuable asset of his religious and temporal power at the disposal of the French. . . . [The French] are great road-makers, and their policy has been to construct good roads from their base at Casablanca eastwards to Algiers, *via* Rabat, Meknes and Fez, and southwards to Marrakesh. In addition, Meknes on the north is connected with the port of Knitra, and Marrakesh on the south with the ports of Mazagan, Safi and Mogador. To the south of the Meknes-Fez route a road is being constructed across the Middle Atlas. Finally, the French have constructed their section of the Rabat-Tangier road, but the Spanish have neglected to complete their share of the undertaking. Elsewhere the native tracks have been taken in hand, and made fit for motor traffic in fine weather. . . . To meet the urgent military necessities, light railways were laid down to the chief centres . . . but can only handle a very limited amount of traffic. . . . But, again, France is a great railway constructor, and work on the Fez-Meknes-Tangier line is being busily pressed forward. At more than one place . . . fine bridges [were] under construction [in 1922], and elsewhere the earthwork appeared to be completed. In the Spanish and Tangier zones there were also signs of activity. . . . Simultaneously with this main system, lines from the port of Knitra and from Knitra to Rabat and Casablanca are being constructed. . . . A railway . . . to Marrakesh [was projected], with a branch from a point between Bir Rashid and Settat . . . [to] tap the extraordinarily rich deposits of phosphates be-

tween Wad Zam and El-Buruj. . . . [Finally a line from Fez to the frontier of Algiers by Taza and Udja was under consideration. This programme, which works out at about five hundred miles, is part of a larger scheme], in which Paris to Dakkar and Paris to Lake Chad figure. . . . The extraordinary success won by France in Morocco is mainly the work of one man, Marshal Lyautey. . . . As Resident-General in Morocco his services are brilliant. Sympathy and reconciliation have always been the keynote of his policy, and, if obliged to use force, his rapid, staggering blows have been immediately followed by a resumption of friendly overtures. Apart from his own acts, he has succeeded in stamping his views on his subordinates. He has thereby founded a school of administrators and frontier officers. . . . His *Service des Renseignements* may be compared with the famous Political Department of the Government of India, which played so leading a part in the Great War in the Middle East."—P. Sykes, *France and Morocco: An appreciation* (*Fortnightly Review*, Feb., 1923).

MORRIS, William (1834-1806), English poet, artist and socialist. See ENGLISH LITERATURE: 1833-1909; 1880-1920; PRINTING AND THE PRESS: 1880-1900.

MORRIS CANAL, New Jersey. See CANALS: American: Morris canal.

MORRIS DANCE, supposed to have been derived from the Moriscoes (Moors) in Spain and introduced into England, in the reign of Edward III, by John of Gaunt, returning from Spain. It was danced at puppet-shows and belonged to the celebration of the May games with Robin Hood, Friar Tuck, Little John, Maid Marian and the Hobby Horse. In the time of Henry VIII the Morris dancers wore gilt leather and silver paper and coats of spangled fustian and innumerable little bells. Many of the old Morris dance tunes are extant. The Morris dance was suppressed by the Puritans but it still survives in some remote parts of England.

MORRIS ISLAND, at the entrance of Charleston harbor, South Carolina. It was a scene of action during the Civil War. See U.S.A.: 1863 (July: South Carolina).

MORRISON, Robert (1782-1834), English Protestant missionary. See MISSIONS, CHRISTIAN: China.

MORRISTOWN, town on the Whippam river, New Jersey, about twenty-six miles northwest of New York City. Washington established winter quarters here, 1776-1777, 1779-1780. See U.S.A.: 1776-1777: Washington's retreat, etc.; 1780 (January-April).

MORROW MASS SCHOOLS. See EDUCATION: Medieval: 4th-15th centuries.

MORSE, Jedidiah (1761-1826), American Congregational minister and geographer. See ROSICRUCIANS.

MORSE, Samuel Finley Breese (1791-1872), American inventor. See ELECTRICAL DISCOVERY: Telegraphy and telephony: Telegraph: 1753-1874.

MORT, Thomas Sutcliffe (1816-1878), English engineer and Australian pioneer. See INVENTIONS: 19th century: Refrigeration.

MORTEMER, Battle of (1054), defeat of French by Normans at Mortemer.

MORTGAGE LAWS. See COMMON LAW: 1600; EQUITY LAW: 1671.

MORTGARTEN, Battle of (1315). See AUSTRIA: 1291-1349.

MORTIER, Edouard Adolphe Casimir Joseph, Duke of Treviso (1768-1835), French marshal. Distinguished for service in Napoleonic wars; commanded left wing at the battle of Friedland, 1807; member of the chamber of deputies, 1816-1818; premier, 1834-1835. See FRANCE: 1814 (January-March); 1830-1840.

MORTIMER, Roger, Earl of March (1287-1330), English statesman. Lord-lieutenant of Ireland, 1316-1321; implicated in the conspiracy of the Earl of Lancaster; led the forces of Queen Isabella, wife of Edward II, 1326; returned with her to England; overthrew the king, and was virtual ruler during the minority of Edward III.

MORTIMER FAMILY OF WIGMORE, earls of Ulster and March of the Norman line. Ralph de Mortimer followed the earl of Hereford to Wales, where Wigmore became the family seat. In 1385, a member of the family was named heir-presumptive to the throne of King Richard; but the family claim was annulled by the accession of the Lancastrians to power in 1399. The family died out in 1425.—See also ENGLAND: 1309-1471; MORTIMER, ROGER.

MORTIMER'S CROSS, Battle of (1461), battle in the "Wars of the Roses," fought February 2, 1461, on a small plain called Kingsland Field, near Mortimer's Cross, Herefordshire, England. See ENGLAND: 1455-1471.

MORTMAIN, Statute of. See ENGLAND: 1270.

MORTON, John (1420-1500), English cardinal. Bishop of Ely under Edward IV; imprisoned by Richard III; archbishop of Canterbury and chancellor under Henry VII. See EUROPE: Renaissance and Reformation: Catholic reformation.

MORTON, John (1724-1777), American patriot. One of the signers of the Declaration of Independence. See U.S.A.: 1776 (July): Text of Declaration of Independence.

MORTON, Levi Parsons (1824-1920), American banker and statesman. Minister to France, 1881-1885; vice president of the United States, 1889-1893; governor of New York, 1895-1896. See NEW YORK: 1894-1897; GIFTS AND BEQUESTS.

MORTON, Oliver Perry (1823-1877), American statesman. Governor of Indiana, 1861-1865; United States senator, 1867-1877. See INDIANA: 1861-1865.

MORTON, Paul (1857-1911), American financier and cabinet officer. Secretary of the navy, 1904-1905; became president of the Equitable Life Assurance Society, 1906. See U.S.A.: 1901-1905.

MORTON, Thomas (c. 1590-1646), English colonist. Founder of "Merrymount," now Quincy, Massachusetts. See MASSACHUSETTS: 1622-1628.

MORTON, William Thomas Green (1810-1868), American dentist. Noted for work in connection with the discovery of anæsthetics. See MEDICAL SCIENCE: Modern: 19th century: Discovery of anæsthetics.

MORTUATH. See TUATH.

MORVAL, village in northeastern France, about five miles south of Bapaume. It was captured from the Germans by the British during the battle of the Somme, 1916. See WORLD WAR: 1916: II. Western front: c, 3; d, 13; 1918: II. Western front: k, 3.

MORY, town in France, about seven miles northwest of Lens. It was taken by the British in 1918. See **WORLD WAR: 1918: II. Western front: c. 12.**

MOSA, ancient name of the river Meuse.

MOSCHIANS, ancient Asiatic people, living southeast of the Euxine. They were conquered by the Assyrians in the 12th century. See **ASSYRIA: People.**

MOSCISKA, town in Poland. It was attacked by the Austrians in 1915. See **WORLD WAR: 1915: III. Eastern front: f, 5.**

MOSCOW, second city of Russia, on the Moskva river, 400 miles southeast of Petrograd. (See **RUSSIA: Map of Russia and the new border states.**) The population was 1,050,011 in 1920. Moscow was the capital of Russia until Peter the Great removed to St. Petersburg (Petrograd) in 1703. On March 14, 1918, it became the capital of Russia under Soviet government. The city grew around the Kremlin. It is said: "Above Moscow there is nothing but the Kremlin, and above the Kremlin there is nothing but the sky." The walls of the Kremlin are pierced by five gates, one of which, the Gate of the Redeemer, is sacred. In the enclosure of the Kremlin are the great Cathedral of the Assumption, in which the emperors were crowned; Cathedral of St. Michael the Archangel; Arsenal; Treasury; Great Palace (1838-1849); Old Palace; Tower of Ivan the Terrible (300 feet); and on Cathedral Square, "Tsar Kolokol" the largest bell in the world. Other notable buildings are: Cathedral of St. Basil (Vassili) with twenty gilded and painted towers and domes and Temple of the Saviour, finished in 1883 to commemorate the retreat of the French in 1812. Moscow is the second manufacturing city in Russia and a great emporium of trade for western Russia and Asia.

1147.—**Origin of city.**—"The name of Moscow appears for the first time in the chronicles at the date of 1147. It is there said that the Grand Prince George Dolgorouki, having arrived on the domain of a boyard named Stephen Koutchko, caused him to be put to death on some pretext, and that, struck by the position of one of the villages situated on a height washed by the Moskowa, the very spot whereon the Kremlin now stands, he built the city of Moscow. . . . During the century following its foundation, Moscow remained an obscure and insignificant village of Souzdal. The chroniclers do not allude to it except to mention that it was burned by the Tartars (1237), or that a brother of Alexander Nevski, Michael of Moscow, was killed there in a battle with the Lithuanians. The real founder of the principality of the name was Daniel, a son of Alexander Nevski, who had received this small town and a few villages as his appanage. . . . He was followed, in due course, by his brothers George and Ivan."—A. Rambaud, *History of Russia*, v. 1, ch. 12.

MOSELLE, river in France, flowing through Alsace-Lorraine and Prussia, joining the Rhine at Coblenz. Provisions regarding its navigation were included in the Treaty of Versailles. See **VERSAILLES, TREATY OF: Part XII: Section II: Chapter IV.**

MOSES, Hebrew leader and lawgiver. Under his guidance Israel became a nation. If it is accepted that Meneptah is the Pharaoh of the Exodus, then Moses was born in the fourteenth century, B. C. His life is divided into three periods of forty years, two of which were spent in civilized Egypt, the third in the desert, chiefly in the vicinity of Mount Sinai, Kadesh (locality unidentified) and the plains of Moab. Most modern critics agree that the Pentateuch belongs to a later period.—See also **Jews: Children of Israel in Egypt; Exodus; CODES: B. C. 13th-6th centuries.**

MOSES, Bernard (1846-), American writer. Author of a number of works on political science; served on the Philippine Island Commission, 1900-1902. See **PHILIPPINE ISLANDS: 1900: Progress toward civil government.**

MOSES BEN MAIMON. See **MAIMONIDES.**

MOSHEIM, Johann Lorenz von (1604-1755), German ecclesiastical historian. See **UNIVERSITIES AND COLLEGES: 1604-1906.**

MOSLEM LEAGUE. See **INDIA: 1907-1921.**

MOSLEM RELIGION. See **MOHAMMEDANISM.**

MOSLEMS. See **CALIPHATE.**

MOSQUE, Mohammedan house of prayer. The earliest mosque was that at Mecca. The Mosque of the Omayyads in Damascus, one of the oldest now in existence, was built in 705 on the foundations of a Christian basilica. The Mosque of Ahmad Ibn Tulun, built in 879, in Cairo, is interesting as one of the first examples of a genuine Mohammedan style, and contains the characteristic pointed horseshoe arch, and arabesque decorations. The mosque at Cordova, Spain, founded in the eighth century on the site of a Roman temple and Visigothic church, and added to during the next two centuries, was one of the largest and most beautiful of the sacred buildings of Islam. It is now used as a cathedral, and was much impaired by the addition in the sixteenth century of a high altar and choir. The mosques of the East are characterized by the use of the dome, evidently of Byzantine origin. Sancta Sophia was taken over as a mosque in 1456 and was copied in several instances. (See **SAINT SOPHIA.**) The so-called Mosque of Omar, at Jerusalem, is merely a shrine and not a true mosque.—See also **ARCHITECTURE: Medieval; Mohammedan.**

MOSQUERA, Tomas Cipriano de (1708-1878), Colombian general and statesman. Dictator

of Colombia, 1861-1867. See COLOMBIA: 1819-1830; 1830-1886.

MOSQUITO, or MÛSQUITO, INDIANS, several tribes of Indians inhabiting the Mosquito Coast. The Mosquito Indians are unusually intelligent and very dark-skinned, due, it is said, to intermarriage with shipwrecked slaves. From 1655 to 1850 Great Britain claimed a protectorate over the Mosquito Indians, which was disputed by Spain, the Central American republics and the United States. In 1848 the seizure of Greytown (San Juan del Norte) by the Mosquito Indians, with British support, nearly brought on a war, but by the Clayton Bulwer Treaty of 1850 both powers pledged themselves not to fortify, colonize, or exercise dominion over any part of Central America. See NICARAGUA: 1850; 1860-1880; 1894-1905.

MOSQUITO COAST (Mosquitia), extensive region still unexplored on the Caribbean sea and the Nicaragua seaboard, inhabited by the Mosquito Indians. The area is about 26,000 square miles. The Mosquito Coast was discovered by Columbus in 1502 and was a great rendezvous of buccaneers. It was incorporated with Nicaragua in 1894, and is now styled department of Zelaya. The capital is Bluefields. See NICARAGUA: 1850; 1860-1880; 1894-1905.

"MOST FAVORED NATION" CLAUSE.—“Early commercial treaties were arranged by European nations in strict accordance with the idea that every concession granted by one country to any other should be given only in exchange for similar concessions in return. In other words, the negotiation of commercial treaties was a sort of bargaining process in which a foreign nation might be overreached by its antagonist. The object to be kept in mind by either party was the arrangement of an agreement as favorable to it as circumstances, and the relative acuteness of the other, would allow. It is evident that, supposing two nations, A and B, to have signed a commercial treaty granting certain privileges by mutual agreement, B might be at a considerable advantage with respect to a third nation, C, in competing for the trade of A. If, subsequently, an agreement should be entered into between A and C, whereby more elaborate concessions were allowed C than those which had been gained by B, it might turn out that B would not merely be outstripped by C in the competition, but would even be worse off than would have been the case had no treaty been originally negotiated with A. It was this situation which led to the development of the most-favored-nation clause. Under it, states sought to obtain guarantees that in case future commercial concessions should be offered to their competitors, they themselves would, *ipso facto*, enjoy the same concessions. Thus, if the two nations, A and B, had entered into a commercial agreement in which the most-favored-nation stipulation has been incorporated, and if there should be any subsequent treaty between A and C in which larger concessions were granted, A would, by the nature of the case, extend those concessions also to B. Now, it is clear that the interpretation to be placed upon the clause might be such as to extend those concessions to B only in case B should pay for them by the same return concessions granted by C, or should simply be permitted to enjoy them without any further payment than that already arranged for in the original A and B treaty. Writers on international law distinguish several different forms of the ‘most-favored-nation clause.’ They enumerate more particularly the so-called ‘simply reciprocal form’ and the so-called ‘imperative and unconditional form.’ In the first, ‘where reciprocity is the foundation of every clause

in the treaty dealing with a subject of commerce and navigation, the inference points to reciprocity as the foundation for the general covering clause which is to supply omissions and prevent future unfavorable discrimination.’ Under the other interpretation, the commercial favors are granted to all countries under the most-favored-nation clause ‘immediately and without condition’; in other words, without compensating privileges offered in return. It is easy to see why nations like Great Britain, which have adopted free trade as their policy and which have, as a matter of fact, nothing to offer in return for a reduction of duties, are disposed to insist strenuously upon this second interpretation. The ‘simply reciprocal form’ of the most-favored-nation clause, is, of course, the one to which the United States has consistently held. It has, from the beginning, adhered rigidly to the view that trade concessions offered by it to some other country need not become common to a third country with which we have no treaty relations involving the most-favored-nation clause, unless that third nation should meet us on our own ground by granting the same favors that we secured at the hands of the other nations with which we had entered into treaty relations. In the treaty negotiated between the United States and France, February 6, 1778, the following words occur: ‘The most Christian King and the United States engage mutually not to grant any particular favor to other nations in respect to commerce and navigation which shall not immediately become common to the other party, who shall enjoy the same favor freely, if the concession was freely made or on allowing the same compensation if the concession was conditional.’ In Art. IX of the treaty with Prussia, in 1828, and in Art. IX of the treaty with Austria, in 1829, occur the words: ‘If either party shall hereafter grant to any other nation any particular favor in navigation or commerce, it shall immediately become common to the other party, freely, where it is freely granted to such other nation, or on yielding the same compensation, when the grant is conditional.’ On the other hand, European diplomacy has developed the most-favored-nation clause along a different line, following the second of the two interpretations already referred to. As things now stand, most European countries admit that nations which have granted to other nations the benefits of the most-favored-nation clause have guaranteed to the latter that their commercial relations shall not be less favorable with the guarantors than shall those of any other country. In other words, new and more extensive trade concessions granted by country A to C, a third nation, are, *ipso facto*, extended to B, a second nation, with which it has originally entered into commercial relations, while B obtains these advantages without compensation even though they may have been paid for very heavily by C. This, of course, is a marked reversal of the original interpretation of the ‘most-favored-nation clause’ during the eighteenth and first half of the nineteenth century. It is a most important point to bear in mind, in studying the development of reciprocity as a policy, for it will readily be seen that the adoption of the European interpretation of the most-favored-nation clause implies either the giving up of all commercial treaties, or else the conscious recognition of tariff reduction as a system to be regularly applied whenever granted in an individual case. Reciprocity, when limited to isolated instances, becomes nothing more than a process of international bargaining, which may or may not be undertaken, as circumstances of the particular case seem to indicate.”—H. P. Willis, *International aspect of reciprocity*

MUNICIPAL GOVERNMENT

Difference between national and municipal government.—Americans generally admit that their municipal government is the least satisfactory of their various divisions of government. It has been much less recognized in the United States than in Europe that cities are essentially business groupings and that the primary function of city government is the provision of proper living conditions for those who by their gathering together in great numbers have made such conditions proportionately important and also difficult to attain. The cities' political machines have tended to be linked up with the national and state machines; local politics has been colored by the national parties and distorted by national issues. This unfortunate condition has resulted in part from the control which state legislatures exercise to a greater or less extent over city governments, a control which, whether legislative or administrative, has its dangers as well as its justification. The party system of government may well be the best means of securing political democracy for a large territory, but for a small, compact territory, where the

problems are comparatively simple and popular criticism quick to show itself, the best results can surely be obtained by some kind of non-partisan business administration. The commission and city manager forms of government are attempts to provide that kind of administration; they are treated under their own headings. In this article is described the development of the most familiar and accepted forms of municipal government and of the main types of business for which such governments are responsible. This municipal business may be either carried on by private enterprise under public control or operated by the city itself; the gradual spread of municipal ownership is briefly discussed.

Development of the city as a local business unit.—Early American charters.—“The first im-

portant piece of European legislation which recognized that the city, in addition to being an agent of state government, was an organization for the satisfaction of local needs, was the Prussian Cities Act of 1808. This act recognized that each city had a sphere of activity and property apart from the state and gave to the city an organization which has remained in its outlines and characteristic features to the present day [1909]. This organization was so formed as to permit of voluntary action upon the part of the city in the direction of satisfying its own local needs. [See also ADMINISTRATIVE LAW: Prussian; GERMANY: 1807-1808.] The Prussian Act of 1808 was followed in England by the Municipal Corporations Act of 1835, which gave to the English municipal borough a position and organization very similar to those which had been devised in Prussia for the Prussian municipal corporation. France followed the lead given by Prussia and England and, by a series of laws beginning in 1830 and ending in the existing law of 1884, gave to her cities both an organization and powers of local self-government which permit the cities to attend to the distinctly local needs of modern urban life. [See also ADMINISTRATIVE LAW: In France; FRANCE: 1841-1848.] The kingdom of Sardinia, which later developed into the present kingdom of Italy, provided, under the influence of the revolutionary ideas of the year 1848, for her cities, local councils elected by the larger taxpayers. The electorate was enlarged in 1850. The movement toward according to the cities of Italy greater liberty, continued uninterruptedly and, after the union of Italy in 1870, new laws were passed, namely, the present law of 1880 as to the general powers of cities, and a law of 1903 as to the operation by the cities of public utilities, which greatly enlarged the powers of local government possessed by the cities, and recognized that they were not merely agents of the central government, but as well organizations for the satisfaction of local needs. . . . The municipal institutions of the United States were naturally borrowed from those in England as they existed prior to the adoption of the Municipal Corporations Act of 1835. The first important municipal charter was granted to New York, which after several attempts to obtain a charter, received from George II in 1686 what is known as the Dongan charter. [See also NEW YORK: 1686.] During the colonial period as many as seventeen charters of a similar character were granted to various districts, almost all of them outside of New England, where the town system of government gave to the urban districts a satisfactory system of government. These early colonial charters, like the early European charters, were regarded as in the nature of contracts entered into between the people of the cities and the Crown, represented by the colonial government. After the United States secured its independence charters of municipal incorporation were granted by the legislatures of the states and up to about the middle of the nineteenth century were contained in special acts, each of which affected only one city. These charters, both colonial and state, were in large measure based upon the mediæval idea that a special organization of the judicial system in the municipalities was necessary. In fact, the sphere of government recognized by these charters as possessed by the cities, embraced merely the right to exercise judicial powers through the special courts that were established, the right to issue police regulations, and the right to manage the property with which the cities were endowed by the charter, as in the case of New York, or which was ob-

tained in any other way. The cities were not recognized as possessing in the absence of legislative authorization any power to tax their inhabitants and were restricted, so far as income was concerned, to the fines that might be imposed in their courts and to the revenue of their property. They generally, however, possessed the borrowing power and when their debts became so great as to cause anxiety they resorted to various expedients, such as lotteries, in order to pay these debts."—F. J. Goodnow, *Municipal government*, pp. 78-80.

Evolution of types of municipal government in the United States.—Analysis of the various types.—Cabinet form of government.—"The earliest type of city government in the United States was modeled after that which prevailed in the English borough and which still survives with comparatively little change in the English city today. It was simple in form. A single body—the board of mayor, aldermen, and assistants—constituted the government of the city. These exercised judicial and legislative functions primarily. One or two other charter officers were usually provided, such as a clerk and a chamberlain; but such simple administrative functions as were performed were also carried on by or under the direct control of this single body. There was no separation of powers. There was complete group centralization of both power and responsibility. Although the doctrine of the separation of powers exerted a powerful influence in the philosophy of those who drafted our early state constitutions and our national constitution, it is highly probable that in the immediate post-revolutionary period nobody thought of applying this principle of organization to the government of cities. The charters that survived from [the] colonial period were not at once overhauled to give expression to this principle, and I am by no means certain that it was consciously and clearly applied in any American city for more than half a century after the Revolutionary War. . . . It was not until this principle was fairly applied that a new type of municipal organization may be said to have developed in the United States. It is true that as this or that city increased in population the judicial powers of the mayor and aldermen were gradually sloughed off; but this was due not so much to the application of the idea of a division of powers as to the necessity for a division of labor—a necessity arising out of the increase of city functions. It is true, also, that certain features of our state and national governments were early introduced into city governments; but I think it can scarcely be said that the introduction of these features changed in any fundamental respect the colonial type of organization, the essence of which was the concentration of policy-determining and policy-executing functions in a single group of officers. . . . The introduction of the two-chambered council was a disastrous step in the direction of cumbersomeness of organization; but it did not in point of fact affect the fundamental principle of councilmanic domination and control. Individual responsibility became more difficult to locate; but group responsibility and concentration of authority remained. . . . It is probably true that in most of our older cities the break from the type of government under which the council enjoyed almost complete control to a type embodying an administrative organization independent of the council was made not by the introduction of the plan of mayoralty nomination and aldermanic ratification but by the application of the principle of popular election to the heads of administrative departments."—H. L. McBain, *Evolution of types of city government in*

the United States (*National Municipal Review*, Jan., 1917, pp. 19-21, 23).—See also BICAMERAL SYSTEM.—“During the first forty years after the establishment of the American Republic, the net results, according to Fairlie, were: (1) The abolition of the close corporations and the definitive establishment of the rule that each American municipality should have a locally elected council; (2) the unmistakable legal supremacy of the state legislatures over the municipal charters and the powers of the municipalities; (3) the introduction—as yet in a very few places—of the bicameral council system and the veto power of the mayor.’ From 1820 to 1850 the development consisted (1) in the change in the manner of electing mayors, from election by the councils to election by popular vote; and (2) in the limited extension of the bicameral system of council organization. It should also be noted that by the close of this period the property qualifications for the municipal suffrage had in most cases disappeared, and the general tendency of state legislation to enter into great detail in all statutes still further tended to remove all discretionary powers from the local officials, and leave them simply administrative duties to perform. This detailed statutory regulation was, perhaps, to be expected in regard to matters of general state administration, such as poor relief, education, and taxation, which were now often under the control of the municipal authorities. Established in this sphere, it was easy to follow the same rule in legislation for purely local matters in the cities, and especially in the statutes passed without the approval of the municipal authorities in order to insure that the latter would not evade the statutes; while in the case of cities controlled by another political party than that which controlled the state legislature there was a further motive for the most strict and detailed provisions in all the legislation for such cities. It is not said that these results had worked themselves out on any large scale before the middle of the century. It is after, rather than before, the year 1850 that much special legislation came to be enacted without regard to the local authorities, and hence to be considered as an interference with the local government. But even before 1850 something of this sort had been done, and the steps in the process are worth noting in the general development of municipal government.’ During the next thirty years, 1850-1880, the main points to be noted are: (1) The extension of municipal functions in kind and degree; (2) the constant growth of special and partisan legislation for cities, and the first ineffective measures to prevent such legislation; (3) the steady decline of the council; (4) the tendency for the government to disintegrate into independent departments, with no unity or harmony of purpose and action; (5) the development of the mayor’s authority, through the limited powers of appointment and removal and veto power. From 1880 to 1900 there was a continual growth of urban population and municipal activity.”—C. R. Woodruff, *New municipal program*, pp. 252-254.—“It is only in recent years that we have given definite names to types of city government. For lack of a more satisfactory nomenclature for the older types, . . . I should like to [name them and] call the government in which the administrative branch is constituted by mayoralty nominations and councilmanic confirmations the mayor-and-council hybrid. . . . It embodies neither the principle of an independent executive department nor of one responsible to the council. It may be that the system as found in our national and state governments is nothing more than an excep-

tion to the rule of the separation of legislative and executive powers. It is certain, however, that as applied in most cities the exception was at once more obvious and more important than the rule. . . . In spite of the fact that this type of government survives in a number of cities to-day, and in spite of the fact that in exceptional instances it has been measurably successful . . . it is indefensible in theory and unsupported by an overwhelming weight of experience. I should like to call the government in which numerous heads of administrative departments are made subject to popular election the independent-decentralized-executive type. Wholly apart from the viewpoint of the voter with his absurdly long ballot, this type produced in operation many unhappy results. Harmonious co-operation in the work of the city was effected, if at all, only through the agency of political parties. The resulting alternative was either distressing lack of co-operation or government by the city boss. It was clearly founded upon the understandable principle of the separation of policy-determining and policy-executing functions; but that principle is as bad as no principle if there is neither individual nor group responsibility which the electorate can locate. Another type of government was introduced in a number of American cities with the advent of the board plan of departmental control. Where the members of these boards were elected by the voters of the city or, as in some cases, appointed by the governor or the legislature of the state, a strong tendency developed to vest in these boards independent or quasi-independent financial powers and a portion of the legislative power of the city. This wholly new kind of organization may doubtless be called the independent-board type of government. Both the council and the mayor were stripped of all but their names, or were left at best with a pitiful remnant of power. The city was in fact governed by a number of commissions each independent of the other. A more extravagant and unworkable type of government could scarcely have been devised. There are numerous instances in which these popularly elected or state-appointed administrative boards survive in American cities with independent or quasi-independent powers over against the city government proper. I believe, however, that there is no city at the present time [1916] whose government as a whole may be said to be of this type. . . . In spite of the perseverance of our inherited love for checks and balances we have come at last to realize that the dangers resulting from an abuse of large political authority are perhaps after all not so great as the dangers of misgovernment that result from the diffusion of authority and a consequent concealment of responsibility. . . . Mr. Tweed introduced into the New York charter of 1870 the principle of an elected mayor endowed with power to appoint the heads of the ten administrative departments independent of any confirmation by the board of aldermen. This inaugurated a new type of city government in the United States—the independent-centralized-executive type. It was founded upon the principle of the separation of powers, but it was unique in that the administrative branch of the government was organized under the complete control of a single elected chief executive. I do not believe that this feature of the Tweed charter was to any considerable degree responsible for the scandalous corruption that followed almost immediately. However that may be, the charter was short-lived. In 1873 it was replaced by a charter in which the confirmatory power of the board of aldermen was restored. In 1880, however, this type of government was reintroduced in the city of Brooklyn. It

proved almost immediately successful and four years later it was again adopted for New York. It has had and still has great vogue among the cities of New York state. It was introduced into Quincy, Massachusetts, in 1888, in Louisville in 1893, in New Haven and Meriden in 1897, in St. Paul, Duluth, and San Francisco in 1900, in Portland, Oregon, in 1903, in Denver in 1904, in all the cities of Indiana in 1905, in Kansas City, Missouri, in 1908, in St. Joseph, Missouri, in Boston, and in all the cities of Ohio in 1909. The Tweed charter was responsible for the germ of another innovation which may perhaps be regarded as creating a distinctly new type of municipal organization. This was a board of estimate and apportionment. The essence of such a board is that the lion's share of the appropriating power of the city is vested in a group of administrative officials. Such boards are now found in New York city, in Rochester, in all the six second class cities and a few of the third class cities of New York, and in Baltimore. In every instance they are constituted in major part of the mayor and a small number of important administrative officials. In consideration of the fact that whenever a board of estimate is found it invariably forms the most important feature of the government of the city, it may be that the few cities having such boards should be regarded as representative of a distinct type of organization. I say this in spite of the fact that such a board may, of course, be combined with more than one of the several types of government that I have referred to. In point of fact it has been introduced only in cities in which executive responsibility has been centered largely if not entirely in an elected mayor. . . . In the entire evolution of municipal government in the United States there has been nothing so unprecedented as the rapid development within the last decade or so of our two most recent and somewhat related types of government, the so-called commission and city-manager types. [See COMMISSION GOVERNMENT IN AMERICAN CITIES; CITY MANAGER PLAN.] . . . It may be that neither the commission form nor the city-manager type of government is the last word in municipal organization in the United States. To my mind they are of less interest as types than as an expression of a manifest and compelling need, on the one hand, and the proof of a change of public mental attitude on the other. They express the need for simplicity in municipal organization. Democracy cannot function properly through a complicated organization which it cannot visualize and cannot comprehend. Pinning our faith to the catholicon of reorganization, we early began to emerge from simplicity in municipal organization. For more than half a century we reaped the reward that might have been expected from the complications we introduced. We are now in the era of a return to simplicity. It is a sign that is full of hope, whatever may be the specific type of government in which the movement finds expression. . . . I am inclined to believe that had the commission or the city-manager type of government been established a generation or so ago it would have been a dismal failure. In an atmosphere of public indifference, of inactivity, of lack of heart or of interest, it would have lent itself admirably to the machinations of the professional politicians and spoilsmen. We should hesitate to give to the genius of a designer credit that is in fact due to a new motive force—in this case to an awakened, vitalized, and actively operating public opinion."—H. L. McBain, *Evolution of types of city government in the United States* (*National Municipal Review*, Jan., 1917).—"If

concentration of administrative responsibility upon five commissioners works well, further concentration upon the mayor alone will make it possible to hold just one man responsible for the ills of government. From this argument the cabinet form of government was developed. Upon the mayor alone was centered all responsibility, all authority, and all power. The organization of the national government was taken as the pattern for the cabinet form. One great departure from previous forms was made: the legislative body was separated entirely from the administrative; to the council were delegated legislative functions solely. Upon the mayor as the chief executive and his cabinet were vested all administrative functions. Sound in the theory and sound in practice was this separation of legislative and administrative bodies. Under the town-meeting system all legislative functions were performed by all the people assembled in town meeting, and administrative functions were vested in the selectmen. From the beginning of a representative form of government, however, legislative and administrative functions had been combined in the aldermanic council or in the commission. Some separation was made under the board system, but a connection was still there. Not until the cabinet form was tried was the separation once more effective. That this was good practice is manifest. In legislative matters it is advisable that the unit of representation shall be small and the representative body large. By this means, legislative matters are kept more closely in the hands of all the people governed or legislated for. In administrative affairs it is equally imperative that responsibility shall be centralized. By this means the people will always be able to place their finger upon the man responsible for dishonest or inefficient service. Under the cabinet form, therefore, the council, elected by wards or at large according to the tastes of the individual cities, performed only legislative functions; it had nothing to do relative to administrative affairs. The mayor was usually the presiding officer of the council and was generally given the veto power, which formed the only connecting link between the two departments. The council, too, was vested with sole power to make appropriations. By this means it was able to preserve a check upon administrative affairs although having no opportunity for direct interference with details. The law-making body was kept still further in close contact with the people through the initiative and referendum. These supplementary principles gave the nearest approach to the principles of the pure democracy possible under any representative system of government. The organization of the administrative branch of the government varied in different cities. Fundamentally the cabinet form was the same in all cities. In the elected mayor was vested all administrative responsibility and authority. He appointed his own heads of departments and was held responsible for their acts. In some cities, confirmation of these appointments by the council was necessary. It was found better practice, however, to give the mayor a free hand and then hold him to strict account for the acts of his appointees. Departments were organized along the same lines as in the commission form of government. Instead of electing the heads of these departments, however, the mayor only was elected and he, in turn, appointed his administrative heads. Cabinet meetings were usually held daily. At these meetings the mayor, surrounded by his department heads, discussed and fixed matters of general policy, the execution of the details being left to the heads of the respective departments. At these cabinet meetings, too, complaints, petitions, and other com-

munications from the people and from the employees were heard. All meetings were open to the public. Failure on the part of any administrative head to comply with decisions of the cabinet, to carry out effectually and efficiently the functions imposed upon him, was chargeable by the people directly against the mayor. He, therefore, saw to it that only competent and honest men were appointed to these administrative positions. Among the variations of the plan to be found was that some cities gave to the mayor and his cabinet legislative functions. This centered legislative as well as administrative powers in one man. It was neither good theory nor good practice. Tremendous power as well as tremendous responsibility was placed upon the mayor under the cabinet form. He has control directly, or through his appointed cabinet, over all expenditures, salaries, and employees. This was the great objection to the plan. In no small degree it made a dictator of the mayor. It might enable him to perpetuate himself in office, and to plunder the city if he were disposed to dishonesty. Two principles were necessary as safeguards to the cabinet form of government. One, the greatest, was the recall. By means of this, the mayor could be forced from his position either because of dishonesty on his own part or because of dishonesty or inefficiency on the part of the members of his cabinet. The people had a string upon one man only, and that man was the mayor. But as the mayor was responsible for every act of every employee and official in the administration of the city, he was the man who was recalled when any portion of the business of government went wrong. The other safeguarding principle was civil service. The great fear of the opponents of the cabinet form of government was that the mayor, being in absolute control, might perpetuate himself in office through the building up of a great political machine. It was the charge, too, that the business of government might be made to suffer severely every time a new mayor was elected if he were permitted to discharge the small army of employees his predecessor had maintained. Civil service was, therefore, applied to practically all municipal employees subordinate to cabinet members. By this means, in theory at least, the mayor was not given the opportunity to secure such a grip upon the city as to render himself immune from the operation of the recall or defeat for reelection."—F. Short ballot and public spirit in British cities.
—"The city governments of England and Scotland

are the admiration of the world. They are intelligent, progressive, and economical. Ward politicians and reformers are both conspicuous by their absence. Yet to a political grafter of our country the opportunities would seem ideal. The British municipality is run by the council, acting through committees. There is considerable antiquated and outgrown red-tape, and the property interests in the House of Lords often interfere unreasonably with city progress. In some cities the municipal operation of public utilities—gas works, street cars, etc.—is so extended that one tenth of the laboring population is on the city pay-rolls, with none of the civil-service-examination restrictions that we should think vital in such a situation, to check 'patronage.' The development of wholesale organized corruption would seem to be inevitable in such an environment. Its absence is not to be explained by any superior civic spirit in the British public, for before the cities were organized under the present act relating to municipal corporations, corruption in their governments was widespread and quite equal in flagrancy to anything we have ever had in the United States. The explanation is seen when you ride down to business on the tramway on a morning following a meeting of the city council. The doings of the council are spread out in detail in the morning paper, the editorials review the proceedings, the people are chatting on the subject, each citizen knows what the councilmen from his ward did, and criticism is pointed and severe. Everybody in town seems dissatisfied and the councilmen will know it. This is a phenomenon that also reveals itself in Des Moines and other cities in [the United States] . . . under the commission plan, and it sometimes gives to a casual observer the impression that the plan of government is anything but satisfactory to the people. But this criticism, on closer study, is found to be over matters an American would usually regard as trifles—matters which he never debates because so many larger affairs usually need fixing first. They are matters which in typical American towns are never looked into by the people at all. I have seen a city council in England bitterly denounced in an editorial because it had made an architect stick unreasonably close to specifications! The existence of this ready and bitter criticism is not a sign of disease, but a sign of health. The council dares not differ with public opinion. The lash is always busy. The members must explain themselves at every turn. The people not only have the right to oversee the work of their representatives, but they actually are on deck overseeing it. A British council would face a hurricane of public wrath if it did some things which an American city council could do with impunity. That difference is sufficient to account for the relative superiority of the British municipality. How was it brought about? By some great stirring up of the conscience of the people? Are the British citizens, by reason of being conscious taxpayers or for some other cause, more alert on civic matters than our people are? No. . . . The British water-mill works so nicely, not because the stream is stronger, but because the mill turns more easily, its gears being properly adjusted to the energy available. The mechanism by which the British voter controls his city government is a hallot about the size of a post-card. It elects the member of council from his ward. There are two names, or three, on it; the voter selects one. To make up his mind on that simple choice is the whole work of the voter in the campaign and on election day. The chance of his selecting the candidate who really best represents his wishes is excellent—certainly much better than

that of an American voter who is trying to make wise selections for thirty officers at one time. The British council chooses the aldermen (who sit in the council), the mayor, whose duties are mostly ornamental, and all other city officers. The councilmen simply dictate policies for paid superintendents to carry out. They do not themselves receive salaries and they give only their spare time to the city. The service does not mean the abandonment of private careers. The wards are small, and candidates can easily get in personal touch with every voter. The office is a visible and debatable office, since it has 'a large part in determining interesting policies,' and this fact leads to fierce campaign discussions. No candidate could hope for success if he did not permit questions to be publicly addressed to him at the conclusion of his speeches, and this 'heckling' does much to provide a basis for clear opinions among the voters. The phenomenon of political peace when things are going right is also noticeable here, for about one third of the time there is 'no contest,' which means either that at the expiration of his term no one cares to try to prevent the incumbent from remaining in office for another three years, or that only one candidate has asked to have his name printed on the official ballot. Councilmen who do well for one or more terms and are ready to serve again, are so sure to be re-elected that it is useless for new candidates to come forward. Often council members serve for decades. This is good government, and it results from having a form of government which the people readily control. The British city is a democracy. The Two Limitations are respected:—

1. The office is visible. 2. The district is wieldy."—R. S. Childs, *Short-ballot principles*, pp. 91-96.—See also CAUCUS: England: Development of the caucus; BIRMINGHAM, ENGLAND: 1835-1838.

State control over cities.—Legislative versus administrative control.—France, Prussia and England.—Tendency toward administrative control in the United States.—"The fact that the city is discharging many functions which have been assigned to it as an agent of the state government makes it necessary that the state shall exercise some sort of a control over it. The further fact that matters which are at one time regarded as of municipal interest become, with the course of social development, of interest to the state as a whole makes it necessary that the state should always have the power of extending its control over matters which may at one time be regarded as distinctly municipal functions. Finally, the state should have a control over the financial administration of cities so far as the carrying on of that administration necessitates the exercise of the taxing and the borrowing powers. For these reasons there must be provided in the governmental system a state control over the actions of municipalities. But while from the constitutional point of view the control which the state may exercise over municipalities should be a very broad one, from the point of view of legislative policy this control should not be exercised except when necessary. Our study of the history of municipal development shows us that the too extensive exercise of the control of the state over the municipality prevents the development in the municipality of that local life whose existence is so requisite to the proper occupation of that great field of activity opened to the modern municipality by the social development of the nineteenth century. There is a great danger that the municipality may be hampered by the state in the exercise of powers which are neces-

sary to municipal development. There is also great danger that the interests of the municipality will be disregarded by the state, that the municipality will be sacrificed to the state. . . . Two methods have been adopted to keep the necessary control of the state over the municipality within its proper limits: one has consisted in the attempt to assign a sphere of activity to the city within which the organs of the state government may not legally enter and in which the municipalities may act free from state control. This is the course which has been pursued in most of the states of the United States. It consists, in the first place, in forbidding the legislatures of the state governments, and indeed all the authorities of the state governments, to interfere in any way with certain matters specified in the state constitutions and entrusted to the municipalities. It cannot, however, be claimed that this method of regulating the relations of city and state has been successful. The attempts of the people to limit the powers of the legislature over the cities have been largely frustrated by the courts, which have decided both that the sphere of municipal activity protected by the constitution is a very narrow one, and that special legislation is, notwithstanding the constitution, permissible under the device of classification [as when an act is passed to apply to any cities belonging to a certain population class which may actually include only one city]. . . . It would therefore seem as if any method of limiting the control of the state over the city, which is based upon a constitutional denial of the power of the state government to interfere in municipal matters, were foredoomed to failure. It would seem that in order to solve this problem of state control over municipalities the attempt should be made so to organize the control that the state authorities would not be tempted to exercise it improperly, while the existence of their power should not be denied. It has been shown that the main cause of the improper extension of the control of the state over the cities in the United States is to be found in the very narrow powers which the city possesses and that, if we may judge from both European and American experience, such improper extension of the legislative control over cities may be discouraged by the grant of general powers of government to the cities. The mere grant to cities of general powers of government does not, however, make any provision for the control which it has been shown that the state must exercise over municipalities. Indeed, the recognition of general powers in the municipalities would be extremely dangerous to the welfare of the state as a whole if some means were not devised of assuring to the state a control over the actions of the cities. This control is on the continent and to a less degree in England an administrative control, which is the second method of providing for the necessary state control. [See also STATE GOVERNMENT: 1890-1921.] . . . While in England and the United States the centralization of government which has been secured is a legislative centralization, on the continent the centralization has been administrative rather than legislative. The great influence of feudal ideas on the continent prevented the development of the idea of the unity of the state, and no general representative legislative authority was established in early times. There were formed in both France and Germany local legislative bodies whose powers varied considerably at different times. The only unity in the state government was to be found in the administration with the Crown at its head. The purpose of the absolute

monarchy everywhere was to realize the idea of national unity. The absolute monarchy on the continent did, it is true, endeavor with varying degrees of success to extend its centralization to matters of legislation as well as of administration, but the chief success of the Crown in its attempts at centralization was in the domain of administration. By the time of the French Revolution its success was almost complete. In France, . . . the Crown had succeeded in forcing its general scheme of municipal administration on all cities in the Kingdom and had, as a result of the general ordinances in which this scheme was to be found, secured a very large control over the administration of municipal affairs, appointing most of the important officers. The influence of the French Revolution was in the same direction. It secured unity to France and the great law of 1800 made the city but a part of the central administration, giving the central government the appointment of all city officers and subjecting their action to a most strict central administrative control. After the unity of the state had been secured, however, and the supremacy of the central legislative power had been acknowledged the administration began to be decentralized. This decentralization did not, however, result in the denial of the right of the central administration to control the government of the cities where the interests of the state as a whole were affected. It merely provided that, where privileges of local government could be granted with due regard to the interests of the state, this should be done. The same is true of Prussia. The centralization of municipal administration had the same result as in France, that is, the practical absorption of all municipal administration into central state administration. In Prussia further as in France, and largely due to the same causes, a central representative legislature played a very unimportant rôle. Indeed, it did not appear in Prussian history until about 1848. The administration with the Crown at its head attended to legislative as well as to administrative matters. Since 1808, the date of the passage of the Great Cities' Act, the administration, as in France, has been much decentralized. Particularly is this the case within the last fifty years [written in 1909]. But, as in France, notwithstanding the grant of large privileges of local government to the cities, the central administration has large powers of control over their actions in so far as these affect the interests of the state as a whole. The unimportance, indeed the absence for so long a time of any central legislative authority, had of course an important influence on the position which the administration occupied in the post-revolutionary system of governmental polity. Whereas, in England, owing to the early recognition of the supremacy of Parliament, the central legislative body, administrative officers owed allegiance to that body and official duties were minutely prescribed in its mandates, on the continent, on account of the absence of any central legislature, administrative officers owed allegiance to some administrative superior whose instructions delimited their competence and prescribed their duties. When the central state legislature was finally established on the continent it naturally occupied a position very different from that of the English Parliament and the American state legislature. The fact that the detailed duties of subordinate administrative officers had from time immemorial been prescribed by royal ordinances and ministerial circulars of instructions made it perfectly natural for the legislature, so far as it interfered with the administration at all, to confine its interference merely

to the laying down of general principles which were to be elaborated in detail by ordinance and instruction and to permit the administration to continue to exercise in the future as it had exercised in the past a control over the governmental affairs of the local communities. This control hereafter differed from what it had been in the past only in that it was no longer entirely arbitrary but was to be exercised within the general limits fixed by legislation and was in some cases subject to judicial revision. But the predominant position of the administrative organization and its recognized efficiency made it not only unnecessary but also inexpedient and unnatural for the legislature to assume the same special control over administrative matters which it had been the recognized policy of the English Parliament to exercise. To these reasons is due the fact that on the continent the central administrative control exercised over municipalities, which is the remnant now left of the idea that all administration is state administration, is merely a part of the general administrative centralization, and is exercised by the ordinary central administrative authorities, either the executive departments at the capital of the state or the general representatives which the central administration has always had and now has in the localities and which are an essential part of a centralized administrative system. In England a centralized administrative control similar in many respects to that existing at the time on the continent was developed during the nineteenth century. It could not, however, be organized in the same way in which the continental system was organized. The original local self-government system of England could not adapt itself to the changed conditions necessitated by the existence of a central administrative control, without being completely remodeled. The central administration had no representatives in the provinces, but matters of general interest were attended to there by local officers, that is, the justices of the peace. Therefore the new legislation of Parliament, beginning with the Poor Law Amendment Act of 1834, super-imposed upon the original local self-government system a new system of administration with what is now the Local Government Board at London at its head, to which have been given large powers of control over the local authorities established since 1834. When the matter of education became one in which the local communities interested themselves, a similar control over the exercise of their school powers was vested in the Privy Council. . . . The failure of legislative control in the United States has caused recourse in a number of instances to administrative control. Thus in the state of New York the administration of the civil service law by cities is subjected to the control of a state civil service commission which has the power to disapprove the rules of the municipal commissions. In a number of states, such as Ohio, the finances of the cities have been subjected to a similar state control. In a large number of states the management by cities of schools and charitable and correctional institutions and of the public health must be conducted in accordance with rules laid down by state administrative authorities, such as state school boards and boards of charities and health and state superintendents of schools, who also have rights of inspection and supervision of the actions of city officers. When we consider this movement in the direction of administrative centralization together with the constitutional limitations of legislative power which have been described, we can hardly fail to reach the conclusion

that the state control over local corporations in the United States is being changed from a legislative into an administrative control."—F. J. Goodnow, *Municipal government*, pp. 114-119, 126-127.—See also ADMINISTRATIVE LAW.

Home rule for cities in the United States.—Beginning with the third quarter of the nineteenth century, there were introduced significant changes in the local government of American cities. "The creation of new cities, which up to 1850 had . . . been accompanied by special legislative acts of incorporation for each city, now became the subject of constitutional provision requiring the legislature to proceed by general law for the incorporation of cities and forbidding special legislations. . . . By the middle of the nineteenth century the disposition to insert in the state constitution, clauses to check the legislature interference with the municipal government were so decided that whenever a revision was made in a constitution, some such provision was added. . . . [Before 1875 there were three different styles of Charter systems: special charter system, general charter system, and classified charter system. Then came the home-rule charter system.] It was the continuance of legislative interference with cities . . . that resulted in the . . . home-rule charter system. . . . [This] movement began in Missouri in 1875, when the constitution of that year gave to cities of over 100,000 population . . . the right to frame and adopt their own charter. . . . The idea made but slow progress in other states, California, Washington, and Minnesota having the principle in the next thirty years, but since 1900 [written in 1921] nine other states have adopted the home-rule charter system, Colorado, Oregon, Oklahoma, Michigan, Arizona, Ohio, Nebraska, Texas and Maryland. . . . The size of the cities to which the privilege of framing their own charters is extended varies in different states. . . . The freedom accorded to cities to initiate their own plan of city organization has resulted in a tremendous stimulation of interest in these matters, and has been largely responsible for the extensive adoption of the newer forms of city government in this country."—H. G. James, *Local government in the United States*, pp. 111, 309, 310.

City finance.—**Evolution of income sources.**—**Taxation.**—**Expenditures.**—**Financial officers.**—"The receipts of cities for a considerable period in their history, since they were reduced to the position of subordinate members of a greater state, consisted exclusively of private corporate rather than public governmental receipts. The history of most cities in Europe had brought it about that they became owners of considerable amounts of revenue-bearing property. From lucrative rights, from the receipts from this property, and from loans, the expenses of the city government were for the most part defrayed. Cities in England and the United States, further, were not before the nineteenth century regarded as sufficiently governmental organizations to be entrusted with the right of taxation. It was the rule of the English law thus that the mere incorporation of a borough did not confer upon it any power of taxation. The extension of the sphere of municipal activity which was characteristic of the nineteenth century, made it, however, impossible for cities to defray the expenses of their administration out of the income of their property, and recourse was had to the taxing power which was very commonly conferred upon them by the legislature of the state in which they were situated. It is very questionable whether such a complete reversal of the policy of the centuries preceding the nineteenth

century was either necessary or wise. For there was, as it turned out, in the streets of cities a new kind of property whose income, if recognized as being at the disposal of the city, would have been sufficient, particularly in the large cities, to pay a large part if not all of the really local expenses of the city government. In the United States, however, the courts very generally refused to recognize the cities as possessing any property rights in the streets, and the legislatures of the states very commonly wasted this property by improvident grants of it, sometimes in perpetuity, to private persons and companies. These grants were in many instances unaccompanied by conditions by the enforcement of which cities could either derive pecuniary profit for themselves as corporations or indirect advantage for their inhabitants through improvement in service. Prior to the commencement of the nineteenth century the municipal authorities had wasted the city patrimony in England and Europe generally. During that century what might have been a new city patrimony of immense value was wasted by the legislatures of many of the states of the United States. Within recent years, however, a more intelligent view has come to be taken of the rights of the cities and at the present time [1909] an earnest attempt is being made throughout the United States to secure for the city a portion, at any rate, of the profit which is derivable from street and other municipal franchises. One reason why this mistaken policy was adopted in the United States is to be found in the belief which has so generally been held in this country as to the functions of government. Whatever may have been the original ideas held on this subject, the experience of most of our states, which at the beginning of the nineteenth century entered into commercial undertakings, particularly those connected with transportation such as canals and railways, was from the pecuniary point of view so unfortunate that it became the fixed belief of the great majority of the people of the United States that political corporations were inherently unable to conduct enterprises whose purpose was pecuniary profit. This belief has had two effects on the finances of American cities: one was that the city government should undertake only those functions whose discharge would not be undertaken by private companies; the second was that if by any chance the city should have entered upon an undertaking which could be made profitable the charges for services should be reduced so as to cover little if any more than the cost of the service. The advantage to be derived from any city undertaking was to be found not in the pecuniary profit from the undertaking, but in the improvement of the welfare of the inhabitants. As a result of these conditions the receipts derived by American cities from commercial undertakings and property generally, form a very small portion of their total receipts. It is from the public governmental receipts, such as taxes, special assessments for local improvements, and loans to be eventually paid from the receipts of taxation, that by far the major part of the revenue of the American city comes. Only 2% of all revenues of cities of 4,000 inhabitants comes from public utilities. What has been said of American cities is also in large part true of foreign cities, though in Great Britain and Germany some of the cities derive quite a percentage of their revenue from sources other than taxes. Thus Berlin gets 30% of its total ordinary revenue from such sources, the cities of England and Wales, one-sixth, Paris, 22%. . . . The organization provided by the average American, and

indeed European, city for the collection of its receipts has to do, for the reasons stated, mainly with matters of taxation, including in that term 'special assessments.' It is of course true that where it has revenue from property this is collected not by the tax officers, but rather by special boards or authorities having charge of particular classes of property such as a water-works board or commission. In some cases the revenue of city property, such as markets, is collected by the chief financial officer of the city. In a few cities where the revenue of city property has been pledged to the payment of city debts the care of city property may be placed in the hands of a debt or sinking fund commission. This is the case in the City of New York. But apart from these comparatively unimportant matters, the collection of city revenue is in the hands of the taxing officers of the city. . . .

"There are two general systems adopted by the various cities of the United States for organizing the authorities entrusted with the determining of the city appropriations. The first system vests almost all the powers relative to fixing the amount of money to be spent, so far as that is a matter of local determination, in the city council; the second provides a board of administrative officers which has at least coördinate powers with the city council. The first system is the one more generally adopted; the latter system has been established in the City of New York, in a number of the larger cities of the State of New York, all the cities of the State of New Jersey, and in a number of cities scattered all over the country. In some of the cities adopting this second system the board of finances or estimate, as it is often called, has larger powers relative to the amounts of money which may be spent than the council. Thus a greater than ordinary majority vote of the council is necessary to amend the estimates made by the board of finances, or the council is permitted merely to reduce but not increase the estimates made by that body. It is believed by many that it is very desirable to forbid the council to increase the appropriations proposed by the administrative authorities of the city government, and that in this way alone will economical city government be secured. Where a board of estimates or finance is provided, it usually consists of the mayor, the chief financial officer of the city, the president of the council where there is one, the corporation counsel, and other officers who are generally not connected with departments spending large sums of money. In the City of New York it consists, in addition to the mayor, comptroller and president of the board of aldermen, of the presidents of the five boroughs of which the city is composed. These last officers are really at the head of the borough departments of public works (streets and sewers) and naturally, therefore, spend a great deal of money. Where there is no board of estimate the estimates of each department usually are delivered to the head of the finance department who ordinarily revises them before they are submitted to the council. The council usually considers these estimates in committee. The council further is usually authorized to make such changes in the estimates as it sees fit. . . . Ordinarily the budget of an American city does not include the extraordinary expenditures defrayed from the proceeds of loans or special assessments. The same authorities, which make up the budget of current expenses defrayed from the revenue of city property and taxes, usually have charge also of the extraordinary expenditures. There is not, however,

usually any attempt made to estimate beforehand what extraordinary expenditures shall be made each year but each matter requiring such expenditure is attended to as it arises. In the City of New York, however, the charter specifically provides that the board of estimate and apportionment may, without the approval of the city council, expend each year from the issue of bonds, certain specified amounts for the extension of the city streets and school houses, for acquiring new docks, and for increasing the plant of its water works. Expenditures, both ordinary and extraordinary, are not in the average American city altogether a matter of local determination. This is particularly true of the expenditures relative to matters which are regarded as of state interest. Thus, the city is often compelled by law to enter into undertakings which in the opinion of the legislature are of advantage to it, the salaries of its officers are often fixed with considerable detail, particularly the salaries of teachers. In New York City as in Prussia the minimum salaries of teachers are fixed by the state law and in the case of New York the city must devote a certain proportion of the tax levy to the payment of such salaries. These compulsory expenditures form, sometimes, such a large proportion of the total expenditures of the city as to take away much of the importance of the formal budget making authorities. Thus, in New York City it is said that more than half of the expenditures for salaries and wages are fixed by state law. These compulsory expenditures are enforced by the courts on the application of parties interested. In England naturally the whole matter of city expenditures is in the hands of the council. Certain expenses are, however, obligatory. Ordinarily as in the United States the provision for such expenses may be enforced by the courts at the instance of persons interested. This judicial control is supplemented by an imperfect administrative control exercised by the Local Government Board in all matters but schools, where the Board of Education is to act. The estimates often go to a Finance Committee which puts them into the form in which they are submitted to the council. But the council where it has adopted no standing order to the contrary may increase as well as reduce them. In both France and Germany the determination of expenses is made by the council on the proposition of the executive. In France proposals made by the mayor to spend money may be changed by the council by either additions or reductions. In Germany the council may reject the proposals of the executive, when appeal goes to the administrative courts. Provision for obligatory expenses may be enforced on the continent of Europe by the superior administrative authority to which the budget of receipts and expenses must be presented before it has any legal effect. This may be changed so as to make it conform to the law. . . . In the smaller cities of the United States these two functions [of determining the correctness of the claims for payment and of making the actual payments] are quite commonly discharged by the same authority, in the larger they are discharged by separate authorities. Further, in a number of cities, of which New York is an example, the function of determining the correctness of claims against the city is made a part of the duties of the chief financial officer of the city. Where we find the greatest differentiation in the functions of municipal financial administration, we find three separate and distinct officers, namely, a treasurer, or chamberlain, who receives, cares for and pays out city funds,

a comptroller, who is the chief financial officer of the city, and an auditor, who examines into the character of claims against the city. As a general thing the city treasurer is elected by the people in the United States. In New York City he is called the chamberlain and is appointed by the mayor. In other cases he is appointed by the council. The comptroller, where that office is completely distinguished from the others, is almost invariably elected by the people or appointed by the council. The same is true of the auditor. It is thus generally true that the financial administration of most American cities has not been brought under the control of the mayor even in those cities in which the mayor has large powers of control over every branch of city administration. In England payments are regularly made by the borough treasurer, appointed by the council, on orders signed by three members of the council and countersigned by the town clerk. The Municipal Corporations Act provides that an order so made which is not authorized by act of parliament may be removed by writ of *certiorari* on the application of a rate-payer to the Court of King's Bench, which on motion and hearing may disallow or confirm such order. In France the mayor is the only authority in the city government who can authorize the payment of city monies. He is responsible for his action to the city council, which at the budget session examines his account for the past year with the idea of ascertaining if his orders of payment correspond with the appropriations made. The mayor's accounts must also be submitted to the prefect for approval. The orders or warrants of payment issued by the mayor must be honored by the city treasurer, who is appointed by the prefect or president of the republic from a list containing the names of three persons presented by the city council. The German system of providing for expenditures is much like the French except that the officer having charge of city funds is appointed by the municipality. As in France, warrants issued by the competent authority, generally the burgomaster, must be honored by the officer who has possession of the funds, usually a chamberlain or receiver, who is appointed by the city authorities."—F. J. Goodnow, *Municipal government*, pp. 361-374.

Police defined.—Administrative police.—Origin of police systems.—Board control.—Police and public health.—Organization of policemen.—British and Continental police compared.—"The English word 'police' as a term to signify an organized body of constabulary is of comparatively modern origin. When Sir William Blackstone published his celebrated Commentaries in 1765, he gave it a much broader meaning. 'The public police and economy,' he said, 'must be considered as the due regulation and domestic order of the kingdom, whereby the individuals of the state, like members of a well-governed family, are bound to conform to the rules of propriety, good neighborhood, and good manners'—a definition wide enough to include the entire domestic policy of a nation. Not until the Parliament act of 1787, which provided for a constabulary sys-

tem in Ireland, did the word come to be used officially in its modern and somewhat limited sense. To-day we mean by police the primary constitutional force for the protection of individuals in their legal rights, or—to use M. Louis Lepin's definition—"an organized body of officers whose primary duties are the preservation of order, the security of the person and the safety of property."—R. B. Fosdick, *European police systems*, p. 3.—"Administrative police is that part of the police function which has to do with the arrest of offenders against the criminal and police laws and ordinances. The systematic organization of professional, disciplined police forces has only very recently been undertaken. From a very early time the attempt was made to provide officers for the preservation of the peace, like the English Parish constables. . . . There was nothing, however, very systematic about the way in which the government attempted the work, and the attempts which it made were not attended with great success. Besides forming systems similar to that which was based on the parish constable, the governments of the centuries preceding the nineteenth century placed a considerable reliance upon the army for the preservation of order, particularly where that might be disturbed as the result of political offenses. . . . The first attempt to form a modern city police force was made by England, in 1829, by the act passed to improve the police in and near the metropolis of London. The metropolis of London as distinguished from the city of London had grown up naturally about the city through the settlement of persons in what had been rural parishes. As the population of these parishes had increased and it was seen that unmodified rural parish organization was inapplicable to the new conditions, special Acts of Parliament were passed, giving particular parishes a special organization. But, so far as the preservation of the peace and the maintenance of public order were concerned, reliance was placed on the parish constable and the night watchman, who had jurisdiction only in the parish in which they had been appointed. Dr. Colquhoun, a city police magistrate, drew attention, in the latter part of the eighteenth century, to the bad conditions produced by such a system, in a book entitled 'The Police,' which in a short time went through several editions. Various parliamentary committees were appointed to examine into the subject in the early part of the nineteenth century. In 1828 a commission was appointed on the suggestion of Sir Robert Peel, who was then Home Secretary, and in 1829 an act was passed which took out of the hands of the parishes surrounding the city the charge of the preservation of the peace, and provided a metropolitan district, as it was called, which ultimately came to consist of all the country within a radius of fifteen miles from Charing Cross, and in which a new police force was established. The police of the city of London, which had not been affected by the act of 1829, was, in 1830, put upon somewhat the same basis as the metropolitan police force. The fact of Sir Robert Peel's connection with the change will always be associated with the new municipal police methods from the terms of 'Bobby' or 'Peeler' which, originally used in derision, have since come to be applied commonly to city policemen in almost all English-speaking countries. This reform met with great opposition. The committees of Parliament, which in the early part of the nineteenth century had examined into the subject, regarded with considerable misgiving so radical a change in the historical methods of maintaining order. And

Parliament made the change only because of the increase of crime everywhere throughout the metropolitan district. The misgivings of those responsible for the change were but a forecast of the opposition which followed its adoption on the part of the people. . . . The main characteristics which distinguished the new methods from those which they superseded were three in number. They were, first, the professional character of the force. The old system of parish constables and night watchmen had, it is true, been based upon paid service, but the service was paid for on such a low scale that the constable and watchmen were not able to live from their pay alone. The new force, in addition to being much more numerous than the old, received larger compensation and were expected to devote their entire time to their work. The occupation of policemen thus became a definite occupation, requiring certain specific qualifications, although the powers given the new force were little more than those possessed by parish constables. The second characteristic of the system was its centralization. The officers at the head of the new force, at first two commissioners, later one commissioner and three assistant commissioners, who were given the powers of justices of the peace, were appointed by and acted under the immediate direction of the home secretary. In the third place, the new force was organized on a semi-military plan and consisted of constables, sergeants, inspectors, and divisional and district superintendents. In the United States, at the beginning of the nineteenth century, similar conditions existed in the cities as existed in England. Reliance was placed almost entirely on the constables and night watchmen. A good idea of the conditions which existed in one of the large cities of the United States is given by Allinson and Penrose in their 'Philadelphia.' Here it is said: 'The first watchman was appointed in 1700 by the provincial council, and had the whole care of the city within his charge. It was his duty to go through the town at night ringing a bell, to cry out the time of night and state the weather, and to inform the constables of any disorder or fire. In 1704 it was ordered by the common council that the city be divided into ten precincts and that an equal number of watchmen be assigned to each constable therein. In the same year the city was divided into ten wards. The constable was the principal officer of the watch. The watch was not a permanent body of paid men, but every able-bodied housekeeper was supposed to take his turn and watch or furnish a substitute. . . . The system, however, was onerous and unsatisfactory. . . . At length, in 1740, the complaint concerning the want of a "sufficient and regular watch" culminated. It was complained that the watch was weak and insufficient, and that the housekeepers refused to pay the watch money upon the pretense that they would attend the watch duty when warned, but frequently neglected to do so.' In 1750 an act was passed granting to a board, consisting of six wardens to be annually elected, the power to appoint and pay as many watchmen as they deemed proper. 'In conjunction with the mayor, recorder, and four aldermen they were to fix stands throughout the city at which the watchmen were to be posted and to have general control of the watch. The constables and watchmen were supplied with copies of the rules and regulations. The constables reported regularly at the court-house and had general superintendence of the watchmen. Neglect or violation of the police rules of the mayor recorder, aldermen, and watchmen was punished by fine.' The system was not,

however, at all satisfactory. 'During the revolution there was practically no police protection to the city apart from the military, and even after the act of 1789 was passed the same radically inadequate system continued as existed under the charter government. The police force, if we may use the term, consisted of a high constable, the constables, the watch, and the superintendent of the watch, the two former appointed by the mayor, the latter by the city commissioners. The constables had their common law powers. The ordinance of 1789 creating city commissioners and the several ordinances supplementary thereto, placed the appointment and regulation of the watch in their hands where it remained until 1833 subject to removal by the mayor for misconduct. The first decided step to be noticed in this period is that the city commissioners were to appoint a superintendent of the night watch, and hire and employ a sufficient number of able-bodied men to light and watch the city, at fixed wages, prescribe rules for their government, and dismiss them when they thought proper.' The system still was not satisfactory, and several riots occurring, one in 1838 and another in 1844, resulted in the improvement of the system, the police force being organized in 1850 somewhat on the English model. Conditions were very similar in New York. In 1840 an attempt was made to make the force more efficient. The mayor with the approval of the council was to appoint a chief of police, and the captains and men were to be appointed every year in each ward by the aldermen and the assessors. Naturally such a system was unsatisfactory and in 1853 a change was made. By the law passed in this year the mayor, recorder, and city judge were made police commissioners, with power to appoint the members of the force during good behavior. At first great difficulty was found in both Philadelphia and New York in making the men wear uniforms. The attempt to do this excited somewhat the same remark that the later attempts of the late Colonel Waring, to put the street-cleaning force of New York into uniform excited. The wearing of uniform was then considered to be degrading to American manhood, and the attempt to make the men wear it was resented. Indeed, it is said that in Philadelphia the attempt to make the men wear their uniforms was not successful until 1860. But both in Philadelphia and New York the attempt to make a somewhat military force after the English model was successful, and the example of these two cities was followed by others, so that at the present time almost every city in the country has its uniformed police force, organized in military fashion, and professional in character. . . . It will be seen that the system, as originally introduced in the United States, differed in one important respect from that adopted by the English law of 1829. In the United States the preservation of the peace was, at first, regarded as a purely municipal matter, and was therefore put in the charge of the local authorities, the mayor being the most important authority having to do with the matter. In London, and on the Continent as well, it was regarded as a matter affecting the interests of the central government and therefore was either put into the hands of the central government or made subject to its control. The experience of a number of the cities of the United States, under the local management of the police force, was such as soon to produce a change in this respect, which brought the American treatment of the subject more into accord with European ideas. Thus, in 1857, the police of New York city and of Brooklyn was

put into the hands of a centrally appointed police commission having jurisdiction over the newly established metropolitan police district. The example of New York was followed within ten years by Baltimore, St. Louis, Chicago, Detroit, and Cleveland, while other centrally appointed police boards have since been provided in several cities in Massachusetts, among them being Boston, in Cincinnati, Washington, Denver, Newport, Kansas City, St. Joseph, Birmingham, Manchester, N. H., in eleven Indiana cities, and in Providence (1901). In some of the cities, in which these centrally appointed boards were created, return has been made to the method of local appointment. This is so in New York, Chicago, Detroit, and Cleveland. . . . [An important] question in the United States connected with police administration is, What shall be the composition of the authority, whether locally or centrally appointed, which has in its hands the management of the police? Shall it be a board or shall it be a single man? . . . In this country the board system of police management was characteristic of the first attempts to organize a modern police force, namely, those of New York, by the laws of 1853 and 1857. The board system was introduced here, however, probably not because a board was believed to be particularly appropriate to police administration, but because the board system was just about that time believed to be the proper form of municipal government. It is true, that afterward the demands of the spoils system seemed to make a board necessary, for that was the only way in which a division of the spoils of the police force could be made between the two leading political parties, but this consideration does not seem to have affected the legislature which passed the acts of 1853 and 1857, for no trace of the bipartisan idea is found in those acts. Later on, it is, of course, true that the bipartisan idea had a potent influence in giving the board form to the municipal-police authority. The abuses which resulted from bipartisan boards have led, however, in more recent years to quite a tendency toward the abandonment of the board idea altogether, and to placing the management of the police in the hands of one man. There is little doubt that the latter system is the correct one, whether such officers be appointed by the city or by the state. . . . It is, however, hardly to be believed that the mere placing at the head of the police department in American cities of a single commissioner or the appointment of such officer by the state governor, will have the effect of so changing the character of the force as to remove the present grounds for dissatisfaction with the police force as a whole. Such changes would, of course, concentrate responsibility for its management, and take it to a considerable degree out of local politics. But the main reasons for dissatisfaction with the police force in the average large city of the United States, are not that it cannot be held responsible, or that it favors the members of one political party over those of another. The most common complaint against the city police is that, either as a body or through its individual members, it sells the right to break the law. . . . In one respect, . . . the conditions of American life differ very much from those of European life, and the difference is perhaps in large part accountable for the greater use made by the police of American cities of their powers in their own pecuniary interest. In the United States the people have never so clearly as in Europe, and particularly in Continental Europe, distinguished between vice and crime. It is too commonly believed in this country that once we have

determined that an action is vicious, it necessarily follows that such action should be criminally punished. . . . Until we alter somewhat our standards of determining crime we can hardly hope for a different kind of police force. . . . In the United States the police of public health and safety starts from the idea of nuisance. It is further based on the principle that there is to be a legislative determination in great detail as to what are nuisances. There are in this country few elaborate general statutes on the subject, and in those states where special legislation is permitted by the constitution much of the legislation is contained in statutes which affect only one city. New York city was one of the first cities in this country in which the matter of public health was taken in hand. This was done about the middle of the nineteenth century, and here what was accomplished was largely accomplished in the usual way by regulations inserted in the charter of the city. In addition to the special acts passed by the legislature there are also municipal ordinances which are passed either by the city council, as, for example, the present building code of the city of New York, or by some one of the executive departments of the city, as the sanitary code adopted by the department of health. . . . In American cities further administrative public health and safety police power is usually vested in a series of authorities. Thus, in the city of New York, police power is given by the charter to the fire, the health, and the tenement-house departments, and the building departments of the five boroughs into which the city is divided."—F. J. Goodnow, *City government in the United States*, pp. 214-238.—"During [1919 there was] . . . much discussion relative to the right of policemen to affiliate with labor organizations, and to the question of police strikes. At its annual convention in June, 1919, the American Federation of Labor reversed its previous policy and decided to issue charters to all *bona fide* organizations of policemen. In the course of a few months charters had been issued to 33 such organizations. Late in August, the commissioners of the District of Columbia adopted rules forbidding members of the metropolitan police department to join or retain membership in an organization of policemen affiliated directly or indirectly with any other labor organization. Congress, in November, passed a law of the same general character, and the Washington Policemen's Union returned its charter. In Boston, however, events took a more serious turn. On September 9 some 1500 members of the police force went on strike to force the authorities to recognize their newly-formed union and their right to affiliate with the American Federation of Labor. For several days the city was given over to rioting, looting and violence. Only after martial law was declared and soldiers of the state guard were placed in charge of the streets, was a semblance of order restored. In spite of appeals of the officers of the Federation of Labor that the striking policemen be taken back, the Boston police commissioner declared their places vacant. A new personnel was rapidly recruited."—E. D. Groper and H. J. Carman, *Political Science Quarterly*, 1920, *Supplement*, p. 79.—"The police problem is a variable problem, not only as between different countries, but as between different cities in the same country, and even as between different periods of time in the same city. The Italian police are confronted with a situation unfamiliar to the English police: Stuttgart and Königsberg, two typical German cities, require in the way of police activity, somewhat different treatment: Vienna presents to-day a police prob-

lem quite distinct from that of twenty years ago. So many factors are responsible for these variations that it is possible to mention only the more important. Alterations in economic conditions, for example, inevitably produce changes in the kind of activity required of the police. Three hundred thousand paupers settled in Liverpool during the four years that followed the Irish famine of 1849, with consequences visible even to-day in the peculiarly difficult problems which face the police authorities of that city. 'I have no hesitation in saying,' wrote the former Head Constable in 1910, 'that by far the greater part of the crime of Liverpool is due to poverty.' In Dresden, a German city of approximately the same size, the police problem is far less acute. For this condition a variety of causes may be assigned, but prominent among them is the absence of a pauper class. 'We have no real poverty here,' the police president of Dresden told the writer. Again, the task of the police varies with the size of a city and the character of its industries. A large manufacturing center such as Birmingham or Manchester is, from a police point of view, decidedly more difficult to handle than smaller, quieter cities like Worcester and Lincoln. Not only is the total volume of crime smaller in the latter cities, but the number of crimes per thousand of population is smaller, while in point of variety the crimes themselves have a comparatively limited range. Moreover, the proportion of serious crimes, such as murder and burglary, is not so large in the smaller towns as in cities of complex industrial development. The simple social and economic environment of the less important municipalities produces a comparatively simple police problem. Similarly, the police problem varies according as the population of a city is homogeneous or heterogeneous. A population made up of different elements, each with its own traditions, habits and racial peculiarities, is not so easily directed or controlled as one having a common heritage and uniform customs. . . . With the exception . . . of Vienna and other cities of Austria, the populations of European cities are remarkably homogeneous, and the task of the police in preserving law and order is correspondingly simplified. . . . To summarize, we see, that in spite of the common purpose underlying all police bodies, their problems are often widely different. These differences are due to economic conditions, to the size of a city and the character of its industries, to the relative homogeneity of its population and to national traits and traditions which tend to vary both the volume and the character of crime. Sometimes there are other factors, perhaps equally important, which alter the police problem or which, in specific instances combine with the factors already mentioned to produce special situations and corresponding tasks. To this divergence of problem, as well as to the distinct historic evolution through which each of the European nations has come, we must look for an explanation of the differences in power and authority conferred upon the police. In no two countries is the conception of the police in its relation to the public exactly the same. In Great Britain the police are the servants of the community. Their official existence would be impossible if their acts persistently ran counter to the expressed wishes of the people. They depend for their effectiveness upon public sanction. They are civil employees, whose primary duty is the preservation of public security. In the execution of this duty they have no powers not possessed by any other citizens. A policeman has no right superior to that of a private person in making

arrests or asking questions or compelling the attendance of witnesses. Further, he must suffer the consequences of any illegal action he may commit, and he cannot divest himself of responsibility by pleading the orders of his superior officer, if those orders happen to be illegal. In the language of Sir James Stephen: 'With a few exceptions a policeman is a person paid to perform, as a matter of duty, acts which, if he be so minded, he might have done voluntarily.' In sharp contrast is the Continental theory, which, evolved from the necessities of autocratic government, makes of the police force the strong arm of the ruling classes. The Continental policeman is the servant of the Crown or the higher authorities: the people have no share in his duties, nor, indeed, any connection with them. He possesses powers greatly exceeding those of the citizen. Under ordinary circumstances he cannot be prosecuted for illegal action unless permission is obtained from the government, and even then he enjoys the privilege of special laws administered by special courts regulating the relations of public officials to private citizens. Where, in England, the constable may ask no question of those whom he arrests or is about to arrest, criminal procedure on the Continent is based on the interrogatory system, and the police of Germany, Austria, Italy and France are allowed to resort to what are popularly known as 'third degree' methods in their endeavor to wring a confession of guilt from those whom they accuse. 'I have asked dozens of educated Germans living in England,' says an eminent German jurist, 'as to the most characteristic difference between German and English penal procedure. Invariably the answer was: In Germany the accused must prove his innocence: in England his guilt must be proved. This is the impression one gets from our system.' Again, in Germany, where a distinction is made between arrest and detention (*Verhaftung* and *Festnahme*), men may be taken to police stations, questioned and even detained for twenty-four hours, although there is no charge against them and no reasonable ground for suspicion. Moreover, the right of search, restricted by stringent provisions in England and used only in exceptional circumstances under judicial direction, is, in Germany and Austria, much more freely employed, its use resting in many cases solely upon police discretion. Similarly the police in Germany and Austria and to a somewhat limited extent in France and Italy are given powers to restrict freedom of discussion and the right of public meeting to an extent unheard of in England. In other words, the different ideas as to the powers of the police and their relations to the public arise from different constitutional conceptions. The great safeguards to personal liberty established in England by Magna Charta and the Bill of Rights and sustained by centuries of judicial interpretation are almost entirely lacking on the Continent. While the constitutional struggles of the last hundred years in Germany and Austria have not left police powers entirely unaltered, it is scarcely an exaggeration to say that in spirit and procedure they still represent the Continental absolutism of the 18th century. We perceive, therefore, a broad distinction between the English and the Continental conception of police. Fundamentally the distinction is based on different ideas as to the extent of police power which a government shall exercise. In Great Britain police organization has been built up around the conception of a constabulary as a prohibitive or repressive power. Until the middle of the nineteenth century, police legislation was

looked upon as a body of law prohibiting certain actions regarded as prejudicial to the public welfare. On the Continent, however, the idea early developed that the state, in addition to its prohibitive measures, should resort as well to preventive measures. . . . The Continental police were given privileges and powers of control over the population with which the English police were entirely unacquainted. While these powers have, to some extent, been curbed by the liberalism of the nineteenth century, and while, as we shall see, police activity has been greatly limited in modern times, continental and Anglo-Saxon theories are still widely at variance. What we have said of British police requires, however, a qualification. While the function of the English constabulary has, it is true, undergone little or no change, and still conforms to the characterization given above, the conception of police power has broadened. With the expansion of British commerce and industry resulting from the Industrial Revolution, new measures became necessary to safeguard the lives and health of the artisan population, and as a result factory legislation and public health laws were enacted. These are essentially police measures of preventive character. Later similar laws were passed on the Continent. An important distinction in the enforcement of these laws at once developed. In the Continental countries the new statutes were left largely to the regular police officials, who, as we have observed, were already engaged in handling other preventive measures. In Great Britain they were given to various national and municipal departments and branches, for the most part specially formed for that purpose. The contrast with the Continent in respect to the function of the regular police bodies has, therefore, been intensified rather than diminished by the progressive legislation of the nineteenth century. So much for differences of a qualitative nature between British and Continental police—differences, that is, as to the kind of power the policeman possesses. Equally striking is the difference in respect to the scope or extent of police functions—the number of things that the police are charged to look after. Police duties in England are to-day confined roughly to three tasks: first, the maintenance of order; second, the pursuit of criminals; and third, the regulation of traffic. These duties are inter-relative: together they form a unified policy whose objective point is public security, and the police are, generally speaking, concerned with nothing else. In Germany, on the other hand, and to a large extent in Austria and France, police functions far transcend this somewhat restricted scope. In these countries there is hardly a governmental activity that is not more or less directly connected with the police: indeed, in Germany the police force cannot be said to constitute a sharply defined independent authority within the internal administration. Thus in Prussia there are Insurance Police, Mining Police, Water and Dike Police, Field and Forest Police, Cattle-Disease Police, Hunting Police, Fisheries Police, Trade Police, Fire Police, Political Police, Roads Police, Health Police, Building Police and a score of others. . . . The combination of legislative and judicial with administrative functions produces an unwieldy and uncontrollable machine. From an English standpoint—indeed, from the standpoint of any democratic government or any liberal political creed—the practice is greatly to be deprecated. Weidlich's word, 'monstrous,' with which he sums up the entire system, would seem scarcely too strong. But it is important to realize that these added legislative and

judicial powers in no way effect the function of the police as an organization for the protection of public safety. Strip off these powers, which often encumber and impede the police in carrying out their simpler duties, and the same problems will be found that, in spite of modifying circumstances, confront the English and French cities alike. Although, as we have seen, many factors vary the character of the problem, the task of the Metropolitan police Force of London is fundamentally the task of the *Schutzmannschaft* of Berlin, and it is a mistake to assume that, because an official belonging to the latter force has other unrelated functions, his ideas and experience have no applicability in London or elsewhere. The German police organization, in spite of its needless extensions, has many points worthy of careful study by the police forces of other lands."—R. B. Fosdick, *European police systems*, pp. 4-8, 14-21, 36-37.

Fire fighting and prevention.—"American cities have the most highly organized and the best-equipped fire-fighting systems to be found anywhere in the world. The administration of the fire department of a great city is usually entrusted to a layman appointed by the mayor, while the technical work of directing the fire-fighting battalions is committed to the care of an expert, known as the chief, who has seen long and honorable service. Under the chief are the several brigades and their officers stationed at the engine houses distributed at strategic places throughout the city."—C. A. Beard, *American city government*, p. 283.—"The fire-fighting problem was a great one even in the days of the Romans. Rome had her *Præfectus Vigilum*, her fire chief, and a highly organized corps of fire-fighters. In this regard the Romans showed their superiority to the moderns, for London had no fire-fighting apparatus when the great fire of 1666 wiped out the city."—M. C. Deshel, *Safeguarding life and property (Community Civics Pamphlet)*.—"In extinguishing a fire, no matter how small, firemen are not restricted in property destruction. They are given perfect freedom to destroy whatever may be necessary to check the spread of the consuming conflagration. This destruction may amount solely to breaking thru a door, or it may mean the dynamiting of an entire city block. In fire-fighting the one and only object is to extinguish the fire. There is, nevertheless, a paradox. In attempting to extinguish a fire, a fire company may destroy ten or twelve times as much property as would have been necessary upon the order of a fire prevention bureau official to prevent this very same fire. The chief difficulty is, however, that the hands of the fire prevention bureau are tied, while the fire extinguishing department is left free to destroy whatever it deems necessary toward extinguishing the fire. In many cases, to comply with the requirements of a fire prevention bureau, it would be necessary to construct rather than destroy property. This is true because in fire prevention work there is plenty of time to exercise care and good judgment and to carry out the scheme with deliberation. If a city expects its fire prevention bureau to be as effective in the prevention of fires

as the fire companies are in checking them when once started, the officials of these fire prevention bureaus must be accorded more freedom of action. This will not necessarily mean the enactment of more ordinances or legislation, but rather placing fire prevention work outside the rounds of political intrigue and free from the interference of the administration. The fire prevention bureau, which is bound to obey the edict of some political organization and is told that it can do this, but must not do that, or that it must be inactive just before election, and which must consult the leaders of some political organization before taking any important action in fire prevention, is just as badly handicapped as a fire chief who must take orders from some lay official when he is fighting a large conflagration in a city. It is of primary importance that municipal administrations first select thoroly competent officials for fire prevention work and, secondly, give them a free hand to clean up garrets, yards, lots and all other places where a spark might start a fire or where spontaneous combustion might be the beginning of a great conflagration."—*American City, Mar., 1910, p. 293.*—“In Baltimore, the fire chief testified publicly to the fact that the clean-up crusade carried on by the women had been his greatest aid in fire prevention work. It is an obvious fact that proper disposal of rubbish eliminates fuel for the flames. One of the most vigorous anti-fire campaigns ever carried on by women was that waged by the working women of Newark, New Jersey, just after a terrible factory holocaust in that city of numberless factories. The women's trade unions of Newark actually brought about changed conditions in the factories through their splendid organization and fighting spirit. In New York, soon after the Newark experience, about 150 girls were burned in the Triangle Factory fire and women again led the agitation against the evils that exist in shops and factories all over New York. The Women's Trade Union League, many of whose members were burned at this time, started the campaign. A Fire Complaint Committee was formed and through it circulars were distributed broadcast among the workers requesting them to observe conditions where they worked and report certain definite evils to it. Every mail for weeks brought a vast pile of complaints, intelligent and eager, which were turned over by the Committee to those in authority, an effort being made to follow up results. A Citizens' Committee was formed at the instigation of the women of the Trade Union League which maintained enthusiasm through a typical nine days of horror, and then largely subsided, although some influence is undoubtedly seen in the present work of the Fire Prevention Bureau . . . organized in New York. More definite results as far as factories are concerned seem to have been obtained by the Cloak and Suit Makers' Unions through their Board of Sanitary Control. . . . Robert Adamson, New York's Fire Commissioner [under Mayor Mitchell], appointed three women on the force. . . . He wrote to John E. O'Brien, counsel for the women on the civil service list, eligible for appointment: 'It is my intention to appoint women as inspectors in the Bureau of Fire Prevention, so far as the character of the work of that bureau will permit. I understand that Commissioner Johnson felt that the work of the bureau in its entirety could be performed by men, and that he, therefore, declined to make any appointments from the women's eligible list; whereupon the women on this list applied to the court for an order directing the consolidation of the women's eligible list with the

men's eligible list, which application was denied by both the Supreme Court and Appellate Division. . . . I have always felt that the Bureau of Fire Prevention is peculiarly one in which women could, with great advantage to the welfare of the city, be employed. Certain classes of the work in this bureau could, in my opinion, be performed by women even better than by men. For example, the services of women should be particularly available in the inspection of factories where women are employed; in moving-picture places; perhaps in dance halls, and in other places where this department has jurisdiction in prescribing regulations to insure safety in case of fire. . . . If I find that the result of . . . investigation verifies my present view of the matter, I shall appoint women to those vacancies. I believe that the appointment of women in this bureau to do such work as I have indicated will greatly improve the efficiency and usefulness of this most important branch of the fire department, the work of which I find has only fairly been inaugurated.' Mr. Adamson thereupon appointed three women. All are well-known settlement and social workers."—M. R. Beard, *Woman's work in municipalities*, pp. 288-291.

Municipal charities in the United States.—“The relative position of the country and town in the administrative system of the states of the United States seems to have an important effect on the position of the city with regard to public charities. There is not [1909] a single city in New England of more than 40,000 inhabitants which does not do some work in the line of public charities. . . . The reason why poor relief is so generally regarded as a branch of municipal government in New England is to be found in the law imposing on each town the support of its own poor. As a city has gradually supplanted a town it has taken upon itself the town's duty of supporting the poor. In the middle and western states the care of the poor is devolved by the general law upon the town or the county or upon both, while in the southern states, where the town does not exist, the support of the poor is naturally devolved upon the county. The result is that, as a rule, the cities outside of New England which have charge of poor relief are to be found only in the middle and western states, though more frequently in the former than in the latter, while in the southern states it is seldom the case that the city has any functions to discharge relative to the poor. This rule is of course subject to exceptions, particularly so far as concerns the cities in the middle and western states. Thus Buffalo, Rochester, Jersey City and Reading, Pennsylvania, all cities in the Middle states, have no functions to discharge relative to poor relief, the matter being a subject of county administration, while New Orleans, Louisville, Richmond and Charleston, all cities in the southern states, include poor relief within their municipal activity. The larger the cities are, the more liable they are to make poor relief a municipal function. Thus eight of the ten largest cities, namely, New York, Philadelphia, St. Louis, Boston, Baltimore, San Francisco, Cincinnati and Cleveland, manage their own poor. Of the ten second largest cities, however, only five, namely, New Orleans, Pittsburgh, Washington, Newark and Louisville, have any im-

portant functions relative to poor relief, while in the remaining five, namely, Detroit, Milwaukee, Jersey City and Minneapolis, which has no almshouse but supports a hospital, and Kansas City, Missouri, poor relief is attended to by the county in which the city is situated."—F. J. Goodnow, *Municipal government*, pp. 301-302.—See also CHARITIES: United States: 1877-1908.

Early development of public works.—Peculiar problems of different cities.—Ad hoc corporations.—Organizations in charge of public works.—"The concentration of population [despite attempts, in the seventeenth and eighteenth centuries, to limit the size of cities] could not be resisted and cities all over Europe, particularly the political capitals, had therefore to begin to grapple with the problems which this inevitable and irresistible increase in population presented. It must not be supposed, however, that prior to the end of the eighteenth century nothing was done in cities in the nature of public works to improve the conditions of city life. . . . Two interesting accounts of conditions as they existed in Paris at about the beginning of the eighteenth century . . . show that even [then] . . . Paris had made some provision for a public water supply. This consisted of three small aqueducts supplemented by pumps which drew water from the Seine. That these were inadequate is shown by Mildmay's statements that generally water is conveyed to the inhabitants 'by pailfuls sold about the streets as milk is in London.' . . . Similarly crude attempts were made to provide for street paving, cleaning and lighting. Originally every inhabitant was obliged in Paris, as in London, to pave the street or a portion of it in front of his house. The inconvenience of such a method, on account of the unevenness and want of uniformity in the pavement, led in Paris to a change as early as 1609, when the care of the paving was put into the hands of the city authorities and the expense defrayed by a tax placed on each house in proportion to its front on the street. In 1640 the city defrayed the expense out of the proceeds of a tax paid on merchandise brought into the city. The actual work of paving was done by contract made in great detail as to the size of stones and the method of laying them. The contractor was aided in the performance of his contract by a law imposing the obligation on all wagons coming into the city to bring in a certain quantity of paving stones, which were to be delivered gratis at the city limits. This method of caring for street paving was still in force at the end of the eighteenth century. Similar methods were adopted for cleaning the streets. In 1666 the King decreed that a tax for this purpose should be imposed on every house in proportion to its front. The actual cleaning was let out by contract to the lowest bidder. The contractor was obliged to collect the heaps of dirt swept up by the householders, who were required to sweep the street in front of their premises. Half an hour before the carts came along a bell was rung so as to give warning of their approach. . . . The expense of lighting the streets was defrayed also from the receipts of a tax imposed on the householders. . . . The connection between the topography of the city and these undertakings [transportation, sewerage, supplying of water, light, etc.] was not originally of great importance. Municipal sewers were almost unknown prior to the beginning of the nineteenth century. City water supplies, if we may call them such, did, it is true, exist at an earlier date. But they were crude in character, consisting for the most part merely of public fountains to which

water of an indifferent character was conducted in insufficient quantities. No means of transportation except such as was to be found in hackney carriages and sedan chairs was provided, and the art of illumination was so undeveloped that no attempt more serious than that which . . . existed in Paris [where candle lanterns were used] was made to light even the public streets. But with the discovery of gas and electricity and the tramway, and the appreciation of the intimate connection between health and the quality of the water supply municipal public works have assumed supreme importance. Conduits must be laid and tracks must be built which must make use of the public streets. All cities in the western European world now do something in these directions to ameliorate the conditions of city life. The work which any city does depends, however, in large measure upon its geographical situation. A city like Glasgow, which is situated near a hilly country blessed with a heavy rainfall, is called upon to do much less in the way of water supply than a city like New York, situated on the sea coast at quite a distance from elevated land and in a district where droughts are not unknown. Other cities, like those on the Great Lakes, which have a copious supply of portable water near at hand, have still less to do than Glasgow. Their work consists merely in pumping into their distributing system from the reservoir at their very doors. Glasgow has to maintain expensive aqueducts, while New York in addition to aqueducts must maintain large storage reservoirs. Other cities, like Hamburg, have found to their cost that their only available source of water supply is polluted because of the great adjacent population and have had to install filter beds. Filtration of water supply, it may be remarked, will probably be necessary very soon in the case of most cities of any size. What is true of water supply is also true of sewers. Cities situated on tidal waters have merely to run their sewage into such waters. Cities inland, particularly where they are situated on a plain with no great variety of surface, may have to make provision both for sewage disposal and for pumping. Such is the case in Berlin, which also has attempted with some degree of success to conduct farms on which the city sewage is used as a fertilizer. Chicago, or rather the drainage district of which Chicago forms a part, is using the water which is drawn from Lake Michigan for purposes of sewage purification, for the generation of electric power which is used both to light the city streets, and to carry on private manufactures in the city. Some system of sewage purification, it may be said, will probably have to be adopted by all cities of any size. Even a city like New York, situated on tidal waters which rise and fall to a considerable extent, is beginning to apprehend that there is a limit beyond which the pouring of sewage into the waters of the bay cannot go without danger. Glasgow and London have already been obliged to undertake works the purpose of which is to prevent the rivers on which they are situated from becoming polluted. . . .

"An important question in connection with the public works of cities is the method of the organization of the force in charge of them. Generally speaking, all of these works are so distinctly city matters that their care is vested in authorities which are regarded as a part of the ordinary city organization. These are cases, however, where for one reason or another there are formed for the management of particular kinds of public works what the English speak of as *ad hoc* corporations, which are distinct from the ordinary city cor-

poration. Such an arrangement is quite common in Great Britain, where special trusts have been formed for the management of docks, as in Liverpool, or for the improvement of the navigation of a particular river in which some one city is specially interested. This is the case, for example, with the Thames as far inland as London, with the Tyne at Newcastle, and the Clyde at Glasgow. These boards, or trusts, as they are commonly called, while containing representatives of the city which is particularly interested in the work they are doing, have as well in their membership representatives of other localities or interests. . . . Somewhat similar arrangements have been made in the United States in some of the cases in which cities have entered the field of the municipal ownership and operation of public utilities. Examples may be found in the former Gas Trust of Philadelphia and the present Gas Trust of Wheeling. Another instance may be found in the Chicago Drainage District, which has its own organization separate from that of the city. Sometimes a particular public utility is, notwithstanding the local interest it has, taken over by the state government. This is true, for example, of the reservoir system from which Boston and the neighboring cities draw their water supply, and which is under the jurisdiction of the Massachusetts Metropolitan Water Commission, consisting of persons appointed by the state government. Such an arrangement of the matter is justified in those cases in which the influence of the undertaking transcends the limits of a particular locality. This is the case quite commonly with docks, sewers and water and will unquestionably be the case in the not far distant future with transportation, as it changes from an intra-urban to an interurban undertaking. . . . In the United States alone is the question of the organization of the municipal authorities in charge of these public works an important one. Elsewhere the authorities in charge of these matters are usually organized just as are the authorities in charge of other branches of municipal administration. They are ordinarily committees or boards, composed either entirely, as in England, or partly, as in Prussia, of members of the Council. In Prussia, . . . such boards have as a member a permanent professional expert who aids although he cannot control the board in its action. In England the committee usually has, subordinate to it, an expert, who has a practically permanent position and to whose opinion the committee must in the nature of things defer in most if not in all matters. But this expert is distinctly a subordinate and not a member of the board. In both England and Germany each one of the various branches of public works is usually under the immediate control of a special authority. The fact that in both countries each of these authorities acts under the control of the principal city authority is supposed to prevent conflicts of jurisdiction. But these conflicts do sometimes occur. Thus in Glasgow some of the committees have prosecuted in the criminal courts the subordinates of other committees. In Italy a special organization is provided by the law for the authorities in charge of the operation of each public utility, such as gas, etc. In the United States, however, there is no recognized method of organizing the authorities at the head of the matters which have been classified as public works. In some cases the attempt has been made to place a number of these public works, particularly where they have a close connection with the streets, under the control of one authority such as a board or director

of public works. . . . In other cases, particularly in the larger cities, where the work of each of the departments has increased greatly in amount, it has seemed best to provide separate authorities for each of the different kinds of public work, while in one at least, i. e., New York, under the charter of 1901, most of the public works, with the exception of the water supply, are placed in the charge of the presidents of the five boroughs into which the city was divided. Under such an arrangement the several departments of public works were decentralized rather than disintegrated."—F. J. Goodnow, *Municipal government*, pp. 320-342.—See also CITY PLANNING; BILLBOARDS: Court decisions.

Franchises in the United States.—Modification of state constitutions by city franchises, and vice versa.—"In the United States many of the cities seem to have acted with wisdom in their original treatment of the questions arising in connection with the gas supply and transportation. They often granted franchises limited as to term, as in the case of the early gas franchises in New York City, or inserted in the franchises granted, provisions reserving to the city the right of purchase on payment to the companies of the sums such companies had actually expended in building and equipping their plants. . . . In other parts of the country [than New York City] different policies were adopted. Thus in Massachusetts no street railway franchises at all were granted, but the street railway companies were permitted to occupy the streets under revocable licenses. Throughout the middle west franchises with a fixed term, generally rather short, were commonly granted. Considerable trouble and confusion similar to that which arose in New York have arisen everywhere throughout the country by reason of the relations of the cities with the state legislatures. Where companies have not been able to secure what they wished from the cities they have applied to the legislatures, which have in more than one instance favored them to the disadvantage of the cities. Such action has resulted in the insertion in many of the state constitutions of provisions intended to protect the cities. Such, for example, was the provision inserted in the constitution of the State of New York in 1875, which made it necessary that the consent of the city should be obtained before a franchise for a street railway could be granted."—F. J. Goodnow, *Municipal government*, pp. 346-347.—"Nothing could make our paper constitutions and charters in America appear more futile—mere child's play—than to find in them sections or series of sections bravely prohibiting perpetual franchises and imposing whole pages of lucid restrictions upon franchise grants, when we know all the while that most of the actual franchises controlling the utilities in the commonwealth or the city for which the constitution or charter has been written have long since been bartered away in perpetuity and are in no respect subject to the restrictions imposed. So far as the framework of government is concerned, a new constitution or charter is effective in establishing the principles it declares. The old legislature, the old judiciary, the old counties, the old municipal departments, are superseded and displaced by the new, in so far as the constitution or charter calls for changes in the organization of government. But when we come to consider, not the forms of government, but its substantive acts, we find that a constitution drafted in 1015 is subordinate to a contract executed in 1014, or in 1814 for that matter. The result is that modern constitutions and charters, with their manifold and

far-reaching provisions in regard to public utilities and public utility franchises, are often mere masks concealing rather than revealing the truth. In large measure they are theoretical and have no practical significance. Where franchises are granted in perpetuity, a city does not have to be very old or very large before the power to control its public utilities through charter provisions or constitutional amendments applying only to the future is lost forever. Even in the case of street railways, where franchises are usually granted for specific streets rather than for all the streets within the limits of a given municipality, the early grants are almost uniformly on the down-town thoroughfares in the strategic locations, with the result that they command the future development of transit facilities almost as much as if they covered all the streets of the municipality and were exclusive. Competition is a wholly inadequate remedy. Competition of street railways in the same streets, even though temporary, has long since been regarded as impracticable and intolerable except under extraordinary conditions. Competition in water supply and gas service, involving as it does the construction of duplicate systems of mains and the wanton tearing up of pavements and consequent interference with ordinary street traffic, is almost as unbearable as competition in street railways. In electric light and power and in telephone service, the disadvantages of competition from the standpoint of the street itself are serious, but not so forbidding under ordinary circumstances as in the case of the other utilities mentioned. From the standpoint of the public, however, competition in telephone service is theoretically intolerable, while in electric service it may have some immediate advantages. . . . The principal streets, and in some cases all the streets, of the municipalities have been mortgaged in perpetuity to some or all of the principal utilities. . . . Hitherto in New York the constitution has left to the state legislature the franchise-granting power and the power to acquire, own and operate public utilities, to be exercised or delegated as the legislature may see fit, subject to a very few limitations. Under the section 18 of article III of the present constitution the legislature may not pass a private or local bill granting to any corporation, association or individual, the right to lay down railroad tracks or granting to any private corporation, association or individual any exclusive privilege, immunity or franchise. All such grants must be by general law. But the legislature is further prohibited from authorizing the construction or operation of a street railroad except upon condition that the consent of the local authorities having control of the streets be obtained and also that the consent of the abutting property owners be secured, or in case of their refusal, the consent of the appellate division of the supreme court, upon the recommendation of special commissioners appointed to inquire into the necessity of the construction of the railroad. . . . The new constitution of Michigan, adopted in 1908, contains the following provision [art. 8, sec. 23]: "Subject to the provisions of this constitution, any city or village may acquire, own and operate, either within or without its corporate limits, public utilities for supplying water, light, heat, power and transportation to the municipality and the inhabitants thereof; and may also sell and deliver water, heat, power and light without its corporate limits to an amount not to exceed twenty-five per cent of that furnished by it within the corporate limits; and may operate transportation lines without the municipality within such limits as may be

prescribed by law: Provided, That the right to own or operate transportation facilities shall not extend to any city or village of less than twenty-five thousand inhabitants." In 1911, California adopted a series of important amendments to its constitution. One of these conferred the right to own and operate public utilities upon all the municipal corporations of the state. This provision, as amended in 1914, is as follows [art. 11, sec. 19]: "Any municipal corporation shall have power to acquire by purchase, lease, and condemnation or otherwise, in whole or in part, or to construct, and to own, maintain, equip and operate public utilities; and to grant franchises to persons, firms or private corporations to establish, equip, maintain and operate public utilities, upon such conditions and under such regulations as may be prescribed under the organic law of such municipality or otherwise by law. Any municipal corporation may furnish the product or service of any public utility conducted or operated by it to other municipal corporations and the inhabitants thereof, and to consumers and users outside of its limits." The Ohio constitutional convention of 1912 submitted a long series of amendments. One of those related to 'Municipal Corporations.' The following sections were adopted as a part of this amendment [art. 18, section 4 and 6]: 'Sec. 4. Any municipality may acquire, construct, own, lease and operate within or without its corporate limits, any public utility the product or service of which is or is to be supplied to the municipality or its inhabitants, and may contract with others for any such product or service. The acquisition of any such public utility may be by condemnation or otherwise, and a municipality may acquire thereby the use of, or full title to, the property and franchise of any company or person supplying to the municipality or its inhabitants the service or product of any such utility. Sec. 6. Any municipality, owning or operating a public utility for the purpose of supplying the service or product thereof to the municipality or its inhabitants, may also sell and deliver to others any transportation service of such utility and the surplus product of any other utility in an amount not exceeding in either case fifty per centum of the total service or product supplied by such utility within the municipality.' . . . The new Michigan constitution provides that the legislature shall enact general laws limiting the rates of taxation for municipal purposes and restricting the powers of cities in borrowing money and contracting debts. It further provides that whenever a city is authorized to acquire or operate a public utility, it may issue mortgage bonds for the purpose beyond the general limit of bonded indebtedness prescribed by law. Such bonds, however, are not to impose any liability upon the city, but are to be secured only upon the property and revenues of the utility, including a franchise for not more than twenty years to be available for use in case of foreclosure by the bondholders. Under this provision, the legislature has granted a two per cent margin of indebtedness to be incurred against the general credit of the city for public utility uses, thus reducing far below the cost of construction or acquisition the amount of bonds necessarily issued against the utility property itself. Under this provision, the city of Detroit is now [1914] proceeding to acquire the local street railway system. The same provision with regard to the issuance of bonds in excess of the general debt limit was included in the new constitution of Ohio."—D. F. Wilcox, *Constitution and public franchises (New York State Constitutional Con-*

vention Commission Report on Revision of the State Constitution, pt. 2, pp. 186-191, 193-196).

European municipal ownership, particularly British.—Transportation.—Advantages, financial and otherwise.—Electric and gas lighting.—“Municipal ownership is the established official policy of nearly all British as well as of many German cities. In Great Britain the movement is confined to street-railways, gas, water, and electric-lighting enterprises, the telephone properties being owned and operated by the national government. In Germany municipal ownership has no set limits. It includes not only the natural monopolies but abattoirs, markets, docks, mortgage banks, savings-banks, pawnshops, restaurants, wine handling, and occasionally insurance and baking. Many cities in Italy and Austria own and operate the public utility plants, while in France and Belgium the movement is just in its beginning. In Glasgow (present [1915] population 1,150,000) . . . [a] controversy between the company and the men had been prolonged and bitter. The community sympathized with the demands of the employees, who were alleged to be overworked and underpaid. The company, however, declined to arbitrate the question of wages or hours of labor, and the irritation over this question stimulated the demand for ownership. The question was agitated for several years, and in 1894 the council decided to retake the tracks which it had laid under its statutory powers. But the company refused to sell its equipment, so the city had to purchase equipment elsewhere. As a consequence of this action the company ultimately lost its total equipment investment. With the advent of municipal operation fares were reduced 33 per cent. below those previously prevailing, while the length of the hauls was increased. The condition of the employees was also improved. Free uniforms were added, as well as five days' holiday each year. The success of Glasgow stimulated the movement for municipal operation in other cities, for the discontent with private operation was general. Controversy with employees was a common cause of trouble. But probably the main operating motive was the desire of the city to control its transportation system and derive such revenue as was possible out of ownership. For local taxes in Great Britain are very heavy. And the business men and citizens saw in municipal ownership a means for relieving the rates. In addition, cities were considering the installation of electric-lighting plants, and it was seen that power stations could, with economy, be constructed which could be used for lighting as well as for the operation of the street-railway plants. And this has quite commonly been done. A uniform load is possible by this arrangement, the day load being used for the operation of the tramways and power and the night load for the lighting of the city. The street-railways in Great Britain are constructed with much more permanence than they are in America. This is true of private as well as public undertakings. The girder groove rail is universally used. Tracks are heavily ballasted, while the overhead work is very substantial. Many of the towns have erected splendid shops in which they both build and repair their cars. In consequence of the high standard of construction the capital outlay has been very heavy. In 1906 the cost of the Glasgow system was \$93,305 per mile of single track and in Liverpool \$90,536. The London County Council reports a cost of \$106,033 per mile. It is believed that the construction cost in the British cities exceeds that of the average American city (outside of New York, Philadelphia, Boston, Chicago, and

Washington) by approximately 50 per cent. Aside from the large investment in capital account, there are many provisions for the comfort and convenience of the people. For the street-railway is under constant supervision; it touches every citizen daily. It is more difficult to disguise bad service in street-railway operation than in any other public utility. Accidents are of rare occurrence. They have been reduced to a minimum. The same solicitude is manifested in the care of the cars. They are kept fresh with paint and are washed daily. In Glasgow and many other cities all advertisements have been excluded. Employees are courteous and seem animated by a sense of service to the community, and because of the surveillance of the public they are of necessity considerate to the riders. Council committees are on the alert to better conditions and to adopt new devices. There is keen rivalry between different cities, each of which takes peculiar pride in its enterprises, the equipment and the service rendered, as well as the annual balance-sheet. The zone system of fares is universal in Great Britain as it was under private management. In a sense travel is metered just as [are] . . . gas, water, and electricity. Upon each zone a fare of from one to two cents is collected, depending upon the length of the ride. There seems to be no protest whatever against this system, which leads to a very great stimulus of short-haul riders. Four motives animate the councils in the operation of the street-railway system. They are: first, the best possible service at the minimum cost; second, the relief of the taxpayers by more or less substantial contributions to the city budget; third, the widening of the boundaries of the city and the improvement of housing conditions by opening up the countryside; and, fourth, the improvement in the condition of the employees. There is constant pressure to reduce the fares and extend the zones; but the prevailing tendency of councils is to utilize the surplus earnings for the reduction of the debt and the repayment of the loans. Despite this fact, rates of fare are lower than under private management and very much lower than they are in the United States. For instance, in Glasgow there is a one-cent fare for short distances of about a half a mile, and in 1912 43.98 per cent. of the passengers paid but a one-cent fare. The number paying 2 cents formed 37.85 per cent. of the total number, while the percentage paying 3 cents was 7.38. In that year over 80 per cent. of all the passengers paid 2 cents or less. The one-cent fare encourages traffic in the centre of the city and is a great convenience. It stimulates travel when traffic is light. The average fare paid on all of the 136 tramways operated by local authorities in 1910 was 2.1 cents, as opposed to an average of 2.48 cents paid on the 138 private companies. In 1911 the total receipts in Glasgow were \$4,748,740. At the prevailing 5-cent fare charged in America the passengers would have paid \$11,808,305. The total capital investment of the 136 local authorities operating street-railways, which included nearly every large city in the United Kingdom, was in 1910, \$220,541,250. The gross receipts for the year amounted to \$47,437,170, against which were charged operating expenses of \$20,436,216, leaving a net revenue of \$18,000,955. The percentage of net earnings to capital invested was 8½ (eight and a half) per cent. The publicly owned lines were operated at a lower ratio of cost than the private companies, despite the higher wages paid, the shorter hours, and better conditions of employment. [The ratio of the] working expense of the local authorities to the gross income was 62.05

per cent. as against 62.52 per cent. for the private companies. At the same time, while the cities earned 8½ per cent. on their investment, the private companies earned but 4½ per cent. . . . Aside from four small communities showing a deficit, which in 1910 amounted in the aggregate to but \$15,000, most of the companies made very substantial contributions to taxation. The tramways of Manchester contributed \$364,987 to the relief of taxes; of Leeds, \$275,000; of Birmingham, \$100,000; of Liverpool, \$135,000; of Nottingham and of Bradford, \$100,000. In Glasgow the net profits, which amounted to \$265,000, are paid into a special fund, known as the Common Good. In 1910 the total contributions of the public tramways to the relief of taxation were \$2,200,565. In addition, there was a gain to the public of \$7,080,434 in the difference between the average fares charged by the publicly owned tramways and the average fares of the private companies. There is no question about the financial success of public operation. The indebtedness of the cities is being rapidly amortized. In addition to the regular amortization charge provided by law, cities make very substantial contributions to depreciation and reserve. For instance, Glasgow in 1910 repaid its debt to the extent of \$448,470 and added \$1,102,805 to the depreciation and reserve. The sum contributed to depreciation and reserve, in addition to debt repayment, by Manchester was \$375,000; by Liverpool, \$427,555; and by Sheffield, \$106,080. These statistics are authoritative. Municipal authorities are required to keep their accounts according to standards fixed by the local government board. Annual returns are required to be made to the board of trade, while the reports are published each year and are subject to scrutiny. The books of the municipality are also audited by the central authorities, in order to make sure that all requirements as to debt repayment, depreciation, and reserve are properly provided for. Overcrowding is specifically prohibited, and rarely is it necessary to stand. In Liverpool 68 per cent. additional cars are added during the rush hours. In Leeds the service is increased by 30 per cent. in the morning, at noon, and in the evening. In some cities standing is prohibited. Many cities, too, reduce their fares for working men in the morning and evening. In Manchester the 3 and 4 cent fares are reduced to 2 cents, the 5 and 6 cent fares to 3 cents, and the 7 and 8 cent fares to 4 cents. In Leeds four-mile tickets are sold for 2 cents. The purpose of these rules is to encourage working men to live in the country and to still further adjust the tramway service to the needs of the working classes. As indicative of the experiments made by British cities is the instance of Bradford, which carries on a municipal express and delivery service all over the city. This service is not unlike that of the parcel post. Stamps are sold, which are affixed to parcels in the centre of the city. They are then loaded on the street-cars to be delivered to the various sub-stations for distribution throughout the city. At the terminals of each route a uniformed agent collects and delivers the parcels. Rates of charges are as follows: for packages up to 7 pounds, 4 cents; from 7 to 14 pounds, 6 cents; from 14 to 28 pounds, 8 cents; and from 28 to 56 pounds, 10 cents. The entire investment in the parcels-delivery system is but \$17,033, which includes the cost of five motor vans. The total cost of this service in 1910 was \$31,284, and the receipts were \$30,757. During the year 675,719 packages were carried, at great economy to the merchants and citizens. Many of the shopkeepers have been enabled to dispense with

their delivery service, while the congestion of the streets is greatly reduced, as is the unnecessary waste involved in countless delivery wagons traversing the same routes. There is little sentiment for a return to private operation from any class. The financial gains are too obvious. The service is undeniably better on the public tramways than on the private ones, while rates of fare are lower and the condition of the employees is better. Membership on the tramway council committee is sought after as a high honor because of the opportunities for service involved. Cities, too, are eager to introduce new devices and new comforts, and representatives are constantly studying the service of other countries. There has been a steady improvement in cars, a constant effort to better the service and consider the well-being of the community. The double-decker type of car is universal and is very popular. The upper deck is so arranged that it can be closed in winter. Smoking is permitted on the upper deck, which is used by all classes for pleasure riding. The double deck also increases the seating capacity. In addition, there has been no serious trouble between the city and its employees such as prevailed under private operation. The city adjusts differences through the council committee or by arbitration. But controversies of this kind have been very rare, owing to the fact that the city pays a higher rate of wage than prevails in other industries; it supplies the men with free uniforms; it allows, generally, a week's holiday on full pay, and otherwise concerns itself for the well-being of its employees. As a consequence of this a fine *esprit de corps* has arisen among the employees. They seem to take great pride in their jobs and are earnestly zealous in their effort to serve the community. . . . Electric-lighting plants are very generally owned by the British cities. The introduction of electricity was delayed in Great Britain until after it had obtained a foothold in America, and cities refused to grant franchises to private companies until the success of electric lighting was assured. The introduction of electricity was generally coincident with the municipalization of the tramways. The statistics of the *Municipal Year Book* indicate that the rates and charges of municipal companies are considerably lower than those of the private companies. The gas has not been so generally municipalized as either the street-railway or the electricity supply. Gas was introduced many years ago by private companies which were given long-term, indeterminate grants, so that when the city comes to acquire them it has to pay a substantial sum for the franchise. This, along with the idea that electricity would eventually supplant gas, has checked the municipalization of the supply. The returns of local authorities and private companies for the year 1911 show that 298 plants are owned by municipal authorities and 511 by private companies. The public authorities supply 2,666,146 consumers and the private companies 3,751,703. The local authorities earn 0¾ per cent. upon the capital invested and the private companies 5⅝ per cent. . . . The net revenues of the public companies were \$14,636,535, which was used to pay interest upon the investment, for the reduction of the debt and the relief of the taxpayers. The price of gas is much lower in Great Britain than it is in the United States. The returns for 1911 show that the average charge for gas per 1,000 cubic feet by the municipalities was 60 cents, as opposed to 66 cents by the private companies. In Birmingham rates are from 42 to 56 cents per 1,000 feet; in Bradford, Burnley, Halifax, and Rochdale, 50 cents; in Manchester,

from 58 to 60 cents; and in Oldham, 46 cents. Through ownership the cities are able to experiment in a variety of ways. They light the streets very generously. It is a common saying in Great Britain that a lamp-post is as good as a policeman. Tenement districts, slums, and alleyways are lighted as a preventive of vice and crime. Cities also encourage the use of gas by providing cooking-stoves at a low rental or at cost. Among the very poor penny-in-the-slot meters are installed by which the consumer can buy two cents' worth of gas by the insertion of a coin in the meter. The municipal gas plants earn large sums for the repayment of loans and the reduction of taxes. The total contributions to the relief of city taxes amount to more than \$2,000,000 a year."—F. C. Howe, *Modern city and its problems*, pp. 170-187.

German municipal ownership.—Its wide scope.—"German cities engage in a great variety of activities of social betterment. This is due to several causes. In the first place, the *laissez-faire* philosophy of Great Britain and America has never made much headway in Germany. On the contrary, the idea of state and municipal ownership is accepted by all classes as a perfectly natural thing. Both the nation and the cities have owned many things from early times. The steam-railways, telegraph, and telephone services are owned and operated by the individual states. The states and cities are also great land owners. Some of the states own mines and operate them at a profit. A large part of the revenues of Prussia is derived from profit-making enterprises. In the second place, the military organization of Germany leads to constant interference with the lives of the citizens, which interference has been greatly extended in recent years as a means of protecting the health, lives, and efficiency of the people. Finally, the cities are free to do anything necessary for the welfare of the people. They have home rule and can own and operate, regulate and control individual property with almost as much freedom as the state itself. This is the background of the German city upon which a social programme has been reared that has made it the model of the modern world. To this must be added the fact that the city is governed by experts trained in the universities and technical schools. It has at its command the trained men of the empire in finance, education, sanitation, housing, taxation, and administration, as well as the co-operation of the interior department, the universities, and the technical schools. The German city is more adequately equipped with expert assistants than is any private corporation. German cities adopted ownership after a thorough test of private operation. Franchises for street-railways were originally granted for from twenty-five to forty years, but the service was not satisfactory and the equipment was not kept up to a high standard of efficiency. In addition, the housing problem was very acute and means had to be found to remove the population from the old congested quarters of the city. This could only be done through adequate transportation facilities, and the companies were unwilling to extend their lines out into the non-profitable suburbs. Further than this, German cities have worked out comprehensive planning projects in which transportation is an integral part. It was necessary to control the means of transit in order to project industries out into the surrounding country, to provide homes, and to co-ordinate all of the planning projects of the community. The zone system of street-railway fares prevails in Germany as in Great Britain, the average rate of fare being 2½ cents, which includes the right

of transfer. Many devices have been adopted for improving the service. One finds maps within the cars on which are indicators showing the car's destination. Attractive waiting-rooms are erected to accommodate the passengers in inclement weather. Rates are frequently reduced mornings and evenings for working men, and also for children. Cities also own the water, gas, and electricity supplies, which, like the street-railways, are operated with the aim of rendering the greatest amount of service to the community at the minimum cost. Cities also own their water-fronts and develop them with splendidly equipped harbors. The docks are connected with the state-owned railroads; they are designed by experts and are consciously used to promote the industrial development of towns and the commerce of the [former] empire. Immense sums have been spent on municipal docks, those along the Rhine and the North Sea being probably the most perfectly appointed harbors in the world. Düsseldorf, a city of 356,000 people, has erected a great harbor along the Rhine at a cost of \$4,500,000. The building of this dock increased the city traffic by 300 per cent. in ten years' time. Frankfort-on-the-Main, a city of only 414,000 people, two thirds of the size of Cleveland, . . . set aside \$18,000,000 for the dredging of the river, the building of a great inland harbor, and the development of a new industrial section. In anticipation of the harbor the city purchased 1,180 acres of agricultural land, which it planned as a complete industrial section, with provision for rail and water transportation, with sites for all sorts of factories, and with a park and playground for the working people. In addition it laid out a suburb close by the new industrial section for working men's dwellings, some of which have been erected by the city and some by private enterprise. By this means Frankfort [expected] . . . to become a great inland industrial centre, inasmuch as it [could] . . . offer the best of factory sites at a low price to capital. This is one of the ways German cities promote their growth. And Frankfort [expected] . . . to pay for the entire expenditure out of the increased value of the land by selling and leasing the land to industries at prices which [would] . . . ultimately relieve the city of indebtedness."—F. C. Howe, *Modern city and its problems*, pp. 188-190.

Spread of municipal ownership in the United States.—"Although as a general thing the service rendered by public service companies in the United States has been good, and although in most cases the service has continuously improved, and the price charged for the service has commonly been reduced, a few notorious examples of gross over capitalization accompanied by a decided deterioration in the character of the service, aroused what would on the whole appear to be an unreasonable dissatisfaction with the general scheme of private ownership of public utilities. This dissatisfaction was also due in large measure to the belief, which would appear in many instances to have been justified, that public service corporations were exercising a very corrupting influence not only on the city but also on the state governments. The belief was also commonly entertained by the people of the United States that public service corporations were making inordinate profits and it was felt that the public should obtain a larger share than had been accorded to them in the increased profits due to the lessening of operating expenses which had followed the introduction of such improvements as the substitution of electricity for horse power. The results of this feeling were in the first place an extension of municipal opera-

tion. It was believed that municipal operation of water works had on the whole been successful, and was therefore the proper policy to adopt. From 1800-1900 municipally operated water works had increased from six to sixty per cent of the whole number of water works. Of the fifty largest cities only nine rely on private companies for their water supply. The municipal gas plants increased from fifteen in 1900 to twenty-five in 1906. In 1881 there was but one public electric light plant in the United States, in 1902 there were 818, in 1904, 927, in 1907 it was estimated that there were more than 1,000. [In 1919, out of 5543 electric light systems in the United States and its possessions, 1821 were municipally owned.] The movement has, however, hardly touched transportation, although some cities like New York and Boston have built and own subways which are operated by private companies. . . . The more important results of the dissatisfaction in the United States with uncontrolled private operations are to be found, however, in the numerous attempts which have been made to subject private operation to public regulation and control. These attempts have resulted in either local or state regulation. . . . A study of the history of the treatment of these particular branches of municipal public works and of the conditions under which private operation has given and is giving way to public operation can hardly fail to convince us that the sphere of direct municipal activity is gradually extending. Reliance upon the individual property owner for the discharge of such functions as paving and sweeping the streets has almost everywhere given way to public action at public expense. Private water works have been very generally replaced by public water works and there is a considerable movement in Germany and England in the direction of replacing private by public gas and electric works, and tramways, while in the United States, France and Italy there are numerous instances of municipal electric light works for the lighting of the street and a few instances of such gas and electric light works for the distribution of light and power to private consumers. The law of these latter countries is being changed so as to admit of greater municipal activity in the operation of almost all kinds of public utilities."—F. J. Goodnow, *Municipal government*, pp. 347-348, 355.

Porter, *Dangers of municipal ownership*.—W. B. Munro, *Government of European cities*.

Municipal markets.—"The difficulties of properly inspecting perishable foods and the recent increased cost of living have brought to the front the proposition that municipal markets should be established. Just as a great reservoir simplifies the work of water inspection, so a centralization of food supplies in general and radial markets would render public control easier. It is the cost of food, however, that makes the matter more serious, particularly for the poor, who must purchase in small quantities, usually from petty tradesmen, three or four times removed from the producer. With those living constantly on the margin, every penny counts, and if the city can bring producer and consumer face to face, thus eliminating to a considerable extent the middle-

men, it may materially help in the maintenance of a proper supply of healthful foods at low prices. Years ago many of our cities, especially in the South and Southwest, had large markets, but their places have been taken by private concerns, although a few cities, like Boston, New Orleans, Baltimore, and Rochester, still [1912] maintain some municipal trading centers. Nowhere are the markets systematically organized, and no attempt is made to cover the whole field adequately. The subject is now receiving more attention, in answer to the demand for some systematic organization of the trade in food supplies, particularly meats and vegetables. Dubuque, Iowa, maintains a market at which farmers may sell without the interference of middlemen and the result has been a decided reduction in the cost of staples. 'At the recently established market place in Des Moines, between 100 and 200 farmers gather on the city hall lawn and in the streets adjacent thereto between the hours of 5 o'clock and 10 o'clock in the morning without paying any license or rent. They are permitted to sell direct from their wagons to the city consumer. The result has been that they receive approximately 50 per cent. more for their produce than the commission men paid them before, while the city buyers get their produce for approximately 50 per cent. less than was paid formerly.' In other cities, for example, Madison, Wisconsin, recent experiments in marketing have not been so successful, and it is apparent that the problem cannot properly be met without a great deal of skilful management on the part of the municipal authorities."—C. A. Beard, *American city government*, pp. 272-274.

Transportation and health.—"To increase the cost of transportation tends to retard a city's expansion along the lines of community health and safety. Cheap car fares with liberal transfers have been a tremendous factor in Chicago's territorial growth and development. Cheap and rapid transportation is also a means of preventing the crowding together of people in limited areas with the attending damage to both health and morals that always is in evidence in badly congested districts. The question of family health has impelled thousands of people, in Chicago to seek the outlying districts where air and sunshine can be had in abundance and where there is elbow room and a chance for children to grow and develop into healthy and vigorous men and women. And cheap and rapid transportation has made this possible. The workman of to-day can travel a round-trip distance of twenty miles between his home and his work place, and do it in less time than he could have traveled half the distance twenty years or more ago. A well-known health worker said some years ago that improved transportation facilities had taken thousands of people out of the congested districts in a single ward and into neighborhoods where, with no increase in rentals, the living surroundings from a health standpoint were immeasurably superior to those amid which they had formerly lived. And while there can be no accurate estimate made as to the number of lives saved each year on account of the wholesale begira of people from bad to good surroundings, there can be no doubt that such moves do exert a direct and vital influence over both the sickness and the death rates of the city. Especially, too, are fresh air, sunshine, and open-air playgrounds important factors in promoting the healthy, normal development of growing children."—*Transportation and health (American City,*

Mar., 1920, p. 246).—See also PUBLIC HEALTH; CITY PLANNING.
