[^94]form of furtum called plagium). The latter would be in English law an abduction under certain circumstances, but not a theft. On the other hand, ono of tro married persons could not commit furtum as against the other, but theft may be so committed in Englaud since recent legislation. As a furtum was merely a delict, the obligatio ex delicto cauld be extinguished by agrecment between the parties ; it will be seen that this cannot be done in England. In another direction Enclish law is nore considerate of the rights of third parties than was Roman. As will appear hercafter, the thief can give a good title to stolen goods, in Foman law ho could not dn so, except in the single case of a hereditas acquirer by usucapio. The derelopmeat of the law of furtum at Rome is historically interesting, for even in its latest period is found a relic of one of the most primitive theories of law adopted by courts of justice: "They took as their guide the measure of reageance likely to be exacted by an agserieved person under the circumstances of the caso" (Maine, Ancient Laun, ch. x.). This explaias the reason of the division of furlum iuto manifestum and nec manifestum. The manifest thief was one taken red-handed, - "taken with the manner," in the language of old Englioh lar. The Twelve Tables denounced the punishment of death against the manifest thief, for that mould be the penalty demanded by the indignant owner in whose place the judge stood. Tho severity of this penalty nas aftermards mitigated by the pretor, who substituted for it the payment of quadruple the value of the thing stolen. The sane penaliy was also given by the prator in case of theft from a fre or a wrech, or of prevention of search. No doubt the object of this large penalty mas to induce injured persors to refrain from taking the law into their own luands. The Twelve Tables mulcted the non-manifest thief in double the value of the thing stolen. The actions for penaltics were in addition to the action for the stolen goods themselves or their value. The quadruple and double penalties still remain in the legislation of Justinian. Tho search for stolen goods, as it existed in the time of Gaius, ras a survival of a period when the injured person mas, as in the case of summons (in jus rocatio), his orn executive officer. Such a search, by the Twelre Tables, might bo conducted in the house of the supposed thief by the owner in person, naked except for a cincture, and carrying a platter in his band, safeguards apparently against a violation of decency and against any pessibility of his making a false charge ly depositing some of his own property on his neighbour's premises. This mode of search became obsolete before the time of Justinian. Roubery (bona vi rapta) was piolence added to furtum. By the actio in lonorum raptomum quadruple the value could be recovered if tho action mere bronght within a year, only the raluo if brought after the expiration of a year. The quadruple value, it is to be noted, included the stolen thing itself, so that the penalty was in offect ouly a triplo one. It was inclusive, and nct cumulatiro, as in furtum.

In England theft apyears to have been rery early regarded by legislators as a matter calling for special attention. The pre-Conquest compilations of laws are full of prorisions on the subject. It is noticeable that the earlier ones appear to regard theft as a delict which may be compounded for by payment. Considerable distinctions of person are made, both in regard to the owner and the thief. Thus, by the laws of Ethelbert, if a freeman stole from the king he was to restore ninefold, if from a freeman or from a dwelling threefold. If a ineow stole, bo bad only to make a twofold reparation. In the lams of Alfred ordinary theft Tas still only civil, but he who stole in a church was punished by the loss of his hand. The lawe of Ina named as the penalty death or redemption accord
ing to the wer-gild of the thief. By the same laws the thief might be slain if he fled or resisted. Gradually the severity of the punishment increased. By the laws of Athelstan death in a very cruel form was inflicted. At a later date the Leges Henrici Primi placed a thief in the kiag's mercy, and his lands were forfeited. Putting out the eyes and other kinds of mutilation were sometimes the puaishment. The principle of severity continued down to the present ceutury, and until 1827 theft of certain kinds remained capital. Both before and after the Conquest local jurisdiction over thieves was a common franchise of lords of manors, attended with sume of the advantages of modern summary jurisdiction. It might be exercised either over thieres who committed a theft or were apprehended within the lordship (infangthef), or over those inhabitants of the lordship who were apprehended elsewhere (outfangthef). Either or both franchises might be enjoged by grant or prescription. As lately as 1 Pb . and M. c. 15 infangthef and outfangthef were confirmed to the lords marchers of Wales. An analogous franchise was theam, or the right of calling upon the holder of stolon goods to vouch to warranty, i.e., to name from whom he received them. In the old law of theft there were to be found tro interesting survivals of the primitive legal notions which were found in Roman law. Up to a com paratively recent date a distinction analogous to that between furtum manifestunc and nee manifestum was of importance in English criminal practice. The thief "taken with the manner" was by the Statute of Westminster the First not to be admitted to bail (see Letters of Junius, 1xviii.). In modern procedure the probable guilt or innocence of the accused is not so much to be considered in a question of bail as the probability of bis appearance at the trial. The other matter worthy of notice is the old pursuit (secta) by bue and cry. In the pre-Conquest zodes the owner was generally allowed to take the law into his own band, as in early Roman law, and get back his goods by force if he could, no doubt with the assistance of his neighbours where possible. From this arose the later development of the hue and cry, as the recognized means of pursuing a thief. The Statutes of Westminster the First and of De officio coronatoris enacted that all men $^{\text {a }}$ should be ready to pursue and arrest felons, and ten years later the Statute of Winchester (1285) enforced upon all the duty of keeping arms for the parpose of following the hue and cry. It also made the hundred liable for thefts with riolence committed in it, an adoption no doubt in feudal lar of the old pre-Conquest liability of the frithborg. As justice became more settled, the hue and cry was regulated more and more by law, and lost much of its old natural simplicity This led to its gradually becoming obsolete, though the Statutes of Westminster the First and De officio coronatoris are still nominally law as far as they relate to the hue and cry. The Statute of Winchester as to the liability of the hundred was repealed in 1827.
The term theft in modern English law is sometimes used as a synonym of larceny, sometimes in a more comprehensive sense. In the latter sense it is used by Mr Justice Stephen, who defines it as "the act of dealing from any motive whatever, unlawfully and without claim of right, with anything capable of heing stolen, in any of the ways in which theft can be committed" (for which see $\S 296-300$ ), "with the intention of permanently convertiag that thing to the use of any person other than the general or opecial owner thereof" (Digest of the Criminal Lazo, § 295). In this broader sense the term applies to all cases of depriving another of his property, whether by removing or withholding it. It thus includes larceny, robbery, cheating, embezzlement, and breach of trust. Embezzlemeni is a statutory crime created as a separate form of
offence in the last century (see vol. viii. p. 159). The difference between larceny and embezzlement turns mainly on the fact of the master's being in actual or constructive possession of the stolen property (see Possession). Fraudulent breach of trust was not made a specific offence until 1857 (see Trust).

Larceny (a corruption of latrocinium), or theft proper, was felony at common lavr. The common law of larceny bas been affected by numerous statutes, the main object of legislation beiag to lring within the lav of larceay offencea which were not larcenies at common law, either becanse they were thefts of things of which there could be no larceny at cemmon law, e.g., beasts fere nature, title deeda, or choses in action, or because the coommon law regarded tham merely as delicts for which the remedy was by civil action, e.g., frandulent breaches of trust. The earliest Act in the atstutes of the resIm dcaliog with larceny appears to be the Carta Forestem of 1225 , by which fine or imprisonment was isflicted for atealing the king's deer. The next Act appears to be the Statute of Westminstcr the First (1275), dealing again with stcaling deer. From this it seems as though the beginnieg of legislation on the onbject was for the purpose of protecting the chases and parks of the king and the nobility. An immense mass of the old Acts will be fonnd named in the repealing Act of 1827,7 and 8 Geo. IV. c. 27. An Act of the same date, 7 and 8 Geo . IV. c. 29 , remored the old distinction between grand and petit larceny. ${ }^{1}$ The former was theft of goods above the value of twelve peoce, in the house of tho 2wner, det from the person, er by night, and was a capital crime. It was petit larcent where the value was twelve pence or ueder, the pnnishment being imprisonmeat or whipping. The gradual depreciation in the valno of moncy afforded good ground for Sir Henry Spclman's sarcasm that, while everything else becamo dearer, the lifo of man became continually cheaper. The distinction between grand and potit larcesy first appears in atatute law in the Statuto of Westrainster the First, c. 15, but it was not created for the first timo by that statute. It ia found in some of the preConquest codes, as that of Athelstan, and it is recognized io the Leges Henrici Primi. A distiaction between simple and compound larceny is still found in the booka. The latter is larceny accompanied by circumstances of aggravation, os that, it is io a dwellinghouse or from the person. Tho law of larceny is now contained chiefly in tho Larceny Act, 1861, 24 and 25 Vict. c. 96 (which oxtends to England and Jrelasd), a comprehensize enactreet including larceny, embezzlement, fraud by bailees, agents, bankers, factors, and trustecs, sacrilege, burglary, housebreaking, robbery, obtaining money by threats or by falso preteoces, and receiving stolen goods, and prescribing procedure, bath civil and criminal There are still, however, somo earlier Acts in force dealing with special cases of larceny, such as 33 Hcn. VIII. c. 12, as to atealing the goods of the king, and the Game, Post-Office, and. Merchant Shippigg Acts. Later Acts provido for larceny by a partner of partnership property ( 31 and 32 Vict. c. 116), and by a husband or wife of the property of the other ( 45 and 46 Vict. c. 75). Proceedings against persons aubject to naval or military law depend upen the Naval Discipline Act, 1866, and the Army Act, 1881. Thero are several Acts, both before and after 1861, directing how the property is to be laid is indictments for stealing the goods of connties, friendly societies, trades unions, \&c. The principsl conditions which mast exist in order to constitute larceny are these:(1) there must be an actual taking into the posscssien of the thief, though the emallest removal is sufficient; (2) there must be an intent to deprive the owner of his preperty for an indefinite period, and to assume tha cntire dominion over it, an intent eften described in Bractea's words as animus furandi; (3) this intent must exist at the time of taking; (4) the thing taken nust be ono capable of larcens either at common law or by statute. One or two cases falling under the law of larceny are of special interest. It was held more than once that a servant taking corn for the purpose of feeding his master's horses, but without any intention of applying it for his own benefit, wes guilty of larceng. To remedy this hardahip, 26 and 27 Yict. c. 103 was passed to declare such an oct not to be felony. The case of appropriation of goeds which bave been fouad bas led to sone difficulty. It now seems to ba the law that in order to coustitute a larceny of lost goods there must lo a felonieus intent at the time of finding, that is, an iutent to deprize the owne of them, coupled with reasonable meass at the same time of knowing the owner. The mere retentioe of the goods when tho owner bas become knowa to the finder does not maka the retention criminal Larceny of money may be committed whee the money is paid by mistake, if the prisoner took it animo furandi. In two recent cases the question mas argued before a very full Court for Crown Cases Reserved, and in each caso thera was a atrikiog diference of opinion. In Reg. v. Middleton, Lavc Rep., 2 Crown
${ }^{1}$ This provision was most uneceessarily ropeated in the larceny Act of 1861.

Coses Reservel. 38, the prisoner, a depositar in a post-office sariugs bank, received hy the mistake of tha clerk a lerger sum than was emitled to. The jury fonnd that he hed the animus furandi at the time of taking the moncy, and that he know it to be tho money of the postomaster-gencral The majosity of the court held it to he larceny. In a case ia 1885 (Reg. v. Ashwell, Law Rep.; 10 Uneen's Beach Division, 190), whero the prosccuter gave the prisoner s sovereign believag it to be a alnlling, and the prisoner took it noder that belief, but afterwards discovered its valuo and retained it, the rourt way equally divided as to whether the prisoner was guilty of larceny at common law, but held that he was not guilty of larceuy as a bailec. Tho procelare in prosecutions for larcony has been consilcrably affected hy recent legialation. The inconvenienres of the common-law rules of iaterprotation of indictments leal to certain smeadments of the law, now cootaned ia the Larceny Act, for the purpose of aroiding the frequent follures of justice owine ta the strietness with which indictmenta were construed. Three larcenies of property of the same person within six months may now be charged in one indictment. On an indictment for larceny the prisoner mey be found guilty of embezzlement, sad vice ecrsa; and if the prisoner be indicted for obtsiniog goods by false pretences, and the offence thru out to be larceny, he is not entitled to be ucyritterl of tho misdemeanour. A count for receiving may bo joined with the comnt for stealiug. In many cases it is unnecessary to allege or prove ownerslip of the property the subject of the indictment. The Act also coataina numerous provisione as to venue and the apprehengion of offonders. In another direction the powers of courts of Scommary Jerisdiction (q.v.) have been exteaded, in the case of charges of larceoy, embezzlement, and receiving stolen goods, agaiost childreu sad young persons and agaiust adults plealing gnilty or waiving their right to trial by jury. The maximun punishusent for larceny is fourtecn years peual servitude, hut this can only be inflicted in certain exceptional cases, such as horso or cattle stealing cad larceny by a servant or a person in the ecrvice of the crown or the police. The extreme punishment for aimple larceny after a previous conviction for felony is ten years penal servitudo. Whipping may be part of the eentence on boys under sixteed.

Robbery is larceny accompanied hy violence or threatened violence. Whother ohtaining money by threata to accuse of crime was robbery at common law mas open to some doubt. It is now a specific offence under the Larceny Act, punishable by penal eervitude for life. Whipping may be added as part of the scatence for robbery by 26 and 27 Vict. c. 44.

Cheating is either a common-law or statutory offence. An indictment for cheating at common law is now of comparatively rare occurrence. The etatutory crime of obtaining money by false pretenees is the form in which tho offence generally presents itself. Like embezzlensent, this offence dates as a statntory crime from the last century. It now depends upon the Lareeny Act. A falso pretenco is defined by Mr Justice Stephen as "a false represeata. tion marle eithor by words, by mriting, or by conduct that some fact or facts existed" (Digcst of the Criminnl Law, § 330). Tho principal points to notice are that the false pretence must be of an existing fact (e.g., it was held not to be a faise pretence to promise to pay for goods on delivery), and that property must have been actually obtained by the false pretence. The broad diatinction between this offence and larceny is that in the former the owner intends to part with his property, in the latter he does not. By 22 and 23 lict. c. 17 , no indictment for obtaining money bv false pretences is to be piesented or found by the grand jury unless the dufendant has been committed for trial or the indictment is anthorized in one of the ways mentioncd in the Act. The maximum punishment for the common-law offence is five or imprisomment at discretion, for the statutory five years' penal servitudo.
Slolen Goods. - The omber of the goods stolen has an action egainat the thief for the goods or their value. How far he is entitled to pursme his civil rioght to the exclusion of criminal prosecution does not seem very clear apon the authorities. Ouo of the latest statements of the Jam was that of Mr Justice Watkin Williams:-" It has been said that the true pridciple of the common law is that there is neither a merger of the civil right, nor is it a atrict condition precedent to such right that there ohall have been a prosecution of the felon, but that there is a duty imposed apon the injured person not to resort to the prosecution of his private suit to the neglect and exclusion of the vindication of the public las ; in my cpinion this view is the correct one" (Midland lnsorance Company v. Smith, Lavo Rep., 6 Queen'a Bench Division, 568). Dealing with stolen goods hy persons other than the thief may affect the rights of such persoas either criminally or civilly. Two varieties of crime arise from such dealings. (1) Receiving atolen goods knowing them to have been atolen, a misdemeanour at common Paw, is by the Larceny Act a felony punishable by penal aervitude for fourteen years where the theft anounts to felony, a misdemeanour [unishable by pens] eervitude for sevec years where the theft is a misdemeanour, as in obtaining goods by fe!se pretences. Recent possession of stnlen property may, according to circurastances
euppert the presumption that the prisones is a thief or that be is a reccirer. The Prevention of Crime Act, 1871, made important changes in the law of evidence in cherges of receiving. It allows, under proper safeguards, evidence to be giren in the course of the trial of the finding of other siolen property in the possession of the accused, and of a provions conviction for any offence incolrin.? fraud and dishonesty. (2) Componading theft, or theftbote, tha: is, taking back stolen goods or receiving compensation on coudition of not prosecuting, is a misdemeanour at common law. It need not necessarily be committed by the owner of the goods. Under the Larceny Act it is a felony punishable hy seveo ycars' peoal servitude to corruptly take money or remard for helping to recore: stolen goods without nsing all due diligence to bring the offender to trial. By the ame Act, to advertise or print or publish anv aidvertisement offering a reward for the return of stolen goods, and using any words purportiog that no questions will be asked, \&c., rende:s the offender liabln to e penalty of $£ 50$. This penalty mos: by 33 and 34 Vict. c. 65 , he sued for within eix months, eod the asscnt of the attorney-gencral is necessary. Various Acto provide for the liabilities of parmbrokers, publicans, marine-store dealers, and others ioto whose possession stolen goods come. Search for stolen foods can only be andertaken by a polica officer under the protection of a search marrant. The law as to stolen goods, 89 far es it affects the civil rights and lisbilitics of the owner and third parties, is shortly as follows. As a geucral rule a purchaser takes goods enbject to any infirmities of title. The property in money, bank-notes, and negotisble instruments passes by delivery, and a person taking sny of these bona fide and for valne is entitled to retain it as against \& former owner from whom it may have been stoled. In the case of other goods, a bona fide purcbaser of atolen goods in market orert (see SALE) obtaios a good title (except sa against the crown), provided that the thief has not been convictel. After conviction of the thief the property revests in the owner, aad the court before which the thief was couvicted may order reatitution, except in the cases specially mentioned in the Larceny Act, i.e., the bona fide discharge or transfer of a security for value with. out notice snd the fraudulent dealing by a trostee, banker, \&c., with goods and locuments of titlo to goods entrusted to him. After conviction of the thief the goods must be recovered from the person in whose hands they are at the time of the conviction, for any sales and resalea, if the frist sale was in market overt, bre good until conviction of the thief. If the goods were obtained by false protences and not by larceny, the question then is whether the property in the goods has passed or not, and the answer to this question depends upon the nature of the false pretences employed. If the vendee obtains possession of goods with the intention by the reador to transfer both the property and the possession, the property vests in tice vendee uatil the veador bas done some act to dis. affirns the transaction. But if there was never any such intention, - -if, for instance, the vendor delivers the goads to A. B. nader the belief that he is C. D.,-the property does not rest in the transferce, and the orvier may recover the goods cved from a bona finde purchaser. ${ }^{1}$

Scolland.-There is a vast quantity of Acta of the Scottish parliament dealing with theft. The general policy of the Acta was :o make thefts what were not thefts at common las, e.g., stealing fruit, dogg, hafks, or deor, and to extend the remedies, e.g., by giving the justiciar authority throughout the kinedom, by making the master in the case of theft by the eervant liable to give the latter up to justice, or by allowine the uso of firearma against thieres. The general result of legislation in England and Scotland has been to assimilate the law of theft in both kingdoms. As a rule, what would be theft in one would be theft in tbo other. There can be theft of children in Scots as in Roman isw, ander the name of plaginm. The crime of stonthrief is robbery accompanied by exceptional violence. The English receiving stolen foods and obtaining monoy under falso pratences are rapresented by the reset and fraud of Gcoits law. Theftbate or redemptio furti appears in legislation as early as the assizes of King William, c. ". The offender was there subjected to the ordeal of water if convicted? on the oath of three mitnessea, to be immediately hanged if the oath of three seniores were added. The offence was mate punishable by $1430, c .1,1515, c .2$, and appears etill to be a crime. Blacknailing, noder that name, was forbidden by 1567, c. 27. There is no consolidation Act for Scotland like the Larceny Act for England and Ireland, but various Acta are io force dealing with epecific offences or with procedure. Thus 7 Anne c. 21, § 7, makes theft by landed mea no longer treason, as it had previously been. 4 Geo. II. c. 32 deals with theft of lead, \&c., fixcel to houscs, 21 Geo. II. c. 34 with the admissibility of an accomplice en witness in a cherge of cattlo stealing, 51 Gco. 111. c. 41 with theft of linen, \&c. The most important Act relating to procedure is 31 and 32 Vict c. $95, \S 12$, by which s previous conviction for theft may be libelled and prored as aggravation at robbery, and a

previuns couviction tor robbery as aggravation of theft. Stolen goods are always taken subject to the inherent vitium reale of their acquisition, and the true owner may recover tham from any one in whose possession they are. The protection given hy market overt is unknown in Scotland. See Macdonald, Criminal Law, p. 18.
unknown in Scothand. See Macdonald, Criminal Law, p. 18.
Unuted States. The law depends almost entirely npon Stato
legislation, and is in general accordanco with tbat of England The only Acts of Congress bearing on the subject deal mith theft in the army and nary, and with theft and ruceiving on the high scas or in any $p^{3 l a c e}$ under the exclusive juristiction of tho United Statcs. The loctrine of market overt is not acknewledged by any
(J. W+.)

## THEISM

THE term thensm has three significations. In its wilest acceptation its object is the Divine, whether regarded as personal or impersonal, as one being or as a number of beings. In this sonse theism is coextensive with religion and worship, includes all forms of polytheism and of pantheism, as well as all varieties of mouotheism, and so may bo said to denote the genus of which polytheism, pantheism, and monotbeism are species. The conception of the Divine, in its utmost abstractness and generality, is, however, so rague that it may reasonably be donbted if the forms of fleism, thus understood, can be distributed into strictly logical and natural species, with definitions at once perfectly distinct in themselres and exactly accordant with phenomena. It may seem as if polytheism and monothoism mușt, by arithmotical necessity, be exclusive of each other and exhaustive of theism; but this is not so. Pantheism may clearly partake of the uature of both, and has been sometimes extravagantly polytheistic, sometimes only doubtfully distinguisbable from fully developed monotheism. Probably fer, if any, polytheistic religions aro purely polytheistic, or, in other words, do not imply in some mode and measure the unity es well as the plurality of the Divine. Christian monotheism answers to a formal definition of monotheism only inasmuch as it holds to the unity of the Godhcad, but contravenes it inasmuch es it holls that in the one Godhead there are three Divine persons, each God.

The complete negation of theism in its generie sense is atheism-the denial of the existence or of the knowability of tho Dirine. It is only in modern times that the word atheism has acg ired this meaning, only in recent times that it has come to be exclusively employed with this meaning. The Greeks meant by it simply disoelief in the Greek gods. The early Christians were called atheists because they refused to acknowledge the pagan de:ties, Protestants have been charged by Roman Catholics and Roman Catholics by Protestants witn atheism. Throughout even the 18th century the word was used in an extremely loose manner, and often affixed to systcms by which the existence and agency of God were uncquivecally recognized. Atheism, in the sense now generally admitted to be alene appropriate, may be of three specics,-namcly, denial of the existence of the Divine, denial that the Divine has been shown to exist, and denial that it can be knoirn that the Divine exists. The first species has been called dogmatic atheism, the second critical atheism; ;and the third has been designated, and may conveniently be designated, religious agnosticism. Agnosticism per se should not be identified with atheism or with any of its forms. The term antithcism has been used by some theologians, e.g., Clalmers and Foster. as equivalent to dogmatic atheism ; but it may with much more practical adrantage be employed to denote all systems of belief opposed to theism, either in the generic sense already indicated, or in the specific sense of monotheism. Understood in this latter mode, it is mach more comprehensive than the term atheism. Polytheism and pantheism are alike antitheistic theories, although on different grounds; while only those theorics which deny that there is evidence for beliof even in the existence of any god, any divine being, are atheistic.

It is somershat remarkable that the term theism by itself never occurs in its etymological and generic sense, never means as a separate word what it means in the compourds atheism, polytheism, pantheism, and monotheism. Ordinarily it is identified with monotheism, and consequently opposed to polytheism and to pantheism, as well as to o.theism. Whereas polytheism acknowledges a plurality of finite gods, theism as monotheism acknowledges only one absolute infinite God. Thereas pantheism regards all finite things as merely aspects, modifications, or parts of on eternal self-existent being-all material oojects and all particular minds as necossarily derised from a single infinite substance,-and thus combines, iu its conception of the Divine, monisin and determinism, theism as monotheism, while accepting rmonism, rcjects determinism, and attributes to the Divino all that is essentially implied in free personal existence and agency. Pantheism is, bow. orer, wonderfully protcan, and rarely conforms to its ideal ; hence tho systems called pantheistic are seldom purcly pantheistic, and aro often more monotheistic than pantheistic.

Sometimes the term theism is emplayeur in a still mere Thelsio special sense, namely, to denote one of two kinds of a monotheism, the other kind being deism. Although deus delam. and theos are equivalent, deism has come to be distinguished from theism. The former word first appeared in the 16th century; when it was used to designate antitrinitarian opinions. In the 17 th century it came to be applied to the riew that the light of nature is the only light in which man can know God, no special revelation having been given to the human race. Dr Samuel Clarke, in the Boyle Lectures preached in 1705, distributed deists into four classes. The first class " pretend to believe the existence of an eternal, infinite, independent, intelligent being, and, to aroid the name of Epicurcan atheists, teach also that this supreme being made the world; though at the same time they agree with the Epicureans in this, that they fancy God does not at all concern Himself in the gosernment of the world, nor bas any regard to, or care of, what is done therein." The secend class acknow ledge not only that God made all things, but that He sustains and governs them, jet deny that He has any ragard in His government to moral distinctions, these being merely the products of human will and law. The third class believe in the being. natural attributes, pro vidence, and to some extent in the moral attributes and government of God, but deny the immortality of the soul and a future state of rewards and punishments. The fourth class acknowledge the being, natural and moral perfections, and proridence of God, as also the immortality of the soul and a future state of rewards and punishments, yet profess to believe only what is discover nble by the light of rature, without believing any divise revelation (Clarke, On the Attrilutes, pp. 140-153, ed. 1S23). This division is not an exact classification, nor does it rest on any precise definition of deism, but it, with substantial accuracy, discriminates and grades the varieties of English deism. Clarke did not contrast deism with theism, or even employ the latter word. His contemporary, Lord Shaftesbury, on the other hand, generally used the term theism, yet only as synongmeus with deism.
and with a protest against either being opposed to revelation (Characteristics, vel. ii. p. 209, ed. 1727). Kant, in his Kiritik der reinen Fernunft, explicitly distinguished and opposed deism and theism, but in a very peculiar manner. "The person who belieres in a transcendental theology alone is termed a deist; he who acknowledges the possibility of a natural theology also, a theist. The fermer admits that wo can cognize by pure reason alone the existence of a supreme being, but at the same time maintains that our conception of this being is purely trauscendental, and that all that we can say of it is that it pessesses all reality, without being able to define it more closely. The second asserts that reason is capable of presenting us, from dhe analogy of nature, with a more definite conception of this being, and that its opcrations, as the cause of all things, are the results of intelligence and free will. The former regards the supreme being as the cause of the world-whether by the necessity of his nature, or as a free agent, is left undetermined; the latter considers this boiog as the author of the world" (Werke, ii. 491, edited by Rosenkranz, Meiklejohn's tro, 387-8). The account here given of deism seems neither self-consistent nor intelligible, and applies, equally well or equally ill, to every system-atheistic, agnostic, pantheistic, idealistic, or materialistic-which admits the existence but not the intelligence or personality of an Crvesen, eternal being, or first cause; and the account of thoism excludes all reference to revelation, and applies to every form of what has been regarded as deism. In receent theology deism has generally come to be regarded as, in common with theism, bolding in opposition to atheism that there is a God, and in opposition to pantheism that God is distinct from the world, but as difering from theism in maintaining that God is separate from the world, having endowed it with self-sustaining and self-acting. powers, and then abandoned it to itself. This distinction is real, and perhaps the best attainable. At the same time many called deists must be admitted not to have taught deism thus understood: for example, most of the "English deists" did not deny that God was present and active in the laws of nature, but merely denied that He worked otherwise than through patural laws. If by deism be meant belief in a personal God who acts only through natural laws, and by theism belief in a personal Cod who acts both through natural laws and by special interrentions, this distinction also is real, and may be useful. The chief objection to it is that deism when so contrasted with theism does not denote, or eren iaclude, what theologians have generally agreed to call by the name.

The present article will treat specially of theism in the sense of menotheism, but not to the exclusion of the relations between theism thus uaderstoon and theism in other acceptations.

Monotheism has been very generally assumed to havo been the primitive religion. Lord Herbert, Cudworth, and others bave elaborately defended this opinion in the pazt, and it still fiods learned advocates. On the other hand, the rast majority of recent anthropelogists held that :eligion originated in some rude phase of pelytheism, and that monotheism has been everywhere preceded by polytheism. Schelling, Max Müller, and Hartmann have maintained that the starting-point of relizion was henotheism, an imperfeet kind of monotheism, in which God was thought of as one, only because others had not yet presented thems.lves to the mind,-a menotheism of which pelytheism was not the contradiction, but tho natural development. Pantheism has also been frequently represented to bo the earlicei phase of religion. All theso representations, homever, will Le found on examination to be very conjectural. The present state of our knowledge does not warrant our
holding any view regarding the nature of primerai retıgion as established. The data which carry us farthest in our search for the historical origin of religion are undoubtedly the names expressive of the Divine which have been pres served in the most ancient languages. They show us how men conceired of the Divinity leng before the erection of the oldest monuments or the inscription of the oldest records. Language is much older than any of the state; meuts in language. But language by no means carries us back to primitive man, or even to the historical origin of the idea of deity. The Egyptian word nutar and th' names of the Egsptian geds found in the oldest Egyptian inscriptions prove that at a date long before the Egyptians wrote history, or are known to have worshipped animala or ancestors, they conceired of Divinity as power, and their deitics as great cesmic forces; but, as that word and these names cannot be shomn to havo belonged to man's primitive speech, they cannot show what was man's primitive religious belief, and do not disprere that the forefathers of the people shio first used them may have had some lower and ruder conception of the Divine than that which they convey ' There are, according to Dr Legge, ue werds in the Chinese language knowa to by older than ti, t'ien, shang-ti, and these words are good Listorical evidence that the Chinese conceived of the Divine, thousands of years befors the Christian era, as: universal ruling power, comprehending the visible heavens, and an invisible, iafinite, omnipresent force, manifested in the azuro of the firmament, possessed so far of intellectua' and moral qualities, and werking towards ethical ends. There is no evidence that when the Clinese first used these words they worshipped fetiches, but neither is there evidence to the contrary, and even if there were it would not disprove that the aucestors of the Chinese had passed through an era of fetichism. All members of the Semitic family of languages have the werd $E l$, or some nodification of it, to denote deity, and herice we may conclude that the Semites had the werd in this sense before they separated and became distinct peoples, but not that the idea of God originated when the word was first thus employed. All members of the Teutonic group of languages have the word God, or some slightly modified form thereof, and all members of the Slavic group of languages have the word Bog, or some modification thereof, to express the same conception: it does not follow that either Teutons or Slavs had no idea of deily until the former so applied the word God, and the latter so arplied the word Bog. Beth Teutens and Slavs are Aryaus, and there is an older Argan term for deity than either God or Bog. The Sanscrit deva, the Latin deus, and the nortbern ti, tivaz, are forms of a word which must have been used by the Aryans to express their idea of the Divine mhen, in a prehistorie age, they lived together in their orizinn? heme ; but wo are not entitled to infer that eren that prehistoric Aryan term is the oldest word for deity. It may not be older than the primitive Semitic word or the primitive Turanian werd, or the nutar of the Egsptians, or the $t$ tien of the Chinese, or the carliest desiguations for the Divine in the earliest African and Anerican languages And there may bave been Divine names older than auy of these. The scieuce of language has been able to recoo struct in part a prehistoric Aryan language, and mi.y similarly be able to reconstruct a prehistoric Semitic language, a prehistoric Turaniau, and perhaps a prehistoric Hamitic lauguage. Should it proceed thus far it will probably perceive that all these prebistoric languages arose out of a still carlier prehistoric language in which also were words expressing ideas of the Dirine. There may be many strata of language buried too deep for human excaration io the abysses of unrecerded time. Bv no pos-
sibility, therefore, can the analysis of existung languages disclose to us the oldest name for deity or the historical origin of the idea of deity. Geology shows the vast antiquity of man, and nothing proves that he may not have been awed or comforted by thoughts of the Divine ages before the invention of the oldest Aryan or Semitic words. It is merest conjecture to assign the formation of the conception of deity to the dawn of historic time. Between primitive speech, primitive religion, the primitive condition of man, and the little streak of light called human history there stretches an immeasurable expanse of darkness.

The belief in primitive monotheism is generally rested on the authority of the opening chapters of Genesis. It is, however, doubtful if the appeal to them be legitimate, because doubtful if their strict historicity can be proved to those who insist on judging them merely by critical and historical criteria, or even if it can be fairly inferred from the view that they form part of a revelation. Then, although these chapters plainly teach monotheism, and represent the God whose words and acts are recorded in the Bible as no mere national Cod but the only true God, they do not teach, what is alone in question, that there was a primitive monotheiem,-a monotheism revealed and known from the beginning. They give no warrant to the common assumption that God revealed monotheiem to Adam, Noab, and others before the flood, and that the traces of monotheistic beliefs and tendencies in heathendom are derivable from the tradition of this primitive ard antediluvian monotheism. The one triue God is represented in Genesis as making himself known by particular words and in particular ways to Adam, but is nowhere said to have taught him that He only was God. Adam knew, of course, only one God, as there was only one God to know; but that he knew there was only one God we are not told, nor are any grounds given us even for conjecturing that he knew it. We are told that God created the heavens and earth, but not that Adam was told it, and we know too littlo about Adam to be able to conceive how he could have understood the statement. We are informed that he knew God-the God who manifested himself to him in particular acts, but not what general idea he formed of God-whether henotheistic, pantheistic, or monotheistic, whether definitely exclusive of polytheism or not, or in what measure anthropomorphic. It is not otherwise as regards what is reported of Ncah. In fact, primitive monotheism is read into the records in Genesis only because they are read in an inaccurate and uncritical manner. If read aright, it would be seen that, while they speak much of how God acted towards man, they epeak so extremely little as to what early man knew of God that the appeal to them on behalf of the hspothesis of primitive monotheism must be futile, even on the traditional view of their authorship and historicity. ${ }^{1}$

It is impossible to prove historically that monotheism was the primitive religion. Were, then, the oldest known historical forms of religion monotheistic? Many maintain they were, but adequate evidence has never been adduced for the opinion. The oldest known religion is probably the Egyptian, and for at least three thousand years its

[^95]history can be traced by the aid of authentic records con- Esyptrac temporary with the facts to which they relate. Its religion. origin, however, is not disclosed by Egyptian history, and was unknown to the Egyptians themselves. When it first appears in the light of history it has already a defnite form, a character not rude and simple, but of considerable elevation and subtility, and is complex in contents, having certain great gods, but not so many as in later times, ancestor-worship, but not so developed as in later timcs, and animal worship, but very little of it as compared with later times. For the opinion that its lower elements were older than the higher there is not a particle of properly historical evidence,-not a trace in the inscriptions of mere propitiation of ancestors, or of belief in the absolute divinity of kings or animals; on the contrary, ancestors are always found propitiated through prayer to some of the great gods, kinge worshipped as emanations and images of the sun-god, and the divine animals adored as divine symbols and incarnations. The greater gods mentioaed on the oldest tombes and in the oldest writing: are comparatively few, and their mere names-Osiris, Horus, Thoth, Seb, Nut, Anubis, Apheru, Ra, Isis, Neith, Apis-conclusively prove that they were not ancient kinge or deceased ancestors, but chiefly powers of nature, and especially, although not exclusively, of the heavens; yet from the earliest historical time they were regarded as not merely elemental, but as also ethical powers, working indeed visibly and physically in the aspects and agents of nature, yet in conformity to law and with intelligence and moral purpose. Wherever the powers of nature are thus worshipped as gods, the feeling that the separate powere are not all power, that the particular deities are not the whole of divinity, must be entertained and will find expression. The Egyptians had undoubtedly such a sense of the unity of the Divine from the dawn of their history, and they espressed it so strongly in various ways from \& very early period that they have been pronounced monotheists not merely by theologians attached to a traditional dogma but by most eminent Egyptologists-De Rouge, Mariette, Brugsch, and Renouf. As these scholars, however, truthfully present the facts, they satisfactorily refute themselves. À religion with about a dozen great godsdistinct as regards their names, characteristics, histories, relationships, symbols, and worship-is not monotheism in the ordinary or proper sense of the term. A religion in which the Divine is viewed as merely immanent in natura, and the deities deemed physical as well as moral, elemental as well as ethical powers, is rather pantheistic than monotheistic. Further, all assertions to the effect that the unity of the Divine is most emphatically expressed in the earliest historical stages of the religion are contrary to the evidence adduced even by those who make them. To quote Patah-Hotep as a proof of the monotheiem of the Egyptian religion in its oldest historical phase is as uncritical as it would bo to draw Homeric theology from the dialogues of Plato. The Egyptian religion was a polytheism which implied monism; it was not monotheism, which is exclusive of polytheism. Hence, notwithstanding frequent approximations to monotheism, the general result of the development of its monistic principles was pantheism, not monotheism. As to the ancient Chinese religion, Dr Legge easily shows that Prof. Tiele's description of it as "a purified and organized worship of spirits, with a predominant fetichist tendency," has no historical warrant, but he fails complete! y to substantiate his own view, namely, that it was a strict and proper monotheism. The names T'ien and Ti afford no evidence that the early Chinese fathers regarded deity as truly and properly spiritual and personal. It is not in the mest ancient Chinese writings that sdirituality and personality
are ascribed to $T$ 'ien, and such ascriptions are exceptional in Chinese writings of any date. The great development of ancestor worship in China has been largely due to the impersonal character of T"ien. The arguments which have been adduced in support of the hypothesis of a primitive Semitic monotheism are also insufficient. M. Renan's belief in a monotheistic instinct peculiar to the Semitic race has been so often and so convincingly ehown to be contradicted both by history and psychology that another refutation of it might well be regarded as a mere slaying of the slain. Divine names like El, Baal, Adon, and Mclech, being the oldest terms in the Semitic languages expressive of the Divinity, and baving been retained through all the changes and perversions of Semitic religien, have often been maintained to imply that primitive Semitic belief was monotheistic. But in reality Baal, Melech, and Adon were not names originally, or indeed at any time, given to the one Supreme God, or exclusively to any particular god ; on the contrary, they were titles applicable to many different gods. The oldest historical form of Aryan religion-the form in which the Yedas present it-is designated by Max Müller henotheism, in opposition to the organized anthropomorphic polytheism to which he restricts the term polytheism, but henotheism thus understood includes polytheism in its wider and more ordinary acceptation, while it excludes monotheism properly so called. The oldest known form of Aryan religion was indubitably polytheistic in the seuse of being the worship of various nature-deities ; and everything approximating to monotheism in India, Persia, Greece, and other Aryan-peopled lands was the product of later and more advanced thought. The assertion that history everywhere or even anywhere shows religions belief to have commenced with monotheism is not only unsupported by evidence, but contrary to evidence. ${ }^{1}$

While the oldest known religions of the world were thus not forms of monotheism, neither were they mere polytheisms, wholly devoid of monistic and monotheistic germs and tendencies. The Chinese religion, indeed, can hardly be said to have been at any period a polytheism, the Chinese people no more regarding spirits and deceased ancestors as gods than Roman Catholics so regard angels and saints. They bave throughout their whole known history explicitly and clearly acknowledged the unity of the Divine-the uniqueness of Tien (Ti, Shang-Ti). Had they in like manner acknowledged the spirituality, personality, transcendence of the Divine, their monotheism would have been indubitable. Then, even in those ancient religions, where a plarality of deities is apparent, a sense of the unity of the Divine is notwithstanding implied, and in the course of their development comes to expression in various ways. It could not be otherwise, for in these religions the divine powers (deities) are also powers of nature, and bence sprung from and participant in a mysterions common nature, an ultimate and universal agency which is at once the source of physical and divine existences and forces. Neither nature-deities nor powers of nature are ever conceived of, or indeed can be conceived of, as entirely distinct and independent. The lowest forms of polytheism, such as fetichism and animism, have no more marked characteristic than the indefiniteness of their

[^96]idea of the Divine and the imperfect individualization of their deities. In the highest formis of nature-worship, e.g., the Vedic, Egyptian, and Babylonian-Assyrian, the same trait is perceptible. This implicit menism of natureworship may, through the action of rarious causes, come to explicit utterance in diverse modes, and has in fact done so, with the result that even in the oldest known polytheisms are to be found remarkable approximations to monotheisn. One form of approximation was benotheism. When worship is ardent and earnest the particular god worshipped is apt to have ascribed to him the attribute日, as it were, of all the gods-an almost absolute and exclusive godhead. Max Müller has shown how prominent a phenomenon henotheism is in the Vedas, Page Renouf has shown that it is very conspicuous also in the ancient inscriptions and hymns of Egypt. Horus, Ra, Osiris, Amun, Knum, were severally spoken of as if each were absolnte God, invested not only with distinctive divine attributes but with all divine attributes. In the religious records of Babylon and Assyris monotheistic approximations of the same kind are likewise sommon. Now, in theaselves such monotheistic modes of expression may truly be held to be the products of passing moods of mind, not reflexions of permanent conviction. But every mood of mind tends to perpetuate itself, and the enthusiasm of piety which utters itself in henotheistic praises and prayers may take abiding possession of the soul of a powerful ruler or even of the hearts of a whule class of seciety or of a whole people, and may seem to them to find the strongest possible confirmation in experience. We may illustrate from Assyrian religious history. Tiglath-Pileser showed a marked preference for the worship of Asshur, to him "king of all the gods," "he who rules supreme over the gods." Nebuchadnezzar, again, showed a great partiality-for the god Merodach, and applied exclusively to him such magnificent titles as "the lord of all beings," "the lord of the house of the gods," " the lord of lords," "the lord of the gods," "the king of heaven and earth." Nabonidus, on the other hand, specially revered Sin, the moon-god, and represented him as "the great divinity,"" "the king of gods upon gods," "the chiei and king of the gods of heaven and earth." A preference of this kind might arise from some merely accidental or personal cause, and be confirmed by experiences mainly individual, and yet have a vast historical influence. The devotional choice of a people must tend, howerer, still more than that of any monarch to the elevation of one god towards absolute godhead It was accordingly what raised Asshur, the special national god of the Assyrians, to the head of the BabylonianAssyrian pantheon during the Assyrian period. In a struggle of deities for supremacy the national god has an immense advantage in that he lias both the piety and the patriotism of the people on his side. His rule is identified with providence ; he is credited with all the victories and successes of the nation; and his power and godhead seem certified by fact and experience. The logic of events in every adrancing nation combines with the essential tendencies of piety and with the growth of conscience and reason to promote belief in the unity and perfection of the Divine. The general course of providence is no more polytheistic than it is a thcistic. The best exemplification of the operation of tho picty of an influential class in transcending polytheism is Brahmanism. But for the impulse given by Brahnanical piety Brahnranical speculatiou would never have reduced the Vedic gods to manifestations of Brahma. Honotheistic forms of approximation to monotheisin are not, however, the only ones. Particular gods -all of them-may be dropped out of vier, and the generic thought of God alone retained. The mind and
heart of the devout may be directed exclusively to the power of the powers, the God in the gods, God simply, the Divinity. The formation of names expressing Divinity in the abstract is an evidence of the existence of such a process, and names of the lind are to be found even among very rude peoples. But there are more obvious and conclusive indications. In one of the most ancient of books, for example, and probably the oldest manuscript in the world, the maxims of Patal-Hotep, a wise Egyptian prince of the fifth dynasty, God simply (nutar) is often spoken of without a name or any mythological characteristic, and in a way which is in itself quite monotheistic. "If any one beareth himself proudly he will be humbled by God, who maketh his strength." "If thou art a wise man, bring up thy son in the love of God." "God loveth the obedient, and hateth the disobedient." Sentences like these standing alone would be prononnced by every one monotheistic ; and even when standing alongside of references to "gods" and "powers" they show that said gods and powers were not deemed by the Egyptian sage inconsistent with oneness of power and godhead or exhaustive of their fulness. In Babylonian-Assyrian religious history there are also distinct traces of the rise of the spirits of worshippers above particular deities, simply to deity. Sometimes they appear with special clearness in connexions which tell of awakened and afflicted conscience, of the pressure of a sense of $\sin$ and guilt forcing on the heart, as it were, a conviction of One with whom it has to deal, of its need of the forgiveness and favour, not of this god or of that, but of God. The following passage may be cited as an instance. "O my Lord, my sins are many, my trespasses are great, and the wrath of the gods has plagued me with disease, and with sickuess and sorrow. I fainted, but no one stretched forth his hand! I groaned, but no one heard! O Lord, do not abandon Thy servant ; in the waters of the great stream do Thou take his hand; the sins which he has committed do Thou turn to righteousness." Many parallel passages might be drawn from Hindu, Greek, and other sources. Clearness of moral perception is decidedly favourable to monotheistic belief. The practical reason contributes as well as the speculative reason, and precisely in the measure of its healthiness and vigour, to the formation of a true idea of the Divine. It was due more to their moral earnestuess and insight than to their intellectual superiority that the Persians came nearer to monotheism than any other people of heathen antiquity. Abriman was entirely evil, aud therefore only to be hated and combated; While Ahuramazd was absolutely divine, perfectly good, and therefore to be supremely worshipped and obeyed. This moral dualism approached more closely to true monotheism than the later speculative monism, which placed above both Ahuramazd and Abriman Zervanakarene, boundless time, indeterminate being, an ethically indifferent destiny. Finally, reason in striving to understand and explain the world tends towards monotheism. The mind cannot be expected to recognize the uuity of God until it recognizes the unity of nature; when it sees vature to be a whole, a universe or cosmos, it cannot but form a conception of it which will be pantheistic, if the unity of substance, law; and evolution be aloue acknowledged, and monotheistic if a unity of causality, rational plan, and ethical purpose be also apprehended. In the measure in which reason advances either on the path of scientific inrestigation or of philosophical speculation, polytheism must retreat and disappear ; in the measure in which it discerns unity, order, sygtem, moral government, indications of spiritual character and design in the world, monotheism must rise and spread. Now, in the chief progressive heathen nations reason, it can be proved, has gradually gained on imagination. Hence the
polytheisms which they built up in their youth have bee: undermined and broken down by them in their maturity. ${ }^{1}$

A monotheistic movement can be clearly traced in ancient Greece. The popular religion of Greece, as it appeared in the Homeric poems, was as distinctly poly theistic and as little monotleistic as any known religion. Its gods were all finite, begotten, and thoroughly indi, vidualized beings. The need of unity was responded to only by tho supremacy of Zeus, and Zeus was subject to destiny, surrounded by an aristocracy far from orderly or obedient, and participant in weakness, folly, and vice. To its eternal honour the Greek spirit, however, was not content with so inadequate a conception of the Divine, but laboured to amend, enlarge, and elevate it. The poets and dramatists of Greece purified and ennobled the popular myths, and, iu particular, so idealized the character and agency of Zeus as to render them accordant with a true conception of the Godhead. The Zeus of Eschylus and of Sophocles was not only not the Zeis of Honier, but was a god belief in whom was inconsistent with belief iu any of the Honeric gods. The dramatists of Greece did not assail the popular conception of Diviuity, but they substituted for it one which implied that it was without warrant or excuse. They developed the germs of monotheism in the Greek religion, while leaving untonched its polytheistic assumptions and afirmations. These, however; were not only persistently undermined, but often directly attacked by the plilosophers, some of whom eventually reached a reasolled knowledge of the one absolute Nind. Xenophanes, Limpedocles, and Anaxagoras were among the pre-Socratic philosophers who, on grounds of reason, rejected the polytheism and anthropomorphism of the current mythology, and advocated belief in one allperfect divine nature. Socrates, although avoiding all attacks on the popular religion calculated to weaken the popular reverence for divine thiugs, had real faith only in the one supreme Reason, the source aud end of all things; and the best representatives of later Greek philosophy were in this respect his followers. Plato attained by his dialectic a conception of God which will always deeply interest thoughtful men. God he deemed the lighest object of knowlelge and love, the source of all being, cognoscibility, truth, excellence, and beauty,-the One, the Good. The controversy as to whether his conception may he more correctly designated theistic or pantheistic will, perhaps, never be brought to a decisive conclusion, but in its general truth and graudeur it must be admitted far to transcend either the monotheism of the vulgar or any popular form of pautheism. Aristotle's characteristic cautiousness of judgment showed itself in the very meagreness of his theology. The representation which he gives of God hardly meets at all the demands of affection and of practical life, jet so far as it goes will be generally regarded as thoroughly reasonable. It is more unequivocally theistic than that of Plato. It sets forth God as without plurality and without parts; free from matter, contingency, change, and development; the eternal unmoved mover, whose essence is pure energy; absolute

[^97]spirit，self－thinking reason，the voń⿱宀八工 vońrews；the one perfect being：whose life is completely blessed，and whose likeness is the goal towards which the whole universe tends．Stoicism was originally and predominảntly a materialistic or bylozoic form of pantheism ；but some of its greatest representatives conceived of God in a decid－ edly theistic manner as the supreme moral reason．The beautiful hymn of Cleanthes to Zeus is full of the purest devotional feeling，springing from a clear sense of personal relationship to the one all－ruling personal Spirit．Greek philosophy proceeded throughout its whole course in entire independence of the popular polytheism，and was a con－ tinuous demonstration of its futility；and it largely con－ tributed to that reasoned natural knowledge of God which must underlie all rational belicf in revelation．It discerned in some measure all tho chief arguments which have since－ been employed as theistic proofs．It failed，ho rever，to conceive of God as truly creative，or of the universe as in its very substance the result of divine action；it failed also to make evident，even to cultured minds，the superiority of monotheism to pantheism and scepticism ；and it failed especially to convert the common people to faith in one sole Deity．${ }^{1}$
Israel presents us with the first example of a mono－ to cadistic nation．Tho controversies as to how Israel ac－ quired this pre－eminenco cau only be decided by critical and historical investigations into which we cannot here enter（see Israfl）．
The science oi Old Testament theology，giving due beed ．o the results of critical，historical，and exegetical research regarding the documents with which it deals，has to trace by what means and through what stages Hebrew mono－ theism was developed and established；and to the treatises on this science our readers must be referred．The mono－ theistic movement in Israel was one of continuous progress through incessant conflict until a result was reached of incalculable value to humanity．That result was a faith in God singularly comprehensive，sublime，and practical，－ a faith which rested，not on speculation and reasoning，but on a conviction of God having directly revealed Himself to the spirits of men，and which，while ignoring meta－ physical theorizing，ascribed to God all metaphysical as well as moral perfections；a faith which，in spite of its simplicity＇，so apprehended the relationship of God to nature 2s neither to confound them like pantheism nor to separate them like deism，but to assert both the immaneace and the transcendence of the divine ；a faith in a living and per－ sonal God，the almighty and sole creator，preserver，and ruler of the world ；a faith，especially，in a God holy is all His ways and righteous in all His works，who was directing and guiding human affairs to a destination worthy of His own character ；and，therefore，an csscatially ethical， elevating，and hopeful faith．The existonce of utterances in the Hebrew Scriptures which show that Hebrew faith was not always thus enlightened，and sometimes conceived of God as partial and cruel，is no reason for not acknow－ edging the gencral justice and grandeur of its representa－ tion of the Supreme．${ }^{2}$

The God of the Old Testament is also the God of the New．Christ and the aposties accepted what Moses and he prophets had taught concerning God ；they assigaed to

[^98]Him no other attributes than had already becn assigned to Him．Like Moses and the prophets also they mado ac attempt formally to prove the existence or logically to define the nature of God，but spole of Him either as from vision or inspiration．And yet their doctrine of God has original and peculiar features．Thus，first，the fatherhood of Clod was taught with incomparable distinctness and fulness by Jesus Christ，－a fatherhood not merely of natural creation or national clection，but of spiritual relationship of love，sympathy，mercy，and grace for individual souls．Such fatherhood，if acknowledged at all，was only very rarely and vaguely aeknowledged in heathendom，and，although not wholly absent from the Old Testament，is far from clearly and prominently there， and，indeed，is present chiefly by implication in passages which refer directly only to God＇s connexion with the people of Israel，as an elect and covenant people；it is conspicuous and central，however，in the conception of God introduced by Christianity．Secondly，Divine father－ hood had its correlate in Divine sonship．God is repre－ sented in the New Testament as revealing His fatherhood through His Son，Jesus Christ．In Old＇Testament repre－ sentations of Israel，the Messiah，and Wisdom，and in the Logos doctrine of Judæo－Alexandrian philosophy，some approximations to this conception of the Divine may be traced，but they fell far short of it．According to the New Testament，God is not merely infinitely exalted above the world and definitcly distinguished therefrom，nor merely immanent and everywhere operative in nature，but also incarnate in Christ ；and Christ is not merely＂the Son of man，＂essentially shariag in humauity and truly representing it before God，but also＂the Son of God，＂ essentially sharing in Divinity，and giving the fullest disclosuro of it to man．The foundation of the Christian faith as laid down in the New Testament is that Christ through His uniquo relation as Son to the Father perfectly declared aod expressed the nature and will of God in relation to human salvation．Thirdly，God is exhibited in the New Testament as the Spirit，the Holy Ghost，who dwells in the spirits of men，to work in them the will of the Father，and to conform them to the image of the Son． Only when thus exhibited can the revelation of the Divine name be regarded from the New Testament point of view as other than manifestly incompletc．Even the manifesta－ tion of God in Christ，being objective and single，must be supplemented by a manifestation which is subjective and multiple，before the one God，the one Christ，can find a place in the manifoldness of souls，the multitude of sep－ arate hearts and lives．The manifestation of the Spirit is such a manifsstation，and completes in principlo tho revelation of．the Christian idca of God，the revelation of Iis threefold nature and name．This revelation completed God can be thought of as absolute spirit，absolute love， absolute good，and was，to some extcnt explicitly，and throughout implicitly，so represented in the New Testa－ ment．It is preciscly in virtue of the threefold represen－ tation of God characteristic of the New Testament that Christianity is still held by so many of the world＇s pro－ foundest thinkers as the alisolute and perfect religion，the croma and consummation of religion，－speculatively con－ sidered，an absolute revelation of God，and practically considered，a perfeet salration，－within which thero may be infinite evolution and progress，but beyond which there can be no true light or real growth．${ }^{3}$

The threefold representation of God in the Ner Tresta－ ment was an eatirely religious and practical representa－ tion，inseparably connected with the historical facts of

[^99]Christ's life and the spiritual experiences of the early Cluristians. It was not an ontological or even theological doctrine, and will be identified by no competent exegete with the dogma of the Divine Trinity set forth in the cecumenical creeds. The propositions constitutive of the dogma of the Trinity-the propositions in the symbols of Nice, Constantinople, and Toledo relative to the immanent distinctions and relations in the Godhead-were not drawn directly from the New Testament, and could not be expressed in New Testament terms. They were the products of reason speculating on a revelation to faith-the Nerr Testameres representation of God as a father, a redeener, and a sanctifier-with a view to conserve and vindicate, explain and comprehend it. They were only formed through centuries of effort, only elaborated by the aid of the conceptions and formulated in the terms of Greek and Foman metaphysics. The evolution of the doctrine of the Trinity was far the most important fact in the doctrinal history of the church during the first five centuries of its post-apostolic existence. To trace and describe it fully would be almost to exhibit the history of Christian thought during these centuries. It had necessurily an immense influence on the development of theism. The acceptance of the catholic doctrine of the Trinity implied the rejection of pantheism, of abstract monotheism, of all forms of monarchianism or unitarianism. It decided that theistic, development was not to be on these lines or in these directions. At the same time the dogma itself was a seed for new growths of theistic thought, and demanded a development consistent mith its own nature. It is a doctrine, not as to the manifestations and revelations of Godhead, but as to their gromnd and explanation, the constitution of Godhead, a doctrine as to a trinity of essence, which accounts for the Trinity of the gospel dispensation. It affirms the unity of God, but requires us to conceive of His unitr, not as an abstract or indeterminate self-identity, not as "sterile, monotonous simplicity," but as a unity rich in distinctions and perfections,the unity of an infinito fuluess of life and love, the unity of a Godhead in which there are Father, Son, and Holy Spirit, a trinity of persons, a diversity of properties, a variety of oficees, a multiplicity of operations, yet sameness of nature, equality of power and glory, oneness in purpose and affection, harmony of will and work. It finds its dogmatic expression as to what is ultimate in it in the formula-One substance in three persons, of which the first eternaliy generates the second, and the third eternally: proceeds from the first and second. Now, manifestly, however much such a doctrine as this may have satisfied thought on a revelation as to the Godhead, it cannot have exhausted or completed it. If it answered certain questions it raised others, and these more speculative and profound than thoso which had been answered. What is meant by affirming God to be "substance" or "in three persons"? What is meant by divine "generation" or "procession"? How are the substance and persons related? How are the persons distinguished and interrelated? These and many kindred and connected questions reason became bound to discuss by its adoption of the doctrine of the Trinity. This obligation could only be temporarily and partially cvaded or concealed by representing the doctrine as "a mystery" to be accepted simply on authority or with blind faith. Data of the doctrine may have been given to faith, but the doctrino itself was the rork of reason, and on no ground not plainly absurd could that work be held to have terminated in 589 A.D. As soon as an inspired record is left at all, as soon as any speculation is allowed on its contents, as sonn as the process of forming doctrine is permitted to begin, all conceirable right to stop the movement anywhere is lost. Br the
blending, howerer, of trinitarianism with theism the whole claracter of the latter was, of necessity, profoundly changed. A trinitarian theism must be vastly different from a unitarian as regards practice. It must be equally so as regards theory. It must he far more speculative. Dy its very nature it is bound to undertake speculative labours in which a simply unitarian theism will feel no call to engage. ${ }^{1}$

It was the general conviction of the early Christian writers that formal proofs of the Divine existence were neither necessary nor useful. In their view the idea of God was native to the soul, the knowledge of God intuitive, the mind of man a mirror in which, if not rusted by sin, God conld not fail to be reflected. The design argument, however, came early into use and was frequently employed. More speculative modes of reasoning were resorted to by Dionysius of Tarsus, Angustine, and Boetius. The unity of God had to be incessantly affirmed against polytheists, Gnostics, and Mlanichæans. The incomprehensibility of God and His cognoscibility were both maintained, although each was sometimes so empbasized as to seem to obscure the other. That the knowledge of God may be reached by the three ways of cousality, negation, and eminence was implied by the pseudo-Dionysius, although only explicitly announced by Scotus. Neither any systematic treatment of the Divine attributes nor any elaborate discussion of single attributes was attempted. The hypothesis of eternal creation fonnd a vigorous defender in Origen, but met with the eame fate as the dualist hypothesis of uncreated matter and the pantheistic hypothesis of cmanation. Of all the patristic theolngians Augustine was undoubtedly the most philosophical apologist and exponent of theism. He alone atteinpted to refute agnosticism, and to find a basis for the knowledge of God in a doctrine of cognition in gencral. On the large, difficult, and as jet far from adequately investigated subject, the influence of Platonic and Aristotelian, Stoic and Academic, Neopythagorean and Neoplatonic speculation on the formation of the Christian doctrina de Deo, it is, of course, impossible here to enter. ${ }^{2}$

Mohammed (570-632) founded a monotheistic religion which spread with amazing rapidity through Arabia, Syria, Persia, North Africa, and Spain, and gave, almost wherever it spread, a mighty impulse to the minds and wills of men. It was received as the gifl of special inspiration and revelation, although its creed contained little of moment on which reason would seem to be incompetent to decide. It had obvious merits, and must be admitted to have rendered real and important services to culture, religion, and humanity, but had also conspicuous faults, which have done much injury to individual, domestic, and national life. If the latest were always the best, it would be the most perfect of the three great theistic religions of the world; but it is, in fact, the least developed and most defective. Instead of evolving and extending, it marred and mutilated the theistic idea which it borrowed. Instead of reprosenting God as possessed of all spiritual fulness and perfections, it exhibited Him as deroid of the divinest spiritual attributes. It recognized His transcendent exaltation above His creatures, but not His sympathetic presence with His creatures; apprehended vividly His almighty power, His cternity, His ommipresence and omniscience, but only vaguely and dimly His moral glory, His love and goodness, His rightonusness

[^100]and holiness. The Allah of Mohammed was essentially C.aspotic will, and so fell far below the Jahveh of Moses, essentially righteousness, and the Heavenly Father of Christ, essentially boly love. Mohammedanism is almost as contrary to C'bristianity as one form of theism can be to another. It is as unitarian as Christianity is trinitarian. Its cardinal tenet is as distinctly anti-trinitarian as anti-polytheistic. It has often been represented as having had the providential task assigned it of preparing the way for Christianity by destroying polytheism ; in reality, it has hitherto offered a far more stubbora resistance to Christianity than any polytheistic religion has done. ${ }^{1}$

The mediæral world was so complex, so full of contrasts and contradictions, that it cannot be "summed up in a formula." Most general statements current regarding it will be found on examination only partially true. It is often described as the age in which external religious authority ruled, and all religious thought ran in narrow, strictly prescribed paths, whereas, in fact, the medixval theologians were far freer to speculate on almost all points of religious doctrine than Protestant divines have been. Because traditionalism abounded, it is forgotten that rationalism also abounded; because scholasticism flourished, that mysticism was prevalent ; because theism wae common, that pantheism, speculative and practical, was not uncommon. The Middle Age was, however, par excellence, the age of theology. Theology never before or since so interested ard dominated the human intellect. Nearly every eminent mediæval thinker was a theologian. The chief streams of theistic belief and speculation which traversed the Middle Age were three, - the Christian, Jewish, and Mohammedan. The first was much the broadest and fullest. Few points of theistic doctrine were left unhandled by the Christian divines of the Middle Age. The conclusions came to on the chief points were various and divergent. As to the maner in which God is known, for instance, some laid stress on faith or authoritative revelation ; others on immediate consciousness, the direct vision of the pure in heart, the illumination of the Spirit of God in the minds and hearts of the true children of God; others on reason and proof; and some attempted mediation and synthesis. Anselm gave logical form to an a priori argument for the Divine existence based on the idea of God as a being than whom a greater cannot be conceived. His most ingenious attempt to demonstrate the absurdity of supposing the perfect, the iafinite, to be a mere subjective fiction prepared the way for the multitude of attempts, identical or similar in aim, which have since been made. Thomas Aquinas was the best representative of those who held that the invisible God was only to be known through His visible works. He argued from motion to a mover, from effect to cause, from the contingent to the necessary, from lower kinds of good to a supreme good, and from order and purpose in the world to a goveraing intelligence. Raymond of Sebonde added to the ontological and physico-teleological arguments a moral argument. William of Occam criticized keenly and unfavourably both the a priari and a posteriori proofs, and beld that the existence of God was not a known truth but merely an article of faith. There was not less diversity of view as to how far God may be known. Erigena held that even God Himself could not comprehend His own nature, and Eckhart that the nature of God is necessarily unknowable, as beiog a nature without nature, without predicates, without opposites, pure oneness. That man cannot know God's real nature, cannot know Him per essentiam, canoot have a quidditiva cognitio Dei, and that

[^101]the so-called attributes of God are only descriptive of the effects of His operations as they appear to the buman mind, or even are merely symbols or metaphors, was maintained by many of the scholastic doctors. Aquinas, for example, with all his confidence as a dogmatic eystembuilder, so denied the cognoscibility of God. That the buman mind may have a true, although it cannot have a periect knowledge of God, -an apprehensive but not a comprehensive knowledge of Him, -was, however, in the Middle Age, as it has been ever since, the prsition most commonly taken up. The scholastic divines discussed a multitude of foolish questions regarding liod, but that was not due to extravagant faith in the power of the human mind to know or comprehend God. Prof. Sheldon very justly says, " on the whole, tho scholastic theology, notwithstanding some strong negative statements, assumes in reality a minimum of acquaintanceship with the essential nature of God." The negative statements are, for the most part, those of the mystics with respect to the beatific vision. Mediæral discussions as to the nature of God turned chiefly on two points, - the relation of the Divine essence to the Divine attributes and of the one Divine substance to the three Divine persons. The conclusion come to by the vast majority of scholastic theologians on the first point was that the attributes were not really or objectively in God, but merely human repro seatations rellected, as it were, on the idea of God, becanse the mental constitution of man is whe $t$ it is, and because God wished to be thought of in certain divers manners. To hold them objectively real in God, and therefore intrinsically distinct either from the essence of God or from one another, was considered to be incompatible both with the incomprehensibility and with the absolute simplicity of the Divine nature. Duns Scotus, in maintaining that the attributes were fornalitates realiter distincte, took up an exceptional position. On the other point the conclusion as generally reached was one secmingly quite inconsisteat with the foregoing, namely, that the persons were obiectively and eternally real and distinct. The discrepancy is especially apparent in those theologians (e.g., Anselm, Abelard, Hugo and Richard of St Victor, Alcxander of Hales, and Aquinas) who represented the persons of the Trinity as corresponding to distinctions among the very attributes which they in another reference denied to be distinct. The mediaral schoolnen, with very few and doubtful exceptions, conjoined with their theisin the doctrine of the Trinity as defined by the ancient church. Roscelin of Compiègne and Gillert de la Porrée laid themselres open to the charge of tritheism ; and obviously nominalism, by allowing nothing but a nominal existence to the essenco or general nature of which the individual is a specinen, tended towards tritheism, -towards resolv. ing the Trinity into a triad of Divine individuals or selfsubsistent beings, connected only ly a common suecific character. While the schoolmen accopted the doctrine of the Trinity on authority, they did not conceive themselves precluded from endearouring to illustrate it and to make it appear as consonant to reason as possible. They sought to show its consisteacy with the unity of God, and its general reasonableness by various sjeculative considerations, but especially by the aid of analogies drawa from the constitution of the mind and even from particular physical phenomena. They did not suppose that they were thereby demonstrating the doctrine of the Trinity: they fully recognized that doctrine to be the indication of a mystery, "dark with excess of light," and the truth of which could only be directly apprehended in the beatifio vision conferred by the highest and most special grace; but they proceeded on the belief that, inasmuch as it was a central truth of revelation, the whole creation, add
XXIII. - 3 I
anove all, the nature and essence of man's spirit, must bear witness to it. At least one good result followed. Those who exercised their minds on the doctrine of the Trinity were necessarily led in some measure to furm another idea of God than that of either an indeterminate unity or a confused synthesis of attributes,-to think of Him, with some clearness and steadiness, in an organic and harmonious manner, as absolute being, absolute life, absolute spirit, absolute intelligence, absolute love. Such thought as this distinctly appeared in Anselm, the St Victors, Aquinas, Bonaventura, Dante, \&c. The omnipresence, omnipotence, and omniscience of God, and, generally, what are called His metaphysical and intellectual attributes, were discussed with excessive elaborateness and subtlety, while His moral attributes were left in the background, or considered without sufficient earnestuess or insight. The problems regarding the rclationship of the Divine attributes to human agency, and, in particular, as to the compatibulity of Divine prescience and predestination with kuman freedom and responsibility, were even too laboriously and minutely debated between the mediæval Augustinians and their opponents. What the disputants on both sides lacked was intellectual humility. They strode along "dim and perilous ways" as if they were in plain and safo paths, or as if their own faculties were superhuman. As to the general relation of God to the universe, few, if any, of the schoolmen can be charged with deism. While assigning to God a being and life transcending the universe, they also affirmed that He was everywhere in the universe, everywhere wholly present, everywhere essentially and activcly present. Pantheism was prevalent all through the Middle Ages, but only two of its representatives, perhaps-Erigena and Eckhart,showed much speculative capacity. ${ }^{1}$

Mohammedan theism drew chiefly from faith and fanaticism the force which carried it onwards with such rapidity in its early career of conquest. At the same time it powerfully stimulated reason, as soon appeared in remark. able intellectual achievements. Of course, reason could not fail to reflect on the contents of the faith by which it had been awakened. The result was the formation of many schools of religious opiaion. So far as our subject is concerned, however, all mediæval Mohammedan thinkers may be ranked as philosophers, theologians, or mystics. The philosophers derived little of their doctrine from Mohammed. Even in what they taught regarding God they followed mainly Aristotle, and in some measure the Neoplatonists. They maintained the unity of God, but conceived of it in a way unknown to Mohammed, namely, as a unity allowing of the reality of no distinctions, qualities, or attribates in God. Then, althongh they affirmed the unity of God in the strictest abstract manner, they were not monists but dualists, inasmuch as they denied creation ex nihilo, and asserted the eternity of matter. The mode in which they supposed the multiplicity of finite

[^102]things to have been produced from God was by a series of emanations originating in Divine intelligence, nst in Divino will. Their proofs of the Divine exstence were, for the most part, founded on the principle of causality. Tho philosophers did not openly oppose the theism of the Koran, but they ignored it or set it aside, and representec. it as only a useful popular faith, not a response to the demands of cultured reason. The "theologians," on the other hand, took their stand upon the Koran, sought to defend and derelop into doctrine its representations of God, and to show the inconclusiveness and inconsistencies of the teaching of the philosophers regarding God. Even those of them, however, who exalted faith and revelation most-the orthodox Motakallemin or Asharites-by no means dispensed with philosophy and reason. It was chiefly on the metaphysical hypothesis of the atomic constitution of matter that they rested their proofs of the Divine existence. It was by subtle reasonings that they sought to establish the non-eternity of matter and the unity and immateriality of God. It was on speculative grounds that they contended God had eternally possessed all the attributes ascribed to Him in the Koran. Tbeir predestinationism was as logically elaborated as that of the Augustinian scholastics. There flourished for a short period a school of liberal Mohammedan theologians, the Motazilites, who, while accepting the two fundamental doctrines of Islam-the unity of God and the divine mission of Mohammed,-refused to regard the Koran as an absolute religious authority, and sought to transform Mohammedanism into a reasonable and ethical monotheism. They insisted on the rightful conformity of faith to reason, on human freedom, and on the righteousness as well as the unity of God. They endeavoured, in fact, to substitute for a God whose essence was absolute or arbitrary will a God whose essence was justice. This meant, however, not to develop or even reform, but to subvert and displace the Johammedan idea of God, and the wouder is, not that they failed in so arduous a task, but that they had the courage to undertake it. Mohammedan mysticism (Sufism) was a reaction, chictly of the Persian mind, against the narrowness and harshness of the monotheism of the Arabian prophet. Unlike philosophy, it was not a mere exotic, but an indigenous growth within the Mohammedan area, and hence orthodoxy has never been able to eradicate it. It has been the chief support of spiritual feeling and the chief source of poetry iu Mohammedan laads. It still flourishes, has branches innumerable, and through its poets has shed seed widely even over Christendom. The mystics refuse to think of God as an arbitrary unlimited Will, separate and apart from everything; as one who reveals Himself clearly only tbrough the words of a prophet ; as a being before whom man is mere dust and ashes, and who demands no higher service than fear, unquestioning faith, and outward obedience. In their view God is immanent in all things, expresses Himself through all things, and is the essence of every human soul. There is not only no God but God, but no being, life, or spirit except the being, life, and spirit of God; and every man may be God's prophet, and more even than His prophet. For a man to know God is to see that God is immanent in himself, and that he is one with God, the universal life which breathes through all things. Such knowledge or vision must glorify all nature, and must dilate and rejoice the heart of him who possesses it. Joy and ecstacy must characterize tho worship of the Suf. A religious scepticism based on philosophical scepticism-disbelief in the existence of God grounded on disbelief in any truth not guaranteod by sense or mathematical demonstration - was not unknown among the Saracens, although no work in defence of it has come down to us, and perhaps none may have been written.

In Algazel philosophical scepticism was combined with religious dogmatism and mysticism. He subjected the doctrinés of the philosophers to a keen and hostile criticism, and maintained that reason was incompetent to reach the knowledge of God, yet cherished an ardent and exalted faith in God, based partly on the Koran and partly on mystic contemplation and devout experience. ${ }^{1}$

Jewish and Mohammedan religious thought were intimately connected in the Middle Age, and ran a nearly parallel course. The Rabbanites and the Karaites of Judaism corresponded to the orthodox and the Motazilites of Mohammedanism. In their theism there was no new feature or peculiar significance. Jewish thcosophic mysticism found expression in the Kabbalah. The idea of God there presented was at once excessively abstract and excessively fanciful. It must be studied, however, in the original source or in special works. The Jewish philosophers differed little from the Arabian philosophers in their teaching regarding the evidences of the Divine existence, the nature and consequences of the Divine unity, and the meaning of the Divine attributes. At the same time, they, with a few exceptions, affirmed the non-eternity of matter, and did not, like the Arabian Aristotelianz, represent providence as merely general. They maintained strongly the transcendence of God and the impossibility of the human mind forming any positive conception of His essential being. They held that He was known as necessarily existent, but also as in Himself necessarily unknowable. Their view of the unity of God led them to an idea of God which may not, nujustly be designated agnostic, and which prevented their regarding either nature or Scripture as a revelation of what God really is. Almost alone among eminent Jewish writere of the Middle Age, Jehuda Halevi contended that the representation of God given in the revelation to Iarael was self-evidencing, independent of the support of philosophy, and unattainable in any speculative way. The function of reason was, in his view, not to sit in judgment on what had been delivered regarding God to the Jews, but to repel the objections which philosophy had brought against $i t$, and to show the inadequacy of the results reached by unaided human inteligence. Maimonides andertook to establish that reason and faith, science and revelation, were at one in what they affirmed regarding God, but in order to make out his thesis he sacrificed the literal sense of Scripture whenever it did not accord with the tenets of his philosophy, and substituted for the representation of God given through Moses and the prophets one rery different in character. His idea of Cod is highly abstract and metaphysical, -the idea of a being so unlike every other being that no name or predicate whatever when applied to Him can bear its ordinary, or indeed any intelligible meaning. Existenco, eternity, anity, power, wisdom, justice, and other attributes, are not in Him what they are in auy other being or even analogous in Him to what they are in any other being. ${ }^{2}$

[^103]In Christian Europe the human mind took a fresn start at the epoch of the Renaissance. It revolted against the authorities to which it bad long been submissive, and exercised private judgment with a confidence nocorrected and unmoderated by experience. It turned with ardour to the free discussion of the greatest theme of thought, and probably at no period of history has there been more individual diversity of opinion on that theme. God and His relation to the universe were treated of from a multitude of points of view. Scepticism, naturalism, and pantheisnı appeared in various forms ; all ancient systems of thought as to the Supreme Being found advocates; all modern theories as to the nature of the Divine were in some measure anticipated. Did our limits permit it rould not be uninteresting to expound the specalations concerning Deity of several of the writers of the Renaissance, and especially, perhaps, of these three-Nicolaus of Cuss, Giordano Bruno, and Thomas Campanella. The theosophic mysticism of the period was a preparation for the Reformation. ${ }^{3}$
The fusion of theology and philosophy was the distinctive feature of mediæval Christendom; their separation has been a marked characteristic of inodern Christeodom. Even when both have been occupicd with religious inquiries and thoughts of God they have kept apart; they have often co-operated, but seldom commingled. Theology has been on the whole cleric, and comparatively conservative ; philosophy has been on the whole laic, and comparatively progressive. But for theology holding fast to what had been handed down as truth regarding God there must have been little continnity or consistency in the development of religious convictions; but for philosophy restlessly seeking ever more light there would have been little growth or increase of knowledge of the Divine.

The Reformers held that there was a knowledge of God naturally planted in the human mind, and also derivable from observation of the constitntion and government of the world, but that this knowledge was so marred and corrupted by ignorance and sin as to require to be confirmed and supplemented by the far clearer and fuller light of the special revelation in the Scriptures. They were deeply sensible of the evils which had arisen from the over-speculation of the scholastic divines on the nature of God, and were under the impression that it would have been well if men had been content to accept the statemente of Scripture on the subject with simple and unhesitating faith. Luther wished theology to begin at once with Jesus Christ. Melanchthon said, "There is no reason why we should devote ourselves much to these most lofty subjects, the doctrine of God, of the unity of God, of the Trinity of God"; and in the early editions of his Loci Communes he entered into no discnssiod of these themes. Zwingli in his De Vera et Falsa Religione and even Calvin in his Institutio Religionis Chresianz delineated tho doctrina de Deo only in outline and general features. In the confessions of the churches of the Reformation nothing which the ancient charch had cecumenically determined os regards that doctrine was rejectcd, and nothing new was added thereto. It soon became apparent, however, that the mind wonld by no means confioe its thoughts of God within the limits which the Reformers belioved to be alone legitimate and safe. The ioca of Cod is so central in religion that it must nffect and be affected by overy change of thought on

any religious theme. The many and violent controversies within Protestantism all reacted on the doctrine relative to Deity, causing it to be studied with intense energy, but in a manner and spirit very unfavourable, on the whole, to truth and piety. Every new dispute elicited more abstruse conclusions and more subtle definitions. In the disputations of orthodox divines of the 17 th and 18th centuries as to the nature, the attributes, the decrees, and the operations of God, we see scholasticism with all its peculiarities reintroduced and often exaggerated Yet Protestant theism was in various respects an adpance on that of the doctors of medioval scholasticism. The protest of the Reformers against the faults of the scholastic treatment regarding God did not lose its pertinency or value because their own followers fell into these very faults. If the subsequent history plainly showed that the doctrine could not have been so fixedly and exhaustively deterinined by the ancient church as the Reformers supposed, it also showed that the scholastic treatment of the doctrine had been justly condemned by them, and that speculation regarding God when not rooted in spiritual experience must necessarily be unfruitful. "The scholasticism of Protestantism was in essential contradiction to the genius and aim of Protestantism. Then, in the Protestant doctrine of God more prominence was given than had previously been done to His manifestation in redemption, to the relation of His character towards sin, and, in particular, to the attribute of justice. The strong emphasis laid on the rightcousness of God marked a distinct ethical advance. At the same time the idea of God in the older Protestant theology was far from ethically complete. His fatherhood was strangely ignored or most defectively apprehended. Absolute sovereignty had assigned to it the place which should have teen given to boly love, and was often conceived of in an risethical manner. Further, whereas nmong mediæval elcologians it was the rule and not the exception, among Protestant divines it was the rare exception and not the sule, to affirm God to be unknowable. They asserted merely His incomprehensibility and man's limited knowledge of His perfections. They did not in general, however, abandon, at least explicitly, the premiss from which mediæval theologians inferred the Divine incognoscibility, namely, that the absolute simplicity of the Divine essence was incompatible with the existence of distinctions therein. ${ }^{1}$

Difference of opinion as to the relation of reason to Scripture was in the Protestant world one of the chief causes of difference of belief as to God. Assaults on trinitarianism were contemporary with the Reformation, and they proceeded more on the conviction that the doctrine of the Trinity was unreasonable than that it was unscriptural. The founder of Socinianism, indeed, not only fully accepted the authority of Scripture, but went so far as to represent it as the source of all religious truth, even of the primary truths of natural religion; yet, while be thus apparently and in theory attributed the knowledge of God more to Scripture and less to reason than did Luther or Calvin, really and in practice be did just the reverse, because he conceived quite otherwise of the connexion between Scripture and reason. While he beld Scripture to be the source of religious truth, he also held reason to be so the organ of religious truth that nothing contrary to reason could be accepted on the authority of Scripture, aud that only those declarations of Scripture could be deemed to beinterpreted aright which were interproted in accordance with the axioms of reason. Luther, on the other hand, proclaimed aloud, Strangle reason like

[^104]a dangerous beast if it dare to question Scripture; and Calvin, although he did not speak so barshly, demanded the unqualified submission of reason to the authority ol Scripture. Antitrinitarianism has maintained its ground throughout the Protestant area, has assumed a variety of forms, and has exerted a poweriul influence. It has been unable, it is often said, to do more than revive the doctrines which distracted the ancient church and were condemned by it as heresies. And this must be so far admitted. The doctrine of the Trinity comprehends only a few propositions, and every departure from it must involve a rejection of one or more of these, and must, consequently, belong to some one of a very few possible types or classes of belief. But essentially the statement is superficial and unjust. For the ways in which, and the grounds on which, both the affirmations of which the doctrine consists and the vegations of these lave been maintained have not been the same. Alike the defences and the attacks have in the later era implied a deeper consciousness of the nature of the problems in dispute than those of carlier times. As of history in general, so of the history of the doctrine of God, it holds good that no present has been the mere reproduction of any past. The rationalistic process Deism was carried farther in English deism and its Continental developments. Deism sought to found religion on reason alone. It represents "nature" as the sole and sufficient revelation of God. There is no warrant for the view that the deists held nature to be independent of God, selfcoaservative and self-operative,-or, in other words, God to be withdrawn from nature, merely looking on and "seeing it go." They believed that God acted through natural laws, and that it was doubtful if He ever acted otherwise than through these. Whatever was taught about God in Christianity and other positive religions beyond what reason could infer from nature ought, in their opinion, to be rejected as fiction and superstition. All their zeal was negative,-against "superstition." What was positive in their own doctrine had but a feeble hold on them. God was little more to them than a logical inference from the general constitution of the world. They lacked perception of the presence of God, not only in the Bible, but in all human life and history. ${ }^{2}$

Modern philosophy, from its rise to the close of the 18 th Moden century, showed a double development, the one ideal and rhilothe ather empirical, the Cartesian and the Baconian. The sophy. former was the more essentially religious. Descartes endeavoured to found philosophy on an indubitable refutation of absolute scepticism. Such a refutation he believed himself to have effected when he had argued that thought, eren in the form of doubt, necessarily implies the exist ence of him who thinks; that the implication yields a universal criterion of certainty; and that the presence of the idea of God in a man's mind, the consciousness of the mind's imperfection, and especially the character of the mind's concept of God as that of the most real being containing every perfection, demonstratively establish that God is and is what $H e$ is thought to be. God is and is true; therefore man has not been made to err, and whatever he clearly and distinctly sees as true must be true. In the opinion of Descartes, the idea of God is inherent in reason, is the seal of all certainty, and the corner-stone of all true philosophy. To the whole Cartesian school theology was the foundation of all science. To Spinoza,

[^105]who most fully developed some of the distinctive principles of Descartes, it was identical with all science, for to him God was the only substance, and all things elso were ouly His attributes or modes. Besides the pantheism of Spinoza, the occasionalism of Guelinx, Malebranche's vision of things in God, Leibnitz's pre-established harmony and optimism, and Wolf's rationalism were natural, if not necessary, outgrowths from the same root,-Cartesian theism. Perhaps, of all the many services to the cause of theism with which Cartesianism must be credited the greatest was that it constantly gave promiaence to the absolute perfection of God. ${ }^{1}$ Baconian or empirical philosophy was content if, by the ways of causality and design, it could rise to an apprehension of a First Cause and Supreme Intelligence. It tended of itself to a phenomenalism, sensationism, associationism, unfavourable to theism. It was, however, counteracted, restrained, and modified by Cartesianism and Platonism, and it naturally allied itself with positive science. The massive defence of theism erected by the Cambridge school of philosophy against atheism, fatalism, and the denial of moral distinctions was avowedly built on a Platonic foundation. The popularity during the 18 th ceatury of the design argument, and what was called physico-theology, was largely due to the impression made on the general mind by the brilliant discoveries of the founders of modern astronomy, chemistry, and other physical sciences. Bishop Berkeley showed how an em. pirical philosophy might be logically evolved into a theistic immaterialism, Hume how it might be logically dissolved into an agnostic nihilism.

In the 16 th, 17 th, and 18 th centuries mysticism had many representatives, several of whom, as, e.y., Weigel, Ottingen, Swedenborg, and especially Jacob Boehme, are entitled to a considerable place in any detailed history of theism. To the ejes of Boehme God rerealed Himself from without and within in the most real and intimete manner. In the powers, antagonisms, and conjunctions of creation he saw the energies, struggles, and victories of the creative Spirit itself; in the constitution and operations of physical and human nature, the essential constitution and necessary processes of the Divino nature. His thoughts of God were in striking contrast to those of the deists and natural theologians of the 17 th and 18th centuries, and strikingly anticipated those of a Schelling, Hegel, and Baader in the 19 th century. Could Swedenborg's doctrine of correspondences be verified, our means of insight into the character of God would be largely extended.

The 19th century is aufficiently far advanced to allow us to see that a new epoch even in the history of theism began near its commencement. The revolntion in philosophy initiated by Kant has profoundly affected theistic thought. It has introduced that type of agnosticism which is what is most original and distinctive in the antitheism of the present age, and at the same time atimulated reason to undertake bolder inquiries as to the Divine than those which Kant prohibited. The enlarged and deepened views of the universe attained through the discoveries of recent physical science have rendered incredible the idea of a God remote from the world, irresistible the

[^106]conviction that the eternal source of things must be immanent in their constitution, changes, and laws. The rapid growth of biology and the spread of the doctrioe of evolution have not only tended in the same direction, but given a new and nobler conception of the teleology of the universe, and, consequently, of God as the supreme intelligence. History-which the natural theologians of the 18th century so strangely ignored, which the solitary Italian thinker Vico alone recognized with clearness and comprehensiveness of vision to be necessarily the chief scene of the relf-revelation of God-began with Lessing and Herder to be generally seen in its true religious light. The comparative or historical method of study has created two disciplines or sciences, comparative theology and Biblical theology, - which are both largely occupied with tracing the development of the idea of God. The ethical apirit of the age has so told on its religious teaching that to no generation save that to which the gospel was originally given has the Divine fatherhood been 80 distinctly set forth as to the present. Dogmatic theology, especially in Germany, has been earoestly active; and its chief representatires have laboured so to amend and advance the doctrine concerning God that it may satisfy the new requirements which have arisen.

It is now necessary briefly to indicate the present etate of thought Presant on the chief points and problems of theism.
As to the origin, then, of our sctual idea of Gor, thet, it is eeen, thought can only be the whole religions history of man which precedes it, Origio of and the whole religious nature of man which underlies that history. ides of It is absurd to refer exclusively to any faculty, intuition, or feeling, Gol any- revelation or iastruction, say person or event, what can be traced in growth and formation through thousauds of years, and can be ohown by facts and documents to have been infuenced by all the chief causes which have made history what it is. The history of the idea of God is the centre of all history, both explained by and explsining it; and our ninetesath-ceatury idea of God is the result of the entire historico-psychological process which has produced the culture and religion of the 19th century. The idea of God is what it now is because God's whole guidance of man and man'e whole search for God, the whole economy and evolation of things and the whole constitution and development of thonght and feeling, have been what they have bern from the beginning of history to the present time. Anthropology, comparative paychology, the scicace of langusge, comparative theolog7, Biblical theo. logy, the history sf philosophy, and the history of Christian doctrine, have cill been eagarged in attemptiag to discover the factors and etages of the vast and complex prosess which has rasulted in the accepted ides of God; and, by their separate and conjunct endeavours, they have succeeded in casting great light on all parts of the process.

As to the absolute historical origin of theism-8s to where, when, and how the theistic conception of the Divine first obteined recog. nition among meu-s definitive answer has not jet been reached. But the labour expended on the problem has not been wasted. It hes made clearer the nature of the inquiry, rendered aprarent the nosatisfactoriness of previons solations, opeocd up glimpses of divers ways by which men have been led to belief in the nnity of God, and accumulated means and materials for future and probsbly more onccessful work.

The question ss to the psychological origin of theism cannot be Wholly separated from that as to its historical origin. Unlesa theism can be shown to be the primitive form of religion, it cannot be held to have had an entirely pecaliar and distinct psychological origio, but must be viewed as rimply a phase or develonment of religion. It eannot be said that thero is as yet agreement as to the psychological origin, or as to the psychological constitution even, of religion. The liypothesis of a aimple impartation of the knowledge of God and spiritual things through primitire rovelation, or through instruction aud tradition which go back to the first appearance of man oo earth, atill retains a hold on certain conser. vative minds, but has received no confirmation from modern scionco and discovery, aud is plainly of its very nature inadequate. A revelation relative to God io words or aigns conld here no meaning to a miad devoid of thoughts of God; spiritual instruction is ouly possible where there are spirital powers to nnderstand and proft by it; tradition will carry nothiog far to which intelligencs is iodifferent. There have been many attempts mado dnring the present century to refer the origin of belief in God to somse emotional source, somo element or state of sensitivity. Thus Strenss has reaffirmed the hypothesis of Epicurus, Lacretins, and Horme, thet fear ruade the gods; Feuerbach has resolved religion into desira,

God being conceived to be what man would wish himself to be; Schloiermacher has argued that a feeling of absolute dependence, of pure and complete passiveness, is our evidence for the presence of an infinite onergy, an infinite being; Mansel has represented the feeling of dependence and the conviction of moral obligation as the eourcea of the religious coneciousness ; Pfleiderer represents religion as a response to the sense of conflict and contradiction between man'e feelings of dependence and of freedom; Rauwenhoff traces its origin to respect (Achtung), the ront also of moral conduct and of family life; others have referred it to specific ethical feelings; and many have represented it to be essentially love. The number of these attempts and the diversity of these results are explained by the complexity of religious feeling. In religion all the feelings which raise man above the merely animal condition are involved. Man is not religious by any one feeling or by a few feelings, but by the whele constitution of his emotional nature. His heart, with all its wealth of feelings, has been made for God. Hence all the theories referred to have easily been shown to be one-sided, and to have exaggerated the significance and influence in religion of particular emotional elements, but heace also they all contain more or less important portions of the truth, and have all contributed towards a knowledge of the full truth. Man is not only, howerer, disposed by all his chief sentiments for religion, but all these sentiments, when mormally and healthfully developed, tend toward's theism. It is only in a theistic form of religion that they can find true rest and satisfaction. One God can alone be the object of the highest devotional fear, can alone be regarded as ideally perfect, or as a being on whom the worshipper is absolutely dependent, can alone be loved with the whole heart and esteemed with madivided revcrence, can alone be recognized es the solo author of the raoral law, the alone good. The theories which trace the origin of religion to feeling have the merit of recognizing that religion is not an affair of mere intellect; that the Divine could sot even be known by men if they had not feelings and affections as well as intellectual powers; that, if God be love, for oxample, He can only be known by love; that, if He have moral ettribntes, we must have moral feelings in order to be able to recognize them. On the other hand, in oo far as those theorios represent religion as reducih] to mere feeling or as independent of intellect, they have the fault of overlooking that ell the feelings includer in religion presuppose apprehensions and judgmento, and are ralid only in so far as they have the warrant of intelligence. It is ae much an orror, however, to account for religion by any one intellectual principle as by ally one emotional eloment. Religion has no one special seat, such as "the central point of unity behind eoneciousneas," imagined by Schleiermacher; no "special organ," such as "conscienco" was supposed to be by Schenkel; and no one special principle of cognition, such as the law of causality has been repreocnted to be by several philosophers and theologians. All the ultimate principles of cognition ore involved in. religion, and all lead, if consistently followed far enough, to theism. The whole head as well as the whole heart has been made for religion, and for the perfect form of religion. Max Müller, in his Hibbert Lectures, traces the idea of God to a special faculty of religion-" a eubjective faculty for the apprehension of the infinite," "a mental faculty, which, independent of, nay, in opite of, sense and reason, enables man to apprehend the infinite under different names and under varying disguises." This view will not bear, perhaps, a closa scrotiny. The infinite, as an implicil condition of thought, is not more involved in religions than in other thought. We cannot think anything as finite without implying the infinite. Space cannot be thonght of except as extensively, nor time except as proecnsively, infinite. As a condition of thought, tho infinite is involved in religious knowledge only so far as it is involved in all knowledge. On the other hand, as an explicit object of thought, it is not present in the lower forms of rcligion at all, which exiat only because tha thought of infinity is not associated in the religious consciousness with that of Deity, except where reflexion is someWhat highly developed; and, even in the highest stages of religion, it is only apprehended as one aspect of Deity. Infinity is not God, but merely an attribute of the attributes of God, and not even an exclusively Divine attributc. The hypothesis that the idea of God is gained by intuition or vision is proved to be erroneous by the fact that the idea of God, and the process by which it is reached, are capable of being analysed, and therefore not sirmple, and likewiso by the variety and discordance of tha ideas of God which have been actnally formed. The apprehension of God seems to be only. possible throngh a process which involves all that is essential in the human constitution-will, affection, intelligence, conscience, reason,-and the ideas which they supply-cansa, design, goodness, infinity, \&c. These are oo connected that they may all be embraced in a single act and coalesce in ono grand issue. During the last thirty years there has been more psychologicel investigation as to the origin and nature of religion than during all previous history; and tha whole tendency of it has been to set aside all solutions which represent man as religions only in virtne of particular eenti. ments or prisciples, and to make manifest that the paychology of
religion is that of the entire hnman nature in a special relationenip. The best of the later investigations are much more therough and comprekensive than any of earlier dato. ${ }^{1}$

The agnosticism originated by Kant has been one of the distinctive and prominent phenomena in the history of religion and theism during the 19 th century. It oprang out of an earlier agnosticism. Hume and his predecessors admitted that tho conditions of thought - otherwise, the categories of experience or ideas of reason-wera in appearance necessary and objectively valid, but in reality only arbitrary and suljective, their sceming necessity and objectivity being illusory, and consequent on mere repetitions end accidental associations of sensations and feelings. Kant showed that they were not only seemingly but really necessary to thought, and irresol vable into the particular in experience. He denied, however, that we are entitled to consider them as of more than subjective applicability,-that what we necessarily think must necessarily be, or be as we think it. He aftirmed all knowledge to be confined to experience, the phenomenal, the conditioned. It was quite in accordance with this view of the limits of knowledge that he should have denied that we can know Ged, even while he affirmed that we cannot but think of God. It was by no means in obvious harmeny with it that he ehould have affirmed that we must, on moral grounds, retain a certain belief in God. Sir W. Hamilton and Dean Mansel followed Kant in holding that we can have no knowledge of Ged in Himsclf, as knowledge is only of the relative and phenomenal. They otreve to show that the notions of the unconditioned, the infinite, the absolute, are mere uegations of thought, which destroy themselves by their mutual contradictions and by the absurdities which they involve. Yet both of these philosophers held that there is a revelation of God in Scripture and conscience, and that we are bound to believe it, not indeed as teaching us what God really is, hat what Ho wishes us to believe concerning Him. Herbert Spencer, adopting Kant'a theory of the limits of knowledge, and regarding as decisive Ilamilton and Mansel'e polemic against the philosophies of the Absolute, has concluded that the only truth underlying professed revelatione, positive religions, and so-called theological sciences is the existence of an unknowable and unthinkable cause of all things. In tha vier of the Positivist the unknowable itsclf is a metaphyeical fiction. The Kantian doctrine has had a otill more extensive influence in Germany than in Britain, and German philosophers and theologians have displayed great ingenuity in their endeavours to combine with it some sort of recognition of God and of religion. Fries, De Wette, and othere have relegated religion to the sphere of faith, Schleiermacher and his followers to that of fceling, Ritsch] and his echool to that of ethical wants, F. A. Lange to that of imagination, \&c. Their common aim has been to find for piety towards God a special place which they can fonce off from the rest of human nature, so as to beable to claim for religion independence of reason, speculation, and ecience, a right to existence even although necessarily ignorant of the object of its faith, feeling, moral sense, or phantasy. ${ }^{2}$

The movement indicated has led to no direct conclnsion which has obtained, or is likely to ohtain, general assent. It has had, however, a very important indirect result. It has shown how interested in, and dependent on, a true criticism or science of cognition are theism and theology. It has made increasingly manifest the immense significance to religion of the problem as to the powers and limits of thonght which Kant stated and discussed with so much vigour and originality. Hence research into what the Germans call "die erkenntnisstheoretischen Grundsïtze"-the philosophical bases-of theism has been greatly otimulated and adranced by the movement. This is an enormous gain, which mors than compensates for sundry incidental losses. Kant's eolution of the problem which he placed in the foreground of philosophy has not been found to bo one in which the mind can rest. From his agnosticism down to the very ompiricism which it was his aim to relute descent is logically inevitable. The agnosticism of piety has in no form been abla to discover a halting place,-a epot on

[^107]which to raise theism or any solid religions construction. In no form has it been-able to prove its legitimacy, to maintain ita selfconsistency, or to defend itself oucceasfully againat the agnosticism of anbelief. It is, therefore, not surprising that it should have been very enerally regarded as dangerous to theism in reality, gen when friendly to it in iateation. Yet there is much in the theory of cognition on which it proceeda which the theist can atilize. Indeed, no theory of cognition can afford a eatisfactory basis to theism which does not largely adopt and assimilato that of Kant. He has conclusively ohown that all our knowledge is a synthesis of contingent impressions and necessary conditions; that without the latter there can be neither sense, understanding, nor reason; that they conatitute intelligence, and are the light of mind; that they also pervade the whole world of experience and illuminate it; that there is neither thing nor thought in the uni verse which does not exhivit them in some of their aspects; that apart from them there can be no reality, no truth, no science. The agnostic corollariea appended to this theory by Kant and others, instead of being necessary consequeaces from it, are inconeiatent with it. Kant and the agnostica say that we know only the conditioned; but what they prove is that we know also the conditions of thought, and that these conditions are thernselvea anconditionerl, otherwise they would not be neceasary. They affirm that we can know only the phenomenal and relative, but what they establish is that it is as impossible to know only the relative and phenomenal as to know only the absoluto and noumenal, and that in so far as wo know at all wo know through ideas which are and important, sense. They maintain, what is very true, if reat a truiam, that the categories are only valid for experience, end they imply that thia is because experience limits and defines the categories, whereas, according to their own theory, it ia the categorica which condition experience and enter as constituents into all experience, so that to say that the categories are only valid for experieace means very little, experience merely existing 80 far as the categeries enable us to have it, and being valid 80 far aa the categories are legitimately applied, although not farther, which against eenaiblo experience. They have denied the objectivevalidity of the categories or necessary conditions of thought. This denial is the distinctive feature of all modern agnoaticism; and the theist who would vindicate the reality of his knowledge of God, the legitimacy of his belief in God, the worth of his religious experience, hat conse the reasoninga by which it has been supported; show category being unthinkable and inconcoivable; and indicate how its admission mast subvert not only the fondation of theology but of all other eciences, and resolve them all into castles in the air, or into such stuff as dreams are made of. In the accomplishment of this tesk es much guidance and aid may be found, perhaps, in the theoriea of cognition of Ferrier and Reamini as from those of any of the Germans; hut Hegel and his followers, not a fow of the Herbartists, Ulrici, Harms, and many other German thinkers, bave contributed to show the falaity of the critical theory at this point. Amended here, it ia a theory admirably fitted to be the corner-stone of a philosophical theism.
More may be attempted to be done in the region of the necessary and unconditioned. The conditions of thought, the categorien of experience, the ideas of reason are all linked together, $\theta 0$ that each has its own place and is part of a whole. Aad of what whole? The idea of God, All the metaphysical categories are included thereia, for God is the Absolute Being; all the physical categorieg, Her io Ahso $\Delta$ bsoluta Force and Life; all the mental categories, for Absolutely iaclusive, the most comprehensive, of all ideas. It is the idea of ideas, for it takes up all other ideas into itself and gives them unity, so that they comstitute a system. The whole system issues ioto, and is rendered organic by, the idea of Gorl, which, indeed, contains within itself all the ideas which are the conditions of human renson and the ground of known exiatence. All aciences, and even all phases and varieties of human experience, are only developments of some of the ideas included in itis supreme and all-comprehenaive idea, and the developments hare in no instance exhausted the ideas. Heace in the idea of God must be the whela truth of the universe as well as of the mind. These sentences are an attempt to express in the briefest intelligible form what it was the aim of the so-called philosophy of the Absolute to prove to be not only true, but the truth. Hegel and Schelling, Krause and Barder, and their associates, all felt themselves to have the one mission in life of making manifest that God was thus the truth, the light of all knowlodge, eolf-revealing ite all ocience, the ools object of all philosoplay. The Absolute with which they occupied themselves so earnestly was no abstraction, no fiction, such as Hanilton and Dlansel supposed it to be, -not the wholly indetermything, not the Unknowable, - but the ground of all relationship,
the foundation alike of exiatence and of thought, that which it is not only not impossible to know, but which it is impossible not to know, the knowledge of it being implied in all knowledge. Hegel expressed not only his own conviction, but the central and vital thougnt of the whole anti-agoostic movement which culminated in him when be wrote, "The object of religion is, like that of philosophy, the oterval truth itself in its objective existence: it is God, and nothiag but God, and the explanation of Gou. Philosophy is not a wisdom of the world, but a knowledge of the unworldly; not a knowledge of outward matter, of empirical leing and life, buy knowledge of that which is eternal, of that which is God and which flows from His nature, as that must manifest and develop itselfHeace philosophy in explainiag religion explains itself, and in, explaining itself explains religion. Philosophy and religion thus coincide in that they have one and the same object." The adherents of the philosophy of the Absolute muat be edmitted to have fallen, in their revolsion from agaegticiem, into many extrad vagances of gnosticism ; but a theist who does not aympataize with their main aim, and oron accepts most of the results as to which they are agreed, canoot be credited with having-mach philosophical insight into what a thorough and consistent theism impliea. A God who is not the Absolute as they understood the term, not the Unconditioned revealed in all that is conditionet, and the esaential content of all knowledge at ita highest, cannof be the God aither of a profound philosophy or a fully-developed religion. The philosophy of the Ahsolute ras, on the whole, a great advance towards a philesophical theism. ${ }^{1}$

And yet it was largely pantheistic, and tended atrongly towarde pantheism. This was not surprising. Aoy philosophy which is in thorough earnest to show that God is the gound of all existence and the condition of all knowledge must fiad it difficult to retain a. firm grasp of the personality and trauscendence of the Divine and to set them forth with due prominence. Certainly some of the most influential representativea of the philosophy of the Absolute ignored or misrepresented them. The consequence was, however, that a band of thinkera soon appeared who were animated with the most zealous desire to do justice to these aspects of the Absolute, and to make evident the one-sidedness and inadequacy of every pantheistic conception of the Divinc. This was the commen aim of those who gathered aroand the younger Fichte, and whose literary organ was the Zeitschrift fur Philosophio. Chalybäus, K. Ph. Fiacher, Sengler, Weisse, Wirth, and Ulrici may be aamed as among the ablest and most active. . The Roman Catholic Guinther and his followers worked in much the same spirit. Lotze has effectively co-operated by his ingenious defence of the thesis that "perfect personality is to be found only in God, while in all finite spirits there exists only a weak imitation of personality; the finiteness of the finite is not a productive condition of personality, but rather a limiting barrier to its perfect development." This movement algo, then, has tended to develop and contributed to earich the theory of theism. Its apecial mission has been to prove that theism is wider than pantheism, and can include all the truth in pantheism, while pantheism must necessarily exclude truth in theism essential to the vitality and vigonr both of religion and of morality. ${ }^{2}$,

The philosophy of the Absolute, judgen of from a distinctly theistic point of view, was defective on nnother side. It regarded too exclosively the necessary and formal in thought, trusted almost entirely to its insight into the significance of the categories a a its porrers of rational deduction. Hence the idea of the Divise which it attained, if vast and comprehensive, was also vagre and abstract, sbadowy and naimpressive. Correction was needed on thia eide also, and it came through Schlejermacher and that large company of theologians, among whom Lipsius and Ritschl are at present the most prominent, who have dwelt on the importance of proceeding from immediate personal experience, from the direct testimony of pious feeling, from the practical necds of the moral life, \&c. From these theologians may be learned that God is to be known, not through mere intellectual cognition, but threugh opiritual experience, and that no dicta as to the Divine not verifiable in experience, not efficacious to sustain picty and to promote virtue, to elevate and purify the beart, to invigorate the will, to ennoble

## THELSM

the character, to sanctify both individuals and communities, are likely to be true. Experience of the Divine can be the richest and anrest experience only if it not merely implies all that is absolute and necessary in consciousness and existencc, but is also confirmed and guaranteed by all that is relative and contingent therein.
What are known as "the proofs" for the Divine existenca hava from tha time of Kant to the present beer, often represented as sophistical or useless. This view is, however, less prevalent than it was. During the last twenty years the proofs have been in much greater repute, and have had far more labour expended on them, than dnring the previous part of the century. They have, of course, been considerably modified, in conformity with the general growth of thought and knowledge. For instance, they are no longer gresented elaborately analysed into series or groups of syllogisms. It is recognized that the fetters which wonld assuredly arrest the progress of physical and mental science cannot ba favourable to that of theology. It is recognized that the validity of the proofs must be entiraly dependent on the truthfulness with which they indicate the modes is which God reveals Himself, the facts through which mau apprehends the presence and attributes of God, and that, therefore, the more eimply they are statcd tha better. Man knows God somewhat as ha knows the minde of his fellow-men-namely, inferen-tially,-yet through an experience at once so simple and so manifold that all attempts at a syllogistic representation of the process must necessarily do it injustice. The closeness and character of the connexiod of the proofs have also come to be more clearly seen. They are perceived to constitute an organic whole of argument, each of which establishes its separate element, and thus contributes to tha general result-confirmatory evideuce that God is, and complemeotary evidence as to what God is. The explanation of this doubtless is that the apprehension of God is itself an organic whole, a complex and harmonious process, involving all that is essential in the human mind, yet all the constituents of which are so connected that they map be embraced in a singlo act and coalesca into one grand issue.
The cosmological argument coucludes from the existeuce of tha world as temporal and contingent, conditioned and phooomensl, to the existence of God as its one eternal, unconditioned, self. existent cause. It is an argument which has beeu in no respect discredited by recent research and discussion, which is in aubstance accepted not only by theists but by pantheists, and which forms the basisaven of the philosophy of Herbert Spencer. The principle on which it proceeds-the principle of causality-has only come to je mors clearly seen to ba ultinate, universal, and necessary. The hgpothesis of an infinite series of causes and effects has not had its burden of irrationality in the least diminished. Tha progress of acience has not tended to show that the world itself may be reasonably regarded as eternal and self-existent; in the view of theists it has only tended to reader more probable tha doctrina that all physical things must have their origin in a single mon-physical cause. The necessity of determining eright the bearings of the now views reached or suggested by science as to the ultimate constitution of matter, the conservation of energy, cosmic evolution, the age aud duration of the present physical system, \&c., has been tha chief factor in the latest developments of the argument $a$ contingentia mundi. The teleological argument, which concludes from the regularities and adjustments, preconformities and harnonies, in nature that its first causo must be an intelligence, has heen both corrected and extended owing to recent advauces of ecienca and capecially of biological science. Tha theory of evolution has not shaken the principle or lessened the force of the argument, while it has widened its scopo and opeued up ristas of grander design, but it has so changad its mode of presentation that already tha Bridgevcater Treatises and eimilar works are to some extent antiqusted. Perhaps the most promising of the later applications of the argument is that which rests on the results obtained by a philosophical study of history, and which seeks to show that the goal of the evolution of life, so far as it has yet proceeded, is the perfecting of human nature, and the eternal eourca of things a power which makes for truth and righteousness. The ethical argument-the proof from conscience and the moral orderheld a very subordinate place in the estimation of witers on natural theology until Kant rested on it slmost the whole weight of theism. It has ever eince been prominent, and has been tha argument most ralied on to produce practical conviction. Much importance is now rarely attached to those forms of the metaphysical argument which ara deductions from a particular conception, as, e.g., of a perfect being. Ignorance alone, however, can account for the assertion often met with that the argument is generally abandoned. It has only been transformed. It has passed from a stage in which it was presented in particular ontological forms into one in which it is set forth in a geveral epistemological form. As at present maintained it is to the effect that God is the idea of ideas, the ultimate in human thought, without whom all thought is confusion and selfcontradiction. In this form, by what theologians and religious philosophers possessed of much epeculative insight is it not heid? ${ }^{1}$

See the present whiter's Theism, end the ludications of the Utareture given in tian zotes.

The changes adopted in the methods of theistuc proof have all tended in one direction, namely, to remeve or correct extreme and exaggerated conceptions of the Divine transcendence and to produce a true appreciation of the Divine immanence, -to set aside deism and to enrich theism with what is geod in pantheiom. The general movement of religious speculation within the theistic aroa has beed towards medistion between the extremes of pantheism and of deism, torrards barmozious combination of the personal self-equality and the universal agency of the Divizo: Positive science has power. fully co-operated with speculation in giving support and impulse to this movement. While the modern acientific view of the world does not result in pantheism, it affords it a partial and relative justification, and requires a theism which, while maintaining the personality of God, recognizes God to be in all things and all things to ba of God, through God, and to God. It may be said that thoism has always thus recognized the Divine immanence. Tha vague recognition of it, however, which precedes scientific insight and the conquest and absorptiou of pantheism is not tc be identified with the realizing comprehension of it which is their result. ${ }^{2}$
As to the further treatment of the idea of God in recent or con. teroporary theology, the following may be mentioned as, perhaps, the chief distinctive features:-first, tha general endeavour to present the idea as a harmonious reflex of the Divine nature and life, instead of as a mere aggregate of attributes; secondly, and consequedtlj, the greater cars shown in the classification and correlation of the attributes, so as to refer them to their appropriate places in the one great organic thought; and, thirdly, the morc truly cthical and spiritual representation given of the Divinr chsractor. To realize the nature and import of tha first of thess features it is only necessary to compare the expositions given of the idea of God in the works of such theologians as Nitzsch, Thomasiu, Dorner, Philippi, Kahnis, and even more in those of the represen. tatives of German speculativa theism, with sucla as are to be forind in the treatises of Hill, Watson, Wardlaw, and Hodge, which, although published in the present century, express only the views of an earlier age. As to tha second point, there has of lats been a vast amount of thought expended in endeavouring so to classify and co-ordinate the attributes, aud so to refer them to the various moments of the Diviua existence and life, as that God may ba abla to be apprehended both in His unity and completeness, self-identity and epiritual richness, as one whole harenonious and perfect personality. Of the work attempted in this direction our limits will mot allow us to treat. In regard to the third feature, any one who will peruse an essay like Weber's Vom Zorne Gottes, or Ritschl'e De Ira Dei, and compares the way in which the Biblical conception of the wrath of God is there presented with the moda of exhibiting it prevalent for so mady ages, is likely to be convinced that considerabla progress has been made oven in recent times in the study of the moral aspects of God's character. That the Divine glory must centre in moral perfection, in holy love, is a thought which is undoubtedly being realized by all theists with ever-increasing clearness and fuluess. ${ }^{3}$
It follows from the above that theistic thought has been moving in a direction which could not fail to snggest to thosa influenced by it that a rigidly unitarian conception of God must ba inadequate, and that the trinitarian conception might be the only one in whieh reason cad rest as self-consistent. So long as the simplicity of the Divina nature was conceived of as an abstract eelf-identity, intelligence could not venture to attempt to pass from the unity to the trinity of the Godhead, or hope for any glimpse of the possibility of harmoniously combining them. But, this view of the simplicity of the Divine nature having been abandoned, and an idee of God attained which assigns to Him all the distinctions con-patible with, and demanded by, completeness and perfection of personality, the doctrine of the Trinity necessarily entered on a new etage of its history. The free movement of thought in this century, far from expelling it from its place in the mind of Christendom, has caused it to strike deeper root and grow with fresh vigour. Neper aince the Nicene age has theological speculation been so actively occupied with tha constitution of tha Godhead, and with tha trinitarian representation thereof, as from the commencement of tha present century. It is, of course, impossible here to describe any of the attempts which, during this period, bava been mada to show that the absolute Divine self-consciousness implies a trinitarian form of existence, and that intelligently to think the essential Trinity is to think those moments in tha Divine existence without which personality and self-consciousness are unthinkable; or that a worthy conception of Divine love demands a trinitarian moda of life; or that a world distinct from God presupposes that God as triune is in and for Himself a perfect and infinite world, oo that

See the extramely interesting papers by Peabody, Montgomery, Howison, and [Harris In the Journal of Speculatice Philosophy for Oct. 1885 , on the questlon, "1s Panthelsm the Legitimate Ontcome of Modern Scionce? " Also F. E. Abbot'e Scientific Theism, 1885; 日nd J. Fiske's Jlea of God as affected by dfodern Abows screntific
Knowledge, 18 R.
Bruch, Lehre con den Oölf. Eigenschaften, 1842; Moll, De Juto Auributorum Det Discrimine, 18 kJ . Both are, however, already inadeoliato.

His attributes and activities already fully realized in the trinitarian life can procecd outwards, not of necessity cut of absolute freedom; or that the whole noiverse is a manifestation of His triune nature, and all finito spiritual life a reflexion of the archetypal life, selfsustained and self-fulfilled therein. All the more thonghtful trioitarian divines of the present endeavonr to make it apparent that the doctrine of the Trinity is not one which has been merely imposed upon faith by external authority, but one which satisfies reason, gives expression to the self-evideacing substance of reveIation, and explains and supports religious expericace. If it be thought that their surcess has not been great, it has to be remem. bered that they have been labouring near the commencement of a movement, and so at a stage when all individual efforts can have unly a very limited worth. To one general conclusion they all seem to have came, namely, that the idea of God as aubstanco is not the only idea with which wo can conoect, or in which we may find implied, tri-personality. The.category of sabstance is, in some respects, one very inapplicsble to God, as the philosophy of Spinoza has indirectly shown. If the theologians referred to be correct, the dectrine of the Trinity is not specially dependent upon it. In their view Ged cannot be thought of consistently as, c.g., Absolute Life, Abselute Intelligence, or Absolute Love, unless He be thought of in a trinitarian manner.

While trinitarian theism has thus doring tho present century shown abundant vitality aad vigour, it cannot bo said to have gained any decided victery over unitarisn theism. The latter bss also within the same period spread more widely and shown more practical activity, more spiritual life, than in any former age. The onitarianism represented by a Slartineau is a manifest advance on that which was represented by a Priestley. Theism in its unitanan form is the creed of very many of the most cultured and most religions minds of our time, alike in Europe and America. In this form it has also signally shown its power in conternporary India. Brabmoism is, perhaps, the most remarkable example of a unitarian theism which exbibits all the characteristics of a positive faith and a charchly organization. The onitarian theism of the present age is distinguished by the great variety of its kinds or types. None of these, it must be added, are very definite or stable. Hence unitarisn theism is often seen to spproximsto to, or become absorbed into, agnosticism or pantheism, cosmism or humanitarianism. This may be due, however, less to its own character than to the charactet of the age. ${ }^{1}$

The mind of man has clearly not yot cessed to be intensely interested in thoughts of God. There are no grounds apparent. for supposiag that it will ever cease to seek after Him or to strive to enlarge its knowledge of His ways. And, if the idea of God be What has been suggested in the foregoing pages, the search for God cannot fail to meet with an ever-growing response. If the idea of God be the most comprehensive of ideas, inclusive of all the categories of thought and implicative of their harmonions synthesis and perfect realization, all thought and experience mest of its very nature tend to lead onwards to a fuller knowledge of God. For the knowledge of God, on this vient, consists in no mere inference reached through a process of theological argumentation, but in an arer-growing apprehension of an ever-advancing self-revelation of God; and all philosophy, science, experionce, and history must necessarily work together to promote it.

All speculative thonght, whether professedly metaphysical or professedly theological, is concersant with ideas included in the idea of God. It deala with what is necessary in and to thonght; and within that sphera, notwithstanding many aberrations, it has made slow but sure progress. The history of philosophical apeculation is not only, like the whole history of man, essentially rational, but it is, in substance, the history of reason itself in its purest form, - not the record of an accidental succession of opinions, but of the progressive apprehension by reason of God"s revelation of Himself in its own constitution. "There is nuch in the bistory of speculative thought, just as in the outward life of man, that belongs to the accidental and irrational-errors, vagaries, paradoxes, whimsicalities, assuming in all ages the name and the guise of philosophy. But, just as the studeat of the constitutional history of England can trace, amidst all the complexity and contingeacy of ontward and passing events, through successive times and dynasties, underocath the waywardness of individual passion and the straggle for ascendency of classes and orders, the silent, steady development of that system of ordered freedom which we namo the constitution of England, so, looking back on the course which human thought has travelled, we shall be at no loss to discern benesth the aurface change of opinions, unaffected by the abnormal displays of individal folly a ad noreason, the traces of a continnous onward movemont of mind." And this continuous onward movement is towards the clearer and wider apprehension of the whole eystem of ultimate traths which is comprehended in the idea of the Absolute Truth. The thoughts of men as to God are necossarily

[^108]enlarged by increase of insight into the conditions of their own thinking. The disquisitions of merely professional theologians on the nasture and attributes of Cod hava dooe far less to elucidate the idea of God than the plilosophica' piers of great specusative thinkers, and would have done less than they have actually accomplished wera it not for the guidance and suggestion found in these views.

The sciences co-operate with speculative philosophy and with one snother in aiding thought to grow in the knowledge of God. The greatness, the power, the wisdom, the goodness, of the God of creation and providence must be increasingly apprehended in the measure that nsture and its course, humanity and its history, are apprehended; and that measure is given us in the stage of development attained by tne sciences. "God's glory in the hearens," for example, is in some degree visible to tho naked eye and nuinstructed iotellect, bot it becomes more perceptible and more impressive with every discovery of astronomy. Not othcrwise is it as regards all the sciences. Each of them has its distinctive and appropriate contribation to bring towards the completion of the revelation of God, sad caunot withhold it.

But the idea of God is not one which can be rightly apprehended merely through intellect apeculatively excrcised or operating cn the findings of science. It requires to be also apprehended throngh moral experience and the discipline of life. Neither individuals Dor communities can know more of God as a moral being than their moral condition and character permit them to know. The apprehension of God and the sense of moral distinctions and moral obli. gations condition each other and correspond to each other. History shora ns that sincere and pious men may receive as a eupernaturally revealed truth the declaration that God is love, and yet hold that His love is very linited, being real only to a faroured class, and that He has foreordained, for His mere good pleasure, millions of the haman race to eternal misery. How was such inconsistency possible? Largely because these men, notwithstanding their sincerity and piety, were lacking in that love to man through experience of which alone God's love can he truiy apprehended. In like manner, it is not only the acience of law which cannot advance more rapidly than the sense of justice, but also theology ao far as it treats of the righteousness of God. Thns the knowledge of God is conditioned and influenced by tha course of man"a moral expericace.

The same may be aaid of the distinctively religions experience. In it also there has been a continuous discovery and a continuous disclosure of God. It is uot long aince the ethnic religions were Fery generally regarded as merely stages of human folly, so many monu. ments of aversion to God and of departure from the truth as to God. It was supposed that they were adequately described wben thej were called "idolatrics" and "superstitions." This riew rested on a strangely unworthy conception both of human oature and of Divine providence, and is fast passing away. In its place has come the conviction that the history of religion has been essentially a process of aearch for God on the part of man, and a process of self-revelation on the part of God to rasn, resulting in a continuous widening and deepening of human spprehension of the Divine. All, indeed, has not been progress in the history of religion either in the othaic or Christian period; much has been the roverse; but all stages of religion testify that man has been sceking and findion: God, and God making Himself known anto man.

But, while knowledge of God may reasonably be expected unceasiogly to grow, in all the ways which have been indicated, from more to more, it is not to be supposed that doubt or deaial of Gol's cxistence must, therefore, speedily disappear. Keligious agnos. ticism candot fail to remain long prevalcot. The very wealth of contents in the idea of God inevitably exposes the idea to the assaults of agnosticism. ' All kinds of agnosticism merge into agnosticism as to God, from the very fact that all knowlelge impliea and may coatribute to the knowledga of God. The more comprehensive an ides is from the more points can it be assailed, and the idea of God, being comprehensive of all ultimate ideas, may be Rssailed through them all, $3 s$, for example, though the idea of being, or of infinity, or of cansality, or of personality, or of rectitude. Then, in snother way, the uniguo fulness of tho idea of God explains the prevalence of agnosticisin in regard to it. The ideas are not precisely in God what they are in man or nature. God is being as man or nature is not ; for Ho is independent, and necessary being, and in that bense tho one true Being. God is not limited by time and space as creatures are; for, whereas xuretion sod extension merely are predicates of creatures, the correspon ding attributes of God are eterDity and immensity. God ss first cause is a canse in a higher and moro real sense than any scond caune. So as to personality, intelligence, holiness, love. Just because tho ides of God is thus elerated in all respects, thero aro many mio ls which fail or refuse to rise up to it, and which because of its rery truth reject it as not true at all. They will not hear of thas Absolute Truth which ia simply the ides of God; but that they reject it is their misfortune, not any argumcot against tho truth itself.
(R. F.)

THEMIS, the Greek mythological personification of castom. In Homer the word occurs both in the singular and in the plural (themistes), with the sense of "custom," "nowritten lam." But even in Homer Themis is also spoken of as a goddess who, at the command of Zeus, calls the gods to an assembly and summons or disperses the assemblies of men. But after all she is a thin abstraction, a faint shadow, by the side of the full-blooded gods of Olympus. Hesiod furaished her with a pedigree (making her the daughter of Sky and Earth), and married her to Zeus, by whom she became the mother of a brood of wellbred abstractions,-Legality, Justice, Peace, the Hours, and the Fates. Pindar, no doubt with a full sense of her abstract nature, speaks of her as the assessor of Zeus. In one passage (Pron., 209) Eschylus seems to regard her as identical with Earth, snd "Earth-Themis" had a worship and priestess at Athens, whero Athene also sppears with the surname Themis. There was a tradition that the oracle at Delphi had first been in the hands of Earth, who transferred it afterwards to Themis, who in turn gave it up to Apollo. Themis had temples at Athens, Thebes, Tanagra, and Epidaurus. At Olympia she had an altar, and at Troezen there was an altar of the Themides (plural of Themis). In modern writers Themis sometimes stands as a personification of law and justice, -an idea much more abstract and advanced than the original sense of "traditional custom."

THEMISTIUS, aamed єúфpaôns, or "the well-languaged," was a rhetorician and philosopher of the latter half of the 4 th century. Of Paphlagonian descent, he settled sad taught at Constantinople. Thence ho was called to Rome, but, after a short stay in the West, returned to the Eastern capital, where be resided during the rest of his life. Though a pagan, he mas admitted to the senate by Constantius in 355 . He was prefect of Constantinople in $38 t$ on the nomination of Theodosius. Themistius's paraphrases of Aristotle's Posterior Analytics, Physics, and De Anima are deservedly esteemed; but weariness and disgust are the sentiments stirred by the servile orations in which he panegyrizes successive emperors, comparing Evt one and then another to Plato's "true philosopher," anc, when all other compliments have been exhausted, to the "idea" itself. (See Reisks, quoted with spproval by Dindorf in the preface to his edition: "Fuit aulicus adulator et versipellis, vanus jactator philosophiæ suæ, specie magis quam re cultæ, ineptus et ridiculus verator et applicator Homeri et veteris historix, tautologus of sophista; in omaibus orationibus pæne eadem, et ubique argutiæ longe petitr.") Themistius's paraphrases of the De Colo and of book $\Lambda$ of the Metaphysics have reached us only through Hebrew versions.
The first edition of Themistius'e works (Venice, 1534) incloded the paraphrases and eight of the orations. Nineteen orations were known to Petarins, whose editions appeared in 1613 and 1618. Harduin (Paris, 1684) gives. thirty-three. Another orstion was discovered by Angelo Mai, and published at Milan in 1816. The most recent editions are W. Dindorfs of the orations (Leipsic, 1832) and L. Spengel's of the paraphrases (Leipsic, 1866). The Latin trenslations of the Hebrew versions of the parephrases of the De Coclo and book 1 of the Metaphysics were published at Venice in 1574 and 1558 respectively. See Fabricius, Bibliotheca Graca, vi. 798 sq .

THEMISTOCLES was born in the latter part of the 6th century B.o., some time during the rule of the Pisistratidx at Athens, the son of an Athenien father, Neocles, by a foreign women from Thrace or Caria. A wayward, ambitious, aspiring boy, out of sympathy alike with ordinary boyish amusements and with the learning and culture of the age, be was told, it is said, by his schoolmaster "that he would certainly be something great, whether good or bad.".ar. The victory of Marathon in 490 stirred the young man's soul, and he seems to have foreseen that it was but
the beginning of a yet greater cunfict. Ho resolved from that time to make his country great, that he might be great and famous himself. As he mas rising to political distinc tion, be had for his rival the Greek "Cato," the incorruptiblo Aristides, a purer patriot, a better citizen, but a less sagacious and far-seeing statesman. The two men were in sharp antagonism as to what their country's policy should be, and it ended in a vote of ostracism which sent Aristides into temporary banishment in 483 . The main question between them probably was whether Athens should seek greatness by sea or by land (see vol. xi. p. 99), and the victory of the policy of Themistocles led on to the most brilliant era in Greek history, the maritime supremacy of Athens. Persia, he felt sure, was meditating a great revenge, and Athens must make herself a naval porrer to avert the blow. Already. s small war with the Eginetan islanders, close to her prra shores, had roused her energies, sad at the prompting of Themistocles she had built 200 ships and trained a number of seamen. In 480 the storm which Themistocles had clearly foreseen burst; the great king, as he was called, was covering the land with his troops and the sea with his ships. Greece was divided and panicstricken; Thessaly and all to the north of Bootia had joined the enemy, and the despair of the remainder of the Creek world was echoed by the oracle of Delphi. There was, however, a word of hope in the memorable phrase of the " wooden wall," which, it was generally felt, must point to the flect, more, however, with a view to flight than to resistance. Salamis, too, was named in the oracle, coupled with the epithet "divine," which Themistocles cleverly argued portended disaster to the enemies of the Greeks rather than to the Greeks themselves. It was a great achievement when he finally prevailed on his fellowcitizens to quit their city and their homes-it seemed for ever-and to trust themselves to their ships. There had been some sea-fights off the northern shores of Eubca; the Spartans had fallen at Thermopyla, and Xerxes and his host were now laying waste Attica, not, however, before its inhabitants had convejed their families to the adjacent island of Salamis, where also the Greek fleet had taken up its station, the Persian armada of 1200 vessels being in harbour at Phalerum. The Athenians from their ships saw the flames in which their city, its acropolis and its temples, were perishing, but tbeir spirits rose with calamity, and with one heart, at the bidding of Themistocles, they called back all of their brethren who were in temporary banishment, Aristides among them. Nearly twothirds of the entire fleet was theirs, but for the sake of unity among the allies, who would follow only the lead of Sparta, they acquiesced in its being under the command of a Spartan admiral. It was clear, however, that the fate of Greece now depended on the action of the Atheniane and on the prudonce and ability of Themistocles, by whom they were guided. The Greeks of the Peloponnese, more particularly the Corinthians, were for moving the flect from Salamis to the istbmus, ss the enemy's land forces were already in possession of the neighbouring shores of Attica. Seeing the danger of yet further disunion, with the probable result of the breaking up and dispersion of the fleet, and haring in vain protested against quitting their present station, Themistocles went straight to the Spartan admiral, Eurybiades, and induced him to call another council. There was much angry debating, till at last the Spartan felt he must yield to the threat of Themistocles that the Athenians would either fight at Salamis or sail away as they were to Italy. But the Peloponnesian Greeks were still dissatisfed, and insisted that they ought to be at the isthmus for the defence of what yet remained

[^109] and your children:"
oi Greece ; a third council was Leld, and Themistocles felt that its decision would be against him, when, by a sudden happy thought, he contrived to have a secret message conveyed to the commanders of the Persian fleet through his slave, an Ionian Greek from Asia, a mau of intelligence and education, and well acquainted with the Persian language. The communication came in the name of Themistocles, who professed that he wished well to the king, and that now was a good .opportunity for attacking and crushing the Greeks, as they were divided among themselves and wcre bent on flight. The stratagem was successful, and the euemy's great armada adranced along the coast of Attica that same night, and took up a position which effectually confined the Greek fleet within the Darrow ${ }^{1}$ strait between Salamis and the southern shore of Attice. The Greek captains, not knowing the state of the case, were still wraugling through the night, when just before daybreak the banished Aristides came from L.Egina with the news that the Persian fleet was close at hand and thet retreat was impossible. "Let us still be rivals," he said to Themistocles, "but let our strife be which can best save our country."

The great victory of Salamis (see vol. xi. p. 100) left Greece mistress of the sea, and was followed by the retreat of Xerxes. Themistocles, it is said, frightened the king back to Asia by another secret message, to the effect that the victorious Greeks were bent on following him up to the Hellespont and burning his bridge of boats, but that he was doing his best to check their ardour, though in reality he had himself advised immediate pursuit of the enemy. We cannot but admire the man's sagacity and farsightedness in thus laying the king under an obligation which be might some day turn to his own proft, though we cannot but feel that he bad some of the worst as well as some of the most splendid characteristics of the Greek. After the victory Themistocles sailed with the Athenian squadron through the e. gean, and from some of the islanders who had sided with the enemy he exacted hears fines, out of which, it appears, he filled his own purse. When the Greeks met at the isthmus to decide according to custons the prizes of merit for the glorious day of Salamis, he received only the second prize, the first being a warded to the Spartan admiral, but by way of compensation he was soon afterwards heartily welcomed at Sparta, and loaded with honours so extraordinary as to imply that even the Spartans themselves recognized him as the first man in Greece. It was not long, however, before he gave them deadly offence. After the victories of Platea and Mycale in 479 the Athenians went back to their desolate city and began to rebuild and fortify it. Jealous fears of the growing power of Athens were a wakened, and the Spartans, as representatives of the Greeks generally, formally protested against the fertification of a Greek city outside the Peloponnese, on the ground that some future Persian invader might make it a base of operations. Themistocles saw the dangers of Spartan opposition, and got the Athenians to commission him to arrange matters along with two other envoys, who, however, were purposely not allowed to arrive at Sparta at the same time as himself. He told the Spartan magistrates that before he could transact business with them he must wait for his colleagues; meanwhile Athens was being fortified, every man, woman, and child putting a hand to the work, and as soon as Themistocles understood that it was sufficiently adranced he declared openly that Athens would brook no sort of interference. The Spartans felt they bad been tricked, but they could do nothing. And now Themistocles proceeded to fortify Pireus, and to enlarge the harbour, thus providing Athens with an excellent naval dockyard, and holding out an inducement to foreigners to settle in the

[^110]city for the purposes of trade. Twenty war ships, too, were at his suggestion to be built every year, and nothing left undone to make Athens prosperoue and powerful.

A few years afterwards (in 471 probably) we find his political career terminated by a vote of ostracism, due perhaps in part to Spartan influence at Athens, and also to an offensive boastfulness and ostentation which disgusted the sensitive Athenian democracy. He was even charged with corrupt practices and with receiving bribes from Persia. From Argos, whither he had retired as an exile, he was forced to flee by a threat of the Spartans, who alleged that they bad proofs of his treasonable complicity in the schemes of their countryman Pausanias, and to take refuge in the island of Corcyra ; but here again he was pursued by Spartan and Athenian commissioners, and driven to seek the protection of Admetus, king of the Molossians, the chief people of Epirus. In the court of this half-Greek balf-barbarian prince he found a hospitsble reception, and he was furnished with the means of crossing the Ægean to Ephesus. Shortly after his arrival in Asia, the son of Xerxcs, Artaxerxes, succeeded to the throne of Persia, and to him Themistocles contrived to make himself known as a fugitive from ungrateful Greece, which he had saved, and now ready and willing to advise and assist the king in avenging his father's defeat. He was treated, it is said, with marked respect, and was liberally pensioned with the revenues of three wealthy towns-Magnesia, Myus, and Lampsacus. It was at the first of these, which was near the coast, and whence he might be supposed to have opportunities for watching the affairs of Greece, that be passed the last year of his life, dying a natural death at the age of 65. The year of his death is not accurately ascertainable ; opinions vary between 460 and 447.

Herodotus, Thucydides, and Plutarch are our chief original sources for the life of Themistocles. The subject is fully treated iv the histories of Grote and Thirlwall.
(W. J. B.)

THÉNARD, Louis JacQues (1777-1857), was born ou the 4th of May 1777, at Louptière, near Nogent-sur-Seine, in Champagne. His father, though a poor man, sent him to the academy of Sens, where he received a liberal education. At the age of sixteen he went to Paris to study pharmacy. He attended the lectures of Fourcroy and Vauquelin, aud saw that the only way to dearn chemistry was to work at it. Vauquelin, himself a poor man, admitted a few students to his laboratory on payment of a fee of 20 francs a month. But this fee was prohibitory to the peasant's son ; the utmost that his father could send him just kept him alive in Paris. Thenard went to Vauquelin and asked to be allowed to do any menial work for him, if only be would let him assist in his laboratory. One of Vauquelin's sisters had slipped into the room and heard part of the conversation; she said to her brother, "He is a good lad ; you should keep him ; he will help you in the laboratory, and look after our pot au feu; your dandy assistants always let it boil." Thénard was engaged on these terms. Long afterwards he said that he looked upon the chemistry of the pot au $j e u$ and the process of simmering as of very great importance: they had been the turning-point of his life. Thénard assisted Vauquelin in the laboratory and at his lectures, and, when by starving for a day or two be accumulated sous enough to pay for a seat in the gallery, used to go to the theatre to improve his pronunciation and rub off his rustic accent.

By and by Vauquelin gave him an opportunity of testing his powers as a lecturer. Having to go for some days to the country, he asked Thénard to take his place. For the first two or three lectures his attention was fixed on his work, and his eyes did not wander from the lecture table. On the fifth day he sentured to look round the room, when to his consternation he saw Fourcroy and

Vauquenn among the audience. They were so satisfied with what they had heard that they obtained for Thenard in 1797 an appointment as teacher of chemistry in a school, and in 1798 the post of repétiteur at the Ecole Polytechnique.

In 1804 Vruquelin resigned the professorship of chemistry at the Collége de France, and successfully used his influence to have Thenard appointed. In 1810 he succeeded Fourcroy both as professor of chemistry at the Ecole Polytechnique and as member of the Academy. He was also appointed professor of chemistry in the faculty of the sciences. He was made a chevalier of the Legion of Honour in 1814, commander in 1837, and grand officer in 1842. In 1825 Charles X. gave him the title of baron; from 1827 to 1830 he represented the department of Yonne in the chamber of deputies. In 1832 Louis Philippe made bim a peer of France. As vice-president of the conseil supérieure de l'instruction publique, he exercised a great influence on scientific education in France. He died 21st June 1857, and was buried at La Ferte, near Châlon-surSaône. In 1861 a statue was erected to him at Sens, and in 1865 the name of his native village was changed to La Louptière-Thénard. Thénard was tall and strongly built, his hair was thick and black, his eyes bright, and his manner active and prompt. He married, in 1810 , Mlle. Humblot, granddaughter of Conté. His wife and several of his children predeceased him. He was survived by his son Paul, who had assisted him in some of his later researches.

Thénard was above all things a teacher : as he himself said, the professor, the assistants, the laboratory, everything, must be sacrificed to the students. The history of his discovery of the peroxide of hydrogen well illustrates the predominance of the teacher in his character. Ho was lecturing on the formation of salts, and had told his students that a metal must be oxidized to a certain extent in order that it may combine with an acid to form a salt; if the metal be combined with more than the proper quantity of oxygen, the excess of oxygen will be given off when the oxide is treated with an acid, and, as an illustration, be mentioned the action of acids on peroxide of barium. As he spoke his conscience smote him, for the experiment had not been made. Immediately after lecture ho mized perozide of barium and nitric acid, keeping the temperature low by means of ice. He was surprised to see the peroxide dissolve without any evolution of gas. He left the mixture standing, and next day, before lecture, noticed small bubbles of gas rising from it. Pouring some of the liquid into a test-tube and warming it, he saw a largo amount of gas escape, which be easily recognized as pure oxygen. At first he thought the acid had been oxidized, but he soon saw the true explanation of the phenomena, and discovered the peroxide of hydrogen. His lecture experiments were few, well-chosen, and accurately performed. If any failure occurred he would roundly scold his assistant, often apologizing for his vehemence when the short fit of anger was over. His lecture room, seated for 1000 , was alnust always crowded by eager and attentive students and visitors.

Like most great teachers, Thénard published a test.book, and perhaps we may say that by his Traité de Chinie Elementaire, Theorique et Pratique ( 4 vols., Par1s, 1813-16; 6th ed., 5 vols., 1833-36) he did even more to further the progress of the science than by his mumerous and mpportaut original discoveries. His first original paper (1799) was on the compounds of arsenic and antimony-with oxygen and sulphur. Careful analyses let him to couclusions as to the composition of the metallic oxides contra dictory of some of Berthollet's theorotical views; he also showed (1802) that Berthollet's "zoonic acid" was impure acetic acid. Berthollet, far from resenting these corrections from a younger man, took this opporturity of introducing kimself, and invited Thenard to become a member of the "Société d'Arcucil," to the proceedings of which Théuard contributed important papers. Soon after his appointment as revétiteur at the Ecole Polytechnique

Thénard mả̉s thee acquaintance of Gay-Lussuc, and formed with him a lifeleng fiendslip. Thcir joilt work, and its relation to the discoveries of Davy, have been fully rccorded in the anticle Gar. Lussac. Uf his sepatate investigations perlaprs the nost important is that on the compound ethers, beguri in 1807. He showed that each acid gives its own ether, and that the acill and alcohol can be rccovered by decomposíng the cthes by n.eans of caustic alkali. His discovery of peroxide of hydrogen (1818) has already boer. described. His researches on scbacic acid (1802) and on bile (1807) also deserve special notice. The blue sulstance knowu as Thénard's blue (essentially aluminate of cobalt) was prenared ly him in response to a demand by Cliaptal for a chear blue, as bright as ultranarine, and capalle of ctanding the tempernture of the porcelain furnace
Thenard's rescarches were chiefly pohlished in the Annales de Chinie ef do Physigue, in the Mémoires de la Societe d dreuell. and io the Comptes Rendus and the Memoires of the Acedeny of Sciences.
(A. C. B.)

THEOBALD, LEWIS (1688-1744), will survive as the prime butt of the original Dunciad when as a playwright, a littérateur, a translator, and even as a Shakespearean commentator, he will be cntirely forgotten. The son of an attorney, Theobald was horn at Sittingbourne, in Kent, in 1688 , and, after a inoderate education at Isleworth, studied for the profession of law, - a profession, however, which he never practised. He was a man with literary impulses, but without genius, even of a superficial kind; as a student, as a commentator, hemight have led a happy and enviable life, had not the vanity of the literary idea led him into a false position. His Persian Princess (1711) and his Electra (1714) gained no distinction. In 1726 The Double Falsehood had a certain vogue, partly from Theobald's pretence that the greater part of the play was by Shakespeare. In 1717 he commenced a series of papers (not to "The Censor," as has sometimes been stated, hut under that title) which appeared in Nist's TFeekly Journal; these do not seem to have been highly thought of by his contemporaries, but they were successful in gaining for Theobald not a few enemies, among whom Denn.w may be named. Seren or eight years later Theobald's censorious tendencies had intensified rather than moderated, and in 1726 be ventured to attack the most eminent literary man of the day in his Shakespear Restored, or a Specimen of the many Errors as well committed as unamended by Mr Pope in his edition of this Poet. Two years later the censor was himself castigated severely, and, as the dedicatee of The Dunciad, he had long an unenviable notoriety; as readers of the famous satire will remember, he occupicd the $\mu$ lace of chief victim until replaced by Colley Cibber in 1743. In the matter of Shakespeare editing, however, he had the advantage of his powerful rival. When in 1733 Theobald published his edition of Shakespeare in seven volumes, that of Pope had to go to the wall. Lewis Theobald wrote other dramas besides those already mentioned, and translated plays from Sophocles and Aristophanes, besides a rendering of Plato's $P h æ d o$ and a part translation of the Odyssey ; but for none of these things is he now remembered. The student of English history might fiud it worth while to glance through Theobald's Life of Ruleiyh (1719). He died in 1744.

## For plays, \&c., see the Biogruphia Dramatica, vol. i

THEOCRITUS, of Syracuse, the foremost Greek pas toral poet, lived a lifo of which nothing is known except from allusions in his owa works. The epigram appended to his poems makes hin say, "I ann a Syracusan, a man of the people, a son of Praxagoras and Philinna." He must have been born early in the 3d century, among a Dorian people, whose Doriau speech survives in his rural idyls. These " little pictures" chiefly represent the life of shepherds, neat-herds, and fisbermen in the woods and on the shores of Sicily. They aro doubtless inspired by the popular poetry of his time, and have much in common with the Romaic chants of the modern Grcek shepherds. The first idyl is a song ou Dabhnis. the ideal
herdsman, suog by the shepherd Thyrsis to a goatherd. The second is the magical chant which Simæths pours forth to the magic moon, in the hopo of recovcring ber lover. In the third a gostherd sings to bis love, Amaryllis. The fourth is an interchange of rude banter between two country fellows; and the fifth is of the asme kind. The scenes are in southera Italy. The sixth is a Sicilian singing match between two ideal herdsmen, -not contemporary rustics, but poets of nobler themes. The scene of the seventh is in Cos, where the poet introduces himself at a singing match. He may have been attached to the Asclepian medical school in Cos; his friend Nicias was a physician. Sicily and rival minstrels occupy the ninth idyl. The teath contains probably some real popular ditties, chanted by the reapers. The eleventh, addressed to Nicias, is a piece of artificial mythological genre, "The Cyclops in Love." The twelfth is a lyric, almost of passionate affection. The thirteenth is another idyl on a mythical topic, the adventures of Hercules and Hylas. The fourteenth and fifteeath are sketches of military and arban life, the mercenary soldier in love, and the gathering at the Adonis feast in Alexandria. Theocritus bad wandered to the court of Ptolemy, and joined the literary society of his court. The sisteenth is a patriotic piece: the poet urges Hiero to assail the Carthaginians in Sicily. The seventeenth is a conventional hymn to Ptolemy Philadelphus on bis marriage with his sister. The eighteenth is an epithalamium ; the nineteenth a tiny picture of Eros stung by a bee; the twentieth is the complaint of a herdsman rejected by a girl of the town; the twenty-first an idyl of fisher life: two poor old fishermen recount their dreams. The twenty-second idyl is a piece of heroic myth, the' adventures of Castor and Polydeuces ; and the twenty-fourth ie a tioy epic on the infancy of Hercules. The twenty-third is an amorous complaint. The twenty-fifth describes the slaughter by Hercules of the Nemean lion. The twentysixth justifies, in the interests of the ritual of Dionysus, the murder of the curious Pentheus. The twenty-seventh is the "Wocing of Daphnis," or "Oaristys," an amorous disconrse between a girl aod a 6 wain. The twenty-eighth is a graceful piece of vers de sociéte, sent to a lady with the gift of an ivory distaff. The twenty-ninth is amorous; and there remain an imperfect and a spurious piece, and a set of twenty-three epigrams.

On a general view, Theocritus's survining poems turn out to be-(1) rural idyls, the patterns of Virgil's eclogues, and of all later pastoral poetry ; (2) minute epics, or cabinet pictures from mythology; (3) sketches of contemporary life in verse ; (4) courtly compositions; and (5) expressions of personal kindliness and attachment. The first category and the third are those on which the fame of Theocritus depends. His verse has a wonderful Doric melody; his shepherds are natural Southern people: it is not his fault that what he wrote truly of them bas become a false commonplace in the pastoral poetry of the North.

Of Theocritus's own life we only know what bas been .ecorded, that he lived in Syracuse, Cos, and Alerandria, and that he was acquainted with Nicias, with Aratus, the aztronomical writer, and with Philinus, head of a school or eect of physicians. The rest is silence or conjecture. Suidas says that, in addition to the surviving poems, the Pratidx, tho Hopes, Hymns, the Heroines, Dirges, Elegies, and Iankics were attributed to him.
The charm of Theocritus can only be tasted in his original Doric, but the best English vetsion is by Mr C. S. Calverley. M. Coust'e book on the Alexandrine school of poetry may he recommended. J. Hauler, De Thooc. Vita et Carminibus (Freiburg, 1855), Herapel. Quæst. Theoc. (Kiel, 1881), and Rannow, Studid Theocritca (Berlin, 1886), may also be found wseful. The best English edition of tho poems is that of Bishop Wordsworth. (A. L.)

THEODOLITE. Seo Surveyino.
THEODORA, tho mife of the emperor Josinian (q.v.), Was born probably in Constantinople, though according to some in Cyprus, in the early years of the 6th century, and died in 547. We shail first give the usually received account of her life and character, end then proceed to inquire how far this accoant deserves to be accepted. According to Procopius, our chief, but by no means a trustworthy authority for her life, slee was the daughter of Acacius, a bear-feeder of the amphitheatre ot Constautinople to the Green Faction, and while still a child was eent on to the stage to earn her living in the performanccs called mimes. She had no gift for either music or dancing, but made herself notorious by the spirit and impudence of her acting in thêrough farces, as one may call them, which delighted the crowd of the capital. Becoming a noted courtesan, she accompanied a certain Hecebolus to Pentapolis (in North Africa), of which he had been appointed governor, and, having quarrelled with him, betook herself first to Alexandria, and then back to Constantinople through the cities of Asia. Minor. In Constantinople (where, according to a late but apparently not quite groundless story, she now endeavoured to support herself by spinning, and may therefore have been trying to reform her life) she attracted the notice of Justinian, then patrician, aod, as the all-powerful nephew of the emperor Justin, practically ruler of the empire. He desired to marry her, but could not overcome the cpposition of his aunt, the empress Euphemia. After her death (usually assigned to the jear 523) the emperor yielded, and, as a law, dating from the time of Constantine, forbade the marriage of women who had followed the stage with senators, this law was repealed. Thereupon Justinian married Theodora, whom he had already caused to be raised to the patriciate. They were some time after (527) admitted by Justin to a share in the sovereignty; and, on his death four months later, Justinian and Theodora became sole rulers of the Roman world. He was then about forty-foury jare of age, and she some twenty jears younger. Procopius relates in his unpublished history (Avéкסoтa) many repulsive tales regarding Theodora's earlier life, but his evident hatred of her, though she had been more than ten years dead when the Anecdota were written, aud the extravagances which the book containa, oblige us to regard him as a very doubtful witness. Some confirmation of the reported upposition of the imperial family to the marriage has been found in the story regarding the conduct of Justinian'e own mother Vigilantia, which Nicholas Alemanni, the first editor of the Anecdota, in his notes to that book, quotes from a certain "Life of Justinian," by Theophilus, to which be frequently refers, without saying where be found ito Since the article Justinian (q.v.) was published, tha present writer has discovered in Rome what is believed to be the only MS. of this so-called life of Justinian; and his examination of its contents, which he has lately published, makes him think it worthless as an authority. See article Taeorbilus.

Theodora speedily ecquircd unbounded influence over her busband. Ho consulted her in overything, and allowed her to interfere directly, as and when she pleascd, in the goverament of the empire. She hád a right to interfere, for she was not merely his consort, but empress regnant, and as such entitled equally with himself to the exercise of all prerogatives. In the most terrible crisis of Justinian's reign, the great Nika insurrection of 532 , her courage and firmness in refusing to fly when the rebels wcre attack ing the palace sared her husband's cromn, and no doubt strengthened her command orer his mind. Officials took an oath of allegiance to her as vell as to the cmperor (Nov. viii.). She even corresponded with forcigo nmbassador and instructed Belisarius how to deal rith the popes. I
copius describes her as acting with harshness, seizing on trivial pretexts persons who had offended her, stripping some of their property, throwing others into dungeons, where they were cruelly tortured or kept for years without the knowledge of their friends. The city was full of her spies, who reported to her everything said against herself or the administration. She surrounded herself with ceremonious pomp, and required all who approached to abase themselves in a manner new even to that half-Oriental court. She ras an incessant and tyrannical match-maker, forcing men to accept wives and women to accept husbands at her caprice. She constituted herself the protectress of faithless wives against outraged husbands, yet professed great zeal for the moral reformation of the city, enforcing severely the laws against vice, and immuring in a " bouse of repentance" on the Asiatic side of the Cosphorus five hundred courtesans whom she had swept out of the streets of the capital. How much of all this is true we have no means of determining, for it rests on the sole word of Procopius. But there are slight indications in other writers that she had a reputation for severity.

In the religious strife which distracted toe empire Theodora took part with the Monophysites, and her coterie usually contained several leading prelates and monks of that party. As Justinian was a warm upholder of the decrees of Chalcedon, this difference of the royal pair excited much remark and indeed much suspicion. Many saw in it a design to penetrate the secrets of both ecelesiastical factions, and so to rule more securely. In other matters also the wife spoke and acted very differently from the husband; but their differences do not seem to have disturbed either his affection or his confidence. The maxim in Constantinople was that the empress was a stronger and a safer friend than the emperor; for, while he abandoned his favourites to her wrath, sho stood by her protégés, and never failed to punish any one whose heedless tongue had assailed her character.

Theodora bore to Justinian no son, but one daughter,at least it would seem that her grandson, who is twice mentioned, was the offspring of a legitimate daughter, whose name, however, is not given. According to Procopius, she had before her marriage become the mother of a son. who wheu grown up returned from Arabia, revealed himself to her, and forthwith disappeared for ever; but this is a story to be received with distrust. That her behaviour as a wife was irreproachable may be gathered from the fact that Procopius mentions only one scandal affecting it, the case of Areobindus. Even he does not seem to believe this case, for, while referring to it as a mere rumour, the only proof he gives is that, suspecting Areobindus of some offence, she had torture applied to this supposed paramour. Her health was delicate, and, though she took all possible care of it, frequently quitting the capital for the seclusion of her villas on the Asiatic shore, she died comparatively young. 'Theodora was smal' in stature and rather pale, but with a graceful figure, beautiful features, and a piercing glance. There remains in the apse of the famous church of St Vitale at Ravenna a contemporaneous mosaic portrait of her, to which the artist, notwithstanding tho stiffness of the material, has succeeded in giving some character.

The above account is in substance that which historians of the leat two centuries and a half have accepted and repeated regarding this famons empress. But it must Leadmitted to bs open to serieus doubts. Everything relating to the early carcer of Theodora, the faulta of her girlhood, the charges of cruclty and iusolence in her gevernment. of tho cmpire, rest on the sele authority of the Arecdoter of Procopius, - a buek whese credit is shaken by its bitterness and extravagance. If we reject it, little in lcft against her, except of course that action in ecclesiastical affairs which excited the wrath of Baro* nius, who had deneunced her before the Anecdota were published.
In favour of tho pinture which Procopius gives of the emrress it may be argued (1) that abe certainif did interfere constantly and
a bitrarily in the administration of public affairs, and showed hereelf therein the kind of persou who wonld be crnel and unscrupal. ous in her choice of means, and (2) that we gather from other Writers an inpression that she was barsh and tyrannical, os, for instance, from the references te her in the lives of the popes in the Liber Pontifictlis (which used to pass under the name of Anastasiua, the papal librarian). Her threat to the person whom she commanded to bring Vigilius telier was "nisi hoc fecoris, per Viventem in sxccula excoriari to faciam." Much of what we find in these lives is legendary, but they are seme evidence of Theodori's reputa. tion. Again (3) the statute (Cod., v. 4, 23) wbiclı repeala the older law so far as relates to scenica mulicres is now generally attributed to Justin, and agrees with the statement of Procopins that an alteration of the law was made te legalice her marriage. There ie therefore reason for holding that she was an actress, and, considering what the Byzantine stage was (as appears cren by the statute in question), ber life cannot have been irreproachable.
Against the evidence of Procopins, with such confirmations as have been indicated, there is te be set the silence of other writers, contemperaries like Agathias and Evagrius, as well as such later historians as Theophanes, none of whon repeat the charges as te Theodora's life before her marriage. To this consideration no great weight need be attached. It is difficult to establish any View of the coutreversy without a long and minute examination of the autherities, and in particular of the Anecdota. But the niest probable conclusions seent to be-(1) that the odious details which Procopiue gives, aur which Gibbon did not blush to ceny, deserve no more weight than would bo given nowadays to tie malignaut scanclal of disappointed courtiers nuder a despotic gevernment, where scandal is all the blacker because it is propragated in secret (see Prooopros); (2) that apparently she was an actress and"a courteas, and not improbably conspicuous in both those charae tera; and (3) that it is impessible to determine how far the specific chargea of cruelty and oppression brought againat her by Procepius deserve credence. We are not bound to accept them, for they are uncerroborated; yet the accounts of Justinian'a gevernmeut given in the Anecdote agree in toe many respects with what we know aliunde to enable us to reject them altegether; and it must bo admitted that there is a certain internal consistency in the wholo picture which the Anecdotry rresent of the empress. About the beauty, the intellectnal gifts, and the imperious will of Theedera there can be no donbt, for as to these all our authoritiea agree. She was evidently an extraordinary persen, bern to shine in any station of life.

Her fortunes have employed many pens. Among the latest serious worke dealing with them may be mentioned M. Antonin Dóbidour's L'Imperairice Theodora: Etude Critique, Paris, 1885, which endeavours to vindicate her from the aspersions of Procopiua; and ameng wore imaginative writinga are Sir Hemry Pottinger's interesting romance Blue and Green (London, Hurst and Blackett, 1879), M. Rhangabé's tragedy Өєobwpa (Leipaic, 1884), and M.. Sardou'a play Theodora, preduced in Paris in 1884. Ses also Dr F. Dahn's Prokopios von C'asarea, 1865.
(J. BR.)

THEODORE of Mopsuestia, the most eminent representative of the so-called school of Antioch, the beginnings of which date from about the middle of the 3 d century (see Lucian and Paul of Samosata). He was born at Antioch about the middle of the 4th century, and was a friend of Chrysostom; in rhetoric the celebrated Libanins was his teacher. Soon, however, he attached himself to the school of the great exegete and asce ${ }^{\circ}$; Diodorus, a presbyter in Antioch, and, with only a transitory period of vacillation, he ever afterwards remained faithful to the theology and ascetic discipline of this master. Under Diodorus he lecame a skilful exegete, and ultimately the pupil outstripped the master in Biblical learning. About 353 Theodore became a presbyter in Antioch, and began to write against Eunomius the Arian and against the christology of Apollinaris. Soon after 392 he became bishop of Mopsuestia in Cilicia (the modern Missis near Adana). As such he was held in great respect, and tonk part in several synods, with a reputation for orthodoxy that was never questioned. It was greatly to his advantage that in the Eastern Church the period between the years 390 and 428 was one of comparative repose. He was on friendly terms even with Cyril of Alexandria. He died in 428 or 429 , towards the beginning of the Nestorian controversy.

Theodore was a very prolific writer, but, before all, an exegote. He wrete commentaries ou alnost every book of the Old and Now Testaments, of which, hewever, only a amall proportion is now.
extant, as st a later period he lost credit in the charch. We atill possess in Greek his commentary on the Minor Prophets, and in Latin translatious commentaries on the mioor Pauline epistles, besides very many fragments, especially of that on the epistle. to the Romans. Theodore's importance as an exegete lies in two char-acteristics:-(1) in opposition to the allegorical method he insists on getting at the literal meaning, and adheres to it when found; (2) in his interpretation of the Scriptures he takes into account the histerical circumstances in which they were prodnced, and substitates the historical-typological for the pneumatico-christological interpretation of prophecy; in other words, he interpicts all Old Testament passages historically in the first iustance, and aecs the fulfilment of old Testarnent prephecy in the history of Christ and His church only in so far as the entire Old Testament is a "shadow of things to come." Following his master Diodoras, who bad
 Theodore also was the author of a special dissertation against the allegorists, i.e., against Origen and his followers, which, however, has uniortunately perished. The comparative freedom of Theodore's view of inspiration is also notoworthy, He discriminates between historical, prophetical, and didactic writings, and io accordance with this distinction assumes varying degrees of inspiration. Finally, he entertained very bold opinions about the canon and several of the books incladed in it. He esteemed very lightly the Solemonic writings and the book of Job; Canticles he explained as a nuptial poem of Solomon's; the book of Job appeared to him in many places hardly worthy of its subject, and he censares the writer sharply; Chronicles, Ezra, and Nehemiah he entirely rejected; he denied the accuracy of the titles of the Psalms, and referred the so-called Messianic element almost invariably to the kings of Israel; he even criticized the catbolic epistles and rejected the epistle of James. His commentaries contain a great deal of learned matter, and his grammatico-historical observations are still to some extent aseful. Bat, on the other hand, his learning must not be overestimated. It falle behind that of Origen, Eusebius, and Jerome, notrithstanding the auperiority of his method. It is specially noticeable that Theodore troubled himself little shont textual criticism. He simply accepts the text of the LXX. as that of revelation, and never manifests the slightest effort to control it by the original or by the Syrisc.
But in addition to his commentaries Theodore also wrote extessive dogmatico-polemical works, which were destined to operate long after his death disastrously for his fame. As a disciple of Diodorus, Theodore accepted the Nicene teaching on the doctrine of the Trinity, bat at the same time in christology took np a position rery clesely approaching that of Paul of Samosata. The violence of his opposition to his fellow countryman, Apollinaris of Laodicea, perhaps the mest acnte and far-seeing theologian of the ccatury, made it necessary for Theodore to formulate his christology mith precision (in fifteen books on the Incarmation-all lost except a few
fragments-and in special treatises against Apollinaris) the Logos to bave assumed a complete manhood, He held throagh the stages of ethical development just as in the case of any other human being. In this the Logos only supported toe man Christ Jesus, bnt was not essentially connccted with him; the Logos
 and could not exist, because the finite is not "capax infiniti," and because any ívwots rould have destroyed the reality of the human nature. The same sober and thoughtful way of looking at things, and the same tendency to give prominence to the moral element, which characterize the commentaries of Theodore appear also in his dogmatic. When, accordingly, the Nestorian controversy broke out, his works also were dragged into the discussion. At Ephesus, indeed, the memory of Theodore does not appear to have been attacked, ${ }^{1}$ but soon afterwards the assault began. Marius Mercator, Rabulas of Edessa, Cyril, and other monophysites brought the charge of heresy against his writings, and bought to counteract their inflaence. But it was not antil more than a century afterwards that hie fagatical adversaries succeeded-in spite of the strong oprosition of the best theologians of the West-in obtaining from Justinian the condempation of his works in the controversy of the Tria Capitula, as it is called ; this act of the emperor was confirmed by the fifth ceumenical council, and Theodore's name was accordingly deleted from the list of orthodex writers. From that dsy Theodnee's works ceased to be read within the Byzantine Chureh, and beace have bean lost. The Syrizns, on tho other hand, have always held in high esteem the memory of the great tcacher, and have even carried back their liturgy to his aame. The Nestorians possess, or possessed, a very large number of writings by him in Syriac translations. ${ }^{\text {a }}$

Theodore took parl also in the Pelagian controversy at the time when it raged in Palcstine. In the treatise, only partially pre-

[^111]See Photing, Bıoliolh., c. 177 ; Sercator, p. 339 sg., ed. Belos.
devpárous, he sharply controverts the doctrine of original sin and Jerome ita advecate. In his view the theory of Augustine is "a new heresy," "a malady"; he regarded it as a doctrine which necessarily led to dualism and Manichæism. The attitude thus taken by Theodore is not surprising; he more ncarly takes up the ground of the old church doctrine as set forth in the apologists and in the great Greck fathers of the 3 d and 4 th centuries. The Pelagians driven from the East were received by him in Cilicia

A brother of Theodore, Polychronius by name, bishop of A pamea, also achieved fame as an exegete, and expounded the theology of the school of Antioch. ${ }^{4}$

Literature.-Migne, Potro!., ber. Gr.. Ixy. The Grcek fragmente of Theodore Now Teatameut commentarie bave been collected by Fritzsche (Thcod. Jfops, is W. T. Comnh. Turin, 1847). The commentaries on the l'aullos eplstles (Plith Spic. Solesm., 3. 43 gq .) have beea recognized by Jacobl (Zischr. f. ehrist. missensch," and edited by Jacobi (Hallo Uaiverstly Programm, $18 s 0-60$ ). They have also beea edited very admirably by Swete (theod. Mops. in epp. Fid the fragments of the Cambridie, 1880-82), along with the Greek fragments sind tho fragments of tha dogmatical writifes, on this edition, ece Schürer, Theol. Jif. Ztg. 1880-82. Tha commentary on the Minor Propbeta will be found in Mura Nov. Patr. Sibrinh., vii. 1854 (Wespern, Berlid, 1834 ; Mal, Scripl. Vet. Voo. Coll. Wi., 1832). See nwo Sachao, Theod. Mops. Fragm. Syriaca, Lelpsic, 1869 , and Baithgen, "Der Paimencommentar des Theod. $\nabla$. Mopa. In Syr. Bearbeitung, in 2tschr. f. AThiche Wisseasch. $\nabla .53 \mathrm{sg}$. Exiracts from the writiogs of theodore occur al councite in of Marius Mercator, ia the Aca of the third and art cecumenical councis, Facondus, Liberatus, and Theodore"a chef adversary, Leontius Ibyzantinas.
The pridelpal monograph on Theosore, spart fram the excellent prolegomena of Swete, is that of Kihn (Th. r. Mops, u. Juntius Afric. afs Exegetm, Frefbug, 1880). On bls Importance for the history of dogina, see the great worka of par and Dorner. Chret, 1885.
(A. HA.)

THEODORE, the name of two popes. Theodore I., pope from November 642 till May 649, succeeded John IV. He was the son of a bishop, and was born in Jernsalem. A zealous opponent of monothelitism, in the course of the protracted controversy he in a Roman synod excommunicated Pyrrhus, patriarch of Constantinople, and signed the document with ink mingled with consecrated wine. Theodore II. had a pontificate of only twenty days (Nor.-Dec. 897).

THEODORET, bishop of Cyrus, and an important writer in the domains of exegesis, dogmatic theology, church history, and ascetic theology, was born in Antioch, Syria, about 390. At an early age he entered the cloister; and in 423 he became bishop of Cyrus, or Cyrrhus, a small city hetreen Antioch and the Euphrates, where, except for a short period of exile, he spent all the rest of his lifa The date of his death is uncertain, but it must have been at least six or seven years later than the council of Chalcedon (451). Although thoroughly devoted to the ideals of monasticism, he discharged his cpiscopal duties with remarbable zeal and fidelity. He was diligent in the cure of souls, labouring hard and successfully for the conversion of the numerous Gpostic communities and other herctical sects which still maintained a footing within the diocese. He himself claims to have brought more than a thousand Marcioaites within the pale of the church, ard to have destroyed many copies of the Diatessaron of Tatian, which were still in ecclesiastical use; and he also exerted himself to improve the diocese, which was at once large and poor, by building bridges and aqueducts, beautifying the town, and similar works.

As an exegete Theodonet belongs to the Antiochcae school, of which Diodorus of Tarsus and Theodore of Mopsuestia were the heads. He was not actually the personal disciple of either, but he adopted their methods, though without the consistency snd boldness of the first-named. His extant commentaries (those on Canticles, on tho Prophets, on the book of Psalms, and on the Panline epistles-the last the most raluable) are among the best performances of the fathers of the church. They are bricf, yet net wanting in that element of practical edification on which Chrysostom lays special weight as characteristic of the Antiochenes. In addition to these completo commentarics, we have fragments of some othera (of that on lsaiah, for exatnple), principally met witl in caters. There are also special elucidations of some diffcult Scripture texts.

Theodoret's chief importance is as a dogratic theologian, it having fallen to his lot to take part in the great monophysiteNestorian controversy and to be the most considerable opponent of the views of Cyril and Diosenrus of Alexandria. For more than twenty years he maintained the strugglo against the Aloxandrian

 person of Christ we must strictly distinguish two natures (hyposlases), which are united indeed in one person (prosopon), but are not amalgamated in essence. For these years his history coincides with that of the Eastern Church from 430 to 451 , and for this very reason it is impossible to sketch it even briefly here (see Hefele, Conc.gesch., vol. ii.). The issue was not nnfavouratle to Theodoret'e canse, but melancholy enough for Theodoret himself: the council of Chalcedon condemned monophysitism indeed, but he unhappily Fielded to pressure so far as also to take part in pronouncing "anathoma upon Nestorius, and upon all who call not tho Holy Virgin Mother of God, and who divide the one Son into two." As Theodoret had proviously been a constant defender of Nestorins, it was impossible for him to concur in this sentence upon his anfortunate friend with a clear conscience, and in point of fact he did not change his ntru dogmatic position. It is distressing, therefore, to find him in his subsequent. Epitome classing Nestorius as a heretic, and speaking of him with the ntmost hostility. Some of Theodoret's dogmatic works are no longer extant: of his five books $\Pi \in \rho l$ évavo $\rho \omega \pi \dot{\eta} \sigma \in \omega \rho$, for example, directed against Cyril after the council of Ephesus, we now possess fragments merely. A good deal of what passes under his name has been mrongly attriboted to him. Certainly genuine are the refutation ('Avatporit) of Cyril's twelvo
 (written about 446), consisting of three dialogues, ontitled respect-
 itism of Cyril is opposed, and its Apollinarian cherecter insisted on. Among the apologetico-dogmatic works of Theodoret must be reckoned his ten discourses $\Pi_{\epsilon} \rho \mathrm{l}$ троvolas.

Theodoret gives a valuable exposition of his own dogmatio in the fifth book of his Aipєтiкทิs какодиOlas inisout, already referred to. ${ }^{1}$ This, the latest of his works in the domain of church history (it wes written after 451 ), is a source of great though not of primary importance for the history of the old heresies. - In spite of the investigations of Volkmar and Hilgenfeld, we are still someWhat in the dark as to the authorities he used. The chief uncertainty is as to whether ho know Justin's Syntagma, and also as to whether he had access to the Philosophumena of Hippolytus in their complete form. Besides this work Theodoret has also left us a charch history in five books, from 324 to 429 , which wes pablished shortly before the conncil of Chalcedon. The style is better than that of Socrates and Sozomen, as Photius has remarked, but as a contribution to history the work is inferior in importance. It is probable that its author was acquainted with the labours of Socrates; he appears also to havo used those of Philostorgius the Arian, but not those of Sozomen. Something indeed still remains to be cleared up as to the sources he employed; spart, however, from some documents he has preserved, relating to the Arian controversy, he does not contribute much that is not to be met with in Socrates. He made a thorough study of the writings of Athanasius for the work. As regards chronology he is not very trustworthy; on the other hand, his moderation towards opponents, not except-

 438-is of en historical and opologetic character, very largely indebted to Clement of Alezandria and Eusebius; it aims at showing the advantages of Christianity, as compared with Hellenism, and deals with the assaults of pagan adversaries. The superiority of the Christian faith both philosophically and ethically is set forth, the chief stress being laid on monachism, with which heathen philosophy has nothing to compare. Much prominence is also given to tha cult of saints and martyrs.

On this side of his character, howerer, Theodorel can best be studied in the thirty ascetic biographies of his \$i入 $60 \in 0$ ioropic. This collection, which has been widely read, is a pendant to the Historia Lausiaca of Palladius and the monkish tales of Sozomen. For the East it has had the same importance as the similar writings of Jerome, Sulpicius, Severus, and Cassianus for the West. It shows that the "sobriety" of the Antiochene 6cholars can be predicated only of their exegesis; their style of piety was as exaggerated in its devotion to the ideals of monasticisin as was that of their monophysite opponents. Indeed, one of the oldest leaders of the school, Diodorus of Tarsus, was himself among the strictest ascetics.

Nearly 200 letters of Theodoret have come down to us, partly in e soparate collection, parily in the Acta of the councils, and partly in the Latin of Marius Mercator; they are of great value not only

[^112]for the biography of the writer but also for the history of his diocese end of the church in genemal.
Tha edidion of Slrmond (Parlis, 1692) was afterwarda completed by Garnier (1684), wbo has also written dissertations on the author'a works. Schulze and Nösselt, publibhed a new edition (B vols., Halla, 1769-74) based on that of thelr predecessors; a glossary was afterwards added by Baner. Tbe repint will bo found in vols. lxex.-lxxiv. of Migne, and conslderabla portions occur in Mansl. Besldes the eartler labours of Tillemont, Celller. Theodoret," in Herzog.Plitt's Realencykh, vol. x
THEODORIC, king of the Ostrogoths (c. 454-526). Referring to the article Goths for a general statement of the position of this, the greatest ruler that the Gothic nation produced, we add here some details of a more personal kind. Theodoric was born about the year 454, and was the son of Theudemir, one of three brothers who reigned over the East Goths, at that time settled in Pangonia. The day of his birth coincided with the arrival of the news of a victory of his uncle Walamin over the sons of Attila. The name of Theodoric's mother was Erelieva, and she is called the concubine of Theudemir. The Byzantine historians generally call him son of Walamir, apparently because the latter was the best known member of the royal fraternity. At the age of seven he was sent as a hostage to the court of Constantinople, and there spent ten years of his life, which doubtless exercised a most important influence on his after career. Shortly after his return to his fathef (about 471) he secretly, with a comitatus of 10,000 men, attacked the king of the Sarmatians, and wrested from him the important city of Singidunum (Belgrade). In 473 Theudemir, now chief king of the Ostrogoths, invaded Mresia and Macedonia, and obtained a permanent settlement for his people near Thessalonica. Theodoric took the chief part in this expedition, the result of which was to remove the Ostrogoths from the now barbarous Pannonia, and to settle them as "foederati" in the heart of the empire. About 474 Theudemir died, and for the fourteen following years Theodoric was chiefly engaged in a series of profitless wars, or rather plundering expeditions, partly against the emperor Zeno, but partly against a rival Gothic chieftain, another Theodoric, son of Triarius. ${ }^{2}$ In 488 be set out at the head of his people to win Italy from Odoacer. There is no doubt that he had for this enterprise the sanction of the emperor, only too anxious to be rid of so troublesome a guest. But the precise nature of the relation which was to unite the two powers in the event of Theodoric's success was, perhaps purposely, left vague. Theodoric's complete practical independence, combined with a great show of deference for the empire, reminds us somewhat of the relation of the old East India Company to the Mogul dynasty at Delhi, but the Ostrogoth mas sometimes actually at war with his imperial friend. The invasion and conquest of Italy occupied more than four years (488-493). Theodoric, who marched round the head of the Venetian Gulf, had to fight a fierce battle with the Gepidæ, probably in the valley of the Save. At the Sontius (Isonzo) he found his passage barred by Odoacer, over whom he gained a complete victory (28th August 489). A yet more decisive victory followed on the 30th September at Verona. Odoacer fled to Kavenna, and it seemed as if the conquest of Italy was complete. It was delayed, however, for three years by the treachery of Tufa, an officer who had deserted from the service of Odoacer, and of Frederic the Rugian, one of the companions of Theodoric, as well as by the intervention of the Burgundians on behalf of Odoacer. A sally was made

[^113] Theodoric was made innster of the houschold troope and in 484 consul
from Ravenna by the besieged king, who was defeated in a bloody battle in the Pine Wood. At length (26th February 493) the long and severe blockade of Ravenna was ended by a capitulation, the terms of which Theodoric disgracefully violated by slaying Odoacer with his own hand (15th March 493). See Odoacer.
The thirty-three jears' reign of Theodoric was a time of unexampled happiness for Italy. Unbroken peace reigned within her borders (with the exception of a trifing raid made by Byzantine corsairs on the coast of Apulia in 508). The venality of the Roman officials and the turbulence of the Gothic nobles were sternly repressed. Marshes were drained, harbours formed, the burden of the taxes lightened, and the state of agriculture 80 much improved that Italy, from a corn-importing, became a corn-exporting country. Moreover Theodoric, though adhering to the Arian creed of his forefathers, was during the greater part of his reign so conspicuously impartial in religious matters that a legend which afterwards became current represented him as actually putting to death a catholic deacon who had turned Arian in order to win his favour. At the time of the contested papal election between Symmachus and Laurentius (496-502), Theodoric's mediation was welcomed by both contending parties. Unfortunately, at the very close of his reign (524), the emperor Justin's persecution of the Arians led him into a policy of reprisals. He forced Pope John to undertake a mission to Constantinople to plead for toleration, and on his return threw him into prison, where he died. Above all, he sullied his fame by the execution of Boetius and Symmachus (see Boertios). It should be observed, however, that the motive for these acts of violence was probably political rather than religious,- -jealousy of intrigues with the imperial court rather than zeal on behalf of the Arian confession. Theodoric's death, which is said to have been hastened by remorse for the ozecution of Symmachus, occurred on 30 th August 526. He was buried in the mausoleum which is still one of the marvels of Ravenna (q.v.), and his grandson Athalaric, a boy of ten years, succeeded him, under the regency of his mother Amalasuntha.

Authorilies. - The authorities for the life of Theodoric are very imperfect. Jordanes, Procopius, and the curious fragment known as Anonymus Velesii (printed at the end of Ammianus Marcellinus) are the chief direct eources of narrativo, but far the most important indiract source is the Varis (state-papers) of Cassiodorus, chief minister of Theodoric. Malchus furnishes some interesting particulars as to his early life, and it is possible to extract a littlo information from the turgid panegyric of Ennodins. Among German acholars Dahn (Konige der Germanen, ii., iii., and iv.), 2aobo (Geschichte des Ostgothischen Reichs in Italien), and Sartorius (Versuch über die Regierung der Ostgothen, \&c.) have done most to illustrate Theodoric's principles of government. The English reader may consult Gibbon's Decline and Fall, chap. xxxix., and Hodgkin's Italy and her Invaders, vol, iii., and Lellers of Cussiodorus. (T. II.)

THEODOSIA, or Kaffa, a seaport and district town of Russia, situated on the east coast of Crimea, 69 miles to the east-north-east of Simpheropol. Its roadstead,
which has a width of 18 miles and is never frozen, is well protected from east and west winds, and partiy also from the south, but its depth is small, ranging from 11 to 14 feet and reaching 35 feet only in the middle. The want of railway communication with the interior prevents it from gaining the commercial importance it might otherwise have possessed, so that its population was only 10,800 in 1881.-a low figure when compared with the 20,000 it had in 1672 and still more with the figure returned in last century. Many remains of its former importance exist in the city and neighbourhood, the chief being a beautiful mosque-formerly a Genoese cathedral-synagogues several centuries old, old towers with inscriptions, baths, and a palace of Shah-Ghirei in the suburbs. Gardening is one of the leading industries ; fishing, a few manufactures, agriculture, and trade are also carried on. The foreign trade, which in 1830-40 reached an average of $£ 90,000$ for exports and $£ 66,500$ for imports, afterwards fell off, but it has experienced a revival in the course of the last 15 years, the exports of corn, linseed, and wool having reached $£ 167,853$ in 1884 . The imports are insignificant.
Theodosia, a Milesian colony, was in Strabo's day a flourishing seat of trade (especially in grain), with a harbour capable of accommodatiug a hundred ships; but before Arrisu'a tima (c. 125 A.D., it appears to have been destroyed. More than a thousand yea. B later (1263 to 1267) the Genoese established here their colony Kaf.. or Eefa, which grew rapidly up notrithstanding the rivalry of the Venetians. It was fortifed, and became the see of a bishop, as well es the chief centre for the Genoese colonies on the Black-Sea coasts. It remained nearly iadependent uatil 1475 , when it was taken by the Turks, but it continued to prosper uader their rule, under the name of Kutchuk-Stambul, or Kryon-Stambul (Stambul of Crimea). The Russiang took it in 1771, and annexed it in 1774. From that date it began to decay, and had only 3200 iohabitants in 1829, the emigration of the Crimean Tartars and the competition of Odessa being obstacles to its further gromth.
THEODOSIUS I, emperor of Rome, surnamed the Great, was the son of Theodosius, Valentinian's great general, who in 368-69 drove back the Picts and Scots from the Roman territories in Britain, and, after other successes on the Continent, was at last despatched to sup. press the revolt of Firmus in Mauretania (372). Shortly after (376), the elder Theodosius, despite his great services, was put to death by order of Valens, próbably through fear lest he should be the Theodosius or Theodore whom the prophetic tripod indicated as the future emperor.

The younger Theodosius was born about the year 345 . He was a native of Spain, but the exact place of his birth 15 uncertain (Cauca in Galicia acoording to Idatius and Zosimus, Italica accordligg to Marcellinus). Pacatus and Claudian seem to claim for him at least a relationship: to Trajan, of which, bowever, there is no satisfactory proof. He accompanied his father into Britain (308), and a little later distinguished himself by defeating the Sarmatians who had invaded Meesia (374). On his father's death be retired to his native place, where he lived quietly till after the great battle of Adrianople (August 9, 378), when Gratian summoned him to share the empire. Theodosius was made Augustus at Sirmium, January 19, 379, and was assigned all the Eastern provinces, including Illyricum. It was a time of great peril for the Roman state. The Huns had just made their appearance on the western shores of the Black Sea, and, after overthrowing the great nation of the Ostrogoths, had driven the more southern Visigoths to take shelter within the empire. Valens had consented to rcceive them (3i6) on condition that they should deliver up their arms and surrender their children as bostages to be distributed throughout the cities of the East. The latter half of the compact was enforced, but not the former ; and the barbarians, left without any sustenance, began to plunder the open country. After their great victory at Adrianople they rcached the walls
of Coustantinople, whence they were driven back by the valour of a band of Saracens. Meanwhile the Ostrogoths, the Taifali, the Huns, and the Alans had all crossed the Danube to share the spoils of the empire; and it was against this motley host- that Theodosius had to contend. He appears to have gained some successes even before his elevation to the empire (Theodoret, v. 5, 6), and shortly after this retired to Thessalonica to organize his forces. He breathed courage into what remained of the Roman army, and summoned the very miners to his standard. But his chief reliance was placed in certain bodies of the Goths whom he had enrolled in his service. These, under their royal leader Modares, gained at least one decisive victory, probably in the course of 379 . From the unchronological account of a later writer, Zosimus, to whom we owe almost all the details of Theodosius's early campaigns, we may infer that in the course of this year or the next Fritigern and his Visigoths were gradually driven across the Danube, where they seem to have met with the Ostrogoths who had shared their fate. For a time the united nations turned their energy against the Western empire, till they forced Gratian to grant them leave to settle in Pannonia and Mœsia. Before setting out on their new journey they perhaps combined their forces to attack Athanaric, who had retreated with his section of the Visigothe into the wilds beyoud the Danube at the time of the Hunnish invasion. Unable to withstand their onset, Athanaric offered his services to Theodosius, and was recesved into Constantinople with every mark of favour, 1lth January 381. Fifteen days later he died, and was honoured by the emperor with a splendid funeral, while his followors faithfully discharged the duty of guarding the Danube.

In the two preceding years Thessaly and Macedonia had been swept by the barbarians. On one occasion the omperor himself barely escaped from their hands in a midnight attack which they had been induced to make by the sight of his blazing watchfires; on another the united forces of the Ostrogoths and Visigoths crossed the Danube with the design of pillaging Greece. In his efforts against the invaders Theodosius was ably seconded by his colleague Gratian, who despatched his Frankish officers Baudo and Arbogastes to drive the enemy out of Macedonia and Thessaly (380), and, while Theodosius lay sick at Thesealonica, mado such terms with them as the latter emperor was glad to accept on his recovery. A little later, presumably towards the middle of 381, Promotus, Theodosins'a Lieutenant, inflicted a terrible defeat on a motley host that was attemptiog to cross the Danube. This was perhaps the decisive battle in the war ; and we read that on October 3,382 , all the remaining Goths in the empire submitted to Theodosius. Many of them appear to have entered the Roman army as "fœederati"; and indeed, from the very commencement of his reign, Theodosius seems to have pursued a consistent policy of eprolling the Gothic warriors. At times they accepted his gifts while meditating treachery in their hearts; and Eunapius has preserved the story of how Fravitta, the leader of the faithful party, slew with his own hands his disºvnest colleague Eriulf at a banquet in the emperor's owu tent. Zosimus has charged Theodosius with burdening the provinces with excessive duties for the purpose of maintainiug a host of useless barberian offeers, while the common soldiers were left unpaid. These barbarian troops, according to ine same writer, often treated the Roman citizens with the utmose indignity, and on more than one occasion provoked a retaliation ju: which the emperor refused to see any excuse. They were nut, bowever, all quartered in one place, but received into the legions; while others were sent to Egypt. On the whole, it may be said that his policy of attaching the invaders to binself was the saluation of the empire; it was they
who bore tne orunt of the battle of the Frigidns; and the knowledge of the emperor's good faith towards the Teutonic auxiliaries in his service must have contributed largely to the defection of Eugenius's army on the same occasion.

In 383 Theodosius created his eldest son Arcadius Augustus. The same year saw the revolt of Maximus in Britain and the murder of Gratian (August 25, 383). For five years Theodosius consented to accept tho usurper as his colleague; but, when Maximus, flushed with success, attempted a few years later to make himself master of Italy, which, siace the sudden death of Valentinian I. (17th November 375), had been governed under the name of his young son Valeutinian II., Theodosius advanced against the invader and overthrew him near Aquileia (28th July 388). This rictory was followed by the murder of Maximus and his son Victor, after whose death Theodosius conferred upon Valentivian II. all that part of the empire which his father had held. Theodosius is said to have been induced to take this camyaign by his love for Valentinian's sister Galla, whom ha now married. Meanwhile there had been fresh dangers from the Goths. In 386 another band of the Grœthingi or Ostrogoths, attempting to cross the Danube, was cut off by Promotus The same general, in the course of the next two years, punished the barbariaus who had deserted Theodosius at the beginning of the campaign against Maximus. Such aignal ervices as these, though coupled with the fact that he had saved the emperor's life, did not prevent Promotus from falling a victim to the intrigues of the favourite Rufinus, who is charged by Zosimus with compassing the death of other noble men. If we may trust the evidence of the last-mentioned historian, from the end of the jear 388 Theodosius resigned himself to gluttony and voluptuous living, from which he was only roused by the news that, in the Western empire, Arbogastes the Frank had slain the foung emperor Valentinian and set up the grammarian Eugenius in his stead (15th May 392).

Into the curious history of the short-lived pagan revival in the Western empire there is no need to enter here. Zosimus assures us that the tears of Galla threw the whole court into confusion; but there can be little doubt that to 2 religious, if not superstitious, mind like that of Theodosius it might well have seemed that he was fighting the battles of God, as he led his army of the cross against an enemy on whose standard shone the image of Hercules (Theodoret, v. 24). His host consisted partly of Romans and partly of barbarians. Timasius was leader of the former, but under him was ranged the more renowned Stilicho ; the latter were led by Gainas the Goth and Saul the Alan. The engagement was fought near the river Frigidns, some thirty-six miles distant from Aquileia. On the first day Theodosius's barbarians, engaging with those of the hostile army, were almost destroyed, and the victory seemed to be with Eugenius. After a night of prayer, towards cock-crow the emperor was cheered by a vision of St Philip and St John, who, mounted on white steeds, promised him success. With the morning he received and accepted the offer of service on behalf of the enemy's ambusb, and once more advanced to the conflict. But eren so, the issue of the day was doubtful till, if we may trust the concurrent testimony of all the great contemporary church historians, a sudden gust of wind blew back the eneny's arrows on themselves. This was the turningpoint of the battle: Eugenius was slain by the soldiers; and two days later Arbogastes committed suicide (September $5-9,394$ ). From the north-eastern parts of Italy Theodosius passed to Rome, where he had his son Honorins proclaimed emperor under the guardianship of Stilichor Thence he retired to Milan, where he died of dropss (17th

January 395), leaving the empire to be divided between his two sons Honorius and Arcadius, -Honorius becoming emperor of Rome and the West, Arcadius of Constantinople and the East.
Important, howerer, as the reign of Theodosius was from the political poiut of vicw, it is perhaps still more important from the theological. According to Sozomen, his pareuts were tsth crthodor Caristians, according to the creed sauctioned by tho council of Nicera. It was not, however, till his illness at Thessalonica that the emperor received baptism at the hands of Bishop Ascholius, whercupon, bays the same historian, he issucd a decree (February 380) in favour of the faith of St Peter and Pope Damasus of Rome. This was to he the true catholic faith; the adherents of other creeds were to be reckoned as heratics and punished. The great council of Constantinople, consisting of 150 orthodox and 36 Macedonian bishops, met in the following year, confirmed the Nicene faith, ordered the affairs of tho various sees, and declared the hishop of Constantinople to rank next to the bishop of Rome. The emperor cannot be acquitted of the intolerance which marks edicts such as that depriving apostatizing Christians of the right of hequest. It was not till 389 or 390 that he issned orders for the destruction of the great idol of Scrapis at Alezandria. Other edicts of an earlier or later date forbade the unorthodox to hold assemblies in tho towns, enjoined the surrender of all churches to the catbolic bislops, and overthraw the heathen temples "throughout the whole world." During the reign of Theolosius Gregory of Nazianzus was made bishop of Coustantinoplesn appointment which he did not long retaiu. Iu 383 Thoodosius malled a new council for the discussion of the true faith. Tha srthodox, the Arians, the Eunomians, aud the Macedonians all aent champions to maintain their special tenets before the emperor, who finaily decided in favour of the orthodox party. He seems to have onfered the Novatians to hold assemblies in the cify. Perhaps the most remarkable incident in the life of Theodosins from a personal print of view is the incideut of his submission to the reprimands of Ambrose, who dared to rehuke him and refuse to admit him to the Lord'a Supper till he had done public penance for auffering his Gothic anxilianies to murder the townsmen of Thessalonica (390). Equally praiseworthy ia the generous pardon that the emperor, after muck intercession, granted to the seditious people of Antioch, who, out of anger at the growiug imposts, had heaten down the impcrial statues of their city (387). When the Christians in the eastern part of the eupire destroyed a Jervish aynagogue and a church belonging to the Talentiniays, Theodosius gave orders for the oflenders to make reparation. Such impartial condvet drew forth a remonstrance from Anabrose, who, where the interests of his creed was concerned, could forget the common principles of justice. In a sermon preached hefore Theodosins he introduced the Deity Him. self holding an argument against Theodosins on the eubject of his remissness, and the imperial penitent yielded to the eloquent bishop. So plient a disposition rendered him very dear to the saint, who availed himself of his infuence to counteract the efforts of Symmachus aud tho Romen senste for the restoration of tho pagan rites at the altar of victory. "I loved the man," aays St Ambrose, "who, patting off his kingly robea, mourned puhlicly in the church a sin to which the guilo of others had exposed bim, -an enperor who thought it no shame to do an act of public penance that even private people would have hlushed to perform." The inspired vision of the saint $\varepsilon$ saw the deceased emperor received into heaven hy his old colleague Gratian; while Maximns and Eugenina down in bell wers already experiencing how grievous a ain it is to take up arms against lawful princes (Ambrose, De Obitu Theod.).
Theodosins was twice married-(1) to Elia Flacilla, the mother of Arcadias (377-408) and Honorins (384-423); (2) to Ga山a (d. 394), the daughter of Valentinian I.

The chief authoritios for the age of Theodoalas are Ammianns Marcellinus, Zosimus, Eunapius, and the ecclesiastical historlana (Socrates, Sozomen, Theodoret). Atuch information may also be gleaned from the writings of St Ambrose, St Gregory of Nazlanzus, Isidora of Seville, and tha orators Pacatns, Libanlus, Themlstius. Of modern authorities Thilemont cupplles en unrivalled collection of facts drily cellected from all contemporary or gearly contemporary sonrces: he ls specially asefnl for his synopses of the Theodostan laws. Clinton's Fast gre the best guida for the chronulogy of tha perlod. It is hardly necessary to contlon tha brillant account given by Glbbon, or, in later years, fom tha standoolat of Itallan history by 31r Hedgkin.
(T. A. A.)

THEODOSIUS II. (401-450) succeeded his father Arcadlus as emperor of the East in 408. During his minority the empire was ruled by the prætorian prefcct Anthemius and Pulcheria, who became her brother's guardian in 414. Under his sister's care the young emperor was brought uo rather as a virtuoso than a prince. The chief events of Theodosius's reign are the wars with Persia in 421 and 441, the council of Ephesus (434), ard the invasion of the Huns under Attila (441-448). In 450 Theodosius was thrown from his horse while huntiag, and re-
ceived injuries from whieh he died. He married Athenais, who on being baptized took the name of Eudocian It was during his reign that the Codex Theodosianus, or collection of the constitutions of the Roman emperors, was formed. The idea took birth as early as 425, but was only put into execution between 435 and 438 ; in the latter year the Code was published.

THEODOSIUS III. was the last of three emperore whose short reigns filled the interval between the death of Justinian II and the accession of Leo the Isaurian. The emperor Anastasius had scnt a fleet to frustrate the intended expedition of the Saracens from Alexandria against Constantinople. On reaching Rhodes the troops rose against their leader, John the Deacon, slew Lim, and, starting for Constantinople, landed at Adranyttium, where they made a collector of the tases emperor by the title of Theodosius III. The new emperor besieged Constantinople for siz months before he took it; Anastasius resigned, and retired to a monastery, leaving his place to be filled by Theodosius III., who likewise resigned next year (717) in favour of Leo III. The closing years of Theodosius's life were speut in a monastery.

THEODOSIUS, of Tripolis, a Greek geometer and astronomer, three of whose works were contained in the collection of lesser writings named "O $\mu$ tкрòs áarporo$\mu$ оú $\mu \mathrm{evos}$ (sc. то́тоs), or 'O $\mu$ ккро̀s ảotpóvo $\mu$ os. ${ }^{1}$ Pappus of Alezandria, at the commencement of the sixth book of his Surayurn, speaks of this collection, the study of which is indispensable to any one who would master the science of
 which were highly esteemed in the school of Alexandria, were intermediate between the Elements of Euclid and the Almagest of Ptolemy, for the understanding of which, indeed, they formed an indispensable introduction. Of the life of Theodosius nothing is known. As to the time when he lived different opinions have been held, he being placed by some in the first century before and by others in the second century after the Christian era. The latter opinion is founded on an error of Suidas (s.v.), who on the one hand identifies the author of the three works referred to aboze with a seeptical philosopher of the same name who lived at the time of Trajan or later, and on the other hand distinguishes him from a native of Tripolle who wrote a poem on spring. It is now génerally admitted that the subject of this article is the same as Theodosius the mathematician, who is mentioned by Strabo amongst the natives of Bithynia distinguished for their learning, and whose sons were also mathematicians, the same, too, as the iaventor of a universal sun-dial (horologium $\pi$ тpos $\pi \hat{a} v$ к $\lambda^{\lambda i \mu a) ~ o f ~ t h a t ~ n a m e ~ w h o ~ i s ~}$ praised by Vitruvius (De Architectura, ix. 9). His date, therefore, could not have been later than the 1st century b.c.; he may, however, have lived in the preceding century, ipasmuch as the names mentioned by Strabo in the passage referred to above are, as far as we know, arranged chronologically, and Theodosius immediately follows Hipparchus, who made astronomical observations betreen 161 and 126 e.c., and preeedes Asclepiades the physician, who lived at Rome at the beginning of the Ist century B.C.
The statement that be was " of Tripolis" is made, not on the authority of Suidas, as has been erroneously said, but because he is so described in the title of his principal work It is probable, therefore, that he was a native of

[^114]Bitbynia, and resided at Tripolis, where he wrote his work. Pripolis is generally taken to be the city of that name on the Phœnician coast, but it may have been a town of the same name in Lydia, on the Meander.
His chief work- $£ \varnothing$ atpikd, in three books-treats of the properties of the sphere and its fections, with the olject of establishing the geometrical principles of spherical astronomy. This work, which is classical, is distinguished for the order and clearness of the exposition as well as for the rigeur of its proofs, and bas ever since formed the basis on which the subject of spherical geometry bas been treated. It does not contain any trace of spherical trigonometry, which, on the other hand, wss the special subject of the work having the same title, and included in the same collection, of Monelaus of Alezandris, who lived at the end of the 1st century.
Montucla suspected that a great part of the three books of Theodosius must have been known beforo his time, and that he merely did with respect to this branch of geometry what Euclid had done with the elemeats, namely, he collected and incorporated in his wark the different propositions found before his time by astronomers and geometers. This conjecture of Montucla has been coafirmed by A. Nokk (Uebcr dic Spharik des Theodosins, Karlsruhe, 1847), by Heiberg (Litterargeschichtliche Studien über Euklid, pp. 43 sq., Leipsic, 1882), and by Hultsch, from whose researches, and especially owing to the publicstion by the last of the cditio princeps of Autolycus, it is now quite certain that as early as the middle of the 4 th century b.c. there existed a Greek text-book on Spherics which, in its essential contents, scarcely devisted from the three books of Theodosius. He must therefore be regarded as merely the editor, or at most the elaborator and expounder, of a doctrine which existed some centuries before him.
The Spherics of Theodoslus was translated into Arabic at the beglaning of the 10th century, ond from the Arable Into Latlu in tho 12 th ceatury by Plato of Tivell (Tiburtinas). Thls trazslatlon was publislied in 1518 at Venkee, but was found so faulty by J. Yoegelinas tbat he published a now Latin versioa, together with addtions from-the Arabisn comraeatators, Vlenns, 1599 , 4 to ; other Latla translations were publiahed by F. Maurolycus, Messina, 1558 , [ol.; by C. Clavjas, Rome, 1586,4 to ; and by Berrow under the title, Theodosil Sphserica, Methodo Nova Illustrala et Succircte Demonstrata, London, 1675,4 to. The Greek text was Arst publlshed, snd with It s Latin transicilon, by J. Pena, Paris, 1558,4 to ; It has been edited since by Joseph Hurt, Oxford, 1707 , and by E. Nizze, Berlin, 1832, bat theso two editions sre founded on that of Puna. There is also a German trans!ation by Nizze, Strslsund, 1826. His two editions are accompanied with valuable notes and an appendlx contaialng additions from Voegelinus and others.
The two other works of Theodoslus which have come down to us have not aa yet been published in the original. The propositions, without demnnatrations, in the work repi $\dot{\eta} \mu$ ep $\hat{\nu} \nu$ каi $\nu v к т \tilde{\omega} v$ ( On Days and Nighis), in two books, were given by Dasypodius, Ia Greek and Latin, In his Sphzricse Doctrinse Proposiliones, Strasburg, 1572, 8vo. A Latín version of the coroplete work, with ancient scholia and figures, was given by Joseph Aaria, Rome, 1591, 4to. Pappus has given a pretty full coramentary en the first book of this work of Theodosius. Hie work дерwíanjaewv (On Habilations) also was published by Auria, Rome, 1588, It gives an acconnt of how, for every lnhabitant of the earth from the equator. to the pole, tho starry firmament preaents teself in the course of a year. The propositlons la it were also given by Dasypodius in his work mentloned above.

THEOGNIS of Megara was one of the early Greek elegiac poets; be probably flourished about the middle of the 6 th century b.c. We derive our knowledge of his life from the poems that bear his name. After the fall of Theagenes, who had made himself tyrant of Megara about 625 , the usual struggles between oligarchy and demociacy ensued. Theognis was a violent partisan of the oligarchical faction in his native town, and wrote elegies in which he gave expression to the emotions roused in him by the varying phases of the struggle. He appears on one occasion to have lost his property (verse 345) and been driven into exile: perhaps it was then that be visited

Sicily, Eubcea, and Sparta ( 783 sq.). In the end-if we may trust 1123 sq. - Le returned to Megara, and lived, at least for a time, in something like prosperity. The date of his death is unknown. The verses handed down to us under the name of Theogais amount in ell to 1389. Not a few of them are ascribed on the evidence of the ancients to Tyrtæus, Mimnernus, and Solon ; modern criticism has made it probable that two of the longer elegies $a \cdot \theta$ from the hand of Evenus (467-496 and 667-686); other frayments are demonstrably later than Theognis. It is now generally admitted that the Theognidea were put together long after Thengnis-possibly even as late as the 4th century B.C.-by some compiler who wished to provide a good collection of moral maxims for educational purposes. To separate the genuine fragments of Theognis from those which were ascribed to him by the reverence of a later age is a hopeless task.
The collection is divided into two books. The first, which is addressed to a youth called Cyrnus, cr Polypædes, openo with a spirited invocation of Apollo and Artemis, along with the Muses and the ${ }^{\circ}$ Graces (vv. 1-18); then follows a passage which bas been much discussed in comnexion with the early history of writing, recommending Cyrnus to set a seal apon the suthor's verses, to prevent forgers from passing off spurious iines under his name (see Jevens, Hist. of Greck Lit., p. 46). With verse 27 begins a series of counsels to Cyraus. On the whole they are remarkable neither for loftiness of tone por for poetic elevation. Cyraus is counselled to avoid "tho bsd" and frequent the bociety of "the good" menthe terms "good" and "bad" being used to denoto sristocrats and democrats, just as кadds kà $\gamma a \theta$ ds mennt an oligarch in the later days of the Pelopounesiad War. Sometimes the violence of party feeling leads Theognis beyoud all bounds, as when he prays that he may "drink the black blood" of his opponents (349; of. 337339 and 361). One striking feature in these elegies is the continual refrain about the evils of poverty. "To avoil poverty one should even throw oneself into the vasty deep, or from the beetling rocks" ( $175-176$; of. 266 sq., 351 sq ., and 649 sq .). Elsewhere the poet reprosches Zeus with allowing evil men to prosper, and aflicting the good ( 373 sq .); he also complains that the punishment due to wicked men often falls upon their sons (731 sq.). A pleasing feature is the high value which is placed npon friendship: one is not to part with a friend lightly, or upon eome slight occasion of displeasure ( 323 sq .). At the same time no ore knowe better tben Theognis how quickly frieuds fail one in adversity (299-300). Life has on the whole few charns for our poet: "the best thing for man is not to be beru or look upon the rays of the ewift sun; once born it is best for him to pass as 800 n as possible the gates of dosth, and lie with a great barrow of earth above him" (425-429). The prevailingly 6 ad tone of the elegies is occasionally broken by a convivial note. "It is shameful," says the paet, "to be drunk when others are sober, or sober whon others are drunk" (626627); "among the aproarious I sm very uproariuns, but among the proper I am the properest of men " (313-314). The only elegy which possesses any considerable poetic merit in the first book is that in which Theognis predicts immortality for his young friend throngh the fame swaiting his own poems. Tbo second book (1221-1389) consists of a number of amatory elegies addressed to some young friend of the auther's. In vigour and harmony of versification they are on the whole euperiur to the first book; but most if not all of then are probably spurious.
Bergk, Poetm Lyrici Oreci, ii. 117-236, Lelpsle, 1882

## THEOLOGY

T१HE word iheology comez from a heathen sourcefrom the Greek classics. In the Republic of Plato and the Metaphysics of Aristotle it occurs, and in its etymological meaning of "discourse or doctrine concerning Deity and Divine things"- גóyos тєpıे roû Ocoû каi $\pi \in \rho \grave{\imath}$ тûv $\theta \in \epsilon \hat{\imath} \dot{v}$. Men who wrote about the gods and their doings, or who speculated about the Divine in the origination and operations of nature-men like Homer, Hesiod, Pherecydes, and Thales,-were called $\theta$ colóyou. But there could, of course, be no theclogical science based on the popular religion of Greece. Theology was only to be found among the Greeks in the form of philosophical speculation. Through St Augustine we know that Varro,
"the most learned of the Romans," distinguished three kinds of theology, - the first mythical or fabulous, the second physical or natural, and the third civil or popular. The mythical theology be censured as containing many things contrary to the dignity and nature of immortal beinge; the natural theology he described as that which is true but beyond the capacity of the vulgar; the civil theology he considered to be that which it was good for the citizens to believe-the received religion of Rome. The general attitude of the Greek and Roman mind to religion was unfavourable to the cultivation of theology. Religion being dissociated in thought from truth could not give rise to scieace

The words theology and theologian do not occur in Scripture, but it was inevitable that they should be transplanted into Christian soil. ©éóloyos is found, as a V.R. in the inscription of the Apocalypse-the Revelation of John "tho Divinc;" "the theologian," - and almost certainly
 rov̂ $\lambda$ óyou $\theta$ cótnta, -that the $\lambda$ óoos is $\theta$ cós. In the 3 d and 4th centuries a theologian usually meant one who distinguished himself in defending the personality and Divinity of the Logos. It was on this ground that Athanasius and Gregory Nazianzen were honoured with the distinctive appellation of "theologians." The term theology hàs r.ot yet lost its early signification of "doctrine concerning God," although a much wider meaning is more common. Theology in its ordinary general acceptation includes, as one of its divisions, theology understood as the treatment of the problems which directly refer to the Eeing, attributes, and works of God. The Introductio ad Theologiam; and a later form of it, the. Theologin Christiana, composed by Abelard in the 12 th century, first gave currency to an asceptation of the word inclusive of all religious truth or belief. Among later scholastics the common designation for a general compendium of religious doctrine was Summa Theologix. Of such Summe among the most celebrated and characteristic are those of Alexander Hales, Albertus Magnus, and Thomas Aquinas. The medixral mystics deemed the essence of theology to be the immediate 'intuition of God, who, being once in contact with the soul, reveals to it the truth of all the principles of faith, and gives it at the same time spiritual peace and happiness. This view led to a use of the word which was prevalent among the Reformers and their immediate successors,-a subjective application which identified it with what was haracteristic of the mind of a true theologian, an enlightened and experienced homo renatus. In this sense it was a living practical acquaintance with the revelation of grace and truth made by God to man, a "habitus practicus," a "sapientia eminens practica," as it was called. With it, however, these earlier Protestant divines generally conjoined that objective application of the term which was current in later scholasticism, and this at length wholly displaced the subjective acceptation; in other words, theology came to signify, not knowledge of a certain kind as inherent in the mind and operative in the life of the individual, but knowledge in itself, a body of systemat:zed truth, a science. Theology, thus understood, may be viewed, discussed, and applied in a variety of ways, so as to give rise to certain kinds or species of theology. In the 17 th century the necessity for specialization of this sort began, from the operation of several causes, to be widely and strongly felt, and it became usual for divines to indicate by the titles of their theological systems the point of riew and mode of treatment adopted. An adjective added to the term "theologia" served their purpose. Of adjectives tius emplojed in the 17 th and early part of the 18 th century, the following may. be mentioned as either frequently used or of some intrinsic interest:-theoretica, practica, didactica, elenctica, polemica, irenica, pacifica, positiva, comparativa, dogmatica, theoretico-practica, didac. tico-elenctica, $\&<$ c.

The extension given to the signification of the term theology was for a very lengthened period almost unirersally restricted to the knowledge dcrivable from the Scriptures, the systematic exhbition of revealed truth, the sclence of Christian fatth and life. It is still thus, perhaps, that the word is most commonly understood. Two things, however, have naturally suggested the employment of it in a wider manner First, there was tho rise and development of a theology not based on revelation,- the rise and development of what 18 called natural theolož.

The Greeks and Romans could not distinguish between nature and revelation, reason and faith, because ignorant of revelation and faith in their distinctive Christian sense. In the patristic and scholastic ages of the church, and for some time after the Reformation, men were not in general prepared to admit that there was a knowledge of God and of His attributes and of His relations to the world which might be the object of a science distinct from and independent of revelation. Yet the most learned and thoughtful even of the scholastic divines recognized in some measure that such was the case, and could hardly, indeed, do otherwise after they had become acquainted with the contributions which Greek, Jewish, and Arabian philosophers had made to the defence and elaboration of the doctrine concerning God. The separation of natural and revealed theology was virtually the work of the scholastics. The Theologia Naturalis sive Liter Creaturarum of the Spanish physician, Raymond de Sebonde, who taught theology in the university of Toulouse during the earlier part of the 15th century, was, perhaps, the first work which, proceeding on the principle that God has given us two books, the book of nature and the book of Scripture, confined itself to the interpretation of the former, merely indicating the mutual relations of natural and revealed religion. A conviction of the truth of the distinction which he so clearly apprehended gradually spread; mure and more importance came to be attached to it. The deists proceeded on it, and tried to exalt natural theology at the expense of all theology professedly based on revelation, by representing the former as the truth of whicb the latter was the perversion. The wisest of their opponents, and thoughtful Christian writers in general-the adherents of the moderate and rational theology of the 17 th and 18th centuries-strove, on the other band, to show that natural theology was presupposed by revelation. and should carry the mind onwards to the acceptance of revelation. Thus natural theology came into reputation, notwithstanding the opposition of those who have denied its existence and contended that the reason of itself can teach us absolutely nothing about God or our duties towards Him. The recognition of natural theology contributed to awaken an interest in the various religions of the world, and thus led to the second circumstance referred to, namely, the rise of what may be called comparative theology, although it has hitherto been more generally designated the science of religions. It can be shown to bave originated in the attempts made to prove that the principles of natural theology were to be found in all religions. In Bishop Steuco of Kísami's De Perenni Philosophia, published in 1540, and in Lord Herbert of Cherbury's De Religione Gentilium, published in 1663, wo have two of the earliest and most characteristic attempts of the kind. From that time to the present the study of religions has proceeded at varying rates of progress, but without interruption. Important results lave been obtained, and especially this result, the ascertainment, to the satisfaction of all competent judges, of a right method of investigation, -the establishment, as the true mode of study, of the comparative method. As we have a right to speak of comparative anatomy and comparative philole $\boldsymbol{r}^{\circ}$, so bave we $\Omega$ right to speak of comparative theolo cy. The inference from the preceding remarks is obvinus. If there be a natural theolngy and a comparative th.cology, it is a mistake to identify theology per se with Christian theology. The word Christian is, in this case, a real and great restriction of tho signification of the word theology, and Cbristian theology is not the only kind of theology. The proper procedure is to give to theology a general and comprehensive meaning. which can be limited and specialized, when requisite, by adjectives like "natural" or "Clisistian."

What, then, is the general signification which we should give to the term? There is room for difference of opinion, and especially as to whether God or religion should be regarded as the object of the science. Is theology the science which treats of God? or is it the science which treats of religion? The latter view is now, perbaps, the more current. In addition to intrinsic reasons, the critical and sceptical spirit of the time is in its favour. Many speak of theology as a science of religion because they disheliere that there is any knowledge of God to be attained. Dr Martineau, in his lecturo on Ideal Substitutes for God, protests against this tendency, and contends that the older view of theology, as the doctrice or rational apprehension of God, ought not to be abandoned, seeing that the new " science of religions," i.e., "the systematic knowledge of what men have believed and felt on things sacred to them," can be no proper substitute for the old "theology." We may admit, however, that the protest is essentially true,-that a knowledge of man's religious opinions, emotions, and actions can never supply the place of a knowledge of God, that, when from religion its objective basis, the reality and apprehensibility of God, is taken away, the study of it can have merely the psychological interest which belongs to mental disease and illusions, and yet prefer the definition of theology as "the science of religion" to its definition as "the doctrine of God." The latter seems much too narrow. Even Christian dogmatics is about as much occupied with man as with God. The doctrines of sin and of the church, for example, are not doctrines regarding God. Then, although the new "science of religions" is not a substitute for the old "t theology," it is still a 'science, or at least a very interesting and important branch of knowledge, whick yet cannot be brought under the definition of theology approved by Dr Martineau, -the definition immediately yielded by the etymology of the term. The science of religion is a very different thing from the "science of religions." It is far more comprehensive. The "science of religions" is but one of the latest offshoots of the science of religion ; the old theology is its main trunk or stem. Theology, when viewed as the science of religion, has not to do merely with the religious consciousness and its states. It must aim at the complete comprehension of religion, and, unless religion be a delusion and disease, this can never be attained by treating religion merely as a subjective or psychological process to which there are no corresponding objective realities manifested either through nature or revelation. We have no right to assume that it is thus without a real and rational foundation in fact; on the contrary, we are bound to inquire whether it has external grounds and real objects or not, and, if it have them, what they are. We must endeavour to ascertain and expound its objective grounds as well as its subjective contents. Thus the definition of theology as the science of religion in no way excludes what is implied in the definition of it as the science conversant about God and Divine things. It includes more than the latter definition, but does not exclude anything contained therein.
The definition of theology as the science of religion has been objected to by Dr Charles Hodge on two grounds: ${ }^{1}$ first, that the word religion is ambiguous, having both an objective sense and a subjective sense, and that its etymology is doubtful ; and, second, that to define theology as the science of religion "makes theology entirely independent of the Bible. For, as moral philosophy is the analysis of our moral nature and the conclusions to which that analysis leads, so theology becomes the atalysis of onr religious consciousness together with the truths which that analysis evolves." As to the first objection, the word Frvematio Theology, vol, i, pp. 20-21.
religion has, it is true, more significations than one, and consequently may be ambiguously used, but in point of fact it is not so used in the definition in question, in which religion is understood in its generic meaning, and as inclusive both of subjective and of objective religion. Theology bas to treat of both, and if it treat of them aright it will not confound them. "The etymology of the word religion is doubtful." Very true. But is ne word to be employed in a definition if its etymology be doubtful? That wonld be an extremely hard law. In definition we have only to do with the actual meaning of terms; we have nothing to do with their origin or history. As to the second objection, it bas to be remarked that the definition does not make theology entirely independent of the Bible. It does not make Biblical theology in any degree independent of the Bible. It does not imply that the Bible is not the sole perfect standard by which truth and error, health and disease, are to be separated in the religious consciousness of individuals and the religious history of the race. It only implies that all religious phenomena whatever are to be studied by the theologian, just as moral philosophy cannot leave any moral phenomena unstudied. Moral philosophy, in treating of vice as well as of virtue, does not thereby equalize vice and virtue ; and no more does comparative theology, when it treats both of Christianity and heathendom, assume that the former has no superiority over the latter. It is merely a part of the task of moral philosophy to analyse the moral consciousness; it is an equally essential part thereof to inquire into the foundation of rectitude, and to determine objective moral distinctions and relations. In like manner theology has much more to do than merely to analyse the religious consciousness; it has also to treat of the grounds and objects of religion. If some reduce it to a mere analysis of the religious censciousness, and overlook or deny that there is an objective religions revelation in nature and Scripture as well as a religious susceptibility in the mind of man, this is no logical consequence of the statement that theology is the science of religion. There needs, perhaps, no other proof that the definition to which Dr Hodge objects is of some use than to consider for a moment his own definition. "Theology is the science concerned with the facts and the principles of the Bihle." Is theology, then, not concerned with the facts and principles of the physical world, the human mind, and hietory, so far as these are disclosures of Gol's nature and ways? How can theology start from the Bible when it needs to be proved that there is a revelation from God in the Bible? And how can this be proved unless it is known from otber sources than the Bible that there is a God? If there he such sources, theology must have to do with them; it can have no right to neglect anytbing by which God may be known or by which light may be thrown on the relations between God and man. It is a service to theology so to define it as to leave no room for asserting that it is only conversant with the Bible.

Theology, then, is the science of religion. What does this definition imply as to the relation of theology to religion? It implies, first, that theology presupposes and is preceded by religion. This is but an instance of the general truth that experience must precede science, and that science must be founded on experience. The im plicit use of principles is always prior to their explicit development. Speech is a great deal older than grammar ; men reasoned long before Aristotle taught them how they reasoned; and just as there must be specch before grammar, and reasoning before logic, so must there be religion before theology. Secondly, that theology is the science of religion implics that theology must not only succeed religion, but must evolve out of it a system of
truths entitled to be called a science. Science is knowledge in its completest, highest, and purest form. Theo$\log y$, therefore, by claiming to be the science of religion, professes to be the exhibition of religious facts and principles in their most general and precise shape, in their internal relationship to one another, in their organic unity and systematic independence. The principles of causality and of unity in the human mindimpel it to eeek law and order, explanation and connexion, as regards the phenomena of religion no less than any other species of phenomena; they impel it, in other words, to perfect its knowledge of these phenomena, and can allow it no rest until it has attained to the system and science of them. Theology is the scientific system of them, and as such is a necessity to the thoughtful religieus mind. It is ne accident that in every age and nation thoughtful men have reflected on their religious convictions, and sought to trace them to their grounds, and to harmonize and systematize them, or that the Christian church has anxiously studied and debated for centuries problems concerning God, Christ, ain, ealration, dec.,-no accident, but the necessary consequeace of those fixed laws of human nature by which man over seeks, once that his intellect has been truly a wakened, to define and complate his knowledge. Conscieus that his religious experience, however vivid, involves much which requires to be cleared up; perceiving that the religious history of his race presents many apparently contradictory facts, many perplexing problems ; a ware that the Bible is no more a system of theology than nature is a system of mechanics or chemistry, -man cannot, as a rational being, da otherwise than endeaveur by the investigation of the whole phenemena of the case to verify, analyse, combine, and co-ordinate his notions as to spiritual things, se as to work them up into a comprehensive, consistent, firmly established, adequatoly certified, naturally organized whole, a scientific system.

But how may man hope to sacceed in his efforts to arrive at a scientific understanding of his religious beliefe, feelings, and practices? How may be educe and elaborate from the phenomena of religion a system of theology entitled to be called science? Only, it is obvious, by following a truly scientific method. What then is a truly ecientific method in theology? And what is implied in following it ? To these questions a comprehensive, ailthough necessarily brief, answer must now be given.

A right method in theology, as in all other sciences, is sech a use of reason on appropriate facts as will best attain truth. It implies, therefore, as an essential condition, a right relation of reason to religious truth or fact, and to the evidence for it. What the right relation is may, perhaps, be defined with substantial accuracy in the follewing propositions. (1) Religious truth, like all other truth, is "above reason" in the sense of being not created by but manifested to reason, but is not "above reason" in any special sense which withdraws it from the cognizance of reason. The truthe of al science are the discoperies but not the creations of science, and they have been discovered because they existed, because they are the equivalents of a reality which is independent of science. In regard alise to mathematical, physical, mental, and religious truth, reason has only pewer to seek it, and to find or to miss it; it has no power to make it or right over it, but must accept it as something presented or given to it, and to which it is bound to do homage and yield submission. In this sense all truth is above reason and revealed to reason. In this sense reason stands to religieus truth in the same relation as to physical truth, and to Christian truth in the same relation as to the truth in natural religion. Reason is simply the instrument or faculty of adoreheading the truth manifested or revealed
to it, and it can iu no case apprehend truth without the aid of the appropriate manifestation or revelation. Unless Christ had lived and taught,-reason ceuld never have known His character and dectrine ; but no more could it have known Dante and his Divira Commedia, Shakespeare and bis creations, Napoleon and his achievements, unless these men had appeared in the werld and accomplished in it their work. Without Christ the truth in Christ could not be known, but, Christ being given, that truth comes under the cognizance of reason, ceases to be in any special sense above reason, and, affords to reason material fer science. By truths ebove reason are semetimes meant truths which cannet be fully apprehended by reason. Such truths are, however, in no way peculiar to religion. In all regions and directions reasen finds that its range of vision is limited, and that its knowledge and science are bounded by nescience and mystery. Truths of special revelation are sometimes represented as above reason in the sense that reason can have.no other evidence for them than that of testimony and external autherity. But what truths of Scripture have thus been revealed to reveal nothing, and are thus deveid of intrinsic light, of natural aftinity to reason, of self-ovidencing power? If there be any such, it must be admitted that they cannot in themselves fall within the province of science, although the testimony and assent to them may. Where reason atops science must end. (2) Reason in its investigation of religion must be completely free, i.e., subject to no othel laws than those which are inherent in its own constitution. In regard to most sciences there is no need to insist that the method of science is one in which reason is free, because all who occupy themselves with these sciences acknowledge it. But in regard to theology it is otherwise. All who call themselves theologians are by no means disposed to admit that reason, in its search for religious trath and in its efforts to construct theological science, must be absolutely free ; on the contrary, many of them hold that the church or the Bible, tradition or the common sense of humanity, must be allowed to have a co-prdinate or even superior jurisdiction. The proposition laid down implies that, if any view of this kind be true, theology is essentially different from 8cience, and it is vain to speak of scientific method in theology. It implics that all claims to religious suthority must be based on and conformed to reason, and that all the deliverances of every professedly religious anthority must be submitted without reserve or restriction to the reason of the theolegian before be can make a scientific use of them. This leads us to another proposition. (3) The only ascertainable limits of reason in the investigation of religious truth, as of other truth, are these which are inherent in its own constitution; and in the search of religieus truth, as of oll other truth, reason ought to go as far as it can go without violation of the laws of its own constitution. Reason has its limits in its own laws. It is the business of psychelogy and logic to discover what these luws aro. When they are known the powers of reason are known, because reason can never claim to be irrational. It is useless, however, to attempt to mark off the external or objective boundaries of rational research. Human inquiry has, no doubt, external boundaries beyond which it will never pass, bat all apparent boundaries of this kind recedo as they are approached There is even absurdity, self-contradiction, in the very attempt to draw any line eeparating the knowable from the unknowable. To know it one must have already dene what we affirm to be impossible,-known the nuknowable. We cannot draw a boundary unless, we вee over it. Reason cannot investigate too deeply any matter whatever, cannot possibly go too far, so long as it remains reasen. Its own laws, the lans of eridence
and of inference, are the only discoverable expression of its lawgiver's "thus far." When it violates any of these laws it has gone too far, but only then, and then simply because it lizs ccased to be rational. As long as it conforms to them the farther it goes the better. All this holds good not less in regard to religion than to any other object of investigation, and is an essential condition of the possibility of religious science. (4) In the study of religion, as in every other department of study, reason should admit nothing as true without sufficient evidence, while rejecting nothing sufficiently proved by evidence of any kind although it caunot be proved by evidence of another kind, or although it may be imperfectly understood or have unsolved difficulties connected with it. Theology is sometimes said to bo a doctrine or science of belief or faith (" "Glaubenslehre"). Not a few, however, of those who say so rcgard belicf or faith as essentially inclusive of reason, in the form of an immediate apprehension of primary truth or self-evident fact; in which case theology is only a Glaubenslehre in common with other sciences, and belief or faith is in no special mode or measure its foundation. But, whenever by belief or faith is meant mere belief or faith, a belief or faith independent of and unconformed to reason, the apprehension and appreciation of truth,-to affirm that theology is based on such belief or faith is to represent it as so unlike every other science that it clearly cannot be a science at all. For all belief or faith we are bound to have real evidence, and enough of it. But we have no right to reject any real evidence because there is not more or because there is not evidence of some other kind,-no right to neglect to follow any light there is because it may be dim, and much around it may be dark,-no more right to refuse to accept any well-established conclusion as to God and religion because there is great uncertainty as to the essence of religion, and because God in His absoluteness and infnitẙ immeasurably transcends our highest thoughts, than we have to ignore or costest the conclusions of physical science because we cannot tell what matter is, and becanse we find that every hypothesis as to its nature brings with it many doubts and dificulties.

The foregoing conditions are perhaps the most general
quarces of reliErous and fundaniental of those to which reason must conform if it would originate and follow a scientific method in theology. The next question which demands an answer is, Whence are the data to be derived on which reason must operate in religious apprehension and theological investigation? What are the sources of religious truth? Reason bas not the truth in itself, but in order to possess it must find it. As the eye has not physical light within itself, but merely so corresponds to it as to apprehend it, not otherwise is it with reason and intellectual light. By sources of religious truth can only be meant the media through which God manifests Himself,--the ways by which He makes himself known ; and the physical world, finite minds, human history, Scripture, and the testimonium Spiritus Sancti may all be maintained to be such sources. The atheist and the agnostic will not allow that there are any sources of religious truth; the deist and the rationalist will only admit the claims of general revelation, the exclusive Biblicist only of Scripture ; and the mystic will trust chiefly to special spiritual illumination; while the iheologian of broader view will hold that all the ways indicated are sources, $8 e e i n g$ that in and through them all knowledge and experience as to God and religion may be acquired, and must contend that in the study of theology none of them is to be ignored or excluded, underestimated or overestimated, but all are to be duly considered, and the information supplied by each to be taken in connexion witk that supplied by the rest. The sources are distinct,
but not isolated. The light from each combines and harmonizes with the light from all the others. The revela. tion of God in nature is presupposed by that in Scripture, and Scripture contributes to unveil the spiritual significance of nature. Without the light which the buman mind supplies there can be no illuminatiou from any other source, and yet all the light of the human mind is gained in connexiou with the light from external sources. History gradually evolves the significance of nature, mind, and Scripture, yct cannot be understood if dissevcred from the creation in which it is placed, from the mind of man in the principles and faculties of which it is rooted, or from Scripture as the record of the development of a plan of redemption which gives unity and meaning to the whole historical inovement. However deep and full a source of religicus truth the Bible may be, it is neither independent of other sources nor a substitute for them; on the contrary, while castiug light on them all it likewise reccives light frow them all. The living apprehension of spiritual realities presupposes a discernment which the Divine Spirit alone can give; yet that Spirit, according to the testimony of Scripture, speaks not of Himself, but only in conformity with what has already been uttered by the Father and the Son. It would obviously neither be consistent with the scope nor possible within the limits of an article like the present to determine the distinctive features, natural spheres, and various relationships of the media of revelation or sources of religious truth, but a sufficiently thorough investigation having this aim may safely be pronounced to be one of the chief desiderata of theological science.

The process of theological method itself has next to be procens considered. Its first step is the ascertainment of the of logical relevant facts. But these sre all the facts of nature and methon history, all the truths of Scripture, and all the phases of religion. The various departments of theology are based on and inclusive of various orders of these facts, and each order of facts must be ascertained and dealt with in appropriate special ways. Thus the relevant data of The fane natural theology are all the works of God in nature and ran natu, providence, all the phenomena and laws of matter, mind, logy; and history, -and these can only be thoroughly ascertained by the special sciences. The surest and most adequate knowledge of them is knowledge in the form called scientific, and therefore in this form the theologian must seek to know them. The sciences which deal with nature, mind, and history hold the same position towards natural theo$\log y$ which the disciplines that treat of the composition, genuineness, authenticity, text, development, \&c., of the Scriptures do towards Biblical theology. They inform us, as it were, what is the true text and literal interpretation of the book of creation. Their conclusions are the premisses, or at least the data, of the scientific natural theologian. All reasonings of his which disregard these data are ipso facto condemned. A conflict between the results of these sciences and the findings of natural theology is inconceivable. It would be a conflict between the data and conclusions of natural theology, and so equivalent for natural theology to self-contradiction. Then, the data of Biblical theology are all the words contained in the Bible, viewed in their appropriate positions and historical conuexions, and what these are and signify can only ive ascertained by the processes of historical criticism and of hermeneutics. Biblical theology is the delineation of a section of the history of religious ideas, -that section of which the traces and records remain in the Bible. But the Bible comprehends many strata of writing, deposited at different times, and collocated and connected in various ways, and the history of its composition, the age and succession of its parts, must be ascertained before we can exhibit the history of its coutents, the sourse of the evolu-
tion of its ideas. If the theories of zecent critics as to the formation and relationship of the conponeut portions of the Old Testament be true, the view taken of the development of Old Testament theology, must be very different from that formed on the supposition that the traditional theory is correct. And which theory is correct is a question of fact which can only be decided by dispassionate and thorough critico-historical investigation. So false readings must be distinguished from truc, erroneous translations from correct, and appropriate from inappropriate interpretations, which presupposes an adequato measure of linguistic, grammatical, and exegetical knowledge and skill. The religion of the Bible, however, is but one of a multitude of religions which have left traces of themselves in documents, monuments, rites, creeds, customs, institutions, individual lives, social changes, \&c.; and there is a theological discipline-comparative theology-which undertakes to disclose the spirit, delineate the character, trace the development, and exhibit'the relations of all religions with the utmost attainable exactitude. Obviously the mass of data which this science has to collect, sift, and incerpret is evormous. They can only be brought to light and set in their natural relationships by the labours of hosts of specialists of all kinds. That hypotheses in this domain will for long arise and vanish with disappointing rapidity is only what is to be expected from its rast cxtent, the amount of its baried wealth, the gradual and frasmentary way in which its contents must be disinterred, the losses and changes which have occurred in the course of time, and the constant suggestion of fresh interprotations of ancient texts and ber solutions of old problems which must come from unceasing discorery. Some theological discipines, it must also be observed, presuppose others, and have consequently among their data the conclusions of those other disciplines. All doctrine, for example, founded on special revelation presupposes doctrine founded on general revelation; all Christian theology must imply and incorporate catural theology. Christian dogmatics has to make use of the results of natural theology, Biblical theolory, and comparative theology, and to raise them to a higher stage by a comprehensive synthesis which connects tiem with the person and work of Christ, as of Him in whom all spiritual truth is comprehended and all spiritual wants supplied. The conception of it prevalent until lately, as a system formed of generalizations and inferencas from texts of Scripture, answers properl弓 to no theolog.cal science, but mach more nearly to Biblical theology than to Christian dogmatics.

When religious data have beon ascertained, the materials of $t$ noological science have been obtained, but the scientific odifice itself has still to be constructed. The general trutins involved in particular disclosures have to be ovolved; the laws of the development of pheoomena have to be discovered; elements have to bs reached by analysis and comprehensive views by synthesis; laws and facts, fundamental and derivative principles, have to be exhibited in their natural orgenic connexion. This can only be done aright by right metheds, and only by a varioty of methods. No ove-sided process can be appropriate or sufficient. The method must cooform to the nature of the matter dealt with and to the end that has to be attained. Theology includes a variety of sciences or disciplines, and these differ so greatly in character that they plainly canoot bo studied aright if studied precisely in the same way. Some of them are more allied to criticism, others to history, and others again to philosophy. In some deduction can manifestly have littlo place, while in others there is no obvious reason why it shonld not be largely used. There is no kind of science which, with its special processes, may not bo called on to contribute to some department of theology.

There must be, therefore, in theology need and scope for a great rariety of applications of method.

It is easy, howeser, to exaggcrato the importance of acquaintance with the formal rules of method laid down by logicians. The theory of method must be preceded by practice-true theory by successful practice; and the ablest practitioners are always only to a small extent guided in their practice by conscious reference to the rules of method prescribed by logicians. In theology, as in all other departments of science, a man can only become an investigator by investigating. And whether he will become, throngh the practice of investigation, a successful investigator or not will depead far more on his general intellectual char. acter, his ingenuity, originality, tact, and seasibility, his familiarity with the relevant facts and with the researches which are really bringing now truths in his department to light, his perseverance and diligence, than on his knowledge of what the theorists on inethod hare taught as to its מature and requirements. Yet, of course, such instruction as logical theory can give is not to be despised, but to be received and acted on with all due appreciation.

When the data of the, theologian are before him as particular facts, it is obvious that he must so enumerate and classify, so analyse and generalize, so correlate and combine them, as to elicit from them the principles which they imply, before either his procedure or results can be properly characterized as scientific. In other words, a method which starts from particulars raust, in order to be scientific, be largely inductive. But in theology, as in all other departments of knowledge, the only induction which is of any ralue is more than any mere summation or combination of facts. This is not the place for a discussion of the nature of a true induction; but on any view it must hold good that to understand aright what induction in theology is we must know what is implied in all that is comprehended in it , -the ascertainment and collocation of facts, the discrimination of their characteristics, the classification of them, the analysis of what is complex, the synthesis of what is partial, the tracing of uniform relations, the inferential act, dc. Much which would not be without interest or use, or even some degree of novelty, might be said on all these points. Numerous as have been treatises on theology, there has not as jet appeared a single earnest attempt to expound the nature of method in theology; even the many works professedly dealing not only with the encyclopzdia but with the methodology have, in reality, quite ignored theological method proper. The present writer can only here note the desideratum ; to supply it rould require a special and leggthened discussion. The so-called methods of inductionthe methods of agreement, of differeuce, and of concomitant rariations-are as applicable io theology as in physical or mental science. They äre not, properly speaking, processes of induction; they are merely rules for testing inductions. Their value, of course, is not thereby lessened.

The theologian, not less than the physicist, must be od his guard against fancying that the validity or certainty of his inductions is to be estimated by the number of his instances. Many who have undertaken to frove the Divine existeoce by the cosmological and teleological arguments have made the fatal mistake of supposing that all that was needed was an accumulation of what they deemed examples or illustrations of Divine wisdom. They have overlooked that what is, above all, necessary is to show the truth of the principles of causality and fioality, and the legitimacy of those applications of them, which are involved in the cosmological and teloological arguments. They hare spont their strength on what is easy, superficial, and indccisive, and had none left to deal with what is difficult, decp, and of vital moment. $T$ rey have failed to XXII. - 34
apprehend that the essential question at issue is not, What or how many appearances of order and of adaptation may be traced in the various provinces of nature? but, Do such appearances in any case warrant an inference to a supernaturai intelligence and purpose ? In like manner many slogmatic theologians have seemed to think that in order to establish a doctrine it was enough to cite a number of texts in its favour. Often their doctrines mould be more sasily believed if their texts were fewer. Often in the Westminster Confession, for example, where the doctrine sauses no difficulty, the texts cited in connexion therewith are quite inadmissible as proofs. Induction requires the strictest regard to relevancy. Whether the data for the proof of general truths in theology must be many or may be fow will largely depend, as in physical and mental science, on the nature of the traths. When Newton had made out that the law of gravitation explained a single fact, applied to the moon, no person who fully comprehended his demonstration could seriously doubt either of the certainty or of the universality of the law. It was q case of a vast intellectual conquest achieved by one decisive victory. What remained was merely to take possession of what had been won, and to explain certain spparent anomalies. On the other hand, when Mr Darwin published his Origin of Specres, he had already accumulated, with amazing indnstry and ingenuity, and through the uninterrupted investigations of many years, a multitude of observations and considerations in support of the general propositions therein enmaciated as laws of biological evolution. Of similar observations and considerations there has since keen an enormous increase. Yet the so-called Darwinian, laws are still under discussion. Why has their proof or disproof been so different a process from that of the establishment of the law of gravitation? Largely because they are in themselves so different in nature. Laws of evolution can only be reached through the minute investigation of a far greater number of changes and appearances than laws of persistence. The discovery of truths of beconing may not be a more difficult but it is certainly a more delicate and complex process than the discovery of truths of being. Now this distinction not only emerges in theology but pervades it. In some departments of theology the laws to be discovered are laws of evolution, while in others they are laws of existence. Hence the method to be followed in the former must be predominantly chronological and genetic, in the latter predominantly açalytic and synthetic. For example, in Biblical theology and comparative theology the inductive process must be of the kind appropriate in historical investigation, whereas in natural theology and Cbristian dogmatics it must be of the kind appropriate in systematic investigations into which considerations of time, place, and circumstance do not enter. The faculties of inind and processes of method implied in the complete comprehension of religion as a concrete manifestation of spirit are those which are of prime moment in the bisterical disciplines of theology; the faculties of mind and processes of method involved in the clear apprebension of the truths and laws of religion in its abstract or essential nature are those chiefly requisite in the theoretical disciplines of theology; and, speaking generally, complete comprehension of the concrete presupposes a more minute and exbaustive acquaintance with particulars than does a clear apprehension of the abstract. To determine with scientific precision and thoroughness, for example, what were the stages of the development of doctrine in the Bible, or even to trace with such accuracy and completeness as the data supplied by the Bible and alrxiliary sources permit the growth of single important ideas, as, e.g., election, heliness, atonement, and kingdom of God, demands laborious critical
investigation and comprehersive and minute historical knowledge Given, on the other Land, the Christian ideas of God aud of man, and the fundamental relation letween God and man caunot be othernise conceived by enlifhtened reason and conscience than as one of salvation through faith and not by works. True, as all physical nature obeys the law of gravitation, so all Scripture nud spiritual experience testify to the powel of the principle of faith; but then, also, as the dccisive proof of the former lies in the thorough elacidation of any phenamenon which exemplifies it, not in the collection of numerous illustrative phenomena, so the decisive proof of the latter lies in an adequate analysis of any portion or form of the life of genuine faith, not iu the accumulation of examples of faitb drawn from the Scripturs or other records.

The two methods of induction to which reference has Elece. just been made-the listorical and the thetical-are to be carefully distinguished but not absolutely separated, aud still less exbibited as antagonistic. Both have specific and appropriate functions; neither is exclusively legitimate or can alone accomplish the work of science. The historical method by itself can only yield history. It has done all that can in any circumstances be reasonably expected from it, when it has enabled us accurately to realize the course of the history studied, or, in other words, when it has given us a correct reflexion of the history. If, not content therewith, we would further ascertain the nature and laws of the factors which formed the history we must supplement the historical with the thetical method. The historical method leads only to history, and in no form or province is history science. Science even of history, or of any department of history, cannot be reached simply by the historical method, but further requires recourse to the processes of positive science Comparative theology, Biblical theology, and the history of Claristian doctrines are most valuable theological dis ciplines, but, inasmuch as their methods are purely historical, their results are also purely historical, and they are not, rigidły speaking, sciences, but ouly sections of the history of religion. The tendency to substitute bistory for science, and the historical method for the scientific method, is prevalent in the present day in theology, as well as in ethics and jurisprudence, social philosoply and political economy. Obviously, however, it rests on ax aggeration and illusion. and confounds things which ought to be distinguished. Neither history of the objects of 8 science, nor history of the ideas or dactrines of a science, is science, and the historical method of itself can only give us in connexion with science either or both of these forms of history. It is, therefore, inherently absurd to suppose that the historical method can bo sufficient in such theological disciplines as uatural theology and Christian dogmatics. In reality, it is not directly or immediately available in the study of these disciplines at all, and that just because it does not directly or immediately yield theary, doctrine, science. Only be who knows both the history of the objects and the history of the ideas of a science, and especially of a poychological, social, or religious science, can be expected to advance the science. In the splere of religion, as in every other sphere, to confound history with science is to eliminate and destroy science; but in no sphere is knowledge of history more a condition of the attainment of science, and histarical research, properly conducted, more serviceable to sciontific investigation, than in that of religion. To the historical method we owe, not only the historical disciplines of theology, but also in a considerable measure the recent progress oi its positive or theoretical discipliacs. It can never, however, be, as som fanatical disciples of the historical school would have us to suppose, the method of these last.

The inductions of theology, even in its systematic or non-historical departments, often require to be very careful and comprehensive in order to be conclusive. Theorics or doctrines like the Christian dogmas of the Trinity, incarnation, and atonement were only arrived at through the labours and controversies of many generations of theolcgians. It could not be otherwise. These dogmas, simple as they may seem to a superficia! glance and untrained eye, are in reality very complex organisms of thought, only capable of being formed by a long process of evolution. They are theories inclusive of many theorems. They comprehend a number of directly constitutive propositions and a still greater number of propositions subordinate and subsidiary to these. Every proposition which they involve should be the expression of real and relevant facts. As wholes they ought to combine a inultitude of particulars of different kinds, and eren of kinds the harmony of which is far fron obvious and needs confirmation. Whoever intelligently accepts any one of these dogmas must, by necessary implication, reject a bost of hypotheses regarding its subject, as either inadequate or positively erroneous. Inasmuch as they are not consistent with or are contrary to the dogma, he is logically bound to repudiate then, and yet he is only logically entitled to do so if his proof of the dogma have been so comprehensive and complete as to include their separate and collective refutation. The establishment of the whole truth is only possible through the disproof of all the opposing errors. How the inductive method is applied in theology, however, will be better understood by the examination of a particular exemplification of it than by a general description; and, perhaps, as regards at least form, a more careful or elaborate exemplification could bardly be pointed out than that exhibited iu Dr Crawford's treatisc on the atonement. An examination of it will show how very complox in reality may be a doctrine which is very simple in appearance, and how comprehensive, thercfore, must be the inductive procedure necessary to establish it and to warrant the rejection of the hypotheses which must seem to one who accepts it to err by excess or defect or to be absolutely false.

Tha inductions of theology, like those of other sciences, are seldom or never mere or pure inductions. They would he useless if they were. The examples of pure induction given in treatises on logic may serve their purpose, the illustration of the pature of ratiocination, but they are nct reasonings of a kind which can increase positive knowledge. The abstraction of induction from deduction may be needed to exhibit its distinctive formal character, but it is fatal to its practical effciency. In all reasoning meant to increase our knowledge of objects, induction must receive from deduction some measure of assistance and guidance. This certainly holds true in theology. In regard to the doctrine of the Trinity, for cxample, the nost difficult questions involved turn largely on the signification and application of the terms emplojed in its expression. These terms must be somehow defined, and definitions once introduced cannot fail to bo used to some extent as principles of deduction. They are often largely so used by those whe are quite unconscious of making any use of them, and who have no suspicion that the course and charazter of their reasonings are modified by them. Definitions often secretly introduce a great amount of hypothesis and deduction into reasonings imagined to be exclusively inductive. Further, principles of deduction are directly and explicitly introduced. The truth of the catholic doctrine, or indeed of any doctrine, of the atonement, for example, cannot be proved purely by induction. It is necessary to start with some assumption as to the authority of the Scriptures, or at least as to the authority of those whose teaching is contained in the Scripturcs.

That assumption itself should, it is true, be proved by a process of apologetical and critical reasoning whicb is in the main inductive. It cannot, however, any more than the doctrine of atonement, be proved by a purely or exclusivtly inductive process, i.e., without some co-operation or participation of deduction; and once proved, it becomes a principle of which a deductive use is made. Every particular statement of Scripture is read and interpreted in the light of it. So far as this is the case, deduction underlies all the inductions of doctrine hased on the statements of Scripture. Of course, the dogmatic theologian, in so far as he founds on Scripture, is bound not to presuppose more than he is prepared to prove as a Christian apologist or Biblical critic and interpreter. The assumptions made in systematic theology ought to be tho firmly ascertained results of its subsidiary sciences. And the less assumed the better, as the relcvancy of the reasoning employed will be so much the more widely acknowledged. Every additional assumption diminishes the number of persons who will grant the principles on which the argumentation proceeds. When, for instance, a doctrine like plenary inspiration is assumed as the basis of an argument for the atonement, the number of persons who can be benefited by the argument must be few. Those who will grant plenary inspiration are not likely to require to be convinced of the truth of the ordinary doctrine of the atonement ; they are almost certain to be already convinced. On the other hand, a man may have loose or vague views of inspiration, and yet it may be possible to satisfy him that the doctrine of the atonement is well founded. The proof of the doctrine of the atoncment may receive support and confirmation from the proof of the doctrine of plenary inspiration, but ought not to be made dependeat on it.
Scientific method has not only to ascertain the facts and data of science, and to discover its laws, but also to distribute and co-ordinate its contents. And this last is likewise an important function. Science is system. To exclude system from science is to suppress and destroy science. The spirit of system is in itself nothing more than the spirit of order and unity. Without unity and order-that is, without system-there is no science; instead of it there can be only confused ideas, isolated opinions. It is absurd to condemn either system or the spirit of system in theology or any other science. To systematize is an intellectual necessity; to systematize aright is a happy achierement and an immense boon; it is merely systematizing erroneously which is evil. Theoblogy, by professing to be a science, pledges itself to systematize in a scientific manner. By claiming to be the science of religion it undertakes to exhibit the truths of religion in their proper relationship to one another, in their organic unity and essential interdependence. Thus to proceed is necessary to it, not only as a consequence, but also as a means of the development of its constituent dogmas, for no doctrine can be truly and fully crolved in isolation, but only in connexion with kindred ductriues and through the general growth of the science or system to which it belongs. Increasc of insigbt into any oue truth brings with it clearer views of all contiguous and related truths, and the collective light thus gained illmmines each particular to which it extends. To apprehend more distinctly the relations between either facts or theorics is to understand better the facts or theor:es themselves. To comprehend any single doctrine aright we must study, not merely its special data, but those of allied doctrines, trave its connexions with thoso doctrines, and vicw both it and them as parts of an organic and harmonious whole. Hence the endearour to systematize the contents of scienco should not mercly follow the formation of its separate doctrines, but likewise accompany and participate in the process of their forma-
tion. Wiscly conducted systematization is entitled to be deemed an aid to discovery. It reveals where exploration is needed, and indicates the directions in which research will be successful. It is the highest form and effort of synthetic thought, and synthesis is a not less necessary and fruitful operation in scientific method than analysis.

Unfortunately it cannot be denied that there has been a vast amount of erroneous systematizing in theology, and that it has done a vast amount of harm. Doubtless much of the aversion felt and expressed to system in theology is to be traced to the imperfect, artificial, false character of many theological systems. Instead of exlibiting religious truths in their real significance and interdependence, theological systens have often disguised and disfigured, cramped and contorted these truths, or eveo ignored and rejected them. How, then, is a true and appropriate system to be distinguisled from one which is false and imperfect? In various respects, which can bere be merely mentioned.
Thus, first, a true systern is natural and not artificial. In equivalent terms, it is directly derived from the character of the matter of which it treats, and not arbitrarily imposed on that matter from without. Every system of thought, whether true or false, must, of course, be the product of intellect, but no true system is a mere invention of intellect, a mere subjective creation interposed between the mind and things; it is, on the contrary, a representation of the real natures and relations of things. The human intellect can only construct a tríue system by finding in and among facts the connexions and harmonies which are actually there. But to do this may require more labour than is agreeable, or may contravene some cherished prejudice, or may not be recognized to be the sole legitimate procedure, and so it may devise, instead, a formula or scheme of thought suggested by some idaa drawn from an extraneous source, force that sclieme or formuia upon things to which it is inappropriate, and so construct a system which is artificial and erroneous. Most sciences have suffered from artificial systematization of this kind, but probably none nearly so much as theology. Metaphysical philosophy has always sought to shape and modify religious and even distinctively Scriptural truths according to its own ideas, methods, and dogmas. Paul and John have often been merely the masks through which Plato and Aristotle have taught. Hegelian divines have passed all religious beliefs, all Scriptural doctrines, through the dialectic devised by their master, and, whatever those beliels and doctrines may have been before subjection to the operation of that wonder-working machine, they have always come out ground into Hegelian notions. Jurisprudence exerted os similar influence, owing to its having been the ouly science which was studied with zeal and success in the Latin world when theology began to be independently cultivated by the Latin Church. The La + :n mind was so possessed by juristic or forensic ideas that the Latin fathers could not avoid looking at the gospel through them. This way of viewing it is still familiar. The socalled federal school of theology, long and widely influential, exhibited the whole system of religious truth according to the analogy of a covenant,- a succession of covenants between Gorl and man,--in other words, according to a conception which is essentially juristic and political, not intrinsically and properly religious. The making of a metaphor in this manner the basis of an entire system of theology is far from uncommon. Thus, because sin may be likened to dieease or to darkness or to death, and holiness to health or light or life, not a few would conceive of all religious truth according to these similitudes, and do violence to the reality when it does not easily adapt itself to the moulds which they have chosen for it. Dr Chalmers, for instance, distributed all systematic theology
into a study of the disease and a study of the remedy, and treated the doctrine of the Trivity merely as an appendix. At present, owing to the dominaocy of physical science, there is a strong temptation to work upon spiritual facts with physical categories, and even to identify, i.e., to confound, the spiritual with the plysical. Hence we hear of natural law, in the sense of mechanical or biclogical law, in the spiritual world.

Secondly, in a true system of theology the material and formal constituents of knowledge will be duly conibined, but not in a false system. No true system of theology can be constructed simply by logical deduction from abstract conceptions, from a priori assumptions, from selfevident axioms. Mere reasoning from data so insufficient as these may be made plausible and imposing by being thrown into syllogistic, dialectic, or mathematical shapes, but it cannot be made truly profitable and productive. When the Wolfians bad presented theology in the semblance of geometry, they liad merely succeeded in dressing it in masquerade and binding it with fetters. Reason can only work effectively in theology when it is in possession of a large and close acquaintance with Divine things and acts harmoniously with the whole spiritual nature. On the other hand, without the application of logical reflexion to the truth implicitly contained in the sources of religions knowledge, without the help of definition, induction, deduction, and all the processes involved in analysis, generalization, judgment, and reasoning, we never could reach a sçientific system at all. Such a system is not simply an aggregation or accumulation of the data and constitueats of religion, but the product of all the activities and forms of thought which give to the contents of religious experience the order and organization which theo logy, as science, demands.
Thirdly, a true system is one in which unity is the result of the conciliation of all relevant principles, even although they may be apparently antagonistic, while a false system is one which bases itself on some particular principle or idea to the exclusion of others, also legitimate. In a true system unity is produced by harmonizing differences; in a false system it is produced by ignoring differences. A true system of theology is one which grows out of the struggle of opposing elements and recognizes the validity and significance of all religious truth. It is not, for example, so based on Divine sovereignty that injustice is done to Luman liberty, or so based on free will that God's agency is largely ignored, but it assigns to both Divine efficiency and buman action their proper place, and does so, not meerely by maintaining the truth of both, but also by exhibiting their relationslip and harmony.

Fourtlity, in a true system all the members are not merely included, connected, and classified,-they are also unified through reference to a centre. A true system must be a unity of members pervaded by a common life. In its remotest members must be traceable the pulsations of its heart. Only of late lave theologians begun clearly to recognize that this characteristic of a true organic systen must be taken into account in the formation of their science. Long after they were fully alive to the importance of treating of each head of doctrine or article of faith, each separate theological locus, they felt hardly any interest as to how the various doctrines, artieles, or loci were to be connected. They were often content to take the order of arrangement from some external source, some creed, confession, or cateclism. It was a step in advance when, although still arranging the dogmas merely in a series, they endeavoured to give eacl dogma its place, on the ground o? its matural and intrinsic relationship to other dogmas. Theologians have, indeed, differed much as to what is the proper seriatim order. One, for examule

Gas begua with the nature and state of man, a second with the being and character of God, a third with the Divine authority of the Scriptures, and a fourth has followed the order of the Divine dispensations. Yet there need be no doubt that there is such an order, one in which every dogma is exactly where it ought to be. This order, it may also be safely affirmed, can only be one of advance from the simpler to the more complex. An order in which each dogma has before it only its natural antecedents, and after it only its natural consequents, must be one of continuously increasing complexity. The spirit of order and of system cannot rest, however, in the series. It must classify as well as connect the doctrines. This also may be accomplished in rarious ways, and even when there is gencral agreement as to what are the natural gioups, there may be coasiderable differcnce of opinion as to their celimitation. But the most perfect distribution by classification, if unsupplemented, inust be unsatisfactory. A still higher kind of unity has to be attained. It is that of the only unity which is truly organic. It is that of co-ord:nation and correlation tbrough a single central principle. An intellectual system, a system of scieace or doctrine, caa only have this unity, and be in consequence a true system, when all its particular trnths and various departments or divisions of truth are connected with one another and combined into a whole by reference to a common and ceatral truth. The necessity of conforming to this condition of systematizing has now begun to be felt among theologians, and hence in several modern systems of Cbristian dogmatics the doctrines are not merely distributed into groltps, but an attempt is also made to find a centre for the whole system in a single pervasive idea. Such a centre Rothe, for example, finds in the religious consciousness, a consciousness of sin and of grace; Kahnis in the doctrine of the Trinity; and Thomasius and H. B. Smith in Christ Himself, His person and work. So far as Christian theology is concerned, the last of these views is doubtless correct. Cluristian theology, like Christianity itself, must be Christocentric. All its doctrines either directly and immediately relate to Clirist's manifestation of God and redemption of man, or are the antecedents and consequents of those which do. To Christ the entire system owes its distinctive character. For general theology, on the other hand, the central and vital idea cau be no other than that of religion itself. It must obviously be one derived from the domain of the science itself, and indeed from the essential nature of the object of the science. As it would be au error to seek the priaciples of biology elsewhere that in "life," or of psychology elsewhere than in "mind," so must it be to seek the principles of theology elsemhere than in "religion." Theology is the science of religion, and in the true idea of religion should be found the central and constitutive priaciple of the general system of theology. That it can be found therein will appear as we proceed.

Must the work of method in theology end, however, sven with the formation of a system which answers to the requiremeats just indicated? Is there no still higher procedure or application of theological method legitimate ? This is to ask if there be any place for a speculative method in theology, and if speculative theolegy rest on any solid basis.

The history of theology might, perhaps, suffice of itself o show, on the one hand, that speculation has a large and 1 :gitimate place in the sphere of theology, and, on tho other hand, that its place is one the limits of which are difficult to fix or keep within. Cluristian theology was initiated by Guostic speculation, grandly reasonable in aiming at the exhibition of Christianity as the absolute truth and absolute religion, but otherwise wildly extra-
vagant. An Origen and an Augustune owed largely tc speculativeness both their successes and their failures. The defects of scholasticism were due more to misdirection of the reflective understanding than of the speculative reason, and it was especially the speculative and the mystic dirines of the Middle Age who opened up the way tc modern thonght and nodern theology. Men like Nicholas of Cusa, Bruno, Telesio, and Camplanella, looking from the heights of speculation, saw some aspects of religious truth which the lieformers, standing on lower if safer and lese cloudy ground, overlooked. A Descartes and a Spinoza, into whatever errors they may have fallen, certainly did much, and in a directly speculative manner, to enlarge and advance the rilosophy of religion. Kant supposed that. by his critical researches into the nature and limits of knowledge, he kad made an end of speculative theology and done that would effectually deter reason from specu lative adventures. It sooa became apparent that his expectations had been doomed to disappointment, that is reality he had excited speculative reason to extraordinary activity and even audacity, and inaugurated an era of theology far more speculative than any which had preceded it. The great speculative movement in philosophy headed by Fichte, Schelling, Hegel, Baader, Krause, and others passed on immediately into the sphere of theology, its leaders themselves proceeding to apply their principles and methods to the explanation of the doctrines and phases of religion. Theologians by profession soon followed in their footsteps. Danb and Marheinecke constructed systems of Protestant dogmatics by means of Hegel's dialectic. Stranss, Baur, and their followers reached by the same method negative and antichristian results, bringing out the contradictions between the doctrines of the church and the speculative truths to which it was held that they should give place. Many theological systems of an almost exclusively speculative character have since appeared in Germany. Weisse's Philosophische Dogmatik and Rothe's Theologische Ethik are good tspical instances. And, while not so predominant, the speculative nse of reason is yet conspicuous io the treatises on Christian dogmatics of Dorner, Martensen, Schöberlein, Hofmann, Liebner, Biedermann, and others. In the department of philosophy of religion a speculative procedure is not less frequently followed, either as alone appropriate or as a necessary supplement to the genetic and historic method. Rosmini, Gioberti, and Mamiani inangurated in Italy a speculative theology second only to that of Germany. Contemporary French theological literature can boast of at least one work displaying real speculative power, -the Philosophie de la Liberté of M. Secrétan. In America Hickok, Bushnell, and Mulford may be mamed as having shown confidence in the competency of speculative reason in the spiritual sphere. In Britain Principal Caird has argued in favour of a speculative procedure in theology with raro skill in his Introduction to the Philosophy of Religion. On the whole, however, both in America and Britain, the speculative method has received little recognition from theologians. But this, of-course, may be held to be partly cause and partly effect of the want of life and originality, of thoroughness and truthfnlness. of ordinary American and British systematic theology.
Is therc, then, room and need in theology for the speculative method? The answer must depend on what is meant by speculative method. There are kinds of socalled speculation which are plaiuiy illegitimate and inapplicable. Thus, some have represented speculative theology as part of a philosophy of which the whole esystem is deduced in a purely and strictly logical manner from an $m$ priori principle, idea, or datom. On this fiew the specmlativa thinker somehow apprehends on absolute first of
thenght or being, or both, and then from this primary and necessary datum evolves syllogistically or dialectically a whole philosophy, whicn includes a whole theology. Such speculation may be safely pronounced futile and delusive. It can never reasonably vindicate its choice of a startingpoint, for the absolute first of existence and thought can only be that to which the worlds of fact and experience, of matter and of mind, refer us as their ultimate explanation. It ascribes an extravagant power to mere formal thinking. It is only consistent with exclusive idealism and exclusive rationalism, both justly discredited apecies of philosophy. It makes theology wholly dependent on a philosophy waich must be false, since pure reason cannot, as it assumes, spin out of its own essence or out of any single datum the whole system of truth.

There is, however, a theology which clains to be at once speculative and independent of philosophy. Such was the theology which Rothe sought to elahorate in his Theological Lthics. In the "Introduction" to that work he has fully explained his method. It is, as there represented, the very same metuod with that of speculative philosophy, but it starts from a different point,- Dot from pure self-cousciousness, but from the religious self-consciousness or God-conscionsuess. Its primary datum is, according to Rothe, as immediately certain as that of speculative philosophy, the pious man being just as directly sure of God as the natural man is of his own self. Out of this datum it must evolve all its conclusions by an inward logical necessity, and construct an entire theological system of such a nature that every single thought implicitly supposes the whole. Speculative theology thus conceired of needs but a single fact, the datum from which it starts, and that fact must be a self-evident one, given immediately in and by consciousness; all the rest is a succession of inferences deductirely obtained. The facts of religion presented in nature, history, and Scripture not only need not but ought not to be taken into account by it, although at the close of its labours its success must be tested by the conformity or nonconformity of its results with those facts.
"This aystem of a priori thought," says Rothe, "to be snccess. tul as a speculation, must be an ahsolutely corresponding and constant image of the reality; but the speculative process itself takes no thought whether there be such a reality existing, or how the ileas which it constructs are related to it; but, without looking either to the right hand or to the left, it follows only the course of logical necessity, until it bas accomplished the whole circle of its ideas, and constructs a complete system. Then .first the speculative thinker looks out of himself, in order to compare the system of thought which he has independently constructed with the objective reality, and to assure himself of his correctness by such a comparison; but in so doing he is slipping out of the region of apeculative into that of reflective thinking. The necessity of such a verification, indeed, he acknowledges unconditionally, but he distinguishes clearly betwees the speculation itself and that reflective critical process by which alone such a verification can be realized. With referenco to the empirical reality around him, he acknowledges that his specnlation is incorrect if his system of thought is not there reproduced, but he still persists that he has to complete his speculative labour without any direct reference to it. He concludes rather, from a clear want of correspondency, that he has speculated incorrectly, and can look for his error in nothing else than in his departure from a strict adherence to the laws of logic. Forthwith, then, he destroys his laboriously constructed system; but if he again proceed to construct another, he must proceed in the very same manner as before, i.e., by looking solely into his own thoughts, as though there were no world around him."

Rothe, it will be observed, cannot be charged with haviug made theology dependent on philosophy. He represented theological speculation and philosophical speculation as starting from different data, as running parallcl to each other, and so as throughout distinct. But this was to avoid one extreme by falling into another. It was virtually to deny the unity of thought, and to assume an ineredible dualism in the universe of speculation. A theology absolutely separated from philosophy muss be even
more unsatisfactory than one wholly dependent on it. Then, the method itself proceeds on assumptions unsupported by evidence, yet far from self-evident. It assumes, for instance, that a system of ideas generated a priori will be a counterpart of reality, although it is neither inconceivable nor improhable that the characteristics of real existence may be incapable of being determined by the mere logic of necessary thought. Reason should not thus be credited with the extraordinary power of comprehending reality without requiring to apprehend and study.it. Another assumption is, that a complete and self-consistent system can only be reached by an exclusively a priori procedure, whereas it is far more likely that such a system will only be attained by a combination of different processes. Again, the primary datum of theological speculation as understood by Rothe-the idea of God-is assumed to be immediately given and immediately certain. But the idea of God is not immediately given or immediately cortain. The piety which chooses to affirm so is a piety capricious in its affirmations; the speculation which starts from such a foundation starts from an assumption easily shown by psychology and history to be erroneous. Rothe went even farther astray. He represented not only the bare consciousness of God but the Christian, yea, the evangelical God-consciousness, as a simple and primary datum of consciousness. This was utterly arbitrary. It was to treat as an original apprehension what is indubitably an acquired experience. No a priori system-no properly deductive system-can be reasonably imagined to have such a starting-point. For these and other reasons, theological speculation of the kind advocated by Rotho may be rejected.

Still another species of theological speculation, however, has been attempted and commended,-one which seems more modest, and claims to be more distinctively Cbristian. It is the method advocated and exemplified in the Schriftbeweis of Von Hofmann. He, iustead of starting like Rothe with the religious consciousness, chose to start from a real concrete fact, what he calls the Christianity of the Christian,-a Christianity which be supposes to have acquired in the Christian a separate standing of its own, in virtue of which, and independently even of Scripture, it is self-evident certain truth sustained aud authenticated by the Spirit of God. From this fact or experience, expressed in its simplest and most geveral form, as a personal relationship or fellowship between God and man through Jesus Christ, Hofmann would deduce the whole theological system by a process of "thinking within" the central fact, so as logically to evolve from it its manifold wealth of contents, and would refrain on principle from looking outwards, and taking into account the religious facts presented by history, experiedce, or Scripture. Now, in this system also, speculation is in excess. Such a speculative deduction of facts from facts as is contended for is impossible. Facts are not so involved in one another that they can be evolved from one another by mere thinking, and still less so that from one fact a whole system of facts can be thus evolved. From a single bone, indeed, of an animal which he has never seen or heard of a naturalist may in thought correctly construct the whole skeleton, but not by think」 ing within or from the one fact before him, but by making use of all the knowledge he has acquired of the structure of adimals, of the relations of bones to bones. Dr Hofmann himself was quite unable to carry out the method he contended for. His so-called speculative argu* ments are mere semblances of what they profess to be, Instead of the contents of his system being really "de rived " from the simplest expression of the fact of Christianity, new propositions are constantly borrowed from the known contents of Cbristianity, and added from without
or the efopplest expression, in order to help out the unfolding of the system. Further, iu Hofmann's system of speculation, is in that of Rothe, we ate asked to start from an assumption which is not, andi caulot be, justi-fied-the assumption that Christianity in the Christian is independent of its objective grounds. Surely every experience may reasonably be called upon to produce eridence of its legitimacy and validity; aud, if so called upon, how can it avoid referring to its grounds? It is only by an examination of the grounds of an experience that we can know whether it is an experience of reality or a form or effect of illusion. The fact from which we are told by Hofmann that we must deduce all other farts is only itself intelligible in the light of many of these facts, and even of the Christian system as a whole; it is a fact which has many conditions, and the right understanding of it requires its being viewed under its rarious conditions, not as abstracted from and independent of them.
In the forms indicated, then, speculation has failed to make good its claim to participate in the formation and development of theology. Does it follow that its claim is wholly unfounded? By no means. Speculation in the forms described pretends to an independence of reality and a creative power for which there is no warrant in reason or confirmation in fact. Hence the futility of such speculation is no disproof of the utility of a specnlation which will fully recognize reality and directly endeavour to elucidate it. Speculation of this latter kind seems to be a necessary condition of true systeratization and a necessary supplement to induction and to all the special methods of particular sciences. In a true philosophy, for instance, acience and speculation must necessarily be combined. So far from claiming independence of the sciences, a trne philosophy will base itself upon them, and scek to rise above them by means of them. It is only thus that it can hope to reach the ultimate universal and real priaciple of knowledge aud being, without which there can be no rest for reason or unity in the universe. But, having asceaded by, an analytic and inductive course to tha unity of an sil-comprehensive ultimate principle, philosophy nust endeavour to descend from it in a synthectic and deductive manner, so as to exhibit the whole organism of existence, or to determine how the many laws of science and the many facts of experience are connected with the absolute in being and causation, and through it with one aaother. It is conceivable that the descent should be accomplished in various ways, and Plato and Plotinus, Descartes and Spinoza, Fichte, Schelling, Hegel, Krause, Gioberti, and others have attempted it each in a way of his own; but two things are obvious, namely, that philosophy cannot consistently decline the task, and that any method it may adopt in trying to perform it must be one essentially speculatire. An inductive and analytic method is clearly inapplicable, for the highest and last results of induction and analysis are just what are to be elucidated through being viewed in relation to the one supreme truth or fact. And among the data with which philosoplyy must thus synthetically or speculatively deal aro those of religion. It requires to show how what theology teaches as to God's nature and operations comports with what itself affirms as to the sbsolute source and ground of existence, and this necassarily commits it to have recourse to a theologicospeculative use of reason. And to a very large use of it if, for example, theism bo true ; since, in this case, the absolute principle of philosophy can bo no other than God Himself, and its highest task no other than to show Him to be the essence of all existence, the light of all knowledge. In this case philosophy must ineritably become in the bighest stage of its development a speculative theology.

Nor can positive theology dispense with speculation.
cannot, indeed, begin with it or confine itself to it,-caumot start with some single immediately certain religious fact, and then by mere force of logic cvolve therefrom a whole theological eystem. Its data are all real facts of religion, and these it must deal with, in the first place, mainly by observation and induction. But obsersation and induccion will not always alone lead to a satisfactory result. Observation is confined to experience, which gives only the particular. Induction, in so far as it effects a transition from the particular to the general, already involves the activity of speculative reason; it makes discoveries only when guided by theory; it can never of itself reach ultimate truth; and it is manifestly not its function to raise coherent comprehensive systems on their proper constructive principles. Then, the theologian who renounces speculation must deal most inefficiently with the chief ideas and doctrines of his science. Consider the greatest idea of all-the idea of God. Mere observation and induction do not yield the idea. Exclusively applied, they cannot take us beyond the contingent and conditioned, cannot take ns beyond atheism and secularism. Waive, however, this objection, and grant that the idea of God may be given, say, through revelation. What sort of idea must it be in the mind of the theologian who refuses to specnlate? Merely that of a complex of the attributes predicated of God in the Bible. Surely that is unworthy to be accounted an idea of God at all. The theologian who is in earnest with the idea of God, who would find order and light in the idea, who would think of Him as He is, Absolute Being, Harmonious Life, Infinite Personality, Perfect Spirit, Ultimate and only Complete Explanation of the Universe, must assuredly speculate, and speculate.freely and largely, although he ought also to do so humbly and reverently. Even if he would maintain that we cannot lave a knomledge of God as He is--that we must renounce the hope of a speculative knowledge of Him, and be content with a merely regulative knowledge,--he will find that ho needs, as Kant, Hamilton, Mansel, and Spencer have practically so fully acknowledged, speculation, and much speculation, to support his thesis. The mind is not necessarily relieved from the duty of exercising speculative thought on the nature of God by receiving a special revelation regarding God. Christianity is a proof that such revelatiou may only increase obligation in this respect. It brought with it a wondrous idea of God, one of marrellous practical efficacy, but one also which forced Christian reason into paths of speculation, which could only be formulated after lengthened and severe speculative labour, and which no intellectually or spiritually quickened soul can accept otherwise than rith speculative exertion, And this may show that speculation is as legitimate and applicable within the sphere of Christianity as within thal of gencral theology. The compreliension of Christianity requires that we penetrate to its distinctivo and central principle, and view all its contents in the light of that principle. It is only so that we can hope to accomplish either a true systematization or a true elucidation of ity contents. The procedure by which this is effected cannot be one of mere formal logic, of pure deduction, or strict demonstration; it must be one which implies a constant reference to facts and inductive results; but still it must be ono which is essentially syntletic and speculative.
Theology is a unity, a whole, but a very complex unity, a whols of many dissimilar jarts. It may ba spoken of in a broad and general ray as a science, lut not less correutly as a department of sciences. Yt includes nany studies or disciplines which man be culltivated is a scientific spirit and according to scientific metbods, and these sturies or disciplines, whilo closely connected, are also clearly distinct. They are by no menns mero divisions of a special science. Ňatural therlogy nid Cliristian dogmatics aro as distinct science.
from each other as phe, sics is from chemistry or anatomy from pbysiology. Comparativo theology and Biblical theology nro as
distinct from each other as the atudy of the general history of mankind is from the study of the history of Eagland.
Hence arise a number of problems. How are the theological sciences related to the non-theological sciences a ad to one another? sciences are they located in the vast organism of science as a whole ? and how are they connccted with oae another so as to form a omaller organic whole in themselves? What principles have they in common, and what tasks are proper to each? Wherein do they agree and wherein do they differ in their methods of research These are very important questions. There cannot be an earnest and scientific study of theology where they are overlooked. It is the special task of the theological discipline called "encyclopadia of theology" to discuss aad answer them, -or, in other words, to determine the boundaries of theology, to exhibit anf explain its inper organization, to indicate its componeat parta, and to trace their relations both to one another and to the theological system as a whole. This discipline is, therefore, the appropriate scientific approsch and introduction to theology and to the various theological sciences.

It is of comparatively little, importance whether or not it be itself called a theological acience. Strictly epeaking, perhaps, it is rather a section or rolongation of that division of genersl philosophy which treats of the relations of the sciences. One of the tasks of philosophy is to defiae and distribute, classify and co-ordinate, the eciences, so as to exlibit them as parts of an harmonious cosmos or members of a well-proportioned corpus. Bụt philosophy, when in the pursuit of its merely geperal ends, cannot be oxpected to go into details aod to concern itself with all the aubdivisions and ramifications of ocience. It will be content to trace main liaes, to appreciate leading principles, processes, and results, and, in a word, to erhihit the organic unity and variety of acience as a whole. It will leave the exact and exhaustive distribution and survey of any particuler kind or group of sciences to those who arc extensively and minutely acquainted with that kind or group of sciences. The oomprehensive philosophic survey of any order or department of studies is the encyclopadia thereof. Hence there is encyclopædiz of mathematics, of physics, of philology, and of jurisprudence, as well as of theology. Encyclopzedia of philosophy, however, comprehends all the departmental eacyclopadias of science. And this for the simple reason that philosophy is inclusive and unitive of all science. As scientia scientiarum philosophy is, as Hegel has aptly said, "wesentlich Encyolopädie." Hence theological encyclopædia-the encyclopedia of the scicnces conversant with religioa-may reasonally be held to be essentially a prolongation, a direot continuation; of pbilosophy.
Theological encyclopædia has had its course determined by the general moveruent of theology. The various theological disciplines required to be evolved before they could be co-ordinated. The desigaation "theological encyclopædia" first occurs in its current technical sense in Mursines's Prinx Linez Encyclopredizs Theologices (1764). It was only with the publication of Schleiermacher's Kuree Darstellung des theologischen Studiuris in 1811 that the full acieatific importance of the discipline was weade evident. It has aince been diligently cultivated in Germany, and is at length finding recogaition in other countries.

There are, however, serious defects even in the latest and best expositions of it. Two of these may be noted as being so serioua that, owing to their prevalence, theological eacyclopxdia can hardly be said to have ovea yet eatered a truly scientific stage. Oue is the virtaal or express identification of theology with Christian theology. All the chief theological encyclopædists of Germany-Hagen bach, Lange, Räbiger, Rothe, Von Hofmann-follow Schleiermacher in this amazingly absurd procedure. Logically the Brahmanist, Buddhist, and Mohammedsn might with cqual justice identify all theology with their owa. The superiority of Christianity to other religions, the uniqueness of Christianity among religions, does not alter the pature or lessen the magnitude of the error. Every encyclopædia of theology which confounds the general with the special so completely as to identify theology with Christian theology forfeits its title to recognition as acientific; aed almost all, even of the latest and best thcological encyclopædias, do so. The other fault referred to is that, even in the latest and best of theological encyclopedias, the constituent sciences of theology are not so coordinsted with reference to a centre as to reuder apparent their organic conaexions. The German encyclopedists siace Schleiermacher claim, indeed, that they so distribute the various disciplines of theology as to exhibit its antural organization. But the claim is not well founded. In reality, their schemes of distribution have po real unity. They are simply arragements of the arious theological disciplines in a fourfold, threefold, or twofold menner, i.c., for example, as exegetical, historical, systematie, and practical, or as historical, systernatic, and practical, or as didactic and practical. But this is merely external classinication. It may he faultless of its kiod, but it cannot of itself yield more than a superficial and mechanical arrangement of the theological sciences. Theology, to be scientifically surveyed and distributed, must be viewed as a he scientifically surveyed and distrinuted, must be riewed as a
to have a definite place in it from its very nature and definition, as the science or philosophy of religion. Their relationship to one another must be determined by their relationship to the whole of which they are parts, to that science or rather philosophy which treats of religion as a whole. They can only be unified and coordinated in a truly organic manaer by their due reference to religion, and consequently proper inclusion and location in the philosophy of religion. This necessity has as yet been only verbally acknowledged by theological encyclopredists.
There is an all-comprehensive scieace of religion,-one which treats of religioo in its unity and entirety 1 t alope completely answera to the idea and definition of theology. It is the ons general theological science, comprehends and dominstes the apecial theological sciences, so as to be the science of these sciences, and hence, io accordance with the true distinction between philosophy and science, is properly called philosophy rather than science-the philosophy of religion. All philosophy is science, but all science is not philosophy. Plilosophy, as distinguished from acience, is goneral or universal as distinguished from particnlar or special ecicace. This distinction is, of course, not an absolute one, hut of degree-of more or less; every other distinction between them, however, is pasitively erroneous. The one general theological acience is appropriatoly, therefore, terned philosophy. It is the philosoplay of religion as there is a philosophy of nature and a philosophy of mind, each inclusive of various scicnces. It is of the very nature of plilosophy to be both befere and after the sciances to which it relates, - to be at once their root and result, and at the eame time their bond of union and source of life. And the general thealogy which may justly be ideatified with philosophy of reli. gion has undoubtedly held this relation to the special theological sciences. It preceded them, being the germ from which they evolved, the root from which they have sprung ; it has grown up along with them, permeating them as their common life; and it also succeeds and transcends them, hasing itself on them and perfecting itself by means of them. 1t is the one geoeric science of the object with which it deals, and vast enough to comprehend a wholo group of sciences, because its object-religion-is so rich. complex, and varied.

The primary task of a philosophy of religion is to ascertain and exhibit the pature of religion. Now, a general theory of religion is the natural iatroduction to all special religious stuclics and theological sciences, and yet can itself ooly he brought to perfection through the advancement of these studics and sciesces. For example, we can on!y adequately understend the nature of religion through study of the history of religion, and yet we cannot trace the history of religion at all onless we know generally what religion is. Again, in such works on Christian dogmatics as those of Šhenkel, Kahnis, Diedermann, and Lipsius, we fiod a considerable placa assigned to an investigation into the geacral nature of religion. The investigation is nanifestly not there strictly appropriate ; its true position can only be in another and wider science. At the same time, it is undoubtedly a necessary antecedent to the investigations of Christian dogmatics, from the very fact that Christianity is a religion. On the other haud, Christiacity is not only a religion, but a religion which claims to be the perfect or absolute rcligion; and, clearly, if the claim he well fouaded, the complete nature of religion caa only be understood through that full knowledge of Christianity which Christian scietice may he expected to give.

From the very nature of religion the science or philosophy which treats of it as a whole must obriously be most compreheasive. Religion is a relation between a worshipping subject and a worshipped object. It implies both distinction and unity. Were there no distinction between the subject and the object there would be no religion, whether the self-identical unity were named God or man. Were there only distinction between them-were God and man absolutely separate from and iadifferent to each other, religion must be in this case also impossible. Religion thus surposes two factors, which are different yet related, 60 far distiact and so far alin; and our victrs of religion must depend on our riews of these two factors. It involves still more. God does not

[^115]act on man by the direct manifostation of His absolute essence, nor does man know God by inmediate vision. Take eway the physical and moral worlds and the written word and the Incarnate Word of God-buppose, that is to say, both general and special revelation removed-and an impassable chasm will separate man from God and all religion be destroyed. Tho revelation in nature and the revelation through particular inspiration and intervention, however, bridge over this chasm, and consequently religion is overywhere found existing in eoroe form. But even revelation would be uselcss if ran had not facultics to apprehend it and to arail him. aelf of it. The communion of man with God aupposes powers of communion in man as well as in God. It can only bs realized through religious facultics and processes which can be analysed and which have laws of exercise and evolution that can be traced. Further, religion has a history which ohows how man lias interpreted or misinterpreted the revelations made to him, what forms religion has assumed in various lands and ages, and how these forms-the religions of the world-have arisen and epread, developed and decayed, influenced one another and affected morality, civilization, and general history. Thus religion, from its very nature or idea, requires us to treat-(1) of the object of religion (God), (2) of the subject in religion (man), and (3) of the media and process of religion, -or, in other vords, (a) of the modes of Divine manifestation, (b) of the powers of human apprahension of the Divine, and (c) of religion itself as a kind of psychical life. All the special theological eciences deal with some of these themea, or some pertion op portions of aome of these themes, in certain asnects, but the philosophy or genersl scienco of religion deals with them all in their entirety and organic connectedoess, the form appropriato to philosophy-to ecience which comprehends and thereby transcends special ecioncea.
For the philosophy of religion, as the highest discipline of theology, the most natural order to be followed in the treatment of its themes is probably that which has been indicated. It is the order whictr has been most commonlyadopted in treatises that aimed at rys. tematic completeness. God, man, God'e manifestation of Himself to $\operatorname{in} 3 n$, man's experience of God, and the development of religions, -these are the topics, and auch is, in the main, tho order of their discussion, usually found in philosophies of religion proporly so called. This is, however, because the philosophy of religion as a distinct discipliue presupposes tha reaults of tha several epecial theological sciences. Theology ends as it begins, in unity; but the unity in which it onds is very different from that in which it begins. It begins with the confused unity of common knowleuge, the complex and undifferentiated germ of the theelogical eciences; it ends with the unity of tho clearest and deepest insight, in which all distinctions are at onco recognized and reconciled. This last is the uaity of that ultimate stage of theological knowledgo which can alone claim to be philosophical as diatinguished from ecientific; and it can only be reached by those who have attained to an adequats mastery of all the sciences conversant with religion. The philosophical student of the whole mnst have otudied scientifically its parts, know what is to be known about them, and make use of his knowledge in his orn proper labours. The atudent of the parts needs to know only in a gencral way what religion is, and muat follow in his atudies an ordar of procedure detcrmined by his lack or limitation of knowledgg. Tho courae by which the mind traverses the partial and apecial eciences of religion and rises to a philosonhy of religion cannot be the eame as that through which it unfolds a philosophy of religion itself, exhibits and confirma a religious theory of the universe, and harmonizes and olucidates all results of theological regearch and all varisties of religious phenomena.

The philosophy of religion is itsolf, of course, special in relation to philosophy, of which it is only a dopartment. And thero may even be a apecial kind or form of the philosophy of religion, if thest kind or form be genaral enough to iuclude a natural group of theo. logical bciences and to have regard to their collective effects. A opecial religion may be so significant, so important, and the aubject of so many theological disciplines as to render indispensable the division alike of the philosophy aud of the sciences of religion into genaral and special. Christianity, as the most perfect form of religion, the fullest revelation of epiritual truth, the source and theme of a large group of sciences, is euch a religion. Hence there may be, and ahould be, not only a philosophy of religion hut $\sigma$ philosophy of Cbristianity, - bat only a geperically religious but a epecifically Christian theory of the universe. If the claims of Christianity be warranted, if in it religion and revslation were consummated, the philosophy of religion can only reach a a3tis. factory conclusion when it has passed into a philosophy of Christianity, or, in other words, attaincd auch a compreheusion of existence end-life in relation to the person and work of Clirist as 13 possible to the humanspirit The philosophy of Christianity mnst obvously be connocted with all Christian disciplincs in the samo manner as the philosophy of religion is with all other theological disciplines

Tha history of the philosophy of religion has, of couree, beer closely conjoincd with the histories beth of theoloty and of philosonhy, and influcaced by all the causeg which hava affected them. in the wido eense of religious reflexion it is as old as
oither philosophy or theology. As a distinct depsrtment of philosonhy, and-the highest and most comproheasiva theological science, it is of compsratively rocent origin, and, indeed, younger than many a living individual ; but even in this latter acnse the whole bistories both of philosophy and of theology have been needed as tho proparation and foundation for it. It could only appear in its alone adequate form when both philosophy and theology wero highly dive'oped, when both had freed themselves from the yoke of all authority eave that of truth and reason, when both had discovered their appropriato mothods, when they could so combine as to do no violence to the proper nature of either-a kind of combination most difficult to accomplish. But this, as might easily be chown, was not before philosuphy and theology becana at once critical and speculative, or, in other words, before that great revolution of thought with which the Dames of Kant, Hegel, and Schleiermacher are so gloriously associatad. Only in the present cantury have philosophy and theology reached tho stage in which they can unito and produco a philosophy of raligion, And within the century many philosophies of religion have made their appear. ance, especially in Germany. Indeed, all the more cminent philo. sophers of Germany have fully recognized that a philosophy of religion is a most essential department of philosophy. That not a few of the so-called philosophics of religion produced havo beeu very defective and erroneous is ouly what was to be expected. The worth of a man'e philosophy of religion cannot bo greater than the worth of his philosophy and theology in general. It is impossible that the philosophy of relinion of an Hegolian and a Neokantiat can accord, very possible that both may be far romoto from the truth. If empiricism, positivism, or materialism be true philosophy, or if authority be the foundation of religion and tho standard of theology, a philosophy of religion must bo illegitimate and supcrlluous. When religion is assumed to consist merely of belicfe, emotiono, and actions which have no objective grounds, no ral and rational basis, its development can only be an ohject of history and of psychological analysis, and there can ba no philosophy of religion, but eimply a ecience of religrions, which, secing that it deals entirely with certain forms of mertal disease and delusion, must be deemed merely a department of mental pathology. A jbilo. sophy essentially roligious must combine with a theology essentially rational in order to yield what deserves to be callod a philosophy of religion. If religion be the living appreheasion nod enjoymont of the truth which philosophy has for its mission to aeek to comprehend, then, but ouly then, must a philosophy of religion be necessary alike to philosoplyy aud religiou. ${ }^{1}$
We now pass to opecial theological dieciplines which can at the utmost merely becoms sciences as distinguislied from philosophy. They all deal with religion, each of then treating of some particular portion or sapect of it; and the order and mode in which they do eo determinos their relations to one azother and the order of their euccession. If wa would rise, for example, through otudy of the parts or phases of religion in a aure and natural manaer to a knowledge of it as a whole, we mast neecssarily begin with what of it is nearest and most accessible to us. But what is so is its history. In its historical manifostation it is a phenomenon which no ore can refusa to acknowledge. The history itself, bowever, is not only a most extensive but a very complex pheuoraenon. It is externsl and internal, corporesl and ajpiritual, a history of outward ovents and actions, institutiona and titos, and also nf ideas, convictions, and affections. What is external is uearer and more accessible to us than what is intermal, and it is through the former that we must pezetrate into the latter. They cannot bo quito separated, for tho external is only intelligible ilirough the internal, end the internal ouly sttainable and verifiable throagh the external ; but they can be oo far differentiated, and thara is a history mainly of what is oxternal in religion and another mainly of what is internal. The ordinary history of religion is mainly concerned witli tracing the growth of roligion in its most appareut form and institutional character! It may be divided into three great ecctions-the ethnic, Biblical, and ecclesisstical, -the history of the heathen religions, the history of tho Jewish roligion and of the rise of Christiaaity, and the history of the Christian church.'
${ }^{1}$ Thare is a laborlous and Impartal history of tho phllosophy of rellgloo by

Whether history in this form, oven when studied in the most accurate and thorough manner, should be called science may be doubted, as it is simply occupied with the discovery and description of the particular and conerete. It is not usual so to designate it in any of its sections. The history of religious beliefs and ideas may be as purely and properly history as that of external institntious and transactions. It deals, however, not only with what is internal and epiritual but also with what is abstract and general, and heace it is at least more akin to science than is common history, and its acctions are often called sciences. These sections are three in number, and correspend to tho sections of the ordinary history, They are known as comparative theology, Biblical theology, and the history of Christian doctrine. To the last of these, symbolics may fairly claim to be a necessary supplement. They are quito distinct from a conceivably attainable knowledge of We laws of religious history, such as might be with strict propriety ciesigoated science of religious histery, a department of science of Listory. Of historical science in this last sense there is as jet xtremely little.

Religion is a spiritual process, and its history continuously mplies the affections and operations of mind. The historical treatment of religion, therefore, necessarily leads to its psychological treatment. The history alike of religious events and actions and of religious ideas and beliefs can only be explained through a knowledge of the religious powers and processes, i.c., of the psychological facters and states which condition and determine its development. The psychological study of religion, although it has been greatly neglected, should reach over a very large depertment of theology. The department may be distributed into three disciplines-the general, comparative, and epecial psychology of religion. The first sheuld treat of the general religious nature of man; the second should discover and compare the psychical peculiarities to be found in the various religions; and the third should exhibit claborately the psychology of a particular religion, as, e.g., Biblical and Christian psychology.
The historical and psychological sciences of religion deal with religion merely as an historical and psychological phenomenon. They do not imply its truth, and can be cultivated by those who regard it as a doltasion equally with those who acknowledge it to be a certainty. It is the office of apologetics to determine rhether or not it is true and how far it is true. If it end not in a negative result, in agnosticism or atheism, it must prove that God reveals himsclf to man, aud that man apprehends God. In other words, apologetics treats of the media of revelation-aliko the objective and subjective, Divine and human media-and so is the science, on the one hand, of revelation, and, on the other hend, of religious certitude. It is divisible into general and special, or, in equivalent terms, into theological and Clristian apologetics, - the former being the scientific exhibition of the grounds of natural religion, and the latter of the grounds of the Christian religion. They are sometimes combined, inasmuch as both are needed in order to establish the truth of Christianity. In Germany it has become not uncommon to fuse them into one under the name of fundamental theology, described as the science which treats of the foundation of Christianity. And, undonbtedly, it is not only expedient but even necessary to treat of both as introductory and preparatory to the construction of Christian scicnce. But tho distinction between them must not, therefore, be forgotten or ignored. Theological apologetics might be irresistible althongh Christian apologetics Were futile. Theological apologetics derives its validity from its relation to natural theology, which has an absolute value of its own, wholly independent of any other science, of Cbristianity, or of anything else. 1 The alliance of theological and of Christian apologetics is perfectly legitimate; the attempt to combine them into a single science, into a single homogeneous discipline, is decidedly the reverse.

The highest stage of theological sciense is the methodical education and exhibition of the truth involved in religion, either as con${ }_{i}$ tcuts of faith or clements of life. When conversant with the faith $i^{i}$ is docmatics, when with the life ethics; but, of course, liere ngain distinction is net to be confonnded with separation. True faith is living faith, and true life is the life of faith. Dogmatics and ethics are so intimately related that it is not surprising that they should have been long left undifferentiated, or that a few ominont theologians should atill deny that they can be properly treated apart. Theology at this stage is commonly designated systematic, although the term is not a good one, and others, little if any better perhaps, as didactic, theoretical, positive, thetic, \&c., have been suggested as substitutes. Systematic theology, like historical, psychological, and apologetic theology, is divisible into general and special, the former including natural theology and theologrical ethics, and the latter Christian dogmatics and Christian ethics. The identification, 60 common in Britain, of systematic theology with Christian dogmatics is, of course, solely due to the survival among us of prescientific thought and language in theology.

The historical and psychological sciences of religion may be conjoined under the designation of empirical, or phenomenological, ur
historical (in the widest sonse); the apologetic and systematic eciences nuder that of didactic, thetic, speculative, or systematic (in a loose sense). This trofold division of them is the one gene. rally sdopted. And as it rests on an obvious and impertant dis. tinction it is fully entitled to acceptance, provided it be 60 received as not to bide or extrude the fourfold-division fonnded on the real moments or stages of the process of theological investigation.

There are a considerable number of disciplines not included in the divisions indicated, yet for which the theological encyclopædist is bound to find appropriate places. The best classification of these is into exegetical and practical. So-called exegetical theology, however, is in all its departments simply instrumental and intro. duetory to historical thcology; and practical theology is in all its departments concerncd with the use and application of religious knowledge, not with its acquisition and advancement. The former is not directly occupied with religion but with the records and documents from which its history must be ascertained; the latter is art and not science.

Considering theology, then, only as science directly engaged on religion, the following are the sciences which belong to general theology:-(1) the history of religions; (2) comparative theology; (3) psychology of religion; (4) theological apōlogetics; (5) natural theelogy; and (6) theological ethics. Those of Christian theology are-(1) Biblical history; (2) ecclesiastical history; (3) Biblical theology; (4) history of Christian doctrine; (5) symbolics; (6) Biblical and Christian psychology; (6) Christian apologetics; (8) Christian dogmatics; snd (9) Christian ethics. The remainder of this article will be devoted to a brief indication of the nature of such of the above studies as have not already been treated of in separate articies.

The history of religions and comparatire theology differ from each other as sacred history and Biblical theology or ecclesiastical history and the history of Christian doctrines differ. That they should rarely be distinguisced proves only that the ethnic sacred books have not yet been oo closely studied as the Bible, and that the histories of the great ethnic religions are not yet so well knowu as the history of Christionity. Ae regards both the history of relimions and comparative theology, see Religions.

The general psychology of religion shonld analyse tho religions nature of man and trace the laws of its development. It has to ascertain the principles which guide reason in the search after God; to determine what subjective religion is, what clements it involves, and through what stages it may pass; and to show how the understanding and imagination, the emotions and affections, the qualities and energies of will, operate in religiou and influence its character. While general psychology of religion thus treats man as framed and fitted for religion, the comparative psychology of religion treats of the psychological composition and peculiarities of the various concrcte and collective manifestations of religion. It is related to the general psychology of religion as comparative psychology to general psychology. It must concern itself with the religions of the rudest peoples. It has to explain what is psychologically distinctive of fetichism, animal worship, naturalistio religions like the Vedic, anthropomorphic polythoisms like those of Greece and Rome, and pantheisms like Brahmanism and Bud. dhism. For example, in each of these forms of religion imagination works diferentiy, and the comparative psychology of religion forma give a complete view of the operations of imagination in the intellectusi principles and all the chief sentiments.

The psychological study of religion was not, as is often said, begun by Kant. Hume - in virtue of his Natural History of Neligion, whe clear recognition of the distiaction between the causes and the reasons of religion-is much more entitled to be considered initiator in this department, but even his claim may be contested. The department is one of which there is as yet no general survey, and of which many portions have been ontirely overlooked. What the ordinary psychologists-e.g., Bain, Snlly, Thompson, Rabier, Fortlage, Strimpell, Volkmann, Wundt-say segarding it is very vague and meagre. The only two points which have been closely investigated are those as to the nature of religious cogrition and the essence of religion, and as to both speculation has been frequently allowed to disturb and pervert psychological analysis For some of the later literature on these points, see notes on article Treism. Neither the general nor the comparative psychology of religion as yet exists in a ceparate and appropriate form. Wbat religions psychology there is will be found chiefly in the writings of anthropologists like Bastian and Tylor, of comparative philologists like Max Müller and Steinthal, of philosophers like Spencer and Renouvier, of theologians of the school of Schleiermacher, and, above all, in the historics of religions and the philosophies of religion. ${ }^{1}$

Theological apologetics is not to be confounded with natural
1 Allott's Psychology and Theology, Newmen Smyth'e Religious Feching, Brinton's' Relioious Senliment, Hsppel's Anlage des Menschen rwe Religion, Ulric's Goll und Mensch, and Lesbazellie's "Bases Paychologiques do la ReD
theolagy, irom which it is as distanct as Christian apologetics is from Christian logmatics. It lajsa foundation for natural theology, inasmuch as it vindicates religion by showing that it rests on pobjective spiritual truth. It presupposes a knowledge of religion as an historical and paychological phezomenon, but none of natural theology, which it, of conrse, leaves as a science to establish.its own doctrines. It has the following taska to perform. (1) To show that man is capable of apprehending the divine. This requires the refutation of agnosticism and the riadication of the priaciples implied in religious knowledge and certitude. ${ }^{1}$ (2) To prove the reality of a revelation of the Diviae in physical nature, miad, and history. The results of the various sciences will thereby be shown to be data of theology. It requires the refutation of atheism, materialism, positivism, and secularism, and of all principles which logically involve these systems. (3) To exhibit the reasons for the true conception of the Divine, and to expose the arguments employed in favour of false conceptions. The defence of theism, for example, must be accompanied by proof of the erroneousness pand insufficioncy of the polytheistic, dualistic, deistic, and pantheistic hypotheses. (4) To adduce whatever evidence may be contained in general revelation for the inmortality of the ooul and a future state of remards and punishments.

Natural.theology is the systematic exposition of the truths in natural or general revelatios. Its data are the facts and laws of nature, as ascertained by physical, mental, and historical science. Its inductions and inferences relato to God, men, and their relationship. Its appearance as a distinct science mary be dated from the publication of Raymond de Sebonde's Theologia Naturalis in 1436 , although portions of it had been admirably presented by ancient philosophers; e.g., Socrates, Plato, Aristotle, and Cicero. It flourished with extraordinary vigour in the latter half of the 17 th and thronghout the 18 th century. It should endeavoar to perform the followiag tasks. (1) To deacribe the nature, character, and attributes of God, so far as they are disclosed by the material world, mind, and history. (2) To treat of God in relation to the world and man, and of the world and man in relation to God, under which head all questions as to creation, providence, theodicée, optimism and pessimism, oducation of the haman race, \&c., will fall to be discussed from the standpoint of general revelation. (3) To determine, so far as can bo doue from general revelation, what nan maj reasoabbly hope for as to deliverance from sin and its consequences, and what he may reasonably believe as to the conditions of existence in a future world. As to this third point the view is prevalent that the light of nature discloses nothing regarding man's salration or future destiny. But does this vjew not arise from overlooking that the kiogdom of God is within, and from falsely supposing that salvation is entrance into an external, non-spiritual hearen on conditions which, being in themselves non-natnral, cannot be naturally known i The heathen hations hare certainly not supposed nature to bo wholly silent and dark on the onbject. In every developed othnic religion there is a aoteriology and eschatology as well as a theology. Man is no where necessarily without hope any moro than without God in the world. ${ }^{3}$

Theological ethics differs from nataral theology in that it seoka in nature, viewed as a Divine revelation, laws of epiritual life, not merely religious doctrines. Its place is betreen moral philosophy and Christian ethics. It is unmistakably distiact from both, and may be more plausibly includad in natural theology than in either. It ahould endeavour (1) to determine how religion and morality aro distinct and how connected ; (2) to ascertain how morality has been affected and modified by the various positive othnic religions and the various religious but non-Christian philosophies; (3) to exhibit hom the character of God, as delineated by natural theology, stands related to the moral law, the moral life, and the chiof ethical end or supreme good of man ; (4) to describe the nuties which the light of Dature ohows that man owes directly to God ; and (5) to trace how piety to God must influenco personal and eocial virtue. Unlike moral philosophy and Christian ethics, it can hardly be auid to have boen yot treatod as a separate discipline and presented as a whole. Danb and Marhoineke bsre, indeed, Fritten works mominally on Theological Norals, and Fothe and Fon Hofmann on Theological Ethics, but in all these Trorks it is really Christian ethics which is exhibited to us under certain epreculative lights. There is, however, a very extensive literature relating to particular

## ${ }^{i}$ For the literatnre on agnostlctsm, 800 above, p. 248 note 2.

Indlications as to the hletory and literatore of many particolar Qpestions ond portions of both disciplines are given in the ooles to Fliot's Theism and Antitheistic Theories. One of the best bletehes of the history of natural theology ts that in Zocklder's Theologio Naturalis. Here it may be eufficied to mentou tho follew1oc woiks:-Butler's Analogy; Paley's Natural Theology; Chalmera's Natural Theology; the Bridgencader Treatises: Thomrson's Theism: Talloch's Theism : M'Cosh's Mehiod of the Dicine Governmens: Liricl's Gas und dio Nalur: Jules Simon's Nashrol Religion (Eng. tr.) ; Janet's F'inol Causes (Eng. (T.) ; Caro'a Idie de Dicu, 5iL od. ; Gratry'e Corrainuare do Dicu, 7th ed. and Uargerlo a Theodicese, 8 d ed.
problems and portions of theological ethics. Thus कhat has beer just indicated no problem first-that es to the relation of religion and morality-has been loug much discussed. ${ }^{3}$ The second problem demands trile and close bistorical research; it has been touched at a multitude of points, but only touched. With the third problem, or rather group of problems, almost all systems of Christian ethics have to some extent dealt; and with the fourth and fifth problems almost all aystems of moral philosonlay.

We now pass to Christian theolory. Its historical section includes, besides the histories of Israel and the church (as to which gee Isbafl and Cnurch II istory), Biblical theology, the history of Christian doctrine, and Christian eymbolics.

All hermeneutical studies are auxiliary to exegesis, and all Biblical exegesis leals up to that comprehensive and connected View of the development of Biblical idens which it is the aim of Biblical theology to set forth. Biblical theology is not to be under: etood as meaning a theology founded on the Bible-Curistian dogmatics ander another name. It does not ascume that the Bible is either a source or standard of truth. It does not set forth the ideas which it exbibits as true in themsolves, but only as truly in the Bible. It seeks no other truth than truth of exposition. It aims at doing no more than giving a true account of what are the religious ideas in the Bible, of how they are related as set forth in the Bible, and of what their history has been throughout the Biblical period. Its aole business is critically to ascertain and truthfully to exhibit what Scripture teaches, what each writer, ovea, of Scripture teaches, in a purely objective, organic, historical manner. It cannot possibly be confounded with Christian dogmatics by any ons who has the slightest notion of what it is, although the latter must in great part rest on it and derive most of its materials from it. It is the ultimate direct reault and the most comprehensive and perfect prouluct of Biblical exegesis, and related to the history of retigious ideas as a part to the whole in which it is included, comparative theology preceding and the history of Christian doctrine following it. It dividea into theology of the Old Testament and theology of the New Testament; and $150^{\circ}$ mothod is one appropriate to an historical discipline, and, therefore, chronological, genetic, analytic, and aynthetic. It is a com. paratively recently conatituted departnent of theological science, both Catholic and Protustant divines having made for ages the enormous mistake of etudying Scripture-so far as their interest therein was theoretical and not practical-primarily in order to find proof of the doctrines contained in their creeds and coufessions They failed to a pprehend and appreciate the seemingly very simple thought that Scripture should be studied in the first instavice with a giaglo oyo to find out what was really in it, and that to this end the study of it should be strictly and purely exegetical and his. torical. J. Ph. Gabler, in his thesis De Justo Discrimiue Theologiss Biblicas et Dogmaticer, published in 1787, was the first clearly to ehow the true character of Biblical theology as as essentially historical atudy. Sinca then it has been cultivated $n$ ith great zeal by a host of able labourers.

The history of Christian doctrioe only began to be treated as a separate theological discipline in the latter part of the 18 th century. Proviously it was dealt with as an appendix to doge matics or as a part of church history. It is not an appendix to dogmatics, but it includes its history and contribute日 to lay a foundation for it. No doctrime can be either correctly onderstood or right!y developed where there is ignoranee of its history. The history of Christian doctrine is a part of the history of Christianity, namely, ile history of Christian beliefs, as distinguished, on tha one hand, from the history of Christian lifo and practice, and, on the other hand, from the outward history of the church. It is a part also of the history of religious thought, and of the history of thought in general, and tberefore closely connected with the history of philosophy. 1ts development must be admitted to be ruled by the general lawe of the intellectual history of maio. It may ha taken, however, in a wider or marrower sense,-in the former being the history of Christian thought and belief as auch, and iu the latter the history ouly of dogmas atrictly eo called, i.e., of doctrines formulated and promulgated by ecclesiastical anthority, and accepted either by the whole church or by large divisions of the church. There ought perhaps to bo a history of doctrines in both eenses. One in the former aense has only been undertaken recently by Ilarnack. The method of the bistory of Chistian doctrive must be strictly historical, and at the same time both analytic and syathetic, seeing that both the history of the scparatu ductrines and the gencral and connected evolution of tho doctrines require to be traced. Its periods will coincide with those of church history, but they ought to bo determined from direct examisation

of the development of the doctrines. It is incorrect, therefore, to represent the discipline as having its general distribution into periods given it by church history. ${ }^{1}$

Symbolics is the historico-comparative siudy of the dormatic systems of the various Christian commnnions, as expressed and involved in their symbolical documents. It treats of the origin, history, and contents, and relations of difference and agreement, of the rarious creeds and confessions of Christendom. It mas preceded by "polemics" and "controversial theology"-pre-scicntific and anti-scientific kinds of theology. The older so-called systematic theologies and systems of divinity-consisted largely of symbolical matter treated in an unscientific and ungenerous spirit. Christian dogmatics will never be properly purified until Christian symbolics receives intelligent and due recognition, and has relegated to it the subjects which properly belong to jt. Christian symbolics may be sail to have made ita appearance as a separate scientific discipline with Jlarheineke's Syimbolik, pnblished in 1810. The chicf reason why it appeared thus late was the difficulty of exercising in this spliere the impartiality of the true historical spirit. The arrangement cf its material is determined partly by the order of succession in which the churches appeared in history and partly by the historical importance of the different churches. "In some treatises on symbolics the symbolical system of doctrine of each church is treated separately, while in others the several doctrines of the various churches are compared together. Each of these methods has its advantages and disadvantages. Their combination is requisite." ${ }^{\prime 2}$

The psychology of Christianity may be beld to include Biblical psychology and the psychology of the Christian life. It must be admitted, however, that the right of the former to a place aunong psychological sciences is doubtiful. It is universally admitted that it ought to present what is taught in the Bible as to the origia, nature, faculties, states, processes, and fature development of the human spirit, and also elicit tho conceptions implied and preoupposed in the Biblical statements on these points. But if it do this in a merely bistorical manner, and do mothing beyond this, it must manifestly be regarded as simply a section of Biblical theology, To be entitled to bo considered a scparate psychologico-theological discipline it must at least elso discuss the questions as to the truth of the ideas relative to the huraan spirit expressed and implied in Scripture, as to their accordance with the facts of mind, and their relationship to the conclusions of ordinary scientific nsychology; and even then it may be held to be rather the result of a peculiar combination of history, apologetics, and psycholocy than a properly psychological discipline. However this may be, the study is an exceedingly intercsting one. It has had a lengtlicned history, for in almost every generation since the $2 d$ century treatisca on some of its subjects liave appeared. It was inaugurated by Melito and Tertullian, obtained in the 17 th and 18 th centuries distinct recognition under the desigrpation of "psychologia sacra" or "psycliologia e sacris literis collecta," and acquired iresh life and scientific form from tho publication of Beck's Umriss der biblischen Seclenlehre in $1843 .{ }^{s}$

The psychology of the Christian lifo is a much more comprehensive discipline than Biblical psychology, and one as to the precise place
aud scope of which no dubiety noed befelt. Its work is to elacidate all the distinctively Christian phenomena both of the individual and of the collective life. As to the former it should evolve a theory of personal Christian experience, normal and abnormal, in its purity and in its perversions. As to the latter, it bhould explain the spiritual experience of Christian society-the development of Curistian piety-in different ages, countries, and churches. For the accomplishment of the former task it will find help and material in religious poetry, religions biography and antobiography, and all other expressions and records of personal Christian experience ; and for the accomplishment of the latter in all the sources and contents of church history, although these must be used in accordance mith the psychological purposo in view. Christian psychology thus understood is a department of theology still to form. And the difficultie3 in the way of its formation must be allowed to be very great. They will only be overcome by men in whom profonad psychological scienco and insight are combined with a raro ausceptibility and richness of spiritual life.
For Christian apologetics, see Apolooetios. For Chrisciar dog. matics, mee Dogratic.

Christian dogmatics and Christian ethics are the two disciplines includad in Christian bystematic theology. They ought to be separated and cultivated apart, and yet must be recognized to be closely connected, and each the necessary complement of the other. The former sees in Christ the truta and the may thereto ; the latter sees in Him the life and the way thereto. Christian ethica is much the more recent discipline of the two, and it has not yet attained the same definiteness and homogeneousness. Alike as to method and distribution there is greater indecision and confusion. Among its earlier cultipators Nere Danrus, Calixtus, Perkins, Ames, Colville, Mosheim, Crnsius, Stäudlin, and Von Ammon. Schleiermacher may justly bo regarded as tho founder of modern Christian ethics. His superiority to his predecessors was due chiefly to his profounder apprchension of the nature of the problems of philosophical ethics, and to his comprehensive and spiritual concepfion of the kingdom of Goul as the highest good, pervasive and regulative of every sphers of human life, iudustry and art, science and plilosophy, fanily, church and state. The following may be given as a scheme of Christian ethics. I. Determination of the natnre, liniits, and method of tho scimee, and of its relations to other disciplines, and especially to those which are ethical and theological. II. Presunpositions of the science: these are-(1) the ethical idea of God as revealed in nature and in Christ ; (2) man as a moral being and in his relaiion to tho law and revelation of God; (3) creation and prorideuce as etinical systems; and (4) the king. dom of God in itself, in relation to creation and providence, and as tho goal of moral life. III. The fundamental conceptions of the science: these are-(1) tho Christian ethical lars; (2) the Christian conscience; (3) the Christian ethical ideal ; and (4) Christian virtue. IV. The reign of sin in tho individual and society viewed in the light of Christianity. V. The origin and progress of the kingdom of God in tho individual soul, and ita manifestation in the virtues and graces of the Christian character. VI. The realization of the kingdom of God in the various spheres o society-the family, the clurch, the nation.
(F. F.)

THEOPHILUS. Nicholas Alemanni, in his notes to the first edition of the Anecdota of Procopius (see Procopics), published in 1623 , repeatedly quotes a Life cf Justinian, which he attributes to "Theophilus Abbas, preceptor Justiniani," but without telling us where he found this Life or who Theophilus was. Subsequent writers have continued to quote Theophilus from Alemanni's notes for the facts ascribed to him in those notes, and, among others, for the name Uprarda, said to have been the original name of Justinian, and other proper names of members of the family of that emperor. Mr Bryce has, since the article Justinian was published, discovered in the Barberiai library at Rome what appears to be the MS. of the so-called Life of Justinian used by Alemanni. It is in Latia, and purports to be an extract made by Iran

[^116]Tomeo Marnavich, a Croatian ecclesiastic (1573-1639): from a Life of Justinian by a certain Bogomil (Græcє Theophilus), who is alleged to have been the instructor of Justinian, and abbot of St Alexander at Prisrend (in Macedonia), and afterwards bishop of Sardica (now Sofia in Bulgaria), the original of which Life, in Slavonic, is stated in the Barberini J1S. to exist in the Slavonic monastery of Basilian monks on Mount Athos. No such Slavonic MIS. (so far as is known) bas ever been discovered in Athos or elsewhere; no Slaronic MS. of the age of Justiaian could possibly exist; and the contents of the Latin extract preserred at Rome are of so legendary a character as to throw the greatest doubt on the facts cited from Theophiius by Alemanni, including the name Upravda abore referred to, and the Slavonic origin of Justinian. It seems doubtful whether this Theophilus Abbas, whom

[^117]the I. man MS. identifies with a certain Domnio, bishop of Sardica in 517 (see Marcellinus Comes, Chernicon, ad ann. 51\%), ever existed at all. Mr Bryce has printed this Roman MS., with his observations thereon, in the Avchivio Storico of the R. Società Romana di Storia Patria, IS87.

THEOPHRASTUS, the successor of Aristotle in the Peripatetic schools was a native of Eresus, in Lesbos. The date of his birth is a matter of inference, and has been fixed between 373 and 368 B.c. It is said that his original name was Tyrtamus, and that the name Theophrastus was given him by Aristotle on account of his eloquence, but this story is quite as likely to be an afterthought suggested by the name at a later date. After receiving his frst introduction to philosophy in Tesbos from one Leucippus or Alcippus, he proceeded to Athens, and became a member of the Platonic circle. After Plato's death he attached himself to Aristotle, and in all probability accompanied him to Stagira. The intimate friendship of Theophrastus with Callisthenes, the fellow. pupil of Alexander the Great, the mention made in his will of an estate belonging to him at Stagira, and the repeated notices of the town and its maseum in the IIistory of Plants aro facts which point to this conclusion. Aristotle's affectionate confidence in his pupil and friend is proved by his making Thcophrastus guardian of his children in his will, and designating him as his philosophic successor at the Lyceum on his own removal to Chalcis. Eudemus of Rhodes was not without claims to this position, but the master, according to the well-known story, delicately indicated his preference by the remark that the wines of Lesbos and Rhodes were both excellent, but the Lesbian was the sweeter. Aristotle also bequeathed to Theophrastus his library and the originals of his own works. Theophrastus presided over the Peripatetic school for thirty-five ycars, and died in 288 e.c. Under his guidance the school flourislzed greatly in point of numbers, and at his death he bequeathed to it his garden with house and colonnades as a permanent seat of instruction. His popularity was also shown in the regard paid to him by Cassander and Ptolemy and by the completo failure of a charge of impiety brought against him. He was honoured with a public funeral, in which the whole people took part.

Theophrastus's philosophical relation to Aristotlo and his place in the development of Peripatetic doctrine have been sketched noder the head Peripatetics. It remains to say a few words abont his works Froun the lists of the ancients it appears that the activity of Theophrastus extended over the whole field of contemporary knowledgo. Logical, physical, biological, psychological, ethical, political, Thetorical, and metaphysica! treatises are mentioned, most of which probably differed little from the Aristotelion treatment of the same thencs, though supplementary in details, Oo the whole, Theophrastus seenis to have developed by preferenco the observational and scientific side of his mastor, and of this character are the books and fragments that have come down to us. The most important of these are two large botanical treatises, On
 ten), and On the Causes of Plants ( $\pi \in \rho$ l $\phi$ vī̀v airtêv), in six hooks (originally eight). These constitute the mest important contribu• tion to botanical seience till we come to modem tinies, and furnish proof of the author's extrasive and careful nbservation combined with a cousiderable critical saracity. We also possess fragments of a History of Physics, a fragmentary treatise On Slones, a work On Sensation ( $\pi$ epl aioend $\sigma \in \omega s$ ) in the same condition, certain metaphysica! ȧmopiat, which probably oace forned part of a systematic treatise, and the well-known Ethical Characters (ñorsol xapaктn̄pes), containing a delineation of moral types, probably an extract or compilatiou by a later hand from a larger ethical work of Theo. phrastus. Various smaller scientific fragments have been collected in the editions of J. G. Schneider (1818-21) and F. Wimmer (1886) and in Usener's Analecta Theophrastea.
THEOPIYLACT, a well-known Biblical comnentator, was born most probably at Euripus, in Eubœa, about the middle of the 11 th centurj. He became a deacon at Constantinople, and attained a bigh reputation as a scholar, as is shown by the fact that he became the tutor of

Constantine Porplayrogentus, son of Michael VII., for
 went into Bulgaria as archbishop of Achris. In his retter he complains much of the rude manners of the Bulgarians, and he sought to be relieved of his office, but apparently without success. His death took place after 1107
His commentaries on the Gospels, Acts, the Pauline episties, aod the Minor Prophets are founded ou those of Chrysostom, but deserve the considerable place thoy hold in exenetical literature for their appositeaess, sobriety, aceuracy, and judiciouspess. His other extant works include seventy-five letters and various hoanilies and orations and other miner pieces. A splendid edition of the whole in Greek and Latin, with a preliminary dissertation, was rublished in 1754-63 by J. F. B. M. de Rossi (4 vols. fol., Venice).

THEOPHYLACT of Simocatta. Sce vol. iv. p. 613.
THEOPOMPUS of Chios, a celebrated historian and rhetorician, was born abont 378 b.c. In early youth he seemseto have spent some time at Athens, along with his father, who had been exiled on account of his Laconian sympathies. Here he becamo a pupil of Isocrates, and rapidly made great progress in rhetoric: we are told that Isocrates used to say that Ephorus required the spur but Theopoupus the bit (Cic., Brutus, § 201). At first he appears to have composed epidcictie speeches, in which he attained to such proficiency that in $352-35$ ! he gained the prize of oratory given by Artemisia in honomr of her husband, although Isocrates was himself anoong the competitors. It is said to have been the advice of his teacher that finally deternined his career as an Listorian, - a career for which his abundant patrimony and wide knowledge of men and places (Fr. 26) had singularly fitterl him. Through the influence of Alexander; he was restored to Chios about 333 , and figured for some time as one of the boldest and most uncompromising leaders of the aristocratical party in his native town. After Alexander's death he was again expelled, and took refuge with Ptolemy in Egypt, where he appears to have met with a somewhat cold reception. The date of his death is unknown.
The works of Thcopompus were chinfly historical, and later writers frequently cite them as authorities. They inclucied an
 iotopiat), tho History of Philip (\$ıגıлтıкá), and several panegyrics and hortatory addresses, the chief of which was the Letler to Alexander. The genuineness of the epitome of lierodotns has been called in question; wo possess only five quotations from it, preserved by grammarians or lexicographers, and consisting only of single words. The Hellenics was a somewhat ambitious work in 12 books, extenting from 411 (where Thucydides breaks off) to 394 -the date of the battle of Caidus. A few insignificant fragmeuts remain, but do not suffice to give us any idea of the geoeral character of the work. By far the most ambitions history written by Theopompus was the $\Phi$ intratкá. Ia this he narrated the history of Philip's reign (360-336) in 58 books, with frequent digressions on the names and customs of the various races and conntries of which he had occasion to speak. So unmerous were these digressions that Philip 1II. of JIacerlon reducel the bulk of tho history from 58 to 16 books by cutting out those parts which had mo connexion with the achievements of the king. It wes from this history that Diodorus and Trogus Pompeius derived much of their materials. Several fragments, chicfly ancedotes and strictures of varions kinds upon the character of mations and individuals, are preserved by Athemeus, Plutarch, and others. Of the Leller to Alcurander we possess one or two fragments cited by Atheweus, animalverting severely upen the immorality and diss! pations of Harpalus. The Attack upun Plato, an 1 the trentise On Piety, whith aro sometimes referred to as separate works, were perhaps only two of the many digressions in tho history of Philip; sonie writers have dothted the ir authenticity.

The nature of the extant fragnent fully bears ont the criticisms of antiquity upon Theopompus. Their style is clear and pure, full of choice and poiated expressions, but lacking in the weight and dignity which only profomm thought cau supply. As we might expect in a pupil of Isocrates, he is especially careful to avoid biatus. The artistic unity of his work suffered severely from tbe frequent episodes with which it was interspersed; his account of Sicily, for example, extended orer several books. Another fault was his excessive fonduess for romentic and incredible stories (Fr. 33, 66, 76, \& .) ; a collection of some of these was afterwards made aud published uader his name, with the title of Oavudora
(Diog. Laert., 1. 115). He was also severely blamed in antiquity for his censoriousness, and throughout his fragments no feature is more striking than this (Fr. 54, 65, \&ic). On the whole, however, he appears to have been fairly impartial. Philip himself he censures sererely for drunkenness and immorality (Fr. 136, 178, 262, 298), while Demosthenes receives his warul praise (Fr. 239, 263). There can be no doubt that in the Philippica the world has lost a great rariety of pleasant cales and historians much valuable information upon many difficult points of Greek history and life.

See Mäller, Fragmenta Kisfoyicorum Grecorum, 1. 278-333, Parl9, 1385.
THEORBO. See LUTE, vol. xv. p. 71.
THEOSOPHY, as its derivation implies, is a term used to denote those forms of philosophic and religious thought Which claim a special insight into the Divine nature and its constitutive moments or processes. Sometimes this rnsight is claimed as the result of the operation of some nigher faculty or some supernatural revelation to the individual ; in other instances the theosophical theory is not hased upon any special illumination, but is simply put forward as the deepest speculative wisdom of its author. But in any caso it is characteristic of theosophy that it starts with an explication of the Divine essence, and endeavours to deduce the phenomenal universe from the play of forces within the Divine nature itself. It is thus differentiated at once from all philosophic systems which attempt to rise from an analysis of phenomena to a knowledge more or less adequate, of the existence and nature of God. In all such systems, God is tho terminus ad quem, a direct knowledge of whom is not claimed, but who is, as it were, the hypothesis adopted, with varying degrees of certainty in different thinkers, for the explanation of the facts before them. The theosophist, on the other hand, is most at his ease when moving within the circle of the Divine essence, into which be seems to claim absolute insight. This, howerer, would be insufficient to distinguish theosophy from those systems of philosophy which are sometimes called "speculative" and "absolute," and which also in many cases proceed deductively from the idea of God. In a wide sense, the system of Hegel or the system of Spinoza may be cited as examples of what is meant. Both thinkers claim to exhibit the universe as the erolution of the Divine nature. They must believe, therefore, that they have grasped the inmost principles of that nature: so much is involved, indeed, in the construction of an absolute system. But it is to be noted that, though there is much talk of Cod in such systems, the known universe-the world that now is-is nowhere transcended; God is really no more than the principle of unity immanent in the whole. Hence, while the accusation of pantheism is froquently brought against these thinkers, the torm theosophical is nover used in their regard. A theosophical system may also bo pantheistic, in tendency if not in intention; but the transcendent character of its Godhead definitely distinguishes it from the speculative philosophies which might otherwise seem to fall under the same definition. An historical surrey shows, indeed, that theosophy generally arises in connexion with religious nceds, and is the expression, of religious convictions or aspirations. Now the specifically religious consciousness is not pantheistic in any naturalistic sense; God is rather regarded as the trauscendent source of being and purity, from which the individual in his natural state is alienated and afar off. Theosophy accepts the testimony of religion that the present world lies in wickedness and imperfection, and faces the problem of speculatively accounting for this state of things from the nature of the Godhead itself. Theosophy is thus in some sort a mystical philosophy of the existence of evil; or at least it assumes this form in some of its most typical representatives.

The name with which it is oftenest cour led is mysticism (see Mysticism). The latter term has properly a practical rather than a sueculative reference; but it is currently
applied so as to include the systems of thought on which practical mysticism was based. Thus, to take only one prominent example, the profound speculations of Meister EckHart (q.v.) are always treated under the head of Mysticism, but they might with equal right appear under the rubric 'Cheosophy. In other words, while an emotional and practical mysticism may oxist without attempting philosophically to explain itself, speculative mysticism is almost another name for theosophy. There is still a certain difference observable, however, in so far as the speculative mystic remains primarily concerned with the theory of the soul's relation to God, while the theosophist gives his thoughts a wider scope, and frequently devotes himself to the elaboration of a fantastic philosophy of nature.

In the abore acceptation of the term, the Neoplatonic doctrine of emanations from the supra-essential One, the fanciful emanation-doctrine of some of the Gnostics (the æons of the Valentinian system might be mentioned), and the elaborate esoteric system of the Kabbalah, to which the two former in all probability largely contributed, are generally included undor the head $c_{i}^{f}$ theosophy. In the two latter instances thero may be noted the allegorical interpretation of traditional doctrines and sacred writings which is a common characteristic of theosophical writers. Still more typical examples of theosophy are furnished by the mystical system of Meister Eckhart and the doctrine of Jacob Boemme (q.v.), who is known as "the theosophist "par excellence. Eckhart's doctrine asserts behind God a predicateless Godhead, which, though unknowable not only to man but also to itself, is, as it were, the essence or potentiality of all things. From it proceed, and in it, as their nature, exist, the three persons of the Trinity, conceived as stadia of an eternal self-revealing process. The eternal generation of the Son is equivalont to the eternal creation of the world. But the sensuous and phenomenal, as such, so far as they seom to imply independence of God, are mere privation and nothingness; things exist only through the presence, of God in them, and the goal of creation, like its outset, is the repose of the Godhead. The soul of man, which as a microcosmos resumes the nature of things, strives by self-abnegation or self-ancihilation to attain this unspeakable reunion (what Eckhart calls being buried in God). Regarding evil simply as privation, Eckhart does not make it the pivot of his thought, as was afterwards done by Boehme, but his notion of the Godhead as a dark and formless essence is a favourite thesis of theosophy. The followers of Eckhart are either practical mystics, or reproduce at most what may be called their master's speculative theology, till we come to Boehme.

Besides mystical theology, Boehme was indebted to the writings of Paracelsus. This circumstance is not accidental, but points to an affinity in thought. The nature philosophers of the Renaissance, such as Nicholas of Cusa, Paracelsus, Cardan, and others, curiously blend scientific ideas with speculative cotions derived from scholastic theologyं, from Neoplatonism, anu eren from the Kabbalah. Hence it is customary to speak of their theories as a mixture of theosophy and physics, or theosophy and chemistry, as the caso may be. Boehme offers us a natural philosoplyy of the same sort. As Boehme is the typical theosophist, and as modern theosophy has nourished itself almost in every case, upon the study of his works, his dominating conceptions supply us with the best illustration of the general trend of this mode of thought. His speculation turns, as has been said, upon the necessity of reconciling the existence and the might of evil with the existence of an all-embracing and all powerful God, without falling into Nanichæanism on the one hand, or, on the.
other, into a naturalistic pantheism that denies the reality of the distinction between good and evil. He faces the dificulty boldiy, and the eternal conflict between the two may be said to furnish bim with the principle of his philosophy. . It is in this connexion that he insists on the necessity of the Nay to the Yea, of the negative to the positive. Eckhart's Godhead appears in Boehme as the abyse, the eternal nothing, the essenceless quiet ("Ungruad" and "Stille ohne Wesen" are two of Boehme's phrases). But, if this were all, the Divine Being would remain au abyss dark even to itself. In God, however, as the condition of His manifestation, lies, according to Boehme, the "eternal nature" or the mysterium magnum, which is as anger to love, as darkness to light, and, in general, as the negative to the positive. This principle (which Boebme often calls the evil in God) illuminates both sides of the antithesis, and thus contains the possibility of their real existeace. By the "Qual" or torture, as it were, of this diremption, the universe has qualitative existence, and is knowable. Even tho three persons of the Trinity, though existing idealiter beforehand, attain reality only through this principle of nature in God, which is hence spoken of as their matrix. It forms also the matter, as it were, oat of which the world is created; without the dark and fiery priaciple, we are told, there would be no creature. Hence God is sometimes spoken of as the father, and the eternal nature as the mother, of things. Creation (which is conceived as an eternal process) begins with the creation of the angels. The subsequent fall of Lucifer is explained as his surrender of himself to the principle of nature, instead of dwelling in the heart of God. He sought to make anger predominate over love ; and he had his will, becoming prince of hell, the kingdom of Cod's anger, which still remains, however, an integral part of the Divine universe. It is useless to follow Boebme further, for his cosmogony is disfigured by a wild Paraceisian symbolism, and his constructive efforts in general are full of the uncouth straining of an uutrained writer. In spite of these defects, his speculations have exercised a remarkable influence within the present century, notably upon the later phases of Schelling's philosophy, upon Franz von Baader, Molitor, and others. : Sclelling's Philosophical Inquiries into the Nature of IIuman Freedom (1809) is almost entirely a reproduction of Boehme's ideas, and forms, along with Baadcr's writings, the best modern example of theosophical speculation. In his philosophy of identity Scherime (q.v.) had already defined the Absolute as pure indiffereace, or the identity of subject and object (of the ideal and the real), but without advancing further into theogony. He now proceeded to distinguish three moments in God, the first of which is the pure indifference which, in a conse, precedes all existeace-the primal basis or abyss, as he calls it, in agreement with Boehme. But, as there is nothing before or besides God, God must have the ground or cause of His existence in Himself. This is the second moment, called nature ia God, distioguishable from God. but inseparable from Him. It is that in God which is not God Himself ; it is the yearning of the eternal One to give birth to itself. This yearning is a dumb uointelligent longing, which moves like a heaving sea in obedience to some dark and indefinite law, and is powerless to fashion anything in permanence. But in correspondence to the first stirring of the Divine existence there awakes in Cod Himself an inner reflexive perception, by means of which-since no object is possible for it but God-God beholds Himself in His own image. In this, Cod is for the first timo as it were realized, although as jet only within Himself. This perception combines as understanding with tho primal yearning, which becomcs thereby free creative will, and

Frorks formatively in the originally larless natare or ground, In this wise is created the world as we know it. In every natural existence there are, therefore, two principles to be distinguished-first, the dark principle, through which this is separated from God, and exists, as it were, in the mere ground; and, secondly, the Divine principle of understand, ing. The first is the particular will of the creature, the second is the universal will. In irrational creatures the particular will or greed of the individual is controlled by external forces, and thus used as an instrument of the universal. But in man the two principles are consciously prcsent together, not, however, in insoparabls union, as they are in God, but with the possibility of separation. This possibility of separation is the possibility of good and evil. In Boehme's spirit, Schelling defended his idea of God as the only way of vindicating for God the conscious ness which naturalism denies, and which ordinary theism emptily asserts. This theosophical transformation of Schelling's doctrine was largely due to the influence of his contemporary Basder (q.v.). Baader distinguishes, in a manner which may be paralleled from Boehme, between an immanent or esoteric process of self-production in God, through which He issues from His unrevealed state, and the emanent, exoteric, or real process, in which God overcomes and takes up into Himself the eternal "nature" or the principle of selfhood, and appears as a Trinity of persons. The creation of the world is still further to be distinguished from these two processes as an act of freedom or will ; it cannot, therefore, be speculatively constructed, but must be historically accepted. Baader, who combined bis theosophy with the doctrines of Roman Catholicism, bas had many followers. Among thinkers on the eame lines, but more or less independent, Molitor is perkaps the most important. Swedenbora (q.v.) is usually reckoned among the theosophists, and some parts of his theory justify this inclusion; but his system as a whole has little in common with those speculative constructions of the Divine nature which form the essence of theosophy. as strictly under, stood.
( A .8 se .)
THERA, or, as it is now called, SANTokin, is a volcani¢ island in the Æigean Sea, the southernmost of the group of islands, called Sporades, which intervene between the Cyclades and Crete. From the last-named island it is separated by a space of 60 miles of sea, but the lofty Cretan ranges of Dicte and Ida are clearly visible from it in fine weather In shape Saatorin forms a crescent, and encloses a bay on the north, east, and south, while on the western side lies the smaller island of Therasia. The encircling wall thus formed, which is elliptical in shape and 18 miles round in its inner rim, is
 Ther rim, is Thera and neighbouring 1slards. broken in two places,-towards the north-west ty a strait a mile in breadth, where the water is not less tias 1100 feet deep, and towards the south-west by an aperture about

3 miles wide, where the water is shallow, and an island called Aspronisi or White Island, lying in the middle, serves as a stepaing-stone between the two promontories. The cliffs rise perpendicularly from the waters of the bay, in some'places to the height of 1000 feet; but towards the open sea, both in Santorin and Therasia, the ground slopes gradually away, and has been converted into broad level terraces, everywhere covered with tufaceous agglomerate, which, though extraordinarily bare and ashen to the eye, is the soil which produces the famous Santorin wine. Towards the south-east rises the limestone peak of Mount Elias, the highest point of the island ( 1887 feet), and the only part that existed before the volcano was formed. In the middle of the basin lie three small islands, which are the centre of volcanic activity, and are called Palæa, Mikra, and Nea Kaumene, or the Old, the Little, and the New Burnt Island ; the lighest of these, Nea Kaumene, is 351 feet above the sea-level. Owing to the depth of the water there is no anchorage, and vessels have to be moored to the shore, except at one point in the neighbourhood of the modern town, where there is a slight rim of shallow bottom. The cliffs both of Sautorin and Therasia present an extraordinary appearance, being marked in horizontal bands by black lava, white porous tufa, and other volcanic strata, some parts of which are coloured dark red. The modern town of Thera (or Phera, as it is more commonly pronounced) is built at the edge of these, overlooking the middle of the bay at a height of 900 feet above the water, and the houses of which it is composed are themselves peculiar, for their foundations, and in some cases their sides also, are excarated in the tufa, so that occasionally they are hardly traceable except by their chimneys; and, owing to the absence of timber,-for, with the exception of the fig, the cactus, and the palm, there are hardly any trees in the island,-they are roofed with barrel vaults of stone and cement. Both wood and water have occasionally to be imported from the neighbouring islands, for there are no wells, and the rain water, which is collected in numerous cisterns, does not always suffice. The largest of the other towns or villages is that of Apanomeria, near the northern entrance, which is crowded together in a white mass, while the rocks below it are the rededest that are seen in the island.
Santorin has from the earliest times been a centre of volcanic agency, and is closely connected with the earthquake movements to which the countries in the neighbourhood of the Egean are subject, and which have been the chief causo of the destruction of the public buildings of ancient Greece. It is hardly accurate to speak of the basin which forms the harbour as a crater, for most goologists, including Lyell, aupport the view that the whole of this, epace was once covered by a single voleanic cone, the incline of which is reprcsented by the outward elope of Santorin and Therasia, While the position of the crater was that now occupied by the Kaumene Islands; and that, at some remote period, owing to the sinking of the strata beneath, the central portion of this, extending over an area which a French writer compares with that included within the fortifications of Paris at the time of the siege, fell in, by which convulsion the basin was formed. The principal eruptions that have taken place within historic times are that of 196 n.c., When, as we learn from Strabo (i. $3, \$ 16$, p. 57 ), flames rose from the water halfway between Thera and Therasia for four days, and the island of Palæa Kaumene was ejected; that of 726 A.D., during the reign of the emperor Leo the Isaurian, when an addition was made to that island, and the pumice-stone that was cast forth was carried by the waves to the shores of Asia Minor and Macedonia; that of 1573, when Mikra Kaumene appeared; that of 1650, a foarful eruption, which deatroyed many lives by its nozious exhalations, and ended in the upheaval of an island in the sea to the north-east of Santorin, which afterwards subsided and became a permanent reef below the ees-lovel; that of 1707, when Nea Kiumene arose; and, within the recollection of the present generation, that of 1866.
Santorin and Therasia have been recently the scene of a remarkfible archæological discovery. In the southern parts of both those islands prehistoric dwellings have been found at some height above the sea, and there is no reasonable canse to doubt that these date
from a period autecedent to the falling in of the crater and the formation of the bay. This is proved by their position underncath the layer of tufa which covers the islands, and, moreover, hy these layers of tufa being broken off precipitously, in the same way as the lava-rocks, a fact which can ouly be explained hy the supposition that they all fell in together. The foundations of the dwellings rested, not on the tufa, but on the lava below it; and here and there between the stones branches of wild olive were found, accord. ing to a mode of building that still prevails in the island, in order to resist the shocks of earthquakes. Part of the skeleton of a man was discovered, and largo vases, some containing grain, othera stone instruments very carefully worked. Some of these vases were of fine yellowish earth, ornamented with brown bands; some, of smaller size, were more elaborately decorated, sometimes with lines representing foliage, and in a few instances with figures of animals; some were of red earth, without ornament; while others, of pale red earth, were of very large dimensions. No implements of metal were found. Naturally it has been the subject of much discussion what was the origin of this very primitive art. The late ML. Dumont, who was the leading authority on the subject (Les Céramiques de la Grèce Propre, pp. 74, 75, 209), though speaking with great caution on account of the insufficiency of the evidence, iuclined to the belief that it was partly derived from Phonician influence, but at the same time that there were evident traces of uative originality. Comparing it in respect of date with the other prehistoric developments of art in the neighbourhood of the Egesn, he would place it later than that of Hissarlik, but earlier than those of Ialysus in Rhodes, and of Mycenæ.

In Greek legend the island of Thera was connected with the story of the Argonauts, for it was represented as sprung from a clod of earth which was presented to those heroes by Triton (Apollon., Argonaut., iv. $1551 \mathrm{sq} ., 1731 \mathrm{sq}$.). According to Herodotus (iv. 147), a Phœenician colony was established there by Cadmus-a story which proves at least the belief that there was an early settlement of that race in the island. It has even been conjectured (see vol. xviii. p. 806) that the alphabet was introduced into Greece, not, as was commonly believed, throurh Thebes, but by way of Thera. Subsequently, we are told, a colony from Sparta, including some of the Minyæ, was led thither by Theras, who gave the island his own name, in place of that of Calliste which it had borne before. But the one event which gave importance to Thera in ancient history was the planting of its famous colony of Cyrcne on the north coast of Arrica by Battus in 631 B.c., in accordance with a command of the Delphic oracle. The ancient capital, which bore the same name as the island, has been identified by an inscription as occupying a site on the eastern coast called Mesa-Vouno, between Mount Elias and the sea. The other remains of the classical period consist of walls and tombs, together with several herod or small shrines, one of which, now dedicated to St Nicholas Marmorites, who is so called in honour of his marble structure, is an almost unique specimen of a perfoct Greek temple, for even the roof remains intact. After the fourth crusade, when the Byzantine empire was partitioned among the Latins, this island formed a portion of the duchy of the Archipclago; and it was at this period that it received the name of Santorin, i.e., St lrene, after the patron saint of the place, to whom Tournefort mentions that in his time nine or ten chapels were dedicated. 'At the present day Santorin is in a prosperous condition, for, in addition to the wine trade, which is highly remunerative, there is a large export of pozolana, which has been much used for the works at-Port Said in connexion with the Suez Canal, since, when mixed with lime, it forms a very hard cement which resists the action of the sea.
General information with regard to the Thera groap will be found in Ross's Inselfeisen, and in Lieut. Leycester's paper in vol. xx. of the Journal of the $R$. Geogr. Soc,; a very complete aecount of the scientific phenomens is given in Fouqués Saztorin et ses Eruptions. On the prehistoric antiquities, Lenormant, Revue Archeologigue, new ser., vol. Xir, and Fouqqé, Archires des M/issions, 2 d

account fo given in Mr Bent's Cylades.

THERAMENES, an Athenian who played a prominent part in the history of Athens towards the close of the Peloponnesian War and in the revolution which followed it. He was one of the conspirators who, in 411 B.c., abolished the democracy at Athens, and substituted the oligarchy of the Four Hundred. The adhesion of the army in Samos to the democracy, however, created dissensions among the oligarchs at Athens. Theramenes supported the more moderate section, and was the chief means of destroying a fortress which the extreme section had been building at the mouth of the harbour, ostensibly as a protection against any violent movement on the part of the democrats, at Samos, but really, according to Theramenes, to admit the encmy. He further accused Antiphon and Archeptoles mus, members of the extreme oligarchical party, whul
aceording to Lysias, had been his own intimate friends, and sccured their capital punishment. In 410 Theramenes commanded one of the three squadrons of the Athenian fleet in the victory over the Spartans at Cyzicus. In 409 he took part in the siege of Chalcedon and the capture of Byzantium. At the battle of Arginuse in 406 he was one of the officers deputed by the generals in command to pick up the crews of the disabled ships; but the rescue mas not effected, on account, it seems, of the storm. Nevertheless, on his return to Athens, Theramenes took a leading part in accusing and procuring the condemnation to death of the generals for neglecting to rescue the men. When Athens was besieged by the Peloponnesians, Therainenes conducted the negotiations for surrendering the city, traitorously prolonging them till starvation compelled the Athenians to accept the rigorous terms imposed by Sparta. After the surrender he formed one of the notorious Thirty who, backed by a Spartan garrison, misgoverned Athens. But by opposing their excesses he incurred their suspicions, and, being denounced by Critias, the most violent of the Thirty, be was, in defiance of the forms of law, put, to death (404). He submitted to his fate with a fortitude which won the admiration of his contemporaries and of posterity, and which might well have graced the close of a better life. His ability and eloquence are recognized by Thucydides, and Aristotle is said by Plutarch (Nic., 2) to have reckoned him one of the three best patrints of Athens. This latter judgment is not borne out by the facts as we know them. Rather Theramenes appears as a selfish and faithless trimmer, who deserved his nickname Cothurnus (a boot which fitted either foot).

The chief authorities for his life are Thucydides, viii.; Xenophon, Hellenica, i., ii. ; Lysias, Contra Erat. ; Diodorus, xiii., xiv.

THERAPEUTÆ. See Monachism, vol. xvi. p. 698.
THERESA, St (1515-1582). Teresa de Cepeda, perhaps the favourite saint of modern Spain, was born at Avila, in Old Castile, on the 28th of March 1515, -at the rery time, adds her biographer, " when Luther was secreting the poison which he vomited out two years later." She was one of a large family-eight sons and three daughters. Her father was a Spanish gentleman of good family, whose time was chiefly occupied with devotional reading and works of charity. Teresa's mother, his second wife, was a beautiful woman, confined generally to a sofa by delicate health. From her her danghter appears to have inherited both delicacy of health and a remarkably susceptible imagination. She delighted in the books of knight-errantry which abounded in the library, and Fier children sat up at night in their nursery over the same romances. But Teresa's imagination was judiciously diverted by ber father to another form of heroism. She was soon as deep in the histories of the martyrs as she had been in the tales of chivalry. She learned from these histories that martyrs passed straight to heaven without any detention in purgatory ; and, being eminently practical as well as imaginative, she reselved to secure that blessing for herself. When she was seven years old, she started uff with her little brother to go and seek martyrdom in the country of the Moors. They had reached the bridge on the stream which runs through the town, when an uncle met them and brought them back. Balked thus of their desire, they played at hermits, making themselves cells in the garden, and giving array their pocket-money to beggars. Teresa lost her mother early, and as she grew up the vanities and flirtations of a pretty girl took the place of these pious imaginations. Her father deemed it best to send her to be educated in an Augustinian convent in the torn, but without any thoughts of her adopting a religious life. She would probably have married like her sisters, had it not been for an attack of illness. She was
sent a way for change of air on a visit to one of her sisters, and on her way home spent some days with a saintly uncle, who was on the ere of entering a monastery, and who strongly urged her to withdraw from the world. Her father was greatly opposed to the step, but Teresa was not to be turned from what she conceived to be her duty. She was only eighteen when she left home ons morning, and applied for admission at the Carmelite convent of the Incaruation. She was disappointed at first at the slackness of discipline. The sisters mixed frecly in the society of Avila, receiving visits and returning them, and often absenting themselves from the cloister for months at a time. For the first three years she was constantly subject to attacks of sickness, fainting fits, and paroxysms of pain, but she prayed to St Joseph, after which she became comparatively better, though her nervous system was completely shaken. But she appears afterwards to have accommodated herself with tolerable success to the worldliness of her environment, though not without intervals of religious misgiving. "For twenty years," she says, "I was tossed about on a stormy sea in a kretched condition, for, if I had small content in the world, in God I had no pleasure. At prayer time I watched for the clock to strike the end of the hour. To go to the oratory was a rexation to me, and prayer itself a constant effort." At one time she abandoned prayer altogether, as she found it impossible to fix her thoughts, and she abhorred the hypocrisy of mechanically repeating a fortu of words. It was in the year 1554 (her noviciate daind from 1534), when she was thus nearly forty, that the event known as her conversion took place, and the second part of her life began. The death of her father roused her to serious reflexion, and one day, as she entered the oratory, she was struck by the image of the wounded Christ, placed there for an approaching festival. The blood was depicted as streaming over the face from the thorns and running from the side and the hands and feet. The spectacle of suffering pierced Teresa's breast; she fell in tears at the feet of the figure, and felt every worldly emotion die within her, The shock threw her into a trance, and these trances, accompanied by visions, recurred frequently in the subse. quent part of her life. They hare since been adduced as Divine attestations of her saintship, but the sisterbood in the conrent set them down to possession by a deril ; ber new departure was due in their eyes to no worthier motive than the desire to be peculiar and to be reputed better than other people. Teresa herself was very humble, and thought their explanation might be true; she took ber case to her confessor and to the provincial-general of the Jesuits. The latter put her under a course of discipline: she was to flog herself with a whip of nettles, to wear a haircloth plaited with broken wires that would tear the skin, and to meditate daily on the details of Christ's passion. One day, while thus occupied, her trance came upon ber, and she heard a voice say, "Thou shalt have nu more converse with men, but with angels." After this the trance or fit always returned when she was at prayers, and she felt that Christ was close to her. Presently she was able to see him, "exactly as he was painted rising from the sepulchre." Her confessor directed her to exorcise the Ggure, and she obeyed with pain, but, it is needless to say, in rain. The visions grew more and more vivid. The cross of her rosary was snatched from lier hand one dey, and when returned it was made of jewels more brilliant than diamonds, visible, bowever, to Ler alone. She had often an acute pain in her side, and fancied that an angel came to her with a lance tipped with firc, which he struck into ber heart. The 27th of August is kept sacred io Spain to this mystery, which has also formed a favourite subject of Spanish painters: it forms the frontispiece of
XXIII. - ${ }^{6} 6$
the biography which is put into the hands. of Catholics. 'She had also visions of another description: she was shown hell with its horrors, and the devil would sit upon her breviary, belabour her with blows, and fill her cell with imps. For several years these experiences continued, and the verdict as to their source still remained far from unanimons. Meanwhile, on the broad stage of the world, the Reformation continued to spread and establish itself; and this great falling away became the subject of much searching of hearts to pions Catholics. Tepesa reflected like the rest, and her experience led her to find the real cause of the catastrophe in the relaxation of discipline within the religious orders. If the ancient rules' could be restored, it appeared to her that the evil might be stemmed; and she formed the project of founding a house In which all the original rules of the Carmelite order before its relaxation would be observed. She met, not unnaturally, with great opposition from the authorities of the order, and in particular from the prioress and sisters of the Incarnation, who looked upon the step as a reflexion upon themselves. Nevertheless, she persevered with her scheme, being encouraged to appeal to the pope by certain priests who saw the benefit which would accrue to the church from ber zeal. A private house in Avila was secretly got ready to serve as a small convent, and, when the bull arrived from Rome, Teresa went out on leave from the Incaruation and installed fuur poor women in the new house dedicated to her patron St Joseph. It was on the 24 th of August 1562 that mass was said in the little chapel and the new order constituted. It was to be an order of Descalzos or Barefoots, in opposition to the relaxed parent body, the Calzados. The sisters were not to be literally shoeless, but to wear sandals of rope; they were to sleep on straw, to eat no meat, to be strictly confined to the cloister, and to live on alnis without regular endowment. After lodging lier four sisters, Teresa returned to the Incarnation, as in duty bound; but, when the secret was discovered, Carmelites and townspeople were alike furious. Yiolence, however, was prevented, and the inatter was referred to the council of state at Madrid. Philip II. referred it again to the pope, and after six months a fresh bull arrived from Pius V. The provincial of her order now gave her leave to remove and take charge of her sislerhood. The number of thirtecn, to which on grounds of discipline she had limited the foundation, was soon filled up, and Teresa spent here the five happiest years of her life. Her visions continued, and, by cominand of her ecclesiastical superiors, slie wrote her autobiography containing a full account of these experiences. She hersalf, however, profoundly as she believed in their reality, saw the danger which attachos to such experiences, and was far from basing any claim to holiness upon thein. One of her visions about this time is interesting as illustrating what is called her mysticism. She fancied that she was a mirror withont frame and without dimensions, with Christ shining in the centre of jt, and the mirror itself, she knew not how, was in Christ. Teresa was now encouraged to carry her work still further, for the chureh was girding itself to the work of the Counter-Reformation. The general of the order visited her at Avila, and gave ber powers to found other houses of Descalzos, for meu as well as women. The last fifteen years of ber life were spent mainly in journeys witi this end and in the continually growing labour of organization. She travelled in a rude cart in all weathers, and the story of her hardships and misadventures impresses us with the strength of will that animated her old and shaken frame. Convents were founded at Medina, Malaga, Valladolid, Toledo, Segovia, and Salamanca, and two at Alva under the patronage of the famous duke. Then she had three
years of $r k_{0}$, as prioress of her old convent or the incard mation. She next went to Seville to found a house, thug overstepping for the first time the boundaries of the Castiles, to which her authorization limited her. The latent hostility of the old order was aloused ; the general ordered the imnediate suppression of the house at Seville, and procured a bull from Gregory XIII. prohibiting the further extension of the reformed houses (1575). But the movement against her came from Italy, and was resented by Philip and the Spanish authorities as undue interference; and, after a fierce strnggle, duriug which Teresa was twn years under arrest at Toledo, the Carmelites were divided into two bodies in I580, and the Descalzos obtained the right to elect their own provincial-generals (see Carmelftes). The few remaining years of Teresa's life were spent in the old way, organizing the order she had founded, and travelling about to open new convents. Sixteen convents and fourteen monasteries were founded by her efforts; she wrote a history of her foundations, which forms a supplement to her antobiography. At Burgos, during the whole of a wet autumn and winter! she endured terrible privations. Her own nuns, too, were not always as single-minded and obedient as the ideal sisterhood of her hopes had been. Those at St Joseph in Avila mutinied for a meat diet; the prioress at Medina answered her impertinently. Her last journey of inspection was cut short at Alva, where she died on the 29th of September 1582, and was laid in her first, but not her last, resting-place. A violet odour and a fragrant oil were said to distil from her tomb; and when it was opened nine montlis afterwards the flesh was found uncorrupted. A hand cut off by a fervent brother was found to work miracles, and the order became convinced that their, founder had been a saint. It was resolved in 1585 to' remove her remains to Avila, where she was born, the sisters at Alva being consoled by permission to retain the mutilated arm. But the family of the duke of Alva procured an order from the pope enjoining that the body' should be restored to Alva, and she was accordingly laid there once more in a splendid tomb. But even then sho was not allowed to rest: she was again disentombed, to be laid in a more maguificent coffin, and the greed of reverential relic-seekers made unseemly havoc of her bones.

## Teresa was canonized by Gregery XV. in 1622. The honour

 was doubtless largely due to her asceticism and mystic visions. She called herself Teresa de Jesus, to signify the closeness of hei relatiou to the heavealy Bridegroom, who directed all her actiona Thourh she deprecated excess of ascetic severity in otbers, sno scourged hersclf habitually, and wore a peculiarly painful haircloth. But her life shows her to have been, besides, a woman of strong practicality and good sense, full of natural shrewdness, and with ituusual powers of organizetion. "You deceived me in saying she was a woman," writes one of her confessors; "she is a bearded man." Slie was brave in the face of difficulties and dangers, pure in her motives, and her utterances, some of which liave been quoted, have the true ethical ring about them. Her MSS. अero collected by Philip I1. and placed in a rich case in the Escorial the key of which the king carried about with lim. Besides hew autobjography and the history of her foundations, her works (all written in Spanish) contain a great number of letters and varions treatises of mystical religion, the chief of which are The Way of Perfcction and The Castle of the Soul. Both describe the progress of the sonl towards perfect mnion with Goul.Her works, edited by iwe Dominicans, were first pullished in 1587, and have since appeared in various edltions. They were soon afterwards transiated Into 1tallan, French, and Latin; an English translation of the Life and works (except the letrers) by A. Woodhead appeared in 1669. More recently various transla. thons of tha Life havo appeared, -by Jolin Dalton (1851), who also translated the IFay of Perfection, and by Mavid Lewis (1870), followed in 1871 by the Foundations from tho asme land. Biographes appeared soon after her death by the Jesuit Ribera, who had been her confessor (1602), and by Diego de Yepez, confessor to l'hilip 11 . (1599). Detalls are alog giren in Ribadeneyra'a Flos Sanctorum and In Alinn Butter's Lives of the Saints. A separate blography, with prefaca by Arclibishop Manning, apperred in 1865 , and an intercsting and nympathetle account of her life is given in the Quarterly Revieto for'October 1883. (A. SE.)

THERMAL SPRINGS, See GEOLOGY, vol. x. pp. 223, 270, and Mineral Waters.

THERMODYNAMICS. In a strict interpretation, this branch of science, sometimes called the Dynamical Theory of Heat, deals with the relations between heat and work, though it is often extended so as to include all transformations of energy. Either term is an infelicitous one, for there is no direct reference to force in the majority of questions dcalt with in the subject. Even the title of Carnot's work, presently to be described, is much better chosen than is the more modern designation. On the other hand, such a German phrase as die bewegende Kraft der Wärme is in all respects intolerable.

It has been sbown in a previous article (Energy) that Newton's enunciation of the conservation of energy as a general principle of nature was defective in respect of the connexion between work and heat, and that, about the beginning of the present century, this lacuna was completely filled up.by the researches of Ramford and Dary (see also Heat). In the same article Joule's experimental demonstration of the principle, and his determination of the work-equivalent of beat by various totally independent processes, bave becn discussed.

But the conservation of energy, alone, gives us an altogether inadequate basis for reasoning on the work of a heat-engine. It enables us to calculate how much work is equivalent to an assigned amount of heat, and vice versa, provided the transformation can be effected; but it tells us nothing with respect to the percentage of either which can, under given circumstances, be converted into the other. For this purpose we require a special case of the lav of transformation of energy. This was first given in Carnot's extraordinary work entitled Reflexions sur la Puissance Motrice du Feu, Paris, 1824. ${ }^{1}$

1 The author, N-L-Sadi Carnot (1796-1832), was the second eon of Napoleon's celebrated minister of war, himself a xaathematicisa of real note evea among the wonderful galaxy of which. France could then boast. The delicate constitution of Sadi was attributed to the agitated circumstaaces of the tine of bis birth, which led to the proscriptioa add temporary exile of his pareats. He was admitted in 1812 to the Ecole Polytechnique, where be was a fellow-atudent of the famous Chasles. Late in 1814 be left the school with a commission in the Engineers, and with prospects of rapid advancement in his profession. But Waterloo and the Restoration led to a second and fial proscription of his father; and, though Sadi was not himself cashiered, he was porposely told off for the merest drudgeries of his serviep; il fut " envoyé successivernent das plusieurs places fortes pour y faire son métier d’iagénieur, compter des briques, réparer des paas de murailles, et lever des plans destiaés à a'enfocir dans les cartons," as we learn from a biographical notice writtea by his younger brother. Disgusted with an employment which afforded him neither leisure for original work nor opportunities for acquiring scientific instruction, be presented himself in 1819 at the examination for admission to the ataff-corps (etat-major), and obtained a lieutenancy. He now devoted himself with astooishing andour to mathematics, chemistry, Datural history, tecbaology, and evon political economy. He was an enthusiast in music and other fine arts; and he habitually practised as an amusemeat, while deeply studying ia theory, all sorts of athletic sports, including swimming and fencing. He became contain in the engineers in 1827, bat left the service altogether in the followiog year. His aaturally feeble constitution, farther weakened by excessive devation to atudy, broke down finally in 1832. A relapse of scarlatina led to prain fever, from which be had but partially recovered when be fell a fictin to cholera. Thus died, at the early age of thirty-six, ona of the most profound and orizinal thiakers who have ever devoted themoelves to science. The work damed above was the only one he published. Thengh of itself sufficient to put him in the very foremost rank, it contains ouly a fragmeat of Sadi Carnot's discoveries. Fortunately his manuscripts have been preserved, aod extracts from them have beeu appended by his hrother to a reprint (1878) of the Puissance Motrice. These show that he had not only realized for himself the true nature of heat, but bad noted down for trial many of the best modera methods of finding its mechanical equivalent, such as those of Joule with the perforatcd piston aud with the internat friction of water and mercury. W. Thomson's experiment with a corrent of gas forced through a porous plug is also givea. Ono sentence of extract, however, must suffice, aud it is astanishing to think that it was writted over sixty years ago. "On peut conc poser en thèse générala que la puissance frolrice est en quantité́ invariablo dans la nature, qu'elle D'est jamais, \& proprement parler, ui produite, ni détruite. A Ja vérité. ella change de forme, c'est-dे-dire qu'elle
'The chief novelties of Carnot's work are the introduction of the idea of a cycle of operations, and the invaluable discovery of the special property of a reversible cycle. It is not too mach to say that, without these wonderful novelties, thermodynamics as a theoretical science could not have been developed.

Carnot's work seems to hare excited no attention at the time of its publication. Ten years later (1834) Clapeyron gave some of its main features in un anaIytical form, and he also employed Watt's diagram for the exhibition of others. Even this, bowever, failed to call attention properly to tho extremely novel processes of Carnot, and it was reserved for Sir W. Thotason (in 1848, and more at length in 1819) to point out to scientific med their full value. His papers on Carnot's treatise, following closely after the splendid experimental researches of Colding and Joule, secured for the dynamical theory of beat its position as a recognized branch of science. James Thomson, by Carnot's methods, predicted ir 1849 the lowering of the freezing point of water by pressure, which was verified experimentally in the same year by his brother. Von Helmholtz had published, two years before, a sirikingly original and comprehensive pamphlet on the conservation of energy. The start once given, Rankine, Clausius, and W. Thomson rapidly developed, though from very different standpoints, the theory of thermodynamics. The methods adopted by Thomson differed in one special characteristic from those of his concurrents,-they mere based entirely on the experimental facts and ou necessary principles; and, when hypothesis was absolntely required, attention was carefully directed to its nature and to the reasons which appeared to justify it.

Three specially important additions to pare science followed almost directly from Carnot's methods:-(1) the absolute definition of temperature ; (2) the thermodynamic fuaction or entropy; (3) the dissipation of energy. The first (in 1848) and the third (in 1852) were given by W. Thomson. The second, though introduced by Rankine, was also specially treated by Clausius.

In giving a brief sketch of the science, we will not adhere strictly to any of the separate paths parsued by its founders, but will employ for each step what appears to be most easily intelligible to the general reader. And We will arrange the steps in such an order that the necessity for each may be distinctly visible before wo take it.

1. General Notions.-The conversion of mechanical work into heat can always be effected completely. In fact, friction, without which even statical results would be all but unrealizable in practical life, interferes to a marked extent in almost every problem of kinctics,-ancl work done against friction is (as a rule) converted into heat. But the conversion of heat into work can be effectod only in part, usually in very small part. Thus beat is regarded as the lower or less uscful of these forms of energy, and when part of it is clevated in rank by couversion into work tho remainder sinks still lower in the scale of uscfulness than before.

There aro but tivo processes known to us for the con version of heat into work, viz., that adopted in heatengines, whero the changes of volume of the "working substance" are employed, and that of clectromagnctic engines driven by thermoelectric currents (see Electricriv, vol. viii. p. 96). To tho latter wo will not again refer. And for simplicity we will suppose ihe working sulstance to be fluid, so as to have the same Iressure throughout, or, if it be solid, to be isotropic, and to be subject only to bydrostatic pressure, or to tension uniform in all directions and the same from point to point.
produit tantôt ua genre de mouvement, tantôt un autre; mais cliw n'est jamais aqéantic."

The state of unit mass of such a substance is known by experiment to be fully determined when its volume and pressure are given, even if (as in the case of ice in presence of water, or of water in presence of steam) part of it is in one molecular state and part in another. But, the state heing determinate, so must be the temperature, and also the amount of energy which the substance contains. This consideration is insisted on by Carnot as the foundation of his investigations. In other words, before we are entitled to reason upon the relation between the heat supplied to and the work done by the working substance, Carnot says we must bring that substance, by means of a cycle of operations, back to precisely its primitive state as regards volume, temperature, and molecular condition.
2. Watt's Diagram.-Watt's indicator-diagram (see Steam-Fingine) enables us to represent our operations graphically. For if OM (fig. 1) represent the volume, at any instant, of the unit mass of working substance, MP its pressure, the point $P$ is determinate and corresponds to a definite temperature, definite energy, de. If the points of any.curve,
 as $\mathrm{PP}^{\prime}$, in the diagram represent the successive states through which the working sub. stance is made to pass, the work done is (loc. cit.) represented by the area MPP' $\mathrm{M}^{\prime}$. Hence, a cycle of operations, whose essential neture is to bring the working substance back to its primitive state, is necessarily represented by a closed boundary, such as PP'Q'Q, in the diagram. The area enclosed is the excess of the work done by the working substance over that spent on it during the cycle. [This is positive if the closed path be described clockwise, as indicated by the arrow-heads.]
3. Carnot's Cycle.-For a reason which will immediately appear, Carnot limited the operations in his cycle to two kinds, employed alternately during the expansion and during the compression of the working substance. The first of these involves change of volume at constant temperature; the second, change of volume without direct loss or gain of heat. [In his hypothetical engine the substance was supposed to be in contact with a body kept at constant temperature, or to be entirely surrounded by non-conducting materials.]. The corresponding curves in the diagram are called isothermals, or lines of equal temperature, and adiabatic lines respectively. We may consider these as having been found, for any particular working substance, by the direct use of Watt's indicator. It is easy to see that one, and only one, of each of these kinds of lines can be found for an assigned initial state of the working substance; also that, because in expansion at constant temperature heat must be constantly supplied, the pressure will fall off less rapidly than it does in adiabatic expansiog. Thus in the diagram the adiabatic lines $P Q, P^{\prime} Q^{\prime}$ cut the lines of equal temperature $P P^{\prime}$, $Q Q$ downwards and to the right. Thus the boundary of the area $P P^{\prime} Q^{\prime} Q$ does not cross itself. To determine the behaviour of the engine we bave therefore only to find how much beat is taken in along $\mathrm{PP}^{\prime}$ and how much is given out in $Q^{\prime} Q$ Their difference is equivalent to the work expressed by the area P1'Q'Q.
4. Carnot's Principle of Reversibility.-It will be observed that each operation of this cycle is strictly reversible; for instance, to take the working substance along the path $\mathrm{P}^{\prime} \mathrm{P}$ we should have to spend on it step by step as much work as it gave out in passing along PP', and we should thus restore to the source of heat exactly the amount of heat which the working substance took from it during the expansion In the case of the adiabatics
the work spent during compression is the same as that done during the corresponding expansion, and there is no question of loss or gain of beat directly.

If, however, a transfer of heat between the working substance and its surroundings bave taken place on account of a finite difference of temperature; it is clear that such an operation is not reversible. Strictly speaking, isothermal expansion or contraction is unattainable in practice, but it is (without limit) more closely approximated to as the operation is more slowly performed. The adiabatic condition, on the other hand, is more closely approximated to in practice the more swiftly the operation is performed. We bave an excellent instance of this in the compression and dilatation of air caused by the propagation of a soundwave.

And now we have Carnot's invaluable proposition, a reversible heat-engine is a perfect engine,-perfect, that is, in the sense that no other heat-engine can be superior to it. Before giving the proof, let us see the immense consequences of this proposition. Reversibility is the sole test of perfection; so that all heat-engines, whatever be the working substance, provided only they be reversible, convert into work (under given circumstances) the same fraction of the heat supplied to them. The only circumstances involved are the temperatures of the source and condenser. Thus we are furnished with a general principle on which to reason about transformation of heat, altogether independently of the properties of any particular substance.

The proof, as Carnot gave it on the hypothesis of the materiality of beat, is ex absurdo. It is as follows. Suppose a heat-engine A to be capable of giving more work from a given amount of beat than is a reversible engine $B$, the temperatures of source and condenser being the same for each. Use the wo as a compound engine, A working direct and B reversed. By bypothesis B' requires to be furnished with part only of the work given by A to he able to restore to the source the beat abstracted by A, and thus at every complete stroke of the compound engine the source has its heat restored to it, while a certain amount of external work has been done. This would be the Perpetual Motion (q.v.).
5. The Basis of the Second Law of Thermodynamics. Carnot's reasoning, just given, is based on the hypothesis that heat (or caloric) is indestructible, and that (under certain conditions) it does work in being let down from a higher to a lower temperature, just as does water when falling to a lower level. It is clear from several expressions in his work that Carnot was not at all satisfied with this yiew, even in 1824, and we have seen that he soon afterwards reached the true theory. But it is also clear that such an assumption somewhat simplifies the reasoning, for in his hypothetical heat-engine all the heat which leaves the boiler goes to the condenser, and vice versa in the reversed working. The precise point of Carnot's investigation where the supposed indestructibility of heat introduces error is when, after virtually saying compress from $Q^{\prime}$ to a state $Q$ determined by the conditien that the heat given out shall be exactly equal to that taken in during the expansion from P to $\mathrm{P}^{\prime}$, he assumes that, on farther compressing adiabatically to the original volume, the point $P$ will be reached and the cycle completed. J. Thomson, in 1849, rectified this by putting it in the true form :compress from $Q$ to a state $Q$, such that subsequent adiabatic compression will ultimately lead to the state $P$.

We have now to consider that, if an engine (whether simple or compound) does work at all by means of heat, less heat necessarily reaches the condenser than left the boiler. Hence, if there be two engines A and B as before, and the joint systen be worked in such a way that $R$ constantly restores to the source the heat taken from it by,

A; we can account for the exccss of work done by 1 over that spent on B solely by supposing that $B$ takes more heat from the condenser than $A$ gives to $i t$. Such a compound engine would transform into work heat taken solely from the condenser. And the work se obtained might bs employed on $B$, se as to make it convey heat to the source while farther cooling the condenser.

Clausius, in 1850 , sought to complete the proof by the simple statement that "this contradirts the usual behaviour of heat, wbich always tends to pass from warmer bodies to colder." Some years later he employed tbe axiom, "it is impossible for a sclf-acting inachine, unaided by any external agency, to convey heat from one body to another at a higher temperature." W. Thomson, in 1851 , employed the axiom, "it is impossible, by means of inenimate material agency, to derive mechanical effect from any portion of matter by cooling it below the temperature of the coldest of the surrounding objects." But he was careful to supplement this by further statements of an extremely guarded character. And rightly so, for ClerkMaxwell has pointed out that such axioms are, as it were, only accidentally correct, and that the true basis of the secand law of thermodynamics lies in the extreme smallness and enormous number of the particles of matter, and in consequence the steadiness of their average behaviour. Had we the means of dealing with the particles individually, we could develep on the large scale what takes place continually on a very minute scale in every mass of gas, -tbe occasional, but ephemeral, aggregation of warmer particles in one small region and of colder in another.
6. The Laws of Thernoodynamics.-I. When equal quantities of mechanical effect are produced by any means whatever from purely thermal sources, or lost in purely thermal effects, equal quantities of heat are put out of existence, or are generated. [To this we may add, after Joule, that in the latitude of Manclester 772 foot-pounds of work are capable of raising the temperature of a pound of water from $50^{\circ} \mathrm{F}$. to $51^{\circ} \mathrm{F}$. This correspends to 1390 foot-pounds per centigrade degree, and in metrical units to 425 kilogramme-metres per calorie (see Неat).]
II. If an engine be such that, when it is worked backwards, the physical and mechanical agencies in every part of its motions are all reversed, it produces as much mechanical effect as can be produced by any thermodynamic engine, with the same temperatures of source and refrigerator, from a given quantity of heat.
7. Absolute Temperature.-We have seen that the fraction of the beat supplied to it which a reversible engine can convert into work depends only on the temperatures of the beiler and of the condenser. On this result of Carnot's Sir W. Themson based his absolute definition of temperature. It is clear that a certain freedom of choice is left, and Thomson endeavoured to preserve as close an agreement as possible between the new scale and that of the air thermometer. Thus the Lefinition ultimately fixed on, after exhaustive experiments, rons:-"The temperatures of two bodies are proportional to the quantities of heat respectively taken in and given out in localities at one temperature and at the other respectively, by a material system subjected to a complete cycle of perfectly reversible thermodynamic operations, and not allowed to part with or take in heat at any other temperature ; or, the absolute values of two temperatures are to one another in the propertion of the heat taken in to the heat rejected in a perfect thermodynamic engine, working with a source and refrigerator at the higher and lowcr of the temperatures respectively." If we now refer again to fig. 1 , we see that, $t$ and $t^{\prime}$ being the absolute temperatures correspondince to $P P^{\prime}$ and $Q Q^{\prime}$, and $H, H^{\prime}$ the amounts of heat talen
in during the operation $\mathrm{PP}^{\prime}$ and given out duriug the operation $Q^{\prime} Q$ respectively, we lave

$$
\mathrm{H} / t=\mathrm{H}^{\prime} / l^{\prime},
$$

whatever be the values of $t$ and $t^{\prime}$. Also, if heat be measured in terms of work, we have

$$
\mathrm{H}-\mathrm{H}^{\prime}=\text { area } \mathrm{PP}^{\prime} \mathrm{Q}^{\prime} \mathrm{Q} .
$$

Thus with a reversible engine working between temperatures $t$ and $t^{\prime}$ the fraction of the heat supplied which is converted into work is $\left(t-t^{\prime}\right) / t$.

It is now evident that we can construct Watt's diagram in such a way that the lines of equal temperature and the adiabatics may tegothon intercept a serics of equal areas. Thus let PP' (fig. 2) be the isothermal $t$, and on it so take points $P$, $P^{\prime \prime}, P^{P \prime \prime}$, \&c., that, as the working substance passes from P. to $P^{\prime}, P^{\prime}$ to $P^{\prime \prime}$, scc., $t$ units of beat (the unit being of any assigned value) shall in each case be taken in. Let $\mathrm{QQ}^{\prime}$,
 $R R^{\prime}$, \&c., be other isothermals, so drawn that the successive areas $P Q^{\prime}, Q^{\prime}$, \&c., between any two selected adiabatics, may be equal. Then, as it is clear that all the successive areas between each one pair of isothermals are equal (each representing the area $t-t^{\prime}$ ), it follows that all the quadrilateral areas in the figure are equal.

It is now clear that the area included between $\mathrm{PP}^{\prime}$ and the two adiabatics PQR, $P^{\prime} Q^{\prime} R^{\prime}$ is essentially finite, being numerically equal to $t$. Thus the temperature for each isothermal is represented by the corresponding area. This is indicated in the cut by the introduction of an arbitrary line $\mathrm{SS}^{\prime}$, supposed to be the isothermal of absolute zero. The lower parts of the adiabatics also are unknown, so that we may draw them as we please, subject to the condition that the entire areas PS', P"S", $\mathrm{P}^{\prime \prime} \mathrm{S}^{\prime \prime \prime}$, \&c., shall all be equal. To find, on the absolute scale, the numerical valus of two definite temperatures, such as the usually employed freezing and boiling points of watcr, we must tberefore find their ratio (that of the heat taken and the heat rejected by a reversible engine working between these temperatures), and assign the number of degrees in the interval.

Themsen and Joule experimentally showed that this ratio is about $1 \cdot 365$. Hence, if we assume (as in the centigrade scale) 100 degrees as the range, the temperatures in question are 274 and 374 ncarly. A full discus. sion of this most important matter wiil be found under Heat.
8. Entropy.-Just as the lines $\mathrm{IP}^{\prime}, \mathrm{QQ}^{\prime}$, i.c., are claracterized by constant tempe:aturo along each, so we figure to ourselves a quantity which is characteristic of eacl adiabatic line, 一being constant along it. The equation of last section at once peints out such a quantity. If we write $\phi$ for its value along $P Q$, $\phi^{\prime}$ for $P^{\prime} Q^{\prime}$, we may define thus $\phi^{\prime}-\phi=\mathrm{H} / \mathrm{l}$.
From the statements as to the equality of the areas in fig. I the reader will see at once that the area bounded by $t, t^{\prime}, \phi, \phi^{\prime}$ is $\left(t-t^{\prime}\right)\left(\phi^{\prime}-\phi\right)$. We are concomed only with the chunges of $\phi$, not with its actual maynitude, so that any one adiabatic may bo chosen as that for which $\phi=0$.
9. The Dissipution of Energy.-In the before-cited article Exerar (vol. viii. 1. 210) this part of the subject has alrcady been treated. Since that article was written Sir William Thumson las introduced the tern thernodynamic motivity to signify "the possession the waste of which is
called dissipation." We speak of a distribution of heat in a body or system of bodies as having motivity, and we may regard it from rithout or from within the system.

In the first case it expresses the amount of work which can be obtained by means of perfect engines employed to reduce the whole system to some definite temperature, that, say, of the surrounding medium. In the second case the system is regarded as self-contained, its hotter parts acting as sources, and its colder parts as condensers for the perfect cugine.

As an iostance of internal motivity we aay take the case of a system consisting of two equal 1 rrtions of the same substance at different temperatures, $s$ y a pound of boiling water and a pound of ice-cold $r$ ater. If we neglect the (small) change of specific heat with temperacure, it is found that, when the internal motivity of the system is exhausted, the temperature is about $46^{\circ} \mathrm{C}$., being the centigrade temperature corresponding to the geometrical mean of the original absolute temperatures of the parts. Had the parts been simply mixed so as to dissipate the interoal motivity, the resulting temperature would have been $50^{\circ} \mathrm{C}$. Thus the work gained (i.e., the original interaal motivity) is the equivalent of the beat which would raise two pounds of water from $46^{\circ} \mathrm{C}$. to $50^{\circ} \mathrm{C}$.

As an instance of motivity regarded from without we may take the simple case of the working substance in §.2, on the hypothesis that there is an assigued lower temperature limit. As there is no supply of heat, it is clear that the maximum of work will be obtaioed by allowing the anbstance to expand adiabatically till its temperature sinks to the assigned limit.

Thus if $P$ (fig. 3) be its given position on Watt's diagram, $\mathbb{P Q}$ the adiabatic through $P$, and $P^{\prime} Q$ the isothermal of the lower temperature limit, $Q_{p}$ is determinate, and the metivity is the area PQNM. If, agaio, we wish to find the motivity when the initial and final states P and $\mathrm{P}^{\prime}$ are given, with the condition that the temperature is not to fall below that of the state $P^{\prime}$, the problem is reduced
 to finding the course $P P^{\prime}$ for which the area PP'I'M is greatest. As no heat is supplied, the course cannot rise above the adiabatic $P Q$, and by hypothesis it cannot fall below the isothermal $P^{\prime} Q$,-bence it must be the broken tine PQP'. Thus, under the circumstances stated, the motivity is represeated by the area MPQP'M1. If any other la wful course, such as $P P^{\prime}$, be taken, there is an unnecessary waste of motivity represented by the area $\mathrm{PQP}^{\prime}$.
10. Elemenlary Thermodynamic Relations.-From what precedes it is clear that, when tha state of unit mass of the workiag substance is gives by a point in the diagrain, an isothermal asd an adiabatic cin be drawn through that point, aad thus $\phi$ aad $t$ are determiaate for each. particular substaace when $p$ and $v$ are given. Thus aay two of the four quantities $p, v, t, \phi$ may be regarded $s s$ functions of the other two, chosen as indepcadent rariables. The change of energy from ong stato to another can, of coursa, be oxpressed as in §9, above. Thus, puttiag E for the anergy, wa have st once

$$
d \mathrm{E}=t d \phi-p d v
$$

(1)
if $\phi$ and $v$ bo chosen as iadapendent variables, and if huat ba measured, as above, in uaits of work. This eqaatios expresses, in symbols, the two lawe of thermodyaamics. For it states that the gain of energy is the axcess of the heat supplied ova: the work done, which is an expression of the first law. And it expresses the hest supplied as the product of the absolute temperature by the gain of entropy, which is a statement of the second law in terms of Thomson's modes of measuring absoluta temperature.

But we now have two equatious in 'partial differsntisl co. sficieats:-

$$
\left(\frac{d \mathrm{E}}{d \phi}\right)-t, \quad\left(\frac{d \mathrm{E}}{d v}\right)=-p
$$

From these sve have two exaressions for the value of $\left(\frac{d^{3} E}{d v d \phi}\right)$.

Equating them, we are lad to tha thermodynamic relation

$$
\left(\frac{d t}{d v}\right)=-\left(\frac{d p}{d \phi}\right)
$$

## the differential coefficients beiag agaia partial.

This axpresses a property of all "working substances," dafined as in § 1. To stata it in words, let us multiply and divide the right hand side by $t$, and it then reads:-

The rate at which the temperature falls off per unit increase of volume in adiabatic expansion is cqual to the rate at which the pressure inereases per dynamical unit of heat supplied at constant volume, .multiplied by the absolutc temperature.

To obtain a similar result with yand $t$ as iadependent variables, we have only to subtract from both sides of (1) the complete differentisl d $(t \phi)$, so thst

$$
d(\mathrm{E}-t \phi)--\phi d t-p d v .
$$

Proceeding exactly as bcfore, wa find

$$
\left(\frac{d \phi}{d v}\right)-\left(\frac{d p}{d t}\right)
$$

In words this rasalt luns (whes both sides are multiplied by $t$ ):-
The rate of increase of pressure with temperature at constand volume, multiplied by the absolute tempcrature, is equal to the rato at which heat must be supplied per-unit increass of volume to keep the temperature constant.

Very slight variations of tha process just given abtain the follow* Ong varisties of expression:-

$$
\left(\frac{d v}{d \phi}\right)-\left(\frac{d t}{d p}\right) \text { and }\left(\frac{d v}{d t}\right) \Rightarrow=\left(\frac{d \phi}{d p}\right)
$$

which are to be interpreted as above.
11. Increase of Total Energy under various Conditions.-The expression (1) of $\$ 10 \mathrm{may}$ be put in various forms, each convenient for some special purpose. We give ove exampla, as sufficiently showing the processas omployed. Thus, auppose we wish to find how the energy of the working substance varies with its volume whes the temperature is kept constant, we must express $d \mathrm{E}$ in terms of $d v$ and $d t$. Thus

$$
d \mathrm{E}=t\left(\frac{d \phi}{d t}\right) d t+t\left(\frac{d \phi}{d v}\right) d v-p d v
$$

But we have, by, $\S 10$, undsr 1 resent conditions

| $\left(\frac{d \phi}{d v}\right)=\left(\frac{d p}{d t}\right)$ |  |
| :--- | :--- |
| Hence | $\left(\frac{d E}{d v}\right)=i\left(\frac{d p}{d t}\right)-p$, |

a result assumed in a previous article (Radiation, vol. xx. p. 217). If the working substance have the property (thst of tho eo-c.allod "idssl" perfect gas)
we see that, for it,

$$
\rho v=\mathrm{R} t
$$

$$
\left(\frac{d \mathbb{E}}{\frac{l v}{l v}}\right)=0
$$

The energy of (unit mass of such a substance thus dapends upos its temparature alose.
12. Specific Heat of a Fluid.-Specific heat in its most general acceptation is the heat required, uader some giren condition, to raisa the temperature of usit mass by ouo degrea. Thus it is tho beat taken in while the workiug sulstance passes, by some assigned path, from one isotharmal $t$ to another $t+1$; and this may, of course, have as many values es there aro possible paths. Usually, howsver, but two of these paths are spoken oif, and these aro tal6o parallel respectively to the coordinato axes in Watt's diagram, so that we speak of the specific heat at coastant volemo or at con. staut pressure. In what followe thase will bo denoted by $c$ and $k$ respctivaly.
T'se $v$ and $p$ for the iudependent variables, ss in the diagransnd let $\kappa$ be the specific heat correspoadiag to the condition

Theo

$$
\begin{gathered}
f(v, p)-\text { const. } \\
\kappa d t-t d \phi-t\left(\frac{d \phi}{d v} d u+\frac{d \phi}{d p} d p\right) ;
\end{gathered}
$$

while

$$
0-\frac{d f}{d \theta} d v+\frac{d f}{d p} d p,
$$

and $d t-\frac{d t}{d v} d v+\frac{d t}{d p} d p$.

Thus ${ }^{7}$

$$
k=\frac{\frac{d \phi}{d v} \frac{d f}{d p}-\frac{d \phi}{d p} \frac{d f}{d v}}{\frac{d t}{d v} \frac{d f}{d p}-\frac{d \ell}{d p} \frac{d f}{d v}} .
$$

This cepression vanishes if $f$ and $\phi$ vary together, i.e., in saushens. axpansion, and becomes infinite if $f$ and $t$ vary together, o.e., zu isothermal expansion; as might easily have beea foresesa. Otherwise it has a finite value. It is ueual, howevar, to choose $v$ and t as independedt rariables, while we deal analytically (as distin. guished from diagrammatically) with the subject. From this point of tiew we bave

$$
x d t-t\left(\frac{d \phi}{d v} d v+\frac{d \phi}{d t} d t\right)
$$

Bat the last term on the right is, by definition, cdt; 80 that

$$
(\kappa-c) d t=t \frac{d \phi}{d t} d v_{2}
$$

with the condition

Thas

$$
\begin{gathered}
\frac{d f}{d t} d t+\frac{d f}{d v} d v=0 \\
\kappa-c=-i \frac{d \phi}{d v} \frac{d f}{d t} \int \frac{d f}{d v},
\end{gathered}
$$

which is a perfectly general expression. As the most important case, lot $f$ represent the pressure, thea wo sce, by § 10 , that

$$
\frac{d \phi}{d v}=\frac{d p}{d t}
$$

aud the formals becomes

$$
\hbar-c=-c\left(\frac{d p}{d t}\right)^{2} / \frac{d p}{d v}
$$

13. Properties of an Ideal Substance which follous the Lavs of Boyls and Charles.-Closely approximate ideas of the thermal behavionr of a gas such as sir, at ordinary temperatures and pressures, may be obtained by assuming the relation

$$
p o-R i
$$

Which expresses the lswa of Boyle sud Cbarles. Thns, by the fermuls of last section, wo bave at once

$$
\dot{r}-\varepsilon-\ell \frac{\mathrm{R}^{3}}{v^{3}} / \frac{p}{v}-\mathbf{B}
$$

a relation given originally by Carnot.
Hence, in ench a substance,

$$
d \phi-c \frac{d t}{t}+(k-c) \frac{d v}{v}
$$

or $\quad \phi-\phi_{u}-c \log t+(t-c) \log 0$.
In terms of volnne sud pressure, this is

$$
\begin{gathered}
\phi-\phi_{0}-e \log p / \mathrm{R}+k \log v_{1} \\
p_{2} 8 / \epsilon \cdots \mathrm{R}_{\epsilon}\left(\phi-\phi_{0}\right) / \rho
\end{gathered}
$$

or
the equation of the sdiabatics on Watt's diagram.
This is (for $\phi$ constant) the selation between $p$ and $\theta$ in the propagation of sond. It follows from the theory of wave-motron (Hydromeohanics) thst the speed of sound is

$$
\sqrt{\frac{\hbar_{i}}{c} \mathrm{Rt}},
$$

Where $t$ is the temperature of the ondisturbed air. This expression gives, by compsrison with the observed speed of sound, a very accurate determination of the ratio $k / \mathrm{c}$ in terms of R . The valne of $R$ is easily olntained by experiment, and wo hare just secn thst it is equal to $k-e$; so that $k$ and $e$ can be found for sir with great sccuracy by this process, -a most remarkable iostance of the indirect measurcmeat of a qoantity (c) whose dirct dotermination presents very formidable dificulties.
14. Effect of Prcssuro on the Mclting or Boiling Point of a Substance. - By the second of the thermodynamis relations in $\$ 10$, above, we have

$$
\left(\frac{d p}{d t}\right)-\left(\frac{d \phi}{d v_{0}}\right)
$$

so that

$$
\delta p=\left(\frac{d p}{d t}\right) \delta t+\left(\frac{d p}{d v}\right) \delta v-\left(\frac{d \phi}{d v}\right) \delta t+\left(\frac{d p}{d v}\right) \delta v
$$

But, if the fraction e of the working substauce be in one molecular stato (say liquid) in which $V_{0}$ is the rolume of unit mass, while the remainder 1 - $e$ is in a state (solid) where $\mathrm{F}_{1}$ is the volnme of unit mass, we have obviously

$$
v-6 V_{0}+(1-6) V_{1}
$$

Let $\mathrm{L} \overline{\mathrm{b}}$ the latent hest of the liquid, then

$$
\left(\frac{d \phi}{d v}\right)=\frac{t d \phi}{t\left(V_{0}-\sqrt{1}\right) d s}-\frac{\mathrm{L}}{l\left(\mathrm{~V}_{0}-\nabla_{1}\right)}
$$

Also, as in e mixture of the same substance in two different states, the pressare remaias the same while the volnme changes at constantitempersture, we have $d \rho / d v=0$, so that finslly

$$
\delta t=\frac{t\left(V_{0}-\nabla_{1}^{\prime}\right.}{\mathrm{L}} s p
$$

which sinow how the tomperatare is altered by a small change of presaure

In the case of ice avd water, $V_{1}$ is greater than $\nabla_{0}$, so the temperature of the freezing-point is lowered by increase of pressure. When the proper namerical values of $Y_{0}, \nabla_{1}$, and $L$ srointroduced, it is fonnd that the freezing point is lowered $u 5$ about $0^{\circ} .0074 \mathrm{C}$. for each additional atmosphere.

When water and atean are in equilihriom, we have $V_{0}$ much greater than $\nabla_{3}$, so that the boiling-point (as is well known) is raised by pressure. The aame happene, and for the amme reason,
with the melting point, in the case of bodies which expand in the act of melting, sach sa beeswar, paraffo, wo.loiron, sud lava Such bodies may therefore be kep̣t solid by safficient pressure, oven at temperatures far above their ordinary melting points.

This is, in a slightly altered form, the reasoving of James Thomson, alluded to abore as one of the first striking spplications of Carnot's methods made after his work was recalled to notice.
15. Effect of Pressure on Maximum Density Point of Water. One of the most singular propirties of water at atmospheric pressure is that it has its maxinum density at $4^{\circ} \mathrm{C}$. Another, first pointed out by Canton in 1764 , is that its compressibility (per atroosphere) is greater at low than at ordiaary tomperatures, - being, according to his measurementa, $0.000,049$ st $34^{\circ} \mathrm{F}$., and only $0.000,044$ at $64^{\circ} \mathrm{F}$. It is easy to see (though it aplears to have beed first pointed out by Puschlin 1875) that the second of these properties involves the lowering of the maximum density peint by increase of pressure. Te calculate the mumerical amount of this effect, note that the expassibility, like all other thermsl properties, may be expressed as a function of any two of the quantities $p, v, t$, $\phi$; say in the present case $p$ and $t$. Then we have for the expan. sibility

$$
e=\frac{1}{v}\left(\frac{d v}{d t}\right)=\left(\frac{d}{d t}\right) \log v \Leftrightarrow f(p, t)
$$

Also the compressibility may be expressed as

$$
\Leftrightarrow-\frac{1}{v}\left(\frac{d v}{d p}\right)=-\left(\frac{d}{d p}\right) \log v
$$

The relstion betwcen small simultaneous increments of pressare and temperature, which are such as to leave the expasibility uncbauged, is thus

$$
\left(\frac{d e}{d l}\right) \delta t+\left(\frac{d e}{d p}\right) \delta \dot{p}=0
$$

Now the expansibility is zere st the maximnm density pernt, fer which therefore this equation belds. But the equations above give

$$
\left(\frac{d c}{d p}\right)=\left(\frac{d^{2}}{d p d t}\right) \log v=-\left(\frac{d t}{d t}\right)
$$

so that

$$
\left(\frac{d e}{d t}\right) \delta t-\left(\frac{d t}{d t}\right) \delta p=0
$$

The volnme of water at low teroperaturcs noder atmospheric pressure varies approximately as

$$
1+\frac{(\ell-4)^{2}}{144,000}
$$

Thus we bave $\left(\frac{d \ell}{d \ell}\right)=\frac{1}{72,000}$ nearly; sud from Canton's exp̄èrid mental result above stated we gather that (ronghly at least)

$$
\left(\frac{d t}{d t}\right)=-0.000,005 \frac{1 \cdot 9}{30}--0 \cdot 000,000,3
$$

from which the formuls gives $-0^{\circ} .02 \mathrm{C}$. nearly for the clisage of the maximum deasity point due to one additional stnosphere.
Recent inrestigations, carricd out by direct as well as by indirect mothods, seem to agree in showing that the truc value is somewhat less than this, viz., about $-0^{\circ} 018 \mathrm{C}$. ; so that water bas its maximnm density at $0^{\circ} \mathrm{C}$. when subjected to about 223 stmospheres. Thns, taking account of the resnlt of $\$ 14$ gbove, we find that the maximum density point coincides with the freezing point at $-2^{\circ} \cdot 8 \mathrm{C}$. under an additional presure of about 377 atmospheres, or (say) 2.5 tons reight per square inclu.
16. Motivily and Entropy, Dissipation of Energy.-The notivitv of the quantity $H$ of heat, in a body at teruperature $t$, is

$$
\mathrm{H}\left(t-t_{0}\right) / t
$$

Where $f_{0}$ is the lowest available temperature.
The entropy is expressed aimply as
$\mathrm{H} / \epsilon$,
being independeut of any limit of tcmperature.
If the heat pass, by conduction, to a body of temperatare $t$ (less than $\ell$, but greater than $\ell_{0}$ ), the chage of rootivity (i.e., the dissipation of energy) is

$$
H t_{0}\left(\frac{1}{t}-\frac{1}{t^{2}}\right)
$$

Which is, of courso loss; while the corresponding change of entropy is the gain

$$
11\left(\begin{array}{l}
1 \\
i
\end{array}-\frac{1}{\ell}\right)
$$

The numerical values of these quautives differ by the factor $r_{0}$ so that, if wa could have a condouser at absoluto zero, there coold be no dissipation of energy. But we seo that Clansius's statement that the entropy of the miverse tends to a maximom is practically merely snother way of expressing Thomeon's earlicr tbeory of the dissipation of energy.

When heat is exchanged aroong a number of hodies, part of it
being transformed by heat-engines into work, the work obtainable (i.c., the motivity) is

$$
\Sigma(\mathrm{H})-\ell_{0} \Sigma(\mathrm{H} / \varphi) .
$$

'Che work obtained, however. is simply
$\Sigma(\mathrm{H})$.
Thus the waste, or amount needlessly dissipated, is $-t_{0} \Sigma(H / t)$.
This nust be essentially a positive quantity, excopt in the case when perfect engines have been employed in all the operations. In that case (unless indeed the unattainable condition $t_{0}=0$ were fulfilled) $\Sigma(H / t)=0$,
which is the general expression of reversibility.
17. IV orks on the Subject.-Carnot's work lias, as we have seen, been reprinted. The scattered papers of Raukine, Thenson, and Clausius have also been issued in collected forms. So havo the experimental papers of Joule. The special treatises on Thermodynamics are very numereus; but that of Clerk-Maxwell (Theory of Heal), though in some respects rather formidable to a beginner is as yet far superior to any of its rivals.
(P. G. T.)

THERMOELECTRICITY. See Electricity, vol. viii. pp. 94 sq.

THERMOMETER, an instrument for detecting and measuring differences in temperature. The name is usually restricted to instruments adapted for use at moderate temperatures; those for measuring high temperatures are termed pyrometers (see Pyrometer). Thermometry has been treated theoretically under Heat (see vol. xi. p. 558 sq .). It here remains to trace the history of thermometers, and to describe the principal forms in use.

History. -The honour of inventing the thermometer has been given to several natural philosophers of the 16 th century; the claims of Robert Flidd are more tangible than those of Drebbel and Santorio, but the instrument invented by Galilee before 1597 seems best entitled to be considered the precursor of accurate thermometers. All the early instruments were air thermoscopes, and, until the variations of atmospheric pressure were discovered, their use was only deceptive. Galileo's thermometer (fig. 1) consisted of a glass bulb containing air, terminating below in a long glass tube which dipped into a vessel containing a coloured fluid. The variations of volume of the enclosed air caused the fluid to fall or rise in the tube, to which an arbitrary scale was attached. The great step in advance of inventing the alcohol thermometer is also due to Galileo, but the date (probably 1611 or 1612) is not precisely known. Rinieri

FIg. 1. certainly had alcohol thermometers made before 1647 , and they are referred to as familiarly known in the oldest memoirs of the Accademia del Cimento (1667). In form they resembled those now in use; they had large spherical (or, occasionally, cylindrical or helical) bulbs, and the degrees intended to represent thousandths of the volume of the reservoir were marked with beads of enamel fused on to the stem (fig. 2). All the Florentine instruments were graduated in the same way, but the scale was arbitrary, and the recorded readings were accordingly supposed for a long time to be useless. In 1829 the fortunate discovery by Antineri of a number of those early Florentine thermometers enabled their scale to be ascertained and translated into known degrees. The temperature of melting ice was marked by them as 13.5 , while 50 corresponded with $55^{\circ} \mathrm{C}$. No means of comparing observations made by thermometers of different manufacture existed until certain fixed points of universal accessibility were discovered. The thermal conditions of freezing fle. 2. water were studied with great care, but natural congelation Was generally supposed to take place at variable tompera-
tures, until Fahrenheit preved that, however much water could be cooled down without 'freezing, the temperature when ice began to form was always the same. Hooke, in 1665 (Micrographia, p. 38), describes the manufacture and graduation of comparable spirit thermometers with the freezing point of water as the zero of their scales, and he evidently recognized it as fixed. Halley in 1693 stated that the temperature of boiling water is constant, and this was again proved by Amontons in 1702. In 1694 Renaldeni of Padua proposed to graduate thermometers by taking as standards of temperature mixtures of definite volumes of ice-cold and boiling water. This method, although theoretically admirable (see Heat, vol. xi. p. 559), is delective in practice. Seven years later Newton proposed anonyinously (Phil. Trans., 1701, vol. xxii. p. 824) a thermometer scale on which the temperature of freezing water was $0^{\circ}$, and that of the blood of a healthy man $12^{\circ}$. Continuing the graduation of a linseed-oil thermometer above this point, he found that water boiled at $34^{\circ}$. Fahrenheit in 1714 took as fixed points the temperature of the human body and that of a mixture of ice and sal ammoniac or common salt. In 1721 be made a mercury thermometer according to Halley's suggestion of 1693 , and by means of it he proved the dependence of the boiling point on pressure. It was not until after Fahrenheit's death that the freezing and boiling points of water were universally accepted as fixed points on tha thermometric scale. The thernometer has remained unchanged in its main features since the middle of the 18 th century. Mercury has been found the most convenient fluid for ordinary use, in spite of the advantages (Heat, vol. xi. p. 561 sq.) presented by lighter and more volatile liquids. Graduation of thermometers, by marking off volumes of the stem equal to a given fraction of the capacity of the bulb, although reintroduced by Réaumur in 1730, has now been entirely discontinued.

The idea of a self-registering thermometer early pien sented itself. Many forms were devised by natural philosophers and instrument-makers. That of Sixe, in 1782 , a precursor of which, dating frem the 17 th century, is preserved amongst the instruments of the Florentine Academy, was the most successful.

Scales.-The absolute zero of temperature is the logical Deginning of a thermometric scale, but some point easy of reference is desirable, and this is found in the temperature at which ice melts and water freezes. The second accepted fixed point is that at which distilled water boils under the pressure of 760 millimetres ( 29.92 in .) of mercury. For the division of the space between the two fixed points into degrees of convenient length only three of the innumerable methods proposed have survived, and one of these, the centigrade, is rapidly becoming universal. The oldest system, that of Fahrenheit, dates from 1724. It is used for meteorological purposes, and popularly, in Great Britain, the British colonies, and the United States. The freezing point is marked $32^{\circ}$ and the boiling point of water $212^{\circ}$. At first Fahrenheit employed a scale of 180 degrees; the zero was $\}$ 了laced at "temperate" ( $9^{\circ} \mathrm{C}$.) ; $90^{\circ}$ at "blood-heat," the point to which the alcohol rose when the thermometer was placed under the arm of a liealthy man; and $-90^{\circ}$ at the temperature of a mixture of ice and salt, then believed to be the greatest possible cold. In 1714 Fahrenheit changed his scale at the suggestion of the Danish astronomer Roemer, placed $0^{\circ}$ at his "absolute zero," and divided the space between that and the warmth of the human body into 24 degrees. The freezing point of water thus became $8^{\circ}$. For convenience, these long degrees were divided into quarters, which were afterwards termed degrees; thus the freezing point became $32^{\circ}$ and blood heat $96^{\circ}$. A mercury thermometer graduated ir:
this way, with divisions of equal length continued above blood heat, registered $212^{\circ}$ in boiling water Thus the Fahrenheit scale came from a dnodecimal reckoning.
De Jisle, in 1724, introduced a scale in which tho boiling point of water was marked $0^{\circ}$ and the temperature of the cellars of the Paris Onservatory $100^{\circ}$. He afterwards adopted the freezing point of water as his upper fixed point, and called it $150^{\circ}$. This scale was used for many years in Russia, but is now obsolete.

In 1730 Reaumur made alcohol thermometers with their zero at the freezing point of water, and degrees of oncthousandth of the volume of the bulb. On some of these the boiling point of water was $80^{\circ}$; but the instruments were defective in principle and very unegual in their indications. Deluc introduced mercury thermometers graduated from $0^{\circ}$ in melting ice to $80^{\circ}$ in boiling water, and these, with Reaumur's name attached, are in use for popular purposes in Germany, Holland, and other parts of the Continent,

Celsius adopted a centesimal scale in 1742. The boiling point was marked $0^{\circ}$ and the freezing point of water $100^{\circ}$. Linnæus introduced the mode of reckouing from $0^{\circ}$ in melting ice to $100^{\circ}$ in boiling water, which is now known as the centigrade, and is used universally in laboratories, and in all except English-speaking countries for every scientific purpose.

Fahrenheit's scale is convenient for meteorological work on account of its short degrees, admitting of great accuracy in reading and compactness in recording, and on account of its low zero, which makes it possible in temperate climates to dispense with negative quantities. On the other hand, the centigrade scale is on the whole so convenient, its use is so nearly universal, and the advantage of a uniform system is so great that it must ultimately be adopted for all pnrposes. ${ }^{1}$

Air Theramonetrr - Uider constant pressuro gases expand eqnally for equal increments of heat. Hence, when an air thermomoter is graduated between two fixed points the graduation may be continued above and below these points in degrees of the same length; and any number of air thermometers so made will agree amongst thenselves at every tenperature. The pripciple of air thermometers is treated of in HEAT (ut sup. $\mathrm{h}_{\text {and }}$ andenples of apocisl forms are described in thist article and in PrRoweter The sir therimometer is the uitinate standaris of reference to which all ether thermoneters are referred.

$100^{\circ}$ is determined, and the temperature of any enclosure is then ascertained by placing in it the thermometer filled at zero, and weighing the liquid that runs out. Thermometers on this principle were used by Regrault in his celebrated researches on steam.
Sturdard Thermomelers.- The tube is sometimes made with elliptical bore to ensure visibility of the mercury column, but it is usually circular in section. The internal diameter most be as nearly as possible uniform. This is tested by a preliminary calibration in which a elocrt thread of mercury is measured in different parts of the tube. The length of stem and the range of the thermometer baving been docided upon, the size of the bulb is calculated from the known expansibility of mercury and the section of the bore. The bulb is made as nearly as possible the required size, either by blowing it from a tube or preferably by forning it of a glass cylinder, and attached to the stem. The bulb is usually cylindrical in form and it must be uniform in thickness. The utmost care requires to be cxercised to keep the bulb and stem dry and clean and to fill them with pure mercury reeently distilled. The mercury is boiled in the thernomoter for some time to drive out all traces of air and noisture, and the point of the stem is sealed off. If the thermometer is not intended to measure temperatures up to the boiling point'of mercury, an expansion should De made at the top of the iube to prevent bursting from accidental overheating. Under Heat (vol, xi. p. 661) the changes of volume which thermometer bulbs undergo in cooling and for a long time aftervards are discussed. The process of annealing by heatiug to a tenperature exceeding $400^{\circ} \mathrm{C}$. for some hours as originally proposed by Person, ${ }^{2}$ or in vaponr of mercury for several daya as recently practised ot Kew, renders the thermometer much less liable to sufficr change of zero by the lapse of time or by heating to any lower temperature. All instruments of precision should be treated in this way, or kept for several years after they have been filled and sealed before they are graduated.
The first fixed point on the scale is marked at the place where the mercury stands when the thermometer is buried in melting ice from which the water is allowed to drain awas, the eecond at the place where the mercury stands when the thernometer is immersed in steam of water boiling freely under the pressure of 760 mm . ( 29.92 inches) of mercury corrected to $0^{\circ} \mathrm{C}$. The space betwecr these may be graduated either in arhitrary equidistant divisions, as it is best to do in delicato instruments, or in degreas of any scale. Each degree centigrade is $r$ fo of the volume of the tube between the freezing and boiling points; if the tube is quite uniform in bore the degrees will be of equal length and may be marked off correctly by a dividing engine. If the prelimiusry calibration showed the tube to vary in diameter, the degree marks are often edjusted to correspond to intervals of equal volume. It is better in all cases, whether degrees or arbitrary divisions aro adopted, to have them of equal length and correct the readings by the callisration curve. The scale may be continued sbore and beneath the fixed points in degrees or divisions of the same length.
Calibration consists in meaanring the internal volume of the thermometer tube by means of a thread of mercury detached from the main column. There are several ways of doing this, fer particulars of which reference may be made to the British Associstion Fepport on the subject (1882, Pp. 145-204), where references to erigiral memoirs, are given. The best and simplest is Gay Lussac's "step by ste?" inethod.
The most recent and approved processes of manufacturing, testing, and n ing standard thermometers of great delicacy and high precision are described ly Guillaume in his "Études Thermométriques" (Travauzet Necmoires du Burcaut International des Poids et Mesures, v. 1888) ; ${ }^{3}$ for additional inforimation the work of Pickering cited below may also be consulted.
Comparison of Thermomaters. - As the apparent expansion of nuercury in glass from $-39^{\circ}$ to $100^{\circ} \mathrm{C}$.s is very nearly proportional to the amount of heat imparted to it, a thermometer made and divided as indicated abovo is a дatural standard. But the apparent expansion with different kinds of glass differs (see Heat, vol. xi. pp. $563-4)^{5}$ sad, except at the fixed pointo or near them, mereury thermometcrs of different construction will only fortuitously agree sbsolutely amodg themselves or with the air thermometer. Bosscha ${ }^{6}$ states that at $50^{\circ} \mathrm{C}$. the mercury thermometer shows an error of $0^{0} 5$, other experimcntere place it as high as $1^{\circ}$, but Mascart found it to amount only to $0^{\circ} 06$. ${ }^{\circ}$ For purposes of ordiDasy experiment thermometers are compared at several temperatures with some standard instrument of known valuo-that of tho K EN observatory for Great l3ritain, -and all results are stated in terms of the standard

The methods of comparison at Kew are

[^118]described by Welsh (Pros, $\mathcal{R}$ S., vi. 181) and Whipple (Phil. Mag., [5], xxi., 1886, p. 27).
The reading of thermometers is greatly facilitated by the process of ensmelling the back, snd still more by that of entirely surround. ing the instrument with onamel except over a parrow strip through which the mercury is 日een. ${ }^{1}$ The onamel must not be allowed to oncroach on the bulb, for that rould endanger the homogeneity and etrength of the glass

Thermometers Employed for Special Purposes. - Physical and Chemical Work.-For all purposes of minute accuracy where thermometers are applicable standard instruments must be employed. They mast be used in one position only. The stem is nsoally engraved with an arbitrary seale of equal divisions, the total range not exceediog $15^{\circ} \mathrm{C}$., and zeadings are made by a cathetometer at some distance. The use of an intermediste bulb, first reeommended by Person, enables the fixed points to bo observed on instruments of very short range. Results of great accuracy, cortainly to $0^{\circ} .005 \mathrm{C}$., may be obtained in this way for comparative porposes if sufficient care be taken; but the greater the sensitiveness of a thermometer the more difficult is it to obtain a Beries of concordant readiogs (HEat, vol. si. p. 562). Pickering ${ }^{2}$ uses thermometers of extreme sensitiveness, in which, by conveying the excess of mereury iato an expansion at the top of the stem, he secures that the same part of the short arbitrary scale is used for every temperature that has to be measured. In physical researches thermoolectric junctions are more often used than thermometers for measuring very small differences of tomperature.
For ordinary work in a chemical or physical laboratory thermo. uneters.are used which can be read easily to one-tenth of a degree centigrade, and hare a range from $0^{\circ}$ to $100^{\circ}$, or in some casea to $350^{\circ} \mathrm{C}$. They are always either engrared on the stem or graduated on an included scale (see H户at, figs. 4, 5), and are not mounted on frames of any kind. It is not necessary to calibrate such thermometers; but they should be compared with a standard at several temperatures and frequently verified in melting ico and eteam of boiling water.
Zincke's cbemi al thermometer for high temperature has a scalo commencing at $100^{\circ} \mathrm{C}$. In Geisster's nitrogen thermometer the range is extended by raising the boiling point of the included mercury, the upper part of the tube heing flled with rareficd nitrogen.
Afcteorological. - The thermometer was early spplied to the study of differences of climate, and this is still one of its most inportant ases. The wet and dry bulb thermometers placed in the shade give the tcmperature and humidity (sce Hyorometry) of the surrounding nir, but "shsde" and "surrounding air" require to be defined. Shade is intended to exclude rain and prevent all radiation; and the surrounding air is that of the atnusphere in the ueighbourhood of the thermoraeter outside any shelter that may be used. The simplest way of observing is to hang up a thermometer in the ahadow of some rather cuistant object and leave it until it acquires a steady temperature; but this method hes beeu found impracticable and does not give very exact results.

In different countries different patterns of thermomoter shelter are employed and exposure takes place at a different height above the ground. Results so obtained cannot be critically compared, and the relative mean temperatures of the atmosphere in different countries are only known to within one or troo degrees. The Stevenson double-loupred screen (sea vol. xvi. p. 115), a box open below, provided with a solid roof, is used at all meteorological stations in Great Britaio. It is placed 4 feet from the ground, $a=d$ painted white outside and inside. The results derived from its use are comparable, becanse the conditions in which it is employed are the same, but the general introduction of a double roof would greatly add to its efficiency. Exposure outside windows or in wall bores is the rule in Austria. In France the Renou screen id largaly used; it is a flat roof one equare metro in extent, and double; the thermometers are hang under it two metres from the ground. A eimilar roof, but of much larger size, is emploged in Australia, in combination with a metal thermometer-box. A metallic box, constructed of double louvres with sn air-space botween, finds favour in Spain. In Russia and Switzerland Wild's ebelter is extensively employed. The thermometers are onclosed in a case composed of two or three concentric zinc cylinders perforated to admit air, and placed 11 feet above the ground. They are protected by a large shelter of wood, the south wall and roof of which are double and made of solid boards, between which air circulates; the east and west sides are louvred, and the north side entirely opeo. A aimilar sbelter is used in Canada, to cover a box of single abeet-iron louvres in which the thermometers are placed $4 \frac{1}{2}$ feet from the ground. Various systems of exposure were authorized in the United States until 1885. It was then decided, as tho result of experiments ${ }^{3}$ carried on for nearly two years, that a uniform pattern of shelter be adopted by the Signal Service. It

[^119]is f single-louvred wonden box, 3 feet 6 incles long, 3 feet wide and high, with a movable bottom and a double roof. The louvres ore provided with an upright flange on their inner side, designed to keep rain from the thermometers. The bottom of the shelter is to be fixed either 9 feet above a roof or 16 feet above grass.

All these screens are confessedly imperfect, slthough most of them are well adapted for the elimatcs in which tliey are used. Numerous comparisons of different screens with each other have been mado, ${ }^{4}$ but in some cases sufficient preeautions in the way of using instruments precisely similar and only dissimilarly situated have not been observed, and the results are uncertain. A critical comparison of the leading forms of thermometer shelter in use is still a desideratun.
The sling thermoneter ${ }^{5}$ (thermometre fronde), a small thermometer whirled in the air at the end of a string, is often nsed ob a standard, and gives more correct resdings than most closed screens. All open screens aro untrustworthy. Aitken ${ }^{6}$ has devised a series of thermometer boxes on a new principle, radiation being taken sdvantage of to produce a constant draught over the thermometer bulbs hy the use of a long blackened chimney. These give admirable results. Very small and bright objects are little affected by radiation: hence thermometers with bulbs of amsll diameter and coated with a hright deposit of gold or silver have been used without acreens. The sir temperature has also becn calculated by mesns of a formula from the readings of $t$ wo similar thermometers, the bullus of which are unequally affected by radiation. Some form of sling thermometer should always be used for observations at sea; the Board of Trade screen generally employed is theroughly objectionsblp, and can only give moderately good results by the exercisa of great precautions on the part of the observer.?

As s rille, thermometers for meteorological purposes are made with spherical bulbs, although cylindrical reservoirs present certain advantages. Ta ersure perfect uniformity in registration, the bulbs should all be as nearly as possible of one size, constructed of one kind of glass, and the mounting perfectly uniform. Better-class instruments have the bulb clear of the frame, and the stem attached te a slab of metal, of porcelaia,
 or of glass backed by wood; but sometimes they are simply fixed to a boxwood scale. In all caself they should bo graduated on the stem, and compared with standard, but in view of the uncertainty of the methods of ther, mometer exposure great delicacy is undesimble

The inflnence of heiglit on themnometers for ascertamng thi temperature of the air has been investigated witl somewhat con. ficting results; a the dispraity is at least jartlv due to the use of dissimilar instruments.

Registering Thermometers.-Rutherford's maxunum, invented before $1790,{ }^{9}$ was an ordinary mercury thermometer placed horizon. tally; the column pushed before it a small stecl index, which was left at the lighest point reached. It is lattle used now. The maximum thermoneters in common use for metenrological purposes are Negretti \& Zambra's and Phillips's. The forner is a modified outtlos thermometer. It is inado with a constriction in the tube near the bulb, past which the merrmy easily expands, but cannot return when the temperature falls, as the column oreaks at the narrowed point when the finid in the bulb begins to eontract. The thermometer acts horizontally, but Evelett devised a modification whieh is hung bulb uppermost, and the mercury, as it passes the constriction, falls down and stands as a columa in the inverted tube. The thermometer is sct by swinging

[^120]It. Phmips's maximum, claimed alse by Walferdin, bas a portion of tho mercury thead separated from the rest by a minute bubble of air. It is placed horizoutally, aud. as temperoture increases, the detached prortion of inercury is pushed forward and is not withlrawu when the main column retreats toward the bulb od cooling. It is set for a new olservation by lringing it into a verticai position and tapping it slightly. By reducing the length of the index aud the lore of the stem this therusometer uay bo made suitable for uso in any position without altering its registor. Walfcrdin's outlow maximum thermometer is a modification of that of Lord Charles Cavendish ${ }^{1}$ and the type of a number of similar instrunents. It is set by filling the stem cotircly with unercury from a lateral chauber at the top (ig. 4). Tho instrumul is placed vertically, and as temperatura rises mercury overflows into the roservoir. To be read, the thermometer is brought back to its originsl temperature, then the number of degree 6paces left vacant at the top of the tube shows the excess of maximum tempera. ture above that at the time of setting.

The miuiumn therdometer in most frequent use 18 that of Johu liutherford, inveuted in 1790 . It is a spirit thermometer, preferably filled with anylalcoliol to redice zisk of distillation, in the column of which a stanall preebaiu inder is included. The instrument is hung horiroutally, aud, as temperature falls, the index is drawn back by the surface tension of the fluid. When tempera-
 ture rises, the liqnid fows past the index casily, leaving it at the lowest point attained. Bandin invented a modilication called the thermometre d martcuu in 1862; it acts vertically, the index being fixed by a spring, as in Sixe's thermoneter, and set by a long glass needle included in the stem, which, when the instrument is ioverted, falls on the index and drives it to the surface of the alcohol. The sacreurial mininuu of Casella is an instroment of great delicacy and beanty, extremely difficult to make, sod requir. ing careful haudling in its use, A side tube cf wide bore ac (fig. 5) is jonned to the stern of an ordinary mercurial thermometer near the bull. This tube terninates in a small
 chamber $a b$, cut off by a perpendicular glass diaphragm which is perforated by a hele of greater liaunoter than the thermometer stem. When set, the mercury in the steus indicates the actual temperature, and the chamber is cmpty. On the principle of Balfour Stermart's iluctua. tion thermometer, ${ }^{2}$ when the instrument is heated the urercury remains stationary in the stem but expands into the chamber ab. When cooled, the nercury passes out of the chamber; when this is cmpty, the temperature lias returned to that at which the instrument was set, the surface attraction of glsss and merchery prevents the fluid learing the diaphragm $b$, and all subsequent contraction sakes place from the stem. The position of the mercury colunin in the stem marks the minimum temperature siuce last setting. Tho instrument is set by raising the bull ead aud allowing all the mercury to flow from the chamber.
Thermometers which record the actual tenperature at ady required time, by a change of position produced by a clock, wero amployed by Blackader ${ }^{3}$ in 1826 . His process was complicated and uncertain. Negretti \& Zambra have a eimpler arrangement that works well. Several of their reversing thermoneters (see nnder Decp-Sea Thernometcrs) sre pivoted on a frame, and leld upright ly eatchas which are withdrawn in turn at definite intervals by an electrical arrangement rogulated by e elock. Eack. instrument, when it reverses, preserves the record of temperature at that moment until it is set again.
No thoroughly eatisfactory self-registering maximum or minimum thermonseter has yet been produced. In all existing forms the fndications ore liable to be disturbed by shaking. Where alcohol is the fluid used, it is apt to volatilize and accurulate at the top of the tube, oo registering a much lower temperature than actually occurs. It is extrencly difficult slso to free alcohol thermometers from air, which gradually escapes from solution in the fluid and puders the instruanedt untrustworthy or even useless.
Tiadiation Thermometers. - The intensity of solar radistion is measured by the pyrheliometer, which usually consists of a body hoated by the sun's rays and s thermometer to measura the rise of temperature. In ancteorology radiation is measured by thermomsters simply exposed with blsckencd bulls. Results of tho utmost diversity are given by dillerent methoc's. As there is no mbans of determiniog the true messure of rasliation, all that cau be cone is to bave the instruments whose incicatione are to be compered constructed and exposed in the sane way. The naual

[^121]form, as suggestel by Herschel, is a maximunu thermoatete: with a spherical bull, holf an inch in dameter coated with lampblack and placed in the contre of a spherical vissel of clear glass, $2 \frac{1}{2}$ iuches in diameter, and exhausted of sir. The state of the vacuum may bo showd by iacluding a sinall mercurial mauometer, or a radiometcs, or by soldering iu platiuuu electrodes through which a discharge can bo made in the interior. It is not osseutial that the vacuun bo very perfect; some observers prefer to employ a globe filled with dry air. For separate anstruments to be comparable, Whipple a a Ferrel ${ }^{5}$ havo showa that the lullos must bo truly spherical, of equal thickness and size (a differenco of 8 per cent. in diameter produces variations of several dergrecs), blackened sufficiently to absorb all radiation falling on them, snd placed accurately in the centre of perfectly spherical enclosures, which must also be of equal dianeter. The stem should be as small as possibled in proportion to the bulb; and before being used for comparatire purposes all radlation thermometers should be compared with an arlitrary staudard by daily exposure for seresal wceke to subshine.

Mininanu radiatiou therioonoters, intended to measure radiatice frou the earth at night, are usually filled with alcolol, and much ingeunity has heen expended on increasing their delicacy. The bulbs are unde very largo relatively to the bore, sud constructed so as to expose a great surface, the reservoir being often helical, leuticular, annular, syoou-shaped, forked, or cveu like a gridiron.
Earth Thernometers. - Saussure introduced the use of sluggish thermoneters packed iu non-conducting material for taking the teuncrature of the soil at different depths. Symon's earth thermometer on this phiuciple is a slow-action iustrument cased in felt, aud is lowered by a chain into an iron tube which hos previously been sunk to the required depth. It may be withdrawu aud read withont changing its rccord. The underground temperature comnittee of tho British Association have used weth elow-action aud self-registering thermometers for their obscrvatious in mines and shafts. ${ }^{8}$.
Thermoneters with very long stems, which can be read above gronud, fitted in deep borings in the rock, are used at the observatories of Greeuwich and Edinburgl for investigatiog earth temperature. Those at present established at the Royal Obscrvatory, Ediuburgh, ${ }^{7}$ are the successors of a sot fixed in the rock iu 1837, and broken accidentally in 1876. They are placed witli their bulbs at depthe of $25,12,6,3$ feet beneath the surface respectively, and one has its bulb just covered. The readings of the intermediate thermonefters supply dats for correcting the long columus of alcohol in the deeper ones for the different temperatures of their different parts. Allowance ruay ba made for this elfect without calculation by utilizing the príueiple applicd by. Sainte-Claire Deville to pyrometers. A second sted, similar in every wsy to that of the thermometer. ucarly filled with the came fluid, but hermetically sealed at the lower end, is fixed beside the thermometer stem. The fluctuations it shows are due solely to causes affecting the stelu and not the bulb of the thermometer, aud they are ehnimated fron the reachugs of the latter by taking account only of the difference of level of the fluid in the two tubes.
Deep-Sea Thernoncters.-The earliest observations of warintle bencath the surface were made by raisiog samples of water io a valved box and noting the tewperature when it was brought on board. Saussure, io addition to this, used sluggish thernmometers, which be left iminersed for several hours before reading. His latest therwometer for sea. work was filled with alcohol, and had a bulb more than au iuch in diameter, which was inneedded io a mass of wax and enclosed in a stout woolenc casu. It attaincel the temperature of its surroundings very elowly, preserved it ior a long time, aud gave, in his hanils, thoroughly trustwortby results. On the introduction of registering thermometers these were usent, bnt tiso uosuspected magnituile of the effect of prossure at great depths mado the earler records entirely misleading.
A tuodification of Sixe's thormometer, protected from pressure by the adlition of an outer bulb partially filled with a liquid, is now usuafly employed oa deep-sea cxpeditions. Thoso used on the "Challer.ger," uadar the namo of Miller-Casella thermometers, were of the form shown in fig. 6. The tube is U-shaped, the beod and part of each lion filled with mercury, the rest of tho tube, the bulb, and part of the expansion on the other eide with alcobol. A A ateel index, held in its place by tho pressure of a bair, is immorsed

[^122]in the epirit in each limb above the mercury, which pushes one or other before it as the temperature is rising or falling, and leaves them at points denoting the highest end lowest temperatures passed through. The indexes are set by a magnet. The "Challenger" thermometers, which were not graduated on the etems, were secured side by side with porcelain temperature scales to vulcanite frames and placed in copper cases perforated to allow a circulation of water. Tait investigated tho wholo subject of pressure corrections efter the return of the expedition, and fouud that the high result obtained by a previous experimenter was due mainly to heat developed by compression of the vulcanite, which affected the thermometer in the press, but would not do so at sea. The correction which had to be applied was rather less thao $\frac{4}{4}$ of a degree Fahr. per mile of depth. ${ }^{1}$ These thermometers require to be immersed from twenty minutes to half an bour bofore they acquire the temperature of the water, they can only be read to quarter degrees Fahr., and they eimply indieate the extreme teluperatures through which they have passed. Buabanan has greatly improved the instrument by reducing the bore of the tube on the minimum side, which is that most frequentiy used, thus giving long degrees. Ao arbitrary scale is engraved on the stem. ${ }^{3}$ His mercury piezometer is affected by temperature and by pressure, and enables the actual temperature at any known depth to be found.

Aimé in $1845^{8}$ invented a very ingenious arrangement of outtow thermometers, which were inperted by a weight slipping dowu the line, and registered as they were being drawn up. His instru. ments were aceurate, but very delicate and troublesome to manage. Within the last few yoars Negretti and Zambra have patented several forms of modified outflow thermometere. The first instrument of the kind was complicated and unmanageable, but that how before the public is both simple and convenient. It consiste of a mercury thermometer with a cylindrical bulb and a stem AC (fig. 7) of wide bore terminating in a amall pyriform aneurism. The stem is contracted and conterted just above the bulb, and when the inetrumest is turned upside down the mercury columa breaks at this peint and flows down iato the tube, which is graduated in the inverted position. To protect it from pressure the thermometer is hermetically өealed in a strong glass tube, the portion of which surrounding the hulb contains a quantity of mercury socured by a ring of indis-rubber cement. Whon the thermometer is made to turn over at any depth in water of any temperature, the record remains nearly unaltered, and, until set for a new observa. tion, ezables the actuel temperature at the instant of reversal to be ascertained at any subsequent time and in any other place. The detached column etanding in the tube changes ita length slightly by change eif temperature. A series of expcriments with twelve instroments has ehown thet for $60^{\circ} \mathrm{F}$. change of tem. perature there is a diference of one degree in the reading of the inverted thermometer. Hence a correction must be applied in all cases where the tenperature at which the thermometer is read diffore more then a few degrees from that at which it was inverted, contrary to the opinion of the Germen observers. ${ }^{6}$ If a thermometer is inverted in water and read whilo wet, the temperature by which it ehould be corrected is obrionsly that given by the wet-bu!b in air. In view of the great range of temperature experienced ip deep-sea work in the tropics, the size of the littio overflow cell $\mathbf{B}$, which prevents mercary from the bulb from entering the tube must be considerably increased before the thermometer can be nsed with safety for euch parposes. The Negrotti and Zembra thermometer acquires the temperstura of its surroundings very rapidly (two or three minutes ere usually sufficientl); it can be read easily to tenths of a degrce Fahr.; and, above all, it ascertaios temperature at erect points of depth, and has thus revealed layers of remarkably varying temperature ${ }^{5}$ wlich could not have been detected by the other instruments in use.
The loaded woolen frame originally cmployed for reversing the thermometer is unsatisfactory, and Magnaghi's reversing gear actuated by the revolution of a amall propeller eet in motion by the water when the thermometer is drawn up briskly, is not to be trusted in shallow water or where there are rapid currents. When the pin is withdrawn tha tiermoneter caso turns over and is clamped by a eide-spring on the frame. Ruag ${ }^{6}$ edopted a simpler and better though sumewhat clumsy frame, in which the thermometer fas made to turn by slipping a neight down the line.

## : "Challenge, * Narrative, 11, ApF 1., 1882.

For a gencial accoont of deep-aea thermooibters, sce Zuchanan, Proc. $R$ \& $E_{z}$ z. $1878_{\text {, }} 77$; and - Chal." Roporss, Nartaure, vol 1., 1884, pe 84
${ }_{3}$ Ann Chim. Phys.. [3], 1845, xv. 1
Ergebnesse der Uncersuchungensfahry der Dracho, Berda, 1880, p, \%
Mul. Jour. Scot. Met. Soc. [3], 1986, No. Il. p. 283.

The United States Fish Commission ${ }^{7}$ employ the thermometer in a frame adepted for use on a wire sounding line, and also actuatrd by a messenger, but the thermometer is not clamped on turning over. The Scottish marine station produced ${ }^{s}$ a modification of Mognaghi'e frame, the propeller being replaced by a forked lever beld down by a spiral spring and reised when the thermometer is to bo reversed by the impact of a Rung's messenger (fig. 8). A messenger placed on the line below, and hung by a loep to the upper groove of the thermometer, is let go when the thermemster turns and reverses another instrument lower down. Instead of being lashed to the sounding lioe, the fremo is retained by a ram'a horn spiral below and clamped by a small vice at the upper end. Buchanen has modified and simplified the fratue, combining its mode of attachment to the line with the Auerican method of reversing.

Neumayer ${ }^{9}$ has attempted to nse a photographic thermograph for deep-sea work, the light being supplied by a Geissler tubo excited by a small battery. Siemens'e elactrical thermometer has also been experimented with, ${ }^{10}$ but hes hardly been brought to a practicable state, and the same miny be said for the use of thermoo!ectric junctions.

Hypsometer. - The boiling-point thermometer or hypsometer may be rased to obtain an independent measure of the pressure of the atmosphere, and so to determine ao altitude or verify an aneroill barameter. It consists of a very delicete morcury thermometer graduated ouly for 20 or 25 degrees Fahr. in the neighbourheod of the boiling point of water and divided on the stem into tenths. A large aneurisun on the tube a little above the bulb should ellow the freezing point to be verifial from time to time on the portion of stem beneath it. Tlise thermoreter is hung in a cylindrical tin vessel in which water is boilad by a spirit lamp pleced underneath. The bulb must be raised considerably above the level of the water, and the whole stem to the top of the mercury column imnersed in the steam. Aiter steam hes been escaping freely for some time the temperatere is read, and by reference to a table the barometric pressure, and consequently the altitude, is obtained.

Clinical Thermometers.-The first nse to which thermoneters wero applied was the study of the tempersture of the blood in fevers; end the constancy of the temperature of the healtly liuman body was for a century considered sufficient to entitle it to the position of a fixed point in graluating thermome. ters. The increased importance now attached to temperature in disease has led to the production of many forms of clinicel thermometor. The large instruments intended to bo :ead in situ are now eutirely superseded by ounall maxiunm self-registering thermometers. Greduatiou is carried to one-tifth of a degree, and the usual range is about 25 degrees Fahr., from $85^{\circ}$ or $90^{\circ}$ to $110^{\circ}$ or $115^{\circ}$. Olive-slapped

Fir. 8, - Seol lisb Frame iur Deep-Sea Thar mometar. Mas aengerdescels
ing ta rever se the inatrumeyt bulbs have boen nsed, but a cyliadrical form is most commes. There should be an arrangement like thet suggested for hypros. metcre to enable the freezing peint to be verifed. Casella'e thernemeter on Phillips's system has a small expansion on the ste $\mu$, followed by a contraction, to prevent the index following the rist of the mercury into the bulb when the iustrument is nat in nee. The "half-minute thermometer" is quick in action; it has a bulb of very small diameter and an extremely fine bore, the mercury thread being rondered visible by Hieks's arrangement of a leus. fronted stem. Immisch's avitreous thermometer is recommended for clinical use ou account of its small size, convenient shape, and non-liability to get out of order.
Thernometers for Technical Purposes.-These are mede in an infinite variety of forms, adapted to the various processes of manufacture and industry. The scale is often dispensed with in these instruments, a movable pointer being fixed at the point at which the mercory is to be kept. Air or steam thermometers (see PYRO. METER) are rapidly superseding mercury instrumento for all temperatures above the boiling point of water. The cheap German paper-scele thermometers are largely used, fitted in wooden cases,

[^123]ne dairy thernometers, and a larger aiz, for brewing purposes. Alarm thermometers are ofter employed, in which electric contact is made snd a bell rung when the temperature exceeds or falls short of e certain limit. Thermostats of various forms are made use of, in which a thermometer, by the position of the mercury in the atem, regulates the gas-supply of a burner and thus the heat of an enclosure.

Metallic Thermometers. - Thermometers depending on change in length or ferm of composite metal bare, auch as Crighton's zinc-iron bar and Bréguet's silver-gold-platinum spiral (see PYRometer), sre converted inte registeriog instruments by the addition of tro light painters pushed forward by the index needle as it travels round the graduated are to either side and left at their extreme points. Jiirgunsen in 1841 constructed a chronometer, the balance wheel of which was arranged ac as to exaggerate the effects of change of temperature and thus to affect the rate. It furnished a jery close spprozimstion to the mean temperature between the intervals of rating, and was approved by Arago for use in observations. Hermann and Pfister'a metallic thermometer ${ }^{1}$ is probably the best adapted for meteorological purposes, and has giren eatisfactory results at the Zurich observatory. It is a flat spiral of brass and ateel, which unrolls and coils up according to changes of temperature, moving an index an a divided horizontal circle and marking the maximum and minimum by light pointers. In order to secure regular resulte, the instrument must be annealed by heating for some time in beiling linsced oil.

Seversl instruments koown popularly as motallic thermometers depend on a different prisciple, that of the chauge of form in a thin metallic enclosure containing liquid. Immisch's avitreous thermometer (fig. 9) is sn example. A minute Bourdon's tube is fixed at one end, and the other bears on the ehort srm of a lever, the long arm of which acts by a rack on the pinion forming the sxis of the pointer. It is only one inch in diameter and extremely accurate.

Thermographs. -The first form of thermo. graph, due to Wheatstone, was an electrical spparatus. It has recently been improved by Van Rysselberghe, in whose bands it has assumed the following form. The thermometer is of rather wide bore and open above. At intervals of quarter of an hour a wire is moved gradually down the tube by a clock nutil
 it touches the mercury; an electric circuit Avitreous Thermorneter. is thus completed, and causes an indentation by a diamond point which moves in the same way as the wire down a rotating cylinder covered with thin sheet copper or zinc. The metal sheet is renewed at each revolution of the cylinder, and it is snfficient to join the indented points with a graver to have a plate from which any number of copies of the record may be printed. Cripn's thermograph records hourly on a revolviag cylinder. It consists essenfially of a mercury thermometer coiled into a flat spiral and suspended on a horizontal axis. Any change of temperature displaces the centre of gravity of the system, and the instrument rotates through an arc, moving a pencil as it does so. A perfectly continuous record is produced by the photographic thermograph. Wet and dry bulb thermometers are so arranged that a beam of light passes through an air-speck, which separates part of the mercury thread, or through the vacant part of the tube, and falls on a rotating cylinder covered with photograplic paper on which it traces the curve of temperature Huctuation. This apparatus is probably the mest perfect of its kind. In Bowkett's thermograph the change of form of a curved tube containing oil moves a pencil radially orer a card turned horizoutally by a clock. The resulting cnrve is referable to polar instead of rectangular coordinates; the radius measures temperature, the anglo time. Richard's thermo. graph is also actuated by means of a sealed metallic capsule containiog fluid. It draws a continnous curve in ink on a revolving drum on which one sheet lasts for seven days. This instrument is largely employed in observatories to check eyo-observations, and is jreculiarly adapted for use in positions to which access can only be hasl occasionally. It is made in many forms, one of which is specially adapted for marine work, the sealed capsule being rolled inte the form of a cylinder and exposed to the water on both surfaces.
(H. R. M.)

## théroigne de mericourt, Anne Joseph

 (1762-1817), was born at Marcourt (from a corruption of which name she took her usual designatien), a small town in Luxerr.bourg, on the banks of the Ourthe, on 13th August 1762. She was the daughter of a well-to-do farmer, Peter Théroigne. She appcars to hare been well educated, having been brought up in the consent ofRobermont; she was quick-witted, strikingly handsome in appearance, and intensely passionate in temper; and -he had a strong and almost voleanic power of cloquence, which she used with great effect upon the mobs of Paris during that short space of her life (1789-93) which alone is of historical interest. The story of her having been betrayed by a young seigneur, and having in consequence devoted her life to avenge her wrongs upen aristocrats, a story which is told by Lamartine and others, is unfounded, the truth being that she left ber bome on account of a quarrel with ber stepmother. She went to Par:s, and, on the outbreak of the Revolution, she was surrounded by a coterie of well-known men, chicf of whom were Pétion and Desmoulins. She belonged to their party to the last, became in fact the "Fury of the Cironde." On 14th July 1789 she came prominently into notice at the fall of the Bastilie, and for about four years thereafter she was seen in many of the stormiest scenes of the Revolution, being known as "la belle Liégoise," and singularly attired in a riding habit, a plume in her hat, pistols in her belt, and a sword dangling by her side. Early in October she took a leading part in the march to Versailles, and the return journey with the king and queen to the capital. No horror appalled her, and the violemee of ber language and her power with the mob were no less retnarkable than the influence which she was able, by combining cajolery, threats, and money, successfully to exert on the royalist soldiers, so winning them over to the Revolution. Being justly accused of dangerous conduct, her arrest was ordered in the following year (1790), and she left Paris for Marcourt, whence after a short stay she proceeded to Liége, in which town she was seized by warrant of the Austrian Government, and conveyed first to Tyrol and thereafter to Vienna, accused of having been engaged in a plot against the life of the queen of France. After an interview, howerer, with Lcopold II., she was reieased; and she returncd to Paris, crowned of course with fresh laurels because of ber captivity, and resumed her influeace. In the clubs of Paris her voice was often heard, and even in the National Assembly she would violently interrupt the expression of any moderatist views. She commanded in person the 3 d corps of the so-called army of the faubourgs on 20th June 1792, and again won the gratituda of the reople. She shares a heary respensibility for her conncxion with the riots of the 10 th of August. A certain contributor to Desmoulins's journal, the Acts of the Apostlcs, Suleau by name, earned her savage hatred by associating her name, for the sake of the play upon the word, with a deputy named Populus, whom she had never seen. On the 10 th of August, just after she had watched approvingly the massacre of certain of the national guard in the Place Vendome, Sulcau was peinted out to her. She sprang at him, dragged him among the infuriated mob, and he was stabbed to death in an instant. But the time came when her party was in peril at the hands of one more extreme, and she now wildy urged the mob to more moderate courses. Then the furies of the "Mlountain" seized the fury of the Cironde, and they stripped her naked, and flogged her in the public garden of the Tuilerics: The infamous affront drove her mad. She was removed to a private house, thence in 1800 to La Salpetriere for a month, and thence to a place of confinement called the Petites Maisons, where she remained-a raving maniac-till 1807. She was then again removel to La Salpetrière, where she died, never having recovered her reason, on 9th June 1817.

THESEUS, the great hero of Attic legeud, ${ }^{2}$ son of
${ }^{2}$ All the passages in the Ilicul and Odyssey in which his name or allusions to his legend occur are regarded with niere or less probaé bility as spurious.

Ægeus, king of Athens, and Rthra, daughter of Pitthẹus, king of Trezzen. Thus through his father he was descended from Erechtheus ad the autochthones of Attica; through his mother he car zof the Asiatic house of Pelops. Egeus, being childless, went to Delphi to consult the god; who gave him an ambiguous answer. He went to Trozen, and told the oracle to Pittheus, who, seeing its bearing, contrived that Egeus should have intercourse with his daughter 凷hra. ङgeus then departed to Atheus, and in due time Ethra, who remained at Trœzen, brought forth Theseus. It was given out that the child's father was Poseidon, the great god of Trozen, and in after ages the Trœezenians pointed to the Holy Isle as the place where Poseidon and Ethra met, and where Ethra raised a temple to Atheue Apaturia, at which Trcezenian maids dedicated their girdles before marriage. For his tutor and guardian young Theseus had one Cannidas, to whom, down to Plutarch's time, the Athenians were wont to sacrifice a black ram on the ove of the festival of Theseus. On passing out of boyhood, Theseus, in accordance with custom, went to Delphi, and there cut off his front hair. Egeus had deposited his sword and boots under a heavy rock, telling Ethra that, if she gave birth to a son who, on attaining manhood, should be able to lift the rock and remove the sword and boots, she was to send him with all secrecy to his father at Atlens. Theseus now lifted the rock, removed the sword and boots, and set out for Athens. He encountered many adventurerp on the way. First he met Periphetes, surnamed Coryneres (Clubman). Him Theseus slew, and carried off his club. At the isthmus of Corinth dwelt Sinis, called the Pine-Bender, because he killed his victims by fastening them to the top of a pinetree (or two pine-trees), which he had bent down and then suffered to fly up. Theseus boisted the Pine-Bender on Lis own pine-tree. Now, the deceased Pine-Bender had a pretty daughter, who ran aud hid herself in a thicket where asparagus grew plentifully; and, when Theseus came to look for her, slie prajed to the asparagus, and promised that if it wonld hide her she would never injure asparagus any more. Theseus wiled her from the thicket, and from their uniun sprang the family of the Ioxids, who worslipped asparagus. Next Theseus despatched the Crommyonian sow (or boar) a dreadful monster. Then Le flung over the cliff the wicked Sciron, who, while his guests were perforce washing his feet, used to kick them over into the sea. In Eleusis Theseus wrestled with and killed. Cercyon. A little farther on he slew Procrustes, who had only one bed for all comers: if his guest was too short for the bed, he stretched him out; if he was too long, he cut him down to the requisite length. At the Cephissus Theseus was met by the Phytalid family, who purified bim from the taint of bloodslied. As he passed through the streets of Athens, his curls and long garment reaching to his ankles drew on him the derision of some masons, who were putting on the roof of the new temple of Apollo Delphinius: "Why," they asked, "was such a pretty girl out alone ?" In reply. Theseus took the bullocks out of their cart and flung them bigher than the roof of the temple. He found his father married to Medea, who had fled from Corinth. Being a witch, she kuew Theseus before his father did, and tried to persuade Egeus to poison his son; but Ægeus at last recognized him by his sword, and took him to his arms. Theseus was now declared heir to the throne, and the Pallantids, who had hoped to succeed to the childless king, conspired against Theseus, but he crushed the conspiracy. He then attacked the flame-spitting kull of Marathon and brought it alive to Athens, where he sacrificed it to Apollo Delphinius. Now comes the adventure of the Cretan Minotaur (see Minos), whom.Theseus slew by the aid of Ariadne (q.v.).

While Thescus was iu Crete, Minos, wishing to see whether Thesens was really the son of Poscidon, flung his ring into the sea. Theseus dived and brought it up, together with a golden crown, the gift of Amphitrite. On the return voyage the ship touched at Naxos, and thero Thescus abandoned Ariadne. He landed also at Delos, and there he and the youths danced the crane dance, tho complicated movements of which were meaut to imitate the windings of the Labyrinth. ${ }^{1}$ In historical times this dance was still danced by the Delians round the horned altar-an altar entirely coniposed of left-sided iorns. Theseus lad promised Egeus that, if he returned successful, the black sail with which the fatal ship always put to sea ${ }^{2}$ should be exchanged for a white one. But he forgot his promise; and, when from the Acropolis at Atlens Fgeus descried the black sail out at sea, he flung himself from the rock, and died. Hence at the festival which commemorated the return of Theseus there was always weeping and lamentation. Thesens now carried out a political revolution in Attica by abolishing the semi-independent powers of the separate townships and concentrating those powers at Athens, and be instituted the festival of the Panathenæa, ${ }^{5}$ as a symbol of the unity of the Attic race. Further, according to a deurocratic tradition, he abolished the monarchy, and substituted in its place a popular government; but, to obviate the evils of a pure democracy, he instituted the three classes or castes of the eupatrids (nobles), geomori (Lusbandmen), and demiurgi (artisans). He also minted coins bearing ths figure of au ox. He extended the territory of Attica as far as the isthmus of Corinth.

Ho was the first to celebrate in their full pomp the Isthmian games in bonour of Poseidon; for the games previously instituted by Hercules in honour of Melicertes had been celebrated by night, and had partaken of the nature of mysteries rather than of a festival. Of Theseus's adrentures with the Amazons there were different accounts. According to some, he sailed with Hercules to the Euxine, and there won the Amazon Antiope as the meed of valour ; others said that he sailed on his own account, and captured Antiope by stratagem. Thereafter the Amazons attacked Athens. Antiope fell fighting on the side of Theseus, and her tomb was pointed out on the south side of the acropolis. By Antiope Theseus had a son, Hippolytus. On the death of Antiope, Theseus married Phædra. She fcll in love with her stepson Hippolytus, who, resist ing her advances, was accused by her to Theseus of having attempted her virtue. Theseus in a rage imprecated on his son the wrath of Poseidon. His prayer was answered : as Hippolytus was driving beside tho sea, a bull issuing from the waves terrified his horses, and he was throtn and killed. This tragic story is the subject of .one of the extant plays of Euripides.

The famous friendship between Theseus and Pirithous, king of tho Lapiths, originated thus. Hearing of the

1 The Ostiaks of Siberis have an elaborate crane dance, in which the dincers are dressed up with skins and the heads of cranes (Pallas, Reise durche verschiedene Provinsen des russischen Reichs, iii. 65).

So, too, the ship that sailed annually from Thessaly to Troy with offerings to the ohade of Achilles put to sea with sable saile (Pbilostratus, Heroica, $\mathbf{x x} .25$ ). The ship that was to bring Iseult to the mortally wounded Tristram was to hoist a white eajl if she-was on board, a buack sail if sife was not. The black eails recur in the modern. Greek version of the tale of Thesous. Ccmparv Aezatich Researches, ix. 97.

3 Besides the Panathenæs, Theseus is said to have instituted the festival of the Synoikia or Bretoikia. Wachsmuth ingenionsly enpposes that the latter feetival commemorated the local unior in a single city of the eeparate settlements on the Acropolis and ite immediate neighbourhood, while the Panathenæa commemorated the political union of the whole of Attica (C. Wachsmuth, Dis Stadt Atherr in Alterthum, p. 453 sq.).
strength and courage of Theseus, Pirithous desired to put them to the test. Accerdingly he drove away from Marathon sume corrs which belonged to Theseus. The latter pursued, but, when he came up with the robber, the two heroes were so filled with admiration of each other that they swore brotherhood. At the marriage of Pirithous to Hippodamia (or Deidamia) a fight broke out between the Lapiths and Centaurs, in which the Lapiths, assisted by Theseus, were rictorious, and drove the Centaurs out of the country. Theseus and Pirithous now carried off Helen from Sparta, and when they rew lots for her she fell to the lot of Theseus. who *cok her to Aphidnæ, and left her in charge of hie motier Æthra and his friend Aphidnus. He now descended to the lower world with Pirithous, to help his friend to carry off Proserpine. But the two were caught, and confined in Hades till Hercules came and released Theseus. Meantime Castor and Pollux had captured Aphidnæ, and carried off their sister Helen and Ethra. When Theseus returned to Athens, he found that a sedition had been stirred up by Menestheus, a descendant of Erechtheus, one of the old kings of Athens. Failing to quell the outbreak, Theseus in despair sent his children to Euboea, and, after solemnly cursing the Athenians, sailed away to the island of Scyrus, where he had ancestral estates. But Lycomedes, king of Scyrus, took him up to a high place, and cast him into the sea, that he died. Others said that he fell of himself over the cliff as he was taking his evening walk. Menestheus reigned at Athens, but, when he died before Troy, the sons of Theseus recovered the kingdom. Long afterwards, at the battle of Marathon ( 490 b.c.), many of the Athenians thought they saw the phantom of Theseus, in full armour, charging at their head against the Persians. When the Persian war was over, the Delphic oracle bade the Athenians fetch the bones of Theseus from Scyrus, and lay them in Attic earth. It fell to Cimon's lot in 469 b.c. to discover the hero's grave at Scyrus, and bring back his bones to Athens. They were deposired in the heart of Athens, and henceforth escaped slaves and all persons in peril sotioht and found sanctuary at the grave of him who in his life had been a champion of the oppressed. His chief festival was on the 8th of the month Pyanepsion (October 21st), but the 8th day of every month was also sacred to him.
Whatever we may think of the historical reslity of Theseus, his legend seems to centain recollections of historical events, e.g., the $\sigma_{i v a i k i} \sigma^{\prime} \delta \delta_{5}$, whether by this we understand the political centralization of Attica st Athens or a local union of previously separato eettlements on the pite of Athens. The birth of Theseus at Trezen points to the immigration of an lonian family or tribe from the south. With this agrees the legend of the contest between Athene sad Poseidon for supremacy on the acropolie of Athens, for Theseus is intimately connected with Poseidon, the grest Ionian god. Egeus, the father of Theseus, hass been identified by some medern scholars with Poseidon.
The Atheuisn festival in October, popularly aupposed to commemorate the return of Theseus from Crete. is interesting, as some of its festures are identical with those of larvest-festivals atill observed in the north of Eurepe. Thus the ciresione, a brench of olive wreathed with weol and decked with fruits, bread, \&c., which was carried in procession and hung over the door of the house, where it was kept for a year, is the Erntemai (Harvest-may) of Germany. ${ }^{1}$
The well-preserved Doric temple to the north of the ecropolis at Athens, commooly known as the Theseum, was long aupposed to be the sanctuary in which the bones of Theseus reposed. But erchreologists are now much divided on this question. It is agreed, however, that the temple is ef the 5 th century B.c., and that the date of its construction cannot differ widels from that of the Parthenon. ${ }^{3}$ There wero soveral (according to Philecherus, fonr) temples or Ghrines of Theseus at Athens. Milchhëfer thinks he has fonnd one of thera in the neighboarhood of Pirene. ${ }^{3}$

[^124]Onr chlet authority for the legend of Thesens is the life by Plntarch, which Is a compllation from earler wifters $G$ Ollbert, who has inveatgated tha sonrces from which Plutarch drew for hia lifa of Theseus, believea that hia chiet anthority was the Altht; of later, and that Ister mainly followed Phllochoros. See Philologus, xxxill., 1974, p. 46 sq.
There is a modera Greek iolik-tale which preserrea anome features of the legend of Theseus and the Minotaur, but for the Minataur has been aubaritnted a bevenheaded anako. See Bernard Schmidt. Orvechbsche Möhrchen, Sagen, und Folks. lieder, p. 118 sq .
(J. G. FR.)

THESMOPHORIA, an ancient Greek festival, celebrated by romen only in honour of Demeter ©eqرoфópos. At Athens, Abdera, and perhaps Sparta, it lasted three days. At Athens the festival took place on the 11 th , 12 th , and 13th of the month Pyanepsion (24th, 25th, and 26th October), the first day being called Anodos (ascent), or, according to others, Kathodos (descent), the second Nesteia (fast), and the third Kalligeneia (fairbora). ${ }^{4}$ If to these days we add the Thesmophoria, which were celebrated on the 10th at Halimus, a township on the coast near Athens, the festival lasted four days. ${ }^{5}$ If further we add the festival of the Stenia, which took flace on the 9th, the whole festival lasted five days. ${ }^{6}$ The Stenia are said by Photius to have celebrated the return of Demeter from the lower world (Anodos), and the women railed at each other by night. ${ }^{7}$ The Thesmophoria at Halimus seem to have included dances on the beach. ${ }^{8}$ The great feature of the next day (the Anodos) is generally assumed to have been a processiou from Halimus to Athens, but this assumption seems to rest entirely on an interpretation of the name Anodos, and it loses all probability ' hen we observe that the day was by others called Kathodos. ${ }^{9}$ Probably both names referred to the descent of Demeter or Proserpine to the nether world, and her ascent from it. ${ }^{10}$ The next day, Nesteia, was a day-of sorrow, the women sitting on the ground and fasting. ${ }^{11}$ As to what took place on the Kalligeneia we have no information. Nor can we define the time or nature of the secret cerermony called the "pursuit," or the "Chalcidian pursuit," and the sacrifice called the "penalty." 12

During the Thesmophoria (and for nine days previously, if Ovid, Met., x. 434, is right, and refers to the Thesmophoria) the womed abstained from intercourse with their

[^125] Demosth., 30) atates that the Neateia took place on the 16 th of Pyenepsion, but in this he standa alone.

- Schol. on Aristoph., Thesin., 80; Phetiuk, Lex., s.v. ©ef 0 oф opfop in $\mu$ '́par $\delta^{\prime}$ (where Naber should not hase altered the MS, reading $\delta^{\prime}$ into

${ }^{8}$ Schol. on Aristoph., Thesm., 834.
7 Photius, Lex., s. ₹. $\sigma \tau$ fvia; cf. Apollodorus, i. 5, 1.
${ }^{6}$ Plut., Solon, 8 ; for this passage probably refers to the Theswophoria, the Cane Colias mentioned being near Halinue (see Erläuternder Text to the Karlen von Attika, is. i sq.). The Thesmepherium at Halimus is mentioned by Pansanjas (i. 3I, I).
- Hesychius (e.r. Kyooos) and the Schol on Arist., Thesm., 585, euppose that the dey was so called becanee the wemen ascended to the Thesmophorium, which (according to the echoliast) stood on a height. But no ancient writer mentione a procession from Galimus For the dame Kathodos, see Schol., loc. cil.: Photins, Lex., or.
 feetival (commonly assumed, by the writers who accept the ststen.ent. to be the Anodos) the women carried on their heads the "books of the law," We have only the authority of the scholias on Theocritus, iv. 25, who displays bis ignorance by describing the womels as rircins (see below), and esying that they went in procession to Eleusis. The etatement may therefore bo dismissed as an etymological fictiou. Aristophanes, Eccles., 222, is no evidence tor the lool-cerrying.

10 The Bootian fostivel of Demeter, which was held at about the same time as the Athenian Thesmophoria, and at wlich the negara (see below) were opened, is distinctly statod by Plutarch (De ls. et Osir., 69) to have been a mormiug for the dgaceut (Kathodas) of I : veerpine.

husbands, and to fortify themselves strewed their beds with Agnus castus and other plants. The women of Miletus strewed their beds with pine branches, and put fir-cones in the sanctuaries of Demeter. ${ }^{1}$ Whether unmarried women were admitted to the festival seems doubtful; in Lucian's time it would appear that they were. ${ }^{2}$ The women of each deme (township) elected two married women of their number to preside over them at the festival; and every married man in the township who possessed property to the value of three talents had to provide a feast for the wemen on behalf of his wife. ${ }^{5}$ During the festival the women seem to have been lodged by tres in tents or huts, probably erected within the sacred presincts of the Thesmophorium. ${ }^{4}$ They were net allowed to eat the seeds of the pomegranate or to wear garlands of flowets. ${ }^{5}$ Prisoners were released at the festival, ${ }^{6}$ and during the Nesteia the law-courts were closed and the senate did not meet. ${ }^{7}$ Aristophanes's play on the festival sheds little light on the mode of its celebratiou.

At Thebes Thesmophoria were celebrated in summer on the acropolis.(Cadmeia) ; at Eretria during the Thesmopheria the women cooked their meat, not at fires, but by the heat of the sun, and they did not invoke Kalligeneia (which seems to mean that they did not celebrate the last day of the festival) ; at Syracuse, during the festival, cakes called mylloi, made of sesame and honey in the shape of pudenda muliebria, were handed round. ${ }^{5}$ Agrigentum, Ephesus, and Dryme, in Phocis, had also their Thesmophoria. ${ }^{9}$

The above was nearly all that was known about the Thesmo. phoria down to 1870 . In that year E. Rohde published in tha Rheinisches Muscum (N. F. 25, p. 548 sq.) a scholion on Lucian !Dial. Merctr., ii. 1), which he discovered in the Vatican MS. Palatinus 73, and which furaishes some curious ilatals about tlio Thesmophoria. It also explains two obscure and corrupt pessages of Clemens Alexandrinus and Pausanas, the true meaniag of which had been divined by Lobeck (Aglaophamus, p. 828 sq.). The substance of the scholion is this. When Proserpine was carried off by Pluto, a amineherd called Euhuleus was herding his swide at the apot, and his herd was angulfed in the chasm down which Pluto had vanished with Proserpine. Accordingly at the Thesmophoria it was customary, in memory of Eubulsus, to fling pigs into tha "chasms of Demater and Proserpine." (These "chasms" may hava been natural carerns or perhaps vaults. The scholiast speaks of thera also as adyla and megara. ${ }^{10}$ ) In these chasms or sdyta thare were supposad to be serpents, which guarded the adyta and consumed most of the flesh of the pigs that were thrown

${ }^{10}$ MrC. T. Newton discovered in tho sauctuary of Dameter and the Infernal Deities at Cnidus a chamber which may have been one of the megara referred to by the scholiast. It contained hoves of pigs and marhle figurea of pigs. The chamber was not, however, originally aubtarraneav. Ses Newtoo's Discoveries at Halicarnassus, \&c., ii. p. 383 sq. ; Id., Travels and Discoveries in the Levand, il. p. 180 sq. According Zo Porphyry (Do Andro Nympharum, 6) the Infernal Daities had megara, as the Olympian had templea, and the aacrificial pits of the former cortesponded to the altars of the latter.
in. The decaped remains of the flesh were afterwards fetched by women called "draners" (antletriai), who, after observing rules of ceremonial purity for three days, descended into the caverus, aad, frightening away the serpeats by clappiag their hands, brought up tha remsius and placed thera on the altars. ${ }^{11}$ Whosver got a portion of this decayed flesh and sowed it with the sead in tha ground was aupposad thereby to secura a good crcp. ${ }^{13}$ The rest of the scholion is obscure, sad perhaps corrupt, hut the following seams to be the sensa. Tha ceramony above described was called the arretophoria, and was supposed to exercise the same quicksaing and fartilizing influenca on man as on fields. Further, along with the pigs, sacred cakes made of dough, in the ahapo of serpents and of phalli, were cast into the caveros, to aymbolize the productivity of the arth and of man. Branches of pines wers thrown in is for a similar reason.

Tha custom described in this important acholion is clearly the same as that reforred to by Clemans Alezandridus (Proirep., § 17) and Pausunias (ix. 8, 1). From the latter we learn that tha pigs were aucking pigs, and from the former (if we adopt Lohack's
 in alire. From Pausauias we may further perbaps infar (though the passage is corrupt) that the remains of the piga thrown down in one year were not fatched up till the same time next year (cp. Paus., x. 32, 14). The question remains, At what point of the Thesmophoria did the ceremouy deacribad by the acholiast on Lucian take placa: Rolda thinks that it formed part of the cersmonies at Halimus, his chief ground boiug that Clemans (Protrep., 34) and Arnobius (v. 28) mention phalli in counexion with the "mysteries at Halimus"; but it is not cartaiu that these myateries were the Thesmophoria. Tha legend of Eubulans seams to show that the corenvon commemorated the descent of Proserpina to the nether world; and, if we are right iu our interpretation of the name Kathodos as applied to the first day of the Thesmophoria proper, the ceramouy described would daturally fall on that day. Furthor, if our interpratation of Pausauas is correct, the same day must have witnessed the dasceut of the liviug pigs and the ascent of the ratten pork of the previous year. Heace the day night ba anduftanatly styled Kathodos or $\Delta$ nodos ("descent" or "asceat") ; and so in fact it was.
It is usual to uterpret Thasnophorus "lawgiver" and Thesmophoria "the feast of the lamgiver." But the Greek for "lawgiver" is not Thesumophorus but Thesmothetes for Nomothates, when nomos displaced thesmos in the rease of "law"). If we compare such names of festivals as Oschophoria, Lampadophoria, Hydrophoria, Sciropbona ("the carryings of grapes, of torches, of water, of umbrellas") with the corresponding Oschophorus, Lampsde. phorus, Hydrophorns, also Thallophorus and Kanephorus, we can scarcely help concluding that Thasmophoria must originally have meant in the literal and physical sense the carrying of the thesmoi, and Thesmophorus the persou tho so carried them; and, in view of tha caramony disclosed by tha acholiast on Lucisn (compared with the analogous ceramony observed by the Arraphoroi at Athans), weare strougly teraptad to supposa that the women whom he calls Antletriai may bave hean also known, at one time or other, as Thesmophorei, and that the thesmoi were the sacra which they carried and deposited on the altar. Tha word would then be used in its litaral sense, "that which is set down." How the name Thesmophorus should have bean trassferred to the goddess from her ministers is of course a dificulty, which is bardly disposed of by pointing to the apithsts Amallophorus ("shaaf-bearing") and Mislophorus ("appla-baaring"), which vera applied to men as well as to the goddess.

As to the origin of tha Thesmophoria, Herodotus (ii. 171) asserta that they were introducad into Greece from Egypt by the daughtere of Danaus; whila, according to Plutarch (Eragments, p. 55, ed. Dübarr), tha feast was introduced into Athens by Orpheus the Odryaian. From these statements we can only infer the similarity of the Thesmophoria to the Orphic rites and to the Egyptian rapreasutation of the suffarings of Osiris, in connexion with which Plutarch meations them. The Thesmophoria would thas form one of that class of rites, widely spread in Westorn Asia and in Europie, in which the main feature appears to be a lamentation for the annual decay of vegetation or a rajoicing at its revival. This seams to have bean the root, e.g., of the lamentations for Adonis and Attis Ses W. Mannhardt, Antike Wald- und Feld-Kulle, p. 264 sq.
${ }^{11}$ Compare the fuactions of the two Arrephoroi at Athena (Pans., i, 27, 3). For aerpents in connexion with Demater, compasa Strebo, ix. 1,9 .
${ }_{13}$ This, as Mr Aodraw Lang has pointed out, resembles the Khond custom of barying the fleah of the hnman victim in the fislda to fertilize them. The haman victim was with the Khoods, like the pig with the Greeks, a sacrifics to the Earth goddess.- See. W. Macpher800, Memorials of Service in India, p. 129.1

THESPIE, an ancient Greek city of Beotia. It stood on level ground commanded by the low range of hills which runs eastward from the foot of Mount Helicon to Thebes. In the Persian invasion the Thespian contingent of 700 men voluntarily stayed with the Spartans at Thermopyle, and shared their fate. For its resistance to the Persians, the city was burned by Xerses ( 480 r.c.). Nevertheless, in the next year 1800 Thespians shared in the great victory of Platea. At the battle of Delium (424) the flower of the Thespians fell fighting against Athens on the side of Thebes, and in the following year the jealous Thebans availed themselves of the weakness of their gallant confederate to pull down the walls of Thespix. The walls were restored by the Spartans under Agesilaus in 378 , but were again destroyed by the Thebans, apparently before the battle of Leuctra (371). ${ }^{1}$ After the battle the Thespians, who had taken no part in it, withdrew to a strong place, Ceressus, from which, however, they were expelled by the Thebans. In 343 the city was not yet restored; but it must have been subsequently, for it is mentioned in the Roman wars.

In the 2d century Pausanias mentions that Thespix contanned a theatre, a market-place (agora), and canctuaries of Aphrodite, the Muses; and Hercules. Love (Eros) was the deity most venerated by the Thespians; they possessed a very ancient image of him in the shape of an unhewn block of stone. The marble statue of Love by Ptaxiteles was the great eight at Thospie, and drow crowds to the place. It was carried off to Rome by Caligula, restored by Claudius, and again carried off by Nero. There was also a bronze statue of Love by Lysippus. From an inscription we learn that one of the deities worshipped was Demeter Achea, the "Mater Doloross." Tho Thespians also worshipped the Muses, and celebrated a festival in their honour in the sacred grove on Mount Helicon. Remains of vhat was probably the ancient citadel are stil' to be seen, consisting of an oblong or oral line of fortification, solidly and regularly built. The adjacent ground to the east and south is coverch with foundations, bearing witness to the extent of the ancient city. The neighbouring villaye Eremokastro, on bigher ground, was thought by Ulrichis to be probably the site of the aneient Ceressus. In 1883 there were discovered, about 1200 yards east of Eremokastro, on tho road to Arkopodi (Leuctra), the remains of a polycrudrion, including a colossal stone lion. The tomb dates from the 5th century B.o., and is probably that of the Thespians who foll at Platiea, for those whe fell at Thermopyle were buried on the field.

THESSALONIANS, Epistles to the. Thessalonica, now Salontica (q.v.), was in the time of the Romans the aost important town of Macedonia. In consequence of 1ts advantageous situation, on a good harbonr and on the Via Egnatia, the great trade road which connected the Adriatic with the Hellespont, the town had surpassed the old capital Pella, and had indeed becomo one of the chief commercial centres of the ancient world. Since the Roman conquest the seat of the Roman provincial government had been here. Here, as in Corinth, tho conditions were favourable for the reception of Christianity. The popuiation was not purely Greck, but cosmopolitan, a mixture of divers nationalities. Such a population is always more susceptible to religious novelties for good and for evil than one of old, firmly established national growth. The apostle Paul experienced this to his great joy and satisfaction here also, as he for the first time set foot on the

[^126]shores of Europe with the message of Jesus Christ. It was about the year 52 or 53 that he, on his arrivai from Philippi, nreached the gospel of Christ in the rich merchant city As in other places, he began with the Jews. There was a Jewish congregation at Thessalonica, as at all the great ports and trading centres of the Mediterranean, with thcir own synagogue and regular service. For three Sabhaths Paul stood up in the synagogue, proviog loy the Scriptures that Jesus was the promised and expected Messiah (Acts xvii. 1-3). Me had not rauch success with the Jews, but this was more than compensated by the number of "devout Greeks" (i.e., Gentiles who already had some connexion with Judaism) whom bo won to a belief in Christ. Ho found hearing especially with the chief women (Acts xviii. 4). But Paul had also converted a not smaller number of real teathens. Indecd, they must have constituted the majority of the Christian church there formed, for in his first epistle he says quite generally that his readers, :n consequence of his preaching, had turned from idols to the one true God (1 Thess. i. 9).
Paul's stay in Thessalonica was short. The plots of the Jews soon obliged him to leare the town, and he betook hirsself to Bercea (Acts xvii. 10), thence to Athens (Acts xvii. 15), and finally to Corinth (Acts xviii. 1). The two epistles were written to the church of Thessalonica during a stay of a year and a half in Corinth (Acts xviii. 11), about 53-54, not before this in Athens, as is osserted in the subscription of both episties in the Codex Alexandrinus and other MSS. For when Paul wrote the first epistlo some time had elapsed since the formation of the church : some members were already dead (1 Thess. iv. 13), and Paul had worked for somo time, not only in Macedonia, but also in Achaia (i. 7, 8). On the other hand, the churchr appears to be comparatively young; the couversions are still spoken of everywhere in Macedonia and Achaia (i. 9). All this points to the conclusion that the first epistle was written in Corinth, and this is confirmed by tho opening salutation (i. 1), in which Silvanus (Silas) and Timotheus are named as joint authors, for they were in Coriath with Paul (Acts xviii. 5).
The first epistle gives us a very clear pieturo of the disposition aud state of such a young church, composed of former heathens. They had received with enthusiasm the gospel of Jesus Christ, the Bringer of salvation, the Saviour in the approaching day of judgment (i. 9, 10). But the realization of this salvation is now a amaited with impatience, and a sense of disappointment is experienced because some members of the church have died without having seen the advent of the Lord (iv. 13). At the same time many there are still living in gross heathen sins and vices (iv. 1-8). Paul had sent back Timotheus from Athens to Thessalonica in order to advise the young inexperienced church, and to ohtain news concerning it (iii. 1-5). He has just returned to Paul (iii. 6), and tho information received through this sourco is the occasion of the first epistle, ${ }^{2}$ designed to supply the place of Paul's personal presence and bring neir exhortation and instruction from the apostle to tho young church, which still much needed guidance.
We have no information conceraing the effect of this lotter. It is conceivablo, however, that the church required yet further advice and direction from the apostle, and so far it is not remarkable that Paul saw the need for a second similar letter of teaching and exhortation. This second epistle also, if it is genuine, was written during Paul's stay of a year and a half at Corinth, very soon afur

[^127]the first. For it also is written in tho conjoined names of Silvanus and Timotheus, who were still with Paul, while we must understand from Acts xviii. 18 that after Paul's departure from Corinth they ceased to be his companions. The occasion of this epistle seems especially to have ariseu from the circumstance that the chirch had been put into fear and anxiety about the advent of Christ, perhaps by a pretended letter from Paul. Two passages point to the existence of such a thing: in ii. 2, Paul says that the church shall not let itself be alarmed " by word or by letter as from us " (i.e., nominally coming from us), and in iii. 17 again Paul lays emphasis on his signature by his own hand as the token (of genuineness) to be noticed in each letter. If any case the chief aim of the epistle is to tranquillize the church concerning the advent of Christ, which is not yet immediately imminent. He particularly exhorts them not to let themselves be shaken in mind, as that the day of Christ is at hand (ii. 1, 2). For before this day comes the "man of sin" muast first appear, who seats himself in the temple of God, and gives himself out for God (ii. 3-5). And he too is for the present kept back by another power (ii. 6, 7). Only when the latter is taken out of the way shall "that wicked" be revealed, and the great falling a way shall follow (ii. 8-12).
The genuineness of the two epistles has not remained unquestioned by the newer criticism. Baur declared himself against the genuineness of both epistles, ${ }^{1}$ and he is followed by Van der Vies ${ }^{2}$ and several others. ${ }^{3}$ But in general the predominant opinion of impartial criticism at present is that the genuineness of the first epistle is certain, while that of the secoud must be given up.
This is the opinion of Milgenfeld ( $Z$. f. wiss. Theol., 1862, p. $225-264 ; 1866$, p. $295-3 \theta 1$; 1869, p. 441 s $q . ; 1870$, p. 244 sq.), Van Manen (Onderzoek naar de echtheid van Paulus tweeden brief aan de Thessalonicensen, Utrecht, 1865), S. Davidson (Introd. to the Nero Testament, 2d ed., 1882, i. 4-16, 336-351), Teizsäcker (Das apostolische Zeitalter, 1886, y. 249-261); and Holtznann also leans to the same view, without, however, definitely committing himself (Einl. ind d. N. T., 2d ed., 1886, p. 233-241), The genuineness of the firsi epistle ie viudicated by Lipsins (7heol. St. u. Kr., 1854, p. 905-934), Von Soden (ibid., 1885, p. 263-310), and Paul Schmidt (Der erste Thessalonicherbrief neus erklärt, Berlin, 1885), while, on the other hand, Kern (Tübing. Zeitefr. f. Theol., 1839, ii. 145-214) and Bahnsen (Jahrb. fur prot. Theol., 1880, p. 681-705) attack that of the secoud. Grimm (Theot. St. u. Kr., 1850, p. 753-816) and Westrik (De echiheid van den tweeden brief can de Thessalonicensen, Utrecht, 1879) have untered the lists for the genuineness of both epistles.

The final decision of the newer criticism is jastifed by the evidence. No real difficulties can be brought against the genuineness of the first epistle, but they certainly can against that of the second. When Baur finds that the epistles lack the characteristic Pauline ideas, he is only so far right that the doctrine of justification by faith is not dealt with, for which, however, no occasion arises. It has been asserted that there are traces of imitation of the epistles to the Corinthians, but the points of resemblance are'not such as to juatify this conclusion. The connexion of the passage in 1 Thess. ii. 16 (the wrath of God is already come upon the Jews) with the destruction oi Jerusalem rests on an arbitrary, vay false, interpretation. And it cannot be maintained on impartial examination that in 1 Thess. ii. 14, 15, the Jewish churches of Palestine are set forth in a way unlike Paul, ns an example for the heathen churches.
The objections to the second epistle are much weightier, though bere also not all the arguments adduced by hostile

[^128]critics are ralid. It has been often said that the author, like the author of the Apocalypse, regards Nero as the Antichrist, expecting him to reappear as the arch-enemy of Christ. But this interpretation of the short statement of our instle cannot be proved. The assumption that before the dawn of salvation godlessness would reach its height, through the appearance of an arch-enemy of God and His church is, so to speak, a dogmatic postulate which rests on the prophecies of Daniel and other prophets of the Old Testament. And, in so far as the picture of this archenemy is endowed with historical features, they can quite as well have been drawn from Caligula as from Nero. For Caligula had already laid claim to the honours of a god, and brcause of this appeared to the Jews to be the embodiment of godlessness. The assumption of such an Antichrist would not be striking in Paul. Even if it is. correct (as is generally and with reason taken for granted) that by the hindrance which keeps back the appearance of Antichrist (2 Thess. ii. 6, 7) the established might of the Roman emperor and empire is to be understood, this view would be quite in keeping with Paul's views about the Roman dominion (Rom. xiii. 1-7). Yet it must be conceded that the statements on this head create real difficulty, if we compare them with those nf the first epistle, in which all stress is laid on the fact that the day of the Joord comes as a thief in the night, and that man must be prepared for it at any moment ( 1 Thess. v . 1-11). In the second epistle it is. pointed out with equal emphasis that the day of the Lord is not immediately imminent, and that certain events must come first. (2 Thess. ii. 1-10). It is certainly very striking that Panl, 30 soon after the admonitions of the first kind, should bave given the quieting assurances of the second. And 2 Thess. ii. 2 and iii. 7 can bardly be explained except by the supposition that the readers had been thrown into alarm by a pretended epistle from Paul. Could this have beer dawed in that early time, almost under the eyes of the apostle? Finally, it is not to be denied that the style of the second epistle is different from that of the first, and that the contents often appear a mere imitation, except in the eschatological passages on account of which it was written. It must therefore be admitted that weighty if not conclusive cousiderations have been produced against its genuineness.
(E. $\mathrm{s}^{*}$.)

## THESSALONICA. See Salonioa.

THESSALY is the district of northern Greece which intervenes between Macedonia and the more purely Hellenic countries towards the sonth, and between the upland region of Epirus and the Egean Sea. It forms an irregular square, extending for about sixty miles in each direction, and this area, which is for the most part lerel, is enclosed by well-marked boundaries - by the Cambunian Mountains on the north, and by Othrys on the south, while on its western side runs the massive chain of Pindus, which is the backbone of this part of Greece, and towards the east Ossa and Pelion stand in a continuous line ; at tho north-eastern angle Olympus rises, and is the keystone of the whole mountain system. The eleration of eome of the summits in these ranges is considerable, for three of the peaks of Pindus are over 5000 feet, and Olympus, Ossa, and Pelion reach respectively the height of 9754 , 6407 , and 5310 feet. The coontry that is contained within these limits is drained by a eingle river, the Peneius, which, together with the water of its numerous confluents, passes into the eea through the Vale of Tempe. This place, whicn the Greeks were accustomed to associate with rural delights, is a chasm, cloven in the rocks, as the fable tells us, by the trident of Poseidon, between Olympus and Ossa; but thongh it posseeses every element of tha sublime, rat its features are soft and beantifu! irom the
boad winding river, the luxuriant vegetation, and the clades that at intervals open out at the foot of the cliffis. It is about four miles and a half long, and towards the middle of the pass, where the rocks are lighest, the presipices in the direction of Olympus fall so steeply as to bar the passage on that side; but those which descend from Ossa are the loftiest, for they rise in many places not less than 1500 feet from the valley. Owing to the length and narrowness of the ravine, it was a position easily defended, but still it offered a practicable entrance to an invading force, in consequence of which a number of castles were built at different times at the strongest points. On the north side of Thessaly there was an important pass from Petra in Pieria by the mestern sido of Olympus, debouching on the plain northward of Larissa; it was by this that Xerxes entered, and wo learn from Herodotus (vii. 173) that, when the Greeks discovered the eristence of this passage, they gave up all thoughts of defending Tempe. On the side of Epirus the main line of conmunication passed over that part of Pindus which was called Mount Lacmon, and descended the upper valley If the Pencius to Rginium in the north-west angle of Thessaly, near which place now stand the extraordinary wonasteries of Meteora. This was the route by which Iulius Ceesar arrived before the battle of Pharsalia. dnother pass through the Pindus chain mas that of Gomphi, farther south, by means of which there was conmunication with the Ambracian Gulf. The great southern pass was that of Cœela, which crosses Mount Othrys near'y apposite Thermopylæ. These Thessalian pā̄̄ее were of the utmost importance to soutbern Greece, as commanding the approaches to that part of the country.
Though Thessaly is the most level district of Greece, it does not present a uniform unbroken surface, but is consrosed of a number of sections which open out into one awother, divided by ranges of hills. The principal of these were called Upper and Lower Thessaly, the former comprising the western and south-western part, which contains the higher course of the Peneius and all those of its tributaries that flow from the south-the Enipeus, the Apidanus, the Onochonus, and the Pamisus; while the latter, which reaches eastward to the fout of Ossa and Pelion, is inundated in parts at certain seasons of the year by the Peneius, the flood-water from which forms the lake Nessonis, and, when that is full, escapes again and pours itself into the Lake of Boebe. The chief city of the latter of these districts was Larissa ; and the two were separated from one another by a long spur, which runs southwards from the Cambunian Mountains on the western side of that city. Again, when Thessaly is entered from the aouth by the pass of Cela, another plain, containing a imall lake, which was formerly called Xynias, intervenes, and a line of low hills has to be crossed before the town of T.'aumaci is reached, which from its commanding position ovorlooks the whole of the upper plain. The riew from this point has been described by Livy in the following remarkable passage :-"When the traveller, in passing thr,ugh the rugged districts of Thessaly, where the roads are entangled in the windings of the valleys, arrives at this cit.; on a sudden an immense jevel expanse, resembling a rast sea, is outspread before him in such a manner that the eye cannot easily reach the limit of the plains extended beneath " (xxxii. 4). To the north-eastwards of this, where a portion of the great plain begins to run up into the mountains, the Plain of Pharsalia is formed, which is iatersected by the river Enipeus; and still farther in the same direction is the scene of another great battle, Cyaoscephala. Thessaly was further subdivided into four districts, of which Pelasgiotis embraced the lower plain of the Peneius, and Hestiæotis and Thessaliotis respectively
ths northera and the southern portions of the upper plain ; while the fourth, Phthiotis, which lies towards the southeast, was geographicaily distinct from the rest of the country, being separated from it by a watershed. The determining feature of this is the Pagasmus Sinus (Gulf of Volo), a landlocked basin, extending from Pagasæ at its head to Apheta at its narrow outlet, where the chain of Pelion, turning at rigLt angles to its axis at the end of Magnesia, throws out a 1 :0jecting line of broken ridges, while on the opposite side rise the heights of Othrys. In the beroic age this district was of great importance. It was the birthplace oi Greck navigation, for this seems to be implied in the story of the Argonauts, who started from this neighbourhood in quest of the golden fleece. From it the great Achilles came, and, according to Thucydides (i. 3), it was the early home of the Hellenic race. The site of Iolcus, the centre of so many poetic legends, is at no great distance from the modern Volo. Near that town also, at a later period, the city of Demetrias was founded by Demetrius Poliorcetes, who callcd it one of the three fetters of Greece, Chalcis and Corinth being the other $t w o$.

The history of Thessaly is closely connected with its geography. The fertilily of the land offered a temptation to invaders, and was thus the primary canse of the early migrations. It was this motive which first induced the Thessalians 10 lcave their bome in Epirus and descend into this district, and from this movement arose the expulsion of the Bootians from Arne, and their settlement in the country subsequently called Bootia; while another wave of the same tide drove the Dorians also southward, whose migrations changed the face of the Peloponnese. Again, this rich soil was the natural home of a porverful aristocracy, such as the families of the Alenadæ of Larissa and the Scopariæ of Crannon; and the absence of elevated positions was unfavourable to the foundatiols of numerous cities, which might have fostered the spirit of freedom and democracy. The plains, also, Fere suited to the brecding of horses, and consequently the force in which the Thessalian nation was strong was cavalry, a kind of troops which has usually been associated with oligarchy. The wealth and the semi-Hellenic character of the people-for in race, as in geograph: ical position, the Thessalians lield an intermediato place betrees the non-Hellenic Macedonians and the Greeks of pure bloodcaused them to be wanting in patriotism, se that at the time of the Persian wars we find the Aleuadix making common cause with the enemies of Greece. When they were united they were a formidable power, but, like cther half-organized communities, they seldom combined for long togcther, and consegueutly they infuenced but little the fortunes of the Grecks.

For severel centuries during the Middle Ages Roumanian immigrants formed so large a part of the population of Thessaly that that district was called by the Byzantine writers Great Walachia (Meqád $\quad$ Bגax $(a)$ : the Jewish traveller, Benjamin of Tudela, who passed through the country in the latter half of the 12 th century, describes them as then occupying it. At ihe present day only a few colonies of that race remain, the principal of which aro found on the western side of Olympus and in some of the gorges of Pindus. The Turkish inhabitants are settled in the larger towns, and bere and there in the country districts the most impertant colony being those called Koniarates, wno were brought from Konieh in Asia Minor shortly before the taking of Constantinople, and planted under the south-west angle of Olympus. The Greeks, however, form the vast majority of the population, so much so that, even while the country belouged to the Ottomans, Greek tras employed as the official language. In accordaneo with the provisions of tho Berlin treaty, Thessaly was ceded to the Greeks by the Porte in 1881, and since that period it has formed a portion of the Hellenic kingdom.
(H. F. T.)

THETFORD, an ancient borough and market-toma, partly in Norfolk and partly in Suffolk, is situated on the Thet and Little Ouse, and on tho Great Eastern Railmay line between Cambridge and Norwich, 36 miles south-west of Norwich, 12 north of Bury St Edmunds, to which there is a branch line, and 96 north-north-east of London. Tho Little Ouse, which divides the counties, is crossed by a cast-iton bridge erected in 1829. In the time of Edward III. the tomn had trenty churches and eight monasteries. There are now three churches-St Peter's, St Cuthbert's, and St Mary's : of these St Mary's, on the Suffelk side, is the largest. There aro various monastic
remains in the town. The most important relic of antiquity is the castle hill, a mound 1000 feet in circumference and $10 \bigcirc$ feet in height, probably the largest of the Celtic earthworks in England. The grammar school was founded in 1610. In King Street is the mansion-house occupied as a hunting lodge by Queen Elizabeth and James I. Brewing and tanning are carried on; and there are also manure and chemical works, brick and lime kilns, flour-mills, and agricultural implement works. The Little Ouse is navigable from Lynn for barges. The population of the municipal borough (area 7296 acres) in 1871 was 4166 and in 1881 it was 4032.

Thetford is eupposed to have been the Sitomagres of the Romans, In the time of the Saxous, by whom it was called Theodford, it was the capital of East Anglia. During the heptarchy it was frequently desolated by the Danes. It res burned by them in 998 after a drawn battlo between Swend end Ulfcytel, and again after Ulfcytel's second battle at Ringmere, 10 th May 1004. From the reign of Athelstan to that of King John it possessed a mint. The see of Elmhara wes removed to it in 1070 , but it was transferred to Norwich in 1094. At Domesday it had Give burgesses, but by the time of Edward III. they had increased to 953 . It was incorporated by Elizabeth in 1573. It returned tro membere to parliament from the time of Edward VI., but was disfranchised in 1868.
-THEVENOT, Jean de (1633-1667), an eminent Oriontal traveller, was a native of Paris, where he received his education in the college of Nararre. The perusal of works of travel ${ }^{2}$ moved him to go abroad, and his circumstances permitted him to please himself. Leaving France in 1652 , he first visited England, Holland, Germany, and Italy, and at Rome he fell in with D'Herbelot, who invitcd him to be his companion in a projected reyage to the Levant. D'Herbelot was detained by private affairs, but Thevenet sailed from Rome in May 1655, and, after vainly waiting five months at Malta, took passage for Constanfinople alone. He remained in Constantinople till the end of the following August, and then proceeded by Smyrna and the Greek islands to Egypt, landing at Alezandria on Nerr Year's Day 1657. He was a year in Egypt, then visited Sinai, and, returning io Cairo, joined the Lent pilgrim caravan to Jerusalem. He visited the chief places of pilgrimage in Palestine, and, after being twice taken by corsairs, got back to Damietta by sea, and was again in Cairo in time to view the opening of the canal on the rise of the Nile (August 14, 1658). In January 1659 he sailed from Alexandria in an English ship, taking Goletta and Tunis on the way, and, after e sharp engagement with Spanish corsairs, one of which fell a prize to the English merchantman, reached Leghorn on April 12. He now spent four years at home in studies useful to a traveller, and in November 1663 again sailed for the East, calling at Alexandria and landing at Sidon, whence he proceeded by land to Damascus, Aleppo, and then through Mesopotamia to Mosul, Baghdad, and Mendeli. Here he entered Persia (August 27, 1664), proceeding by Kirmanshahan and Hamadan to Ispahan, where he spent five menths (October 1664-February 1665), and then, joining company with the merchant Tavernier (q.v.), proceeded by Shiraz and Lar to Bender-Abbas, in the hope of finding a passage to India. This was difficult, because of the opposition of the Dutch, and, though Tarernier was able to proceed, Thevenot found it prudent to return to Shiraz, and, having visited the ruins of Persepolis, made his way to Basra, and sailed for India November 6, 1665, in the ship "Hopewell," arriving at the port of Surat January 10, $1666 .{ }^{\circ}$ He was in India for thirteen months, and crossed the country by Golconda to Masulipatam, returcing overland to Surat, from which he sailed to Bender-Abbas and went up to Shiraz. ${ }^{2}$ He passed the summer of 1667 at Ispahan,

[^129]disabled by an accidental pistol shot, and in October started for Tebriz, but died on the way at Miyan; (November 28, 1667).
Thevenot. Was on accomplished linguist, skilled in Tuskish Arabic, and Persian, and a curious and diligent observer. His was also well skilled in the natural sciences, especially in botany, for which le made large collections in India. His persenal character mas admirable, and his writings are atill esteemed, thougb it has been justly observed that, unlike Chardin, be saw only the outside of Eastern life. The account of his first journoy was published at Paris in 1665 ; it forms the first part of his collected Voyages. The licence is dated December 1663, and the preface oliows that Therenot himself arranged it for publication before learing on his second voyage. The second and third parts were posthumously published from his journals in 1674 and 1684 (all 4to). A collected edition appeared at Paris in 1689, and a eecond in 12 mo at Amsterdam in 1727 ( 5 vols.). There is an indifferent English translation by A. Lovell (fol., London, 1687).

THiAN-SHAN, or Celestial Mountains. See Asla (vel. ii. p. 686), Syr-Daria, and Tureestan.

THIBAUT, Anton Friedrion Justus (1774-1840), one of the greatest of Cerman jurists, was born at Hameln, in Hanover, January 4, 1774, that is, ten years after his contemporary and rival Hugo, about a year before Feuerbach; and five years before Savigny. Thibaut's father was an officer in the Hanoverian army, a skilful mathematician, and, like his son, a man of much force of character. His mother was the daughter of the oberbürgermeister of the town. The Thibauts were of French descent; they came from a family which had been driven out of France on the revocation of the edict of Nantes: As a child and youth, Thibaut lived in Hameln, Harburg, and Hanover. ' He was foad of rowing, skating, and strimming, and, abovio all, of music, which remained his passion through life. As a lad he set his heart, chiefly fer romantic reasons, on being a forester, and he actually spent two years es such. But he soon became disenchanted, and in 1792 went to Göttingen to study. In 1793 he moved to Königsberg, where Kant still taught. Thibaut was deeply affected by the critical philosophy; his very latest writings bear traces of it, and it is not unimportant in the history of jurisprudence in Germany that Hugo was equally influenced by it. From Königsberg. Thibaut moved in 1794 to Kiel, where he formed a friendship with Niebuhr, at that time a student there. They lived for a year in the same honse, taking their meals together, and holding much converse on literature and politics. Both already displayed the bent of their minds - Niebubr despondent and affrighted at the pregress of the French Revolution, Thibaut hopeful, undismayed, and certain that eventually all would be well. In 1798 he was appointed extraordinary professor of civil law, and in the same year appeared his Versuche über einzelne Theile der Theorie des Rechts (Kiel, 1798), a collection of essays, of which by far the most important was entitled "Ueber die Einfluss der Philosopnie auf die Auslegung der Positiven Gesetze." Taking as his text an observation of Leibnitz, he sought to show that history without philosophy could not interpret and explain law. The essay was partly by anticipation a corrective of the teaching of the historical schooi of jurists. It enters into speculations on the possibility of forming an ideal body of law as a measure and mode of exposition of particular law, -speculations which have never been continued, certainly not by Thibaut. In 1799 be was made ordinary professor of civil law. In that year was published his Theorie der logischen Auslegung des römischen Rechits, one of his most remarkable works, a farourite book of Austin's, and, as his well-annotated copy in the Inaer Temple library shows, one which he liad most carefully studied. In 1800 Thibaut married the daughter of Professor Ehlers at Kiel. In 1802
somowhat cnvious scholar is wrong in saying that this was Thavenot's only visit to the ruins (Chardin, Voyages, ed. Langlés, viii. 345). Sie Thevenot, pt. ii. bk. 3, chap. 6.
he published a short criticism of Feuorbach's theory of sriminal law. It is an excellent illustration of his good rense; it discriminates between what is good and what is ansound and crude in the writings of criminal law reformers; it recalls in many ways the speculations of Bentham. The same year appeared Thibaut's essay Ueber Besitz und Verjöhrung. In 1803 Thibaut was called to Jena, where he spent three years, made happier than they othervise would hare been by intercourse with Goethe and Schiller, At the invitation of the grand-duke of Baden he went to Heidelberg to fill the chair of civil law and to assist in organizing the university; and he never quitted that torn, though he received in afte: years, as his fame grew, invitations to Göttingen, Munich, and Leipsic. His class was large, his influence-great; and, except Hugo and Savigny, no civilian of his time was so well known. In the work of the university he took an active part; and he cultivated with rare devotion bis favourite art. In 1814 appeared his Civitistische dbhandiungen, of which the principal was his famous essay, the parent of so much literature, on the necessity of a national code for Germany. He had no wish to enter into official or practical life. "I am Professor Thibaut, and wish to be nobody else." In 1819 he was appointed representative in the first chamber of the Baden parligment. He was also mado member of the Scheidungsgericht. In 1825 appeared anonymously his work Ueber die Reinheit der Tonkunst, in which he eulogized the old miusic, and especially that of his favourite master, Palestrina. It involved him in a contest with Nägeli and other admirers of the new school of music, whose merits Thibaut was somewhat slow to own. This has been translated into English by W. H. Gladstone. In 1836 Thibaut published his Erörtorume"n des römischen Rechts. One of his last works was a contribution in 1838 to the Archiv für die civilistische Praxis, of which he was one of the editors (see below). He died peacefully, full of years and honour, on the 29th of March 1840.

Thibaut was of the middle height and broad-shouldered, his ejes bright and piercing, his head noble and striking; his whole appearance told of power, simplicity, and reserve. All who knew him speak of his strong personality, his manly consistent nature. Young men loved him, and he drew to the young. If. he somptimes signed his letters "Semper idem A. F. J. Thibaut," it was not a phrase. Every incident told of him has a curious flavour. He was much more than a jurist: he deserves to. be remembered in the history of music. Palestrina and the carly composers of charch music were his delight. "Jurisprndence is my business; my music room is my temple." His friend, Dr Baumstark, has left an interesting record of his musical pursuits and of the work of his "Sangvercin" at Heidelberg. Among the masters of Carman prose Thibaut hulds no mean place. Nothing could bo clearer, more unpedantic and uapretentious, than his exposition; his prose is scarcely inferior to Lessing's. Like his speech, his written style was simp!e and manly, but it is simplicity marked by care, and is rich in the happy accidents of expression which come only to true artists. He liked the old classical models; he read and reread the classice, ancient and modern, his taste being catholic enough to include Plato and Chrysostom, Montaignc, Hume's Essays, Adam Smith's works, Ferguson's Essay on the History of Civil Society (which ho particularly admired), and the later derelopments of German literature.
Most of Thibaut's works have already been mentioned. Sereral of them, however, deserve further notice. And first as to his cssay刀 the nccessity of a code for Germany ("Ueber die Nothwendir. teit eines allgomeinen burgerlichen Rechts fur Dentsciland "). Kin more persuasive argument for codification was ever advancer. It has all the vige ur of Benthsnis aryuments for the samo causc,
bnt is withont hie pamphletecring recklessness of expression. Unlike Hugo, whosa cducation dsted back to the tirne when French literatura mas supreme in Germany and who felt himsell aomerthai a atranger to later German culture, Thibsut was of his own time eensitivo to tho great change which had come over Germany aftel tho battle of Leipsic, consclions of the insufficiency of Roman law and eagor to promoto the greatness of his country. In his con' tribution to the "Archiv fur die civilistische Pra:cis, in 1838, on "the so-called historical and unihistarical schonl," he tolls the histary of his memorabla essay on the necessity of a coda fos Germany. Ho had scen many German soldiers in 1814 about $\ell$ march to Paris. Ho realized the chenge which this denoted; and out of the fulness of his heart he wrote tho essy $y$ in a fortnighto The mode of treatment is more comprehensive ton the theme and to-day, perhaps partly for this reason, tho cssay is us readable as it aver was ; jurists have wot yet carried out all the oug. gestions whicle it contains. For Germany, its sciil freed and its honour vindicated, a happy future had, ho predictod, been opened up. "The division into small atates was inevitublo, and not to be deplored. The existence of great states is alvaya in a eensd nunaturel ; it iraplies a warm life only at one point, -8 conatanf repression of individuals for a common object, and no real unity between the rulers and tho aubjects. In a land of small statea, on the other hand, the peculiarity of cach nes full play; thero is developuent of variety, and the unity of princes and people is decper and more living." The only unity practicable and needfal in Thibaut'a judgment was oue of lsw; nud for such all the German Governmenta should labour. His review of tha atato of jurispradence in Germany is severe; it recalls the contemporaneous criticisms passed by Beatham on English law. Thibmut pointed out luminoualy tho contrast between the fuudamental conceptions of Roman and German society, and the inadequecy of Roman law to supply defects in German jurieprudence. It was not pleasing to many jurists to be told that a fow lectures on the laws of the Persians and Chiuose would do moro to awaken a true judicial gense than minute disquisitions on tha Roman law of intestacyobservations tho full effect of which Thibsut himself did not perlasps conctive. The essay was as much a condemnation of the entire atate of jurisprudence as an argment for codification; it wes a challonge te civilians to justify their very exiatenca. Savigny took up the challonge thus thrown down; and a long controvcray as to points not very clearly defined took place. The glory of the controveray belanged to Savigny; tha real victory rested vith Thibant. By recent legislation Germany has carried out some of the ideas of Thibant; and others indicated bat not developed in his essay remain te be completed by a acientific school of jurista One of his works best worth reading is his Theory of Construction. Though directly applicable to Romen lave, it is, of general nse. The subject is divided into- two branches-"Interyretation nacb der Absicht des Cesctzgeber" and "Interprotation nash dena Grunde des Geaetzes," or, ss Austiu expressea the distinction in a marginal note on his copy," What the legislator would hava contemplated had he conceived his purpose completely and distinctly, and what the legislator actually contemplated." It would bo interesting to compare the rules of interpretation stated by Thibaut with the rules of construction, familiar to English laryerg, laid down by Coke in Ileydon's Caso, $3,7 b$, Reports. Thibaut'a best-known work is on the Pandects (System des Pandeftenrechts, 3 vols., 1803), a part of which was translated by Lord-Justice Lindley. He was one of the earliest to criticize tho divisions found in the Institntes, and he carried on with Ilugo a controversy as to theso points. Thibant's own classification earlier is unsatisfactory. Ife divided the subject into public law (that which treats of the relationa botwcen Govorument and subjects), private law, and international law. Public law ho subdivided into constitutional law (Staalso recht, tho laws binding on tho sovereign) and administrativa law (Regierungsrcch, or criminal law, and laws relatim, to financo und polico). Tho laws relating to civil process wero dealt with partly under administrative law and partly under privato law. Statua was placed partly in tho former partly in tho latter; and tho law as to guardianship and parantal authority is treated as a jart of the lew of polica. Thibnut, hawever, abandoned in 1 ractice this unscientific dirision. One of his most interesting works is bis posthumons treatiso on tho "Cods Civil," Lekrbuch des franzassischon Civirrchts in stceer Perghichung mit den römischen Civil. rechl. While criticizing the code, which bo desigastes as in tho highest degres unsystematic, bo recognizes in it merits which Cerman jurists of bis time were reluctant to admit.
In modern German legal literaturo Thibaut's influenec is not rery perceptible. Even at Heidelberg it was quichly supersted ly that of his sucuessor, Vangerow, and in Gurmany his works are now little used as text-booke. But those best ablo to jndge Thabaut have nost prasel him. Austin, who used mucb to him, describea him as one "who tor penetrating acul ness, rectitulu of judgment and depth of learning, and cloquenco f exposition may be pleced, bf the sido of Ton Savigny; at tho head of all living civilians; and elsewhere ho prases Thibaut's indefatigable perseverance aud
"aagocity not surpassable." High though such eulogies are, they are scarcely adeqnate. In Thibaut's worlis are promises which ho did not fulfil, and they contain fertile suggestions which future jurists may ntilizc. It was not the least of his merits that he introduced scientific methods into legal practice and practical aease into jurisprudence.
(J. M H .)

THIELT, a town of Belgium, in the province of West Flanders, 15 miles south-south-east of Bruges, on a branch line between lngelmunster and Deynze. It manufactures linen and woollen goods, gloves, vinegar and spirits, and has tanneries and bleacheries. There is also some trado in cattle and grain. The town was of considerable importance in the Middle Ages, but was almost entirely destroyed by fire in 1383, a calamity from which it never wholly recovered. The population in 1876 was 10,527 .

THIERRY, the name of two excellent French historians, brothers (Augustin and Amédée), both of whom, though their literary and historical faculty was not quite equal, displayed the same devotion to historical study.
I. Jacques Nicolas Augustin Thierry (1795-1856), the elder and most gifted, was born at Blois on the 10th May 1795. He had no advantages of birth or fortune, but was greatly distinguished at the Blois grammar school, and entered the Ecolo Normale, an establishmeut which, designed on the best principles to supply France with perfectly equipped teachers, has on the whole done more service to journalism and literature than to pedagogy. He appears to have been very susceptible to personal influences, and was for a time docile to St Simon and afterwards to Comte. Buthis real bent was towards more golid studies, and, under the impulse of the strong current setting at the time towards medirval research, he began, and in 1825 published, his History of the Norman Conquest of England, much altered and improved in the later edition of 1840 . Two years later he published important Lettres şur l'Histoire de France, attacking the traditional method of history-writing, and recommending recourse to the priginal documents. About this time the heavy calamity of blindness threatened him, and by 1830 he had totally lost his sight. His marriage, however, with Julie de Quérengal, a woman of ability, considerably lightened his misfortune, and about the same time he was elected to the Académie des Inscriptions. He continued to pursue his historical studies, now through other eyes, and in 1834 published Dix Ans d'Études Mistoriques, which was followed by his capital work, the Récits Merovingiens, in 1840. His later years were chiefly occupied in the study of the history of the Tiers Etat, which bore fruit in mere than one publication. He died at Paris on May 22, 1856.

The duller sohool of picturesque Dryasdusts (a rather miraculous combination) who have profited by Thierry's labours and continned his work have sometimes charged both him ond his brother with having entered on history with their minds full of Walter Scott, and with baving subordineted facts to graphic presentation. The charge is entirely unjust, and is generally found in tho montha of those who ere particularly ill qualified to make it, inasmuch as they owe Thierry nearly everything in style. By others he is de. scribed as the founder of the picturesque school, and in this capa. city, no donbt, he has much to answer for. His own work, howover, is of a very high and remarkablo character. He had hardly any forerunners, nnless Gibbon may be counted as one, and his freedom from the besetting sin of his own school-the subordina. tion of aober history to picturesque deacription and romantic narrative-is best aeen by comparing him with his contemporary Barante, who, however, is himself not to be named otherwise than honoris causa.
II. Amédee Simon Dominique Thierry (1797-1873) was the younger brother of Augustin, and was bern on the 2d August 1797. He began life as a journalist (after an essay, like his brother, at schoolmastering), was connected with the famous rol antic harbinger the Globe, and obtained a small Governr ent clerkship. His tirst book was a brief history of Guicnno in 1825, and three years Later appeared the Histnire des Gaulois, which was received
with much favour, and obtained him, from the royalist premier Martiguac, a history professorship at Besançon. He was, however, thought too liberal for the Government of Charles X., and his lectures were stopped, with the result of securing him, after the revolution, the important post of prefect of the Haute-Saône, which he held eight years. During this time he published nothing. In 1838 he was transferred to the council of state as master of requests, which post he held through the revolution of 1848 and the coup d'état till 1860, when he was madu senator-a paid office, it must be remembered, and, in effect, a lucrative sinecure. He also passed through all the ranks of the Legion of Honour, became a member of the Académie des Inscriptions in 1841, and in 1862 received the honerary degree of D.C.L. at Oxford. He had, except during the time of his prefecture, never intermitted his literary work, being a constant contributor to the Revue des Deux Mondes, his articles (usually worked up afterwards into books) almost all dealing with Roman Gaul and its period. The chief were the Histoire d'Attila (1856), frequently reprinted, tho Histoire de la Gaule sous l'Administration Romaine (1840-2), a Tablear de l'Empire Romain, and, in imitation of his brother, certain Récits of Roman history, a book on St Jerome in 1867, and one on Chrysostom and Eudoxia in 1873. He died March 27, 1873.

His literary and historical genins was perhaps inferior to his brother's, and he exhibits more of the defects of the anecdotic method of writing listory, but he shared Augustin's passion for going to the fountainhead and for animating tho dry bones of mere chrouicles and mere academic discussions with accounts of the lifo of peoples.

THIERS, a town of France, chef-lien of an arrondisscment in the department of Puy-de-Dôme, on the railway between Clermont and St Étienne, 24 miles east-northeast of the former town. It is most picturesquely situated on the side of a hill, at the font of which the Durolle rapidly descends throngh a narrow valley into the Dore, in its turn a tributary of the Allier. The streets, rising in steep rows, contain many wooden and gabled houses, some of which are as old as the 15 th century, and a fine viuw of the Plair. of Limagne and the Dôme Hills is obtainalle from the termaces. All the processes of making cutlory may bo scen at Thiers, giving employment to 12,000 wo k men in the town and the villages within a radius of 6 tc 7 miles. Sheath-making, tanning, and paper-making (chitfiy stamps and playing cards) employ 8000 hands, and th. business done reaches $£ 1,200,000$ per annum. The chu iclof Le Moutier, so named from a Bencdictine monastyry of which it formed part, contains building of the 7 th, 8 th, and 11th centuries; the tower is more modern. There were 12,005 inhabitants in 1886 (commune 16,754).
Thiers was sacked in 523 by the soldiers of Thierry, the sou of Clovis; and Gregory of Tours speaks of a wooden chapel which then existed here (an the site of the present church of Le Moutier). The church of St Genez was built in 573 by Avitus, bishof of Clermont, on the site of the ancient Tigernum Castrum, was rehuilt in 1016 by Wido, Jord of Thiers, and again in the 12th centary. There is some curious mosaic work of the 12 th century, aud a fine tomb of the 13 th. The commercial importence of Thiers was greatly increased three centories ago, when the manufacture of the larger kinds of cutlery was introduced from Chateldon, between Vichy and Thiers.

THIERS, LOUIS ADOLphe (1797-1877), " liberator of the territory," as even the short-lived gratitude of France continues to call him, was born at Marseilles on April 16, 1797. His family are somewhat grandiloquently spoken of as "cloth merchants ruined by the Revolution," but it seems that at the actual time of his birth his father was a locksmith. His mother belonged to the family of the Chéniers, and he was well educated, first at tho Lycée of Marseilles, and then in the faculty of law at Aiz. Here ho began his life-long friendship with Mignet, and was
called to the bar at the age of 23 . He had, however, little taste for law and much for literature ; and he obtained (it is said by an ingenious trick, and in spite of unfair and prejudiced attempts to deprive him of it) an academic prize at Aix-for a discourse on Vauvenargues. In the early autumn of 1821 Thiers went to Paris, and was quickly introduced as a contributer to the Constitutionnel, at first on literary and then on general and especially political subjects, as well as art and the drama. In each of the years immediately following his arrival in Paris he colleeted and published a volume of his Constitutionnel articles, the first on the salon of 1822 , the second on a tour in the Pyrences. Ho was put out of all need of money by the singular benefaction of Cotta, the wellknown Stuttgart publisher, who was part-proprictor of the Constitutionnel, and made over to Thiers his dividends, or part of ther. Meanwhile he became very well known in Liberal society, especially in the house of Laflitte, and he had begun and was rapidly compiling (at first with the assistance of M. Felix Bodin and afterwards alone) the celebrated Histoire de la Révolution Francaise, which founded his literary and helped his political fame. The first two volumes appeared in 1823, the last two (of ten) in 1827. The book brought him little profit at first, but became immensely popular. The well-known sentence of Carlyle, that it is "as far as possible from meriting its bigh reputation," is in strietness justified, not merely in regard to this, but in regard to all Thiers's historical work, which is only too frequently marked by extreme inaccuracy, by prejudice which passes the limits of accidental unfairness and sometimes seems to approach those of positive dishonesty, and by an almost complete indifference to the merits as compared with the successes of his heroes. But Carlyle himself admits that Thiers is "a brisk man in his way, and will tell you much if you know nothing." In other words, the Histoire de la Révolution (again like its author's other work) possesses in a very high degreo the gifts of clearness, liveliness, and intelligible handling which so often distinguish French writing. Coming as it did just when the reaction against the Revolution was about to turn into another reaction in its favour, it was assured of success.
For a moment it seemed as if the author had definitely chosen the lot of a literary man, even of a literary hack. He planned an Histoire Générale, and was about to survey mankind from China to Peru on the deck of a French man-of-war as a preliminary process. But the accession to power of the Polignac ministry in August 1829 changed his projects, and at the beginning of the next year Thiers, with Armand Carrel, Mignet, and others, started the National, a new opposition newspaper, which openly attacked the older Bourbon line and was foremost in provoking the famous and fatal Ordonnances of July, Thiers himsclf was the soul (or at least one of the souls) of the actual revolution. What share ho had in the process sometimes attributed to him of "overcoming the scruphes of Louis Philippo" is no doubt a dcbateable question, with the problem in linine of the debate whother Louis Philippe had any scruples to overcome. At any rate Thiers had his reward. He ranked, if not at once, yet very 8000 , as one of the radical though not republican supporters of the new dynasty, in opposition to the party of which his rival Guizot was the chief literary man, and Guizot's patron the duke of Broglie the main pillar among the nobility, and which might be called by comparison Conservative. At first Thiers, though eleeted deputy for Aix, obtained only subordinate places in the ministry of finance. After the overthrow of his patron Laffitte, he scemed to change his politics and becamo much less radical, aud, after the troubles of June 1832, this teuc!.
ency was strengthened or rewarded by his appointment to the ministry of the interior. He repeatedly changed his portfolio, but remained in office for four years, became president of the council and in effect prime minister, and began the series of quarrels and jcalousics with Guizot which make one of the chief and not the most creditable features of the politics of the reign. At the time of his resignation in 1836 he was foreign minister, and, as usual, wished for a spirited nolicy in Spain, which he could not carry out. He travelled in Italy for sone tinne, and it was not till 1838 that ho began a regular campaign of parliamentary opposition, which in March $18 \pm 0$ made him president of the council and foreign ministe: for the second time. But he held the position barely six months, and, being unable to force nn the king au anti-English and anti-Turkish policy, resigned on October 29, afte: having, as was generally thought, with the direct purpose of stirring up Anglophobia, begged the body of Napoleon irom England. This was made the occasion of the ceremcay immortally ridiculed by Thackeray, and, it is said, con demned by Thiers himself as unvorthy of the occasion. He now had little to do with politics for some years, and spent his time on the preparation, on a much larger scale than his first work, of his Histoive du Consulut et de l'Empire, the first volume of which appeared in 1845, and which continued to occupy him for more than tweuty years of composition and nearly twenty of publication. During the interval, though he was still a member of the chamber, he spoke rarely, but after the beginning of 1846 his appearances were more frequent, and he was evidently bidding once more for power on the liberal and reforming side. Immediately before the revolution of February be went to all but the greatest lengths, and when it broke out he and Odillon Barrot were sumanoned by the king, but it was too late. Thiers was unablo to govern the forces he had helped to gather, and he resigned.
Under the republic he took up the position of conservative republican, which he ever ofterwards maintained (his acceptance of the republic being not mucls more heartfelt than his subsequent acceptance, after an interval, of the empire), and he never took office. But the consistency of his conduct, especially in voting for Prince Louis Napoleon as president, was often and sharply criticized, one of tho criticisms leading to a duel with a fellow deputy, Bixio. On the whole, his conduct during these years, and still more during the last years of Louis Philippe, may be said to have been not wholly creditable. He was arrested at the coup diétat (when some malicious and apparently false stories were spread as to his cowardice), was sent to Mazas, and then escorted out of France But in the following summer he was allowed to return. For the next decade his history was almost a blank, his time being occupicd for the most part on The Consulate and the Empire. It was not till 1863 that he re-entered political life, being elected by a Parisian constituency in opposition to the Government candidate. For the seven years following he was the chief speaker among the small band of anti- Imperialists in the Frenel chamber, and was regarded generally as the most formidable enemy of the cmpire, all the more formidable because he never gave occasion for taking any violent steps against him. It laas been pointed out that, whilo nominally protesting against the foreign enterprises of the empirc, he perpetually harped on French loss of prestige, and so contributed more than any one else to stir up the fatal sprit which brought on the war of 1870 , and that, while constantly criticizing and weakening the Government of his country, he gave it no help nor even offered any. Eyen when the Liberal. Imperialist Ollivier ministry was formed, he maintainod at first an angting but benevolent neutrality, and the,
an open opposition, and it would be pleasant to feel more certain than wo can feel that his vigorous denuncia. tion of the war with Prussia was the result of honest. conviction, and not inerely of the fact that it was not his war. At any rate, it brought him great anpopularity for the moment, with a correspoading reaction of gratitude when the crash came. Again it is impossible to be sure whether mere "canniness," or something better, kept him from joining the Government of the National Defence, of which he was in a manner the author.

Nevertheless the collapse of the empire was a great opportunity for Thiers, and it was worthily accepted. He undertook in the latter part of September and the first three weeks of October a circular tour to the different courts of Europe, in the hope (which he probably knew to be a vain one, though the knowledge neither daunted his suirit nor relaxed his efforts) of obtaining some interveation, or at least some good offices. The mission was unsuccessful; but the negotiator was on its conclusion inmediately charged rith another-that of obtaining, if possible, an armistice directly from Prince Bismarck. For a time this also failed, as the Provisional Government would not accept the German conditions; but at last France was forced to yield. The armistice having been arranged, acd the opportunity baving been thus obtained of electing a National Assembly, Thiers was chosen deputy by more than twenty constituencies (of which ho proferred Paris), and was at once eiected by the Assembly itself practically president, nominally "chef du pourorr exécutif." Ho lost no time in choosing a coalition cabinet, and then personally took up the negotiation of peace. l'robably no statesman has orer had a more disgusting task; and the fact that he discharged it to the satisfaction of a vast majority, even in a nation popularly reputed the vanest, the least ballasted with common sense, and the most ungrateful to public servants who are unsuccessful, is the strongest testimony to Thiers's merits. After contest. ing the mafter, on the one side with the determination of Germany to hare the pound of flesh, on the other with the reluctance of the Assembly to submit to the knife, be succeeded in convincing the deputies that the peace was necessary, and it was (March 1, 1871) voted by more than Gre to one.

Thiers held office for more than two years after this event,-a length of tenure which, in tho circumstances and considering the French temper, is very surprising, and shows the strength of the general conviction that he alone could be trusted. Ho lad at frst to meet and crush at once the mad enterprise of the Paris commune ; and the severity which was undoubtedly shown in doing this is more than justified by two considerations, first, that failure to suppress it would have meant anarchy throughout France; and, secondly, that the Germans would almost to a certainty have made it a pretext for further demands. Soon after this was accomplished, Thiers became (August 30) in name as well as in fact president of the republic, and be set himself with rigour and success to the tasks of rearranging the army, the finances (including the paying off of the war indemnity), and the civil service, and of procuring the withdrawal of tho German arniy of occupation.

T'ne strong personal will and inflexible opinions of the president had much to do with the resurrection of France; hut the rery same facts uade it inevitable that he should excite riolent opposition. It seems to be generally acknowledged that to him personally were due the establishment and retention of the republican rather than the monarclical form of government, to which latter the Assembly as first elected was notoriously disposed. Ho uas a confirmod protectionist, and freo-trado jueas Lad
made great way in France under tho empire: bo was an advocate of long military service, and the depotees of la revanche wero all for the introduction of gencral and compulsory but short service. Both his talents and his temper mado him utterly indisposed to maintain the distant, Olympian, apparently inactive, attitude which is supposed to be incumbent on a republican president; and (fur his tongue was never a carefuily governed one) he cometimes let drop expressions scarcely consistent with constitutional theories of the relation of the chief of the state, whether president or king, to parliament. In January 1872 he formally tendered his resignation; but the country was then in too manifestly ciisorganized a condition to allow even his enemies to accept it. His position, however, was clearly one not teaable for long in such a country as France. The Right (ard not merely the Extreme Right) hated him for his opposition to the restoration of tho monarchy, and with some justice reminded him of former declarations ard opiaions on the subject ; the Extreme Left could not forgive the suppression of the commune, while some radical leaders, who may hare had little sympatby with the commune itself, saw in his great reputation and imperious personality a bar to their own accession to power. His chief supporters - men liko Rémusat, Barthélerny SaintHilaire, and Jules Simon-mere men rather of the past than of the present ; and he had few younger adherents.

The year 1873 was, as a parliamentary scar in France, occupied to a great extent with attacks on Thiers. In the early spring regulations were proposed, and on April 13 were carried, which Fere intended to restrict the cxecutive and especially the parliamentary powers of the president. On the 27 th of the same month a contestad clection in Paris, resulting in the return of the opposi. tion candidate, M. Barodet, was regarded as a grave disaster for the Thiers Government, and that Government was not much strengthened by a dissolntion and reconstitution of the cabinet on May 19 . Immediately after. wards the question was brought to a head by an interpel. lation moved by tho duke of Broglie. Tho uresident declared that he should take this as a veto of want rif confidence; and in the debates which followed a rote cf this character (though on a different formal issue, and proposed by M. Ernoul) was carried by 16 votes in \& house of 704. Thiers at once resigned (May 21 ).

He survived his fall four jears, continuing to sit in the Assembly, and, after the dissolition of 1876 , in the Chamber of Deputies, and sometimes, though rarely, speaking. He was also, on the occasion of this dissolution, elected senatur for Belfort, which his exertions had sared for France; but be prefarred the lower house, where he sat as of old for Paris. On May 16, 1877 , he was one of the " 363 " who voted want of confidence in the Broglie ministry (thus paying his debts), and he took considerable part in organizing the subsequent electoral campaign. But he was not destined to see its success, being fatally struck mith apoplexy at St Germain-en-Laye on September 3. Thiars had long been married, and his wife and sister-in-law, MIle. Dosne, were his constant companions; but he left no children, and bad had only one-a daughter, - who long predeceased him. Ho bad been a member of the Academy since 1834. His personal sppearance was remarkable, and not imposing, for he was very short, with plain features, ungainly gestures and manners, vary near-sighted, and of disagreeabla voice; yet he becama (after wisely giving up an attempt at the ornate style of oratory) a very effectire speaker in a kind of conversational manner, and in the epigram of debate he had no superior among the statesmen of his time except Lord Beaconsield.

Thiers is by far the most gifted and interesting of tho group of literary statesmen-not scatesmen who have had a penchant for
literature, hut men of lettera whose literary distinction has mado them politiciaos-which forms a uniquo featuro in tho French political history of this century. Numcrous as these are, there are only two who are at all comparable to him-Guizot and Lamartine; and as a statesman hestands far above hoth. Nor is this eminonce mercly due to his great opportunity in 1870 ; for Guizot maght ander Louis Philippe bave almost made himself a French Walpole, at least a French Palinerston, and Lamartıno's opportunitics after 1848 were, for a man of political genius, illimitavie. But both failed, -Lamartino almost ludicrously,-whilo Thiers ini hard conditions made a striking if not a brilliant success. A devil's advoceto may indeed urge that his egotist a od alnost gasconading temperament atood hiu in stad in the trying circumstances of his negotiations with the powers and with Prince Bismarck, -but this is not really to his discrelit. Noless inasterful methods than his would haro sufficed to bring France into order from the chaos succecding the fall of the empire and the invasion of the Germans. But Thiers ouly showed well when he was practically supremc. Eren as the minister of a coustitutional monarch his intoleranco of interfercuce or joint authonty, his temper at onco imperious and intriguing, his invetemate inclination towardsbrigute, that is to say, underhand rivalry aud caballing for power and place, showod themselves uafavourably; and his coustant teudency to inflane the agcressive and chauvinist surit of his country, though it may fairly clain to havo beeu a kind of patriotism, nerglecterl fact, was not lused ou any just estimato of the relative power and jutcrests of France, and led his country wore than once to tho verge-once, though he affected to waru her off, over the verge-of a great calamity. In opposition, hoth !nuler Louis Chilipice and under the empire, and cren to some extent in tho last furr yeors of his life, his worse qualities vere always manifestull. But with all theso drawbacks loconqued and wall retain o place in what is gerhaps the highest, as it is certaiuly tho smallest, cliss of statesmen-the class of those to whon their country has had recourse in a great disaster, who havo shown in hringing her through that disaster the utmost constancy, comrage, devotion. and skill, and who have been rewarded by as much success os the occasion permitted.

As a man of letters Thiers is very nuch smaller Ho las not only the fault of diffuseness, which is common to so Diany of the best-known histories of this century, but others as scrions or more so. The charge of elishonesty is one never to he hifhtly made against men of such distinction as his, especially when therr evideat confidenec in their own infallibility, their faculty of mgentoos casuistrj, and the strcugth of rill which makes them (unconsciunsly. at : loulti) closo and keep closed the cyes of their mind to all incouvenicnt facts and infercuces supply a more charitahle explanation. But it is certain that from Thicrs's dealings with the men of the first Revolution to his dealines with tho battlo of Waterloo, coustant, angry, and well-supported protesta against his unfairness wero not lacking. Although his search among documents was undoubtedly wide, its results are by no means alvays accurate, and his admiress themsolves admit great inequalities of style in himo. These tharacteristics reappear (accompanied, however, by frequent touches of the epigrammatic power above mentioned, which scems to lave some to Thiers more leadily as an orator or a journolist then as on historian) in his specclies, which bave, since his death, been collected in many volumes, by his willow. Sainte-Beruve, whose notices of Thicrs are gencrally kindly, says of him, "\$1. T'liers sait tout, traurhe tout, parle de tout," and this ommiscience and "cocksuraness" (to use the word of a pimo ininister of Eugland con. temporary with this prime mivister of France) are jerhaps tho chicf pervading features both of the statesman and the than of letters.

His historles, in many different editlong, and his specches, as abore, aro easily accesslble; bls minor works and newspaper amticles have nol, wa belleve, been eollected in any form. Works on him, by Mi Laya, IS de Mazailo, his collengue and friend 31 Jules Simon, and uthers, are nunitruiv But a thinough bocrapho ical stady of hm has not yet been made a and, thongb monumenis canueh hava beea ralsed in has own oomntry, it evea thero oten romptabird that the ancessant and fulle political serucztes of tha reputation and weakened the memory of the last great satcsman of abscored the reputation and weakened the memory of the last great statesman

(GAnce.

THIRLWALI., Coxxop (1797-1875), bishop of St David's, was born at Stepney on 11 th January 1797, and was the son of the Rev. Thomas Thirlwall, at the time recturer at St Dunstan's, Stepney, and afterwards rector of Bowers Gifford, in Essex. The family were of Northumbrian extraction. Young Counop showed the mest remarkable precocity, learning Latin at three, reading Greek at four, and writing scrmons at seven. When he was twelve his admiring father published his Primitix, sermons and poens, the thoughts of an imitative boy in the style of a grown man. No especial greatness could have been safely predicted from these performances, which Thidwall assiduously strove to suppress in after years He shortly afterwards went to the Charterhouse, whero
he wrote a number of letters to a friend named Johu Candler, some of which have been preserved. They display the same extraordinary prematurity, but are barren of anything original except what lio himself calls "sensibility to the great and beautiful in morality." By a curious coincideoce bis future rival in Greck history, Grote, and liare, his coadjutor in the translation of Nicbuhr, were among his sclioolfellows. He took up his rosidence at Trinity Collegc, Cambridse, in October 1814, and gained the Craven tuiversity scholarship, ono of threo recorded instauces of this honour being obtained by freshmen, and the chancellor's classical medal. In October 1818 he was elected to a fellowslip, and immediately went for a year's travel ou the Cootinent. At Rone he gained the friendship of Bunsen, which had a nost important influenco on his life. On his return," "distrust of his own resolutions and convictions" led him to abandon for the sime his intention of beinis a clergyman, aud he settled down to the study of the law, "with a firm determination not to sufficr it to engross my time so as to prevent me from pursuing other branches of knowledge." This was not the way to lecomo lord chancellor. and, though he nfterwards says, "My aversion to the law has not mcreased," he adds, "It searcely could." How little his beart was with it was shown by the latume ho soon insposed upon himself of trauslating and prefacing Schleciermacher's essay on tho Ciospel of St Luke, "very injudi ciously," says Maurice, who seems to think that it may have cost Thirlwall the archbishopric of Canterbury. The translation, nevertheless, marks an era in English theology. He further, probally influenced by Hare, who had already translated Tieck, rendered two of the latter's most recent Nooellen into Englisl. In 1827 he at length made up bis mind to quit his uncongenial profossion, and was ordained deacou the same year. Beyond all question ho might have obtained the highest distinction both as jurist and advocate, had law interested hime more, or other thing. less. No one ever possessed a more judicial mind. Of his oratory, Mill, whom he opposed at a debating society, says, "Before he had uttered ten sentences I set him down ns the best speaker I had ever heard, and I bave never since heard any one whom I placed above him."

It is not often that a scholar twice makes an epoch by a translation. Such was Thirlwall's destiny : be joined with Hare in translating Niebuhr's History of Romo ; the frst volume nppeared in 1828. The translation was nttacked in the Quarterly as favourable to scepticism, and the translators jointly replied. [n 1831 the friends established the Philological Museum, which lived through only six numbers, though am8ng Thirlwall's contributions was his masterly paper on the irony of Sophocles,-"the most exquisite critcism I ever read," says Sterling. On Hare's departure from Cambridge in 1832, Thirlwall became essistant college tutor, which led him to take a memorable share in the great controversy upon the admission of Dissenters which arose in 1834. Dr Turton, the regius professor of divinity, had written a pamphlet oljecting to the admission, on the pretext of the apprehended unsettlement of the religious opinions of young clurchmen. Thirlwall replied by ןointing out that no provision for theological iustruction was in fact made by the collegcs except compulsory attendance at clanel, and that this was mischicvons. This attack upon a time-hallowed piece of college discipline brought upon bim a demand for the resignation of his office as nssistant tutor. He complied at once ; his friends gencrally thought that he ought to Lave tested the master's power. The occurrence marked him out for promotion from a Liberal Government, and in the nutumn he reccived the chancellor's living of Kirby-under-Dale, in Yorkshire. Though devoted to his par

## 314

ochual dnties, he found ume to begna the book which has remained the principal work of one whose performance, however great, rarely ruse to the level of his power. His Fistory of Greece, unfortunately for him and for us, was a commission from Lardner's Cabinet Cyclopsdia, and was originally intended to have been condensed iuto two or three duodecimo volumes. The scale was enlarged, but Thirlwall always felt cramped. He seems a little below his subject, and a little below himself. Yet, such was his sbility that his history is usually allowed to fall only just short of Grote's, a work undertaken with far greater enthusiasm, and executed with far greater advantages. Sterling pronounces him "a writer as great as Thucydides and Tacitus. and with far more knowledge than they." The first volume was published in 1835, the last in 1847. A noble letter from Thirlwall to Grote, and Grote's generous reply, are published in the life of the latter.

In 1840 Thirlwall was raised to the see of St David's. The promotion was entireiy the act of Lord Melbourne, an amateur in theology, who had read Thirlwall's introduction to Schleiermacher, and satisfied himself of the propriety of the appointment. "I don't intend to make a heterodox bishop if I know it," he said. Thirlwall so little expected the bonour that he was absent on a pedestrian tour, and it was some days before he could be found. In most essential points he was a model bishop, and in acquainting himself with Welsh, so as to preach and conduct service in that language, he performed a feat which few bishops could have imitated. It cannot be sajd that he was greatly beloved by his clergy, who felt their intellectual distance too great, and were alternately frozen by his taciturnity and appalled by his sarcasm. The great monument of his episcopate is the eleven famous charges in which he from time to time reriewed the position of the English Church with reference to whatever might be the most pressing question of the day,-addresses at once judicial and statesmanlike, full of charitable wisdom and massive sense. No similar productions, it may safely be said, were ever so eagerly looked for, or carried with them such weight of authority. His endearours to allay ecclesiastical panic, and to promote liberality of spirit, frequently required no ordinary moral courage. He was one of the four prelates who refused to inhibit Bishop Colenso from preaching in their dioceses, and the only one who withheld his signature from the addresses calling upon Coleuso to resign his see. He took the liberal side in the questions of Maynooth, of the admission of Jews to parliament, of the Gorham case, and of the conscience clause. He was the only bishop who voted for the disestablishment of the Irish Church, though but as a painful necessity. Concurrent endowment would have been much more agreeable to hum. For many years he was the only statesman ou the pench; it would hare been a great benefit to the Church of England had it been possible to have raised him to the primacy upon the death of Archbishop Howley. But such was the complexion of ecclesiastical politics that the elevason of the most impartial prelate of his day would have been resented as a piece of party spirit.

Thirlwall's private life was happy and busy. He never married, but found sufficient outlet for his deep affectionateness of pature in his tenderness to the children of others, and to all weak things except weak-minded clergymon. He was devoted to animals, and rivalled Southey and Jeremy Bentham in his love for cats. Perhaps the most durable monument to his memory will be his incomparable volume of letters to a friend, Miss Johnes of Dolaucothy, a young lady in every way worthy to be the correspondent of such a man. Even as letters these rank with the best in the language; but as letters from age to youth, bympathizing with all its feelings, entering into ull its pleasures,
at once inspiring and amusing, guiding without seeming to direct, and cntertaining without seeming to condescend, they are unique in their delightful beanch of literature. They are also important as revealing Thirlwall's mind 'on numerous subjects which he has not elsewhere treated, and most interesting from their picture of simplicity of character associated with greatness of intellect, and of the multiplicity of his intellectual interests, from which novele and fine art were by no means excluded. During his latter years he took great interest in the revisiou of the anthorized version of the Bible, and was chairman of the revisers of the Old Testament. He resigned his see in May 1874, and retired to Bath, where he died on July 27, 1875.

As scholar, critic, and ecclesiastical statesman Thirlwall is almost above praise. He was not a greaf original thinker; he lacked the creative faculty and the creative impulse. The world owes such vestiges of his power as it possesses to a series of fortunate accidents-an importunate editor, vexatious church controversies, and an admirable friend. Though not most fully exerted, the force of his mind is perhaps best appreciated in the volume of his letters edited by Dean Perowne. His treatment of every question is consummate ; the largest and the smallest seem alike to him. His character, with its mixture of greatuess and gentleness, was thus read by Carlyle:-"a right solid honest-hearted man, full of knowledge and sense, and, in spite of his positive temper, almost timid."
Thirlwall's Eistory of Grecce remaius a standard book. His literary and theological remains have beeu edited by Dean Perowne in three volumes, two of which are occupied by his charges. His letters ou literary and thcological subjects, with a connecting memoir, hare been published by Dean Perowne and the Rev. Louis Stokes. His Letters to a Friend were originally published by Dean Stanley, and there is a rerised and corrected edition. For a general view of Thirlmall's life and character, see the Edinburgh Reviev, vol. cxliii, for a picture of him in his diocese, Temple Bar, vol. lxxvi. The rerier of his letters in Blackwood's Maga. zine for 1852 is by the late Rev. W. Lucas Colling.
(R. G.)

THIRSK, a market-town in the North Riding of Yorkshire, is sitnated on the North Eastern Railway, and on the Codbeck, a branch of the Strale, 21 miles south of Darlington, 11 north-east of Jipon, and 210 north of London. The Codbeck is crossed by two stone bridges connecting the old and the new town. The church of St Mary, in the Perpeudicular style, with parvise, chancel, nave, aisles, porch, and tower 80 feet in height, is the noblest church in the Riding. The chancel was repaired in 1811, and the whole building restored in 1877. The moat of the ancient castle built by the Mowbrays about 980 still remains. The principal modern buildings are the assembly roous (1849), the mechanics' institute (1852), and the new court-house (1886). Standing in the fertile district of the Vale of Mowbray, the tomn has an extensive home and foreign agricultural implement trade. Ironfounding, engineering, tanning, and brickmaking are carried on, and there are large flour-mills. The population of the parliamentary borough, now disfranchised (area 11,828 acres), in 1871 was 5734 , and in 1881 it mas 6312. The population of the township in 1881 was 3337.

Thirsk owes its origin to the castle of the Mowbrays, and here Roger de Mowbray erected his atandard, in conjnuction with the king of Scotland, agaimst Henry 11. Upon the suppression of the revelt the castle was destroyed. In the reign of Henry VII., Неary Percy, earl of Northumberland, is said to have been put to death beneath an elm tree which formerly grew on St James'e Grcen. Thirsk was a borough by prescription, but was never incorporated. It first returned members to parliament in the reign of Edward I, but not again till the last parliament of Edward V1. In 1832 the nnmber of representatives was rednced to one, and in 1885 it ceased to be separately represented.

THISTLE. This term, as geneally employed, is of vague application, being given to almost any herbaceous plant that is of a spiny character. More atrictly, it is ap-
plied to the species of Carduus. These are Composite herbs with very spiny leaves, and similar bracts surrounding a head of purplish-white, tubular, 5 -parted flowers seated on a pitted and hairy receptacle. The anthers have appendagos both at the apex and at the base. The style has a ring of hairs at the point of bifurcation of the two stigmata. The fruit is surmounted by a tuft of silky white hairs. The species are numerous, and some are of great beauty, though not unnaturally looked on with disfavour by the farmer. The Cotton Thistle, remarkable for its covering of white dowa, is Onopordon Acanthium; the Blessed Thistle is Carduus benedictus; the Holy Thistle, the leaves of which are spotted with white, is $C$. Marianus. The common C. lanceolatus seems to be the most suitable protetype for the Scotch Thistle, though that honour is also conferred on Onopordon Acanthium, the cotton thistle, a doubtful native, and on other species. The great objcction to thistles from an agricultural point of view resides in the freedom with whick they produce seed, and in the vigour of their underground growth, which makes their uprooting a matter of difficulty. Partial uprooting may indeed, in the case of the perennial species, iacrease the nuschief, for each fragmeut left behind may grow into a distinct plant. Annual species might be kept in check were they cut down before the flowers appear, but unless all the cultivators in a particular district co-operate the efforts of individuals are of little avail. The Globe Artichoke and Cardoon are very near allies of the thistles. The Saflower, Carthamus, anotber thistle, yields a serviceable dye; the Burdock, Arctium lappa, has an edible root; and numerous allied species have medicinal properties.
thistle, Order of tee. See Knigethood, vol, xir. p. 123.
'fhistlewood conspiracy, or Cato Street Conspiracy, a plot formed in 1820 to murder Lord Castlereagh and other ministers of the British crown, and to seize the Bank and Mansion-House and proclaim a provisional government. Its chief instigator was Arthur Thistlewood, or properly Thistlewaite, bern in 1770, the son of a civil engineer in Lincolnstirc, who bad held a commission in the militia and afterwards in the line in the West Indies. In America and in France ho had imbibed revolutionary views, and, leaving lost his wife's fortune in speculation and on the turf, bad planned the desperate scheme probably for his own benefit as well as the good of the nation. The intention was to inurder the ministers in the house of the earl of Harrowby in Mansfield Street on the evening of the 23d February. For this purpose between twenty and thirty men assembled in a stablo in Cato Street, Edgeware Road, but while they were arming themselves they were pounced upon by the police, and a large number captured, though the majority, including Thistlewood, escaped. A reward of $£ 1000$ having been offered for Thistlewood, he was arrested next day at 10 White Street. After a trial Thistlemood and four others were executed on the lat May, while five were transported. On being asked on the scaffold if he repented, Thistlewood replied, "No, not at all ; I shall-soon know the last grand secret."

thol uck, Friedrich August Gottreu (1799-1877), German theologian and preacher, was born at Dreslau, March 30, 179 $\hat{S}_{0}$, in humbla circumstances. He received his education at the grammar school and university of his natire town, and early distinguished himself by wonderful versatility of mind, a phenomenal power of acquiring languages, and aa omnivorous appetite for books. I romantic love of the East and its literature led him' to exchange the university of Breslan for that of Berlin, that he might study Oriental lancuages to greater aairad-
tage, and there he was received into the house of the Orientalist Von Dietz. He was introduced to Pietistic circles in Berlin, and came specially under the influence of Baron Von Kottwitz, who became his "spiritual father," and of the historian Neander. Before deciding on the career of theological professor, he had in view that of a missionary in the East. Meanwhile he was feeling the influence to a certain degree of the remantic schoel, and of Schleiermacher and Hegel too, though he never sounded the depths of their systems. At length, in his twenty-first year, he finally decided to adopt the academioal calling. From December 1820 to April 1826 he was "privat-docent" and "prof. extraordinarius" of theology in Berlin, though he was at the same time most active in the work of home and foreign missions. He lectured on the Old and New Testaments, theology, apologetics, and the history of the charch in the 18th century. The first fruit of his Oriental studies and his iatroduction to his profession was his work Ssufismus, sive Theosophia Persarum Pantheistica (1821); following the same line of study he published Blütensammlung aus der morgenländisctien Mystik (1825) and Speculative Trinitätslehre des späteren Orients (1826). His well-known essay on the nature and moral influence of heathenism (1822) was published by Neander, with high commendation, in his Denkwürdigkeiten; and his Commentary on the Epistle to the Romans (1824) secured him a foremost place amongst the most suggestive, if not the most accurate, Biblical interpreters of that time. Another work, which was soon translated into all the principal European languages, Die Lehre von der Sünde und vom Versöhner (1823), the outcome of his own religious history, procured for him the position which he ever after held of the modern Pietistic apologist of evangelical Christianity. In 1825, with the aid of the Prussian Government, he visited the libraries of England and Holland, and on his return was appointed professor of theology at Halle, the centre of German rationalism. Here he made it his aim to combine in a higher unity the learning and to some extent the rationalism of Semler with the devout and active pietism of Francke ; and, in spite of the opposition of the theological faculty of the university, he succeeded in changing the character of its theology. This he effected partly by his lectures, particularly his exegetical courses, but, above all, by his personal influence upon the students, and, after 1833, by his preaching. His theological position was that of a mild and large-hearted orthodoxy, whieh laid more stress upen Christian experience than upon rigid dogmatic belief. On the two great questions of miracles and inspiration he made great concossions to modern criticism and philosophy. The battle of his life was on behalf of personal religious experieace, in opposition to the externality of rationalism, orthodosy, or sacramentarianism. He fought this battle with weapons taken in the first instance from his own personal history, but also from the wide world of human culture, ancient and modern. Carl Schwarz happily remarks that, as the English apologists of the 18 th century were themselves infected with the poison of the deists whom they endeavoured to refute, so Tholuck abserbed some of the heresies of the rationalists whom he tried to overthrow. As a preacher Tholnck ranked amongst the foremost of his time. He was also one of the prominent members of the Erangelical Alliance, and few men were more widely known or more beloved throughout the Protestant churches of Europe ard America than he. He died at Halle, June 10, 1877.

After his commentaries (on. Romans, the Gospel of John, tha Sermon on the Mount, and the Epistlo to the Hebrews) and several volnmss of sermons, his best-known books are Stunder christlicher Andacht (1839, 8th cd. 1870), intended to taks the place of Zschokks's standard rationalistic work with the samo title, and his repiy to Sirauss's Lifo of Jesus (Glaubudrdigkcit der rvanglisehen

Geschichic, 1837). He published at variens timea valuable centribn. tions towards a history of ationalism, - Vorgeschichte des Rationalismus (1853-62), Geschichtc des Rationalismus, i. (1865), and a namber of essays connected with the history of theolegy and espe. cinlly of apologetics. His vierss of inspiration rere indicated in his work Die Propheten und ihre Weissagungen (1860), in his essay on the "Alte Inspirationslehre," Deutsche Zeitschrift für christliche $W$ isscruschaft (1850), and in his Gespräche uber die vornehmsten Glaubensfragen der Zeil (1846, 2d ed. 1867).

THOMAS, St, one of the twelve apostles. The synoptical Gospels give only his name, associating him in their lists with Matthew (Mat. x. 3; Mark iii. 18; Luke ni. 15) ; in Acts i. 13 he is coupled with Philip. In the Gospel of John (xi. 16 ; xiv. 5 ; xx. 24 sq.; xxi. 2) he appears in a characteristic light, full of personal devotion and ready to die with his Master, but slow to grasp the true significance of the redeeming death of Jesus, and incredulous of the resurrection till direct evidence convinces him of its truth and at the same time of the Divinity of his risen Lord. John translates the Aramaic name or surname Thomas (אמNn) by the Greek equivalent Didymus (twin) Tradition has it that he was the twin brother of a sister Lysia (his parents being Diophanes and Rhoa, and his birthplace Antioch; "XII. Apost. Patriæ," in Chron. Pasch., ii. 142), cr of a brother Elieser (Hom. Clem., ii, 1), or, according to the Acta Thome (ed. Bonnet, pp. 11, 23), of Jesus Himself. The last form of the tradition scems to be derived from the name Judas Thomas, which he bears in Edessene legend (ff. Eusebius, II. E., i. 13,10 ), and implies the identification of Thomas with Judas, the brother of the Lord. The mast ancient tradition makes Thomas the evangelist of Parthia (Eus., II. E., iii. 1, 1); and at Edessa, which claimed to possess his bones, it was related that their missionary Thaddæus (Eus., II. E., i. 13, 10), or Addai (Doctrine of Addai, ed. Phillips, 1876, p. 5), was scnt to them ky him. Later tradition, originating with the Gnostic Acta Thomx, and accepted by catholic teachers from the middle of the 4th century, makes him proceed to India and there suffer martyrdom. The Indian king Guadaphorus of the Acta is, however, certainly identical with the historical Gondophares (see Persta, vol. xviii. p. 603), whose dynasty was Parthian, though his realm included regions loosely reckoned to India. The Parthian and Indian missions of Thomas may perhaps therefore be regarded as derived from a single tradition. Later authors, but not the Acta, give as the ecene of his martyrdom the city of Calamine, which the modern Christians of St Thomas (see below) identify with Mylapur, but which Gutschmid would connect with the Calama of Nearchus, on the coast of Gedrosia, which was under the sceptre of Gondophares. Other names of historical persons and places can be traced with more or less probability in the Acta, but these do not alter the utterly apocryphal character of the legend, which indeed is in many respects easier to understand if we accept the bold hypothesis of Gutschmid, that it was borrowed by the Gnostic author from a Buddhist story of the conyersion of Arachosia (N. Rhein. Mus,, xix. $1618 q$ ).
The Acta Thome, very imperfectly published by Thilo (1823) and Tischhondorf (1851), bave been edited in Grook, together with the Latin De Miraculis and Passio S. Thomer, by Bonnet (Leipsic, 1883), and in Syriac, with an English translation, by W. Wright (Apocryphal Acts, 2 vols. London, 1871). See also Lipsius, Die apocryphcen Apostelgeschichten, vel.' i. (Branswick, 1883), for these and other veraiens of the legend. The Acta are said by Pbotuus
 Charinus, but this unknown parsonage is to ba theught of as a cellecter of Gnostic "Acts of $\Delta$ postles," rather than as the first anthor. In epite of extensive catholic revision, thay form one of the meat Interestigg moniments of early Gnosticism Interabl evidenco
assigns them with great probability to the school of Dardesanea, and the vary ancient allegorical hymn about the soul which is inscrted in the Syriac text (p. 274 sq., Eng. tr., p. 238 sq) is per. haps by Bardesanes himself (cf. Noldeke in Z. D. DI G, 1871, p. 676). It is one of the most remarkable pieces in Syriac litarature.

Cnristians of St Thomas is a name often applied to the members of tho ancient Christian churches of soutlicin India, which claim him as their first founder, and heneur as thenr sccond founder a certain Themas of Jernsalem, whe is said te hara led a Christian colony to Malabar in 345 A. D. ${ }^{1}$ According to therr tradition, St Thomas went from Malabar to Mylapur, now a auburb of Madras, where the shrine of his martyrdom, rebuilt by the Pertuguese in 1547, still stands on Dount St Themas, and where a miraculous cross is shown with a Pahlavi inscription which may be as old as the end of the 7th century. We know from Cosmas Indepleustes that there were Christian churches of Persian (East-Syrian) origin, and doubtless of Nestorian creed, in Ceylon, in Malabar, and at Caliana (north of Bombay) before the middle of the 6th century, and even then St Thomas, the reputed apostle of Persia, may hara been their apecial saint. The ancient churches of southern ludia never died out or wholly lost their sense of connexion with their mother church, for we find them sending deputies in 1490 to the Nestorian patriarch Simeon, whe furnished them with bishops (Assemani, Bib. Or., iii. 1, 590 sq.). IJard pressed by the Meslems, they welcomed the approach of the Portuguese, but preved by ne means tractable to efforts to bring them within the Roman obedience. At length a fermal union with Rome was carried through in the synod of Diamper (1599). Syriac was to remain the ecclesiastical language, but the service books wers corrected and purified from error. A century and a half of foreign Jesuit rule followed, but the levo of independenca was not lost. A great schism took place in 1653, and of 200,000 Christians of St Thomas only 400 remained leyal to Reme, theugh many of their churches were seon weu back by the Carmelites. Those whe remained independent iell under the influence of the Jacobite Mar Gregorius, styled patriarch of Jerusalem, who reached Malabar in 1665 as an emissary frem Ignatins, patriarch of Antiech. Frem his time the independent Christians have been Jacebites, the counter-efferts of the Nestorians under Mar Gabriel, bishop of Adharbaijan, having apparently come to nothing after his death in 1730. Siuce the visit of Claudius Buchanan, whose Christian Re. scarches in Asia (1811) excited great interest, much has been done for tho Christians of South. India by English missionary effert, and Anglicans have cultivated friendly relatinns with the clergy of tho independent native church, while disceuraging dependence on tha Jacobito patriarch of Antioch.
A. valuabla though tedious and Al-arranged blstory of tha Christian of St
Thomas has been written by W. Germañ, Die Kirche der Thomaschristen Gutersloh, 18\%\%. Sea also La Croze, Histoire du Christianisme des Indes. thomas becket, or À Becket. See À Becket
THOMAS of Celano, the contemporary and supposed biographer of Francis of Assisi, was born probably towards the end of the 12th century, and died about 1255. He derives his surname from Celano (q.v.), in the Abruzzo Ulteriore. His name does not occur among those of the earliest disciples of Francis, but he is recorded by some historians of the order, though not by all, to have held the office of custos in various Franciscan houses (Cologne, Mainz, Worms, Spires) from 1221 onwards. An old biography of Francis, which is incorporated in the Acta Sanctorum, is attributed to Thomas with much probability, and nothing cogent has been urged against his authorship of the Dies Ire (see Hymns, vol xii. p. 583), although, so far as is at present known, his name is not associated with that remarkable poem by any writer earlier than 1385.
thonas of Erceldoune, called also the Rhymer (c. 1225-c. 1300), occupies a prominent place as a poet and prophet in the mythical and legendary literature of Scotland. The historical person of that name figures in two charters of the 13 th century, and from these it appears that he owned lands in Erceldoune (now Earlston), in Berwickshire, which were made over by his son and heir to the cloister of the Holy Trinity at Soltra, or Soutra, on

[^130]the burders of the same county. He figures in the works of Barbour and Blind Harry as the sympathizing contemporary of their heroes, and Wyntoun tells how he prophesicd a battle. In the folk-lore of Scotland bis name is associated with aumerous fragments of rhymed or alli, terative verse of a more or less prophetic and oracular character ; but the chief extant work with which his name is associated is the poem of Sir Tristrem, edited from the Auchinleck MLS. by Sir Walter Scott in 1804, and again in 1886 for the Scottish Text Society by Mr G. P. M'Neill. In the latter edition the claim of Thomas to the authorship of this work (conceded by both editoris) is fully discussed.
thonas a Krialis. See Kempis.
ThOMASIUS, Chpistian (1655-1728), German jurist aud publicist, was born at Leipsic January 1, I655, and educated by bis father Jacol Thomasius, professor of philosopby and eloquence, a learned man, and friend of Spener. Through bis father's lectures Christian came under the influence of the political philosophy of Grotius and Pufendorf, and continued the study of law under Stryck at Frankfurt on the Oder. In 1681 he commenced the career of professor of law at Leipsic, and soon. attracted attention by his abilities, but particularly by his daring attack upon all ancient prejudices. His views on matters of law were heretical; he made the daring innovation of lecturing in German instead of Latin; he published a monthly periodical in which he ridiculed with vast wit and humbur the pedantic meaknesses of the learned; he took valiantly the side of the Pietists in their controversy with the crthodox, and defended mixed marriages of Lutherans and Calvinists. In consequence of these and other sins, he was preached against from the pulpits, forbidden to lecture or to write (May 10, 1690), and his arrest was soon commanded. He cscaped the latter by \#ight to Berlin, and the elector Frederick III. offered him a refuge in Halle, mith a salary of 500 thalers and the right to lecturo there. He took part in founding the university of Halle (1694), where he became second and then first professor of law and director of the university. He was one of the most esteemed university teachers and influential writers of his day. He died, after a singularly successful and honourable career, in his 74 th year, September 23, 1728.
Though not a profourd and systematic philosophical thinker, hut rather a clever eclectic of the connion-sense school, Thomasius prepared the way for great reforns io pliilosophy, anul, above all, io law, literature, social life, and theology. It was his nissiun to bring all the high matters of divine aud humau sciences into close and living contact witl the cveryday world. He made leanning, law. philosonhy, and theology iook at every thing from a rational common-sense point of view, and speak of everything in vigorous German. He thns created 80 croch io German literature, fhilosorhy, and lav, and SJiittler opens with lim tho modern periph of uccecsiastical history; Tholuck prooounces limn "the persotififed spirit of illurainism." He mado it one of the aiuns of his life to frco ${ }^{3 p h l i t i c s}$ and jurisprudence from the control of theology. Ho fought bravely and consistently for frecdom of thought and speech on celigious matters. He is often syoken of in Coriasa works as tho author of the "territorial system," or Erastian theory of ecelesiastical gorernmeat. But he taught that the state may interfero with $\operatorname{lcg}$ gal or public duties only, anil not with moral or private ones. He introduced a dew definition of horesy, and pronouaced it a bughear of the theologians. Ho would not have eron a theists punished, though they should be expelled the country. He came forward as ao earnest opponent of tho prosccution of witches and of the uso of torture. In theolony he was not a a naturslist or a dcist, but a belierer io the necessify of revealed roligion for salvation. He felt strongly the infueuco of the Pictists at times, particularly of Spener, and thero was a mystie wcin in his thought; but other elements of his nature werc too powerful to allow him to attach himself finally to that party.
Thomasius's most popular and influential German pablications xere his periodical Monnlsgesprache, vornehnnlich uber newe Dicher (1688); Einft itung zur Verriun flehre (1691, 5t11 ed. 1719); Verniuft. ige Gedankien über allerhand duserlicscrne, gemischte, phillosorhisthe, und juristische Hündel (1723-26); Geschiche der Weashcit und Thorhei ( 3 yols, 1993); Āurze Letrsütee von dem Laxecr der

thompson, Sir Benjamin, Coent Remford (17531814), an eminent man of science, enlightened philanthropist, and sagacious public administrator, was born at Woburn, in Massachusetts, in 1753, and died at Autcuil, near Paris, in 1814. II is fanily bad been settied in New England since the middle of the century preceding bis birth, and belonged to the class of modcratcly wealthy farmers. His father died while Thompson was very young, and his mother speedily married a sccond timc. But be seems to have been well cared for, and his cducation was so far from neglected that, according to his own statement, he was at the age of fourteen sufficiently advanced "in algebra, geometry, astronomy, and even the higher mathematics," to calculate a solar eclipse within four seconds of accuracy. In 1760 be was apprenticed to a storekeeper at Salem, in New England, and while in that cmployment occupied himself in chemical and mechanical experiments, as well as in engraving, in which he attained to some proficiency. The outbreak of the American war put a stop to the trade of his master, and he thereupon left Salem and went to Boston;, where he engaged himself as assistant in another store. He afterwards applicd himself to the study, with a view to the practice, of medicine, and then (although, as he affirns, for ouly six weeks and three days) he became a school teacher-it is believed at Bradford on the Merrimack. Thompson was at that period between eighteen and nineteen years old, and at nineteen, he says, "I married, or rather 1 was married." llis wife was the widor of a Colonel Rolfe, and the daughter of a Mr Walker, "a highly respectable minister, and one of the first settlers at Rumford," now called Concord, in New Hampshire. His wife was posscssed of considerable property, and was his senior by fourteeu years. This marriage was the foundation of Thompson's success. Within threè years of it, however, he left his wife in America to make his way to wealth and distinction in Europe, and, although his only child by her, a danghter, subsequently joincd him, he never saw and, so far as anything appears to tho contrary, never attempted or desired to see Leer again.

Soon after his marriage Thompson became acquainted with Governor Wentworth of New Hampshire, who, struck by his appearance and bearing, conferred on bim the majority of a local regiment of militia. IIe speedily became the object of disirust among the friends of the American cause, and it was considered prudent that he should seek an early opportunity of leaving the country. On the evacuation of Boston by the royal troops, thercfore, in 17i6, he was selected by Governor Wentworth to carry despatcbes to England. On his arrival in Londou he almost immediately attracted the attention of Lord George Germaine, secretary of state, who appointed him to a clerkship in his office. Within a few months he was advanced to the post of secretary of the province of Georgia, and in about four years he was made undersecretary of state. His official duties, however, did not materially interfere wiih the prosecution of scientific pursuits, and in 1772 be was elected a fellow of the Royal Society. Among the suljects to which he especially directed his attention were the explosive force of gunpowder, the construction of firearms, and the system of signalling at sea. In connexion with the lasty le made a cruiso in the Channel fleet, on board the "Victory," as a volunteer under the command of Admiral Sir Clar!es Hard5. On the resignation of Lord North's administration, of which Lord George Germaine was one of the least
lucky and most uapopular members, Thompson left the civil service, and was nominated to a cavalry command in the revolted provinces of America. But the War of Ircuependence was practically at an eud, and in 1783 he finally quitted active service, with the rank and balf-pay of a lieutenant-colonel. He now formed the desiga of joining the Austrian army, for the purpose of campaigning against the Turks, and so crossed over from Dover to Calais with Gibbon, who, writing to his friend Lord Sheffield, calls his fellow-passenger "Mr Secretary-Colonel-. Adniral-Philosoplier Thompson." At Strasburg he was introduced to Prince Maximilian, afterwards elector of Bavaria, and was by him invited to enter the civil and military service of that state. Having obtained the leave of the British Government to accept the prince's offer, he received the honour of knighthood from George III., and during eleven years he remained at Munich as minister of war, minister of police, and grand chamberlain to the elector. His political and courtly employments, however, did not absorb all his time, and he contributed during his stay in Bavaria a number of papers to the Philosophical Transactions. But that he was sufficiently alert as the principal adviser of the elector the results of his labours in that capacity amply prove. He reorganized the Bavarian army; he suppressed mendicity and found employment for the poor ; and he immensely improved the condition of the industrial classes throughout the country by providing them with work and instructing them in the practice of domestic economy. Of the prompt and the businesslike manner in which be was wont to carry his plans into execution a single example may serve as an illustration. The multitude of beggars in Bavaria had long been a public nuisance and danger. In oue day Thompson caused no fewer than 2600 of these outcasts and depredators in Munich and its suburbs alone to be arrested by military patrols, and transferred by them to an industrial establishment which he bad prepared for their reception. In this institution they were both housed and fed, and they not only supported themselves by their labours but earned a surplus for the benefit of the electoral revenues. The principle on which their treatment proceeded is stated by Thompson in the following memorable words:-"To make vicious and abandoned people happy," he says, "it has generally been supposed necessary first to make them virtuous. But why not reverse this order? Why not make them first bappy, and then virtuous?" In 1791 he was created a count of the Holy Roman Empire, and chose his title of Rumford from the nane as it then was of the American township to which his wife's family belonged. In 1795 he visited England, one incident of his journey being the loss of all his private papers, includ. ing the materials for an autobiography, which were contained in a box stolen from off his postchaise in St Paul's Churchyard. During his residence io London he applied himself to the discovery of methods for curing smoky chimneys and the contrivance of improvements in the construction of fireplaces. But he was quickly recalled to Bavaria, Munich being threatened at once hy an Austrian and a French army. The elector fled from his capital, and it was entirely owing to Rumford's energy and tact that a hostile occupation of the city was prevented. It was now proposed that he should be accredited as Bavarian am. bassador in London; but the circumstance that he was a British subject presented an insurmountable obstacle. He, bowever, again came to England, and remained there in a private station for several years. In 1799 he , in conjunction with Sir Joseph Banks, projected the establishment of the Royal Institution, which received its clarter of incorporation from George III. in 1800. Rumford him. self selected Sir Humphry Davy as the first scientific
lectarer there. Until 1804, when ho definitively sittled in France, Rumford lived at the Royal Tastitution in Albemarle Street, or at a house which be rented at Brompton, where he passed his time in the steady pursuit of those researches relatiug to heat and light and the economy of fuel on which his scientific fame is principally based He then established himself in Paris, and married (his first wife having been dead for many yeare) as his second wife the wealthy widow of Lavoisier, the celebrated chemist. With this lady he led an extremely uncomfortable life, till at last they agreed to separate. Rumford took up his residence at Auteuil, where he died suddenly in 1814. in the sisty-second year of his age.

He was the foumder and the first recipient of the Rumford medal - of the London Royal Society. He was also the founder of the Rumford needal of the American Acadomy of Arts and Sciences and of the Rumford professorship in Harvard university. His complete works were published by the American Academy of Arts and Sciences at Boston in 1872 ; and a full and extremely interest. ing memoir of the author which was issued with then was repub. lished in London by Messrs Macuillan in 1876.
(F. DR.)

THOMPSON, Thomas Peronnet (1783-1869), mathematician and political writer, was born at Hull in 1783. He was educated at the Hull granmar school, and in October 1798 entered Qucens College, Cambridge. He entered the nary as midshipman in the "Isis" in 1803, but in 1806 exchanged to the army. Through his acquaintance with Wilberforce, he was appointed governor of Sierra Leone in 1808, but was recalled on account of his hostility to the slave trade. In 1812 he returned to his military duties, and, after serving in the south of France, was in 1815 attached as Arabic interpreter to au expedition against the Wahlabees of the Persian Gulf, with whom he negotiated a treaty (dated January 1820) in which the slave trade was for the first time declared piracy. He was promoted major iu 1825, lieutenantcolonel in 1829, and major-general in 1854. He entered parliament as member for Hull in 1835, and. afterwards sat for Bradford. He took a prominent part in the cornlaw agitation, his Catechism of the Corn Laws (1827) being by far the most effective panphlet published on the subject. He was joint-editor of the Westminster Reviero, to which he contributed a large number of articles, republished in 1824 in six volumes, under the title Exercises, Political and Others. His mathematical publications were of a somewhat eccentric kind. He published a Theory of Parallels (1844), and was also the author of Geometry without Axioms, in which he endeavoured to "get rid" of axioms and postulates. His new Theory of Just Intonation (1850) is, however, a contribution of great value to the science of musical acoustics, and has gone through many editions. It may be said to form the basis of the tonic sol-fa system of music. He died 6th October 1869.

Thonson, Sir Charles Wyville (1830-1882), was born at Bonsyde, Linlithgowshire, became prcfessor of natural history in Aberdeen, Cork, Belfast, and finally Ediaburgh, and will be specially.remembered as a studeut of the biological conditions of the depths of the sea. Being interested in crinoids, and stimulated by the results of the dredgings of Sars in the deep sea off the Norwegian coasts, which had conclusively disposed of the error of Edward Forbes, that animal life ceased at a depth of a few hundred fathoms, he succeeded, along with Dr W. B. Carpenter, in obtaining the loan of H M.S. "Lightning" and "Porcupine," for successive deetp-sea dredging expeditions in the summers of 1868 and 1869. It was thus shown that animal life existed in abundance down to depths of 650 fathoms, that all invertebrate groups were represented (largely by Tertiary forms hitherto believed to be extiuct), and, moreover, that deep-sea temperatures are by no means so constant as was supposed, but varv
considerably, aud indicate an oceanic circulation. Further dredging expeditions at greater and greater depths followed. The remarkable results gained for hydrography as well as zoology, in association with the practical needs of ocean telegraphy, soon led to the granting of H.M.S. "Challenger" for a circumnavigating expedition, and Thomson sailed at the end of 1872 as director of the scientific staff, the cruise lasting three years and a half. On his return he received many academic honours, and was knighted. In 1877 he publishod two volumes of a preliminary account of the results of the voyage, meanwhile carrying on his administrative labours in connexion with the disposition of the special collections and publication of the monographs of these. His licalth, never robust, was meanwhile giving way; from 1879 he ceased to perform the duties of his chair, and he died in 1882.
Sco obituary notice in Proc. Moy. Soc. Edin., 1883, also Thomson's Voynge of H.M.S. Challenger, London, 1877, and Thomson and Morray, Reports of the Voyage of II.ML.S. Challenger, Edinburgh, 1885 .
THOMSON, James (1700-1748), author of The Seasons, was a native of the Scottish Border country, his father being successively minister of the parishes of Ednam and Southdean, in Roxburghshire. He was born at Ednani on September 11, 1700, and was reared at a distance from the social influences and literary fashions that helped to form and fix the manner of the "classical" school, the monotony of which be was the first to break. Amidst the bare breezy hills and glens of a Border parish, his youth was safe against the ascendency of the taste established in the metropolis. Jedburgh school and Edinburgh naiversity gave him his book learning of the ordinary type; and he was fortunate enough to have neighbours of extraordinary accomplishment, who opened his eyes to the poetic side of nature, and encouraged him in verse-making. The teacher from whom he learnt most was a Mr Riccalton, or Riccaulton, a graduate of Edinburgh, who lad taken to farming, but was afterwards persuaded to enter the church, and made some contributions to theological literature. This scholarly enthusiast taught Latin to the boys of Jedburgh in an aisle of the church, and encouraged Thomson in his poetical turn by example as well as precept. We have the poet's own acknowledgment that the first hint of the Seasons came from a striking dramatic poem by Riccaulton entitled $A$ Winter's Day. As a schoolboy Thomson wrote verses, and at the university be continued the practice, but his early efforts were not particularly promising. He was intended for the ministry, and was for five years a student of divinity; but in 1725 he determined to follow his friend and classfellow David Mallet to London, and seek his fortune there. Through the influence of Lady Grizel Baillie, herself a song-writer, he obtained a tutorship in the family of Lord Binning; but the plain-looking and plain-mannered poet had not the adroitness of his friend Mallet, and he gave up the post after a few months, It was while he lingered in the ncighbourliood of Barnet, without employment, without money, with few friends, saddened by the loss of his mother (his father had died when he was eighteen), that Thomson conceived the idea of the first of his poems on the Seasons, Winter. The linesWelcorme, kindred glooms,
Congenial horrors, hail!
came from the heart; they expressed his own forlorn mood on the approach of the winter of 1725 . Winter appeared in the spring of 1726. A publisher, Millan,-not Millar, who afterwards published for hin,-gave him three guineas for the poem. The tradition is that it attracted no notice for a month, but that, at the end of that time, a litepary clergyman, Whatley, chanced to take it up trom a bookseller's counter and at once rushed off to the coffee-
houses to proclaim the discovery of a new poet. The town received the discovery with acclamation; in another month a second edition was called for. No time could have been better suited for the appreciation of Thomson's striking qualities; they were so entirely unlike what the public had for many years been accustomed to. The fresh treatment of a simple theme, the warm poetical colouring of commonplace incidents, the freedom and irregularity of the plan, the boldness of the descriptions, the manly and sincere sentiment, the rough rigour of the verse, took by surprise a generation accustomcd to witty satire and burlesque, refined diction, translations from the classics, themes valued in proportion to their remoteness from vulgar life. Thomson at once became famous, and, his naturally easy temper roused to full exertion, vigorously followed up his success with Summer and an Ode to the Memory of Sir Isaac Newton. Spring was completed and published in 1728. A longer interval elapsed before the appearance of Autumn; it was published in 1730, and followed presently by a handsome cdition of the whole four Seasons. Meantime, drawn into the ardent political strife of the time, he had produced, in 1729, his Britannia, and early in 1730 had made his first attempt as a dramatist with Sophonisba. From this time there was a manifest slackening either in his will or in his power to produce. He was appointed travelling tutor to the son of Sir Charles Talbot, travelled with his pupil on the Continent, and in 1733 obtained a small sinecure in the Court of Chancery. It may lave been this removal of the spur of necessity that made him take longer over his poems. But it is a fair theory that the rigid taste of the time for finish, which he had unconsciously defied with triumplant results, began to make good an ascendency over him, and that he wrote less because he was cramped by fear of the critics. None of the other Seasons have the same large and careless frcedom as Winter; Autumn especially, the last of then, is much more laboured, and his revisions and enlargements in successive editions show an anxious ambition after the finish of the classical school. How. ever this may be, he hesitated long over nis next poem, Liberty; the first part was published in 1734 and the conclusion in 1736. He intended it to be his masterpiece, but with all his care and pains it has fallen into deserved oblivion. In 1737 he lost his sinecure by the death of his patron, but was recompensed by a pension from the prince, Poverty, rather than natural fitness or inclination, drove him. again to dramatic composition. Agamennon was produced in 1738 , with indifferent success. Next year a play, written in the intercst of the prince and the opposition, was interdicted by the lord chamberlain. The masque of Alfred, written by Thomson in conjunction with Mallet, and containing the song Rule Britannict, was produced in 1740, Tancred and Sigismunda in 1745. A ycar before this last event the "poetical posture" of the poet's income was improved by his appointment to the sinecure office of surveyor-general of the Leeward Islands. The Castle of Indolence was his last work. It was not published till the year of his death (1748), but he had been long engaged upon it. The poem is full of character and humour, with here and there passages of elaborately rich description ; it is fuller than any other of the personality of the poet, of the good-nature, generosity, and solid wisdom which gained him the affection of so many friends; but still it is in the Seasons, a ad especially in the first of them, that Thomson is seen at his best and strongest.

Till tho advent of Scott and Byron, Thomson was the most ridely popular poet in our language; and as late as the middle of this century a sumptuous edition, illustrated by the Etching Club, was priated three times within ton years (1812-52). Tho popuiar verdict on Thomson bas bean unanimously justifed by critics.
(W. M.)

THOMSON, JAMES (1834-1882), author of The City of Drealful Night, was born at Port Glasgow, in Renfrewshire, on November 23, 1834, the eldest child of a mate in the merchant shipping service. His mother was a deeply religious woman of the lrvingite sect, and it is not improbable that it was from her the son inherited his sombre and imagiuative temperanent. On her death, James, then in his seventh year, was procnred admission into the Caledonian Orphan Asylum, from which he went out into the world as an assistant army schoolmaster. At the garrison at Ballincollig, near Cork, he encountered the one brief happiness of his life: he fell passionately in love with, and was in turn as ardently loved by, the daughter of the armourer-sergeant of a reginent is the garrison, a girl of very exceptional beauty and coltivated mind. Two years later, when Thomson was at the training college at Chelsea, he snddenly received news of her fatal. illness and•death. The blow prostrated him in mind and body; and the former endured a hurt from which it never really recovered. Hencefortin his life was one of gloom, disappointment, misery, and poverty, rarely alleviated by episodes of somewhat brighter fortunc. While in Ireland he had made the acquaintanco of Mr Charles Bradlaugh, then a soldier stationed at Ballincollig, and it was undor' his auspices (as editor of the London Investigator) that Thomson first appealed to the public as an author, though actually his earliest publication was in Tait's Edinburgh Magazine for July 1858, under the signature "Crepusculus." In 1860 was estallished the "paper with which Mr Bradlaugh has been so long identified, The National Reformer, and it was here, among other productions by James Thomson, that appeared (1863) the powerful and sonorons verses "To our Ladies of Death," and (1874) his chief work, the sombre and imaginative City of Dreadful Night. In October 1862 Thomson left the army, and through Mr Bradlaingh (with whom for some subsequent years he lived) gained employment as a solicitor's clerk. In 1869 he enjoyed what has been described as his "only reputable appearance in respectable literary society," in the acceptance of his long poem, "Sunday up the River," for Fraser's Mfagazine, on the advice, it is said, of Charles Kingsley. In 1872 Thomson went to the Western States of America, as the agent of the shareholders in what he ascertaincd to be a fraudulent silver mine; and the following year he received a commission from The New York World to go to Spain as its special correspondent with the Carlists. During the two months of his stay in that distracted country he saw little real fighting, and was himself prostrated by a sunstroke. On his return to England be continued to write in The Secularist and The National Reformer, under the at last well-known initials "B. V." I In 1875 he severed his connexion with The National Reformer, owing to a disagreement with its editor ; henceforth his chief source of income (1875-1881) was from the monthly periodical known as Cope's Tobacco Plant. Chiefly through the exertions of his friend and admirer, Mr Bertram Dobell, Thomson's best known book, The City of Dreadful Night, and other Poeres, was published in April 1880, and at once attracted wide attention; it was succeeded in the autumn by Vane's Story, and other Poems, and in the following year by Essays and Phantasies. All his best work was produced between 1855 and 1875 ("The Doom of a City," 1857 ; "Our Ladies of Death," 1861; Weddah and On-elBonain: "The Naked Goddess," 1866-7; The City of Dreudful Night, 1870-74). In his latter years Thomson too often sought refuge from his misery of mind and body

[^131]in whe Lethe of cpinm and alcohol. His mortal iliness came npun him in the house of a poct friend; and he was conveyed to University College hospital, in Gower Strect, where shortly after he died (June 3, 1882). He was buried at Highgate cemetery, in the same grave, in uncon secrated ground, as his friend Austin Holyoake.

To the productions of Jaines Thomson already nentionce mas be added tho posthumous volume entitled A Voice from the Nile, and other Pocins (1884), which has the advautage of Mr Bertrans Dohell's valuable prefatory memoir and an etched portrait of the poet. This volume containa nuch that is interesting, but nothing to increase Thomson's reputation. If an attempt ho made to point to the most apparent literary relationship of the author of The City of Dreadjul Night, ono might venture the suggestion that James Thomson was a yonnger brother of De Quincey. If he las distinct affinity to any writer it is to the author of Suspiria de Profund is; if we look further aficld, wo might perhaps discern shadowy prototypos in Leopardi, Heine, and Laudalaira. But, after all, Thomson holds so unique a place as a poet that the effort at cinssification may well be dispensed with. If he wantains his owis lonely little height, ic will be as a distinct individuality. His, it is absolutely certain, was no literary pessimism, no assumed gloom. The poein "Insomnia" is a distinct chapter of hiography; and in "Mater Tonehrarum" and elsewhere among his writings self-revelative passagee are frequent. The merits of Thomson's poetry are its imaginative power, its sombre intensity, its sonorous music ; to theso chararteristics may he added, in lifg lighter pleces, a Heinu-like admixture of strange gaiety, pathos, and caustic irony. Much the same may be said of his best prose. His faults are a morotong of eprithet, the not infrequent use of mero rhetoric and verbiage, and perhaps a prevailing lack of the senso of form, to these may be adJed an occasional vulgar recklessnesn of exprossion, as in parts of Vanc.s Story and in somo of lis prose writincs. Time will reduce his noteworthy work within a narrow compass, but within that limit it will be found as remark. able as it is unique.

THOMSON, JoHN (1778-1840), amateur landscape painter-Thomson of Duddingston, as he is commonly styled, -was born on September 1, 1778, at Dailly, Ayrshire. His father, gracdfather, and, as we are informed, great-grandfather also, were clergymen of the Church of Scotland. The father determined that his son should follow the ancestral profession, and, greatly against his natural bent, -for all his thoughts turned instinctively towards art, -he acceded to the parental wish. He studied in the university of Edinburgh; and, residing with his elder brother, Thomas Thomson, afterwards celebrated as an antiquarian and feudal lawyer, he made the acquaintance of Francis Jefirey and other young members of the Scottish bar afterwards notable. The pursuit of art, however, was not abandoued; during the recess he sketched in the country, and, while attending bis final college session, he studied for a month under Alexander Nasmyth. After his father's death he became, in 1800, his successor as minister of Dailly ; and in 1805 he was translated to the parish of Duddingston, clase to Edinburgh. Tho practice of art was now actively resumed, and it came to be continued throughout life-apparently without any very great detriment to pastoral duties. Thomson's popularity as a painter increased with his increasing artistic skill; and, having mastered his initial scruples against. receiving artistic fces, on being offered £15 for a land-scape-reassured by "Grecian" Williams's stout assertion that the work was "worth thrice the amount"-the minister of Duddingston began to dispose of the productions of his brush in the usual manner. In 1830 he was made an honorary member of the Royal Scottish Academy. Besides that of art, Thomson had other singularly varied tastes and aptitudes. He was an accomplished performer on violin and flute, an exact and well-read student of physical science, and one of the writers on optics in the carly numbers of the Edinburgh Review. His life passed peacefully away in the kindly and charitable discharge of bis clerical duties, varied by the enthusiastic pursuit of his art, and the enjoyment of intercourse with a singularly
wide and eminent circle of friznds, which, among artists, included Turner and Wilkio, and among men of letters Wilson and Scot,-the latter of whom desired that Thomson, instead of Turner, should have illustrated the collected edition of his works. He died at Duddingstun on the 27 th of October 1840 (not the 20th, as stated by some authorities). Thomson was twice married, and his second wife, the widow of Mr Dalrymple of Cleland, was herself also a skilful amateur artist.

Thomson holds an honourablo position as the first powerful Jandscapist that Scotland produced, and he is still among her greatest. Pis styled was founded, in the first instanco, upon the practice of the Dutch masters ; but ultimately he submitted to the influence of the Poussins and the Italians, rightly believing that their method-in the richer solemnity of its colour and tho deeper gravity of its chiaroscuro-was more truly fitted for the portrayal of the scenery of Scotland, more in larmony with the gloom and the glory of its mountains and its glens and tho jassion of its wave-vexcd cliffs. But to the study of the art of the past he joincd a close and constant reference to nature which kept his own work frcsh and original, thongh, of course, he never even approaclice such seientific accuracy in the rendering of natural form and effect as is expected from even tho tyro in our recent schools of iandscape. His art is clearly distiuguished by "style"; at their best, his works show skilful selection in the leading lines of their composition and admirable qualities of abstract colour and tone. Thomson is fairly represented in the Scottish National Gallery; and the Aherlady Bay of that collection, with the soft infinity of its clouded grey sky, and its sca which loaps and falls agrain in waves of sparkling and of shadowed silver, is fit to rank among the triumphs of Scottish art.
tholi. See Æsir, vol. i. p. 210, and Mythology, vol. xvii p. 156.
thoreau, Henry David (1817-1862), one of the most strongly-marked individualities of modern times, epent the greater part of his life in the neighbourhood of the place where be was born-Concord, a village town of Massachusetts, pleasantly situated some twenty niles northwest of Boston, a midst a pastoral country of. placid beauty. I'o Thoreau this Concord country contained all of beauty and even grandeur that was nccessary to the worshipper of nature : he once journeyed to Canada ; he went west on ane occasion ; he sailed and explored a few rivers; for the rest, he haunted Concord and its neighbourhood as faithfully as the stork doesits ancestral nest. John Thoreau, his fa ther, who married the daughter of a New England clergyman, was the son of a John Thoreau of the isle of Jersey, who, in Boston, married a Scottish lady of the name of Burns. This last-named John was the son of Philippe Thorcau and his wife Marie le Gallais, persons of pure French blood, settled at St Helier, in Jersey. Frorn his New England Paritan mother, from his Scottish grandmother, from his Jirscy-American grandfather, and from his remoter French ancestry Thoreau inherited distinctive traits: the Saxon element perhaps predominated, but the "hauntings of Celtism" were prevalent and potent. The stock of the Thoreaus was a robnst onc ; and in Concord the family, through never wealthy nor officially infiuential, was ever bild in peculiar respect. As a boy, Henry drove his mother's cow to the pastures, and thius carly became eramoured of certain aspects of nature and of certain dit lights of solitude. At school aul at Irarvard university he in nowise distinguished himself, though he was an intelligently receptive student; he became, however, pro: ficient enough in Greek, Latin, and the more gencral acquirements to cnable him to act for a time as a master. But long beforc this he lad become apprenticed to the learring of nature in preference to that of man: when only twelve years of age he bad mado collections for Agassiz, who had then just arrived in America, and alrcady the meadows and the hedges and the stream-sides liad becomo cabinets of rarc knowledge to him. On the desertion of schoclmastering as a profession Thoreau bccame a decturer and auther, though it was the labour of his hands
which mainly supported him through many years of his life : professionally he was a surveyor. In the effort to reduce the practice of economy to a fine art he arriver at the conviction that the less labour a man did, over and above the positive demands of necessity, the better for him and for the community at large; he would have had the order of the week reversed,-six days of rest for one of lahour. It was in 1845 he made the now famous experiment of Walden. Desirous of praving to himself and others that man could be as independent of his kind as the nest-building bird, Thoreau retired to a hut of his own construction on the pine-slope over agatnst the shores of Walden Pond, - a hut which he built, furnished, and kept in order entirely by the labour of his own hands. During the two years of his residence in Walden woods he lived by the excrcise of a little surveying, \& little job-work, and the tillage of a few acres of ground which produced him his beans and potatoes. His absolute independency was as, little gained as if he had çamped out in Hyde Park; relatively he lived the life of a recluse. He read considerably, wrote abundantly, thought actively if not widely, and camato know beasts, birds, and fishes with an intimacy more extraordinary than was the case with. St Francis of Assisi. Birds came at his call, and forgot their hereditary fear of man; beasts lipped and caressed him; the very fish in lake and stream would glide, unfearful, between his hands. This exquisite familiarity with bind and beast would make us love the memory of Thoreau, if his egotism were triply as arrogant, if his often meaningless paradozes were even more absurd, if his sympathies were even less humanitarian than we know them to have been. His W'alden, the record of this fascinating two years' experience, must always remain a production of great interest and consillcrable psychological value. Some years before Thoreau took to Walden woods he nade the chief friendship of his life, that with Emerson. He became one of the famous circle of the transcendentalists, always keenly preserving his own individuality a mongst such more or less potent natures as Emerson, Hawthorne, and Margaret Fuller. From Emerson he gained more than from any man, alive or dead; and, though the older philosopher both enjoyed and learned from tho association with the younger, it cannot be said that the gain was equal. There was nothing electrical in Thoreau's iutercourse with his fellow-men ; he gave off no spiritual sparks. He absorbed intensely, but when called upon to illuminate in turn was found wanting. It is with a sense of relief that wo read of his haring really becn stirred into active enthusiasm anent the wrongs done the ill-fated John Brown. With children he was affectionate and gentle, with old poople and strangers considerate. In a word, he loped his kind as animals, but did not seem to find them as interesting as those furrod and feathered. In 1847 Thoreau left Walden Lake abruptly, and for a time occupied himself with leadpencil making, the parental trade. He never warried, thus further fulfilling his policy of what one of his essayistbiographers has termed "indulgence in fine renounccments." At the comparatively carly age of forty-five he died, on 6th May 1862. His grave is in the beautiful cemetcry of Sleepy Hollow, besido those of Hawthorne and Emerson.
Thoreav'a fane will rest on Walden, the Excursions, and his Letters, though he wrote wothing which is not deserving of notice. Up tiil his thirtictly year he dabbled in Yerse, but he had little ear for metrical music, and he lacked tho spiritual impulsivencss of the true pooet. He hall occasional flashes of insight and could record beautifully, notwithstanding: his little poom "Haze" is surcharged with concentratcd loveliness. Ilis weakDess as a philosophcr is hia tendency to base tho laws of the universo on the expericnce-born, thought-produced convictions of one man-himself. His wcakness as a writer is the too frequent striving after antithesis and parador. If he bad bod all kis own originality without the itch of appearing
original, he would have mado his fescination irresistible. As it is, Thoresa holds a naique place. He was a naturalist, but absolutely devoid of the pedantry of science; a keen observer, but no retailer of disjointed facts. He thus holds sway orcr tiro domains: he has tho adherence of the lovers of fact aod of the children of fancy. He must slways be read, whether lovingly or interestedly, for he has all the variable charm, the strange saturninity, the contradictions, ansterities, sud delightful surprises, of Nature herself.

THORIUM, in chemistry, is the name of the as yet unisolated radical of thoria, one of the now numerous "rare earths." Thoria was discovered by Berzelius in 1828 in the mineral now called thorite. It is present also in pyrochlor, monazite, orangite, and euzenite. Being similar to the oxides $\mathrm{TiO}_{2}$ and $\mathrm{ZrO}_{2}$ of titanium and zirconium, thoria is assumed to 1 e a binoxide $\mathrm{ThO}_{2}$. The atomic weight, according to Cleve, is $\mathrm{Th}=233$, O being 16 .
THORN (Polish Torin), an interesting old town in the province of West Prussia, is situated on the right bank of the Vistula, near the point where the river enters Prussian territory, 26 miles south-east of Bromberg and 92 miles south of Dantzic. Its position near the frontier of Russian Poland makes it a strategic point of importance ; and, strongly fortified since 1818, in 1878 it was converted into a fortress of the first class. The " old town," founded in 1231, and the "new town," founded thirty-three years later, were united in 1454, and both retain a number of quaint buildings dating from the 15 th and 16 th centuries, when Thorn was a flourishing member of the Hanseatic League. The town-house, of the 14 th and 16 th centuries, the churches of St John and the Virgin, with aisles as lofty as the nave, the ruined castle of the Teutonic order, and the gates, leaning tower, and fragments of the walls, all of the 13th century, are among the most interesting edifices. The ancient wooden bridge, now burned down, at one time the only permanent bridge across the lower Vistula, has been succeeded by a massive iron railway viaduct, half a mile long. Thorn carries on sn active trade in grain, timber, wine, colonial wares, and iron, and has manufactures of leather, hats, starch, candles, and numerous other articles. It is famous for its "Pfefferkuchen," a kind of gingerbread. Part of the trade is carried on by ressels on the Vistula. In 1885 the population was 23,914 (in 1816 7909), about three-fifths being Protestants and two-fifths (chiefly Poles) Roman Catholics.
Thorn, foanded in 1231 by the Teutonic order as 8 bn ortpost against the Poles, was colonized mainly from Westphalia. The first peace of Thorn, betweea the order and the Poles, was concladed in 1411. In 1454 the tomaspeople revolted from the knights of the order, destrojed their castle, and sttached themselves to the king of Poland. This resulted in a war, which wss terminated in 1466 by the secoad peace of Thorr. In the 15th and 16 th centuries Thorn was \& Hanse town of importance, and received the titles of "queen of the Vistala" and "the beantiful." It ombraced the Reformation in 1557, and in 1645 it was the ecene of a "colloquinm charitativum," or discussion betrixt the doctors of the rivsl creeds, which, however, resulted in no agreement. In 1724 s riot between the Protestant and Roman Cathofic inhabitants was soized apon by the Polish king as $\mathbf{s}$ pretext for beheading the burgomaster and nine other leading Protestant citizens, za act of oppression which is known as the "bloodbath of Thorn." The second partition of Poland conferred Thorn apon Prussis; by the treaty of Tilsit it was assigned to the duchy of Wrrasw ; but since the congress of Vienna it has again been Prussian Copernicus was born at Thorn in 1473.
THORNBACK is the name given to a species of ray (Raja clavata) which is found all round the coasts of Enrope, and locally abundant; it derives its name from
the peculiar armature of the skin of its body, the upper and lower surfaces of the body of the female being armed with scattercd, more or less numerous, large round osseous bucklers, each with a spine in the centre; the tail also is armed with rows of similar bucklers. In the male fish these bucklers are absent, or nearly so. The thornback does not grow to the same large size as the skates, a specimen three feet across being considered large. It is more valued as food than the other rays, and consumed in large quantities, fresh as well as salted.

THORNHILL, Sir JAMES (1676-1734), historical painter, was born at Melcombe Regis, Dorset, in 1676, coming of an anciect but impoverished county family. His father died while he was young, but he was befriended by his maternal uncle, the celebrated Dr Sydenham, and apprenticed to Thomas Highmore, sergeant-painter to King William III., a connexion of the Thorchill family. Little is known regarding his early career. About 1715 he visited Holland, Flanders, and France; and, having obtained the patronage of Queen Anue, he was in 1719-20 appointed her serjeant-painter in succession to Highmore, and was ordered to decorate the interior of the dome of St Paul's with a series of eight designs, in chiaroscuro heightened with gold, illustrative of the life of tbat apostle,-a commission for which Louis Laguerre had previously been selected by the commissioners for the repair of the cathedral. He also designed and decorated the saloon and hall of Moor Park, Herts, and painted the great hall at Blenheim, the princesses' apartments at Hampton Court, the hall and staircase of the Southsea Company, the chapel at Wimpole, the staircase at Easton-Neston, Northamptonshire, and the hall at Greenwich Hospital, usually considered his most important and successful work, upon which he was engaged from 1708 to 1727. Among his easel pictures are the altar-pieces of All Souls and Queen's College chapels, Oxford, and that in Melcombe Regis church ; and he executed such portrait subjects as that of Sir Isaac Newton, in Trinity College, Cambridge, and the picture of the House of Commons in 1730, now in the possession of the earl of Hardwicke, in which he was assisted by Hogarth, who married Jane, his only daughter. He also produced a few etchings in a slight and sketchy but effective manner, and executed careful full-size copies of Raphael's cartoons, which now belong to the Royal Academy. About 1724 be drew up a proposal for the establishment of a royal academy of the arts, and his scheme had the support of the lord treasurer Halifaz, but Government declined to furnish the needful funds. Thornhill then opened a drawingschool in his own house in James Street, Covent Garden, where irstruction continned to be given till the time of his death. He acquired a considerable fortnne by his art, and was enabled to repurchase his family estate of Thernhill, Dorsetshire. In 1715 he was knighted by George I., and in 1719 he represented Melcombe Regis in parlinment, a borough for which Sir Christopher Wren bad previously been member. Having been removed from his office by some sourt intrigue, and suffering from broken health and repeated attacks of gout, he retired to his conntry seat, where he died on the 4th of May 1734. His son James was also an artist. He succeeded his father as serjeant-painter to George II., and was appointed "painter to the nary."
.The high contemporary estimste of Sir James Thornhill's works has not since been confirmed; in spite of Dr Young, "late times", do not

He is weak in drawing,-indeed, when desling with complicated, Ggures he was assisted by Thomas Gibson; snd, ignorant of the great monumental art of Italy, he formed himself upon the lower

Foodel of Le Brun. It nust, however, be admitted that, in the departmonts of art which he chose for his own, he was the best putive painter of his time.
THORWALDSEN, Bertel (1770-1844), a very able Danish sculptor, was the son of an Icelander who had settled in Copenhagen, and there carried on the trade of a wood-carver. While very young Bertel Thorwaldsen learnt to assist his father; at the age of eleven be entered the Copenhagen school of art, and soon hegan to sbow his exceptional talents. In 1792 he wou the highest prize, the travelling studentship, and in 1796 he started for Italy in a Danish man of-war. On the 8th of March 1797 he arrived in Rome, where Cauova was at the height of his popularity. Thorwaldsen's first success was the model for e statue of Jason, which was higbly praised by Canova, and he received the commission to execute it in marble from Thomas Hope, a wealthy English art-patron. From that time Thorwaldsen's success was assured, and he did not leave Italy for twenty-three years. In 1819 he returned to Denmark, where he was received with the greatest enthusiasm. He was there commissioned to make the colossal series of statues of Christ and the twelve a postles which are now in the Fruenkirche in Copenhagen. Theso wore executed after his return to Rome, and were not completed till 1838, when Thorwaldsen again returned to Denmark. He died suddenly in the Copenhagen theatre in 1844, and bequathed a great part of his fortune for the building and eadowment of a museun in Copenhagen, and also left to fill it all his collection of worky of art, and the models for all his sculpture, - a very large collection, cxhibited to the greatest possible advantage. Thorwaldsen is buricd in the courtyard of this museum, under a bed of roses, by his own special wish.
On the whole Thorwaldsen was tho most snccessful of all the imitators of elassical senl|ture, and many of his statucs of pagan deities are moddellal with mnel of the antigue feeling for brealth and purity of design. 11 is attempts at Christian sculpture, such as tlic tomb of Pius V11, in St Peter's and tho Cluilst and A postles nt Copeulagen, aro less successful, anil were not in accordance with the sculptor's real sympathics, which were purely classic. Thorwaldseri's privato lifo was not atmirable: ho worked sone. times with feverish cagerness; at other times, he was idlle for many montlss tonctlier. A great number of lis best works exist in privato collections in England. His not very sucessful statue of Lord Byron, ofter being refused a placo in Westuninster Abbey, was finally deposited in the library of Trinity College, Cambridge Tho most widely popular among Thorwaldsen's works liave becu sonce of his bas-rulicfs, such as the Night and the Mlorning, which be is sail to lare modellecl in ono daj. In tho 1rain his jopularity is nov a thing of the past, owing chiffly to the reac. tion against the pseudo-classic style of sculpture.
A wellilliustrated occmunt of Thir waldsen and lids works is given bp Fureno

 Thicle, Thorwald den's LDben, Lelpsic, 1852-56.

THOU, Jacques Auguste de (1553-1617), sometimes known by the Latinized form Thuanus, as his great listory is by the name Thuana, was hom at Paris on Cotober 8, 1553. He belonged to a family of distinction in the Orlsanais, of which the elder branch had, he tells us, been noblesse d'epée, though he gives no particulars except of those who had for some generations been nublesse de robe. He and his were closely connected hy birth, marriage, and friendship with several of those great legal families-the Harlays, the Huraults, the Brularts, the Lamoignons, and others-which for many generations furnished France with by far her most valuable class of prblic men. The historian's father was Christophe de Thou, first president of the parlement of Paris, a man whose strong legal and religions prejudices against the Huguenots bave rather obscured, in the eyes of historians, his undoubted ability and probity. Curistophe's brothers, Adricn and Nicolas, were both men of nark, the former being also a lawyer, and the latter ultimatcly becoming bishev of Cbartres in which eapacity be "instructed"

Henry IV. at his conversion. De Thou's mother was Jacqueline Tuleu, dame de Céli. He was a delicate child, and seems by his own account to have been rather neglected by his parents; perhaps it was for this reason that, though he grew stronger with age, he was destined for the ohurch. He took minor orders, and obtained some benefices. It was, however, to the legal side of the ecclesiastical profession that he was devoted, and, after being at school at the Collége de Bourgogne, be studied law at Orleans, Bourges, and Valence, being at the last two places under the tuition of jurists no less celebrated than Hotman and Cujas. It was not, however, till he approached middle life that he definitely renounced the clerical profession, married, and accepted lay offices. Meanwhile he had travelled much and discharged important duties. In 1573, that he might profit by seeing foreign parts, he was attached to the suite of Paul de Foix, who was sent on a circular mission of compliment to the Italian princes, and with him Do Thou visited Turin, Milan, Mantua, Venice, Rome, Florence, and many minor places. On his return he studied for four years, travelling to the Netherlands in the interval,-and in 1579 to Germany. Two years later he was appointed to a royal commission in Guienne, and made the acquaintance of Henry of Navarre and of Mentaignc. He had already become the friend of most of the cminent men of letters of the time, from Ronsard downwards, and was particularly intimate with Pierre Pithou, the soul of the future Sative Menippuce. De Thou, by all his sympathies, belonged to that later and better phase of the politique party which devoted itself to the maintenance of royalty as the one hope of France; and, when Henry III. was driven from his capital by the violence of the Guises and the League, De Thou followed him to Blois. After his renunciation of orders, he had been made, first, master of rocyuests, and then president a mortier, which was the highest dignity he cver attained. After the death of Henry III. he attached limsclf closcly to his successor, and in 1593 was apprinted (be was a great biblioplile) grand matre of the royal library, in succossion to Amyot, the translater of Mutarch and Longus. It was in this same ycar that he began his bistory, the composition of which was interrupted, not only by his regular official duties, but by frequent diplomatic missions at bone and abroad. His most important employinent of all was on the commission which, in face of the greatest difficulties on both sides, successfully carried throngh the negotiations for the cdict of Nantes. Nor were his duties as a diplomatist intermitted by the death of Henry IY., though the Government of Marie de' Medici refused him tho place of premier president which he dosirech and hart his feelings l.y appointing him instead a momber of the financial coma mission which succeeded Sully. This appointment he rather strangeiy chose to think a, degradation. It ls, huwever, absurd to say that the affair, which ho survivel six years, had anything to do with his death. That, as far as it was hastcned by any mental affliction, seems to have been rather due to grief at the death of his second wife, Gasparde de La Châtre, of whom aod of his sons and daughters by her (his first marriago with Maric de Barbançon had been childless) be was extrencly fond. His eldest son, François Auguste, was the friend of Cinq Mars, and shared his downfall and fate. But this was a quarter of a century after De Thou's own death, which happened on May 7, 1617.
Althongh a distioguished ornament of France, De Thou lias nothing to do, properly speaking, with French literature. Thositns minor works in Latin (a poem on lawking, somo parpplyracs of tho IBible, \&c.), he wrote also in Latin tho great history "hirh lias malo his namo known Entitled llistoria Sui Temporis, it benine shortly before the author's birth (in $15 \$ 0^{\circ}$ ), and cxtends to 1607 ,
ten years befora his deatl. The first part, in cightecn books, was pulilishod in 1604; the second, thirsl, and fourth appearel in 1000 and the two following years. Tho last part, which makes a totol of 138 books, rlid not appear till 1620, under tho care of tho suthor's frionds Rigatlt and Dupuy, whom he hat manell his literary executors. The first mamollikewise put final tonches to De Thon's nutobiorraphy, which, also written in Latin, appears in French in most collcctions of French momoirs. It contains minuto details of the author's life down to 1607 , mixed with rather miscellancous descriptions of interesting places which he had visited (such as Mont St Michel, an carlo's oyric in Danphiné, \&c.) ; nud its composition is said to havo been partly dotermined by the obloguy cast foy liseted adherents of tho papacy on tho History. Do 'l'hon was imlect obnoxions to these on inany gromnds. He had helped to negotinto tlocectict of Nautes; he had npposed the acknowletenent in France of the decrees of 'Irent; ho hat been o stealy Anti-Lesguer; null lie was necused of speaking in tho Mistory itsclf ef Protestants nul Pruteqtantism, not moroly with criminal milducss, but with gomething like sympathy. It is necelless to say that theso blots in the Wistory have secmed beautics to later and more dispassionato students. Thers is no doubt that the charges of partiality on mingr and mostly personal points are cither disprovable or manportant; and tha whole scems to be as fair and as carefully eccurato as at such a tino was possible. On tho other hand, the work is undoubtedly plamed aud cxecuted on much toe large a scale, and the inclusion of cencuts in forcign countrics, on which tho anthon was often but ill-informed, has not improved it. But it is clearly and on tho whole cxcellently written, and will always be, as far as any gencral contemporay history can be so called, tho great authority for at least tho French part of its sulyect and period. It wits first published as a whole when, as above mentionol, the hast part aprearch in 1620, ond it was several times reprinted. More than a humbed years later, in 1733, an Liglishman, Sammel Buckley, working in part on the materials of 'lhomas Cirte, producod at Lombon wint is recognized as the standard cilition of tho original, in 7 vols. folio. The stamind French trauslation was inato immediately afterwards by a gromp of literary 1 nen, the best known of whon were the Ablis Dusfontaines and IPreost, the anthor of Mranon Lescent. A choice ropy of the first enlition of the first part, with the amo of Honry IV. on tho bincling is in the Britisla Aluscum library.
THIOUSAND AND ONE NIGHTS. The Thousand and One Nughts, commonly known in English as The Arabian Nighls' Entcrtaimments, is a collection of tales rritten in Arabie, whieh first becamo generally known in Europe in the early part of last century through the French translation by Antoine Galland (q.u.), and rapidly attained such universal sopularity that it is unnecessary to describe the contents os the book. But the origin of the Aralian Jights claims lisenssion in this place. In the Journal Asiulique for li'27, p. 253, Von Flanmer drew attention to a passago in the Golden Mewrlou's of Maseudi (ed. Barbier de Mcynarc. iv. $S 9$ sq.), written in $9 \pm 3$ A.D., in which eertain storics current among the old Arabs are compared with "the books which have reached us in translations from Persian, Indian, and Greck, such as the book of ICezio ifscine, a title which, translated from Persian into Arabie, means "the thousand tales.' This book is popularly called The Thousched and One Nights, and contains the story of the king and his vizier and of his daughter Shiraz\&d and her slave girl Dinazád. Other books of the same kind are the book of Ferie anel Simas, containing stories of Indian kings and vizicrs, the book of Sindibad, des." Yon Hammer conclurled that tho Thouscurd and One Nights were of Persian or Indian origin. Against this conelusion De Sacy protested in a memoir (Ment. de rAcad. des Inscr., $1833, \mathrm{x} .30 \mathrm{sq}$. ), demonslrating that the character of tho book we know is genuincly Arabian, and that it must have been written in Egypt at a comparatively recent date. Von Hammer in reply adduced, in Jour. As., 1539 , ii. p. 175 sq., a passaro in the Fihrist (987 A.D.), which is to the Collowing effect:-
"The ancient Persians were the first to invent tales, and make books of them, and some of their talcs wero pat in the mouths of animals. The Ashchanians, or thire dynasty of l'crsian kings, and after them the Sisanians, had a special part in the development of this literaturo, which found Arabic translators, and was taken up liy necomplishod Arabic literati, who culited it and initated it. flhe carliest book of the kind was the Mezdi adetn or Thousand

Talcs, which harl tho following origin. A certain Pcrgie. Kis be was accustomed to kill his wives on the morning alter the ceublubliction of the sarriage. But oned he married a clover prinues called Shahrazad, who spent thomamiaro night in telling n atory which in tho morning reached a point so interesting that the king spared her, and asked rext night for tho sequel. F'lis weat on for a thousand nights, till Shahruzad liad a son, aud ventured to tell the kinf of her devico. He admired her intelligence, loved her, and spared her life. In all this tho princess was assisted by the king's btewardess Dinazate. This book is said to havo been witten for the princess IIomái ( $\mathbb{C S S}$. IIomini), danghter of l3ahman. . . . It contains nearly two hundred stories, ono story often ocelipjing scveral niglits. I lavo repeatedly secn the completo book, but it is really a incagre and uninteresting production" (Fihrist, cd. Fhigul, p. 301).

Persian tradition (in Firdausi) makes Princess Tomai the daughter and wife of Bahman Ardashifr, i.e., Artaxerxes I. Longimanus. She is depicted as a great builder, a kind of Persian Seminamis, and is a lalf-nyythical personage already mentioned in the Avesta, but lier lerend scems to be founded on tho listory of Atossa and of Parysatis. Firdensl says that she was also called Shahrazad (Mohl, v. 11). This namo and that of Dinizid both occur in what Mastudi tells of licr. Aecording to him, Shahrazad was Homati's mother (ii. 129), a Jowess (ii. 123). Bahman had married a Jewess (i. 11S), who was instrumental in delivering lier mation from captivity. In ii. 122 tlis Jewish maiden who did her poople this service is called Dinizad, but "tho accounts," says out author, "vary." Plainly slio is the listlier of Jewinil story. Tabarl (i. 688) calls Esther the mother of Bahman, and, liko Firdausl, gires to Homai tho name of Shalirazid. Tho story of Esther and that of the original Nights havo in fact one main featuro in common. In tho former the king is offended with his wife, and divorces her; in tho Arubian Nights ho finds her unfaithful, and kills her. But both stories agree that thereafter a new wife was bronght to him crery might, and on the morrow paseed into the sceond house of the women (Esther), of was slain (Jights). At length Estlice or Shahbrazad wins lis licart and becomes queen. The jssuc in tho Jewisll story is that liather faves lier people ; in the Nights the gainers are "the danghters of the Mosiems," but the old story liad, of course, some other word than "Moslems." Estlier's fonter-father becomes vizier, and. Sliahrazad's father is also vizier. Shahrazad's plan is helped forvard in the $\lambda_{\text {Fighls }}$ by Dinizíd, who is, according to Masiudi, her slave gill, or, according to other MSS., her murse, and, aecording to the Fihuist, the king's stewardess. Tho last aceount comes nearest to Esther ii. 15, where Esther gains tho favour of the king's clamberlain, keejer of the women. It is also to fo noted that Alnsuerus is read to at night when he cannot slecp (Esther vi. 1). And it is just possiblo that it is worth notice that, though tlie wame of Alasuerus corresponds to Aerxes, Joscplus identifies him with Artaxerxes I.

Now it may be taken as admitted that the book of Esther was written in Persia, or by one who had liced in Persia, and not carlier than the 3 d century b.c. If now there is real weight in the points of contact letween this story and tho Arabian Nights - and the points of difference cannot be held to outweigh the resemblances between two legends, each of which is nceessarily so far removed from the hypothetieal common somree-the inference is important for both storics. On the one bancl, it appears that (at least in part) the book of Esther draws on a Persian source; on the other hand, it oecomes probable that the. Nights are older than the Sastaian period, to which Lane, iii. 677 , refers them.

It is a piece of good fortune that Mas'udl and the Fibuist give us the information cited above. For in general the Moslens, though very fond of stories, are asbamed to recognize them as objects of literary curiosity. In fact, the next mention of the Jights is found ouly after
a lapse of three centuries. Makrizh, describing the capital of Egypt, quotes from a work of Ibn Said (c. 1250 A.D.), who a asain cites an older author (Al-Kortobi), who, in speaking of a love affair at the conrt of the caliph Al-A mir (1097-1130), says "what is told about it resembles the romance of A1-Battal, or the Thousand and One Nights " (IIitat, Búlak ed., i. 485, ii. 181).

That the Nights which we have are not the original translation of the IIezar Afsane is certain, for the greater part of the stories are of Arabian origin, and the whole is so thoroughly Mohammedan that even the princes of remote ages who are introduced speak and act as Moslems. It might be conceived that this is due to a gradual process of modernization by successive generations of story-tellers. But against this notion, which has been entertained by some scholars, Lane has remarked with justice that, much as MSS. of the Nights differ from one another in points of language and style, in the order of the tales, and the division into nights, they are all so much at one in essentials that they must be regarded as derived from a single original. There is no trace of a recension of the text that can be looked on as standing nearer to the Hezár Afsine. And the whole local colour of the work, in point of dialect and also as regards tho manners and customs described, clearly belongs to Egypt as it was from the 14 th to the 16 th century. Some points, as De Sacy and Lane have shown, forvid us to place the book earlier than the secoud balf of the 15 th century. Galland's MS. copy, again, was in existence in 1518. Lane accordingly dates the work from the close of the 15 th century or the beginning of the 16 th, but this date appears to bo too late. For Abu'l-Mahasin, an Egyptian historian who died in 1470 , writing of Hamdi, a famous highwayman of Baghdad in the 10th century, remarks that he is probably the figure who used to be popularly spoken of as Abmed al-Danaf (ed. Juynboll, ii. 305). Now in the Nights Ahmod al-Danaf really plays a part corresponding to that of the historical Hamdi, being now a robber (Lane; ii. 404) and again a captain of the guard (Lane, ii. 249). It would seem that Abn'l-Mahasin bad read or heard the stories in the Nights, and was thus led to compare the bistorical with the fictitious character. And, if this be so, the Nights must have been composed very soon after $1450 .{ }^{1}$
No doubt the Nights have borrowed much from the Hezar 4 fsine, and it is not improbable that even in the original Arabic translation of that work some of the Persian stories were replaced by Arab ones. But that our Nights differ very much from the Hesir Afsane is further manifest from the circumstance that, even of those stories in the Nights which are not Arabian in origin, some are borrowed from books mentioned by Mas íds as distinct from the Hezar Afstine. Thus the story of the king and his son and the damsel and the seven viziers (Lane, chap. xxi. note 51) is in fact a version of the Book of Sindbad, ${ }^{2}$ while the story of Jalf ${ }^{\prime}$ ad and his son and the vizier Shammás (MNaghten, iv. 366 sq.; of. Lane, iii. 530) corresponds to the book of Ferza and Simas. ${ }^{3}$

Not a few of the tales are unmistakably of Indian or

[^132]Persian origin, and in these poetical passages are rarely inscrted. In other stories the scene lies in Persia or India, and the source is foreign, but the treatment thoroughly Arabian and Mohammedan. Sometimes, indeed, traces of Indian origin are perceptible, even in stories in which Harún al-Rashid figures and the scene is Baghdad or Basca. ${ }^{4}$ But most of the tales, in substance and form alike, are Arabian, and so many of them have the capital of the caliphs as the scene of action that it may be guessed that the author used as one of his sources a book of tales taken from tho era of Baghdad's prosperity.

The late date of the Nights appears from sundry anachronisms. In the story of the men transformed into fishwhite, blue, yellow, or red according as they were Moslems, Christians, Jews, or Magians (Lane, i. 99), 一the first three colours are those of the turbans whicb, in 1301, Moharmmed b. Kelaun of Egjpt commanded his Moslem, Christian, and Jewish subjects respectively to wear. ${ }^{5}$ Again, in the story of the bumpback, whose scene is laid in the 9th century, the talkative barber says, "this is the year 653 " ( $=1255$ A.D.; Lane, i. 332, writes 263 , but see his note), and mentions the caliph Mostansir (died 1242), who is incorrectly called son of Mostads. $6^{\circ}$ In the same story several places in Cairo are mentioned which did not exist till long after the 9 th century (see Lane, i. 379). ${ }^{7}$ The very rare edition of the first 200 nights published at Calcutta in 1814 speaks of cannon, which are first mentioned in Egypt in 1383; and all editions sometimes speak of coffee, which was discovered towards the end of tho 14 th century, but not generally used till 200 years later. In this and other points, e.g., in the mention of a mosque founded in 1501 (Lane, iii. 608), we detect the hand of later interpolators, but the extent of such interpolations can bardly perhaps be determined even by a collation of all copies. For the nature and causes of the variations between different copies the reader may consult Lane, iii. 678, who explains how transpositions actually arise by transcribers trying to make up a complete set of the tales from several imperfect copies.

Many of the tales in the Nights have an historical basie, as Lane has shown in his notes. Other cases in point might be added: thus the chronicle of Ibn al-Jauzf (died 1200 A.D.) contains a narrative of Kamar, slave girl of Slaghb, the mother of Al-Molstadir, which is the sourco of the tale in Lane, i. 310 sq , and of another to be found in M'Naghten, iv. 557 sq. ; the latter is the better story, but departs so far from the original that the autbor must have had no more than a general recollection of the narrative be drew on. ${ }^{8}$ There are other cases in the Nights of two tales which are only variations of a single theme, or even in certain parts agree almost word for word. Some tales are mere compounds of different stories put together without any art, but these perhaps are, as Lane conjectures, later additions to the book; yet the collector hinself was no great literary artist. We must picture him as a professional story-teller equipped with a mass of miscellaneous reading, a fluent power of narration, and a ready faculty for quoting, or at a push improvising, rerses. His stories became popular, and were written down as he told them, -hardly written by bimself, else we should not have so many variations in tho text, and such insertions of "the narrator says," "my noble sirs," and the like. The frequeat coarseness of tone is proper to the condition of Egyptian society under the Mameluke sultans, and would not have been tolerated in Baghdad in the age

[^133]to which so many of the tales refer. Yet with all their faults the Nights have beauties enoagh to deserve their popularity, and to us their merit is enhanced by the pleasure we feel in being transported into so ontirely novel a state of society.
The original of some of the most interesting tales in Galland's version, as "Aladdin and the Wonderful Lamp," "Ali Baba and the Forty Thieves," has just been discovered by Dr Zotenberg in a MS. recently acquired by the National Library at Paris. A careful examination of this MS. and of the Wortley.Montagu MS. in the Bodleian may lead perbaps io a more certain conclusion as to the time of composition.

The Thousand and One Nights beceme known in Europe through A. Galland's French version ( 12 vols., 12ma, Paris, 1704-12) ; the publication was an event iu literary history, the influence of which can be traced far and wide. This translation however, left much to be desired in paint of accuracy, and especially failed to reproduco the colour of the original with the exactness which thase who do not read merely for amusement must desire. It was with a special view to the remedying of these defects that Lane produced in 1840 his admirably accurate, if somewhat atilted, translation, enriched with most valuable notee end a discussion of the origin of the work. (new edition, with some additional notes, 3 rols., 8 re ., London, 1859). Lane's translation omits the tales which he deemed uninteresting or unfit for a European public. No full translation into Euglish can be published, and, though two such have been privately printed, and one of these (by Sir R. Burton) is being reproduced in an expurgated form, Lane's version is atill unsuperseded for all serious use. Of the Arabic test of the Nights the priacipal editions are-(1) M'Naghten's edition, 4 vols., 8vo, Calcutta, 1839-42; (2) the Breslau edition, 12 vols., 12 mo , 1835-43, the first 8 vols. by Habicht, the rest by Fleischer (compare as to the defects of Habicht's mork. Fleischer, De Glossis Habichtianis, Leipsic, 1836); (3) the first Búlák edition, 4 vols., 1862-3.
(M. J. De G.)

THRACE is a name which was applied at various periods to areas of different extent, but for the purposes of this article it will be taken in its most restricted sense, as signifying the Roman province which was so called (Thracia, see Plate of the Roman empire in vol. xx.) after the district that iutervencd between the river Ister (Danube) and the Hwnus Mountains (Balkan) Lad been formed into the separate province of Mœesia, and the region betweeu the rivers Strynion and Nestus, which included Philippi, had been added to Macedonia. The boundaries of this were-towards the N . the Hæmus, on the E. the Euxine Sea, on the S. the Propontis, the Hellespont, and the Ægean, and towards the W. the Nestus. The most distinguishing features of the country were the chain of Rhodope (Despoto-dagh) and the river Hebrus (Maritza). The former separates at its northernmost point from the Hæmus, at right angles, and runs southward at first, nearly parallel to the Nestus, until it approaches the sea, when it takes an easterly direction: this bend is referred to by Virgil in the line (Georg., iii. 351)Quaque redit medium Rhadope porrectas sub axem.
The summits of this chain are higher than those of Hæmus, and not a few of them range from 5000 to 8000 feet ; the highest point, eo far as is at prosent known (for these mountains have been imperfectly explored), rises towards the north-west, near the point where now stands the famous Bulgarian monastery of Rilo. The Hebrus, together with its tributaries which flow into it from the north, east, and west, drains nearly the whole of Thrace. It starts from near the point of junction of Hæmus and Rhodope, and at first takes an easterly direction, the chief town which lies on its banks in the earlier part of its course being Philippopolis; but, when it reaches the still more important city of Hadrianopolis, it makes a sharp bend towards the eouth, and enters the sea nearly opposite the island of Samuthrace. The greater part of the country is hilly and irregular, though there are considerable plaius; but besides Rhodope two other tolerably definite chains
intersect it, one of which descends from Hæmus to Adrian ople, while the other follows the coast of the Euxine at no great distance inland. One district in the extreme north-west of Thrace lay beyond the watershed that separates the etreams that flow into the Egean from those that reach the Danube: this was the territory of Sardica, the modern Sophia. In the later Ronan period two main lines of road passed through the country. One of these skirted the southern coast, being a continuation of the Via Egnatia, which ran from Dyrrhachium to Thessalonica, thus connecting the Adriatic and the Ægean; it became of the first importauce after the foundation of Constnatinople, because it was the direct line of communication between that city and Fome. The other followed a northwesterly course through the interior, from Constantinople by Hadrianopolis and Philippopolis to the Hrmus, and thence by Naissus (Nisch) through Moesia in the direction of Pannor:ia, taking the same route by which the post-roed now runs from Constantinople to Belgrade. The climate of Thrace was regaided by the Greeks as very severe, and that country was spoken of as the hone of the north wind, Boreas. The coast in the direction of the Euxine also whs greatly feared by sailors, as the harbours were few and the sea proverbially tempestuous; but the southern shore was more attractive to navigators, and here we find the Greek colonies of Abdera and Mesambria on the Fyean, Perinthus on the Propontis, and, the most famous of all, Byzantium, at the meeting-point of that sea and the Bosphorus. Another place which proved attractive 10 colonists of that race was the curious narrow strip of ground, called the Thracian Chersonese, that intervened between the Hellespont and the Bay of Melas, which penctrates far into the land on its northern side. Ainong the cities that occupied it, Sestos and Callipolis (Gallipoli) are the most worthy of meation. In order to prevent the incursions of the Thracians, a wall was built acros its isthmus, which was less than five miles in breadth. The north-eastern portion of the Egean, owing to its proximity to the coast of Thrace, was known as the Thracian Sea, and in this were situated the islands of Thasos, Samo. thrace, and Imbros.
There is no sufficient evideuce to deternine the ethnological affinities of the Thracian race. Their language has perishod, and the information respecting them which has conie down to us hardly furnishes more than material for conjecture, so that the miost that we can affirm on the subject is that they belonged to the IndoEuropean family. The most striking archæological monuments of the prehistoric period are the sepulchrel mounds, which have been compared in appearance to the tumulus on the plain of Morathon; these ere found by thousands in various parts of the country, espe. cially iu the neiglibourhood of the ancient towns. As Roman implements and ornaments have heen found in some of them, it is fiain that this mode of burial continued to be practised until s late period. The deity whose worship prevailed most extensively in the country wes Dionysus. The most pawerful Thracian tribe Was that of the Odrysx, whose king, Teres, in the middle of the 5tb cantury b.o. extended his dominion so as to include the greater part of Thrace. During the Peloponnesian War his son Sitalces wes an elly of some importance to the Athenians, because ho kept in check the Macedonian monarch, who opposed the intefests of the Athenians in the Chalcidic peninsula. On the death of that pritus his kingdom was divided, eid the power of the Thracians was consequently dininished; but in the time of Philip of Mlacedon we find Cersobleptes, who ruled the south-astern portion of the country, exercising an important influence on the poficy of Atbens. During the early period of the Roman empire the Thracian kings were allowed to maintain an indepandent sovereignty, while acknowledging the auzerainty of Rome, and it was not until the reign of Vespasian that the country was redured to the form of o province. From its ontlying position in the northern part of the Balkan peniusula, it was much exposed to the inroads oi barbarian invaders, $s o$ that it was overrun ly the Goths on several occasions, and subsequently by the Huns; but its proxirnity to Constantinople' caused its fortunes to be closely connected with those of that city, from the time Then it became the capital of the Eastern empire. In-the course of time its inhabitants seem to have been theroughly Romanized, end to have adopted the Latin language, end thera in
much probability in the view that they were the progenitors of the Vlachs, or Roumanians south of the Danube, whose language is of Latin origin, and who at various periods formied an important factor in the countries to the northward of Greece. The first evidence of the depelopment of this nationality is found in a curious story told by Theophanes at the end of the 6th century. At that time a khan of the Avars liad overrun the Eastern empiro and appeared before the walls of Constantinople; but two generals of the imperial forces, who had concealed themselves in the Balkan, oucceeded in mustering a considerable body of troops, ind were on thcir way to surpriso the rear of the Avers when their project mas brought to sn end by the following occurrence. One of the beasts of burder happened to fall down in the line of march, on which some one close by called out to its driver, in the language of the country, "Torna, torns, fratre," that is, "Turn him round, brother." The driver did not hear this, hut the other eoldiers did; and, thinking the cnemy were upon them, and that this was the sign for rotreat, they took up the cry "Toras, torna," and the whole force fled precipitately. It seems probable that the men who used theso words were Roumsnian inhebitants of the Balken. In the course of the Middle Ages the northern parts of Thrace and some othor districts of that country were occupied by a Bulgarisn population; and iu 1361 the Ottomaus, who had preriously established themselves iu Europe, made themselves mesters of Adrienople, which for a time became the Turkish capital. When Constantinople fell in 1453, the whole country passed into the hands of the Turks, and in their possession it remained until 1878, when, in accordence with the provisions of the tresty of Berlin, the northern portion of it was placed under a aeparate administration, with the title of Eastern Houmelia; this province has now hecome, to all intents and purposes, a part of the principality of Bulgaria. The popalation of Thrace at the present day is composed of Turks, Greeks, and Bulgarians.
(H. F. ‘.f.)

## thrale. See Piozzi.

THRASYBULUS, an Athenisn who played a distinguished part in the latter years of the Peloponnesian War and in the restoration of the democracy at Athens. In 411 b.c., as an officer in the Athenian armament at Samos, ho energetically opposed the oligarchical conspiracy of the Four Hundred, and was mainly instrumental in keeping the fleet and army loyal to the democracy and in procuring the recall of the banished Alcibiades. At the battle of Cynnosems, in the same year, he commanded the right wing of the Athenian fleet, and to his valour and conduct the Athenian victory was largely due. He took an active part in the naval operations of the followicg ycars, being present at the victories of Cyzicus (410) and Arginusæ (406). In 407 be commanded a squadron on the Thracian coast, where he reduced places which had gone over to the Lacedæmonians. When tho infamous Thirty Tyrants were at the height of their power in Athens, Thrasjbulus, who as a democrat had been banished, marched from Thebes with about seventy men, with the connivance of Thebes, pad established hinnself at Phyle, a strong place in the rear of Athens. There he repulsed an attack directed against him by the Thirty; his numbers increased, and, after surprising nad routing a body of foot and horse, he eeized Pureus, the port of Athens, but, finding the circuit of the walls too great to be defended by his smaill force, he retired into the adjoining Munychia. Here he was attacked by the troops of the Thirty, but in the streetfighting the democrats bad the best of $i t$, and the Thirty were in consequence deposed and retired to Eleusis. Hostilities, he rever, continued until Pausanias, one of the kings of Sparta, intervened, and by force and craft effected a reconciliation. The democrats marched into Athens with all the pomp of war, and eacrificed to Athene on the Acropolis This restoration of the democrscy by Thrasybulua ranked henceforward with the memorable deeds of A thenian history. To his counsels seems due in part the credit for the wise moderstion with which the democrats used their victory, and the inviolate good faith with which they observed the politicsl amnesty. The grateful citizens rewarded their champion with an olive crown. In 395, whon Thebes was threatened by Sparta, the Athenisns, stimulated by Thrasybulus, repaid the
friendly shelter which the Thebans had afforded them it exile by resolving to stand by Thebes against Sparta, and by actually sending a force under Thrasybulus to ber aid. In 390 , while the war known as the Corinthian was still dragging on, Thrasybulus was sent with a fleet to check the growing power of Sparta in the Egean. He substituted a democracy for an oligarchy at Byzantium, and won the friendship of Chalcedon; then, landing in Lesbos he defeated a joint force of Lacedæmoniansand Lesbians In the following spring he prepared to assist Rhodes, which was tbreatened by the Lacedæmonians; but to recruit his forces he levied contributions from various cities. At Aspendus, in Pamphylis, an outrago committed by some of his men roused the anger of the people, who fell on him by night, and slew him in his tent. Ho was buried at Athens, in the Ceramicus, near the graves of Pericles and Phormio.

THREE RIVERS, the third city of Quebec province, Canada, and capital of St Maurice county, is situated at the confluence of the rivers St Maurice and St Lawrence. The St Maurice flows in from the north, and, being divided at its mouth by two islands, the channels give the town its name. It is on the line of the Canadian Pacific Railway, 78 miles south-west of Quebec, snd 92 north-east of Montreal. Founded in 1634 , Three Rivers is one of the oldest towns in Quebec. It is the centre of a large lumber trade, which is carried on by the St Maurice and its tributaries. Three leagues from the city are the St Maurice forges, where iron wares were formerly manufactured extensively. Other industries are furniture and cabinet making, boot and shoo making, and those carried on in the spool factories, brass and lead foundries, sawmills, and carriage factories. The city is the residence of the Roman Catholic bishop whose diocese bears the same name. The chief trade is in lumber, grain, cattle, \&c., which find sale in South America, the West Indies, Great Britain, and the United States. The city sends one member to the Canadisn House of Commons and one to the Legislative Assembly. The population of the city in 1881 was 8670 (males 4173, females 4497). The district of Three Rivers comprises the counties of St Maurice, Nicolet, Champlain, and Maskinongé.

TEROAT DISEASES. These form a large and important class, and include some of the most serious and fatal of maladies (see Croup and Drphtheria). The present article will be deroted mainly to a general account of the more common diseases affecting the upper part of the rospiratory passages, but certain morbid conditions of the back of the mouth and of the gullet will also be referred to. The diagnosis of not a for of these diseases has been greatly aided by the introduction into medical practice of the laryngoscope; but, while the use of this instrument ie a part of the education of every well-equipped medical practitioner, the minute investigation and the treatment of the more occult and serious maladies affecting the throat are by general consent, and with much adrantage, relegated to the specialist.

Laryngitis, or inflammation of the macons membrane of the Laryinx, may be either acute or chronic

Acute laryngitis is usually produced by exposure to cold directly, or by a catarrh extending either from tho nassl or from the bronchial micous membrano into that of the larynx. It is an occasional accom. paniment of certain of tho infectious disesses in which the throat is liable to suffer, such as small-pox, measles, ecarlet fever, and erysipelas. Excessive use of the voice, as in loud spesking or aing. ing, sometimes gives rise to laryogitis. Further, the inhalation of irritating particles, vapours, \&c., and the local effects of owallowing very bot fluids, are well-recognized causes. Tho chiof changes in the larynx are great redness, with swelling of the perts, which sffect the rhole interior of tho carity, but are epacially marked fhere the tissues are lax, aurh as the neighbourhood of the epigiottls and
of the vocal cords. The effect is to produce narrowing of the chanael for the entrance of air, and to this the chief dangers are due. The symptoms vary with the intensity of the attack, but, along with more or less feverishness and constitutional disturbance, there is usually a sense of heat, dryness, and pain in the threat, attended with sume difficulty in the act of ewallowing. Cough is a constant symptom, and is either loud, barking, or clanging, or else husky and toneless. It is at first dry, but afterwards is accompanied with expectoration. The voice, like the cough, is rough or husky. The breathing shews evidence of laryngeal obstruction, both inspiration and expiration being prolonged and difficult, with a comewhat hissing sound, and with almost no interval between the two acts. In severe cases the face and eurface generally hecome livid, and suffocation threatens, particularly during the paroxysma of coughiog. In favourable cases, which form the majority, the ettack tends to abate in a few days, but on the other hand death may occur suddenly in a suffocative paroxysm, particularly in the case of childrea. Many cases of acute laryagitis are so compara. tively slight as to make themselves known only by hoarsencss and the character of the cough; nevertheless in evcry instance the attack demands serious attention. The treatment consists in keeping the patient in bed in an atmosphere of $60^{\circ}$ to $73^{\circ} \mathrm{F}$., made moist by steam. The use of warm gargles, and the frequeut inlialation of the vapour of hot water, coutaining such soothing substances as benzoin, coniurs, hop, \&c., and the application of hot fomentations to the throat, will be found of much valne. Internally diaphoretics, such as atall doses of antimony or Dover's powder, are also to be recommended. Such remedies usually suffice to relieve the attack, but in very eevere cases more achive interference may be necessary. When there is much owelliug of the mucous membrane in the upper portion of the larynx, scarification of the parts with the aid of the laryngoscope may afford relief, but trachootomy should not be neglected where death appears, to be imminent from suffocation. Attacks of laryngitis may be largely prevented in those liable to them by a regimen calculated to invigorate the syetem, euch as the cold bath, regular open-air exerciso, \&c.

Chronic laryngitis may occur as a result of repeated attacks of the acute form, or may arise independently from such causes as habitual exposure (especially where along with this there is overindulgence in alcohol), the habitual overuse of the vocel organs, \&c. The changes taking place in the parts are more permanent than in the acute form, consisting mainly in thickening of the mucous membrane, vocal cords, \&c. With it may be ulceration, and also sometimes destruction, of the cartilaginous parts of the larynx.f The symptoms vary according to the extent and amount, as well as the duration, of the infammation. Thas there may simply be a certain huskiness or hoarseness on attempta at the use of the voice, this condition being well exemplified in the a0-called clergyman's sore throat (dysphonia clericomm) ; while, on the ether hand, there may be, not only complete loss of voice, but severe pain in the act of ewallowing and great difficulty in breathing, accom. panied sometimes with expectoration of large quantities of matter in the cases where ulceration is present. Under this variety of the diaease may be included the nlceration due to syplilis and that occurring in the course of phthisis, both of which aro attended with the aymptoms now mentioned. The diagnosis and the treat. ment of a) such cases is greatly aided by the use of the layyngoscope, by which a view of the affected parts can be obtained, and the proper remedies more readily applied. In the treatment of the chronic forms of laryngitis rest to the parts is essential, any attempts at continuing the use of the voice only aggravating the condition; while tonic remedies and regimen should be diligentlj employed to strengthen the system generally. Applications to the affected parts in the forms of solutions of silver, alum, zinc, tannin, \&c., either hy means of a sponge-probang introduced into the cavity or by the simpler method of epraying, are often beneficial. The insuffation of powders, such as iodoform, or starch mixed with a minute quantity of morphia, is also of service, as are likewise inhalations of vapours of iodine, carbolic acid, turpentinc, eucalyptus, \&c. In aggravated forms of this disease tracheotnmy is occasionally necessary to rolieve threatened suffocation.
Symptoms similar to those already described are produced by tumours and othor growths in the larynax. Such growths may ho of eimple character, in the form of isolated fibrous formations attached by a peduncle to some portion of the laryngeal inucous membrane, or as warty excrescences occurring upon or in the neighbourhood of the vocal cords. They are detected by means of the laryngoscope, and can often be dealt with effectually by the surgeon. In the more eerious malignant tumours (epitheliomatous or cancer. ons), which either take origin in the larynx, or apread into it from adjacent parts, iuterference by surgical measures can only afford temporary relief.

Certain affections of the larynx are of purely nervous origin, and occur independently of any local disease. One of the most imn rtant of these is laryngismus stridulus, otherwise called child-crowo. ing or spasmodic croup. This condition occurs chielly during the
early years of childhood, often in infants during dentition, and manifests itself after premonitory symptorne of a common catarrh, lasting a day or two, by the occurrence of a viblent suflocative attack due to sudden apasmodic approximation of the vocal cords, and consequent interruption to the breathing. The synuptoms are not connccted with any local infammatory condition, hut are the result of reflex irritation affecting the nervea supplying the laryngeal muscles. Such disturbance appears specially apt to occur in rickety or otherwise unhealthy children, in connexion either with dentition or with disurders of the alimentary canal. The onset is sudden, resembling a convulsire eeizure, and symptoms of euffocstion are at once developed. The child makes strong efforts to inspire, which are accumpanied witl stridulous or crowing suunds, but, notwithstanding, very little air can enter the chest owing to the spasm of the glottis, and unless relief speedily comes death may be very rapid. In most cases, however, the attack quickly passes off, and the child aeems little the worse. A liability to this disorder is eometimes observed in families, and in such instances the attacks are apt to occur in their more serious and fatal forms. Treatment to be of any avail must be promptly applied. It coneists mainly in the employment of means to allay the apasm. The use of the warm bath is very serviceable for this purpose, as is also chloroform inhalation. But one of the simplest and most effectual measures is putting the finger bacis into the child's moutb, which is sufficient in many cases to relax the spasm of the glottis, and permit the entrance of air. In impending asphyxia the dashing of cold water over the face and chest, and the use of artificial respiration, should be tried, and even tracheotomy or laryngotomy if practicable. In all cases every effort should be made to discover sny causes likely to prolluce nervous irritation, such as teething, intestinal worms, \&c., and to deal with these by appropriate remedies.

Symptoms not unlike these now described sometimes occur in adults es the result of irritation of the recurrent laryog sal nerve, by the pressure upon it of a thoracic aneurism or other tumour. Such pressure, if long continued, results in paralysis of the nerve, occasioning more or less coustant trouble in breathing.

In the condition known as norvous aphonia, which occurs mostly in women of hysterical habit or in circumstances of enfeehled health, the voice becomes reduced to a whisper, but there is seldom any affection of the breathing, or cough, and the laryngoscope reveals a perfectly healthy state of the parts. In such cases the remedies must be directed to the improvement of the general health. The use of electricity (faradism) applied to the neck is often attended with marked henefit.

Diseases affecting the Trachea are usually associated with laryngeal affections on the one hand or branchial on the other, sud their separato consideration ia unnecessary.

The Tonsils are frequently the seat of inflammation, and acute tonsillitis or quinsy is one of the most common forms of sore throst. This affection is usually induced by cold, but it would appear to ariso under other cooditions also, such as digestive disturbaruces, \&c. It is eaid to be more common in persons of rheumatic constitution, and one attack prediaposes to othera. The symptoms come on somewhat suddenly and eharply, with chill fallawed by fever, the temperature frequently attaining a high point of eluration. Pain is experienced in the act of swallowing from the outset. The inflammation is usually at first confoed to one towsil, but on examining the throat there is seen to be considerable redness and swelling of the whole eurrounding mucous membrave, the uvula, soft palate, \&c., while a copious accretion accumulates at the parts, and causes much discomfort. The act of swallowing becomes increasingly difficult, and fiuids are apt to regurgitate through the nose. Pain is felt along the Eustachian tube towards the ear, and there are tenderness and awelling in the neck about the angle of the jaw on the affected side. The voice acquires a peculiar and very characteristic enufling tone, and there may be some embarrassment to the breathing. In a few daye tho inflamed coosil shows aigns of snppurating, and an alscess is neen to he bulging forward into the mouth. When this bursts or is evacuated, speedy relief is obtained, and the patient. is soon restored to his usual bealth. Occasiooally, however, the inflammation passes from the one tonsil to the other, and a similar experience has to be gone through sgain. An attack of quiner raroly lasts beyond a week or ten days, and is not as a rulo attended with danger to life, although it ia said that suffocstion has occasionally occurred owing to the burating of a largo tonsillar abscess during sleep, and the passage of its contents into the trachea. The treatment for a quinay is much the same as that for an ordinary catarrli of cold, -confinement to the house, the employment of diaphoretics or mild laxatives, together with light diet, being all that is necessary as regards general management. For the relief of the local inflammation the frequent employment of warm gargles of milk and water or glycerin and water or the inhalation of vapour afford much relief, as do also hot applications to the neck. Some authorities recommend the sncking of ice and the external application of cold compresses, but on the waso
warmth appears to bo the more eoothing remedy. Whou sn absecss has formed it may be punctured, but care ze puires to be olbsorved in doing this that no injury be inflicted on any important blood-vessol.
The tonsils are frequently tho seat of permanent culargement chronic lonsillitis), which may result from frequont sttacks of quinsy or may exist independently. They aro often scen in delicato young people, aud, in the case of come at lcast, denoto a atrumous tendsucy. They givo trouble from tho mechnnical impediment they present to swellowing and clear articulation, and when very large they cause the breathing to be more or less noisy at all times, but especially during sleep, while rgain they masy give rise to a mensure of deafness. They are treated by renedics which prompte the general uutrition, such as cod-liver oil, iron, \&c., by the use of astringeut gargles, and wheu necessary by cxcision.

The Pharynx or opper portion of the gullet (seeu to a large extent on looking at the back of the mouth) is frequeutly the reat of a chronic inflammatory cordition, asually associated with derangementa of the digestive organa, and sometinies the result of excessive tobacco smoking. On inspection the mucous membrane is seen to be unduly red and glazed looking, with the enlarged follicles staudiug out promincutly. It produces coosiderable iritation, cough, and discomfort, which nay he of long continu. ance unless subjected to appropriato treatracnt. This cousists in removing any locsl source of irritation, in rectifying by dist and other remedies (see Stomach Diseases) any gastric disturbence, and by the application to the parts of siiver or other mild caustic solution.
The Eisophages or gullet may be the seat of catarthel or uflammatory conditions, but the more important ailmenta alfecting this tract are those which arise from local injuries, wuch es the apallowing of scalding or corrosive substances. This may causo alceration follomed with cicatrization which asrrows the passage and produces the symptoms of stricture of the cesopharnus, - armely, paiu acd diffeulty is swallowing, with regurgitation of the food. The eeverity of the case will uecessarily depend upon the amonnt of narrowing and consequent mechanical obstruction, but in some instanees this has occurred to such an extent as practically to ocelude the canal. Cases of csophageal stricturo of the kind now referred to may sometimes be reliered by the diligent use of the bougie, but not nnfrequently, in order to prevent death by starvation, surgical interference is requisite to form an opening in to the stomech by mecns of which food may be introduced.

A sti" more serious and frequeut cause of osophageal stricture is that due to cancerous growth in the canal, which may occur at soy part, but is most common at the lower end, in tho ricinity of the eatrance into the stomach. Tho eymptoms of this condition are increasing difficulty in the passage downrrards of the food, the steady declins in streogth, end the derelopment of the caucer ous eachexia, together with cnlargements of the glends in the neck ; while the disgnosis is rendeced the more certain by the abseace of auy cause, such as local iujury, for the formation of a stricture, and by the age (as a rule at or beyond middle lifo). Treatment here can only be pallistive whale life continues, which in genoral is not loog. Feeding by tho bowel (enemata) may be envantageously resorted to as supplementery to efforts to ednin. ister liquid motriment in tho usual way. It is to bo observed in all cascs of arganio etricture that the food does not vecessarily roiurn st once, but scema as if it lasd passed into the stomach. In reolity, howover, it has passed iuto the dilated or pouched portion of the conal, which is almost almays present imiocdistely above the seat of stricture, where it remains until, from ita amount, it regurgitstes back ioto the mouth, when it can bo seed, ly the absonce of any crideuce of digestion, that it has norer been rithin tho envity of tho stomach. While in this way a largo quantity of tho food roturng, it often happeas that a small amount of tl: a Hynid portion docs triekle through the oarrowod canal into tha otomach, and thus lifo may be prolowged for s considerablo time

Strictures of the cesophagns may also be produced by the pres. sure of tumoars or ancurisms within the eavity of the chest but external to the canal. Further, a varioty of cesophageal atricture is zot anfrequently met with which is due entirely to wervous causes, and is quite unconnected with orcanic disease, -namely, that form occurring in hysterical femaleg termed spaswodic etricture. Here the attack of difficulty iu swallowing coincs on nsually when tho patient is of meals, and the food cannot pass down. The absuce, howerer, of all history of any organic source of disease, and especially the perfect facility with mlich the oesophageal tube or bounio is passcd, logether with other manifeatations of hysteria commonly present, serve readily to estahlish the diagnosis The remedies most suitallo are tonics and the frequeot passage of the siomsch. tube, which aq a rule soon entirely rerooves tho terdency to soasm.
Finally, dificulty in amallowing sometimes occurs in cortan serious aervous disceses from paralysig affecting tho nerves supply. ing the muscular coats of the oesophagus, which thas loses its propulsive porer. When eneh complications occur they usually denote an adrajccu atage of the ceotral diseasa with which they are connected, and aspeedilv fatal termination
(J. O. A.)

THRONDHJEM, or 'I'rondejem (1)ronthem), the third town of Aorway, capital of the Throndhjen stift and of the South 'Throadhjem amt, is pleasantly situated on the southern shore of the Throndhjem fjord, at the month of the Nid, 318 milcs by rail to the north of Christiania, in $63^{\circ} 25^{\prime} 52^{\prime \prime} \mathrm{N}$. lat. and $10^{\circ} 33^{\prime} 19^{\prime \prime}$ E. long. In front of tho town is tho islet of Nunkholm, fermerly a monastery and now a fortress ; on the high ground to the east is the small stronghold of Cbristiansten. The houses of Throndhjem, principally of wood, are substantial, spacious, and well lighted; and the streets are wide, regular, and scrupulously clean. The principal building is the calhcdral, partly dating from about 1090, but chieffy belonging to the 12th and 13th centurics (c. 1161-1248). Its extreme length was 325 feet and its extremo brcadth 124 feet; but in the 14 th, 15 th, and 17 th centurics it suffered grcatly from repeated fires; after the last of theso the nave was completely abandoned, and soon becamo a heap of ruins. The building, which still ranks as the finest ecclesiastical edifice in Norway, and is the place of coronation of the Norwegian sovereigns, is now undergoing extensive but judicious restoration. The workmanship of its eastern windows and of the marble or steatite columns of the choir is specially noteworthy. Throndhjem possesses thrce churches in all, and amoag its other public buildings may be mentioned tho residences of the stiftsantmand and the bishop, the grammar school, the real school, the head office of the Bank of Norway, the deaf and dumb institute, the hospital, and the theatro. It is the seat of the royal Norwegian scieutific society, in connesion with which aro an excellent library and a good zoological and antiquarian museum. Throndhjen, which bas steamboat communication with Christiania, Hamburg, and Mull, and is connceted with Sweden by the Meraker Railway (63 miles), carries on an extensive trado ia copper (from the Rüros mines), timber, oil, and dricd and salted fish; the industries includo shipbuilding, sawmilling, distilling, tanning, rope-making, znd ribbor-making. The population ia 1875 was 22,152 ; in 1885 it was estimated at 24,000

Throndhjem, origiually Nidaros, was founded by Olaf Tryegyason, who buile a rojal residence and a church here in 996 . It was made an archlishopric in 1152 . The city attained its highest development shout tho latter lalf of the 13 th century, by which time it had become an important pilgrimage centre and had as many es fifteen churcheg. It has slistsincd frequent sieges, as well as devastating conflagrations. Ita importance declined about tbe timo of the Roformation, when it ceased to be a resort of pilgrims. At the berinuing of the present century its inhabitants numbered only 8832.

THRUSH (A. S. prysce, Icel. pröstr, Norw. Trast, $O$. H. Germ. Drosce, whence the modern German Drossel, to be compared with the analogous English form Terostles, ${ }^{\text {a }}$ now almost obsolete, both being apparently diminutives), the namo that in England secms to haro been common to two species of birds, tho first now generally distinguished as the Song-Thrush, but known in many districts as the Mavis, ${ }^{2}$ the seeond called the Mistletoe-Thrush, but having many other local designatious, of which nore presently.

The former of these is ono of the fincst songsters in Europe, but it is almost everywhero so common that its merits in this reanect are often disregarded, and not unfrequently its melody, when noticed, is ascribed to the princo of feathered vocalists, the Nigntingale (vol. xvii. p. 493). Tho Song.Thrush is too well known to need description, for in the spring and summer there is hardly a fiold, e copse, or a garden that is not the resort of a pair or moro; and the brown-backed bird with its spotted breast,
1 For may interesting facts conaected with the mords "Thrush" and "Throstle" which canoot bo cotered upon bere, tho reader should consult Prof. Skeat's Etymological Dictionary.
${ }^{2}$ Cognate with the French Mrawvis, though that is nowadaye almoer restricted to the ReDwio (vol. xx. p. 318). Its diminutive is Varvielte, the modern table-name of the Skylark, and perhaps Maris Fis to Eng'ish origionly the table-дame of the Thrasb.
hopping over the grass for a fow yatds, then pausing to detect the morement of a worm, and vigorously seizing ths same a moment after, is one of the most familiar sights. Hardly less well known is the singular nest built by this bird-a deep cup, lined with a thin but stiff coating of fragments of rotten wood ingeniously spread, and plastered so as to present a smooth intorior-in which its sea-grcen eggs spotted with black aro laid. An early breeder, it builds nest after nest during the season, and there can be few birds more prolific. Its ravages on ripening fruits, especially strawberries and goosebarries, excite the enmity of the jmprudent gardener who leaves his crops unprotected by nets, but he would do well to stay the hand of revenge, for no hird can or does destroy so many snails, as is testified to the curious obscrver on inspection of the stones that it selects against which to dash its captures, - stones that are besmeared with the slime of the victims and bestrewu with the fragments of their shattered shells. Nearly all the young Thrushes reared in the British Islands-and this expression includes the storm-swept isles of the Outer Hebrides, though not those of Shetland-seem to emigrate as soon as they are fit to journey, and at a later period they are followed by most of their parenis, so that many parts of the kingdom are absolutely bereft of this species from October to the end of January. On the continent of Europe the qutumnal influx of the birds bred in the North is regarded witl much interest, as has been already stated (Birds, vol. iii. p. 765), for they aro easily ensnared and justly esteemed for the table, while their numbers make their appearance in cartain districts a mstter of grest iusportance.
The secoud species to which the name applies is distinguished as the Mistletoe-Thrush, or, by corrupt sbbreriation, the MisselThrush. ${ }^{1}$ It is known slso in many districts as the "Storm-cock," from its habit of singing iu squally weather that silences almost all other birds, and "Holm. (i.e., Holly-) Thrush," while the harsh cries it utters when angry or slarmed have given it other local names, as."Screech," "Shrits," and "Skrike," all traceable to the Anglo.Saxon Scric. ${ }^{2}$ This is a larger species than the last, of paler tints, and 'couspicuous in flight by the white patches on its outer tail-feathers. Of bold disposition, snd fearless of the sleety storms of spring, as of predatory birds, the cock will take his stand on a tall tree, "liko sn enchanter calling up the gala" (as Kuapp hsppily wrote), snd thence with loud roice proclaim in wild and discontinuous notes the fervour of his love for his mate; nor does that love cease when the breeding-season is past, since this species is one of those that appear to pair for life, and even when, later in the year, it gathers in small flocks, husband and wife may bo seen in close company. In defence of nest and offspring, too, few birds are more resolute, and the Daw, Pie, or Jay that approaches with an ill intent speedily receives treatment that causes a rapid retreat, while even the marauding cat finds the precincts of the "master of the coppice" (Pen y lhoyn), as the Welsh name this Thrush, unsuitable for its stealthy operations. The connexion of this bird with the mistletoe, which is as old as the daye of Aristotle, is no figment, as some have tried to maintain. Not only is it exceedingly fond of the luscions viscid berries, but it aeems to be almost the only bird that will touch them. Of other British Thruehes, the Fieldfare (vol. ix. p. 142), Redwing (vol. xx. p. 318), and the Blackbird and Ring-OUses (vol. xyiii. p. 75) fiare been before noticed in thess pages, 89 has been (under the first of those headiugg) the so-called "Robiu" of North America.

The Thrushes hare been geverally considered to form a distinct Family, Turdidx, which is placed by some taronomers the highest in rank among birds. An attempt has already been made (Ornithology, vol. sviii. pp. 30, 48) to point out the fallacy of this viers, and space is here wanting to dwell longer on the matter. This is the more to be regretted, for, though many modern systematists will admit the close connexion of the Turdidx and some of the so-called Fanily Sylviida or Warblers (q.v.), the abolition or modification of the latter, by wholly or partially merging it in the former, has not yet been satisfactorily effected, and Mr Seebohna, in his portion of the British Museum Catalogue of Birds ( $\mathrm{\nabla} . \mathrm{p} .1$ ), being con.
1 There is no doubt of the bird taking its nams from the plant Mistletos ( 1 iscum albam), sbout the spelling of which there can be no uncertaiuty-A.S. Misteltan, the fual syllable originally dignifying "twig," sud surviving in the modern "tine," ss of a fork or of a deer's sutler.
${ }^{2}$ It seems quite possible that the word Sbaike (vol. xxi. p 845), thongh now conmonly accepted as the equivalent, in an ornithological senss, of Lanius, msy have been originally applied to the Sistletos. Thrush. In seteral of the Anglo-Saxon Vocabularies dating from the 8th to the 11 th century, as printed by Thonss Wright, ths word Scric, which can bo hardly syything elso than the early form of "Sbrike," is glossed Therche
pelled by the conditions previously laid down by Mr Sharpe (op. cit., iv. pp. 6, 7) to unite them, protests against doing so. His own assignment of the Subfamily Turdinx is into 11 genera, of which, however, 6 ouly would be commonly called Thrishes, and it must be borne in mind that in establishing these he regards coloration as the most valid character. They are Geocichla with 40 species, T'urdus with 48, Merula with 52, Mimocichla with 3, Catharus with 12, and Monticola with 10. These last, well known as Rock-Thrushes, make a very near approach to the Nightingale (vol. xvii. p. 498), Redstart (sol. xx. p. 317), and Vheatear (q.v.).
(A. м.)

THUCYDIDES. Thucydides was the greatest historian of antiquity, and, if not the greatest that ever lived, as some have deemed bim, at. least the historian whose work is the most wonderful, when it is vieised relatively to the age in which he did it. The most important facts which wo know about him are those which he has told us himself. It matters very little, fortunately, that the biographical materials are scaniy. For posterity, his life is represented by his life's labour, the IIistory of the Peloponnesian War ; and the biographical facts are of intere.st chiefly as aids to the appreciation of that history. He was probably born in or about 471 b.c. The only definite testimony on the snbject is contained in a passage of Aulus Gellius, vho says that in 431 Hellanicus "seems to hare been" sixty-five years of age, Herodotus fifty-three, and Thucydides forty (Noct. Att., 15, 23). The authority for this statement was Pamphila, a compiler of biographical and historical notices, who lived in the reign of Nero. She must have had access to Greek sources of the th century в.c.; and her precision-though qualifed, in the version of Gellius, by the word "seems"-would warrant the supposition that she had taken some pains to secure accuracy. Further, the date which she assigns is in good accord with an inference fairly deducible from the language of Thucydides himself, viz., that in 431 he had already reached the full maturity of his powers. Krüger, indeed, would place his birth earlier thay 471, and Ullrich later, but for reasons, in each case, which can scarcely outireigh the ancient authority.

The parentage of Thucydides was such as to place him in a singularly favourable position for the great work to which he afterwards deroted his life. His father Olorus, a citizen of Athens, belonged to a family which derived wealth and influence from the possession of gold mines at Scaptesyle, on the Thracian coast opposite 'Thasos, and was a relative of his elder namesake, the Thracian prince whose daughter Hegesipyle married the great Niltiades, so that Cimon, son of Miltiades, was a cousin, perhaps first cousin, once removed, of Thucydides. It was in the vauit of the Cimonian fanily at Athens, and near tho remains of Cimon's sister Elpinice, that Plutarch saw the grave of Thucydides. Thus the fortune of birth secured three signal advantages to the future historian: he was rich; he had two Lomes-one at Athens, the other in Thrace, -no small aid to a comprehensive study of the conditions under which the Peloponnesian War was waged; and his family connexions were likely to bring hin. from his early years into personal intercourse with the men who were shaping the history of his time.

The development of Athens during the forty years from 471 to 431 was, in itself, the best education which such a mind as that of Thucydides could have received. In the first two decades of his life the expansion and consolidation of Athenian power was proceeding; between his twentieth and fortieth year the inner resources of the city were being applied to the embellishment and ennoblement of Athenian life. As Cimon had been the principal agent in the former period, so Pericles was the ceatral
figure of the latter. A consciousness of such periods may be traced in the passage of the Funeral Oration where Pericles refers, first, to the acquisition of empire by the preceding generation, and then to the improvement of that inheritance by his own contemporaries (ii. 36.5). It is a natural aubject of regret, though it is not a just cause of surprise or complaint, that the History tells us nothing of the literature, the art, or the social life under whose influences its author had grown up. The Funeral Oration contains, indeed, his general testimony to the value and the charm of those influences. There we have the very essence of the Athenian spirit condensed into a few pregnant sentences, which show how thoroughly the writer was imbued with that spirit, and how profoundly he appreciated its various manifestations. But le leaves us to oupply all examples and details for ourselves. Beyond a passing reference to public "festivals," and to "beautiful surroundings in private life," be makes no attempt to define those "recreations for the spirit" which the Athenian genius had prorided in such abundance. No writer of any age, perhaps, has rendered a more impressive tribute to the power of the best art than is implied in the terse phrase of Thucydides, when, speaking of the works which the Athenian daily saw around him, he declares that "the daily delight of them banishes gloom"
 not to Thucydides that we owe any knowledge of the particular forms in which that art was embodied. He alludes to the newly-wilt Partheuon only as containing the treasury; to the statue of Athene Parthenos which it enshrined, only on account of the gold which, at extreme need, could be detached from the image ; to the Propylæa and other buildings with which Athens had been adorned under Pericles, ouly as works which had reduced the surplus of funds available for the war. Among the illustrious contemporaries whose very existence would be unknown from his pages are the dramatists Eschylus, Sophocles, Euripides, Aristophanes; the architect Ictinus; the eculptor Phidias; the physician Hippocrates; the philosophers Anazagoras and Socrates. If Thucydides had mentioned Sophocles 88 a geveral in the Samian War, it may be doubted whether he would have noticed the circumstance that Sopbocles also wrote dramas, unless it had been for the purpose of distinguishing him from a namesake. And, had he lived to carry his story down to the debate in the Athenian ecclesia after the battle of Arginusæ, wo may conjecture that Sarrates, if named at sll, would have been barely mentioned as the one prytanis ont of fifty who resisted an unconstitutional act, 一with some expression, perhaps, of praise, but mithout any fuller characterization. Wo think of the countless occasions which Herodotus, if he had dealt with this period, would iare found for invaluable digressions on men and manners, on letters and art; we feel the severity of the loss which the reticence of Thucydides has caused to us; and we might almost be tempted to ask whether the more genial, if laxer, method of Herodotus does not indeed correspond better with a liberal conception of the historian's office. No one can do full justice to Thucydides, or appreciate the true completeness of his work, who has not faced this question, and found the answer to it. It would be a hasty judgment which inferred from the omissions of the History that its author'a interests were exclusively political. Thucydides was not triting the history of a period. His subject was an event-the Peloponnesian War, - a war, as he believed, of unequalled importance, alike in its direct results and in its political significance for all time. To his task, thus defined, he brought an intense concentration of all his faculties. He worked with a constant desire in make each successive incident of the war as clear as
possible. To take only two instances: there is notning in literature more graphic than his description of the plague at Athens, or than the whole narrative of the Sicilian expedition. But the same temper made him resolute in excluding irrelevant topics. The social life of the time, the literature and the art, find no place in his picture simply because they did not belong to his subject. His work was intended to be "a possession for crer." He could conceive a day when Sparta should be desolate, and when only ruins of Athens should remain. But his, imagination never projected itself into a time when the whole fabric of Hellenic civilization should have perished. Could his forecast have extended to an age when men of "barbarian" races and distant climes would be painfully endeavouring to reconstruct a picture of that civilization, - when his own narrative would need the help of sidelights which seemed to hin wholly unneccssary, -then, assuredly, he would bave added all that such readers could require. But he would not have done this in the manner of Herodotus, by free indulgence in digression; rather he would have gathered up the social and intellectual phenomena of his day in a compact and systematic introduction, specially dcsigned for the non-Ifellenic reader.

The biography which bears the name of Marcellinus states that Thucydides was the disciple of Auazagoras in philosophy and of Antiphon in rhetoric. Such statemerts were often founded ou nothing more than a desire to associate distinguished names, and to represent an eminent man as having profited bJ the best iustructiou in each kind which his contemporaries could afford. It this case there is no evidence to confirm the tradition. But it may beo observed that Thucydides and Antiphou at least belong to the same rhetorical school, and represent the same early stage of Attic prosc. Both rriters uso words of an antique or decidedly poetical cast ; bollı joint rerbal contrasts ly insisting on the precise difference between terms of similar import; and hoth use metsphors somewhat bolder than were congenial to Greek prose in its riper* age. The differences, on the other hand, between the style of Thucydides and that of Autiphon arise chiefly from two general causes. First, Antiphon wrote for hearers, Thucydides for readers ; the latter, consequently, can use a degree of condensation, and a frcedom in the arrangement of words, which would have been hardly possible for the former. Again, the thought of Thucydides is often more complex than any which Antiphon undertook to interpret; and the greater intricacy of the historian's style exhibits the endeavour to express each thought. ${ }^{1}$ Few things in the history of literary prose are Style of more interesting than to watch that figorous mind in its Thucy. struggle to mould a language of magnificent but in- dides. mature capabilities. The obscurity with which Thucydides has sometimes been reproached often arises from the very clearness with which a complex idea is present to his mind, and his atrenuous offort to present it in its entirety, when the strong consciousness of logical coherence will make him heedless of grammatical regularity. He never sacrifices the thought to the language, but he will sometimes sacrifice the language to the thought. A student of Thucydides may always be consoled by the reflexion that he is not engaged in unravelling a mere rhetorical tangle. Every light on the sense will be a light on the words; and, when, as is not seldom the case, Thucydides comes rictorionsly out of this struggle of thought and language, having achieved periect expression of his meaniug in a sufficiontly lucid form, then his style risea into an intellectual brilliancy-thoroughly manly, and also penctrated with intense feeling-which nothing in Greek prose literature surpasses
${ }^{1}$ Sea Jebb's Altic Orators. vol. i. p. 35.

The History shows not only a thorough insight into the political ideas of Pericles, but also a sympathy with him, and an admiration for his character, which indicate personal friendship. If, before 431, Thucydides had wished to take a prominent part in the public life of Athens, everything wás in his favour. Dut there is no trace of his baving done so ; and it is possible that his opportunities In this respect were modified by the necessity of frequent visits to Thrace, where the management of such an important property as the gold mines must have claimed the occasional presence of the proprietor. The manner in which be refers to his personal influence in that region is such as to suggest that he had sometimes resided there (iv. 105.1). He was at Athens in the spring of 430 , when the plague broke out. If his account of the symptoms has not enabled physicians to agree on a diagnosis of the malady, it is at least singularly full and vivid. He bad himself been attacked by the plague; and, as he lrivfly adds, "he had seen others suffer." The tenor of his narrative would warrant the inference that he had been one of a fow who were active in ministering to the sufferers -in that fearful time when religion and morality lost all control over the despairing population of Athens-when all the ordinary decencies of life were set at nought, and when even the nearest relatives failed in the duties of humanity towards the dying.
The turning-point in the life of Thucydides came in the winter of the year 424. He was the:: forty-seven (if his birth has been rightly placed in 471), and for the first time he is found holding an official position. He was one of two generals entrusted with the command of the regions torards Thrace ( $\tau \grave{\alpha} i \pi i$ © © $\dot{\alpha}$ ín $\bar{\prime}$ ), a phrase which denotes the whole Thracian seaboard from Macedonia eastward to the vicinity of the Thracian Chersonese, though often used with more special reference to the Chalcidic peninsula. One reason why Thucydides bad been chosen for the post was the local influence which he possessed among the people of the Thracian seaboard, through his fanily connexions and his ownership of the gold mines. His colleague in the command was Eucles. About the end of November 424 Eucles was in the city of Amphipolis, on the river Strymon. That city was not mercly more important to Athens than any othcr place in the region, -it was the stronghold of Athenian power in the north. To guard it with all possible vigilance nias a mattor of peculiar urgeucy at that mourent. The ablest of Spartan leaders, Brasidas, was then in Thrace with a Peloponnesian army,-not, indeed, close to Amphipolis, but still within a.distance which imposed special caution on Athenian officers. He was in the Chalcidic peninsula, where he had already gained rapid success; and part of the population between that peninsula and Amphipolis was already known to be disafected to Athens. Under circumstances so suggestive of possible danger, we might have expected ihat Thucydides, who had seven ships of war with him, would have been near his colleague Eucles, and ready to coopperate with him at a monent's notice. It appears, however, that, with his ships, he was at the island of Thasos, several miles distant from the Thracian coast. Brasidas, making a forced march from the Chalcidic peninsula, suddenly appeared bcfore Amphipolis. Eucles sent in all haste for Thucydides, who arrived with his ships from Thasos just in time to beat off the enemy frons Eion at the mouth of the Strymon, but not in time to save Amphipolis. Only a few hours before, it had capitulated to Brasidas, who had offered exceptionally favourable terms. The profound rexation and dismay felt at Athens found expression in the punishment of the commander who seemed primarily responsible for so grave a disaster. For the next twenty years-i.e., till 404
-Thucydides was an exile from Athens.- It is not improbable that the charge brought against him was that of treason ( $\pi \rho \circ \delta \circ \sigma i a$ ), for which the penalty was death, and that he avoided this penalty by remaining in banishment. A special psephism is said to have been required before Thucydides could return in 404 , which would have been regular if a capital sentence had been on record against him, but not so if he had been merely under sentenee of exile. Cleon is said to have been the prime mover in his condernnation; and this is likely enough. Eucles was probably punished also. Grote was the first. modern writer to state the reasons for thinking that Thucydides may have been really guilty of culpaole negligence on this occasion, and that his punishmentwhich had usually been viewed as the vindictive act of a reckless democracy-may have been well deserved. Everything turns on the question why he was at Thasos just then, and not at Fion. No one disputes that, after the summons from Eucles, he did all that was possible. It is true that the facts of the situation, so far as we know them, strongly suggest that he ought to have beon at Eion, and do not disclose any reason for his being at Thasos. But it is only fair to remermber, in a case of this kind, that there may have been other facts which we do not know. There is some presumptive evidence of carelessness ; but we can hardly say more than that. The absence of Thucydides from the neighbourhood of Amphipolis at that precise juncture may have had some better excuse than now appears.

From 423 to $40 t$ the home of Thucydides was on his property in Thrace, but much of his time appears to have been spent in travel. He visited the countries of the Peloponnesian allies,-recommended to them by his quality as an exile from Athens; and he thus enjoyed the rare advantage of contemplating the great war from a point of view opposite to that at which he had previously been placed. He speaks of the increased leisure which his banishment secured to his study of events. He refers partly, doubtlcss, to detachment from Athenian politics. partly, also, we may suppose, to the opportunity of visiting placcs signalized by recent events, and of examining their topography in the light of such information as he could collect on the spot. The local knowledge which is often apparcnt in his Sicilian books may have been acquired at this pcriod. The banislıment of Thucydides was the most fortunate event that could have occurred for him and for us, when it enabled him, in this way, to look at his subject all round. If it is always hard for an historian to be impartial, it is especially so for the historian of a great war in which his own country bas becn one of the combatants. The mind of Thucydides was naturally judicial, and his impartiality-which seems almost superhuman by contrast with Xenophon: Hellerica-was in some degrce a result of temperament. But it cannot be doubted that the evenness with•which he holds the scales was greatly assisted by the experience which, during these years of exile, must have been familiar to him-that of hearing the views and aims of the Peloponnesians set forth by themselves, and of estimating their merits otherwise than would havo been easy for an observer in a hostile camp.
His own words make it clear that he returned to Atbens, at least for a time, in 404. Classen supposes that his return took place in the autumn of that year, about six months after Athens had surrendered to Lysinder, and while the Thirty were still in power. Finding that the rule of the oligarchy was becoming more and more violent, Thucydides again left Athens, and retired to his property in Thrace, where he lived till his death, working at his History. The preponderance of testimony certainly goes
to show that he died in Thrace, and by viotence. It would seem that, when he wrote chapter 116 of his third book, he was ignorant of an eruption of Etna which took place in 396. There is some reason then, for believing that he did not survive his seventy-fifth year. According to ancient tradition, he was killed by robbers. His relics were brought to Athens, and laid in the vault of Cimon's family, where Plutarch saw their resting-place. The abruptness with which the History breaks of agrees with the story of a sudden death. The historian's daughter is said to have saved the unfinished work, and to have placed it in the hands of an editor. This editor, according to one account, was Xenophon, to whom Diogenes Laertius assigns the credit of having "brought the work into reputation, when he might have suppressed it." The tradition is however, very doubtful. In its origin, it may have been merely a guess, suggested by a feeling that no one then living could more appropriately have discharged the office of literary executor than the writer who, in his IIellenica, continued the narrative.

At the outset of the Listory ' 1 nucydides has quacated his general conception of his work, and has statad the principles which governed its composition. His purpose had been formed at the very beginning of the war, in the conviction that it would prove more im. portant then any event of which Greeks had record. The leading belligerents, Athens add Sparta, were both in the higbest condition of effective equipment. The whole Hellenic world-including Greek asttlements outside of Greece proper - was divided into two parties, either actively helping one of the two combatants or meditating such action. Nor was the movement confived within even the videst limits of Hellas; the "barbarian" world also was affected by it,-the non-Hellenic populations of Thrace, Macedonia, Epirus, Sicily, and, fually, the Persian kingdom itself. The aim of Thucydides was to preserve an accurate record of this war, not only in view of the intrinsic interest and importence of the facts, but also in order that these facts might be permanent sources of political teaching to pesterity. His hope was, as he aays, that his History would be found profitable by "those who desire en exact knowledge of the past as a key to the future, which in all probability will repeat or resemble the past. The rork is meant to be a possession for ever, not the rhetorical triumph of an hour." As this context shows, the oft-quoted phrase, "a possession for ever," had, in its author's meaning, a more definite import than any mere anticipation of abiding fame for his History. It referred to the permanent value of the lessons which his History contained. Thucydides stands alone among the men of his own daye, and has no superior of any ago, in the width of mental- grasp which could seize the general significance of particular events. The political education of manlind begau in Gresce, and in the time of Thacydides their political life wes otill young. Thucydides knew only the small city-commonwealth oo the ode hadd, and on the other the vast berbaric kingdom; and yet, as has been well eaid of him, "there is hardly a problem in the science of government which the statesman will not find, if not solved, at any rate handled, in the pages of this universal master."

Such being the spirit in which ho approached lis task, it is interesting to inquire what were the points which he himself considered to be distinctive in his macthod of executing it. His Greck predecessors in the recording of events had beed, he conceived, of two classes. First, there were the epic pocts, with IIomer at their head, whose characteristic tendency, in tho eyes of Thucydides, is to exaggerste the greatoess or splendour of thiugs past-as, for instance, conceding the historicel character of tho Trojan war, be supposea the streogth of the Greek flect to be overstated in the Iliad. Secoudly, there were the Ionian prose writers whom he calls " chronielers" ( 10 оо子páфo九). These writers are directly kdown to us only by meagie fragmocuts; but Dionysius of Halicarnassus has described their general characteristics in a manner which servez to illustrate the differences indicated by Thucjuldes between their work and his own. Their geaeral object was to diffuse a kDowledge of legends preserved by oral tradition, snd of mritten docu-ments-usually lists of officisls or genealogies-proserved in public archires; and they published their materials as they found them, without sDy attempt at sifting fact from fable. Thucydides de-
 -the difference betwecn the terms answering to that between com. pilation of a somewhat mechanical kind and historical composition ia a higher sense. The vice of the "chroniclers," iu his view, is that they cared only for popularits, and took no pains to make their narratives trustworthy. In contrast with these predecessors,

Thacydides has subjected his materiale to the most searching scrutiny. The ruling principle of his wark has beeu atrict adherence to carefully verified facts. "As to the deeds aoze in the wer, I hava not thought myself at liberty to record them on hearsay from the firat informant or on arbitrary conjectura. My account rests either on personal knowledge or on the closest possible eerutiny of each statement mado by others. The process of research was laborions, because conflicting eccounts were given by those who had witnessed the saveral events, as partiality ewejed or memory served them."

A period of at least twenty years must heve elspsed between the date at which Herodotus ccased to write ar I that st which the History of Thucydides received its present furm. There can be no doubt that Thucydides knew the History of Herodotus, and that in coine places he alludes to it The diligence and the honesty of Herodotus are alike besond question, and would, we may be sure, have been fully recegnized by Tliucydides. The work of Herodotus was distinct in kind from that of the Ionian chroniciers, and was of an immeasurably higher order. While they dealt, in a bold fashion, with the andals of separate cities or pooples, Herodotes set the first example of multifarious knowledge suberdinated to the execution of a great historical plan, and also showed for the firet time that a prose history could have literary charm. But Thucy. dides doubtless thought of Herodotus as ha:ing certain traits in common with the Ionien chroniclers, and as being liable, so far, to the same criticism. Ons such trait would be the inadequate sifting of evidence; another, the mixture of a fabulous elemeat with historicai fact; and another, perhaps, the occasional siming at rhetorical effect. Of this last trait the chicf instaoces would be those imaginary dialogues or epeeches with whieh Herodotus sometimes enlivens his narrstive. This brings us to no important topic, - the purpose with which Thucydides himself has admitted speeches into his History, and the manner in which ther have been composed.
The speeches constitute between a fourth and a fifth part of the IIistory. If they नere eliminated, an admirable narrative would indeed remain, with a few comments, usually brief, on the mord striking characters and ovents. But ve should lose all the most rivid light on the inner workings of the Greak political mind, on the motives of the actors, and the arguments which they used, in a word, on the whole play of contemporary feeling and opinion. To the specches is due in no small measure the imperishable intellectual interest of the Ilistory, sines it is chiefly by the speeches that the facts of tho Pelopodncsian W'ar sre so lit up with kecy thought as to become illustrations of genersl laws, and to acnuire a permaneat auggestiveness for the student of politics. When Herodotus made his persons hold conversations or deliver speeches, he was fellowing the precedent of epic poetry; his tone is usually colloquial rather than rhetorical ; bs is merely making thought and motive vivid in the was datural to a simple age. Thucydides is the real founder of tho tradition by which historions were eo long held to be warranted in introducing set specches of their own composition. His own account of lis practice is given in the following words. "As to the speeches made on tha eve of the war, or in its course, I hare found it difficult to retain $\theta$ memory of the precise words which I had heard spoken; and so it was with those who brought me reports. But I have made the persons say what it seemed to me most opportune for them to say in view of each sitnation; at the same time 1 have adhered as closely as possible to the general sense of what was actually said." So far as the language of the specches is concerned, then, Thucydides plainly arowa that it is mainly or wholly his own. As a general rule, there is littlo attempt to mark different styles. The case of Pericles, whom Thucydides must have repeatedly heard, is probably an excention; the Thucydidean specehes of Pericles offer several axamples of that bold imagery which Aristotle and Plutarch ogree in ascribing to him, while the Funeral Oration, especially, has a certain majesty of rhythm, a certain union of impetuous movement with lofty grandeur, which the historian has given to no other apeaker. Such strongly markerl charccteristics as the curt bluntness of the Spartan ephor Sthenelædas, or tho insolent rehemenca of Alcibiades, are also indicated. But the dramatic truth of the speeches gencrally resides in tha matter, not in the form. In regard to those speeches which wero delivered at Athene before his banjsbsnent in 424 , and seven auch speeches are contained in the LEstory, -Thucydides could rely either on his own recollection or on tho sources accessiblo to a resideat citizen. In these cascs there is good reason to belleve that he has repro. duced the substance of what was actwally said. In other cases he had to trust to more or less imporfect reports of the "general eense"; and in somo instances, no doubt, the speech represents simply his own conception of what it would hava been "most opportuno" to say. Tho most gvident ef such instances occur is tho addresses of Jeaders to their troops. The historian's aim in these military harangues-which are usually short-is to briog out the points of a airategical bitustion; a modera mriter would lisre attained the object by comments prefred of exbjoined to
his account of the battle. The comparative indifference of Thucydides to dramatic perisimilitude in these military orations is curiously shown by the fact that the specch of the general on the one side is sometimes as distinctly a reply to the speech of the general on the other as if they had been delivered in debate. We may be sure, however; that, wherever Thucydides had any authentic clue to the actual tenor of a specch, he preferred to follow that clne rather than to uraw on his own invention. Voltaire has described the introduction of set speeches as "a eort of oratorical falsohood, which the historian used to allow himself in old times." The strongest characteristic of Thucydides is bis devotion to truth, -his laborious persistence in separating fact from fiction; and it Is natural to ask why he adopted the form of set speeches, with tho neasure of fiction which it involved, instead of simply atating, in lis own jerson, the argurments and opinions which he concerved to have becis provalent. The question must be viowed from the ataudpoint of a Grook in the 5th contury b.c. Epic pootry had then for many gencrations exercised a powerful influence over the Greck inind. Jlomer had necustomod Grecks to look for two clo. meuts in any complete expression of human cnergy, -first, an accomnt of a man's deeds, then an image of his mind in the report of his worls. The Homeric horoes aro exhibited both in action and in speech. Further, the contemporary realers of Thucydides were men habitnated to a civic life in whicb public spect played an all-important part. Every adult citizen of a Greck democracy was a nicinher of the assembly which dobated and decided great issues. The law-courts, the fustivals, tho drama, the market-place itself, ministered to tho Gicek lopo of animated description. To a Greck of that age a written history of political events would havo scemed strangely insipicl if speech "in the first person" had been absent from it, especially if it did not nffer somo mirror of theso deluates which were inseprarably associated with the central interests and tho decisive nomonts of political life. In making historical persons say what they might havo said, Thneydudes confuned that oratorical lieenco to tho purpose which is its best justification: with him it is strictly dramatic, an aill to tho complete presentment of action, by the vivid expression of ideas and argmments which were really current at the tiunc. Among later histormans who continued the practice, Polybus, Sallust, and Tracituq most resemblo Thucydides in thes particular ; while in tho Byzantine lastorians, as in some moderns who followed classical precelent, the speches were usually mero oecasions for rlectorical display. Jootta's Jistory of Italy from 1780 to 1814 alfords one of the latest examples of the practice, which was peculiarle suited to the ltalian genius.
Tho present division of the IIistory into cight books is one wheth night well havo prozeded from the author himself, as being a natural and convement disnosition of tho contents. The first bonk, after a general introduction, scts forth the causes of tho Peloponnesinn War. The first nino years of tho war are containel in the sceond, third, and fourth books, -three vears in eacli. Tho fiftli book contains tha tenth year, followed by tho interval of the "insecure peace." Tho Sicilian expedition fills tho sixtli and serenth books. The cighth book opens that last clapter of the strugerle which is known as the "Decclean" or
"Ionian" War, ant breaks off abruptly-in the midille of a sentence, indecd-in the year 411. The words in which Grote bids farewell, at that point, to Thacydiles well express what every careful stuilent must feel. "To jrass from Thucydides to the Ifcllenier of Xenoplion is a descent truly mournful; and yet, when we look at Grecian history as a whole, we have great reason to rejoice that even so inferior a work as tho lntter has reached us. Tho historical paposes and conceptions of Ihucydides, as set forti, by himself in his preface, are exalted and philosophical to a degrec altogether wonderful, when we consiler that he had no pre-cxisting molcls beforo him from which to derive them. And the cight books of his work (in spite of the unfinished condition of the last) aro not unwortliy of these large promises, cither in spirit or in execution."

The principal reason against believing that tho division into cimht books was made by Thucydides himself is the fact that a dilierent division, into thjrtecn books, was also current in antiquity, as appears from Marcellinus ( $\$ 58$ ). It is very improbable-indeed harelly conccivable-that this shomld have been the case if the cirflit-book division had come down from the hand of the author. Vie may infer, then, that the division of the work in to eight books was introduced at Alexandria, -perlaps in the 3 d or 2 d century B.c. T...' tivision was already familiar to the grammarians of the Augustan arce. Dionysius of Halicarnassus, who recognizes it, has also anolluer mode of indicating portions of the work, viz., by stichometrin, or the number of lines which they containcd. Tbus, in the MS. which he used. the first 87 chanters of book $i$. containerl about 2000 lines (equivalent to about 1700 lines in Bekker's stercotyped 8 vo text).

Ullrich has maintained with much acuteness that Thucydides composed the first three books and about half of book iv. in the pears 421-413, and the rest of the rork after 404. His general
ground is tho existence in i.-ir. of pasiages which seem to imply ignorance of later avonts. Classen has fully examincl the ovidence, and, as a result, has arriyod at tho following conclusion. it is possible that a irst rough draft of the llistory, down to 413 , inay fiave been eketched by Thacydides boforo 405. But tho whole History, from the first book onwards, was worked iip into its present form only after 404. This viow is condirmed by somo passages, found even in the earliest books, which imply that tho writer already knew the latest incidents, or the final issmo, of tho war. We have scen that, aftor 404 , Thucydides may have enjoyed some six or seven years of leisure. Several peenliarities of expres. sion or statement in book viii. stggest that it had not yet receiyed the author's final rovision at the timo when death broke of the work. The absence of specehes from the cighth book has also been remarked. But it should be observed that much of the eighth book is occupied with negotiations, cither clandestinc or indecisive, or both. Its narrative hardly presents any moment which required such dramatic emphasis as tho speeches usually impart. The neere misrepresentations by which Alcibiades and Chalcideus prevailed on tho Chians to revolt certninly did not claim such treatinent.

Tho division of the war by summero and winters (кata of́pos ual Mode of $\chi \in \boldsymbol{\mu} \boldsymbol{\omega} \boldsymbol{y}$ ) - the end of the winter being considered as the end of tho reckonia year-is perhaps the only one which Thucy dides hinself usecl, for time. thero is no inclication that ho made any division of the llistory into books. His "summer" includes spring and autumn, and extends, generally speaking, from March or the berinning of $A$ pril to the end of October. His "winter"-Novenber to February inclusive-mecns practically the period during which military operations, by land and sea, are wholly or jiartly suspiended. When ho speaks of "sumincr" and "winter" as answering respectively to "half" the jesr ( v .20 .3 ), the plirase is not to lic pressed: it means mercly that he divides his year into these two parts. The mode of reckoning is cssentially a rough one, and is not to be viewed as if the commencement of summer or of winter could be preciscly fixed to constant dates. For chronulogy, licsides the festivals, ho uses the Athenian list of archons, the Spartan list of ephors, and the Argive list nf priestesses of Hera,

There is no reference to the History of Thucs dides in the extant Greck writers of the 4 th century b.c. ; but Lucian has preserved a tradation of the enthusiasm with which it was studied by Demo. sthenes. Tho great orator is said to have copied it out cight times, or even to have learnt it hy heart. It is at least heyond doubt that the study of Thucydides contributed a very powerful influenco to the style of Demosthenes, though that influence rather passed into tho spirit of bis oratory than showed itsclf in any marked resemblances of form. The Alexandrian critics acknowledged Thucydides as a great master of Attic. Sallust, Cornelius Nepos, Cicero, and Quintilian are among the Roman writers whoso adniration for bim can be tracel in thoir worle, or has been expressly recorded. Tho most claborate ancient criticism on the dictioo and composition of Thncydides is contaiped in threa essays by Dionysius of Halicarnassus.
Among the best MSS. of Thucydides, the Codex Vnticanus 126 (1th eent.) re. MSS., do prescnis a recension made In tho Alexandyian or Roman age. In the first six bonks the number of pas-ages in whith the Vnticanis alone has preserved atrue reading is comparsilively bmall; in book thi. it is somewhat Inrger; in bouk riai. It is so laree that here the Vatiennus, os enmpared with the other MSS, nequires the character of a reviscdext. Otherimportan: MSS. nie the l'alatinua 252 (11th cent.): tho Cesselanis ( 1252 A.D.); the Altgustentis Mollacensis 430 ( 1301 A.D.). A cillation, in Louks i. H., of two Cambridgo MSS, of the 15 th century (Nx. 3. 18, KE. 5. 19) has been publishcd by Shilleto. Setcral Parisinn NSS. (II, C. A. F.), ond a Venctinn MSS. (V.) collated by Arnold, nloo descrve mention. The Aldise cdition was published in 1302. It was formerly supposed that there had been fwo Juntine cditions. Shlleto, in the " Notice " prefixed to book L., first pointed out that the only Juntine edition was that of 1526, and that the belicf in an carlice Juntine, of 1506, arose merely from the occidental omission of the word vicesimo in the Latin version of the imprint.
Of recent edalions. the most cernerally uscful is Classen's, in the Weidmann beries (Berlin, 1962-79) ; cnch book can ba obtained scparately. Arnold's cdition (1848-51) coniains much that is still valunble. For bouks I. and ii. Stilleto ${ }^{\circ}$ with many difficurt namo those of Duker, Eekker, Gocher, Poppo, and Krüger. Bétani'e fexicon to thuefdides (2 vols, Gencya, is 33 ) is well executed. Jowelt's translation (Oxford, 1883) is sopplemented by a folumic of notes. Dale's version (Bohn) also deserves 1883) is sopplemented by a tolumic of notes. Dase s version (Bohn) also deserves
mention for its fidelity, as Crawley's (London, 1976) for its vigour liellenica (London, 19Se) contains an cssny on "The Specches of Thucydides," pp. 266-323, (London, $195 e$ ) contains an essny on "The Speches of Thucydides," pp. 26G-323,
which has becn translated into German. Tlie beat cluo to Thucydidean biblio. graplyy is in Eogelmann's Scriptores Grieci, pp. 74 sq s., Bth ed., 1980. (1.. C. J.)

THUGS. That the Sanskrit root sthag (Pali, thak), "to cover," "to conceal," was mainly applied to frauduYent concealment, appears from the noun sthaga, "a cheat," which has retained this signification in the modern vernaculars, in all of which it has assumed the form !nag (commonly written thug), with a specific mcaning. The Thugs were a well-organized confederacy of professional assassins, who in gangs of from 10 to 200 travelled in various guises through India, wormed themselves into the confidence of wayfarers of the wealthier class, and, when a favourable opportunity occurred, strangled them by throw-
ing a bandkerchief or noose round their necks, and then plundered and buried them. All this was done according to certain ancient and rigidly prescribed forms and after the performance of special religious rites, in which the consecration of the pick-axe and the sacrifice of sugar formed a prominent part. From their using the noose as an instrument of murder they were also frequently called Phansigârs, or "noose-operators." Though they themselves trace their origin to seven Mohammedan tribes, Hindus appear to hava been assuciated with them at an early period ; at any rate, their religious creed and practices as staunch worshippers of Devì (Kali, Durgâ), the Hindu goddess of destruction, had certainly no flavour of Islam in them. Assassination for gain was with them a religious duty, and was considered a holy and honourable profession. They had, in fact, no idea of doing wrong, and their moral feelings did not come into play. The will of the goddess by whose command and in whose honour they followed their calling was revealed to them through a very complicated system of omens. In obedience to these they often travelled hundreds of miles in company with, or in the wake of, their intended victims before a safe opportunity presented itself for executing their design ; aud, when the deed was done, rites were performed in bonour of that tutelary deity, and a goodly portion of the spoil was set apart for ber. The fraternity possessed also a jargon of their own (Ramasi), as well as certain signs by which its members recognized each other in the remotest parts of India. Even those who from age or infirmities could no longer take an active part in the operations continued to aid the cause as watchers, spies, or dressera of food. It was owing to their thorough organization, the secrecy and security with which they went to work, but chiefly to the religious garb in which they sbrouded their murders, that they could, unmolested by Hindu or Mohammedan rulers, recognized as a regular profession and paying tazes as such, continue for centuries to practise their craft. Both the fractions into which they were divided by the Nerbudda river laid claim to antiquity : while the northern, however, did not trace their origin farther back than the period of the early. Mohammedan kings of Delhi, the southern fraction not only claimed an earlier and purer descent, but adhered also with greater strictness to the rules of their profession.
The earliest authenticated mention of the Thugs is found in the following passage of Zláu-d dín Barnf's History of Firoz Shah (written about 1356): "In the reign of that aultan," that is, about 1290, "aome Thugs were taken in Delhi, and a man belonging to that fraternity was the means of about a thousand being captured. But not one of these did the sultan have killed. He gave orders for them to be put into boats and to be conveyed into the lower country, to the neighbourhood of Lakhnaut1, where they were to be set free. The Thugs would thus have to dwell about Lakhnaut1, and would not trouble the neighbourhood of Delhi any more" (Sir H. M. Elliot's History of India, vol. iii. p. 141). The first European travellers who speak of them without mentioning their pame are Thevenot (1665) and Fryer (1673). Though \{nstances of Thuggee had been known to the English rulers in India for many years, and sporadic efforts bad been made by them towards the extinction of the gangs, it was not till Lord W. Bentinck (1828-35) took vigorous steps in this matter that the system was gradually uomasked, and finally all but stamped out. His chief agent, Captain (afterwards Sir William) Sleeman, with several competent assistants, and the co-operation of a number of ative states, sureeeded in completely grappling with the evil, so that up to October 1835 no fewer than 1562 Thugs had been committed, of which number 382 were
hanged and 986 transported or imprisoned for life. It is true that, according to the Thuggee and Dacoity Report for 1879, the number of registered Punjabi and Hindustani Thugs then still amounted to 344. But all of these had already been registered as such before 1852 . It may, therefore, fairly be assumed that none are alive now, and that the whole fraternity may be considered as extinct.
Full particulars concerning the aystem of Thaggee are giveu by Dr Sherwood, "On the Murderers called PŁánsigárs," and J. Shakespear, "Observations regarding Bradheks and Thegs" (both treatises in vol. xiii., 1820, of the Asiatic Researches); [W. N. Sleeman,? Ramaseaana, or a Vocabulary of the Language used by the Thugs, with an Intioduction and sippendix, Calcutta, 1836 ; the Edinburgh Review for Jan. 1837; [E. Thornton,] Illustrations of the History and Practices of the Thugs, London, 1837; Meadowa Taylor, Confessions of a Thug, London, 1839 ; Major Sleeman, Reporl on the Depredations committed by the Thug Gangs, Calcutta, 1840 ; J. Hutton, Popular Accornt of the Thetgs and Dacoits, London, 1 ' 57 Yule and Burnell, Glossary of Anglo-Indiar Colloquial Word's and Phrases, London, 1886, p. 696 sq.
(R. R.)

THUGUT, Franz Maria von (1734-1818), foreign minister of Austria, was born of humble parentage at Linz in 1734, placed in the Government school of Oriental studies in 1752, and sent to Constantinople as an interpreter in 1757. At Constantinople he rose from post to post in the embassy, until in 1771 be became internuncius or ambassador. In 1776, after the war between Russia and Turkey, he obtained from the latter power the cession of the province of Bukowina to Austria. After thus crowning bis long service in the East and gaining the confidence of Maria Theresa, he was sent by her without the knowledge of her son, the experor Joseph, to Berlin, to avert by a peaceful settlement with Frederick the Great the threatened Bavarian war. In 1790 he was employed in the negotiations of Sistova, and his next mission was to Paris, where he entered into close relations with Mirabeau as the friend of Marie Antoinette. On the invasion of France by the allied armies in 1792, Thugut was sent to the scene of operations. It is well known that Kaunitz, the veteran minister of Austria, condemned the terms of the alliance with Prussia, as securing to Prussia the annexation of a great part of Poland, while only bolding out to Austria an uncertain prospect of acquiring its equivalent in Bavaria. Thugut, a politician of the same achool, viewed the new alliance with even greater hatred. After the failure of the campaign of 1792 he formed the deliberate opinion that persons around the duke of Brunswick bad been bribed by the French, and that the retreat had been ordered in consequence. A few months later the anticipations of Kaunitz were realized. Prussia seized western Poland, while Austria remained as far as ever from gaining Bavaria. The emperor Francis now dismissed the ministers responsible for the Prussian alliance, and called Thugut to power. From this critical moment the alliance was doomed, and the allied commanders thwarted rather than assisted one mnother's operations on the eastern frontier of France. On the other hand, Thugut drew nearer to Russia, and negotiated at St Petersburg for the aeizure of Venice by Austria. With England he desired to stand on a good footing; but, while Pitt's object wes the overthrow of the revolutionary Government, Thugut's was simply the acquisition of territory for Austria. This discrepancy of aim led to results exasperating to the English ministry, such as the fall of Toulon, to which Thugut neglected to send the troops which he had promised. The evacuation of Belgium in 1794, usually attributed to Thugut's treachery, was, however, due to the incapacits or intrigues of others. In 1795, after the withdrawal of Prussia from the coalition, Thugut obtained financial help from England, gained from Russia a large abare of Poland in the last partition, and prepared to carry on the mar against France with the utmost energy. The campaign
of the archduke Charles in 1796 drove the French from the east of the Rhine, and Bonaparte, who had conquered northern Italy up to Mantua, narrowly escaped destruction before this fortress. But for the genius of the French commander and the wretched character of the Austrian generals and officers, the immense efforts made by Thugut at this time would have turned the tide of the war. Defeat after defeat seemed to make no impression upon his "world-desolating obstinacy"; and, even when Bonaparte had advanced to within eighty miles of Vienna, it is stated that the empress had to throw herself at her Lusband's feet when in conference with his minister, in order to overcome the resistance of the latter to an armistice. The subsequent peace of Campo Formio was hotly condemned b.: Thugut, who tendered his resignation. Then followed the congress of Rastadı and the murder of the French envoys, long attributed, but without any real ground, to Thugut himself. War was renewed; the French were driven out of Italy by Austrian armies assisted by Suvaroff; and it-was determined that the allies should conquer Switzerland, and so invade France where the frontier is nost epen. Thugut, now at the height of his power, and ar more anxic is to recover Beigium than to ererthrow the republic, took the fatal step of withdrawing a great part of the Austrian forces from Switzerland at the ver. moment when the Russians were entering it. The result : as t.le destruction of the Russians by Masséna and the total failure of the campaign, followed by the secession of Russia from the coalition. Still full of designs for annexatiou in Italy, Thugut continued the war with the help of England. On the very day when he renewed his engagements with England the news arrived of the battle of Marengo, which at one blow made an end of all that Austria had won in Italy in the preceding year. Nothing dauuted, Thugut continued, during the armistice which followed, his preparation for the struggle with Moreau in the valley of the Danube; and, if he could have inspired his master with his own resolute spirit, the result of the war might have been different. But, while Thugut was actually receiving the British subsidies, the emperor, without the knowledge of his minister, surrendered the fortresses of Ulm and Ingolstadt to Moreau, in returu for an extension of the armistice. Thugut's passionate indignation on learning of this miserable act is impressively described in Lord Ninto's despatches from Vienna. He withdrew from office; but Lord Minto's protests compclled the emperor again to place in his hands the direction of affairs, which he held until the battle of Hohenlinden made all further resistance impossiblo. He was then, in deference to French influence, banished from Vienna, ant never resumed office. In his retirement he was occasio ally consulted, as after the battle of Wagram in 1809, when he recommended the emperor to make peace at any cost, stating that the existence of the Austrian monarchy was at staks and that the dissolution of Napoleen's empire was not far off. After the overthrow of Napoleon he returned to the capital, where be died May 29, 1818. Thugut pessessed many of the qualities of a great man,-indomitable courage, calmness iu danger, devotion to public interests, enormous industry; but all this was spoilt by the persistent disregard of obligations towards allies in the greedy pursuit of Austria's own aggrandizement, and by the intriguing spirit inseparable fron this policy. The materials for forming a fair estimate of Thugut's conduct of affairs fron 1793 to 1801 nave but recently been gisen to the world. Of his private life next to nothing is known.
TH: LE was the name given by Greek and Roman Nengraphers to a land situated to the north of Britan, woteh they believed to bu the most northerly portion of

Europe, or indeed of the known world. The first writer who mentioned the name was Pytheas of Alassilia, whose statements conccrning it have been already given under the heading Pytaeas. But it is impossible for us to determine with certainty what those statements, which have only been transmitted to us at second or third hand, really were, and still more so what was their real signification. It is almost certain that Pytheas did not himself profess to have visited Thule, but had only vaguely heard of its existence, as a land of unknown extent, situated, accord. ing to the information he had received, six days' voyage to the north of Britain. This account was adopted by Eratosthenes (though rejected by Polybius and Strabn), and accordingly this unknown land became a cardinal point in the systems of many ancient geographers, as the northern limit of the known world. Nothing more was learnt concenning it until the Romans under Agricola (about 84 A.D.) accomplished the circumnarigation of the northern point of Britain, and rot only visited, but according to Tacitus subdued, the Orcades or Orkney Islands. On this occasion, the historian tells us, they caught sight also of Thule, ${ }^{1}$ which in this instance could only mean the group of the Shetland Islands. No further account of this mysterious land is found in any ancient author, except vague statements, derived from Pytheas, but mostly in an inaccurate and distorted form, concerning its position and the astronomical phenomena resulting from this cause. It is probable that what Pytheas really reported was that at the summer solstice the days were twenty-four hours in length, and conversely at the winter solstice the nights were of equal duration, a statement which would indicate the notion of its position in about $66^{\circ} \mathrm{N}$. lat., or under what we now call the Arctic Circle. The skill of Pytheas as an astronomer would have been quite sufficient to lead him to the conclusion that this would be the case at some point in proceeding northwards, and the rapid changes in this respect that would be reported to him by any navigators that had really followed the shores of Britain to any considerable extent in that direction would confirm him in the correctness of his views. He had, too, a very exaggerated notion of the extent of Britain (see Pytheas), and hence he would be led to place an island which was six days' voyage to the north of it much nearer to the Arctic Circle than its true position.
The statement of Pytheas on this point appears to have obtained almost universal belief until the time of Marinus of Tyre and his successor Ptolemy, who were led-apparently from their knowledga that the group of islands to which the namo of Thule had been applied by the Romaus was really not very far distant from the Orcades-to bring down its position cousiderably more to the south, so that Ptolemy places the island of Thule, which he still regards as the most northerly point of Europe, in only $63^{\circ} \mathrm{N}$. lat. Unfortunately this more reasonable viev has been discarded by many modern writers, who have gone back to the statements of Pytheas ccacerning the leagth of the day, and have in consequence iusistea upon placing Thule within the Arctic Circle, and hava thus been led to identify it with Iceland. The improbability of such an hypotisesis, when we consider the state of ancient naviga. ticn. is in itself a sufficient refutation, and there appcars no reason. able doubt that the Thula of $\mathrm{P}_{j}$ theas, like that of the Romans and of Ptolemy, was merely an exaggerated and solnewhat erroneous conception of tha large group of the Shetlaul Islanda, of which the principal, called Mainland, is in fact so predominant that the whole may well have been considered as one large island rather than a scattered group like the Orkneys. If we might trust to the accuracy of Strabo's quotation (ii. 5, p. 114), that Pytheas called Thule "the most northerly of the British lslands," thia would be decisive on the point; but unfortunately the verbal accuracy of such references by ancient writers can seldom be relied on, and Strabo nad evidently never seen Py theas's original work.
it appears, however, to be certain that lceland was really visited by aome lrish monks long before its discovery by tha Northmen, and ia described under the name of Thula by a writer named Dicuil, himself an Irish monk. who wrote in the first half of the

[^134]9th century, in such a manner as to leare no doubt that his statements really refer to that extensive but remote island. See Letronne, Ficcherchcs sur Dicuil, Paris, 1814.
thÜMmel, Moritz Adgust von (1738-1817), German writer in prose and verse, one of the imitators of Wieland (see vol. x. p. 541), was born May 27, 1738, in the ncighbourhood of Leipsic, was educated at Rossleben and the university of Leipsic, and from 1761 till 1783 held various offices in the ducal court of Saxe-Coburg. Ho died at Coburg on October 26, 1817. He wrote a comic prosc epic, Wilhelmine, oder der vermählle Pedant (1761); Die Inoculation der Liebe (1751), a tale in verse; Reise in die mittäglichen Provinzen von Frankreich (17911805), a romance in 10 rols.; and Der heilige Kilian, oder das Iricbespaar (1818) An edition of his works was published at Leipsic in 8 vols. in 1854-55.
thunderg, Carl Peter (1743-1828), an emident traveller, and one of the most distinguished botanists of the school of Linnæus, was born in 1743. He became a pupil of Linnæus at the university of Upsala, where he graduated in medicine in 1770. Obtaining a travelling scholarship, he visited Holland, whence he embarked on a voyage of exploration to Java, in quest of vegctable treasures. He sailed as far as the Cape of Good Hope in 1771, and three years aftermards went to Japan, remaining five years, engaged in making collections of plants, and in observing the habits, manners, and language of the people. On his return in 1779 he visited England, and made the acquaintance of Sir Joseph Banks. In 1777 he was made demonstrator oi botany at Upsala, and be succeeded Linnxus as professor of botany in 1784. Thunberg published in 1784 his Flora Japonica; in 1788 he began to publish his travels. He completed his Prodromus Plantarum in 1800, in 1805 his Icones Plantarum, and in 1813 his Flora Capensis Thunberg published numerous memoirs in the Transactions of many Swedish and foreign scientific societies, of sixty-six of which he was an ionorary member He died in 1828.
THUNDERSTORIF. All the more ordinary phenomena of thunderstorms lad, about 1750, been conclusively traced to electrical charges and discharges (Euectricity, vol. viii. p. 6), so that they could casily be reproduced on a small scale in the laboratory To the article cited we therefore refer for their explanation. Some of the laws of relative frequency of thunderstorms, in different places at the same season or in the same place at different seasons, will be found in Mfreorology (vol. xvi. p. 128). A discussion of the cause of thunder, and of the circumstances which give rise to a crash, a roll, or a peal of thunder is given under A. soustics (vol. i. p. 107). In what follows, therefore, the rarcr phenomena of thunderstorns, and the possible sources of the atmospheric electricity, will be the chief points treated.

Thicre can be little doubt that atmospheric electricity, at least in the great developments which characterize a thunderstorm, is due in some way to water. Before a great thunderstorm the lower air is usually at an abnormally high temperature, and fully saturated with water vapour, so that it is in a thoroughly unstable condition. 1 mmense cloud masses, often miles in rertical thickncss, which produce almost midnight darkacss by day in the region of the stornl, and which appear, when scen from a distance, as if boiling upwards, are always a notable feature of great thunderstorms. These are usually accompanicd by torrents of rain, or by violent hail-showers. And it is commonly observed that each flash of lightning is followed, after a brief interval, by a sudden but temporary increase in the rate of rainfall. At what stage of its transformations the elcctrification is developed by watersubstance is, as yct, only guessed at,-though it scems
most reasonable to conclude that it is anterior to the formation of cloud, i.e., to the condensation of rapour. And, though the idea was at one time very geoerally beld and still has many upholders, it seems unlikely to be the direct result of evaporation. For, were it due directly either to eraporation or to condensation, it is almost impossible to donbt that proof would long siace have been furnished by careful experiment, even if made on a scale so limited as that afforded by our laboratories. No trace of electrical effect has been found to attend the precipitation of moisture ; and the electrical effects, sometimes considerable. Which have been found associated with evaporation have always been accompanied by relatively violent physical and mechanical actions which are not observed in conjunction with atmospheric electricity. It has been suggested by some authoritios that the electricity of a thunderstorm is developed during the formation of hail, by others that it is due to the molecular actions which accompany the diminution of total surface when two or more drops of water coalesce into a single one. It has been ascribed to the friction of moist against dry air, and to the dust-particles which appear to be necessary for the condensation of vapour. Again, it has been suggested that it may be a niero phenomenon of contact electricity, due to the impact of uncondensed vapour particles on particles of air. It is almost unnecessary to observe that, whatever hypothesis we adopt, some explanation must be given of two important points:-(1) What becomes of the electricity equal and opposite to that in cach drop, which must be produced simultaneonsly with it? (2) By what means is the attraction between the drops and the recipient of the opposite charge of electricity overcome so that the drops may be enabled to part with their charge? It is to be presumed that gravity satisfies the second of these questions. As to tho first, it seems to necessitate the presence of something besides water, in order that the electric separation may be commenced, and thus appcars to be fatal to the capillary theory indicated above. Whatever be the true source of the charge, it is easy to see, by known properties of electricity, that even an exceedingly small charge on each rapour particle would lead to a very high potential as soon as a visible drop is formed, and that as a drop increases in size its potential is proportional to its surface. That drops of rain are often individually electrificd to a very high potential is proved by the frequent occurrcnce of "luminous rain," when the ground is feebly lit up by the multitude of tiny sparks given out by the drops as they come near it. The flakcs of falling snow, also, are often strongly elcetrificd, so that smart sparks lave been drawn from an umbrella on which the snow was falling. But the law of electric repulsion shows us at once that, as soon as the drops in a cloud are sufficiently electrified, at lcast the greater part of their charge must pass to the boundary of the cloud. When this occurs, the nature of the further belaviour of the charge presents no difficulty. The reason for our singularly complete ignorance of the source of atmospheric electricity scems to lie in the fact that it can only be discovercd by means of experiments made on a scale very much larger than is attainable with the ordinary resources of a laboratory. The difficulties will probably be easily overcome by the first nation which will go to the expense of providing the nccessary means.

Nunberless other explanations of the origin of thunderstorms have been suggested; but the more reasonable of these do little more than shift the difficulty, for they begin by assuming (without any hint as to its source) an elcctrification of the earth as a whole, or of the lower (somctimes the upper) laycrs of the atmosphere. Induction, zonscetion, ic., are then supposed to effect the rest.

Another and much less reasonable class of explanations depends upon magneto-electricity. Some of these introduce the so-called "unipolar" induction supposed to be due to the rotation of the earth, which behaves like a gigantic nagnet. Of this nature is the suggestion of Edlund, which was recently crowned by the Academy of Sciences of Paris. That rapid variations in the earth's magnetic elements, such.as often occur on a large scale, as in a " magnetic storin," have at least a share in the production of the aurora is a perfectly reasonable and even plausible hypothesis, long ago brought forward by Balfour Stewart. But we bave yet to seek the source of these variations.

The brightness of a flash of lightning is usually much underrated. It is true that it rarely gives even at night an illumination greater than that due to moonlight. But it must be remembered that Swan has proved that the impression of a flash on the cye depends upon the duration, being nearly proportional to it, and steadily increasing for about a tenth of a second. Now the duration of a light-ning-lash is (roughly speaking) only about one millionth of a second. This is proved by the fact that the most rapidly rotating bodies appear to be absolutely steady when illuminated by it. Hence, if it could bo made to last for a tenth of a second, it would give near objects an illumination one hundred thousand times more brilliant than that of moonlight. It must be remembered that the flash is not a mere line, but a column, of intensely heated air, driven outwards from the track of the discbarge at a rate initially far greater than that of sound.

What is called "summer lightning" or "wild-fire" is sometimes a rather puzzling phenomenon. In the majority of cases it is merely the effect of a distant thunderstorm. It is also often due to a thunderstorm in the higher strata of the atmosphere overhead, -the reason why we hear no thunder being not so much the distance from the spectator as the fact that sounds generated in rarer air lose rapidly in intensity as they are propagated into denser air. But, besides these more common forms of the phenomenon, there is certainly a form of sheet lightning which occurs, without either sound or cloud, often close to the spectator. The cause of this is not at all obvious.

But the most mysterious phenomenon is what goes by the name of "globe lightning" or "fire-ball," a phenomenon lasting sometimes for several seconds, and therefore of a totally different character from that of any other form of lightning. The fire-ball is almost incomparably less brilliant than forked lightning, because, though it lasts long enough to give the full impression of its brightness, it is rarely brighter than iron in the state which we call "red-hot." It is always spherical, often more than a foot in diameter, and appears to fall from a thunder.cloud by its own gravity, sometimes rebounding after striking the ground. It usually bursts with a bright flash and a loud explosion; occasionally discbarging flashes of lightning. No experimenter has yet succeeded in producing artificially enything resembling these natural and intensely charged Leyden jars.
The term " thunderbolt," which is nowadays rarely used except by poets (and by the penny-a-liners), preserves the old potion tinat something solid and intensely not passed along the track of a lightning flash and buried itself in the ground. Two distinct classes of phenomena probably gave fise to this notion. When lightning strikes the ground it pften bores a hole of considerable depth, which is found to be lined in its interior with vitrified sand. This presents no difficulty. But Aerolites (q.v.) are often found, in the boles which they have made, still intensely hot, in consequence of their rapid passage through the air. A hasty generalization seems to have connected these two entirely independent phenomena, end thus given rise to the notion
of the thunderbolt. The ancient notion that a lightning flash could occur in a clear sky is probably to be accounted for by the occasional appearance of these ultramundane visitors.

The sulphurous smell of lightning, which is vividly described in the Odyssey, is now known to be due to the formation of Ozone (q.v.).

For the precautions necessary to prevent danger from a thunderstorm, see Lightning Conductor.

A whole volume of Arago's collected works is devoted to thunder. storms, and many important observations are to be found in the writ. ings of M. D'Abbadie and other scientific travellers. (P. G. T.)

THÚN-KHWA, or Thonegwa, a district in the Pegu division of Lurmab, lying between $17^{\circ} 37^{\prime}$ and $19^{\circ} 28^{\prime}$ N. lat., and between $95^{\circ} 53^{\prime}$ and $96^{\circ} 53^{\prime}$ E. long., with antarea of 5413 square miles. It is bounded on the N. by Henzada, E. by Rangoon, S. by the Bay of Bengal, and W. by Bassein district. Thewhole district is a large deltaic plain, divided by the numerous channels of the Irrawaddy into saucer-shaped islands, with deep depressions in the centre. The Irrawaddy traverses Thün-khwa from north to south, throwing of numerous branches until it falls into the Bay of Bengal. Geologically, Thún-khwa is composed of "older alluvial clay," differing from that of the Gangetic basin in being less rich in lime.
The population of Thún-lihwa in 1881 was returned at 284,063 (males 150,131, females 133,932); Hindus numbered 723, Mohammedans 1650, Christians 6894, and Buddhists 274,237. The largest towns in the district are Yandoon and Pantanaw, with populations (1881) of 12,673 and 6174 respectively. The land is nuch less fertile than that of the neighbouring districts. In 1855-86 the area under cultivation was 349,259 acres, and the cultivable area 1,262,374 acres. The principal crops are rice, fruits, vegetables, and sugar-cane. The total revenue realized in the year 1885-86 amouted to $£ 194,737$, of which the land contributed $£ 66,590$. Thúu-k liwa was constituted a districi in 1875, and its history previous to that date is identical with that of Henzada, to which administrative division it originally belonged. During the first Burmees war no resistance was offered to the British in the district as it ar present exists except at the town of Donabyu. At the time of the second war Donabyu was undefended, hut, after the oceupation of Prome, Myat Htin, an ex-thúgyi of a snall circle, succeecled in collecting a body of men and defied thr British. Early in January 1853 the enemy were driven out of Donabyu, but on jrenetratiug into the interior the British were forced to retire. In a subsequent engagement the British were driven back; but the enemy were oventually dispersed and their works captured.

THURGAU, or Thurgovia, a canton of Switzerland (ranking as seventeenth in the Confederation), takes its name from the river Thur. It is bounded on the N. by the Rhine, on the E. by the Lake of Constance (the cantonal frontier being so drawn as to leave the town of Constance to Baden), on the $S$. by a line running from Arbon on the lake west and south-west to Hörnli, and on the W. by a line drawn from Hörnli passing east of Winterthur and west of Frauenfeld to the Rhine, a little west of Diessenhofen and opposite Schaffbausen.: It is thus slaped like a triangle, of which the Hörnli ( 3274 feet, the highest point in the canton) is the apex, and comprises the middle basin of the Thur. Its total area is $381 \cdot \frac{1}{2}$ square miles, of which 322.6 (or 84.6 per cent.) is reckoned as "productive land," 69.8 being covered by forests, and 6.9 by vineyards. Of the "unproductive" portion no less than 50.5 square miles consists of the cantonal share of the Lake of Con. stance. According to the census of 1880 , the population amounted to 99,552 (females being in a majority of 1000 ), an increase of 6252 on the census of 1870 ; of these, 99,026 are German-speaking. . In religion the inhabitants are divided, there being 71,821 Protestants to 27,123 Roman Catholi.s; the canton till 1815 was in the diocese of Constance, and since 1828 has been in the reconstructed diocese of Basel, though for some time after 1873 the Government would not recognize the authority of Bishop Lachat, in consequence of his support of the dogme of

Infallibility at the Vatican council. The capital is Frauenfeld (5811 inhabitants), and Romanshorn (population 3647) is an important railway centre on the lake. The canton has many small villages, and the population is chiefly employed in agricultural pursuits, though cotton-spinning is rapidly increasing. The orchards are $80^{\circ}$ splendid that Thurgau has been called "the garden of Helvetia." A network of well-made roads traverses it in every dizection.
The Thurgau originally took in all the country, ronghly epeaking, between the Renss, the Lake of Lucerne, the Rhine, and the Lake of Constance; but many smaller districts (Zürichgau, Toggenbarg, Appenzell, St Gall) were gradually carved out of it, and the county was reduced to about the size of the present canton when in 1264 it passed by the gift of the last count of Kyburg to his nephew Rudolph of Hapsburg, chosen emperor in 1273. In 1415 the count, Duke Frederick of Austris (a Hepsbnrg), wes put under the ban of the empire by the emperor Sigismund for having aided Pope Jobn XX11I. to escape from Constance, and the county was overrun, 8igismund i.is 1417 mort gaging to the city of Constance the eppeellate jurisdiction in all ciril snd criminal matters (" landgericht"" and "blatbann") arising with in the county, which le had declared to be forfeited in consequence of Frederick's conduct. In 1460 tome of the Confederates, now Decoming very eager for conqnests, overran 4 4d seized the county. Winterthur was esved, but in 1461 Frederick's son, Duke Sigismand, hed perforce to cede the county to tbe Confederates. Henceforth it was ruled as a "subject district" by seven members of the Leagne, - Bern, occupied in the west, not being admitted to $s$ ehare in the governneat till 1712, efter one of the wars of religion. It was only in 1499 that the Confederation (then consisting of ten members) obtained from Constance her supreme jarisdiction, through the mediation of the duke of Milan, but there were etill forty-two minor jarisdictione belonging to various lords, apiritual and temporal, which went on till 1798 and greatly limited the power of the Confederates. Thurgan had hoped, but in vain, to be admitted in 1499 a full member of the Confederation.
At the time of the Reformation many of the inhabitants became Protestants, and bitter quarrels ensued between the Protestant and Catholic (the latter having a large najority) membera of the Confederation who had rights over Thurgau, with regard to the toleration of the new doctrines in the "sabject districts" such as Thurgau. By the first peace of Kappel (1529) the majority in each "commune" was to settle the refigiou of that "commune," but by the eecond (1531, after Zwingli'e death) both religions were to be allowed side by side in each "commune." Thurgau thus became a "canton of parity," as it is to this day. lits rulers, however, continued to watch each other very closely, and Eilisn Kesselring, one of the chief military commanders in Thurgan, was in 1633, or anspicion of having connived at the advance of the Swedes throngh Thurgau on Constance, seized by the Catholic cantons and severely punished. In 1798 Thurgau became free, and was one of the ninetteen cantons of the Helvetic republic, being formally reeceived (like the othe" "sabject lands") as a full member of the Swiss Confederation in 1803 by the Act of Mediation. It was one of the very first cantons to revise, in 1830, after the July revolution in Paris, its constitution in a very liberal sense, and in 1831 proposed a revision of the federal pact of 1815. This failed, but the new federal constitutions of 1843 (of which one of the two drafters was Kern of Thargau) and 1874 were approved by very large majorities. In 1849 the cantonal constitution was revised and the veto introduced, by which the people might reject a bill passed by the cantonal assembly. Finally, in 1869 , the bxisting constitution was drawn up, by which the "initiative" (or right of 2500 electors to compel the cantonal assembly to take, any subject into coneideration) and the "obligatory referendum" (by which all laws passed by the cantonsl assembly, and all finsncial resolutions involving a capital expenditure of 50,000 francs or an annual one of 10,000 , must be submitted to a popalar franes or an annual one of the cantonal government consists of a
vote legislative assembly (now of ninety-seren members; one to every 250 electors) and an executive council of five members, both elected directly by the people; 5000 electors can at any time call for a populer vote on the question of the dismissal of either one or the other. Further, to ebow the very democratic character of the oonstitution, it may be sdded that members of botn hotses of the federal assembly are in Thrrgau elected direct by the people. The "commanes". in Thurgau are of no less than eleren or twelve varieties. The division of tie lands, \&c., of the old "burgher commanes $"$ " between them and the new communcs, consisting of sll residents (with whom political power rests), was carried out (1872) in all of the 214 commnnes; but there are still thirty-ight guilds or corporations with specisl rights over certain forests, $\dot{\text { we. }}$
Thi best history of the canton is that b5 bJ. A. Pupporefr, of whikb \& eccond ud very much eularged editlon is now (1887) belog published.
thurif, or Thurivm, a city of Magea Grecia on the Gulf of Tarentum, near the site of the older Sybaris ( $q . v$. ). but farther inland. It owed its origin to an attempt made in 452 b.c. by Sybarite exiles and their descendants to repeople their old home. The new settlement was crushed by Crotona, but the Athenians lent aid to the fugitives, and in 446, or rather in 443, Pericles sent out to Thurii a mised body of colonists from various parts of Greece, among whom were Herodotusand the orator Lysiab. The pretensions of the Sybarite colonists led to dissensions and ultimately to their expulsion; peace was made with Crotona, and also, after a period of war, with Tarentum, and Thurii rose rapidly in power and drew settlers from all parts of Greece, especially from Peloponnesus, so that the tie to Athens was not always acknowledged. The oracle of Delphi determined that the city bad no founder but Apollo, and in the Athenian war in Sicily Thurii waa at first neutral, though it finally helped the Athenians. Thurii had a democratic constitution and good laws, and, though we hear little of its history till in 390 it received a severe defeat from the rising power of the Lucanians, many beantiful coins testify to the wealth and splendour of its days of prosperity. In the 4th century it continued to decline, and at length called in the help of the Romans against the Lucanians, and then in 282 against Tarentum. Thenceforward its position was dependent, and in the Second Punic War, after several vicissitudes, it was depeopled and plandered by Hannibal (204). In 194 a Roman colony was founded, with Latin rights, known for a time as Copix, jut afterwards by the old name of Thurii. It continued to be a place of some importance, the sitnation being favourable and the region fertile, and does not seem to have been wholly abandoned till the Middle Ages. Its site, near Terranova di Sibari, is marked by considerable ruins of the Roman period (cf. Lenormant, in Academy, xvii. 73, and Barnabei, ibid., xvi. 55 sq.).

THURINGIA (Germ. Thüringen), a territorial term without modern political significance, designates, strictly -speaking, only that district in Upper Saxony that is bounded by the Werra, the Harz Mountains, the Saale, and the Thuringian Forest; but in common parlance it is frequently used as equivalent to the Thuringian states, i.e., the group of small duchies and principalities lying between Prussia, Hesse-Nassau, Bavaria, and the kingdom of Saxony. ${ }^{1}$ The name is derived, with great probability, from that of the Hermunduri, a branch of the great Suevic family; and the ancient Thuringians, a heathen tribe first mentioned in the 5th century by Vegetius Renatus, are believed to be the descendants of that Teutonic people. The Thuringians seem at one time to have occapiea territories stretching from the Elbe not far from Hamburg to the Danube at Ratisbon ; but about 531 their empire was overthrown by the united Franks and Sazons. The north part of their lands fell to the Saxons, and was known for some time as the North Thuringian gan; the district to the south of the Thuringian Forest was called Franconia after its con. querors; and the name Thuringia was restricted almost to the narrow limits to which it now properly applies. The adrance of the Sorbs to the east bank of the Saale about the middle of the 7 th century made the limitation still more exact. Thuringia remained under Frankish dominion, and varions Frankish counts ruled in the diferent "gaus* into which it was dirided. Christianity, if not introduced, was confirmed in this district by the British Boniface ; a

[^135]bishopric was founded at Erfurt ; and under Charlemagne the Thuringian marls was the base of active operations against the heathen Sorbs. In 839 the title of duke of Thuringi2, (ducatus Toringubx) appears; but that of landgrave seems to bave superseded it ; neither dignity implied sovereignty over the whole district. Otto the Illustrious, duke of Saxony (880), added Thuringia to his duchy, but the union was not permanent. About the beginning of the 12 th century Louis the Springer, builder of the Wartburg, rose to eminence among the Thuringian nobles; and about 1130 his son, also Louis, was appointed landgrave by the emperor Lothair I. Thuringia now began to be a united land under one prince; and the landgraves, who aequired the Saxon palatinate on the fall of Henry the Lion of Sazony in 1180, rose to considerable power. The last landgrave of this line was Henry Raspe (1242-1247), brothcr and successor of Louis the Saint. His death was followed by a devastating war of succession between bis nicea Sophia, duchess of Brabant, and Henry the Illustrious, margrave of Meissen (1221-1288), whose mother Jutta was a Thuringian princess. Peace was finally established in 1263: Sophia received Hesse, and Henry took the rest of Thuringia, the general history of which thenceforth merged in that of Meissen, and later of Saxony, although it maintained its separate name. Thuringia was included in the administrative circle of Upper Sazony (see vol. xxi. _ 352, note 3). For its subsequent fate, and the rise of the present Thuringian states, see under Saxory (vol. xxi. pp. 353 sq.).
The most striking natural feature of Thuringia is the Thuringian Forest (Thilringervald), a range or systam of hills, extending in ans irregular line from the neighbourhood of Eisenach in the north. west to the Lobensteiner Kulm on the Bavarian frontier on the sonth-east, aud forming the southern boundary of Thuringia, separating it from Franconia. On the south-east it is continued directly by the Frankenwald Mountains to the Fichtelgcbirge, which is in immediato connexion with the Erzgebirge, while on the north-east it approaches the Harz Mountains, and thue takes its place is the great Sudetic clain of central Germsny. The length of the illuringian chain is 70 miles, and its breadth paries from 8 to $25^{\prime}$ miles. It nowhere rises into peaks, and only a few of its rounded summits reach the height of 3000 feet; the successive hills melt into each other in gentle undulatioos, forming a continuous and easily traced comb, and ouly the north-west alopes are precipitous, aud seamed with winding gorges. This mountainrange encloses many clarming aud romentic valleys and glens; the most prominent feature of its picturesque scencry is formed by the fine forests, chiefly of pires and firs, which clothe most of tho hills. The north-west part of the system is the loftier and the more deneely woodell, os well as the more beautiful; the highest oummits here are the Grosser Beerberg ( 3225 feet), Sclineekepf ( 3179 ), and the Inselberg (2957), all in the duchy of Gotha. The southeast part of the Thuringian Forest is the me1e populous and industrial ; the chief eummits sre the Kieferle ( 2851 feet) st Steinheid, the Blessberg ( 2834 feet) near Schalkan, the Wurzelberg ( 2746 feet) uear Oelze, and the Wetzstein ( 2719 ) near Lehcsten. The crest of the Thusingian Forest, from the Werra to the Saale, is traversed by the Rennsteig or Rainsteig, a broad path of unknown antiquity, though it is believed to he referred to in a letter of Pope Gregory Ill. dated 738. The vame means probably "frontierpath"; and the path marks iv fact the boundary between Thuringia and Franconia. It may he also regarded as part of the boundary. lino betwéen North and Sonth Germany, for dialect. customs, local names and costume are different ou the two sides.

## thuringorum lex. See Salic Law.

THURLES, an ancient market-town of Ireland, in the county of Tipperary, and the seat of the Catholic archdioccse of Cashel, is pleasantly situated on the Suir, and on the Great Southern and Wcstern Railway, 46 miles east of Limerick, 29 west from Kilkenny, and 87 southwest of Dubliu. The cathedral of St Patrick is a beautiful building, erected at a cost of $£ 45,000$. The town is the seat of other important Catholic establishments, including an Ursuline couvent, in which is a large board-ing-school for young ladies; a Presentation convent; St Patrick's Catholic college (1829) for ecclesiastical students,
where was held in 1850 the sjzed of Thurles, composed of all the Catholic bishops of Ireland ; and an establishment of Christian Brothers, who devote themselves to the instruction of boys on the Lancastrian method. The torm has a considerable agricultural and retail trade. The population was 5008 in 1871, and 4850 in 1881

Originally the town was called Durlas O'Fogarty. In the 10the century it was the sceno of the defeat of the Irish by the Danes. A preceptory was founded here by the Knights Templhars, who possessed themselves of a castle erected early in the 13th contury. A castlo was subseqnently erected by James Butler, first lord palatine of Tipperary, of which till recently a tower still remainel.
thurlow, Edward Thurlow, Baron (1732-1803), was born at Bracon-Ash, in the county of Norfolk, in 1732. His father was a cle:gyman, and held successively the livings of Littie Ashfield in Suffolk and of Stratton St Mary's in Norfolk. His mother Elizabeth was the daughter of Robert Smith of Ashfiald. Thurlow received his early education at bome. He was next placed undcr the care of Mr Brett at Scarning, where he remained for four years, and was then sent to the grammar school of Canterbury, where he was considered a bold refractury clever boy. In October 1748 Thurlow entered Caius Collcge, Cambridge, and speedily justified his school reputation. The dean of the college, upon the extent and accuracy of whose classical acquirements grave suspicion rested, had directed hin, as a punishment for some act of insubordination, to translate a chapter of the Spectator, into Greek. Thurlow executod bis task with care, and then gave it for revisal, not to the dean, but to the tutor of the college. When reprimanded for having thus infringed the college rules, Thurlow retorted that he had carried his exercise to one who could inform the dean whether or not he had obeyed his orders. The insult was too grave for rustication, and yet too slight to justify expulsion. Thurlow was therefore permitted to withdraw his name from the college books, and he left Cambridge without a degree (1751). H9 now took chansbers, and began regularly to keep terms in the Inner Temple, which he bad joined while still an undergraduate. He was for some time a pupil along with the poet Cowper in the office of Mr Chapman, an eminent solicitor in Lincoln's Inn. On 22d November 1754 Thurlow was called to the bar, and subsequently went on the western circuit-at first with little success. But the tide turned. In the case of Luke Robinson $v$. the Earl of Winchelsea (1758) Thurlow came into collision with Sir fletcher Aorton. then the terror of solicitors and the tyrant of the bar, and put down his arrogance with dignity and success. From: this time his practice increased rapidly. In Decemoer 1761 he was made a king's counsel, through the infurenc? of the duchess of Queensberry. In January 1762 he was elected a bencher of the Inner Temple. It now becamo necessary for him to take his side in politics, and, after repeated oscillations, and with some hesitancy, Thurlow threw Limself iuto the ranks of the Tory party. In May 1768 he became member for Tamworth. In 1769 the Douglas Peerage case came on for hearing in the House of Lords, and Thurlow, who had drawn the pleadings some Jears before (Notes and Queries, 3d ser., iiii. 122), led for the appellant in a speech of great ability and analytic power. In March 1itio, as a recognition of his defence in the previous January of the expulsion of Wilkes, Thurlow was made solicitor-general on the resignation of Dunning, and in the following year (23d January 1771), after be had enhanced his reputation with the Government by attacking the rights of juries in cases of libel (Rex $u$. Miller, 20 Siate Trials, 870-896) and the liberty of the press (16. Parly. Hist., 1144), was raised to the attorncegeneralship. Thurlow's public life was as factious as his youth had been daring. His riolent laatred of the Amcrican colonists, and his extreme and imprudent assertion
that as attorney-general he might set aside by scire facias as forfeited every charter in America (debate on the American Prohibitory Bill, 18 P. H., 999); bis speech in aggraration of punishment in the case of Horne Tooke (20 S气. Tr., 777-783) when ho argued that the prisoner ought to be pilloried, because imprisonment was no penalty to a man of sedentary habits and a fine would be paid by seditious subscription; and his consistent opposition to all interference with the slave trade,-are characteristic of the man. In 1778 Thurlow became lord chancellor and Baron Thurlow of Ashfield (June), and took his seat in the House of Lords, where he soon acquired an almost dictator:al power. He resolutely opposed the economical and constitutional reforms proposed by Burke and Dunning. Under Rockingham he still clung to the chancellorship, while conducting himself like a leader of the opposition. To the short-lived ministry of Shelburne he gave a consistent support. Under the coalition of Fox and North (April to December 1783) the great seal was placed in commission, and Lord Loughborough was made first commissioner. But Thurlow, acting as the king's adviser, and in accordance with his wishes, harassed the new ministry, and ultimately secured the rejection of Fox's India Bill (24 P. II., 226). The coalition was at once dissolved. Pitt accepted office, and Thurlowagain became lord chancellor (December 23, 1783). At first he supported the Government heartily, but soon his overbearing temper asserted itself. Imprudently relying on the friendship of the king, and actuated by acarcely disguised enmity to Pitt, Thurlow passed rapidly from occasional acts of hostility to secret disaffection, and finally to open revolt. He delivered himself strongly against a bill, introdueed without his privity, for the restoration to the heirs of attainted owners of estates forfeited in the Jacobite rebellion of 1745 . Partly to please the king and queen, partly from dislike to Burke, and partly perhaps from a real belief in the groundlessness of the accusation, he supported Warren Hastings on every occasion "with indecorous violence." His negotiations with the Whigs during the discussion of the Regency Bill (1788-19th February 1789) went beyond the limits of mere perverse coquetry, and were designed to secure his seat on the woolsack in the erent of Fox being called to power. The climax was reached in 1792 , when he virulently attacked Pitt's bill "to establish a sinking fund for the redemption of the national debt," not on account of the economic objections to which it was justly liable, but on the trivial ground that it was an unconstitutional attempt to bind fature parliaments. The bill was carried, but only by a narrow majority, and Pitt, feeling that co-operation with such a colleague was impossible, insisted successfully on lis dismissal (June 15, 1792). The ex-cbancellor, who had a few days before (June 12) been created Baron Thurlow of Thurlow, with remainder to his brothers and their male deseendants, now retired into private life, and, with the exception of a futile intrigue, under the auspices of the prince of Wales, for the formation of a ministry from which Pitt and Fox should be excluded, and in which the earl of Moira should be premier and Thurlow chancellor (1797), finally abandoned the hopes of office and the dictatorship which he had so long exercised in the House of Lords. In $1: 95$ he opposed the Treason and Sedition Bills without success. In 1801 he spoke on behalf of Horne Tooke-now his friend-when a bill was introduced to render a priest in orders ineligible for, a seat in the House of Commons. His last recorded appearance in the House of Lords was on May 4, 1802. He now spent his time between his villa at Dulwich and Brighton, Bognor, Scarborough, and Bath. He died at Brighton on 12th September 1806. and was buried in the Temple chureb. Thurlow
was never married, but left three natural daughters, for whom be made a handsome provision. The title descended to his nepher, son of the bishop of Durham.

Lord Thurlow was a master of a coarse canstic wit, which habitually in his private and too frequently in his public life displayed itself in profanity. He was a good classical scholar and made occasional translations in verse from Homer and Euripides. His judicial and his ecelesiastical patronage was wisely exercised; he was the patron of Dr Johnson end of Crabbe, and was the first to detect the great legal merits of Eldod. Thurlow's personal appearence was striking. His dark complexion, harsh but regular features, severe and dignified demeanour, piereing black eyes and bushy cyebrows, doubtless contributed to his professional and political eminence and provoked the sarcasm of Fox that he looked wiser than any man ever was. Yet he was far from being an impostor. By intense though irregular application he had acquired a wide if not a profound knowledgo of law. Clear-healed, self-confident, and fluent, able at once to reason temperately and to assert strongly, capable of grasping, rapidly assimilating, and forcibly reproducing minute and complicated detnils, he possessed all the qualities which command snecess. His speeches in the trial of the duchess of Kingston for bigany ( 20 S. T., 355-651) are singularly vigorous and effective, while his famons opening in the Douglas Peerage case and his argument for the crown in Canpbell v. Hall ( $20 S$. T., 312-316) show that he might have rendered high service to the judicial literature of his country had he relied more upon his own industry and less upon the learning of Hargrave and Kenyon

THURSO, a seaport, police burgh, and burgh of barony of Caithness, Scotland, is situated at the mouth of the Thurso, on the beautiful Thurso Bay, at the northern terminus of the lighland hailway, 21 miles north-west of Wick, and 367 north of Edinburgh by rail. The new town, regularly built with broad strcets and good houses, is steadily increasing in population. In Macdonald Square, now laid out with ornamental walks, there is a statue of Sir John Sinclair (q.v.). Along the sands a promenade 300 yards in length was formed in 1882. The town-hall (1870) embraces a court-room and rooms for the free public library and the museum, which contains the geological and botanical specimens of Robert Dick, the "Thurso baker," commenorated by Samuel Smiles, as well as a large collection of northern birds. In the neighbourbood are large quarrics for Caithness flags, which are cut and dressed in the town. They constitute the principal export, but the trade of the port is hindered by the inconvenience of the harbour. There is, however, communication with the south and west, and with Orkney by steamer from Scrabster pier, 3 miles to the north. To the east is Thurso Castle, the residence of the Ulbster branch of the Sinclairs. The population in 1871 was 3622 and in 1881 it was 4026.
Thurso was the centre of the Norso power on the mainland when at its height under Thorfinn (1014), aud afterwards till the battle of Largs. Count Moddan, neplew of King Duncan, quartered his army for a time at Thurso, which ho ternis "the town of Caithness," and was llentifully supplied by spoil till surprised and slain by Thorkel in 1040. In the tine of Malcolm II. Earl Erlend resided in the town. In 1633 it was created a burgh of barony, and was the seat of the sheriff courts of the county till they were removed to Wick in 1828.
THIIIE. The genus Thymus (nat. ord. Laliatx) comprises a number of fragrant aromatic undershrubs, with very small leaves and whorls of small lilac flowers in the axils of the leaves or at the ends of the branches. The common garden thyme, a native of the Mediterranean region, is Thymus vulgaris; the wild thyme of our banks is T. Serpyllum. Marjoram (Origanum) is also closely allied. All these plants are remarkable for their essential oil, to which their fragranee is duc. From this oil is produced by distillation a substance known as thymol, analogous to camphor. It is homologous with phenol or carbolic acid and may be used as a disinfectant and germicide.

TIBBUS, or 'lubus, a nomad race of North Africa, occupying the eastern section of the Sahara from about $12^{\circ}$, where they are conterminous with the Tuareg Berbers, to about $24^{\circ}$ E. long., and from Fezzan southwards nearly to Lake Tchad, $25^{\circ}$ to $15^{\circ} \mathrm{N}$. lat. Their westernmost settlements are the oases of Agram, Kawar, and Jebado, their northernmost the district of Qatrún within the Fezzan frontier, while south and south-east they merge gradually in the Negroid populations of Kanem, Bornu (Tchad basin), Wadai, and north-west Dar.Fúr. But the heart of the nation is concentrated in the central region of Tibesti or Tu , whenca they take their collective name of Tib-bu or Tu-bu, i.e., "people of Tibesti or Tu." There are two main divisions, - the northern Teda, more or less full-blood Tibbus, and the southern Dasa, more or less mixed or Negroid Tibbus. Somewhat more distantly connected with the same family are the Baele of the eastern and southeastern oases and the Zoghawa (Zaghwa) of Dar-Fúr, making a total population of about 190,000, distributed as follows:-

## 190,000

The Tibbus, who are not expressly meutioned under this name by any ancient or medieval writer, are usually identified with the Garamantes of Herodotus (iv. 183), whose capital was Garama (Edrisi's Germa) in Phazauia (Fezzan), and of whom Ptolemy already spoke cloubtfully as Ethiopians (Negroes?): "(v, $\omega \nu$ סz kal
 them to the Berber connexion, whose fifth great division he deals with under the names of Gumeri (Garamantes?) ami Bardxi or Bardoa, that is, the Teda of the Barlai oasis, Tibesti. ${ }^{2}$ Lastly Barth on linguistic grounds grouped thens with the Kanuri of Bornu, who are undonbtedly Negrocs ; and since his time (1952-53) the Tiblus havo been regarded by most ethologists as a Negro or at least a Negroid people. ${ }^{3}$ Nachtigal, who has studied them more carefully than any modern observer, sees gooll reason to challenge this conclusion (op. cit., ch. vii.) ; and, although his own iufercaces are somewhat varue, he supplies sullicient evidence for a solution of this difficuit etluological problem. There can be no donbt that the Tcla, or true Tibbu, probably identical with the Tedamansii, a branch of the Gammantes, placed by Ptolemy south of the Samamycii in Tripolitana, ${ }^{\text {a }}$ are physically a Hanitic, not a Nogro people, elosely resembing their western Tuareg neigbbours. They are a pure homogeneous raee, who have for ages undergone no perceptible change in their rocky homes, and who are still distinguished by the regular features, loug black ringletty hair, haughty bearing, and ficree expression conmon to so many of the Derber and other Hamitic peoples. Mostly of middle size, they are finely proportioned in all their limbs, except the somewhat too small hauds aud feet, with lighter complecion than that of the southern Dasa, and no trace of the Hat nose, thick tumid lips, or other marked characteristics of the true Negro. "Their women are charming while still in the bloom of youth, unrivalled amongst their sisters of North Africa for their physical beauty, pliant and graceful figures" (keane's Reclus, xi. p. 429). But there has been a gencral displacement of the race southwards ; and, while only a few still liuger in the northern Qatrun and Kufara districts, laree numbers have since medirval times penetrated into the Eanenu, Boruu, Wadai, and Dar-Fír regions of central Sudan. Here they have everywhere merged with tho natives, so that in tho Dasa, Kanembu, Kanuri, Baele, and Zogharra groups the Tibbu
${ }^{1}$ Cf. Kanem-bu $=$ people of Kanem, bu being the plural personal postix answering to the Bantu prefir ba, q00 (Ba-Suto, Wa-Ganda, \&c.), aud to the be of Ful-be $=$ Fuil people or Fulahs from Pul. In Tedlaga the root $t e$ means "rock"; hence Tu-bu= "rock-dweliers," as described by Herodotus and as exnlained in their Arab designation Reshideh, from reshad = rock, bill.

See Vater, Mithridates, ii. p. 45 of Berlin ed. 1812, and Nachtigal, Stihara und Sudan, 1881, ii. p. 189.
s "Urspriinglich ein Negervolk," Lepsius, Nubische Grammatik (Einteilung), Berlin, 1880.

The original inhabitants of the Kufara (Kufra) oasis in south Tripolitana were Teda, some of whom still survive in a small hamlet sonth of Jebel Nari. Since the berinning of the 18 th centary they have been replaced elsewhere in Kufara by the Zwiya Arabs from the Leshkertel oases.
rare presents all the shades of transition between the true Negre and the true Hamite that are also found to prevail between the hlacks of western Sulan and the Tuareg Berbers, and between the Nubas and other eastern Sudan Negroes and tho Hamitic Gallas Somáli, and Bejas.
The same transitional stages are observed in the Tibbu forms of specclı, which constitute a wide-spread linguistic family, whose most archaic and purest branch is the Tedaga of Tibesti (Nachtigal). Tbrongh the southern Dasaga the Tedaga merges in the more highly developed and more recent Kanem, Bornu (Kanuri), Ennedi (Baele), and Dar-Fír (Zogháwa) dialects, which, owing to the abscnee of grammatical gender and some other structural features, are usually classed as Negro languages. But a Negro tongue could not have arisen among the Hamites of the Tibesti uplands, and the explauation of this linguistic difficulty is obviously the same as that of the physical puzzie. The Negro affinities of the southern members of the gronip hare arisen through assimilation with the original and now partly displaced Negro idioms of central Sudan. There remains the final difficulty that Tedaga itself bas absolutely nothing in common with the Berber or any other Hamitic tongue. If therefore it is neither Hamitic nor Negro, the only two stock languages recognized by Lepsius in Africa (op. cit., passim), how is it to be placel? First of all Lepsius's hasty generalization, wholly inconsistent as it is with the conditions occurring in other parts of the continent, must be unhesitatingly rejected. Room having thus been found for other linguistic fainilies, the Tedaga of Tibesti may be readily explained as an independent evolution from a primeval Tibbu-Berber germ, amalogous to other linguistic evolutious in other isolated or inaccessible highland regions, such as the Caucasus, the Pyrenees, and the Anahuac tableland. The common germ, essentially evanescent in its naturc, has long since perished, or can no longer be detected, and the Tibbu and Lierber languages stand side by side as now fundamentally distinct, while the two races still remain physically one. The Tibbus are therefore a llamitic people, who in their secluded rocky homes have bad time to evolve an Independent form of speech, which southwards has become largely assimilated to the Sudanese Negro dialects.

Lying on the track of the great caravan route between Fezzan and Lake Tchad, the Tibbus have always been a predatory race, levying blackmail on the convoys passing through their territory, maintaining intertribal feuds, and carrying on constant warfare with the surrounding Berber and Sudanese populations. This, combined with the serere struggle for existence in their inhospitable upland valleys, has rendered them harsh, greedy, and suspicious, -sentiments reflected in their hard features and stern expression. Till comparatively recent times all were pagans, whence the term Kufra (Kufara), "Land of the Unbeliever," applied by the Arabs to the southern oases of Tripolitana. But for two or three centuries they have been zealous Mohammedans, and some have eveu lately been brought within the influence of the political Senusiya sect (see Tripoli, below). They are a frugal race, living mostly on goat's milk, dates, berries, durrha, and the fruit of the dum-palm; nevertheless they are of robust constitution and remarkably agile. They are also intelligent, crossing the wilderness by a sort of instinct quite unintelligible to the stranger, and in all ordinary transactions they display surprising tact and shrewdness. The tribal organization embraces dardai or headmen, maina or nobles, and the common folk, while the unwritten law of custom rules supreme over all classes. The women, who are orderly and industrious, are well treated, and the polygamy allowed by the law is little practised. But the rendetta is still a social institution.
(А. Н. к.)

TIBER. See Italy, vol. xiii. pp. 43S-439.
TIBERIAS, now TAbariya, a city of Palestine, on the western shore of the Sea of Galilee or Lake of Tiberias, occupies a narrow strio of plain under a hill in a feverish but fertile situation. Recent estimates place the population at from 2000 to 3000 ,-about half the inhabitants being Jews, and many of the latter immigrants from Poland. The streets are indescribably filthy, and an Arab saying is that "the ling of the fleas holds his court at Tiberias." The walls of the town and the castle on the north were in great part ruined by an earthquake in 1837, when half the population perished. The most interesting building
is a very ancient synagogue by the lake, the lower story of which is said to have been unaffected by the earthquake. Outside the town are the plastered monuments ("whited sepulchres ") of Ir. Akiba and Maimonides. Half an hour to the south are the famous hot baths mentioned by Pliny (H.N., จ. 15 [71]). Josephus calls this place Emmaus, which has suggested an identification with Hammoth-dor (Josh. xxi. 32) or Hammon (1 Chron. vi, 76 [61]), names which perhaps point to the existence of thermal springs.
Tiberias was founded by Herod Antipas apparently not beforc 26 A.D., ${ }^{1}$ and so was quite a new place at tho time of our Lord's ministry in Galilee. And, though it became the capital of Galilee, it was at first a purely Greek eity, which accounts for its not appearing among the scenes of the Galilæan ministry. It joined in the war of liberty, but yielded without resistance to Vespasian, and was restored by him to its master Agrippa, on whoso death in 100 it fell directly under Roman rule. The place camo-to bo a grcat seat of Jews and Jewish learning: it was the residence of R. Judah, the ellitor of the Mishnali; and, thongh the schools of Palestino were ultimately overshadowed by thoso of Babylonia, the school of Tiberias was still famous in the time of Jerome. According to Epiphanius; the first Christian chareh was built by Constantine, and frose this timo we hear of bishops of Tiberias. The Arabs took Tiberias in 637; it was restored to Christenclom by Tancred, but yiclded to Saladin in 1187 after tho battle of Ilittín. It was again in Christian hauds from 1240 to 1247. In the middle of the 18th century it was one of the fortresses of the renowned Sheikh Záhir, who for many ycars deled the Turkish power.

TIBERIUS ( 42 b.c. -37 A.d.), emperor of Rome, whose full name was Tiberius Claudius Nero, was born on the Palatine Hill on 16 th November 42 в.c. When he became a member of the imperial family, the court genealogists made him out to be one of the ancient patrician Claudii ; but the pedigree is at some points difficult to trace. His father, who bore the same name, was an officer of Julius Cæsar, who attarwards proposed to confer honours on the assassins, then joined Mark Antony's brother in his mad uttack on Octavian, took refuge with Mark Antony, and returned to Rome when the general amnesty was proclaimed in 39 b.c. Livia, the mother of Tiberius, was also of the Claudian family, out of which her father had passed by sidoption into that of the Livii Drusi. Early in 38 Livia was amicably ceded to Octavian (the future Angustus), and three months after her new marriage Drusus, brother to Tiberius, was born. Livia had no children by Augustus, and therefore devoted all her remarkable gifts to the advancement of her sons. They were treated with high consideration by the emperor, yet Augustus held firmly to the hope that his throne might be filled on his death by one in whose veins ran the 'blood of the Octavii; and not till Tiberiuts was past forty aid there appear any probability that he would ever rise to be emperor. He passed through the list of state offices in the usual princely fashion, beginning with the quæstorship at the age of eighteen, and attaining the consulate for the first time at twentynine. From the great capacity for civil business which he displayed as emperor it may be inferred that he applied himself with determination to learn the business of government.

But from 22 to 6 b.c. and again from 4 to 10 A.D. by far the greater part of Tiberius's life was spent in the camp. His first service was as legionary tribune in one of the desperate and arduous wars which led to peace in the Spanish peninsula through the decimation, or rather the extermination, of the rebellious tribes. In 20 b.c. Augustus scnt Tiberius with an army to seat Tigranes of Armenia on the throne as a Roman vassal. As Tiberius approached the frontier of Armenia, he found its throne racant through the assassination of the king, and Tigranes stepped into his place without a blow being struck. Tiberius cromned Tigranes king with his own hand. Then the Parthian monarch grew alarmed and surrendered "the spoils and the
standards of three Roman armfes." The senate ordered a thanksgiving such as was usually celebrated in honour of a great victory. The following year was passcd by Tiberius as governor of Transalpine Gaul. In the next year (15) he was despatched to aid his brother Drusus in subjugating the Ræti and Vindelici, peoples dwelling in the mountainous region whence the Rhine, Rhonc, and Danube take their rise. ${ }^{2}$ Drusus attacked from the eastern side, while Tiberius operated from the upper waters of the Rhine, and by stern measures the mountaineers were reduced to a state of quietude, and could no longer cut communications between northern Italy and Gaul, nor prosecute their raids in both countrics. In 12 b.c. Agrippa, the great general of Augustus, to whom he may be almost said to have owed his throne, and who was its chief support, died at the age of fifty-one, leaving Jnlia, the emperor's only child, a widow. Agrippina, daughter of Agrippa by an earlier marriage, was wife of Tiberius, and had borne him a son, Drusus, afterwards father of Germanicus. Livia with great difficulty prevailed upon Augustus to replace Agrippa by Tiberius, who was com pelled to exchange Agrippina for Julia, to his bitter grief. During the year of mourning for Agrippa, which delayed his new marriage, Tiberius was occupied with a victorious campaign against the Pannonians, followed by successful expeditions in the three succeeding summers. For his victories in the Danube regions, the emperor conferred on him the distinctions which flowed from a military triumph in republican times (now first separated from the actual triumph), and the enjoyed the "ovation" or lesser form of triumphal entry into the capital. On the death of Drusus in the autumn of 9 в.c. Tiberius, whose reputation had hitherto been eclipscd by that of his brother, stepped into the position of first soldier of the empire. The army, if it did not warmly admire Tiberius, cntertained a loyal confidence in a leader who, as Velleius tells us, always made the safety of his soldiers his first cere. In the campaign of the year after Drusus's death Tiberius traversed all Germany between the Rhine and the Elbe, and met with slight opposition. Pי1t it would be too much to believe the statement of Velleius that "he reduced Germany aimost to the position of a tributary province." He was rewarded with the full triumph, the military titlo of "imperator," and his second consulship, though the opposition of the powerful Sugambri had been only broken by an act of treachery, the guilt of which should perhaps be laid at the door of Augustus. In 7 в. $\dot{c}$. there was another but insiguificant campaign in Germany. Next year Augustus bestowed on his stepson the tribunician authority for five years. Tiberius was thus in the most formal manner associated with the emperor in the conduct of the government on the civil side; but Tacitus (Ann., iii. 56) goes too far when he says that this promotion maraed him out as the heir to the throne.
Tiberius now suddenly begged permission to retire to Rhodes and devote himself to study. He seems to have declined absolutely at the time to state lis reasons for this course, but he obstinately adhered to it, in spite of the tears of Livia and the lamentations of Augustus to the senate that his son had betrayed him. If we may velieve Suetonius, Tiberius determined to commit suicide by abstention from food, and Augustus only gave way when this design was all but accomplished. The departure from Italy was as secret as it could be made. Iears afterwards, when Tiberius broke silerce about his motives, he declared that he had retired in order to allow the young princes, Gaius and Lucius, sons of Julia, a free course. There was perhaps a portion of the truth wrapped up in this declaration. Like Agrippa, who retired to Mjtilene
2. See tho discussion in Schürer, Gesch. d. Jüd. Foolles. ii. 127 sq.
to avoid the young Marcellus, Tiberius had clearly no taste to become the servant of the two children whom Augustus had adopted in their infancy and evidently destined to be joint emperors after his death. But it may well be believed that Tiberius, unlike Agrippa, had no burning ambition to see himself in the place destined for his stepsons; and it may have been in his eyes one of the attractions of exile that it released him from the obligation to aid in carrying out the far-reaching designs which Livia cherished for his sake. But the contemporaries of Tiberius were no dou'd right in believing that the scandal of Julia's life did more than all else to render his position at Rome intolerable. His conduct to her from first to last gives a strong impression of his dignity and self-respect. When at last the emperor's eyes were opencd, and he inflicted severe punishment upon his daughter, her husband, now divorced by the emperor's act, made earnest intercession for her, and did what he could to alleviate her suffering At Rhodes Tiberius lived simply, passing his time mainly in the company of Greek professors, with whom he associated on pretty equal terms. He acquired a very considerable proficiency in the studies of the day, among which must be reckoned astrology. But all his attempts at composition, whether in prose or verse, were laboured and obscure. After five years' absence from Rome, he begged for leave to return ; but the boon was angrily refused, and Livia with difficulty got her son made nominally a legate of Augustus, so as in some degree to veil his disgrace. The next two years were spent in solitude and gloom. Then, on the intercession of Gaius, Augustns allowed Tiberius to come back to Rome, but on the express understanding that he was to hold aloof from all public functions,-an understanding which he thoroughly carried out.

He had scarcely returried before death remored (2 A.D.) Lucius, the younger of the two princes, and a year and a half later Gaius also died. The emperor was thus left with only one remaining male descendant, Agrippa Postumus, youngest son of Julia, and still a boy. Four months after Gaius's death. Augustus adopted Agrippa and at the same time Tiberius. The emperor now indicated clearly his expectation that Tiberius would be his principal successor. The two essential ingredients in the imperial authority-the proconsulare imperium and the tribunicia potestas -were conferred on Tiberius, and not on Agrippa, who was too young to receive them. Tiberius's career as a general now began anew. In two or three safe rather than brilliant campaigns he strengthened immensely the Roman hold on Germany, and established the winter camps of the legions in the interior, away from the Rhine.

In 5 A.D. it became necessary to attack Maroboduus, who by combining peoples formerly lostile to each other had constructed a formidable power, with its centre in Bohemia, menacing the Roman acquisitions in Cermany, Noricum, and Pannonia. The operations were conducted both from the Rhine and from the Danube, Tiberius being in command of the southern army. Just as the decisive engagement was about to take place, Tiberius learned that Pannonia and Dalmatia were aflame with insurrection in his rear. He was therefore forced to conclude peace on terms honourable to Maroboduus. The terror inspired in ltaly by the Pannonian and Dalmatian rebellion under the able chief Bato had had no parallel since the invasion of the Cimbri and Teutones. The four serious campaigns ;which the war cost displayed Tiberius at his best as a general. As he was about to celebrate his well-won triumphs, the terrible catastrophe to Varus and his legions turned the rejoicing into lasting sorrow, and produced a profnund change in the Roman policy towards Germany.

Although Tiberius with his nepherv and adopted son Germanicus made in 9 and 10 A.D. two more marches into the interior of Germany, the Romans never again attempted to bound their domain by the Elbe, but clung to the neighbourhood of the Rhine. Tiberius was thus robbed in great part of the fruit of his campaigns ; but nothing can deprive him of the credit of being a chief founder of the imperial system in the lands of Europe. From the beginning of 11 , when he celebrated a magnificent triumph, to the time of the emperor's death in 14 'Tiberius remained almosi entirely in Italy, and held rather the position of joint emperor than that of expectant heir. Agrippa Postumus had proved his incapacity beyond hope, and had heen banished to a desolate island. In all probability Tiberius was not present when Augustus died, although Livia spread reports (eagerly amplified by Velleius) of an affectionate interview and a lingering farewell.
Tiberius ascended the throne at the age of fifty-six. What struck his contemporaries most was his absolute impenetrability. As was said of a very different man, the poet Gray, "he never spoke out." All his feelings, desires, passions, and ambitions were locked behind an impassable barrier, and had to be interpreted by the very nncertain light of his external acts. It is recorded of him that only once did he as commander take counsel with his officers concerning military operations, ana that was when the destruction of Varus's legions had made it imperatively mecessary not lightly to risk the loss of a single soldier. He was an unparalleled master of passive and silent dissimulation, and the ineritable penalty of his inscrutability was widespread dislike and suspicion. But behind his defences there lay an intellect of high power, cold, clear, and penetrating all disguises. Few have erer possessed such mental vision, and he was probably never deceived either about the weaknesses of others or about his own. For the littleness and servility of public life in regions below the court he entertained a strong contempt. It is a question whether he ever liked or was liked by a single bcing; but he did his duty by those with whom he was connected after a thorough though stern and unlopable fashion. As a general he commanded the full confidence of his soldiers, though he was a severe disciplinarian ; yet the men of his own legions greeted his accession to the throne with a mutiny. Tiberius proved himself capable in every department of the state more by virtue of industry and application than by genius. His mind moved so slowly and he was accustomed to deliberate so long that men sometimes made the mistake of deeming him a weakling and a waverer. He was in reality one of the most tenacious of men. When be had once formed an aim he could wait patiently for years till the favourable moment enabled him to achiere it, and if compelled to yicld ground he never failed to recover it in the end. The key to much of his character lies in the observation that he had in early life set before himself a certain ideal of what a Roman in high position ought to be, and to this ideal he rigidly and religionsly adhered. He may in ene sense be said to have acted a part throughout life, but that part had entered into and interpenetrated his whole nature. His ideal of character wae pretty much that of the two Catos. He practised sternness, silence, simplieity of life, and frugality as he deemed that they had been practised by the Fabricii, the Curii, and the Fabii. That Tiberins's character was stained by vice before he became emperor no one who fairly weighs the records can believe. The persuasion entertained by many at the end of his life that he had been always a monster of wickedness, but had succeeded in concealing the fact till he became emperor, has slightly, but only slightly, discoloured the narratives we possess of his earlier years. The clange which came over him in the last years of his life seems to have been due to a kind of constitutional clouding of the spirits, which made him what the elder Pliny calls him, "the gloomiest of mankind," and disposed him to brood over mysteries and superstitions. As this gloom deepened his will grew weaker, his power tended to fall into the hands of unworthy instruments, terrors closed in around his mind, and his naturally clear vision was perturbed.

The change of masters had been anticipated by the Roman world with apprehension, but it was smooth! $;$ accomplished. Tiberius was already invested with the necessary powers, and it may even be that the senate was not permitted the satisfaction of giving a formal sanction to his accession. Agrippa Postumus was put to death; but Livia may be reasonably regarded as the instigator of this crime. Livia indeed expected to share the imperial authority with her son. At first Tiberius allowed some recognition to the claim; but he soon shook himself

free, and later became estranged from his mother and held no communication with her for years before her death. The history of Tiberius's relations with other members of his family is hardly less miserable. Perhaps with any other commander than Germanicus the dangerous mutiny of the troops on the Rhine which broke out soon after Tiberius's accession would bave ended in a march of the discontented legions upon the capital. The perilous episode of Arminins caused the recall of Germanicus and his despatch to the East on an honourable but compratively inactive mission. The pride and passion of Agrippina, the granddaughter of Augustus and wife of Germanicus, tended to open a breach between lier husband and the emperor. In his Eastern command Germanicus found himself perpetnally watcheri and even violently opposed by Piso, the governor of Syria, who was suspected to have received secret orders from Tiberins. When Germanicus died at Antioch in 19 A.D., the populace of Rome combined with Agrippina in demanding vengeance upou Tiso; and the emperor was forced to disown him. The death of Germanieus was followed four years later by that of Drusus. These two princes had been firm friends, and Livilla, the wife of Drusus, was sister to Germanicus. Years afterwards it was found that Drusus had fallen a victim to the treachery of his wife Livilla, who had joined her ambition to that of the emperor's minister of state Sejanus. When Drusus died, Tiberius nominated two of Agrippina's sons as his heirs. But Sejanus had grown strong by nursing the emperor's suspicions and dislike for the household of Germanicus, and the mother and the princes were imprisoned an a clarge of crime. In his memoirs of his own life Tiberius declared that he killed Sejanus becanse he had discovered that he entertained a mad rage against the sons of Germanicus: But the destruction of Sejanus did not save Agrippina and her two children. The third son, Gaius Cresar (Caligula), lived to become emperor when Tiberius died in 37 .

Throughout his reinn Tiberius strove carnestly to do his duty to the empire at large ; his guiding principle was to maintain with an almost superstitions revercnce the constitutional forms which had been constrieted by Augustus. Only two changes of moment were introdnced. The imperial guard, hitherto only seen in the city in small detachments, was by the advice of Sejanus encamped permanently in full force close to the walls. By this measure the turbulence of the populace was kept in check. The officer in command of the guard became at once the most impertant of the emperor's lieutenants. The other change was the practically complete abolitiou of the old comitia. But the senate was treated with an almost liypocritical deference, and a pedantically precise compliance with the old republican forms was obscrved towards the senatorial magistrates. The care expended by Tiberius on the provinces was unremitting. His favonrite maxim was that a good shepherd shonld shear the flock and not flay it. When he died he left the subject peoples of the empire in a condition of prosperity such as they had never known before and never knew again. Soldiers, governors, ant oflicials of all kinds wero kept in wholesome dread of vengeance if they oppressed those beneath them or enconraged irregularity of any kind. Strict economy permitted light tazation and enabled the cmperor to show generosity in periods of exceptional distress. Public security both in Italy and abroad was maintained by a strong hand, and commerce was stimnlated by the improvement of communications. Jurisdiction both within and without the capital wis on the whole exurciced with steadiness and equity, and the laws of tho empire mere at many points improved. The social and moral reforms of Angnstus were upheld and carried further. Such risings against the emperor's authority as occurred within the lionan domain wero put down with no great difficulty. The foreign or rather the frontier policy was a policy of peace, and it
was pursucd with considerable success. With few exceptions the duties of the Roman forces on the bordera were confined to watch. ing the peoples on the other side while they destroyed each other. On the Rhine, at least, masterly iuactivity achieved tranquillity which lested for a long period.

The disrepute which attaches to the reign of Tiberius has come mainly from three or four sources, from the lamentable story of the imperial household, from the tales of hideous debauchery practised in deep retirement at Caprea during the last eleven years of the emperor's life, from the tyrany which Scjanus was permitted to wield in his master's name, and from the political prosecntions and executions whicla Tiberius encouraged, more by silent compliance than by open incitement. The otorica of immorality are recorded chiefly by Snetonius, who has evilently ueed a poisoned sourcc, possibly the memoirs of the younger Agrippina, the mother of Nero. Tiberius loved to shroud himsclf in mystery, and such stories are probably the result of unfriendly attempts to uplift the darkness. If history ventures to doubt the blackness of Theodora, that of Tiberins grows cootinnally lighter noder tho investigations of criticism. Suctomius makes tho cmperor's condition to have been one of mania, issuing frequently in the abandomment of all moral restraint. But in that case the atathority of Tiberius, which was as firnly upheld during the years spent at Capreæ as it had been carlier, sust have fallen to pieces and come to an end. With respect to Sejanus it is jupossible to acquit Tiberius of blame. If he was deceived in his favourite he must have been willing to be deccived. He conferred on Sejanus a position as great as had been held by Agrippa during the reign of Augustus, and the minister was actually, and all but formally, joint eroperor. Of the administrative ability of Sejanus there can be no question; but the charm aud secret of his power lay in the use he made of those apprehensions of personal danger which seem never to have been absent from his master's mind. The growth of "delation," the darkest shadow that lies on the reign, was in part a consequence of the supremacy and the arts of Sejanns. Historians of Rome in ancient times remembered Tiberius chiefly as the sovereign under whose rule prosecutions for treason on slight pretexts first became rife, and the hateful race of informers was first allowed to fatten on the gains of judicial murder. Augustus had allowed considerable licence of speech and writing against himself, and had made no attempt to set up a doctrine of constructive treason. But the history of the state trials of Tiberius's reign shJws conclasively that the straining of the law proceeded in the first instance from the eager flattery of tho senate, was in the earlier days checked and controlled to a great extent by the emperor, and was by him acquiesced in after a timo with a sort of contemptuous indifference, till he developed, under the influence of his fears, a readiness to shed blood.
The principal aut orities for the reign of Tiberius are Tacitos and Snctonius. The Anncls of Tacitus were not pnblished till pearly eigbty years after the death of Tiberius. He rarely quntes an suthority by vame. In all probability cetent he suabied himself of oral tradition; and of archives and original records he made some, but comparatively little, use. In bis history of Tiberins two influences were st work, in simost cqual strength: on the one hand he strives continuslly sfter fairmess; on the other the bias of a man steeped in senatorial traditions forbids hirn to attain it. Tacitus is certainly not among the bistorians in whom tur confidence grows by repeated reading. Sactonius was n hiographer rather than an historisn, and the sncient biographer was even less given to exhaustive inquiry than the ancient historian; moreover Suetonius was not gifted with great critieal racalty, thongh he told the trath so far as he could see it. His Lives of the Turelze Cosars was written nearly at the time when Tacitus was conposing the Annals, bnt was poblished a little inter. Vellcins Patcrealus is hy far the oldest suthority for any part of Tiberius's life. He had been an officer under Tiberius, and bo cnlogizes his old gencral enthusiastically,-fceling it necessary, howevcr, to do less than justice to the Rehicvements of Germanicus. To Velleius all defenders of Tiberius have eazerly appealed. In truth it is his silence alone which affords any external aid in repelling the charges of Tacitus and Scetonios, and the fact that Velleius puhlished his work in the lifetimo of his master deprives that sileoce of ita value. The eulogy of Sejanus whieh is linked with that of Tiberics must needs shale faith in the scrupulousness of the anthor. It is still douhtful whether Dio Cassius (whose History ended with the year 229) in his narrative of the reign of Tiberius is to shy-great extent independent nf Tacitus. In recent times a considerable rass of inscriptions has added to onr knowledge of the almintistration of this emperor. The chier accanat of Tiberius in Finglish is that contained in Dean Merivale's History of the Romans under the Empire Mr Bees,y has written on interesting defence of him in his Catiline, Clodius, and Tiberius. Tho best recent history of this period is Hermann Schiller's Ge schichte der römischen Kaisereeit (Gintha, 1883). Numerong manngraphs relating of the imperial sdministration of thic provinces by Tiberios have heen treatod by Mommsen in the firth volume of his IVistory of Rome, laanslated intn Iengich under the title of The Romax Provinces from Augustus so Iriodetian. ## TIBET

TIBET, ${ }^{1}$ Thibet, or Tübet, an extensive and highly elevated region in the heart of Asia, comprising tablelands ranging from 10,000 to 17,600 feet aboye sea-

[^136]level. The Himalayan mountain ranges and the transverse ranges of upper Yun-nan constitute the southern scarp
itself, though only found there in an attenusted form. The following forms are also met with-in Chinese ennals $T^{\prime \prime} 1$ b-bat (5th cont) and
the Yun-ling Doountains of China the eastern scarp, and the Kuen-Lun (Kiun-Lun) ranges the northern scarp, towards Turkestan and Mongolia; on the west, where it narrows considerably, it merges into the Pamir tablelands. Its extreme length from east to west exceeds 1600 miles ; its breadth from north to south ranges from 150 niles in the rest to an average of 500 in central Tibet and a maximum of 700 in the east. The area of Tibet exceeds 200,0n0 square miles.

Much of Tibet is wholly abandoned to wild animals, and much is uncultivable and occupied only by various wandering tribes of nomads. The centres of the settled and
Tie-bu- ${ }^{\prime}$, T'u-bo-te (11th cant.) ; in Mongolian, Tiubet, Toost; in Arabic Tubset; Rabbi Benjamin (1165), Thibet; J. de Plano Carpioi (1247), Thabet; Rubruquis (1253), Marco Polo (1298), Tcbet; Ibn Batuta (1340), Thrbat ; Ibo Hankal (978), Al Biruai (1020), Odoric of Pordenona (c. 1328), Orazio della Penna (1730), Tibet. A 'libetan, arriving at Darchiendo from Lhasa, states that he comes from Teu-peu, meaniog High or Upper Tibet,-Stod-Bod in coutradistinction to SwerBod of Lower Tibet. The former expression, were it eupported by any ancient authority, might be regarded as tha etymological origin of "Tibet"; historical svidence, howerer, seems to iadicato another eource. The state of which Lhása is the capital is often called "Deba jang" or "land of the Dabas" (sdepa ljongs). The title of the tepa lama is familiar. Chiaesa records say that tha king of the coustry is called diba ; and Joh. Gruaber ioforma us that the king is styled devn or teva, and ia descensled from an ancient race of Tangut Tatars. Tha Chiness anoals of the T'ang dynasty record that Fanni Tubat, the historical founder of a state in the east of Tibet in 433, gave to his fominioa his surname of Tulat. This was a famons family name proper to a日versl Tatar dynasties which ruled io tha north aod northwest of China, and lelonged to the Sien-pi race, in the laagaage_ of which tubat meat "a coverlet." An appended logend atated that the fifth ancestor of Liluku, the founder of the couthern Liang dynasty and family and father of Fanai, derived the aurname of Tubat, which becams that of his family, from the fact that he was lorn in a coverlet while his mother Huyksha was aleepiog. However worthleas the legend, thers is complete aimilarity between the oams of the Tubat or Tobat Tatars and that of Tibet, and we may with considarable gafety take the latter word as derived from the former, the fact beiag that it was and is still extausively used in the aease of "great," "chief," among the Tatar tribea. Tibet, however, is not the name by which the modern Tibetans designats themselves and their country. Bod-pa, "s man of Bod," Bod-yul, "country of Bod," are tha expressions in curreat use; but what "Bod" means is nacertain. Hodgson has maintained that before the airival of Indirn teschers the peopls had no nama for themsalves or their country, and the presant Boil comes from tha Sanskrit $B^{\prime}$ ot-an opiuion which, though inconaistent With the evidence collected about Tubat, is rather confirmed by a legeadary account. According to that acconnt, the country, which wes occupied by a race of mon aot yet emerged from primitive barbariam, was originally called Bod-rgyal, i.e., "Bod'e victory." The pecondary name then might be in its simple form Bod, a Buddhist hppellative auggested by the Sanskrit homonyme of -bat or $-b^{\prime} a t$, part of The name brought in by tha Tatar conquerors. Anyhow there is no occesion for the othar otymologies suggested, such as that from Euddba, or that proposed by Schiefner ( $t$ 'ub und $p^{\prime}$ od, both meaning "able," "capsble"). An old name for Tibet in the native books is GJong-mar'-gyi-yul, "country of the red-faced men," во called apparently from the aucient national custom of painting the face red, a practica which was forbidden by Kiog Srong-btsan at the instance of his wife Wan cheog, a Chisess priacess. Among the Mongols Tibet was eimply called Barontala (the "right side"), in contradis. tinction to Dröntala (the "left side"), which was anoug them the name of Mlongolia. In China, during the Yuan or Mongol dynasty, it was called Wei-gze-Tsang, in which we recogniza the nemes of the two ceatral provinces of $\mathrm{DbUa}(\mathrm{U})$ aad Tsaog. Khachi, Khache, Khaschi, Fashi, are varions forms of a term which is often mat with in books as applied to a part of the platears of Tibet, and which cannot vithout difficulty be iclentified in positiva gaography. Wa taks it to bs aimply a revival of tha old name of tha 'r'angut or Hia kingdom, the Khashi or Khoshi of the Moogols (982-1227), on the north-east of Tibet, on the west of the Hoaug ho, whence Ho-ai in Chinese history, and perhaps the origio of the nama. In the 11 th century Milaraspa mede use of the term K'aché for Mussulman; Huc and Gabet hava reported the usa of the cause expression io the ceotral provinces with a similar accaptation. A popular ety $10 \operatorname{logy}$ has coafounded it with the words K'a-ché for K'a-chen, literally " lig nouth," which is now supposed to be its meaning when applied to Mohammedaos. Kashair is also cslled K'a ché, from tha fact that it is under Mohammedan rule, beys Jaeschke; but, as this has been the case only since 1605, thera is grest probability that here tha term ia simply used as as abridged form of Kashmir.
(T. DE L.)
agricultural population lie to the south, iu a region named Bod-yul (meaning Bod-land) by the iulabitants, who are called Bod-pas ; by the Hindus it is calied Bhot, and by the Chinese Si-tsang. The greater portion of this regiou is governed, under the supremacy of China, by lamas and syalpos, eccle.iastical and lay Borl-pas, the principal seat of gorerument being at Lhása, the chief city of Bod-yul. Portious are subject to Kashmir and Nepal, and to independent chieftains, and portions are directly subject to China; but the Bod-pa ethnological element prevails nore or lcss throughout.

Tibet was long a terra incognita to Europeans. It is difficult of access on all sides, and everywhere difficult to traverse. Its great eleration causes the climate to be rather arctic than trojpical, so that there is no gradual blending of the climates aud plysical conditions of India and Tibet, such as would tend to promote intcrcourse between the inhabitants of these neighbouring regions; on the contrary, there are sharp lines of demarcation, in a nountain barrier which is scalable at only a few points and in the social aspects and conditions of life on either side. No great armies hare ever cros ed Tibet to invade India; even those of Jenghiz Klan took the circuitous route via Bokhara and Afghanistan, not the direct route from Mongolia across Tibet. Thus it was no easy matter Earoo for the early European travellers to find their way into perns and explore Tibet. Friar Odoric of Pordenone is sup- 1 trave
posed to have reached Lhasa circ. 1328 , travelling from Cathay; three certuries afterrards the Jesuit Antouio Andrada, travelling from India, entered Tibet on the west, in the Manasarowar Lake region, and made his way across to Tangut and north-western China; in 1661 Fathers Grueber and D'Orville travelled from Peking via Tangut to Lhassa, and thence through Nepal to India; and during the first half of the 18 th century various Capuchin friars appear to have passed freely between Delhi and Zhása, by way either of Nepal or Kashmir. The Airst Englishman to enter Tibet was George Bogle, iu 1774, on an embassy from Warren Hastings to the tashi (tcshu) lama of Shigatze. In 1811 Thomas Manning mado his way from India to Jhása; he is the only Englishman Who has succeeded in reaching the sacred city, and he had soon to leave it. During the 19 th century Europeans have been systematicaliy prevented from entering the country or speedily expelled if found in it. In 1844-46 the French missionazies Huc and Gabet made their way to Lhása from China, but were soon deported back aganIn 1866 the Abbe Dergodins travelled through portio of eastern Tibet and reached Chiamdo (in iilián.), butit was prevented from approaching any closer to Lhása. Last of all the Russian Colonel Prejevalsky succeeded in exploring portions of northern Tibet, but was unable to penetrate southwards into Bodland.

Geographers have long been in possession of maps of Tihet, compiled from surveys executed early in the 18 th century loy lamas, under instructions from the Jesuit fathers who made a gurvey of China for the emperor Kang-he. The lamas' naps were the loasis of D'Anville's Allas, published in 1733 , and wers employed Jy Klaproth in constructing his map of Asia in 1824 ; but they are generally very meagre, only reliabla in the vicinity-of the principal roads, and occasionally very misleading. They must have licen compiled at hest from rude estimates of distance and direction, and in aoms parts from mere hearsay or conjecturc. They ars, however, supposed to have been hased on astronomical determinations of position; but this is improhable, for the latiturles of such important places as Lhása and Pátang are 30 to 60 niles in error. Our knowledge of the geography of the country is complete only for portions of western Tibet, which are aubject to the maharajah of Kashmir, and hava been regnlarly surveyed. This knowlerlge has been largely supplemented during the last twenty jears by the work of natives of India-the so-called trans. Himelayan cxjlorers of the Iadian Survey, notably Pandits Nain Singlı and Krislun ( $A-K$ ) - Who have been traincd to calry route surveys through regions which they may, but Europeaus may not, euter.

Tibet is commonly divided into two parts called Great and Little Tibet, the former Iying between $102^{\circ}$ and $79^{\circ}$ Es long., the latter between $79^{\circ}$ and $74^{\circ}$. Great Tibet is broadly divisible into a western region, in which there is a considerable preponderance of tableland over hill and mountain and of lake basins over river basins, and an eastern region, in which the reverse holds good and the surface of the ground is so greatly corrugated that the natives call it rong-rtsub, "a rough country full of ravines." In Little Tibet the Himalayas converge towards the KuenLun, and the breadth of the plateau meridionally diminishes to less than a fourth of what it attains in Great Tibet. The entire region may be broadly divided into three iongitudinal zones, increasing in elevation from south to north, viz., a southern zone, which contains the centres of the settled and agricultural population; a middle zone, comprising the pasture lands of the Bod-pa nomads; and a northern zone, for the most part abandoned to wild animals, but partly occupied by tribes of Turkic and Mongolian nomads. The southera and middle zones comprise Bodland proper and are divided into four provinces, viz., Nári (Ngari, Ari) on the west, between $74^{\circ}$ and $85^{\circ}$ E. long.; Khám, otherwise Do-Khám, on the east, between $92^{\circ} 30^{\prime}$ and $102^{\circ}$; and in the centre, Tsáng, adjoining Nári, and U or Us (otherwise Y or Wei), adjoining Khám; the two central provinces are commonly called U-tsáng, as one. A considerable belt of the middle zone is known as the Hor country. The middle and northern zones embrace the greater portion of the region known to Bod-pas as the Cháng-táng (Byán-táng, Ján-táng) or "Northern Plain," which, however, protrudes southwards and abuts upon the Himalayas from $80^{\circ}$ to $85^{\circ} \mathrm{E}$. long., thus interposing a nomad population between the settled populations to the east and the west. The northern zone merges on the west into the Pamir tablelands.

The tableland of Tibet attains its maximum elevation, 17,600 feet above sea-level, on the 79 th meridian, in the Lingzi-tang plateau of the northern zone; thence there is a gradual fall east, west, and south, the plateau level on the 97 th meridian being about 13,500 feet in the northern zone and 10,000 in the southern." Between the 82 d and 90 th meridians the northern zone is known only from the maps of the lamas' surver, which indicate a surface slightly corrugated with hills and containing numerous lakes, some of great size, but no rivers of importance.

The river basins in this zone apparently commence to the east of the 90 th meridian and from them issue the Di-chu ${ }^{1}$ (Chinese Kin-sha-kiang), whose headwaters unite at Di-chu Rab-dun, in $94^{\circ} 30^{\prime}$ E. long.; the Chiamdo river or Lan-tsan-kiang; the Hoang-ho, in about $96^{\circ}$, which fows through the Kiaring and Orin lakes (13,500 feet above the sea and each exceeding 80 miles in circumference) and passes northrards out of Tibet through the Kuen-Lun; and the Ja-chu or Yalung-kiang, also in about $90^{\circ}$ E. long., which flows southwards through eastern Tibet. In the middle zone a system of lakes on the 90th meridian gives birth to the Nag-chu, which becomes the Sok-ctru and lower down the Giama-Nu-chu-known to the Cbinese as the Lu-tse-kiang-and, trending southwards, winds round tho eastern extremity of the Himalayas. In the lorer zone the Indus and the Yaro-tsanpo rise on either side of the 82 d meridian and flow in opposite directions parallel to the Himalayas, and then, passing through openings in those mountains twenty degrees apart in longitude, enter India on the extreme east and mest. The Lohit Brahmaputra rises behind the eastern Himalayas and flows

[^137]south-westwards into India. The Giama-Nu-chu, Chiam-do-chu, and Di-chu flow southwards into Burma and Yunnan, through closely contiguous valleys beiween a system of meridional ranges which project as spurs from the Tibetrn plateau. Test of $82^{\circ}$ a single water-parting between north and south-that of the Mus-tagh and Karakoram, some= times called the Turkic-separates Indo-Tibetan from Turko-Tibetan waters; east of that meridian there are longitudinal water-partings between the basins of the several rivers already mentioned.

The Himalayan Mountains, which constitute so considerable a portion of the southern scarp of Tibet, consist of a succession of longitudinal chains, running in general parallel to each other along the glacis of the plateau. The: 9 chains are much higher on their southern than on their northern faces, and are connected in some parts by tracsserse ridges, but in other parts are broken and interruptel by fissures and valleys. The principal chain is the one of high peaks covered with perpetual snow which culmizates in Mont Everest, 29,000 feet above the sea. This chain may be regarded as the geographical boundary between Tibet and India. In some parts it is the water-parting; but at the several points where its continuity is broken the water-parting recedes to an inner chain on the plateau, and basins aro formed between the two chains, the waters of which descend in rivers to the plains of India. The plateau is a region of plains and wide open valleys of little depth; the scarp is a region of mountains and narrow confined valleys of great depth. The narrow valleys of the scarp, being lower, are warmer and more farourably adapted for cultivation than the broad valleys of the plateau.

Higher than these last are the plains of the Cháng-táng, Chang* which are, for the most part, too high and cold for any tíng but pastoral uses. All such tracts the inhabitants call rand chang-tang, though the werd strictly signifies "the Northern Plain"; and all tracts which contain valleys warm enough for cultivation they call rong (signifying a ravine or narrow valley or cleft in a hill), but more particularly the lower and warmer valleys which produce crops twice in the fear; the rord is also commonly employed to indicate a tarm country. The alluvial beds in the valleys are composed of the debris of the surrounding rocks, laid out in horizontal deposits, which in course of time have become furrowed into gigantic ravines with a succession of narrow terraces in steps on each flank. It is on the existing lower allurial beds and the remnants of higher beds that cultivation is carried on, in plote which are usually well watered and very fertile. The sharp needle-peaks, which are highest of all and bare of soil, but covered with perpetual snow, are met with most frequently in tracts of rong, and the rounded hills coated with grass to altitudes sometimes exceeding 16,000 feet in tracts of chang-ting. The forest-clad mountain slopes which are occasionally met with occur chiefly in the rong. The general direction of the hill and mountaiu chains is east and west, but north-west and south-east in we stern Tibet, north-east and south-west in the province of $U$, and north and south in eastern Tibet. The peaks rise in mans parts to between 20,000 and 25,000 feet-in the Mus lagh range to 28,250 -above the sea-level, but rarely to more than 10,000 , and often to not more than a few hundred, feet above the general level of the plateaus from which they spring. The priscipal water-partings in some dis tricts follow the crests of low ridges and gentle undulations which are of barely appreciable elevation abore the surface of the ground.

Nári, the western province of Bodland, is divided into the sub-provinces of Ladak and Balti on the west, between $75^{\circ}$ and $79^{\circ}$ E. long., now a part of Kashmir : Khursum.
between $79^{\circ}$ and $82^{\circ}$, conterminous with the Himalayan provinces of British India; and Mang-yul or Dokthol, between $82^{\circ}$ and $87^{\circ}$, conterminons with western Nepal. The last two are under the government of Lhása. Western Nári is bounded on the sonth by that portion of the Himalayan chain of snow-peaks which stretches in almost a direct line north-west from the Manasarowar Lake region to the Nanga Parbat peak ( 26,620 feet), at first facing the plains of the Punjab, then passing north of Kashmir. The provinces appertaining to Kashmir have already been described in the article Ladak and Balti (q.v.). The Karakoram chain, although its principal pass is 18,500 feet above eea-level, nowhere rises very high above the tableland. It constitutes a portion of the water-parting between India and Turkestan, separating the Lingzi-tang plateau, the highest in all Tibet, from the broad and open valley of Chang-chenmo; it has been traced eastwards to the meridian of $82^{\circ}$, but no farther.

Khorsum is mainly chang-táng, but has some upland cultivation round the capital, Rudok, and in the Gartang valley, and lowland cultivation in the rong of the great plateau ( 120 miles long by 15 to 60 broad) of Guge or Hundes, the upper basiu of the Sutlej. In this province lie, within the small area of a square degiee, the sources of four great rivers-the Indus, the Yaro-tsanpo, the Sullej, and the Karnali-the sacred lakes of Manasarowar and Rakas 'l'al, 15,300 feet above the sea and each 50 miles in circuruference, and two famous mountains, Nimo Namling ( 25,360 feet) to the south, believed by the Tibetans to be their lighest mountain, and to the north the sacred Kailas Cangri (21,830 feet), the Kantysee of the lamas' survey. From the Kailas Gangri a chain of hills stretches to the north-west, separating the upper basins of the Sutiej and the Indus; to the north of that another chain, running east and west, culminates in the Aling Gangıi peaks ( 24,000 feet) and separates the Indus basiu from the Pangong Lake ( 100 miles long, from 3 to 7 broad, and 14,000 feet in altitude), near which Rudok is sitnated. Roads pass from Ladak to Lhása through the plains of Rawang and Sarthol, the gold-fields of Thok Jalung and Thok Daurakpa, and the Hor country.

Mang-yul, or Dokthol, contaius the upper basins of the Yaro-tsanpo-here known as the Nári-chu-aud its principal affluents, the Cha-chu and the Charta-tsanpo. The province is wholly Chang-t负g and its population uomadic, the capital, Sarka Jong, being merely a good-sized village.

The common border of the provinces of Nári and Tsang falls nearly on the 87 th meridian. Here the Cháng-tang recedes from the Himalayas, and its southern scarp, trending north-east, forms the upper fringe of tracts appertaining to U-tsang that are capable of producing a single crop annually. This region constitutes the most important portion of the basin of the Yaro-tsanpo, for it contains the chief towns and monasteries of the settled Bod-pas. Cultivation commences on a slight scale where the river enters Tsang on the west. The first town of any importance is Junglache ( 13,600 feet), on the right bank, with a large monastery. Thence goods may be taken down the river for some distance by boats of leather over a wooden framework, light enough to be curried back overland. Eighty-five miles lower down, also on the right bank, are the city of Shigatze or Digarchi ( 12,000 feet) and the great monastery of Tashilunpo (Teshu-Lumbo), the residence of the "tashi lama," one of two spiritual incarnations of equal rank, of which the other, the "dalai lama," resides at Lhása; the monastery contains 3500 lamas. Between Junglache and Shigatze the river receives the Raka-tsanpo from thë changatíng on its left, and the Sakja-Jong-chu from that on its right. The latter descends from the Himalayan water-parting past the monastery of Saky\&
( 13,900 feet), which is surrounded by cultration and governed by a chief lama called the "sákya-gángma," who is held in considerable reverence as an avatar. At Shigatze the Yaro-tsanpo receives the Pena-Nyang-chu from a valley to the south-east which contains the towns of Pena-jong and Gyangtse-jong ( 13,000 feet), and numerous monasteries and villages, and through which passes the main road from Bhutan to Shigatze travelled by Bogle in 1774. A little lower down it receives from the left the Shiang-chu, which rises in the Ninchen-thangla range and flows past the town of Namling (12,200 feet, 200 houses), where sheep are employed as baggage animals, the country being too cold for donkeys and the roads too stony for jaks. Then at Shangpa (Jagsa) it receives trom the right the Rong-chu from the famous Yamdok-tso or Scorpion Lake to the sonth-east. This lake is 120 miles in circumference, $\mathbf{1 3}, 800$ feet above the sea, and is surrounded by villages and monasteries; its scorpion claws embrace a peninsula which rises above 16,000 feet, is grassgrown to its summit, and embosoms the Damo-tso, a sacred lake, 24 miles round and 500 feet above the main lake, which is expected some day to rise and destroy all animal life by a flood. Here the roans from India vir Bhatan and from Shigatze to Lhás̊ converge, and after crossing the Khamba-lá (15,000 feet) strike the Yaro-tsanpo at Chiak-jam-chori ( = "the iron bridge at the rocky bank"). The river in its course from Shangpa down to this point is unnavigable, passing over rapids between precipitous bills; there is no road on either bank. A little below the bridge it receives from the left the Ki-chn, the river of Lhdsa (q.v.), the chief city of Borllanc. Below the junction of the Ki-chu the Yaro-tsanpo cerstinues its castward course through a broad and well-peopled valley. It is crossed at Chetang by a ferry ou the road from Lhása to Tawang in Bhutan wiu the Yarlvag-chu valley (right bank), which is said to be the pleasaratesl and most populous in Tibet; fruits grow in profusion at its lower extremity and the hills are forest-clad. At Chetang the river is 350 yards broad, 20 feet derp, and 11,000 feet alove the sea, and has a sluggish current. On crossing the meridian of $92^{\circ} 30^{\prime}$ E. it passes out of the province of U into that of Khám and enters its eastern basin. After traversing the Eastern Kongbo (Khombo) district, it trends north-east for 100 basin of miles-in general parallel with the contiguous Kongho ranges and the distant Nincheu-thangla-and on reaching $94^{\circ}$ turns abruptly to the south. Its course has been explored 20 miles bolow the bend, to Gya-la-Sindong ( 8000 feet), but no farther. The basin is bounded on the north and east by the continuous plateaus of Lharugo, Arig, Pemba and Lhojong, Pasku, Dainsi, and Nagong, and on the south by the inner. Himalayan water-parting. Numerous tributaries join the river from both sides, but little is known of them. Those from Kongbo, Lharugo, and Arig are said to unite and join it a little above Gya-la-Sindong, and one from Nagong a little below. This last rises near the Ata-Gang-la, a pass over the Himalayas between the Nagong plateau and the Zayul district, and is said to be on the direct road from Lhása to Zayul via Gya-la-Sindong; it is probahly joined by the Kenpu river of the lamas' survey, which rises in the southern scarp of the I'emba-Lhojong plateau and probably flows through the Potod and Pomed districts of Khám. The independent Lhoyul country lies to the south of the Nagong-chu (lit. "black water"). The region is generally of a comparatively low elevation, is said to have much more of rong than of cháng-táng, and probably contains much more forest and luxuriant vegetation than any other part of Tibet north of the Himalayas.

The lawer course of the Saro-tsanpo has long been a matter of controversy between English and French geographera: the former
have maintained, in accordance with information from natives of Tibet and Assam, that it enters the Assam valley and is the principal source of the Brahmaputra riser, of which the Lohit Brahmaputra river is the eastern source; the latter have maintained, on the authority of Chinese geographers, that it flows into Burma and is the principal source of the Iramadi river. But now its eastern basin has been explored, and the Lohit Brahmaputra has been found to have its sources in a rance bordering the Giama-Nu-chu; the Yaro-tsampo must therefore mecessarily pass into Assam, and measurements of the discharges of the principal rivers entering Assam from the nortle conclusivcly identify it with the Dihong. That river, which receives the Lohit Brahmaputra a little below Sadiya ( 450 feet ahove the sea), has been explored upwards into the Himalayas to a point within 100 miles of Gya-la-Sindong; but as yet nothing is known of the connecting channel, excent that it must hare a fall of about 7000 fect, or as much as the entire fall of the Yaro-tsanpo in its upper course of 900 miles.

The Tibetan basins to the south of the Taro-tsanpo which are included between the Himalayan chains of water-parting and of high snow-peaks are the Bheri, the Kali Gandak, and the Buria Gandak, subject to Nepal ; then the following, which are subject to Lhása:-(I) the Tirsuli Gandak, on the direct road from Kathmandu to Dokthol via Kirong (9700 feet); (2) the Bhotia Kosi, through which the road from Kathmandu to Shigatze passes via Nilam Jong or Kuti (13,900 feet) into (3) the Arun-Barun basin, 120 miles by 30 , which embraces the Dingri Maidan and Shikar Jong plateaus and the great Chomto Dong Lake (14,700 feet); this same road, after passing Sikkim and western Bhutan, where the chain of high snow-peaks, including Kanchinjinga ( 27,815 feet), is the water-parting, traverses (4) the Lhobra, (5) the Cha-yul, and (6) the Mon-yul basins, which are also crossed by the road between Chetang and Tawang. East of the 93 d meridian the height of the peaks of the outer Himalayan chain falls to about: 15,000 feet; the inner line of water-parting recedes northwards, and with it the boundary of Lhása rule. The included basins are occupied by independent semi-sarage tribes,Miris, Aborz, Mishmis, \&c. ; but about the 97 th meridian Lhása rule again asserts itself. The mountains again rise to a great height in the Nechin-Gangra range, the easternmost Himalaya, which terminates about the 98 th meridian in spurs thrown off to the north and south, parting the waters of tho Lohit Brahmaputra and the Giama-Nu-chu. The southern spur bends westwards in horse-shoe fashion round the Zayul basin, and then merges into the range which separates upper Assam and eastern Bengal from Burma. Lhésa rule extends over Zayul, and for a short distance down the ralley of the Giama-Nu-chu, embracing some tracts which lie outside the geographical limits of Tibet, as lower Zayul, where the elevation falls below 4000 fect and the climate is so warm that criminals are sent there from Lhása as a punishment.
The Giama-Nu-chu is called hy the Chinese the Lu-kiang or Lu-tsc-kiang. Its course is known down to obout $27^{\circ} 90^{\circ} \mathrm{N}$. lat., a few marches below Bonga, on the left bank, where the Abbé Desgodins establiglacd a mission etation temporerily; but mothing certain is known of its lower course. It is generally believed to be identical with the Salwin river, which the Chinese also call the Lu-kiang; but the sinilarity of name is not conclusive of identity, for the Lin comntry covers a large area, and its neme may be given to e sccond river rising among the Ly-su and Lu-tse tribes to the south. Nothing certain is knowin of the Salwin ehore $25^{\circ} \mathrm{N}$. lat. ; where it is crossed on the road from Tali-fu to Bano, it is almost certainly of too small a volume to hare its sources farther off than, say, 250 miles in the southern Tibetan scarp, end not far away in the heart of Tibet. There is a considerable probability that the Giama-Nuclill is the cource of the Irarredi, and thus thet Chinese geogrephers have been right in assigning a Tibetan origin to that river, though wrong in identifying it with the laro-tsanpo.

The Daynl plateau, with the lofty mountams of Kokarpo to tle north near Dayul ( 11,450 feet) and Dokela to the sontlı meny Bonga, lies betreen the Giama Nu-chu and the Cliando or Lan-tsan-kiang; the latter river is believed to become the Mckang of Cambodia. The Ou-kio river of the dul心 Descrodins rises in an important valley between
the Giama-Nu and Chiamdo rivers and, flowing past Dayul, joins the former above Bonga. Next comes the Makhani plateau, between the Chiamdo and the Di-chu, of whicls the chief town (II,900 fect) is called Gartok by Tibetans and Kiangka by Chinese. East of the Di-chu or Kin-shikiang lie the plateaus of Batang, Litang, and Darchendo, which, though geographically and ethnologically Tibetan, are directly under China. The last two are separated by the Ja-chu, which is known as the Yalung in its southerly course to join the Kin-sha; the united streans flow east wards throngh China as the Yang-tse-kiang or Blue river.

The western Hor country lies to the north, on the direct route between Ladak and Lhása; it is a region of extensive grassy plains and numerous lakes, some of great size, ar.d occasional hill ranges, which, though often snow-covered, are of no great elevation above the tableland. It is inhabited by nomads-Cláng-pas of local origin and Khánpas from the east-and occasional communities of golddiggers and of traders in salt and borax, which are plentifully found on the margins of the lakes. Thok Daurakpa ( 15,300 feet), the centre of a large gold-field, is the chief settlement. Within a remarkable basin, surrounded by high hills and enclosing the great Dangra-lim Lake and a cluster of small but well-built villages, Ombo, are lands which produce a profusion of barley at an altitude of 15,200 feet, - a unique instance of cultivation at so great a height, no other cultivation occurring within 300 miles on either side. The Tengri-nur or Nam-cho, 150 miles in circunference and 15,350 fect above the sas, lies to the north-west oi Lhása; and beyond it there is said to be a still larger lake, the Chargut-cho, and numerous smaller lakes, to one or more of which the sources of the Giama-Nu-chu may perhaps be traced, though as a rule the lakes in this region have no outlet. The Ninchen-thangla range lies betreen the Tengri-nur and Lhasa; it is considered by some writers to rival the Himalayas, but is probably not more than 300 miles long nor anywhere higher than 24,000 feet above the sea.

The Cláng-tang attaine its greatest width (over 500 The miles) on the meridian of $55^{\circ}$; north of Lhása it contracts Ching to 400 miles, and is probably narrowest ( 140 miles) on the meridian of $97^{\circ}$. It is covered to a very considerable extent $t_{2}$ probally everywhere below 16,000 feet, with a succulent grass, which forms from May to August the softest of green carpets and furnishes an abundance of grcen pasture. Willow and tamarisk are occasionally met with on the margins of the lakes; but as a rule there is little mood or scrub of any kind, and cultivation only in rery exceptional localities, such as Ombo. Myriads of wild animals -chiefly the yak and the antelope, but also the ass and the caniel-roam over the entire region, but mostly congregate in the uninhabited northern portion; their argols furnish a plentiful supply of fuel, without which it would be impossible for travellers to cross the country, as there are stretches of hundreds of miles in which no other fucl is procurable. As the Cuing-tang narrows to the east, its surface becomes corrugated with chains of low hills. Here too there is more marsh land than on the west the Odontala plateau at the sources of the Hoang-ho river is described by Prejevalsky as one rast bog in summer, during the prevalence of the south-west monsoon from the Indian Ocean. The openings between the meridional hill ranges to the south permit the rain clouds to pass up to much higher latitudes before discharging their moisture than on the west, where they are faced by the great longitudinal ranges of the Himalayas.

The Kuen-Lun has been identified, geologically, by Stoliczka, as far mest as the Victoria Lake on the great Pamir, in $74^{\circ}$ E. long.; it has been snrvejed between 11 and $8 \%$, where it rises to more than 22,000 feet, and
towers above the plains of eastern Turkestan．To the east it is known for some distance as the Ioguz－Daran（Eleven Passes）rango；Prejevalsky observed a prominent peak （Jingri， 20,000 feet）on the 90 th meridian，east of which sucoessive portions are known as the Angirtakshia，Shuga， Namohon，Burkhan Budha，and Dzun－mo－Lun ranges．The rivers flowing north through openings in the Fuen－Lun are generally small，with the excention of the Hoang－ho．East of the 85th meridian the Kuen－Lun constitutes the chord of an are formed by the Altin Tagh，Nan－shan，and Koko－ nur ranges，which project northwards and border the plains of the Lob－nur region and the Chinese province of Kan－ suh；several hill ranges and some great plateaus－notably those of Chaidam or Tsaidam－are comprised between the arc and the chord，and the region generally is closely allied to Tibet in its physical aspects．Occasional peaks rise to considerable altitudes and are covered witl perpetual snow ； the plateaus form a succession of steps ascending from the plains of Gobi to the Tibetan plateau．

Darchiendo，called Ta－chien－ln by the Chineso，on tho extreme eastern boundary of Tibet，is the principal emporinm of the trade between that conntry and China．Thence tvo important roads lead to Lhása；one called the Júng－lám or＂official road＂（935 miles long），tbe other the Cháng－lám or＂northern road＂（ 890 miles）．Tbe former，which is the more direct，is the post road and that by which officials travel between Lhása and Peking；but it crosses much rugged and difficult country．The other is preferred by traders，as being less difficult and less harassed by officials，and mostly passing over plains with on abundance of pasture for their haggage animale．Tho former has long been known from the pub－ lished travele of Huc and Gabet and the embassies from Nepal to China，and its eastern section，from Batang to Iarchiendo，has been traversed by several Europeans of late years．The latter lies in regions in eastern Tibet into which no European has yet penetrated， but which were recently crossed by Pandit Krishns from orth to eonth ；they belong to the province of Khám，which appears to be oplit up into a number of districts，each governed by its own gyalpo or chieftain，who in somo instances is subject to Lhasa，in others to China，but not unfrequently is independent of hoth．Darchiendo itself lies iu the Minia（Miniak）district，from which the Chang－ lám passes through a succession of petty districts，Tau，Dango，Dau， and Rongbacha or Horko，skirtiog Niarong（Cyarung？）．The inhobitants of this last are said to have conquered the neighbouring districts and to have even braved the Chinese，but at last to bave boen won over to Lhása by bribery．Rongbacha lies in tho ralley of the Ja－chn and contains the large town and monastery of Kanzego （ 2500 honses， 2000 lamas ；10，200 feet above the sea）．Beyond it lies，in the valley of the Di－chu，the district of Dar－ge（De－gue）， said to be one of the richest and most populous in all Tibet，con． taining towns in which tho best jerellery，saddlery，guns，and ewords are manufactured．The Chang－lám passes through Dar－ge up to Kegudo（11，800 feet），where it meets roads over the Chang． tang from Chaidam on the north and the Koko－nur district in the north－east．Very little is known of the country betmeen the Cháng－ lám and the frontiers of China；it is called Sifan or＂the country of the western barbarians＂by the Chinese；to the north are the districts of Chiamogolok and Banakhasum，inhebited by marauding tribes，and lower down are the Amdo and Thochu districts，on the borders of tracts occupicd by the Manchu tribes of Sze－chuen （China）．From Kegudo the Cháng－lam trends westwards over the eastern Hor country，all chang－tang，for 300 miles．The ronte has not yet been explosed，but probably passes through the pasture． lande of the Sok－pas；on reaching Lake Chomora it turns south－ wards，thon passes the monastery of Shiabden（ 14,930 feet），a notable resting－place for caravans，crosses the lower scarp of the Cháng－táng by the Lani pass（ 15,750 fect），and finally descends into the Lhása platcau．
The Jung－lam or official road from Darchiendo passes through Litang（ 13,400 feet ； 2500 houses）and Latsog（ 8150 feet； 2000 houses）to Gartok or Fiangka，crossing en route the Yalung and Kin－sha rivers；thence it proceeds up the valley of the Chiamdo－ chn or Lan－tsan－kiaog，and has been traversed by the Abbé Desgodins via Dayag（his Tchraya）to Chiamdo（his Tchamouto）． He saye，＂To get an idea of the congguration of the ground let any one take a sheet of parchment，crumple it in his hands into many creasee，and then spread it ont on a table，and he will obtain s roap in relief，furrowed with depressious and steep slopes and presenting very little flat surface．＂Cbiamdo is the chief town of the proviuce of Khám，and，being considered a point of great strategic importance，is atrongly garrisoned；it las a large monas－ tery，containing 3000 lamas．It is situated at the junction of tro （ivers，which are frozen in wincer；but in summer the ralleys are
highly cultivated．Thence the Jung－lám proceeds south－west to the bridge of Shang－ye．Jam（Kia－yu－kiao）over the Giama－Nn－chn －here called tho Sok river－and then ascends to Lhojong（ $13,1 \leq 0$ feet）－tbe Lourondson of the lamas＇survey－where it is joined by the road from Gartok via Zayul and Nagong．It then trends westwards over the plateans alrealy mentioped as bordering the eastera basin of the Yaro－tsanpo，passes occasional small villages， monasterics，and lakes，crosses two lofty passes－the Nub－Gang－lá （ 17,940 feet）and the Tola－lis（ 17,350 feet）－descends to the little town of Giamda（ 10,900 feet）in Kongbo，and，passing out of Khán into U，enters the Lhása plateau．From the capital it is continued over a distance of about 900 miles to the westera limits of Khorsum， crossing the Iaro－tsanpo at the Chiak－jan－chori bridge and recross－ ing at Junglache，midway passing through Shigatze；it then tra－ verses a great breadth of cháng－táng and crosses the meridional water－parting at the Muriam－la（ 15,500 feet）．There are twenty－ five etaging places called tarjums，from 20 to 70 railes epart，be－ tween Lhása and Rudok，with accommodation－sometimes houses， but more generally tents－for abont 200 men ；they are under the charge of a jalno，who is bound to provide jaks and other beasts of burden and horses for carrying the mails，impressing them from the nomads eucamped near the tarjums．The road is generally well defined：loose stones are cleared away in the narrow defiles，and piles of stones，surmonnted by flags on sticks，aro erected at places on the open stretches of tableland where the track is liable to be lost．
The climate of Tibet differs greatly in different parts and at different seasons of the year．In western Tibet the frost is perna－ nent from October to April，and the lakes and rivers down to 8000 feet are frozen every winter；at 15,000 feet the thermometer falls below the freezing－point every night ；and at 20,000 feet there is probably perpetual frost in the shade．The meau monthly tempera－ tures and ranges of temperature，embracing from six to ten yeara＊ observations at the meteorological ohservatory at Leh（in $34^{\circ} 10^{\prime}$ N．lat．，height 11，540 feet），are as follows in degrecs Falrenheit ：－

| 폄 웃 |  |  | 号 | 号 | ： | 者 |  | $\begin{aligned} & \stackrel{\text { ® }}{\text { a }} \\ & \text { ल̈ } \\ & \text { H } \end{aligned}$ | S 或 N | 鵾 | 离 |

At Lhasa（in $29^{\circ} 39^{\prime} \mathrm{N}$ ．lat．，height 11，800 feet）the mean tem－ peratures observed by tho pandits were $36^{\circ}$ in Fcbruary and March and $61^{\circ}$ in June and July．Southern Tihet is described as being delightful in summer，－the land covered with vegetation，streams flowing in every valley，and all nature bright，sparkling，and fresh． But in winter snow and frost reign supreme；all vegetation is dried np ；the lakes and rivers are frozen；tho roads and footpaths are paved with ice；and cold cutting winds sweep across the surface of the land．In northern Tibet Prejevalsky found＂a terrible climate＂in summer at 14,000 feet：in the second half of May wintry snowstorms were not unfrequent and the frost by uight reached $-9^{\circ}$ Falir．；and in June and July there were frosts $\left(23^{\circ}\right.$ Fahr．）every clear bight．In the winter the cold is intense；Huc and Gabet，crossing the Di－chu river in 1846，found a great herd of $y$ aks entombed in ice，the river having frozen whilst they were swimming across．
（J．T．W．）

## Industry，Trade，and Government．

Tho industrial arts are at a somewhat low ebb，though in metal．Industry founding the natives display a certain amoment of alility and taste． Their statues and small bells are，however，only copies of Indian models．They use the iron from their mines，which is very good． for making excellent blades for sabres and other weapons．They are very fond of precious stones，but do not know how to work them．Their chief industries are comected with wool，the great and inexhaustible staplo of the country．Weaving is geuerally the work of women．－The cloth usually camployed for summer garments is the lwa－wa，which is dyed with madder or indigo，and sold in pieces cight or tel inches in width and abont twelve yards in length．Another sort of cloth largely sold is the chro or pring， of a leetter quality of wool，fincr and thicker，which is ofteu mamu－ factured in DbLsa（U），whence it is sometines called DbUs p＇rig； it is generally dyed dark red．T＂crma is a superior kind of thin woollen cloth，\＆flanael－like fabric，dyed dark red，of which there are two sorts，－lc－t＇er，made of shawl wool，and bat－t＇cr，of common wool．Sag－lad is for fine clnth made of fine shawl．wool（le－na）； aud snam－bu is a woollen cloth，very coarso and loosely woven，tho common sort of which is not dyed．

Every Tibetan is more or less a trader．Officers for the super inteodence of trade，called garpons，are appointed by the king，the ministers，and the great lamaserais．The import and export traffic is carried on by cararans，which，according to tho loute and its dimixin pploy yaks or sheep．The two great markets are

Shigatze (or Digarchi) and Lhass, where the caravans arrive in Uecember and January from Chins and Moagolia, Khám aad Sze-chuen, Bhutan, Sikkim, and Nepal, Kasamir and Ladsk. Of the four principal trade routes the two which start from Darchiendo have hecn mentioned above ( p .342 ). The third route, 915 miles ia length, starting from Si-ning in Kan-su (Chios), runs along the Eoko-nur to Jun, therce to Di-chu Rab-dun, crosses the homa or lower Dangla,. and proceeds via Giaro and Lake Chomora to Lhása; this ronte, which is forbidden to the Chinese, is less frequented than the others because of tise numerous bands of robbers infesting the country towards Si-ning. Mnch more important is the route which comes from the west, with Leh as its otarting point; it runs via Gartok, Lake Maaasaromar, Muriam pass, Tadom, and Shigatze to Lhása. Like the other caravans, the gearly one which follows this route otops several times on the way for local fairs; the districts passed through aro compelled to furnish it with 300 jaks for carrying goods and to provide food for the travellers. The centres for Tibetan trade on the borders arefor Mongolia and north China, Si-ning ; for Sze-chuen, Darchiendo; and in Assam, Davangiri and Udalcuri, where there is a great fair trice a year in connexion with the Tawang route. Darjiling is the central mart for the Chumbi valley trade, Patna for that passing through Nepal, and Leh and Kashmir in the west. From Chiaa come silks of all raricties (Buddhist prejudice not permitting the Tihetans to rear silk worms and kill them), carpets, and hardware; from Mongolia leather, saddlary, sheep, and horses; from Khám perfume; from. Sze-chuen brick tea (some six millions of ponnds annually; tea in leaf is not in use in Tibet); from Tawang, Bhutan, and Sikkim rice and tohacco; from Nepal broadcloth, silk, indigo, coral, pearls, sugar, spices, and Indian manufactures; from Ladak snd Kashmir saffron and Indian commodities. Silver and gold are the most important articles of export; then follow salt, wool, woollen manufactures, furs, drugs, and musk. By the Nepal and Ladak rontes Tibet exports large quantitios of yaks' tails, horax, gold, silver, and pouies. In 1882-83 the total exports to India amounted to $£ 58,322$ (Punjab $£ 17,710$, North.West Provinces and Oudh $£ 40,612$ ). The imports into Tibet reached $£ 24,197$ ( $£ 1530$ from Punjab, £22,667 from North. West Provinces aad Oudh). The principal exports were borax ( $£ 17,222$ ), salt ( $£ 13,978$ ), wool and woollen goods (£4936). The imports included grain (£13,587), cotton goods ( $£ 2875$ ), aud ougar ( $£ 2395$ ). In $1883-84$ the export of borax had increased by 12, 329 maunds (about 453 tons), that of wool and woollen goods by 2244 maunds ( 82 tons), while the exports of ealt had decreased by 572 mannds ( 21 tons). The whole of the increase in borax is in the, trade with Kumaun, and in weight it is almost donble the increase in the export of rice from that district, for which it is bartered in Tibet, the usual rate of exchange lring two of borax to one of rice. The total excess of the value of exports over impoits amounted to nearly two lakhs of rupees. In 1885-86 the valne of the wool and voollen stuffs exported rose from $£ 4300$ to $£ 8800$. These figures, however, coovey no adequate idea of the British trade with Tibet, as a large quantity of goods passes through Nepal. Russian woollen cloths, coarse and loose, of scarlet, green, blue, aad riolet colour, as well as hearthrugs, thickly woven and of a flowered pattern, come through Yarkand and are conveyed all over the country.

Since 1720 Tibet has been a dependency of Chins, and as such is nnder the Chinese viceroy of Sze-chuen. Chinese authority is represented by two imperial delegates, one of whom is the assistant of the other. They direct exclusively the foreign and military administration of the country, leaviag the civil and religious government in the hands of the Tibetans. They are appointed for terms of three years. Snbordinate to these are two daluhi or great officers and two paymasters, residing, one of each grade, at Lhása and at Bzhikartse (Shigatze or Digarchi). Next in rank are three commanders, residiag at Lhasa, Digarchi, and Dingri near the Nepal frontier: Below these are three tingpuns, non-commissioned officers, who completa the staff of military Chinese officers in the country. The usual number of Chinese troops, all ManchuTatars, in Tibet does not exceed 4500 men ( 2000 at Lháse, 1000 at Digarchi, 1000 at Giangchi, 500 at Dingri). In matters of civil government the supreme authority belongs to the dalai lama, the rgyal-ba rin-po-cé, residing ia tho famous tenple-palace of Potala (see LHASA, yol. xiv. p. 500). But he is consulted only in cases of emergency, when his decision is never questioned. His powers are traosmitted to a special officer for life, nominated by the Chinese Government, who is knomn by several titles, euch as de-sri or the Moagol nomokhan, "king of the law"; he is the rgyal-po or "king" as well as the prime minister of the dalai lama, and the regent when the latter is a minor. Ho is selected front among the four head lamas of the Chomoling, Fonduling, Tangialing, and Chajoling divisions near Lhása, so-called from their chicf monas-

1 This is still in a disturbed state, the pass being closed by the Tibetans in consequence (1) of the important preparations mads in 1886 for a commercial mission to Lhass hy Mr Macsulay and (2) of the pressore of the Nepalese Government on that of Tibet in a receat treaty, in order that the whole trade should osess through Neinal.
teries or dgoripa (rulg. gomba). Each of the four must be, like thic dalai lama, $3 n$ avatar, i.e., when removed by diath he must reappear in the flesli $s s$ a child, sod be raised to that position. Of equal rank with the nomokhan is tho dela lana of dGa-ldan, the great monastery near Lhása; he, however, is not an avatarian lama: Lis appointment has to bo confirmed by the Chinese emperor. Next to him is the lama guru or chaplain of the dalai lama, the dircctor of his cooscience; lie may be an avatar, but his nemination is also in the hands of the Chiaese cmperor, and this furnishes $2 n$ interesting clue to the extcot of the impcrial power orer the church of Tibet. Tho nomokhan rules with the help of five ministers: four of theso-laymen-are for the fuaucial, judicial, revenue, and home departments, and a fiftn, a iama, for ecclesias. tical affairs. The four provinces of Mngari-Khorsum, DbUs , g'โasng (Tsking), and Khams (Khám) are ruled each by a bka-blon or governor, with a proper staff of minor officera, voder the authority of the nomokhan. Besides these there are several minor kings or rgyal-pos ontside of the four provinces; but within these provinces there are four principalities which are under tlie direct government of the Chinese imperial delegates. These are (1) Dayag or Chraya and (2) Kismdo or Chiamdo, both on the east; (3) hKira-sis-lhun-po or Tashiluapo, where resides the pan-den rin-po-te lama, who yields to none but the dalai lama in religious importance, and, though an aratar, requites also the confirmation of the Chiaese emperor to his election; ; (4) Sakya-Kongma, couth-west of the preceding. There is also a Chinese officer ( $y$-tsin) in resideace at Lhása who ouperintends eeveral minor principalities seattered over the country. Every five years Lhása, Chiamdo, and Tashilunpo scod envoys with presents to the emperor. In the east of the country is the principality of Darge or Degue, in the upper course of the Yalung.kiang, ruled by a king who recoguizes the suzerainty of Chins, and at the sams time since 1863 has managed to keep on good terms with the king of Lháse, to whom he has promised submission. On the lower course of the same river are the Chentui or Gyarung tribes, who from the conquest of Tibet were subject to China, but since 1864 have been transferred by the Chinces Government to the rule of the king of Lhasa, who is now represented among them by a Tibetan resident. South of the Chentui is the principality of Dar-rtse-mdo or Darchiondo, the Ta-chien-lu (Tatsienlu) of the Chinese, the rGyala of the Tibetans, where the government, ander the supervision of Chioese officers, is entrusted to a native kiog, called Ming-chang-se by the Chinese and rGyala rgyal-bo or king of rGyala by the Tibetaus.

## Ethnolgay

The Tibetans, in a legend of the Tandjur, pretend to be the do- Inhabifd scendants of an ape, sent to the saory kiagdom (i.e. Tibet) by anta Chenresig (Spyan-ras-gzigs = Avalokitêshvara), and of a Tibetan srimno (a femalo demon or rubshasi). They had six children, whom, as soon as they were weaved, they abandoned in a forest of fruit trees. Coming back after a few jears, the father found to his great surpriss that their number had increased to 500 . Bnt, ss they were starving, he had recourse to his patron Chenresig, who declared that he would be the guardian of the race. So he went to Mount Tise (or Kaila the Su-Diern), and threw down a great quantity of the fiva kinds of grain, with which the farnished apes long fed themselves. As the consequence of eating this grain the mookeys' tails and the hair on their bodies grew shorter and shorter, until they finally disappeared. The monkeys hegan to speak and became men, and clothed themselves with leaves. The interest of this legend, when stripped of its Buddhistic sulornments, lies in the fact that belief in a mookej ancestor seems to havo been common to various branches of the race. The Taog-chang and Peh-lang tribes boasted also of being descended from a monkey; they were the two great divisions of the Tang-hiang or Tangut, offsets of the same Sicn-pi stock as that of the conquerore of Tibet under Fanni Tubat (see note, p. 338 sbove). The iahabitaats of Tibet belong to the Moogoloid races. Besides the Tibetans so called, occupying the greater part of the country, especially io the south from west tc east, there are Turkio tribes called Hor in the north?west, Mongol trihes called Sog (Sok) in the north-east, and several ill-defined tribes oa the borders of China, who differ from the others. The Tibetan race is not thoroughly homogeneous, as may be scen from the various accounts of travellers. On the west they are described as being sloort, with an average stature of 5 feet 2 inches, according to the measurements of General Alezander Cunningham ; in central Tibet and the east they are of middle stature, rather tall than short, -a diference resulting apparently from their intermingling with the surroundiag races. As general characteristics, they are strong, slender in limb, with black eyes slightly oblique, large mouth, brown hair, no beard, a clear ruddy brownish complexion with an intelligent expression. They are a people of good natural gifts, mild in temper, true to their word, kind and simpla, tond of music, dancing, and singing, but thoroughly imbued with superstition and lacking enterprise. Exception is marle of the peoplo of the eastern borders, who are described as beiog cheats and cowards. The most highly gifted are the inhabients of Ando, the region beyond Kham, havine

Koko-nur on the nortn and China on the east. Taller than the Tibetans of the west, they aro famed for their quick intelligenco and open disposition; a large proportion of the readers and chief lamas of the great schools and tho highor onicials beloug to this race. The nomad tribes of the north-east are known by the Chinese common appellative of Sifan ("western aliens"). They include Mongol, Tibetar, and other tribes. In tho east, near the borders of China, are the numerous tribes called Gyarung or Cbentui; their language bas been studied by Hodgson, who has pointed out its remarkable similarity of structure to that of the Tagals in the Philippines. To tho south theso are the Laka or Lolo (mainly iff Sle-chuen), Liso, and Moso; the last-named have advanced to some extent into Indo-China. The Laka or Lolo aro remarkable for their European white fcatures. Their languago, along with that of the Liso and Moso, \&c., forms a group cornato to the Burmese. Not so far east are the Lutzo or Kumung, Melam, Arru, Pagny or Djion, Telu, and Remepu, all apeaking a rlialect of Tibetan, mixed with foreign words, for which the namo of Melam is appropriate. Savages are found, says the pandit explorer A-K, in some of tho valleys of the range north of Saithang (i.c., the Altin-tagh north of the Syrten plain). They have a thick and dark skin, aro well built and apparently well fed. They are clad in skins, and live in caves and dens or under the shelter of overhanging rocks. Being ignorant of the use of arms in the cbase, they lie in wait for their prey near springs of water or salt flats. They are remarkable for their fleetness of foot; even a horscman finds difficulty in overtaking them. Whenever they seo a civilized man tboy run off in great alarm. They are said to know how to kindle a firo by meana of a flint; and they flay the onimals they kill with sharp-edged stones. This is not tho only survival of the Stonc Age, for in tho caso of somo religious rites the lamas are shaved with a "lightning stouc." Tho country is thinly pcopled and large tracts in the upper plateans and Mngari-Khorsum are quite uninhabited. In the province of Kham the population is very irregularly distributed, and the nomad character of the tribes occupying a great part of the upper country makes any estimate doubtful. Tho central provinces of DbUs and gTsang are the most densely peopled, and A-K puts the population of Lhasa at 25,197 ( 7540 boing lamas). The totals lately given by Chinese authoritics ( $4,000,000$ ) and by the Russian staff-officers $(6,000,000)$ are probably nearer the trinth than the $11,000,000$ and $33,000,000$ of former authorities. The Tibetans are a very spcial people, and all possiblo circumstances, especially marriages and births, aro mallo occasions for feasting and enjoyment. The burial customs are peculiar: First tho hair is plucked out from the ton of the head, 11 order to facilitato transmigration: The corpse is not disposed of everywhere or always in the same way (lack of fuel somethmes preventinge cromation), and the lamas decide whether it is to bo put away by interment, by throwing into the river, by burning, or by exposure to beasta and birds of prey. The last-namel mode (remarded as very honourable) has almost disorpeared $m$ tho west, hat is still practised in the central and eastern provinces; the body is cut in pieces and the bones broken into fragments by professional corpse butclers, and, when all the flesh has been devoured at the selected spot, called duir krod, to which the body had been previously caricd, it is not unusual to throw the remaining fragments of the broken bones into tho liver; sometimes tho phalanges of the fingers are preserved to bo used in bead-rolls. Tho lamas aro gencrally inhumed in a sitting posture, the knees being hrought ap to tho chin and corded together as tightly as possilile. In the caso of the gyaljos or kalilons tho body is burned in a metal vessel, the ashes bcing afterwards earcfully collected to Le inale into an image of the deceascd. Polyandry has been practised from the carliest times, and has been carried by the spread of the race into more genial countrics, such as Bhutan. Tho joint hnsbanils are usually, but not always, brothers. Tho arrangement geems to work smoothly, and women onjoy general consicleration, according to all travellers who have spokon of the subject. The redding ceremony takes place at the houso of tho hrides parents, after arlequate presents hare been offered by the elder brother, husband or hriclegroom, and without the assistance of any priest. It consista chiefly in the engagement of tho intending sponses and the placing of a pieco of butter by the bride's parent on the head of the bridegroom and by his paront on that of the bride. Unless otherwise stated by the mother in each case, tho elder husband is tho putative father of the children, and the others are uncles. Polyandry lias resulted in the assignment to tho wifo of a paramount position, which in the north-east and pist of the country has grown among certain tribes into a real sove: eignty, of which we hear from the berinnings of Chinese history, and which has left certain survivals among the Lolo and Moso tribes of the present day as well as in the late Eurmese court.

There are two religions in Tibet-Buddhism, in the shape of Lamaism (q.v.), and an earlier creed, generally called the Bon religion, of which not much is known. The latter, a creed erolved from Shamanism, docs not seem, from what is said in Buddhist books, to have received any regular form cither in doctrinc or other wise until the introduction of Euddhum, which incited the Bonpo
to scek in a betto organization tho means of helding their own They borrowed much from tho Bueddrísts, as the latter did from them, - many deities supposed to bo Buldhist becauso of their Budubist names being simply Bon gods. At the present thy the two religions exist peaceably side by side, and the bon ereed las numerous adherents and rich convents in the central provinecs of DbUs and gTsang, but fow in tho western and castern provinces. Tho Bonpo are somotimes called the "Scet of tho Jllack," as clistinguishod from the "Red" or Old and "Yellow" or Reformed Lamaists, both appellations boing derived from tho colour of their garmente, though Donpo have been secn in red as well as in black. They aro also called Griun-druiu-pa(sco below). The cstablishment of tho bonpa or Bon-ěos, i.c., the Bon religron, is attributcd to Gisen-ribs, also called Bstan-na Gsen-rabs, ie, Gisn-rabs of tho doctine, the namo under which bo is worshipped in tho temples of his sect, as, for instance, at Tsodam in cast Tibet, not far from Bonga; hia statuc, which occupres tho contral place, represents him as supatting, with his right arm outside his red scarf, and boldingt in his left the raso of knowlcdgo. In a Bon sutra ho is said to hold in his right hend tho ron hook of mercy, with which ho fishes pcople out of tho ocean of transmigration, in his left hand the scal of equality, and to wear on his head tho mitra jewel. His full namo is Bon gsen-rabs-gruñ-drun." Gisen-rábs-mi-no, or "(the) excellent luman god," another name of tho samo personage, has been iclentified by some Trbetan authorities with Lao-tsze or Lao-kiun of Chins. This identification, howover, rests only on the slender basis of an apparent aflinity of sound botween the sicn of gsen and a common Chinese appellativo for the Taoists. The genuinc resemblances between Bonpa and Taoism come from tho fact that both religions have drawn from similar sources, from the nativo rnde Shamanism which ia much tho same in both countrics, from the tantric and esoteric doctrines of India, and from Buddhist ideas. The identity is sufficient to havo deceived tho uncritical mind of native scholars, and the matter has not yot been carcfully examined by Europeans. The eighth book of the Grub-mthah-sel-kyi-mé-lon, in twelvo books, by a Tibetan lama, Chkoikyi Nyima (1674-1740), which, with three others, has been lately translated by Sarat Chandra Das (in Jour. As. Soc. Beng. for 1881-1882), gives some information on the risc of the Bonpa in the region of Shang-shung, identificd, not with the modern region of tho samo namo in the north-west of Lhasa, but with Guge or Ghughè and Knáor or Upper licsahr. Three stages are pointed out in the development of tho Bonpa after the time of its mythical founder, who reckoncd among his spiritual descendants sages of Persia, Leg-tang-mang (some names of Lao-kiun ?) of China, of Thomo, of Miniak (east Tibet), of Sumpar, and of Shang-shung. The first stage is that of the human and hiatorical founder of the religion, a sago of tho name of Shong-hon, who lived in the semihistorical time of Thi-de-tsanpo, the sixth king of Tibet (tho first is said to have ruled about 415 e.c.). The second stage, dating from the 3 d century n.c., is that at which Bon theories and doctrines began to cxist, a beginming coincident with the arrival in the country of three Bon priests from Kashmir, Dusha, and Shangshung. The recital down to this point gives evidence of the vogueness of the traditions prescrved by the Tibetans with reference to their own beginnings, and shows that the author has striven hard to pat togcther shreds of ancient reminiacence within a falulous and mythical account With the third stage we come down to hiatorical times. It is divided into three periods, -the first dating from the arrival of an Indian pandit by way of Kashmir, who wrote some of the Bon books; the second being that of the introduction of Buddhism and the consequent persecution leading tho Rompo to multiply their sacred books, whith they concealed; and the last beng that of the revivai of the Lolspa and the bringing forth of the hidden books subsequent to tho overthrow and temporary effacement of Buddhism by gLang-dlarma (208-1013). According to this source, which, howerer, is certainly tinged hy Buddhist prejudico, it was only at tho last-mentioned dato that the Bonpa reached its completo organization.

Eighteen principal gous and goddesses are enumerated, including the red wrathful razor spirit, tho black wrathful razor spirit, the tizer god of glowing fire (the popular god universally worhipped), the messencer demon Rgyal-po, otherwise Pe(d)kar rgyal po (much dreaded and worshipped in the central provinces: he is said to be ilentical with the deity Kye-páng of Lhasa, figured as a wooden atick or log decked with rags; see Jaeschke, Dict., p. 7) the god of sound, the great demon, and the serpent demon. Information is lacking as to the specific characteristics of these gods, and it is not clear to which of them belongs the title of Junetu bzany-po, frequently cited sa the chief Bon god; ho is reputed to hare a wife Yom-ki-long-mo, the eternal female principle, and from their union have resulted all the minor gods and the whole world

[^138]Of the Beapa literature the only text which has been made accessible to Westera scholars is a sutra translated by A. Schiefper in Mim. de $l^{\prime} A c a d$. de St. Pitersb. (xxviii., No. 1) called Gisangma kizh hbum diar-po ("The holy white nâga, the hundred thousand "); but Buddhist influence is so manifest in it that no correct idea of the primitive Bon religion can be derived from it. In a native account, dating from the 18 th century and translated by Sarat Chandra Das, the following are enumerated-three works on philosoply and metaphysics, four meditative works, nine ritual serials, six series of epistles, and four mystic works of a late period, in all of which the title of the translated sutra is not mado known. It is stated in the translation that these Bon ecriptures originally consisted of wholesale plagiarisms, subsequently altered in orthography and terminology from Buddhist carmnical morks The Bonpo are said to bave got the counterparts of the Koh.gyur in general. As a correlative of the six-syllable prayer of the lamas òm mani pad-me hüm (rulgarly "om-mani péaé-on"), they havo one in eight syllables, which they pronounco $m a$-tri-mu-trc-sa-ladiu. The Bonpo are Dow frequently confounded with the Red Lamas or Buddhists of the Old school, who are distinguished from the Yellow or Reformed seet by their garments.

## History.

From the 12th century B.c. the Chinese used to call by the name of Kiang the tribes (about 150 in number) of nomads and ehepherds in Koko-nur and the north-east of present Tibet; but their know. ledge continued to be coafined to the border tribes until the sixth century of our era. In the annals of the T'ang dynasty it is said that the population of the country originated from the Bat-Kian or Fah Kiang ; and, as the information collected in the first part of the notice concerning Tu-bat, afterwards Tu-ban, the uodern Tu-fan, dates partly (as is proved by internal evidence) froin a time anterior to the T'ang dynasty ( 618 A.D.), some degree of reliance may be placed on its statements. There we are told that Fanni, a scion of the southern Liang dynasty of the Tu-bat fanily (which flourished from 397 to 415 at Liang-chu in Kan-suh), who had submitted to the northern Liang dynasty, fled in 433 with all lis people from his governorship of Lin-sung (iu Kin-chu) westwards across the Yellow river, and founded beyond Taih-slihh ("heapy stones ") a state amilst the Kiang tribes, with a teritory extend. ing over a thonsand $l i$. By his mild and just rule he was soon enabled to establish his sway over an immense territory. $1 l$ is original state was apparently situated along the upper course of the Yalung river, an affluent of the Kin-sha-kiang. The foregoing statements, which are most probably genuine history, are preceded in Tibetan chronicles by a mass of legends iarented by the aative Buddhist historians for the purpose of connectiug their monarchy with India.
Throngh the exertions of Prinsep, Csoma de Eörüe, E. von Schlag. intweit, and Sarat Chandra Das we possess five copies of lists of kings, forming the royal canon of Tibet from the legendary beginnin오영 between the 5 th and $2 d$ century B. C. down to the end of the roonarchy in 914 . But the serions divergences which the g show (except as to later times and in general outlines) make their un. authentic character plain. As the last published list is accompanied by a commentary, it is the easiest to follow, and requires only to be cupplemented here and there from the other lists and from the Chinese sources. The first king, Gnya.lihri htsso-po, is said to havo been the fifth son of King Prasenadjit of Kosala, and was born with obliquely drawn eyes. He led north of the Himalayas into the Bod country, where he was elected king by the twelve chicfs of the tribes of couthern and central Tibet. He took np bis residence in the larlung country south of Lhisas. This Yarlung, which borrowed its name from the Yalung of the state of Fanns Tu-bat, is a river which flows into the Yaro-tanpo. The first king and lis six successors are known as tho beven celestial Khri; the next serics consists of six kings knowia as the carthly legs; and they were followed by eight terrestrial lde. This threefold succession is apparently an imitation or a debased form of the ancient legend of heavenly, earthly, and human rulers, which mas carricd into Persia and China and from the latter country into Japan and Tibet, -the relative dumber of kings leing altered in the last-named countries to suit local convenience and the small amount of truth which they contain. Whilst giving an Aryan descent to their first kings, the ancient Tibetans essigned to their princesses a divine origin, and called them thamo, "goddess." The gynaeratic habits of the rare are manfested in the names of all these kings, which were formed of a combination of those of their parents, the mother's gencrally preceding that of the father. The lde kings were followed by four rulers sumply called bisan ("mighty").

Then occurs a break in the lineal descent, and the king next in order (c. $46 i$ ) may be the Tatar Fanni Tu-hat, but most probably Lis son and suecessor. His name was Lhe-tho thori gnyad.btsan, otherwise Gnyan-btsan of Lha-tho thori, according to the custorn usual in Tibet of calling great personages after the name of their birtholace. Lha-tho means "heaps of stones," and therefore
appears "to be a tradslation of Tsih-shih, "heapy stones," the country mentioned in connexion with the foundation of a stato by Fanni Tu-bat. It was during his reign that the first Buddhist objects are reputed to have reached Tibet, probahly from Nepal. Little is said of his three inmediato successors. The fourth was $\mathrm{gNam-r}$ srong btsan, who died in' 030 . During his reign the Tibotans obtained their first knowledge of arithmetic and mediciae from China; the prosperity and pastoral wealth of the country were 60 great that "the liag built his palace with cement moisteded with the rilk of the cow and the yak." To the same king is attributed the discovery of the incxhaustible salt mine called Chyang-gits'wa (Byang.gi-ts'wa = "porthern salt"), which still supplies the greater portion of Tibet. The reign of his illustrious son, Srong btsan sgam-no, opened up a new eri, he introduced Rudrlhism and the art of Writing from Inrlia, and was tio founder (in 639) of Lha-ldan, afterwards Lha-sa. Ila was preatly belped in his proselytism by his two mives, one a Nepal princesa, daughter of King Jyoti varma, the other an imperial danghter of China; afterwards, they being childless, ho tuok two more priucesses from the Ru-yong ( $=$ "left corner" ?) and Mōn (general appellative for the nations between Tibet and the Indian plains) countrics, As a conqueror he extended his sway from the still unsublued Kiang tribes of the north to Ladak in the west, and in the south he carried his power through Nepal to the ladian side of the Himalayns. Hovy far southward this dominion at first extended is not known; but in T03 Nepal and the country of the Brahinans rebelled, and the Tibetan king; the third successor of Srong htsan sgam-po, nas killed while attempting to restoro bis power. It is rather curious that nothing is said of this Tibetan ruto in India, oxcept in the Chinese annals, where it is montioned until tle end of the monarchy in the loth centory, as extending over Bencal to the sea,-the Bay of Bengal being called the Tibetan Sea J. R. Logan has found ethuoIngical and linguistic evidence of this domination, which was left unmoticed in the Indian listories. Jlang-srong mang btsau, tho second 600 and 6 uccessor of Sroug btsan sgam $\cdot$ po, continuit 2 the conquests of his father, eubdued tho Tukuhmn Tatars around the Koko-nor in 663, and ottacked the Chinese; after some odverse fortune the latter took their roveugo and penetrated as far as Lhasa, where they burnt the royal palace (Iumbu-lagang). Iibri lde gtsng-brtan-uesag-ts'oms, the grandson of Mang-srong and seconcl in succession from him, promoted the epread of Buddhism and obtained for his son, Jangta'a Lhapon, who was famcus for the beauty of his person, tho hand of the accomplished princess liyinehang, daughter, otherwise えuny-chu, of the Chineso emperor Jny. tsung. But the lady arrived after tho death of her betrothed, and after long hesitatiou became the hrida of the father. She gave birth in T30 to Jihri srong leleu litsan, in the Buddhist annals the most illustrinus nonarch of his comntry, because of the strenuous efforts he made in favour of that religion during his reign of fortysix years (743-789). Mis son and successor Mluui bisan-po, being deterunined to raise all his anbjects to tiao samo level, enacted that there should be no distinction between poor and rich, humble and great. He compelled the wealthy to share their riches with the indigent and helpless, and to mako them their equals in respect of all the conforts and conditions of lifo. He repeated this experin:ent three tinies; but each time he found that they all returged to tleir former couclition, the rich becoming still richer aud the poor still poorer. The aages attributed this curious phenomenon to the good and evil acts of their former lives. Nothing of im. portance occurred during the following reigns, until that of Ralfachen, who won glory hy his care for the translations of the Buddhist scriptures which ho caused to be completed, or rewritten more accurately when required. In this leign a severe gtruggle took place with China, peace being concluded in 821 at Ch'angmgan and ratified at Lhusa the following year by the erection of bilingual tableta, which otill exist. Ralpaclien was assassiaated by the partisans of gLang-dharma and the country fell into disorder. gLang- Wharina instituted a violent persecution of Buddhism; but he was soon assassinated in his turn, and the kingfom divided into a western and an eastern part by his two sons. The partition did not, however, prevent internecine wars. The history for some time now becomes rather intricate, and requires some atteution. Pal K'or tsan, the second western king, after a reign of thirteen years died leaving two sons, Thi Tasii Tsegpa-pal and Thi Kiyida Nyimagon. The latter went to NGgari (Mhgari) and founded the capital Purang; he left threo sons, of whom the eldest declared hiraself king of Mang-yul (the Moahuil of our maps), the aecond seized Purane, and the joungest, Detsud.gan, become king of the provinco of Shang-shung (the madera Ghughe). The revival of Gnddhism begars with the two sons of the last-named, the elder o! whom becamo a monk. Tho younger, Khorré, inherited his father's throne, and was followed in his authority by twenty successors Tasi Tisegpa also had three sons, - Palde, Ilodac, and Kyido. The descendanta of the first mado themselves masters of Gung.t'arıen, Lugyalwa, Chyipa, Lhatse, Langlung, and Tsakor, Nhere they soverally ruled as petty chicfs. The descendants of Eyids spread soverally ruled as petty chiefs, Jang, Tanag, Jarulag, and Gyaltse
diatricts，Where they also ruled as petty princes，Hodde left four． sons，－Phabdese，Thids，Thich＇ung，aud Gnagpa．The frat and fourth became mastera of Tsangrong，the second took possassion of Amdo and Teongkha，the third bocame king of DbUa ，and removed the capital to Yarlung，south of Lhása．He was followed on his throns from aon to son by elerch successors．History is ailent an to the fate of the eastern king，the other aon of gLang－clharma， gnd his auccessors，but the geographical nemes of the ehieftainships enumerated ebove make it clear that the western kingdom had extaniled its power to the east．Chronology is deficient for all that period．While the dynasty of Ehorre in Shang－shung and that of Thich＇ung in DbUs were running，anothar authority，destined to become the auperior of both，had arisen in Tibet．Khorré left his throne to his son Lhade，who was himself encceeded by his three aous，tha youngest of whom invited the celobrated Indian Buddhist， Atisha，to leave his monastery Vikrama Shila for＇libet，where he aettlod in the great lamaserai of Thoding in Ngari．Besidcs religious books and teachings，he introduced in 1026 the method of computing time by cycles of sixty ycars，＂obtained from the Indian province of Shambala．＂He was the first of the eeveral chisf pricsts whose authority became paramount in the country． The kings of DbUs greatly patronized tham，as for instance in the case of the celebrated Sakya Pandita by the aerenth of thess kings． Pandita，at the special request of Kuyuk，the successor of Ogdai， paid a visit to his court in 1246－48．Five ycara afterwards Kublai Khan conquered all the east of Tibet；and，after he had ascended the throne of China，the Mongol emperor invited to his court Phagspa Lodoi Gyaltshan，the nephow of the aamo Pandita．He remained twelve years with the emperor，and at his renquest franicd for the Mongol language an alphabet imitated from the Tibetan， which，however，did not prove aatisfactory，and disappeaind after oighty five years without having becn very largely nsact．In return for his acrvices，Kublai invested Phagspa with sovereimn power over （1）Tibet proper，comprising the thirtecn districts of $U$ and Thaing， （2）Khim，and（3）Amdo．From this time the Sakya－pa lanas becume the universal rulers of Tibet，and remaincd so，at least nominally，under twenty－one successive lamas during seventy ycare （1270－1310）．Their yamo was derived from the Sakya monastery， which was their cradle and abole，and their authonity for temproml matters was exercised by specially appointed rements．When tho power of tho Sakya began to wane，that of tho rival monasterics of bigung，Phagdub，and Tshal increasce largely，and their respectivo influence and authority overbalanced that of the successors of Phagspa．It was at this troubled eproch that Chyang Club Gyalt－ alan，bettor known as Plagmoin from the uame of his native town， appeared on the secne．He subduel Tibet proper and Khim，for the contiausd pessessioiz of which he was，however，couppelled to fight for suveral years；but lio succeceded in the long zun，and witli the approral of the court of Pcking established a dynasty which furnishel twelve rulcrs in succession．When the Mongol dyuasty of China passed away，the Mings confirmed und cnlarged the dominion of the Tibctan rulers．secognizing at the same time the chicf lamas of the cight principal monasteries of the country． Peaco and prosperity gradually weakened the benign rule of the kings of this dynasty，and during the reign of the hast but one internecine war was rife between the chiefs and nobles of $U$ and Taing．This state of things，vecurring just as the last rulers of the Ning dynasty of China were struggling against the encroach－ ments of the Manchus，their future successors，favoured the inter－ ference of a khoskot Mongol prince，Tengir To，called in the Tibetan sources king of lioko－11ur．The Mongols were intercisted in the religion of the lamas，cspecially since 1576 ，when Altan， khakan of the Tumeds，and lis cousin summoned the chicf lama of the uost important monastery to vasit him．This lama was Soduan rGyantso，the third successor of Geduudub，the founder of tho Tashilumbo monastery in 1447，who had been elected to the more important abbotship of Gallan near Lhasa，and was thus the first of the great，afterwards dalai，lamas．The immediate successor of Gedundub，who ruled from 1475 to 1541 ，had appointed a special afficer styled depa to coutrol the civil admiuistration of the conntry． To Sodnam rGyaintso the Mongol khans gave the title of Valjra Dalai Larua in 1576，and this is tho first use of the widely hnown title of dalai lama．During the minority of the fifth（really the third）dalai lama，when the Mongol king Tengir To，under the pretext of supporting the religion，intervened in the affairs of the country，the Pau－ch＇cu Lo－sang Ch＇o－kyi Gyal－ts＇ang lama obtained the mithdrawal of the invaders by the payment of a leavy war indemnity，and then applicd for help to the first Mauchu emperor of China，who hid just ascended the throne．This step enraged the Mongols，and causerl the advance of Gushri Khan，son and auccessor of Tengir To，who invaded Tibet，dethroned all the petty princes，including the king of Tsáng，and，after having subjugated the whole of the country，made the fifth dalai lama supreme monarch of all Tibet，in i645．Tho Chineso Government in 1653 confirmed the dalai lama in his authority，and he paid a visit to the emperor at Peking．Tinc Mongol Khoskotes in 370 f and the Sungars i： 1717 interecred again in the succession of the dahai
lama，but the Chineae army finally conquered the country in 1720 ， and the present syatem of government was established The ercnts which hava happoned aince that time bave beeu recorded iu the articleb Lhaba and Ladas．

## Lanovaog and Literature．

Bod－skad is the general name of the language of Tibet，which is also occasionally called Gangs－ctan－gyi akad（i．e．＂the glaciera languaga＂$)$ ．This namo is apccially applied to the forms in use in DbUa－gTang．The vernacular ia called p＇dl－skad or common language in contradistinction to the yos－skad or book lenguage． Besides the Bod－elad there are two chief dialecta ${ }^{2}$ in Great Tibat，－ that of Thama，apoker in the three provinces of MiJo（Darrtsc－ mdo），Khám，ani Gong in the east，and that of Ngari－Khorsum in the west．Jaeschke arvanged theso dialects under threo heads，－ （1）western，including those of Balti and Purig，the most archaic， and of Ladak and Lahul ；（2）central，including those of Spiti and of DbUs and ETaang ；（3）Khams．To the same Bhot group belong the Clanglo or Bhutani or Lhopa，the language of Bhutan，of which we have a grammatical notice by Robinsou（1849），and the Serpa and the Takja，of Tawang，both of which are only known through the vocabularics collectel by Hodgson．The later Takpa forms tho transition botwecn the lihot group and the Si－fan groun，which in－ cludes the Miniak，Sungpan，Lifan，and Thochu dialects，spoken near the castern borlers，as well as the Horpa，apoken on a larger area west of the preceding，and much mixed with Trurkic in－

The Capuchin friars whó were ecttled in Lhisa，for a quarter of a century frola I719 aludicd the language；two of them，Franciaco Orazio della Peana， well knowa from his accurate description of Tibet，and Cassian di Maccrata oent home materials which were utilized by the Angustiae friar Aug．Ant．Georgi of Rimini（ 1711.97 ）in his Alphnbetum Tibetanum（Rome，ITip， 4 to），a ponderous and confused compilation，which may he still referreal to，but with breat caution． The Tibetan clanacters were drawn by Della Penna，and engraved by Ant． Fontarita in I735．Ia 1 s20 Abel Kemusnt publisherl his Nicherches sur les J．angues Tertares，a chapter of which was devoted to Tiluctin．Tho next work of inportance was a dictimary，intemed for European atudents，which was pmblislicd，with Tibetan types，at the expense of the East India Company，in 1806 at Scrampur，and edited by John Narshman，froma a MS．cojuy matu by Fr．Chr．G．Scluocter，o missionary in Bengal，who had sulstituted Euglisl for the Itulian of the original．It was the unsifted result of the labourg of at unknowu ltalian inisslinary，who hal been stationed cither fin eastern Tiluet or close to the fronticr in Bhatan．It was properly a collection of all the aentences he conld gat written by a native teacher，completed with extiactas from the Fadma bungyig，a popmlar serics of legends alout Fadma Sambliava， Unfortunately tho work，was left undimished，aml unrevised，as thero was no Tibetan scholar to correct the proofs．Though richer in words than later dictinuarics，the work cannot，for these reasonsybe accepted as an anthority on any doubtful point．The gramantical notice，consisting of forty pages frome

gredients. With tho exception of the Sokps, \& Mongol dialect, aur of the Gyarung, a pre-Chineso dialect, the languages spoken in Tibet belong to the largo linguistie family cowmonly called TibetoBurman, a division of the Kiten-lun group, which is a part of the Turano-Scythion stock.

The language is more consouantal than vocalic, though much ooftened in tha central dialect. The consonants, 30 in number, which aro deemed to possess an inherent sound $a$, are the follow-
 $m a, t s a, t s^{\prime} \pi, d z a, v a, z h a, z a, ' h, y a, r a, l u, s h r, s a, l i a, ' a$, tho so. called Sanskrit cerebrals are represented by the letters $t a, t$ ' $a$, da, na, sha turned the other way. I'a, when combined as second consonant with $k-, p=, m-$, is written under the first letter. Ra, when combined as second letter with $k_{-}, t-p$-, is written under the first, and when combined with another consonant as first letter over the second. The vowels are $a, i, u, \varepsilon, 0$, which oro nat distinguished as loog or short in writing, though they are so in the vernachlars in the case of words altered lyy plonetic detrition. Arglomerations of consonants are not objectionable; sud they are ofteo met with as initials, giving the appearauce of telescoped words-an appearance which historical etymology often confirms. Many of these initial cousonants are silent in the softened dialects of the central provinces, or have becn resolved into a simpler one of anotlier character. The language is much ruled by laws of euphony, which have been strictly formulated by grammarians. Among the initials, five, viz., $g, d, b$, $m$, ' $h$, aro regardcl as prefixes, and aro called so for all purposea, though they belong sometines to the stem. As a rule none of these letters can be placed before any of the same organic elass. Post-positions, $p a$ or $b a$ and $m a$, are required by the noun (subatantivo or adjective) that is to be singled out ; po or bo (masc.) and mo (fenı.) are used for distiaction of gender or for emphasis. The cases of nouns are indicated by suffixes, which wary their initials according to the final of the nouns. The plural is deooted wheu required by adding one of several words of pluralits. When several words are connected in a sentence they seldom require more than one case elemeut, and that comes last. There are peraonal, demonstrative, interrorgative, and reflexive pronouns, as well as an indelinite article, whicly js also the numeral for "one." The personal pronouns are replaced by various terms of respect when speaking to or before superior's, and there are many words besides which are ooly employed in cercmonial language. The verb, which is properly a participle, has no element of person, and denotes the conditions of tense and mood by an external and internal inflexion, or the addition of auxiliary verbs and suffixes when the stem is not susceptible of inflexion. The conditions which approximate most closely to. our present, perfect, future, sud imperatire are marked either by aspiration of the initial or by one of the five prefix consonants according to the rules of eupliony, and the whole looks like a former system thrown into confusion and disorder by phonetic decay. As to the internal vowel, $a$ or $e$ in tho present teods to bceome $o$ in tlie imperatire, the $e$ chaoging to $a$ in the past and future; $i$ and $u$ are loss liable to change. A final sis also occasionally added. Only a limited number of verlis aro capable of four changes; some cannot assume more than three, some two, and many only onc. This defieiency is mado np by the addition of auxiliaries or suffixes. There are do dumeral auxiliaries or segregatives used in counting, as in many languages of eastera $\Delta$ sia, thourh words expressive of a collective or integral aro often used after the tens, sometimes after a snaller number. In scientifie and astrological works, the uumerals, as in Sanskrit, are expressed by symbolical words. In the order of the sentence the substantivo precedes the adjective and the verb stands last; the object and the adverlj precede the verb, and the genitive precedes the noun on which it depeads. An active or causal verb requires before it the instrumental instead of the nominative case, which goes only before a neuter or iotransitive verb. Tha chief differences between the classical language of the Tibetan translaturs of the 9th century and the vernacular, as well as the language of native mords, existed in vocabulary, phrascology, and grammatical structure and arose from the influence of the translated texts.

The Tibetan languare, in its written and spoken forms; has a great interest for philologists, on account of its bearing on the history of the so-called monosyllabic languagea of eastern Asia. Is the Tibetan a monosyllabic language passing to agglutination $f=$ tho reverse \& The latter is the faet, 89 wo shall see further on. The whole question has turned upon the elueidation of the pheoomenon of the silent letters, generally prefixed, which differs itiate the spelling of many words from their pronuaciation, in tho central dialect or eurrent speceh of Lhása As long as the sounds of this dialect only were known, the problem could not be fully grasped. Rémusat rather dubiously suggested, while Schmidt and Schiefoer maintained, that the silent letters mere a devieo of grammarians to distinguish in writing words which nere not distinguished in speech. Eut this convenient opinion was not sufficient for a general explana. tion, being supported by only a few cases. Among these ore- (a) the addition of silent letters to forcign words in anslogy with older termis of the laguage (e.j., the Persian lidjiz was tran-
seribed sluggsig or "timer-leopard," because tho foreign term left untouched would have been meaningless for Tibetan readers) ; (b) the sddlition low the anko of uniformity of prefixed letters to words etymolorically deprived of them; (c) the probable addition of letters by the Buddhist teachers from India to llibetan words in order to make the moro siunlar to Sauskrit expressions (for instance, rjefor "king." witten in initation of raja, though the oliginal worl was je or she, as is shown by cognate languages). On the other land, whilo phonetically the abore explanation was not inconsistent with such cases as rka, dkalh, bkah, bskia, and ngz, rnga, ngag, sngacs, lnga, ngal, and brese, brdzun, dbyar, \&c., where the italicized letters are pronounced 1 m full and the others are left aside, it failed to explain other cases, sucl: as dyra, ingron, slyod, syiy(wh, sbrang, sbrab, b̌ra, k'ri, lirad, k'rims, krus, de., pronomuced da, don, cod or šicod, ěcn, dung, dede, ta, li, lad or tch, t'im, tut, \&c., and many others, where tho spoken forms are obviously the alteration by wear and tear of somads originally similar to the written forms. Csoma de Korös, who was acyuainted with the somewhat archaic sounds of Ladak, was ablo to point to only a few letters as silent. But Major Cunningham, in his book ou the same country (1854), held that the Tibetan writing, wheu first applied to the langusge, was the faithful trenscription of speech, and be gave as a proof that the name of the provinco of U , written DUUs, was the Dcbasse of Ptolemy: Foucaux, in his Grammaire (1858), quoted a fragment from a native work on grammar several ceaturies old, in which tha pronunciation of the oupposed silent letters is carefully described. Since then the problem has been disentangled; and now minor points only remain to be cleared up. Jaesclike deroted special atteation to the dialectica! sounds, ond showed in several papers and by the comparative table prefixed to his dictionary that in the western and easiern dialects these sounds eorrespond more or less elosely to tho written forms. Thus the valuable testimony of these dialects may be added to the evidence furaished by foreiga transcriptions of Tibetan words, loan words in conterminous languages, and words of common descent in kindred tongues. And the whole shows plainly that the written forme of words which are not of later remodelling are really the representatives of the pronunciation of the langugge as it was spoken at the time of the transcription. The concurrence of the evidence indicated above enables us to form the following outline of the evolution of Tibetan. In the 7th century there was oo difference between the spoken and the written language. Soon afterwerds, when the language was extended to the western ralleys, tho prefixed and most of the important consonants vanished from the spoken words. Tho ya-tag and ra-tag or $y$ and $r$ subscript, and the $s$ after vowels and consonants, were etill in force. The next change took place in tho central provinces; the ra-tags were altered into cerebral dentals, and the yatags became $x$. Later on the superscribed letters and finals a sad $s$ disappeared, except in the east and west. It was at this age that the language spread in Lahul and Spiti, where the superscubed letters were silent, the $d$ and $g$ finels were hardly heard, and $a_{n}, 0,1$ $u s$, were $a i$, oi, ui. . The worr's introduced from Tibet into the border languages at that time differ greatly from those introdnced at an earlier period. The other changes are more recent abd restricted to the provinces of $\mathbb{U}$ and Tsang. The vowel sounds ai, $o i, u \hat{i}$, have become $\vec{e}, \bar{\delta}, \bar{u}$; and $\alpha, o, u$ vefore the finals $d$ and $\hat{u}$ are Dow $\ddot{a}, \ddot{0}$, $u$. The mediá have become aspirate tenues with a lorv iutonation, which also marks the words having a simple initial consonant; While the former aspirates and tho complex initiels simplified in speech are uttered with a ligh tonc, or, as the Tibetans say, "with a woman's voice," shrill and rapidly. Au inhabitant of Llasa, for example, finds the distinction between sh and $z h$, or between $s$ and $z$, not in the consonant, but in the tone, pronouncing sh and $s$ with a ligh note and zh and $\approx$ with a low one. Tlie introduction of the important compensation of tones to balanco phovetic losses had begun several centuries beforo, as appears from a Tibetan MS. (No. $462 b$ St Petersburg) partly published by Jaeschks (Monatsber. Akad. Berl., 1867). A few instances will serro to illustrate what hes been said. Iu the bilingual inscriptions, Tibetan and Chinese, set up at Thása in 822, and published by Bushell in 1850, we remark that tho silent letters wers pronounced: Tib. spudgyal, now pugyal, is rondered suh-pot-yc in Chiaese symbols; khri, 口ow $l^{\prime} i$, is kich-li: hbrong is muh-lucing; snyan is sheh-njoh and su-njoh; srong is st, Tun, su-luny, and si-lung. These trangcriptions show by their variety that they were made from the spoken and not from tho written forms, and, considering the limited capacities of Chinese orthoepy, wero the mearest attempt at readering the Tibetan sounds. Sjura or spreu (a monkey), now altered into deu at Lháss, \{ou in Lahul, Spiti, and Tsángo, is still more reegnizable in the Gyarung shepri, and in the following degenerated forms - shrere in Ladak, streu-yo in Khams and in cognato languages, sube in Libıbu, sahere in Lepeha, simai in Tablung Naga, sibch in Abor Mliri, slibe in Sibsagar Miri, sarrha in Kol, sara in Kuri, \&e. Grog-ma (ant), now altered into the spoken loma, is still Ryoma in Bhutan, and, without tho suffix, Rorok in Gyarung, k'oro in Sokpa, k'orok, k'alck in Kiranti, dec. Grane-po (eold), spoken l'ammo, is still grang-mo in Takna, hyam in Bur.
mese $_{2}$ \& $C . \Delta$ respectful word for "hesd " is $u$, written $d b u$, which finds its cognates in Murmi thobo, Kusunda chipr, Sibsagar Miri itub, \&c. Byut (bird), spoken chya, is still pye in Gyarnng. Brjod (to speak), pronounced jod, is cognate to the Burmese pycuihtso, the Garo brot, \&c. The word for "cowries" is 'gron- in written, rumin spoken Tibetan, and grwa in written Burmese; slop (to learn), spoken lop, is slop in Dielam. "Mloon" is alava in written and dawa in spoken language, in which -va is a suffix ; the word itself is zla-, cognate to the Mongol ssara, Sokpa sara, Gyarung $t$-sile, Yayu cholo, \&c. The common spoken word for "head" is go, written mgo, to which the Munipuri noko and the Mishmi mkure sre relatod. Sometimes the written forms correspond to double words which have disappeared. For instance, gye (eight), which is written brgyad and still spoken vrgyad in Balti in the west and Ehams in the east, is gyad in Ladak, Lahul, and U. The same word does not appear elsewhere; but we finl its twa parts separately, such as Gurnng pre, Murmi pre, Taksya phre, and 'Cakpa gyet, Serpa gye, Garo chct, sc. Rla (horse) is reduced to ta in speech, but we find ri, rhyi, roh in Sokpa, Horpa, Thochu, Mliniak, and td, tah, teh, t'cy in Lhopa, Serpa, Murmi, Kami, Takpa, \&c., both with the same meaning. Such are the various pieces of evidence obtained from an endlcss number of instances. The cases referred to above do not, owing to the difference of the causes, yield to sny explanstion of this kind. And it must be admitted that there are also many cascs, some of them caused by irregularities of writing, modification of spelling by decay, and by a probable use of prefixes still unascertained, which also resist explanation, though the account just given stands good whatever solution the question of prefixes may receive in future.
Little is known of the non-religious literature of Tibet. The most popular and widely circulated book is called The Hundred Thousand Songs of the Vencrable Milaraspa. Their author Milar. aspa (unless the work should be attributed to his disciples), often called Mila, was a Buldhist ascetic of the 11th century; according to Jaeschke, during the intervals of meditation he travelled through the southern part of mildule Tibet as a mendicant friar, instructing the people by his improvisations in poetry and song, proselytizing, refuting and converting heretica, and working manifold miracles. His legends aro not without wit and poetical merit. A number of poems written in an elevated and special style, dramatic works, and collections of fairy tales and fables are said to be in existence. A very, extensive work, the Djrung yg (Sgruïs yg), regarded as the national epic in Kham, has been partly seen by Desgodius and Baber. It is in prose; lut the dialogue, interspersed with songs, is metrical, and is much wore extensive than the prose framework. Religious discussions and philosophical dissertations alternste with comic episodes. It includes three divisions,-the Djiung ling, which descrites the invasion of part of Tibet hy the Djiung or Hoso ; the Hor ling, which recounts the conquest of the Hor (Turk tribes) by the Tibetans, and conveys much historical information in a tale of magic and marvel; and the Djia ling (Chinese division), which narrates a contest of unknown date between the Tibetans and the Chinese. This work has apparently never been published, and even the manuscripts of the three divisions csnnot, says Raber, be obtained in a complete form. But every Tibetan, or at least overy native of Kham, who possesses any education, is able to recite or to cbant passages of great length. Another Tibctan epic, the

Giyaldrung, praises Dagyolong, a famous warrior who subdued the savage men of Khám. Besides these poems we find allusions to a sgiving, referring to the Yesser Khan. Dramatic works exist, as woll as translations of Galen, also of the Ramayana in the first vol. of the Bstodts'ogs of the Bstan-ngyur. For the religious literature, which is considerable, see LaMaism.

Writing was not introduced until the 7 th ceatury. Notched sticks (shing-chram) and bnotted cords were in current use, but the latter contrivance is only faintly allnded to in the Tibetan records, while of the other thero are numerous examples. No neution is anywhere made of a hieroglyphical writing, but on the eastern frontier the medicine-men or tomba of the Moso have a peculiar pictorial writing, which is known in Europe from two published MSS. (in Jow'n. Roy. As. Soc., 1S85, vol. xvii.) ; though apparently now confined solely to purposes of witcheraft, it perhaps contains survivals of a former cxtensive system superscded by the slphabetic writing introduced from India. According to tradition -a tradition of which the details are open to criticism-the alphahet was introduced from India by 'onmi Sainb'ota, who was sent to India in 632 by King Srong btsan to study the Sanskrit lauguage and Buddhist literature. Tonmi Sambota introduced the socalled "writing in thirty characters" (six of which do not exist in Sanslenit) in two styles, - the "thick letters" ol "letters with heads," now commonly used in priuted books, and the half-cursive "cornered letters," so called from their less reguiar heads. The former are traditionally said to have been derived from the Landza character. The Landza of Nepal, however, is certainly not the origin of the Tibctan letter, but lather an ornamental development of the parent letter. The close resemblance of the Tibetan char. acters " with heads" to the Gnpta inscriptions of Allahahad shows them to have been derived from the mommental writing of the period; and various arguments sppear to show that the other Tibetrn letter came from the same Indian character in the style in which it was used in common life. The Tibetan half-cursive was further developed into the more current "headless" characters of which there are several styles. From the monnmental writing of Tibet was derived, for the special use of the Mongols in the 13th century, the short-lived writing known as Bagspa, from the name of the lama who worked it out.

TIBULLUS, Arbius (c. $54-19$ b.c.), was the second in the tetrad of the elegiac poets of Rome. As we learn from Ovid, he was the successor of Cornelius Gallus and the immediate predecessor of Propertius. The information which we possess about him is extremely meagre. Besides the pooms themselves-that is to say, the first and second books-we have only a few references in later anthors and a sho:s. Life of probable but not undoubted genuineness. We do not know his prænomen; and his birthplace is uncertain. It is, however, a plausible conjecture that he came from Gabii. The year of his birth has been variously assigned; bui 54 в.c. may be taken as approximately correct. This would make him about twentyfive when he accompanied Messala on his Aquitanian campaigu in 29, and thirty-five at his untimely death in 19. His station was that of a Roman knight; and he had irherited a very considerable estate. But, like Virgil, Horace, and Propertius, he seems to have lost the greater part of it in 41 amongst the confiscations which Antony and Octavian found expedient to satisfy the rapacity of tieir victorious soldiery. Tibullus, like Propertins, seems to have lost his father carly. He once mentions his mother
and sister ; and, according to Ovid's elegy upon him, they were alive at his death.
Tibnllus's chief friend and patron was M. Valerius Messala Corvinus, himself an orator and poet as well as a statesman and commander. Messala, like Mrenenas, was the centre of a literary circle in Rome; but the bond between its members was that of literature alone. They stood in no relations to the court; and the name of Augustus is never once to be found in the writings of Tibullus. It was doubtless this community of taste which gained the young poet the friendly notice of Messala, who offered him an honourable position on his private staff when he was despatched at the end of 30 by Augustus to quell the Aquitanian revolt. Tibullus distinguished himself in the campaign and was decorated for his services. But this did not rouse in him any military ardour. His tastes lay in quite other directions; and he always speaks of wai with horror and dislike. At tho end of the war in 29 Tibullus returned to Rome, and thenceforward his lifa seems to have been divided between Rome and his country estate, though his own preferences were altogether for the country life. Soon after his return he made the
acquaintance of his first love, Delia. This is what he calls her in his pocms; but we learn from Apuleius that her real name was Plania. Delia seems to bave bcen a woman of middle station. It is impossible to give an exact account of the intimacy. The poems which refer to her are arranged in no chronologica! order. She appears now as single, now as married; but we do not hear anything either of her marriage or of her husband's death. It is clear, however, that it was the absence of her husband on military service in Cilicia which gave Tibullus the opportunity of making or renewing the acquaintance. It was not dropped when he returned, probably with Messala in 27. It was not a difficult task to deceive the simple soldier ; and Delia was an apt pupil in the school of de-ception,--too apt, as Tibullus saw with dismay when he found that he was not the only lover. His entreaties and appeals were of no avail; and after the first book we hear no more of Delia. It was during the earlier period of this attachment and probably in the spring of 28 that, yielding to his friend's earnest and repeated requests, Tibullus left Delia to accompany Messala on a mission to Asia. He fell ill, however, and could not get farther than Corcyra. In the second book the place of Delia is taken by Nemesis, which is also a fictitious name. Nemesis (like the Cynthia of Propertius) was a courtesan of the higher class; and she had other admirers besides Tibullus. He complains bitterly of his bondage, and of her rapacity and hardheartedness. In spite of all, however, she seems to have retained her hold on him until his death. Tibullus died prematurely, probably in 19, and almost immediately after Virgil, in order, as their contemporary Domitius Marsus pathetically puts it,

> 'That none might sing of gentle lovo in elegy's sad lay,

Or gallant march of royal war on epic feet essay."
The character of Tibullus is refected in his poems. Though not an admirable it is certainly an amiable one. He was a man of generous impulsea and a gentle únsel lish disposition. He was loyal to his ifriends to the vergo of self.sacrifice, as is shown by his leaving Delia to accompany Mcssala to $\Delta$ sia, and constant to his mistressos with a constaney lut ill deserved. Hia tenderneas towards them is enhanced by a refinement and delicacy of feeling which are very rare amonsst the ancients. Horace and the rest taunt the cruel fair with the retribution that is coraing with the yeara, when they will exult over the decay of the once imperions bearty. If Tibullus refers to such a fate, he does it by way of warning and not in any netty spirit of triumplh or revenge. Cruelly though he may have been treated by his love, he does not invoke curses upon ber head. Ile goes to her little sister's grave, hung so often with his garlands and wet with his teare, and bemoans his fate to the durnb ashes there. Tibullus has no leanings to an active life : his ideal is a quiit retirement in the country with the loved one at his side. He has no ambition and not eveu the troct's yearning for inmortality His muse may go packing if it camot propitiate the fair. As Tibullus loved the country life, its round of simple duties and innocent recreations, so he clung to its faiths, and in an age of crude matcrialisin and the grossest supcrstition he was religious in the old Roman may. A simple, gentle, affectionate nature such as his could not foil to win esteenn ; and his early desth causel deep regret in Rome. Tibullua was remarkable, his biographer tells us, for his good looks and the caro that be bestowed upon his person. As a poct he rominds us in many respects of the English Collins His clear, finished, and yet unaffected style made him a great favourito with his countrymen and placed him, in the judgment of Cuintilian, at the head of tbeir elegiac writers. And certainly within his own range he has no Roman rival. For natural grace and tenderness, for exquisiteness of feeling and expression, he stands alone. He has far fewer faulta than Propertiua, and in particular he never overloads his lines with Alesandrian learning.' But, for all that, his range is limited; and in power and conpass of imagination, in vigour and originality of concention, in richness and variety of poetical treatment, ho is much lisis inferior. The eame differences are perceptible in the way the two poote handle the ir metre. Tibullus is smoother and more nusical but liable to become monotonous; Propertius, with occasional harshnesses, is more vigorous and varied. It need ouly bo added that in many of Tibullus'a poems a symmetrical composition is obrion, although the symmetry must never bo redaced to a fixed and unclastic seheme. it is probable that we have lost somo of the genuino poems of Tibullus. On the other haud, much bas come down to us under
his rame which must certainly be assigned to others. Only the first and second books of the usual order, or about 1240 rerses, can claim his authorship. The first book consists of pooms written at various times hetween 30 and 26. It was probably published about 25 or 24 . The second book seems to have been a posthumous priblication. It is very short, containing only 428 verses, and is cvidently incomplete. In hoth Dooks occur poems which give evidence of internal disorder; but acholara cannot agree upon the remedies to be applied.

The third book, which contains 290 verses, is by a much inferior hand. The writer calla himalf Lygdamus and the fair that lie aings of Nexra. He was born in the same ycar as Ovid, in the consulship of Hirtins and Pansa; hat there is nothing Ovidian about his work. He has very little poetical power, and his style is meagre and jejune. He has a good many reminiscences and imitations of Tibullus and Propertius; and they are not always happy. The separation of the fourth book from the third has no ancient quthority. They form one in the best MSS., and are quoted as one in the anthologies of the Middle Ages. The division dates from the revival of letters, and is due to the ltalian scholars of the 15 th contury. The fourth book consists of poems of very dilferent quality. Tho first is a composition in 211 hexameters on the aehievements of Messala; and very poor stuff it is. The author is unknown; but he was certainly not Tibullus. The poem itself was written in 31, the year of Messala'e consulship. The next eleven poems relate to the loves of Sulpicia and Cerinthus. Sulpicia was a Roman lady of high station and the daugliter of Valeria, Messala's sister. She had fallen violently iu love vith Cerinthus, about whom we know nothing but what the noet tells us; and he soon reciprocated her feelings. The Sulpicis elegies divide into two groups. The first comprises iv. 2-6, containing uinety-four lines, in which the theme of the attachment is worked up into four graceful poems composed for Sulpicia and Cerinthus alteruately. The second, iv. 8.12 (to which seven should be added), consists of Sulpicia's own letters. They are very ahort, only forty lines in all; but thoy have a quite unique interest as being the only love poems by a Romsn woman that have escaped the ravages of time. Their frank aud passionate outpourings remind us of Catullus. The atyle aud metrical handling hetray the novice in pootical writing; and the Latinity is "feminine." The thirtcenth poem (twentyfour lines) claima to be by Tibullus; but it is a miserablo forgery. It is little more than a cento from Tibullus and Propertius. The fourteenth is a little epigram of four lines. There is nothing to determine its authorship. Last of all comes the epigram of Donitius Marsu: already seferred to. To sum up: the third and fourth hooks a ppear in the oldest tradition as a single book; if separated, they mould contain only 290 and 373 lines respectively, as against 812 of the first book and 428 of the incomplete second; and they comprise pieces by different authors and in very different styles, none of which can be assigned to Tihullus with aay certainty. The natural conclusion of this is that we have here a collection of scattered compositions relating to Messala and the members of his circle which has been added as an appendix to the genuine relics of Tihullus. When this collection was made cannot be exactly determined; but it was certainly not till after tho death of Tilullus, and probably not till after Mcssala's. Besides the foregoing, two pieces in tbe collection called Priapea have been attributed to Tibullus; but there is very littlo external and so internal evidence of his euthorabip. The text of Tibullus is, on the whole, better preserved than that of Catullus, and still more oo than that of Propertius. But it still containg many corruptions and eoveral lacunæ, besides the disarrangerments already referred to.

The value of the short Vila Tibulli, which is found at the end of the Ambrosian and Vatican, also of inferior, MSS., has been much discussed. E. Baelrema maintains that it is genuine, and possibly an abstract from the book of Suetonius, De Poctis, - a conjecture supported by the fact that even in so short a piece of writing more than one Suetonian phraso occurs (Baehr., Tibullische Elatl., p. 4 sq.), -while Schulze (Z̈schr.f. d. Gymnasialwocsen, Berlin, $\bar{x} \times \mathrm{xi}$ i. 658) recards it as a mere rifacimento of llorace, Ep, i, 4, and various passages in Tibullus. E. Hiller (Rhein. Mfus., Iviii. 350) thinks it genuine, but assigns it to the late classical period, -a view quite consistent with an ultimato Suctonian origin. It is as follows :- "Albius Tibullus, eques R. o Gabiia [Bachrens's ingenions conjecture for the MS. eques regalis, R. being the customary abhreviatinn for Romanass], insignis forma cultuque corporis observabilis, ante alios Corvinum Messalamob ingenium [so Baehr., M1SS. originem, others oratorem] dilexit, cuius et contuberualis Aquitanico bello militaribus donis donatus est. Hic multorum iudicio priscipem inter elegrographos optinet locum. Epistulx quoquo eins, quam. quam breves, omnino utiles sunt [so the MSS.; Bachrens reads subtiles. The letters referred to aro Sulpicia's]. Obiit adulescens, ut indicat epigramms superseriptum" (i.c., the one ascribed to Domitins Marsus. These words seem to be a later addition to the Life).-Another moot question of some importance is whether our poet should be identified with the Albins of IIorace (Od., i. 33 ; Epist., i. 4), as is done by the commentator Porphyrio (200-250
A.D.) in bis Scholia. In the forner passage Horace tells Albius to moderate his grief at the cruelty of Glycera, nor to descant in piteous elegies on her broken faith and the victory of a younger rival. It is clear that Glycera cannot be Nemesis; for it is a pseudouym, as the context shows, and Horace would, of course, have used the same pseudonym as Tibullus. If, on the other hand, Nemesis were a real name, Horace had no occasion to use a pseudonym. It is possible that Tibullus had another mistress, Glycera, of whom we know nothing further, and that the miserabiles elegi have perished ; but this is a mere supposition. The Albius of the epistle has an estate at Pedun, where Horace conjectures he may be musiag or writing. He is handsome, rich, and knows how to enjoy life. He is wise and has tho gift of speech, popularity, reputation, and good health abunde, -an enviable list of attributes, but certainly one which does not agree very well with what we know from elsewhere of Tibullus. The theory, then, that theso passages refer to Albius Tibullus must be pronotnced, with Baehrens, unproven ; and the forma of Horace's Albius must not be used, as Schulze uses it, to subrert the credit of the insignis forma of the Life-Ovid, Trist., iv. 10,53 sq., "successor fuit bic [Tibullus] tibi, Galle, Propertius illi, quartus ab his serie temporis ipse fui." In the preceding coinplet he had said, "Yergiliuns vidi tantum nec amara Tibullo tempus amicitire fata dedere meæ." Ovid, wbo was born in 43, would he only twenty-four at Tiballus's death if it occurred in 19.-The loss of Tibullus's landed property is attested by himself (i. 1, 19 sq .), "Vos quoque felicis quondam, nnuc pauperis agri custodes, fertis munera vestra, Lares. Tunc vitula inuumeros lustrabat cæsa invencos; nunc agna exigui est hostia parva soli" (comp. 41, 42). Its canse is only an inference, though a very probable one. That be was allorred to retain a portion of his estate with the family mansion is clear from ii. 4, 53 , "Quin etiam sedes iubeat si vendere avitas, ite sub, imperium sub titulumque, Lares." Compare the passages quoted abore and i. 1, 77, 78. Messala composed epigrams (Plin., Ep., V. 3) and bncolic poems (comp. the pseudo-Virgilian Catalepton, ii.) ; but he was more conapicuous as a patron than as a poet. On his circle and that of Mecenas, see Teuffel, Gesch. der römischen Literatur, 4 th ed., p. 431 (vol. i. p. 389 of the Eng. transl.). Other members of the circle were Messala's brother, Pedins Publicola, Emilius Macer (probably the Macer addressed in ii. 6), Valgius Rufus, Lygdamus, Sulpicia, and others, and even Ovid to a certain extent (Ov., Pont., i. 7, 28 sq.; Trist., iv. 4, 27 sq.). Tibullus vas Messala's contubernalis in the Aquitanian war (Vita Tib. and Tib., i 7, 9 sq., a poem composed for IIessala's triumph). It should be stated that the date of the Aquitanian campaign is still undetermined. It has been assigned to 30,29, and 28 . He received militaria dona (Fita); Baehrens unkindly suggests it was for purely poetical services (Tib. Bl., p. 15). Tibullus's dislike of war is al ways coming to the surface (e.g., i. 3; i. 10), and so also his love of quiet and retirement (i. I; ii. $1 ; 3,1 s q$.).-Apuleius (Apol., 10), "saccusent Tibullum . . . quod ei sit Plania in animo, Delia in versu"; this is the most probable form of the name, Delia ( $\delta \bar{n}$ dos) being a translation of Plania. As regards her station, it should be noticed that ehe was not entitled to wear the stola, the dress of Roman matrons (i. 6, 68). Her busband is mentioned as absent (i. 2, 67 sq.). She eludes the custodes placed over her (i. 2, 15, and 6,7 ). Tibullus's suit was faroured by Delia's For Tibnllus's illness at Corcyry affectionate terms (i. $6,57 \mathrm{sq}$.). For Tiballus's illness at Corcyra, see i. $3,1 \mathrm{sq}$., 55 s. 9 . The fifth elegy was written during estraugement (discidium) snd the sixth after the return of the husband and during Delia's double-infidelity. On the difficulty of "harmonizing" the Delia elegies, see F. Leo (in Kiessling and Wilamovitz-Mollendorf's Philol. Unters., ii. pp. 18.23), who is, bowever, too sceptical. Any other attachments that Tibullus formed (such as the supposed one for Glycera) must have fallen between the end of the Delia and the beginning of the Nemesis counexiou. - Ovid, writing at the time of Tibullus's death (Am., iii. 9, 31), says-"Sic Nemess longum, sic Delia, nomen habebunt altera cura recens, altera primus amor." Nemesis is the subject of book ii. 3. 4, 6. The mention of a lena (ii. 6) settles her
position. The connexion had lasted a year when ii. 5 was written position. The connexion had lasted a year when ii. 5 was written (see ver. 109). It is worth noticing that Martial selects Nemesis as Tha sonrce of Tibullus's reputation, "fama est arguti Nemesis lasciva Tijulli" (Epigr., riii. 73, $\boldsymbol{1}$ ); compare xiv. 193, "ussit amatorem Nemosis lasciva Tibullum, in tota iuvit quem nihil esse domo," कbere, however, the second line is taken from one of the Delia elegries. Orid, Amores, iii. 9,58 , "me tonuit moriens deficiente masu." The point of this can only be seen by reference to Tib., i. 1 , 60, where Delia is addressed, "te teneam moriens deficiente manu." qneque, Vergilio comitem, non æqua, Tibulle, Mors iuvenem campos misit ad Elysios, ne foret aut elegis roolles qui fleret amores aut caneret forti regia bella pede."-Tibullus condemns the rougb handlin which the inamorata often suffered from her Roman iover, e.g., i. 10, 59-60-"A ! lapis est ferrumque, suam quieamyue puellam paraphrased abovo (ii. 6,41 ) is perbaps unmatcined in ancient poetry. "desino, ne dominæ luctus renoventur acerbi. Non ego sum tanti
ploret ut illa semel. "- His love for a rustic life and rustic wership appears throughout whole poems, as in i. 1 and ii. 1, 2. Of his poetry he says (ii. 4, 19), "Ad dominam faciles aditus per carmina quæro; ite procul, Musæ, si nilil ista valent."-Specimens of Tibullus at his best may be found in i. 1, 3, 89-94; 5, 19-36; 9, 45-68; ii.6. Quintilian says (Inst., x. 1, 93), "Elegia quaque Græcos provocamus, cuius mihi tersus atque elegans maxime ridetur auctor Tibullus; suut qui Propertium malint ; Ovidins utroque lascivior sicut durior Gallus." - Uvid (Am., l.c.) well calls bim cultus, Martial argutus," fine-toned." A short but not inadequate account of Tibullus's prosody is given by L. Mueller in his introduction to Tibullus (Calullus, Tibullus, und Propertius, Leipsic, 1880). Catullus and Tibullus lengthen a short vowel before $s p$ and fr; Propertius always keeps it short in similar conjunctions, eren where $s$ is followed by two consonants, as in striges. Catullus, and in three cases Tibullus, allow a trisyllabic verb to close the pentameter. Propertius never permits hinself this liberty, al. thougb in his earlier poems he bas as many trisyllabic endings as Tibullus. - The chronology of the first book is discussed amongst others by Bachrens (Tib. Bl., . Pp. 12-24). But the data do not admit in all cases of his precise determinations. Baehrens and Hiller (Horones, xviii. 353) agree that the secoud book was posthumous. Ji it bad been known to Oril when lie wrote bis elegy on the poet's death, it seams certain that be would bave quoted from it. Hiller assigns 2 B.C. as au inferior limit, by wbich time Or., Ars Am., iii. 3, $535 \mathrm{sq}$. ., must bare been written. Amongst the "disarranged noems" are i. 1, 4, 6 and ii. 3, 5. Proposed rearrangements of them may be found in Hiller's Tibullus (1.985). Charisius (pp. 66 and 105) qnotes part of a hexameter which is not found in the extant poems of Tibullus.

The Tibullian authorship of book iii. has long agy beeu surrendered by scholars. Its latest defenders bave been Fusi (De Elegg. Libro quem Lygdami esse putant, Münster, 1867) and the English translator, J. Cranstoun. It has been snggested that Lygdamus (৯újos, whito marble) is a Grecizing of Albius, some relation of Tibullus (compare Hiller, Hermes, xviii. 353, n. 2); and this is possible. Gruppe's long.exploded theory that Ovid was the autlor bas been recently revired by J. Kleeman (De Libri III. Carminibus qua Tibulli Nomine circumferuntur, Strasburg, 1876). Considerable difficulty is caused by iii. $5,15-20$, which contains agreements with three passages of Ovid, Ars Ani., ii. 669 sq.; Tr., iv. 10, 6: "cum cecidit fato consul uterque pari" (Lygdamus and Ovid nsing word for word the same expression for the year of their birth, the consulsbip of Hirtius and Pansa); and Am., xi. 14, 23 s\%., which are much too close to be accidental, and in which the theory that Ovid was the imitator is excluded by the fact that the lines are much more appropriate to their surroundings in Ovid than in Lygdamus. In cousequence Baehrens (Tib. Bl., 40) regards the poem as written after 13 A.D., the date of the Tristia, while Hiller (l.c., p. 359) regards the lines as a later addition by Lygdamus himself. In either case it would, be published after 13. The line quoted above may bave obtained proverbin currency before either of the passages was written, as the death of both consuls in one year would have impressed the Roman imagination as powerfully as the coiucident deaths of Adams and Jefferson did the American. In that case no part of book iii. need be later than the Cbristian era. For Lygdamus's imitations of Tiballus, see Gruppe, Die römische Elcgic, i. 112 sq. There are resemblances between the pseudo.Tibullus and the Catalepton (Baehr., op. cit., p. 52).-The view of Baehrens (Tib. Blätt., 49) and others that ifi. and iv. originally formed one book may now be considered established, in spite of Birt'ө objections (Das antike Buchwesen, 426 sq .) ; and Hiller in his edition prints them as one. They were published some time after book ii., probably after the death of Messala (Baehrens, op. cil., 48, adds, "and of his son Dlessalinus"). Further determination of the date is impossible. We do not know when they were added to the genuine poems of Tihullus; but it was probably before the Life was written. - Most scholars since Lachmann (Kl. Schr., ii., 149) hare condemned the "Panegrric on Messala." It is an iuflated and at the same time tasteless declamation, entirely dovoid of poeticab merit. The language is often absurdly exaggerated, e.g., 190 sq. The author himself scems to be conscious of bis own deficiencies ( $1 \mathrm{sq} ., 177 \mathrm{sq}$.). All that we know about him is that he, like so many of his contemporaries, had been reduced to poverty by the loss of his estates ( 181 sq .). The date is fized by 121 sq.-Sulpicia was the daughter of Servius Sulpicius (iv. 10 , 4), and she seems to have been under the tutelage of Mcssala (cf. 14, 5-8), her uncle by marriage (Haupt, Hermes, iv. 33 sq.). Cerinthus is a real name. He was probably a Greek (Eaehr., p. 41 and nots). Eo is not to be identified with the Cornutus addressed in Tib., ii. 2, 3. Gruppe (op. cit., 2 2) and Teuffel (Sudien, 367) attribute iv. 2-6 to Tibullus himself; but the style is different, snd it is best to answer the question as Brehrens does (p. 46) with a non liquct. For Sulpicia's style and its feminine Latinity, compare Gruppe (op. cit., i. 49 sq.).-The direct ascription of iv. 13 (verse 13 - "munc licet e caelo mittatnr amica Tibullo") to Tibullus probably led to its being included in the collection. Later on, it and
the epigram together caused the addition of the pseudo-Tibulliana to the genuine works. Although not suspected till recently, it is unquestionably spurious; see the examination by lostgate (Journ. of I'hil., ix. 280 sq.).-Theauthorship of the two Priapea (one an epigrant and the other a longer piece in iambics) is discussed by Hiller (Hermes, xviii. 343-9). His conclusions are that, as regards tho iambics, the theory that Tibullus was its author, though from the nature of the case ii does not admit of complete disproof, rests upon the slightest of foundations, and, as regards the epimam, that the bypothesjes of a Tibullian autborship is శuite ioaduissible.
The text of:10uHus is inamuch better condition than it was in Lachmana's time, thamks to $\$$. e recent ciscovery of new MSS. by E. Baehrens, Of these tho Ambrosianus (A), of date a bout 1374, and the Vaticanus (S), eod of the luth or becinniag of the 15 th century, agree so closely that they can be referred to nn original extant in the early part of the 13 th or $13 t h$ ccatury but lomg since iost. A third the Guelferbytanus (G), writhen in Lombard characters, but on parchuent "f the baginning of the 1 oth cealury. Baehrens, who athaches great inporta, in to the original readzus, of this codex, coasiders it a faithful copy of a 10 th or 11 th century MS. Buswles these we have a number of extracts fiow Tiluollusin the Florilejiun l'avis:unm, an anthology from various Latin writers which probably dates back to tho 11 th century, and which wo have frosm two MSS. at Paris (TGH7 and 179031: see Meyncke, Nhcin. Nus., Xxv. 3 sy. Bachrens considers that tbese cxcerpta Parisina and $G$ are closely connected, and that their orjcinal and that of $A$ and $V$ were both descended from a more ancient MS., which he calls $O$, but which was still full of corruptions, Thu so-called Excerpta Frisingensia, preserved is an 11 th-century MS. (zow at Munich), but unfortunately very few in number, are extrncted from a much bettes MS. than O. Still better was tbe Fragmentum Cuiacianum, which we koวw enly from Scaliger's collation (in the library at Leyden), aad which is to be carcfully distinguished from the codex Cuacianns, s late MS. containing Catullus, Tibullus, and Propertios, and still extant. It only contanca from iii. 4, 65 to the end. The codices which Lachnamn used are later thma all the forecoing and full of interpolations. Baehreas's estimate of the M (s, anthoritica for 'libullus has not becn zecepted in sll its dotails. In particular his high estimate of G has been dispoted by Leo, op. cit., p. S; Rothstein, De Tibulli Codicibus, p. 67 sq. (who also endeavours to raise Lachmann'a MSS. to an inde. penuent position again) ; and others. R. Leonhard, in a careful disserta. tion, De Codicious Tibullianis Capita Tria (Munioh, 18S2), agrees with Baehreas it the Main, though lis pedigrec of the MSS. (p.53) is more elaborate.
Editions.-The lirst two editions of Tibullos and tho pseudo-Tibulliana are that with Catullos, Fropertius, and the Silve of Statias by Vindelin de Spira (Yeaice, 1172) and one of Tibullus separately by Floreotins de Argentian, probably priutcd in the same year. Compare IIuschke, Tibullus, Prof, vi, sq., axiii, sq. Amongst others we may nention those by Scaliger (with Catullas and Fropertius, Paris, 1577, 15S2, \&c.), Broukhoys (Amsterdam, 170s), Vulpius (iaiva, J74), lfeyve (Leipsic, 1S17, 4lı ed. by Wunderlich: with supplement
 by Dissen, 1919), Ifuschke (Leipsic. 1819, 2, vols, Lachmant (Berlin, 1829, the first critical edition), Dissen (Gottingen, 1885 ). The inost important edition With critical apparatus is that of E. Baehreus (Lcipsic, 1sis). The most recent cdition, with critical inlroduction and index, is E. Hiller'a (Leipsic, 1885). Recent texts are those of L. Moeller (Leipsic, 1SSO; also with Catullus and Propertils) and Halupt-Vahlen (Leipsic, 1885 ). There is no good recent enmmentary on Tibullus; wehave to fall back on Heyne and Dissen. That by B. Fabricius (Berlid, 1881 ) does not even comprise all the poems. Some contributions are made to the sulject in F. Leo's paper in Kiessling's and WilamowitzAloellendorfs Hhilol. Unters., ii. P. $\$$ sq., and by J. Vablen in the Monalsberichte of the Ucrlin Academy, 1s78, ppo 343-356. For fuller billiographies, seo Engelmentis Dibliothecr Scriptorum Lntinorum (cd. Prenss, 18S2) and J. E. B. Mayor'a Bibliographical Clue to Latin Literalure (1875). For the older editions, see the preface to Husch\&e's. There is an excellent account of Tibullins in W. 8. Teuffel's Gesch. $d$. römisch. Literatur (4th ed., L. Scbwabe, 18S2). Those in the Eng. tr. and Pauly's Real-Encyhlopadie Rre antiquated. The following translations into English verse are known,-by Dare (Londoa, 2720), Grainger (London, 1789, 2 vols., with Latin texi adad notes, subsequently reprinted), Cranstoun (Edinhurgh and London, 1SEn). An Essay towards a New Edition of the Elegies of Tibullus, with a 'IVanslation and Nopes (London, 1722), tnerely cont.aios i. I and T, $29 \cdot 19$. Sir C. A. Elton, Specimens of the Classic Pocts (Loudon, 1SI 4, vol. xii. 141-171) contains i. $1 ; i 1.4 ;$ iii. $2.4 ;$ 6, 39 to end; iv. 2, 3. To thess ahould probably be added Tibullus, with other Translations from Oviu, Horace, \&ec., by Richard Whiffin, London, 1829 . Cranstoun's is the only comflete version of merit; but it is far inferior to the trauslations by Elton, from

TICINO, or Tessis, a canton of Switzerland, ranking as eighteenth in the Confederation, consists of tho upper basin of the river from which it takes its name, -the Val Leventina, with the tributary valleys of Blegno and Maggia -and farther south takes in the districts of Lugano and Mendrisio between Lakes Maggiore and Como. Its total area is $1088 \cdot 2$ square miles, which is exceeded by only four other Swiss cantons, -Graubiinden (Grisons), Bern, Valais, and Yaud. Of this 725.8 squate miles are classed as productive, including 215.3 square miles covered by forcsts and 33.8 by vines; of the uuproductive portion 24.3 zquare miles are occrppied by lakes (most of that of Lugano belouging to the canton) and $13 \cdot 1$ ly glaciers. The highest points in the canton are the Dasodino ( 10,749 fect) in the north-west and the Talrhein ( 11,148 feet) in the north-east corners. In 1880 the population was 130,777 (the females cxcecding the males by 10,000 , doubtless owing to the ennigration of tho latter), beily an increase of 11,158 on that of 1870 ; the increaso was particularly marked in the lal Jwontina and is due to the influcuec of the St Gothard Railway, which traverses
the citire canton. Of this population 129,409 speak Italian: 342 of the remainder form the German-speaking hamlet of Bosco or Gurin in the Yal Caverna (in northwest), a colony from the neighbouring valley of Formazza or Pommat, which is politically Italian. In religion 130,017 are Ioman Catholics. Until 1859 Ticino was partly (Yal Leventina, Yal Blegno, and the Riviera) in the metropolitan diocese of Nilan, chiefly in that of Como, and is still practically (though not legally) administered by these two bishops,-all attempts made lietherto to incor. porate them with the see of Chur or to secure the erection of a special see for them haring failed. The chief townare Lugano (6129 inlabhitants), Airolo (367.1), Mendrisic (2749), Locarno (2645), and Bellinzona (2436). Formerly Lugano, Locarno, and Bellinzona were the capital by turns of six years cach; but since 1881 the seat of government has been permanently fixed at Bellinzona. Ticino slands in a conparatively low position as regards moral, educational, agricultural, and commercial matters. It has produced a number of sculptors, painters, and architects. Many of the men migrate during the sunmer in search of work as picture-dealers, waiters in caft́s, climney-sweeps, and especially as masons, plasterers, labourers, and navvies. A large quantity of fruit is grown ; the chicf articles exported are cattle, hay, fish, chestnuts, and earthenware. In manners, customs, and gencral character the inhabitants strongly rescmble their Italian neighbours.
The canton is made up of all the permancht conquests (with one or two trifling exceptions) made by different members of the Swiss League south of the main chain of the Alps. From nu listorical point of view Italian Switzerland falls into three grouns: -(1) Yal Leventina, conquered by Uri in 1440 (previonsly helf from 1403 to 1426); (2) Bellinzona, the Riviera, and Val Bleguo (held from 1419 to 1426), won in 1500 from the duke of Dilain by mens from Uri, Schryz, and Nidwald, and confirmed by Louis XII. of France in 1503 ; (3) Locarno, Yal Maggia, Lugano, and Mendrisio, scized in 1512 by tho Confederates when fighting for the Holy League against France, rulcal by the twelve members then in the League, and confirned by Francis 1 . in the treaty of 1516 . Theso districts' were goverued by bailiff lolding office two ycars and purchasing it from the inembers of the League; each member of group 3 sent annually an envoy, who conjointly constituted tho supremo appeal in all matters. This governnent was very harsh and is one of the darkest pages in Swiss listory. Yet only one open revolt is recorded-that of the Leventina against Uri in 1755. In 1798 the peeplle were distracted hy the Swiss and "Cisalpine republic" partics, but sided with the Swiss. On being freed from their hated inasters, they were formed into two cantons of the 11elvetic republic-Bellinzona ( $=1$ and 2 above) and Lugano ( $=3$ ). In 1803 all these districts were formed into one canton-Ticinowhich became a full member of tho Swiss Confederation. From 1810 to 1813 it was occupied by the troops of Napoleon. The roads over the Bernardino (1819-22) and the St Gotthard (1520-30) were mado under the constitution of 1814. But many of the ol. 1 troubles reappeared and were only done away with by the constitution of $23 d$ July 1830, which (with subsequent modifications) prevails at tho presont time. A legislative assembly ( 112 niembers) chosen by dircet election and an executive (5 mentibers) closen by tho legislaturo are its principal features. Tho "optional referchdum " (pernitting the sulbission of any lavy to a popular vote if asked for by a certain number of citizens) was adopted in 1883. In 18 48 , on religious grounds and owing to feals as to customs duties, the canton yoted in the sainority against the Foderal constitution of that year; but in 1874, though the people yoted against the rerised constitution, the logislature alop ted it, and the canton was counted as one of tho majerity. Since 1830 ticic local listory of the canton has been very disturbed owing to tho fact that, though Rornan Catholicism is the state religion, and all the poppulation are Roman Catholic (tho few Protestants having been expellell from Locarno in 1555), they are divided between the liadical nod Ultrainontane parties. Sinco 1576 tho intervention of Fclcral troops (already known in 1870) has been quite common in consennenco of conflicts of the local authorities inter sc, or agaiust tho Federal assenubly.
Sce Der К゙rndon Tessin, by Stefano Frauscinl (St Gsit, IS33).

## Tici. Sec Mite.

TICKELL, Twomas (1686-1740), English man of letters, the son of a clergyman, was born at linidekirk; near Carlisle, in 1686. After a good preliminary sducation be
went to Queen's College, Oxford, where in 1708 he took his degree, and of which college he was two years later elected fellow. He did not take orders, but by a dispensation from the crown was allowed to retain his fellowship until his marriage in 1726. As a poet Tickell displayed very mediocre qualities. His success in literature, as in life, was mainly due to the friendship and patronage of Addison, who pronured for him (1717) the under-secretaryship of state, to the chagrin of Steele, who thenceforth bore Tickell no good will. During the peace negotiations with France Tickell published the Prospect of Peace, which was well spoken of in the Spectator and reached a sixth edition. In 1717 he brought out a translation of the first book of the Iliad contemporaneously with Pope's version. Kensington Gardexs, his longest poem, which appeared in 1722, is inflated and pedantic, and was doomed to oblivion from its birth. Dr Johnson's criticism of it gives it its due meed of praise and blame. The most popular of Tickell's poetical writings was the ballad of "Colin and Lucy," which will bear comparison with somo of the ballad poems of Wordsworth. Whether from fear of Pope's rivalry or from unbiassed choice, Tickell abandoned the translation of the Iliad and set about rendering the Odyssey and Lucan into English. In 1725 he was appointed secretary to the lords justices of Ireland, -a post which he retained until his death, which took place at Bath on 23d April 1740. Tickell rose once above the level of mediocrity, when he wrote his elegy addressed to the earl of Warwick on the death of Addison. Posterity has endorsed Dr Johnson's affirmation that this elegy is equal in sublimity and elegance to any funeral poem which had theretofore appeared, -and this notwithstanding Steele's canstic disparagement, that it was only "prose in rhyme.". Tickell also contributed to the Spectator and the Guardian.
See "T. Tickell," in Johnson's Lives of the Poets; the Spectator ; Anderson's Engtish Poets; Ward's English Poets.
TICKNOR, George (1791-1871), historian of Spanish literature, was born at Boston (Mass.), on 1st August 1791. He received his early education from his father, Elisha Ticknor, who, thongh at that time in business, bad been principal of the local Franklin public school and was the originator both of the system of free primary schools in Boston and of the first New England savings-bank. He studied at Dartmonth College from 1805 to 1807, and on leaving it was placed for nearly three years under Dr Gardiner, a pupil of Dr Parr. In the autumn of 1810 Ticknor entered the office of a leading Massachusetts lawyer, and, though his studies appear to lave been literary rather than legal, he was admitted to the bar in 1813. He at once commenced practice; but a year's experiment convinced him that scholarship and letters would be more congenial to his abilities. In the spring of 1815 be set sail for England. Attractive in appearance, cnltured, vivacions, and sympathetic, he had won many influential friends in America, and his introductions gave him access to most of khe men then worth knowing in Europe. He spent nearly two jears at Göttingen; but he also visited the chief towns on the Continent, meeting Prescott for the first time at Paris, and spending some months in Spain and Portugal, the life and literatures of which had already strong attractions for him. Returning to America in the summer of 1819, he was inducted in the Augnst following to the Smith professorship of French and Spanish literature and to the college professorship of belles-lettres at Harvard. The history and criticism of Spanish literature was in many respects a new subject at that time even in Europe, -the Spaniards themselves having no adequate treatment of their literature as a whole, and both Bouterwek and Sismondi having worked with scanty or second-hand resources. To supply this want, therefore, he gave his most
serious thought, developing in his lectures the scheme of his more permanent work. In June 182.1 his father died, and in Scptember be marriod Anna, daughter of Samuel Eliot, a merchant and founder of the chair of Greek literature at Harvard College. In tho years following 1821 Tickn made a vain effort to irtroduce measures of university reform. The death of his only son in 1834 and the subsequent failure of his wife's health led him to resign his post at Cambridge to Longfellow; and in the spring of 1835 he again went to Europe, where he remained until 1838. From that time till his death he lived chiefly at Boston. Till 1849 he published only occasional reviews and papers, such as his essays on Moore's Anacreon, on Milton's Paradise Lost, and on Thatcher's Sernons, in 1812; on Michael Stiefel, in 1816 ; on Griscom's Tour in Europe and on General La Fayette, in 1824 ; on amusements in Spain and on changes in Harvard College, in 1825 ; on Chateaubriand, in 1827 ; on Daniel Webster, in 1831; and on the best mode of teaching living languages, in 1832. His History of Spanish Literature, the first editions of which appeared inp New York and London in 1849, was welcomed on all hands as the standard work on the subject, and was rapidly translated into Spanisl and other Continental languages. Whatever its defects, it at least reduced to system and clearness a large mass of varied historical material hitherto only vagucly known ; and its copious references to authorities and editions and its loving exploration of the byeways of the literatnre made it as valuable to scholars as its direct and unpretentious style made it popular with general readers. In many respects it was the admirable literary complement of the historical work of Prescott. Like his, the bent of Ticknor's mind was expository rather than critical; and in both cases the standards applied were of a conventional rather than of an advanced nature. As with Prescott the glow of vivid narration often hides rather than reveais the underlying problems of social and philosophic import, so with Ticknor a certain fund of graceful and genial commonplace is apt to gloss over the really vital critical issues of the subject-matter. At crucial moments in place of the keener edge of criticism one is apt to find only the paper-knifo intelligence of the ordinary book-lover. The defect, however, was common to the critical schools of the time. The merits of the work in its accurate survey of comparatively untrodden ground were individual and of an exceedingly high order. Ticknor subsequently took an active part in the establishment of the Boston public library, in the interests of which he paid in 1856 another visit to Europe, and to which he left at his death his fine collection of Spanish and Portuguese works. In 1859, on the death of Prescott, he at once began to collect materials for a life of his friend, which was published in 1864. His death took place at Boston on 26th January 1871.

A Life of Ticknor, with his letters and journals, was edited by George S. Hillard, Boston, 1876.

TICONDEROGA, a village and township of the United States, in Essex county, New York, situated upon the stream connecting Lakes George and Champlain, and cxtending back upon an abrupt promontory which separates the two lakes. Two railroads enter the village,-tho Delaware and Hudson and a branch of the Central Termont. The population in 1880 was 3304.

Coummanding the direct route from the St Lawrence to the Hudson, Ticonderoga was early seized by the French and fortified under the name of Fort Carillon. In July 1758 it was unsuccessfully attacked by Abercrombic. In the same month of the succeeding year it was abandoned by the French upon the approach of an English army under Amherst, who occupied it and greatly strengthened its works. At the beginning of the Revolution, in 1775, the fort was surprised and captured by Ethan Allen and a party of Vermont militia. In 1778 it was retaken by the Engish unde. Burgoyne and was held by them until the close of the war.

## TIDES

I. On the Nature of Tides.
§ 1. Definition of Tide.

WTHEN, as occasionally happens, a ship in the open sea meets a short succession of wares of very unusual magnitude, we hear of tidal waves; and the large wave caused by an earthquake is commonly so described. The use of the term "tide" in this connexion is certainly incorrect, but it has perhaps been fostcred by the fact that ouch waves impress their records on automatic tide-gauges, as, for example, when the wave due to the volcanic outbreak at Krakatoa was thus distinctly traceablo in South Africa, and yerhaps even faintly at Brest. We can only adequately define a tide by reference to the cause which produces it. A tide then is a rise and fall of the water of the sea produced by the attraction of the sun and moon. A rise and fall of the sea produced by a regular alternation of day and night breezes, by regular rainfall and evaporation, or by any influence which the moon may have on the weather cannot strictly be called a tide. Such alternations may, it is true, be inextricably involved with the rise and fall of the true astronomical tide, but we shall here distinguish them as meteorological tides. These morements are the result of the action of the sun, as a radiating body, on the earth. Tides in the atmosphere would be shown by a regular rise and fall in the barometer, but such tides are undoubtedly very minute, and wo shall not discuss them in this article, merely referring the reader to the Mécanique Céleste of Laplace, bks. i. and xiii. There are, however, very strongly marked diurnal and semi-diurnal inequalities of the barometer due to atmospheric meteorological tides. Sir William Thomson in an interesting speculation ${ }^{1}$ shows that the interaction of these quasi-tides with the sun is that of a thermodynamic engine, whereby there is caused a minute secular acceleration of the carth's rotation. This matter is, however, beyond the scope of the present article. We shall here extend the term "tide" to denote an elastic or viscous periodic deformation of a solid or riscous globe under the action of tide-generating forces. In the technical part of the article by the term "a sinnple tide" we shall denote a spherical harmonic deformation of the water on the surface of the globe, or of the solid globe itself, multiplied by a simpla harmonic function of the time.

## §2. General Description of Tidal Phenomenu. ${ }^{2}$

If we live by the sea or on an estuary, we see that the water rises and falls nearly twice a day; speakiug more exactly, the average interval from high water to high water is about $12^{\text {b }} 25^{\text {m }}$, so that the average retardation from day to day is about $50^{\mathrm{m}}$. The times of high water are then found to bear an intimate relation with the moon's position. Thus at Ipswich high water occurs wleen the moon is nearly south, at London Bridge when it is southwest, and at Bristol when it is east-south-east. For a very rough determination of the time of ligh water it is ruffrient to add the solar time of high water on the days of new and full moon (called the "establishment of the port") to the time of the moon's passage over the meridian, either visibly abore or invisibly belor the horizon. The interval between the moon's passage orer the meridian and high water varies sensihly with the moou's age. From new moon to first quarter, and from full moon to third quarter (or sather from and to a day later than each of these phases), the interval diminishes from its average to a mini-

[^139]mum, and then increases again to the average; and in the other two quarters it increases from the average to a maximum, and then diminishes again to the average.

The range of the rise and fall of water is also subject to great variability. On the days after new and full moon the range of tide is at its maximum, and on the day after the first and third quarter at its minimum. The maximum is called "spring tide" and the minimum "neap tide," and the range of spring tide is usually between tro and three times as great as that of neap tide. At many ports, howrever, especially non-European ones, two successive high waters are of unequal heights, and the law of variability of the difference is somewhat complex; a statement of that law will be easier when we come to consider tidal theories. In considering any tide we find, especially in estuaries, that the interval from high to low water is longer than that from low to high water, and the difference bctween the intervals is greater at spring than at neap.

In a river the current continues to run up stream for Piver some considerable time after high water is attained and tides to run down similarly after low mater. Much confusion has been occasioned by the indiscriminate use of the term "tide" to denote a tidal current and a rise of water, and it has often been incorrectly inferred that high water must have been attained at the moment of cessation of the upward current. The distinction between "rising and Distinofalling" and "flowing and ebbing" must ve carefully rise and maintained in rivers, whilst it vanishes at the sealoard. fall from If we examine the progress of the tide-wave up a river, ebb.
we find that high water cscurs at the sea earlier than higher up. If, for instance, on a certain day it is high water at Margate at noon, it is high water at Gravesend at a quarter past two, and at London Bridge a few minutes before three. The interval from low to high water diminishes also as we go up the river; and at some distance up certain rivers-as, for example, the Severn-the rising rater spreads over the flat sands in a roaring surf and travels ups the river almost like a wall of water. This kind of sudden rise is called a "bore." s In other cases where the differ. enco between the periods of rising and falling is considerable, there are, in each high water, two or three rises and falls. A double high water exists at Southampton.

When an estuary contracts considerably, the range of tide becones largely magnified ns it narrows ; for ezample, at the entrance of the Bristol Channel the range of spring tides is about 18 feet, and at Chelistow about 50 feet. This augmentation of the height of the tide-wave is due to the concentration of the energy of motion of a large inass of water into a harrow space. At oceanic prorts the tidal phenomena are much less marked, the range of tide being usually only 2 or 3 feet, and the interval from high to low water eensibly equal to that from low to high water. The changes from spriug to neap tide and the relation of the time of high rater to the woon's transit remain. however, the same as in the cace of the river tides.

In long and narrow seas, snch as the English Cfuannel, the tide in mid-channel follows the same law as at a station near the mouth of a river, rising and falling in cqual times; the current runs in the direction analngous to up rtream for three hours before and after high water, and down atream for the same period vefore and after low water. But near the sides of chaunels and near the mouths of bays the changes of the curreuts are very complex; and near the headlands separating two lays there is usually at certain times a very swift current, termed a "race."

[^140] Thomeon, in Hhu, Nig., 1886-87.

In inland seas, such as the Mediterranean, the tides are nearly insensible except at the ends of long bays. Thus at Malta the tides are not noticed by the ordinary observer, whilst at Venice they are conspicuous.
The effect of a strong wind on the height of tide is generally supposed to be very marked, especially in estuaries. In the case of an exceptional gale, when the wind veered round appropriately, Airy states ${ }^{1}$ that the water has been known to depart frem its predicted height at London by as much as 5 feet. The effect of wind will certainly be different at each port. The discrepancy of opinion on this subject appears to be great,-so much so that we zear of some observers cencluding that the effect of the wind is insensible. Variations in barometric pressure also cause departures from the predicted height of rater, high barometer corresponding to decrease of height of water. Roughly speaking, an inch of the mercury column will correspond to something less than a foot of water, but the effect seems to vary much at different perts. ${ }^{2}$

## § 3. General Explanation of the Cause of Tides.

## ride-

 zenerat. ing Sorces.The moen attracts every particle of the earth and ocean, and by the law of gravitation the ferce acting on any particle is directed towards the moon's centre, and is jointly propertional to the masses of the particle and of the moon, and inversely proportional to the square of the distance between the particle and the moon's centro. If we imagine the earth. and ocean subdivided into a number of small portions or particles of equal mass, then the average, both as to direction and intensity, of the forces acting on these particles is equal to the ferce acting on that particle which is at the earth's centre. Fer there is symmetry about the line joining the centres of the two bodies, and, if we divide the earth into two portions by an ideal spherical surface passing through the earth's centre and having its centre at the moon, the portion remote from the moon is a little larger than the pertion tewards the moen, but the nearer pertion is under the action of forces which are a little stronger than these acting on the further portion, and the resultant of the weaker forces on the larger portion is exactly equal to the resultant of the stronger forces on the smaller. If every particle of the earth and ocean were being urged by equal and parallel forces, there would be no cause for relative motion between the ocean and the earth. Hence it is the departure of the ferce acting on any particle from the average which constitutes the tidegenerating force. Now it is obvious that on the side of the earth towards the meen the departure from the average is a small force directed towards the moon; and on the side of the earth away from the moon the departure is a small force directed away from the moon. Also these two departures are very nearly equal to one another, that on the near side being so little greater than that on the other that we may negloct the excess. All reund the sides of the earth along a great circie perpendicular to the line poining the moon and earth, the departure is a ferce directed inwards towards the earth's centre. Thus we see that the tidal forces tend to pull the water towards and away from the moon, and to depress the water at right angles to that direction. If we could neglect the rotations of the bodies, and could consider the system as at rest, we should find that the water was in equilibrium when elongated inte a prolate ellipsoid with its long axis directed towards and zway from the moen.

But it must not be assumed that this would be the case When there is motion. Fer, suppose that the ocean consisted of a canal reund the equator, and that an earthquake or any other saluse were to generato a grat wave in the canal, this wave would travel along it with a velocity de-

[^141]pendent on the depth. If the canal were about 13 miles deep, the velocity of the wave would be about 1000 miles an heur, and with depth about equal to the depth of our seas the velocity of the wave would be about half as great. We may conceive the moon's tide-generating force as making a wava in the canal and continually outstripping the wave it generaies, for the moon travels along the equator at the rate of about 1000 miles an hour, and the sea is less than 13 miles deep. The resultant oscillation of the ocean must therefore be the summation of a series of partial waves generated at each instant by the moon and always falling behind her, and the aggregate wave, being the same at each instant, must travcl 1000 miles an hour so as to keep up with the moon.

Now it is a general law of frictionless oscillation that, if a slowly varying periodic force acts on a system which would oscillato quickly if left to itself, the maximum excursion on one side of the cquilibrium position occurs simultaneonsly with the maximum foree in the dircction of the excursion ; but, if a quickly varying periodic force acts on a system which would oscillate slowly if left to itself, the maximum excursion on one side of the equilibrium position occurs simultaneously with the maxinum force in the dircction opposite to that of the excursiou. An example of the first is a ball hanging by a short string, which we push slowly to and fro ; the ball will never quit contact with the hand, and will agree with its excursions. If, however, the ball is hanging by a long string we can play at battledore and shuttlecock with it, and it always meets our blows. The latter is the analogue of the tides, for a free wave in our shallow canal gees slowly, whilst the moon's tide-generating action goes quickly. Hence, Tides inn When the system is left to settle inte steady oscillation, it verted is low water under and opposite to the moon, whilst the ferces are such as to make it high water at those times.

If we consider the moon as revelving round the earth, the water assumes nearly the shape of an oblate spheroid with the minor axis pointed to the moon. The rotation of the earth in the actual case introduces a complexity which it is not easy to unravel by general reasoning. We can see, howverer, that if water moves frem a lewer to a higher latitude it arrives at the higher latitude with mere velocity frem west to cast than is appropriate to its latitude, and it will move accordingly on the earth'e surface. Following out this conception, we see that an oscillation of the water to and fro between south and north must be accompanied by an eddy. Laplace's solution of the difficult problem involved in working out this idea will be given below.
The conclusion at which we have arrived about the tides of an equaterial canal is probably more nearly true of the tides of a glebe partially covered with land than if we were to suppose the ocean at each mement to assume the prelate figure of equilibrium. In fact, observation shows that it is more nearly low water than high water when the moon is on the meridian. If we consider hew the oscillation of the water would appear to an observer carried round with the earth, we see that he will have low water twice in the lunar day, semewhere about the time when the moon is on the meridian, either above or below the horizon, and high water half way between the low waters.

If the sun be now introduced, we have another similar tide of about half the height, and this depends on solar time, giving low water somewhere about noon and midnight. The superposition of the tro, modified by friction and by the interference of land, gives the actually obscrved aggregate tide, and it is clear that about new and full moon we must have spring tides and at quarter moons neap tides, and that (the sum of the lurar and solar tidegenerating forces being about three times their difference)
the range of spring tide will be about three times that of neap tide.
So far we have supposed the luminaries to move on the equator; now let us consider the case where the moon is not on the equator. It is clear in this case that at any place the moon's zenith distance at the upper transit is different from her nadir distance at the lower transit. But the tide-generating force is greater the smaller the zenith or nadir distance, and therefore tho forees are different at successive transits. This was not the caso when the moon was deemed to movo on the equator. Thus there is a tendency for two successive lunar tides to be of unequal heights, and the resulting mequality of height is called a "diurnal tide." This tendency vanishes when the moon is on the equator; and, as this occurs each fortnight, the lunar diurnal tide is evanescent onco a fortuight. Similarly in summer and winter tho successive solar tides are generally of unequal height, whilst in spring and autumn this difference is inconspicuous.

One of the most remarkable conclusions of Laplace's theory of the tides, on a globe corered with ocean to a nniform depth, is that the diumal tide is everywhere nonexistent. But this hypothesis differs much from the reality, and in fact at some ports the diurnal tide is so large that during two portions of each lunation there is only one great high water and one great low water in each twentyiour hours, whilst in other parts of the lunation the usual semi-diurnal tide is observed.

## §4. Historical Skelch. ${ }^{1}$

In I687 Newton laid the foundation for all that has since been added to the theory of the tides when he brought his grand generalization of universal gravitation
Kopler. to bear on the subject. Kepler had indeed at an earlier date recognized the tendency of the water of the ocean to move towards the centres of the sun and moon, but he was unable to submit his theory to calculation. Galileo expresses his regret that so acute a man as Kepler should have produced a theory which appeared to him to reintroduce the occult qualities of the ancient philosophers. His own explanation referred tho phenomenon to the rotation and orbital motiou of the earth, and he considered that it afforded a principal proof of the Copernican system.

In the 19th corollary of the 66th proposition of book i . of the Principia, Nerton introduces the conception of a canal circling the earth, and he considers the influence of a satellite on the water in the canal. He remarks that the movement of each molecule of fluid must be accelerated in the conjunction and opposition of the satellite with the molecule, and retarded in the quadrateres, so that the fluid must undergo a tidal oscillation. It is, however, in propositions 26 and 27 of book iii. that ho first determines the tidal force due to the sun and moon. The sea is here supposed to cover the whole earth, and to assume at each instant a figure of equilibrium, and the tide-generating bodies are supposed to move in the cquator. Considering only the action of ihe sun, he assumes that the figure is an ellipsoid of revolution with its major axis directed towards the sun, and he determines the ellipticity of such an ellipsoid. High solar tide then occurs at noon and midnight, and low tide at sunrise and sunset. Tho action of the moon produces a similar ellipsoid, but of greater ellipticity. The superpositiou of these ellipsoids gives the principal variations of tide. He then procceds to consider the influence of latitude on the height of tide, and to discuss other peculiarities of the phenomenon. Observation shows, however, that spring tides occur a day and a half after syzygies, and Newton falsely attributed

[^142]this to the fact that the oscillations nould last for some time if the attractions of the two bodies were to cease.

The Newtonian hypothesis, although it fails in the form wheh he gave to it, may still be mado to represent the "Astrea tides, if the lunar and solar ellipsoids have thetr major fictifs" ares always directed towards a fictitious noon and sun, which are respectively at constant distances fron the true bodies; these distances aro such that the syzygies of the fictitious plancts occur about a day or a day and a lialf later than the true syzygics In fact, the actral tirles may be supposed to be generated directly by the action of the real sun and moon, and the wave may be inagined to take a day and a half to arrive at the port of obsecvation. Thus period has accordingly been called "the age of the tide." In what precedes the planets have been supposed to more in the equator; but the theory of the two ellipsoids cannot bo reconciled with tho truth when they more in orbits inclined to the equator. At equatorial ports the theory of the ellipsoids would sit spring tides give morning and evening high waters of nearly equal height, whatever tho declinations of the bodies. But at a port in any other latitude these high waters mould be of very different heights, and at Brest, for example, when the declinations of the bodies are equal to the obliquity of the elliptic, the evening tide would be eight times as great as the morning tide. Now obscrvation shows that at this port the two tides are nearly equal to one another, and that their greatest difference is not a thirticth of their sum.

Newton here also offered an erroneous explanation of the phenomenon. In fact, we sh II see that by Laplace's dynamical theory the diurnal tid is evanescent when the ocean is of uniform depth over tlo carth. At many nonEuropean ports, however, the diurnal tide is very important, and thus as an actual means of prediction the dynamical theory, whero the ocean is treated as of uniform depth, may be hardly better than the equilibriur. theory.

In 1738 the $\Lambda$ cademy of Sciences of Paris offered, as a D. Bernsubject for a prize, the theory of the tiles. The authors oulliand of four essays received prizes, viz, Daniel Bernoulli, Euler, Maclaurin, and Cavalleri. The 1 rst three adopted not only the theory of gravitation but also Newton's method of the superposition of tho two ellipsoids. Bernoulli's essay contaiued an extended derelopmeut of the conception of the two ellipsoids, and, under the name of the equilibrium theory, it is commonly associated with his name. Laplace gives an account and critique of th:e essays of Bernoulli and Euler in the Mécanique Céleste. The essay of Maclaurin presented little that was new in tidal theory, but is notable as containing those theorems coneerning the attraction of ellipsoids which we now know by his name. In 1746 D'Alembert wrote a paper in which he treated the tides of the atmosphere; but this work, like Maclaurin's, is chiefly remarkable for the importance of collateral points.

The theory of the tidal movements of an ocean was therefore, as Laplace remarks, alinost untouched when in 1774 he first undertook the subject. In the Mécanique Cefleste ho gives an interesting account of the manner in which he was led to attack the problem. We shall give below the investigation of the tides of an occan covering the whole earth; tho theory is substantially Laplace's, although presented in a somewhat different form. This theory, although very wide, is far from representing the tides of our ports. Observation shows, in fact, that the irregular distribntion of land and water and the variablo depth of the ocean produco an irregularity in the oscillan tions of the sea of sueh complexity that the rigorous solution of the problem is altngether beyond the power of analysis. Laplace, however, rested his discussion of tidal observation on this principle-The state of oscillation of "1 system of borlies in which the primilive conditions of move
ment have disappeared through friction is coperiodic with the forces acting on the system. Hence, if the sea is solicited Dy a periodic force expressed as a coefficient multiplied by the cosine of an angle which increases proportionately with the time, there results a partial tide, also expressed by the cosine of an angle which increases at the same rate; but the phase of the angle and the coefficient of the cosine in the expression for the height may be very different from those occurring in the corresponding term of the equilibrium theory. The coefficients and the constants or epochs of the angles in the expressions for the tide are only derivable from observation. The action of the sun and moon is expressible in a converging series of similar cosines; whence there arise as many partial tides, which by the principle of superposition may be added together to give the total tide at any port. In order to unite the several constants of the partial tides Laplace considers each tide as being produced by a fictitious satellite moving uniformly on the equator. Sir W. Thomson and athers have followed Laplace in this conception; but in the present article we shall not do so. The difference of treatment is in reality only a matter of phrascology, and the proper motion of each one of Laplace's astres fictifs is at once derivable from the argument (or angle under the sign of cosine), which we shall here associate with the partial tides.
Lubbock, Subsequently to Laplace the most important workers in Whewell, this field were Sir John Lubbock (senior), Whewell, and

Airy. The work of Labboek and Whewell (see § 34 below) is chiefly remarkable for the coordination and analysis of enormous masses of data at various ports, and the construction of trustworthy tide-tables and of cotidal maps. Airy contributed an important review of the whole tidal theory. He also studied profoundly the theory of waves in canals, and explained the effects of frictional resistances on the progress of tidal and other waves. Of other authors whose wurk is of great importance we shall speak below.

Amongst all the grand work which has been bestowed on this difficult snbject, Newton, notwithstanding his errors, stands out first, and next to lim we must rank Laplace. However original any future contribution to the science of the tides may be, it would seem as though it must perforce be based on the work of these two.
Biblio. graply.

A complete list of works bearing on the theory of the tides, from the time of Ncwton down to 1881, is contained in vol. ii. of the Bibliographie de l'Astronomie by Houzeau and Lancaster (Brussels, 18S2). This list does not contain papers on the tides of particular ports, and we are not aware of the existence of any catalogue of works on practical observation, reduction of observations, prediction, and tidal instruments. Feferences are, however, given below to several works on these points.

## II. Tine-generating Forces.

## § 5. Investigation of Tide-ycncrating Polcnlial and Forecs.

We lave already given a general explanation of the mature of tide-generating forces; we now proced to a rigorous investigation.

If a planct is attended by a single satellite, the motion of any body relatively to the planet's surface is found by the process described as reducing the planet's centro to rest. The planet's centre will be at rest if every body in the system has impressed on it a velocity equal and opposite to that of the planct's centre ; and this is accomplished by impressing on every body an acceleration equal and opposite to that of the planet's centre.

Let $M,, n$ be the masses of the planct and the satellite ; $r$ the radius vector of the satellite, measured from the planct's centre ; $P$ the radius vector, measured fron the sane point, of the particle whose motion we wish to determine; and $z$ the angle between $r$ and $\rho$. The satellite moves in an elliptic orbit about the planet, and the acceleration relatively to the planct's centre of the satellite is $(M+m) y r^{3}$ towards the planet along the radius rector $\gamma$. Now the centre of inertia of the planet and satellite renains fixed in space, and the centre of the planct describes an orbit round that centre of inertia similar to that described by the satellite round the planet, but with linear dimensions reduced in the proportion of $m$ to $M+n$.

Hence the acceleration of the planct's centre is $m / r^{2}$ towavis the centre of inertia of the two bodics. 'Thus, in order to reduce the planet's centro to rest, we apply to crery partucle of the system an acceleration $m / r^{2}$ parallel to $r$, and directed from satellite to planet.

Now take a set of rectangular axes fixed in tho planct, and let $M_{1} r, M_{2} r, M_{3} r$ bo the coordinates of the satellite referred thereto: and let $\xi, \eta \rho$, $s p$ be the coordinates of the particle $P$ whose radins is $\rho$. Then the component accelerations for relucing the planet's centro to rest are $-m \mathrm{M}_{1} / r^{2},-m \mathrm{M}_{2} / r^{2},-m \mathrm{M}_{3} / r^{n}$; and since these are the differential coeflicients with respect to $p \xi, p \eta$, ps of the function

$$
-\frac{m \rho}{r^{2}}\left(\mathrm{~N}_{1} \xi+\lambda \mathrm{I}_{2} \eta+\mathrm{N}_{3} \zeta\right)
$$

and since $\cos z=M_{1} \varepsilon+M_{2} \eta+M_{3} 3_{2}$, it follows that tho potential of the forees by which the planet's centre is to be reduced to rest is

$$
-\frac{m \rho}{r^{2}} \cos =
$$

Now let us consider the other forces acting on the particle. Tho planet is spheroidal, and thercfore does not attract equally in all directions ; but in this investization we may mako abstraction of the ellipticity of the planet and of the ellipticity of tho occan due to the planctary rotatiou. This, which we sct asite, is considered in the theories of gravity and of tho figures of plancts. Outsido of its body, then, thic planct contributes forese of which the potential is M/P. Next the direct attraction of the satellite contributes forces of which the potential is the mass of the satellite divided by the distance between the point $P$ and the satellite; this is-

$$
\frac{n}{\sqrt{\left\{r^{2}+p^{\prime}-2 r p \cos z\right\}}}
$$

To determino tho forces from this potential wo regard $\rho$ and $=$ as the variables for differentiation, and we may ald to this potential any constant we pleasc. As we aro sceking to find tho forecs which urge $P$ relatively to $M$, we add such a constant as will mako the whole potential at tho planet's centre zero, and thus we take as the potential of the forces due to the attraction of the satellite-

$$
\frac{m}{\sqrt{\left\{r^{2}+\rho^{2}-2 r \rho \cos z\right\}}}-\frac{m}{r}
$$

It is obrious that $r$ is very large compared with $\rho$, and we may thercfore expand this in powers of $\rho / r$. This expansion gives 14

$$
\frac{m}{r}\left\{\frac{\rho}{r} P_{1}+\frac{\rho^{2}}{r^{2}} P_{2}+\frac{\rho^{3}}{r} P_{3}+\& . \operatorname{c}\right\} \text {, }
$$

where $P_{1}=\cos =, P_{2}=\frac{3}{2} \cos ^{2} z-\frac{1}{2}, P_{3}=\frac{5}{6} \cos ^{3} z-\frac{9}{3} \cos z$, \&c. The reader familiar with spherical harmonic analysis of course recognizes the Legendre's functions; but the result for a few terms, which is all that is necessary, is easily obtainable by simple algebra.

Now, collecting together the various contributions to the potential, and noticing that $\frac{m}{r} \cdot \frac{\rho}{r} P_{1}=\frac{m \rho}{r^{2}} \cos z$, and is therefore equal and opposite to the potential ly which the planet's centre was reduced to rest, we have as the potential of the forces acting on a particle whose coordinates are $\rho \stackrel{5}{5}, p \eta$, $p \zeta$

$$
\begin{equation*}
\frac{M I}{\rho}+\frac{m \rho^{3}}{r^{3}}\left(\frac{1}{2} \cos ^{2} z-\frac{1}{2}\right)+\frac{m \rho^{3}}{r^{4}}\left(\frac{1}{8} \cos ^{3} z-\frac{3}{2} \cos z\right)+ \tag{1}
\end{equation*}
$$

Poteatial,
The first term of (1) is the potential of gravity, and the terns of the scrics, of which two only are written, constitute the tide-generating potential. In all practical applications this serics converges so rapidly that the first term is amply sufficient, and tius we shall generally denote

$$
\begin{equation*}
V=\frac{3 m}{2 r} \rho^{2}\left(\cos ^{2} z-\frac{1}{3}\right) . \tag{2}
\end{equation*}
$$

as the tide-generating potential.
In many mathomatical works the tide-generating force is pre- Moen sented as being due to an artificial statical system, which produces aod antr nearly the same force as the dynamical system considered aborc, nown. This statical systen is as follows. Stopping all the rotations, we divide the satellite into two equal parts, and place them dianceri. cally opposite to one another in the orbit. Then it is clear that, instead of the tern

$$
\frac{m}{\sqrt{\left[r^{2}+\rho^{2}\right.} \frac{m}{-2 r \rho} \cos -1}-\frac{m}{r}
$$

we have

$$
\frac{\frac{1}{\sqrt{2}} m}{\sqrt{\varphi^{2}+\rho^{2}-2 r \rho \cos z^{2}}}+\frac{\frac{1}{2} m}{\sqrt{\left\{r^{2}+\rho^{2}\right.}+2 r \rho \cos =l^{2}}-\frac{n}{r}
$$

And this reduces to

$$
\frac{2 n}{r^{3}} \rho^{n} P_{2}+\frac{m}{r^{5}} \rho^{4} P_{4}+\ldots
$$

The first term is the same as before; hence the statical system produces approximatcly the same tide-generating force as the true systrm. The "moon" and "anti-moon," hovever. produce rigorously the same force on each side of the planet, whereas the true system only satisfies this condition approximately. ${ }^{1}$
${ }^{1}$ The reader mas refer to Thomson and Tait's Natural Philosophy (1883), part ii. §§ 798-821, for further considerations on this and analcous subjects, together with some intercsting examples.

## § 6. Form of Equilibrium.

Let us consider the slape assumed by a layer of fluid of density $\sigma$, lying on a globe of mass $3 T$, when acted on by disturbing forces whose potential is

$$
\begin{equation*}
V=\frac{3 m}{2 n^{2}} \rho^{2}\left(\cos ^{2} z-\frac{1}{3}\right) . \tag{3}
\end{equation*}
$$

Suppose the layer to be very thin, and that the mean radius of the layer is $\alpha$, and let the equation to the boundary of the fluid be

$$
\begin{equation*}
\rho=\alpha\left[1+c\left(\cos ^{2} z-\frac{1}{3}\right)\right] \tag{4}
\end{equation*}
$$

We assume this form, because the theory of larmonic analysia tells us that the departure from sphericity must be represented by a function of the form $\cos ^{2} z-\frac{1}{3}$. That theory also gives us as tho potential of a layer of matter of depth $\varepsilon a\left(\cos ^{2} z-\frac{1}{3}\right)$, and density $\sigma$, at an external point the value

$$
\frac{4}{6} \pi \sigma a^{2}\left(\frac{\pi}{\rho}\right)^{3} \mathbf{t}^{\prime}\left(\cos ^{2} z-\frac{1}{2}\right) .
$$

Hence the whole potential, outside of and up to the fluid layer, is $\frac{M}{\rho}+\frac{3 m}{2 r^{3}} \rho^{2}\left(\cos ^{2} z-\frac{1}{3}\right)+\frac{4}{6} \pi \sigma a^{2}\left(\frac{a}{p}\right)^{3} \mathfrak{f}\left(\cos ^{2} z-\frac{1}{2}\right) \ldots \ldots(5)$.
The first term of (5) is the potential of the globe, the second that of the disturbing force, and the third the potential due to departure from sphericity.
Now the fluid must stand in a level surface; hence, if we equato this potential to a constant, we must get back to the cquation (4), which was assumed to be that of the surface. In other words, if wc put $\rho=a\left[1+\varepsilon\left(\cos ^{2} z-\frac{1}{3}\right)\right]$ in (5), the result must be constant, provided the departure from sphericity is small. In effecting the substitution for $p$, wo may put $p=a$ in the small terms, but in the first term of (5) wo put

$$
\frac{M}{p}=\frac{M I}{a}\left[1-\varepsilon\left(\cos ^{2} z-1\right)\right] .
$$

The whole potential (5) can only be constant if, after this sulstitution, the cocfficient of $\cos ^{2} z-\frac{1}{3}$ vanishes. Thus we must have

$$
-\frac{M}{a} \varepsilon+\frac{3 m a^{2}}{2 r^{3}}+\frac{8}{b} \pi a a^{2} t=0 .
$$

But if $s$ be the mean density of the planet $M={ }_{j} \pi a^{3}{ }^{3}$, and gravity $g=M / a^{2}$. Then we casily find that

$$
\begin{equation*}
\varepsilon=\frac{3 m a}{2 g r^{3}} \frac{1}{1-\frac{3}{6} \sigma / \delta} \tag{6}
\end{equation*}
$$

of Thus the equation to the surface is

$$
\begin{equation*}
r=a\left\{1+\frac{3 m a}{2 g m^{3}} \frac{1}{\left.1-\frac{3}{\sigma}\right\}^{\delta}}\left(\cos ^{2} z-3\right)\right\} \tag{7}
\end{equation*}
$$

if $\sigma$ be small compared with $\delta$, the ceefficient is $3 \mathrm{ma} / 2 \mathrm{gr} r^{3}$; thus we see that $1 /\left(1-\frac{3}{5} \sigma / 0\right)$ is the coefficient by which the mutual attraction of the fluid angments the deformation of the fluid under the action of the disturbing force. If the density of the fluid be the same as that of the spherc, the angmenting factor becomes $\frac{5}{2}$, and we have $\varepsilon=\frac{1}{4} \mathbf{m a n}^{6} / \mathrm{gr}^{3}$, which gives the form of equilibrium of a fluid sphere under the action of these forces. Since $\frac{3 m}{2 r^{3}}=\frac{g}{\alpha}\left(1-\frac{3 \sigma}{5 \delta}\right) \varepsilon$, it follows that, when the form of equilibrinm ia $\rho=a\left[1+8\left(\cos ^{2} z-\frac{1}{3}\right)\right]$, the potential of the forces is

$$
\begin{equation*}
V=\frac{g}{a}\left(1-\frac{3 \sigma}{5 \delta}\right): \rho_{\rho}\left(\cos ^{2} z-\frac{1}{3}\right) . \tag{8}
\end{equation*}
$$

More generally, if we neglect tho attraction of the fluid on itself, so that $\sigma / \hat{0}$ is treaterl as sinall, and if $\rho=a(1+s)$ be the equation to the surface of the fluid, where sis a function of latitude and longitude, then the potential of the forces under which this is an equilibrimm form is

$$
\begin{equation*}
\mathfrak{r}=\frac{g p^{2}}{a} s \tag{9}
\end{equation*}
$$

It thus appears that wo may specify any tile-generating forces by means of the figure of equilibrium which the fluid wond assume under them, and in the theory of the tides it hae been found practically convenient to specify the forces in this way.

By means of the principle of "forced vibrations" referred to in the historical sketel, we shall pass from the equilibrium form to the actual oscillations of the sea.

## § 7. Development of Tide-gencrating Potential in Terms of Hour-Anglic and Declination.

We now proceed to devclop the tidc-mencrating potential, and inall of course implicitly (\$ 6 ) detcrmine the equation to the cquilibrium figure.
We have already seen that, if $z$ be the moon's zenith distance at the point $P$ on the eartla's surface, whose coordinates referred to $A, B, C$, axes fixed in the earth, are $a \xi, a \eta$, $a \zeta$, then
$\cos z=\xi \mathrm{M}_{1}+\eta \mathrm{M}_{2}+\zeta \mathrm{M}_{3}$
where $\mathrm{M}_{3}, \mathrm{M}_{2}, \mathrm{M}_{3}$ are the moon'a direction cosincs referred to the same axes. Then with this valuc of cos $z-$

$$
\begin{align*}
& \cos ^{2} z-\frac{3}{3}=2 \xi \eta M_{1} M_{3}+\varepsilon^{\xi^{2}-\eta^{2}} \\
& 2 \frac{M_{1}{ }^{2}-M_{2}{ }^{2}}{2}+2 \eta \xi M_{2} M_{3}+2 \xi \zeta M_{2} M_{3}  \tag{10}\\
&+\frac{3}{2} \cdot \frac{\xi^{2}+\eta^{2}-2 \zeta^{2}}{3} \frac{M_{1}{ }^{3}+3 I_{2}{ }^{2}-2 M_{3}{ }^{2}}{3} \ldots \ldots \ldots(10) .
\end{align*}
$$

Tho axis of C is taken as the prolar axia, and Als is the cquatorial plane, so that the functions of $\xi, \eta, \zeta$ are functions of the latitude and longitude of the point $P$, at which we wish to find the potential.
The functions of $M_{1}, M_{2}, M_{3}$ depend on the moon's position, and We shall have occasion to develop them in two different ways, first in terms of her hour-angle and declination, and secondly (§ 23) in terms of her longitude and the elements of the orbit.

Now let A be on the equator in the meridian of $P$, and $1390^{\circ}$ east of $A$ on the cquator. Then, if $\$ 1$ be the moon, tho inclination of the plane NIC to the plano CA is the moon's easterly looal honr-angle. Let $h=$ local hont-angle of moon and $\delta=$ moon'a declination : we havo
whence

$$
\mathrm{M}_{1}=\cos \hat{c} \cos \hbar_{,}, \mathrm{M}_{2}=\cos \delta \sin h_{1}, \mathrm{M}_{3}=\sin \delta_{1}
$$

$2 \mathrm{M}_{1} \mathrm{M}_{2}=\cos ^{2} \delta \sin 2 h_{,} \mathrm{M}_{1}{ }^{2}-\mathrm{M}_{2}{ }^{2}=\cos ^{2} \hat{0} \cos 2 h$,
$2 \mathrm{M}_{2} \mathrm{M}_{3}^{2}=2 \sin \hat{\delta} \cos \hat{i} \sin h, 2 \mathrm{M}_{1}^{2} \mathrm{M}_{3}=2 \sin \hat{i} \cos \hat{0} \cos h_{4}$ $\frac{M_{1}{ }^{2}+M_{3}{ }^{2}-2 M_{3}{ }^{2}}{3}=\frac{1}{3}-\sin ^{2} \delta$.
Also, if $\lambda$ bo the latitude of $P$,

$$
\xi=\cos \lambda, \eta=0, \zeta=\sin \lambda
$$

and

$$
\xi \eta=0, \frac{\xi^{2}-\eta^{2}}{\frac{2}{1}}=\frac{1}{2} \cos ^{2} \lambda, \xi \zeta=\frac{1}{2} \sin 2 \lambda, \xi \eta=0, ~
$$

Hence (10) becomes

$$
\begin{array}{r}
\cos ^{2} z-\frac{1}{3}=\frac{1}{2} \cos ^{2} \lambda \cos ^{2} \delta \cos 2 h+\sin 2 \lambda \sin \delta \cos \delta \cos h \\
+\frac{\pi}{2}\left(\frac{1}{3}-\sin ^{2} \delta\right)\left(\frac{1}{3}-\sin ^{2} \lambda\right) \ldots \ldots \ldots \ldots \ldots \ldots \tag{11}
\end{array}
$$

The angle $h$, as defined at present, is the eastward local hour-angle, and therefore diminishes with the time. As, however, this function does not change sign with $h$, it will be more convenient to regard it as the westward local hour-angle. Also, if $h_{0}$ be the Greenwich westward hour-angle at the monent under consideration, and $l$ bo the west longitude of the place of observation $P$, we have

$$
\begin{equation*}
h=h_{0}-l . \tag{12}
\end{equation*}
$$

Hence we lave at the point $P$, whose radins vector is a,

$$
\begin{array}{r}
V=\frac{3 m a^{2}}{2 r^{3}}\left\{\frac{1}{2} \cos ^{2} \lambda \cos ^{2} \delta \cos 2\left(h_{0}-l\right)+\sin 2 \lambda \sin \delta \cos \delta \cos \left(h_{0}-l\right)\right. \\
\left.+\frac{\pi}{2}\left(\frac{1}{2}-\sin ^{2} \delta\right)\left(\frac{1}{3}-\sin ^{2} \lambda\right)\right\} \ldots \ldots \ldots \ldots \ldots .(13) .
\end{array}
$$ for latitude and longitude, and also for radius $a$, if we care to find oped in the radial disturbing force.

## § 8. Evaluation of Tide-gcnerating Forces, and Lunar Defcxion of Gravily.

The westward component of the tide-gencrating force at the earth's surface, where $\rho=a$, is $d V / a \cos \lambda d l$, and the northward component is $d V / a d \lambda$; the change of apparent level is the ratio of these to gravity $g$. Therefore, differentiating (13), changing signs, and writing $\frac{3 m}{2 J I}\left(\frac{a}{r}\right)^{3}$ for $\frac{3 m a}{2 g r^{3}}$, we have component clange of level south. ward

$$
\begin{gathered}
=\frac{3 m}{4 M}\left(\frac{a}{r}\right)^{3}\left\{\sin 2 \lambda \cos ^{2} \delta \cos 2\left(h_{0}-\tau\right)-2 \cos 2 \lambda \sin 2 \delta \cos \left(h_{0}-l\right)\right. \\
\left.+\sin 2 \lambda\left(1-3 \sin ^{2} \delta\right)\right\} ;
\end{gathered}
$$

component change of level westward

$$
\begin{align*}
&=\frac{3 m}{2 \lambda}\left(\frac{a}{r}\right)^{3}\left\{\cos \lambda \cos ^{2} \delta \sin 2\left(h_{0}-l\right)\right.  \tag{14}\\
&\left.+\sin \lambda \sin 2 \hat{\sin } \sin \left(h_{0}-l\right)\right\} .
\end{align*}
$$

$\qquad$
The westward component is made up of two periodic terms, one going through its variations twice and the other once a day. The sonthward component has also two similar terms; but it has a third term, which locs not oscillate about a zero value. If $\Delta$ be a declination such that the mean value of $\sin ^{2} \hat{s}$ is equal to $\sin ^{2} \Delta$, then, to determine the southward component so that it shall bo a truly periodic function, we must subtract from the above $\sin 2 \lambda\left(1-3 \sin ^{2} \Delta\right)$, and the last term then becomes

$$
3 \sin 2 \lambda\left(\sin ^{2} د-\sin ^{2} \delta\right)
$$

In the case of the moon, $\Delta$ rarics a littlc according to the position of the moon's node, but its mean valne is about $10^{\circ} 31^{\prime}$.
The constant portion of the southward component of force has its effect in causing a constant lieaping up of the water at the equator; or, in other words, the moon's attraction has the effect of cansing a small permanent ellipticity of the earth's mean figure. This augmentation of cllipticity is of course very small, lut it is nccessary to mention it in order that the meaning to be attributed to lunar deflexion of gravity may be clearly defined.
If we consider the motion of a pendulum-bob during any one day, We see that, in consequence of the semi-dimrnal changes of level, it twice describes an ellipse with major axis east and west, with ratio of axes equal to the sine of the latitude, and with linear dimensiona pronortional to $\cos ^{2} \hat{\delta}$, and it once describes an cllipse whose north and south aris is proportional to $\sin 2 \delta \cos 2 \lambda$ and whose cast and

West axis is proportional to $\sin 2 \delta \sin \lambda$. Obviously the latter is circular in latitude $30^{\circ}$. When the moon is on the equator, the maximum deflexion occurs when the moon's local hour-angle is $45^{\circ}$, gnd is then equal to

$$
\frac{3 m}{2 M}\left(\frac{a}{r}\right)^{3} \cos \lambda
$$

At Cambridge in latitude $52^{\circ} 43^{\prime}$ this angle is $0^{\prime \prime} 0216$.
1 An attempt, made by George and Jlorace Darwin, ${ }^{1}$ to measure the lumar deflexion of a pendulum failed on account of incessant variability of level occurring in the supports of the pendulum and arising from unknown terrestrial changes. The work done, therefore, was of no avail for the purposes for which it was instituted, but remained as a contribution to an interesting subject now be. ginniug to be studied, viz., the small changes which are always taking place on the upper strata of the carth.

## § 9. Corrcction to Equilibrium Theory for Continents.

In the equilibrium theory as worked out by Newton and Bervoulli it is assumed that the figure of the ocean is at cach instant one of equilibrium under the action of gravity and of the tidegenerating forces. Sir W. Thomson has, however, reasserted ${ }^{2}$ a point which was known to Dernoulh, but has since been overlooked, namely, that this law of risc and fall of water cannot, when portions of the glole are contiactats, be satisficd by a constant volume of water in the ocean. The law would stitl hold if water were appropriately supplied to and exhansted from the ocean; and, if in any confguration of the tide-gencrating body we imagine water to be instantaneously so supplied or cxhausted, the level will every. where risc or fall by the same licight. Now the amount of that rise or fall dejends on the position of the tide-generating body with reference to the continents, and is different for each such position. Conversely, when the volume of the occan remains con. ataut, we have to correct Bernonlli's simple equilibrium theory by an amount which is constant all over the globe at any instant, but which changes in time. Thomson's solation of this problem has aince been redued to a form which is easier to grasp intelligently than in the shape in which ho gavo it, and tho results have aiso been reduced to numbers. ${ }^{3}$ It appears that there are four points on the earth's surlace at which in the corrected theory the semi. diurnal tide is er...-mont, and four others where it is doubled. A similar statement holds for the diurnal tide. As to the tides of lons period, there are two prallels of latitude of evanescent and two of rloubled tida.

Now in Bernoullis theory the semi-diurnal ride vanishes at the poles, the diumal tide at tho poles and the equator, and the tides of long perioul in latitudes $35^{\circ} 16^{\prime}$ north and sonth. The nunnerical solution of the corrected thery shows that the points and lines of doubling and cvancscence in every casc fall close to the points and lines where in tho uncorected theory there is evaneseence. When in passing from the uncorrected to the corrected theory we speak of a doubled tide, the tille doubled may be itself mil, so that the result may still be mit. The conclusion, therefore, is that Thomson's correction, althourth theoretically iuteresting, is practically so small that it may be left out of consicleration.

## III. Dǐamical Theory of Tides.

## § 10. Hislorical Eiplanation.

Dyna-

## mical

 theory.The problem of tilal oscillation is essentially a dymamical one. Even when. the ocean is taken as covering the whola earth, it presents fommidable difficulties, and this is the only case in which it has been litherto solved. "Laplace gives the solution in bks. i. and iv. of the Mecanique Celcsic ; but his work is mmecessarily complicated by the inappropriate introduction of spherical harmonic analysis, and it is generally admitted that his investigation is difficult. Airy, in his "Tides and W'aves" (in Ency. Mctrop.) presents the solution free from that complication, but lie has made a criticism of Laplace's method which $w \in$ believe to be wrong. Sir W. Thomson has written some interesting papers (in Phil. Alag., 1875) in justification of Laplace, and on these we base the following paragraphs. This portion of the article is given more fully than others, because there exists no complete fresentment of the theory frue from objections of some kind.

## §11. Equations of Motion.

Let $r, \theta, \phi$ be the radius vector, co-latitude, and east longitude of a point with reference to an origin, a polar axis, and a zero-meridian rotating with a uniform angular velocity $n$ from west to east. Then, if $R, H, \Xi$ be the radial, co-latitudinal, and longitudinal accelerations of the paint, we liave

## ${ }^{1}$ Reports to the Britioh $18500_{0} 1851$ (iork) and 1882 (Southampton). <br> \% Thomson and Tait, Nat. Phil., \& 807.

arwin and Turner, Proc. Rov. Soc., 1886
Wrer ". Thomson'a paper "On the Gravitational Oacillationa of Rotating Water," in Phil. Mag, August 1850, beara on tho eame subject. It is tha only sttempt which has hitherto been macle to conalder tho effects of the esrth's sutation on the osclilatlons of land-locked aeas.

$$
\left.\begin{array}{l}
R=\frac{d^{2} r}{d t^{2}}-r\binom{d \theta}{d t}^{3}-r \sin ^{2} \theta\left(\frac{d \phi}{d t}+n\right)^{2} \\
\Xi=\frac{1}{r} \frac{d}{d t}\left(r^{2} \frac{d \theta}{d t}\right)^{2}-r \sin \theta \cos \theta\left(\frac{d \phi}{d t}+n\right)^{2} \\
H=\frac{1}{r} \frac{1}{\sin \theta} \frac{d}{d t}\left[r^{2} \sin ^{2} \theta\left(\frac{d \phi}{d l}+n\right)\right]
\end{array}\right\}
$$

Now suppose that the point never moves far from a zero position and that its displasements $\xi, \eta \sin \theta$ co-latitudinally and longitudinally are very large compared with its radial displacement $\rho$, and that the velocitics are so small that their squarcs and products are negligible compared with $n^{2} r^{2}$; then we have

$$
\begin{aligned}
\frac{d r}{d t} & =\frac{d \rho}{d t^{\prime}} \text { a very small quantity: } \\
\sin \theta \frac{d \phi}{d t} & =\frac{d}{d l}(\eta \sin \theta), \\
r \frac{d \theta}{d t} & =\frac{d \xi}{d t}
\end{aligned}
$$

Hence (15) is approximately

$$
\left.\begin{array}{l}
\mu=-n^{2} \gamma \sin ^{2} \theta  \tag{16}\\
\Xi=\frac{d^{\prime} \xi}{d t^{2}}-2 n \sin \theta \cos \theta \frac{d \eta}{d l} \\
H=\sin \theta \frac{d^{2} \eta}{d t^{2}}+2 n \cos \theta \frac{d \xi}{d i}
\end{array}\right\} .
$$

With regard to the first equation of (16), we observe that the time has disapueared, and that $I$ has exactly the same form as if the system were rendered statical by introducing a potential $\frac{1}{2} n^{2} r^{2} \sin ^{2} \theta$ and anmmlling the rotation of the axes. Since inertia plays no sensible part radially, it follows that, if we aprlly these expressions to the formation of equations of motion for the ocean, the radial motion need not be considered. We are left, therefore, with only the last two equations of (16).

We now have to consider the forecs by which an element of the Comocean is urged in the direction of co-latitucic and longitudc. These ponent forces are those due to the extermal disturbing forces and to the forces. pressure of the surrounding fluid, the attraction of the fluid.on itself being supposed regligible. We lrave seen in (9) that, if fluid on a sphere of radius a be under the action of disturbing forces whose potential is $U r^{3}$, and if $r=a+b$ be the equation to the surface, then must $g \boldsymbol{f}_{\mathbf{g}}=U a^{2}$. Hence, if $\varepsilon$ be the equilibrinm height of ticle, the potential of the disturbing force is $g \mathrm{gr}^{2} / a^{2}$. But, if the cicvation bo f, the potential under which it wonld be in equilibrium is $g b r^{2} / a^{2}$. Therefore, if $b$ be the elevation of the tide in our dynamical problem, the forces due to hydrostatic pressure on an element of the occan are the samo as would be caused by a potential $-g h r^{2} / a^{2}$. Hence it follows that the whole forces on the clement are those due to a potential $-g(\mathfrak{l})-\mathfrak{f}) r^{2} / a^{2}$. Therefore fiom (16) we see that the equations of motion are

$$
\left.\begin{array}{rl}
\frac{d^{2} \xi}{d t^{2}}-2 n \sin \theta \cos \theta \frac{d \eta}{d t} & =-\frac{g}{a} \frac{d}{d \theta}(\mathrm{I}-\varepsilon)  \tag{17}\\
\sin \theta \frac{d^{2} \eta}{d t^{2}}+2 n \cos \theta \frac{d \xi}{d t} & =-\frac{g}{a \sin \theta} \frac{d}{d \phi}(b-t)
\end{array}\right\}
$$

tions" metion

It remains to find the equation of continuity. This may be deduced geometrically from the consideration that the volume of an element of the fluid remains constant; but a shorter way is to derive it from the equation of continuity as it occurs in orclinary hydrodynamical investigations. If $V$ be a velocity potential, the equation of con. tinuity for incompressible fluid is

$$
\begin{gathered}
\delta r \frac{d}{d r}\left(r^{2} \frac{d V}{d r} \sin \theta \delta \theta \delta \phi\right)+\delta \theta \frac{d}{d \theta}\left(r \sin \theta \frac{d V}{r d \theta} \delta r \delta \phi\right) \\
+\delta \phi_{l l \phi}^{d}\left(r-\frac{1}{r \sin \theta}-\frac{r V}{d \phi} \delta r \delta \theta\right)=0 .
\end{gathered}
$$

The element referred to in this equation is defined by $r, \theta, \phi$, $r+\delta r, \theta+\delta \theta, \phi+\delta \phi$. The co-latiturlinal and longitudinal velocitics are the sane for all the clementary prism defined by $\theta, \phi$, $\theta+\delta \theta, \phi+\delta \phi$. and the sea bottom. Then $\frac{d V}{d d \theta}-\frac{d \xi}{d t^{\prime}} \frac{d V}{r \sin \theta d \phi}=$ $\sin \theta \frac{d \eta}{d l}$; and, since the radial velocity is $d b / d l$ at the surface of the ocean, where $r=a+\gamma$, and is zero at the sea bottom, where $r=\alpha$, wa have $\frac{d V}{d r}=\frac{r-a}{\gamma} \frac{d J}{d \ell}$. Hence, integrating with respect to from $r=a+\gamma$ to $r=a$, and again with respect to $l$ from the tima $c$ to the time when $\mathfrak{b}, \xi, \eta$ all vanish, and treating $\gamma$ and $b$ as small come pared with $a$, we have

$$
\begin{equation*}
\eta a \sin \theta+\frac{d}{d \theta}(\gamma \xi \sin \theta)+\frac{d}{d \phi}(\gamma \eta \sin \theta)=0 . \tag{18}
\end{equation*}
$$

This is the equation of continuity, and, together with (17), it forms, the system which must be integrated in the general problem of the: tides. The difficulties in the way of a solution are so great thal none has hitherto been found, except on the supposition thal $\gamma$, the depth of the ocean, is only a function of latitude. In this case (18) becomes
$b a+\frac{1}{\sin \theta} \frac{d}{d \theta}(\gamma \xi \sin \theta)+\gamma \frac{d \eta}{d \phi}=0$.
§ 12. Adaplation to Forced Oseillations.
Since we may suppose that the free oscillations are annulled by fiction, the soiution required is that corresponding to forced oscillations. Now we have seen fror (13) that $\varepsilon$ (which is proportional so $V$ ) has terms of three kinds, the first depending on twice the moon's (or sun's) hour-angle, the second on the hour-angle, and the third independent thereof. The coefficients of the first and second terms vary slowly, and the whole of the third varies slowly. Hence r has a semi-dinrnal, a diurnal, and a longe jeriod term. We shall see later that these terms may be expanded in a series of approximately semi-diurnal, diurnal, and slowly varying terms, each of which is a strictly harmonic function of the time. Thus we may essume for t a form $\mathrm{e} \cos (2 n f l+k \phi+a)$, where $f$ and $k$ are numbers, and where $e$ is only a function of co-latitude and of the elements of the orbit of the disturbing body. According to the usual method of treating oscillating systems, we may therefore make the following assumption for the form of zolution

$$
\left.\begin{array}{l}
\varepsilon=0 \cos (2 n f l+k \phi+a)  \tag{20}\\
\eta=h \cos (2 n f t+k \phi+a) \\
\xi=x \cos (2 n f+k \phi+a\} \\
\eta=y \sin (2 n f t+k \phi+a)
\end{array}\right\}
$$

Where e, $h, x, y$ are functions of co-latitude $\theta$ only. Substituting these values in (19), we have

$$
\begin{equation*}
\frac{1}{\sin \theta} \frac{d}{d \dot{\theta} \theta}(\gamma x \sin \theta)+h \gamma y+h a=0 \tag{21}
\end{equation*}
$$

Then, if we write u for $l_{1}-e$, and put $n=n^{2} a / g$, substitution from (20) in (17) leads at once to

$$
\left.\begin{array}{l}
x f^{2}+y f \sin \theta \cos \theta=\frac{I}{4 m} \frac{d u}{d \theta}  \tag{22}\\
y f^{2} \sin \theta+x f \cos \theta=-\frac{\hbar}{4 m \sin \theta}
\end{array}\right\}
$$

Solving (22) for x and y , we have

$$
\left.\begin{array}{rl}
x\left(f^{2}-\cos ^{2} \theta\right) & =\frac{1}{4 m}\left(\frac{d u}{d \theta}+\frac{k}{f} u \frac{\cos \theta}{\sin \theta}\right)  \tag{23}\\
y \sin \theta\left(f^{2}-\cos ^{2} \theta\right) & =\frac{-1}{4 m}\left(\frac{\cos \theta}{f} \frac{d u}{d \theta}+\frac{\pi n}{\sin \theta}\right)
\end{array}\right\}
$$

Then substituting from (23) in (21), we hava

$$
\begin{aligned}
& \frac{1}{\sin \theta} \frac{d}{d \theta}\left[\frac{\gamma\left(\sin \theta \frac{d u}{d \theta}+\frac{k}{f} u \cos \theta\right)}{f^{2}-\cos ^{2} \theta}\right]-2 \cdot \frac{\cos \theta}{\frac{\cos }{f} \frac{d u}{d \theta}+\frac{2 u}{\sin \theta} \theta\left(f-\cos ^{2} \theta\right)} \\
& +1 m a(n+e)=0 \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots(24) .
\end{aligned}
$$

This is Laplace's equation for tidal oscillations in an ocean whoso depth is only a function of latitude. When a is found from this equation, its value substituted in (23) will give $x$ and $y$.

## § 13. Prcparation for Solution.

Prepara- The ocean which is considered in this case is not like that on the tion for carth's surface, and therefore it does not seem desirable to pursue volrtion the integration of (24) except in certain typical cases.

In (13) we have the expansion of the disturbing potential and implicitly of the disturbing forces in three terms, the first of which is variable in half a day, the second in a day, and the third in balf the period of resolution of the tide-raising body. Forestalling the results of chapter iv.- each of these terms nay be expressed as the sum of a series of strictly harmonic functions of the time; the first set of these have all approximately semi-diurnal periods, the second approximately dinrial periods, and the third vary

- slowly in dependence on the pcriodic time of the tide-generating body. The first set involve twice the terrestrial longitude, the second the longituds, and the third set aze independeat of the longitude of the place of observation. From these statements compared with (13) we see that in the semi-diurnal terms $f$ is approximately unity, $k=2$, and $r=F \sin ^{2} \theta$; in the dinrnal terms $f$ is approximately $\frac{1}{2}, k=1$, and $\mathrm{r}=\mathrm{E} \sin \theta \cos \theta$; in the terins of loog period $f$ is a snali, fraction (for the fortnightly tide about ${ }^{\text {r }}$ ), $t=0, t=\mathrm{E}\left(\frac{1}{3}-\cos ^{2} \theta\right)$. The departure from exactness in the relation $f=1$ for the semi-dinmal, and $f=\frac{1}{2}$ for the diurnal terms is gencrally (except for certain critical depths of ocean) not such as to greatly chavge the nature of the results from those obtained when $f=1$ and $\frac{1}{2}$ rigorously. Hence the integration of (24) will be pursued on these three hypotheses, giving Laplace's three kinds of oscillation. The hypothesis which will be made with regard to $\gamma$ is that $\gamma=l\left(1-q \cos ^{2} \theta\right)$, and in the caso of the semi-diurnal tides we shall be compelled by mathematical difficnlties to suppose $q$ to be either unity or zero. The tides of zonal seas may be worked out, and mere complex laws of depth may be assumed; but for the discussion of such cases the reader is referred to Thomson's papers in Phil. Mag., 1575.

There might be reason to conjecture that the form of $n$ wonld be aimilar to that of $e$, and this is in fact the case for the diurnal tides
for any value of $q$ and for the semi-diurnul tides whou $q$ is unity. Before proceeding further it will bo convenient to exhibit twoi purely analytical transformations of the first two terms of (24) ! which hold true for certain values of $k$ and $f$, and when $q$ has such : a form as that suggested. If we put $k=1, f=\frac{1}{3}, \gamma=l\left(\mathbb{I}-q \cos ^{2} . \theta\right)$ then, if $\theta=A \sin \theta \cos \theta$, it will be found on substitution that

$$
\frac{1}{\sin \theta} \frac{d}{d \theta} \frac{\gamma\left(\sin \theta \frac{d v}{d \theta}+2 v \cos \theta\right)}{\frac{1}{4}-\cos ^{2} \theta}-\gamma \frac{2 \cot \theta \frac{d v}{d \theta}+\frac{v}{\sin ^{2} \theta}}{\frac{1}{2} \cos ^{2} \theta}=-8 l q v \ldots(25)
$$

Again, if we putt $k=2, f=1, q=1, \gamma=l\left(1-\cos ^{2} \theta\right)=l \sin ^{2} \theta$, and if
$v=A \sin ^{2} \theta$. $v=A \sin ^{2} \theta$,

$$
\begin{equation*}
\frac{1}{\sin \theta} \frac{d}{d \theta} \frac{\gamma\left(\sin \theta \frac{d v}{d \theta}+2 v \cos \theta\right)}{1-\cos ^{2} \theta}-2 \gamma \frac{\cot \theta \frac{d v}{d \theta}+\frac{2 v}{\sin ^{2} \theta}}{1-\cos ^{2} \theta}=-8 l v \tag{26}
\end{equation*}
$$

Another gencral property of (24) is derived from the suppositide that $n$ is expressed in a series proceeding by powers of $l$; thns

$$
\begin{equation*}
\mathrm{u}=v_{0}+v_{1} \frac{l}{a}+v_{2} \frac{b^{2}}{a^{2}}+\ldots \tag{27}
\end{equation*}
$$

Let $v_{0}, v_{1}, v_{2}, \& c_{\text {., }}$, be so chesen that, when a is substituted in (24), tho coeflicient of each frower of $\{$ vanishes indepentently; then the term independent of $l$ obriously gives $x_{0}=-c$, and the connex. ion between successive $v$ 's is

$$
\left.\frac{1}{\sin \theta d \theta} d \frac{\gamma\left(\sin \theta \frac{d v_{m}}{d \theta}+\frac{k}{f} v_{n} \cos \theta\right)}{f^{2}-\cos ^{2} \theta}\right]-k \gamma \frac{\left(\frac{\cos \theta}{f} \frac{d v_{m}}{d \theta}+\frac{k v_{m}}{\sin \theta}\right)}{+4 m l v_{m+1}}=0 \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots(28) .
$$

We shall suppose below that $u$ is expansible in the form (27), and shall use (28) in conjunction with (25) or (26) for finding the successive values of the $r$ 's.

## § 14. Diurnal Tide.

Let us first consider the diurna! tidés. We have e $=\mathrm{E} \sin \theta \cos 0$, Diurnal $k=1$, and $f=\frac{1}{2}$; then $v_{0}=-\mathrm{E} \sin \theta \cos \theta$. Hence by (28) and (25) tide. $-8 l q v_{0}+4 m l v_{1}=0$ and therefore $v_{1}=\frac{2 q}{m} v_{0}$. Applying the same theorem a second time, $r_{2}=(2 q / m) v_{1}$, and so on ; therefore $n=v_{0}\left\{1+2 l q / m a+(2 l q / m a)^{2}+\ldots\right]$

$$
\begin{equation*}
=\frac{v_{n}}{1-2 l q / m a}=-\frac{e}{1-2 \operatorname{lq} / m a} . \tag{30}
\end{equation*}
$$

But $\mathrm{u}=\mathrm{h}-\mathrm{e}$; bence $\mathrm{h}=-\frac{2 l q / m a}{1-2 l q / m a}$ e
It appears, therefore, that the tide is "inrerted," giving low water where the equilibrium tide gives high water. If $q=0$, so that tho ocean is of uniform deptb, the tide vanishes.
§15. Scmi-Diurnal Tide, with Frariable Depth.
Next ict ns consider the semi-diurnal tide in the case where $q=$ ? , Semioo that $\gamma=l \sin ^{2} \theta$. Then $e=E \sin ^{2} \theta, k=2, f=1 ; a \operatorname{ls} \theta v_{0}=-e=$ dural $-\mathrm{E} \sin ^{2} \theta$. Hence by (28) and (26) - $8 l v_{0}+4 m l v_{1}=0$, whence $r_{j}=$ tide $2 / m v_{0}$. Applying tho sanve theorem a second time, $v_{3}=(2 / m)^{2} v_{0}$, and so on; therefore $v=v_{0}\left[1+21 / m a+(2 l / m a)^{2}+\ldots\right]$

$$
\begin{equation*}
=\frac{r_{0}}{1-2 l / m a}=-\frac{e}{1-2 l / m a} . \tag{32}
\end{equation*}
$$

Hence $\quad h=u+c=-\frac{2!/ m a}{1-2 l / m a}$
If $2 l / m a=\frac{3}{3}$, the height of tide is equal to the equilibrium height; but it is inverted, giving low water where the equilibrinm theory gives ligh water. In the case of the earth $m=1 / 289$, and therefore this relation is satisfied if $l=a / 1156$. Heoce in a sea 3000 fathoms dcep at the equator, and shallowing to tho poles, we have inverted semi-diurnal tides of the equilibrium height.

## § 16. Scmi-Diurnal Tide, with Uniform Dcpth.

The method of derelopment used above, where we proceed by powers of the depth of the ocean, is not applicable where the depth is uniform, because it leads to a divergent series. We have therefore to resume equation (24). In the case of tbe semi-diurnal tides wo have for the depth $\gamma=l$ (a constant by hypothesis), $k=2, f=1$ approximatel; and $e=E \sin ^{2} \theta$. Now for brevity let $\beta=4 \mathrm{ma} / \mathrm{l}$, $\nu=\sin \theta$, so that $e=E v^{3}$. Then we fiod that on development (24) becomes

$$
\nu^{2}\left(1-\nu^{3}\right) \frac{d^{2} u}{d \nu^{3}}-\nu \frac{d u}{d v}-\left(8-2 \nu^{2}-\beta \nu^{4}\right) u=\cdot \beta E^{3} \ldots \ldots(33)
$$

Let ns now assume as the solution of this equation

$$
\mathrm{u}=\left(K_{2}-\mathrm{E}\right) \nu^{2}+K_{4} \nu^{4}+K_{6} \nu^{6}+\ldots+K_{2} \nu^{2 i}+\ldots \ldots \ldots \text { (34) }
$$

Substituting from (34) in (33), and equating to zero the coefficients of the successive powers of $\nu$, wo find $K_{2}=E \quad K_{8}$ apparently indeterminate, and
$2 i(2 i+6) K_{2 H+4}-2 i(2 i+3) K_{x+2}+\beta K_{2 i}=0$
Sirce $K_{0}=0$, this equation of condition may be beld to apply for all positive integral values of $i$, beginning with $i=0$. It is obvious that $K_{4}$ is determinable in terms of $K_{1}^{\prime}$ and $K_{2}, K_{0}$ in terms of $E$.
and $K_{4}$, \&c., oo that all the $K^{\prime}$ 's are to be found in terms of $K_{2}$, which is known, and of $K_{0}$, which is apparently indeternoinate.

The condition for the convergency of the eeries (34) for $u$ and for the series $d u / d \nu$ is that $K_{2 i+2} / K_{2 i}$ shall tend to a limit less than unity. The equation (35) may be written

$$
\begin{equation*}
\frac{K_{2 i+1}}{K_{2 i+2}}=\frac{2 i+3}{2 i+6}-\frac{\beta}{2 i(2 i+6)}-\frac{K_{2 i}}{K_{2 i+2}} \ldots \tag{36}
\end{equation*}
$$

Now $K_{2+2} / K_{2}$ tends to be either infinitely small or mot infinitely small. If it be not infinitely small in the limit, the second term on the right of (36) becomes evancscent when $i$ is very great, and We have in the limit when $i$ is very large-

$$
\frac{K_{2 i+1} \nu^{2 i+4}}{K_{2 t+2} \nu^{2 i+2}}=\frac{2 i+3}{2 i+6} \nu^{2}=\left[1-\frac{3}{2(i+3)}\right] \nu^{2}=\left[1-\frac{3}{2 i}\right] \nu^{9} .
$$

But the ratio of successive terms of $\sqrt{ }\left(1-\nu^{2}\right)$ tends to become ( $\left.1-\frac{s}{2} / i\right) \nu^{2}$. Hence, if $K_{2 i+2} / K_{21}$ does not tend to become infinitely small, $u=A+B \sqrt{1-\nu^{2}}$, where A and B axe finite for all values of $\nu$. Again, under the same circumstances we lave in the limit when $i$ is very large-

$$
\begin{gathered}
\frac{(2 i+4) K_{2 i+4^{2}}}{(2 i+2) K_{24+2} \nu^{2 i+2}}=\frac{2 i+4}{2 i+2} \cdot \frac{2 i+3}{2 i+6} \nu^{2}=\left(1+\frac{1}{i+1}\right)\left(1-\frac{3}{2(i+3)}\right) \nu^{2} \\
=(1-1 / 2 i) \nu^{2} .
\end{gathered}
$$

But the ratio of successive terms of $\left(1-\nu^{2}\right)^{-\frac{2}{2}}$ teads to $\left(1-\frac{1}{2} / 2\right) \nu^{2}$. Hence, if $K_{2 i+2} / K_{2 t}$ does not tend to become infinitely omall, $d u / d \nu=\mathrm{C}+\mathrm{D}\left(1-\nu^{2}\right)^{-\frac{1}{2}}$, where C and D are fiuite for all values of $\nu$.
Now

$$
\frac{d u}{d \theta}=\frac{d u}{d \nu} \sqrt{1-\nu^{2}}=\mathrm{C} \sqrt{1-\nu^{2}}+\mathrm{D} .
$$

Therefore at the equator, where $\nu=1, d \mathrm{u} / d \theta=\mathrm{D}$, a finite quantity. Hence the hypothesis that $K_{2 f+2} / K_{2 a}$ tende to be not infinitely amall leads to the conclusion that $u$ and $d n / d \theta$ are finite at the equator. But on scconnt of the symmetry of the syatem the co-latitudinal displacement. $\xi$ must vanish at the equator, and therefore $x$ also. $\mathrm{By}(23)$, when $f=1, k=2, \nu=\sin \theta$,

$$
\nu^{2} x=\frac{1}{4 \ln }\left(\frac{d u}{d \theta}+2 u \cos \theta\right)
$$

Bat we have jnst eeen that this hypotheais makes $u$ finite when $=1$ or $\theta=90^{\circ}$, and therefore at the equator

$$
\mathrm{x}=\frac{1}{4 m} \frac{d \mathrm{u}}{d \bar{\theta}}, \text { s finite quantity. }
$$

Now eymmetry necessitates a ranishing valne of $d u / d \theta$ at the equator. Thus the bypotlicsis that $K_{2 i+2} / K_{21}$ tends to be not infinitely small is negatived, and we conclude that, on account of the aymmetry of the notion, it is infinitely amall for infinitely great values of i. This being eatablished, let us write (36) in the form

$$
\begin{equation*}
\frac{K_{2 i \div 2}}{K_{2 d}}=\frac{\frac{1}{2} \beta}{2 i^{2}+3 i-\left(2 i^{3}+6 i\right) K_{2 t+\sqrt{2}} K_{2 b+2}} \tag{36a}
\end{equation*}
$$

Mathod
Hence by repeated application of (36a) we have

$$
\frac{K_{2 t+2}}{K_{2 i}}=\frac{\frac{1}{2} \beta}{2 i^{2}+3 i}-\frac{\left(i^{2}+3 i\right) \beta}{2(i+1)^{2}+3(i+1)}-\frac{\left[(i+1)^{2}+3(i+1)\right] \beta}{2(i+2)^{2}+3(i+2)-\& c . ~(37) . ~}
$$

And we know that this is a continuous approximation to $K_{2 t+2} / K_{21}$, which must hold in order that the latitudinal velocity may vanish at the equator. Writing $N_{i}=K_{2 i+2} / K_{2 i}$, oll the $N^{\prime}$ 's may be computed from the continued fraction (37). Then
$K_{2}=\mathrm{E}, K_{4} / \mathrm{E}=N_{1}, K_{6} / \mathrm{E}=N_{1} N_{3}, K_{8} / \mathrm{E}=N_{1} N_{2} N_{2}$ \&c.
We cannot compute $\bar{K}_{8}$ from $K_{4}, K_{8}$ from $K_{6}$ and eo on; for, if we do, then, short of infinite accuracy in the gumerical values, we shall be gradually led to successive values of the $\overrightarrow{K^{\prime}}$ s which tend to equelity. ${ }^{2}$
This process was followed by Laplace withont explanation. It Was attacked hy Airy in his "Tides and Waves" (in Ency. Metrop.) and by Ferrel in his Tidal Researches (U.S. Coast Survey, 1873), but was justified by Sir W. Thomson in the Phil. Mag. (1875, p. 230). The investigation given here is substantially Thomson's.

Laplace gives numerical oolutions for three different depths of the sea, गे these correspond respectively to the cases of $\beta=40,10,5$, and the solutions are
$\beta=40, \mathrm{~h}=\mathrm{E}\left\{\nu^{2}+20 \cdot 1862 \nu^{4}+10 \cdot 1164 \nu^{8}-13 \cdot 1047 \nu^{9}-15 \cdot 4488 \nu^{10}\right.$
$-7.4581 \nu^{12}-2 \cdot 1975 \nu^{14}-0.4501 \nu^{16}-0.0687 \nu^{18}$
$\left.-0.0082 \nu^{20}-0.0008 \nu^{23}-0.0001 \nu^{24} \ldots\right\}$
$\beta=10, \mathrm{~h}=\mathrm{E}\left\{\nu^{2}+6 \cdot 1960 \nu^{4}+3.2474 \nu^{0}+0.7238 \nu^{\theta}+0.0919 \nu^{10}\right.$ $\left.+0.0076 \nu^{12}+0.0004 \nu^{16} \ldots\right\}$
$\beta=5, \mathrm{~h}=\mathrm{E}\left\{\nu^{2}+0.7504 \nu^{4}+0.1566 \nu^{6}+0.0157 \nu^{8}+0.0009 \nu^{10}+\ldots\right\}$

[^143]Since $h$ vanishes when $\nu=0$, there is no rise and fall of water at the poles. When $\nu=1$ at the equator, we find

$$
\begin{aligned}
& \beta=40, \mathrm{~h}=-7 \cdot 434 \mathrm{E} \\
& \beta=10, \mathrm{~h}=11 \cdot 267 \mathrm{E} \\
& \beta=5, \mathrm{~h}=1.924 \mathrm{E} .
\end{aligned}
$$

The negative sign in the first case shows that the tide is inverted at the equator, giving low water when the disturbing body is on the meridian. Near the pole, however, that is, for small values of $\nu$, the tides are direct. In latitude $18^{\circ}$ (approximately) there is a nodal line of evanescent semi-diurnal tide. In the second and third cases the tides are everywhere direct, increasing in magnitude from pole to oquator. Ao $\beta$ diminishes the tides teud to assume their equilibrium value, because all the terma, save the first, become evaneaceut. When $\beta=1$ (depth $r$ of redius) the tide at the equater etill exceeds its equilibrium value by 11 per cent. As $\beta$ diminishes from 40 to 10 the nodal line of evanescent tide contracts round the pole, and when it is infinitely small the tidea are infinitely great. The particular value of $\beta$ for which this occurs is that where the free oscillation of the ocean has the same period as the forced oscillation. The values chosen by Laplare were not well adspted for the illustration of the regults, because in the cases of $\beta=40$ and $\beta=10$ the depth of the acean is not much different from that velue which would give infinite aemi-diurnal tide. For values of $\beta$ greater than 40 we olould find other nodal liues dividing the sphere inte regions of direct and inverted tides. We refer the reader to Sir W. Thomson's papere for further details on this interestiug point.

## § 17. Tides of Long Period; Laplace's Arguneent froin Friction.

In treating these oscilletions Laplace remarks that a very omall Laplace"k amount of friction will be sufficieut to cause the surface of the arguocean to assume at each instant its form of equilibriom, and hement sdduces in proof of lis conclusiou the considerations given below. from The friction here coutemplsted is such that the integral effect is frintion represented by a retarding force proportional to the velocity of the unsoasd water relatively to the bottom. Although proportionality to the square of the velocity would probsbly be nearer to the truth, yet Laplace's hypothesis suffices for the preaent discussion.

In oscillations of this class the water moves for half a period north, and then for half a period soutl. In ascillating systems, where the resiatances are proportional to the velocities, it is usual to epecify the resistance by a modulus of decay, namely, that period in which a velocity is reduced to $e^{-1}$ of its initial value by friction. Now the friction contemplated by Laplace is such that the modulus of decay is short compsred with the semi-period of oscillation. I'he quickest of the important tidea of long period is the fortnightly (see chapter iv.) ; hence, for the applicability of Laplace's conclusion, the modulus of decay must be short compared with a week. Now it seems practically certain that the friction of the bed of the ocean would not materially affect the velocity of a elow ocean current in a day or two. Hence we cannot accept Laplace'e discussion as satiafactory. However this may be, we now give what is oubstantially his argument.

Let us write 6 for the reciprocal of the modulus of decay. Then the frictional forces introduced on the left-hand side of (17) are $+6 d \xi / d t$ in the first and $\sin \theta 6 d \eta / d t$ in the second. Laplace's hypothesis with regard to the magnitude of the frictional forces enables us to neglect the terms $d^{2} \xi / d t^{3}$ and $\sin \theta d^{2} \eta / d t^{2}$ compared with the frictional forces. Then, if we observe that in oscillations of this class the motion is entirely latitudinal, cquations (17) and (19) become

$$
\begin{aligned}
& 6 \frac{d \xi}{d t}-2 n \sin \theta \cos \theta \frac{d \eta}{d t}=-\frac{g}{a} \frac{d}{d \theta}(\mathrm{D}-t) \\
& \sin \theta \in \frac{d \eta}{d t}+2 n \cos \theta \frac{d \xi}{d t}=0 \\
& b a \sin \theta+\frac{d}{d \theta}(\gamma \xi \sin \theta)=0
\end{aligned}
$$

From the first two of these we easily obtain

$$
\begin{equation*}
\left(\xi+\frac{4 n^{2}}{g^{2}} \cos ^{2} \theta\right)^{d \xi}=-\frac{g}{a} \frac{d}{d \theta}(\xi-\ell) \tag{39}
\end{equation*}
$$

Ae a first epproximetion we treat $d \xi / d t$ ss zero, and obtain $\boldsymbol{b}=\boldsymbol{e}$, or the height of water satisfies the equilibrium theory. In these
 equation of (38) re can obtain a firat approximstion to $\xi$; then, substituting in (39), we obtain on integration a second epproximation to b. Laplace, however, considers as adequate the firat approxime tion, which is simply the conclasion of the equilibrium theory.
§ 18. Tides of Long Period in an Ocean of Uniform Depth.
As it seems certain that these tides do not estisfy even epprox.. mately the equilibrium law, we now procsed to find the solution where there is no friction. In the case of these tides $k=0, f$ a small fraction, and $\theta=\mathrm{E}\left(\frac{1}{3}-\cos ^{2} \theta\right)$. The equation (24) then becomes

$$
\frac{1}{\sin \theta} \frac{d}{d \theta}\left(\frac{\gamma \sin \theta \frac{d \mathrm{u}}{d \theta}}{f^{2}-\cos ^{2} \theta}\right)+4 m a(\mathrm{n}+\mathrm{c})=v \vdots
$$

$\sigma_{3}$ writing $\mu$ for $\cos \theta$ and $\theta=E\left(\frac{1}{3}-\mu^{2}\right)$,

$$
\begin{equation*}
\frac{d}{d \mu}\left(\gamma \frac{1-\mu^{2}}{\mu^{2}-f^{2}} \frac{d u}{d \mu}\right)=4 m a(u+e) . \tag{40}
\end{equation*}
$$

,We shall confine the investigation to the case where $\gamma=l$, a con stant, and where the sea covers the whole eurface of the globe. The symmetry of the motion in this case demands thet $u$ when expended in a series of powers of $\mu$ ahall only involve even powers. Lot us assume, therefor $\theta$, thet

Then $\begin{aligned} \quad \frac{\mu^{2}-f^{2}}{} \overline{d \mu}= & \mathrm{B}_{1} \mu+\mathrm{B}_{3} \mu^{3}+\ldots \\ \frac{1-\mu^{2}}{\mu^{2}-f^{2}} \overline{d \mu} & =\mathrm{B}_{1} \mu+\left(\mathrm{B}_{3}-\mathrm{B}_{1}\right) \mu^{3}+\ldots+\left(\mathrm{B}_{2 i+1}-\mathrm{B}_{2 i-1}\right) \mu^{2 i+1}+\ldots \\ \frac{d}{d \mu}\left(\frac{1-\mu^{2}}{\mu^{2}-f^{2}} \frac{d \mathrm{u}}{d \mu}\right)= & \mathrm{B}_{1}+3\left(\mathrm{~B}_{3}-\mathrm{B}_{1}\right) \mu^{2}+\ldots \\ & +(2 i+1)\left(\mathrm{B}_{2 i+1}-\mathrm{B}_{2 i-1} j \mu^{23}+\ldots . \ldots . .(42) .\right.\end{aligned}$
Again,
$\frac{d u}{d \mu}=-f^{2} \mathrm{~B}_{2} \mu+\left(\mathrm{B}_{1}-f^{2} \mathrm{~B}_{3}\right) \mu^{3}+\ldots+\left(\mathrm{B}_{2 i-1}-f^{2} \mathrm{~B}_{2 i+1}\right) \mu^{2 i+1}+\ldots \ldots(43)$
$\mathrm{u}=\mathrm{C}-\frac{1}{2} f^{2} \mathrm{~B}_{1} \mu^{2}+\left\{\left(\mathrm{B}_{1}-f^{2} \mathrm{~B}_{3}\right) \mu^{4}+\ldots+\frac{1}{2 i}\left(\mathrm{~B}_{21-3}-f^{2} \mathrm{~B}_{2 i-1}\right) \mu^{2 i}+(44)\right.$,
where $C$ is a constant. Then, writing $\beta$ for 4 ma/l, as in the case of the aemi-diurnel tide, eubatituting from (42), (43), and (44) in (40), end equating to zero the successive coefficients of the powers of $\mu_{\text {, }}$ me find

$$
\begin{equation*}
\mathrm{B}_{3}-\mathrm{B}_{1}\left(1-\frac{1}{2.3} f^{2} \beta\right)+\frac{1}{3} \beta \mathrm{E}=0 \tag{45}
\end{equation*}
$$

$B_{2 i+1}-B_{2 i-1}\left(1-\frac{1}{2 i(2 i+1)} f^{2} \beta\right)-\frac{\beta}{2 i(2 i+1)} B_{23-3}=0$
Thus the constant C and $\mathrm{B}_{3}, \mathrm{~B}_{5}, \& \mathrm{c}$., are all expressible in terms of $B_{1}$, and $B_{1}$ ia apparently indeterminate. We may remark that, if

$$
-\frac{\beta}{2.3} \mathbf{B}_{-1}=\frac{1}{3} \beta \mathbf{E}^{2} \text {, or } \mathrm{B}_{-1}=-2 \mathbf{E} \text {, }
$$

the equation of condition (45) may be held to apply for all values of $i$, from ono to infinity. Let us write (45) in the form

$$
\begin{equation*}
\frac{\mathrm{B}_{2 i+1}}{\mathrm{~B}_{2 i-1}}=1-\frac{1}{2 i(2 i+1)} f^{2} \beta+\frac{\beta}{2 i(2 i+1)} \frac{\mathrm{B}_{2 i-3}}{\mathrm{~B}_{2 i-1}} \ldots \ldots \ldots \tag{46}
\end{equation*}
$$

When $i$ is large $B_{2 i+1} / B_{2 i-1}$ either tends to become infinitely small or it does not do so. Let us suppose that it does not tend to become infinitely small. Then it is obvious that the successive B's tend to become equal to one another, and so also do the values of $\left(\mathrm{B}_{2 i-2}-f^{2} \mathrm{~B}_{2 i-i}\right) / 2 i$ and the coefficients of $d \mathrm{u} / d \mu$. Hence we havo $d u / d \mu=L+M /\left(1-\mu^{b}\right)$, for all values of $\mu$, where $L$ and $M$ are finite. Hence this hypothesis gives infinite velocity to the fluid at the pole, where $\mu=1$. But with a water-covered globe this infinite velocity is impossible, and therefore the bypothesia is negatired, and $B_{2 i+1} / B_{2 i-1}$ must tend to become infinitely small. This being established, let us write (46) in the form

$$
\begin{equation*}
\frac{\mathrm{B}_{2 i-1}}{\mathrm{~B}_{2 i-3}}=\frac{-\frac{f}{2 i(2 i+1)}}{1-\frac{f^{2} \beta}{2 i(2 i+1)}}-\frac{\mathrm{B}_{2 i+1}}{\mathrm{~B}_{2 i-1}} \tag{47}
\end{equation*}
$$

By repeated applications of (47), we have in the form of a continued fraction

$$
\begin{equation*}
\frac{\mathrm{B}_{2 i-1}}{\mathrm{~B}_{2 i-3}}=\frac{-\frac{\beta}{2 i(2 i+1)}}{1-\frac{f^{2} \beta}{2 i(2 i+1)}}+\frac{\frac{\beta}{(2 i+2)(2 i+3)}}{1-\frac{f \cdot \beta}{(2 i+2)(2 i+3)}}+\frac{\beta}{1-\frac{\beta}{(2 i+4)(2 i+5)}} \frac{f^{2} \beta}{(2 \dot{i}+4)(2 i+5)}+\& c . \tag{48}
\end{equation*}
$$

And we know that this is a continuous approximation, which must hold in order to satisfy the condition that the water covers the whole globe. Let us denote this continued fraction by $-N_{i}$. Then, if we remember that $\mathrm{B}_{-1}=-2 \mathrm{E}$, we hare

$$
\mathrm{B}_{1}=2 \mathrm{E} \lambda_{1}, \mathrm{~B}_{3} / \mathrm{B}_{1}=-\lambda_{2}^{-}, \mathrm{B}_{3} / \mathrm{B}_{3}=-N_{3}, \mathrm{~B}_{-} / \mathrm{B}_{6}=-\lambda_{4}, \& \mathrm{c}
$$

60 that

$$
\mathrm{B}_{3}=-2 \mathrm{E} N_{2} N_{2}, \mathrm{~B}_{5}=2 \mathrm{E} \Lambda_{1} \nu_{2} \mathrm{~N}_{3}, \mathrm{~B}_{7}=-2 \mathrm{E} N_{1} \Lambda_{2} N_{3} N_{4} \text { sec. }
$$ and

$$
\left.\mathrm{C}=-\frac{1}{3} \mathrm{E}+2 \mathrm{E}\right\rangle_{2} / \beta
$$

Then $h=u+0$

$$
\begin{align*}
= & \mathrm{C}+\frac{1}{3} \mathrm{E}-\left(\mathrm{E}+\frac{1}{2} f^{2} \mathrm{~B}_{1}\right) \mu^{2}+\frac{1}{4}\left(\mathrm{~B}_{1}-f^{2} \mathrm{~B}_{3}\right) \mu^{4}+\frac{1}{8}\left(\mathrm{~B}_{3}-f^{2} \mathrm{~B}_{5}\right) \mu^{6}+\ldots \\
= & \mathrm{E}\left\{2 N_{2} / \beta-\left(1+f^{2} N_{1}\right) \mu^{2}+\frac{1}{2} N_{3}\left(1+f^{2} N_{2}^{6}\right) / \mu^{4}\right.  \tag{49}\\
& \left.\quad-\frac{1}{N_{1}} N_{2}\left(1+f^{2} N_{3}\right) \mu^{6}+\ldots\right\} \ldots \ldots \ldots \ldots \ldots(49) .
\end{align*}
$$

Now wo find that, when $\beta=40$, which makes the depth of the eea 3000 fathoms or $\frac{1}{8} 0 \mathrm{o}$ the radius of the earth, and with $f=.0365012$, which is the value for the fortnightly tide (see chap. iv.),
$N_{1}=3 \cdot 040692, N_{2}=1 \cdot 20137, N_{3}=\cdot 66744, N_{4}=\cdot 12819, N_{3}=\cdot 29819$, $N_{6}=21950, \lambda_{7}=\cdot 16814, N_{8}={ }^{\circ} 13257, \lambda_{9}=107, \lambda_{10}={ }^{\circ} 1$.
These valuea give
$2 N_{1} / \beta=\cdot 15203,1+f^{2} N_{1}=1 \cdot 0041, \frac{1}{2} N_{1}\left(I+f^{2} N_{3}\right)=1 \cdot 5228$,
$\frac{1}{3} N_{1} N_{2}\left(1+f^{2} N_{3}^{r}\right)=1 \cdot 2187, \quad 1 N_{1} V_{2} N_{3}\left(I+f^{2} N_{4}\right)=60989$,
$\frac{1}{6} N_{2} \ldots N_{4}\left(1+f^{2} N_{5}^{5}\right)=20888, \frac{1}{6} N_{1} \ldots N_{8}\left(1+f^{2} N_{6}^{6}\right)=005190$,
$\left.\$ N_{1} \ldots N_{6}^{\prime} 1+f_{1}^{2} N_{7}\right)=00976, \frac{1}{6} N_{1} \ldots N_{7}\left(I+f^{2} N_{8}^{*}\right)=.0014_{1}$ $\frac{1}{8} N_{2} \ldots N_{5}\left(1+f^{2} N_{g}\right)=\cdot 00017$.
So tlat
$h / e=\left\{\cdot 1520-1 \cdot 0041 \mu^{2}+1 \cdot 5228 \mu^{6}-1 \cdot 2187 \mu^{6}+6099 \mu^{8}-\cdot 2089 \mu^{10}\right.$ $\left.+.0519 \mu^{12}-0098 \mu^{14}+.0014 \mu^{16}-.0002 \mu^{18}\right\} \div\left(1-\mu^{2}\right)(50)$. At the pole, where $\mu=1, \mathrm{~h}=-\mathrm{E} \times \cdot 1037=\mathrm{e} \times \cdot 1556$ and at the equator, where $\mu=0, \mathrm{~h}=+\mathrm{E} \times \cdot 1520=\mathrm{e} \times 4561)$ (51).

Now let us take a second-case, where $\beta=10$, which was also one of thoso solved for the caste of tho gemi-diurnal tide by Leplace, and we find
$\mathrm{h} / \mathrm{E}=\cdot 2363-1.0016 \mu^{2}+.5910 \mu^{6}-\cdot 1627 \mu^{6}+.0258 \mu^{8}-.0026 \mu^{20}$ $+{ }^{\circ} 0002 \mu^{1 ?}$.
At the pole, where $\mu=1$, we find $h=-\mathrm{E} \times 3137=\mathrm{e} \times 471$, and at the equator $\mathrm{l}=+\mathrm{E} \times 2303=\mathrm{e} \times \cdot 709$. With a deeper ocean wc should soon arrive at tha equilibrium value for the tide, for $N_{1}, N_{2}$. \& c., become very small, and $2 N_{1} / \beta$ becomes equal to $\frac{1}{3}$. In this case, with such oceans as those with which we have to deal, the tides of long period are considerably smaller than the equilibrium value.

## § 19. Stabitily of the Oceen.

Imagine a globe of density $\delta$, surrounded by a spherical layer of Stability water of deusity $\sigma$. Then, still maintaining the spherical figure, and of the with water still covering the nuclena, let the layer be displaced ocean. sidewaye. The force on any part of the water distant $r$ from the centre of the weter and $r$ from the centre of the nucleus is $\frac{4}{3} \pi r^{\prime}$ towards the centre of the fluid sphere and $f \pi(\delta-\sigma) r$ towards the centre of the nucleus. If $\delta$ be greater than $\sigma$ there is a force tend. ing to carry the water from placea where it is deeper to places where it is shallower; and therefore the equilibrimm, thus arbitrarily dis. turbed, is stable. If, lowever, $\delta$ is less than $\sigma$ (or the nucleus lighter than water) the force is such that it tenda to carry the water from where it is shallower to where it is deeper, ond therefore the equilibrium of a layer of fluid distributed over a nucleus lighter then itself is unstable. As Sir William Thomson has remarked, ${ }^{1}$ if the nucleus is lighter than the ocean, it will foat in the occan Stabilitics with part of its surface dry. Suppose, again, that the fluid layer of various be disturbed, so that its equation is $r=a\left(1+s_{1}\right)$, where $s_{1}$ is a sur. orders. face harmonic of degree $i$; then the potential due to this deformation is $\frac{4 \pi \sigma}{2 i+1} \frac{a^{i+3}}{r^{i}+1} s_{i}$, and the whole potential is

$$
\frac{4 \pi \partial i^{3}}{3 r}+\frac{4 \pi \sigma}{2 i+1} \frac{a^{i}+3}{r^{i+1}} s_{k} .
$$

If, the efore, $\sigma /(2 i+1)$ is greater than $\frac{1}{3} \delta$, the potential of the forces due to deformation is greater than that due to the nucleus. But we liave seen that a deformation tends to increase itself by mutual attraction, and thercfore the forces are such as to increase the deformation. If, therefore, $\sigma=\frac{1}{3}(2 i+1) \delta$, all the deformations up to the ith are unstable, but the $i+1$ th is stable. ${ }^{2}$ If, however, $\sigma$ be less than $\delta$, then all the deformations of any order are such that there are positire forces of restitution. For our present purpose it suffices that this equilibrium is stable when the ruid is lighter than the nuclens.

## § 20. Precession and lutation.

Suppose we have a planet covered with a shallow ocean, and that Freces. the ocean is set into oscillation. Then, if there are no external dis- sion and turbing forces, so that the oscillations arc "frec," not "forced," nutation the resultant moment of momentum of the planet and ocean remains constent. And, since each particle of the occan excentes periodic oscillations about a mean position, it follows that the ascillation of the ocean imparts to the solid carth oscillations such that the resultant moment of momentum of the whole system remains constant. But the mass of the ocean being very small compared with that of the planet, the component angular relocities of the planet necessary to counterbalance the moment of momentum of the oscillations of the sea are very small compared with the component angular velocities of the sea, and therefore the disturbance of planetary rotation due to oceanic reaction is negligible. If now an external disturbing force, such as that of the moon, acts on the system, the resultant moment of momentum of sea and certh is unaffected by the interaction between them, and tho precessional and mutational c, uples are tho same as if sea and earth were rigidly connected together. Thercfore tho additions to theso couples on account of tidal oscillation are the couples due to the attraction of the moon on the excess or deficiency of water above or below mean sea.lcrel. The tidal oscillationa are very small in height compared with the equatorial protuberance of the earth, and the density of water is fiths of that of surface rock; lience the additional conples are very amall compared with the conples due to the noon's action on the

1 Thomson and Talt, Niat. Nhil. $\$ 816$.
2 Compare an Important paper by Poincaré. In Ack . Afath. (1985), 7; 3, 4.
solid equatorial protuberance. Thereforo precession and nutation take place sensibly as though the sea were congealed iu its mean position. If the ocean be rogarded as frictionlcss, the principles of energy show us that these insensible additional couples must be periodic in time, and thus the corrections to nutation must consist of semi-diurnal, diurnal, sod fortnightly nutations of absolutely insensible raagnitude. We shall have much to say belorv on the results of the introduction of friction into the conception of tidal oscillations as a branch of speculative astronomy.

## § 21. Some Prenomena of Tides in Rivers.

- In § 2 we have given a description of some of the phenomens of the tide-wepe in rivers. As a considerable part of our practicel knowledge of tides is derived from observations in estuaries and rivers; we give an investigation of two of the most important features of the tide-wave in these cases. It must be premised that when the profile of wave does not present the simple harmonic form it is convenient to analyse ita shape into a series of partial wayes superposed on a fundamental waye; and generally the prin. ciple of harmonic analysis is adopted, in which the actual ware is regarded as the sum of a number of simple harmonic waves.

The tide-wave in a river is a "long" wave in which the vertical motion of the water is very small compared with the horizontal, the river very shallow compared with the wave-length, and the water which is at any moment in a vertical plade always remains so throughont the oscillation.
Suppose that the water is contained in a straight and shallow canal of uniform depth; then take an origin of coordiostes at the bottom, with the $x$ axis horizontal in the direction of the canel, and the $y$ axis vertical; let $h$ be the undisturbed depth of water; let $h+\eta$ be the ordinate of the surface correspondiog to that fluid whose undisturbed abscissa is $x$ and disturbed abscissa $x+\xi$; and let $g$ be gravity. The equations of motion and continuity ${ }^{2}$ are

$$
\left.\begin{array}{rl}
\frac{d^{2} \xi}{d t^{2}} & =g h \frac{d^{2} \xi / d x^{2}}{(1+d \xi / d x)^{3}} \\
\eta & =\frac{-h d \xi / d x}{1+d \xi / d x} \tag{52}
\end{array}\right\}
$$

For krevity we shall write $v^{2}=g h$ and $u=v t-x$. Since for "long " waves $d \xi / d x$ is small, the equations (52) become approximately

$$
\left.\begin{array}{c}
\frac{d^{2} \xi}{d t^{2}}=v^{2} \frac{d^{2} \xi}{d x^{2}}\left(1-3 \frac{d \xi}{d x}\right)  \tag{53}\\
\cdot \frac{\eta}{\hbar}=-\frac{d \xi}{d x}+\left(\frac{d \xi}{d x}\right)^{2}
\end{array}\right\}
$$

For finding a first approximation we neglect the second term on the right of each of (53). The solation is obvious! 3

$$
\left.\begin{array}{l}
\xi=a \cos m(u t-x)=a \cos m u \\
\eta=-m a b \sin m u
\end{array}\right\}
$$

54) gives the lieight of the water whose undisturbed abscissa is $x_{3}$ and since $\xi$ is small this is approximately the height at the point on the bank whose abscissa is $x$. But now suppose that at the origin (the mouth of the river) the canal communicates with a basin in which there is a forced oscillation of water-level given by $\eta=\Pi \sin n \ell$.
.....(55).

This represents the oceanic tide, and $n$ is that which we coll below, ( $£ 23$ ) the speed of the tide. Then obviously $m=n / v$, so that at any point $x$ up the river

$$
\begin{equation*}
\eta=H \sin n\left(t-\frac{x}{\sqrt{g h}}\right) \tag{56}
\end{equation*}
$$

(56) gives the first approximation to the forced tide-wave, and it is clear that any number of oscillations mey be propagated indopendently up the river with tho velocity $\sqrt{g h}$ due te the depth of Over the river. In passing to the second approximation wo must seoarate tices. the investigation into two branches.
(i.) Over-Tides (se日 $\$ 24$ ).-We now suppose that the tide at the river mouth is simply (55). On substituting the approximato values (54) in (53) our equations berome

$$
\left.\begin{array}{l}
\frac{d^{2} \xi}{d l^{3}}=v^{2} \frac{d^{2} \xi}{d x^{3}}+\frac{3}{2} v^{2} a^{2} m^{3} \sin 2 m v  \tag{57}\\
\frac{\eta}{h}=-\frac{d \xi}{d x}+\frac{1}{2} m^{2} a^{2}-\frac{1}{2} m^{2} a^{2} \cos 2 m u
\end{array}\right\}
$$

We have now to assume an appropriate form for the solution of (57), such as $\quad \xi=a \cos m u+A x \cos 2 m u+B \sin 2 n u \varepsilon$.........(58). We have here in effect assumed that the second and third terins of (58) are small compared with the first. It is clear, however, that at a distance from the origin the term in A will become large. This dificulty may be eluded by taking the camal of finite length, and supposing that, where the canal debouches into a second basin, a second appropriate forced oseillation is maintained. The length of the canal romains arbitrary, save that the second term of (58) shall still be small compared with the first. On substituting from (58) in (57) we have $B$ indeterninate and $A=-\frac{5}{8} \pi^{2} m^{2}$; hence $\eta / h=\frac{1}{2} m^{2} a^{2}-m a \sin m u+\frac{3}{4} m^{3} a^{2} x \sin 2 m u+\left(2 m \mathrm{~B}-\frac{1}{6} n v^{2} \alpha^{2}\right) \cos 2 m u(59)$. This gives the elevation of the water whose undisturbed abscissa is $x$, that is to say, at the point whose abscissa along the bank is $X=x+\xi$. If we put $x=X-\xi$ in the largest term of (59), and treat $\xi$ as small, and put $x=X$ in the small terms, (59) becomes
$\eta / h=-m a \sin m(v t-X)+m^{3} a^{2} X \sin 2 m(v t-X)$
$+\left(2 m \mathrm{~B}-\boldsymbol{s}^{2} m^{2} a^{2}\right) \cos 2 m(v t-X)$.
But at tho origin (55) holds true, tberefore $\mathrm{B}=\mathrm{I}_{18} \mathrm{~s}^{3} m a^{3},-m a h=H$, end $m v=n$. Thus the solution is

$$
\begin{equation*}
\eta=H \sin n\left(t-\frac{X}{\sqrt{y h}}\right)+\frac{3 H^{2} n}{4 h \sqrt{g h}} X \sin 2 n\left(t-\frac{X}{\sqrt{g h}}\right) \tag{60}
\end{equation*}
$$

From (60) we can see what the proper forced oscillation at the Solution further end of the canal must be ; but this matter has no present giviog interest. The first term of ( $\delta 0)$ being called the fundamental, tho first second gives what is called the first over-tide; and by further over-tids approximation we can get the second, third, \&c. The over-tide travels up the river at the same rate as the fundamental, but it has double frequency or "speed," and the ratio of its amplitude to that of the fundamental is $\frac{3 H}{4 h} \frac{n X}{\sqrt{g h}}$.
As a numerical example, let the range of tide at the river mouth be 20 feet and the depth of river $50^{\circ}$ feet. The "specd" of the semi-diurnal tide is about $1 / 1.9$ radians por hour ; $\sqrt{g h}=27$ miles per hour ; hence $\frac{3 H}{4 h} \frac{n X}{\sqrt{g h}}=\frac{1}{342} X$. Therefore 34 miles up the river

Fig. 1
the over-tide is roth of the fundariental and has a range of 2 feet. If the river shallows very gradually, the formula will still hold, and we see that the height of over-tide varies as (depth) ${ }^{-3}$.

Fig. $1^{2}$ read from left to right exhibits the progressive change of shape. The steepress of the advancing crest shows that it is a shorter time from low to high water than vice versa. The law of the ebb and flow of currents mentioned in $\$ 2$ may also be easily determined from the above investigation. We leave the reader to determine the effect of friction, which is giveu by inserting a term $-\mu d \xi / d t$ on the right-hand side of (57).
(ii.) Compound Tides (see § 24). We shall now consider the mutual influence of two waves of different periods travelling up the river together. In the first approximation they are quite independeut, and we may assume
$\xi=a \cos m(v t-x)+b \cos [n(v t-x)+\varepsilon]$ $\qquad$
In proceeding to the second approximation, we only take notice of those terms which result from the interaction of the two, and omit all others, writing for the sake of brevity

$$
\left\{\begin{array}{l}
\{n-n\}=(m-n)(v t-x)-\epsilon, \\
\{n+n\}=(m+n)(v t-x)+\epsilon .
\end{array}\right.
$$

With the value of $\xi$ assumed in (61), we find, on substituting in (53) and only retaining terms depending on mutual influence, that the equations for the second approxintation are

1 See, for crample, Lamb's Hydrodynamics, chap. vii.
2 Froin Airy, "Tides and Waves."
$\left.\begin{array}{l}\frac{d^{2} \xi}{d l^{2}}=v^{2} \frac{d \xi \xi}{d x^{2}}+\frac{3}{2} v^{2} \alpha b m n[(m+n) \sin \{m+n\}-(m-n) \sin \{n t-n\}] \\ \eta / h=-a b m n[\cos \{m+n\}-\cos \{m-n\}]-d \xi / d \dot{x}\end{array}\right\}(62$. $\eta / h=-a b m n[\cos \{m+n\}-\cos \{m$
Now let us assume as the solution
$\left.\begin{array}{rl}\xi= & a \cos m(v t-x)+\mathrm{A} x \cos \{m+n\}+\mathrm{B} \sin \{m+n\} \\ & +b \cos [n(v \ell-x)+\epsilon]+\mathrm{C} x \cos \{m-n\}+\mathrm{D} \sin \{m-n\}\end{array}\right\} \ldots(63) ;$
and let us elude the difficulty about the increasing. magnitude of the second term in the same way as before. Substitutino in tho equation of motion, we have for all time,
$2(m+n) A \sin \{n+n\}+2(m-n) C \sin \{m-n\}$
$+\frac{3}{2} \alpha b m n[\{n+n) \sin \{m+n\}-(m-n) \sin \{m-n\}]=0$.
This gives $\mathrm{A}=-\frac{8}{3}$ abmn and $\mathrm{C}=+\frac{3}{3} \alpha b n n$. B and D remain arbitrary as beforc. and will be droppel, because they are to bo determined by the condition that at the origin the terms of $d E / d x$ in $\cos \{n+n\}, \cos \{n-n\}$ are to vanish, whence
$\eta / h=-a n \sin n(v t-x)-h n \sin [n(v f-x)+\epsilon]$
$+\frac{3}{4} a b m n[(n z+n) x \sin \{m+n\}-(m-n) x \sin \{m-n\}]$

+ terms in $\cos \{m+n\}$ and $\cos \{m-n\}$.
Then wo pass from $x$ to $X$ as in the last section, and make tho terms in cos $\{m+n\}$ and $\cos \{m-n\}$ vanish by proper values of $B$ and D, and we have

$$
\eta=a m h \sin m(v t-x)-b n h \sin [n(v t-x)+\epsilon]
$$

$+{ }^{3} a \ln n x X[(n+n) \sin \{n+n\}-(m-n) \sin \{m-n\}]$ (64).
Now at the river's mouth, where $x=0$, suppose that the oceanic tide is represeuted by $\eta=H_{3} \sin n_{2} t+H_{9} \sin \left(n_{2} t+\epsilon\right)$.

Then

$$
-a m=H_{1} / h,-\delta n=H_{2} / h, h a b m n=H_{1} H_{2} / h,
$$

$$
m v=n_{3}, \quad n v=n_{2}, v=\sqrt{g h}, \quad m \pm n=\frac{n_{1} \pm n_{2}}{\sqrt{g h}},
$$

so that (64) becomes

$$
\begin{align*}
\eta= & H_{1} \sin n_{2}\left(t-\frac{X}{\sqrt{g h}}\right)+H_{2} \sin \left[n_{2}\left(t-\frac{X}{\sqrt{g h}}\right)+\epsilon\right] \\
& +\frac{3 H_{1} H_{2} n_{1}+n_{2}}{4 h} \sqrt{\overline{g h}} \sin \left[\left(n_{1}+n_{2}\right)\left(t-\frac{X}{\sqrt{g h}}\right)+\epsilon\right] \\
& -\frac{3 H_{1} H_{2}}{4 h} \frac{n_{1}-n_{3}}{\sqrt{g h}} \boldsymbol{x} \sin \left[\left(n_{1}-n_{2}\right)\left(t-\frac{X}{\sqrt{g h}}\right)-\epsilon\right] . . \tag{65}
\end{align*}
$$

As a numerical example, suppose at the mouth of a river 50 fect decp that the solar semi-diurnal tide has a range $2 H_{1}=4$ feet, and thelunsr $2 H_{2}=12$ feet; then $n_{1}+n_{2}=$ bit $_{6}$ radians per bour, $n_{1}-n_{2}=r^{2}$, radians per hour, and as before $\sqrt{g h}=27$ miles per hour. With these figurea

$$
\frac{3 H_{1} H_{2}}{4 h} \frac{n_{1}+n_{2}}{\sqrt{g h}} X=\frac{1}{170} X .
$$

Thus 15 miles up the river the quater-diurnal tido (in $\$ 24$ below, called MS) has a semi-range of an inch. But the luni-soiar fort nightly tide (callod MSSf in § 24) would have a scmi-range of $z^{\prime}$ th of an inch. Where the two interacting tides are of nearly equal epeed, the sumnation compound tide is very large compared with the differential tide. As before, when the river shallows gradually this formula will still hold.
It is interesting to note the kind of effect produced by these compound tides. When the primary tides are in the same phase
Then $\quad\left(n_{1}+n_{2}\right)\left(t-\frac{X}{\sqrt{g h}}\right)+\varepsilon=2 n_{1} t-\left(n_{1}+n_{2}\right) \frac{X}{\sqrt{g h}}$;

$$
\left(n_{1}-n_{2}\right)\left(t-\frac{X}{\sqrt{g h}}\right)-\varepsilon=\quad \cdot\left(n_{1}-n_{3}\right) \frac{X}{\sqrt{g h}} ;
$$

snd
$\begin{gathered}\eta=\left(\Pi_{1}+\dot{H}_{2}\right) \sin n_{1}\left(l-\frac{X}{\sqrt{g h}}\right)+\frac{3 H_{1} H_{2}}{4 h} \frac{n_{1}+n_{2}}{\sqrt{g h}} \sin \left[2 n_{1} t-\left(n_{1}{ }^{\prime}+n_{2}\right) \frac{X}{\sqrt{g h}}\right] \\ -\frac{3 H_{1} H_{2}}{4 h} \frac{n_{3}-n_{2}}{\sqrt{g h}} \sin \frac{\left(n_{1}-n_{2}\right)}{\sqrt{g h}} x .\end{gathered}$
Hence the front slope of the tide-wave is steeper at spring than at neap tide, and the componnd tide shows itself in the form of $8 n$ augmentation of the first over-tide; and the converse statements hold of neap tide. Also mean-water mark is lower and higher alternately up the river at spring tide, and higher and lower alternately at. neap tide, by a small amount which depends on the differential tide. With the river which we were considering, the slternation would be so long that it would in actuality be either all lower or all higher.

## IL. The Harmomic Analysts.

§ 22.
The comparison between tidal observations and tidal theories, and the formation of tables predicting the tidal oscillations of the sea, have been carricd out in two different ways, which may be called the "synthetic" and the "analytic."
The semi-diurnal rise end fall of tide with the weekly alternation of spring snd neap would naturally suggest to the investigator to make his formula conform to the apparent simplicity of the phenomenon. He would seek to represent the height of water by either one or two periodic functions with a variable amplitude; euch a representation is the aim of the synthetic method. That method has been followed by all the great investigators of the past, -Newton, Bernoulli, Maclaurin, Laplace, Lubbock, Whewell, Airy. Since at European ports the two tides which follow one another on any one day are nearly equal, or, in other words, there is scarcely a sensible diurnal tide, these investigators bestowed comparatively little attention to the diurnal tides. If these aro neglected, the oynthetic method is simple, for a single function suffices to repreaent the tide. In nou-Europeau ports, however, the diurnal tide is sometimes so large as to mask the semi-diurnal, snd to make only a single instesd of a double high water in twenty-four liours. To represent this diurnal tide in tha syothetic method we are compelled to introduce at least ono more function. There should alao be a third-function representing the tides of long period; hut until the last few years these tides have scarcely been considered, and there. fore we shall have little to say of them in explaining the synthetic method. The expression for the tile-generating forces due to either oun or moon consists of three terms, involving the declinations and hour-angles of the planet. One of these terms for each goes through its periad approximatelyotwico a day, a second onee a day, sud the third varies slowly ( $\$ 7$ ). The mathematical basis of the synthetic method consists of a synthesis of the mathematical formula. The semi-diurnal term for the moon is fused with that for the sun, and the samo process is carricd out for the diurnal and slowly varying terms. A. mass of tidal observation at a place where the diurnal tide is small, even if, as in sll tha older observations, it consists merely
of neignts and times of high and low water, soon shows that the fusion of two simplo harmonic or reriodic functions is insufficient to represent the state of tide; and the beight and time of high water are found to need corrections for the variations of declination, of mation in right ascension, and of the parallaxes of both bodies.

But when continuons tidc-gauges were set up far more extanded data than those of the older ollservations became accessihle to the investigator, and more and more corrections were found to be expedient to adapt the formule to the facts. A systematic method of utilizing all the data became also a desidcratum. This state of matters led Sir W. Thomson to suggest the analytic method. ${ }^{1}$ It is true that the dynamical foundations of that method have always lain below the surface of the synthetic method, and have constantly been appealed to for the thicoretical deternination of corrections; nevertheless, we must regard the explicit adoption of the analytic method as a great advanice. In this method we conceive the tidal forces or potential duo to each disturbing lody to be developed into a series of terms each consisting of a constant (determined by the elements of the planet's orbit and the obliquity of the ecliptic) multiplied by a simple harmonic function of the time. Thus in place of the terms of the synthctic method for the three classes of tides we have an indefinitely long serica of erms for each of tho three classes. The loss of simplicity in the expression for the forces is far more than counterbalanced by the gain of facility for the discussion of the oscillations of the water. This facility arises from the great dynamical principle of forced oscillations, which we have explained in the hiatorical sketch. Aprlying this principle, we seo that each individual term of the harmonic development of the tidegenerating forces corresponds to an oscillation of the sea of the same period, but the amplitude and phase of that oscillation must depend on a netrork of causes of almost inextricsble complication. The analytic method, then, represents tho tide at any port by a series of simple harmonic terms whose period is determined from theoretical considerations, but whose amplitude and phase ara found from observation. Fortunately the serics representing the tidal forces converges with sufficient rspidity to permit us to consider only a moderate number of harmonic terma in the series.

Now it seems likely that the corrections which have been applied in the use of the synthetic method right have heen clothed in a more satisfactory and succinct mathematical form had investigatora first carried out the harmonic development. In this article we shall therefore invert history and come back on the synthetic method from the analytic, and shall show how the formulæ of correction stated in harmonic language may be made comparable with them in synthetic language. One explanation is expedient before pro- Fusion of ceeding with the hermonic development. Thera ara certain terms terma in the tide-generating forces of the moon, depending on the longi- affected tude of the moon's nodes, which complete their revolution in 18.6 by moyears. Now it has heen found practically convenient, in the appli- tion of cation of the harmonic method, to follow the synthetic plan to the moon's extent of classifying together terma whose speed differs only in node. consequence of the morement of the mon's node, and at the same time to conceive that there is a small rariability in the intensity of the generating forces.

## § 23. Development of Equilibrium Theory of Tides in Terms

 of the Elements of the Orbits.Within the limits at our disposal we cannot ao more than in. Equilidicate the processes to be followed in this development.
We have already seen in (3) that the expression for the moou's tide-generating potential is

$$
\mathrm{V}=\frac{3 m}{2 r^{2}} \rho^{2}\left(\cos ^{2} z-\frac{1}{2}\right),
$$

$$
\begin{aligned}
& \text { and in (10) that } \\
& \cos ^{2} z-\frac{1}{2}=2 \xi \eta M_{1} M_{2}+2 \frac{\xi^{2}-\eta^{2}}{2} \cdot \frac{M_{1}^{2}-M_{2}^{2}}{2}+2 \eta \xi \Delta M_{2} 3 M_{3}+2 \xi \xi M_{1} M_{3} \\
& +\frac{3 \xi^{2}+\eta^{2}-2 \xi^{2}}{3} \cdot \frac{\mathrm{Mr}_{1}{ }^{2}+\mathrm{Mr}_{2}{ }^{2}-2 \mathrm{M}_{3}{ }^{2}}{3}, \\
& \text { Where } \mathrm{M}_{1}, \mathrm{M}_{2} \mathrm{M}_{3} \text { are the dircction cosines of the moon referred to }
\end{aligned}
$$ axes fixed in the earth. We require to find the functions $M_{1} M_{2}, \frac{1}{3}\left(M_{1}{ }^{2}-M_{2}{ }^{2}\right)_{2}$ 8 c ., of the moon's direction cosines. ${ }^{2}$ Let A, B C (fig. 2) be the axes fixed in the earth, C being the north polo and $A B$ the equator; let $X, X, Z$ be a second set of axes, XY being tle plane of the moon's orbit; M the projection of the moon in her orbit; $I=2 \mathrm{C}$, the obliquity of the lunar orbit to the equator; $\chi=A X=B C Y ; l=M X$, tho

${ }^{1}$ Alry and after him Clazallon, appear to have been amongst the frrst to nse a kind of harmonic analysis for reducing tudal observations; bat, as Airy did ant emancrpate himsclf from the use of hour-ancles, decll astions, sc., his work can hardty be considered as an exarople of the analyt' ' method; aeo his "Tides and Wiaves," and Hatt's I'henomene des Marces, Paris, 1835.
${ }^{2}$ For further details of the analyais of this section, sce the Report "On Marmonic Analysis, \&c.," fur 1683 to the Britush Association (Southport).

Moon＇s moon＇s longitude in her orbit measured from $\mathbf{X}$ ，the intersection of longitude the equator with the lunar orbit，hereafter called the＂interscction．＂ ad obli．Then
quity of
orbit in－ troduced．

日ystem for the whole earth，and to regard high tide and high water as coneentaneous in the equatorial belt，and of oprosite meanings． outside of the critical latitudes．We here conceive the function alwaye to be written $f-\sin ^{2} \lambda$ ，so that outside of the critical lati－ tuder high tide is low water．We may in continuing the develop－ ment write the $\mathfrak{X}$－ $\mathrm{j}-\tilde{Z}$ functions in the form appropriato to the equilibrium thcory，with water covering the whole earth；for the actual case it is only then necessary to multiply by the reducing factor，and to subtract the phase alteration к．As these are mn－ known constante for cach place，they would only occur in the development as oymbols of quantities to be deduced from observa－ tion．It will be understood，therefore，that in the following schedules the＂argument＂is that part of the argument which is derived from theory，the true complete argument being the＂argu－ ment＂$-\kappa$ ，where $\kappa$ is derived from observation．
Up to this point we have supposed the moon＇s longitude and the earth＇s position to bo measured from the intersection；but in order to pass to the ordinary astronomical formula we must measure the longitude and the earth＇s position from the vernal equinor．Henco we determine the longitude and right ascension of the intersection in terms of the longitude of the moon＇e node and the inclination of the lunar orbit，and introduce them into our formale for the $\overline{\text { 玉道－}} \mathfrak{Z}$ functions．The expressions for the functiona corresponding to solar tides may be written down by symmetry，and in this cese the intersection is actually the vernal equinox．

The final result of the process oketched is to obtain a series of Explane terms each of which is a function of the elements of the moon＇s or tion of eun＇s orbit，and a function of the terrestrial latitude of the place of achednles observatiou，multiplied by the cosine of an angle which increases below． uniformly with the time．We shall now write down the result in the form of a schedule；but we must first state the notation eni－ ployed ：－e，$e,=$ ecceatricities of lunar and solar orbita；$I, \omega=0$ b． liquities of equator to lunar orbit and ecliptic ；$p, p_{,}=$longitudes of lunar and solar perigees ；$\varpi, \varpi,=$ hourly incromente of $p, p_{i} ; s, h=$ moon＇s and sun＇s mean longitudes；$\sigma, \eta=$ hourly increments of $s$ ， $h ; t=$ local mean solar time reduced to angle ；$\gamma-\eta=15^{\circ}$ per hour ； $\lambda=$ latitude oi place of observation；$\xi, \nu=$ longitude ia lunar orbit， and R．A．of the intersection ；$N=$ longitade of moon＇s node ；$i=$ inclination of lunar orbit．The speed of any tide is defined as the Speed rate of increase of ita argument，zad is expressible，therefore，as lefined a linear function of $\gamma, \eta, \sigma, \bar{w} ; f, s$ we may neglect $\bar{w}$ ，as being very sinall．

The following schedulea，tben，give b the height of tide．The arrangement is as follows．First，there is a universal coefficient $\frac{3 m}{21}\left(\frac{a}{c}\right)^{3} a$ ，which multiplies every term of all the schedules．Secondly， there are general coefficients，one for each schedule，viz．， $\cos ^{2} \lambda$ for the semi－diurnal terms， $\sin 2 \lambda$ for the diurnal，and $\frac{1}{2}-\frac{3}{2} \sin ^{2} \lambda$ for the terms of long period．In each schedule the third column， headed＂coefficient，＂gives the functions of $I$ and $e$（and in two cases also of $p$ ）．In the fourth column is given the mean semi－range of the corresponding term in numbers，which is approximately the value of the coeflicient in the first column when $I=\omega$ ；but we pass over the explanation of the mode of computing the values．The fifth columin contains arguments，linear functions of $t, h, s, p, v, \xi$ ．In ［A ，i．$] 2 t+2(h-\nu)$ and in $[A, i i] t+.(h-\nu)$ are common to all the arguments．The arguments are grouped in a manner convenient for subsequent computation．Lastly，the sixth is a column of specds，being the hourly increase of the arguments in the preceding column，estimated in degrees per hour．It has been found practi－ cally convenient to denote eacli of these partial tides by an initial letter，arbitrarily chosen．In the first column we give a descriptive name for the tide，and in the second the arbitrarily chosen initial． In some cases no initial has been chosen，and here wo indicate the tide by the analytical expression for its specd，or hourly increase of argument．
The schedule for the solar tides is drawn up in prectsely the same manner，the oniy difference being that the coefficients aro absolute constants．The eccentricity of the solar orbit is so small that the elliptic tides may be omitted，except the largor elliptic semi－ diurnal tide．In order that the comnarison of the importance of the solar tides with the lunar may bo complete，the same noiversal coefficient $\frac{3 m}{2 M}\left(\frac{a}{c}\right)^{3} a$ is retained，and the special coefficient for cach
 sun＇s mass．With

$$
\frac{M}{m}=81 \cdot 5, \frac{\tau}{\tau}=\cdot 46035=\frac{1}{2 \cdot 17226^{\circ}}
$$

To write down any term，take the universal coefficient，the general coefficient for the class of tides，the spccial coefficient，and multiply by the cosine of the argument．The result，taken with the positive sign，is a term in the equilibrium tide，with water covering the whole earth．The transition to the actual case by the introduction of a factor and a delay of phase（to bs derived from observation）has been already explained．The sum of all the terms is the complete expression for the height of tide $h$ ．

## Schedulc of Lunar Tides.

[^144]Q, $\mathrm{Mm}, \mathrm{K}_{2}$ (solar), Ssa, $\nu, \mathrm{MI}_{1}, \mathrm{~J}, \mathrm{~L}, \mathrm{~T}, 2 \mathrm{~N}, \mu, \mathrm{OO}, 3 \sigma-\varpi$, tides. $\gamma-3 \sigma-\pi+2 \eta, \gamma-4 \sigma+2 \sigma, \sigma-2 \eta+\sigma, 2(\sigma-\eta), \lambda$.
The tides depentimor on the fourth power of the moon's parallax arise from the potential $V^{r}=\frac{m}{j^{4}} \rho^{n}\left(\frac{5}{3} \cos ^{3} z-\bar{z} \cos z\right)$. They give a iso to a small dinrnal tide $\mathrm{M}_{1}$, and to a small ter-diurnal tide $\mathrm{M}_{3}$; but we shall not give the analytical ievelopment.

## § 24. Mctcorological Tiles, Orer-Tides, and Coinpound Tides.

All tides whose period is an cxact multiple or submultiple of a Meteoro mean solar day, or of a tropical year, aro affected by meteorological locical conditions. Thus all the tides of the pincipal solar astronomical tidea. serieg $S$, with speeds $\gamma-\eta, 2(\gamma-\eta), 3(\gamma-\eta)$, \&c, arc subject to more or less metcorolorical paturbation. An ammal inequality in the diurual metcorological tith $S_{1}$ will also give riso to a tido $\gamma-2 \eta$, and this will be fuscel with and indistinguishablo from tho astronomical $P$; it will also give rivo to a tide will speed $\gamma$, which will be indistinguishablo from the astronomical lart of $k_{1}$. Similarly the astronomical tide $K_{2}$ maj bo perturbed by a scmi-ammal inequality in tho scmi-diumal astronomical tide of speed $2(\gamma-\eta)$. Although the diurnal elliptic tude $S_{1}$ or $\gamma-\eta$ and the semi-amenal and annual tides of speeds $2 \eta$ and $\eta$ are all probahly quite insensiblo as arising from astronomical canses, fot they have been found of sufficient importance to be considered. Tho anminal and scmiannolal tides are of enormous importanco in some rivers, representing in fact the yearly flooding in tho rainy season. In the reduction of theso tides the armumenta of the $S$ srries are $l, 2 l, 3 l, \& c$., and of the anmual, scmi-ammal, ter-annual tides $h, 2 h, 3 h$. As far as can be foreseen, tho magnitudes of theso tides are constant from year to year.

We have in $\S 21$ considered the dymamical theory of over-tides. Over The onlysides of this kind in which it has hitherto been though: tiden. necessary to represent the change of form in slabllow water lelong to the principal lunar and principal solar scrics. Thus, besides the fundamental astronomical tites $\mathrm{M}_{2}$ and $\mathrm{S}_{\mathrm{E}}$, the over-fides $\mathrm{M}_{8}, \mathrm{NI}_{6}, \mathrm{H}_{8}$ and $S_{4}, S_{6}$ lare heen dedned by harmonic analysis. The height of the fundamontal tide $\mathrm{M}_{2}$ varics from jear to juar, according to the variation in tise obliquity of the lunar orbit, and this variabulity is represented by the coeflicient $\cos ^{5} \frac{11}{2}$. It is probable that tho variability of $\mathrm{M}_{4}, \mathrm{M}_{6}, \mathrm{M}_{3}$ will bo represented by the square, culie, and fourth power of that coclficiont, amd theory (\$ 21) indicates that we should make the argument of tho over title a luntiple of tho argument of the fundamental, with a constant subtracted.
Compound tides have been aloo considered dymamically in $\$ 21$. Dy combining the speecls of the in portani tidex, it will be foum that there is in many cases a componnd tido which lias itself a specel. identical with that of an astronomical or metcorological tide. Wo thos find that the tides $Q, K_{1}, \lambda m, P, M_{2}, M f, O_{1}, M_{1}, L$ are liablo to perturbation in shallow watur. If cither or both the component titles are of lumar origin, tho heisht of the compound tide will chango from yoar to ycar, and will probably vars proportionally to the product of the coefficients of the component tid's. For tho purpose of properly reducing the muncrical value of the compound lides, wo require not merely the specd, but also the argument. The following schalule gives the adopted initials, argument, and speed of the principal componnd tides. The cocflicicuta are the produets of those of the two tides to be compounded.
[C.]-Schedule of Compound Tidcs.

§ 25. On the Form of Presentation of Resulls of Tidal Observations.

## 1mu*

## diato re

## suilt of

## pualysis

Supposing $n$ to be the speed of any tide in degrees per mean solar hour, and $t$ to be mean solar time elapsing since $0^{b}$ of the first day of (say) a year of continuons obserration, then the immediate result of harmonic aaalysis is to obtaia $A$ and $B$, two heights (estimater in feet and tenths) such that the heirgt of this tide at the time is given $L y A \cos n t+B$ sin $n$. If we put $R=\sqrt{ }\left(A^{2}+B^{2}\right)$ and $t a .2 \xi=B / A$, then the tide is represeated by

$$
\mathrm{R} \cos (n t-5)
$$

In this form $R$ is the semi-range of the tide in British feet, and $\zeta$ is an angle such that $\zeta / n$ is the time elapsing after $0^{b}$ of the first day uatil it is ligh water of this particular tide. It is obvious that $\zeta$ may have any value from $0^{\circ}$ to $360^{\circ}$, and that the results of the aaalysis of successive years of observation will not be com. parable with one another when presenterl in this form.
But let us suppose that the results of the analysis are presented in a number of terms of the form

$$
\mathrm{f} \mathrm{H} \cos (V+u-\mathrm{k})
$$

where $V$ is a ligear function of the moon's and sun's mean lorgitudes, the mean loagitude of the moon's and sua's perigees, and the local mean solar time at the place of observation, reduced to angle at $15^{\circ}$ per hour. $V$ iacreascs uniformly with the tiae, a ad its rate of increase per mean solar hour is the $n$ of the first method, and is called the speed of the tide. It is supposed that $u$ stands for a certain function of the longitude of the node of the lunar orbit at an epoch half a year later thau $0^{\text {b }}$ of the first day. Strictly speakiag, $u$ should be taken as tho samo function of the longitide of the mooa's node, parying as the norle moves; Lut, as the variation is but small io the course of a year, $u$ may be treated as a constant and put equal to an average ralne for the year, which average ralue is taken as the true value of $u$ at exactly mid year. Together $V+u$ constitute that function which has been tabulated as the "argument" in the schedules of $\S 23$. Since $V+u$ are together the whole argument according to the equilibrium theory of tides, with sea covering the whole earth, it follows that $\kappa / n$ is the lagging of the tide which arises from kinetic action, friction of the water, inperfect clasticity of the earth, and the distribution of land. It is supposed that $H$ is the mean value ia British feet of the semi-range of the particular tide in question; $f$ is a numerical factor of augmentation or climinution, due to the variability of the obliquity of the lunar orbit. The valne of $f$ is the ratio of the "coefficient" in the third column of the precediag schedules to the mear value of the same term. For example, for all the solar tides f is mnity, ard for the principal lunar tide $\mathrm{N}_{2}$ it is equal to $\cos ^{4} \frac{1}{2} I \div \cos ^{4} \frac{1}{2} \omega \cos ^{4} \frac{1}{2} i$; for the mean value of this term has a coefticient $\cos ^{4} \frac{1}{2} \omega \cos ^{4} \frac{1}{3} i_{0}$. It is obvious, then, that, if the tida] observations are consisteat from jear to year, H and x should come out the same from each year's reductions. It is only when the results are presented ia such a ferm as this that it will be possible to julge whether the harmonic analysis is yielding satisfactory results. , This mode of giving the ticlal results is also essential for the use of a tide-predicting machine (see § 3S).

We must now show how to determine H and $\kappa$ from $R$ and $\xi$. It is clear that $H=R / f$, and the determination of $f$ from the schedules depends on the evaluation of the mean value of each of the terms ia the schedules, into which we shall not enter. If $V_{0}$ be the ralue of $V$ at $0^{h}$ of the first day, then clearly

$$
\begin{aligned}
& \zeta=V_{0}+\imath-\kappa, \\
& \kappa=\zeta+V_{0}+u .
\end{aligned}
$$

so that
Thus the rnle for the determination of $\pi$ is: Add to the value of

The value of the argument at on of the first day.
The results of harmoaic analysis are usually tabulated by giving $\mathrm{H}, \kappa$ under the initial letter of each tide; the results are thus comparable from year to year. ${ }^{1}$ For the purpose of using the tidepredicting machine the process of determining $H$ and $\kappa$ froal $R$ and
${ }_{1}$ See, for example, a collection of results bs Baird and Darwin, Proc, Roy. Soc., No. 230,1855 .
$\zeta$ has simply to be reversed, with the difference that the instant of time to which to refer the argument is $0^{h}$ of the first day of the new year, and we must take note of tbe different value of $u$ and $f$ for the new year. 'l"abies" have becn computed for f and $u$ for all longitudes of the moon's node and for each kind of tide, and the mear longitudes of moon, sur, and lunar periges may bo ex. tracted from any ephemeris. Thus when the mean eemi-range H and retardation $\kappa$ of any tide are known its lieight may be com: puted for any instant. Thosun of the heights for all the piacipai tides of course gives the actual height of water.

## § 26. Nitmerieal Harmonic Analysis for Tides of Short Period.

The tide-gange (described below, §36) furnishcs us with a continums graphical record of the beight of the water above some known datuin mark for every instant of ,time. The first operation performed on the tidal record is the measurement in feet and decimals of the height of water above the datum at cvery mean solar hour. The period chosen for analysis is about oue year and the first measurement corresponds to noon.

If $T$ be the period of any one of the dinrnal tites, or the double period of any one of the semi-diurnal tides, it approximates moro or less nearly to $2 \frac{5}{2} \mathrm{~m} . \mathrm{s}$. licurs, and, if we divide it into thentyfour equal parts, we may speak of each as a T-hour. We sliall for brevity refer to meau solar time as S-time. Suppose, now, that we have two clocks, each marked with $360^{\circ}$, or 24 hours, and that the hand of the first, or S-clock, gocs round once in 24 S -hours, and that of the secoud, or T.clock, goes round once in twenty-four T-hours, and sulpiose that the two clocks are started at $0^{\circ}$ or $0^{\text {b }}$ at noon of the initial day. For the sake of distinctness, let us imagine that a T-hour is longer thau an S-hour, so that the T-clock goes slower thaa the S-clock. The measarements of the tide curve give us the height of water exactly at each S-hour ; and it is required frorn these data to determine the height of water at each T-hour. For this end we are, in fact, instructed to count T-time, hut are only allowed to do so by reference to S-time, and, moreover, the time is always to be specified as an integral number of hours. Commearing with $0^{\text {b }}$ of the first day, we begin counting $0,1,2$, \&c., as the T-land comes up to its hour-marks. But, as the S-hand gains on the T-haud, there will conse a time when, tho T-hand being exactly at the $p$ hour-mark, the S-laad is nearly as far as $y+\frac{1}{2}$. When, however, the T-hand has advanced to the $p+1$ hourlaark, the S -hand will bo a little beyond $p+1+\frac{1}{2}$, - that is to say, a little less than half an hour before $p+2$. Counting, then, in T-time by reference to S-time, we jump from $p$ to $p+2$. The counting will go on continuously for a number of hours nearly equal to $2 p$, and then another number will be dropped, and so on througlout the whole year. If it had been the T-hand which nent faster than the S-liand, it is obvious that one number would be repeated at two successive hours instead of one being dropped. Wo may describe each such process as a "change."

Now, if we have a sheet marked for entry of lieights of water Method according to T-hours from results measured at S-hours, we must of ansly. enter the S-measurements continuously ap to $p$, and we then comesis. to a change ; dropping one of the S -scries, we go on agaia contiauously until another change, when another is dropped; and so on. Since a clange occurs at the time when a T-liour falls almost exactly lialf.way between two S.hours, it will be more accurate at a chaage to insert the two S-cntries which fall on each side of the truth. If this be done the whole of the S-scries of measurements is eatered on the T-sheet. Similarly, if it we the T-hand which goes faster than the S-hand, wo may leave a gap in the T-series instead of duplicating an entry. For the analysis of the T-tide there is therefore prepared a sheet arranged in rows and columns; each row corresponds to one T-day, and the columns are marked $0^{h}, 1^{\text {b }}, \ldots 23^{h}$; the 0 's may be called T-noons. A dot is put in each space for cutry, and where there is a change two dots are phit if there is to be a doulule catry, and a bar if there is to be no entry. ${ }^{3}$ The numbers eutered ia cach column are summed; the results are then divided, cach by the proper divisor for its column, and thus the mean value for that colnmn is obtained. In this way 24 numbers are found which give the mean height of water at each of the 24 special hours. It is obvious that if this process were con. tinued over a very long time we should in the cnd extract the tide under analysis from amongst all the others; but, as the procesa only extends over abont a year, the elimination of the others is not quite complete. The elimination of the effects of the other tides may be improred by choosing the period for analysis not exactly equal to onc year.

Let us now return to our general notation, and consider the 24 mean values, each pertaining to the 24 T-hours. We supposo that all the tides except the T-tide are adequately eliminated, aad, in fact, a computation of the necessary corrections for the abscnce of complete elimination, which is giren in the Tidal Report to the British Association in 1872, shows that this is the case. It is
${ }^{2}$ Report ou Jiarmonic Analysis to Brit. Assoc., 1583 , and more extended table in Baird's Munual of Tidal Observation, London, 1 ssi.
s A sample page is given in the Report to the Brit. Assoc., 1883.

## Neces-

 sity for sugmen ug fac ors.obvieus that any one of the 24 ralnes does not give the true height of the T-tide at that T-hour, but gives the average height of the water, as due to the T-tide, estimated over half a T-hour before and half a ' $[$-hour after that hour. A consideration of this point shows that certain augmenting factors, differing slightly from unity, must be applied. In the reduction of the S-series of tides, the numbers treated are the actual heights of the water exactly at the S-honrs, and therefore no angmenting factor is requisite.

We must now explain how the larmenic analysis, which the use of these factors presupposes, is carried out.

If $t$ denetes T-tinue expresserl in T-hours, and $\pi$ is $15^{\circ}$, we express the height $h$, as given by the averaging process above explained, by the formula
$\mathrm{h}=\Delta_{0}+\mathrm{A}_{1} \cos n t+\mathrm{E}_{1} \sin n t+\mathrm{A}_{2} \cos 2 n t+\mathrm{B}_{2} \sin 2 n t+\ldots$,
Where $t$ is $0,1,2, \ldots 23$. Then, if $\Sigma$ denotes summation of the scriea of 24 terms fouad by attributing to $t$ its 21 values, it is obvious that

$$
\begin{aligned}
& A_{0}=\frac{2}{2} \Sigma \mathrm{~h} ; \mathrm{A}_{1}=\frac{1}{2} \Sigma \text { hoos } n t ; \mathrm{B}_{1}=\mathrm{T}_{\mathrm{T}}^{2} \Sigma \mathrm{~h} \sin n t \text { : } \\
& \Lambda_{2}=\frac{⿺^{2}}{2} \Sigma \text { hocos } 2 n t ; B_{2}=\frac{1}{2} \Sigma \Sigma h \sin 2 n t \text {; \&c., \&c. }
\end{aligned}
$$

Since $r$ is $15^{\circ}$ and $\ell$ is an integer, it follows that all the cosines and sines involved in these series are equal to one of the following, viz., $0, \pm \sin 15^{\circ}, \pm \sin 30^{\circ}, \pm \sin 45^{\circ}, \pm \sin 60^{\circ}, \pm \sin 75^{\circ}, \pm 1$. It is found courenient to denote these sines by $0, \pm S_{1}, \pm S_{2}, \pm S_{3}, \pm S_{4}$, $\pm \mathrm{S}_{5^{*}} \pm 1$. The multiplication of the 24 h 's by the various $\mathrm{S}^{\prime} \mathrm{s}$ and the subsequent additions may be arranged in a very neat tobular form, like that given in a Report to the British Association in 1883. The A's and B's having been thus deduced, we have $\mathrm{R}=$ $\sqrt{ }\left(A^{2}+B^{2}\right) . ~ R$ minst theu be unltiplied by the angmenting factor. We thus have the augmented R. Next the angle whose tangent is B/A gives $\zeta$. The alditiou to $\zeta$ of the appropriate $V_{0}+u$ gives $\kappa$, and the multiplication of $R$ by the appropriate $1 / \mathrm{f}$ gives $\mathbf{H}$. The reduction is then complete. An actual numerical example of harmooic analysis is given in the Admirally Scientific Manual (1886) In the article "Tides"; but the process there employed is clightly different from the abuve, because the series of observations is supposed to be a short ooe.

## § 27. ITurmonic Anulysis for Tines of Lang Perior.

For the purpose of determining the tides of long prerion we have to climinats the oscillations of water-level arising lrom the tides of short peried. As the quickest of these tides has a period of inany lays, the height of mean water at one instant for each day gives sufficient data. Thus thers will in a year's olservatious be 365 heights to be submitted to harmonic analysis. To find the daily meau for any day we take the arithmetic mean of 24 consecutive hourly valucs, beginniug with the beight at noon. This height will then apply to the middle iostant of the period from $0^{h}$ to $23^{\mathrm{h}}$, -that is to say, to $11^{\mathrm{h}} 30^{\mathrm{m}}$ at night. The formation of a daily mean does not obliterate the tidal oscillations of short period, becatuse none of the tides, except these of the priucipal solar series, have commensurable periods in mean selar time. A small correction, or "clearauce of the daily mean," has therefore to be applied for all the important tides of short period, except for the solar tides. Passing by tlis clearance, we next tako the 365 daily means, and find their mean value. This gives the mean height of water for the year. We next subtract the mean height from each of the 365 values, and fod 305 quantities $\delta$ h, giving the daily height of water above the nean height. These quantitios are to be the suluject of the harmonie analysis, and the tides chosen for evaluation are those which have been denoted ahove as Mm, Mf, MSf, Sa, Ssa.

$$
\text { Let } \left.\begin{array}{rl}
\delta \mathrm{h}= & \mathrm{A} \cos (\sigma-\sigma) t+\mathrm{B} \sin (\sigma-\varpi) t \\
& +\mathrm{C} \cos 2 \sigma t+\mathrm{D} \sin 2 \sigma t  \tag{73}\\
& +\mathrm{C} \cos 2(\sigma-\eta) t+\mathrm{D} \sin 2(\sigma-\eta) t \\
& +\mathrm{E} \cos \eta t \\
& +\mathrm{C} \cos 2 \eta t+\mathrm{sin} \eta t \\
\hline \mathrm{H} \sin 2 \eta t
\end{array}\right\}
$$

declinations and parallares of cun and moon, the analytical expressions of the following sectious are necessary.

In chapter iv. the mean semi-range and angle of retardation or lag of any one of the tiles have been denoted by H and $\kappa$. We shall here, however, refuire to iatrodnce several of the 11 's and $\kappa$ 'a into the same exjuression, and they must therefore be distinguished from one another. This may ingeneral be conveniently done Ly writing as a subscript letter the initial of the correspending tide; for example $H_{m}, \kappa_{1,2}$ will bo taken to rlenote the $H$ and $k$ of the principal lunar tide $\Delta I_{2}$. This notation does not suit the $\mathrm{K}_{2}$ and $\mathrm{K}_{1}$ tides, and we shall therefore write $\mathrm{II}^{\prime \prime}, \kappa^{\prime \prime}$ for the semi-diuraal $K_{21}$ and $H^{\prime}$, $\kappa^{\prime}$ for the diurnal $K_{1}$ tide. Theso two tides preced according to sillercal tine aud arise from the sun and moon jointly, and a syathesis of the two parts of each is effected in the harmonic methed, although that gynthesis is not explained in chapter iv. The ratio of the solar to the lunar part of the total $\mathrm{K}_{2}$ tide is 46407 ; hence $683 \mathrm{H}^{\prime \prime}$ is the lunar portion of the total $\mathrm{K}_{2}$. There will be no occasion to separate the $t$ wo portions of $\mathrm{K}_{1}$, and we shall retain the synthesis which is effected in the harmonic method.

## § 29. Seini-Diurnal Tides.

The precess adupter is to replace the mean longitudes and ele- Mean ments of the orbit in each term of the harmonic development of the longischedules of $\S 23$ by hour-8ugles, declinations, and parallazes. tude and

At the time $t$ (nean solar time of port reduced to angle) let elementa $a, \delta, \psi$ be D's R. A., declination, and hour-angle, and $l$ D's longitude replaced measured from the "intersection." These and other symbols when by hour. written with subscript accent are to apply to the sun. Then $\nu$ angle, being the R.A. of the intersection, we have from the right-angled declinaspherical triangle of which the sides are $l, \delta, a-v$ the relations tion, and $\tan (\alpha-v)=\cos I \tan l, \quad \sin \delta=\sin I \sin l \ldots \ldots . .(74) . \quad$ parallaz.
Now $s-\xi$ is the $D$ 's nean loagitude measured from the intersection aod $s-p$ is the mean anomaly; hence approximately

$$
\begin{equation*}
l=s-\xi+2 e \sin (s-p) \tag{75}
\end{equation*}
$$

From (74) and (75) we have appreximately

$$
a=s+(\nu-\xi)+2 e \sin (s-p)-\tan ^{2} \frac{1}{2} I \sin 2(s-\xi)
$$

Now, $h$ being the $\odot$ 's mean longitude, $t+h$ is the sidereal hourangle, and
Hence

$$
\ell+h-s-(\nu-\xi)=\psi+2 e \sin (s-p)-\tan ^{2} \frac{1}{2} I \sin 2(s-\xi)(76) .
$$

Again, if we put

$$
\begin{equation*}
\cos ^{2} \Delta=1-\frac{1}{2} \sin ^{2} I \tag{77}
\end{equation*}
$$

we have approximately from (74) and (75)

$$
\left.\begin{array}{ll}
\text { Whence } \quad & \frac{\cos ^{2} \delta-\cos ^{2} \Delta}{\sin ^{2} \Delta}=\cos 2(s-\xi) \\
\frac{\sin \delta \cos \delta}{\sigma \sin ^{2} \Delta} \frac{d \delta}{d t}=\sin 2(s-\xi) \tag{78}
\end{array}\right\}
$$

Obviously $\Delta$ is such a declination that $\operatorname{ain}^{2} \Delta$ is the mean value of $\sin ^{2} \delta$ during a lnuar month. Again, if $P$ be the ratio of the $D$ ' $\theta$ parallax to her meau parallax, the equation to the ellipse described
gives
whence $\left.\quad-\frac{1}{c(\sigma-\sigma)} \frac{d P}{d t}=\sin (s-p)\right\}$
Now it appears in schedule $A$ of $\S 23$ that the arguments of all the lunar semi-diurnal tides are of the form $2(\ell+h-\nu) \pm 2(\rho-\xi)$ or $\pm(s-p)$. It is clear, therefore, that the cosines of sach angles mayLy the relations (76), (78), (79) be expressed in terms of hour-angles, declinations, and parallaxes. Also by means of (77) we may introduce $\Delta$ in place of $I$ in the coefficienta of each term. An approximate formula for $\Delta$ is $16^{\circ} \cdot 51+3^{\circ} \cdot 44 \cos N-0^{\circ} 19 \cos 2 N$. In the licport to the British Association for 1885, the details of the processes indicated cro given.

Before giving the formnls it must be remarked that the resuin is expressed more auccinctly by the introduction of the symbol $\delta$ to denete the D'e declination at a time earlier than that of observa tion by au interval which may be called the "age of the declinas tional inequality," and is computed from the formnla $\tan \left(\kappa^{\prime \prime}-\kappa_{m}\right) / 2 \dot{\alpha}$ or $52^{h} \cdot 2 \tan \left(\kappa^{\prime \prime}-\kappa_{m}\right)$. Similarly, it is conventent to introduce to denote the vaine of $P$ at a time earlier than that of observatio! by the "age of the parallactic inequality," to be computed from $\tan \left(\kappa_{m}-\kappa_{n}\right) /(\sigma-\varpi)$ or $105^{\mathrm{b}} \cdot 3 \tan \left(\kappa_{m}-\kappa_{n}\right)$. These two "ages" probably do not differ in general much from a third period, computed from $\left(\kappa_{t}-\kappa_{m}\right) / 2(\sigma-\eta)$, which is called the "agg of the tide."

The similar series of transformatious when amplied to the selar tides leads to simpler results, bceanse $\Delta$, is a constant, being $16^{\circ} \cdot 33$, and the "ages" may be treated as zero; besides the terme depending on $d \delta_{1} / d l$ and $d P_{\|} / d l$ are negligible. If now we denote by $\mathrm{h}_{2}$ the height of water with reference to mesn water-mark, in so far as the height is affected by the harioonic tides $\mathrm{MI}_{2}, \mathrm{~S}_{2}, \mathrm{~K}_{2}, \mathrm{~N}, \mathrm{~L}$, $\mathrm{T}, \mathbf{R},{ }^{1}$ the harmonic expression is transformed into

$$
\begin{align*}
& \mathrm{h}_{2}=\frac{\cos ^{2} \Delta}{\cos ^{2} \Delta} \mathrm{H}_{m} \cos \left(2 \psi-\kappa_{m}\right)+\mathrm{H}_{2} \cos \left(2 \psi_{1}-\kappa_{4}\right) \\
& +\frac{\cos ^{2} \delta-\cos ^{2} \Delta}{\sin ^{2} \Delta} \cdot 683 \mathrm{H}^{\prime \prime} \cos \left(2 \psi-\kappa^{\prime \prime}\right) \\
& +\frac{\cos ^{2} \delta_{s}-\cos ^{2} \Delta_{1}}{\sin ^{2} \Delta_{1}} \cdot 317 \mathrm{H}^{\prime \prime} \cos \left(2 \psi_{1}-\kappa^{\prime \prime}\right) \\
& -\frac{\operatorname{\theta in} \delta \cos \delta}{\sigma \sin ^{2} \Delta,} \frac{d \delta}{d t}\left[\frac{6 \delta^{n} \Sigma^{n}}{\cos \left(\kappa^{i n}-\kappa_{m}\right)}-\mathrm{H}_{m} \operatorname{tgn} n^{3} \Delta,\right] \sin \left(2 \psi-\kappa_{m n}\right) \\
& +\frac{\cos ^{2} \Delta}{\cos ^{2} \Delta_{k}}\left(P^{\prime}-1\right) \frac{\mathrm{H}_{n} \cos \kappa_{n}-\mathrm{H}_{l}}{\epsilon \cos \epsilon} \frac{\cos \kappa_{t}}{\square} \cos (2 \psi-\epsilon) \\
& +(P,-1) \frac{I I_{z}-H_{r}}{e_{6}} \cos \left(2 \psi_{t}-k_{4}\right) \\
& +\frac{\cos ^{3} \Delta}{\ell \cos ^{2} \Delta,(\sigma-\sigma)} \frac{d P \mid d l}{\left(\sigma H_{m} e-\frac{\mathrm{H}_{n}}{\cos \left(\kappa_{m}-\kappa_{n}\right)}-\frac{\mathrm{H}_{l}}{\left.\cos \kappa_{l}-\kappa_{m}\right)}\right] \sin \left(2 \psi-\kappa_{m}\right)(80), ~} \\
& \text { where } \epsilon \text { is an anxiliary angle defned by } \\
& \tan \epsilon=\frac{\mathrm{H}_{n} \sin \kappa_{n}-\Pi_{l} \sin \kappa_{l}}{\mathrm{H}_{n} \cos \kappa_{n}-\mathrm{H}_{6} \cos \kappa_{l}} \tag{81}
\end{align*}
$$

The first two terms are the principal tides, and the physical origin of the remaining small terms is indicated by their involving $\delta^{\prime}, \delta$, यंJ/dt, $P, P^{P}, d P / d t$. The terms in $d \delta / d t$ and $d P / d t$ are generally smaller than the others.
The approximation may easily be carried furthei. But the above is in some respects a closer spproximation than the expression from which it is derived, since the hour-sngles, declinations, and parallases necessarily involve all the lunar and solar ineonalitics.

& \sin ^{2} \Delta
\end{align*}
$$

Since observation and theory agree in showing that $\kappa^{\prime \prime}$ is geperslly very nearly equal to $\kappa_{n}$, we are justified in substituting $\kappa_{n}$ for $\kappa^{\prime \prime}$ in the bmall solar declinational term of ( 80 ) involving " $317 \mathrm{H}^{\prime \prime}$. Then, using (82) in (80),
Que bols:

lunar
term.
If the equilibrium theory of tides were true, eacb $H$ would be proportional to the corresponding term in the harmonicsily developed potential. This proportionality holds nesrly between tides of almost the same speed; hence, using the expressions in tho column of coefficients in schedule [B, i.] § 23 (with the additicaal tide $R$ there omitted, but having a coeflicient $(\tau, / \tau) \frac{1}{3} \cdot \frac{1}{2} e, \cos ^{\frac{1}{2}} \frac{2}{2} \omega$, found by $\operatorname{sym}$ motry with the lunar tide L), and introducing $\bar{\Delta}$, in place of $\omega$ in the solar tides, we may assume the truth of the proportion

$$
\frac{\cos ^{2} \Delta_{t}}{\sin ^{2} \Delta_{t}} \cdot 317 \mathrm{H}^{\prime \prime}=\frac{1}{3} \frac{\mathrm{II}_{t}-\mathrm{H}_{r}}{e_{t}}=\mathrm{H}_{i}
$$

With this assumption, M , reduces to

$$
\begin{equation*}
\mathrm{M}_{6}=\frac{\cos ^{2} \delta_{t}}{\cos ^{2} \Delta_{t}} \mathrm{H}_{4}+3\left(P_{4}-1\right) \mathrm{H}_{4}=\frac{\cos ^{2} \delta_{t}}{\cos ^{2} \Delta_{t}} \mathrm{H}_{6}\left[1+3\left(P_{4}-1\right)\right] . \tag{84}
\end{equation*}
$$

Hence $\mathrm{M}_{1}=P_{3} \frac{\cos ^{2} \delta_{1}}{\cos ^{2} \Delta_{1}} \mathrm{H}_{0}$
This is the lsw which we should have derived directly from the equilibrium theory, with the hypathesis that all salsr semi-diurnal tides suffer nearly equal retardation. Save for meteorological inflnences, this must certainly be true.

A similsr synthesis of M cannot be carried out, hecause the considerable diversity of speed smongst the luar tides makes a similar appeal to the equilibrium theory incorrect. It may be seen, however, that it would be more correct to write $\cos ^{2} \delta^{\circ}$ instend of $\cos ^{2} \Delta$ in the coefficient of the prosllactic ternis in M sud $2 \mu$.

The three terms of $M$ in (82) give the height of luner tide with its aeclinational and parallactic corrections, and similarly the formula for $\mu$ in (82) gives its value and corrections.

If now $\tau$ denotes the mean salar time elapsing sinice the moon's upper tranait and $\gamma$ the angular velocity of the earth's rotation, it is clear that the moon's hour-angle

$$
\psi=(\gamma-d \alpha / d t)_{r}:
$$

and, since $\mathrm{M} \cos 2(\psi-\mu)$ is $\rho$ maximum when $\psi=\mu$ or differs from $\mu$ by ${ }^{-8} 80^{\circ}$, it follows thst $\mu /(\gamma-d \alpha / d \ell)$ is the "interval" from the moon's upper or lower transit to high water of the lunsr tide. Since $\tau$ is necessarily less than $12^{\text {h }}$, we may during the interval from transit to high water take as an spproximation $d a / d t=\sigma$, the moon's mean motion. ${ }^{1}$ Hence that interval is $\mu /(\gamma-\sigma)$, or $\frac{\gamma}{\frac{7}{\beta} \mu} \mu$ houra nesrly, when $\mu$ is expressed in degrees. Thus (82) for $\mu$ gives by its firsi term the mean interval for the lunar tide, and by the suhsequent terns the declinational and parallactic corrections.

We have said that the synthesis of $M$ cannot be carried out as in the case of $M_{\text {, }}$, brit the partial synthesis below will give fairly good results. The proposed formula is

$$
\begin{align*}
& \mathrm{M}=P_{1}{ }^{3} \frac{\cos ^{2} \Delta}{\cos ^{2} \Delta_{1}} \mathrm{H}_{m}+\frac{\cos ^{2} \delta^{\prime}-\cos ^{2} \Delta}{\sin ^{2} \Delta_{1}} \cdot 683 \mathrm{H}^{\prime \prime} \cos \left(\kappa^{\prime \prime}-\kappa_{m}\right) ; \\
& 2 \mu=\kappa_{m}+\frac{\cos ^{2} \delta^{\prime}-\cos ^{2} \Delta}{\sin ^{2} \Delta_{i}}: 683 \mathrm{H}^{\prime \prime} \sin \left(\kappa^{\prime \prime}-\kappa_{m}\right) \text {; } \\
& \mathrm{M}_{.}=P_{,}, \frac{\cos ^{2} \delta}{\cos ^{2} \Delta_{1}} \mathrm{H}_{4} ; \\
& 2 \mu_{i}=\kappa_{k} \tag{85}
\end{align*}
$$

These formulr liave been used in the example of the computatior of a tide-table given in the Adinirallu Scientifie Mfanual (1886).

## § 31. Synthesis of Litnar and Solar Semi-Diurnal Tides.

Let $A$ be the excess of D's over $O$ 's R.A., so that
sud $\left.\quad \begin{array}{l}\psi_{1}=\psi+A, \\ h_{2}=M I \cos 2(\psi-\mu)+M, \cos 2\left(\psi+A-\mu_{0}\right)\end{array}\right\}$
The syathesis is then completed by writing

$$
\begin{array}{r}
I \cos 2(\mu-\phi)=M+M, \cos 2\left(A-\mu_{i}+\mu\right), \\
H \sin 2(\mu-\phi)=\quad M_{i} \sin 2(A-\mu,+\mu), \\
h_{2}=H \cos 2(\psi-\phi) \ldots \ldots \ldots \ldots \tag{87}
\end{array}
$$

so that
Syntho-
eia to
obtain
Then $H$ is the or $\phi /(\gamma-\sigma)$ or ${ }^{2} \frac{2}{2} \phi$, when $\phi$ is given in degreos, is the "intervsl" from the moon's transit to bigh water.

The formule for $H$ and $\phi$ may be written

$$
\left.\begin{array}{rl}
H & =\sqrt{ }\left\{L^{2}+M I_{1}^{2}+2 M M_{1} \cos 2\left(A-\mu_{1}+\mu\right)\right\}  \tag{88}\\
\tan 2(\mu-\phi) & =\frac{M I_{1} \sin 2\left(A-\mu_{t}+\mu\right)}{M+M, \cos 2\left(A-\mu_{1}+\mu\right)}
\end{array}\right\}
$$

They may be reduced to a form adapted for logarithmic calculation. FortSince A goes through its period in a lunation, it follows that H nightly and $\phi$ have inequalitics with a period of half a lunation. These inequal-. are called the "fortnightly or semi-meustrual inequslities" in the ity. height sud interval.

Spring tide obiously occure when $A=\mu,-\mu$. Since, the mean value of A is $s-h$ (the difference of the mean longitudes), and eince the mean values of $\mu$ and $\mu_{\alpha}$ are $\frac{1}{3} x_{m}, \frac{1}{2} x_{2}$, it follows that the mesu value of the period elapsing after full moon and change of moon up to spring tide is $\left(\kappa_{s}-\kappa_{m}\right) / 2(\sigma-\eta)$. The association of spring tide with full sand change is obvious, and a fiction hss been adopted by Which it is held that epring tide is generated in those configura. tions of the moon and sun, but takes some time to resch the port of observation. Accordingly $\left(\kappa_{1}-\kappa_{m}\right) / 2(\sigma-\eta)$ has been csilled the "sge of the tide." The average sige is about 36 liours $8 s$ far as Age of observations have yet been made. The age of the tide appears not tide. in general to differ very much from the sges of the declinational and parallactic inequslities.

In computing a tide-table it is found practically convenient not to use A , which is the difference of R.A.s st the wuknown time of high water, but to refer the tide to $A_{0}$, the difference of R.A.'s at the time of the moon's transit. It is clear that $A_{0}$ is the apparent time of the moon's transit reduced to angle at $15^{\circ}$ per hour. We have already remarked that $\phi /(\gamma-d a / d t)$ is the interval from transit to high water, and hence st high water

$$
\begin{equation*}
A=A_{0}+\frac{d a / d t-d \alpha_{1} / d l}{\gamma-d \alpha / d t} \phi \tag{89}
\end{equation*}
$$

As an spproximation we may attribute to all the quantities in. the second term their mean valucs, and we then have

$$
\begin{equation*}
A=A_{0}+\frac{\sigma-\eta}{\gamma-\sigma} \mu \tag{90}
\end{equation*}
$$

and $\quad A-\mu_{1}+\mu=A_{0}-\mu_{1}+\frac{\gamma-\eta}{\gamma-\sigma} \mu=A_{0}-\mu_{1}+\frac{88}{8} \mu$
This approximate formula ( 90 ) may be used in computing from (88) the fortnightly inequality in the "height" and "interval."

In this investigation we have supposed that the declinational snd parallactic corrections are applied to the lunar and solar tides be fore their synthesis; but it is obvious that the procens might be reverscd, and that we may form a table of the fortnightly inequslity based on mean values $\mathrm{H}_{m}$ and $\mathrm{II}_{n}$ and afterwards apply corrections. This is the process usually adopted, but it is less exact. The labour of computing the fortnightly inequality, cspecially by graphical methods, is not grest, sud the plan here suggested seems preferable.

[^145]
## § 32. Diumal Tides.

These tides have not been usually treated with completeness in the synthetic method. In the tide-tables of the British $A$ dmiralty we find that the tides at some ports are "affected by diuraal inequality"; such s statement may be interpreted as meaning that the tides are aot to be predicted by the information given in the so-called tide-table. The diurnal tides are indeed complex, and do mot lend themsclves easily to a complete synthesis. In the hatmonic notation the three important tides are $\mathrm{K}_{1}, \mathrm{O}, \mathrm{P}$, and the lunar portion of $\mathrm{K}_{1}$ is ucarly equal to O in height, whilst the solar portion is acarly equal to.P. $\Lambda$ complete synthesis may be carried out on tho lines adopted in treating the semi-diurnal tides, but the advantage of the plan is lost in coasequence of large oscillations of the amplitude through the value zero, so that the tide is often represented by a ncgative quantity multiplicd by a circular fuaction. It is best, then, only to sttempt a partial synthesis, and to admit the existence of two diurnal tides.

Wo sec from schelules [A, ii.] and [B, i.], § 23, that the principal diurnal tldes are those lettered $\mathrm{O}, \mathrm{P}, \mathrm{K}_{1}$. Of these $\mathrm{K}_{1}$ occurs both for tho moon and the sua. The synthesis of the two parts of $K_{1}$ is effected without dillirulty, and the result is a formula for the total $\mathcal{K}_{1}$ tide like that in [ $\mathrm{A}, \mathrm{ii}$.], but with the $\nu$ which occurs in the argunent replaced by a different anglodenoted as $\nu^{\prime}$. If, then, we write

$$
\left.\begin{array}{l}
V_{0}=t+h-2 s-\nu+2 \xi+\frac{1}{2} \pi \\
\mathrm{~V}^{t}=t+h-\nu^{\prime}-\frac{1}{2} \pi
\end{array}\right\}
$$

the three tides $\mathrm{O}, \mathrm{K}_{1}, \mathrm{P}$ are writtcy as follows:-

$$
\begin{aligned}
& 0=f_{0} H_{0} \cos \left(V_{0}-\kappa_{0}\right), \\
& K_{1}=f H^{\prime} \cos \left(V^{\prime}-\kappa^{\prime}\right)_{,} \\
& \left.I^{\prime}=-H_{p} \cos \left[V^{\prime}-\kappa^{\prime}-\left(2 h-\nu^{\prime}\right)+\kappa^{\prime}-\kappa_{\mu}\right)\right] \ldots \ldots(92) .
\end{aligned}
$$

The last two tilcs lave very pcarly the same speed, so that wo may assumo $\kappa^{\prime}=\kappa_{p}$, ami that $H_{p}$ las the same ratio to $H^{\prime}$ es in the equilibrium theory. Now, in schednles [ $A$, ii. ], [B, ii.], § 23 , the coeflicient of $\mathrm{K}_{1}$, viz., $\mathrm{H}^{\prime}$ (the sumu of the lunar and solar parts), is -26522, and tho cocflicient of $\mathrm{P}_{3}$ viz., $\mathrm{H}_{p,}$ is 087:25, so that H $=3.023 \mathrm{H}_{p \text { p }}$ or say $=3 \mathrm{H}_{p} \quad$ Hence to have

## Partial

$$
\mathrm{K}_{1}+\mathrm{P}=\mathrm{H}^{\prime}\left[\mathrm{r}^{\prime}-3 \cos \left(2 h-\nu^{\prime}\right)\right] \cos \left(\mathrm{V}^{\prime}-\kappa^{\prime}\right)
$$

$$
-\mathrm{H}^{\prime} \frac{j}{} \sin \left(2 h-\nu^{\prime}\right) \sin \left(\mathrm{V}^{\prime}-\kappa^{\prime}\right) .
$$

IS thercforo, wo put

$$
\left.\begin{array}{rl}
\mathrm{R}^{\prime} \cos \psi & =\mathrm{H}^{\prime}\left[\mathrm{f}^{\prime}-\frac{1}{3} \cos \left(2 h-\nu^{\prime}\right)\right]  \tag{93}\\
\Gamma^{\prime} \sin \psi & =\left\{11^{\prime} \sin \left(2 h-\nu^{\prime}\right)\right. \\
K_{2}+L^{\prime} & =l^{\prime} \cos \left(V^{\prime}+\psi-\kappa^{\prime}\right) .
\end{array}\right\}
$$

It is clear that $\psi$ and R' have a semi-annual inequality, and thereforo for sereral wecks together $\mathrm{R}^{\prime}$ and $\psi$ may lo treated as constant.

Now supposo that wo compute $V_{0}$ and $V^{\prime}$ at the cpoch-that is, at tho initial noon of the period duriag which we wish to predict the tides-and with theso values put

$$
\zeta_{0}=\kappa_{0}-V_{0} \text { at cpoch, } \zeta^{\circ}=\kappa^{\prime}-V^{\prime} \text { at epoch }-\psi \text {. }
$$

Then tha specd of $\mathrm{V}_{0}$ is $\gamma-20$, or $13^{\circ} 91303$ par hour, or $360^{\circ}-25^{\circ} \cdot 3673$ per day; and the apecd of $V^{\prime}$ is $\gamma$, or $15^{\circ} .0410686$ per hour, or $360^{\circ} \cdot 9856$ per day. Hence, if the the mean solar time on the ( $n+1$ ) th day sinco tho initial moment or epoch,

$$
V_{0}-\kappa_{0}=360^{\circ} n+13^{\circ} \cdot 943 \mathrm{t}-\zeta_{0}-25^{\circ} \cdot 307 n_{1}
$$

$V^{\prime \prime}+\psi-\kappa^{\prime}=360^{\circ} n+15^{\circ} \cdot 041 t-\zeta^{\prime}+0^{\circ} \cdot 986 n$.
Diarnal Thercforo tho diurnal tilles at time $t$ of tho $(n+1)$ th day are given by
$\mathrm{O}=\mathrm{f}_{\mathrm{n}} 1 \mathrm{~T}_{\mathrm{o}} \cos \left[13^{\circ} \cdot 943 \mathrm{t}-\zeta_{8}-25^{\circ} \cdot 367 \mathrm{n}\right]$. $\}$
$\left.\mathrm{K}_{1}+\mathrm{P}^{2}=11^{\prime} \cos \left[15^{\circ} 0.011 \mathrm{t}-\zeta^{5}+0^{\circ} \cdot 986 n\right]\right]$
If too substitute for t tho timo of hinh or lor wator as computed simply from the scmi-diunal tisle, it is clear that the sum of theso two expressions will give the diurnal corrction for height of tida at high or low water, provided tho diurnal tides are not very large. If wo consider the maximum of a function

$$
A \cos 2(t-a)+B \cos n(t-\beta),
$$

where $B$ is arnall compared with $A$ and $n$ is nearly unity, wo sce that the time of maximum is given approsimately by $t=a$, with a correction it determincd frem

$$
\begin{gathered}
-2.1 \sin (2 \dot{\circ} \hat{\prime})-n \Delta \sin n(\alpha-\beta)=0 ; \\
\quad \delta t=-\frac{180^{\circ}}{\pi} \cdot \frac{n B}{4} \sin n(a-\beta) .
\end{gathered}
$$

In this ray we find that the corrections to the time of high weter from O and $\mathrm{K}_{1}+\Gamma$ aro

$$
\left.\begin{array}{l}
\delta t_{6}=-0 \mathrm{~h} \cdot 988\left(1-\frac{\sigma}{\gamma-\sigma}\right) \frac{\mathrm{f}_{0} H_{0}}{H} \operatorname{bin}\left[13^{\circ} \cdot 843 \mathrm{t}-\zeta_{0}-25^{\circ} \cdot 367 n\right] \\
\delta t^{\prime}=-0 \mathrm{~h} \cdot 988\left(1+\frac{\sigma}{\gamma-\sigma}\right) \frac{R^{\prime}}{\bar{H}} \sin \left[15^{\circ} .041 t-\zeta^{\prime}+0^{\circ} .986 n\right]
\end{array}\right\}
$$

H lenoting the height and the timo of high water es computed from the ocmi-diurnal tide. If $t$ next denotes tho time of low water the same corrections with opposito sigu give the corrections for low water.
If tha diurnal tides aro largo a secona approximation mill be necessary. Theso formulre havo beón used in computing a tide-table in the example given in the Admirally Sciculfife Lanual (1886).
§ 33. Explanation of Tidal Torms in corımon use ; Datum Letcls.,
The meas beight at epring tide between ligh and low rater is called the spring rise, and is equal to $2\left(\mathrm{H}_{\mathrm{m}}+\mathrm{H}_{\mathrm{h}}\right)$. Tho height between mean high-water mark of neap tide and mean low-nater mark at spring tide is callod the neap rise, and is equal to $21 I_{\text {man }}$ The mean height at neap tide between high and low water is called the neap range ; this is equal to $2\left(\mathrm{H}_{m}-\mathrm{H}_{1}\right)$. Neap range in nsually about one-third of spring range. The mean period betwecn full or chaage of moon and spriag tido is called the age of the tide; this is equal to $\left(\kappa_{1}-\kappa_{m}\right) / 2(\sigma-\eta)$, or, if $\kappa_{s}-\kappa_{m}$ bo expressed in degrees, $0 \mathrm{~b} .984 \times\left(\kappa_{s}-\kappa_{m}\right) ; \kappa_{s}-\kappa_{m}$ is commonly about $36^{\circ}$, and the age abont 36h. The period elapsing from the moon's upper or lower transit until it is high water is called the interval or the hinitidal interval. The interval at full moon or change of moon is callcd the cstallish ment of the port or the vulgar cslablishment. The interval at spring tide is called the corrected or mean cstablishment.
The mean establishment may he found from the vulgar cstablishment by means of tho spring and weap rise and the age of tho tide, as follows.
Let a be the ago of the tide reduced to angle at the rato of $1^{\circ}$.016 to the hour. Then the mean establishment in hours is equal to the vulgar establishment in hours, diminished by a period expressed in hours numerically equal to ${ }^{\text {n }}$, of the angle whose tangent is $H_{s} \sin a /\left(H_{m}+H_{s} \cos a\right)$, expressed in degrees. Also $H_{y} / H_{m}$ is equal to the ratio of the excess of spring rise over neap rise to neap riso.
The French have called a quantity which sppears to be identical with $\mathrm{H}_{m}+\mathrm{H}_{\nu}$ or half the spring rise, the unit of height, and then defino tho height of any other tide by a tidal coefficient. ${ }^{1}$

Tho practice of the British Admiralty is to refer their soundings and tide-tables to "mean low.water mark of ordinary spring tides." This datum is found by taking the mean of the low-water marks of such obseryations at spring tide as are available, or, if the observatious are very cxteasive, by excluding from the mean such spriog tides as appear to be aboormal, owing to the largeness of the moon's parallax at the timo or any other cause. The Admiralty datum is not, then, susceptiblo of exact scientific definition; but, when it has once been fixed with refcrence to a bench mark ashore, it is expedient to adbere to it, lyy whatever process it was first fixed.
It is now proposed to adopt for any new Indian tidal stations a Indian low-water datum for the tide-table to be called "Indian low-water dateas. mark," " and to be defined as $\mathrm{H}_{\mathrm{m}}+\mathrm{H}_{4}+\mathrm{H}^{\prime}+\mathrm{H}_{0}$ below mean.water level. Although such a datum is not chosen from any precise scientific considcrations, it is susceptible of exact definition, is low enough to cxelude alnost all negativo entries from the table (a sine qua non for a good dstum), and will dificr bat little from tho Admiralty deturn, however that may be detormined. A valuahle list of datum levels is given by Mr J. Shoolbred in a Reporl to tho British Association in 1879.
§ 34. On the Reduction of Observalions of High and Low Wrater.'
A continuous register of the tide or obscryation at fixed intervals Oberva of time, such as cach honr, is certainly the best; but for the tions at adequate use of such a accord semo plan enalogous to harmonic H.W. analysis is necessary. Observations of high and low water only andLw have, al lcast until recently, been more usual. Some cere has to bo taken with respect to these obscrvations, for about high and low water an irregularity in the rise and fall becomes very noticeable, especially if the place of obscrvation is hadly chosen. ${ }^{4}$ Observations should therefore be taken every five or ten minutes for half an hour or an hour, embracing the time of high and low water. The time and height of high and low water chould then be loand by plotting down a curve of heights, and by taking as the trae tide-curve a line which presents a streeping curvature and smoothes away the minor irregularities. A similar but less elaborate process rould render hourly observations more perfect. In the reduction the immediate object is to connect the times and heights of high and low water with the moon's transits by means of the cstablishment, age, and fortnightly inequality in the interval and beight. The reference of the tide to the establishment is not, bowever, scientifically desirable, end it is botter to determine the mean establishment, which is the mean interval from the moon's transit to high water at spring tide, and the sgo of the tide, which is the nean period from full moon and change of moon to spring tide.

For these purposes the observations mey be conveniently treated graphically. ${ }^{\circ}$ An equally divided borizontal scalo is taken to represent the twelve hours of the clock of civil time, regulated to the time of the port, or-more accurately-arraaged slyays to show

[^146]apparent tirse by being fast or slow by the equation of time; this time-scale represents the time-of-clock of the moon's transit, either uppar or lower. The scale is perbaps most conveniently arranged in the ordes V, VI, . . ., XII, I . . . IIII. Then esch interval of time from transit to high water is set off as an ordinate above the corresponding time-of-clock of the moon'a transit. A swceping carve is drawn nearly through the tops of the ordinates, so as to cut off minor irregularities. Next along the same ordinates are set off lengtha corresponding to the height of water at each high water. A second similar figure may be made for the interval and height at low water. ${ }^{1}$ In the curve of high-water intervals the ordinate corresponding to XII is the establishment, siace it gives the time of high water at full moon and change of moon. That ordinate of high-water intervals which is coincident with the greatest ordinate of ligh-water haights gives the mean establishmant. Since the moon'o transit falls about fifty minutes later on each day, in setting off a fortaight's observations there will be about five days for each four times-of-clock of the upper transit. Hence in these figures we may regard each divisicn of the time-acale 1 to II, 11 to III, \&c., as representing twenty-five hours instead of one hour Then the distance from the greatest ordinate of high-water heights to XII is called the age of the tide. From these two figures the times and leights of high and low water may in general be predicted with
fair approximation. We find the time-of-clock of the moon's upper or lower transit on the day, correct by the equation of time, read off the corresponding heiglits of high and low water from the figures, end the iatervala being also read off are added to the time of the moon's tranait and give the times of high'and low water. At all porta there is, however, an irregularity of heights and intervals between successive tides, and in consaqueuce of this the curves present more or less of a zigzag appcarance. Where the zigzag is perceptible to the eye, the curves must be smoothed by drawing them so as to bisect the zigzags, because these diuraal inequalities will not present themselves similarly in the future. When, as in some equatorial ports, the diurnal tides are large, this method of tidal prediction fails.
This method of working out observations of high and low water was not the earlicst. In the Mécanique Celestc, bks. i aud v., Laplace treats a large mass of tidal observations by dividing them into classes depending on the configurations of the tide-generating bodies Thus he separates the two syzygial tides at full moon and change of moon and divides them into equiboctial and solstitial tides. He takes into consideration the tides of several days embracing these configurations. He goes through the tides at quadratures on the same general plan. The effects of declination and parallax and the diurnal inequalities are similarly treated. Lubbock (Phil

Trans., I83I sq.) improved the method of Laplace by takiug into account all the obscrved tides, and not merely those sppertaining to certain configurations. He divided the observations into a number of classes. First, the tides are separated into parcels, ona for each month; then cach parcel is sorted according to the hour of the moon's transit. Another classification is made according to declination; snother according to parallax; add a last for the diurbal inequalities. This plan was followed in treatiog the tides of London, Breat, St Helena, Plymouth, Portamouth, and Shecrness. Whewell (Phil. Trans., 1834 sq.) did much to ri'ace Lubbock'a scsults to a mathematical form, and made a hirhly important advance by the introduction of graplical methods by meana of curves. The method explained above is due to him. Airy remarks of Whewcll's papers that they appear to ba "the best specimens of reduction of new observations that we have ever sean.'

## Yi. Tidal Instruments and Tidal Prediction.

§35. Gencral Remarks.
Practical tidal work is divisible into the three stages of observavation, reduction of observationa, and prediction.
The simplest observation is that of the height of water on a

[^147]graduated staff fixed in the eea, with such sllowsnce as 1s possible made for wave-motion. It is far better, however, to sink a tube into the ses, into which the water penetrates through small holes. The wave-motion is thus sanulled. In this calm water there lies a float, to which is attached a cord passing over a pulley and counterpoised at the end. The motion of the counterpoise against a scale is observed. In either case the observations may be made every haur, which is preferable, or the times and heiglits of bigh and low water may be noted. We have explained in § 34 the methods of reducing the latter kind of obscrvation. Although more appropriate for rough observations, this method is susecptible of great accuracy when carefully used. It has been largely super seded by the harmonie method, but is still adhered to by the British Admiralty. In more careful obseryations than those of which we are speaking the tidal racord is automatic and continuous; the reduction may be, and probably at some future time will be, mechanical ; and the prediction is so already. We shall therefore devote some apace to general descriptions of the three classes of instrument. The harmonic reductions are at preseat (1887) actually done numerically, and in chapter iv we have indicated the nature of the arithmetical processes.

## § 36. The Tide-Gange.

The site for the erection of a tide-gauge depeas on local circure stances. It ohould be placed so as to present a fair representation of the tidal oscillations of the surrounding area. A tank is generally provided, communicating by a channel with the sea at about 10 feet (more or less according to the prevalent surf) below the Iowest low-water mark. In many cases on open coasta and fre-
quently in estuaries the tank may be dispensed with. At any rete we suppese that water is provided rising ond falling with the tide, without much weve-motion. The netare of the installation depends entirely on the circumstances of the case. . A verticsl pipe is fixed in the water in such a way as to admit it only through holes small enough to annul wave motion and large enough to make no sensible retardation of its rise and fall in the pipe. The diamcter of the pipe differs greatly in differcut instruments: sometimes that which we have described as the tank serves as the pipe, and sometimes the pipe alone dips into the sea. A cylindrical float, usually a hoilow metallic box or a block of green-licart mood, hangs and floats in the pipe, and is of such density as just to sink vithout sapport. In Sir W. Thomson's gauge the float hengs by a fine platinum wire, in Newman's (nsed in India) by a metallic ribbon. In the latter a chain hangs at the bottom of the flost of ench weight that, whether the water be high or low, there is the same upward force on the float. It is necessary that the pull on the float should be constant, otherwise a systematic error is introdnced between rising and falling water. The suspension wire is wrapped round a wheel, and imparts to it rotation proportinnel to the rise and fall of tide. By a simple gearing this wheel drives another, by which the range is reduced to ony convenient extent. A fine wire wound on the final wheel of the train drags a pencil or pen up and down or to and fro proportionately to the tidal oscillations. The pencil is lightly pressed against a drum, which is driven by clockwork so as to make one revolution per day. The pen leaves its trace or tide:curve on paper wrapped round the Jrum. Generally, bowever, the paper is fixed to the drum, and the record of a fortnight may be taken without change of paper. An example of a tide-curve for Apollo Bunder, Bombay, from 1st to 15 th January 1884, is shown in fig. 3. Sometimes the paper is in a long band, which the drum picks off from one coil and delivers on to enother. The contact of the pen inust be such that the work done in dragging it over the paper is amall, otherwise a varying tension is thrown on to the float wire. Hence, if the friction is considerable, the float mast be lerge.

The conditions necessary for a good tide-gange appeer to be better satisfied by Sir W. Thomson's then by any other; but, as his in. strument is recent, other forms have been much more extensively used, and heve worked well. The peculiarity of Thomson's tide. gauge is that, by giving the drum en inclination to the vertical, the pressure of the pen on the paper and on its gnides is very deli. cately regulated to the minimom necessary for effecting the purpose. In other gauges the drum has been either vertical or horizontal, and the amount of friction has necessarily been considerably greater. ${ }^{\text {a }}$

## § 37. The Harmonic Analyser.

Bat. If s function $H$ be expressed as a series of harmonic terms, and monio if one pair of these terme be $\mathrm{A} \cos n t+\mathrm{B}$ sin $n t$, tben, if $T$ be a iLalyser. multinle of the complete Deriod $2 \pi / n$, we have

$$
\mathrm{A}=\frac{2}{T} \int_{0}^{T} H \cos n t d t, \mathrm{~B}=\frac{2}{T} \int_{0}^{T} H \sin n t d t
$$

Thns a machine which will effect these integrations will give $A$ and B. Snch a machine has been invented by Prof. Jemes Thomson and perfected by Sir W. Thomson. In fig. 4 let $\mathrm{TT}^{\prime}$ be a circular table, capable of rotation about the inclined ghaft s. Let 3 be a spbere tonching the table anywhere along its horizontal diameter. Let C be a cylinder, of somewhat smaller diameter then the sphere, capable of rotation about a horizontal axis parallel to the table, and touching the sphere so that CS is parallel to TT'. Suppose that the point of contact of the sphere with the table is distant $x$

Fio. 4.-Harmonic analyser. from the centre of the table, and nearer to us than the shaft; then, when the ghaft $s$ and the table $T T^{\prime}$ turn in snch a direction that $T$ rises from the paper and $T$ goes below it, the sphere will turn in the direction of its errow. If the radius of the sphere is $a$, and that of the cylinder $b$, then, when the table turns through a small angle $\delta \theta$, the sphere turns through $r \delta \theta / a$ and the cylinder through $x \delta \theta / \bar{n}$. This augle venishes if S touches the table at the centre, aul is reversed if the epliere be moved across to the other side of the centre. Also rhilst the table is turning the sphere may be rolled backwards and forwarde without rubbing, and thus transmits motion flom the table to the cylinder without slipping. Now ollppose the turning of the table is so conatrained that $\delta \theta=\pi \cos \psi d \psi$, whilst $x$ is constrained to be equal to the arbitrarily varjing qnentity $H$. Then the total angle turned through by the cylinder, as the machine rans, is nroportional to $\int H \cos \psi d \psi$. If we impart to the table a simple

1 For further details concerning the establsorment of tide cro pres, see Major Brald's Man al of Tidal Observation, Londou, 1857, sud Sir W Tbonison, "On Tidal Instruments," in Iist. Civ. Eng., rol Lx. p. 10.
harmonic oscilletory motion, with e period proportioual to the anar half-day, whilst the aphere moves, relatively to the centre of the table, proportionately to the tide-beights or the same time-scale, then, at the end of a sufficient number of Iunar days, we shall find that the total angie turned through by the cylinder is proportional to either the $A$ or $B$ component of the luner semi-diurnal tide. An index, Which points to a dial, may be fixed to the cylinder, so that the required result may be read off.

In the harmonic analyser the tide-curve diacram is wrapped on a dram, which is turued by one hand, whilst with tho other a pointer is guided to follow the tide-curve. As the drum turns proportionatoly to mean solar time, appropriate gearing causes two tables to execute harmonic oscillationa in phases at right angles, with lunar semi-diurnal period. At the same timo a fork attached to the pointer guides the two spheres so that their distances from the centres of their tables are equal to the tide-hcight in the diagram. The indexes attached to the two cylinders give the two components of the lunar semi-diurnal tide, and the approximation improves the longer the tide-curve which is passed through the machine. Corresponding to each of the principal lunar and solar tides there are a pair of tables, spheres with guiding forks, and cylinders similarly geared, and there is enother sphere and another table, which last always turns the same way and at the sams rate as tho drum, from which the mean height of water is determined. Such an lnstrument has been constructed under the supervision of Sir W. Thonson, but has not yet been put into practical nse, so that we cannot say how it will compete with the arithmetical harmonic analysis. A similar, but less complex machine for the analysis of metcorological observations is in constant use in the Meteorological Offico in London, and is found to work well. ${ }^{2}$

## § 38. The Tide-Prcdicting Instrument.

The first suggestion for instrumental prediction of tides was given, Tidewe believe, by Sir W. Thomson in 1872, and the instruments since predich. made heve been fonnded on the principles which he then laid down. ing ivMr Edward Roberts bore a very important part in the first practical strument realization of such a machine, and a tide-predicter was constructed by Légé for the Indian Government under his direction. Thomson's is the only instrument in Europe es yet in regular practical use for navigational purposes. It requires much skill and care in manipulation, and it has been ably worked by Mr Foberts for the production of the Indian tide-tables ever eince its completion. We refer the reader to Sir W. Thomson's paper on "Tidal Instruments," in Inst. C.E., vol. $1 \times v_{0}$, and to the subsequent discussion, for a full acconnt of the aeveral instruments, and for details of the share borne by the various persons concerned in the realization of the idea.

Fig. 5 illustrates diagrammstically the nature of the instrument. $\Delta$ cord passes over and under a succession of pulle ${ }^{\bullet \bullet a}$, being fixed at one end and baving at the other a pen which touches a revolving drum. If all the pulleys but one be fixed, and if that one executes a simple harmonic motion up and down, the pen will execute the ssme motion with balf amplitude. If a second pulley be now given an harmonic motion, the pen takes it up also with half amplitude. The game is true if all the pulleys are in harmoric motion. Thus the per sums them all up, and leaves a trece on the revolving drum. When the drum and pulleys are so geared that the angular motion of the drum is proportional to mean solar time, whilst the har
 monic motions of the pulleys correspond in range and phase to all Fio. 5.-Tide-predicting instrament. the importent lunar and solar tides, the trace on the drum is a tide-curre, from which a tide-table may be constructed The harmonic motion of the pulley is given by an arrangement indicated only in the case of the lower pulley in the figure. The pulley frame has attached to its vertical portion a horizontal slot, in which slides a pin fixed to a wheel. Suppose that whilst the drum turns through $15^{\circ}$ the whed turis through $25^{\circ} 984$. Now a lunar day is 24.842 mean solar hours; hence as tho drum turns throngh $15^{\circ} \times 24.842$ the whee] turns through $24.842 \times 28^{\circ} .884$ or $720^{\circ}$. Thus, if the drum turns with an angular velocity proportional to colar time, the whicel turns with twice the angulas velocity proportionel to lunar time, and the pulleygeared to the wheel execntes lnnar semi-diurnal harmonic oscillations. When the throw of the pin end its engular position on its wheel aro adjusted so as to correspond with the range and phase of the observed lunar aemidiurnal tide, the oscillation of the pulley remains rigoronsly ac curate for that tide for all future time, if the gearing be rigorously accurate, and with all needful eccuracy for somo ten years of tide
${ }^{2}$ For forther detalls, seo Appendixes fil., Iv., F., to Thonson and Tait's Nat Phil., 18i9, vol. 1., part 1.; Jaines Thomson, Proc. Roy. Soc., vol. xxivo, $15 \%$ p 202, and (Sir W. Thomeod) pp. 208, 271; Sir W. Thomson, Pron Lust. C.E. pul Lev.
with gearing as practically constructed. Tho upper pulleys have to be carefully counterpoised as indicated. It lass not becn found that any apprcciable disturbance is caused by the inertia of the moving parts, even when the speed of working is high. The predicter of the India Offico takes about four hours to rnn off a year'a tides, but greater apeed seems attainable by modification in the gearing. The Indian instrument, in the store department at Lambeth, has puilleys for the following tides (see chap. iv.): $-\mathrm{M}_{2}, \mathrm{M}_{4}$ $M_{\omega}, K_{1}, S_{1}, S_{2} O, N, P_{2} K_{2}, Q, \nu, J_{,} \quad \lambda, 2 M S, 2 S \Delta I$, MIS, Saa, Sa.

## § 39. Numerical Harmonic Anuoysis and Prediction.

In chapter iv. we have discussed the application of the numerical harmonic method to a long series of hourly observations. An actual numerical example of this analysis, with modifications to render it applicalle to a short aeries, such as a fortnight, is given in the Admiralty Scientific Manual, 1886 , where also an example of the numerical and graphical prediction of the tides may be found. The formulo used are those given in chapter v.

Vil. Progress of the Tide. Wave ofer the Sea, and the Tides of tee British Seas.
§ 40. Meaning of Cotidal Lines.
Sufficient tidal data would of course give the state of the tide at every part of the world at the same instant of time, and if we were
to follow the successive changes we should be able to picturs mentally the motion of the wave over tho ocean and the successive changes in its height. The data are, however, as yct very incomplete and only a rou-h scheme is possible. A map purporting to give the progress of tho tide-wave is called a map of cotical lines. For a perfect representation three series of maps would be required, one for the semi-diurnal tides, a sccond for the diurnal tides, and a third for the tides of long period. Each class of map would then show the progress of the wave for each configuration of the tidegenerators. But as yet the only cotidal maps made are those for the mean semi-diurnal tide, and only for the configuration of new and full moon. The knowledge of the tides is not very accurato throughout the world, and therefore in the maps which we give it is assumed that the same interval elapses at all places between new and full moon and spring tile.
$\Delta t$ spring tide, as wo hare seen in (87) and (88),
$h_{2}=(M+M,) \cos 2(\psi-\mu)$,
aince $A-\mu$, becomes then cqual to $-\mu$. As a rough approximation spring tide ocenrs wheu the moon's transit is at one oclock at night or in the day. We only assume, however, that it occurs simultaneously everywhere. Now let $\tau$ be tho Greenwich mean time of high water, and $l$ the E. long. in hours of the place of observation, then, the local time of high water being the time of tho moon'a transit plus the interval, and local time being Greenwich time plus E. long., we liare

Fic. 6.-Cotidal lines of the world.
where $\mu$ is in degrees. Therefore, if we draw over the occan a succession of lines defined by equidistant integral values of the Greenwich time of high wafer, and if we neglect the separation of the moon from the sun in longitude in twelve hours, the successive lines will give the motion of the semi-diurnal tide-wave in one hour.

## § 41. Cotidal Lines of the World.

No recent revisal of cotidal lines has been made with the aid of the great mass of tidal data which is now being accumulated, and Fe therefore reproduce (fig. 6) the chart of the world prepared by Sir George Airy for his arricle on "Tides and Waves." The parts of the world for which data are wanting are onitted. The Roman numerals upon the cotidal lines denote tho hour in Greenwich time of high water on the day of new or full moon. Airy remarks ( $\$ 5$ 575.581) that the cotidal lines of the North Atlantic are accurately drawn, that those of the South Atlantic are douhtful, and in the Pacific east of New Zealand are almost conjectural. The cmbodiment of recent observations in a cotidal chart would necessitate some modification of these statements.

When a free ware runs into shallow water it travels with less velocity and its height is increascd. This is observable in the flexure and crowding of the cotidal lines near continents and oceanic islands, as, for example, about the Azores, the Bermudas, and the coast of South America. The velocity of the tide-wave gives good information as to the depth of the sea. In the North Sea it appears to travel at about 45 miles an hour, which corresponds to a depth
of 140 feet, and wo know that the depth aloug the decper channe is greater and along the sides less than this. In the Atlantic the wave passes over $90^{\circ}$ of latitude, from the southern to the northern ouo o'clock line, in twelve hours, that is at the rate of 520 miles an hour. If the Atlantic tide could bo considered as a free wave generated by the Pacific tide, this velocity would correspond to a depth of 18,000 feet. Airy considers, haverer, that the Atlantic forms too large a basin to permit the neglect of the rlirect tidal action, and thinks that the tides of this ocean derive extremely little of their character from the Pacific.
"There is ancther consideration," he says, "which must not he left out of sight. It is that, supposing the cotidal lines to be accurately what they profess to be-namely, the lines counecting all tho points at which high water is simultaneous-they may, nevertheless, with a compound series of tide-waves, not at all represent tho ridgo of the tide-wave which actually runs over the ocean. Thus an eyo at a great distance, capable of observing the swells of the tide-waves, might see one huge longitudinal ridge extending from the mouth of the Amazon to the sea beyond Iceland, making high water at one time from Cape de Verde to the North Cape, and at another time from Florida to Greenland, and another ridge transversal to the former, travelling from the coast of Guiana to the northern sea; and the cotidal lines which we have traced nay depend simply on the combination of these waves. It does not appear likely that we can ever ascertain whether it is so or not ; but it is certainly possible that the original waves may have these or similar forms:
and if so it is rain for us to attempt entirely to explain the tices of the Atlantic.

IIe sums up the discussion of the chart by saying:-
"Upon the whole, thercfore, we are driven to the conclnsion that we eannot at all explain the cause of the form of the cotidal lines in the ocean, so far as they bave been traced with any probability. And, supposing us to know with tolerable certainty those corresponding to the semb-diumal tide, we cannot at all predict those which should hold for the diurnal tide."

## § 42. Cotidal Lines of the British Scas.,

Fig. 7 shows the cotidal lines in the seas surrounding the British Islands. Here the lines refer to full moon and chango of moon and not to spring tide. The small figures along different parts of the coast denote the extreme range of the tide in yards. This figure is from the same source as the preceding one, and wo again reproduce a portion of Airy's remarks.
'The tides in the English Channel claim notice as having been the aubject of careful examination by many persons, English and

Fio. 7.-Cotiual lines of British scas.
Frencl. It appears that in the upper part of the Channel the water fors up the Channel nearly three hours after high water and runs down nearly three hours after low water (this continuanee of the current after high water, if it last three hours, is ealled by sailors tide-and-half-tide; if it last one hour and a half, it is called (ide-and-quarter-tide). On the Euglish side of the Channel, espeeially opposite the entrance of bays, the directions of the currents turn in twolve hours in the same direction as the hands of a watch; on the French side they turn in the opposito dircetion. This is catirely in confermity with thcory. The samo laws are recognized as holding in tho British [Bristol ?] Clannel, and in the German or North Sea near the Scotch and English coasts.
"With regard to the Irish Channel wo lhave only to remark that there is a wery great differenco in the heimht of tho tide on the different sides, the tide on the east sile being considerably the greater. They are also greater in the northem part (nerth of Wicklow on one side, and of Bardsey Jsland on the other side) than in the southern part. Betreen Wexford and Wicklow they are very small.
"The tides of the German Sea present a very remarkable pecoliarity. Along the eastern coast of England, as far as the month of the Thames, the tide-wave, coming from the Atlautic round the Orkney Islands, fors towards the south. Thus, on a certain day, it is high water in the Mnrray [Moray] Firth at eleren o'clock, at Eerwick at two o'clock, at Flamborough Head at five o'clock, ond so on to the entrance of the Thames. Put on the Belgian and Dutch coasts immediately opposite, the tide-wave flows frem the sonth tonards the north. Thus, on the day that wo havo supposed, it will be bigh water off the Thames at eleven o'eloek (the tile having travelled in trelve hours from the Murray Firth) anal at Calais ncarly at the same time ; hut at Ostend it will be at twelve, of The IIague at two, of the Ilelder at six, and so on.
"We believe that a completc explanation may bo fonnd in the arrangement of the great sheals of the North Sea. It most be remarked that (exeept nithin a very small distance of Norway) the North Sca is considerably deeper on the English side than on the German sido ; so much so that the tide-ware coming from the north runs into a deep bay of dcep water, bounded on the west side by the Scoch and English coasts as far as Newcastle, and on the east side by the great Dogger Dank. As far as the latitude of Hull, the English side is still tho deep one ; and, though a species of channel through tho shoal there allows an opening to the east, yet immediately on the south of it is the Wells Bank, which agrait contracts the dcep channel to the English side. After this (that is, in the latitude of Yarmouth) tho decp clannel expands cqually
to both sides. It seems reasonable to to both sides. It seems reasonable to conclude from this that the great set of north tide is on tho English sillo of tho North Sea, both between the Dogger Bank and Encland and between the Wells Bank and Englaud (a branch streaus of tide having been given of to the east between theso two banks), and that any passage of tide wave orer these banks may be neglected. Now this view is supported in a remarkable degree by the tidal observations on two dangerous shoals called the Ower and Leman, Jying between Cromer and the Wells Rank, but nearer to the latter. It appears that on theso sheals the direction of the tide-current revolves in the same nanner as the lands of a match, prowing conclusively that the Orer and Leman are on the left hand of the main stream of tide (supposing the face turned in tho direction in which the tide proceeds), or aro on its eastern border, and therefore that the central stream is still nearer to the coast of Norfolk. From a point not far south of this wo may suppose the tide to diverge in a fan-shaped form over the uniformly decp Lelgian Sea. Along tho English coast the wave mill flow to the sonth; but it will reach the whole of tho Belgian and Dutch coast at the samo instant; and, if this tide alone existed, wo doubt not that the time of high water would be sensibly the same along the whole of that coast.
" But there is another tide of great magnitude, namely, that which comes from the English Channel through tho Straits of Dover. This also diverges, wo conccive, in a fain form, affecting the whole Belgian Sea : the western part turns into the estuary of the Thames; the castern part runs along the Dutch coast, producing at successive times high water (even as coubined with the North Sea tide) along successivo points of that coast from Calais towards the Helder. And this we believe to be the complete cxplanation of tho apparently opposite tido-currents. The hranch tide of the North Sea rumuing between the Dogger Bank and the Wells Bank will assist in propagating the tide along the Gcrman coast from the Hellder towards tho mouth of the Ellue. We have gone into seme detail in this explanation for the purposo of showing the importance of considering the form of the bottom in explanations of speeific tides.
"A sct of observations has been mado by Captain Hewett (at the point $\Lambda$, fig. 7) on the depth and motion of tho water at a strictly definite point a fiv milcs south of tho Wells Bank, near the middle of the Belgian Sca. The resulf was that tho change of clevation of the surface was insensible, lunt that there was a considerable stream of tide alternately north-east and south-west (magnetic). T1.e point in question correspends pretty well to the intersection of the cotidal lines of nino o'clock of the Nerth Sea tide and three $0^{\circ}$ clock of the English Channcl tide (orlinary establishment), and these tides would thercfore wholly or partially destroy eaeh other as regards elevation. As regards the compound tide-strcam, the greatest positive current from one tido will be conabined with the greatest negative current of the other, and this will produce a strcam, whose direction agrees well with observation. At $3^{\mathrm{h}}$ en the day of new moon, the North Sca tido would bo running north (magnetic): and the English Channcl tido rould bo ruming east, and therefore the compound current would bo mnning north-east ; at $9^{\mathrm{b}}$ it would be running south-west. Both currents, and conscquently the com: pound current, would ceaso at about $0^{\mathrm{h}}, 6^{\mathrm{b}}, \& \mathrm{c}$., on the day of nemy moon; and, as the observations wero mado rather more than a day befere new moon, tho slack water would oceur an hour on mors befere noon. The whole of this agrees well with the obscrvations."

## Vili. Tidal Deformation of tize Solim Earth.

## § 43. Elastic Tides.

The tide-gencrating potential varics as the square of the distance from the eartli's centre, and tho corresponding forces act at cerery roint throughout its mess. No solid matter possesses the property of absolute rigidity, and wo must therefore admit the probable existence of tidal elastic deformation of the solid carth. The problem of finding tho state of strain of an clastic splere under given stresses was first solved by Lame $;^{1}$ he made, however, but ferl flyysieal deductions from lis salution. An independent solution was found by sir W. Thomson, ${ }^{3}$ who drew some interesting conclu: sions concerning the earth.

[^148]His problem, in as far as it is now material, is as follows." Let a sphere, of radius $a$ sad density $w$, be made of elastic material whose bulk and rigidity moduli are $k$ and $n$, aad let it be subjected to forces due to a potential $w r^{2} S_{2}$ per uait volume, where $S_{3}$ is a surface epherical harmonic of the secend order. Then it is required to find the strain of the sphere. We refer the reader to the original sonrces for the methods of solution applicable to apherical shells and to eolid epheres. In order to write Thomson's solution we put $r, \lambda, l$ for radius vector, latitude, and longitude, and $\rho, \mu, \nu$ for the corresponding displacements. Then the solution is as followe :-

$$
\left.\begin{array}{l}
\rho=\frac{w}{\left(19 k+\frac{1}{3} n\right) n}\left[\left(8 a^{2}-3 r^{2}\right) k+\frac{2}{3} a^{2} n\right] r S_{2}  \tag{96}\\
\mu=\frac{w}{2\left(19 k+\frac{4}{3} n\right) n}\left[\left(8 a^{8}-5 r^{2}\right) k+\frac{2}{3}\left(a^{2}-r^{2}\right) n\right] r \frac{d S_{2}}{d \lambda} \\
\nu=\frac{w}{2\left(19 k+\frac{4}{3} n\right) n}\left[\left(8 a^{2}-5 r^{2}\right) k+\frac{2}{3}\left(a^{2}-r^{3}\right) n\right] \frac{r}{\cos \lambda} \frac{d S_{2}}{d l}
\end{array}\right\}
$$

For either tidal or rotational stresses

$$
S_{2}=\tau\left(\sin ^{2} \lambda-\frac{1}{3}\right)
$$

in the case of tides $\tau=\frac{8}{2} m / c^{3}, m$ sud $c$ being the moon's mass and Bistance, cad in the case of rotation $\tau=-\frac{1}{2} \omega^{2}$, $\omega$ being the sngular velocity about the polar axis. The equation to the eurface is found by putting $r=a+\rho$, where in the expression for $p$ we put $r=a_{n}$ Hence from (95) the form of surface is given by

$$
\begin{equation*}
: a\left\{1+\frac{15 w a^{2}}{19 n}\left[1+\frac{\frac{6}{8} n / k}{1+\frac{4}{57} n / k}\right] r\left(6 \sin ^{2} \lambda-3\right)\right\} \tag{97}
\end{equation*}
$$

In most solids the bulk modulus is coasidersbly larger than the rigidity modulus, sad in thio discussion it is onfficient to neglect $n$ compared with $k$. With this approximation, the ellipticity e of the ourface becomes

$$
\begin{equation*}
e=\frac{5 w a^{2}}{19 n} \tau \tag{98}
\end{equation*}
$$

Now euppose the sphere to be endued with the dower of gravitation, and write

$$
\begin{equation*}
\mathrm{r}=\frac{19 n}{6 w a^{2}}, \mathrm{~g}=\frac{2}{\sigma} \frac{g}{a} \tag{99}
\end{equation*}
$$

where $g$ is gravity at the ourface of the glohe. Then, if there were ho elasticity, the ellipticity wonld be given by $e=\tau / g$, and without gravitation by $c=\tau / r$. And it may be proved in geveral ways that, gravity and elasticity co-operating,

$$
e=\frac{T}{r+g}=\frac{T}{g} \cdot \frac{1}{1+T / G}
$$

(100).

If $n$ be the rigidity of steel, and if the globe have the size and mean density of the earth, $r / g=2$, sad with the rigidity of glass $r / g=3$. Hence the ellipticity of an earth of steel under tide-generating force would be $\frac{1}{8}$ of that of a fluid earth, and the similar fraction for glass would be $\frac{3}{3}$. If an ocean be euperposed on the globe, then, if the globe rises and falls with the tide es thongh it were fluid, there will obviously be no tide visible to an observer carriod ap and down with the solid; and with any degree of rigidity the visible tide will be the excess of the fluid tide ahove the colid tide. Hence on an earth with rigidity of eteel the oceanic tides would be reduced to $\frac{3}{3}$, and with rigidity of glass to $\frac{?}{5}$ of the tides on a rigid earth.

## § 44. Rigidity of the Earth.

Althongh the computation of oceanic tides is as yet impossible, it canaot be odmitted that perfect rigidity in the earth would aug. ment the tides in the proportion of 5 to 2 , although they might perhaps be augmented in the propertion 4 to 3 . Thus Thomson concludes that the earth's mass must have an effective rigidity at least as great as that of steel. If it were true, ss was held until recently, that the earth is a fluid ball coated with a crust, that crust must be of fabulous rigidity to resist the tidal sargings of subjacent fluid. Heace we sre led to the coaclueion that far the garger nortion of the earth's mass, if not all of it, is a solid of great tigidity. Un in the present mae the argument by which the tides of long period were proved to inve approximately their equilibrium hoight has generally doun accepred without much doubt, but we have (§ 17) shown good cause for rejecting Laplace's argument, at least for a fortnightly tide. It appeared formerly that, from aumerical data as to the heights of the tidee of long period, we ehould be able to compute the actual effective rigidity of the earth's mass. Bat from $\S 18$ we see that, slthough these tides remain incalculable, Fet with such oceans as ours the tides of long period must conform much more mearly to the equilibrium laws than do the tides of short period. Thus a comparison of the observed heights of the tides of long period with the equilibrium law still remains of interest, although the ovaluation of the earth's rigidity appears with present data unsttainable. Acting on the old belief, Mr G. H. Derwin has compared the lunar fortaightly and monthly tides, as observed for thirty-three years at various Indian and European ports, with the equilibrium theory, and has found that tho tideheights were about two-thirds of the equilibrium height. ${ }^{1}$ From this the coaclusion was drawn that the effective rigidity of the earth wes as great as that of steel. Whilst, then, this precise com-

[^149]parison with the rigidity of steel falls to the ground, the investise:tion remains as an important confirmation of 'l'homson's concinsuan as to the great efiective rigidity of the earth. When extensive and accurate knowledge of the tides has been attaiued, the sttempted evaluation of the rigidity may coaceivably be possible, becausb there is a minute tide with a period of 18.6 year's ( $\$ 23$, scheculs [A, iii.]) of which Laplace's argument must hold good. Great accu. racy will, however, be necessary, becsuse the height of the tiderit the equator only amounts to ooe-third of an inch, a ad a preliminary inquiry eeeme to show that there are othce relatively considerapio Variations of eea-level arisiag from naexplajaed causcs. ${ }^{2}$

Sir W. Thomsen's selution of the strain of an elastic ephere bias been slso used to determine what degree of streagth the materiais of the esrth must have in order that the great coatinental plateaus and mountains may not sink in. ${ }^{3}$ In another investigation it has been ehown that lacsl elastic yielding on the coast-lines of continents may produce an augmentation of apparent tide in certain, places on account of the flexure of the upper strata, when a great weight of water is added and subtracted from tho adjaceat oceanio srea at high and low tide. ${ }^{4}$ There is reason to believe that ouch flezure bas actually jeen observed by a delicate form of level on the coast of the Bay of Biscay. ${ }^{\circ}$

## §45. Viscous and Elastico-Viscous Tides.

It might be oupposed thst the earth is composed of a viscous fluid of great stiffess, or that it possesses an elasticity whica breaks down under continued stress. Both these hypothescs have been considcred, sad the resulte sre confirmstory of the coaclusion that the earth is made of very stiff material. These problems appear to have been worthy of attack, although the existence of measurable oceanic tides of loug period negatives the adoption of the hypothesis of true viscosity, at least under stresses comparable with tide-generating forces.

If a sphere of radius $a$, density 20 , viscosity modulus $v$, be under the action of forces due to a potential per anit volume $\operatorname{vor}^{2} S_{2} \cos n t, s 0$ that $n$ is the speed of the tide, the solution of the problem showe that the tide of the ephere is expressed by

$$
\frac{a S_{2}}{\mathrm{~g}} \operatorname{coseco\theta }(n t-\epsilon) \ldots \ldots
$$

where

$$
\tan \epsilon=n \frac{r}{g}, \quad r=\frac{19 v}{520 x^{2}}, \quad g=\frac{9}{5} \frac{g}{a} .
$$

Thns the tides of the viscous globe are to the equilibrinm tides of \& fluid globe as $\cos \epsilon$ to uaity, and there is a rotardation $\epsilon / n$ of the time of high tide after the passage of the tide-generator over the meridian. Further, by arguments similar to that applied in the case of elastic tides, it is found that oceanic tides are redaced by the yielding in the proportion of sin $\epsilon$ to unity, and that there is an apparent acceleration of the timo of high water by $\left(\frac{1}{2} \pi-e\right) / n_{0}{ }^{-}$ It sppears by aumerical calculation that, in order that the oceaaio eemi-diurnal tide may have a value equal to two-thirds of the full smeunt on a rigid globe, the stiffness of the globe must be about twenty thoussad times as great as that of pitch et freezing tempersture, when it is hard and brittle. We must here pass by the results of the bypothesis of an elasticity degrading under the influence of continued stress.

## IX. Tidal Feiotion.

## § 46. General Explanation.

The investigation of the tides of a viscous ophere has led us to the consideration of a frictionally retarded tide. The effects of tidsl friction are of euch general interest that we give a sketch of the principal results without the aid of mathematical symbols. In fig. 8 the peper is euppesed to be the plape of the orbit of a satellite Il revolving in the direction of the arrow abont the olaaet C. which. rotates in the direction of the arrow ahoat an ans peryenuicalar tol the paper. The rotation of the planet is suppesed to be more rapid, then that of the satellite, so that the day is shorter then the month. Let us suppose that the planet is either entiroly fluid, or has an ocesa of such depth that it is high water under or nearly nader the satellite. When there is no friction, with the gatellite at $m$, the planet is eloagated into the ellipsoidal shape shown, cutting the mean sphere, whech is dotted. But, when there is friction in the fluid motion, the tide is retarded, and high tide occurs after tina 6atellite has passed the meridian. Then, if we keep the same figu: to represent the tidal elongation, the satellite must be at M, instes, of at $m$. If we aumber the four quadrants as shown, the satellit. mast be in quadrant 1. The protuberance $P$ is nearer to the satellite than $P^{\prime}$, and the deficiency $Q$ is further away than the deficioncy

[^150] Oscillatione of a Viscous spherold," Proc. Lond. Mfath. Soc., Nov. 1881, p. 6L.
Q. Hence the resultant action of the planet on the satellite mast be in some such direction as MN. The action of the satellite on the planet is equal and opposite, and the force in NK, not being through the planet's centre, must prodnce a retarding couple on the planet'e rotation, the msgnitude of which depends on the length of the arm CN. This tidal frictional eouple varies as the height of the tide, and also depends on the eatellite's distance ; its intensity in fact varies as the equare of the tide. generating force, and Fg. \& therefore as the inverso aixth power of the aatellite's distance. Thas tidal friction miat retard the planetary rotation. Let ns now consider ite effect cu the eatellite. If the force acting on $M$ be resolved along and perpendicular to the direction CM, the perpendicular component tends to accelerate the satellite's velocity. It alone would carry the satellite further from C then it would be dragged beck by the central force towarda C. The ratellite would describe a spirsl, the coils of which would be very nearly circular and very nearly coincident. If now we resolve the central component force along CM tangentially and perpendicnlar to the spiral, the tangential component tends to retard ths velocity of the satellite, whereas the distarbing force, already considered, tends to accelerate it. With the erg forco, already considered, teads to accelerate ito With tion must prevail over the acceleration. ${ }^{1}$ The moment of momentum of the whole syatem remains unchanged, and that of the planetary rotation diminishes, so that the orhital momert of momentum mast increase; now orbital moment of momentum increase日 with increasing distauce and diminishing linear and angular velocity of the satellite. The action of tidal friction may appear eomewhat paradoxical, hut it is the exact converse of the accelera. tion of the linear and angular velocity and the dimination of distance of a satellite moving throngh a resisting mediun. The latter result is generally more familiar than the action of tidal friction, and it may help the reader to realize the result in the present case. Tidal friction theu diminishes planetary rotation, increases the aatellito's distance, and diminishes the orbital angular velocity. The comparative rate of diminution of the two angular velocities is geuerally very diferent. If the satellite be close to the planet the rate of iucrease of the eatellite's periodic time or month is large compared with the rate of increase of the period of planatary rotation or day; but if the satellite is far off the converse is true. Hence, if the satellite starta very near the planet, with the month a little longer than the day, as the satellite recedes the month aoon increases, 8 that it contains many days. The number of days in the month attains a maximum and then dimioishes. Finally the two angular relocities anbside to a second identity, the day and month being identical and both very long.

We beve supposed that the ocean is of anch depth that the tides are direct ; if, however, they are inverted, with low water under or nearly under the eatellite, friction, instead of retarding, accelerates the tide; and it would be easy by drawing another figure to sce that the whole of the above conclusions hold equally true with inverted tides

## 847. Exact Investigation of the Semular Effects of Tidal Friction.

The general conclusions of the last acction are of auch wide in. terest that me proceed to a rigorous discussion of the principal effects of tidal friction in the elementary case of the circular orbit. In order, however, to abridge the iavestigation wo shall only consider the case when the planetary rotation is more rapid than the aatellito's orbital motion.

Supposa an attractire particle or astellite of mass $m$ to be moving in a circular orbit, with an angular velocity $\Omega$, round a planet of mass 35 , and suppose the planet to he rotating about on axis perpendicular to the plane of the orbit, with an angular velocity ; 6urpose, also, the mass of the planct to be partially or wholly imperfectly elastic or viscous, or that there are oceaus on the surface of the planet ; then the attraction of the satcllite must produce a relative motion in the parts of the planes, and that motion must be subject to friction, or, in other words, there must bo frictional tides of some cort or other. The system must accordingly be losiag energy by friction, and its configuration must change in such a may that its whole energy diminishes. Such a system does not differ much from those of actual plancts and satellites, and, therefore, the results deduced in this hypothetical case must agree pretty closely with the actual course of evolution, provided that time enough has

[^151]been and will be given for such changes. Let $C$ be the moment of inertis of the pladet about its axis of rotation, $r$ the distance of the catellite from the centre of the plamet, $h$ the resultant moment of momeatum of the whole bystem, e the whole energy, both kinetic and potential, of the syotem. It is assumed that the figure of the planet and the distribution of its internal density are such that the attraction of the satellite causcs no couple about any axis perpendicular to that of rotation. A epecial aystem of units of mass, length, and time will now be adopted such that the analytical reaulta are reduced to their simplest forms. Let the unit of mass, be $M(m / \mu+m)$. Let the unit of leagth $\gamma$ be such a cistance thst the moment of inertia of the planet about its axis of rotatiou may be equal to the moment of inertia of the planet and satellite, treated es particles, about their centra of inertia, when distant $\gamma$ spart frum one another. This condition gres
whence
$$
M\left(\frac{m \gamma}{M+m}\right)^{2}+m\left(\frac{M \gamma}{M+M}\right)^{2}=C ;
$$

Let the nnit of rimer $\mu / m\}$
time $r$ be the time in which the sacellite rovolves . 3 ahout the planet, when the satellito's radins vector is equal to $\gamma$. In this case $1 / \tau$ is the satellite's orbital angular velocity, and by the law of periodic times we have

$$
\tau^{-2} \gamma^{3}=\mu(\Delta \Gamma+m)
$$

where $\mu$ is the attraction betwecn unit masses at anit distanca Then by cubstitution for $\gamma$

$$
\tau=\left\{\frac{C^{3}(M L+m)}{\mu^{2}(M / m)^{3}}\right\}^{\frac{1}{4}}
$$

This aybtem of nnits will be found to make the three following Spect functions each equal to unity, viz, $\mu^{3} J I n,(M+m)^{-\frac{1}{2}}, \mu M m$, sad $C$. vich The units are in fact derived from the consideration that these functions are each to be unity. In the case of the earth and noon, if we take the moon'a mass as हr马 ${ }^{1}$ d of the earth's and the earth'a moment of inertia as $\quad 1 M_{a^{2}}$ (as is very uearly the case), it may easily be shown that the unit of mass is so 3 of the earth'e mass, the unit of length 5.26 earth's radii or 33,506 kilomêtres ( 20,807 miles), and the unit of time 2 hrs. 41 minutes. In these units the present angular velocity of the earth's diurnal rotation is expressed by 7044 , and the moon'e present radius vector by $11 \cdot 454$. The two Monent bodies being supposed to revalve in circles sbout their common of me. centre of inertis with an angular velocity $\Omega$, the moment of nomen - menticus tum of orbital motion is

$$
M\left(\frac{m r}{M+m}\right)^{2} \Omega+\lambda I\left(\frac{M I r}{M r+m}\right)^{2} \Omega=\frac{\lambda I m}{M I+n L} r^{*} \Omega
$$

Then, by the law of periodic times in a circular orbit,

$$
\begin{aligned}
& \Omega^{2} r^{3}=\mu(M+2 n) \\
& \Omega r^{2}=\mu^{3}(M+m)^{\frac{1}{2}} r^{3}
\end{aligned}
$$

whence $\quad \Omega r^{2}=\mu^{\frac{3}{2}}(M+m)^{\frac{1}{2}} r^{\frac{2}{3}}$.
The moment of momentum of orbital motion

$$
=\mu^{\frac{2}{2}} \operatorname{SI}(M+m)^{-\frac{1}{2}} r^{\frac{1}{2}},
$$

and in the special units this is equal to $r^{\frac{2}{3}}$. The moment of momentum of the planet's rotation is $C r$, and $C=1$ in the apecial nnits. Therefore
$h=n+r^{\frac{1}{2}}$
(102r
Since the moou's present radius vector is $11 \cdot 454$, it follors that the orbital momentuin of the moon is $3: 384$. Adding to this she rotational momentum of the earth, which is $\% 04$, we obtain 4.088 for the total moment of momentum of tho moon and earth. The ratio of the orbital to the rotational nomentun is $4 \cdot 80$, so that the total momeot of momeutum of the system would, but for the oblipuity of the ecliptic, be $5 \cdot 50$ times that of the earth's rotation. Again, the kintic energy of orbital motion is

$$
\frac{1}{2} M\left(\frac{m r}{M+m}\right) \Omega^{2}+\frac{1}{2} \ln \left(\frac{M I r}{M+m}\right)^{2} \Omega^{2}=\frac{1}{2} \frac{M / n}{M+m} r^{2} \Omega^{2}=\frac{1}{2} \frac{\mu M I m}{r}
$$

The kinetic eaergy of the plavet's rotation is $\frac{1}{3} \mathrm{Cn}^{2}$. The potential energy of the system is $-\mu 3 / \mathrm{in} / \mathrm{r}$. Adding the tlirce ewergies to gether, and transforming in to the special units, we have

$$
\begin{equation*}
2 e=u^{2}-1 / r \tag{103}
\end{equation*}
$$

Now let $\quad x=r^{\frac{2}{3}}, \quad y=n, \quad Y=2 e$
It will be noticed that $x$, the monent of momentum of orbital rootion, is equal to the square root of the satellite's distance from the planut. Then equations (102) and (103) become $h=y+z$.
(104) is the equation of conservation of moment of momnatum, or, shortly, the equation of momentum ; ( 105 ) is the equation of coergy.

Now consider a system started with given positive moment of momentum $h$; and we have all sorts of ways in which it may be started. If the two rotations he of opposite kinds, it is clear that we may start the system with any amount of energy however grest, but the true maxima and minima of energy compatible with tha given moment of momentun are supplicd by $d \Sigma / d x=0$, | or | $x-h+1 / x^{3}=0$, |
| :--- | :--- |
| $-h-h x^{3}+1=0$ |  |

that is to say, $\quad x^{3}-h x^{3}+1=0$.
. (106)
Wre shall presently see that this quartic has cither tro real roots
and tro imaginary, or all imaginary roots. The quartic may be derived from quite s different cousiderstion, viz., by finding the conditiou puder which the satellite may move round the planet so that the planet shall always show the same face to the satellite, -in fact, so that they move ss parts of one rigid body. The condition is simply that the satellite's orbital angular velocity $\Omega=n$, the planet' $\theta$ sngular velacity of ratation, or $y=1 / x^{3}$, since $s=y$ and $r^{\frac{1}{2}}=\Omega^{-\frac{1}{8}}=x$, By substitutiag this value of $y$ in the equation of momentum (104), tre get as before
$x^{4}-l x^{3}+1=0$
At present we have only obtained one result, viz., that, if with given moment of momentum it is possible to set the satellite and planet moving as a rigid body, it is possible to do so in two ways, aud one of these ways requires a maximum amonat of energy and the other a minimum ; from this it is clear that one must be a rapid rotation with the sstellite near the planet and the other a slow one with the satellite remote from the planet. In the three equations

$$
\begin{aligned}
& h=y+x \\
& \begin{aligned}
Y & =(h-x)^{2}-1 / x^{3} \\
3 y & =1
\end{aligned} \\
& \text { (107), } \\
& x^{3} y=1 \\
& \text { (108), }
\end{aligned}
$$

107) is the equation of momentum (108) that of (107) is the equation of momentum, (108) that of caergy, and (109) may be called the equation of rigidity, since it indicates that the two bodies move as thongh parts of one rigid body. Io illustrate these equations geometrically, we may take as abscissa $x$, which is the moment of momentum of orbital motion, 60 that the sxis of $x$ may be called the axis of orbital momentum. Also, for eqnations (107) and (109) we may take as ordinate $y$, which is the moment of momentum of the planet's rotation, so that the axis of $y$ may be called the axis of rotational momentum. For (108) we may take as ordinate $Y$, which is twice the energy of the system, so that the axis of $Y$ may be called the axis of energy. Then, as it will be couvenient to exhibit all three curves in the same figure, with a parallel sxis of $x$, we must have the axis of energy identical with that of rotational momentum. It will not be necessary to consider the case where the resultant moment of momentum $h$ is negative, because this would only he equivalent to reversing all the rotations; $h$ is therefore to be taken as essentially positive. Then the line of momentum whose equation is (107) is a straight line inclined at $45^{\circ}$ to either axis, having positive intercepts on both axes. The curve of rigidity whose equation is (109) is clearly of the same nature as a rectangular hyperbola, but it has a much more rapid rate of apprasch to the axis of orbital momentum than to that of rotational momentum. The intersections (if any) of the curve of rigidity with the line of momentum have abssissm which are the two roots of the quartic $x^{4}-h x^{3}+1=0$. The quartic has, therefore, two real roots or all imaginary roots. Then, eince $x=\sqrt{ } r$, the intersection which is moro remoto from the origin indicates s configuration where the satellite is remote from the planet; the other gives the configuration where the satellite is closer to the planet. We have already learnt that these two correapond respectively to minimum and maximum energy. When $x$ is very large, the eqnation to the curve of energy is $Y=(h-x)^{2}$, which is the equation to a parabols with a vertical axis parallel to $Y$ and distant $h$ from the origin, so that the axis of the pars: bola passes through the intersection of tha line of momentuna with the axis of orbital momertum. When $x$ is very emall, the equation becomes $Y=-1 / x^{2}$. Hence the axis of $\bar{F}$ is ssymptotic on both sides to the curve of energy. Then, if the line of momentum intersects the curve of rigidity, the curve of energy has a maximum verticslly undernesth the point of intersection nearer the origin and a minimam andernesth the point more remote. But, if there are no intersections, it has no maximum or ninimum.

Fig. 9 shows these curves when drawn to scale for the case of the earth and moon, that is to say, with $h=4$. The points $a$ and $b$,

sarily remains indistinguishable from $B$. As the zero of energy is quite arbitraly, the origin for the energy curve is displaced domnWarda, and this prevents the two curves from crossing one another in a confusing manner. On account of the limitation imposed we
neglect the case where the quartic has no real roots. Evory point of the line of momentum gives by its abscissa and ardinate the squaro rooc of the eatellite's distance and the rotation of the planet, and the ordinate of the energy curve gives the energy correspouding to each distance of the satellite. Part of the figure has no physical meaniog, for it is impossible for the aatellite to move round the planet at a distence less than the sum of the radif of the planet and eatellite. For exsmple, the moon's diameter being about 2200 rmles, and the earth's sbout 8000 , the moon'e distance cannot be less then 5100 miles. Accordingly a strip is marked off and shaded on each side of the vertical axis within which the figere has no physical mesning, The point $P$ indicates the present configuration of the earth and moon. The curve of rigidity $x^{3} y=1$ is tha same for all values of $h$, and by moring the line of momentum parallel to itself pearer to or further from the origin, wo may represeat all possible moments of momentum of the whole system. The smallest amount of moment of momentum with which it is possible to set the system moving as a rigid body, with ceutrifugal force enough to balance the mutual attraction, is when the line of momentum touches the curve of rigidity. The condition for this is clearly that the equation $x^{4}-h x^{3}+1=0$ should have equal roots. If it has equal roots, each root must he $\frac{3}{4} h$, and therefore

$$
\left.\left(\frac{3}{2} h\right)^{4}-h^{\left(\frac{3}{2}\right.} h\right)^{3}+1=0
$$

whence $h^{4}=4^{4 / 3} / 3^{3}$ or $h=4 / 3^{\frac{3}{2}}=1 \cdot 75$. The actual value of $h$ for the moon sud earth is shout 4 ; hence, if the moon-earth system were started with less than $\frac{7}{15}$ of its actual moment of momentum, it would not be possible for the two bodies to move so that the earth Mar should always show the same face to the moon. Again, if we trarel mum along the liae of momentum, there must be oome point for which number $y x^{3}$ is a maximum, and since $y x^{3}=n / \Omega$ there must be some point of day $u$ a for which the number of plapetary rotations is greatest during one mont revolution of the satellite; or, ghortly, there must be some configuration for which there is s maximum number of days in the month. Now $y x^{3}$ is equal to $x^{3}(h-x)$, and this is s maximun when $x=\frac{3}{4} h$ and the maximum number of days in the month is $\left(\frac{9}{4} h\right)^{3}\left(h-\frac{9}{4} h\right)$ or $3^{3} h^{4} / 4^{4}$; if $h$ is equal to 4 , , is nearly the case for the earth and moou, this becomes 27. Hence it follows that we now have very nearly the maximum number of days in the month. A more accurate investigation is a paper on the "Precession of a Viscous Spheroid" in Phil. Trans., part i., 1879, showed that, taking account of solar tidal friction and of the obliquity to the ecliptic, the maximum number of dajs is about 29 , and that we have already passed through the phase of maximum. We will now consider the Disensphysical meaning of the figure. It is assumed that the resultant sion of moment of momentum of the whole system corresponds to s positive figare. rotation. Now imsgine two points with the same abscissa, one on the momentum line and the other on the energy curve, and snppose the one on the energy curve to guide that on the momentum line. Then, eince we are eupposing frictional tides to be rsised on the planet, the energy must degrade, and however the two points are set initially the point on the energy curve must alwags slide down \& slope, carrying with it the other poiut. Looking at the figure, we bee that there are four slopes in the energy curve, two running down to the planet and two down to the minimum. There are thercfore four waye in which the oystem msy degrade, according to the way it was started; but we shall only consider one, that corresponding to the portion $A B b a$ of the figure. For the part of the line of momentum $A B$ the month is longer than the day, snd this is the case with all known satellites except the nearer one of Mars. Now, if a satellite be placed in the condition A-thst is to asy, moving rapidly round a planet which slways shows the same foce to the satellite-the condition is clearly dynamically unstable, for the least disturbance will determine whether the'system shall degrade down the slopes $a c$ or $a b$-ihat is to ssy, whether it falls into or recedes from the planet. If the equilibrium breaks domn by the satellite receding, the recession will go on until the syatem has reached the state corresponding to $B$. It is clear that, if the intersection of the edge of the shaded strip with the line of momentum be identical with the point $A$, which indicates that the satellite is just touching the planet, then the two bodies are in effect parts of a single body in an unstable configuration. If, therofore, the moon was originally part of the earth, we shoold expect to find this identity. Now in fig. 9 , drawn to scale to represent the earth and moon, there is so close an spproach between the edge of the shaded band and the intersection of the line of momentum and curve of rigidity that it would be scarcely possible to distinguish them. Hence, there seems a probsbility that tho two bodies once formed parts of a single one, which broke np in consequencs of some kind of instability. This view is coufirmed by the more detailed consideration of the case in the paper on the "Precession of a Viscous Spheroid," alfeady referred to, and subsęquent papers in the Fhilosophical Transactions of the Royal Society.

1 Fnifurther consideration of this snbject gee a series of papers by $8 f r Q$. R Darwin, in Froceed. and Trans. of thedioyal Bociety from 1sis to 1881, and

§ 48. Amount of Tidal Relardation of Earth's Rotation.
With respect to the actual smount of retardation of the earth's rotation, we quate the following from Thomson and Tait's Nat. Phil. (1883), § 830.

In observational astronomy the earth's rotation serves as a time keeper, and thus a retardation of terrestrial rotation will appear astronomically as an scceleration of the motion of the heavenly bodies. It is only in the case of the moan's motion that such sn apparent scceleration can be possibly detected. Now, as Laplace first pointed ont, thero must bo a slow variation in the moon's mean motion arising from the secular changes in the eccentricity of the earth's orbit around the sun. At the present time, and for scveral thousand years in the future, the variation in the moon's motion is sud will bo sn soceleration. Laplace's theoretical calculation of the smount of that acceleration sppesred to sgreo well with the results which were in his day accepted as representing the facts of observation. But in 1853 Adams showed that Laplace's reasoning was at fault, snd that the aumerical results of Damoiseau's and Plana's theories with refcrence to it cousequently require to be sensibly altered Hansen's theory of the secular acceleration is vitiated by an error of principlo similar to that which affects the theories of Damoiseau and Plans; but, the mathematical process which he followed being different from theirs, he arrived st somewhat different results. From the erroneous theory Hsasen found the value of $12^{\prime \prime} 18$ for the coefficient of the term in the moon's mean longitude depending on the square of the time, the unit of time being a century - in a lster computation given in his Darlegung he found tho coefficient to be $12^{\prime \prime} 5 \mathrm{C}^{2}$
"Io 1859 Adams commanicated to Delaunay bis final result, namely, that the caefficient of this term appears from a correctly conducted iovestigation to be $5^{\prime \prime} 7$, so that Bt the end of a century the moon is $5^{n} \cdot 7$ before the position it would heve had at the same time if its mean angular velocity had remaired the same as at the beginning of the century. Delaunay verified this result, and added some further small terms which increased the coefficient from $\delta^{\prime \prime} 7$ to $6^{\prime \prime} \cdot 1$.
"Niaw, according to Airy, Hanscn's palue of the 'adrance' represents very well the circumstances of the eclipses of Agathoclos, Larissa, and Thales, but is if angthing too emall. Newcomb, on the other hand, is inclined from an elaborate discussion of the socient eclipses to beliere llansen's ralue to be too large, snd gives tro competing values, viz., $8^{\prime \prime} 4$ and $10^{\prime \prime} 9.9$
"In any case it follows that the value of the sdrance as theoretically deduced from sll the canses, known up to the present time to be opcrative, is smaller than that which agrees with observation. In what follows $12^{\prime \prime}$ is taken ss the observational value of the adrance, and $6^{\prime \prime}$ as the explained part of $t$ is phenomenon. About the beginning of 1866 Dolaunay suggested that the true explanation of the discrepancy might be a retardation of the earth's rotation by tidal friction. Using this hypotheais, and allowing for the consequent retardation of the moon's mean motion by tilal reaction, Numeri- Alams, in an estimato which he has communicated to us, founded cal result on the rough assumption thst the parts of the carth's retardation as to earth' $\theta$ ation. due to solar and lunar tides are as the squares of the respective tide.generating forces, finds 22 sec , as the error by which the eartb, regarded as a time-keeper, wonld in a century get belind a perfect clock rated at the beginning of the ceutury. Thus at the cnd of a century a meridian of tho carth is $230^{\prime \prime}$ behind the position in which it would have been if the earth had continucd to rotata with the same angular relocity which it had at the beginning of the century.

Whatever be the valne of the retardstion of the carth's rotation it is necessarly the result of several caused, of which tiflal friction is almost certainly preponderant. If we accept Adams's estimate ss applicable to the outcome of the parious cascurring causes, then, if the rate of retardation giving the integral effect were uniform, the earth as a time-keeper would be going slower by 22 of a second per jear in the middle, and by ' 41 of a second per jear st the end, than at the beginning of the century. The latter is $\frac{1}{71.7 \times 10^{\circ}}$ of the preseot sngular velocity ; and, if the rate of retardation had been nuiform during ten million centurics past, the earth must havo beca rotating faster by abont one-gerenth than at prescut, and the centri-

[^152]fugal force must hare been greater in the proportion of $817^{9}$ to $717^{2}$ or of $67^{\prime}$ to 51 . If the consolidation took place then or earlier, the ellipticity of the upper layers must have been $\frac{1}{3} \frac{1}{\sigma}$ instead of sbout $8 \frac{1}{80}$, as it is at present. It must necessarily remain uncertain whether the earth would from time to tine sdjust itself completely to a figure of equilibrium adapted to the rotation. Bot it is clear that a want of completo adjustment would leavo traces in a propooderance of land in equatorial regions. The existence of large continents sod the grcat effective rigidity of the earth's mass reader it improbable that the adjustments, if sny, to the appropriste figure of equilibrium would bo complete. The fact then that the continents are arranged slong meridians rather than in sn cquatorial belt affords como degreo of proof that the consolidation of the earth took placo at a timo when the diurnal rotation differed but little from its present value. It is probsble, therefore, that the date of consalidation is considerably more receut than a thouGaud million jears ago. It is proper, however, to add that Adams lays but little stress on the actual uumerical values which hara been used in this computation, and is of opinion that the amount of tidal retardation of the earth's rotation is quito uucertain."

## §49. Effects of Tidal Friction on the Elcments of the Moon's

 Orbil and on the Earth's Rotation.It wonld be impossille within the limits of the present srticle to discuss completely the effects of tidal friction; we therefore confone ourselves to certain general considerations fihich throw light on the nature of those effects. Te lave in tha preceding sections sapposed that the plenct's sxis is perpendicular to the arbit of tha satellite, and thst the lsttcr is circular ; we shall now suppose the orbit to be oblique to the equator and eccentric, snd shall slso consider some of the effects of the solar perturbation of the moon. earth system. For the sake of brevity the planct will be called the earth, and the eatellite the moon. The complete investigation was carried out on the hypothesis that the planet was a viscous spheroid, because this mas the only theory of frictionally resisted tides which had been norked out. Although the results would bo practicaliy the same for any system of frictionally resisted tides, we ehall speak below of tho planet or earth ss a viscous body."

We shall show that if the tidal retardation be small the obliquity oull of the ecliptic increases, the earth's ratation is retarded, and the quity of moon's distance and periodic time are incrcased. Fig 10 represents the the earth ss scen from above the soutls pole, so that $S$ is the pola and tha onter circla tho equator. The earth's rotatlon is in the direction of the curved srrow st S. The half of the inner circle Which is drawn with a full line is $C$ a scmi-small-circlo of south latitudo, and the datted semicircle is a semi-small-circlo in the eame worth latitude. Generslly dotted lines Indicate psrts of the figure Which are bclow the plane of the
 paper. It will make tho explanation somewhat eimpler if we suppose the tides to be raised by a moon and anti-moon diametrically opposite to one snother. Let II sad $\mathrm{IN}^{\prime}$ bo the projections of tho moon snd sati-moon on to the terrestrial sphere. If tho fluid in which the tides are raised were perfectly frictionless, ${ }^{6}$ or if the earth were a perfect fluid or per. fectly elastic, the apices of the tidal spheroid would be at M and $\Delta I^{\prime}$. If, however, there is interal friction, due to any cort of viscosity, the tides will lag, snd we may suppose the tidal apices to be at T snd T'. Now suppose the tidal mrotuberances to bo replaced by two equal heavy particles st $T$ and $T$, which ere in stantancously rigidly connected with the earth. Then the aftraction of the moon on $T$ is greater than on $T^{v}$, and that of the antimoon on $\mathrm{T}^{*}$ is greater than on T . The resultant of these forces is clearly s pair of forces actiog on the earth in the dircction TM, T'A'. These forces clearly canso a couplo about the axis in the equator, which lies in the same meridian os the inoon and sutimoon. The direction of tho couple is shown by the curved srrows st $\mathrm{L}, \mathrm{L}$ '. If the effecta of this couple loe compounded with the existing rotation of the earth according to the principle of the eyroscope, tho couth pole $S$ tends to approach $M$ sad the north pole to approsch M'. Hence, supposing the moon to more in the ecliptic, the inclination of the earth's axis to the ecliptic diminishes, or the obliquity increases. Next the forces TM, T'M1' clearly produce, as in the simpler case considered above, a couple about the earth's polar asis, which tende to retard tho diurnal rotation.

This gencral explanation remains a fair represcatation of the state of the case ao long as tho differeni barmonic constitucnts of tho aggregate tide-wave do mot suffer rery different smounts of re-
-Thean explanations, together with other remarks, are to be fonnd in the abstracts of Mr G. II. Darwiu's mennolrs in Proc. Roy. Soc., 18.8 to $18 s 1$.
of Wo here sappose tho tides not to bo Inverted If they are inverted the cunclusion is precisely the same.

XXIIL - $4^{8}$
tardation; and this is the csae so long as the viscosity is not grest. The rigorous result for a viscous planet ahows that in general the obliquity will increase, and it sppears that, with small viscosity of the planet, if the period of the satellite be longer than two periods of rotation of the planet, the ohliquity increases, and vice versa. Hence zero obliquity is only dynsmically stable when the period of the eatellite is less than two periods of the planet's rotation.

Suppose the motions of the planet and of its solitary satellite to be referred to the invarisble plane of the system. The axis of resultant moment of momentum is normal to this plana, and the component rotations are that of the planet about its axis of figura and the orbital motion of the planet and catellite round their common centre of inertis; the sxis of this lstter rotation is clearly the pormal to the satellite's orbit. Heace the normal to the orbit, the axis of resultant moment of momentum, snd the planet's axis of rotation must alweys lie in one plane. From this it follows that the orhit and the planet's equator mnst necessarily hava a common node on the invariable plane. If either of the component rotations alters in amonnt or direction, a corresponding change must take place in the other, auch as will kecp the resultant moment of momentum constant in direction and magnitude. It has been shown that the effect of tidal friction is to increase the distance of the satellite from the planet, and to transfer moment of momentum from that of planetary rotation to that of orbitsl motion If, then, the direction of the planet'a axis of rotation does not change, it fullows that the normal to the lunar orbit must approach the axis of resultant moment of momentum. By drawing e eeries of parallelograms on the came diameter and keeping one aide constaut in direction, this may he easily seen to be true. Thia is equivalent to saying thest the inclination of the sstellite's orbit will decrease. But this decrease of inclination does not always nacessarnly take place, for the previous investigations show that another effect of tidal friction may ho to increase the obliquity of the planet's equator to the invariable plane, or, in other words, to increase the inclination of the planet's axis to the axis of resultant moment of momentum. Now, if a parallelogram be drawn with a conatant diameter, it is aeen that by increasing the inclination of one of the sides to the diameter (and even decreasing its length) the in ingation of the other sidp to the diameter may also be increased. The most farourabls case for such a change is when the side whose inclinstion is increased is nearly as long as the diameter. From this it follows that the inclination of the satellite's orbit to the invariable plane may increase, and that it is most likely to increase, when the moment of momentum of planetary rotation is large compared with that of the orbital motion. The analytical solution of the problem agrees with these results, for it showa that if the viscosity of the planet he emall the inclination of the orhit alwaya diminishes, but if the viscosity, be large, and if the satellite moves with a short periodic time (as estimated in rotationa of the planet), the inclinstion of the orbit will increase. These results coavey aome idea of the physical canses which may lave given rise to the present inclination of the lunar orbit to the ecliptic. For the analytical investigation shows that the inclination of the lunar orbit to a certain plane, which replaces the invarishle plane when the solar attraction is introduced, was initially small, that it then increased to a maximum, and that it finally diminished and is atill dimiaishing.

But the lows above referred to would, by themselves, afford a very ansatisfactory explanation of the inclination of the lnnar orbit, beeanse the sun's attraction is a matter of moch importance. It has been found that, if the viscosity of the planet be small, the inclination of the orbit of the solitary satellita to the invariable plane will always diminish; but, when solar influence is introduced, the corresponding etatement is not true with regard to the inclination of the lunar orbit to the proper plame, for during one part of the moon'e bistory the inclination to the proper plane would have increased even if the viscosity of the earth had been small.

Consider a aatellite revolving abont a planet in an elliptic orbit, with a periodic time which is long compared with the period of rotation of the planet; and auppose that frictional tides are raised on the planet. The major axis of the tidal spheroid alwsye points in advance of the satellite, and exercises on it a forcou which tends to accelerate its linear velocity. When the satellite is in perigee the tides are higher, and this disturbing force is greater than when the satellite is in apogee. The disturbing force may therefore be represented as a constant force, slwaya tending to accelerate the motion of the satellite, and as a periodic force which accelerates in perigee and retards in apoges. The constant force causes a secular increase of the satellite's moan distance and a retardation of its mean motion. The accslerating force in perigee canses the satellite to 6 wing out further than it would otherwise have donc, so that when it comes round to apogee it is more remote from the planet. The retarding force in apogee acts exactly inversely, and diminishes the perigean distrnce. Tbus, the apogean distance increases and the perigean distance diminishes, or, in other words, the eccentricity of the orbit increases. Now consider another case, and suppose the satellite's periodic tima to ba identical with that of the planet's rotation.

Then, when the satellita is in perigee, it is moving faster than the planet rotates, and when in spogee it ia moving slower; hence at apogee the thdes lag, and st perigee they are accelerated. Now the lagging spogean tides give rise to au accelerating force on the batellite, and increase the perigean distance, whilst the acceleratod perigean tides give rise to a retarding force, snd decrease the apogean distance. Hence in this case the eccentricity of the orbit will diminish. It follows from these two results that there must he sonse intermediate periodic time of the sstellite for which the eccentricity does not tend to vary.

But the precediug general explanation is in reality somewhat less sstisfactory than it eeems, because it does not make clear the existence of certain antagonistic influences, to which, however, we ahall not refer. The rigorous result, for a viscons planet, shows that in genersl the eccentricity of the orbit will increase; but, if the obliquity of the planet'e equator he nearly $90^{\circ}$, or if the viscosity be so great as to approach perfect rigidity, or if the jeriodic time of the satellite (messured in rotations of the planet) be short, the eccentricity will slowly dtminish. When the viscosity is small the law of variation of eccentricity is very aimple: if eleven periods of the satellite occupy a longer time than elghteen rotstions of the plsnet, the eccentricity increases, nnd vice versa. Hence in the case of small viscosity a circular orbit is only dynamically stable if the eleven periods are ehorter than the eighteen rotations

## X. Cosmooonio Spectlations founded on Tidal Friction.

## § 50. History of the Earth and Mroon.

We shall not attempt to discnss the mathematical methods by which the complete history of a planet, attended by one or more 6atellites, is to he traced. The laws indicated in the preceding sections show that there is such, a problem, and that it may be solved, and we refer to Mr Darwin's papers for details (Phil. Trans., 1879-81). It may be interesting, however, to give the various resulta of the investigation in the form of a sketch of the possible evolution of the earth and noon, followed by remarks on the other planetary systems and on the solar system as a whole.

Wa begin with a planet not very much more than 8000 miles in Conjee - dismeter, and probably partly solid, partly fluid, and partly gaseoua. tural It is rotating about an axis inclined at about $11^{\circ}$ or $12^{\circ}$ to the nor-genesis of mal to the ecliptic, with a period of from two to four houra, and is moon revolving about the sun with a period not much shortcr than onr from present year. The rapidity of the planet's rotation causes so great earth. a compression of ita figure that it camuot continue to exist in an ellipsoidal form with stability; or else it is so nearly. nonstable that complete instability is induced by the solar tides. The planet then separates into two masses, the larger heing the earth and the smaller the moon. It is not attempted to define the mode of separation, or to say whether the moon was initially a chain of meteorites. Lt any rate it must be assumed that the smaller mass became more or less'conglomerated and finally fused into a spheroid, perhaps in. consequence of impacta between its constituent motoorites, which were once part of the primeval planet. Up to this point the bistory is largely speculative, for the conditions of instability of a rotating mass of flid have not yet been fully investigated. We now have the earth and moon nearly in contact with one Earth another, and rotating nearly as though they were parts of one rigid and body.t This is the system which was the subject of dynamical moon investigation. As the two masses are not rigid, the attraction of subject each distorta the other; and, if they do not move rigorously with of inver the same periodic time, each raises a tide in the other. Also the tigatios. sua raises tides in both. In consequence of the frictional resistance to these tidal motions, such a system is dynamically unstsble. If the moon had moved orbitally a little faster then the earth rotated she must have fallen back.into the earth; thus the existence of the moon compels ua to believe that the equilibrium broke down by the moon revolving orbitally a little slower than the earth rotates. In consequence of the tidal friction the periodic times both of the moon (or the month) and of the earth's rotation (or the day) iacrease; but the month increases in length at a much greater rate than the day. At some early stage in the history of the aystem the moon was conglomerated into a spberoidal form, and acquired a rotation about an axis nearly parallel to that of the earth.
The axial rotation of the moon is retarded by the attraction of the earth on the tides raised in the moon, and this retardation takce place at a far greater rate than the similar retardstion of the earth's rotation. As soon as the moon rotates round ber axis with twice the angular velocity with which ohe revolves in her orbit, the position of ber axis of rotstion (parallel witly the earth's axis) becomes dynamically unstable. The ohliquity of the lunar equator to the plane of the orbit increases, attains a maximum, snd then diminishes. Mesowhile the lunar sxial rotation is being reduced towards identity with the orbital motion. Finally, her equator is nearly coincident with the plane of the orbit, and the attraction of the earth on a tide, which degenerates into a permanent ellipticity

1 See criticisms by Mr Nolan, Genesis of Moon, Melbourne, I885; aino Nature 18th Frebuarg 1886.
of the lunar equator, causee ber always to show the same face to the earth.
$r$ sil thie mast have taken place early in tho history of the earth, to which wo now return. As the month increases in length the lowar orbit becomes eccentric, and the eccentricity resches a maximam when the month occupiss about a rotation and a half of the earth. The maximnm of eccentricity is probably not large. After this the cccentricity diminisishes. The piano of the lunar orbit is at first practically identical with the earth'e eqnator, but es tho moon reecdes from the carth the sun's attrection begins to maka itself felt Wo must thercfore introduce the co.rception of two idesl planes (here called tho proper planes), to which the motion of the earth and moon must be referred. The lunar proper plane is at first inclined at a very snall angle to the earth'e proper plane, and the orbit and equator coincide with their respective proper planes. As soon as tho earth rotates with twico the aogular velocity with which the moon revolves in her orbit, \& new instability sets in. The month is then about twelvo of our present hours, and the dsy ebout eix such hours in leugth. The inclinations of the lurar orbit sod of the equator to their respective proper planes increase. That of the lunar orbit to its proper plezie increasss to - maximom of $6^{\circ}$ or $7^{\circ}$, and ever after diminishes, that of the oguator to its proper plano increases to a meximum of about ${ }_{2}{ }^{4} 45^{\prime}$, and ever after dimioishes. The masimam inclination of the lunar orbit to its proper plene takes place when the day is a littlo less than nioo of our present hours, and the month a littlo less than six of our present days. The maximum inclination of the equator to its proper plane tal:es placo carlier than this. Whilst these changes have been foing on the proner planes have boen themselves changing in thcir positions relatively to one another and to tho ccliptic. At first they wcro ncarly cuinciueni with oie snother and with tho earth's equator, but they then open out, and tho inchnation of the lunar propser plano to the ecliptic continually diminishes, whilst that of tho terrestrial proper plane rent:nually iocrcases. At somo stago the earth became more rigid, and oceans wcro formod, so that occanic tidal friction probably came to play a more imporlant part than bocily tidal friction. If this bo the case, tho cccentricity of the orbit, after passing through a stationary phase, begins to increase agaio. We lave now traced the sjstem to a stato in which the dey and modth are incrcasing, but at anequal rates, the inclination of the lunar proper plane to the ecliptic and of the orlit to the propor plana ara diminishing, the inclination of the terrestrial proper plane to the ccliptic is increasing and of tho equator to its proper plane is diminishing, and the eccentricity of the orbit is increasiog. No new phase now aupervence snd at length we have the systerm in its present configuration. The minimum time in whinh the changes from first to last can have taken placo is $54,000,000$ years
There sire other colleteral results which must arise from a supposed primitive viscosity or plasticity of the eartha mass. Foduriog this course of evolution the earth's mass must hava suffered a scre wing motion, so that tho polar regions hava travelled a little from west to east relatively to the equator. This aflords a possible explanation of the north and sonth trend of our great contiosnts. Also $s$ largo amonnt of heat hes been. generated by friction deep down in tho carth; and gomo very small part of the observed increase of temperature in nnderground boriogs may bo attributalile to this canss. The preceding Listory might vary a little in detail according to the degree of viscosity which we attribato to the earth's raas, and according as oceanic tidal friction is or is not, now and in the more receat past, a more powerful causo of change than bodily tidal friction. The argument reposes on the imperfect rigidity of solids and on the internal friction of semi-solide and Guids; these ara nere causse. Thus changes of the kind here disussed must be going on, and must have gone on in tho past. And for this history of the earth and moon to bo true throughout, it is only necessary to postulate a sufficient lepse of time, and that there is not enough matter diffused through space to materially resist the motions of the moon and earth in perh 3 s $200,000,000$ years. It eesms hardly too mach to say that, granting theso two postulates, and tho existence of a primevel' planet, such ns that above described, a system would nccessarily ha devoloped which would bear astrong resemblance to our owna. A theory, reposing on reres causw, which brings into quantitative correlation tho leog ths of tho present day and month, the obliquity of the eeliptic, and the incl!ination and eccentricity of the loazar orbit should have claims to acceptance.

## § 51. The Other Planelary Suborstems.

If this has been the erolution of the earth and moon, a simuar process must have beea roieg on elsewhere. So far we havo only considered a single satelite and the suo, but the theory may of courso bo extended, with modifications, to plonets attended by several satellites. We will now, thereforo, consider some of tho other members of tho solar system. A largo planet has mach more energy of rotation to bo destroyed, und moment of mormentum to bo redistributed, than a small ono, and thercforo a largo planet ought to aroceod in its evolution moro slowly then is omall one.

Therefore wo ought to find tho larger plenets less sdvanced than the smaller ones. The masses of such of the planets as havo satellites are, in terms of the earth's mass, as follows :- Marse $\frac{1}{7}$; Jupiter $=340 ;$ Satur $=100:$ Uranus $\sim 17$; Neptupe $=20$.
Mars ahould therefore be furthest advanced in its e rolution, and it is here alone in tho wholo syster that we find a satellite moring orbitally faster than tho planet rotates. This will also be the ultimate fato of cur moon, because, after its orbital motion has been redoced to identity with that of the cartli's rotation, solar tidal friction will further reduce the earth's angular velocity; tho tidal reaction on tho meon will then be reversed, and the moon's orhital velocity will iocrease and her distance from the earth diminish. But, since tha moon's mass is very large, she mast recedo to an enorinous distaces from the earth befora this reversal takes placa. Now the estollites of Mars ara very small, and thereforo they need only recede a very short distanco from the planet befiore the reversal of tidal reaction. The periodic time of tho satcllito Deimos is $30^{\mathrm{b}} 18 \mathrm{~m}$, and, as the period of rotation of Mars is $24^{\mathrm{b}} 37 \mathrm{~m}$, Deimos must be still recediog from Mars, bat very slowly. The periodic time of the gatellita l'hobos is 7 7 39 mm ; therefore it must be approaching Mars. It does not seern ninely that it has ever been remote from the planct. ${ }^{1}$ The eccentricities of tho orbits of both satellitee are small: that of Deimos is 0057 and that of Phobos .0066. If tho viscosity of the planet be small, or if occanic tidal friction be the principal cansa of change, both eccentricities are diminishing; but, if the viscosity bo large, both a-八 increasing. As wo have no means of knowing whether tho occentricities aro increasing or diminishing, the larger eccentricity of tho orbit of Plobos cannot be a fact of much impertance either for or against the present viows. But it nust be sadmitted that it io 5 slightly unfavouralle indication. The position of the proper plano of a satcllite is determined by the periodic time of the satellite, the oblatenass of the planet, and the sun's distance. The inclination of the orbit of a estellite to the proper plano is not determined by anything in toe gysten. Heace it is only the inclination of the orbit which can affor any argument for or ogaiost the thesiz. Tho proper planes ,f both satcllitea are necessarily yenrly coincident with the equatior of the planet; bat it is in aicordace with the theory that tho inclioations of the orbits to their respective proper planes should bo small. Any change in the obliquity of the equator of دlars to the plane of his orbit must be eatirely due to soler tides. The present oblignity is sbout $30^{\circ}$, and this points also to au advanced stage of evolution, at least if the axis of tho planet was primitively at all nearly perpendicular to the ecliptic.

We now come to the syatem of Jupiter. This enormens planet is still rotating in about ten hoors; its axis is nearly perpendicular to the ecliptic; and three of its eatellites revolva io screan days or less, whilst tha foarth has a period of $16^{\mathrm{d}} 16^{\mathrm{h}}$. This systsm is obviously far less adranced than our own. Tha igelinations of the proper planes to Jupiter's equator are necessarily small, bot the inclinations of the orbits to the proper planes appear to bs very interesting from a theoretical point of view. They are in the caso of the frrst aatellite $0^{\circ} 0^{\prime} 0^{\prime \prime}$, in the caso of the second $0^{\circ} 27^{\prime} 50^{\circ}$, in that of the third $0^{\circ} 12^{\prime} 20^{\prime \prime}$, and in that of the fourth $0^{\circ} 14^{\prime} \mathrm{E} 8^{\prime \prime}$. Wo have shown abore that the orhit of a satellito is first coincident with its proper plane, and that the inclination afterwards rises to a maximum and fidally declioes. If then wa may assume, as seems reasooable, that the satellites are in stages of evolution correspooding to their distances from tho plauct, theso in. $\%$; ${ }^{2}$ ationa accord well with the theory. The eccentricities of tha orbits of the two inner satelifites are insensible, those of the outer two amnll This doca not tell strongly pither for or agziost the theory, because the history of the eccentricity depends considerably on the nature of the friction to which the tides are subject. Yet it on the whole agrees witl the theory that the ecceatricity abould be greater in the more remote satellites. It appears that the satellites of Jupiter almaya present tho same facs to the plapet, just as does our moon. This was to be expected.
Tho case of Saturn is not altogether so farourable to the theory. The extremely rafid rotation, the ring, and the allort periodic tine of the inner satellites point to an early atoge of developoent; whilst the longer periodic time of the three outer satellites and the high obliquity of the equator indicato a later stage. Perhaps Loth ricwa may he more or less correct, for successive ohedding of salellites would impart a modern appearance to tho gystem. It has probably beea praviously remarbed that the Saturnian system bears a strong analogy to the golar system, Titan being analogous to Jupiter, Hyperion and Iapetus to Uranas and Neptune, and the inaer satalhites to the ioner plancts. Thusanything which aids us io forming a theory of the ono gystem will throw light on the other. The details of tho Saturnian aystem seem to bo more or less favourablo to the theory. The proper planes of the orbits (except that of lapetus) are noarly in the plane of tha ring, and tho iacliaations of all the orbits iereto appear not to ho large. As the result of a Mr Nolan compiders thatheory inapplicable to the caso of Mara ; soe Nafurce $29 t h \mathrm{Julj} 1580$

B carefal series of obsarvations made at Washagton in 1873 , Prof. Assph Hall ${ }^{1}$ finds that the eccentricities of the orbits of Mimas, Encaladus, Tethys, Dione, and Rhea are insensible, that of Titan is ${ }^{\circ} 0284$, of Hyperiod $\cdot 1000$, and that of Iapetus $\cdot 0278$. The satellite lapetas appears always to present the same face to the planet. Concerning Uranus and Neptune there is not nuch to he said, as their systems are very littla known; but their masses are much larger than that of the earth, and their satellites revolve with a short periodic time The retrograde motion and high inclination of the satellites of Uranus ara very ramarkahle. The theory of tha inclination of the orbit has been based on an assumed smallness of inclination, and it is net very easy to sea to what results investigatior might lead if the inclination were large. It must be admitted, hewever, that the Uramian system points to the probability of the existence of a primitive planet, with ratrograde rotation, or at least with a very large obliquity of equator.
It appears from this review that tha other members of the selar system present some phenemena which are strikingly favourabla to the tidal theory of evolution, and nona which are absolutely condemnatery. We shall show in the following section that there ara reasons why the tidal friction arising in the planetary systems cannot hava had so much effect as in the casa of ths earth and moon. That the indications which we hare just noted were not more marked, but jet seemed to exist, agrees well with this concluaion.
§52. Influence of Tidal Friction on the Evolution of the Sola. System.
According to tha nebular hypothesis, the planets and the satellites are pertions detached from contracting nebulous masses. In the following discussion that hypethesis will ba accepted in its main cutlina, and we shall examine what modifications are necessitatad by the influence of tidal friction. It may be shown that the reaction of the tides raised iu tha sun by the planats must have had a very small influence in changing the dimensiens of the planetary orbits round the sun. Frem a censideration of mumarical data with regard to the solar system and the planetary subsystems, it appears improbabla that the planetary orbits hare been reasibly enlarged by tidal friction since tha origin of the saveral planets. But it is possible that seme very small part of tha eccentricitias of the planetary orbits is dus to this cause. From arguments similar to those advanced with regard to the selar system as a whole, it appears unlikely that the satellites of Mars, Jupiter, and Saturn originated very much nearer tha present surfaces of the planets than wa now obserre them. But, tha data being insufficient, wa cannot feel sure that the alteration in tha dimensions of the orbits of these satellites has not been considerable. It remains, however, nearly certain that they cannot hare first originated almest in contact with the present surfaces of the planets, in the same way as in the preceding sketch ( $\$ 50$ ) has been ahown to ba probahla with regard to the moon and earth. Numerical data concarning the distribution of moment of momentum in tha aeveral planetary aub-systems cxhibit so striking a differenca betreen tha terrestrial system and those of tha other planets that wa ahould from this alone hare grocnds for beliaving that tha modes of evolution have bean considerably different. The differenca appears to lie in the genesis of the moon close to the present surface of the planet, and wa slall sea below that solar tidal friction may he asoigned as a reason to axplain how it has happaned that the terrestrial planet had contracted to nearly its present dimensions befere tha genesis of a satellite; but that this was not tha casa with the exterior planets. The efficiency of solar tidel friction is very much greater in its action on the nearer planets than on the further ones. Tha time, howaver, during which solar tidal friction has been pperatiog on the external planets is probably much longer than the peried of its efficiancy for tha interior ones, and a serias of numbers proportional to the total amount of rotation destroyed in the several planets would present a far lass rapid decreasa as ma receda from the sun than numbers simp'y expressive of the efficiency of tidal friction at the several planets. Navertheless it must be admitted that the effect produced by solar tidal friction on Jupiter and Saturn bas not been nearly so great as on the interior planets. And, as already stated, it is very improbabla that so large an amount of momentum should have heen destroyed as to materially affect the orbits of the planets round the sun.

We will now examina how the differences of distance frem the sun would ba likely to affact the histories of the several planetary masses. According to the nebular hypothesis, a planetary nebula contracts, and rotates quicker as it contracts. The rapidity of the revolution causes it to hecoma unstabla, or perhaps an equatorial belt gradually detaches itsalf; it is immaterial which of these.two seally takes place. In either case the separation of that part of the mass which before the changa had tha greatest angular momentum permits the central portien to resuma a planetary shapa. Tha contraciou and the increase of rotation proceed continually until another nortion is detached. and so on. There this recur at interrals a series of epechs of instabinty or of abnormal changa. Now
tidal friction most diminish the rate of inerease of sotation due te contraction, and therefore if tidal friction and contraction are at work tegethar the epochs of inatability must racur more rarely than if contraction alons acted. If the tidal retardation ia suffo ciently great, the increase of retation due to centraction will be SC far countaracted as never to permit an ejoch of instability to occur. Since the rate of retardation due to solar tidal friction decreases rapidly as we recele from the sun, these considerstions accerd witb What we observe in the solar gretem. For Mercury and Venus have no satellites, and there is a progressive increase in the number of satellites as me recede from the sun. Moreover, the number of satellites is not directly connected with the mass of the planet, for Venus has nearly the aana mass as the earth and has no satellite, and the earth has relatively by far the largest satellite of tha whole system. Whether this be the trua causa of the obsarved distribution of astellites amorgst the planets or not, it is remarkabla that the aame canze alse afferds an explanation, as we shall now show, of that diffarence between the earth with the moon and tha, other plauets with their satellites rhich has caused tidal friction to be the priacipal agent of change with the fermer but not with the latter. In tl.s caso of tha coatracting terrestrial mass wa may suppose that there was for a lang time nearly a balauca batween tha retardation due to selar tidal friction and tha acceleration due to cortraction, and that it was net until the plagetary mass had contracted to nearly its present dimensions that an epoch of instability could occur. It may also be noted that if thera be two equal planotary masses which generate satellites, but under very different conditions as to the degres of condensation of the masses, the two satellites will be likely to differ in mase; we cannet of course tell which of the two planets would generata the larger satellite. Thus, if tha genesis of, the moou was deferred until a late epoch in the histery of the terrestrial mass, the mase of the zeon relativaly to the earth moald ba likely to differ from the mass of other satellites relatively to their planets. If tha contraction of the planetary mass he almost complated befors tha genesis of the satellite, tidal friction, due jointly to the satellite and to the cun, will thereafter ho the great cause ef change in the system; and thus the bypothesis that it is the sole cause of change will giva an approximately accurate explanation of tha motion of tha planet and satellite at any aubsequent time. We have already seen that the theory that tidal friction has been the ruling power in the evolution of the earth and moon coordinates the present motions of the two bodies and carries us back to an initial state When the moon first had a separate existence as a satellite; and the initial configuration of the two hedies is such that we are led to bclieve that tha moon is a portion of the primitira earth detached by rapid rotation or other causes. There seems to be some reason to suppose that the earljest form in which the moen had a separate existence ras as a ring or chaiu of meteorites; but this condition precedes that to which the dymamical inrestigation leads back.
Lat us now furn to the other planetary sub-systems. Tha satellites of tha larger planets revolre with short periodic times; this admits of a simpla explanation, for the sinallness of their masses would have prevented tidal friction from being a very efficient causa of change in the dimencions of their orbits, and tha largeness of the planet's masses would have caused them to proceed slowly in their ovolution. If the planets be formed from chains of meteorites or of nebulous matter, their rotation has arisen from the excess of orbital momantum of the exterior over that of the interior matter. As $\pi$ ra hava no means of knowing how broad the chain may hava heen in any casa, nor hom much it may have clesed in on the sun in coursa of concentration, we ara unabla to computa the primitive angular moraentum of a planet. A rigoreus methou of comparison of the primitive rotations of the several planets is thus wanting. we should expect to find wera formed under similar conditions, then rapidly than the interior ones. On making allowance for the mora ent degrees of concentration of tha planets, this is the cass differtha inner satellita of Mars ravolves with a period third of the planet's rotation is perhaps the most remarkable fact in tha solar eystem. The theory of tidal friction explains this perfectly ; and this will be the ultimate fate of all satellites, because the solar tidal friction retaris the planetary ratation rithont directly affecting the satellite's orbital motion. Numerical comparison shows that the efficiency of solar tidal friction in retarding the terrestrial and martian rotations is of about the same degrea of importance, notwithstanding the much greater distance of the planet Mars. In tha abova discussion it will have been apparent that the earth and moon de actually differ from the other planets to such an extent as to permit tidal friction to have been the most impertant factor in their history.

By an examination of the prohable effects of selar tidal friction onl $\%$ contracting planetary mass, we hava been led to assign a causa for tha observed distribution of satellites in tha solar system, and this again has itself aforded an explanation of how it happened tides in moon so originated that the tidal friction of the lunar tides in the earth should have been abla to exerciss 60 larga ar
infnence. Wo have enceavoured not only to sot forth the in Guence which tidal friction may have, and probably has, had in che history of the ejatem, if sufficient timo be granted, but also to point out what effects it cannot have produced. These investigationa afford no grounds for the rejection of tha nabular hypothess; but, while they present evidence in favour of the main outlines of that theory, thay introduce modifications of considerable importance. Tidal friction is a cause of change of which Laplaces a theory trok no account; and, although the activity of that causo may bo regarded as mainly helonging to a later period than the ovents described in the nabular hypothesis, yet it seems that its influence has beeu of great, and in one instance of oven
paramount importance in determining the present condition of thè planote and thoir satollites. Throughout the whole of this discussion it has been supposed that sufficient time is at our disposal ; Sir W. Thomson and others have, howover, aduuced reasoning which goes to show that the history of the solar ayetem muat be comprised within a period considerably less than a hundred million years ${ }^{1}$ It would porhaps be pramaturo to accept this as the final and definite conclusion of aclanco. If, however, it be confrmed, wa aball only be permitted to accept the doctrine that tidal friction has effected considerable modification in the configuration of the moon and earth, and must reject the carlier portion of the history aketched above.
(G. H. D.)

## Table of Contents.

Ceap. 1.-On the Nature op Tides.
s I Defintion of tids.
${ }_{8}^{2} 2$. General deacription of tidel pheno mens
13. General sxplanation of the cause . of tides.
34. Historical akstch.

Calp. II.-Tide.Generatno Forcte
85. Investigation of tids-generating potential and forces.
88. Derelopment of tide-gancrating potential in terms of hoar-angla and declination.
8 \& E Ealoationof tide-generating forces sud lunar deflexion of gravity.
0. Correction to equillbrium theory for continents.
Ceap. ILL-Drnamical Theory of Twes.
810. Historical explanation.
811. Eqnations of motion.
${ }_{8}$ 12. Adaptation to forced oaclllations.
113. Preparstion for solftion.
814. Diurnal tide.

Cuar. V.-Sfintaetio Methoo.
28. On the method and notation. 829. Semi-diarmal tidea.
§ $\$ 0$. Syntheaia of aolar and of Janar portions of the semf-diumal tide.
3 Sl. Syntheals of lanar sod aolar asmsdiurnal tides.
89. Explenation of tudsl terms in common use; datum lavela.
34. On rednction of observstions of high and low water.
Cenf. Vi.-Tmal. Instroments and Tidal Prediction.
35. Gemeral remarks
§ 56 . The tide gange.
87. Tha harmonic analyaer.

SS. Tha tide-predicting instrameato
89. Numerical harmonic analyals snd prediction.
Cgap. VIL. - Prooress of the Tide Wave over the sea and the
Tioes of tee britise seas.

8 41. Cotldal Hinea of the world. 842. Cotidal linea of the Britiah seas

Chap. Vill.-Tidal Deformation op the solid. Earte.
84. Elaatic tides.
84. Rigidity of the earth.
45. Viscous and elastico-Tiscous tidea.
Chap. IX.-Tidal Friction.
86. Oeneral explanatlon.
84. Exact laveatigation of the secular effocta of tidal friction.
848. Amount of tidal retariation of earth'a rotation.
840. Effecta of tidsl mition on the elements of the moon's orblb and on the earth's rotation.
Cgap. X.-Cobudaonio Spectlatione rounded on Tidal Feictiox.
850. Hlatory of the earth and moon. 8 51. The other plsuetary sub-syatems. 852. Infigenca of tidsl friction on the svolution of the solar aystem.

TIDOR, or Tmore, an island $\left(0^{\circ} 39^{\prime} \mathrm{N}\right.$, lat. and $127^{\circ}$ $23^{\prime}$ E. long.) of the East Indian Archipelago, off the west coast of Jilolo (q.v.) and south of Ternate, is nearly circular in form, and has an area of about 58 square miles. A volcano ( 5900 feet), now quiescent, rises in the centre and occupies nearly the whole of the island; its sides are densely covered with forests. The principal productions are sago, rice, cocoa-nuts, and bananas. The capital, Tidor, on the east coast, is a walled town ar, d the seat of a sultan tributary to the Dutch. The population is estimated at 7500. Tidor, which is included in the residency of Ternate, is administered by a "controleur."
TIECK, LODwIG (1773-1853), the most conspicnous figure of the German romantic school of literature, was born at Berlin on 31st May 1773. His father, a ropemaker, was dry, sarcastic, and matter-of-fact; his mother, gentle and pious, with a leaning to mysticism. Tieck partook of both characteristics: half his work and half his genius seem a sceptical commentary on the other half. He cmancipated himself from the prosaic influence of his father's house by a passionate study of Shakespeare. After a brilliant career at school he repaired in 1792 to the university at Halle, and, returning to Berlin in 1794, devoted himself to authorship, in which he had already made experiments. As is so commonly the caso with young writers of genius, his first tales (Abdallah, William Lovell) partook too largely of the melodramatic, and have little permanent value. But the romantic school of Germany, a movement comparable to the Lake school of England, was already in the air, and Tieck was deeply sensitive to its influence. He was strongly fascinated by two of its aspects in particular-the reaction in favour of German medixval art and the revived interest in fairy tales and folk-lore in general. Inspired by his friend Wackenroder, a youth of pions ardour and most pious simplicity, ho wrote his unfortunately unfinished romance Sternbald's Travels, a rers gospel for the artist, at once the complement and the antitype of Wilhelm Meister. His studies in pepular literature resulted in the entertaining adaptation
of Blue Beard entitled Peter Leorecht and several kindred works. Fair Eckbert, his masterpiece, and the masterpiece of all romantic fiction, came to him, he said, by inspiration. He may well be believed: no artifice could have crcated the pervading sensation of dreamy solitude or the intense thrill of the catastrophe. The happy idea of dramatizing popular legend led to the production of a greatly improved Blue Beard, and subsequently of Puss in Boots, a satire on Kotzebue and Iffland, such an alliance of broad bumour and dainty irony as we might expect to find in the lost Middle Comedy of Athens.

It might almost have been better if Tieck had continued to walk in his own way. His was a susceptible nature, too sensitive for perfect independence. In 1798 ho mado the acquaintance of the Schlegels, and was drewn in to their circle. Novalis, undoubtedly the greatest genius of the romantic school, was for a time a compensation to him for the death of Wackenroder, whose essays on art he edited with additions of his own. But Novalis himself soon died, and the intuence of the Schlegel circle, with its bickerings and its "chopping and changing of ribs," was not wholly salutary either in a moral or a literary point of view. August Schlegel inspired Ticck with a passion for the Spanish drama. He also spent much time on a translation of Don Quixote, certainly a masterpiece, and rendered Ben Jonson's Silent IToman, having previously adapted Volpore. One important production of his own nevertheless belongs to this period, the romantic drama of Genoveva, enthusiastically admired by so clear-headed and impartial a judgo as Bishop Thirlwall. He also produced his delightful miniature drama of Little Red Riaing Hood, and was working with great spirit on The Emperor Octavian when ho was suddenly attacked by rheumatic gout, which tormented him more or less for the remainder of his life. Betreen pain and unpleasant literary disputes his activity was long greatly impeded. The narrowness of his means also troubled him. "He had married the
${ }^{3}$ Thozoson and Tait's Nat. Phil., App. E ; Noture, 27th Janasy 1887; Wolf, Theorics Cosmogoniques, 1886.
danghter of Pastor Alberti, and, although he was an amiable man and nothing is alleged against his wife, his bousehold does not seem to have been entirely comfortable. He lived alternately in Jena, Berlin, and Dresden, where he became very intimate with Steffens, and wrote his powerful but dismal tale, The Runenberg. The Emperor Octarian was completed in 1804 , with less success than had been hoped. In the following year Tieck repaired to Italy, nominally to visit the baths of Pisa; but he made this medical injunction the plea for a long stay in the country. The effect of Italian scenery, plastic art, and new impressions in general was to wean him from much of the mysticism in which be had hitherto indulged, and to direct him to the criticism of life. The transition to his new manner is indicated by the additions to his former tales and dramas, which, after several years spent in wandering and in sickness, he published in 1812. The Elves, The Philtre, and The Goblet are tales, distinguished, the last two more especially, by brilliant colouring and elaborate art. Fortunatus, a drama in two parts, added in 1816, wants the spirit of its predecessors, but is pervaded by a quiet sarcastic humour exceedingly enjoyable. Plays and stories were set in a framework of æsthetic conversation, and the entire collection was entitled Phantasus. By this publication Tieck settled accounts with the romantic school, and could no more be regarded as its leader.
Tieck's power of original composition failed him for some years. He devoted himself especially to antiquarian and dramatic studies. In pursuance of the latter he visited England, saw Kemble and Kean on the stage, and renewed acquaintance with Coleridge, whom he had known in Italy': The friendship of Solger was highly important to him, and helped him to the clear definite principles of composition and criticism in which he had proviously been deficient. The period of reflexion gradually worked itself into a period of productiveness, beginning with his charming novelette of The Pictures, translated by Thirlwall. It was followed by a series of similar works extending over nearly twenty years, very unequal in value, but in their best examples belonging to a very high class of art. Their great peculiarity is the blending of narrative with disquisition and comment, so thoughtful and ingenious that, interesting as the action commonly is, the interruption is not resented. They have usually a strongly marked ironical element, as though the writer were only half in earnest, a self-criticism of which a great creative genius would have been incapable, but which bestows unusual piquancy on productions of the second order. The Pictures, already mentioned, is a fine instance of the masterly conduct of a story, and contains a very original figure, the shrewd, sottish, graceless old painter Eulenböck, who, with talent enough to have made a name and a fortune, gains a precarious livelihood by forging old masters. The Betrothal, also translated by Thirlwall, is a severe satire on hypocritical pietism. Among the best of the other novelettes in this style may be mentioned The Travellers, one of the most perfect specimens of the author's irony; Luck brings Brains, a fine study of the power of a weak character to rise to its opportunities when elevated by a sense of responsibility; and The Superfuities of Life, an anecdote delightfully told. The Old Book and The Scarecrow, two of the most fantastically imaginative, resolve themselves into literary satire. The motive of the latter was borrowed by Hawthorne in his Mother Rigby's Pipe. Of fictions with an historical basis, the most popular are those derived from the lives of poets-A Poet's Life, of which Shakespeare is the hero, and A Poet's Death, relating the sad history of Camoens. The Revolt in the Cevennes is an historical romance of considerable compass; but Tieck's musterpiece in this department is his Witches' Sabbath, a
tale almost unparalleled in literature for its delineation of heart-breaking, hopeless misery. The Young Carpenter (1836, but commenced much earlier) can hardly be as signed to any of these classes. It has a strong affinity to Wilhelm Meister, and may be compared with Sternbald, both for its resemblance and its contrast. Finally, in Vittoria Accorambona (1840) Tieck takes yet another new departure, indicating affinities with the modern French school of fiction. The novel has been translated into English, but is probably best known to English readers by Mrs Carlyle's half-earnest half-mocking admiration of the hero Bracciano, a Blue Beard on the highest principles, and her wish that she could have lived two hundred years before, "to have been-his mistress, not his wife."

These novels were all written at Dresden, where Tieck had settled in 1819. He enjoyed especial favour at court, took an active part in the direction of the royal theatre, and gained a new description of celebrity by his semipublic readings from dramatic poets in the court circle. According to the almost unanimous testimony of his hearers, he was the finest dramatic reader of his age. His daughter Dorothea, who united her father's literary talent to her grandmother's mystic piety, was of great assistance to him, especially in the translation of Shakespeare which passes under his name. Schlegel had translated seventeen plays. Tieck had undertaken to translate the remainder, and it has been generally supposed that be kept his word. In fact the translation was almost entirely executed by Dorothea Tieck and Count Wolf Baudissin, Tieck contributing hardly anything but his advice and his name. The truth slips out -quite innocently in the pages of his biographer Köpke, and is fully told by Gustav Freytag (Im Neuen Reich, January 1880). During his residence at Dresden he collected his critical writings, produced his excellent translation of the English' dramatists anterior to Shakespeare, and edited the works of Novalis, Kleist, Lenz, and other contemporaries. In 1842 he accepted the invitation of Frederick William IV. to settle in Berlin, where he had already been to conduct the representation of the Antigone with Mendelssohn's music. He found himself but little in his element in the city of his birth, and the dramatic representations directed by him, including revivals of some of his own plays, were rarely successful. In 1851 his health failed entirely, and he withdrew altogether from the world. He died on 28th April 1853.

Though not a writer of the highest rank, Tieck is nevertheless a most original genius, very unjustly neglected by his countrymen. The best of his compositions in the taste of the romsntic school are absolute masterpieces; and his later productions, if imperfect, occupy a unique position in literature. He may be compared to Wieland, whom he decidedly surpasses, and to Ariosto, whom he would have more than rivalled if he had been capable of a great sustained effort. His eusceptibility and self-distrust checked his genius, but at the same time gave it that peculiar ironic flavour which constitutes its special distinction. $\mathrm{H}_{\theta}$ is like an exquisite side dish, not sufficiently substantisl for a full meal. The attempte to extract a moral sigoificance from the stories in Phantasus seeni entirely thrown away; the purpose ol his later writings, when there is any, is always definite. Perhaps the soundast criticism upon him, at hottom, is Heine's in his Fomantic School, though written at a time when it was his cue to ehow the works of that echool as little quarter as possible. Carlyle's criticism is excellent. but ooly refers to the Phantasus.

The pridcipal contribution to Tieck's biography is the delightful book of Rudolf Köpke (Leipsic, 1855), chiefly drawn from his oral communications and containinghis opinions on a number of subjects. Particulars of his residence at Dresden, more especially of his connexion with the theatre, are given in the memoirs of Friescn (Weimer, 1871). Tales from Phantasus havo been translated in Carlyle's Specimens of German Romance, and are reprinted in his miscellanies. A greatly inferior version, ius some places unscrupulously altered from Carlyle, was published in 1845 with au elaborate preface signed by J. A. F., who does not, however, appear to havo been the translator Several of Tieck's other works have been translated into English, but the only remarkable rendering is Bishop Thirlwall's of The Pictures and The Betrothal. A com-
pleta chronological hast of his mritiogs is apponded to Eöpkc's work.
(R. G.)

TIEDEMANN, Friedrich (1781-1861), German anstomist and physiologist, the son of a philosopher and psychologist of considerable repute, was born at Cassel on 23d August 1781. He graduated in medicine at Marburg in 1804 , but $800 n$ abandoned practice owing to disappointment st his failure to check his father's last illsess. Repelled. on the one hand by tise brilliant but unsubstantial discourses of Schelling on the "Naturphilosophie," and attracted on the other hand by the practical skill and inteligence of the surgical snatomist Sommering, he returned to the -study of natural science. He betook himself to Peris, and became an ardent follower of Ccvier. On his return to Germany he maintained the claims of patient ad sober anatomical research against the prevalent specu. lations of the school of Oken (see Oeen and Morphology), whose foremost antagonist he was long reckoned. His manifold labours in the field of Cuvierian anatomy cannot Se recorded here; but his remarkable studies of the development of the human brain, es correlated with his father's studies on the development of intelligence, maj be mentioned. He spent most of his life (from 1816) as professor of anatomy and physiology at Heidelberg, and died at Munich on 22d January 1861.

TIENTSIN is the largest commercial city in Chih-li, the metropolitan province of China. It is situated in $39^{\circ} 7^{\circ}$ N. lat. and $117^{\circ} 11^{\prime}$ E. long., at the junction of the Peiho and the Wan-ho, which is connected by the Grand Cadal with the Yang-tsze-kiang. It is a prefectural city, and the residence of the viceroy of the province during a great pertion of the year. The town is buiit on a vast slluvial plain, which extends from the mountains beyond Peking to the sea, and through which the Peiho runs a circuitous course, making the distance by water from T'ientsin to the coast about 70 miles, as against 35 miles by road. The soil of the surrounding country being strongly impreguated with sods and nitre is not fertile, but produces sorghum and other coarse grains. The city walls are well built, though not always kept in good order, and measure about three quarters of a mile each way. As in all Chinese cities, the more wealthy inhabitants live in the suburbs, but even their houses have a mean appearance, being built mainly of mud or dried bricks. The streets are for the most part unpaved, and in wet weather are little better than quagmires. Some improvements have, however, been made in this respect of late. The city has always been a great commercial depôt. In 1885 the foreign imports amounted to $£ 3,226,972$ and the exports to $£ 980,852$, and 375 foreign vessels of 279,829 tons visited the port, tes to the value of about $£ 904,496$ being landed for carriage overland, via Kalgan and Kiachta, to Siberia. During the winter the river is frozen, so that communication has to be carried on overland to Chin-kiang on the Yang-tsze-kiang, to which point slso a line of telegraph (now extended to Peking) was opened in 1881. The principal articles of import are shirtings, drills, T-cloths, jeans and twills, opium, woollens, steel, lead, needles, Japanese sea-weed, and sugar; sad of export, skins, beans and pease, straw braid, coal, detes, wool, tobacco, and rhubarb. The coal exported is brought from the Kaiping colliery to the east of T'ientsin ; its output in 1885 was 181,039 tons, 54,976 tons more than in 1884. An experimental railway nearly two miles long has lately been constructed at T"ientsin.

In 1853 T"ientsin was hesieged by an army of Taiping rebels, which had been detached from the main force at Nauking for the capture of Pcking. Ths defences of T'ientsin, however, saved tho capital, and the rebels were forced to retreat. Fiva years later Lord Elgio, accorp panied by the representative of France, steamed up the Peiho, after having forced the barriers at Takn, and took peaceabla
possession of tha tomn. Ilcre the traty of 1858 was signed. Two ycars later, in consequenca of tha treacheroua attack mada on the Engirsh pleapotentiary tha procediug gear at Taku, the city and suburbs wara occupied by an allied English and Freach forco, and wero beld for two yeara. Tha city was constituted aa opea fort. On the astablishmont of Roman Catholic orphanages soms yoars later the pretensions of the priests eo irritated the people that on the occurrence of an enideruic io the achools they attacked tha French and Kussian establishments and murdered tweaty of tha foreign inmates, besides numbers of their nativo followers. The Chiuesa Goreramont at once suppressed the riot, and sent a reprasedtative to Europo to apologize for the outbreak.

TIERNEY, Georoe (1761-1830), an English Whig politician, was born et Gibraltar on 20th March 1761 , being the son of a wealthy merchant resident in Spain. Ho was sent to Peternuase, Cambridge, where he took the degree of LL.D. in 1:E4, and was called to tho bar; but, having inherited an ample fortune, he sbandoned law and plunged into politics. Ee contested Colchester in 1788 , when both candidates received tho aamo number of votes, but Tierney was declared elected. Ilo was, however, dofeated in 1790. He sat for Southwark from 1796 to 1806, and then represented in turn Athtone (1806.7), Bandon (1807-12), Appleby (1812-18), and Knaresborough (181830). When Fox seceded from the House of Commons, Tierney becamo a prominent, if not the leading, opponent of Pitt's policy. It was perbaps for this reason that ho was disliked by Fox. In 1797-such was the height of political passion at this epoch-Wilberforce noted in his diary that Tierney's conduct was "truly Jacobinical"; and in May 1798 Pitt accused him of mant of patriotism. As the words were not withdrawn, a duel ensued at Putney Heath on Sunday, 27th May 1798; but neither combatant was injured. In 1803 Tierney, partly through gratitudo for the peace which had been ratified with France and partly because Pitt wes out of office, joined the ministry of Addington as treasurer of the navy, and was created a privy councillor; but this ill-advised step alienated many of his supporters among the middle classes, and offended most of the influential Whige. On the death of Fox he joined (1806) the Grenville ministry as president of the board of control, with a seat in the cabiuet, and thus brought himself once more into line with the Whigs After the death of Ponsonby in 1817 Tierney became the recognized leader of the opposition in the House of Commons. In the neutral ministry of Canning, the place of master of the mint was held by him, and when Lord Goderich succeeded to the lead Tierney was admitted to the cabinet; but he was already suffering from ill-health and took little part in its deliberations. He died suddenly at Savile Row, London, on 25 th January 1830.
Tierney was a ehrewd man nf tho world, with a natural aptitudo for business. His powers of sarcasm wera a causo of terror to his adversaries, and his presence in debate was much dreaded. His arguments wera felicitous, and, though he nover aimed at tha high. est flights of eloquence, his choice of language was the thema of constant admiration. Lord Lytton, in his peem of St Stephen'a, alludes to "Tierney'a airy tread," and yraises his "light anci yet vigorous " attack, in which he inflicted, "with a placid smails," a fatal wound on his opponent.

TIERRA DEL FUEGO, B large archipelago at the southern extremity of South America, from which it is separated by Magelian Strait, at the Narrows and other points scarcely a mile wide. The group. lies hetween $52^{\circ} 40^{\circ}$ and $55^{\circ} 59^{\prime} \mathrm{S}$. lat. and $63^{\circ} 30^{\circ}$ and $74^{\circ} 35^{\wedge} \mathrm{W}$. long. stretching nearly in a line with the Patagonian Andes for over 400 miles north-west and south-east, between Capes Pillar and Horn,-and for about 270 miles west and east from Cape Pillar to Cape Espiritu Santo (Catherine Point) in the north; southwards it tapers to 120 miles between Capes Horn and St Diego, the latter being continued castwards to Staten Islend, phich is not usually included in the group. Although on ordinary maps this region proseats to the eve a hopelessly confused aggregato of islands,
channels, and fjord-like inlets, as if it had been submerged sufficiently to convert its deep valleys and gorges into

Map of Tierra del Fuego.
marine passages, bays, and bights, it is nevertheless clearly disposed in three main sections, which may be convenient!ly named East, West, and South Fuegia.
East Fuegia consists of the single island of King Charles's South Land (eastern Tierra del Fuego), which is very much larger than all the rest of the group together, being considerably over 200 .miles long from north to south. It obviously forms a southern extension of the Patagonian pampas, which it greatly resembles in its physical constitution, climate, flora, and fauna. The lowJying, flat or slightly rolling plains are covered with a rich growth of tall herbage, which is frequented by the rhea, guanaco, and other animals common to the adjoining mainland, and also peopled by a branch of the same Tehuelche (Patagonian) family. In the south a long peninsula projects westwards to the Pacific. This western limb assumes a mountainous character, Mount Darwin ( 6800 feet) being situated about midway on its south side and Mount Sarmiento (6900, or perhaps 7000 feet), the culminating point of the archipelago, much nearer the Pacific. Although generally supposed to be volcanic, this peak presents such extremely precipitous, in fact, almost vertical flanks that John Ball considers it more probably "a portion of the original rock skeleton that formed the axis of the Andean chain during the long ages that preceded the great volcanic outbursts that have covered the framework of the western side of South America." This is altogether an alpine region with numerous snow-clad summits and glaciers descending down to the sea (Darwin).

Along the south side of East Fuegia flows Beagle Channel, about $55^{\circ} \mathrm{S}$. lat., separating it from South Fuegia, which comprises the islands of Hoste, ZJavarin, Gordon, Londonderry, Stewart, Wollaston, and numerous islets, disposed in triangular form with the base ou Beagle Channel and the apex at the rocky headland of Cape Horn. At its western end Beagle Channel takes the name of Darwin Sound, which leads to the Pacific at Londonderry and Stewart Islands. North of these lies Brecknock Peninsula, the westernmost extension of East Fuegia, cutting off South Fuegia from Clarence Island and Desolation Land, which with Dawson Island and numerous rocks and islets constitute West Fuegia. Desolation Land, so named by Cook, who supposed it to form a coutinuous mass stretching from the western entrance of Magellan Strait to Cockburn Channel, really consists of at least three, and possibly more islands, separated from each other by very narrow channels flowing between the Pacific and the westeru branch of Magellan Strait. The name Desolation has been reserved for the northern member of the group terminating at Cape Pillar; the one next to it

[^153]has been called Santa Inez; the other or others are stili unuamed. When Dall passed through the strait, he wes shown one of the narrow sounds "which have lately been ascertained to penetrate entirely through what used to be considered a single island" (op. cit., p. 241).
Lying almost in \& line with the main Andean axis, both West and South Fuegin are essentially highland regions, conforming in their general characteristics to the interveuing, wastern oxtension of East Fuegia. As compared with the great mass of the latter, they are evarywhere extremely rugged and mountainons, having a mesn elevation of not less than 3000 feet, a much moister climate, and arboreal instead of grassy vegetation. The isothermals of $32^{\circ} \mathrm{Fshr}$. for July (winter) sad $50^{\circ}$ Fahr. for January (summer), with a mean anuual temperature of $42^{\circ}$ Fahr., show that tolersbly mild winters are followed by cool summers, both seasons being accompanicd by overcast skies, constant and sudden changes from fair to foul weather; whilst fogs, mists, rains, snowe, and high winds (prevailing througnout the year) endanger the navigation of the intricate inland channels, and reuder the archipelago one of the dreariest regions on the globe.

A botanical parting line seems to be constituted by the renge of hills running back of Punta Arenas along the east side of Brunswick Peninsula (which, although attached by a narrow nack of land to Patagonia, belongs physically to the insular domain), and terminating at Cspe Froward ( $53^{\circ} 54^{\prime} \mathrm{S}$. Iat.), the southernmost point of the American mainland. West and south of thia line the pampas are replsced by lofty mountains clothed with a dense forest vegetrition from the water's edge to heights of 1000 and 1200 feet, above which stretches a zone of peaty soil with stunted alpine plants as far as the snow line ( 3000 to 3500 feet). The forest apecies are chielly an evergreen beech (Fagus antarctica, S.) and the winter bark (Winleria aromatica), also evergreen, with tall smooth stem and glossy leaves like the laurel. Wild celery, cress, cochlearia, and other anti-scorbutic plants accur on both sides of Magellan Strait, and the beech nourishes a large yellow mushroom, whicb, with the berries of a dwarf shrub, is the only vegetable food of the natives.

In West and South Fuegia the fauna is restricted mainly to two species of fox, a bat, rats, mice, the sea otter, the penguin and other aquatic birds, and various cetaceans in the surrounding watcrs.

To the three geographical divisions correspond three well-marked ethnical groups, - the Onas of East, the Yaghans of South, snd the Alacalufs of West Fuegia. The first are estimated to number 2000 , the others 3000 each, making a total population of some 8000 for the whole archipelago. The Onas are Patagonians who have crossed the strait. The Alacalufs are also immigrants from the mainland, but probably they came at an earlier date, and from the westarn uplands, being apparently a branch of the Auca (Araucanian) race of the Patagonian and Chilian Cerdilleras. They differ altogether in speech both from the Onas, with whom they come scarcely anywhere in contact, and from the Yaligans, who are the true aborigines of the archipelago. These last are in exclusive possession of South Fuegia, and also occupy the north side of Beagle Channel about Drount Darwin and furtber west. To them alone missionary enterprise has hitherto been cxtended, and the English station of Ushiwaya on Beagle Channel has for some years been the only centro of civilizing influences in the archipelago. As Lieutemant Bove of the. Italian Antarctic expedition has made a special study of this branch, ${ }^{1}$ they are much better known then either of the neighbouring races. If they represent an earlier Araucamian immigration than that of the Alacalufs, their extremely low social state, on which all observers are unanimous, may be regarded as the resuit of degradation from a higher condition during their long sojourn in their present inhospitable environment. But it seems more probable that they are the direct descendants of the primitive race by which the archipelago hss been occnpied from in vastly remote period, as is shown by the very grest number of kitchen-middens recently discovered on the coast. Although taller than the Negritoes of the eastern hemisphere ( 4 feet 10 inches to 5 feet 4 inches), the Yahgans present in some respects a more debased type, charscterized by low brows, prominent zygomatic arches, large tumid lips, flat nose, loose wrinkled skin (" pelle grinzosa a cadente," says Bove), black restless eyes very wide apart, coarse black unkempt hair, and head and chest disproportionstely large compared with the extremely slender and outwardly curved legs, conveying an impression of top-heaviness like that of the Akkas of equatorial Africa. Their mental qualities are on the same low level, as is indicated by the almost total absence of clething under such inclement skies, by the brutal treatment of their women, who when old and useless are often eaten, by the lack of human affections or love of offspring; who in rough weather are thrown overboard (Dr Fenton), either as a peace offering to the spirits of the storm or to lighten the eanoe, and by many repulsive practices connected with their food and social habits. The tribal organiza=
tion has not jet been reachecl, each family circlo living apart and combining only in sinall groups against some common cnemy, but recognizing uo hereditary chief or even any temporary leader. Yet the inissonaries, who have reduced the language to writing (Gospel of S: Luke, London, 1881), assert that it contains no less than 30,000 words, although the numerals stop at five, alrendy a compound form (cu-pash-pa), and althouglh the same mord expresscs both hand and finger. But thay have obviously failed to distinguish between distinct terma and the endless grammatical intricacies in which this, like so many other rude forms of speecl, is still involved.

Since 1881 tha eastern portion of Fuegia (with Staten Island) has belonged to the Argentino Repullic and the western to Chili. The boundary line, which is purcly conventional, runs from Capo Espiritu Santo Jue south to Beaglo Channel. Neither power has hitherto occupied any part of I'uegia, except Punta Arenas (Sandy Point) on the Patagonian sille of Jfagellan Strait, where tho Clilians heve for some years maintained a convict and conling station.

Fuecia was discorered ly Magellan in 1520, when ho sailed throught tho strait named after him, and cailed this region the "Land of Fire," either from now extinct volcanic flames, or much more prolably from the fires kindled by tho natives along parts of his course. In 1578 Drake first sighted the point which in 1616 was ramed Capo Hoorn (Anglicized Horn) by the Dutch navigators Lemaire and Schouten. In 1619 the urothers Nolal firet circumnavigated the archipelago, which wos afterwards visited at intervals by Wood and Narborough (1670), Gennes and Froger (1696), Byron (1764), Wallis and Cartaret (1767), Cook (1763), and Weldell (1822). But no aystematic exploration was attempted antil the British Aduiralty nndertook a thorough survey of tha whole group loy King (1826-28) anl Fitzroy (1831-36). The latter oxpedition (Voyage of the "Beagle") was accompanied by Charles Darwin, then a joung man. To these admirahle surveys ia dne most of the present geographical terminology of the archipelago. Since then the work of exploration has becn continued end nearly completed by Dumont d'Urvilla (1837), Charles Wilkes (1839), Parker Snow (1855), Bove (1883), and various English. American, and Roman Catholic missionaries.

TIFFIN, a city of the United States, in Seneca county (of which it is the county seat), Ohio, stands upon the Sandusky river, in $41^{\circ} 7^{\prime} \mathrm{N}$. lat., $83^{\circ} 11^{\prime} \mathrm{W}$. long., 42 miles south-east of Toledo. The city is situaled in the midst of an agricultural region, for which it serves as a shipping and supply point, and has three railroads - the Baltimore and Ohio, the Indiana, Bloomington, nnd Western, and the North-TVestern Ohio. It is the seat of Heidelberg College, one of the minor educational institutions of the State. Tiffin had in 1880 a population of 7879 , an inereaso of 2231 over that in 1870.
TLFLIS, sapital of the province of the same name and of Russian Caucasia, is picturesquely situated ( $44^{\circ} 48^{\circ} \mathrm{E}$. long., $41^{\circ} 42^{\prime} \mathrm{N}$. Jat.) at the foot of high mountains, on both banks of the river Kür, some 500 feet above the level of the Black Sca. The heat in summer is excessive, owing to the confined position; but the surrounding hills (1350 to 2400 feet) shelter the town effectively from the cold winds of a generally severe winter. A large square, the cathedral, one or more handsome streets, gardens, bridges, many fine or neat buildings-among them the grand-ducal palace, the opera-house, and the museum-European shops, the club or circle, hotels, and public offices are evidenco that Western cirilization has not only penetrated but has long provailed in this geographically remote town. Of its 54 churches 26 are Armenian, 2 Lutheran, and 1 Catholic. The (Sion) cathedral traces back its origin to the 5 th century; but in the interval it has suffered much and often. Other churches date from the 14 th and 15 th centuries, the Armenian cathedral of Vank from $1 \not 480$, and the Catholic church from the 14 th century. Tiflis has two
gymassia and pro-gymmasha for boys and two for girls, and a number of other schools; several scientific societies, of which the Caucasian kranelı of the geographical socicty is well kuown; an astronomical and a plysical observatory ; and a public library. The manufactures of tho place are limited to a few cotton and silk factories, tanncries, soapworks, and brick-works. But the petty trades are largely developed; and the artisaus of Tillis (about S000) aro renowned as silrersmiths, gunsmiths, and sword-makers. Since 1883 Tifis has been in milway connexion with Poti and Batum on tlie Plack Sea and with Baku ou the Caspian; but the line from Iinssia to Vladikavkaz has not Jet crossed the inain chain of the Caucasus The trado is of great importance, as Tiflis is the chief centre for tho import of raw silk and silkelu goods, raw cotton, carpets, and dried fruits from Persia, as well as from trans-Caneasia, while a rariety of manufactured wares are imported from Iussia. The foreign trade of trans-Caucasia with Asia, mostly carried on from Tiflis, in 1884 reached the value of $£ 1,729,800$ for exports, and $£ 857,070$ for imports. In 1883 the populatiou nunibered 104,024, as against 71,051 in summer 1865 and 60,085 in winter, exclusive of a garrison of 6800 . Etlnologically, the numbers are-Armenians 31,180, Georgians 14,787, and Russians 12,142, with an admixture of about 1200 Gerınans, 7150 Persians (in summer), 1500 'ratars, and some Jews and Greeks.

Many chroniclers and travellers have written alout Tillis. Perhaps one of the fullest accounts is contained in Brosset's edition of the Descripution Geogrupheque ale la Géorgic (St Petersurg, 1842), Dy the illegitimate son of Wakhtang VI., king of liathli, who Lecame a pensioner of Peter tho Great. English travellera sinco 1849 deacribe Tiflis in its main features zauch in the samo terins. Lady Sheil, writing in 1849, calls it "must thriving, active, and Lastling." Edward Eastrick (1860), cstimating its population at 40,000 and the height of the mountains overlanging it at 3000 feet, ic presents the plain in which the city is situated to bo so barien that "even the Kír . . . inparts to it but a limiten fettility." Mounsey (1866) apesks in warin terms of its social clarms ond tho great hospilality of its inhabivants, and notes it as the seat of guvernment for tho "Caucasian provinces of Russia, heodquaiters of an army of 150,000 men, and the residence of tho govenhor.general." In the old division of 'liflis three distinct townswere inclurled,-Tifis, Kal'a (the fort), and Isni; subscquently Tiflis scens to lara become known as Sảiyidábid, Rala as 'liflis, and Isni as Aulabár. İal'a and Isni possessed citadels; that of the former contained the church of St Nicholas and a royal palace, that of 1lo !atter tha church of the Holy Virgin and the residenco of the archimandrite. The town is now divided into quarters:- the Russian (the finest of all), the Gernan, the Armenian, and that in which are congregated Jows, Jiohammedans, and tho mass of Orientals. Tilis cari lay claim to a very considerablo antiquity. In $455^{\circ}$ tho chicftain of Georgia, Wakhtang, transfersed his capital from Mhtset to the warm springs of Tpilisi, where he erected eoveral churches and a fort. In 570 the Persians took the place and mado it the residenco of their rulers, but retained it only for ten yeare. Tillis anderwent suceessive plunderings and dovastationa at the hords of the Grecks in 626 , of ope of the commendera of Omar in 731, of the Khazars in 828 , and of the Saracons in 851 . The Georgians, however, always managed to roturn to it and to keop it in their permanent posses. sion. In tho courea of the succocding conturies Tinis fell ropeatedly into Persian hande; and it was plundered by Timur about tho end of tho 14 th century. Afterwards the Turks scized it soveral times, and towards the end of the 17 th century the Lesghians mode attacks upon it. In 1795, when the shah of Persia pluadered Tiflis, Kussia acnt troops to its protection, and the Russian occupation became pormanent in 1799.
TIGER. Although this name is often applied by settlers and sportsmen to soveral of tho larger lielidx, as the leopard of Africa and the jaguar of Ancerica, it should properly be restricted to the well-known striped species of Asia, Felis figris of Linnæus, an animal which is only rivalled by the lion in size, strength, and ferocity among the cat-like beasta of prey. It is a true cat on a large scale, snd possesses all tio esscntial characters of tha genus as defined in the articlo Mamalala (vol. xy. p. 434). It belongs to the section in which the pupil of the eyo contracts under the stimulus of light into a round spot and not a vertical slit, and in which the hyoid bone is con-
nected loosely with the skull by a long ligament, instead of by a continuous chain of bones. In these points it agrees with the lion and the leopard and differs from the common cat. Almost everything that is said in the article Lion (vol. ziv. pp. 680-681) of the structure of the skeleton, teeth, and claws of that animal will apply equally well to the tiger, the difference between the two lying mainly in the skin and its coverings. There are, however, slight distinctions in the proportionate size of the lower teeth, the general form of the cranium, and the relative length of the nasal bones and ascending processes of the maxilaries by which the skull of the lion and tiger can be casily discriminated by the practised observer.

Although examples of both species present considerable variations in siza, and reliance cannot always be placed upon alleged dimensions, especially when taken from skins

Tiger (Felis tigris, Linu.).
stripped from the body, it seems well ascertained that the length of the largest-sized Bengal tiger may exceed that of any lion, Larger specimens are certainly recorded, but 10 feet from the tip of the nose to the end of the tail is, according to Jerdon, an unusual length for a large male tiger. The female is somewhat smaller and has a lighter and narrower head. The tiger has no mane, but in old males the halr of the cheeks is rather long and spreading. The ground colour of the .upper and outer parts of the head, body, limbs, and tail is a bright rufous fawn, and these parts are beautifully marked with transverse stripes of a dark, almost black colour. The markings vary much in different individuals, and even on the two sides of the same individual. The under parts of the body, the inside of the limbs, the cheeks, and a large spot over each eye are nearly white. The tigers which inhabit hotter regions, as Bengal and the south Asiatic islands, have shorter and smoother bair, and are more richly coloured and distinctly striped than those of northern China and Siberia, in which the fur is longer, softer, and lighter colourcd.

The tiger is exclusively Asiatic, but has a very wide range in that cuntinent, having been found in almost all suitable localities south, of a line drawn from tho river Euphrates, passing along the southern shores of the Caspian and Sea of Aral by Lake Baikal to the Sea of Okhotsk. Its most northern range is the territory of the Amur, its most southern the islands of Sumatra, Java, and Bali. Westward it reaches to Turkish Georgia and eastward to the island of Saghalin. It is abseut, however, from the great elevated plateau of Central Asia, nor does it inhabit

Ceylon, Borneo, or the cther islands of the Indo-Malayam Archipelago, except those named.

The principal food of the tiger in India is cattle, deer, wild hog, and pea-fowl, and occasionally human beings. The regular "man-eater" is generally an old tiger whose vigour is passed, and whose teeth are worn and defective; it takes up its abode in the neighbourhood of a village, the population of which it finds an easier prey than the larger or wilder animals named abore. Though chiefly affecting grassy plains or swamps, it is also found in forests, and seems to be fond of haunting the neighbourhood of old ruins. As a rule, tigers do not climb trees ; but when pressed by fear, as during an inundation, they have been known to doso. They take to the water readily and are good swimmers. The tigers of the Sundarbans (Gal ges delta) continually swim from one island to the other to change their hunting-grounds for deer. The following extract from Sir J. Fayrer's Royal Tiger of Bengal (1875) may complete this notice of the tiger's habits.
"The tigress gives birth to from two to five, even six cubs; but three is a frequent number. She is a most affectionate and attacher! mother, and generally guards and tains ber young with the most watchful solicitude. They remain with her until nearly full-grown, or about the second year, when they are able to kill for themselves and begin life on their own account. Whilst they remain with her she is peculiarly vicious and aggressive, defending them with the greatest courage and energy, and when robbed of them is terrible in her rage; but she has been known to descrt them when pressed, and even to eat them when starved. As soon as they begin to require ather food than her milk, she kills for them, teaching thens to do so for themselves by practising on small animals, such as deer and young calves or pigs. At these times she is manton and extravagant in her cruelty, killing apparently for the gratification of her ierocious and bloodthirsty nature, and perhaps to excite aud instruct the young ones, and it is not until they are thoroughly capable of killing their own food that she separates from them. The young tigers are far more destructive than the old. They will kill three or four cows at a time, whilst the older and more experienced rarely kill more than one, and this at intervals of from three or four days to a week. For this purpose the tiger will leara its retreat in the dense jungle, proceed to the neighbourhood of a village or gowrie, where cattle feed, and during the night will steal on and strike down a buhlock, drag it inte a secluded place, and then remain near the "murrie," or "kill," for several days, until it has eaten it, when it will proceed in search of a further supply, and, baving found good huntirg ground in the vicinity of a rillago or gowrie, continne its ravages, destroying one or two cows or buffaloes a week. It is very fnd of the ordinary domestic cattle, which in the plains of India arg generally weak, balf-starved, under-sized creatures. One of these is easily struck down and carried or dragged off. The smaller buffaloes are also easily disposed of ; but the bufalo bulls, and especially the wild oues, are formidable antagonists, and have often been known to beat the tiger off, and even to wound him seriously."
(W. H. F.)

TIGER CAT. See Ocelot.
TIGRANES, or Dikran, a name borne by several kings of ancient Armenia. According to the legend of the Armenians, the first of these kings was the Tigranes who in Xenoohon's romance appears as the schoolfellow of Cyrus, and to him they ascribe the foundation of Tisfanocerta (Dikranagerdj on the Tigris. But in reality, as classical writers relate, this city was built by the first historical Tigranes of Armenia, variously known as Tigranes IL. and Tigranes $I_{\text {., for whose history see Persia, vol aviii. }}^{\text {whe }}$ p. 595 sq. His son Tigranes is knowu by his rebellion against his father (Persia, ut supra). Tigranes III. (II.), grandson of Tigranes II. (I.), had a short reign which he owed to a revolution at home and the favour of Augustus. He came to the throne in 20 b.c., having previously been as exile at Rome. Tigranes IV. (III.) was seated on the throne by the Parthians (Persta, p. 600). For Tigranes V. (c. 60 A.D.), a great-grandson on his mother's side of Herod the Great, see Persia, vol. sviii. p. 602.

TIGRIS, ${ }^{1}$ the shorter of the two large rivers rising in
${ }^{1}$ The Tigris is the Hiddekel of the Bible, the Diklat or Idiklat of the cuneiform inourments. The old Persian form Tigrì ("swift as an arrow"), whence Tigris, seems to be councoted etymologically with
the highlands of Armenia and Kurdistan, and (when turned southward) running each its own independent course to the Persian Gulf. Like the Euphrates, the Tigris rises from two principal sources, of which the western and more distant-in $38^{\circ} 10^{\prime} \mathrm{N}$. lat. and about $39^{\circ} 20^{\prime} \mathrm{E}$. long-is a little south of Lake Giuljek, in a peninsula formed by the Eupbrates, and some 2 or 3 miles only from the channel of that river. The names and sources of the different streams forming the Western Tigris-or that part of the upper river which runs, roughly speaking, from Diarbekr to the junction with the Eastern Tigris, about 50 miles north-north-west from Jezíra lbn Omar-are given by Consul Taylor as the Arganeb M'adan and the Dibeneh Su, uniting at Ammaneh castle; the Ambar Su , rising at Heyni ; the Batman Su, formed by the Kulp, the Kaushan, and the Sarum, rising north and north-west of Nerjiki; and the Khuzu or Huzu and the Arzen-Redhwan or Yezid Khaneh Su. Of the Eastern Tigris the chief tributaries are the Bohtan Su and its feeder the Bitlis (which receives tho Keyzer or Shirwan), the Möx, the Shattak, the Chamkari, and the Sarhal Su. Of these the most northerly points may be found on the Kulp or Dibeneh Su about $38^{\circ}$ $40^{\prime} \mathrm{N}$. lat. and the most easterly on the Shattak in $42^{\circ} 50^{\prime}$ E. long.

After the Junction of the eastern and western branches (see the accompanying map) the river pursues a winding

Map showing the tributaries of the Tigris.
course, generally south-east, for about 800 miles, via Mosul and Baghdad, to the point of union with the Eupbrates at Kurna, whence it becomes known as the Shattu 'l-Arat, and falls into the sea some 70 miles farther down. Between Mosul and Baghdad the Tigris receives from its left the Great and the Little Zab and other tributaries from the Kurdish Mountains. Below the confluaice of the latter it is joined by the Diyala, alse from the left, while on the right canals and watercourses connect it more or less directly with the Euphrates, which in the vicinity of Baghdad it approaches to within 30 or 35 miles. The Tigris is navigable for light freight-bearing steamers up to Baghdad, and for vessels of lighter draught to 20 miles below Mosul, but thence to Diarbekr only for rafts. "But owing to the rapidity of the current the traffic is all down stream, carried-on mainly by a primitive style of craft, which is troken up at Baghdad and transported by camels back to Mosul. The journey between theso points occupies three or four days during the fivods and from twelve to fourteen at other-times."

TILBURG, or Tilborg, a town ol Golland, in the

[^154] Dīglā)
pronnce of North Brabant, 13 miles to the east-soath-east of Breda, contains numerous and extensire woollen-factories, employing from 5000 to 6000 persons, and also some calico-printing establishments. It has the usual public buildings, including four Roman Catholic churches, a Reformed church, and a synagogne, but none of architectural or historical interest. The population in 1879 was 28,390 and in 1887 32,016.

TILDEN, Samuel Jones (1814-1886), American statesman, was born at New Lebanon, New York, on the 9th of February 1814. He studied at Yale and at the university of New York, but ill-health prevented him from finishing his course. He studied law and rose rapidly to the first rank at the New York bar. From boyhood he had had a fondness for politics, but had sacrificed it to the practice of law. After 1860 be drifted into New York Stato politics, and became chairman of the Democratic State Committee in 1866. The Tweed "ring" in New York city dreaded $\mathrm{b}-\mathrm{m}$, and in 1869 attempted to remove him from his chairmanship. Tilden then becume the soul of the legal attacks upon the "ring," and worked for the removal of the corrupt judges who were their tools; and in the "ring trials" he accomplished the mathematical feat of 'ascertaining and demonstrating from bank-books the principle on which the spoils had been divided. In 1874 he was elected governor of the State by the Democrats. For years another "ring" had been making money out of the Sfate canals. This, too, Tilden succeeded in breaking up. In 1876 the National Democratic Convention nominated him for the presidency, the Republicans nominating Governor Hayes of Ohio. The result was the disputed election of 1876-77, when each party secured about the same number of electors outside of the three Southern states of Florida, South Carolina, and Louisiana. The Democrats had a majority in these States; but the returning boards, by rejecting votes which they believed bad been obtained by fraud or intimidation, gave their States to the Republicans. Two sets of certificates were therefore sent to Washington, and as no provision had been made in the United States constitution for a dispute of this kind there was no power authorized to dccide between the two parties. In this emergency Tilden consented to the appointment of an extra-constitutional body, an "electoral commission," to decide disputed cases, the decisions of Thich were to hold good unless rèversed by concuirrent vote of the two houses. The commission decided all the cases in favour of the Republican candidates, and Tilden was defeated. He continued in retirement until his death, which took place at Greystone, New York, on 4th August 1886.

TILES (Saxon tigel, connected with Lat. tegula) are used for a great variety of architectural purposes, such as covering roofs, floors, and walls, and are made of many different materials.

1. Roofing Tiles. ${ }^{1}$-In the most important temples of ancient Greece the roof was covered with tiles of white marble, fitted together in the most perfect way so as to exclude the rain. In most cases, as in the Athenian Parthenon aud the existing temple at Egina, the tiles were large slabs of marble, with a Hange along each side, over which joint-tiles (íproi) were accuratcly fitted (see Á in fig. 1): In the temple of Apollo at Rasse, though the main building was of limestone, the roof was corered with very beautiful tiles of Parian marble, which are specially mentioned by Pausanias as being one of the chicf beauties of the temple. Some of these were found by Mr Cockerell during his excarations at Basse carly in the 19th century. ${ }^{2}$ In design they resemble the other examples mentioned

[^155]above, but are peculiar in having the joint-piece worked out of the same slab of marble as the adjacent tiles (see B in fig. 1), at a great additional cost of both material and labour, in order to secure a more perfect fit. Fig. 2

Fro. 1.-Examples of roofing tiles from Greek temples. A, B, marble tiles from Exing snd Bassw, showing two methods of working the joint.tiles. C, C, clay tiles from Olympia. D, sketch ehowing method of jointing at the lower edge. E, longltudinal nection of a clay joint-tile (d̀p $\mu \mathrm{s}$ ). F F, joint-tile with peg to fix it.
shows the way in which they were set on the roof. Great splendour of effect must have been gained by continuing the gleaming white of the columns and walls on to the roof. All along the eaves each end of a row of joint-tiles was usually covered by an antefixa, an oval-topped piece

Fio. 2.-Perspective akatch abowng the arrangement of tiles $B$ in Ag. "1, at Bassw. B, B, Dowels to fix the joint-tiles C, tilting oiece. $a, a$, flat eurface of tiles.
of marble with honeysuckle or some other conventional pattern carved in relief. ${ }^{2}$ In most cases the Greeks used terra-cotta roofing tiles, shaped like the marble ones of fig. I, A. Others were without a flange, being formed with a concave upper surface to prevent the rain getting under the joint-tiles. The lower edge of the tile, whether of marble or of clay, was usually half-lapped and fitted into a corresponding rebate in the upper edge of the next tile (see D in fig. 1). The dipuoi also were half-lapped at the joints (see E in fig. 1). All these were usually fastened with bronze nails to the rafters of the roof. In some cases each joint-tile had a projecting peg to fix it to the next $\dot{\alpha} \rho \mu{ }^{\prime} \mathrm{s}$, as shown at F . In the temples of imperial Rome marble roofing tiles were used like those shown at fig. 1. These were copied from the Greeks along with most other architectural features. For domestic and pther less important work clay tiles (tegulx) were employed, of the form shown in A, fig. 3. These are narrower

[^156]at the lower edge, so as to fit in to the upper edge of the nest tile, and the joints were covered with a semicircular joint-tile (imbrex). Rows of terra-cotta antefixæ were set along the eares of the roof, and were often moulded with very beautiful reliefs. In localities which supplied laminated stone, such as Gloucestershire and Hampshire in

Fig. 3.-A, section and elevation of the clay tiles commonly used in ancient Rome. B, Roman atone tiles, each fixed with one iron nail at the tov angle. C, pan-tilea usad in medimal and modern timea.
Britain, the Romans often roofed their buildings with stone tiles, fastened with iron nails. Fig. 3, B, shows an example from a Roman villa at Fifehead Neville in Dorset, England. Each slab had a lap of about 2 inches over the row of tiles below it ; many large iron nails were found with these stone tiles. In a few cases, in the most magnificent temples of ancient Rome, as in those of Capitoline Jupiter and of Venus and Rome, and also the small circular temple of Vesta, ${ }^{2}$ tiles of thickly gilded bronze were used, which must have had the most magnificent effect. Those of the last-named building are specially mentioned by Pliny ( $H . N .$, xxxiv. 7 ) as having been made of Syracusan bronze, ${ }^{5}$ -an alloy in great repute among the Romans. The bronze tiles from the temples of Jupiter Capitolinus and of Venus and Rome were taken by Pope Honorius I. (625-638) to cover the basilica of St Peter, whence they were stolen by the Saracens during their invasion of the Leonine city in 846.4

In medixval times lead or copper ${ }^{5}$ in large sheets was. used for the chief churches and palaces of Europe; but in more ordinary work clay tiles of very simple form were employed. One variety, still very common in Italy, is shown in C, fig. 3. In this form of so-called "pan-tule" each tile has a double curve, forming a tegula and imbrex both in one. Stone tiles were also very common throughout the Middle Ages. Another kind of roofing tile, largely used in pre-Norman times and for some centuries later for certain purposes, was made of thin pieces of split wood, generally oak; these are called "shingles." They stand the weather fairly well, and many old examples still exist, especially on the wooden towers and spires of East Anglia. At the present day, when slate is not used, tiles of burnt clay are the ordinary roofing material, and many complicated forms have been invented to exclude rain. Most of these are, however, costly and do not answer better than a plain rectangular tile about 9 by 6 inches, fastened with two copper or even stout zinc nails, and well bedded on mortar mixed with hair. For additional security clay tiles are usually made with two small projections at the

[^157]apper edge, which hook on to the battens to which they are nailei. Broseley (Shropshire) is one of the chief places in England for the manufacture of roofing tiles of the better sort. The common kinds are made wherever good clay exists. In some places pan-tiles are still used and have a very picturesque effect; but they are liable to let in the rain, as they cannot be securely nailed or well bedded in mortar. In Gloucestershire, Yorkshire, and other counties of England, stone tiles are still employed, but are rapidly going out of use, as they require very strong roof-timbers to support them, and the great extension of railways has made the common purvle slates cheap in nearly every district.

Some of the mosques and palaces of Persia are roofed with the most magnificent enamelled lustred tues, decorated with elaborate painting, so that they shine like gold in the sun. They were specially used from the 13th to the 15th century. In style and method of manufacture the finest of them resemble the frieze shown in fig. 5 .
2. Wall Tiles.-These have been partly described under Mural Decoration (voL $x$ vii. p. 35). ${ }^{1}$ In most Oriental countries tiles were used in the most magnificent way throughout the Middle Ages, especially in Damascus, Cairo, Moorish Spain, and in the chief towns of Persia. Fig. 4 shows a fine example from a mosque in Damas${ }^{c} 143$. From the 12th to the 16 th century a special kind of lustred tile was largely employed for dadoes, friezes, and other wall sarfaces, being frequently made in large slabs and modelled boldly in relief, with sen-
 tences from sacred books or the uames and dates of reigning caliphs. The whole was picked out in colour, usually dark or turquoise blue, on a ground of cream-white enamel, and in the last firing minute ornaments in copper lustre were added over the whole design, giving the utmost splendour of effect (see fig. 5). Great skill and taste are shown by the way in which the delicate painted enrichments are made to contrast with the bold decoration in relief. . These lustred tiles zometimos line the prayer-niche in houses and mosques; in such cases the slabs usually have a conventional representation of the kaaba at Mecca, with a lamp hangiug in front of it and a border of sentences from the Koran. ${ }^{2}$ The mosques of Persia are specially rich in this method of decoration, magnificent examples existing at Natenz, Seljuk, Tabriz, Ispahan, and other places. ${ }^{3}$ In the 16 th and 15 th centuries tiles of a coarse kind of majolica were used for wall decoration in southern Spain; some rich examples still exist in Seville. These appear to be the work of Italian potters who had settled in Spain. The azulejos (wall tiles) in the Alhambra and

[^158]other buildings in Spain are among the most beautiful productions of Hispano-Moorish art.4 In technique they resemble majolica; but the finest kinds, dating from the

Fia. 5.-Persian lustred tiles of the 13th ceutury, forming
part of a friezo. (South Kensington Museum.)
14 th and 15 th centuries, have designs taken from mosaic patterns, with complicated lines of geometrical interlacings. ${ }^{5}$
3. Floor Tiles.-From the 12th to the 16th century floor tiles in most northera countries of Europe were made by filling up with clay of a different colour patterns sunk in elabs of clay (see Encaustio Tries). In Italy, during the latter part of the 15 th and the first half of the 16 th century, majolica tiles, rich both in pattern and in colour, were used for parements in many places. Comparatively fow examples now cxist ; the majolica enamel was too soft to stand the wear of feet. One of the small south chapels in the church of S. Maria del Popolo in Rome has a very fine pavement of these tiles, executed, probably at Forli, about 1480 for Cardinal della Rovere (Julius II.), whose arms-an oak tree-are repeated frequently among the rich decorations. A still more magnificent tile floor in the uppermost of Raphael's Vatican loggie is mentioned under Robris (vol. xx. p. 591). The same article (p. 589) describes the exquisite majolica tiles which Luca della

Fic. 6. Xajolica paving tiles from Siens, made in 1509. (South Kensington Museum.)
Robbia made as a border for the tomb of Bishop Federighi at Florence. Fine examples of tile paving of 1487 exist in the basilica of S . Petronio at Bologna, and others of

[^159]rather earlier date in S. Paolo at Parma. The chapel of St Catherine at Siena and the church of S. Sebastiano at Venice have majolica paving of about 1510. Fig. 6 shows an example of about this date from the Petrucci Palace in Siena, now in the South Kensington Museum. ${ }^{1}$ In the early part of the 16 th century majolica tiles from Spain were occasionally imported into England. At the south-east of the eajoz'e chapel at Bristol there exists, though much worn, a fine pavement of Spanish tiles dating from about 1520. Others have bepn found in London, at Newington Butts, and in other plac`s. At the present time imitations of the unfortunately named "encaustic tiles" are almost the only sort employed in England and other northera countries. Very coarse and poorly designed majolica tiles are still made and used for paving in Italy and Spain.
(J. H. м.)

TilLemont, Sébastien le Nain de (1637-1698), ecclesiastical historian, was born at Paris on 30th November 1637 , and received his education in the "petites écoles" of the Port Royalists, Nicolo being his principal master. At an early age he became an admiring student of Livy and Baronius and began to accumulate those vast collcctions which form the basis of his monumental works. He continued to carry on his studies in the seminary at Beauvais, where the bishop was a warm patron; but it was not until 1676, two or three years after his return to Paris, that, under the influence of Isaac de Sacy, he entered the priesthood. He took up his abode in a humble dwelling at Port Royal des Champs, where he remained till the dispersion of the "solitaires" in 1679, after which event he spent the remainder of his life (with the exception of a visit to Arnauld in Holland in 1685) at Tillemont, between Montrenil and Vincennes. He died on 28th January 1698 and was buried at Port Royal ; in 1711 his remains were removed to the church of St André des Arcs, Paris.
His great work, At'moircs pour servir ab'histoire ecclesiastique des six premiers siecles to 513 A.D. ( $1693-1712,16$ vols., 4 to), is a model of patient, exhaustive, and what Gibbon has called "xare-footell" erudition (see yol. v. .f. $\overline{765}$ ). Of his equally learned Histoire dce empereurs st des auttres princes qui ont regac dhirant les six premicrs riecles de CEglise ( $1690-1738,4$ to) no more than four volumes were published. Tillemont also gave valuablo assistance to Hermant, Dub Fosse, and other Port Royalists in their historical work
TILLOTSON, John (1630-1694), archbishop of Canterbury, was the son of a Puritan clothier in Sowerby, Yorkshire, where he was born in October 1630. He entered as a pensioner of Clare Hall, Cambridge, in 1647, graduated in 1650 , and was made fellow of his college in 1651. Chillingworth's Religion of Protestantism biassed his mind against Puritanism, and the bias was further confirmed by intercourse with Cudworth and others at Cambridge. In 1656 be became tutor to the son of Edward Prideaux, attorney-general to Cromwell. In what year be took orders is unknown, but, according to the Life published in 1717, the person who ordained him was Dr T. Sydserf, a Scottish bishop. Tillotson was present at the Savoy Conference in 1661, and remained identified with the Preshyterians till the passing of the Act of Uniformity in 1662. Shortly aftervards he became curate of Cheshunt, Herts, and in June 1663 rector of Keddington, Suffolk. For several years after his ordination he devoted himself to an exact study of the Scriptures, ancient ethics, and the writings of the early fathers, especially Basil and Chrysostom. The result was seen in the general tone of his preaching, which was practical rather than theological, and, though regarded by some as latitudinarian, was characterized by the earnestness of sincere conviction and the balanced wisdori gained by thoughtful refexion. He was, moreorer, a man of the world as well as a divine, and in

[^160]his sermons be exhilited a certain indefinable tact which enabled him at once to win the ear of his audience. His style is chiefly remarkable for its simplicity and clearness, and in this respect it mirrored his own candour and sincerity. The qualities above mentioned won him in his lifetime the reputation of "having brought preacling to perfection"; and probably it was because he was neither brilliant, original, nor profound that his preaching was so universally admircd. "His sermons," says Burnet, "were so well heard and liked, and so much read, that all the nation proposed him as a pattern and studied to copy after him." In 1664 he became preacher at Lincoln's Inn. The same year he married Niss French, daughter of the canon of Christ Church, Oxford, and niece of Oliver Cromwell; and he also became Tuesday lecturer at St Lawrence, Jewry. Tillotson employed his controversial weapons with some skill against "atheism" and "Popery." In 1663 he published a characteristic sermon on "The Wisdon of being Religious," and in 1666 replied to Scrgcant's Sure Footing in Christiunity by a pamphlet on the Rule of Faith. The same year he received the degree of D.D. In 1670 he became prebendary and in 1672 dean of Canterbury. Through his wife Tillotson became connected with Dr Wilkins, the second husband of her mother. In 1675 he edited Wilkins's Principles of Natura? Rcligion, completing what was left unfinished of it, and in 1682 his Scrmons, with a preface in which he vindicated Willins from certain misrepresentations of Wood in his History and Antiquities of the University of Oxford, In 1680 he brought out Barrow's Treatise of the Pope's Supremacy, and in 1683 his Sernons. On 5th November 1678 Tillotson preached a sermon against Popery before the House of Commons, in whick ho maintained that it was their duty to make provision against the propagation of a religion more mischievous than irreligion itself; but in a sermon on the Protestant religion in 1680 before the king he propounded the proposition that Catholics could enjoy their own faith, but not openly drav men off from the profcssion of the established religion. Along with Burnet, Tillotson attended Lord Russell on the senfold in 1683, and after the publication of Lord Russell's speech was appointed to appear before the privy council ; but his explanations were regarded as satisfactory, the chief suspicions in connexion with the speech resting on Burnet. Tillotson afterwards enjoyed the friendship of Jady Russell, and it was partly through her that he obtained so much influence with Princess Anne, who followed his advice in regard to the settlement of the crown on William of Orange. He possessed the special confidence of William and Mary, and was made clerk of the closet to the king, 27 th March 1689. It was chiefly through his advice that the king appointed an ecclesiastical commission for the reconciliation of the Dissenters, and he was regarded as the representative in the commission of the views of the king and queen. In August of this year he was appointed by the chapter of his cathedral to exercise the archiepiscopal jurisdiction of the province of Canterhury during the suspension of Sancroft. He was also about the same time named dean of St Paul's. Soon afterwards he was elected to succeed Sancroft; but he accepted the promotion with extreme reluctance; and it was deferred from time to time at his request till April 1691. His attempts to reform certain abuses of the church, especially that of non-residence among the clergy, awakened against him much ill-will, and of this the Jacobites took every possible advantage and pursued him to the end of his life with insult and reproach. "This," Burnet says, "could neither provoke him, nor fright him from his duty; but it affected his mind so much that this was thonght to have shortened his days." He died of palsy on 24 th November 1694.

Por his manuscript sermons Tillotson's mido received 2500 guineas, then an unexampled sum, and for many years their popaherity remained anrivalled. During his lifetime he published Serzons on Several Occasions, 1671, republished with a second voluma addel in 1678 ; Fifty Sermons and the Rule of Faith, 1691 ; Four Sermons concerning the Divinity and Incarnation of our Blessed Saviour, 1693 ; Six Sermons on Several Occasions, 1694. His Postdumous Sernons, edited by Dr Ralph Baker, appeared in 14 vols, 1694; third edition, 1704. His Works were published in 17071710, and wera frequently reprinted. In 1752 an edition appeared in 8 , vols. with Life by Thomas Birch, D.D., compiled from Tillotson's original papers and letters. Of the many subsequent editions the best is that, with Life by Birch, of 1820,10 vols Various selections from his sermons and works have been published eeparately.
See in sddition to Birch's LUVe, Welford's Memortals, Barnet's Own Times, and Macanay's History of England.
tilly, Johann Tserclafs, Count of (1559-1632), a famous general, was bern in February 1559 at the chateau of Tilly in Brabant. It was originally intended that he should become a priest, and he was strictly educated by the Jesuits. He preferred, however, the life of a soldier, and began his military career in the Netherlands, under Alessandro Farnese, in the Spanish service. Aftermards he joined the imperial army, and as lieutenant-colonel ander Duke Philip Emmanuel of Lorraine greatly distinguished himself in Hungary in the war against the Turks. For his brilliant achievements he was raised to the rank of field-marshal. In 1610 he was put by Maximilian I. at the head of his Bavarian army; and soon after the outbreak of the Thirty Years' War he was made commander-in-chief of the troops of the Catholic League. In this position he displayed qualities which placed him among the foremost generals of the age. After the battle of Prague (the White Hill) in 1620 te theroughly subdued Bohemia, and in 1622 conquered the Palatinate, -a service for which Ferdinand II. gare him the title of count. In 1623 he defeated Christian of Brunswick at Stadtlohn in Westphalia, and in 1626 Christian IV. of Denmark at Lutter in Brunswick. The consequence of the latter victory was that Tilly and Wallenstein were able to cross the Elbe; but, as Tilly was wounded before Pinneberg in Schleswig-Holstein, the task of finally compelling the king of Denmark to accept terms of peace had to be left to Wallenstein alone. When Wallenstein was obliged in 1630 to withdraw for a while into private life, Tilly added to the functions he already discharged those of commander of the imperial forces. From this time the only important success achieved by him was the storming of Magdeburg (May 1631), a success accompanied by frightful cruelties, for Which he was at least in part responsible. Gustarus Adolphus had now come forward as the champion of Protestantism, and Tilly, with all his genius and tenacity, was not a match for the Swedish king. Four months after the capture of Magdeburg Tilly was defeated at Breitenfeld in Saxony, and was himself so severely wounded that he escaped from the field with difficulty. In March 1632 he drove the Swedes from Bamberg and placed himself in an entrenched camp at Rain to prevent them from passing over the Lech. Gustavus Adelphus crossed the stream, and in the fight which ensued Tilly was nortally wounded. He died in April 1632 at Ingolstadt, and was buried at Alt-Octting in Bavaria.
Tilly was of medium height, reserved in manner, and wholly indifferont to extornal marks of honour. The Roman Church never had a mora devoted eervant, and ha gave aridence of the essential simplicity of his character by decliniug tha offer of tha emperor to sake him a prince and to grant to him the principality of Calenberg. As ha was not married, his titlo and estates descended to his nephew.
See iilopp, Tilly fird dreistgidarigen Erege, Stuttgart, 1881, and villemmont, Tiuy, Tournag, 1558 .
TLLSIT, a commercial town of East Prussia and the capital of Prussian Lithuania, is situated on the left bank of the Memel or Niemen, 52 miles south-east of the town of Memel and 60 north-east of Künigsberg. The town
is spacious, and has a number of handsome modern buildoings, including a town-bouse, post-office, law-courts, and a large hospital. It contains three Protestant churches, a Roman Catholic chnrch, and a Jewish synagogue. The manufactures include soap, leather, shoes, glass, and other articles, and there are iron-feundries and steam flour and saw mills. Tilsit carries on trade in timber, grain, hemp, flax, herrings, and other nerthern produce; but its trade with Russia, at one time considerable, has fallen off since the.construction of the railway from Künigsberg via Insterburg and Gumbinnen to Kovno. The river is navigable beyond the town. The market-gardening of the neighbourhood deserves mention, and the annual horse-fair and markets are of considerable local i tportance. In 1783 the population was 8060 ; in 188 , it had increased to 21,400 , and in 1885 to $22,42 \mathrm{~s}$.
Tilsit, which received town-rights in 1552, grew up around a castle of the Teutonic order, known as the "Schalauner Haus," founded in 1288. It owes most of its interest to the peace signed here on 9 th July 1807, the preliminaries of which were settled by the emperors Alexander and Napoleon on a raft monred in the Momel. The peace of Tilsit, which constituted the kingdom of Westphalia and the duchy of Wars2m, registers the nadir of Prussia's humiliation under Napoleon (see Prossla, vol. xx. p. 11). The poet Max von Schenkendorf (1784-1817) was born at 'Tilsit.
TIMBER. See Building, Forests, and Strexata or Materials ; also Fir, Oak, Pine, Teak, \&c.

TIMBUKTU, or TinBuctoo (Sonrhai, Timbutu ; Berber. Tumbutku; Arab, Tin-buktu), a city of the Sahara, on the southern verge of the desert, in $18^{\circ} 4^{\prime} \mathrm{N}$. lat. and $1^{\circ} 45^{\prime}$ W. long., at the nerth-east extremity of the Fulah state of Moassina (Massina), 9 miles north of its riverine pert Kabara, on the left bank of the Niger, at the confuence of the numerous branches of the Joliba (upper Niger) where it trends eastwards, and at the converging point of the main trade routes from the Gulf of Guinea and from the Mediterranean across the western Sahara. Timbuktu lies on a terrace formed by the southern scarp of the desert, about 800 feet above sea-level, and overlooking a chain of dhayas or marshy hollows, fringed here and there with a few mimosas and palm thickets, amid the surrounding sandy wastes. These dhayas, which are flooded every three or four years, converting the lowland tracts between the terrace and the main stream into a labyrinth of channels and backwaters, mark the bed of a navigable creek which formerly branched from the Niger northwards to the foot of the scarp, and which in 1640 inundated a low-lying quarter of the city. According to Pouyanne and Sabatier, the main stream followed this course before it took its present easterly curve to Burum, where it bends southwards to the coast. Here also it was probably jeined at some remote period by the now dried up Wady lifessaura from the Tuat oases south of Algeria, although the rough levels taken by Oscar Lenz and others make it uncertain whether the flow through this depression was northwards or southwards. In any case Timbuktu has been left, so to say, high and dry by the general process of desiccation going on throughout the Saharian region. It was founded, or more probably captured, by the Tuareg Berbers abou! the 11th century, and under the Mandingo kings of Mali (Mallé) was a noted mart for gold and salt in the 14th century, mention of "Timboutch" occurring on a Catalan map dated 1373. Under Askia, founder of the extensive but shert-lived Sonrbai empire (1492), it rose to great splendour and became with Gogo a chief centre of Mohammedan culture for the peoples of western Sudan. But since the overthrow (1591) of the Sorrhai dynasty by the Morecco captain, the Andalusian Jodar with his Ruma fellowers, Timbuktu has continued to be the prey of the surrounding unruly populations-Tuarega, Arabs or Arabizerl Berbers, Fulahs (1800), and Toucouleurs (1865). Being thus nt the mercy of all, it has ceased to rebuild its
arsmantled walls, heing content to pay tribute to each in turn and sometimes to more than one simultaneously, for which it indemnifies itself by peaceful intervals of trade whenever the land routes are open and the upper and lower reaches of the Niger are clear of pirates. But at times even the short tract separating it from Kabara is so beset with marauders that it bears the ominous name of "Ur-immandess," that is, "He (God) hears not." Recently, however, it has enjoyed a considerable interval of peace, and the population, estimated by Barth at 11,000 in 1853, had risen to 20,000 in 1880 (Lenz). These form a motley group of Sonrhais, Tuaregs, Mandingoes, Arabs from Minorocco, Berabish Arabs, Bambaras, Fulahs, and since 1850 a few Jewish traders. Apart from some Curistian captives, the place was reached during the 19th century by only four Europeans-Laing from Tripolitana (1826), who was mardered on his return journey, Caillie from the north (1828), Barth from central Sudan (1853), and Lenz from Morocco (1880). Since 1884, however, regular relations have been opened with the French on the upper Niger.
From the ruins covering extensive tracts on the north and west sides, it is ovident that Timhuktu was formerly a mnch larger place than at present. Even the great mosque, which must at one time bave stood in the centre, now lies near the outskirts, where its high but unsightly earth tower forms a striking landmark. The aggregate of mean hovels or mud houses of which the place consists is only relieved by a few etructures of a better class. As in former times, a great staple of trade is salt from Tandeni and other parts of the Sahara, here exchanged with gold dust for kola nuts from the sonth, Manchester goods, and bome other European wares, which with tea are imported from Marocco or penetrate from the British protected territories along the lower Niger. Cowries, slowly yielding to European moneys, are the chief currency. The local industries are mainly confined to some fancy and other leatherwork prepared by the Tuareg women. The local administration is in the hands of an hereditary kahia, a kind of mayor, descended from one of the Ruma farilies. The kahia is himself more or less under the control of a neighbonring Taareg chief and of the powerful Bakhai family, who, as "sherifs" and marabouts, are revered throughout the westorn Sahara. Timbuktu, which possesses some valuable Arabic manuscripts and is still a centre of Moslem teaching, is a converging point of the chief west Sudanese and Saharan races-Arabs or Arabized Berbers to the west; Sonrhais in the immediate ricinity, and thence south-eastwards along the Niger; Ireghenaten or "mixed" Tuaregs oouthwards across the Niger as far as the Hombori Hills and in the fertile Libbako plains beyond them; Fulahs, Mandingoes, and Bambaras in and about the city ; and Imóbag or Imósbarh Tuaregs belonging to the Awellimiden confederation mainly to the porth and east.
tinie, Measurement of. Time is measured by successive phenomena recurring at regular intervals. The only astronomical phenomenon which rigorously fulfils this condition, and the most striking one,--the apparent daily revolution of the celestial sphere caused by the rotation of the earth, -has from the remotest antiquity been employed as a measure of time. The interval between two successive returns of a fixed point on the sphere to the meridian is called the sidereal day; and sidereal time is reckoned from the moment when the "first point of Aries" (the vernal equinox) passes the meridian, the hours being counted from 0 to 24. Clocks and chronometers regulated to sidereal time are only used by astrozomers, to whom they are indispensable, as the sidereal time at any moment is equal to the right ascension of any star just then passing the meridian. For ordinary purposes solar time is used. In the article Astronomy (vol. ii. p. 771) it is shown that the solar day, as defined by the successive returns of the sun to the meridian, does not furnish a uniform measure of time, owing to the slightly variable velocity of the sun's motion and the inclination of its orbit to the equator, во that it becomes necossary to introduce an imaginary mean sun moving in the equator with uniform velocity. Tho equation of time (loc. cit., pp. 772-773) is tho difference between apparont (or true) solar tine and mean solar time. The latter is
that shown by clocks ana watches used for ordinary purposes. Mean time is converted into apparent time by applying the equation of time with its proper sign, as given in the Nautical Almanac and other ephemerides for every day at noon. As the equation varies from day to day, it is necessary to take this into account, if the apparent time is required for any moment different from noon. The ephemerides also give the sidereal time at mean noon, from which it is easy to find the sidereal time at any moment, as 24 hours of mean solar tins are equal to $24^{\mathrm{a}} 3^{\mathrm{m}} 56^{1.5} 554$ of sidereal time. About 21st March of each year a sidereal clock agrees with a mean-time clock, but it gains on the latter $3^{\text {a }} 56^{\circ} 5$ every day, so that in the course of a year it has gained a whole day. For a place not on the meridian of Greenwich the sidereal time at noon must be corrected by the addition or subtraction of $9 \cdot 8565$ for each hour of longitude, according as the place is west or east of Greenwich.

While it has for obvious reasons become customary in all civilized countries to commence, the ordinary or civil day at midnight, astronomers count the day from noon, being the transit of the mean sun across the meridian, in strict conformity with the rule ae to the beginning of the sidereal day. The hours of the astronomical day are also counted from 0 to 24. An international conference which met in the autumn of 1884 at Washington, to consider the question of introducing a universal day (see below), has recommended that the astronomical day should commence at midnight, to make it coincide with the civil day. The great majority of American and Continental astronomers have, however, expressed themselves very strongly against this change; and, even if it should be made in the British Nautical Almanac, it appears very doubtful whether the other great ephemerides will adopt it, the more so as astronomers have hitherto felt no inconvenience from the difference between the astronomical and the civil day.
Determination of Time.-The problem of determining the exact time at any moment is practically identical with that of determining the apparent position of any known point on the celestial sphere with regard to one of the fixed (imaginary) great circles appertaining to the observer's station, the meridian or the horizon. The point selected is either the sun or one of the standard stars, the places of which are accurately determined and given for every tenth day in the modern ephemerides. The time thus determined furnishes the error of the clock, chronometer, or watch employed, and a second determination of time after an interval gives a new value of the error and thereby the rate of the timekeeper.

The ancient astronomers, although they have left ns very ample information about their dials, water or sand clocks (clepsydra), and similar timekeepers, are very reticent as to how these were controlled. Ptolemy, in his Almagest, states nothing whatever as to how the time was found when the numerous astronomical phenomena which he records took place; but Hipparchus in the only book we possess from his hand gives a list of forty-four stars scattered over the sky at intervals of right ascension equal to exactly one hour, bo that one or more of them would be on the meridian at the commencement of every sidereal hour. In a very valuable paper ${ }^{1}$ Schjellerup has shown that the right ascensions assumed by Hipparchus agree within about $15^{\prime \prime}$ or one minute of time with those calculated back to the year 140 b.c. from modern star-places and proper motions. The accuracy which, it thus appears, could be attained by the ancients in their determinations of time

[^161]was far beyond what they seem to have considered necessary, as they only record astronomical phenomena (e.g., eclipses, occultations) as having occurred "towards the middle of the third hour," or "about $8 \frac{1}{3}$ hours of the night," without ever giving minutes. ${ }^{1}$ The Arabians had a clearer perception of the importance of knowing the accurate time of phenomena, and in the year 829 we find it stated that at the commencement of the solar eclipse on 30 th November the altitude of the sun was $7^{\circ}$ and at the end $24^{\circ}$, as observed at Baghdad by Ahmed ibn Abdallah, called Habash. ${ }^{2}$ This seems to be the earliest determinar tion of time by an altitude; and this method then came into general use among the Arabians, who on observing lunar eclipses never failed to measure the altitude of some bright star at the beginning and end of the eclipse. In Europe this method was adopted by Purbach and Regiomontanus, apparently for the first time in 1457. Bernhard Walther, a pupil of the latter, seems to have been the first to use for scientific purposes clocks drivèn by weights : he states that on 16 th January 1484 he observed the rising of the planet Mercury and immediately attached the weight to a clock having an hour-whee! with fifty-six teeth; at sunrise one hour and thirty-five teeth had passed, so that the interval was an hour and thirty-seven minutes. For nearly two hundred years, until the application of the pendulum to clocks became general, astronomers could place little or no reliance on their clocks, and consequently it was always necessary to fix the moment of an observation by a simulteneous time determination. For this purpose Tycho Brahe employed altitudes observed with quadrants; but he remarks that they are not always of value, for if the star is taken too near the meridian the altitude varies too slowly, and if too near the horizon the refraction (which at that time was very imperfectly known) introduces an élement of uncertainty. He therefore preferred azimuths, or with the large "armillary spheres" which played so important a part among his instruments he measured hour-2agles or distances from the meridian along the equator. ${ }^{3}$ Transits of stars across the mcridian were also observed with the meridian quadrant, an instrument which is alluded to by Ptolemy and was certainly in use at the Marágha (Persia) observatory in the 13 th century, but of which Tycho was the first to make extensive use. It appears, however, that he chicfly employed it for determining star-places, having obtained the clock error by the methods already described.
In addition to these rothods, that of "equal altitudes" was much in use during the 17 th century. That equal distances east and west of the meridian correspond to equal altitudes had of course been known as long as sun-dials had been used, but, now that quadrants, cross-staves, and parallactic rules * were commonly employed for measuring altitudes more accurately, the idea naturally suggested itself to determine the time of a star's or the nun's meridian passage by noting the moments when it reached any particular altitude on both sides of the meridian. But Tycho's plan of an instrument fixed in the meridian was not forgotten, and from tho end of the 17 th century, when Roemer invented the transit instrument, the observation of transits across the meridian became the principal means of determining time at fixed observatories, while the observation of altitudes, frst by portable quadraints, aftcrwards by rofiecting sextants, and during the 19 th century by portable alt-azimuths or theodolites, has beon used on journeys.

[^162]During the last fifty years the small transit instrument, with what is known as a "broken telescope," has also been much employed on scientific expeditions; but great caution is necessary in using it, as the difficulties of getting a perfectly rigid mounting for the prism or mirror which reflects the rays from the object-glass through the axis to the eyepiece appear to be very great, for strange discrepancies in the results have often been noticed. The gradual devclopment of astronomical instruments has been accompanied by a corresponding development in timekeepers. From being very untrustworthy, astronomical clocks are now made to great perfection by the application of the pendulum and by its compensation, while the invention of chronometers has placed a portable and equally trustworthy timekeeper in the hands of travellers.

We shall now give a sketch of the principal methods of determining time.

In the spherical trianglo ZPS between the zenith, the pole, and a star the side $Z P=90^{\circ}-\phi\left(\phi\right.$ bcing the latitude), $P S=90^{\circ}-\delta(\delta$ being the declination), end $Z S$ or $Z=90^{\circ}$ minus the observed altitude. The angle $Z P S=\ell$ is the star's hour-angle or, in time, the interpal between the moment of observation and the meridian passage of the etar. We have then

$$
\cos t=\frac{\cos Z-\sin \phi \sin \delta}{\cos \phi \cos \delta}
$$

- which formala can be made more convenient for the use of logaritnms by putting $Z+\phi+\delta=2 S$, which gives

$$
\tan ^{2} \frac{1}{2} t=\frac{\sin (S-\phi) \sin (S-\delta)}{\cos S \cos (S-Z)}
$$

Accoraing as the star was observed west or east of the meridian, $t$ will be positive or negatire. If a be the right ascension of the star,'the sidereal time $=t+a, a$ as well as $\delta$ being taken from an epbemeris. If the sum had been observed, the hour-anglo $\ell$ would be the apparent soler time. The altitude observed must be corrected for refraction, and in the case of the sun also for parallax, while the sun's semi-diameter must be added or subtracted, according as the lower or upper limb was observed. The declination of the sun being variable, and being given in the ephemerides for hoon of each day, allowance must be made for this by interpolating with an epproximate value of tbe timc. As the altitude changes very slowly near the meridian, this method is most advantageous if the star be taken ncar the primo vertical, while it is elso easy to sce that the greater the latitude the more uncertain the result. If a number of altitudes of the same object are ooserved, it is not necessary to deduce tho ciock error separately from esch observetion, but a correction may bo applice to the mean of the zenith distances. Supposing $n$ observatious to be taken at the moments $T_{1}, T_{2} \dot{T}_{3}^{\prime}, \ldots$, the racan of all being $T_{0}$, atd calling the $\approx$ correeponding to this $Z$, we have

$$
\begin{aligned}
& z_{1}=Z+\frac{d Z}{d t}\left(T_{1}-T_{0}\right)+\frac{1}{2} \frac{d^{2} Z}{d t^{2}}\left(T_{1}-T_{0}\right)^{2} \\
& \approx_{2}=Z+\frac{d Z}{d t}\left(T_{2}-T_{0}\right)+\frac{1}{2} \frac{d^{2} Z}{d t^{2}}\left(T_{3}-T_{0}\right)^{2}
\end{aligned}
$$

and so on, $l$ being the hour-angle answering to $T_{3}$. As $\Sigma\left(T-T_{0}\right)$ $=0$, theso equations give

$$
\begin{aligned}
Z & =\frac{z_{1}+z_{2}+z_{3}+\ldots}{n}-\frac{1}{2} \frac{d^{2} Z}{d t^{2}} \frac{\left(T_{1}-T_{0}\right)^{2}+\left(T_{2}-T_{0}\right)^{3}+\ldots}{n} \\
& =\frac{z_{1}+z_{2}+z_{3}+\ldots}{n}-\frac{d^{2} Z}{d \iota^{2}} \frac{\Sigma 2 \sin ^{2} \frac{1}{2}\left(T-T_{0}\right)}{n}
\end{aligned}
$$

But, if in the abore-mentioned trangle wo designste the angles at $Z$ and $S$ by $180^{\circ} \rightarrow A$ and $p$, we havo

$$
\begin{aligned}
& \sin z \sin A=\cos \delta \sin t ; \\
& \sin z \cos A=-\cos \phi \sin \delta+\sin \phi \cos \delta \cos \ell
\end{aligned}
$$

and by differentiation

$$
\frac{d^{2} Z}{d \delta^{3}}=\frac{\cos \phi \cos \delta \cos A \cos p}{\sin Z}
$$

in which $A$ and $p$ a:e determined by

$$
\sin A=\frac{\sin \ell}{\sin Z} \cos \delta \text { and } \sin p=\frac{\sin \ell}{\sin Z} \cos \phi
$$

With this corrected mean of the obscrved zenith distances the houranglo and time arodetermined, and by comparison with $T_{a}$ the crrol of the timekeeper.

The method of equal sltitudes gives ?cry simply the clock error cqual to the right ascersion minus lialf tho sum of the clock times corresponding to the observed equal altitudes on both sides of the meridian. When the sun is observed, a correction has to be applied for the change of decliastion in tho interval between the obserrations Calling this iuterval $2 t$, tho cormetion to the apparent noon
XXIII. - 50
given by the observations $x$, the change of declination in half the interval $\Delta \delta$, and the observed altitude $h$, we have
$\sin h=\sin \phi \sin (\partial-\Delta \delta)+\cos \phi \cos (\delta-\Delta \delta) \cos (t+x)$
and $\quad \sin h=\sin \phi \sin (\delta+\Delta \delta)+\cos \phi \cos (\delta+\Delta \delta) \cos (\ell-x)$
whence, as $\cos x$ may be put $=1, \sin x=x$, and $\tan \Delta \delta=\Delta \delta$,

$$
x=-\left(\frac{\tan \phi}{\sin t}-\frac{\tan \delta}{\tan t}\right) \Delta \delta,
$$

which, divided by 15, gives the required correction in seconds of time. Similarly an afternoon observation may he combined with an observation made the following morning to find the time of apparent midnight.

The observation of the time when a star has a certain azimuth may also ba used for determining the clock error, as the hour-angle can be found from the declination, the latitude, and the azimuth. As the azimuth changes most rapidly at the meridian, the observation is most advantageous there, besides which it is neither necessary to know the latituda nor tha declination accurately. In the article Geonesy (rol. z. p. 166) it has been showu how the observed time of transit over the meridian is corrected for the deviations of the instrument in azimuth, level, and collimation. This corrected time of transit, expressed in sidereal tima, should theu be equal to the right asceusion of the ohject observed, and tha differenco is the clock error. In obsarvatories the determination of a clock's arror (a necessary operation during a night's work with a transit circla) is generally founded on obscrvations of four or five "clock otars," these being standard stars not near the pole, of which the absolute right ascensions have been determined with great care, besides observation of a close circumpolar star for fiuding the error of saimuth and determination of level and collimation error. ${ }^{1}$

Observers in the field with portable instrumenta often find it inconvenient to wait for the meridian transits of one of the fow close circumpolar stars given in the ephennerides. In that case they have recourse to what is known as the method of time determinetion in the vertical of a pola star. The alt-azimuth is first directed to one of the standard stars near the pole, auch as $a$ or $\delta$ Ursæ Minoris, using whichever is nearest to the meridian at tbe time. The instrument is set so that the star in a few minutes will cross the middle vertical wire in the field. The spirit-level is in the meantime put on the axis and the inclination of the latter measured. The time of the transit of che star is then observed, after which the instrument, remaining clamped in azimuth, is turned to a clack star and tha transit of this over all the wirea is observed. The level is applied again, and the mean of the two results is used in the reductions. In case tha collimation error of the instrument is not accurately knorra, the instrument should be raversed and another observation of the sams kind taken. The observations made in each position of the instrument are separately reduced with an assumed approximate value of the error of collimation, and two equations are thus derived from which the clock error and correction to the assumed collimation error are found. This use of the transit or alt-azimuth out of the meridian throws considerably more work on the computer than the meridian observations do, and it is therefore never resorted to except when an observer during field operations is pressed for time. The formulæ of reduction as developed by Hansen in the Astronomische Nachrichten (vol. xlviii. p. 113 sq.) are given by Chauvenet in his Spherical and Practical Astronomy (vol. ii. pp. 216 sq., 4th ed., Philadelphia, 1873). The subject has also been treated at great length by Dollen in two mernoirs, Dic Zcitbcstimmung vcrmittclst des iragbaren Durcigangsinstrument im Verticale des Polarsterns (St Petersburg, 1863 and 1874, 4 to).

Longitude.-Hitherto we hare only spoken of the determination of local time. But in order to compare observations made at different places on the surface of the earth a knowledge of their difference of longitude becomes necessary, as the local time varies proportionally with the longitude, one hour corresponding to $15^{\circ}$. Longitude can be determined either geodetically or astronomically. The first method supposes the earth to be a spheroid of known dimensions. Starting from a point of departure of which the latitude has been determined, the azimuth from the meridian (as determined astronomically) and the distance of some other station are measured. This second station then serves as a point of departure to a third, and by repeating this process the longitude and latitude of places at a considerable distance from the original starting-point may be found. Referring for this method to the articles Earti (Figure of the), Geodesy, and Surveying, we

[^163]shall here only deal with astronomical methods of deter mining longitude.

The earliest astronomer who deternined longitude by astronomical observations seems to have been Hipparchus, who chose for a first meridian that of Rhodes, where ho observed; but P'toleny adopted a meridian laid through the "Insulæ Fortunatie" as being the farthest known place towards the west. ${ }^{\text {a }}$ "When the yoyages of discovery began the peak of Teneriffe was frequently used as a first meridian, until a scientific congress, assembled by Richelieu at Paris in 1630, selected the island of Ferro for this purpose. Although various other meridians (e.g., that of Uranienburg and that of San Miguel, one of the Azores, $29^{\circ} 25^{\prime}$ west of Paris) continued to be used for a long time, that of Ferro, which received the authorization of Louis X1II. on 25ilh April 1634, gradually superseded the others. In 1724 the longitude of Paris from the west coast of Ferro was found by Louis Feuillée, who had been sent there by the Paris Academy, to be $20^{\circ} 1^{\prime} 45^{\prime \prime}$; but on the proposal of Guillaume de Lisle ( $1675-1726$ ) the meridian of Ferro was assumed to be exactly $20^{\circ}$ west of the Paris observatory. Modern maps and charts generally give the longitude from the observatory of either Paris or Greenwich according to the nationality of the constructor; the Washington meridian couference of 1884 has recommended the exclusive use of the meridian of Grcenwich. On the same occasion it was also recommended to introduce tho use of a "uni versal day," beginuing for the whole earth at Greenwich midnight, without, however, interfering with the use of local time. ${ }^{3}$

The simplest method for determining difference of longitude consists in observing at the two stations some celestial phenomenon which occurs at the same absolute moment for the whole earth. Hipparchus pointed out how observations of lunar eclipses could be used in this way, and for about fifteen hundred years this was the only method available. When Regiomontanus (q.v.) began to publish his ephemerides towards the end of the 15 th century, they furnished other means of determining the longitude. Thus Amerigo Vespucci observed on 23 d August 1499, somewhere on the coast of Venezuela, that the moon at $7^{\text {b }} 30^{\mathbf{m}}$ P.M. was $1^{\circ}$, at midnight $5 \frac{1}{2}^{\circ}$ cast of Mars; from this be concluded that they must have been in conjunction at $6^{\mathrm{m}} 30^{\mathrm{m}}$, whereas the Nuremberg ephemeris announced this to take place at midnight. This gave the longitude of his station as roughly equal to $5 \frac{1}{2}$ hours west of Nuremberg The instruments and the lunar tables at that time being very imperfect, the longitudes determined were very erroneous; see Navigation (vol. xvii. p. 251), to which article we may also refer for a history of the long-discussed problem of finding the longitude at sea. The invention of the telescope early in the 17 th century made it possible to observe eclipses of Jupiter's satellites; but there is to a great extent the same drawback attached to these as to lunar eclipses, that it is impossible to observe with sufficient accuracy the moments at which they occur.

Eclipses of the sun and occultations of stars by the moon were also much used for determining longitude before the invention of chronometers and the clectric telegraph offered better means for fixing the longitude of observatories. These methods are now hardly ever employed except by travellers, as they are very inferior as regards accuracy. For the necessary formulæ see Chan-

[^164]venet's.Spherical and Practical Astronomy, vol. i. pp. 518. 542 and $550-557$.

We now proceed to consider the four"methods-for finding the longitudes of fixed observatories, viz., by (1) moon culminalions; (2) rockets or other signals, (3) transport of chronometers, and (4) transmission aftime by the electric telegraph.

1. Moon Culminutions - Oritg to the rapid orbital motion of the moon the sidereal time of its culmiation is different for differeut meridians. If, therefore, the rate of the moon's change ef right ascension is kuown, it is easy from the observed time of culmine. tion at two stations to deduce their difference of longitude. Lat the right ascension of the moon a and its differential coefficieuta he computed for the Greeuwich time $T$, aud let the culmination be observed nt two plaecs whose longitudes from Greeuwich are $\lambda$ and $\therefore$, the time of observation being $T+t$ and $T+t^{\prime}$ Greenwich time, $1.1^{\circ}$ in local time $T+t+\lambda=\theta$ and $T+t^{\prime}+\lambda^{\prime}=\theta^{\prime}$; wo have then

$$
\theta=\theta=\left(t^{\prime}=t\right) \frac{d a}{d t}+\frac{1}{2}\left(l^{\prime 3}-t^{2}\right) \frac{d^{2} a}{d t^{2}}+\ldots
$$

alid, as the difference of longitide is $\left.\lambda^{\prime}-\lambda=\left(\theta^{\prime}-\theta\right)-(t)-t\right)$, we have ouly to determine $t^{t}-t$ from the first equation. This is simply done by a auitalle selection of T. Calling $T+\frac{1}{2}\left(t+t^{\prime}\right)=T$, we bave to put $T^{v}-\frac{1}{2}\left(t^{\prime}-t\right)$ sud $T^{v}+\frac{1}{2}\left(t^{\prime}-l\right)$ for $T+t$ and $T+t^{\prime}$. It is then easy to see that

$$
\theta^{\prime}-\theta=\left(t^{\prime}-t\right) \frac{d a}{d t}+\frac{1}{2 t}\left(t^{\prime}-t\right)^{3} \frac{d^{2} a}{d t^{3}}
$$

and, solving this equation by frrst neglecting tho second term on tho right side sand then substituting the value of $t^{\prime}-t_{1}$ thur sotasis in that term, $\quad t^{\prime}-t=\frac{\theta^{\prime}-\theta}{\overline{d a j} d t}-\frac{1}{24}\left[\frac{\theta^{\prime}-\theta}{\overline{d a} / d t}\right]^{8} \frac{d^{3} a}{\overline{d l^{3}}}$
In order to be ss much as possible independent of instrumental errors, 60 me standard atars hearly on the parallel of the moon are observed at the two stations; these "nıon-culminating stars" are given in the ephemerides in order to secure that both observers take the same stars. As eitlier the preceding or the following liosb, not the centre, of the moon is observed, allorrance must be made for the time the seni-diameter takes to pass the meridian and for the change of right ascension during this time. This metbod was proposed by Yigott towards the end of the 18 tl. century, aud has been much used; but, though it may be very serviceable on journeys and cxpeditions to distant places where the chronometric aud telegraphic methods cannot be employed, it is not accurate enough. for hixed olservatories. This is due, not only to the difficulties attending the observation (the differeace of personal error in observing the moon and stars, the different apparent enlargement of the moon by irraliation in different telescopes and under differeat atmo. spheric circumstances, \& c.), but chiefly to the large coefficient with which $\theta^{\prime}-\theta$ has to be multiplied in the final equation for $\lambda^{\prime}-\lambda$. Errors of four to six seconds of time have tharefore frequently been noticed in !ongitudes obtained by this method from a limitcd number of observations : the longitude of the Madras olscrvatory fras for many years assumed to be $5 \mathrm{~h} 21 \mathrm{~m} 3 \mathrm{~m} \cdot \frac{77}{}$, but aubsequently by a telegraphic deteriniuation this was found to he $4^{s \cdot 37}$ too great.
2. Signals. - In 1671 Picard determined the difference of longitude between Copenhagen and the site of Tycho Brale'a observa. tory by matching from the latter the covering and uncovering of in aire lighted on the top of the observatory torier at Copenhagen. Powder or rocket signals have been in use since the midule of the ISth century; they are nowadays never used for this rurpese, ilthough ssreral of the principal observatories of Europe nicre cenmected in this manner early in the 19 th century $^{-1}$
3. Trenoport of Chronomelers. - This merns of determining langicude wras first tried in cases where the cnronometers could be tiought tho whole way by sea, but the impraved measis of rommunication on land led to its adontion in 1828 between the Gbservatories at Greenwich and Cambrilge, aud in the following years between many other observatories. A few of the more extencive expeditions undertaken for this object deserve to be meutioned. In 1843 more than sixty chrononeters ware acnt sixteen times backwards and iorrards between Altona and Pulkowa, aud in 1844 forty chronometers were sent the same number of times betreeu Altona and Greenwich. ${ }^{2}$ In 1844 the longitude of Valentia on the southwest coast of Ireland was determined hy transporting thirty pocket chronometers via Livernool and kingstown and having an intermediata station at the latter place. The longitude of tho United Statea noval olservatory has bacn frequently determiued from Greenwich Tho foliowing results will mive in ides of tha accuracy of the suthod.

The value now accepted from tha telegraphic determination is $5^{\text {b }} 8^{m a} 12^{8.09}$. Tha probable errors of the results for Pulkowa Altona and Altona-Creenwich mara supposed to be $\pm 0.039$ and $\pm 0.04 \mathrm{~A}$. It is of course only uatural that the uncertainty of tho results for the trans. Atlantic lougitude should be much greater, considering the length of time which elapsed betweea the rating of the chronometers at the observatories of Boston (Cambridge, Massachusctts) and Liverpool. The difficulty of the method con sista in determining the "travelling rate." Each time a chrono meter leaves the station $A$ and returus to it the error is determined, and consequently the rate for the tiure occupied by the journeys from $A$ to $B$ and from $B$ to $A$ aud by the sojourn ot $B$. Similarly a rate is found by each departure from and return to $B$, and the time of rest at $A$ and $B$ is also utilized for deteroiuing the atationary rate. In this way a series of rates for overlapping intervals of time are found, frem which the travelling rates may be interpolated. It is owing to the uncertainty which necessarily attaches to tho rate of a chronometer during long journays, eapecially by land, where they are exposed to shaking and more or less violeut motion, that it is desirable to employ a great number. It is scarcely neressary to mention that the temperature correction for each chronometer muat bo carefully investigated, and the local time rigorously deternined at each atation duriug the entire period of the operations.
4. Telegraphic Deterninution of Lotginhde. -This ras first suggeated by the Americau astronomer S. C. Walker, and owed its dorelopment to the United States Coast Survey, whera it was employcd irom about 1849. Nearly all the more important public olsarvatories ou the contiuent of Europ have now been connected in this Way, chiefly at the instigation of the "Europaische Gradmessung," while the determinations io connexion with the transits of Venus and those carried out in recent years by the American and French Governments have completed the circuit of the greater part of lise giobe. The telegraphic method compores the local time at one station with that at the other by means of electric siguals. If a aignal is sent from the eastern station $A$ at the local time $T$, and received at the western atation $B$ at the local time $T_{1}$, then, if the time taken by tha current to pass thiough the wire is called $x_{3}$ the difference of longituda is

$$
\lambda=T-T_{1}+x,
$$

and similarly, if a signal is reut from $B$ at the time 1, sua received st $A$ at $T_{2}$, we lave $\quad \lambda=T_{3}-T_{3}-\lambda_{1}$
from which the unknown quantity $x$ can be eliminated
The operations of a telegraphic longitude determination can be arranged in two ways. Either the locol time is Ifetermised at both stations and the clocks are compared by tclegraph, or the time determinations are marked simultaneously on the two chronograjhs at the two stations, so that further signals for clock comparison are uunecessary. The first method has to bo used when the telegraph is ouly for a limited time each night at the disposal of the observers, of when the clinatic conditions at the two atations are 60 differeat that clear meather cannot often be expected to occur at both simultaneonsly, also whea the difference of longitude is so considerable thot too much tine would be lost at the eastern station waiting for the arrival of the transit rccord of one star from the westera station before observing auother star. The independent time determinatiou also offers the advantaga that the obscruntions may be taken cithcr ly cyo and ear or by the chronograph, and that the aignals may be either audible beats of a rclay or clironor graphic argnala, the rule belug to have observations and signals made by samilar operations. The best way of using audiluo beat of a relay is to let tho circuit pass through an auxiliary clock. whiclt from aecourl to second alternately makes and breaks this current, the making of the current being rendered audible by thi tapning of the relayy at both stations. If. now, the auxiliary and the observing clocks are regulated to a different rata, the coioci dences of the beats of the relay with those of the observing clock can be noted with great accuracy, from which the difference bet ween the two obscrving clocks is found. It has been proved by experience that the degree of accuracy with which the clock comparison cau bo made by one ceincidence is exactly cqual to that of ona chrono. graph signal, the probable error beiog in hoth cases about $\pm 0^{3} 015$ It should, however, be mentioned that the interval betuten twe cousecutire coincideuces canmot be mada less than two minutes, Whereas the chronograph signals may be given every secoml, ond, as the cusarvationa made with the chronograph are also somewhat more accurate than those made by eye and car, the chronograph ahould ho used wherever possible. The other method, that of simultaiceous registration at both stations of trausits of the sa.no stara, has alao its advantages. Each trensit obserred at both stations furnisles a value of the difference of longitule, so that the final result is less dependent on the clock rate than in the arst method, which oecessitates the comlinetion of a serics of clock
errors determined during the night to form a value of the clock error for the time when the exchange of signals took place. When using this method it is advisable to select the stars in such a manner that only one station at a time is at work, so that the intensity of the current can be readjusted (by means of a rheostat) between every despatch and receipt of aignals. This attention to the intensity of the current is necessary whatever method is employed, as the constancy of the transmission time ( $x$ in the ahove equations) chiefly depends on the constancy of the current. The probable error of a diference of longitude deduced from one star appears to be ${ }^{1}$

> for eyc and ear transits $\pm 0^{5} \cdot 08$,
> for chronograph transits $\pm 0^{5} \cdot 07$
while the probable error of the final result of a carefully planned and well executed series of telegrâphic longitude operations is generally between $\pm 0^{5: 015}$ and $\pm 0^{5} 025$.
It is evident that the success of a deternination of longitude depends to a very great extent on the accurate determination of time at the two stations, and great care must therefore be taken to determine the instrumental errors repeatedly during a night's work. But, in addition to the uncertainty which enters into the results from the ordinary errors of observation, there is another source of error which becomes of special importance in longitude work, viz., the so-called personal error. The discovery of the fact that all observers differ more or less in their estimation of the time when a star crosses one of the spider lines in the transit instrument was made by Bessel in $1820^{2}$; and, as he happened to differ fully a second of time from several other observers, this remarkably large error naturally caused the phenomenon to be carefully examined. Bessel also suggested what appears to be the right explanatiou, riz., the co-operation of two senses in observing transits by eye and ear, the ear having to count the beats of the clock while the cye compares the distance of the star from the spider line at the last beat before the transit with the distance at the first beat after it, thus estimating the fraction of second at which the transit took place. It can easily be conceived that one person may first hear and then ser, while to amother these sensations take place in the reverse order ; and to this possible source of error may be added tho sensible time required by the transmission of sensations through the nerves to the brain and for the latter to act upon them. As the chronographic method of olserving dispenses with one sense (that of hearing) and merely requires the watching of the star's motion and the pressing of an electric key at the moment when the star is bisected by the thread, the personal errors should in this case be much smaller than when the eye and ear method is employed. And it is a fact that in the former method there have never occurred errors of between half and a whole second such as have not unfrequently appeared in the latter method.

In astronomical observations generally this personal error does not cause eny inconvenience, so long as only one observer is employed at a time, and unless the amount of the error varies with the declination or the magnitude of the star; but when absolute time has to be determined, as in longitude work, the full amount of the personal equation between the two observers must be carefully ascertained and taken into account. And an observer's error has often been found to vary very considerably not only from year to year but eveu within much shorter intervals ; the use of a new iustrument, though perhaps not differing in construction from the accustorned one, has also been known to affect the personal error. For a number of years this latter circumstance was coupled with another which seemed perfectly incomprehensible, tho personal error appearing to vary with the reversal of the instrument, that is, with the position of the illuminating lamp east or west. But in 1869.70 Hirsch noticed during the longitude operations in Switzerland that this was caused by a shifting of the rellector inside the telescope, by means of which the field is illuminatel, which produced an apparent shifting of the inage of the spider lines, unless the eye-piece was very accurately frcused for the observer's sight. The simplest and best way to find the equation between two observers is to let one observe the transits of stars over half the wires in the telescope, and the other observe the transits over the remainder, eacla taking care to refocus the eye-piece for himself in order to aroid the abovementioned source of error. The single transits reduced to the middle wire give immediately the equation; and, in order to eliminate errors in the assumed wire-intervals, each observer uses alternately the first and the second half of the wires. Another mathod is in vogue af Greenwich, where each observer with the transit circle from a series of stars determines the clock error and reduces this to a common epoch ( $00^{\mathrm{b}}$ sid. time) by means of a clock rate found independently of personal error. The differences between the clock

[^166]errors thus found are equal to the personal equations. This method cannot, however, be recommended, as the systematic errors in the right ascensions of the stars and any slight variation of the clock rate would affect the personal equation ; the first method is therefore generally used in longitude work. It is advisable to let the observers compare themselves at the beginning, middle, and end of the operations and, if possible, at both the instrmments employed. A useful check on the results is afforded by simultaneous experiments with one of the instruments contrived by C. Wolf, Kaiser, and others (sometimes called "time collimators"), by which the absolute personal error of an observer can be cetermined. Though differing much in detail, these instruments are all constructed on the same principle: an artificial star (a lamp shining through a minute hole in a screen mounted on a small carriege moved by clockwork) passes in succession across a number of lines drawn on oiled paper, while an electric contact is made at the precise moment when the star is biscated on each line by the carriage passing a number of adjustable contact makers. The carrents thus made register the transits automatically on a chronograph, while the observer, viewing the apparatus through his telescope, can observe the transits in the usual manncr either by eye and car or by chronograph, thus immediately finding his personal error. On the Continent these contrivances have frequently been used to educate pupils learning to observe, and experience has repeatedly slown that a considerable personal error can be generally somewhat diminished through practice.
Literalure-General trestiaes on spherical astronomy, such as Briinnow's Lehrbuch der spharischen Astronomie (3d ed., Berlin. 1871 ; translated into English and вeveral other laoguages) and Chauvenet'a Manual, treat very fully of the and berous methods of deternining time by combination of altitudea or azunuths of several atars. The best handbook of telegraphic longitude work is Alhrecht's alresdy mentioned ; but any one engaging in practical work of this kind should coosult the accounta of the numerous longitude determinationa carried out
 duriog recent years, particularly tha pilan of des hon. preussischer

TIMOLEON. The life of Timoleon, one of the noblest and most interesting of the men of old Greece, is closely bound up with the history of Sicily (q.v.), and more particularly of Syracuse (q.v.), in the latter half of the 4 th century b.c. It is as the champion of Greece against Carthage, and of constitutional government against violence and oppression, that he stands out as such a grand figure. His early carecr in his native Corinth was shaped by a tragie incident. Timoleon had saved the life of his brother, Timophanes, on the field of battle; but, when that same brother, at the head of a band of mercenary soldiers, took possession of the acropolis and made himself practically a military despot and master of the city, Timoleon, after an ineffectual protest, let him be struck down by his brother-in-law and one or two other friends who had joined in his remonstrance. By the public opinion of Corinth generally his conduct was approved as patriotic ; but the curses of his mother and the cold looks of some of his kinsfolk and acquaintances drove him from the city into the solitude of the fields, and there, it would seem, for some years he pined away, hating life and even bent on ending it by voluntary starvation. He must have reached middle life when, in 344 r.c., envoys came from Syracuse to Corinth to appeal to the mother-city for relief from the intestine feuds and foreign mercenartes under which the Syracusans, and all the Greeks of Sicily, suffered. Carthage too, their old and bitter foe, after scme jears of quiet, was again bestirring berself and intriguing with the local despots. Corinth could not refuse her help, though her chief citizens declined the responsibility of attempting to establish a settled government in the factious and turbulent Syracuse. By a sort of Divine inspiration, says Plutarch (Tim., 3), Timoleon, being named by an unknown roice in the popular assembly, was chosen by a unanimous vote to undertake the mission. He sailed for Sicily with a few of the leading citizeus of Corinth and a small troop of Greek mercenaries. On arriving at Rhegium he found that his movements were watched by a Carthaginian squadron, acting under the advice of a Syracusan. Hicetas. who had
made himself master of Leontini and aimed at supplanting with Carthaginian aid the younger Dionysius, still nominally tyrant of Syracuse, but actually in possession only of the island citadel. Hicetas, whilst seeming to favour Corinthian intervention, was really working with Carthage on behalf of the tyrants. Timoleon, however, slipped away from the Carthaginian watch and landed at Tauromenium (Taormina), where he had a very friendly reception. At Adranum, an inland town, to which he came by invitation from a party among the citizens, he surprised Hicetas, and drove him back, with his troops utterly defeated, to Syracuse. The Sicilian Greeks now rallied round him, and the following year (343) saw the surrender of Dionysius and Timoleon master of the entire city. Hailed'by the citizens as a heaven-sent deliverer, he at once began the work of restoration, bringing in a multitude of new settlers from the mother-city and from Greece generally, and establishing a popular government on the basis of the laws of Diocles, which had been forgotten under the Dionysian régime. The impress of Timoleon's reforms seems to have lasted to the days of Augustus. The tyrants, too, in the other Sicilian cities were put down, and his old enemy Hicetas went back to Leontini, where he lived as a private though powerful citizen. He made one more attempt to overthrow Timoleon, and induced Carthage to send (340-339) a great army, which landed at Lilybæum (Marsala). The Syracusans could hardly be.brought to face the invader; but with a miscellaneous levy of about 12,000 men, most of them mercenaries, Timoleor marched westwards across the island into the neighbourhood of Selinus and won a great and decisive victory on the Crimisus. The Carthaginian host is said to have outnumbered Timoleon's army in the proportion of seven to one. The general himself led on his infantry in person (Plut., Tim., 27), and their enemy's discomfiturs was completed by a blinding storm of rain and hail driven straight in their faces (Diod., xvi. 79). This victory gave the Greeks of Sicily many years of peace and safety from Carthage. Carthage made, however, one more effort and despatched some mercenaries to prolong the conflict between Timoleon and the tyrants. But it soon ended ( 338 в.c.) in the defeat of Hicetas, who was taken prisoner and put to death, and in a treaty which confined the dominion of Carthage in Sicily to the west of the Halycus (Platani). Timoleon, having put down the despots and given freedom to the Greek cities of Sicily, retired into private life, though he remained practically supreme not only at Syracuse but throughout Sicily. This island, notwithstanding the many elements of discord which political revolution, with the return of exiles and the influx of new settlers, must have brought in, seems to have been during Timoleon's lifetime tranquil and contented. There are some characteristic stories told of his last days. Although blind, le used to come in his car into the assembly in the theatre and give his opinion, which was commonly accepted by a unanimous vote. An officious person once insisted on his giving the ordinary bail in a lawsuit; but he replied that he had himself always been the consistent champion of law and of legal righta for them all. Again, when his military strategy was unfavourably criticized, he expressed his gratitude to beaven that he had won for the Syracusans the privilege of liberty of speech. He died in 337; and was baried at the cost of the citizens of Syracuse, who erected a grand monument to his memory in their market-place.

Platarch's Life of Timoleon and portions of Diodorus Siculus are our chief sonrces of original information. There is an admirable and most interesting account of his life and work in chap. kxxv. of Grota's History of Grecece.
TIMON of Athens, a noted misanthrope, lived during the Peloponnesian War. He is more than once alluded to by Aristophanes and other comedians of the Attic stage.

Plutarch takes occasion to introdnce a short account of his life in the biography of Mark Antony (ch. 70), and he gives his name to one of Lucian's dialogues. Shakespeare probably derived his knowledge of Timon mainly from Plutarch; but the Timon of Shakespeare resembles the Timon of Lucian in so many points that some critics think Shakespeare (or whoever wrote the first sketch of the play) must bave had access to the dialogue in question.

TIMON of Phlius, the well-known sillograph and sceptic philosopher, flourished about 280 b.c. He studied philosophy under Stilpo the Megarian and Pyrrho of Elis, the famous sceptic. . Thereafter he spent some time in Cbalcedon, where he made a fortune by teaching and lecturing. The rest of his life was passed chiefly at Athens, where he died at an advanced age.
The writings of Timon, if we may trust Diogenes Laertius (ix) ch. 12), were exccedingly numerous both in prose and in verse: besides the EANot, he is asserted to have written epic poems, tragadies, comedies, satyric dramas, and other varieties. But he is best known as the author of the $\operatorname{sindo}$ or sarcastic hexameter verses written sgainst the Greek philosophers. They were divided into three books; in the first the author spoke in his own person, while in the second and third Xencphanes of Colophon replied to inquiriea addressed to him by Timon about early and late plilosophera. From the fragnents that remain (about 140 lines or parts of lines, printed in Mullach, Frag. Phil. Grac., i pp. 84.98) we see that Timon possessed some of the qualities of a greab satirist together with a thorough command of the hexameter ; but there is no trace of any loftier ain than to awaken derisive langhter. Philosophers are "excessively cunaing murderera of many mise saws " (ver. 96) ; the only two whom he spares are Xenophanes, "the modest censor of Homer's lies" ( r .29 ), and Pyrrho, against whom "no other mortal dare contend" ( F . 126). Besides the £ $n \lambda 0 t$ te have some lines preserved from the 'Ivoan $\mu 0$, a poem in elegiac verse, which appears to have inculcated the tenets of scepticism, and one or two lines or parts of lines which cannot be with certainty assigned to either poem.

TMMOR, an island of the East Indian Archipelago, the easternmost and largest of the lesser Sundanese group, stretching south-west and north-east for 300 miles between $8^{\circ} 40^{\prime}$ and $10^{\circ} 40^{\circ}$ S. lat. and $123^{\circ} 30^{\prime}$ and $127^{\circ}$ E. long. It has a mean breadth of 60 miles, an area of over 11.000 square miles, and a population roughly estimated at about 500,000 . Timor lies in deep water a little to the west of the hundred fathom line, which marks in this direction the proper limit of the shallow Arafura Sea, flowing between it and northern Australia. It differs considerably from the other members of the Sundanese group both in the lie of its main axis (south-west and north-east instead of west and east), and in the great prevalence of old rocks, such as schists, slates, sandstones, carboniferous limestones, and other more recent sedimentary formations, and in its correspondingly slighter volcanic character. It comes, howover, within the great volcanic zone which sweeps in a vast curve from the northern extremity of Sunatra, throu fo Java and the other Sundanese islands, round to Amboina, Tidor, Ternate, Jilolo, and the Philippines. Tnere appear to be at least two quiescent and other extinct cones, and the surface is everywhere extremely rugged and mountainous, with numerous irregular ridges from 4000 to 8000 feet high, formang alogether a very confused orographic system. Mount Kabaiaki in the eastern district of Manufahi rises above 10,000 feet (H. O. Forbes) ; the culminating point appcars to be Mount Allas ( 11,500 feet) near the south coast. Owing to the prevalent dry easterly winds from the arid plains of North Australia, Timor, like Ombay, Flores, and other neighbouring islands, has a much drier climate, with a correspondingly poorer vegetation, than Java, and bas few pcrennial streams and no considerable rivers. Hacce, apart from almost untouched and unsurveyed stores of mineral wealth, such as iron, copper, and gold, which occur apparent.y in considerable quantities at several points, tho island is poor in patu:al respurces. The uplands, however.

Vheld good wheat and potatoes, while the woodtands, which nowhere form veritable forests, contain much excellent sandalwood. This and a noted breed of hardy ponies form the clief articles of export. Owing doubtless to the zone of deep water flowing letween Timor and the Arafura Sea, the fauna of Timor presents, beyond a marsupial cuscus, scarcely any Australian types. The few mammals, such as a deer, a civet, a pig, a shrew, and monkeys, as well as the birds and insects, resemble ordinary Malayan forms as met with in Java and mose especially in Celebes and the Moluccas. In its natural history, as well as its physical constitution and oceanic surroundings, Timor is thus eutirely separated from Australia and should perhaps be grouped with Celebes, Buru, Ceram, and Jilolo as the surviving fragments of a Miocene continent intervening between Asia and Australia, but at no time connected with either.
The bulk of the popnistion is certainly Papan, hut intermingled in the most varied proportions with Malayan, Indonesian, and other elements ; heace it presents an extraordinary diversity of physical types, as is clearly ehown by the portraits figured in H. O. Forbes's Naturalist's Wenderings in the Eastern Archipeclago. The natives, still mainly indepeadeat of their nominal Dutch aad Portuguese rulers, are divided into a large number of more or less hostile tribes, speaking as many as forty distinct Papuan and Malayan languages or dialects Some are extremely rude and still eddicted to head-hnnting, at least duriag war, and to other barbarous practices. In their uma-luli, or sacred (tabooed) enclosures, rites are performed resembling those of the Pacific islanders.
Politically Timor is divided between Holland and Portugal, the Dutch claiming the westera section of 4500 square miles and 200,000 in halitants, the Portuguess the eastern of nearly 6500 equare miles and 300,000 inhabitants; the respective capitals, centres of goverament, and outports are Kupang st the western extremity and Deli on the north-east coast. But there are a large number of practically iddependent petty states, as masy as forty-seven in the Portuguese territory alone, where they take the name of "renos," or kingdoms, under absolute "leoreis" or kinglets. The Dntch section forms with Sumba, Savu, Rotti, and the surronnding islets a residency administered by a Dutch resident stationed at Kupaug, which has a population of 8000 .
TIMOR LAUT ("Seaward Timor"), called also Teninger, an insular group in the East Indian Archipelago, forming the central and largest link in a double chain of islands which strit ches from Timor through Kel and Aru to New Guinea. it lies nearly midway between Timor and Aru, and forms, hot one continuous mass, as used to be supposed, but a group of three large islands, -Yamdena in the centre, separated by Wallace Channel from Larat in the north and by Egeron Strait from Selarn in the south, besides a cluster or chain of islets on the rest and north sides. From one of these the name Tenimber appears to have been extended to the whole group, which stretches for about 100 miles south-west and north-east, nearly parallel with Timor, from which, however, it differs altogether in its physical constitution. H. O. Forbes, who surveyed Wallace Channel and the northern districts in 1882, describes it as a low coralline group seldom rising above 100 feet, except at Egeron Strait, where the cliffis are 400 feet high, and at Laibobar, apparently a volcanic islet on the west side, which has an extinct crater 2000 feet high. There are no streams, and the poor soil, covered with a typically coral island flora, yields little beyond maize-the staple food-manioc, sweet potatoes, tobacco, some sugar-cane, cotton, and a little rice. The fauna includes buffaloes in a wild state, a marsupial cuscus, some bats, the beautiful scarlet lory, new or rare varieties of the ground-thrush, honey-eater, and oriole. The birds seem to have come mainly from New Guinea, the insects from Timor, and a few of both from Australia.
The aborigines are eridently Papuans, with a ienguage like that of the Kei Islanders ; but there is a large intermingling of Malayau and perhaps Indonesian elements. They are a fine race, often ever 6 feet, and, like all Papuans, noted for their artistic sense, which is shown especially in their wood and ivory carviags. In other respects they are pagans in a low atato of culture, mostly
divided into hostile communities and addicted to piracy. The group belongs to the Dutch, who have a "post-holder" stationcl at Ritabel on the west coast of Larat, a trading station of the Bughis from Celebes.

ThMOTHEUS, a distinguished Athenian general, was a son of Conon, who restored the walls of Athens. To the military qualities of his father he added a love of letters, which found scope in his friendship with Isocrates. The considerable fortune which he inherited from his father seems to have been exhausted by him in the public service. In 375 b.c. the Athenians, then at war with Sparta, sent Timotheus with a fleet to the Ionian Sea, where he gained over Cephalonia and secured the friendship of the Acarnanians and of Alcetas, king of the Molossians. He also made himself master of Corcyra, but used his victory with a moderation which won the goodwill of the conquered. At the same time he defeated a Spartan fleet at Alyria on the Acarnanian coast. In 373 he was appointed to the command of a fleet destined for the relief of Corcyra, then beleaguered by the Spartans. But his ships were not fully manned, and to recruit their strength he first cruised in the Egean. The delay excited the indignation of the Athenians, who brought him to trial ; but, thanks to the exertions of his friends, Jason, tyrant of Pheræ, and A1cetas, king of the Molossians, both of whom came to Athens personally to plead his cause, he was acquitted, but removed from the command, Iphicrates being appointed in his room. Being reduced to great poverty-for he had pledged his private property in order to put the fleet in an efficient state-he left Athens and took service with the king of Persia. We next hear of him in 367 or 366 , when he was sent by the Athenians with an armament to support Ariobarzanes, satrap of Phrygia. But, finding that the satrap was in open revolt against Persia, Timotheus abstained from helping him and turned his arms against Samos, which was occupied by a Persian 'garrison. Ho took it after a ten months' siege ( 365 B.c.). Sailing north, he then captured Sestus, Crithote, Torone, Potidæa, Methone, Pydna, and many more cities. In 358 or 357 , when Eubcea was in danger of falling into the lands of Thebes, the Athenians, in response to a spirited appeal of Timotheus, crossed over into the island and expelled the Thebans in three days. In the course of the Social War, which broke out shortly afterwards, Timotheus was despatched with Iphicrates, Menestheus, son of Iphicrates, and Chares to put down the revolt. The hostile fleets sighted each other in the Hellespont ; but a gale was blowing, and Iphicrates and Timotheus decided not to engage. Chares, disregarding their opposition, lost many ships, and in his despatches he incriminated his colleagues so bitterly that the Athenians recalled them and put them on their trial for having taken bribes from the enemy to betray the fleet. The accusers were Chares and Aristophon. The former was an officer of notoriously bad character; the latter had himself stood in the dock no less than seventyfive times. Iphicrates was not above browbeating the jury, who accordingly acquitted him and his son. Timatheus, who condescended to no such means of securing an acquittal, was condemned to pay a very heary fine. Being unable to pay, he withdrew to Chalcis. The time and place of his death are not mentioned by ancient writers. The Athenians afterwards did what they could to repair the wrong they had done to Timotheus by remitting the greater part of the fine to his son Conon, by burying his remains in the Ceramicus, and by raising statues to his memory in the agora and the acropolis.
Our materials for the life of Timotheus are very imperfect, and the chronology is in eome points nncertain. The chief anthoritics are Isocrates, $\mathrm{r}_{\mathrm{C}, \mathrm{I}} \mathrm{\Sigma} \mathrm{\nabla} ;$; Xenophon, Hellenica, $\mathrm{\nabla}$. and iv. ; Diodorus, xv. and xvi.; Cornelius Nepos, Vit. Tim.; and Polyenns, , Strat, iii. 10. Other scraps are to be gleaned from the orators, Plutarch, Sce The sneech Aaainst Timotheus which has come down to as
nider the name of Démosthenes is probably not by the orator. It is chiefly interesting as illustrating the straits to which Timotheus whas reduced by his aacrifices in tho public causc.

TIMOTHEUS, a celebrated Greek musician and poet, was a native of Miletus, and died, according to the Parian marble, in 357 or 356 B.C., at the age of ninety. He added one or more strings (the number is uncertain) to the lyre, whereby he incurred the displeasure of the conservative Spartans. The few fragments of his poems are collected by Bergk in his Poetx Lyrici Graci.

TLMOTHY, or Tinothecs (Acts xvi. 1, xvii. 14, dec.), a Lycaonian, the son of Centile father but of a Jewish mother, Eunice (2 Tim. i. 5), became a disciple of Paul at the time of his visit to Derbe and I vstra, and in deference to Jewish fecling was circumcised. Ife accompanied the apostle on many of his journeys, and was employed by him on important missions (1 Thess. iii. 2 ; 1 Cor. iv 17, xvi. 10). His name is associated with that of Paul in the opening salutations of both epistles to the Thessalonians, the second epistle to the Corinthians, and those to the Philippians and Colossians. He was therefore with Paul at Rome. At a later date he is mentioned in Heb. xiii. 23 as having undergone imprisonment but been released. For the epistles of Paul to Timothy, sec Pastoral Epistles (rol. xviii. p. 348). On the basis of them he is traditionally represented as bishop of Ephesns, and tradition also tells that he suffered under Domitian. His martyrdom is celebrated on 24th Jannary. The apocryphal Acta Timothei (Greek and Latin) have been edited by Usener (Bonn, $187^{7}$ ) ; compare Lipsius, Apokr. Apostclgeschichten, ii. 2 (1884).

TijićR. Timúr Bey or Tmúr Lang (Tiinur i Leng), "the lame Timur"-vulgarized into Tamerlane-the renowned Oriental conqueror, was born in 1336 at Kesh, better known as Shahr-i-Sabz, "the green city," situated some 50 miles south of Samarkand in Transoxiana. His father Teragai was head of the tribe of Berlas. Greatgrandson of Karachar Nevian (minister of Jagatai, son of Jenghiz Khan, and commander-in-chief of his forees), and distinguished among his fellot-clansmen as the first convert to Islamism, Teragai might have assumed the high military rank which fell to him by right of inheritance; but like his father Burkul he preferred a life of retirement and study. Under the paterial ege the education of young Timur was such that at the age of twenty he had not only become an adept in manly outdoor exercises but had earned the reputation of being an attentive reader of the Koran. At this period, if we may credit the Memoirs (Malfuzat), he exhibited proofs of a tender and sympathetic nature.

About 1358, however, he came before the world as a leader of armies. His cafeer for the next ten or eleven years may be thus briefly summarized from tho Memoirs. Allying himself both in cause and by family connexion with Kurgan, the dethroner and destroyer of Kczan, chicf of the Jagatai, he was deputed to invade Khorasan at the head of a thousand horse. This was the second warlike expedition in which he was the chief actor, and the accomplishment of its objects led to fuither operations, among them the subjection of Khwarizm and Urganj. After the murder of Kurgan the contentions which arose among the many claimants to sovereign power wero arrested by the invasion of Tughlak Timúr of Kashgar, a descendant of Jenghiz. Iimúr was despatched on a mission to the invader's camp, the result of which was his own appointment to the government of Mámarálnalir (Transoxiana). By the death of his father he was also left hereditary head of tho Berlas. The exigencies of his quasi-sovereign position compelled him to have recourse to his formidable patron, whose reappearance on the banks of the Sihon
crcated a consternation not easily allaycd. Máwarálnahı was taken from Timúr and entrusted to a son of Tughlak; but he was defeated in battle by tho bold warrior he had replaced at the head of a numerically far inferior force. Tughlak's death facilitated the mork of reconquest, and a few years of perseverance and energy sufficed for its accomplishment, as well as for the addition of a rast extent of territory. During this period Timur and his brother-in-law, Hosain-at first fellow-fugitives and wanderers in joint adventures iull of interest and romancebecame rivals and antagonists. At the close of 1369 Hosain was assassinated and Timúr, having been formally proclaimed sovereign at Balkh, nounted the throne at Samarkand, the capital of his dominions.

The next thirty years or so wero spent in varıous wars and expeditions. He not only consolidated his rule at home by the subjection of intestine foes, but sought extension of territory by encroachments upon the lands of contemporary potentates. His concpuests to the west and north-west led him among the Mongols of the Caspian, and to the banks of the C'ral and the Volga; those to the south and south-west comprehended almost every province in Persia, including Baghdad, Kerbela, and Kurdistan. To this time belong the vestiges of his presence that still remain, such as the ruined monastery at Keghut near the Aras (Araxes), the eleft stone in the church at Dayiru 'l-- Omar (M'ar Jibrail) near Mardin, and the ruinless sites of such ancient cities as Zaranj in Sistan. In 1398, when Timúr was more than sixty years of age, Farishta tells us that, "informed of the commotions and civil wars of India," he "began his expedition into that country," and on 12 th September "arrived on the banks of the Indus." His passage of the river and upward march along the left bank, the reinforcement he provided for his grandson Pir Mohammed (who was invested in Multann), the capture of towns or villages accompanied, it might be, with destruction of the houses and the massacre of the inhabitants, the battle before Delhi and the easy victory, the triumphal entry into the doomed city, with its outcome of borrors, all these circumstances belong to the annals of India. In April 1399, some three months after quitting the capital of Mahmúd Tughlak, Timúr was back in his own capital beyond the Oxus. It need scarcely be added that an immense quantity of spoil was conreyed array. According to Clavijo, ninety captured elephants were employed merely to carry stones from certain quarries to enable the conqueror to erect a mosque at Samarkand. The war with the Turks which succeeded the roturn from India was rendered notable by the capture of Baghdad, Aleppo, and Damascus, and especially by the defeat and imprisonment of Sultan Bayazid. Chis was Timur's last campaign. Another was projected against China, but the old warrior was attacked by fever and ague when encamped on the further side of the Sihon (Syr-Daria) and died at Atrar (Otrar) on the 17th February 1405. Markham, in his introduction to the narrative of Clavijo's cmbassy, states that his body "was embalmed with musk and rose rater, wrapped in linen, laid in an ebony coffin, and sent to Samarkand, where it was buried." Timur had carried his victorious arms on one side from the Irtish and the Volga to the Persian Gull and on the other from the Hellespont to the Ganges.
Timúr's generally recomized biographers are-'Ali Yazdi, commouly called Sharifu d-Din, author of the Persian Zafarnama, translated by Petis do ls Croix in 1722 , and from French Mohamged by J. Darby iu tho 1ollowng year; and Ahmed inn Ibn 'Arabshăh, anthor of tho Aralic 'A juibu 'l Alakhinkal', called lated by the Dutch Orientalist Golius in 1636 . In tho work of the former, as Sir William Jones remarks, "the Tartarian conqueror is represented as a libers), benevolent, and illustrious prince " in that of the latter ho is "deformed and impious, of a low birth and that of the latter he is "deformed and latuphe favourable account was mriten
a.ader the personal supervision of Timúr's grandson, Ibrihim, while the other was the production of his direst enemy. Few indeed, if any, original annals of this class are written otherwise than to order, under patronage, or to serve a purpose to which truth is secondary. Among less reputed biographies or materials for biography may be mentioned a second Zafarndma, by Maulána Nizamn "d-Din Shanab Gházȧni (Nizám Shámi), stated to be "the earliest known history of Timur, and the only one written in his lifetime"; and vol $\dot{i}$. of the Malln'u's-Sa'dain-a choice Persian MS. work of 1495--introduced to Orientalists in Europe by Hammer, Jahrbücher, Dorn, and (notably) Quatremère. There are also the Memoirs (Mfalfüoki) and Institutes (Tuzukát), of which an important section is styled Designs and Enterprises (Tadbirdt wa Kangdshahd). Upon the genuineness of these doubt has been thrown. The circumstance of their alleged discovery and presentatiou to Shah Jahan in 1037 was of itself open to suspicion. Alhazen, quoted by Purchas in his quaint notice of Timur, and referred to by Sir John Malcolm, can hardly be accepted as a serious anthority. His assumed memoir mas printed for English readers in 1597 by William. Ponsonby under the title of a Historie of the Great Emperor Tamerlan, drawn from the ancient monuments by Messire Jean du Bec, Abbot of Mfortimer; and another version of the same book is to be fonnd in the Histoire du Grand Tamerlan, by De Sainctyon, published at Amsterdam in, 167s. Bnt, althongh the existence of this Alhazen of Jean de Bec has been believed by many, the more trustworthy critics consider the history and historian to be equally fictitious.

Reference may be made to two more sourees of information. i1) Supposed likenesses of Timúr are to be found in books and in the spleudid collection of Oriental manuseripts and drawings in the British Mnsenm. One contained in the Shah Jahin Nama-s gorgeous specimen of illuminated Persian msnuscript and exquisito caligraphy - represents a most ordinary, middle-aged Oriental, with narrow black whisker fringing the cheek and meeting the tip of the chin.in a scanty, pointed beard; a thin moustache sweeps in-a semicircle from above the upper lip; the eyebrow over the almond-shaped eje is marked but not bushy. But it were vain to seek for an expression of genius in the comntenance. Another portrait is included in a set of sketches by native artists, some of which, taken probsbly from life, show great care and cleverness. Timúr is here displayed as a stoutish, long-bodied man, below the middle-height, in age and feature not unlike the first portrait, but with thicker and more straggling hair, and distincter, though not more agreeable character in the facial expression, yet not a sign of power, genius, or any elements of grandeur or celebrity. The uncomfortable figure in the Rodleian Library does not give much help. Sir John Malcolm has been at some pains to invest his portrait of Timúr with individuality. But an analysis of his results leares the reader in more perplexity than satisfaction at the kind of information imparted, and he reverts insensibly to the sources from which his instructor has himself been instructed. (2) As regards plays, in Marlowe's Tamburlaine Timur is described as taill of stature, straightly fashioned, large of limb, having joints strongly knit, long and sinewy anns, a breadth of shoulders to " bear old Atlas's burden," pale of complexion, and with "amber hair Frapp"d in curls." The outline of this description might be from Sharifu 'd-Dín, while the colours are the poet's own. A Lstin memoir of Tamerlane by Perondiuns, printed in 1600: entitled Magni Tamerlauis Scythamum Imperatoris Vita, deescribes Timúr as tall and bearded, broad-chested and broadshouldered, well-built but lame, of a fierce conntenance, sud with receding eye3, which express cruelty and strike terror into the lookers-on. But Jean du Bec's account of 'Timúr's appearance is quite different. Now Tamburlaine was written in 1586. The first English trsuslation of Jean du Bec is dated in 1595 , the Life by Perondinus in 1600 , snd Petis de la Croiz did not introduce Sharifu 'd-Din or 'Ali Yazdi to European readers till 1722. The dramatist must hare heard of Timur in other quarters, equslly reliable it may be with those available in the present stage of Oriental research. At the beginning of the 18 th century Timir was represented in Rowe's Tamerlane as a model of valour and virtue. The plot, however, has little to do with history, and is jmprobable and void of interest. By Mstthew Gregory Lewis again "Timour" is depicted as the conventionsl tyrant of a gorgeous melodrama, slaying, burning, slsughtering, snd commitfing every possible atrocity until checked by violent death and a poetical climax.
Apart from modern European savants and historians, and the more strictly Oriental chroniclers who have written in Persisn, Turkish, or Arabic, the following anthorities may be cited-Laonicus Chalcondylas, Joannes Leunclavius, Joachimus Camerarius, Petrus Perondinus, Lazàro Soranzo, Simon Mairlus, Matthew Michiovins. A score or so of other names are given by Samuel Purchas. See also Clements Markham's Clarijo, in the Hakluyt Society's pablications; White's edition of Dary's translation of the Institutes (1783) ; Stewart's trsnslation of the Malfirdi; Mslcolm's History of Persia; sid Trans. Roy. Soc., 1885.
'F, J. G.)

TIN (Lat. stannum, whence the chemical symbol "Sn"; atomic weight $=117 \cdot 6,0=16$ ), being a component of bronze, was used as a metal thousands of years prior to the dawn of history. But it does not follow that prehistoric bronzes were made of metallic tin. When the unalloyed metal was first introduced cannot be ascertained with certainty. All we know is that about the 1st century the Greek word кa夫бitcpos designated tin, and that tin was imported from Cornwall into Italy after, if not before, the invasion of Britain by Julius Cæsar. From Pliny's writings it appears that the Romans in his time did not realize the distinction between tin and lead: the former was called plumbum album or candidunt to distinguish it from plumbum nigrum (lead proper). The word stannum definitely assumed its present meaning in the 4 th century (H. Kopp).

Grains of metallic tin occur as a subordinate admixture in the gold ores of Siberia, Guiana, and $\cdot$ Bolivia Of tin mineral compounds (which are not numerous) tinstone, $\mathrm{SnO}_{2}$, is the most important; besides it only tin pyrites, which, according to Rammelsberg, exists in two varieties, $\mathrm{FeCu}_{2} \mathrm{SnS}_{4}$ and $\mathrm{ZnFeCu}_{4} \mathrm{Sn}_{2} \mathrm{~S}_{8}$, need be named here.

Tinstone or Cassiterite. - This native oxide of tin, $\mathrm{SnO}_{2}$, forms very hard quadratic crystals of specific gravity 6.8 . The pure mineral is colourless, and it is very scarce; most specimens are brown owing to the presence of ferric or manganic oxide. The faces of the crystals exhibit diamond lustre. There is also another native form, known as " wood tin, ${ }^{\nu}$ occurring in roundish masses with a fibrous radiating fracture. The ore is found in veins or layers within the older crystalline rocks and slates. Being much more highly proof against the action of water and carbonic acid than its matrix, the ore often presents itself in loose crystals as part of the sand of rivers (stream tin). The oldest known deposit of tinstone is that of Cornwall, where it occurs in granite and in the "killas" (a kind of metamorphic clayish slate), associated with wolframite, apatite, topaz, mica, tourmaline, arsenide of iron, and other minerals. Cornish tin ure is characteristically rich in arsenic. Minor European deposits occur in the Erzgebirge, in Brittany, and in Galicia (Spain). A very considerable deposit of pure ore (chielly stream tin) exists in the island of Banca; and in Malacca tinstone is found. Other relatively abundant deposits occur in Bolivia and Pern, and in Queensland and New South Wales (lately discovered).

Retallurgy. - In the extraction of tin frum tinstone ore the first step is to pound the crude ore and wash away the lighter gangue with water (see Metalidrgy, vol. xti. p. 59). The washed ore is "roasted" to burn away the arsenic and sulphur and to convert the iron, originally present in the heary and compact form of pyrites or arsenide, into light friable oxide, which is removed by a second washing process. If much oride of copper is contained in the product, it is extracted with dilute sulphuric acid, and from the solution is recovered by precipitation with metallic iron (see Copper, vol. vi. p. 347). The purified ore, knorrn as "black tin," goes to the smelting furnace. During the roasting process the ore must be constantly agitated to prevent caking, and to bring the arseniferous, dec., parts to the surface. To save manual labour, Oxland and Hocking have constructed a mechanical roaster. It consists of a slanting tube of boiler-iron, coated inside with fire-brick. The lower end opens into the fire-place; the upper communicates with a set of chambers for the condensation of the white arsenic produced. The washed ore, after being dried on the top of the chamber, is run thence by a funnel into the pipe, which is made to rotate about its axis from three to eight times per minute. Before the ore has travelled far down the arsenic and sulphur catch fire, and by the time it reaches the bottom it is fully roasted. It falls into a receptecle below the level of the
fire. Of the impurities of the ore the wolframite (tungstate of iron and manganese) is the most troublesome, because on account of its high specific gravity it cannot be washed away as gangue. To remove it, Oxland fuses the ore with a certain proportion of carbonate of soda, which suffices to convert the tungsten into soluble alkaline tungstate, without producing noteworthy quantitics of soluble stannate from the oxide of tin; the tungstate is easily removed by treatment with water.

Smeling.-The purified ore is mixed with about onefifth of its weight of anthracite smalls, the misture being moistened to prevent it from being blown off by the draught, and is then fused on the sole of a reverberatory furnace for five or six hours. The slag and metal produced are then run off and the latter is cast into bars; these are in general contaminated with iron, arsenic, copper, and other impurities. To refine them, the bars are heated cautiously on an inclined hearth, when relatively pure tin runs off, while a skeleton of impure metal remains. The metal run off is further purified by poling, i.e., by stirring it with the branch of a tree, -the apple tree being preferred traditionally. This operation is no doubt intended to remore the oxygen difflused throughout the metal as oxide, part of it perhaps chemically by reduction of the oxide to metal the rest by conveying the finely diffused oxide to the surface and causing it to unite there with the oxide scum. After this the metal is allowed to rest for a time in the pot at a temperature above its freezing point and is then ladled out into ingot forms, care being taken at each stage to ladle of the top stratum. The original top stratum is the purest, and each succeeding lower stratum has a greater proportion of impurities; the lowest consists largely of a solid or semi-solid alloy of tin and iron.

To test the purity of the metal, the tin-smelter heats the bars to a certain temperature just below the fusing point, and then strikes them with a hammer or lets them fall on a stone floor from a given height. If the tin is pure it splits into a mass of granular strings. Tin which has been thus manipulated and proved incidentally to be very pure is sold as grain tin. A lower quality goes by the name of block tin. Of the several commercial varieties Banca tin is the purest; it is indeed almost chemically pure. Next comes English grain tin. For the preparation of chemically pure tin two methods are employed. (1) Commercially pure tin is treated with nitric acid, which converts the tin proper into an insoluble hydrate of $\mathrm{SnO}_{2}$, while the copper, iron, \&c., become nitrates; the oxide is washed first with dilute nitric acid, then with water, and is lastly dried and reduced by fusion with black flux or cyanide of potassium (2) A solution of pure stannous chloride in very dilute bydrochloric acid is rcduced with a galvanic current. According to Stolba, beautiful crystals of pure tin can bo obtained as follows. A piutinum basin, coated over with wax or paraffin outside, except a small circle at the very lowest point, is placed on a plate of amalgamated zinc, lying on the bottom of a beaker, and is filled with a solution of pure stannous chloride. The beakcr also is cautiously filled with acidulated water up to a point beyond the edge of the platinum basin. The whole is then left to itself, when crystals of tin gradually scparate out on the bottom of the basin.
Properties of Pure Tin. - Au ingot of pure tin is pure white (except for a slight tinge of blne); it exhibits conside abable lustre and is not subject to tarishing on exposure to normal sir. The metal is pretty soft and easily flattened out under the hammer, but almost devoid of tenscity. That it is elastic, within narrow limits, is proved by its clesr ring when struck with a hard body nader circumstances permitting of free vibration. The specific gravity of iogot tin is 7.293 at $13^{\circ} \mathrm{C}$. (Mathiesson). A tin ingot thoogh semingly amor. phous, has a crystalline structure, consisting of an aggregate of ${ }_{q}$ quaudratic octahdedra; hence tha chsracteristic crackling noiso which
a bar of tin givee out when being bent. This stracture can be readered visible by superficisl etching with dilate acid. As the minuter cryetals dissolve more quickly than the larger ones, the eurface assumes a frosted sppearance (moirée métallique), not nalike that of 2 frozen window-pane in winter time. Its cryatalline structure must account for the otriking fact that the ingot, when exposed for a sufficient time to very low tomperstures (to $-39^{\circ} \mathrm{C}$. for 14 hours), becomes so brittle that it falls into powder under a pestle or hammer; it indeed sometimes crumbles into powder epontadeously. At ordinary temperatures tin proves fairly ductile under the hammer, and its ductility eeems to increaso as the temperature rises up to about $100^{\circ} \mathrm{C}$. At some temperature near its fusing point it becomes brittle (vide supra), and still more brittle from $-14^{\circ} \mathrm{C}$. downwards. This behaviour of the metal msy probably be explained by assuming that in any tin crystal the coefticient of thermic expansion has ane value in the direction of the priacipal axis and soother in that of either of the eubsidiary axes. From $0^{\circ}$ to $100^{\circ}$ th two caefficients are practically identical; below $-14^{\circ}$ and from somewhere above $100^{\circ}$ C. upwards they assunie different values; and, as the sevaral crystals are oriented in a lawless fashion, this must tead to disintegrate the mass. Tin fuses at $232^{\circ} \cdot 7$ (Persoz); at a red heat it begins to volatilize elamly ; at $1600^{\circ}$ to $1808^{\circ} \mathrm{C}$. (Carnelley and Williams) it boils. The hot vapour produced combines with the oxygen of the air into white oxide, $\mathrm{SaO}_{2}$

Industrial Applications. - Commercially pura tin is used (principally in Germany) for the making of pharmaceutical apparatus, buch as evsporating basins for extracts, infusion pats, etills, \&c. It is also employed for making two varieties of tin-foil,-one for the eilvering of mirrars (see MIrror, vol. xvi. p. 500), the other for wrapping up chocolate, toilet soap, tobacco, \&c The mirror foil must contain some copper to prevent it from being too readily amalgamated by the mercury. For making tin-foil the metal is ralled into thin sheets, pieces of which are beaten out with s wooden mallet. As pure tin does not tarnish in the air and is proof against acid liquids, such as vinegar, lime juice, \&c., it is utilized for culinary and domestic vessels. But it is expensive, sad tin vessela have to be made very heavy to give them sufficient atability of form ; hence it is generally employed merely as a protecting coating for utensils msde essentially of copper or iron. The tinning of a copper basin is an easy operation. The basin, made acrupulously clean, is heated over a charcoal fire to beyond the fusing point of tin. Molten tin is then ponred in, a littla powdered sal-ammoniac added, and the tin epread over the inside with a bunch of tow. The salammoniac remores the last unsvoidable film of oxide, leaving a purely metallic surface, to which the tin sdheres firmly. For tinning emall objects of copper or brass (i.e., pins, hooks, \&c.) a wet-way process is followed. One part of cream of tartar, two of slum, and two of comman salt are dissolved in boiling water, and the solution is boiled with granulated metallic tin (or, better, mized with a little stannous chloride) to produce a tin aolution ; and icto this the srticles are put at a boiling leat. In the absence of metallic tin there is no visible cluange; but, ss soom as the metal is introduced, a galvanic action sets in and the articles get coated aver with a firmly adhering film of tin. Tinning wrought irou is effected by immersion. The most important form of the operation is masing tinned from ordinary sheet iron (making what is called "sheet tin "). The iron plates, having been carefully cleaned with sand and muriatic or sulphuric acid, and lastly with weter, are plunged into heated tallow to drive away the water withou't oxidation of the metal. They are next steeped in a bath, first of molten ferrugioous, then of pure tin. They are then taken out sad kept suspended in hot tallow to enable the surplus tin to rin off. The tin of the second bach dissolves iron gradnally and becomes fit for the first bath. To tin cast-iron articles they must be decarburetted superficially by ignition within a bath of ferric oxide (powdered hrmatite or similar material), then cleaned with acid, and tinned by immersion, as explained above. By far the greater part of the tin produced metallargically is used for msking tin alloye, the majority of which bave been treated of in preceding articles; see Lead, vol. xiv. p. 378 ; Pewter, rol. xviii. p. 725 ; Bronze, vol. iv. p. $366^{\circ}$; PHosphorus, vol. xviii. p. 817.

Tin Compounds. - The most important of these may be arranged into two classes, mamely, otannous compounds, $\mathrm{Sn} \mathrm{X}_{2}$, and stannic componads, SnX , where X stands for $\mathrm{Cl}, \mathrm{Br}, \frac{1}{2} \mathrm{O}$, \&cc. Stannous compounds are, in general at least, characteristically prone to pass into the stannic form by taking up additional $X_{2}$ in the form of oxyged, chlorine, sc.

Stannows Chloride, $\mathrm{SnCl}_{3}$. -This can be obtained pure only by heating pure tin in a current of pure dry hydrochloric acid gas. It is a white solid, fusing at $250^{\circ} \mathrm{C}$. and volatilizing at a red heat in nitrogen, a vacuum, or bydrochloric acid, without decomposition. The vapour density below $700^{\circ} \mathrm{C}$. corresponds to $\mathrm{Sn}_{2} \mathrm{Cl}$, a bove $800^{\circ} \mathrm{C}$. to nearly $\mathrm{SnCl}_{2}$ (Von Moyer snd Zuiblin). The chlorido readily combines with water into an easily soluble cryatallizs ble bydrate ("tin crystals"). This is made without diffculty by dissolving tin in atrong bydrochloric acid and allowing it to crystallize. For its industrial preparation Nöllner passes sufficiently bydrated hydro-
chloric acid gas over granulated tin contained in stoueware bottles and evaporates the concentrated solution produced in tin basins over granulated tin. The basin itself is not attacked. The crystals contain one $\mathrm{H}_{2} \mathrm{O}$ according to Berzelius, while Marignac finds two; probably both are right. The crystals are very soluble in cold water, and if the salt is really pure a small proportion of water forms a clear solution; but on adding much water most of the salt is decomposed, with the formation of a precipitate of oxy-chloride$2 \mathrm{SuCl}_{2}+3 \mathrm{H}_{2} \mathrm{O}=2 \mathrm{HCl}+\mathrm{Sn}_{3} \mathrm{OCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$.
According to Michel and Kraft, one litre of cold saturated solution of tin crystals weighs 1827 grammes and contaios 1333 grammes of $\mathrm{SnCl}_{2}$. The same oxy-chloride is produced when the moist crystals, or their solution, are exposed to the air ; by the action of the atmospheric oxjgen

$$
\mathrm{O}+3 \mathrm{SnCl}_{2}=\mathrm{Sn}_{2} \mathrm{Cl}_{2} \mathrm{O}+\mathrm{SnCl}_{5}
$$

Hence all tin crystals as kept in the laboratory give with water a turbid solution, which contains stannic in addition to stannous chloride. The complete conversion of stannous into stannic chloride may be effected by a great many reagents, - for iostance, by chlorine (bromine, iodine) readily; by mercuric chloride, $\mathrm{HgCl}_{5}$ in the heat, with precipitation of calonel, $\mathrm{HgCl}_{\text {, or metallic mercury ; by ferric }}$ chlowide in the lecat, with formation of ferrous salt, $\mathrm{FeCl}_{2}$; by arsenions chloride in strongly hydrochloric solutious, with precipitation of chocolate-brown metallic arsenic. All these reactions are available as tests for stannesum or the respective agents. In opposition to stannous chloride, even sulphurous acid (solution) behares as au oxidizing agent. If the tro reagents are mixed, a precipitato of yellow stannic sulphide is produced. By first intention

$$
\mathrm{SO}_{3} \mathrm{H}_{2}+3 \mathrm{Su}^{11} \mathrm{Cl}_{2}=3 \mathrm{Sn}^{I \mathrm{~V}} \mathrm{Cl}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{~L}
$$

The stannic oxy-chloride readily exchanges its O for $\mathrm{Cl}_{3}$ at the expense of the hydrochloric acid, which is always present, and the $\mathrm{H}_{2} \mathrm{~S}$ decomposes, one-half of a molecule of $\mathrm{SnCl}_{5}$ with formation of $\mathrm{SnS}_{2}$. A strip of metallic zinc when placed in a solution of stanDous chloride precipitates the tin in crystals and tales its place iu the solution. Stannous chloride is largely used in tho laboratory is a reducing agent, in dyeiug as a mordant.
Stannous Oxide.-Thia as a hydrate is obtained from a solution of stannous chloride by addition of carbonate of soda; it forms a white precipitate, which can be washed with air-free water and dried at $80^{\circ} \mathrm{C}$. without much change by oxidation. If the hydrate is heated in carbouic acid, the black anhydride SnO remains (Otto). Precipitated stannous hydrato dissolves readily in caustic potasla ley; if the solution is evaporated quickly, it suffers decomposition, with formation of metal and stannate,

$$
2 \mathrm{SnO}+\mathrm{K}_{2} \mathrm{O}=\mathrm{SnO}_{2} \mathrm{~K}_{2} \mathrm{O}+\mathrm{Sn}
$$

If it is evaporated slowly, anlydrous stannous oxide cryatallizes out at a certain stage (Otto). Dry stannous oxide, if touched with a glowing body, catches fire and burns into binoxide, $\mathrm{SnO}_{2}$. Stan. nous oxalate when heated by itself in a tulue leares stannous oxide (Liebig).

Stannic chloride, $\mathrm{SnCl}_{4}$ is obtained by passing dry chlorine over granulated tin contained in a retori; the tetrachloride distils over as a heary liquid, from which the excess of chlorine is easily remored by shaking with a simall quantity of tin filings and re-distilling. It is a colourless fuming liquid of specific gravity 2.269 at $0^{\circ}$ (Pierre) and 2.234 at $15^{\circ} \mathrm{C}$. (Gerlach), is fluid at $-29^{\circ} \mathrm{C}$., and boila at $115^{\circ} \cdot 4 \mathrm{C}$. under 753.1 mm . pressure (Pierre). The chloride uuites energetically with water into crystalline hydrates (ex. $\mathrm{SnCl}_{4}, 3 \mathrm{H}_{2} \mathrm{O}$ ), easily soluble in water. It combines readily with alkaline and other chlorides into double salts: thus $\mathrm{SuCl}_{4}+2 \mathrm{KCl}=\mathrm{SnCl}_{8} \mathrm{~K}_{3}$ avalogous to the chloro-platinate; another example is the salt $\mathrm{SnCl}_{6}\left(\mathrm{NH}_{4}\right)_{3}$, known industrially as "pink aalt," because it is used as mordant to produce a pink colour. The plain chloride solution ia similarly used. It is usually prepared by dissolving the metal is aqua regis.
Stannic Oxide, $\mathrm{SnO}_{2}$.-This, if the term is taken to include the bydrates, exists in a pariety of forms. (1) Tinslone (see above) is proof against all acids. Its disintegration for analytical purposes can bs effected by fusior with caustic alkali in silver, with the formation of soluble stamnate, or by fusion with sulphur and car. honate of soda, with the formatiou of a soluble thio-stannate, $\mathrm{Sn}_{2} \mathrm{~S}_{2}+\mathrm{XNa}_{2} \mathrm{~S}$. (2) A similar oxide is produced by burning tin in air at high temperatures or exposing any of the hydrates to a strong red heat. Such tin-ash, as it is called, is used for the polishing of optical glasses. (3) Metu-stannic acid $\left(\mathrm{H}_{3} \mathrm{OSnO}_{2}\right.$, generally written $\mathrm{H}_{10} \mathrm{Si}_{5} \mathrm{O}_{151}$ to account for the complicated composition of nietastannates, e.g., the soda salt $\mathrm{H}_{8} \mathrm{Na}_{3} \mathrm{Sn}_{5} \mathrm{O}_{15}$ ) is the white hydrate produced from the metal by means of nitric acid. It is insolnble inwater and in nitric acid aod apparently so in hydrochloric acid; but if heated with this last for somo time it passes into a hydro. chlorate, which, after the acid mother liquor has been decanted off, dissolves in water. The solution when subjected to distillation behares pretty much like a physlcal solution of the oxide in hydrochloric acid, whils a solution of ortho-stannic acid in hydrochloric ocid behaves like a solution of $\mathrm{SnCl}_{3}$ in water, i.e., gives of no bsdrochloric acid and no precipitats of hydrated $\mathrm{SnO}_{2}$. (4) Ortho.
stannic acid is obtained as a white precipitate on the addition of carbonate of soda or the exact quantity of precipitated carbona ${ }^{+} e$ of lime to a solution of the chloride. This hydrate, $\mathrm{SnO}_{2} \mathrm{H}_{2} \mathrm{O}$, is readily soluble in acids forming stannic salts, and in caustic potash and soda, with the formation of ortho-stannatea. Of these stannate of sodium, $\mathrm{N}_{2} \mathrm{SnO}_{2}$, is produced industrially by heating tin with Chili saltpetre and caustic soda, or by fusing very finely powdered tinstone with caustic soda in iron vessels. A solution of the puro salt yielda fine prisms of the composition $\mathrm{Na}_{2} \mathrm{SnO}_{3}+10 \mathrm{H}_{2} \mathrm{O}$, which eflloresce in tho air. The salt is much used as a mordant in dyeing and calico-printing. Alkaline and other stanates when treated with aqueous hydrofuoric acid are converted into fluo-stannates (c.g., $\mathrm{K}_{2} \mathrm{SnO}_{3}$ into $\mathrm{K}_{2} \mathrm{Sn}_{n}$ ), which are closely analogous to, and isomorphous with, tho-silicates.
Sulphides. - If tin is heated with sulphur the two unite very readily into stannous sulphide, SnS, a lead-grey mass, which under the circumstances reluses to take up more sulphur. But, if a mixture of tin (or, better, tin amalgan), sulphur, and sal-ammoniag in proper proportions be heated, stamnic sulphide, $\mathrm{SaS}_{2}$, is produced is the beautiful form of aurum musirum (mosaic gold), -a solid consisting of golden yellow, metallic lustrous scales. 1t is used chiefly as a yellow "bronze" for plaster-of-Paris statuettes, \&c.

Arulysis.-Tin compounds when heated on charcoal with carbonate of sods in the reducing blowpips flame yield metal and a scanty ring of white $\mathrm{SnO}_{2}$. The reduction, however, succeeds better with cyanide of potassium as a flux. Stannous salt solutions yield a bromn precipitato of SDS with sulphuretted hydrogen, which is insoluble in cold dilute acids and in real sulplide of ammonium, $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{~S}$; but the yellow, or the colourless reagent on addition of sulphur, dissolves the precipitate as $\mathrm{SuS}_{3}$ salt. The solution on acidification yields a yellow precipitate of this sulphide. Stannic salt, $\mathrm{SnCl}_{4}$, solutions give a yellow precipitate of $\mathrm{SnS}_{2}$ with sulphuretted hydrogen, which is insoluble in cold dilute acids but readily soluble is sulphido of ammonium, and is re-precipitated therefrom as $\mathrm{SnS}_{2}$ on acidification. Only stannous salta (not stannic) give a precipitate of calomel in mercuric chloride solution. A mixture of stannous and stannic chlorido when added to a sufficient quantity of solution of chloride of gold, gives an inteasely purple precipitate of gold purple (purple of Cassius), -a compound which, although kDown for centuries, is to this day little understood chemically. It lehaves on the whole like a compound of $\mathrm{SD}_{2} \mathrm{O}_{3}$ with $\mathrm{Au}_{2} \mathrm{O}$. The test is very delicate, although the colour is not in all cases a pure purple.
(W. D.)

TINAMOU, the name given in Guiana to a certain bird as stated in 1741 by Barrere (France Equinoxiale, p. 138), from whom it was taken and used in a more general sense by Buffon (Hist. Nat. Oiseaux, iv. p. 502). In 1783 Latham (Synopsis, ii. p. 724) adopted it as Englich, and in 1790 (Index, ii. p. 633) Latinized it Tinamus, as the name of a new and distinct genus. The "Tinamou" of Earrere has been identifed with the "Macucagua" described and figured by Marcgrave in 1648, and is the Tinamus majos of modern authors. ${ }^{1}$
Buffor and his successors saw that the Tinamous, though passing araong the European colonists of South America as "Partridges," could not be associated with those birds, and Latham's step, abore mentioned, was generally approred. The genns he had founded was usually placed among the Gallinx, and by many writers was held to be allied to the Bustards, which, it must be remembered, were then thought to be "Struthious." Indeed the likeness of the Tinamou's bill to that of the Raed (vol. xx. p. 506) was remarked in 1811 by Illiger. On the other hand L' Herminier in 1827 saw features in the Tinamou's sternum that in his judgment linked the bird to the Rallidx. In 1830 Wagler (Nat. Syst. Amphibien, \&c., p. 127) placed the Tinamous in the same Order as the Ostrich and its allies; and, though be did this on very insufficient grounds, his assignment has turned out to be not far from tho mark, as in 1862 the great affinity of these groups was shown by Prof. Parker's researches, which were afterwards printed in the Zoological Transactions (r. pp. 205-232, 236-238, pls. xxxix.-xli.), and was further substantiated by him in the Philosophical Transactions (1866, pp. 174-178, pl. xv.). Shortly after this Prof. Huxley in his often-quoted paper in the Zoological Proceedings (1867, pp. 425, 426)
${ }^{1}$ Brisson and after him Linnæus confounded this bird, which they had never seed, with the Trumpeter (q.v.).
was enabled to place the whole matter in a clear light, urging that the Tinamous formed a very distinct group of birds which, though not to be removed from the Carinatæ, presented so much resemblance to the Ratite as to indicate them to be the bond of union between those two great divisions. ${ }^{1}$ The gromp from the resemblance of its palatal characters to those of the Eare (rol. viii. p. 171), Dramæus, he called Dromæognathx, and his decision, if not his name, has since been widely accepted.

The Tinamous thus-by whatever name we call them, Dromao. amathe, Tinami, or Crypturi-will be seen to be of great impertance from a taxonomer's point of riew, thongh in regard to numbers they are comparatively insignificant. In 1873 Messrs. Sclater and Salvin in their Nomenclator (pp. 152, 153) recognized nine genera and thirty-nine species, siace which time about half a dozen other species zaay have been described ; but in 1880 Schlegel (Mrus. PaysBus, viii., Mlonegr. 41, pp. 1-51) would only admit five genera and thirty-one species-the latter because it was the number possessed by the Leyden museum. They are peculiar to the Neotropical Region-four species only finding their way into southern Mexico and none beyond. Some of them inhabit forests and others the nore open conntry ; but sctting aside size (which in this group varies from that of a Quail to that of a large common Fowl) there is an unmistakable uniformity of appearance among them as a whole, so that almost anybody having seen one species of the group would always recognize anether. Yet in minor characters there is considerable difference among them; and first of all the group may be divided into two sub-families, the first, Tinaminex, having four toes, and the second, Tinamutidine, haviog but three-the latter containing, so far as is known, but two genera, Calopcius and Tinamolis, each consisting of a single species, while the former, according to Messrs. Sclater and Salvin (ut supra), may be separated into seven genera, two being Tinamus and Nothoccreus, characterized by the roughness of their posterior tarsal scales, the others, Crypturus, Rhynchotus, Nothoproda, Nothura, and Taoniscus, having smooth legs.
To the ordinary spectator Tinamous have much the look of Partridges, but the more attentive observer will

Rufous tinamou (Rhynchotus rufescens).
notice that their elongated bill, their "small head and slender neck, clothed with very short feathers, give them a different air. The plumage is generally inconspicuous: some tint of brown, ranging from rufous to slaty, and often more or less closely barred with a darker shade or black, is the usual style of coloration; but some species are characterized by a white throat or a bay breast. The wings are short and rounded, and in some forms the feathers of the tail, which in all are Lidden by their corerts, are soft. In bearing and gait the birds show some resemblance to their distant relatives the Ratitx, and Mr

[^167]Bartlett shows (Proc. Zool. Soicty, 1868, p. 115, pl. xii.) that this is especially seen in the newly-hatched young. He also notices the still stronger Ratite character, that the male takes on bimself the duty of incubation. The eggs are very remarkable objects, curiously unlike those of other birds; and, as before stated (Birds, vol. iii. p. 775), their shell ${ }^{2}$ looks as if it were of highly-burnished metal or glazed porcelain, presenting also various colours, which secm to be constant in the particular species, from pale primrose to sage-green or light indigo, or from chocolatebrown to pinkish orange. All who bave eaten it declare the flesh of the Tinamou to have a most delicate taste, as it has a most inviting appearance, the pectoral muscles being semi-opaque. Of their habits not much has been told. Darwin (Journal, chap. iii.) has remarked upon the silliness they show in allowing themselves to be taken, and this is wholly in accordance with what Prof. Parker observes of their brain capacity, and is an additional testimony to their low morphological rank. At least one species of Tinamou has bred not unfrequently in confinement, and an interesting account of what would bave been a successful attempt by Mr John Bateman to naturalize this species, Rhynchotus rufescens, in England, at Brightlingsea in Essex, appeared in The Field (23d Feb. 1884 and 12th Sept. 1885). The experiment unfortunately failed owing to the destruction of the birds by fores.
(A. N.)

TINDAL, MÁtteew (1656-1733), one of the ablest and most popular of the English deists, the son of a clergyman, was born at Beer Ferris, Devonshire, in 1656. He studied law at Lincoln College, Oxford, where he came under the iofluence of the High Churchman George Hickes, dean of Worcester; and in his twenty-second year he was elected fellow of All Souls Collcge, and held his fellorship till his death. About 1685 he saw "that upon his High Church notions a separation from the Church of Rome could not be justified," and accordingly he joined the latter. But, discerning the baselessness and absurdity of Rome's claims, he returned to the Church of England at Easter 1688. In 1694 he published an Essay of Obedience ta the Supreme Powers, in which ho justified the Revolution against notions of passive obedience and jus divinum ; in 1697 an Essay on the Power of t? Magistrate and the Rights of Mankind in Matlers of Meligion, an able vindication of liberty of conscience, though he allows no right of toleration to "atheists"; and in 1698 an essay on The Liberty of the Press, a rigorous exposuro of the proposal to appoint licensers of the press and a porrerful plea for the free discussion of religion. The first of his two larger works, The Rights of the Christian Church associated against the Romish and all other priests who claim an independent power over it, part i., appeared anonymously in 1706 ( 2 d ed., 1706; 3d, 1707 ; 4th, 1709). The book was regarded in its day as an extremely forcible defence of the Erastian theory of the supremacy of the state over the charch, and at once provoked a storm of counter-argument and abuso on the part of those who maintained the independent rights and authority of the church. The law also was invoked against it, and, after several attempts to proscribe the work had failed, one against the author, publisher, and printer succeeded on 12 th December 1707 , and another against a bookseller for selling a copy tho next day. The prosecution did not prevent the issue of a fourth edition and gave the author the opportunity of issuing $A$ Defence of the Rights of the Christian Church, in two parts (2d ed., 1709). The book continued to be the subject of denunciation for ycars, and Tindal believed he was charged by Dr Gibson, bishop of London, in a Pastoral Letter, with having undermined religion and promoted atheisin and infidelity, - a
${ }^{2}$ Hert ron Nathusius has described its microscopic structure (Jour. fur wissensch. Zoologie, 1871, I'p. 330.355).
charge to which he replied in an anonymous tract, $A n$ Address to the Irihabitants of London and Westminster, a second and larger edition of which appeared in 1730. In this tract ${ }^{1}$ he makes a valiant defence of the deists and of the use of reason in•religious matters, and anticipates here and there his Christianity as Old as the Creation; or the Gospel a Republication of the Religion of Nature, London, 1730 (2d ed., 1731 ; 3d, 1732 ; 4th, 1733), which was regarded by friends and foes alike as the "Bible" of deism. It was really only the first part of the whole work, and the second, though written and entrusted in manuscript to a friend, never saw the light. It was said that Dr Gibson prevented its publication. The first part made a great noise, and the answers to it were numerous, the most able being by Dr James Foster (1730), Dr John Conybeare (1732), Dr John Leland (1733), and Bishop Butler (1736). It was translated into German by J. Lorenz Schmidt (1741), and from it dates the influence of English deism on German theology. It is by this book that Tindal is now chiefly remembered; but he had probably adopted substantially the principles it expounds before he wrote his essay of 1697. He objected to be called a simple deist, and claimed the name of "Christian deist," as he held that true Christianity is identical with the eternal religion of nature. He died at Oxford on 16th August 1733.

The religious system expounded in Tindal's Christianity as Old as the Creation, unlike the earlier system of Lord Herbert of Cherbury, was based on the empirical principles of Locke's philosophy. It assumed the traditional deistic antitheses of external and in. ternal, positive and natural, revelations and religions, and perpetusted at the same time the prevalent misconceptions as to the nature of religion snd revelation. The system was, moreover, worked out by the purely a priori mothod, with all but a total disregard of the facts of religious history. It starts from the tremendous assump. tions that true religion must, both from the nature of God and the natuŕe of things, be eternal, universal, simple, and perfect; it maintains that this religion can consist of nothing but the simple and nniversal duties towards God and man, the first consisting in the fulfilment of the second,-in other words, the practice of morality. The suthor's moral system is somewhat confused and inconsistent, but is essentia!ly utilitarian. From such principles it follows necessarily that the true revealed religion can be nothing more nor less than a republication of the religion of nature or reason, and that, if Christianity is the perfect religion, it can only be that republica. tion, and must be as old as the creation. The special mission of Christianity, therefore, was simply to deliver men from the superstition which had in course of time got mixed up with the religion of nature. True Christianity consequently must be a perfectly "reasonable service"; arbitrary and positive precepts can form no true part of it; revelation and reason can never disagree; reason mnst be supreme, and the Scriptures as well as all religious doctrines must submit to ifs tests ; and only auch writings can be regarded as Divine Scripture which tend to the honour of God and the good of man. Thus tested, much in the Old and the New Testaments must be rejected as defective in morality or erroneous in fact and principle. The atrength of Tindal's position was tho underlying conviction of the essential harmony betrrecn man's religicus and rational nature, and consequently of the rationality of Christianity. Its weakness was that, like the whole religicus philoscphy of the time, it was founded on a total misconception of the nature of religion and of revelation, and on as complate a disregard of the course of man's religicus development. Weak points in it were ably exposed by Foster, Conybeare, Butler, and others; but its radical errors needed for their complete exposure the higher conceptions of religion and religious history which were originated by Lessing, Schleiermacher, and Hegel.

## TINGHAE. See CHUSAN.

TINNE, Alexandrine (1839-1869), African traveller, born at The Hague on 17 th October 1839, was the daughter of an English merchant and his wife, Baroness van Steen-gracht-Capellen. Her father died when she was fivd years

[^168]old, leaving her the richest heiress in the Netherlands' After travelling in Norway, Italy, and the East, and visiting Egypt, when she ascended the Nile to near the equator, Mademoiselle Tinné left Europe again in 1861 for a prolonged sojourn in the Nile regions. Accompanied by her mother and her aunt, she set out from Cairo on 9th January 1862. After a short stay at Khartoum, the party ascended the White Nile as far as Gondokoro and explored a part of the Sobat, returning to Khartoum in November. Baron ron Heuglin and Dr Steudner having meantime joined the ladies at Khartoum, the whole party set out in February 1863 to explore the Bahr-el-Ghazal. The limit of navigation at the Bahr-el-Homr was reached on 10th March. From Lake Rek a journey was made overland, across the Bahr Jur and south-west by the Bahr Kosango, to Jebel Kosango, on the borders of the Niam-Niam country. During the journey all the travellers suffered severely. Steudner died in April and Madame Tinné in June, and after many fatigues and dangers the remainder of the party reached Khartoum in July 1864. Mademoiselle Tinné returned to Cairo by Berber and Suakim. The geographical and scientific results of the expedition, largely into a new country, were highly important, as will be seen in Heuglin's narrative in Petermann's Mittheilungen (Erg-hft, Nov. 15, 1865), and in his own Travels in the Region of the White Nile (1869). At Cairo Mademoiselle Tinné lived in somewhat Oriental stẏle during the next four years, visiting Algeria, Tunis, and other parts of the Mediterranean. In January 1869 she started from Tripolis with a caravan, intending to proceed to Lake Tchad, and thence by Wadai, Darfur, and Kordofan to the Upper Nile. In July, however, on the route from Murzuk to Rhat, she was murdered by her escort.

Besides the references slready given, eee John A. Tinnés Geographical Notes of an Expedition in Central Africa by three Dutch Ladies, Liverpool, 1864.

TINNEVELLI, or Tliavelex, a district of British India, in the Madras presidency, lying between $8^{\circ} 9^{\prime}$ and $9^{\circ} 56^{\prime} \mathrm{N}$. lat. and $77^{\circ} 16^{\prime}$ and $78^{\circ} 27^{\prime}$ E. long. It has an area of 5381 square miles, and a coast-line of nearly 100 miles. Madura district bounds it on the N. and N.E., on the S. and S.E. the Gulf of Mannár, and on the W. the southern Ghats. Tinnevelli is a large plain, with an average elevation of 200 feet, sloping to the east with slight undulations. Along the western boundary the mountains rise to 4000 feet; but they send out no spurs into the district, nor are there any isolated bills. The district is watered by numerous short streams, the principal being the Tambraparnf (length 80 miles). In the north the scenery is unattractive and the soil poor; in the south red sandy soil prevails, in which little save the Palmyra palm will grow. But along the banks of the rivers are rice-fields and a variety of trees and crops. Many shoals occur near the shore, and in the north-east numerous rocks and reefs. The bills which divide Tinnevelli from Travancore are chiefly granite and gneiss; and along the coast stretches the broad belt of alluvium common to the whole east coast of India, and in it are many salt marshes, divided by sand-dunes from the sea. Several veins of calc spar cross the district from east to west, and the beds of all the rivers are more or less encrusted with a deposit of lime. The district contains many ancient and magnificent buildings; but the most interesting antiquities are the large sepulchral earthen urns of prehistoric races which have been found at several places, especially along the course of the Tambrapanf, and which contain bones, pottery of all sorts, beads and bronze ornaments, iron weapons, implements, \&c. As the seat of Dravidian civilization Tinnevelli possesses more antiquarian interest than any other part of Madras. The climate is very hot and dry except at
the season of the monsoons; the average annual rainfall throughout the district is less than 25 inches. Tinnevelli possesses several roads, but no canals. The South Indian Railway enters the district five miles north of Virudupatti and runs to Tuticorin ( 77 miles) ; a branch line ( 18 miles) connects this last town with Tinnevelli.
In 1881 the population numbered $1,699,747$ (males 825,887 , females 873,860 ), of whom $1,468,977$ ware Hindus, 89,767 Mohammedans, and 140,946 Christians. Tinnevelli has twelve towns with over 10,000 inhabitants each, riz., Tinnevelli (see below) ; Srivilliputur, 18,256; Palamcotta, 17,964; Tuticorin, 16,281; Kulase Kharapatnam, 14,972; Sivagiri, 13,632; Víravanallur, 12,318; Rajapalayam, 12,021; Tenkasi, 11,987; Káyalpatnam, 11,806; Kalladakúrchi, 10,936 ; and Sivakasisi, 10,833 . Out of the total area of 5381 square miles 1403 are uncultivablo waste. In $1885-86$ cereals, chicfly rice and spiked millet or kambu, the ataple food of the district, occupied 842,741 acres, pulses 192,341, oil seeds 78,127 , and cotton 206,717. The total area of forest is roughly estimated at 1500 squaro miles. Tuticorin is the ouly port of any importance. The chief exports are cotton, coffee, jaggery, chillies, \&c.; sheep, horses, cattle, and poultry are also sent to Ceylon. There is a considerable inland trade with Travancore. The pearl fishery on the coast is now unimpertant. Coastal narigation is dangerous. In 1885-86 the total revenue of the district was $£ 365,744$, of which the land-tax yielded $£ 305,850$.
The early history of Tinnevelli is mixed up with that of Madura and Travancore. Down to 1781 it is a confused tale of anarchy and bloodshed. In that year the nawab of Arcot assigned the revenues to the East India Company, whose officers then undertook the internal administration of affairs. Several risings subsequently took place, aud in 1801 the whole Carnatic, including Tinnevelli, was ceded to the British. Tinnevelli is now the most Christian district of all India, both Roman Cathelic and Protestant.

TINNEVELLI, chief and largest town of the above district, is situated $1 \frac{1}{2}$ miles from the left bank of the Tambraparnf in $8^{\circ} 43^{\prime \prime} 47^{\prime \prime} \mathrm{N}$. lat. and $77^{\circ} 43^{\prime} 49^{\prime \prime} \mathrm{E}$. long. The town was rebuilt about 1560 by Visvanátha, the founder of the Nayakkan dynasty of Madura, who erected many temples, \&cc., among them the great Siva temple. Tinnevelli is an active centre of Protestant missions in south India. In 1881 the pepulation was 23,221 (10,963 males and 12,258 females).

TINTORETTO. See Robusti.
TIPPERAH, a district of British India, in the Chittagong division of the lieutenant-governorship of Bengal, situated between $23^{\circ} 0^{\prime}$ and $24^{\circ} 16^{\prime} \mathrm{N}$. lat. and $90^{\circ} 36^{\prime}$ and $91^{\circ} 39^{\prime}$ E. long., with an area of 2491 square miles. It is bounded on the N. by Maimansinh and Sylhet, on the S. by Noakháli, on the W. by the river Meghna, separating it from Maimansinh, Dacca, and Bakarganj, and on the E. by the state of Hill Tipperah. The district presents a continuous flat and open surface, with the exception of the isolated Lalmái range ( 100 feet), and is for the most part laid out in well-cultivated fields, intersected in all directions by rivers and khals (creeks), which are partially affected by ${ }^{\circ}$ the tides. In the lowlands the soil is uniformly light and sandy; but in the bigher parts a deep alluvial soil alternates with bands of clay and sand. The principal rivers are the Meghna, which is navigable throughout the year for boats of 4 tons burden, and the Gumti, Dákátiá, and Titás, which are also navigable for craft of 4 tons for a considerable portion of their course. There are many marshes or bhils. The principal road is the grand trunk ( 63 miles), which traverses the district from east to west. The wild animals include elephants, tigers, leopards, wild boars, jackals, and buffaloes. The climate is mild, agreeable, and healthy.
The pepulation of the district in 1881 was $1,510,388$ (male9 770,893 , femalé 748,445 ); of theas Hindus numbered 511,025, Mohammed. ans 1,007,740, and Christians 199. Thare are only two tomne with more than 10,000 inhabitants each, viz, Comillah ( 13,372 ) àd Bráhmánbária $(17,438)$. Comillah is the chief town of the district and is situated on the south bank of the Gumti, in $23^{\circ} 28^{\circ}$ N. Lat. and $91^{\circ} 14^{\prime}$ E. long. Rice is the ataple crop of the district ; wheat and berlay, Indian corn and millet, pease, gram, and aavaral othar pulses are clso cultivated, as well as botel-leaf and betal-nut, engar-cana, tobecco, \&c. Tha chief exporte are rice, jute, and betel.
nuts; and the principal imperts sugar, timber, cotton goods, cocos nut oil, bamboos, spices, salt, tobacco, \&c. In 1885-86 the net revenue of the district amounted to £181,481, the laud-tax contributing. £102,866. Tipperah came under the Fast India Company in 1765 ; but more than a fifth of its present area was under the immediate rule of the raja of Hill Tipperah, who paid a tribute of ivory and elephants. At that time Tipperah formed part of Jalal. pur; but in 1822 it was separated, and sinca then great changes have been made in its boundaries. With the exception of a serious raid in 1860 by the Kukis or Lushais, nothing has disturbed the peace of the district.

TIPPERARY, an inland county of Ireland, in the province of Munster, is bounded N.W. by Galway, N.E. by King's county, E. by Queen's County and Kilkenny, S. by Waterford, and W. by Cork, Limerick, Clare, and Galway. Its greatest length north to south, from the confluence of the Little Brosna and the Shannon to the Knockmealdown Mountains, is 70 miles, and its greatest breadth west and east 40. The area is $1,061,731$ acres, or about 1659 square miles.

The surface is extremely varied and picturesque. " The Knockmealdown Mountains on the southern border (2609 feet) are principally of clay slate formation. To the north of this range are the picturesque Galtees, composed of Silurian strata overlaid by Old Red Sandstone (Galtymore 3015 feet). To the east, bordering Kilkenny, are the Slieveardagh Hills, composed of coalstone shales and sandstones, and near Templemore the Devil's Bit Mountains, with a curious gap on the summit. In the north-west there is a Silurian and sandstone group (Keeper Hill 2265 feet). The greater part of the county is a gently undulating plain, belonging to the central Carboniferous limestone plain of Ireland. From the rich level country the rock of Cashel, also composed of limestone, rises with great boldness and abruptness. Tipperary has only one river, the Suir, which has its scarce in the Devil's Bit Mountains, and flows southwards by Templemore, Thnrles, Caher, and Clonmel. The Nore, which also rises in the Devil's Bit Mountains, soon passes into Queen's county, and the Shannon forms part of the western border. A spur of the Leinster coal-field, the most important in Ireland, runs into Tipperary, extending to Cashel, a distance of 20 miles with an average breadth of 5 miles. All the measures are represented. The productive portion of the field is at Killenaule. It consists of a narrow trough ranging in a north-east direction, the beds dipping towards the axis at a high angle. The coal is anthracite and the seams are thin, the workable portion being of limited extent. In the lower measures are marine fossils, and plant impressions are numerous. Copper is obtainable at Lackamore and at Hollyford near Thurles, but only in small quantities. There is a vein of lead at Shallee, and zinc has recently been dug in considerable quantities at Silvermines on the north side of the Keeper Mountains. Manganese, malachite, galena, and barytes are also obtaimable. There are slate quarries at Killaloe. Between Caher and Clonmel are extensive deposits of fine pipe-clay. The Mitchelstown stalactite carerns, discovered accidentally in 1833, attract a large number of visitors.

Agriculture.-Tipperary ranka ameng the best agricultural districts of Ireland. The aubsoil in the lower greunda is limestene, which is overlaid by a rich calcareous loam, capable of yielding the finest cropa. The centre of the county is occupied by the Golden Vale, the most fertile diatriot in Ireland, which atretches from Cashel to the town of Limerick. On the higher diatricts the soil ia light and thin, partaking much of the character of the clay alate and sands on which it rests. Detached pertions of the Bog of Allen encrosch on the north-eastern parts of the county. The total number of holdings in 1885 wa 23,763, oi which 14,969 wera under 30 acres in extent, 4841 between 15 and 30 acres, 4444 betreen 5 and 15, 2861 between 1 and 5 , and 2223 leas than 1 acre. Of the total area 24.8 per cent. Was under crope, including meadow and cloter, 57.8 under graas, 1 fallow, 2.5 plantations, 4.9 bog and marah, 64 barren mountain land, and 3.4 water, roads, fences, \&c. Tha area under corn crops decreased from 85,888 acres in 1876 to

73,753 in 1885, the decrease havisg taken place eince 1882, the areas in the provious years having been remarkably uniform. The area under what decreased from 13,423 acres in 1882 to 5474 in 1885 , and that of oats from 57,332 to 50,196 . But the area under barley, for which distillation causes a steady demand, rose from 13,551 acres in 1876 to 17,993 in 1885. The area under green crops manifests also a tendeacy to decrease ; : e total area in 1885 was 58,833 acres, 33,042 being under potatoes, 19,196 turnips, 2096 mangolds and bectroot, and 4499 other green crops. The area under meadow and clover has been steadily increasing, being 114,149 in 1876 and 127,478 in 1855. The total number of horses in 1855 was 27,365 , of which 17,173 were used for agriculture ; the number of cattlo 254,488 , of which 80,508 were milch cows, the manufacture of butter occupying considerablo attention ; of sheep 203,798, pigs 50,475 , goats 13,011 , and poultry 681,239 . According to tho latest landowners' Return ( $1870^{\circ}$ ), the county was divided amoug 3372 proprietors omning 1,042,457 acres of an annual value of $£ 676,693$, the avarage value of the land being uearly 13 s . per acre. The following possessed upwards of 10,000 acres each:-Viscount Lismore, 34,945; Lord Dunalley, 21,081; G. K. S. M. Dawsod, 19,093; Lady Margaret Charteris, 16,617 ; marquis of Ormonde, 15,765 ; Viscount Hawarden, 15,272 ; N. Buckley, 13,260 ; earl of Clonmel, 11,098 ; and A. Moore, $10,200$.

Manufachures.-A few persons are employed iu mining, but the occupation of the inhabitants is chiefly agricultural. There are a considerable sumber of meal aud four mills.
Railways.-The county is remarkably well supplied with railways. A branch of the Great Southern and Western runs from Roscrea to Nenagh, where it joios a brsnch of the Limerick and Waterford, which in its progress south-eastwards from Limerick crosses t'ie southera corner of the county by Limerick Juaction, Tipperary, Caher, and Clonmel. The main line of the Great Southern and Western to Cork and Fillaroey crosses the centre of the cornty by Templemore, Thurles, and Limerick Junction. A branch of the Limerick and Waterford connects Thurles with Clonrael.

Administration and Population.-Tipperary is divided into a north and south riding, each consisting of six baronies. For parliamentary purposes it is separated into four divisions-East, Mid, North, and South-each returning one member. It contains 193 parishes and 3253 tomn lands. It is in the Leinster circuit. Assizes for the north riding are held in Nenagh and for the south riding in Clòmel. Quarter sessions are held at Cashel, Clonmel, Nenagh, Roscrea, Thurles, and Tipperary. There are twenty-four petty sessions districts and parts of six others. The county is within the Cork pailitary district. Ecclesiastically it belongs to the dioceses of Cashel, Emly, Killaloe, and Lismore. Since 1841 the popalation has decreased moro than one-half. From 435,553 in that year it fell to 216,718 in 1871 and to 199,612 in 1881. The following towns in 1881 possessed over 4000 inhabitants each, viz. -Clonmel (partly in Waterford), 9325 ; Tipperary, 7274 ; Carrick-on-Suir (partly in Waterford), 6583; Nenagh, 5422; and Thurles, 4850. Tha number of persons who couid read and write was 115,185 , who could read only, 24,386 ; the remainder- 60,041 -were unable to read or write. Thare were 248 persons who spoke Irish only and 23,558 able to speak Irish as well as Eagiish.

History and Antiquilies.-Anciently Tipperary was included in the territory of the Tuatha Dé Danann, and afterwards probably of the clan of Degaid. Hensy II., who landed at Waterford in October 1172, received at Cashel the homage of Donald O'Brien, king of Thomond. It was made a conaty by King John in 1210 ; in 1323 Edward III. made it a county palatine in favour of the earl of Ormonde ; and, though the king shortly afterwards resumed his regal prerogative, the connty was regranted in 1337. In 1372 the grant was confirmed to James, second earl of Ormonde, the lands belonging to the church retaining, however, a separate jurisdiction, -a division which continued till the Restoration. In 1617 James I. took the conoty palatine into his own hands. It was, however, restored in 1661 to James, twelfth earl and first duke, whose regalities were further made to include the portions of the county formerly under ecclesiastical jurisdiction. On the-attainder of $\mathrm{J}_{\text {ames, }}$ second duke, in 1715 tho jurisdiction reverted to the crown. There are two round towers within the county, -one at Roscrea and the other on the rock of Cashel. Of the old castles there are few important examples. That built by the first earl of Ormonde at Thurles has now disappeared. On the rock of Cashel there are a massive guand tower and some remains of the ancient wall. The atronghold of Caher, now occopied as a barrack, is still in good preservation. At Roscrea one of the towers of the castle built by King John still remains, and the stronghold of the Ormandes, erected in the reign of Henry VIII., forms the depôt attached to the barracks. The ecclesias ical ruins on the rock of Cashel are among the most remarkable in Ireland. They consist of a cathedral in the Pointed style of the 13th century, partly destroyed by fire in 1495 ; a curious Saxon chapel, ascribed to Cormac MacCullinan, archbishop of Cashel (b. 831); the bishop's palace; the "vicar's choral-house," sill on the summit of the rock ; and Hore abbey at its foot, founded
for Benedictines in 1272. The abbey of Holy Cross was founded in 1182 for Cistercian monks, and is one of the finest monastic ruins in Ireland. The relic of the true cross, from which the abbey takes its Dame, is in possession of the Catholic hierarchy of the district. The other principal ecclesiastical ruius are the priory of Athassel, founded for Augustinian monks about 1200; Fethard abbey, founded in the 14th century, now used as a chapel; the gable and porch of the abbey of Roscrea, founded by St'Cronan in the 7th century ; and a portion of the Franciscan friary founded in the same town in 1490 .

TIPPERARY, a market town in the above county, is beautifully situated near the base of the Slieve-na-muck or Tipperary Hills, a branch of the Galteo range, on the Waterford and Limerick Railway, 3 miles, south-east of Limerick junction and 110 south-west of Dublin. It contains a handsome Protestant church, a Catholic chapel, an endowed grammar-school, a town-hall, and a new corn and butter market. Owing to its situation in the centre of a fine agricultural district, it enjoys considerable prosperity, and its butter market ranks next to that of Cork. The town is of great antiquity, but first acquired importance by the erection of a castle by King John, of which there are now no remains. A monastery founded for Augustinians by Henry III., which has also disappeared, gave a second impulse to its growth. Formerly it was a corporation from a grant made in 1310 by Edward II., but is now governed by commissioners under provision of the Town Improvement Act of 1854 . The population in 1871 was 6638 , and in 1881 it was 7274.

TIPPOO SAHIB (1749-1799), sultan of Mysore, was the son of Hyder Ali (q.v.), and was born in 1749. He received a careful Mohammedan education, and was instructed in military tactics by the I'rench officers in the employment of his father. In 1767 in the invasion of tho Carnatic he commanded a corps of caralry, and he subsequently distinguished himself in the Mahratta War of 1775-79. On the outbreak of the first Mysore War in 1780 he mas put at the head of a large body of troops, with which be achieved several successes; in particular he entirely defeated Brathwaite on the banks of the Colerun in February 1782. He succeeded his father in December 1782, and in 1784 concluded a treaty of peace with the English. In the same year ho assumed the title of sultan. In 1787-88 he subjugated the Nairs of Malabar, and in 1789 provoked English invasion by ravaging the territories of the rajah of Travancore. When the English entered Mysore in 1790, he retaliated by a counter-inrasion, but he was ultimately compelled by Cornwallis's victory at Aribera, near Seringapatam; , to purchase peace by the cession of the half of his dominions (16th March 1792). The English having deemed it necessary to rener hostilities in March 1799, be was in less than two montls shut up in Seringapatam and accidentally killed during the sjege (4th May 1799). See Indis, rol. xii. pp. 803-4.

TIPTON, a town of England, in Staffordshire, is situated in the valley of the Stour, on the London and NorthWestern Railway, $4 \frac{1}{2}$ miles south-east of Wolverhampton and 121 north-west of London. It is built in a somewhat scattered and irregular manner, with coal-pits and iron and other works interspersed. Branches of the Birmingham Canal supply it with water communication. It depends chiefly on its iron manufactures, especially of a heary kind, and has numerous large furnaces and rollingmills. Its principal goods are rails, engine-boilevt tabes, fenders, and fire-irons. It alse possesses morts for making iron bridges and stations, cement-works, brick-works, and maltings. There are no public buildings of importance Tipton has six churches. The parish church is of very ancient date, and its registers go back to the year 1513. Formerly the town was sometimes called Tibbington. It is under the government of a local board formed in 1866. The population of the urban sanitary districi
(area, 2697 acres) in 1871 was 29,445 , and in 1881 it vas 30,013 .

TIRABOSCHI, Gtrolaso (1731-1794), the first, historian of Italian literature, was born at Bergamo on 18th December 1731. Fio studied at the Jesuit college at Monza, entered the order, and was appointed in 1755 professor of eioquence in the university of Milan. Here be produced (1766-68) Vetera Humiliatorum Mfonumenta (3 vols.), a history of the extinct order of the Uniliati, which gave him, at once a distinguished place in literature. Nominated in 1770 librarisn to Francis III., duke of Modena, he turned to account the copious materials there accumulated for the composition of his Storia della Letteratura Italiana. This rast work, in which the progress of Italian literature from the time of the Etruscans to the end of the 17th century is traced in detail, occupied eleven assiduous years, 177182 , and the thirteen quarto volumes embodying it appeared successively at Modena during that period. A second enlarged edition ( 16 vols.) was issued from 1787 to 1794, and was succeeded by many others, besides abridgments in German, French, and English. Tiraboschi died at Modena on 3d June 1794, leaving a high reputation for virtue, learning, and piety.

Tiraboschi wroto besides Bibliotece Modenese (6 vols., 1781-86); Notizie de' Pittori, Scultori, Incisori, ed Arihitetti Modenesi (1786); Memorie Storiche Modenesi (5 vols., 1793-94), and many minor works. He edited tho Nuovo Giomale dei Letterati d' Ltalia (177390), and left materials for a work of great research entitled Diaionario Topogrufico-Storico degli Stati L'stensi (2 vols. 4to, Modena, 1824-25).

TIRESIAS, a famous Theban seèr of Greek legend, was a son of Everes and Chariclo, and a descendant of Udæus, one of the men who had sprung up from the serpent's teeth sown by Cadmus. He was blind, for which various causes were alleged. Some said that the gods had blinded him because he had revealed to men what they ought not to know. Others said that Athene (or Artemis) blinded him because he had seen her naked; when his mother prayed Athene to restore his sight, the goddess instead purged his ears so that he could understand the speech of birds and gave him a staff wherewith to guide his steps. Auother story was that on Mount Cyllene (or on Cythærum) he saw two snakes coupling; he killed the female and became himself a woman. Seven years afterwards he saw the same sight, and killing the male became himself a man again. When Zeus and Hera disputed whether more pleasure was enjoyed by the male or the female sex, they referred the question to 'Tiresias, as be had experience of hoth. He decided in favour of the female sex, and Hera in her anger blinded him ; but Zous gifted him with long life and infallible divination. He lived for seven or, according to others, nine gencrations. In the war of the Seven against Thebes he foretold to the Thebans that they would be victorious if Menceceus offered himself in sacrifice. In the war of the Epigoni he advised the Thobans to flee. They fled, and he with them ; but coming to the Tilphusian well he drank of it and died. According to others, Tiresias was taken prisoner by the victorious Argives and died while they were taking him to Delphi. The Argives took his daughter Manto (or Daphue) prisoner and sent her to Apollo at Delphi, where, being as skilled a seer as her father, she gave oracles. A different version of the legend of Tiresias was given by the elcgiac poet Sostratus (reported by Eustathius on Od., x. 492). According to him, Tiresias was originally a girl, but had been changed into a boy by Apollo at the age of seven; after undergoing several more transformations from one sex to the other, she for the final sex was feminiue) was turned into a mouse and her lover Arachnus into a weascl. Tiresias's grave was at the Tilphusian spring; but there was a cenotaph of him at Thebes, whers also in later times his "observatory," or
place for watching for omens, was pointed out. He had an oracle at Orchomenus, but during a plague it became silent and remained so in Plutarch's time. According to Homer, Tiresias was the only person in the world of the dead whom Proserpine allowed to retain intelligence. He figured in the great paintings by Polygnotus in the Lesche at Delphi. The story of his transformation into a woman is periaps to be explained by the custom of medicine-men dressing like women, which prevails in Borneo, Patagonia, Kadiak (off Alaska), and probably elsowhere. ${ }^{2}$
TIRHUT, or Tirhoot, a district of British India, was formerly the largest and most populous in Bengal. On 1st January 1885 it was divided into the two districts of Darbhangah and Muzafiarpur. For the latter, see MuzafFARPUR. The former, with an area of 3335 square miles, lies betrreen $25^{\circ} 30^{\prime}$ and $26^{\circ} 40^{\circ} \mathrm{N}$. lat. and $85^{\circ} 34^{\prime}$ and $86^{\circ} 46^{\prime}$ E. long., and is bounded on the N. by Nepal, on the E. by Bhagalpur, on the S. by Monghyr, and on the W. by Muzaffarpur. The population of Darbhangah in 1881 was $2,633,44$ (males $1,295,788$, females $1,337,659$ ); of these Hindus numbered 2,323,979, Nohanmedans 308,985, and Christians 325. Its chief towns are Darbhangah, the capital, with 65,955 inhabitants; Madlubani, 11,911; and Rusera, 11,578. The total revenue of Darblangah district in 1885-86 amounted to $£ 157,037$, of which the land revenue yielded $£ 80,442$.

The alluvial tract of country formerly known as Tirhut is varied by undulations, with groves, orchards, and woods. The priucipal rivers are the Ganges, Gendak, Bághmati, Tiljugá, and liaråi, which aro rerely navigable, except during the rainy season, when they are mostly rapid and dangerons. Tirhut produces all sorts of crops, rice boing tho principal; others are wheat, barley, maize, oil-seeds, \&c. ; opium and tobacco are largely grown for cxport. Tha chief industries include the manufacture of indigo, altpetre, coarse cloth, pottery, end inats. Tha Tirhut Stato Railway runs from Mokameh on the Jeft bank of the Ganges through Darbhangah and Muzaffarpur districts north-west into Champaran district as far as Bettia. A ferry over the Ganges at Mokamch connects it with the East Indian Railway. Thero are two branches, one extending from Muzaffarpur oouth-west to Hajipur (to be connected with the Bengal and North-Western Railway at Sonapur by a bridgo over the Gandak), the other ( 226 miles open for tranlic in March 1886) from Samastipur via Darbhangah to Janjarpur, from which it will ox. tend eastwards to Partabganj, a mart upou the Kosi river near the Nepal fronticr.
TIRLEMONT (Flem. 7hienen), a town of Belgium, in the province of Brabant, $29 \frac{1}{2}$ milcs by rail to the cast of Brussels, on the Great Gecte. The old walls, dismantled since 1804, are nearly 6 milcs in circuit, but enclose a large extent of arable and garden ground. The streets are regular, and there are some spacious squares; the market-place contains tho town-hall, rccently restored, and the church of Notre Dame du Lac, founded in 1298, enlarged in the 15th century, but still unfinished. The church of St Gcrmain dates partly from the 9th century. The industrics of the place include the making of steamengines, brewing, distilling, soap-making, tanuing, and various woollen and cotton manufacturcs. The population in 1876 was 13,296 .
Tirlemont was once a much larger and moro flouristing town rnan it now is; it lias suffered much in war and was taken by tho French in 1635 , by Marlborough in 1705 , and. again by the French in 1793. John Bolland, the famous editor of the Acth Sanctorum, was born hero iu 1596 .
TIRY'NS, the T'puys Teixi6ecou of Iomer (Il., ii. 559), was a small Peloponnesian city, in the prehistoric period of the Achoean race, long before the Dorian immigration. It stood on a small rock in the marshy plain of Argolis, about 3 miles from the sea, and was fabled to have

[^169]been founded by King Proetus, the brother of Acrisius, who was succeeded by the hero Perseus. It was the scene of the early life of Heracles, who is henre called Tirynthius. The massive walls were said to have been the work of Cyclopean masons. Its period of greatest splendour was during the 11th and 10th centuries s.c.; but the oity continued to exist till about 468 B.c., when it was destroyed through the jealousy of the inhabitants of the neighbouring Argos, ${ }^{3}$ who had not assisted in the final defeat of the Persians at Platre. ${ }^{2}$
Excavations made in 1884-85 by Schliemann and Dörpfeld over part of the rock on which Tiryns atood have exposed a most interesting building, quite unique as an example of a Greek palace of the 11 th or 10th century b.C., and of special interest from the way in which it closely illostrates the Homeric palaces of Alcinous and Odysseus, and throws a new light on scenes such as the slaughter of the suitors ( $0 d$. ., xxi. and $x$ xii.).

- See Diod., iv. 10 ; Paus., ii. 25 ; and Herod., vi. 83, iz 28. Schlie. mann (Tiryns, Londou, 1886) and Mahaffy (in Hermathena, Dublin), however, deoy the truth of this atatement, believing that Tiryns ceased to exiat aome centories eerlier, in epite of the atrong evidence given by the inscription on the bronze colomn (now in Constantinople), formed by three twiated serpenta, which once oupported the golden "tripod dediasted to Apollo ont of the apoila from Platea. Tiryna occars in the list of sllied atates present at that battle; moreover, recent diecoveries have brought to light remains of an Important boilding of aboat 600 B. 0 .
by \& very mascive wall, varying fiom 30 to 40 feet in thicknens and aversging when complete about 60 feet in height, measuring from its buse outside. Insid, the wall was probably not more then 10 or 12 feet high above the ground, so the masonry scts as s retaining wall to s considerable depth of earth which covers the rock (8e日 fig. 2 below). The wall is built of very large hammer. dressed blocks, some as much as 10 feet loag by 3 feet 3 inches or 3 feet 6 inches wide, with smaller ones to fill up the interstices. The whole was bedded, not in $n$ brtar, but in clay, which has mostly been washed out of the joints; originally the surface was probably protected with a coating of atucco. The only important gateway, which wes on the east side, sway from the sea, probsbly resembled the "lion gate" at Mycenæ. The other entrances are mere slite in the wall. One of these and the chief gate sre shown in fig. 1. Internally the srea of the city was divided by cross walls into three parts at successive levels. The lowest snd middle divisions have not yet been excsisted; the upper part st the south end of the rock was completely exposed in 1884-85 by Schliemsnn and Dörpfeld, sad the slmost complete plan of the various atructures clearly msde out. This division contains the palace of the ruler of Tiryns, a building which shows careful snd skilful construction, olaborato decoration, snd a well-arranged plan, suitahle to the wants of 8 wealthy sutocratic chief, who lived in s manner which partly recalls the luxury of sn Orientsl ling, and slso resembled the feudal state of a mediæval baron, surrounded by a crowd of vassals. From the main gate, which was defended by a tower, a strong passage led between the outer wall snd sn inner one to an inner gate, thence to a propyleum or double porch, with two wooden columns on each aide, adjoining which were chambers for guards. Then came another rimilar, but emaller propyleum, and opposite to that was the entrance to the great court (avi入y) nearly 53 by 70 feet, in which stands the sltar to Zeus Herceus, with a circular pit benesth it to catch the victims' blood. This conrt was surrounded by wooden columns supporting s roof, like s mediærsl cloister; on the south side sre chambers for attend. snts ( $\theta a \lambda d \mu 06$ ). On the north side is the
 with an outer portico supported by two columns (a\&0ovaa) and an inner vestibule ( $\quad$ ро $\delta 0 \mu 0 s$ ) with three doors. ${ }^{\text {. The }}$ hall is sbout 40 by 30 feet, with a circular hearth-stone in the centro (Earia or é $\chi$ ápa). Four columns supported the roof, the central part of which probably rose sbove the rest like a medimval "lantern"; and in this there was probably a door leading out to the flat roof round it-possibly the spootupm of Homer (Od., xxii. 126), through which one of the suitres escaped and so got

Fio. 2.-Section through the outer wall of the city at 20 In fg . 1 . A. Outer base of wsil. B. Inalda levell of city. C. Intermediate platform for the garrison. D. Chambers opeaing on to it, with rool formed of projactlag coursea of atons in large blocks. E. Top of malo wall, paved with clay, level with the insids. F. Woodea columnas on anisting atone bssas, formIng a portlcus or coversd walk along the top of the wall. G. Outar wall of tha colonaade brilt of brick, now mlaalng. H. arms from the treasury or armoury, which was on an npper floor (see Od., xxii. 142 and xxi. 5). On the west side of the hall are s number of amall chambers ( $\theta a \lambda$ á $\mu 0$ ) for the unmsrried men, snd a bath-room about 12 by 10 feet, with its floor formed of one grest slab of stone, sloped so as to drain out at one side through \& pipe Which passes through the wall. The women's part of the house is of equal importance to that of the men, and has its hall and two open courts with pillars. It is approsohed in s very circuitons way, either by a passage ( $\lambda a u u^{\prime} \eta$ ) leading from s side

- The arrowa in fig. 1 show the wey from the city gate to the palace court and hall.

6 The womon'e ball is also called the megeron; see Od., xviii. 198.

- The apboojos is meutioned by Homer (Il., ix. 473, and Od., iv. 302); but in the palace of Odyaseus the allovea seems to have been the only vestibole to the megaron. In several resperts the palace of Tiryns is more magnificent then that of Odyaseus, whose hall was paved with clay, not concrete as at Tiryдa; see Od., xxi. 122, where Telemachas

- The way to the hsram in a modern Oriental house is similsriy medo as circuitous as poseible, for the eaks of grivacy.
door in the main propylæum or br another long passage which winds round the lack of the men's hall, and so leads by a long filght of steps, cut in the rock, to the little postern door in the semicircular bastion. The many small rooms in this part of the palace were probably the bedrooms of the women and married couples of the chiefe family. A staircaso at 16 led to an upper floor, like the $\kappa \lambda i \mu a \xi$ iffmin of $O d$. xxi. 5. The circuit wall round the palace is more strongly constructed than the rest. On the south eide it is bailt in two offsets, forming a level platform for the garrison halfway up. In the upper and thinner part of the wall two narrow passages at different levels are formed in its thickness. They are roofed by projecting coursee of atone in large blocks. The wall on the east side has a similar intermediate platform, on to which open a series of emall chambers formed in the mass of the opper wall (see fig. 2). At the top level the wall was covered by a colonnade of wood pillars resting on circular stone blocks. This supported a flat roof and was open to the inside of the city. The back of the colonnade was built of brick, and is now missing, as are all the brick parts of the city, owing to the bricks having been anly sun-dried.
The methods of constraction employed in the Tiryns palace are of the highest interest. The foundations and about 3 feet of the walls sbove the ground are made of large blocks of stone bedded in chay; above this the wall was of brick, sun-dried, and covered with stucco. The upper story was probably of wood. Some of the thresholds of the doors were massive blocks of stone (גdïvos oü $\delta 6$ s); others were of wood ( $\delta$ pưivos oúôbs). Woad was also used for all the columng, doorposts, and antz ( $\pi$ apaotádes), snd in some cases the walle of the rooms were lined with wood, carefully fixed by dowels, the boles for which still exist. ${ }^{3}$ The doors had pivots of bronze re. volving in well-fitted bronze cap-like sockets let into the thresholds. In the megaron and other rooms the floors are of good concrete, decorated with a simple series of incised linea, coloured blue and red. The stucco of the internal wall is decorated with bold and very effective patterns-birls and scroll-work of gemi. Oriental style ; in many cases the motives are obviously taken frow textile ornaments, as in the most archaic style of vase painting. One example of rich and costly decoration remains,-part of a frieze of white alabsater, sculptured in relief with rosettee and interlacing patterna, and atudded with jewel-like pieces of blue glass or enamel, the $\theta$ pryкds кudyoro of Od. vii. $87 .{ }^{3}$ Further excavations in the lower parts of the city will probably bring to light the dwellings of the citizens who garrisoned the place. The great bulk of the Tirynthians must have lived in houses outside the citadel, but ander the shelter of its protection, just as in medirval Italy villages grew up round the castles of any powerful lord. ${ }^{3}$
(J. H. M.)

TISCHENDORF,4 Lobegott Friedrich Konstantin (1815-1874), an eminent Biblical critic, the son of a physician, was born on 18 th January 1815 at Lengenfeld, near Plauen, in the Saxon Voigtland. From the gymnasium at Plauen he passed in 1834 to the university of Leipsic, where he was mainly influenced by Winer, and began to take special interest in New Testament criticism. In 1840 he qualified as university lecturer in theology with a dissertation on the recensions of the New Testa ment text, the main part of which reappeared in the following year in the prolegomena to his first edition of the New Testament. The importance of these early textual studies was that they convinced him of the absolute necessity of new and exacter collations of MSS., and to this work he now gave himself. Above all he desired to go to Rome; but lack of help and money compelled him to turn first towards Paris, where he remainta from October 1840 till January 1843, busy with the treasures of the great library, eking out his scanty means by making collations for other scholars, and producing for Didot several editions of the Greek New Testament, one of them exhibiting the form of the text corresponding most closely to the Vulgate. The great triumph of these laborious months was the decipherment of the palimpsest Codex Ephracmi Rescriptus, of which the New Testament part was printed before he left Paris and the Old Testament in 1845. His success in dealing with a MS. much of which had been illegible

[^170]to earlier collators brought him into note and gainea public and private support for more extended critical expeditione. From Paris he had paid short visits to Holland (1841) and England (1842). In 1843 he visited Italy, and after a stay of thirteen months went on to Egypt, Sinai, Palestine, and the Levant, returning by Vienna and Munich. ${ }^{5}$ From Sinai he brought a great treasure, forty-three leaves of what is now known as the Codex Sinaiticue ( $\kappa \lambda$ For the time he kept the place of discovery a secret, hoping to return and procure the rest of the book, and the fragments were published in 1846 as the Codex Friderico-Augustanus, a name given in honour of the king of Saxony. He now became professor in Leipsic and married (1845). His teaching was apparently not very remarkable; but his vacations were often occupied by fruitful critical journeys, and in 1853 and 1859 he made a second and a third voyage to the East. In the last of these, in which he had the active aid of the Russian Government, he at length got access to the remainder of the precious Sinaitic codex, and persuaded the monks to present it to the czar, at whose cost it was published in 1862. To gain for critical study a manuscript in point of age second only to the famons Vatican Bible was a splendid triumph; but Tischendorf's Eastern journeys were rich enough in other less sensational discoveries to deserve the highest praise. ${ }^{6}$ Side by side with his industry in collecting and collating MSS., Tischendorf pursued a constant course of editorial labours, mainly on the New Testament, until he was broken down by overwork in 1873. He died on 7th December 1874 at Leipsic.

The grest edition, of which the text and apparatos appeared in 1869 and $1872,{ }^{7}$ was called by himself editio viti.; but this number is raised to twenty or twenty-one if mere reprints from stereotype plates and the minor editions of his great critical texts are included; postbumons prints bring up the total to forty-one. Four main recensions of Tischendorffs text may be distinguished, dating respectively from his editions of $1841,1849,1859$ (ed. vii), $1869-72$ (ed. viii.) The edition of 1849 mas be regarded sa bistorically the most important from the mass of new critical material it used; that of 1859 is distinguished from Tischendorf's other editions by coming nearer to the received tert; in the eighth edition the testimony of the Sinaitic MS. received great (probably too great) weight. The readings of the Vatican MS. were given with more exactness snd certainty than bad been possible in the earlier editions, and the editor had also the adrantage of wing the published labours of Tregelles. Wbatever judgment may be passed on Tischendorfs criticai tact and power, the apparatus of this final edition will not soon be superseded, and oums up a vast series of most important services to Biblical etudy.

Much less important was Tischendorfe work on the Greek "Old Testameat. His edition of the Roman text. with the variants of the Alsiandrien MS., the Codex Ephraemi, and the FridericoAngustanus, was of service when it appeared in 1850, but being stereotyped was not greatly improved in subseqnent issuesi It imperfections, even within the limited feld it covers, may be jndged of by the aid of Nestle's appendix to the sixth issue (1880). Besiden this may be mentioned editions of the Now Testament Apocrypha (Acts of Apostles, 1851 ; Gospels, 1853, 2d ed. 1876 ; Apocalypses, 1866), and varions minor writings, in part of an apologetic character, such as Wann wurden unsere Evangetien verfasst? (1865) and Haben wir den echlen Schriftlext der Evangelisten und Apostel) (1873).

TISIO, or Tisi, Benvenoto (1481-1559), commonly called Il Garofalo, a painter of the Ferrarese school He was born in 1481 at Garofolo, in the Ferrarese terrid tory, and constantly used the gillyflower (garofalo) as a symbol with which to sign his pictures. He took to draw: ing in childhood, and was put to study under Domenico Panetti (or Laneto), and afterwards at Cremona under his maternal uncle, Niccold Soriani, a painter of credit, who died in 1499; he also frequented the school of Boccaccio

[^171]XXIII. - $5^{2}$

Boccaccino. Removing to Rome, he stayed fifteen months with Ciovanni Baldini, acquiring a solid style of draughtsmanship, and finally to Manto., where he remained two years with Lorenzo Costa. Ee then entered the service of the marquis Francesco Gonzaga. Afterwards he went to Ferrara, and worked there four years, showing diligence and delicacy without much severity or elevation of style. Attracted by Raphael's fame, and invited by a Ferrarese gentleman, Geronimo Sagrato, he again removed to Rome, and found the great painter very amicable ; here he stayed two years, rendering some assistance in the Vatican frescos. From Rome family affairs recalled him to Ferrara; there Duke Alphonso I. commissioned him to execute paintings, along with the Dossi, in the Villa di Belriguardo and in other palaces. Thus the style of Tisio partakes of the Lombard, the Roman, and the Venetian modes. He painted extensively in Ferrara, both in oil and in fresco, two of his principal works being the Massacre of the Innocents (1519), in the church of S. Francesco, and the Betrayal of Christ (1524), accounted his masterpiece. For the former he made clay models for study and a lay figure, and executed everything from nature. Both in the Ferrarese territory and in Rome his pictures of small dimensions are very numerous. He continued constantly at work until in 1550 blindness overtook him,-an affliction which he bore with patience, being a man of pleasant friendly disposition and of derout feeling. In the later years of his work he painted on all feast-days in monasteries for the love of God. He had married at the age of forty-eight and died at Ferrara on 6 th (or 16th) September 1559, leaving two children.
Garofalo combined sacred inventions with eome very familiar details. A cortain archaism of style, along with a strong glow of colour, suffices to distinguish from the true method of Rapheel even those pictures in which he most closely resembles the grest master, end this is sometimes very closely. Ho was a friend of Giulio Romanoo, Giorgione, Titian, and Ariosto ; in a picture of Persdise he painted this poet between St Cethetine and St Sebastian. In youth he was fond of lute-playing and also of fencing. He ranks as the best of the Ferrarese painters; his leeding pupil was Girolemo Carpi. The Adoration of the Magi, in the church of St Goorge near Ferrara, and a Peter Martyr, in the Dorininican charch, Ferrara (sometimos assumed to have been done in rivalry of Titian), are among his principal morks not already mentioned. The Palazzo Chigi end the Palazzo Borghese contain numerous examples, and the London National Gallery four, one of them being a Madoma and Christ enthroned, with St Francis and three other eaints.

TITANIUM (atomic weight ${ }^{1}=48 \cdot 08,0=16$ ), designates in chemistry a relatively rare element, which is customarily classed sith the metals, although it comes nearer in its character to silicon than to any of the ordinary metals. Its discovery as an element was due to William Gregor, who found in the mineral menaccanite a new earth, which was regarded as the oxide of a new metal, menachin. Independently of him Klaproth in 1793 discovered a new metal in rutile and called it titanium; he subsequently found that it was identical with Gregor's element. The latter name was, however, retained. Titanium, although pretty widely diffused throughout the mineral kingdom, is not found in abundance. The commonest titanium mineral is rutile $\left(\mathrm{TiO}_{2}\right)$; anatase and brookite, though mineralogically different from rutile and each other, are forms of the same binoxide.
Metallic titunnium is little known. In 1822 Wolleston examined a specimen of those beentiful copper-like crystals which are occsaionally met with in iron-furnsce elags, and declared them to be metallic titazium. This view had currency until 1849, whon Wöhler showed thet the crystals ere a compound, $\mathrm{Ti}(\mathrm{NC})_{2}+3 \mathrm{Ti}_{3} \mathrm{~N}_{2}$, of B cyanide and a nitride of the metal. Reel titanium was made by Wohler and Doville in 1857 by heating to redness fuo-titenate of potassium (see belowi) in rapour of sodium in an atmosphere of dry hydrogen, and extractiog the alkeline fluoride formed by water. The metal thus produced hed the appearence of iron as obtained by the reduction of its oxide in hydrogen. When hested in sir, it burns brilliantly, with the formation of binoxide. Its most cari-
${ }^{2}$ According to T. I. Thorpe'o researcher published in 1883,
ous property is the readiness with which it unites with nitrogen gas into a nitride. The exect composition of this nitriae is not known ; but when heated in hydrogen it loses part of its nitrogen as ammonia, and becomes $\mathrm{Ti}_{8} \mathrm{~N}_{6}$ a metallic-looking yellow solid, and this when heated in nitrogen gas passes into higher nitrides, which are again available for the production of emmonia. . Tessié du Mothay in 1872 proposed to utilize these reactions for the production of ammonis from atros heric nitrogen. Of other titanium compounds the most important are those formed on the type of $\mathrm{TiX}_{4}$ when $\mathrm{X}=\mathrm{Cl}, \mathrm{Br}$, or $\frac{1}{2} \mathrm{O}$, \&c.

The binoxide $\mathrm{TiO}_{2}$ exists as rutile. One method of preparing a pnrer oxide from the mineral is to fuse it, very finely powdered, with six times its weight of bisulphete of potash in platinum, then extract the fuse with cold water, end boil the filtered solution for a long tirne. Titanic oxide separates out 8 s a white hydrete, which, however, is generaliy contaminated with farric hydrate and often with oxide of tin, $\mathrm{SnO}_{2}$. A better method is Wöler's. He fuses the finely powdered mineral with twice its weight of carhonate of potash in a platinum crucible, pounds the fuse, and treats it in a platinum basin with squeous hydrofluoric acid. The alkaline titanste first produced is converted into crystalline flue-titanste, $\mathrm{TiF}_{6} \mathrm{~K}_{3}$ which is with difficulty soluble, sad is extracted with hot water end filtered off. The filtrate, which may be collected in glass vessels if an excess of hydrofluoric scid has been avoided, deposits the greater part of the salt on cooling. The crystals are collected, weshed, pressed, and recrystallized, whereby the impurities are easily removed. The pure ealt is dissolved in hot water sad decomposed with smmonis to produce a slightly smmoniacal hydrated oxide ; this, when ignited in platinum, leaves pure $\mathrm{TiO}_{3}$ in the form of brownish lumps, the apecific gravity of which varies from 3.9 to $4 \cdot 25$, Bccording to the temperature at which it was kept in igniting. The more intense the hest the denser the product. The oxide is fusible only in the oxy-hydrogen fleme. It is insoluble in all acids, except in hot concentrated sulphuric, when finely powdered. Supposing the excess of vitriol to have been hoiled away, the residue, after cooling, dissolves in cold water. The solution, if boiled, deposits its titanic oxide as a hydrate called mota-titanic acid, be. ceuse it differs in its properties from ortho-titanic acid, obtained by decomposing a solution of the chloride in cold water with alka. lies. The ortho-body dissolves in cold dilute acids; the meta-body does pot. If titanic oxide is fused with excess of alkeline carbonate it expels $\mathrm{CO}_{2}$ parts of carbonic acid for $\mathrm{TiO}_{3}$ parts of itself. The aalt $\mathrm{R}_{2} \mathrm{OTiO}_{2}$ is decomposed by water with the formation of a solu. tion of alkali free of titanium, sad a residue of an scid titanate, which is insoluble in water but soluble in cold equeous mineral acids.
The chloride $T_{i} C_{4}$ is obtained 89 a distillate by heating to dull redness an intimate dry yoixture of the binoxide and ignited lamp. black in dry chlorine. The reaction may be carried out in a hard glass tube. For methods of puricication we refer to the hendbooks of chemistry. The pure chloride is a colourless liquid of $1 \cdot 7604$ specific rravity at $0^{\circ} \mathrm{C}$., boiling st $130^{\circ} \cdot 4$ under 753.3 mm . pressure ('S. E. Thorpe). It furnes strongly in moist sir. When dropped very cautiously into cold water it dissolves into a clear solution, which, however, when boiled, deposits most of its oxide in the meta-bydrate form. There are at least, two lower chlorides of titaniam, - one of the composition $\mathrm{Ti}_{2} \mathrm{Cl}_{8}$ and another of the composition $\mathrm{TiCl}_{3}$ both solids and both extremely prone to pass into titanic compounds. A solution of the tetrachloride in weter, as well as of the-soluble hydroxide in dilute ecid generally, when kept in contact with metallic zinc, is reduced to one of the lower chlorides with development of a violet colour. With regard to the detection of titanium we need not add much to what we have alreedy given incidentally. Acid solutions of $\mathrm{TiO}_{2}$ are not precipitated by sul. phuretted hydrogen; but snlphide of smononium acts on them as if it were ammouia, the $\mathrm{H}_{2} \mathrm{~S}$ keing liberated. Oxide of titanium when fused with microcosmic salt (i.e., $\mathrm{NaPO}_{3}$ ) in the oxidizing fiane yields a besd which is yellowish in the heat bat colourless after cooling. In the reducing flame the bead becomes violet, more readily on the addition of tin; in the preseace of iron it becomes blood-red. Titanic oxides when fused on charcoal, oven with cyeuide of potassium, yield po metal.

TITANS, powerful beings of Greek mythology, the children of Sky and Earth. According to Hesiod, the male Titans were Oceanus, Cous, Crius, Hyperion, Iapetus, and Cronus; the female were Thea, Rhea, Themis, Mnemosyne, Phœbe, and Tethys, to whom Apollodorus adds Dione. For the rebellion of the Titans against their father Sky (Uranus), the success and raign of Cronus, and the final consignment of the Titans to Tartarus by Zens, see Mrfiology, vol. xvii. p. 155, and Saturn, vol. xxi. p. 320 sq.

TITHES. It has been explained in Sacrifice (vol. xxi, p. 133) that among ancient peoples sacrificial gifts frequently assume the character of a tribute in kind, paid
to the deity in acknowledgment of the fruits of the land, or the increase of flocks attributed to his blessing. At first this tribute is not measured or onforced by law: the gift is a voluntary one, the magnitude of which may be faxed by a vow, or influenced by public opinion as to what is reasonable, but is not prescribed by any stated authority baving power to exact what is prescribed. In the oldest Hebrew legislation sacrificial gifts to Jehovah (Grstlings and first-fruits) are demanded; but apart from the consecration of the firstlings, which is imperative (Exod. zxii, 29 sq., zxxiv. 19 sq .), the amount is not fixed. In Deuteronomy (xiv. 22 s $q$ q.), on the other hand, the tithe or tenth of corn, wine, and oil is required irr addition to the firstlings of the flock and the herd. This precept, written down in the 7 th century b.c., is plainly no innovation, but rests on older usage (cp. Gen. xxviii. 22; Amos iv. 4); the new point emphasized is not that tithes must be paid, but that they must bo consumed at the central, instead of a local, sanctuary (Deut. xii. 6, 11, xiv. 23 sqq.), apparently at the great autumn feast or Feast of Tabernacles ( $q . v$. .). ${ }^{1}$ Such a tithe is still nothing more than the old offering of first-fruits (bikkū̄im) made definite as regards quantity, and it was only natural that as time went on there should be some fixed standard of the due amount of the annual sacred tribate. ${ }^{2}$ The establishment of such a standard does not necessarily imply that full payment was exacted ; in Gen. xxviii. 22 Jacob vows of his own free will to pay tithes, just as the Arabs used to vow the tithe of the increase of the flock (schol. on Hárith, Moall., 1. 69, ed. Arnold). The Arab did not always fulfil his row, and there was no force to make him do so. But, however inexactly it may often have been paid, the proportion of one part in ten seems to have been accepted in many ancient nations as the normal measure of aacred tribute paid from the gains of husbandry, trade, or even of war. ${ }^{\text {s }}$ The tithe, in fact, appears to have been a common form of tas upon the produce of land or other revenues, for civil as well as for sacred purposes. We find it in Creece (as at Athens), and in Sicily and Asia, under the Roman empire; but its special home was in the East. It was exacted on agricultural products and flocks by Hebrew kings ( 1 Sam . viii. 15, 17), and on imports by the monarchs of Babylon (Aristotle, Cicon., ed. Berlin, p.1352b). Aristotlo gives the tithe on fruits of the soil the first place among the revenues of satraps (Tlid., p. 1345b), and it still forms an important element in the fiscal system of Mohammedan states. It will bo observed that the proportion of one in ten has been applied in the East, and in antiquity generally, to imports of very diferent kinds, and in Mohammedan taxation te find the name retained in cases where much less than a tenth is actually taken. In like manner Aristotle (ut supra) makes סcќ́rך a mere symoaym of érфóptov, or tax on produce ; the proportiou of one to ten, it would seem, was so commonly taken in antiquity as the basis of ad vaiorem taxes that any such tax or tribute might bo called a tithe. As regards the sacred tithe of the Hebrews, a distinction is drawn in Deuteronomy between the ordinary annual tithe, which may not have becn a full tenth, end the "whole" or "full tithe," paid once in three years

[^172](Deut. xiv. 28, xxvi. 12), which the legislator directs to be stored at home, and spent in feeding the poor.

From Amos iv. 4 it is sometimes inferred that in the 8th centurs B. O. the sacrificial tithe, presented at a sanctuary, was triennial Bat when the prophet, mocking the false zeal of the peoplo, says "Bring your sacrifices every morning and your tithes every three daye" (not "years," as E. V.), he Lerdly implies more then thet occasions of aacrifice were three times as frequent as tithe-day, and fo alludes to the fact that there were by old usage three annnal feasts and one annual tithe. A triennial sacrificial tithe is inconceivable when it is remembered that the tithe is only an extension of the first-fruits. The triennial tithe in Deuteronomy seema to be rather an innovation necessary in the interests of the poor, when sacrificial feasts were transferred to the central sanctuary, and ceased to benefit the neighbours of the offerer, who had a prpacrip: tive claim to be considered on ouch occasions (comp. $1 \mathrm{Sam} . \operatorname{xrv}$. $\varepsilon$ sqq. ; Noh. viii. 10 ; Luke xiv. 13).

The priests of the sanctuaries had of old a share in the sacrificial feasts, and among those who are to share in the triennial tithe Denteronomy includes the Levites, i.e., the priests of the local sanctuaries who had lost their old perquisites by the centralization of rorship. After the return, and before the work of Ezra, when Deateronomy was still the law of the ncw Israel, bnt the Levites had become subordinate ministers of the temple, and requircd a more regular provision, the "whole tithe" was naturally fixed on for this purpose; but, instead of remaining in the hands of the tithe-payers to be doled out in charity, it was stored in the temple. Such, at least, wes the plan proposed, though from Mal. iii. 8 sqq. it appears that it was very imperfectly carried out. As Malachi speaks in Dcuteronomic phrase of the "whole tithe," the payment to the Levites was perhaps still only triennial ; and, if even this was difficult to collect, we may be sure that the minor sacrificial tithe had very nearly disappeared. The indifference complained of in Mal. i. Tras in great part due to the fundamental changes in the religion of Israel, which made private altar gifts and feasts almost meaningless. On the other band, the provision of regular support for the priests and Leritos, the ministers of the public ritual, was now all important, and received special attention from Ezra and Nehemiah (Neh. x. 37 sqq., xiii. 10 sqq.). They effected it by enforcing the nem law of the priestly code (Num. zviii. 21 sqq.), in which it is formally laid down that the tithe is a tribute paid to the Lerites, who in turn pay a tithe of it to tho priests. The plain intention of the priestly code is to allow the old tithe of Deuteronomy to drop; but the harmonistic interpretation of the later scribes was to the effect that two tithes wcre to be paid every year, and a third tithe, for the poor, on every third year (Tob. i. 7 sq.; Jos., Ant., ir. 8, \& 22). The last change in the system was the appropriation of the Levitical tithe by the priests, which apparently was effected by John Hyrcanus, though a tradition glariagly inconsistent with Nehemiah ascribes it to Ezra (Mishnah, "Ma'aser Sh.," ${ }^{\text {. }}$. 15 ; "Sota," ir. 10, and Wagcnseil's note).4 (T. R. \&)

## Tithes in Lavo.

Tithes Trere gencrally regarded up to the 17 th contury as existing jure divino, and as having been payablo to the support of the church ever ainco the earliest daye of Christianity. History, as Selden ohowed in his learned and exhaustive treatise (Hislomy of Tithes, 1618), does Dot bear out thia view. In the words of Hallan, "the alore and gradual manner in which parochial churches becatne independent appears to bo of itself a sufficient answer to those who ascribe a great entiquity to tho universal payment of tithea." \&

- A cattle tithe is demanded in Lovit. xyviL 32, and apoken of in 2 Chron axxi. 6. It is doubtful if this was erer acknowledged in practice. See Kuenen, Godsdienst, ii. 269 sq., and Wellhausen, op. cil., v. 1, 52 (Eng. tr., P. 155 sq.), who ergue thai the pasaage in Leviticus is a Later addition. The tendeacy of the Pharisees was to pay tithe on everything, end to make a self-righteous boast of this (Matt. xxiii., 23 ; Luko rviii. 121
- It was bis denial of the divine right of tithes that brooght down tho wrath of the Star Chamber apon the anthor. Ie was forced to retract an opinion too liberal for tho time. See Skcose.
6 Hallam, Mixille Alps. it. 205.

Long before the 8th century payment of tithes was enjoined by ecclesiastical writers and by councils of the church; but the earliest suthentic example of anything like a law of the state enforcing payment appears to occur in the Capitularics of Charlemagne at the pud of the 8 th or beginuing of the 9 th century. Tithes were by that enactment to be applied to the maintenance of the bishop and clergy, the poor, ${ }^{1}$ and the fabric of the church. In course of time the principle of payment of tithes was extended far beyond its original intention. Thus they became transferable to laymen and saleable like ordinary property, in spite of the injunctions of the third Lateran council, and they became payable out of sources of income which were not originally tithable. The canon law contains numerons and minute provisions on the subject of titbes. 'I'he Decrelum forbade their alienation to lay proprietors, denounced excommunication against those who refused to pay, and based the right of the church upon Scriptural precedents. ${ }^{2}$ The Decretals contained provisions as to what was and what was not tithable property, as to those privileged from payment, as to sale or hypo. thecation to laymen, as to priority over state taxes, \&c." Varions ruestions which arose later were settled by Boniface VIII. ${ }^{4}$ The council of Trent enjoined due payment of tithes, and cxcommunicated those who withheld them, ${ }^{5}$
In England the earliest example of legal recognition of tithes is, according to Selden, a decree of a synod in $786 .{ }^{6}$ Other examples before the Conquest occur in the Fodus. Elfredi et Guthrumi and the laws of Athelstan, Edgar, and Canutc. ${ }^{7}$ The tripartite division of tithes does not appear to have been recognized in England by any genuine legal enactuent except as what Mr. Freeman calls "a counsel of perfection." 8 The earliest mention of tithes in statute law proper is in the Statute of Westminster the Second in 1285, c. 5 (f which deals with the patron's writ de advocalione decimarum. From that date until the present year (1887) there have been a large number of Acts dealing with tithes,-the earliest which is still law being 2 Hen. IV. c. 4 , making it an offence to purchase a bull from tha pape for the discharge of land from tithes. The law has only nttained its present condition by slow degrees. and by the combined effect of statutes and judicial decisions. The effect of the Tithe Commutation Act of 1836 has been to make most of the bid lav of merely historical interest, as in the course of the commutation all the questions of Iaw as to prescription, exemption, dic., would have been duly considered by the commissioners before the rentcharge was fiaally apportioned.
Tithes in English law are of 3 kinds,-predial, arising immediately from the soil, as of corn; mixed, arising from thinge nourished by the soil, as of milk or wool ; personal, as of the profits of manual occupations or trades. The right to the last was considerably restricted by 2 and 3 Eilw. VII. c. 13. They ere also divided from other points of view into ordinary and exlraordinary,-the latter being a tithe at a heavier rate charged on hop and market gardens, -and into great and small, as a rule tlose which go to the rector and vicar respectively. Iu general great tithes are predial, small are mixed and personal. It is not everything that is titlable; exemptions are claimable either from the nature of the property or the privilege of the owner. Stone, lime, and such other subatances as are not of annual increase are exempt. So are creatures form nature. Exempt by privilega are the cromn by its prerogative, and spiritual corporations in accordance with the maxim recognized equally by canon and cominon law, ecclesia dccimas non solrit ccclesix. Thus a rector pays no tithes to his vicar, or a vicar to his rector. On the same principle it is a ground of exemution that lands were snciently the property of the privileged orders (at the time of the dissolution of monasteries, the Cistercians and Hospitallers), or ware lands of the greater monasteries discharged from tithe by 31 Hen. VIII. c. 13. Exemption may also be claimed by redemption, by substilution of a rent-charge, by a real composition (that is, an agreement between the incuinbent and the landowner, with the consent of the ordinary and patron, for the discliarge from payment of tithe by means of satisfaction by giving of land or some other real recompense), by a madics (that is, a partial discharge owing to some cristomary inethod of titling or modus decimandi), or by prescription under 2 and 3 Will. IV.c. $100^{\circ}$. Tithes in extraparochial places belonged st common law to the crown, except by custom. Tithes are incorporeal hereditaments (see Real Estate), and may be dealt with like any other real estate of that nature. I'lus they are, if in lay hands, tenements which may be entailed or leased, are subject to dower and curtesy, are assets for the pay. ment of debts, and are (whether in lay hands or not) within the Statute of Limitations. They do not, however, issue out of the land like rents, but are collateral to it. Accordingly tithes are always freehold, even though they are chsrged on copyhold lands. Tithee

[^173]are presumed to go to the person of the parish. This presumption may be rebutted by proof that some or all the tithes go to tha vicar, where the rector is in holy orders, or to a lsy insproprintor. It is ssid that about a third part of the tithes in England is in the bands of laymen. At one time arbitrary consecration of tithes was allowed,-that is, payment to any priest at the will of the tithe. payer. This was forbidden by a decretal epistle of Innocaut IlI., about 1200. "This epistle decretall," says Coke, "bound not the subjects of this realm, but the same being just and reasoneble tiney allowed the same, and so became lex terre." ${ }^{\prime \prime}$ A vestige of the arbitrary consecration perhaps exists in the rarely occurriog rignt of the parson of oue parish to a portion of the tithes of another. Tithes are nayable by all persons alike, whether members of the Church of England or not. Special enactments desl with their recovery from Roman Cathdlics aud Quskers. Up to 1836 tilhes were pald in kind, unless where any other method of payment applied in a particular case, such as a modus in the costure of a pecuniary compensation, or a pecuniary payment under the terms of a public or private Act, as in the city of Loudon ioy 37 Hen . VIII. c. 12, 22 and 23 Car. II. c. 15, and other Acts. Even before 1836, however, the bulk of the tithes had been comintited, but such comniutation was in ordinary cases good ouly diaing the tenure of a particular jncumbency, and did not bind the iucumbent's suc. cessors. The Act of 1836 merely completed nud gave legislativo sanction to a tendency which had been long on the inerease.

The effect of the Tithe Commutation Act, 1836 (6 and 7 Will.) IV. c. 71, frequently amended sincel, was to sulistitute for the tithe paid in kind or the fluctuating commuted tithe a rent-charge-commonly called the tithe selt-charge-equivalent to the market value from time to tine on a septenaial sverage of the exact quantities of wheat, barles, and oats which made up the legal tithes by the estinate in 1830 . Excepted from the operation of the Act are (unless where there is a apecial provision approved by the commissioners) tithes of fisl or of fishing, or any personal tithes other than those of mills, or any mineral tithes, or payments or rent-charges in lien of tithes in London sud other places, resting on the authority of local Acts. The Act has not been wholly successful in its working. By the transfer of estates, and by changes in local agriculture, the old estimates are no longer fairly applicable in all cases. The commutation has been, on the whole, to the advantage of the landowners, for the tithe remains fixed while the rental of land since 1836 has risen, according to Sir James Caird, from 33 millions to 52 millions per annum. Commutation under the Act is either by a voluntary agreement, confimed by the tithe commissioners. ${ }^{10}$ or hy an award of the commissioners. The machiners for determiniag the tithe for any given jear is as follows:-the Board of Tiade is to cause the average-pricos per imperial bushel of each sort of British corn to be computed from the summaries sent by the inspectors of corn returns, obtained from the arerages stated by the jaspectors, and published in the London Gazette weekly, quarterly, and yearly, 6nd a septennial ererage is to be obtained from the sum of the annual sverages áivided by seven ( 45 and 46 Vict. c. 37 , enperseding scet. 56 of the Act of 1836). The rent-charge is computed on the basis of one-third for wheat, one-third for barley, snd one-third for oats. The respectire prices were originally fixed by 7 Will. IV. and 1 Yict. c. 69, s. 7 (as altered by the London Gazette of 9th December 1837), at 76. $1 \frac{1}{4} \mathrm{~d}$. for wheat, 3 s . $11 \frac{1}{2} \mathrm{~d}$. for barley, and 2s. 9d. for oats per bushel. The prices for 1887 were 4 s . 11d., 3 s . $10 \mathrm{~d} .$, sud $2 \mathrm{~s} .7 \frac{1}{2} \mathrm{~d}$. respectively. Owing to this fall in prices, tithe reat-charge which stood at $£ 100$ in 1836 was worth in 1887 only $£ 87,8 \mathrm{~s} .10 \mathrm{~d}$.

After the coming into force of the Act of 1836 all lands wera discharged from tithe, and the tithe rent-charge wae substituted, payable by equal half-yearly payments, each lst of July and Ist of January. A tenant paying the reat-charge is to be allowed the same in sccount with his landlord. The charge thus ultimately falls upon the landlord, whether or not ho pays it in the first instance to the tithe-owner. Land may begiven instead of a rentcharge where the tithe-owner is an ecclesiastical person. Gardens or small tenements may be exempt from titha by 3 and 4 Vict. c. 15. Later Acts give a power of redemption of rent-charge in the case of land required for public purposes, aettled land, scc. (9 and 10 Vict. c. 73 ; 23 and 24 Vict. c. 93 ; 41 and 42 Vict. c. 42 ; 45 and 46 Viet. c. 38). Merger of the rent-charge is allowed by tenants in fee or in tail under the Act of 1836, and by persons heving powers of appointment, tenants for life, and owners of glebes nuder 1 and 2 Vict. c. 64 and 2 and 3 Vict. c. 62 . The mode of recovery of srrears provided by the Act of 1836 was a new one. Up to that time srrears could not be distrained for, unless ia exceptional cases. The remedy of the parson was a suit for sulatraction of tithee, which, by 2 and 3 Edw. VI. c. 13 , could only be brought in a spiritual court. The remedy of tha lay holder was s suit or action in any temporal court by 32 Hen . VIII.

[^174]c. 7. It is provided by the Act of 1836 that, if the rent-charge be in arrear for twenty-one days, the person entitled to it may, after ten dayg rotice in writing, distra:n upon the lands liable to the payment of it. If it be in arrear for forty days, and there be no sufficient distress on the premises, a writ of habere facias possessionem may issue, directing the sheriff to summon a jury to assess arrears. Not more than two years' arreara can be recovered by either means. It appears from these eections of the Act that the chargo binds the land alone, and that there is no personal lizbility of either landlord or tenant. Though the charge is on the land, it is not on the inheritance, and it has been recently decided that erreare are not recoverable by sale of the lands out of which the rent-charge issues. The assessincot of the rent-charge on wastes. coinmon or Lamnias lands, coppice ẇood, turnips, cattle agisted, \&c., and the commutation of coru reats created by local Acts, are the sabject of epecial provisions. The Act of 1836 and later Acts provided for the division of the cliarge upon hop grounds, orchards, fruit plantations, and market gardens into the ordinary and extraordinary charge, the latter to be a rate per acre in addition to the ordinary chargo. The extroordinary titho applies only whilo the land is cultivated as a hop ground, \&c., and in case of new cultivation contes into operation gradually, the full rate not being lovied atence. The incidence of the extraordinary tithe having been found an impediment to agriculture, especially in Keat, the Extraordinary Tithe Commutation Act, 1886 ( 49 aud 50 Vict. c. 54), was passed as a rechedy. It provides-thatno extraordinary tithe is to be charged apon any land newly cultivated after the passing of the Act. With regard to land subject at the passing of the Act to extraordinary tithe, the Act enables the land commissioners to certify the capital value of the extraordinery tithe on each farm or parcel of land, the land to be charged in lien of the tithe with the payment of an sunasl rent-clarge equal to 4 per cent. on the capital value. The owner or any other person intereated in the land may redcem the charge at its cepital ralue. Tithe rent-charge is subject by the Act of 1836 to all parliamentary, parochial, and county rates, and is an hereditament within the Poor Rate Act of the same year ( 6 and 7 Will. IV. c. 96). The latter Act further enacts that in estimating the net snnual value of rateable hereditaments, the rent is to be cstimated free, inter alia, of tithe commutation rent-charge, if any.

Scolland. -The terms" tithes" and "teinds" are both in usc, but the latter is the more common. Teinds are either drawn in kind, valued, or redeemed. Originally they were all drawn in kind, as in England, hut their commutation or redemption was the subject of many Acts of the Scottish parlisment, especislly thoso passed in 1633, the practical effect of which has been to make a fixed burden on the land take the place of a fluctuating payment, and to subatitute a payment of one-fifth of the rent for one-tenth of the produce. In the first instance all teinds weat to the church; but, when at the Reformation the crown became proprietor of the church lands, grants were made by it to the lords of erection or titulars of the tithes, laymen holding of the crown. The Act 1587, c. 29, snnexed the church lands to the crown, with certain exceptions in favour of lay holders and others. All bishops' teinds and those formerly part of the revenue of the chapel royal are now crown property. The Church Patronsge Act of 1874 does not affect the right to teinds of a patron or titular. Teinds in lay hands are sub. ject to the burden of providing a suitable provision for the minister, the etipend being fired Ly the Court of Teinds. All lands are subject to teinds except those which before the Reformation were feued eum decinis inclusis el munguam cnlea separatis, so that the grantee held lards and teinde together. In order to prove such an exemption, the person claiming under a decimæ inclusæ title must ahow that the lands and teinds belonged to monestery, that the lands were never teindable, that they were novalia, or reclaimed by the monks themselves, that the title bears that the lande are held curn decimis inelusis, \&c., and that it is previous to 1587 The judges of the Court of Session sit es commissioners of teinde, - a.jurisdiction epecially preseryed by art. xix. of the Act of Uniod, -and exercise wider powere than any existing body in England, as they possess at once the juriadiction of a court of justice and of the English land commissionere. The constitution and procedure of the Court of Teinds is regulated by 48 Geo. III. c. 138 and subsequent Acts. ${ }^{2}$
Ireland.- Many Acts of the Irish parliament desl with tithes, both generally and locally, the earliest being 33 IIen. VIII. c. 12, based upon the English Act, 28 Hen. VIII. c. 20 . After the "tithe war" at the beginning of the 19th century, a tithe composition payable by the occupier was fixed by 4 Geo. 1V.c. 99 . In 1838 an annual rent-charge equal in smount to three-fourths of the tithe

[^175]composition was substituted for the latter by I and 2 Vict. c. 109. The rent-charge is rccoverable by distrcss where the person lisblc is the occupier, in other cases by action in the High Court of Justice, or by civil bill in claims under $£ 20$. Tho Irish Church Act, 1869 ( 32 and 33 Vict. c. 42), vests all tithe rent-charge then belonging to clergy of the Irish Church in the commissioners of church temporalities in Ireland. By that Act and the amending Act, 35 and 36 Vict. c. 90 , the commissioners aro enabled to purchase the surrenderor assignment of any subsistiog lease of tithe reat-charge made by an ecclesiastical person or corporation, and to sell any reat-charge vested in them to the owner of the land charged therewith for a sum equal to twenty-two and a half years' purclase.
(J. Wt.)

TITHONUS, a character of Greek mythology, a son or, according to others, a brother of Laomedon, king of Troy. He was beloved by Eos (tha Morning), who carricd him a way and dwelt with him at the limit of the world, by the Ocean stream. Eos begged of Zeus, that her lover might live for ever, and her request was granted; but she forgot to ask immortal youth for him, so he shrivelled up into a hideous old man, whom Eos kept shut up in a chamber. At last Tithonus prayed to be rid of the burden of old age and was turned into a grasshopper. Eos had two sons by him-Memnon, king of 在thiopia, and Emathion. Memnon was killed before Troy by Achilles; but the legend is later than the Iliad, which does not mention it. As to Eos herself, her name is etymologically identical with the Sanskrit ush and the Latin ourrora, both meaning "morning." According to Hesiod, Eos was a daughter of Hyperion and Thea, and sister of the Sun and Moon. Homer represents her arising every morning from the couch of Tithonus to carry light to gods and men, drawn in a chariot up the sky by her swift steeds Lanpus and Phaethon. Her common epithet in Homer is "rosy-fingered," the meaning of which is disputed. Besides Tithonus she loved Orion, till Artemis shot hinn with an arrow in Ortygia. She also loved and carried off the youthful hunter Cephalus ; ho was already married to Procris, to whom, in spite of lis infidelity, he was afterwards reconciled. A peculiar form of the Cephalus legend is given by Apollodorus (iii. 14, 3): Cephalus, a son of Hermes and Herse, was carried off by Eos, and from their union in Syria sprang Phaethon. By Astreus, Eos became the mother of the Morning Star and all the starry host.

With regard to representations in art, the combat between Achilles and Memnon was figured on the chest of Cypselus (Pansanias, v. 19, 1), and it appears on early Greek vases of Melos, Corinth, and Chaleis. There was a group of Eos carrying off Cephalus on the rool of the Stos Basileios at Athens, and the ssme bcere was reproo eented on the throne at Amyclo (Pans., i. 3, 1; iii. 18, 12). It also appears on yases, and formed an acrolerion group on the templo at Delos. Eos in her cheriot is represented on rases.

TITIAN (1477-1576). Tiziano Vecellio, or Vecelli, one of the greatest painters of the world, and in especial the typical representative of the Venetian school, was commonly callcd during his lifetine "Da Cadore," from the place of his birth, and has also been designated "It Divino." The country of Cadore, in the Friuli, barren and poor, is watered by the Piavo torrent poured forth from the Carnic Alps, and is at no great distance from Tyrol. Titian, therefore, was not in any sense a Venetian of the lagoons and Adriatic, but was native to a country, and a range of association, perception, and observation, of a directly different kind. Venice conquered Friuli at a date not very remote from the birth of Titian; end Cadore, baving to choose between Venetian and imparial allegiance, declared for the former. Approaching the castle of Cadore from the village Sotto Castello, ons passes on the right a cottage of humble pretensions, inscribed as Titian's birthplace; the precise locality is named Arsenale. The near mountain-all this range of hills being of dolomite for-mation-is called Marmarolo. At the neighbouring village of Valle was fought in Titián's lifetime the battle of

Cadore, a Venetian victory which he recorded in a painting. In the 12 th century the count of Camino became count also of Cadore. He was called Guecello; and this name descended in 1321 to the podesta (or mayor) of Cadore, to the stock to which the painter belonged. Titian, one of a family of four, and son of Gregorio Vecelli, a distinguished councillor and soldier, and of his wife Lucia, was born in 1477.
It used to be said that Titian, when a child, painted upon the wall of the Casa Sampieri, with flower-juice, a Madonna and Infant with a boy-angel; but modern connoisseurs say that the picture is a common work, of a date later than Titian's decease. He was still a child when sent by his parents to Venice, to an uncle's house. There he was placed under in art-teacher, who may perhaps have been Sebastiano Zuccato, a mosaicist and painter now forgotten. He next became a pupil of Centile Bellini, whom he left after a while, because the master considered him too offhand in work. Here ho had the opportunity of studying many fine antiques. . His last instructor was Giovanni Bellini ; but Titian was not altogether satisfied with his tutoring. Tho youth was a contemporary of Giorgione and Palma (Vecchio); when his period 'of pupilage expired, he is surmised to bave entered into a sort of partnership with Giorgione. A fresco of Hercules on the Morosini Palace is said to have been one of his earliest works; others were the Virgin and Child, in the Vienna Belvedere, and the Visitation of Mary and Elizabeth (from the convent of S. Andrea), now in the Venetian academy. In 1507-8 Giorgione was commissioned by the state to execute frescos on the re-erected Fondaco de' Tedeschi. Titian and Morto da Feltre worked along with him, and some fragments of Titian's paintings, which are reputed to have surpassed Giorgione's, are still discernible. According to one account, Giorgione was nettled at this superiority, and denied Titian admittance to his houso thenceforth. Stories of jealousies between painters are rife in all regions, and in none more than in the Venetian,-various statements of this kind applying to Titian himself. One should neither accept nor reject them uninquiringly ; counter-evidence of some weight can be cited for Vecelli's vindication in relation to Moroni, Correggio, Lotto, and Coello. Towards 1511, after the cossation of the League of Cambrai-which had endeavoured to shatter the power of the Venetian republic, and had at any rate succeeded in clipping the wings of the lion of St Mark-Vecelli went to Padua, and painted in the Scnola di S. Antonio a series of frescos, which continue to bo an object of high curiosity to the students of his genius, although they cannot be matched against his finest achievements in oil painting. Another fresco, dated 1503 , is St Christopher carrying the Infant Christ, at the foot of the coose's stops in the ducal palace of Venica. From Padna. Titiar in 1512 returned to Venice; and in 1513 he obtained a broker's patent in the Fondaco de' Tedeschi, termed "La Sanseria " oi "Senseria" (a privilege much coveted by rising or risen artists), and became superintendent of the Government works, being cspecially charged to complete the paintings left unfinished by Giovanni Bellini in the hall of the great council in the ducal palace. He set up an atelier on the Grand Canal, at S. Samuele,-the precise site being now unknown. It was not until 1516, upon the death of Bellini, that he came into actual enjoyment of his patent; at the same date an arrangement for painting was entered into with Titian alone, to the exclusion of other artists who had heretofore been assnciated with him. The patent yielded him a good annuity - 120 crowns-and exempted him from certain taxes, -he being bound in return to paint likenesses of the successive doges of his time at the fixed price of eight
crowns each. The actual number which he executed was five. Titian, it may be well.to note as a landmark in-this all but centenarian lifo of incessant artistic labour and productiveness, was now in the forticth year of his age. The same year, 1516, witnessed his first journey to Ferrara. Two years later was produced, for the high altar of the church of the Frari, one of his most world-renowned masterpieces, the Assumption of the Madonna, now in the Venetian academy. It excited a vast sensation, being indeed the most extraordinary picce of colourist execution on a great scale which Italy had yet seen. The signoria took note of the facts, and did not fail to observe that Titian was neglecting his work in the ball of the great council.
Vecelli was now at the height of his fame; and towards 1521, following the production of a figure of St Sebastian for the papal legate in Brescia (a work of which there are numerous replicas), purchasers bccame extremely urgent for his productions. It may have been about 1523, after some irregular living and a consequent fever, that he married a lady of whom only the Christian name, Cecilia, has come down to us; her first child, Pomponio, was born in 1525, and two (or perhaps three) others followed. Towards 1526 he became acquainted, and soon exceedingly intimate, with Pietro Aretino, the literary bravo, of influence and audacity hitherto unexampled, who figures so strangely in the chronicles of the time. Titian sent a portrait of him to Gonzaga, duke of Mantua. A great affliction befell him in August 1530, in the death of his wife. He then, with his three children-one of them being the infant Lavinia, whose wirth had been fatal to the mother-removed to a new home, and got his sister Orsa to come from Cadore and take charge of the houschold. The mansion, difficult now to find, is in the Biri Grande, then a fashionable suburb, being in the extreme end of Venice on the sea, with beautiful gardens and a look-out towards Murano. In 1532 he painted in Bologna a portrait of the emperor Charles V., and was created a count palatine and knight of the Golden Spur, his children also being made nobles of the empire,-for a painter, honours of an unexampled kind.
The Venetian Government, dissatisfied at Titian's neg. lect of the work for the ducal palace, ordered him in 1538 to refund the money which he had received for time unemployed; and Pordenone, his formidable rival of recent years, was installed in his place. At the end of a year, however, Pordenone died; and Titian, who had meanwhile applied himself diligently to painting in the hall the battle of Cadore, was reinstated. This great picture, which was burned with several others in 1577, represented in life-size the moment at which the Venetian captain, D'Alviano, fronted the enemy, with horses and men crashing down into the stream. Fontana's engraving, and a sketch by Titian himself in the gallery of the Ufizi in Florence, record the energetic composition. As a matter of professional and worldly success, his position from abous this time may be regarded as higher than that of any other painter known to history, except Raphael, Michelangelo, and at a latcr date Rubens. In 1540 he received a pen. sion from D'Avalos, Marquis del Vasto, and an annuity of 200 crowns (which was afterwards doubled) from Charles, V. on the treasury of Milan. Another source of profitfor he was always sufficiently keen after money-was a contract, obtained in 1542, for supplying grain to Cadore, which he visited with regularity almost every year, and where he was both generous and influential. This reminds us of Shakespeare and his relations to his birthplace, Stratford-on-Avon; and indeed the great Venetian and the greater Englishman had something akin in the essentially natural tone of their inspiration and performance,
and in the personal tendency of each to look after practical success and "'the main chance ${ }^{\text {s }}$ rather than to work out aspirations and pursue ideals. Titian had a favourite villa on the neighbouring Manza Hill, from which (it may be inferred) be made his chief observations of landscape form and effect. The so-called Titian's mill, constantly discernible in his studics, is at Collontola, near Belluno. A visit was paid to Rome in 1546, when he obtained the freedom of the city, his immediate predecessor in that honour having been Michelangelo in 1537. He could at the same time have succeeded the painter Fra Sebastiano in his lucrative office of the piombo, and he made no scruple of becoming a friar for the purpose; but this project lapsed through his being summoned away from Venice in 1547 to paint Charles V. and others in Augsburg. He was there again in 1550 , and executed the portrait of Philip II., which was sent to England and proved a potent auxiliary in the suit of the prince for the hand of Queen Mary. In the preceding year Vecelli had affianced his daughter Lavinia, the beautiful girl whom be loved deeply and painted various times, to Cornelio Sarcinelli of Serravalle; she had succeeded lee aunt Orsa, now deceased, as the manager of the lousehold, which, with the lordly income that Titian made by this time, was placed on a corresponding footing. The marriage took place in 1554. She died in childbirth in 1560. The years 1551 and 1552 were among those in which Titian worked least assiduously, - a circumstance which need excite no surprise in the case of a man aged about serenty-five. He was at the council of Trent towards 1555 , of which bis admirable picture or finished sketch in the Louvre bears record. He was never in Spain, notwithstanding the many statements mhich have been made in the affirmative. Titian's friend Aretino died suddenly in 1556 , and another close intimate, the sculptor and architect Sansovino, in 1570. With his European fame, and many sources of wealth, Vecelli is the last man one would suppose to have been under the necessity of writing querulous and dunning letters for payment, especially when the defaulter addressed was lord of Spain and of the American Indies; yet he bad constantly to complain that his pictures remained unpaid for and his pensions in arrear, and in the very year of his death (February) he recites the many pictures which he had sent withia the preceding twenty years without recciving their price. In fact, there is ground for thinking that all his pensions and privileges, large as they were nominally, brought in but precarious returns. It has been pointed out that in the summer of 1566 (when he was elected into the Florentine academy) he made an official declaration of his.income, and put down the various iteras apparently below their value, not naming at all his salary or pensions. Possibly there was but too much reason for the omission.

In September 1565 Titian went to Cadore and designed the decorations for the church at Pieve, partly executed by his pupils. One of these is a Transfiguration, another en Annunciation (norr in S. Salvatore, Venice), inscribed "Titianus fecit fecit," by way of protest (it is said) against the disparagement of some persons who cavilled at the veteran's failing handicraft. He continued to accept commissions to the last. He had selected as the place for his burial the chapel of the Crucifix in the church of the Frari; and, in return for a grave, he offered the Franciscans a picture of the Pieta, representing himself and his son Orazio before the Saviour, another figure in the composition being a sibyl. This worl he nearly finisbed; but some differences arose regarding it, and ho then settled to be interred in his native Pieve. Titian was ninety-nine years of age (more or less) when the plague, ${ }^{1}$ which was then raging in

Out of a total population of 190,000 there perished at this time 50,000.

Venice, seized him, and carried him off on 27 th August 1576. He was buried in the church of the Frari, as at first intended, and bis Picta was finished by Palma Giorane. He lies near his own famous painting, the Madonna di Casa Pesero. No memorial marked his grave, until by Austrian command Canova executed the monument so well known to sightseers. Immediately after Titian's own death, his son and pictorial assistant Orazio died of the same epidemic. His suraptuous mansion was plundered during the plague by thieres, who provled about, scarce controllec.
Titian was a man of correct. features and handsorne persen, with an uncommon air of penetrating observation and self-possessed composure, - a Tenetian presence worthy to pair with any of those "most potent, grave, and reverend signors" whom bis pencil has transmitted to posterity. He was highly distinguished, courteons, and winning iu society, personally unassuming, and a fine speaker, enjoying (as is said by Vasari, who savy himo in the spring of 1566) health and prosperity unequalled. The numcrous heads curreatly named Titian's Mistress might dispose us to regard the painter as a man of more than usually relaxed morals; the fact is, however, that these titles are mere fancy-names, and no inference one way or the other cad be drawn from them. He gave splendid entertain. ments at times; and it is related that, when Henry 11L of Fraace passed through Venice on his war from Poland to take the Freach throse, he called on Citian with a train of nobles, and the painter presented him as a gift with all the pictures of which he inquired the price. He was not a man of universal genius or varied faculty and accoroplishment, like Leonardo da Vinci and Michelaggelo; his one great and supreme endowment was that of painting.

Ever since Titian rose into celebrity the general verdict has been that ho is the greatest of painters, considered technically. In the first place Deither the method of fresco painting nor work of the colossal scale to which fresco painting ministers is here in question. Titian's province is that of oil painting, and of painting on a scalo which, though often large and grand, is pot colossal either in dimension or in inspiration. Titian may properly bo regarded as the greatest manipulator of paint in relation to colour, tone, luminosity, richncss, texture, surface, and harmony, and with a view to the proluction of a pictorial whole conveying to the eye a true, dignificd, and beautiful impression of its general subjectmatter and of the objects of sense which form its constitueat parts. In this sease Titian has never becn deposed from his sovereigaty in painting, nor can one forecast the time in which he will be deposed. For the complex of qualities which we sum up in the words colour, handling, and general force and harmony of effect, he stands unmatched, although in particular items of forcible or impressive execution- Dot to speak of creative invention - some painters, one in one respect and another in another, may indisputably be preferred to him. He carried to its acme that great colourist conception of the Venetian school of which the first masterpieces ere due to the two Rellini, to Carpaccio, aad, with more fully developed suavity of manner, to Giorgione. Pre-eminent invertive power or sublimity of intellect he never evinced. Eved in eaergy of action sDd more especially in majesty or affuence of composition the palm is zot his; it is (so far as concerns the Venetian sclrool) assignablo to. Tintoretto. Titiad is a painter who by wondrous magic of genius and of art satisfies the eye, and through the eye the feeling ${ }^{3}$,-sometinies the mind.
Titian's pictures abound with memories of his home-conntry sod of the region which led from the hill-summits of Cadore to the queed-city of the Adristic. He wes almost the first painter to ezhibit an appreciation of moontains, mainly those of a turreted type, exemplified in the Dolomites. Indeed ho gave to landscapo generally a Dew and oripinal vitelity, expressing the quality of the - bjects of rature and their control over the seatiments and imsgination with a force that bad never before been approached. The carliest Italian picture expressly designated as "Isndscape" was one which Vecelli sent in 1552 to Philip II. His prodoctivo facolty was immense, even when we ollow for tho aboormal length of bǐa professional career. In Italy, England, and elsowhere zoere than A thousand picturcs figure as Titian's ; of these about 250 may be regarded as dubious or spurious. There are, for instance, 2 pictures in the Londod National Gallery, 18 in the Lourre, 16 in the Pitit, 18 in the Udizi, 7 in the Naplcs museum, 8 in the Venetisd occ:demy (besides the series in the private meetiog.hall), and 41 in the Medrid museum.

Naturally a good deal of attontion has boen gived by artists, connoisseurs, and experts to probing the secret of how Tition mavaged to obtain soch astonishing results in colonr and sorfaca The upshet of this research is but mesgra; the socret seems to be not so much ode of workonenship as of faculty. His fgures ware put io with the brnsh dipped in a brown selotion, and theo alterel and worked up as bis intuntion doveloped. The later picturws were
touched off rapidly, telling well from a distant view. He himself averred that after his visit to Rome in 1546 he had greatly improved in art; and in his very last days he said-certainly with the modesty of genius, perhaps also with some of the tenacity of old age modesty of was then beginning to understand what painting meant. In his earlier pictures the gamut of colour rests mainly upon red arid green, in the later ones upon decp yellow and blue. The pigments which he used were nothing unusual; indeed they were both fev and common. Palma Giovane records that Vecelli would set pictures aside for months, and afterwards, examining them with a stern countenance as if they were his mortal enemies, would set to work upon them like a man possessed ; also that he kept many pictures in progress at the same time, turning from one to the other, and that in his final operations he worked far more with finger than with brush. It has been said, and probably with truth, that he tried to emulate Palma Vecchio in softness as well as Giorgione in richness. Michelangelo's verdict after inspecting the picture of Danae in the Rain of Gold, executed in 15 46 , has often been quoted. He said, "That man would have lad no equal if art had done as much for him as nature." He was thinking princinally of severity and najesty of draughtsmanship, for ho "dded, "lity that in Venice they don't learn how to draw well." As a draughtsman of the human figure Titian was not only competent but good and fine, and he is reported to have studied anatomy deeply; but one can easily uncerstand that he fell not a hittle short of the standard of Michelangelo, and even of other leading Florentines. He was wont to paint in a nude figure with Venetian red, supplemented by a little lake in the contour and towards the extremities. He observed that a colourist ought to manipulate white, black, and red, and that the carnations cannot be done in a first painting, but by replicating various tints and mingling the colours. He distanced all predecessors in the study of colour as applied to draperies,-working on the principle (in which Giorgione may perhaps have forestalled him) that red comes forward to the eye, yellow retains the rays of light, and blue assimilates to shadow. In his subject-pictures the figures are not very numerous, and the attitudes are mostly reserved; even in bacchanals or battles the athletic display has more of facility than of furor. His architectural scenes were sometimes executed by other persons, especially the Rosas of Brescia. The glow of late afternoon, or the passionate ardonr of early sundown, was much affected by Titian in the lighting of his pictures. Gencrally it may be said that he took great pains in completing his works, and paius also in concealing the traces of labour. He appears to have had little liking for teaching, partly from distaste of the trouble, and partly (if we are to believe biographers) from jealonsy. He was quite willing, however, to turn to some account the work of his scholars: it is related that on going out-of-doors he would leave his studio open, so that the pupils had a clandestine opportunity of copying his works, and if the copies prored of saleable quality he would buy them cheap, touch them up, and resell them.
Titian's family relations appear to have been happy, except as regards his eldest son Pomponio. This youth, at the age of six, was launched upon the ecclesiastical career; but he proved wasteful and worthless, and Titian at last got so disgusted with him that he obtained the transfer to a nephew of a benefice destined for Pomponio. The fortune which he left was, after his decease, squaudered by the tonsured prodigal. The other son Orazio, born towards 1528, who (as we have seen) assisted Titian professionally, became a portrait-painter of mark,-some of his likenesses, almost comparable with Titian's own, being often confounded with his by owners and connoisseurs. He executed an important picture in the hall of the great council, Acstroyed by fire. He gave to alchemy some of the time which might have been bestowed upon painting. Several other artists of the Vecelli family followed in the wake of Titian. Francesco Vecelli, his elder brother, was introduced to painting by Titian (it is said at the age of twelre, but chronology will hardly admit of this), and painted in the church of S . Vito in Cadore a picture of the titular saint armed. This was a noteworthy performance, of which Titian (the usual atory) became jealous; so Francesco was diverted from painting to ooldiering, and afterwards to mercantile life. Marco Vecelli, called Marco di Tiziano, Titian's nephew, horn in 1545, was constantly with the master in his old age, and learned his methods of work. He has left some able productions, - in the ducal palace, the Meeting of Charles V. and Clement VII. in 1529; in S. Giacomo di Rialto, an Annunciation ; in SS. Giovanni e Paolo, Christ Fulminant. A son of Marco, nanued Tiziano (or Tizianello), painted early in the 17th century. From a different branch of the family came Fabrizio di Ettore, a painter who died in 1580 . His brother Cesare, who also left some pictures, is well known by his book of engraved costumes, Abiti Antichi e Moderni. Tommaso Vecelli, also a paintex, died in 1620. There was another relative, Girolamo Dante, who, being a scholar and assistant of Titian, was called Girolamo di Tiziano. Various pictures of his were touched up by the master, and are difficult to distinguish from originals. Apart from members of his family, the scholars of Titian were not numerous;

Paris Bordone and Bonifazio were the two of superior excellense, Domenico Troscopoli (or Domenico Greco) was employed by the master to engrave from his works. It is said that Titian himself engraved on copper and on wood, but this may well be questioned.
We must now briefly advert to Titian's individual works, taking them in approximato order of time, and merely dividing portraits from other pictures. Details already given indicate that he did not exhibit any extreme precocity; the earliest works which we procced to mention may date towards 1505 . In the clapel of S . Rocco, Venice, is his Christ Carrying the Cross, now greatly dilapidated, which was an object of so much popular devotion as to produco offerings which formed the first funds for building the Scuola di S. Rocco ; in the scuola itself is his Man of Sorrows. The singularly beantiful picture (sce Schools of Paintino, vol. xxi. p. 436, fig. 16) in the Borghese Palace in Rome, commonly named Divine and Human Love (by some, Artless and Sated Love), bears some obvious relation to the style of Palma Vecchio. The story goes that Titian was enamoured of Palma's daughter; but nothing distinct on this point is forthcoming. The Tribute Money (Christ and the Pharisee), now in the Dresden gallery, dates towards 1508; Titian is said to have painted this highly fnished yet not "niggling" picture in order to prove to some Germans that the effect of detail could be produced without those extreme minutix which mark the style of Albert Dürer. The St Mark in the church of the Salute-the evangelist enthroned, along with SS. Sebastian, Roch, Cosmo, and Damiano-a picture much in the atyle of Giorgione, belongs to 1512. Towards 1518 was printed, also in the same class of style, the Three Ages, now in Bridecwater House,-a woman guiding the fingers of a shepherd on a rood-pipe, two sleeping children, a cupid. an old man with two sknlls, and a second shepherd in the distance, -one of the most poetically imprcssive among all Titian's works. Another work of approximate date was the Worship of Venus, in the Madrid musenun, showing a statue of Venus, two nymplis, numerous cupids hunting a hare, and other figures. Tiwo of the London National Galiery pictures-the Holy Family and St Catherine and the Noli Me Tangere-were going on at much the same time as the great Assumption of the Madonna. In 1521 Vecelli fnished a painting which had long been due to Duke Alphonso of Ferrara, probably the Bacchanal, with Ariadne dozing orer her wine-cup, which is now in Madrid. The famous Bacchus and Ariadne in the National Gallery was produced for the same patrón. in 1523. The Flora of the Uffizi, the Venus of Darmstadt, and the lovely Venus Anadyomene of the Bridgewater Gallery may date a year or so earlier. Another work of 1523 is the stupendous En. tombnent of Christ in the Louvre, whose depth of colour and of shadow stands as the pictorial equivalent of individual facial expression; the same composition, a less admirable work, appears in the Manfrini Gallery. The I ouvre picture concs from the Gonzaga collection and from the gallery of Charles 1 . in Whitehall. In 1530 Titian completed the St Peter Martyr for the church of SS. Giovanni e Paolo ; for this work he bore of the prize in competition with Palma Vecchio and Pordenone. Of all his pictures this was the most daring in design of action, while it yielded to none in general power of workmanship and of feelin,: It showed the influence of Michelangelo, who was in Venice while Vecelli was engaged upon it. A calamitous fire destroyed it in 1867; the copy of it which has taken its place is the handiwork of Cardí da Cigoli. To 1530 belongs also the Madonna del Coniglio (Lourre), painted for Gonzaga; to 1536 the Venus of Floreuce; to 1538 the portraits of the Twelve Cæsars, for Gonzaga; and to 1539 the Presentation of the Virgin in the Temple,-one of the conspicuous examples in the Venetian academy, yet not of the first interest or importance. About 1540 were done the forcible but rather uninspired paintings for $S$. Spirito, Venice, now in the church of the Salute-Cain Killing Abel, the Sacrifice of Abraham, and David and Goliath; in 1543 the Ecce Homo of the Vienna gallery, where Aretino figures as Pilate. The Venus and Cupid of Floreace, the Venus of Madrid, and the Supper of Emmaus in the Lonrre were still in hand, or just completed, when Titian was summoned to Augsburg in 1547. In 1554 he sent to Philip 1I. in England a second Danae and a Venus and Adonis. About the same time he sent to Charles V. a Trinity (or, as Titian himself termed it, Last Judgment), which represented the entperor, with his family and othcrs, all in shrouds, praying to the God. liead; Moses and rarious other personages are also portrayed. This was the object upon which Charles continued to keep his eyes fixed until the film of death closed on them. Later pictures, from 1558 onwards, are the Martyrdom of St Lawrence, Christ Crowned with Thorns (Louvre), Diana and Actæon, Diana and Callisto, Jupiter and Antiope, the Magdalene, Christ in the Garden, and Europa, - the last six, for Philip II.; of the two Diana subjects there are duplicates in London and in Vienna. Philip, it will be observed, was equally ar fait with nudities and with sanctities. The Jupiter and Antiope, now much resiored, is commonly called La Vénus del Pardo, having at first been in the Pardo Palace. The Magdalene here spoken of (1561) seems to be the picture now in the Uffzi of Florence; Titian, in one of his letters, said that it was the most
popular picture he had evar painted. In 1563 Vecelli offered to Philip II. his Last Suppsr, which had been in hand for aix years: it wea cut down in the Escorial to buit a particular epacs, and offers now little noticeable beyond the fine grouping. T'es St Jerome of the Brea Gallery in Milan, a work of wonderfui energy, apirit, and force, sspecially for a more than octoganarian hand, wes probably rather earlier than this ; there is a rerica of it in the Escorial. Ons of the master's latest pictures (i574-75) is in Madrid, and commemorates the Battle of Lepanto; it.is a work of failing powsr-but still the power of a Titian. Two of the mosaics in St Mark's church, Vanice, - the Mark ia pontificala, and the eword-sheathing angel on the right of the high altar,-are ater Vecolii's deaigos ; but they are ccntrary to the trus spirit of mosaic work, and the JIark in especial ia a decided ejesore.

We now turn to the portraits,-rorks ao great in style, so atately, and in the hest sense so simp's in perception and feeling that, after allowing everything which can be said on behalf of some other nassters of the craft, such as Raphael, Velazquez, Rubens, and Rembrandt, ons is atill compolled to say that Titian stands on the whels supreme. Annong the highest examples are-Alphonso, duke of Ferrara (Madrić) ; the same duke and his aecond wife Laura Dianti (Louvre), comanonly called Titian and his Mistress; Francis I. (Louvrs), painted towards 1536, but not from direct sittings, for Titian never saw the French king; various likenessea of himself, ons of about 1542, and another of 1562 ; Paul III., also the same pona with his grandsons Cardinal Alessaudro and Duke Ottavio (Naples), -the former, done in about four weeks, was presented to the pontiff in May 1543, and cost two gold ducats; Pietro Aretino (Pitti) : Titian'a daugliter Lavinia (with a fan in the Dresden gallery, with a jewelled casket in Lord Cowper's collection) ; the Cornaro Family (Alnwick Castle); L'Honme all Gant (Louvre), an unknown personaga, youthful and handsome, the ne plus ullea of portraiture ; Sansovino, Eleogora duchess of Urbino, Francesco duke of Urbino, Catherine Cornaro queen of Cyprus (these four are in the Uffizi) ; Charles V. on horseback (Madrid) ; Cardinal Bembo (Naple9), discovered in an uncared-for coudition in 1878, very unlike the pertrait is the Barberini Gallery. The female portraits done by Titian are few, and are almast invariably of women of exalted rank. Of Ariosto, with whom Titian was intimate in Ferrara, though there may probably have been nothing approaching to a romantic friendship between then, the painter is said to hava done three portraits. SIuch uncertainty, however, besets this matter. One of the three appears as a woodcut in an edition of the Oriando Furioso. A aecond, now at Colham Hall, comresponds with the woodcut likenss, and is signed "Titianus F." The third, a work of admir ble heauty, and a most fitting likeness of a poet, is in the National Gallery of London. It is difficult, homaver, to reconcile tho featurcs here with the other portraits, and some conneisseura do not admit that the worls is really a Titian.
Authorities. - For Laghlsh readera, the Life and Times of Titian by Crowe and Cavalcaselle ( $\mathbf{8 8} \mathrm{BiF}^{7}$ ) has auperseded all previous works, aucb sa thoss of 5 ir Abrallani Hume (1829) and Northcole (1830). Mr Josiah Gilbert's boolk, Codore, or Tilian's Country (1869), supplies zany Interesting side-lights on the anbject. Mr R. F. Heath' mosogrepla (1885) is founded nnalily on Crowe and Cavalcaselie and on Gillert, and forms a very conventent compendinm. Ic ItaMan, kee tbe canal sulhorities-Ticozzi, Ridota, Lanzl, ice (W. M. R.)

TITLES OF HONOUR are wards and phrases used for marking and distinguishing the rank or station of the persons to whom they are assigned and appropriated. Whatever may have been their actual or verbal origin, it is certain that among nations which have made any considerable progress in civilization their immediate derivation has been in the great majority of cases from some kind of public office or employment. As Mr Freeman has pointed out, ${ }^{1}$ the principal exceptions to this rule are the merely complimentary additions which it is usual to accord in Europe and America to persons who have no ascertained place or precedence in the social scalc. Among ourselves "mister" or "master" (magister) and its feminine equiralents, and on the Continent signor, señor, and sieur (senior) and their feminime equivalents, are the leading examples. They are cmployed simply to aroid the necessity of calling those to whom they are applied by their proper names only, and are not indicative of any special rank or station. In France, howewcr, maite, which answers to our mister or master, is the professional designation of an avocat, and in England "sir," which answers to signor, senor, and sieur, is the appropriate prefix to the Christian name and surnama of a baronet or a knight. Of the derivatives of dominus-don, donne, and dame-the last in French compounded like sieur with the possessive pro-
noun in ordinary speech and appearing in madame as the feminine equivalent of monsieur, much the same may be said as of the derivatives of magister and senior. And, although our word "lord " has a special reference to the House of Lords, as the German Herr has to the Horrenhaus in certain of its uses, it largely partakes of the cbaracter which belonge to them. Its derivation is anklogous to theirs, and within somewhat narrower limits it is alnost as indiscriminately employed. More strictly lord and lady are the equivalents of baron and baroness, the fifth grade of the British peerage. ${ }^{2}$ But colloquially it is applied to all grades of the peerage except the first; and, though duchesses are not called ladies in society, dukes are unquestionably lords in their capacity as members of the second chamber of the legislature. Certain of the sons and daughters of peers are lords and ladies by courtesy, while the wives of baronets are legally and the wives of knights are conventionally called ladies, although the wives of knights are more accurately described as dames. But besides this we have our lord the king and our lady the queen, lord bishops, lord lieutenants, lord justices, lord advocates, lord mayors, lord provosts, lords of the council, lords of the treasury, lords of the admiralty, lords of manors, and a variety of other lords who have no necessary connexion with the nobility. Lord and lady in fact are among the titles of honour which have never been historically associated with any particular function. Lord was originally in Anglo-Saxon hlaford, probably a corruption of hlafweard, "the warden of bread." Lady in Anglo-Saxon is hlsefdige, and has also some connection with hlaf. Neither name acquired by means of official association any definite signification beyond the more or less general ascription of superiority. ${ }^{9}$

It is exceedingly difficult to distribute titles of honour into rigidly distinct catcgories. The following is as near an approximation as we are able to make.
I. Supreme Sovercign Tilles.-A nong titles implying sovereignty the first place is occupied by "enrperor" and "king." Under existing international arrangemeats the crowned heads of Europe take precedence according to the dato of their accession, add their rank is precisely the same, whether their style is imperial or royal. But tho proper meaning of emperor is the chief of a confederation of states of which kinga are members. The German emperor is an emperor in this sense, and he of courss has precedeace of the kings of Saxony, Bavaria, and Würtanberg, whose dominions are incladed in his empire. But neither he nor the emperors of Russia and Austria bave any precedence as such of the queca of the United Liugdom or the kings of Italy and Spain. Originally the title of king was superior to that of emperor, and it was to avoid the assumption of the superior title of rex that the chief magistrates of Rome adopted the names of Casar, imperalor, and princeps to sigualize their authority. As imperalor was the distinctive title of the ruler of the Western empire, so $\beta$ arideus was the distinctive title of the ruler of the Eastern empire, and the Greek Bagiles is the exact equivelent of the Latin ricx. The emperor of the Enst was called cürokpátup as well as $\beta$ 人aohleús. But Baotheús came to mean the same as imperator in so special a way that the word p指was borrowed to express what had grown to lie the inferior dignity of king.* Uader Charlemagne the imperi3l style of Rome and the royal style of German) wcre united. ${ }^{3}$ It was official, except ao far as peerago itsolf is an office. His title rather marks a raak or class thau an office; it does not at once print out oren the memory of distiact fuactions like those of the duke, the marquis, or the earl " (Lorigman's AKog., vol. it. p. 433).
${ }^{2}$ Miller, Leet. Sci. Lang, 2 d ser., p. 255.
4 Freeman, Comparatirs Poltics, Dp. 161-162.
5 "The great triumph in the lifo of Charles the Great was when the ambasadore of the Eastern emperor Michael addressed Lim according to the full, inperial style (Eginhard, Annals, 812), 'Aquisgrani, u bi ail Imperatorem vencruat . . . more auo, id est, Grees lingua, laudes cí dixeruat, Inperatarem rum et Basilom, aypellantes "" (Freeruad, Comparalite Politics, p. 353). Mr Freemaa notices also tho greal coatroversy coaceroiog the imperial titles, especially the word $\beta$ achicis, which arose three geaerations later hetween the cmperors Basil the Macedoatay and Lewis the Sccoad. Sea also John Lydus, De Magzerdibus, 1, 3, ou the distinction between fúpayvor, $\beta$ aaideús, and aïroxodiop, discussed in Frecmaj, Comn, Pol., P. 445.
however, from Casar, which was common to the Western and the Eastern emperers alike, that the Teutonic word for emperorkaiser - was derived. Until recent times, in fact, no sovereign thought of calling himself emperor unless lie claimed in some way to represent the Roman Cxesars. Dowa to the beginning of the 19th century a German emperor who was not Roman cmperor would have been an anemaly. At remote periods more than one of the West-Saxon kings called himself emperor of Britain, and more than one king of Castilo called himself emperor of the Spains. But these assumptions appear to have been merely intended as protests against tho assertion of superiority over them by tho Roman emperors, German or Greek. Later on the kings of Portugal called themselves eniperor of the Indies. But that title, like the queen of the United Kingdenn's title of empress of India, was secondary only and did not affect their official designation in the hierarchy of European sovereigns.

The title of king does not suggest any of the questions which have been raised by that of emperor. "There is," as Mr Freeman says, "a common idea of kingship which is at once recognized, however hard it may be to define it. This is shown among other things by the fact that no difficulty is ever felt as to translating the word king and the words which answer to it in other languages." Etymologically indeed the Romanco and Teutonic words for king have quite distinct origins. Tlie Latin rex corresponds to the Sanskrit rajah, and meant originally steersman. The Teutonic king on the contrary corresponds to the Sanskrit ganaka, and "simply meant father, the father of a family, tho king of his own kin, the father of a clan, the father of a people."2 In English there is no feminine form of king like königin, the feminine form of könig in German. As the feminine equivalent of king, queen is used, which Prof. Max Dluller says is "the old word for mother." He also cites the translation of the Bible by Ulfilas in the 4 th century to preve its meaning at that early period as wife or woman. The queen was in fact in a special sense "the woman," or "the wife, "the highest of women and the lighest of wives in the kingdom.' King should properly describe the head of a nation in distinction from the head of a tribe, as emperor should properly describe the head of a confederation in distinction from the hend of a nation. The idea of territorial sovereignty, of kingship over a land instead of over a people, grew up under the feudal system. In Britain it was unknown until long after the Norman Conquest. William the Conqueror, like Harold or Edward, was king of the English, and it was only from the reign of Henry II. that his successors were transformed into kings of England. The Eastern titles of sultan and shah are accepted as equivalent to those of em. peror and king in the West. The sovereigns of China and Japan are called emperors both in common and in diplomatic parlance.
II. Honorary Religious Tilles of Sovercigns. -The Gerinan emperors were formery styled "defenders of the church," while the kings of France were called "very christian majesty" and "eldest sons of the church." The queen of England is "defender of the fith," the emperor of Austria as king of Hungary "apostolic unajesty," the emperor of Russia as king of Poland "orthodox majesty," the ling of Spain "catholic majesty," aud the king of Fortugal "very faithful majesty." All these titles were originally conferred by the popes. But the queen of the United Kingdom
${ }^{1}$ Freeman, Comp. Pol., p. 138.
2 Max Mitler, Lect. Sci. Lang., 2d ser., p. 255. "All people, save those who fancy that the name ling has something to do with a Tartar than or with a "canning" or "cunning" msn, are agreed that the English cyuing and the Sanskrit ganaka both come from the same root, from that widely spread root whence comes our own cyn or kin and the Grieek yevos. The only question is whether there is any connexion between cyning and ganalia closer than that which is implied in their both coming from the same original root. That is to say, are we to suppose that cyning and ganaka are strictly the some word common to Sanskrit and Teutonic, or is it enough to think that cyning is an independent formation mado after the Teutons had separated themsolves from the common stock? . . . The difference between the two derivations is not very remote, as the cyaz is the ruling idea in any case; but if we make the word immediately cognate with ganaka we bring in a notion about 'the father of his people' which has no place if we simply derive cyning from cyn" (Freeman, Comp. Pol., pp. $450-451$; sec also his Norm. Conq., vol. i p. 583, and Growth of the Engtish Constitution, p. 171).
"The king's wife was called regina in Latin from the beginning; but there is no English word answering to regina: we have not and never had aיay word like the German königin. The queen is simply queen (cwe n), woman, wife, the highest of wives in her hushand's dominions. So the earl's wife was aimply the earl's wife; the Norman style of countess now came in to fill up what was thorght a defect. \$o with all strictly Eaglish titles, knight, sheriff, portreeve, alderman : they have no feminines; in most cases the wife does not share her husband's dignity. But the mayor, being a French title, has his mayoress, just as the duke has his duchess" (Freeman on "'Titles,' 'in Longman's Magazine, vol. ii. p. 489).
and the emperor of Austria alnne omploy them as part of their official description.
III. Infcrior Titles of Sovereignty.-Grand-dukes rank next to kings. Grand-duke was the original title of the czars and was introduced into western Europe by Pope Pius V., who created Cosimo de' Medici grand-luke of 'luscany in the last half of the 16th century. There are now seven reigning frand-dukes in Germany. Prince and duke are titles also borne by the reicning chiefs of minor Germanic states. There are rcigning princes of Monace and Montenegro. The Eastern equivalents for these subordinate titles are khedive, emir, khan, and bcy.
IV. Tillcs of Nobility.-The titles of the greater nolility are prince, duke, marquis, carl or count, viscount, and baron, aud most of them exist in all European empires and kingdoms. In the United hingdon tliere are no princes outside tho royal family. In Russia there are no dukes except the imperial grand-dukes and.neither inarquises nor viscounts. In Germany there are no viscounts. Among the titles of the lesser nobility or gentry baronet and esiguire are peculiar to the United Kingdom. Knight, chevalier, and ritter are rccoguized throughout Europe, and as far as Persia and Japan. Of old time in Scotland baron, now represented by laird, wias not a title of the gfeater nobility, and the same may bo said of freiherr in Germany. Tho peculiar designations of the chiefs of some of the Scottish clans and Irish septs, as Th ${ }_{3}$ Chisholm, The O'Donoghme, Cameron of Lochicl, Nacgillicuddy of the Rceks, and others must also be included among titles of honour. It would be improper to prefix "mister," or to affix "csquire," to their names in addressing them either orally or in writing, and their wivcs are always called madam. Pasha, bey, and effendi aro the most familiar of the Eastern titles of nobility. The ecclesiastical titlcs of arellbishop, bishop, dean, \&c., and tho military and naval titles of field-marshal, admiral, general, colonel, major, captain, \&u, aro common to all the countries of Europe, and are expressed by words in their several langnages which are the precise equivalents of each other. But their incidentally dignificd character is so overshadowed by their essentially administrative character that they can be regarded as titles of honour only in tho same sense as the titles of officers of stato or justice.
To the foregoing titles of honour may be added the large assortment of complimentary cpithets which are attendant on then, and which are used as alternatively descriptive of the persons by whom they are borne. The Roman Cesars were by decree of the senate called in Latin augustus, or sacred, which was rendered in Greek by $\sigma \epsilon \beta a \sigma \tau \delta s$, or adorable. They were also habitually styled divi, pius and felix, clemevs, tranquillus, and sanctissimus. Augnstalis majestas and ária paoineia were among the styles of the Western and Eastern emperors respectively. Majesty, sacred majesty, or Cæsarean majesty, was the peculiar titlc of the emperors, and it was not assumed by any of the other sovercigns of Europe until comparatively modern titacs. But it is said to have been adopted in France as carly as the reigut of Louis X1. ; in England the first king who used it was Henry VIII. Before that the kings of England had been called grace and highness, and sometimes excellent grace and kingly highness. All emperors are now imperial majes. ties, and all kings majesties, while grand-dukes, royal highnesses, and all inferior reigning potentates are highnesses of one sort or another. Imperial or royal highness is the proper title of the sons and claughters of emperors and kings, serene highness, or highness merely, being that of the members of princely families. The German hoheil, although it is commonly employed as tho equivalent of highness or allcsse, has a special signification of its own. It holds an intermediate rank between altesse royal or royal highness and allesse serénissime or serene highness, unless it is qualified by the adjectives kaiserliche or königliche. For many years, however, it has been appropriated to the less important reigning and the mediatized princely houses, to distinguish them from tho priucely houses of new creation and the mediatized countly houses, to whom the titles of durchlaucht and crlaucht are severally assigned. In the United Kingdom grace is the title of dukes and duchesses, and lordship and ladyship of all other grades of the peerage and the bearers of courtesy titles of superior rank to any one of them. Dukes and duchesses are styled most noble, marquises and mar. chionesses most honourable, and all other peers and peeresses, lords and ladies by courtesy; privy conncillors and the lord mayor of London are styled right honowrable. Hononrable is the title of the younger sons of earls, the sons and daughters of viscounts and barons, and the judges of the High Cenrt of Justice. Archbisbops are most reverend, bishops right roverend, deans very revcrend, archdeacous venerable, and all clergymen reverend. The pope is his holiness, and cardinals are eminences Viceroys, ambassadors, and governors are excellencies. But we have not yet rivalled the nice gradations in the descending scale of illustres, spectabiles, clarissimi, perfectissimi, and egregii which cbaracterized the official or administrative hierarchy of the later Roman empire. (F. DR.)

TITMOUSE (Anglo-Saxon Mase and Tytmase, German Meise, Swedish Mes, Dutch Mees, French Mrésange), tho'
name ${ }^{1}$ long in use for several species of small English birds, wibich are further distinguished from one another by some characteristic appellation. These go to make up the genus Parzs of Linnxus, and with a very uncertain number of othcr genera form the Family Paridse of modern ornithology. Its limits are, however, very illdefined; and here only the species best known to English readers can be noticed.
The first to be mentioncd is that called from its comparstively largo size the Great Titropuso, P. major, but known also in many parts ss the Oxeye. ${ }^{2}$ conspicuous by its black hesd, white cbeeks, and yellew breast, down which runs a hlack line, while in spring the cock makes himself hesrd by a loud love-pote that resembles the neise made in sharpaning a eaw. It is widely distributed throughout the British lslands, and over neasly the whole of Europa and northern Asia. Thio next is the Blue Titrnouse, Bluecap, or Nnn, $P$. cerrulecus, smaller than the last and more common. Its nsmes are so charractoristic zs to make any description needless. A third commons species, but not so numorrus as sither of the foregoing, is the Coal-Titanouse, $P$. ater, distingnishod by its black cap, white cheeks, and white nape. Some interest attaches to this species becanse of the difference observable between the raco inbabiting the scanty remnants of the sncient Scottigh forests and that which nccurs throughout ths rest of Britain. Tho former is more brightly tinted theo the lattor, having 3 clear bluish gray mantle and the lower part of the back grecnigh, hardly either of which colours are to be seen in the same parts of more southrn examples, which last hars been doscribed as forming a distinct species, $P$. britannicus. But it is to be observed that the denizens of the old Scotch fir-woods arg nearly midway in coloration between the dingy southern birds anditbose which prevail over the greater part of the Continent. It would therefore seem urreasonable to speak of two species oaly : rhere should le either ihree or one, and the latter altornative is to be preferred, provided the exiatence of the locs1 races bo duly recognized. Much the same thing is to bs noticed in the next species to be mentioned, the Marsh. Titruouss, $P$. palustris, which, sombre as is its plumarge, is subject to considerable local variation in its very cxtensiver range, and has been called $P$. borcalis in Scandinavis, $P$. alpestris in the Alps, snd $P$. bugubris in sonth-enstera Europe, to say nothing of forms like P. baicalensis, P. cermchatiensis, snd others, whose names denotg its local variations in northern Asia, while ua great violenee is oxercised if to tocse bo tacked on $P$. utricapilla with seversa gcographical races which inhahit Nortb America. A fifth British species is the rare Crested Titmouse, $P$. cristatus, only found in limited districts in Scatland, though common onough, especially in pine-wonds, in many parts of Earops.
It is impossible to state how many species of Parus exist, tbecir recoguition st present being wholly suljective to the viaw taken by thi iuvestipator of the group. Its latest monographer is Dr Gadow (Cat. B. Br. A Muscum, viii. pr. 3-53), who recognizes fortyeight, beside9 8 serersl sub-spccies. North-American orpithnologists include seme fifteen as inhabitants of Canada and the United States ; hut scarcoly two writers agree on this point, owing to the existence of se many local forms. Of the epecies inhabiting the Indian and Ethiepian Regiens there is no space hore to trest, and for the aame reason the presumahly sllied forms of Australia snd New Zealand mnst be left unnoticed. During the greater part of the year the various species of the genus Pamis asseciato in fsmily parties in a way that has becn alresdy descriled (BIRD日, vol. iii, p. 766), and only break up into pairs at the hegirning of tha breeding-saason. The nests are nearly slways placed in a hollow stump, and consist of 8 msss of moss, feathicrs, sind hsir, the liset being workea almost into a kind of felt. Thereen the eggs, often to the number of eight or nine, aro lxid, and these havo 8 trenssucent white shell, freckled or spotted with mist-colour. The first piumage of the young zlosely rcsembles that of the parents ; lint, 80 for 89 is knewn, it hos alwsys \& jellower tinge, very epparent nu the parts, if there bs such, which in tho sdult are whito. Fcw lirds are more restlogs it dispnsition, ond if "irritability" bo tho test of high organization, as a much beprised systematist asserts, the Paridee should stand rery near tha top of the list. Moat of the Furciman species and some of the North-American become familiar, hanlting the neighbourbood of houses, especially in winter, and readily availing

1 The prefix "Tit," by heodless writers often used alone, though equally proper to the Titlerk (cf. PiPIT, val. xis. p. 112), is perbaps eognate with tho Greek ritts, which originally meant a amall ehirping bird (Atun. Nat. Ilistory, ser. 4, x p. 227), and has a diminntiva fortn in the Ieclandic Titlingor-the English or at least Sentish Tillirg. It is by false analngy that the p!aral of Titmouse is made Titmice; it abould be Tiemmuses. A miekname is rery oiten added, as with many ther familiar English birds, sud in this case it is "Tom."
${ }^{2}$ The aignification of this dame is olseure. It may perbapa be correlated with a Swedish name for the bird-Talgoxe.
themsalves of such ecraps of foon, sbout the neturs of whinh they ars not particular, as they can get. ${ }^{3}$ By gardeners cyery Tit mouse is generally regarded as 8 a enemy, for it is suppeserl to. do infinite damage to the buds of fruit-trees sud bushes; but the sccusstion is wholly false, for the buda destreyed are always fonad to bo those to which a grub-the bird's real object-has got access, so that there can bo littlo doubt thot the Titmouse is a great benefactor to the horticultorist, and hardly over moro so than when the careless epectator of its dceds is supposing it to be bent on mischief.

Akin to the genas Parus, bnt in msny respecte differing from it, is Acrcaulct, containirg that curians-looking bird the Long-tailed or Buttlo-Titmouse, with its many local races or species, which must bo here nassed over without a word. The bird itself, having its tail longer than its body, is unilke any other found in the northern hemisphere, whils its nest is a perfect marvel of construction, being in ahspe rearly oval with a small hole in one side. The exterior is studded with pieces of lichen, worked into a firm texture of moas, wool, and apiders' nasts, sad the insido is profusely lined with soft feathsrs- 2379 having been, says Macgillvray, counted in one example. Not inforior in beauty or ingenvity is the nest built by the Pendulins Titmouse, SEgithalus pendulinus, of the south of Europa, which differs, bowever, not merely in composition but in bcing suspanded to a bough, whils the farmer is nearly slways placed between two or more brancacs.

The so-called Bearded Titmouse, Panurus Liarmicus, has habits wholly unlike those of any of the foregoing, and certainly does not belong to the Family Paride, though its real affinity has not jet been clearly shown. It was formerly found in many parts of England, cspecially in the eastern countics, where it bore the name of Reed. Pheasant ${ }^{4}$; but through the draining of meres, the destruc. tion of reed-beds, and (it must be added) the rapacity ol collectors it now only exists as a native in a very few localitics. It is a beautiful litile bird of a bright tawny colour, variegated with black and white, while t..i cock is further distinguished by a bluish grey head and a black tuft of feathers on each side of the chin. Its chief food sceme to be the smaller kinds of freshwater mollusks, which it finds among the reed-beds it seldom quits.

The general afinities of the Paride seem to lie rather with the Sittidas (rf. Nuthatch, vol. xvii. p. 665) and the Tree-Creepers; and those systematists who would ally them to the Laniide (Surikr, vol. xxi. p. 845), or still more interpose the last between the former Families, have yet to find grounds for so doing.

TITUS. By this, his Roman prænomen, is usually known the eleventh of the Twelve Cæsars, Titus Flavive Sabinus Vespastanus, emperor from it to 81 a.d. With his father Vespasin, who rose to empire from the camp, began the Flavion line of emperors, the last three Cæsars. Titus was born in 40 , the year of the assassination of the fourth Cessar, Caius Caligula, and was brought up in the household of Claudius, with that emperor's son, Britanni. cus. There was a story that he was dining at Nero's table when Britannicus was poisoned, and that he himself tazted the fatal cup, and lad in consequence a serious illness. Some time afterwards he erected two statues to tho Joung prince's memory. Educated in the imperial court, he was thorougbly trained in all elegant accomplishments: he could speak Greek fluently, and could compose verses; he was a proficient in music; be could write shorthand, and could imitate landwriting so skil. fuily that ho used to say tbat ho might have been a most

[^176] tooble provide a plasing apectacls by adopting the plan, practised by the late Mr $\Lambda$. F. Knos, of hanging s lomp of suct ar tallow by a abort string to the end of a flexible rod stack aslant into the gronnd cloge to tho window of a aitting-room. It is seldom long before a Titmonee of some kind finds the dainty, and ance fand visits are mado to it nuril cuery morsel is picked off. The attitudes of ths birde as they cliag to the awinging lare are very diverting, and nore but a Titmansa can sueceed in keeping a footlonld upon itw

4 The common names given to this bird are so very jnapplieabla that it is a pity tbat "Silerella" (from siler, as osier) bestowed apon it by Sir T. Browne, its original discoverer, cannot be rasiarel.
successful forger. He was very handsome, with a fine commanding expression, and a vigorous frame, well trained in all the exercises of a soldier. As a young man he served with credit in Germany and in Britain, and ho practised at the bar. Soon he had the command of a legion, and joined his father in Syria; he took an active part in the Jewish war, capturing several important fortresses, among them Tarichææ and Gamala. In 68 he went at his father's bidding on a visit of congratulation to the newly proclaimed emperor, Galba; but, hearing of Galba's death and of the general confusion in the Roman world, be returned to his father in Palestine, having in the peantime consulted the oracle of the Paphian Venus as to his prospects and received a favourable answer. In the following year Vespasian, who, through his son's pleasing manner and adroit management, had made a friend of Mucianus, the governor of Syria, became emperor, and left Titus to finally settle the Jewish war by the capture of Jerusalem. Titus conducted the siege of the city, which for some months was defended amid incredible horrors, with signal ability, and took and destroyed it in September 70. The army saluted their victorious general by the title of "imperator"; in the East Titus was now supreme, and practically emperor.. On his return to Italy by way of Alexandria he fell in with that strange professor of mystical philosophy and magic, Apollonius of Tyana, and listened, it is said, to his pedantic talk and advice. As soon as he arrived at Rome there was the usual triumph for a decisive victory, and both father and son shared it. On the arch of Titus, as it is called, erected some few years afterwards (see vol. xx. p. 830), may still be seen sculptured representations of Jewish captives and of the captured trophics. Titus was now formally associated with his father in the government, with the title of Cæsar, and during the nine remaining years of Vespasian's reign he controlled the administration, and was in fact emperor. He was anything but popular; he had the character of being luxurious, self-indulgent, profligate, and cruel. Summary execution of obnoxions persons seems to have been not uncommon. There was a bad scandal too about his connexion with the shameless Jewish beauty Berenice, the sister of the Agrippa of the Acts of the Apostles; both brother and sister followed Titus to Rome, and were allowed to reside in the imperial palace. Public opinion at Rome was outraged, and Titus, though he had promised Berenice marriage, felt obliged to send her back to the East. Vespasian died in 79, leaving his son a safe throne and a well-filled treasury. The forebodings of the people were agreeably disappointed, for Titus, who, it was feared, would be a second Nero, was known as the "love and delight of mankind." It is possible that his popularity was in some degree due to the fears which the depravity of his brother Domitian, who, it was known, was to succeed him, had begun to excite; but he had the tact to make himself liked by all. He seems to have been thoroughly kindly and goodnatured; he delighted in giving splendid presents, and his memorable saying, "I have lost a day," is said to have been uttered one evening at the dinner table when he suddenly remembered that he had not bestowed a gift on any one that day.

Titus, like his father, spent money on great public workz and in adding to the magnificence of Rome. The Colosseum was completed and dedicated in $l$ is reign, with combats of gladiators, shows of wild beasts, and sham sea-fights and representations of some of the great Greek naval battles. He gave the city what we should now call "a people's palace" in his splendid baths, which surpassed those of Agrippa and of Nero, and supplied the mob with every luxurious appliance free of cost.

During his reign, in 79, occurred the memorable eruption of Vesuvius which destroyed Herculaneum and Pompeii. The emperor visited the scenes of desolatiun and contributed liberally to the relief of the distressed inhabitants.' During his absence a fire raged for threc days at Rome, in which the Capitol was burnt; then followed a pestilence, and again Titus not only helped freely with his purse, but took pains to acquaint himself with the sufferers and gave them his personal sympathy. Italy and the Roman world generally were quiet and peaceful during this brief reign. The only fighting was in Britain under Agricola, who in the year 80 carried the Roman arms into Scotland as far as the Tay. In the following September Titus died, being in his fortieth year, after a reign of two years and rather more than two months. On his deathbed he said, so the story went, that there was but one thing of which he repented: this was commonly supposed to point to his having spared to punish his brother Domitian, who had more than once plotted against his life, and whose succession to empire he must have felt would be a calamity for Rome. The verdict of history is on the whole favourable to Titus, and perhaps deservedly so ; but the general feeling throughout the Roman world after his death was that he had been fortunate in the briefness of his reign.

An admirable account of this emperor will be found in Merivale's History of the Romans under the Empirc, ch. $60 . \quad$ (W. J. B.)

TITUS, one of the companions of St Paul, was of Greek origin (Gal. ii. 3), and appears to have been among the apostle's earliest converts; he is first mentioned (Gal. ii. 1) as having accompanied Paul, then in the course of his second missionary journey, from Antioch to Jerusalem. Here the Judaizing brethren desired that be should be circumcised; but the liberty of the gospel was successfully maintained. He was afterwards sent by Paul from Ephesus to Corinth, with, it would seem, a letter, no longer extant, more than once referred to in 2 Corinthians (ii. 3, vii. 8 ; comp. vol. vi. p. 401). He rejoined the apostle with favourable reports from Corinth in Macedonia, and was again sent (from Philippi) with another epistle, probably what is now known as the second, to the Corinthians, and charged with the further duty of promoting the proposed collection for poor Christians in Judxa. This is practically all that is known of him from the undisputed Pauline epistles. He is nowhere mentioned in the Acts. In the pastoral epistle with which his name is associated he is represented (Tit. i. 5) as having been left by Paul in Crete to "set in order the things that arc wanting, and ordain elders in every city." He is expected afterwards to join Paul at Nicopolis (iii. 12). In 2 Tim. iv. 10 he is spoken of as having gone to Dalmatia. Tradition, obviously resting on the Epistle to Titus, has it that he died in Crete as bishop at an advanced age.

TITUS, Epistle to. See Pastoral Epistles. vol. zviii. p. 348 sq.

TITUSVILLE, a city of the United States, in Crawford county, Pennsylvania, in $41^{\circ} 38^{\prime} \mathrm{N}$. lat. and $79^{\circ}$ $42^{\prime}$ W. long., stands upon Oil Creek, in the midst of the oil region of north-western Pennsylvania. Its predominant industries have reference to the production, refining, and transportation of petroleum. It has two railroadsthe Dunkirk, Allegheny, and Pittsburg, and the Buffalo, New York, and Philadelphia. The city had a population of 8639 in 1870 and of 9046 in 1880.

Titusville, originally a small lumbering town, began its careet of prosperity in 1859, when oil was discovered in this region, and during the succeeding years it was the scene of very great activity. It was chartered in 1867 , when at the zenith of its prosperity. Since that time it has settled down to a less feverish and more healthy growth.

TIUMEN. See Tydmed.

TIVERTON, a borough of Devonshire, England, is finely situated in the midst of beautiful scenery at the conIuence of the Lowman and the Exe, $14 \frac{1}{2}$ miles north of Exeter and 184 west-south-west of London. A branch line connects it with the Great Western, and the Exe Valley Railway with Exeter and Dulverton. The greater part of the town is on the left bank of the Exe; the four principal streets are wide and regular. Since 1262, when Amicia, countess of Devon, caused a stream of water to be directed from Norwood to Tiverton, a distance of 5 miles, every street has had a constantly flowing supply. At points now spanned by bridges there were formerly two fords, one over the Exe and the other over the Lowman; hence Twofordton and Twyfordton the former names of the town. There still remain the principal gateway and an octagonal turret of the ancient castle (now a private residence), built in 1106 by Richard de Riparus or Redvers, first earl of Devon, and the chief residence of the Redvers till the execution of Henry Courtenay, marquis of Exeter, in 1539. The kost ancient part of the church of St Peter is the Norman Coorway; the embattled western tower is 120 feet in feight. For Blundell's free grammar-school (1604) new buildings have recently been erected in the Tudor style. Among other educational establishments are the school of science and art, the blue coat charity school (1714; reastablished as a middle boys' and middle girls' school in 1876), and the Chilcott free school (1611). The other principal public buildings are the market-house (1830-31), the infirmary (1852), the town-hall (1864), and several almshouses. Tiverton was formerly famed for its woollen manufacture, introduced in the 14 th century ; its annual returns in 1612 were estimated at $£ 300,000$, about 8000 persons being employed in the industry. It is now chiefly noted for its lace manufacture, established by John Heathcoat, the inventor of the bobbin net frame. The poprilation of the municipal borough (area, 17,491 acres) in 1871 was 10,024 , and in 1881 it was $10,462$.
The towu existed iu Saxon times. In the reign of Edward the Confessor it was beld by vassals or servants, and in Domesday it is entered as terra regis. In 1200 it had a market and three annual fairs. After the introduction of the woollen trade in 1353 it rapidly increased, and Camden atates that the trado had brought it "much gain and glory." The town and castlo were taken by Fairfax in 1045. Tiverton auffered from the plague in 1591 (whea it had 5000 inhabitants), and from fire in 1598, 1612 , and 1731 . It was incorporated by James I. in I615; hut in 1732 its chartor was forfeited, and a second was not bestowed till 1737. The borongh was deprived of parliamentary representation in 1885.
Sea Harding'a Histery of Twerton, 2 vols., 1845.
TIVOLI (Lat. Tibur), a town of Italy, situated 17 miles east-north-east of Rome on one of the spurs of Monte Ripoli, 830 feet above the sea. Its position is very striking and beautiful ; it stands partly at the edge of the lofty cliff over which the river Anio falls in a most imposing mass of water. The present aspect of the fall is very different from what it was in ancient times, as the water has undermined and carried away great masses of the rock. In 1881 the population of the town was 9730 , and of the commune 10,297 .

Ancieut Tibur was founded, according to the legend adopted by the Roman poots, many conturies before Rome, by the Siculi. ${ }^{1}$ They were expelled by a Greek named Tiburtus, the son of Catil. las, who became the eponymous hero of Tibur. ${ }^{2}$ During the early historic period Tibur, which atood on the bordere of the Sabine territory, was alwaya a bitter enomy of Rome, and on many occasions allied itself to various peoples, even the Gaula, in their attacks on the city. With the rest of Latiun, Tibur was finally conquered by Rome in 335 b. C., a ad on account of ita constant enmity was treated with mach aeverity, not being admitted to the Roman franchise till towards the close of the republican period. Almost no mention of Tihur occurs duriog the time of the empire; but the town is recorded to have auffored severely during the Gothic in rasion in the 6th cantury

[^177]Remains of its city wall stull exist, built of equared blocks of rufa; but the wholo circuit is not clearly determinable. Even the site of the large and wealthy tefuple of Hercules is doubtful, which atood in an extensive temenos, containing libraries and a porticus, where Augustus aometimes administered justice. ${ }^{3}$ At the edge of the cliff still atands a small circular temple, of doubtful dedication, which once had eighteen columns, and closely reaembled that in the Forum Boarium of Rome. Its celle walls are of concrete faced with opus reticulatum, aod ita columns of travertine; it dates from sbout the tinie of Christ. Its popular name is the "temple of the Sibyl." Close hy is another small prostyle-tetrastyle temple resembling that (so called) of Fortuna Virilis in Rome. Remaios of the circuit wall of the forum also exist, with a largo apsidal projection, as well as an extensive crypto-porticus, faced with blank areading and divided internally by a row of twenty-eight columns. Tibur was a favourite summer residence of many wealthy Romans under the enupire, aod especially of Horace and Mrecenas. ${ }^{6}$ One of the chief aqueducts of Rome, "Auio vctus," started froln the Anio at Tibur. The ancient "lapis Tiburtiuus" (modern travcrtine) was ao called from its chief quarries at Tilur, where it has heen during long agea deposited by the water of the river Anio.
Hadrian's villa, which stands at the foot of the Tibur spur of hill ahout 2 miles distant, is one of the most important Roman remains in the world. Between 1870 and 1882 the greater part of its immense area was excavated ; the whole circuit was once no less thau 8 milea. The acheme of this wonderful group of buildings was the fancy of the rich and highly educated emperor Hadrian, who desired to reproduce, within a short distanco of Rome, a nu:nber of the chief Greek sites and buildiags which be had visited in different parts of the world. Besides his own palace be built a large stoa peecile, copied from that at Athens, an odenm, a lyceum, an academy (with its gardens, halls, and porticus), libraries, Latin and Greek theatres, s stadium, palæstra, hippodrome, baths, and many temples. Large gardens, divided into an articicial "Vale of Tempe," "Elysian Tields," and "Tartarus," were watered by a winding etream named the "Euripus." In another place stood a y serapeum," copied from that at Alexandria, and filled with psoudo-Egyptian statues and reliefs, many of which have been recently unearthed. Barracks for the pretorian guard and rows of dwellings for slaves completed this magnificent group of huildings. In many parts the cxisting remains are well preeorved and in some cases the uses of the different buildings can be determioed. ${ }^{8}$ The main walls are of concrete faced with mixad brick and opus reticulatum, once wholly covered with ragnificent Oriental marbles and crowdou with fine Greek and Greco-Roman aculpture ; mosaic of marble and glass w़्!ā iavisbly used for floors, walls, aud vaults, together mith the most elaborate paiated decorations. A large number of fine worka of art have heen discovered hero, auch as the mosaic of "Pliny'a doves" and the Faun in rosso antico now in the Capitol. It is probable that the Venus des Medici came from this villa, together with many other statuea found in the 16 th century whose provenance is now forgoten.
TLAXCALA (Tlascala, i.e., "House of Bread"), an historical city of Mexico, capital of the state of Tlaxcala, which nearly coincides with the old native republi:: of Tlaxcala, occupying the easternmost of the four sections into which the Anahnac plateau is here divided by ranges of hills, between $19^{\circ}$ and $20^{\circ} \mathrm{N}$. lat. The modern town, standing on the site of the old Indian capital, lies (in $19^{\circ} 19^{\prime} \mathrm{N}$. lat., $98^{\circ} 6^{\prime} \mathrm{W}$. long.) on the little river Papagallo (Atoyac, formerly Zahuatl), which flows between two hills at an altitude of considerably over 7000 fcet, some 30 miles north of La Pucbla and 170 by rail from Vera Cruz. Tlaxcala was founded probably about the close of the 13th century, when the Tlaxcaltecs, a branch of the Nahuatl race closely akio to the Aztecs, withdrew from the western side of the central lacustrine district and established a powerful democratic state in a somewhat secluded, hill-encircled, but highly productive tract, 90 miles in length by 70 in breadth, with a total area of over 1550 square miles. The Tlaxcaltecs, hereditary foes of the Aztecs, became, after a short resistance (September 1519), the firm allies of tho Spaniards, their co-operation contributing largely, if not. mainly, to the overtbrow of

[^178]- It has also been called the temple of Vesta, but the real aite of tbia lest was oo tha otbar aida of tba river.
, Hor., Od., i, 7, 10, aad ii. 6, 5.
- Nany of the oanses given to diferent perts by the Roman and queries are baaed on mere convectura,
the Mexican cmpirc. But the result was the enslavement of Tlaxcala itself, the general decay of the country, and ihe dispersion of most of the inhabitants by Cortes. Althnugh now reduced to a population of a little over $50 C 0$, or, including the commune, to 36,000 , and with no inonuments beyond a fine church, an old episcopal palace, and a town-hall, the city at the time of the conquest was a very large place, containing nearly as many inbabitants as the whole of the modern state $(130,000)$. When occupied by the Spaniards, its size and spiendour excited the admiration of Cortes, who describes it in somewhat exaggerated language as " much larger and much stronger than Granada, with as fine buildings and much more pcople than Granada had at the time it was captured, also much better supplied with the things of the earth" (Cartas, 67). It was disposed in four distinct quarters separated by high stone walls, each with a palace for the ruling chief, besides temples, and stone buildings for the nobles. But most of the other houses wero low mind or adobe structures. In the daily market, which was said to be frequented by 30,000 people, were exposed for sale the products of the surrounding conutry,-maize, maguey (extracted from the aloe), and chilli pepper; to these are naw addcd wheat, barley, pease, lentils, and a great rariety of fruits.
$\Delta$ prominent feature of the landscape is the Sierra de Malintzi, or Malinche, that is, "Lord of Marina," a namo given to Cortes after his alliance with the "heroine of the conquest." Tbe Sierra (originally Matlacuezatt), which rises grandly (more than 16,000 feet) above the plateau, takes a prominent placo in Tlaxcaltecan mythology, owing to the peculiar shape of its summit, represcating ia rough outline the body of a nativo woman lying at full length in its grave snd partly wrapped in its cerements. There are some woollen manufactures, centred chicfly in tho capital, and also a few silver, copper, lead, and coal mines in the San Ambrosio and San Matco ranges; but the state is essentially agricultural, yielding larye annusl crops of maize and wheat, the total produce being valued at over $£ 1,000,000$.

TLEMCEN, or Tilinss:r, a town of Algeria, chef-lieu of an arrondissement in the department of Oran, lies 86 miles S.W. of Oran, 2625 feet alove the sea, on a terrace on the northern slope of a range of rocky hills ( 3430 feet). Its white minarets, towers, and battlements rise picturesquely above the surrounding verdure, which is nourished by numerons springs, and even in ancient days gave rise to the Roman name Pomarin. The various quarters are grouped around the principal mosque,--the Jewish to the southwest, the Moorish to the south-east, that of the macrchants to the north-east, while tho new lown with the civic buildings lies to the north-west. Of the sixty-four mosques which existed at the period of tbe French ennquest, several have disappeared. The great mosquo has a minaret adorned with marble columns, and cased with mosaic of the most varied designs; a fountain of alabaster stauds in the alabaster-paved inuer court; and seventy-two columns support the pointed arches of the interior. The mosque of Abul Hasan, now used as a French and Arab school, has two series of arches, which rest on alabaster pillars, and the conrts aro ornamented by sculptures of great beauty and richness; the delicately carved cedar ceiling bears traces of polychromatic painting. The mosque of El-Halawi is specially interesting for the sculptured capitals of its magnificent alabaster columns. Tlemcen, besides numerous other mosques; possesses a fine modern Roman Catholic church in the Byzantine style and five synagogues. The military authorities occupy the Mehuar or citadel, built in 1145, which separates the Jewish and Moorish quarters, and was formerly the palace of the rulers of Tlemcen. Only the mosque and the battlemented wall, flanked by two towers, remain of its former magnificence. Among the antiquities preserved in the museum is the epitaph of Boahdil, the last king of Granada, who died at Tlemcen in 1494. The rast basin under the old
walls, now nsed as a reservoir ( 720 feet in length, 490 in width, and 10 in depth), was appreutly made for naval exhibitions by the surercigns of Tlemcen. The barracks of the Spalis occupy all that remains of Kissaria, a settlement of European merchants from Pisa, Genoa, Catalonia, and l'rovenco. Leather, saddles, Turkish slippers, arms, and woollen goods are manufactured in Tlemcen; the production of oil and flour and market gardening occupy Europeans and natives; good tobacco is also grown. There is an active trade in cattle, wool, grain, and fruit. A railway ( 37 miles) is being built (1887) to connect Tlemcen with Raligun, its port. In 1886 the population (natives, Europeans, and Jews) was 19,745 ( 26,395 in the commune).
The tomn was oriminally at Agadir (Pomarin), to tho east of the present site, where foman inscriptions have been found. At the time of tho $A$ rab invasion the district was held by the Bení Ifren tribe of Zenita Berbers, who ultiinately founded here the sovereignty of the Bení Ya'lá (1002-1080). In 1080 the Almoravid king, alter besicging and sacking the place, built a new town on the site of his canip. Ilis successors reigned sixty-five ycars, when, after holding Arailir four years agsinst the enemy, they were overcome by the Almohades, who massacred the inla bitants, rebuilt, enlarged, and repeopled the ruincd town, and surrounded Tleascon anll Agadir with a common wall. Tlemeen now nomished greatly under the 'Abd al-Wad, also a Zenata dynasty, who ruled hist for the Almohades and after 1242 as nominal vassaly of the Hafsites of Tunis. In 1337 their power was temporarily extinguished by tie Merinids, who built the town of Mensura, west of Tlemeca. They left some fine menuments of the period of their ascendeacy, whicli lasted twcuty-two years. Once more, under the 'Abd al-W'ad, trom 1359 to 1553 , Tlemcen enjoyed prosperity, whea it had a population of 125,000 , an extensise trade, a brilliant court, a powerful army, and its finest buildings were reared. The Spanish occupation of Oran struck a fatal blow at the European comarerco of the town, which gradually lost ell its territory to tho Turks after they had seized Algiers. When the French entered Algeria the sultans of Morocco were worsted by the Kuluglis in their attempt to bold the town. In 1834, and again in 1837, Abd el-Kader sought to re-establish the ancicnt empire of Tlemcen, but tho Freach defiaitely took possession in January 1842.

TOAD. This animal belongs to the Anurous division of the Amphilia, aud toads and frogs are the only representatives of the Anura or Batrachec indigenous to Britain. To an ordinary observer the toad is proved to be an amphibian by its moist soft skin, an anuran or tailless amphibian by the want of a scparate tail. The toad differs from the frog in the following points :-1t has no teeth on either of its jaws or on the roof of its mouth, while the frog has a series of fine tecth on the upper jaw and also teeth on the pralate; the tongue in both animals is attached in front and free behind, but that of the frog is forked at its freo extremity, that of tho toad is not ; the skin of the toad is rongh with large protuberant warts, while that of the frog is smooth; the body of the toad is more globular and pufly than that of the frog; the hind legs in the toad are shorter, and the posterior digits not so completely webbed, tho animal leing moro terrestrial in its habits than the frog. In the toad, as in the frog, there are four digits anteriorly, five posteriorly. The warts of the toad's skin contain large cutaneous glands, which secrete a thick yellowish fluid witb acrid properties, capable of irritating and producing slight inflanmation on the human skin. The use of this secreticn is probably to protect the toad from being devoured by carnivorous anmals. Liko other A mphibia, it has a large membranous bladder communicating with the terminal part of the intestine-the allantoic bladder, - in which fluid accumulates, probably from the kidneys, though the ureters do not open directly into the bladder. The toad, when handled or alarmed in any way, ejects the contents of its bladder. Owing to these peculiarities and its appearance, the animal is commonly regarded with loathing, and credited with far more poisonous properties than it possesses. In its breeding babits the toad resembles the frog: its eggs are fertilized externally at the'
moment of extrusion, as in the frog, the parents resorting to the water for the purpose of reproduction. The ova are laid in spring, and are arranged, not in shapeless masses, but in a string containing a double series of eggs adhering by their gelatinous envelopes; the string extends to a length of three or four fect. The tadpoles are similar to those of the frog, but blacker ; their metamorphosis takes place in the same manner, the three pairs of external gills being first absorbed and replaced for a time by internal gills, which are in their turn lost, the branchial slits being closed by the coalescence of the opercular membrane with the skin. The metamorphosis is complete in autumn. The toad is carnivorous, feeding on flies and other insects and worms. It hibernates in winter, passing its period of torpidity in holes or burrows in the earth. The finding of toads in a state of hibernation has given rise to stories of their being found in the centre of trunks of trees or imbedded in solid rock. The myth of the jervel in the head (Shakespeare) is probably founded on the brightness of the eyes, in which the iris is fiame-coloured.

There are two kinds of toad in Britain,-the Common Toad, which is almost black in colour, and the Natter-jack Toad, which is lighter, smaller, and bas a bright yellow line along the middle of the back. The length of the common toad is $3 \frac{1}{2}$ inches, of the natterjack $2 \frac{3}{4}$ inches. The male natter-jack possesses a bladder or vocal sack beneath the throat communicating with the mouth, which acts as a resonator to its voice ; its cry is "gluck-gluck." The vocal sack is absent in the common toad, and only incompletely developed in the Green Toad of the Continent.
In zoological classification the toad belongs to the genus Bufo, first constituted by Leureuti in the Synopsis lieptilium, of which the following diagnosis is given in the Brit. Mus. Cat. Batr. Sal., 1882:-

Papil horizontal. Tongue elliptical or pyriform, entiro and freo behind. Vomerine and maxillary teeth none. Tympanam dis. tinct or hidden, seldom absent. Fingers free; toes more or less webbed; the tips simple or dilated into small disks. Outer metatarsals united. Omosternum generally missing; if present cartilaginous; sternum a cartilaginous plate, sometimes more or less ossified along the median line. Diapophyses of sacral vertebras more or less dilated. Terminal phalanges obtuse or triangular. Distribution cosmopolitan, except Australis.

Bujo vulgaris, Laurenti, the Common Tosd, is thns distinguished. Crown without bony ridges. First finger as loag as or longer than the second. Parotids distinct. Tympanum staaller than the eye. Toes half $\pi$ ebbed; jo tarsal fold; subarticular tubercles of toes double. The species is widcly distributed, occarring throughout Eurono, Asia, and north-west Africa.

Bufo calamita, Laventi, the Natter-jack Toad, shows the following differences from $B$. vulgaris:-toes not half wobbed; tympanum rather indistinct; a tarsal fold. It is distributed throughout Europo.

According to Boutenger there are 77 epecies of Bufo knowu, of which 35 are confined to the Old World, the rest to the American continent. No species is counmon to the two great continents. The only other species occurring in Europe besides the two which are fonnd in Britain is Bufo viridis, Lausenti, which ranses throughout Europe, Asia, and North Africa.
TOBACCO consists of the learees of several species of Nicoliana (nat. ord. Solanacex), variously prepared for uso as a narcotic. While it is principally manufactured fcr smoking, a large amount is also prepared for chewing, and to a more limited extent it is taken in the form of snuff. Under one or other of these forms the uso of tobacco is more widely spread than is that of any other narcotic or stimulant.

Although the fact bas been controverted, there cannot be a doubt that the knowledge of tobacco and its uses came to the rest of the world from America. In November 1492 a party sent out by Columbus from the vessels of his first expedition to explore the island of Cuba brought back information that they had seen people who carried a lighted firebrand to kindle fire, and perfumed themselves with certain herbs which they carried along with them. The habit of snuff-taking was observed and
described by Ramon Pane, a Franciscan, who accompanied Columbus on his second voyage (1494-6), and the practice of tobacco-cherving was first seen by the Spaniards on the coast of South America in 1502. As the continent of America was opened up and explored, it became evident that the consumption of tobacco, especially by smoking, was a universal and immemorial usage, in many cases bond up with the most significant and solemn tribal ceremones.

The term tobacco appears nut to have been a commonly used original name for the plant, and it bas come to us from a peculiar instrument used for inhaling its smoke by the inhabitants of Hispaniola (San Domingo). The instrument, described by Oviedo (Historia de las Indias Occidentales, Salamanca, 1535), consisted of a small hollow wooden tube shaped like a $Y$, the two points of which being inserted in the nose of the smoker, the other end was held into the smoke of burning tobacco, and thus the fumes were inhaled. This apparatus the natives called "tabace"; but it must bo said that the smoking pipe of the continental tribes was entirely different from the imperfect tabrco of the Caribees. Benzoni, on the other hand, whose Travels in America (1542-56) were published in 1565, says that the Mexican name of the herb was "tabacco."

The tobacco plant itself was first brought to Europe in 1558 by Francisco Fernandes, a physician who had been sent by Philip 1I. of Spain to investigate the products of Mexico. By the French ambassador to Portugal, Jean Nicot, seeds were seat from the Peninsula to the queen, Catherine de' Medici. The services rendered by Nicot in spreading a knowledge of the plant hare been commemorated in the scientific namo of the genns Aicotiana. At first the plant was supposed to possess almost miraculous healing porrers, and was designated "herba panacea," "berba santa," "sana sancta Indorum"; "divine tobacco" it is called by Spenser, and "our holy herb nicotian" by William Lilly. While the plant came to Europe through Spain, the labit of smoking it was initiated and spread through English example. Kalph Lane, the first governor of Virginia, and Sir Francis Drake brought with them in 1586, from that first American possession of the English crown, the implements and materials of tobacco smoking, which they handed over to Sir Walter Raleigh. Lane is credited with having been the first English smoker, and through the influence and example of the illustrious lialeigh, who "tooke a pipe of tobacco a little before he went to the scaffolde," the habit became rooted among Elizabethan courticrs. During the 17th century the indulgenco in tobacco spread with marvellous rapidity througbout all nations, and that in the face of the most resolute opposition of statesmen and priests, the "counterblaste " of a great monarch, penal caactments of the most severe description, the knout, excommunication, and cavital punishment.
The species of Nicotiana number about fifty, but those of which the leaves are used as eources of tobacco aro fers. With tho exception of two species, one native of New Caledonis, the other proper to Australia, they aro all of American origin. They form twe well-defincd groups, the first of which is characterized by the possession of an elongated corolla tube, red in colour, the plante having a eingle unbrazconed etalk which attains a height of from 5 to 7 fect; while to the second group belong such es lusve o arrollen corolla tube of a greeniah-yellow colour, and a muchbranched stem reaching a height of only from 2 to 5 feet. The type of the first group is the Virginian Tobscco, N. Tabaeun, while the best known representative of the second is the Green Tobacco, N. rustica. Tbese two species, together will their numerous varicties, and with the Persian Tobacco, A. pirsica,--ite source of the fameve Tumbeki or Shiraz tobacce,-are the sole sources of commercial tobacco. N. Tabacum is the species from which the tobaccos of Cuba, the Unitod Statea, and the Phil? ppine Islasds, and the Latakia of Turkey, are derived, and it is thus the source of not only the greater proportion of the tobacco of commerce but also the most highly prized and valuable of tos rarictics. N. mestica, originally a native of Brazil, is cultivated
to a considerable extent in South Germany, Hangary, and the East Indies.
The Virginisn tobacco-plant, $N$. Tabacum, is a coarse rankgrowing annual, with a simple unbranched cylindrical stem which attuins a height of 6 feet and upwards, terminating in a panicle of pink flowers. It has alternate simple oblong lanceolate leavee,

Fia. 1.-Flowerlng Top of N. Tabacum
those at the lower part of the stem being slightly stalked, and of large size, reaching to two feet in length, while the upper are semiamplexicaul and of variable outline. The seeds are brown in colour, with a rongh surface, of minute size, and exceedingly numerous, as many as 40,000 having been counted on a single plant. The whole of the green parts of the plant are covered with long soft hairs which exude a viscid juice, giviag the surface a moist glutinous feeling. The hairs are multicellular, and of two kinde, one branching and ending in a fine point, while the other, unbranched, terminates in a clump of gmall cells. Stomata occur on both aurfaces of the leaves, and, with the peculiar hair structure, render the microscopic appearance of the plant highly characteristic.

Fio. 2.-Milczoscople Structure of Tobacco Leaf.
Tobacce will flourish over wide areas and in , very dissimilar climates, but it is best suited for regions having a mean temperature of not less than $40^{\circ} \mathrm{F}$. and where early autumn frosts do not occur. It develops the most highly appreciated qualities in tropical lands possessed of a comparatively dry climate. Tobacco is a most exhausting crop, and requires rich ans abundant manuring. the character of which exercises a distinct infuence on the quality of the product. A crop grown under such widely different conditions of climate and agriculture as is the case with tobacen must of necessity be subject to varied treatraent beth in cultivation and in curing, and here we can refer only to the general features of the growing and securing of the crop.

In European cultivation, the tobacco-seed is sown in a hotbed about the end of March. The sced-beds are kept covered with. damp straw or withered leaves till the seedlings appear above the grouud, after wnich the cevcring is removed, and, to pretect the young plants from frost, to which they are cxtremely sensitive, tho
beds are covered at night with mats. So $\bar{\theta} 00 \mathrm{n}$ as the plants can be handled, they are picked out in rows in a garden bed, where they remain protected from night frost till they have developed five or eix leaves and have a height of 3 to 4 inches. They are then ready for transplanting, by preference in moist weather, into prepared drilis 20 to 25 inches apart in the field. The transplanting is done about the end of May, or earlier in localities free from night frosts, a ad in dry weather the field is plentifully soused with liquid manure. The plants are carefully weeded and attended to, and the soil is frequently stirred with narrow hoes until the period when they show symptoms of flowering. This may be when they are only 3 feet high, or not until they have reached their proper height of 6 or 8 fect; but the flowers must not be allowed to form, except in the case of a few plants left purpesely for seed. To obtain fies and strong leaves on the plant is the great object of the cultivator, and a fine tobacco plant ought to liave from cight to twelve large succulent lcaves. Cultivators commonly diminish the number of leaves by "topping" or breaking off the top, under the idea that the remaining ones will afford the strengest tobacco. Suckers or shoots near the root are carefully removed, and everything is done to concentrate the strength of the plant in the leaves. Every leaf iojured by insects is removed, and the crop is watched until the leaves have a yellowish tint and begin to droop, when they are fit to be gathered. This is usually in September, so that the plasts, from the time of their insertion on the mounds, have occupied the ground four months, during which time they have been subject to many vicissitudes, -from the attacks of insects, from a disesse called "friag," caused by the long continuance of very wet or very dry meather, and from the occurrence of auturan frosts while the crop is yet in the field.
la the harvesting of the tobacco crop several distinct methods are followed. In ordinary European cultivation the ripe leaves aro separated from the standing stalks in the field. The three lower root-leaves are first stripped off and laid, face downward, around the root to wilt, alter which they are bundled and carried to the barn. Afterwards the remainder of the leaves are separated, working frour the top downwards, and, similarly, they are spread on the ground till by wiltigg they lose their brittleness. They are then bundled and packed, tops upward, closely on the floor of the barn for some time to sweat, by which the uniform ripening and oubsequent favourable drying are promated. The bundles are carefully watched to prevent overhcating, which would blacken and injure the leaves. In the tobacco-growing districts of the United States the entire plant is cut down in the field close to the graund, then the atalks are spitted on long rods or laths, care heing taken to keop the leaves from touching each other, and on these rods they are carried and hung in the barn or curing-house for drying.

The curing of the leaves which follows has for its olfjects the drying and preservation of the tobacco, and, by a pracess of slow fermentation, the modification of certaia of the leaf constituents, and the develepment of the characteristic aroma of the substance. Subject to various minor morlifications, the process of curing io carried out either slowly by the air-cure process or rapidly by firecuring. The European cultivators, who geacrally cure by the slow process, either spit the leaves through the middle ou a long rod or string them on a cord, taking care to keep each leaf from touchingits neighbour. These rods or cords of leaves are auspended in a barn or curing-shed in a way which allows the free circulation of the air, and at the same time brings the whole contents of the ahed equally under the drying influence of the air currents. When the weather is clear and dry, free circulation of the air is in every way promoted, but on humid days the meist air is excluded and sometimes artificial heat is required to prevent mildew and rottiag of the leaves. Under favourable circumstances the tobacco will be dry and ready for further treatment in from six to eight weeks, and the leaves should then have a fine bright warm brewn colour.

In the United States the quick-drying process by artificial heat is empleyed principally lor the preparation of export tebacco. Formerly the beat was obtained by means of aa open charceal firo within the cuing-bara, but now the structure is beated by a system of flues which permits of the burning of any kiad of fuel. For dark shipping tobaceo, the entire plants, cut down close to the ground, are immediately housed, and at once dried off. Red sbipping qualities are prepared by leaving the cut stems either in the field or hung on scaffelds in the barns for a few days to wilt and wither in the air, after which they are dried by artificial heat. In the treatment of both dark and red kinds the temperature withiu the barn is gradually raised till it reaches $170^{\circ} \mathrm{F}$., and the drying is complete in from four to five days.

By whichever way treated, the tobacco-leaf at this stage is brittle, and eannot be haadled without crumbling to powder. The contents of the barn are therefore left till moist weather occurs, and then by the admission of atmospleric air the leaf blades absorb moisture and become soft and pliant. In this condition the leaves are stripped from the stems, sorted into qualities, such as "lugs," or lower leaves, "firsts," and "seconds." These are made up into
[" hands," or small hundles of from six to twelve leaves. Each bnndle is tied round with a separate leaf, and in this condition the tobacco is ready for bulking for fermentatiou.

For fermentation the tobacco, whether in bendles, hands, or separate leaves, is piled up or bulked on the floor in a barn into a solid atack to the beight of 5 or 6 feet. Within this stack a process of fermentation is quickly sct up, and the temperature of the mass rises steadily till it reaches obout $130^{\circ} \mathrm{F}$. Great caro ia now taken to prevent overheatiug, and to secure the uniform fermentation of all the tohacco. The pile is front time to time taken down and rehuilt, the tobacco from the top geing to the botton, and that exposed et the edges being turned in to the centre. In froin three to five weeks the fermentation shauld be aufficiently carried out, and the leaves then have a nice uoiform brown colour. The curcd stack may in this cendition be piled up iu store without fcar of further fermentative sctivity, till, with increasing smmer hent, it is subject to the May oweat, which renders further watchfulness neccssary.
'The componcars of tolacco, like those of all vegetable matters, arrage themselves under the three heads of water, mineral acids ond bascs (which pass into the ash on combustion), and organic substances. According to au investigation carried out by Beauchef in Gay-Lussac's 1storatory, the ameunt of ash from 100 parts of mitter dried at $100^{\circ} \mathrm{C}$. is in the roots 6 to 8 , in the stems 10 to 13 , and in the ribs oud leaves 18 to 22 per cent. The greater part of the ash consists of insolublo salts, miucipslly carbonate of line. Thie soluble part consists largely of potash salts ( $\mathrm{KCl}, \mathrm{K}_{2} \mathrm{CO}_{3}$, $\mathrm{K}_{n} \mathrm{SO}_{4}$ ), which may amount to from 5 to 35 per cent., and it is ranarkable that tobacco contains no soda. In addition to the mincral salts proper, tobacco contaius solts of anımonia end nitrates. Is the leaf the proportion of nitrates is greater iu the rila than in the laminx. In the former it may amount to as much as 10 per cent. (calculating the nitric acid as $\mathrm{KNO}_{3}$ ). According to Schloesing (Ann. Chim. Phys., [3], x1. 479), the proqurtion of (combined) uitric acid in tobecco has nothing to do with its combustibility, that is, the length of tine a lighted cigar will glow spontaneously. This quality is a function chiefly of the patash present in combinatiou with organic acids. $\Delta n$ incombustible tobacco, i.e., a tobacco which does not keep a glowing ash, coatains its organic ecids in the form of lime and magnesia salts. The explanation is that, while organic potash salts, being fusible, yield when heated a porous charcoal which glows readily, the corresponding infusible liune alts yield a compact charcoal which is far less combustiole. A combustible tobacco can be rendered incombustible by the incorporation of sulphate or chloride of calcium or magnesiun. By cultivation experiments in a potash-free aoil, it has been ascertained that chloride of potassium used as a manure does not add to the erganic potash salts in the leaves, but the sulphate, carbonete, and nitrate do give up their potash for the formation of organic salts.

Subjoined is an enumeration oit the proximate orgauic components of tobacco leaves, and their relative proportions in 100 parts, according to the Dumerous adalyses made in the leboratories of the Freuch atate tobacco factories:-

Nicatine, $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{~N}_{2}$, a liquid volatile alkeloid, from 1.5 to 9 per cent.
Essential oil,-accordiug to Schloesing, an inportant element in the flavour of tobacco, although its proportion is exceeding!y small.
Nicotianine, a aolid camphor-like body to which, according to other authorities, the odour of tobacco is principally due.
Malic end citric acids, togcther 10-14 per cent., calculated as onhydrides.
Acctic acid, very little in fresh leaves, but increasing in their fermentation. In snuff it may rise to 3 jer cent.
Oxalic acid, 1 to 2 per cent.
Pectic acid, about 5 per cent.
Resins, fats, and other bodies extractable by etter, 4 to 6 per cent.
Bugar, little in the leavea, more in the stems; in the fermentation it disappears.
Cellulose, 7 to 8 per cent.
Albuminoids, calculated from the nitrogen pot present as nicotine, nitrates, or $\varepsilon$ mmonia, about 25 per cent.
Excepting the nicutine, the several organic components of the leaves deve!op, roughly speaking, pari passu until fructification, when certain components are attracted to the fruit, suffering ctemical changes while eo moving. The nicotine determines the itrength of a tobacco, but not its flavour or arome. The mannre snpplied to a tobacco f.eld does not increase the proportion of sicotinc, but affects only the weight of the crop. The percentage $X$ nicotine iu the leaves may to some extent be modified in cultivawoon, -plants wido apart developing fow leaves, but these thick, flesly, and rich in micotine, while closely packed plants throw out numerous but thin and membranous leaves having little nicotine. The proportion of nicotine present increases with the age of the plant. Schloesing found in leaves ot various stagea of growth the plant. Schloesing found in lesves ot various stages of growth the
0.79; July 18, $1 \cdot 21$ : Aug. 6, $1 \cdot \Omega 3$; Aug. 27, 2.27; Scut. ${ }^{-}$8, 3.36 ; Sopth 25, 4.32.
Regarding the changes which take place iu the manufuctured leaf, we take the case of snuff, because with it the chenical chaures are carried fat thest, and yet, qualitatively speaking, they bre of tha same uature as those which amoking tobacco unitergoes. In tho fermentation begun iu curing aud continued in the sauced Jcuf, the malic and citric acids and the nicotine undergo partial oxilation. The oxalate of lime and the pectates remain almost unchauged, and there are formed, of intormediate (not fully oxidized) bodies, ammonia, acetic acid, sod black humic acil, the last giving to snulf its dark celour. A litfle methyl-alcohol is also at the same time formed. At this stage the tobacco-leaf is acid io reaction; but aftcr it is powderod, and again sulmitted for a prolouged period to a alow fermentation in air-tight loxes, it becoues decidedly alkalive by the ammouia, bccause, while acctic acil coutinues to be formed and the ammenia and nicotine remain what thoy are, the malic aud citric scids are progressivcly destroyed. Uoless auulf contaius free emmonis it is " llat," and destitute of pungency.
As to the compesition of tebseco smoke, nomerous investigationa have heeu made. Kissling (Ding. Polyt. Jour., ccliv. 234-246), experimenting on cigara, found that a large proportion of the nicotiue passes unaltered into the smoke. Dealing with a tobacco containing 3.75 per cent. of nicotine, he recovered from the smoke 52.02 per cent. of the total nicotine consumed, while in the uycoasuned remains of the telacco the proportion of nicotine was iocreesed to 503 per cent. With a second ample of tobacco, having likewise 3.75 per cent. of nicotine, the smoke yielded only $27: 83$ per cent. of the total nicotine conaumed, and the percentage in the unconsuoned remaios was raised to 451 . Front a tobacco containiug only 0.30 of nicotins he recovered 84.23 of nicotiue in the smoke. The composition of tobacco smake is highly complex, hat beyond nicotine the only aubstances found in apprecisble quantities are the lower members of the picoline series.
The commercial varietics and the sources of supply of leef-Commer tobseco are exceedingly numerous. Special qualitics of tobacco, as cial vane of wiues, \& c., belong to particular localities, outside of which they ties. caonot be cultivated. These tobaccos are therefore natural monopolies. Moreover, as is also the case with wines, the crops vary in richness and delicacy of flavour with the seasons of their growth, so that in certain years the produce is of much greater value than in others. Further, the properties of certain classes of tobacco render them specially suitable for cigar-making. Others are best fitted for amokiug in pipes; and there are numerous qualities which are valuable for snuff-making. National tastes and habits again freqnently determine the destinstion of tobecco. Thus beavy, strong, and full-flavoured cigars and tobaccos are in favour in thr United Kinglom, while on the Continent lighter and more hriskburning qualities are sought after, and the materials consumed ia the kalians of Persin and the East are not suitable for use in the sbort pipes of the Western nations.

Of cigar tobaccos the most valnable qualities in the world are cultivated in the north-west portions of the islank of Cuha The district of Vuelta Abajo is the source of the highest quality, after which comes the produce of Partidas and Vuelta Arribs. A large portion of the tolacco is inade into cigars in the islaod, but considerablo quantities ale also exported to Europe aod the United States for mixiog with commoner qualities to give Havana character to the home-made cigars. In recent years a large export of tobacco from Brazil, especislly from the province of Bahia, has sprung up, most cs which goes to Germany and Austria for cigar-niaking. The "seeu-leaf" tobacco of Pennsylvania, Connecticut, and Ohio, growu from Havana seed, is devoted to cigar-making ia the Uuited States. In the East the most important cigar-tobacco region is the Philippine Islands, from which come the well-known Manila cheroots aud cigars and a largo quantity of leaf-tobacco of diatinctive aroma Immense quautities of cigar tobacco are also exported frons Jave and Sumatra, most of which passes through the markets of Amsterdam and Rotterdam. In the Madras presidency and in Burmah cigar tobscco is largely cultivated, the strong heavy qualities of which are well known to the British public in the Burmese, Lunka, and Dindigul chcroots.

Of ordinary smoking tobacco, among the most esteened quali ties are Varinas or kanaster, grown in the districts of Varinss, Merida, Margarita, \&e., in Venezuela. The usme kanaster, which covers several varicties of tobacco from South Anserica, is given on account of the wicker baskets (Span. kanastra) in which the material is packed for export. The tobncco refions of the United States-Kentucky, Maryland, Virginia, and Ohio-seud great sulplies of smol:ing leaf of various qualities into the Europeau market, eapecially in to the United Kingulom, Which is almost exclusively eupplied froin thicse sources. Smokiag tulaccos of the bighest quality, rivalling indeed the cigar tobacco of Cuba in flavour ave value, are frown in Turker, and apecially in the provinco of Salonica. The farmons Latakia of the Englisl amokers is produced in the province of Saide, in the worthtra pirt of Syria. (sed
XXII. - $\mathrm{a}_{4}$

Latakia), and thoughout Asiatic Turkoy there is an extensive cultivation and export of smoking tobacco.
In the manufacture of tobacco for smoking, we lave to do with tha numerous forms of tobacco used for smoking in pipes, cinbracing cut smoking mixtures, cake or plug, and roll or epun tobacco. Under this beading come also the cigar and cigarette manufacture.

The raw material in the warehouses is of varions qualities : some is strong, rough, and larsh, aud 60 is unfit for ordinary smoking ; other samples are mild sud fine, with aromatic and pleasant flavour, but devoid of strength. By a proper mixing and bleuding the manufacturer is enabled to prepare the smoking mixture which is desirable for his purpose; but certaiu of the rough, bitter qualities cannot be manufactured without a preliminary treatmant by which their intense disagrceable taste is modified. The storing of such tobacco for a lengthened period matures and deprives it of harshness, and the samo result may be artificially hisstened by macerating the leaves in water acidulated with hydrochloric acid, and washing them out with pure water. The nost efficient means, however, ot improving strong, itl-tasting tobacco is by renewed fermentation artificially induced by uoisture and lieat.
The manufacturer having prepared his mixture of leares, procecde to damp them, pure water aloao being used in the United Kingdom, whereas on the Continent and in America certain "sauces" are enployed, which consist of mixturcs of aromatic substances, sugar, liquorice, common salt, and saltpetre, \&c., dissolved in water. The primary object is to render the leaves soft and pliant; the use of the sauces is to improro the llavour and burning qualities of the leaves used. When uniformly damped, the leaves are separately opened out and sinonthed, tho midrib, if not already removed, is torn ont, except when "bird's eye" cat is to be made, in which mixture the midrib gives the pecullar "bird's eyo" appearance. The prepared tobacco, while still moist and pliant, is pressed hetween cylinders into a light cake, and cut juto fine uniform shreds by a machine analogous to tho chatf-cutter. The cut tobacco is now roasted, partly with the view of driving off moisture and bringing the material into a condition for keeping, but also partly to improve its smoking quality. The roasting is most simply effected by spreading it on heated alabs, on which it is constantly turned. but such a metbod does not yield uniform results, and it exposee the workers to a inost deleterious atmosphere and noxious fumes. A roasting machine is in use, which consists of a revolving drum in which the tobacco is rotated, gradually passing from one end to the other, and all the time under the influesce of a current of heated air passing through it.

For roll, twist, or pigtail tobacco the raw material is damped or aauced as in the case of cut tobacco. The interior of the roll consists of small and broken leaf of various kinds, called "fillers"; and this is enclosed withiu an external covering of large whole leaf of bright quality, such leaves being called "covers." The material is aupplied to the twisting nachinery by an attendant, and formed into a cord of uniform thickness, iristed, and wound on a drum hy mechanism analogous to that used in rope-spinaing. From the drum of tha twisting machine tho epun tobacco is rolled into cylinders of various sizes. These aro enclosed in canras, and around the surface of each stout hempen cord is tigutly and closely coiled. In this form a large number, after being cooked or stored in moist heat for about twenty-four hours, are piled batween plates in an hydraulic press, and subjected to great pressure for a month or six weeks, during which time a slow fermentation takes place, and a considerable exudation of juice results from the severe pressure. The juice is collected for use as a sheep-dip.

Cake or plag tobacco is made by enveloping the desired amount of fillers within covering leares of a fine bright colour. A large number of such packnges are placed in moulds, and submitted to powerful pressure in an hydraulic press, by which they are moulded into solid cakes. Batl cake and roll tobaceo are equally used for omoking and chewing; for the latter purpose the cake is frequently sweetened with liquorice, and sold as honey-dew or sweet cavendish.

For cigar-making the finest and most delicately flavoured qualities of tobacco are generally selected. A cigar consists of a core or central mass of fillers envcloped in an inner and an onter cover or robe. The fillers or inner contents of the cigar must be of uniform quality, and so packed and distributed in a lougitudinal direction that the tobacco may burn uniformly and the smoke can be freely drawn from ead to end. For the inner cover whole leaf of the same quality as the fillers is nsed, but for the onter cover ouly selected leaves of the finest quality and colour, free from all injury, are employed. The covers are carefully cut to the proper size and shape with a sharp knife, and, being damped, a pile of them smoothed out are placed together. In making cigars by the hand, the operator rolls together a sufficient quantity of material to form the filling of one cigar, and experience enables him or her to selcet very unjform quantities. This quantity is wrapped in the inner cover, an oblong piece of leaf the length of the cigar to be made, and of width sufficient to enclose the whole material. The cigar is then rolled in the hand to consoliuate the tabacco and bring it into proper slape, after which it is wrapped in the outer cover. a
alapod piece made to caclose the whole in a spiral manner, oegin. ning at the thick end of the cigar and working down to the pointed end, where it is dexterously finished by twisting to a fino point between the fingers. The finished cigars aro either spreacl out in the smalight to be dricd, or, where that is impracticalle, they uro -exposel to a geotle lieat. They are then nortel into qualitics according to their colour, packed and pressed in boxes, in whith they are storel for sale. Machinery is now entloyed for forming and moulling the fillings of cigars.

Havana cigara are, as regards form, classification, method of putting up, and nowenclature, the models followed lyy mannfacturers of all classes of the goouls. Genuine ("legitinuas") Havana cirours are such ouly as are made in the island; and the cigars mado in Europe and elsewhere from genume Cuban tobacco ore classed as "1lavanas." Other brands of home manufacture contain some proportion of Cuban tolacco; aul rery good cigars may be made in which the onme only of that lighly-prized leaf is employed. When we come to the infcrior classes of cigars, it can ouly be said that they may be made from any kiud of leaf, the more ambitious imitations being treated with various satuces designed to give them a IIarana flavour. The hirhest class of Cubara-made cigars, cailed "vegueras," are preparcd from the very fiacst Vuelta Abajo leaf, rolled when it is just lalf diy, and consequently mever damped with water et all. Next como tho "regalias " similarly made of the best Vuclta Abajo tobacco; and it is only the lower qualities, "ordinary regaliss," which are commonly found in commerce, the finer, along with the "regucras," being exccedingly high-priced. The cigars, when dry, are carcfully sorted according to strength, which is estimated by their colour, and classed in a ecala of increasing strength as claro, colorado claro, maduro, and ascuro. They are pressed ioto tha cigar toxes for sale, and branded with the name or trade maris of their makers. Cheroots differ from ordinary cigars only in shape, being either in the form of a trun. catcd cone, or of nuiform thickness throughout, but always having both ends open and sharply cut across. Cheroots come principally from Mlanila, but there are now lareo quantities imported into the United lingdem from the East Indica aud Burmah.

Cigarettes consist of sinall rolls of fine cut tobacco wrapped in a covering of thia tough paper specially mads for such use Originally cigarettes were entirely prepared by tho smoker himself; but, now that tho consumption of cigarettes las attained gigantic proportions, especially in France, they are very largely inade with the aid of an elaborate system of antomatic machinery. The machines cut the paper, gam its edge, measure out the proper quantity of tobacco, wrap it up, make the gummed edge adhere, cut the ends, and pack the cigarettes iu boxes.
The manufacture of snuff is the most complex, tedious, and difficult undertaking of the tobacco mavufacturer; but it is an art now of relatively little and of decreasing importance. The tobacco best suited for snuff-makinz is thick fleshy leaf of a dark colour the finest qualities of snuff being made with dark Virginin leaf and the Amersfoort leaf of Hollaad; but manufacturers work up many kiods with fragments from the making of ernoking tobacco, midribs, \&c. The varieties and qualities of spuff are many, the differences being dependent on tho material employed, the sauces with which it is treated, and the method of manulacture. The sauces for souff consist of solutions of common salt, with various aromatic substances according to the flayour desired in the finished snuff, and with occasional additions of potash, sal ammoniac, and other salts. The following is an ontline of the method adopted in making snuff on the great scale in the state manufacture of France. The tobacco leaves are moistened with about one-fifth of their weight of salt and water (sp. gr. 1.089 ), made up into blocka, and piled in large rectangular lieaps, in quantities of 40 or 50 tons. The temperature gradnally rises to $140^{\circ} \mathrm{F}$., and sometimes reaches $170^{\circ}$; but the heat must be regulated, or parts of the mass would become blarl as if rharred. The beaps are mode up in spring and antumu, and the fermentation is continued for fire or six monthel when the temperature remains stationary or begins to decline The heap is then opened, and the tobacco is ground, by which means a pale brown dryish powder (rape sec) is obtained. This is mixed with sbout four-tenths of its weight of a solution of commousalt. and is passed through a siese, that the powder may be uniformly moistened. It is then packed in large open chests in quantities of from 25 to 50 tons, where it remains for ning or ten months, and undergoes another fermentation, the temperature "rising in the coutre of the mass to $120^{\circ}$ or $130^{\circ}$. During this process the snuff acquires its dark colour and develops its aroma. But it is not uniform in quality througlout, and is removed to a second cliest, in such a way es thoroughly to mix all the different parts together, and, after the lspso of two months, it is again turned over; and the process is sometimes repeated a third time. When the souff is ripe, the contents of the various chests are mixed together in a large room cipable of holding 350 tons of snuff, where it is left for abont six weeks, and the whole mass beiog uniform in quality is sifted into barrels for the market. The process of manufacture occupies in all from eighteen to twenty months. During thesr
repeated fermentations about two thirds of the nicotine is destroyea, the acidity of tho snulf lisappears, and the mass becomes distinetly alkaline, notwithstanding that acetic aeid is continnonsly evolved. The destruction of malic and citric aeids continues, and the bases thercby sot free saturato the aectic acid formed, leaving free ammonia in the snuff. The properties of snuff ara dependent on the presence of free nicotine, frea ammonia, and the pecular aromatic priaciple developed in the fermentation.

The reduction of tobaceo-lasf to a snuff powler is a task of considerable difficulty, owing to the gummy natura of the substance, which tonds to coat and clog grinding surfaces. In early times tho duly sauced and fermented leaves were made up into "carottes," -tightly tied up spindle-formed bundles, from the end of which the smulier, by means of a "sonff rasp," rasped off his own supply, and hence the name "rape," which we have still as "rappee," to indicate a partieular class of snulf. The practice of tying up the leaves in tho form of carottes is atill followed by makers of fine snulf, es the very slow fermentation which goes on within the bundles is favourable to the development of a rich aroma. For pulverization, the leaves are first ent to shreds with a revolving kaife, and theu powdered either by a kind of mortar and jostle mill, or by falling stampers supplied with knife eutting edgis, or mora commonly they are treated in a conical mill, iu which both the revolving cone and the sides have sharp eutting edges, so that the material undergoes a cutting rather than a grinding action. Tho sualf from the mill is sifted, and that whim remaios on the sieve is returnel to the mill, the remainder beiug passed on as rapy sec for further treatineat as deseribed above.

In nearly all eivilized countries the cultivation of tobacco and its manfacture are conducted under state supervision, and forman impartant sourec of public revenue. In France, Austria-IIungary, Italy, and Spain the cultivation is a state monopoly, and in other countries the crop is subject to heavy exeise duties. Sinco the tima of Charles II. the growth of tobseeo in England has been practically prohibited, the original legislative exactment to that effeet having been passed with the view of encouragiag trade with the young colony of Virginia. When that motive ceased to lave force the supposed diffieulties of collectiog the internal taxation etill influenced the legislature to contivue their prolibition, and consequently a penalty or prolubitive tax equal to sixteca hundred pounds per acre is exigible on the eultivation of tobucco in the United lingdom. In Ireland the duty on the cultiration of tobacco was abandoued between 1822 and 1830 , and in that interval the cultivation grow till about a thousand acres were under the crop. In 1886 the Government permitted the experimantal cultivation of tobacco in England, under certain precautions and restrictions for the security of the revenue. Several proprictors in Kent, Norfolk, and other colnties grew experinental paches with such success as to warraut the continuance of the experiment and to prove tbe entire practicability of cultivating tobaree as an English agricultural crop. The climata is, however, so variable that, were all restrictions removed, and tobaceo grown snbject only to exeise supervision for collecting an equitable tax, it is more than donbttul whether its growth would be a safe and profitable undertaking.
The influence of tobacco on health and morals has, ever since its introduction into Emrope, been a fruitful subject of controversy. On all grounds, except as a medicine, it met the most uncompromisiag opposition when it first became known; but it was precisely the expectations entertained regarding its mediciual virtues which were completely disappointed. Burton, in the Anatomy of Melancholy, gives atrong expression to the two views "Tobacce, divine, rare, superexcellent tobaceo, whieh goes far beyond all the panaceas, potable gold, and philosopher's atones, is a sovereign remedy in all diseases. A good wonit, I coufess, a virtuous herb if it be well qualified, opportunely taken, and medicinally used ; but, as it is commonly abused by most men, which take it as tinkers domale, 'tis a plague, a misehief, a violent purge of goods, lands, health, -hellish, devilish, and damned tobacco, the ruia and overthrow of bedy and soul."' Burton's meaningthat tobaceo in moderation is a good thing, while its excessive use causes many physical zud other evils-has many sympathizers; but the difficulty is to define moderation and exccss. Among nodern autherities, Dr Jonathan Pereira says, "I am not acquainted with any well-aseartained ill effects resu'ung from the habitual practice of smoking.". Similarly Sir Robert Uhristison concludes, "Iu meny individuals who use it habitually, the smoke has so extra. ordioary power in removing oxhaustion, listlessness, , ind restlessness, especially when brought on by bodily or mental fatigue, and this property is the basis of its gencral use as an article of luxury." Dr E. A. Parkes sums up his observations thus: "I confess myself Quito uncertaiu. I can find nothing lika good evidence io booka; too ofter a foregone conelusion, without any endence to hack it, is given. I think we must decidedly admit injury from excess; from moderate use I can seo no harm, except it may be in youth." On the other hand, it is asserted by the oppozents of tobreco, and by the anti-tobaceo soeicties, that the habitual uso of this narcotic leads, especially in the young, to decrease of bodily and mental
vigour, and specially prodnces symptoms of anemia, palpitations intermittent prise, and other affections of tho hem and circula tion. It is an admitted fact that a disense of the vision-tobaceo amblyopia-is contrected ly smokers, and is not uncommon among those nsiag stroog heavy preprations, snch as black trist, Allowing that such incidental cyils may arise from even comparatively moderate intulgenco in tohacco, they are after all as nothiog compared to the vast atgregato of gentle exbilaration, soothing, and social coufort, extracted from the Virginian weed.

With the almost universal prevalecuce of the use of tobaceo, it must be obvicus that tho amount consuned yearly is very great. In the United Kiagdom, which is muel less a tobaceo consumina country than the Uaited States or mary Europoan countries, tho consumption per head has steadily increased, as is shown in the accompanying table.
The custons duty derived from imports of tohacco smounted in

|  | Total Consumptlen. | Per Head. |
| :---: | :---: | :---: |
| 1821 | $\underset{15,598,152}{\text { 96 }}$ | ${ }_{11} 02.71$ |
| 1831 | 19,533,541 | 12.80 |
| 1841 | 22,309,360 | $13 \cdot 21$ |
| 15.51 | 28,062,978 | 16.87 |
| 1871 | 42,775, 334 | 21.49 |
| 1851 | 49,520,493 | 22'60 | 1856 to $£ 9,295,940$, and there cer. taiuly is a considerable quantity of manufactured tobacco smuggled into the kingdon which coures into no oflicial record. In the U aited States the production of tobaceo was in $1840 \quad 219,163,312 \mathrm{lb}$, in $1850139,752,655 \mathrm{lb}$, in $1560434,209,461 \mathrm{lb}$, in $1570262,735,341 \mathrm{tb}$, aud in $1880452,661,157$ 1b. During tho ten years ending 1881 the average anmual production was $472,000,000 \mathrm{it}$, cultivated on from 800,000 to 700,000 acres, the value of the cropls ranging from $\$ 40,000,000$ to $\$ 45,000,000$. In, the same ten years $2,540,818,001 \mathrm{tb}$ of leaf were exportcal, $1,807,006,249$ it were manufactured for home consumption, and the guantity cousumul by growers was estimated to be equal to $2 \$ 0,000,000$ 1o.

For T'obacco Pipe, sce Pipe.
The ilterature of tobacco is very extensive. The late Mr Willam Braggo of Birmingham published in $1=80$ a revised bibljugraphy of the subject, Bibliotheea A'icotsana, extending to 218 quarto pages. Fiom such a mass of authoritles it wuld be vain here to make actections, but mention may be made of Farholt' capital bossiping work, Tubaceo, ths llistory and Associations (2d ed., 1876). Aa modero standard works there may ulso bo quoted Tiedernann"s Oeschichie des Tabals (1856) and Wagner's Tabikcultur. Tubat- und Cigarren-F'abricalion (1884). In tha Tenth Census Jieports of the United States (1883), vol. Jiln, thela are a serle of elaborato papers on the cultivatlon, manufactare, and atatistics of American
totacce.
(J. l'A.-W. D.)

TOBAGO, the most southerly of the Windward group of British West Indian Islands ( $11^{\circ} 9^{\prime} \mathrm{N}$. Jat., $60^{\circ} 12^{\prime} \mathrm{W}$. long.), 20 milcs north-east from Trinidad, is 26 miles in length and $7 \frac{1}{2}$ at its greatest breadth, with an area of 114 square miles ( 73,313 acres). Its formation is rolcanic, and the physical aspect irregular and picturesque, with conical hills and ridges; the main ridge is 1800 feet high and 18 miles long. There are several excellent harbours. The products are sugar, rum, molasses, and fruits of various kinds, only the low ground being cultivated. production is not increasing. In 1885 the rovenue was $£ 10,826$ and the expeuditure $£ 12,031$, while the imports were $£ 30,758$ and the exports $£ 26,414$. The population in 1885 was 19,363 ( 9368 males and 9995 females), principally of African race, the whites being very few. Tobago has a small legislative council and an administrator under the Government of the Windward Islands. Its capital is Scarborough ( 1200 inhabitants), on the sonth-cast coast.

Tobago was discovercd by Columbus in 1498, and the British flag was first plauted in 1580, the island being then occupied by Caribs. It has subsequently been beld by tho Dutch and the French, but ultimately was ceded to tha British crown iu 1814

TOBIT, The Book of, one of the Old Testament apocrypha, relates with many marvellous circumstances the virtues, trials, and final deliverance of Tobit, a pious Istaclito who was carried to Nincveh iu the captivity of the ten tribes, and, after rising into favour and wealth as a trader at the royal court, was reduced to porerty because he habitually buried those of his nation whem the tyrant slew and ordered to he cast forth unburied. Besides this be lost his eyesight through an accident. Reduced almost to despair, like Job, and taunted like Job by his wife ("where are thy alms and righteous deeds ""), he yet puts his faith in Cod and prepares to die, but first resolves to send his son Tobias to Ihage (Rai), in Media, to reclaim an old loan Now his prasers are leard and his righteóus-
ness rewarded, for Raphael, one of the seven angels that present the prayers of the saints before God, is sent in buman form to conduct Tobias on his journey. Thus aided, Tobias not only recovers his father's money, but by killing a fish which attacks him as he washes his feet in the Tigris, becomes possessed of two invaluable drugs, its liver with the heart and its gall. By famigation with the former ho drives away the demon Asmodeus, who had slain the seven bridegrooms of a virtnous Jewish maiden, Sara of Ecbatana, his own kinswoman, aud so wins a good wife, and with the gall he heals his father's eyes. In spite of the absurd machinery and other puerilities, the story is ingeniously constructed, and the picture of Tobit's piety is natural and touching, so that the whole is a very good exhibition of the weakness and the strength of Judaism as it was among the Israelites of the dispersion.

The date of the book cannot be precisely determined. It was written before the destruction of the temple (xiv. 5 ), and is cited by early Christian writers. On the other hand, it is in the highest degree probable that the Greek text is original, ${ }^{1}$ in which case ths book can hardly be earlier than the $2 d$ century b.c. A date about the middle of this century, or a little earlier, at the tine of bitter contlict with the Grecks, seems to accord best with the tono of the book. The sympathy shown for the rictims of tyranny, to whom burial was denied, acquires fresh meaning when compared with such a passage as 2 Mac. v. 10 , and the prominence given to eschatological hopes in the closing verses fits a time when interest in the prophecies of Israel's future glory was resived by the struggle for national independence in Judra.

That Tobit was written by a Jew of the Eastern dispersion (so, e.g., Ewald, Gesch., iv. 269) will hardly bo maintained by any one who accepts the Greek text as original. The book remained almost unknown to the Syriac church, a fact which tells strongly against the hypothesis of an Eastern origin; and at the period to which the work can be best referred EgJpt is the only probable place for a Jewish-Greek compositicn. The Writer knows nothing about the geography of the East beyond a few names which every Jew must have heard, the Tigris, which, by an error common among the Greeks but hardly possible to an Oriental Jew, he regards as flowing between Nineveh and Media; Rhagæ, which was a royal residence of the Parthians; the famous city of Ecbatana; and Elymais (ii. 10), which was associated with the disaster of Antiochus Epiphanes. And in both forms of the Greek text (ri. 9 in the common text, and จ. 6 in the longer) Phagm is falsely represented as quite near Echatana. ${ }^{2}$ Nöldeke surmises, as others have done befure him, that the "fish" which attacked Tobias was the Egyptian crocodile, and this conjecture is raised almost to certainty when we read ia Kazwini i. 132 that the smell of the smoke of crocodile's liver cures epilepsy and that its dung and gall cure leucoma, which was the cause of Tobit's blindness. ${ }^{3}$ Thus the cures of Sara and Tobit are natural ( $f$ f. the longer Greek text, vi. 4 sq.) ; the angel's help is necessary only to secure the medicaments and explain their use.

But though the story may have been written in Egypt it contains Pcrsian elements. There is no inconsistency in

[^179]this, for the authois of Jewish Haggada generally borrowed the themes which they embellished, and that from very various quarters. In fact, at the close of our book there is a brief allusion to another story, ${ }^{4}$ quite unknown to us, which the anthor evidently did not invent. The proof of a Persian element in the tale lies, not in the localities, but in the angelology and demprology. Asmodeus is the Iranian evil spirit Aeshmâ Daevâ, and Raphael, as the guardian of Tobias, has a strong resemblance to the Iraniaa Çraosha Such precise adaptations of Zoroastrian ideas were hardly the common property of Judaism at so early a date; they lead us to conjecture that the writer borrowed from an Iranian story.s And only in this way can we explain the appearance of the dog who goes out and retnrns with Tobias and Raphael. This trait is so inconsistent with Jewish feelings towards the unclean animal that it is omitted in the Hebrew and Chaldee versions. But to the Irauians the dog was not only a sacred animal, the protector of herds and homes, but was the companion of the protecting spirit Craosha (Bundrhesh, chap. xix.), to whom Raphael in our tale corresponds.

The Greek text of Tobit is fouad in a shorter recension (the usual text) and in a longer form preserved in the Codex Sinaiticus (published by F. H. Reusch, 4 to, Bonn, 1870). Thero are fragmeuts of acother form of the longer text ln several cursivcs. All the forms are given in Fritzsche's Libri Apocyyphi, Leipsic, 1871. The shorter text, in the judgment of Fritzsche and Nöldeke, is the earlier. The longer text is also represented by the Latin versions, the second part of the rase Syriac version (the first part is from the hexarlar Greek), and two closely allied Jewish versions, the Aramaic (published by Xeubauer, from a uaique Midrask in the Bodlcian, Oxf., 1878) and the Hebrew, first printed in Constantin. ople (1518), reprinted by Miinster in 1542 (whenco its common Dame Hicbreus Munstcri) and included in Neubaucr's cdition. The Aramaic seems to be a late form of the text known to Jerome, and of which he inade use for the Vulgate Latin; it is certainly a translation from the Greek. There are recent comidentaries on Tobit by Fritzsche (Kurzgef. Handb. zu den Apocr., ii., Leipsic, 1853), Reusch (Freiburg, 1857), Sengelmann (Hamburg, 1857), and Gutberlet (Theissing, 1877). Nöldeke's paper already quoted is indispensable. For other litcrature, eee Schurer, NTliche Zeit. gesch., ii. 608.
(W, R. S.)
TOBOLSK, a government of Western Siberia, having the Arctic Ocean ou the N., Archangel, Vologda, Perm, and Orenburg on the W., Akmolinsk and Semipalatinsk on the S., and Tomsk and Yeniseisk on the E., is one of the largest provinces of tho Russian empire, occupying nearly 7 per cent. ( 531,980 square miles) of its total area. It borders on the Arctic Ocean, from the river Kara to the Bay of the Ghida, the broad peninsula of Fałmat projecting betweec the Kara Sea on the west and the Bay of the Ob; this last penetrates into the continent for more than 550 miles, with a width of from 60 to 70 miles, and receives another long and wide outlet-the bay of the Taz (Tazorskaya). Another wide bay of the Kara Sea-the Baidaratsk, or Kara Bay-runs up into the Yatmal peninsula from the north-west. The islands bolonging to the government are few; Byelyi, at the extremity of Yalmat, and a few small ones along the west coast of the peninsula, as also in the Obi Bay, are for the most part ice-bound. This extensive province occupies the greater part of the lowlands of north-western Asia, which extend eastward from the Urals, and only in the far porth does it include the eastern slopes of these mountains. .The Pai-ho coast-ridge only touches Tobolsk with its southeastern extremity. The Urals proper, which run southwest from the Kara Sea as far as to the Tell-pöss group ( 5540 feet), and thence take a southerly direction, form the boundary between Tobolsk and Vologda as far as the

[^180]pources of the Petchora ( $61^{\circ} 30^{\prime} \mathrm{N}$. lat.), but farther south their eastern slopes are included in the Russian government of Perm, and only their lowest spurs, 200 miles from the main ridge, belong to Tobolsk. The average height of the northern Urals is about 3000 feet, and several of their summits range from 3300 to 4000 and even 4370 feet (Net-yu, in $68^{\circ} \mathrm{N}$. lat.). The remainder of the gevernment is of lowland character, hardly at any point rising above the sea by more than a few hundred feet, but these lowlands vary greatly in their different parts. They assume the character of grassy steppes or prairies in the south, of immense marshes sparsely covered with forest in the north, and of treeless tundras as the shores of the Arctic Ocean are approached. The southern steppes, in their turn, may be subdivided into two distinct portions, -the Tobot and -Ishim steppe in the west, and the Baraba in the east. The former, nearly 43,000 square miles in area, is one of the most fertile parts of the empire. One-third is under forest, and the remainder has a soil of very fertile black earth, which has the further advantage of being sufficiently watered. The climate, indeed, is very severe, the mean annual temperature ( $30^{\circ}$ to $34^{\circ}$ F.) being such as is found only in the north of Sweden and in Archangel; but the warm summer ( $65^{\circ}$ to $63^{\circ}$ in July) and the amount of light received from a bright sky combine to make vegetation develop with a rapidity quite unknown to western Europe. This region now bas a pepulation of more than 800,000 , almost all Russians (only 14,000 aborigines), so that it may he said to be more thoroughly Russian than the Volga provinces. The areaw under crops every year is $3 \frac{1}{3}$ million acres, and the region promises to become a regular granary fer Siberia and north-eastern Russia. The second portion of the southern plains, which might be called the Baraba region, being mostly occupied by the Baraba steppe, covers about $55,000^{\circ}$ square miles. Only its western borders belong to Tobolsk. It also is perfectly flat, and covered with recent deposits; but, as there is no definite slope, the surface waters move slowly, and accumulate into a very large number of lakes and marshes. The climate is moister and the summer still shorter and less bot than in the preceding region. Forests, consisting chiefly of birch, are spread in clusters over its surface. The soil of this region also is very productive, but the fertile patches are separated by marshy grounds, and the dense clouds of mosquitees which fioat over it in summer are a positive pague to beth man and beast. The population pumbers only 250,000 , also almost all Russians (ooly 4000 aberigines), and the area annually under crops is about $1,350,000$ acres. To the north of the regions just specified is that occupied by the administrative districts of Tura, Tobolsk, and Tara, with an area of about 110,000 square miles; this may be described as the taiga region. It is covered throughout with impenetrable forests and quivering inarshes-the dreadful urmans, which are penetrated by man only for some 20 to 50 miles around the widely separated settlements. Immense cedartrees, larches, firs, pines, birches, and maples grow very densely, and the underwood is so thick that a passage can be forced only with the aid of the batchet, the difficulties being further increased by the layers of decayed rood and by the marshes. To cross these, which are treacherously concealed under a swaying layer of grassy vegetation, a kind of snow-shoe must be used even in the summer, and many can be crossed only in winter. Immense arcas of the urmans, especially on the Vasyngan, bave never been visited by man ; but still, from time to time a Russian settlement arises in the forests, mostly founded by Nonconformists in hiding, who frecly receive all serts of fugitives. The south-western parts of this region are crossed by the Siberian highway, and to this circumstance
alone is it indebted for its population of nearly 450,000 ( 32,000 aborigines). Only 2 per cent. of this area is under culture. Farther north extend the tundras, where the average temperature rapidly decreases from the $25^{\circ} \mathrm{F}$. found in the preceding region to $15^{\circ}, 10^{\circ}$, and $7^{\circ}$. The frozen soil during the lettest part of the summer thaws only for a few inches beneath the surface. The frost sets in early, and a thick envelope of snow lowers the spring temperature. Forests cover the southern parts, but the trees become poorer, shorter, and thinner, and buddle into impenetrable thickets; while, farther north, only the creeping variety of birch and the dwarf varieties of willow hold their ground. Within the Arctic Circle the last traces of arboreal vegetation disappear, their northera limit being pushed south by the double bay of the Ob and the Taz and by the proximity of the Kara Sea.

Apart from the Urals, there are no traces of hard rock anywhere in Tobolsk. Down to its southern borders it is covered with Post-Pliocene deposits, which are met with as far as the waterparting between the Irtish and the Aral-Casplan depression. This range of flat hills rises a fem hundred feet a Tore the sea-lovel, and it aeems to mark the limit of extension of the Post-Glacial gulf of the Arctic Occan which covered western Tobolsk during tho Glacial period. Contrary to Humboldt's hypothesis, it remains, however, doubtful whether it was connected in Post-Glacial times with the Aral-Caspian Sea otherwise than by means of narrow straits, which disappcared at any rato at an early stage in that grological period.
The climate of Tobolsk is one of great extremes, the differences between the averages for the hottest and coldest months reaching as much as $70^{\circ} \mathrm{F}$. The average temperatures at Berezoff, Narym, Tobolsk, and Ishim respectively are $24^{\circ}, 28^{\circ}, 31^{\circ} 8$, and $32^{\circ}$ (January, $-8^{\circ} \cdot 3,-8^{\circ},-2^{\circ}$, and $-4^{\circ}$; July from $62^{\circ}$ to $67^{\circ}$ ). Only 194 days at Ishim and 153 at Borezoff have a temperatnre above $32^{\circ}$; and the Ob at Obdersk continues ice-bound for 219 daye (the Irtish 176 days at Tobolsk).
The government is watered by the Ob , which traverses it for more than 1300 miles, and is navigable throughonit. It receives many tributaries, seme of which are 200 to 350 miles long, but flow through quite uninhabited regions. The Irtish, a left-hand tributary of the Ob, covers all the southern part of Tobolsk with its numerons tributaries. It waters Tobolsk for 760 miles, and is navigable for the whole of its length; it receives the great Tobot, abont 420 miles long, also navigable, the lshim, and a number of less important streams; while the Tura, a tributary of the Tobot, is also a channel for navigation. The navigation lasts for nearly six monthe in the south. The first steamer on the Ob system was launched in 1845 and the second in 1860; since the latter date steam narigation has steadily devoloped.

Lakes, some of them salt, occur in great numbers on the waterparting between the Irtiah and the Aral-Caspian, and averywhere in South Tobolsk. Lake Tchany, the largest, covers 1265 square miles. All are being rapidly dried up, and even within the last hundred years they have nudergone great changes. Thus, in the group of lakes of Tchany, in the Baraba steppe, whole villages have arisen on gronnd that was under water in the earlier years of this century. ${ }^{1}$ Immense marshes cover Tobolsk beyond $57^{\circ} \mathrm{N}$. lat., - the Vasyingan marshes in the east, the Koudinsk and Berezovsk marslies in the west, both joining farther nerth the tundras of the Arctic ahorcs.
The pepulation reached $1,283,000$ in 1882 . Althongh recent immigrants, the Russians already constitute 94 per cent. of the aggregato population, and their numbers are ateadily increasing by inmigration, and partly also by the arrival of exiles. No, fewer than 43,750 immigrants from Russia sottlell at Tobolak betiveen 1846 and 1878, but of late this figure has greatly increased. In 1879 as many as 59,134 exiles were on the registers, but of these more than 20,000 had left their abodes and disappeared. As a rule the exiles belong to the poorest class of population. According to M. Yadrintseff, ${ }^{2}$ the native population of Tobolsk was represcnted in 1879 by 29,150 Tartars and 8730 other Turkish inhabit ants, chiefly in the sonth, 22,350 Ostiaks, chiefly on the Ob, 6920 Samoyeles in the north, and 6100 Voguls in the north-west; the tetal amennted to 74,220 , -that is, 6.1 per cont. of tho aggregate population ( $1,206,000$ in 1878). The Ostiaks (q.v.) are in a very misoroble condition, having come under heavy obligations to the Russian merchants, and being compeiled to haud over to thern nearly all the produco of their huatlag and fishing. Tho Tartar settlements in the sonth are prosperous, but not in the Tobolsk district, wbere their lands bove been appropristed for the Russiar
${ }^{\text { }}$ Ses Yodrintseff in Ierestia Russ. Geogr. Soc., 1880.
${ }^{2}$ Siberia us a Colcriy (Russian).
settlers. Of the Rnssians neally 85,000 are Nouconlormists, according to official figures, but the number is greatly narderstated. Many of the Samoyedes,-Ostiaks, and Voguls are nominaliy Christians. The Russians aud the Tartars, who chiefly inhabit South Tobolsk, mostly live by agriculture. Of the total area of land regarded as suitable for cultivation ( $28,400,000$ acres), $15,000,000$ are owned by the peasont communities. Summer wheat, rye, oats, barley, aod some buckwheat are raised. Flax and hemp and tobacco are cnltivated in the south, where rattle-breeding also is extensively carried on. The ravages of anthrax, however (see Murnain, vol. avii. p. 68), are very severe, especially in the marshy parts of the province. The indigenous iuhabitants of the north haul, ia the samo year, nore than 100,000 reindeer. Dogs are used in sledges in the far north. In the forest region the chief means of existence are found in the forests. The pursuit of bears, wolves, foxes, squirrels, ermines, stags, elks, as a!so of sables and beavers (rapidly disappearing), is a regular occupation with the Russiar peasants as well as with the indigenous inhabitauts: sledges aad cars, mats, sieves, wooden vessels, and pitch and tar are also manufactured to a coosiderable extent in the villages (ralued at about $£ 150,000$ ). Cedar-nuts (from 5000 to 8000 cwrts. every year) are gathered, partly for the sako of their oil. The fisherjes of the Ob aud the soutlicra lakes are important; no fewer than 1700 Ostiaks are eagaged in theat on the Ob . No less than $200,000 \mathrm{cw}$ ts of fish are annually canght in tho district of Tara aloce, aud Surgut exports it to the value of $£ 10,000$, whle in the Narym region $10,000 \mathrm{cwts}$. of salt are used for preserving the fish

The iudustries are iusignificant (chichy tanajag, distilliag, and tallow-melting); iroa-works and noollen-cloth mills are still in their infancy. The export of cattle, hides, tallow, corn, flour, fish, and furs to Russia, both from Tobolsk and from the Kirghiz steppe, is of some importance. Spirits are sent fartler east, to Tolosk; while all kinds of manufactured wares are imported from Russia. The fairs of Irbit aud Ishin are the chief centres for trade.

The educational institutions are few. It is worthy of remark that of "secondary achools" (gimnasia and pro-gymanasia) there were in 1883 eirght for girls, with 1065 scholars, and only four for boys, with 711 scholars; of primary schools there wese 250 , with 5844 boys and 1403 gids.

Tobelsk is divided into ten districts (ahrugs), the clief towns (with populations in 1883) being Tunolsk (20,130), Berezoff (1990), Ishim (7100), Kurgau (8570), Surgut (1460), Tara (8640), Turinsk (4650), Tyukatiusk (3000), Tyumeû ( 14,300 ), and Yalutororsk (4500). Of these tonns, ouls Tobolsk and Tyumeñ (g.v.) are really entitled to the desiguation, the others being nacre villages, of less importance than many others on the great Siberian highway which crosses the govermoeni from Tyumen to Todisk.
(P. A. K.)

TOBOLSK, capital of the above goveınment, is situated on the right bank of the Irtish, near its junction with the Tobot. It is 1535 miles from Moscow, and since the alteration of the course of the great Siberian highroad from Tyumeñ to Tomsk it has become an out-of-the-way place, and is no longer either capital of Western Siberia or even an admimistrative centre for exiles, as it was formerly. Viewed from the Irtish, the town has a picturesque aspect, with its kreml, or stone walls, built on a crag 200 feet high, its twenty-one churches, and several elegant buildings. The kreml, built under Peter I. by Swedish prisoners, in imitation of the kreml of Moscow, is 430 yards long by 200 yards in breadth, and contains two cathedrals erected towards the end of the 17th century. Tbe bell of Uglitch, which rang the alarm when the czarevitch Dmitri was assassinated by order of Boris Godunoff, and therefore had its "ear torn away," and was exiled to Siberia, stands close by. The palace of the governor, the administrative offices, the seminary where the historian of Siberia, Slovtsoff, reccived Lis education, the gymnasium where Mendelefff the chemist was trained, and the Marie school for girls, which now supplies Siberia with so many teachers, are in the upper part of the town, where broad grassy spaces separate the wide streets paved with thick planks. A monument to Yermak, the rebel Cossack who conquered Siberia, stands in a prominent place; and one of the sides of the large square on the crag is occupied by the immense prison, where more than 2000 exiles are gathered during the period of navigation. The löwer part of the town stands on a sandy beach of the Irtish, and of ten suffers from floods. Its sanitary condition is very bad. The merchants of Tobolsk carry on a fairly brisk
trade in coru from the south, salt from Semipalatinsk timber and nish from the lower Ob The population, is almost stationary ( 20,130 in 1883 , as against 15,500 is 1839 and 15,200 in 1772 ). Some 12 miles to the south east are the ruins of the "fort of Kutchum,"-the seat o the capital of Siburia, Isker, before the Russian conquest

Tobolsk was founded in 1587 by 500 Cossacks who left Tyumef noder Tchulkoff, and built a wooder fort at the month of the Old Tobol. During the noxt fifteen ycars sevcral other forts, were erected on the territory now occupicd by Tobolsk. - The Ostiaks and Sanoyedes soon submitted to Russian rule, but the Tartars and Bashkirs nade heequent raids, so that a line of forts had, to obe built in the 17 th century from Otenburg to Ishim, In 1752 a new line of forts was erected some 150 miles farthes sonth, and since that time Russian settlers have veen ah!e qquictlvato colonizes thy rost fertile parts to the south of Tobsisk

ToCQueville, 'Alexis Henry Chárles Chérex Comte de (1805-1859), was born at Verneuil ton 'July 29, 1805. His family on the fathers side twere of goor descent, and distinguished both in the lew and in arms while his mother was the grauddaughter of Malesherbee Alexis de Tocqueville was brought up for the bar, or, rather. according to the division of that proftssion in France, for the bench, and became an assistant nagistrate in 1830 . A year later he obtained from the Goverament of July a mission to examine prisons and penitentiaries in Anerica, and proceeded thither with his lifelong friend Gustave de Beaumont. He returned in somewhat less than two years, and prablished a report on the subject of bis mission, but the real result of hio tour was the famous De la Démocratio en A mérique, which appeared in 1835 , and very soon made his repatation. It was at once caught up by influential members of the Liberal party in England, which country Tocqueville soon after visited, and where he married an Englishwoman. Returning to France, and beginning life as a country gentleman at Tocqueville, be thought to carry out the English ideal completely by standing for the chamber of depnties. Dint, with a scruple which illustrated his character, he refused Government nomination from Molé, and was defeated. Later he was successful, and sat for several years both before and after the revolus tion of February, beconing in 1849 vice-uresident of the assembly, and for a few months minister of foreign affairs He was a warm supporter of the Roman expedition. but an equally warm opponent of Louis Napoleon, and after being one of the deputies who were arrested at the coulp détet he retired from public life. Twenty years" after his first, he produced another book, De l'Ancien Régime, which almost, if" not quite, equalled its success., His' health was never very strong, and in 1858 be broke a blood-vessel. He was ordered to the south, and, taking up his residence at Carncs, died there on the 16 th of April 1859. Ile bad published sowe minor pieces during his lifetime, and his complete works, including much unpublished correspondence, were produced after his death in uniform shape by De Beaumont.
During the last twenty years of his life, and for perhaps hall that time after bis death, Tocqueville had an increasing European fame, which for the last ten or fiftecu years has been stationary il not diminishing. Both phenomeaa are susceptible of cxplanation.' Although he lias been accused by some of his own countrymen of haviag "le stylo triste," hls manner, which is partly imitated from Montesquieu, has considerable charm; and be was the first and has remained the chief writer to put the orthedox liberal ideas which goremed European polities during the first half or twothirds of tbe 19th century into an orderly and attractive shape He was, mereover, as las been said, much taken , بp by influen, tial persons iu England,-Senior, Johu" Stuait Minl, and others, and he had the great advantage of writing absolutely the lirst book of reasoned palitics on the facts of democratic goveroment as observed in America. Besides all this he was, if not an entirely impartial $\begin{array}{r}\text { riter, neither a fanatical devotee of democracy nor a }\end{array}$ fanatical opponeat of it. All this gave bim a very great advaucago which be has oot yet wholly lost. At the sarue time he bad defeets which were certain to make themselves felt as time went on, even

Wathont the alteration of the centre of liberal opinnon which has taken place of late years. The chief of these rias a certain weakness which can hardly bo described in English by any word more dig. oified than the familiar term "priggishness." His correspondence with Mole above alluded to is an iostance of this, and it was also reflected on in various epigrams by conntrymen and contemporaries; one of these accuses him of having unluckily "begun to thiok before he had begun to learn," while another, with more real tban appareat inconsistency, declares that ho "avait l'air do saroir de toute éternité ce qu'il venait d'apprendre." His book on America, though andoubtedly a very remarkable piece of political deduction, has the drawback of proceeding on rery insufficient premisses and of trying to be too systematic. His book on the. Ancion Régime is also wanting in solid information, and commits the great crror of assuming rather than proving that the Revolution of 1789 was a procecd. ing of unmixed good, which deliyered France from a state (not of unmized evil, fur Tocqueville was too careful a student to imagine that, but) of eril exclusirely caused by the existence of monarchical and aristocratic institutions. In fact, the fault of both books is that their author is not a practical politician, a fault which is constantly illustrated and exhibited in his correspondence. Ic appears both in reading bistory and in conduccing actual political business (of which, as has been seen, he had some experieace) to have been constantly surprised and disgusted that men and uations did not bchare as he expected them to behave. This excess of the deductive spirit explains at once both the merits and the defects of his two great works, which will probably remain to some extent potitical classics, though they are less and less likely to be used as practical guides.

TODAS. Sce Nfleiri Hills, vol. xiii. p. 509.
TODLEBEN, or Totleben, Eduard Ivavovich (18181884), Russian general, was born at Mittau, in Courland, on May 20, 1818. His parents, who seem to have been of German descent, were of the mercantile class, and he himself was intended for commerce, but a strong instinct led him to scek the career of a military engineer. He entered the school of engineers at St Petersburg in 1835, and passed from that into the army in 1838. In 1847 and the two following years he was employed, as captain of engineers, in the carpaigns against Schamy! in the Caucasus, where he directed the siege operations against the principal mountain fortresser. $\mathrm{O}=$ the outbreak of war between Russia and the Porte in 1853, he was placed at the head of the staff of General Schilder-Scheldner, by whom Silistria was besieged. This general being wounded, Todleben acted in his place until the siege was raised. He was then transferred to the Crimea. Sebastopol, while strongly fortified toward the sea, was almost unprotected on the lard side. Todleben, though still only of colenel's rank, became the animating genius of the defence. By his advice the fleet was sunk, in order to blockade the mouth of the harbour, and the deficiency of fortifications on the land side was mado grood before the allies could take advantage of it. The construction of earthworks and redoubts was carried on with extreme rapidity, and to these was transferred, in great part, the artillery that had belonged to the fleet. In whatever direction the besiegers drew their lines, there Todleben met them with counterworks, until, with the arrival of heavy liussian reinforcements, the besiegers alnost became the besieged. It was in these improvised operations by means of earthworks that Todleben's peculiar power and originality showed itself; he was not a great military leader in the rider sense, nor was be the creator of a great permanent system of defence like Vauban. But for the special problems of Russian marfare, both in 1854 and at a later epoch, he was exactly the man wanted. Until June 1855 he conducted the operations of defeace et Sebastopel in person; he was then mounded in the foot, and at the operations which immediately preeeded the fall of the fortress he was not present. When he recovered from his wounds be was employed in strengthening the fortifeations at the mouth of tha Dniepor, and also those of Cronstadt. In 1856 he visited England, whero his merits mere well noderstocd. In 1860 he was appointed assistant to the grand-duke Nicholas, and he becamo
subsequently chief of the department of engineers. For reasons which aro not known he was given no command when war with Turkey began in 1877. It was not until tho disasters before Plevna had heaped discredit upon the incompetent leaders of the Russian army that the soldier of Sebastopol was called to the front. Todleben saw that Plevna could not be taken by assault, and that it would be necessary to reduce it by drawing works round Osman Pasha, and cutting him off froni communication with the other Turkish commanders. In due time Plevna fell. Todleben then nndertool: the siege of the Bulgarian fortresses. After the conclusion of preliminarics of peace, he was placed in command of the whole Rassian army, and becane responsible for the government and administration of the occupied districts. In the disclarge of these duties he is said to have distinguished himself by his combined firmness and good temper in dealing both with Turkish authorities and with the native population. IIe received the highest military honours and commands when the war was over, and became governor of Odessa. But his health was broken; and after much suffering he died at a German watering-place in June 18S4. He was buried with great solemnity at Sebastopol.

TODMORDEN, a raarket-town of England, partly in Lancashire but cliefly in the West Riding of Iorksiore, stands on the Calder, on the Rochdale Canal, and on tlie Lancashire and Yorkshire Railway, 13 miles west of Halifax, 9 eorth of Rochdale, and $207 \frac{1}{4}$ north-north-west of London. It lies in three ralleys amidst scenery originally romantic, and still in part retaining that characteristic. The townhall (1875) bridges the counties boundary, the Calder, enabling the magistrates to exercise jurisdict in in both counties Of the other buildings, the Unitarian church, the markethall, the freo endowed school, and the Unito. rian free school may be mentioned. A bronze statue has been erected to John Fielden, to whose energy in developing the cotton manufactore the town owes much of its prosperity. The staple industry is the spinning and wearing of cotton, and there are also foumdries and machineworks. The population of the township of Todmoruen and Walsden (area 7007 acres) in 1871 was 9353 , and in 1881 it was 9237 . In addition to this (situated wholy in Iorkshire), tho wrbau sanitary district includes parts of Langfield and Stansfield in Lorkshire, and of Cliviger in Lancashire, the total area boing 15,690 acres, with a population in 1871 of 21,764 , and in 1881 of 23,862 .

As early as the reign of Edward III. Todmorden was in the possession of the Radclices, a branch of the Radcliftes of Radclif? Tower, but it was sold by them about the close of tbe loth cestury. Toduorden Hall is an interesting old building of various dates.

TODY, Pennant's rendering (Gen. Birds, pp. 15, 61) through the French Todier of Brisson (Ornithologi, ir. p. 528) of the somewhat obscure Latin word Todus, ${ }^{1}$ not unhappily applied in 1756 by Patrick Browne (Civ. and Nat. Hist. Jamaica, p. $\operatorname{l}^{76}$ ) to a little bird remarkable for its slender legs and small feet, the "Green Sparrow " or

[^181]"Green Humming-Bird" of Sloane (Voyage, ii. p. 306). The name, having been taken up by Brisson (loc. cit.) in 1760, was adopted by Linnæus, and has since been recoguized by ornithologists as that of a valid genus, thongh many species have been referred to it which are now known to have no affinity to the type, the Torlus viridis of Jamaica, and accordingly have since been removed from it. The genus Todus was at one time placed among the Mfuscicupide (cf. Flycatcher, vol. ix. p. 351); but Dr Murie's investigations (Proc. Zool. Society, 1872, pp. 664-6S0, pl. lv.) have conclusively proved that it is not Passerine, and is nearly allied to the Momotidx (cf. Motmot, vol. xvii. p. 3) and Alcedinidæ '(cf. Kingeisuer, val. xiv. p. 81), though it should be regarded as forming a distinct Family Todidx, peculiar to the Greater Antilles, each of which islands has its own species, all of small size, the largest not exceeding four inches and a half in length.

Of the species already named, T. vividis, Mr Gosse (B. Jainaica, pp. 72-80) gives an iateresting account. "Always conspicuous from its bright grass-green coat aad crinson-vclvet gorget, it is atill a very tame bird; yet this secms rather the tameness of

Tody (Todus viridis). (After Gosse.)
Indifference than of confidence; it will allow a person to approach very near, aud, if disturbel, alight on another twig a few yards distant. . . . commonly it is seen sitting patiently on a twig, with the head drawn in, the beak pointing upwards, the loose plumage puffed out, when it appears much larger tinan it is. It certainly has an air of stupidity when thus seen. Bnt this abstraction is more apparent than feal; if we watch it, we shall see that the oddlooking grey eyes are glancing hither and thither, and that ever and anon the bird sallies out upon a short feeble flight, snaps at something in the air, and returns to his twig to swallow it." Mr Gosso goes on to describe the elgaging habits of oae that he for a short time kept iu caplivity, which, when turned into a room, immediately began ratching oll the insects it could, at the rate of about one a minute. Tho birds of this Fanily also shew their affinity to the Kingfishers, Motmots, and Bee-eaters by burrowing holes in the ground ${ }^{1}$ in which to make their nest, and therein laying eggs mith a white translucent shell. The sexes differ littlo in plunage.

All the four species of Todus, as now restricted, present a general similarity of appearance, and, it may be presumed, possess very similar habits. The genus has been monographed by Mr Sharpe (Ibis, 1874, pp. 344-355) ; but he was unfortunately misled by an exceptionally bright-

[^182]coloured specinen to add a fifth and bad spectes to those that exist-and even these, by some ornithologists, migit be regarded as geographical races. The Cnban form is T. mullicolor; that of Hispaniola is T. subulatus or dominicensis; and that of Porto Rico, originally named in error T. wexicanus, has since been called hypochondriacus. Apart from their structural peculiarities; one of the chief points of interest attaching to the Todidx is their limitation, not only to the Antillean Sub-region, but, as is now believed, to its greater islands.
(A. N.)

TOGA. See Costume, vol. vi. p. 456.
TOCO-LAND, one of the portions of the African continent uuder the protection of the German empire. It forms part of the territory on the west coast formerly distinguished as the Slave Coast, and is bounded on the E. by Little Popo, on the S.W. by the British Gold Coast Colony, and on the N.W. by the still independent territory of the Anlo tribes. The coast-line is only 22 miles in length, and with an area of about 500 square miles Togo-land is estimated to have a population of 40,000 souls. The great physical fcature of the country is the Togo, Hakko, or Avon lagoon, which is* cut off from the ocean by the narrow belt of sandy soil on which are situated Bagida, Porto Seguro, and Bay. The town of Togo lies on the east side of the Togo lagoon, where it extends eastward to Little Popo Lake. The lagoon is fed by a stream from the north, the Haho or Hakko, first discovered by John Duncan in 1846.
See Hugo Zoller, Togoland ; Petermann's Mittheilungen (1886); and Scull. Geogr. Mag. (1886), all of which give maps.

TOKAT, a decayed provincial town of Turkey, in the vilayet of Sivas, and capital of the upper basin of the Iris (Yeschil Irnak), is a poorly-built place of abont 10,000 inhabitants, in a hot, narrow valley, dominated by the ruins of a Byzantine castle, and surrounded by gardens watered by the Iris. It was once an important commercial station, and has still copper foundries. Six miles np the valley are the ruins of the Pontic Comana (q.v.).
TOKAY, or Tokaj, a small town in the county of Zemplén, in the morth-east of Hungary, at the influx of the Bodrog into the Tisza, in $48^{\circ} 7^{\prime} \mathrm{N}$. lat., $21^{\circ} 4^{\prime} \mathrm{E}$. long. The slopes of the adjacent mountains of Hegyallya, which are of volcanic origin, produce excelient wine, several kinds of which are of perhaps the best, sweetest, and strongest quality in the world. Of these, however, none or hardly any come into the market, the wine usuali,y sold under the name of Tokay not being a natural wine, and often not coming from the district at all. Tokay, along with abont twenty-five neighbouring villages, pioduces annually an average of $2,200,000$ gallons. The vine culture has been greatly improved of late years by a company in Budapest. The timber trade, fishing, and export of frnits are also considerable. The population was 4479 in 1880.

TOKIO, formerly called Yedo, the present capital of the empire of Japan, is situated in $35^{\circ} 41^{\prime} \mathrm{N}$. lat. and $139^{\circ \circ} 46^{\prime} \mathrm{E}$. long., at the head of the bay of the same name, on the sonth-east coast of Hondo (mainland), the largest of the group of Japanese islands. It is convected with the seaport of Yokohama by a railway 18 miles in length. The bay of Tokio is shallow, and therefore not well suited for the navigation of large vessels. The wide river Sumida, also called Ôkawa ("great river") near its mouth, runs through the town. For administrative purposes Tokio proper is divided into fifteen $k u$ (districts), of which thirteen lie to tie west and two to the east of the Sumida. Each ku is presided over by an official appointed by the Government, called the ku-chio (chief of the ku), and an assembly (Ku-Kwai) for local administrative purposes is elected every four years by the inhabitants. These ku and
six gun (suburban districts) collectively form the Tokio-Fu, and are under the general superintendence of the fu-chiji (governor). Matters affecting the interests of the whole fu are discussed by an assembly (Fu-Kwai) composed of representatives from all the ku and gun. Order is maintained by a well-organized body of police ( 3648 men in 1885) under the command of a keishisokan (chief commissioner), who, like the fu-chiji, is responsible to the central Government. Since the establishment of this system crime has very materially decreased. There is also a fire brigade of 2000 men, which is connected with the police system, and renders effective service in checking the spread of the fircs to which the town is peculiarly liable. Buildings of brick and stone have lately been erected in many parts of the town. The fifteen ku which form Tokio proper cover an area of 4.01 square ri, and the six gun 27.94 square ri, the whole fu thus extending to about 32 square ri (about 190 square miles). The greater part of the town is flat, particularly near the Sumida, and is intersected by numerous moats and canals, which, with the bridges crossing thern, form a distinctive feature. There are hills varying in height from 50 to 100 feet in the six districts of

Environs of Tokio.
Hongo, Koishikawa, Ushigome, Yotsuya, Akasaka, Azabu, and in part of Shiba. The numcrous residences of the old daimios were the chief characteristics of the town, especially in the Kôjimachi-ku. Many of these have been demolished and Government offices erected on their sites; some have given place to new streets and houses; others, having survived the downfall of the shogunate, still remain surrounded by large gardens, which are celebrated for their elaborate rock-work, artificial lakes, and magnificent trees. Nearly in the centre of the Kôjimachi-ku, on an eminence, surrounded by moats, stood the residence of the shoguns, which was burnt down in 1872. An imperial palace is now in course of construction on this site. Outer moats connected with those already mentioned enclose the whole Kôjimachi-ku and a greater portion of Kanda-ku; one of the moats terminates at the Sumida. The Nihonbashi, Kiobashi, and Kanda-ku, through which the O-dori (main street) passes, are the business quarters of the town. The Nihoubashi (Bridge of Japan), in the ku of the same name, also in the O-dori, is the centre from which all distances are calculated. Nearly all the. principal buildings of the city-such as the Gwaimusho (Foreign Office), the Naimushô (Home Office), the Ōkurashô (Ministry of Fınance), the Monbushỗ (Ministry of Education), and other Government offices, dc.-are situated in those four ku. Among the parks, those of Shiba and Uyeno rank first in size and beauty, the latter containing a large sheet of water. In

1868, when the imperial army entered the city, a body of men called the shogitai, loyal to the cause of Tokugawa, here made a last stand, and during the fighting the magnificent temple of Tôyesau, on the hills of Uyeno, was burnt down. This park, as also the Mukojima (the enlbankment of the Sumida), and the Asukayama park, which is at some distance north-west of Uyeno, are celebrated for their sakura trees (species of cherry), which, when in full bloom, attract crowds of all classes. The famous temple of Kwannon (goddess of mercy) is in the Asakusa park, in which a continual fair is held, with the usual accompaniments of booths, shows, tea-houses, \&c. The districts of Fukagawa and Honjo lie on the east bank of the river, and are connected with the rest of the town by five wocden bridges of considerable length; they are intersected by aumerous canals, and the streets there are regularly laid cut. The means of communication are imperfect; the streets of Tokio are in general irregular, and many are so narrow that they are unsuitable for carriages. The jinrikisha, a kind of chaise drawn by one or in some cases by two or more men, supplies their place to a great extent.' The introduction of tramways in some parts of the town has had the good effect of diminishing the number of second-rate carriages drawn by miserable horses.

There are no reliable data as to the population of Yedo during the shegunate (see below). Owing to the influx caused by the periodical visits of the daimios with their numerons attendants, it probably exceeded one millica during the early part of the present century. At the abolition of the skogunate there was a marked decrease, but the returns of recent years ( $1,121,500$ in 1881; $1,173,603$ in $1883 ; 1,300,073$ in 1885) indicate a rapid increase. Of the $1,519,781$ who constituted the population in 1886, 1,211,357 are to be classed as belonging to the town proper, and $308,42 t$ to the six suburban districts. The sanitary condition of the city leaves much to be desired, but extensive improvements are now being carried out. The general health, however, is good, and the enforcement of vaccination has virtually stamped out the scourge of small-pox. The deaths from cholera are occasionally very numerous, especially among the lower classes.
A well-organized system of education exists, under the supervision of the ministry of education. In 1885 there were in the Tok: Fu 658 public and private elementary schools, with 1503 teachcrs, - the cost of maintaining public schools being 145,152 yen (Japanese dollars). In the same year the boys and girls of school age numbered 172,653, of whom 77,001 attended schools recognized by the Government. Kindergartens on the European system have been introduced. There are also the shihangakko (normal schools), the chugakko (middle schools), and schools, both Government and private, for special branches In the district of Hongo is the imperial university, sub disided into the four branches of law, science, medicine and literature. Many of the students attain a high degree of proficiency.
No mention is made of Tokio in Japanese history before the end of the 12 th century. It appears to have assumed no importance till about 1457, when Ota Dokwan, a general in the acrvice of Uyesugi Sadamasa, governor of Kanakura, built a castlo there. About thirty years later the town fell into tho hads of Ilojo of Odawara, and snbsequeotly, on his overthrow by Hideyoabi aod Iyeyasu, the enstle was granted to the latter, wbo was the founder of the shogun house of Tokugawa. In 1590 Iyeyasu made his tormal eotry into the castle of Yedo, the extent of which he greally enlarged. From this dato tho real importa neo of Yedo commenced. The family of the Tokugawas furnisbed tho ahoguns (or tycoons) of Japau for nearly three hundred years, and these resided during that period at Yedo. Under then the town was vastly extended, land was reclaimed from the hay, canals were constructed, and a water auply introduced. The shoguns compelled the daimios (feudal loris) 10 reside at Yedo with their numerous retinues dur.
ing a constderable portion of thelr lives, and thas the prosperity of the town rapidly iucreased. At the restoration of the supreme authority of the emperor in 1868 the shogunate was abolished, and the population of Ycdo speedily decreased. A fresh vitality was again imparted by the transfer of the court from Eioto, and the town then received its prosent name Tokio (eastern capital). It las since been the seat of the imperial Government, and may be considered the centre of the political, commercial, and literary activity of Japan. It is the channel through which the stream of European cirilization pours into the country, and all recont progress has there taken its rise.
(R. S. L.)

TOLAND, Joan (1670-1722), or Janus Junius, as his sponsors are said to have named him, usually described as a chief leader of the English deists, was born November 30,1670 or 1671 , in the north of Ireland, near Londonderry. He was the son, perbaps illegitimate, of Catholic parents, and was brought up in their faith. But in his fifteenth year he became a zealous Protestant, and in 1687 he passed from the school at Redcastle to Glasgow university, recommended by the magistrates of Redcastle "for his affection to the Protestant religion." Thus early in life he became "accustomed to exarnination and inquiry, and was taught not to captivate his understanding to any man or society." After three years at Glasgow he entered the university of Edinburgh, taking his M.A. degree there June 30, 1690. He then spent a short time in some Protestant families in England, and with their assistance went to Leyden university, to qualify him for entering the Dissenting ministry. He spent about two years in Leyden, studying ecclesiastical kistory especially under the famous scholar Frederick Spanheim. At the expiration of that time he took up his abode, January 7, 1694, at Oxford, having good introductions to Creech, Mill, and others. Here he made large use of the Bodleian Library, and soon acquired the reputation of being "a man of fine parts, of great learning, and of little religion," though there is no svidence to show that the last distinction was justly his due. His letters show that he then claimed to be a decided Christian, and that he was too orthodox to be classed with the Arians or the Socinians. At the same time the characteristic freedom and originality of his mind were displayed by his anticipation of subsequent doubts of the integrity of the book of Job, and the separation of the historical prologue and the speeches of Elibu from the original poem. While at Oxford he commenced the book which called him into notoriety, and became one of the standard "deistical writings"-his Christianity not Mysterious. ${ }^{1}$ The book gave great offence, and several replies to it were immediately published. The author was prosecuted by the grand jury of Middlesex the year of its publication; and, when he attempted to settle in Dublin it the beginning of 1697, he was greeted with dangerous denunciations from the pulpits and elsewhere. He was soon prosecuted before the court of King's Bench, and on September 9th his book was condemned by the Irish parliament to be burned and its author to be arrested. He escaped the latter part of the sentence by flight to England. The title and the philosophical principtes of Toland's book were singularly akin to those of Locke's famous work, The Reasonableness of Christianity, published the year before; and Locke's opponents seized the opportunity of fathering upon the philosopher the doctrines of his more heterodox and less guarded disciple. Thus Toland's work became the occasion of the celebrated controversy between Stillingfleet and Locke, in which Locke takes pains to show the difference between his position and Tolund's. Toland's next work of importance was

[^183]his Life of Milton (1698), in which, jn connexion with his exposure of the fictitious authorship of the Eikon Basilike, he found occasion to make reflexions on "the numerous supposititious pieces under the name of Christ and Eis apostles and other great persons." This provoked the charge that he had called in question the genuinencss of the New Testament writings, and he replied in his Amyntor, or a Defence of MIilton's Life (1699), to which he added a remarkable list of what are now called apocryphal New Testament writings. In his remarks he really opened up the great question of the history of the canon, towards the examination of which Stephen Nye, Jeremiah Jones, and Nathanael Lardner made in reply to him the first valuable contributions. The next year his Amyntor and Christianity not Mysterious were under discussion in both Houses of Convocation, and the Upper House declined to proceed against the author. In 1701 Toland spent a few weeks at Hanover as secretary to the embassy of the earl of Macclesfield, and was received with favour by the electress Sophia in acknowledgment of his book Anglia Libera, a defence of the Hanoverian succession. On his return from the Continent he published a defence of himself, and of the bishops for not prosecuting him, Vindicius Liberius (1702), and several political pamphlets. The next jear he visited Hanover and Berlin, and was again graciously received by the electress and her daughter Sophia Charlotte, queen of Prussia. On his return to England (1704) he published Letters to Serena, and afterwards acknowledged that the queen of Prussia was intended by the pseudonym. In these letters he anticipated some of the speculations of modern materialism. The next year appeared his Account of Prussia and Hanover, of which Carlyle has made use in his Life of Frederick the Great. From 1707 to 1710 he is again on the Continent,-at Berlin, Hanover, Düsseldorf, Vienna, Prague, and The Hague, with very varying fortunes, but generally of an adverse character. In 1709 he published Adeisidæmon and Origines Judaica (The Hague), in which, amongst other things, he maintained that the Jews were originally Egyptians, and that the true Mosaic institutions perished with Moses. This work provoked a number of replies from Continental theologians. In 1710 he returned to England, living chiefly in London and latterly at Putney, loving the country and his books, and subsisting precariously upon the earnings of his pen and the benevolence of his patrons. His literary projects were numerous (see the incomplete list in Mosheim); and the nobler traits of his warm Irish nature appear in his projected history of the ancient Celtic religion and his chivalrous advocacy of the naturalization of the Jews. The last of his theological works were Nazarenus, or Jewish, Gentile, and Mahometan Christianity (1718), and Tetradymus (1720), a collection of essays on various subjects, in the first of which, "Hodegus," he set the example subsequently followed by Reimarus and the rationalistic school in Germany, of interpreting the Old Testament miracles by the naturalistic method, maintaining, for instance, that the pillar of cloud and of fire of Exodus was a transported signal-fire. His last and most offensive book was his Pantheisticon (Cosmopoli, 1720). He died May 11,1722 , as he had lived, in great poverty, in the midst of his books, with his pen in his band, and left behind him a characteristic Latin epitaph, in which he could justly claim to have been "veritatis propugnator, libertatis assertor."
Toland is generally classed with the deists, but at the time when he wrote his first book, Christianity not' Mysterious, he was decidedly opposed to deism, nor does Leland deal with that work as an exposition of deistical vicws. The design of the work was to show, by an appeal mainly to the tribunal of Scripture, that there are no facts or doctrines of the "gospel," or "the Scriptures," or "Chiistian ravelation" which, when revealad, are not perfect) 5
plain, intellipiblo, and reasonable, beiug neither contrary to reason nor incomprelicnsible to it. The work undoubtedly ained a blow at some of tho dogmas of later Christiau timos, but it claimed to be "a viudication of God's revcaled will agaiust the most unjust imputations" which occasioned "so mauy deists avd athcists." Tolanl's line of argument is to show that tho aupposition of the doctrines of the gospel being repugnant to clear and distinct ideas and common notions leada into absurdities and nevitabla acepticisu; that the proof of tha Divinity of Scripture is its self. evideacing power; that, though mon are depedent on Divive revelation for tho kuowledige of tho most ialjortaut truths, tho truths nust themselves bo plam and intelligible when revealed; that all tho doctrines, precepts, and miracles of tho New Testanneut aro perfectly minlligible aud plain; that, thongh reason is dis. ordered in tha caso of many bien, the disorder is not in the faculty itself but in the use made of it; that in the New T'estament "myatery" never means anything inconccivable in itself, but things naturally intelligible enough, which aro gither so reiled by figurativo words or rites, or so lolged in God's aole knowledge and decres, that they comld not bo discorned without apecial rovelation; that no muracle of the gosjel is contrary to reason, for they were all prodnced according to the lawa of nature, though above its ordinary operations, which were therefoco supernaturally assisted; that mysteries were first introluced into Cliristianity by the early admission into the clurch of Levitical ceremonics ant heathen rites and mysteries, and especially by mixing up heathen philoBophy with the simpla religion of Christ. Tho work wos inteuded to be the first of three discourses, in the second of which ho was to attempt a particular aml rational oxplamation of tho roputed Dussteries of the gospel, and in the third a demonstration of the vority of Divino revelafion against atheista and all cuenics of re. vealed religion. But, like so mauy other of his numerons projects, this failed of execution. After lis Christianity not Mysterious and lis Amyntor, Toladd'a N゙azarcnus was of chicf importance, as calling attention to tho right of tho Ebionites to a placo in the early church, thongh it altogether failed to establish his mann argument or to put tha question in the true light. His Pautheisticon, sive Formula celcbranda Sodalitatis Socratice, of which he priated a felv copies for private circulation only, gave great offence as a aort of liturgic service made up of passoges from heathen authors, in imitation of the Church of Enchland liturgy. The titla also was in thoso days alarming, and still 100 ore 80 the myatery which tha author threw rouud the question how far auch societics of mantheists actually existed. Poor Toland had bern outlawed by tha churches of his day, and took a most imprudent Ilelight in alarming and mystifying his persecutors. Thas and all his later thorks must bo read from the point of vicw first suggested by Herder: "Who call refuse to seo iu Toland the man of wisle readiug and of clear jutellect, and the earvest inquirer, although, as embittered by persecutiona, with every fresh book ho dipped his pen in a moro bitiog acid?

TOLEDO, a province of Spain, in New Castile, is bounded on the N. by Avila sad Madrid, on the E. by Cuenca, on the S. by Cindad Real, and on tho W. by Cácercs, and has on area of 5020 squaro miles. The surface is throughout lofty, and in a great part of its extent mountainous. Towards the centre, indecd, there are oxtensive plains or tablelands, but the whele of the soutb and cast is occupied by the Montes de Toledo, which separate the waters of the Tragus on the north from those of the Guadians on the south. These mountains are of no great height; and they wero once densely envered with forests, which have now bcon almost entirely cut down, although there are still woods and groves of considerable extent on their lower slopes. Branches of this chain enclose the province on the east and west, and part of the rango that stretches north of the Tagus approaches its north-western frontier. Toledo is well watered by the Tagus and its affucnts, - the Tajuna, Jarama, Guadarrama, Alberche, and Tietar on the north, and the Algodor, Torcon, Pusa, Sangrera, and Cedron on the south Tha

Guadiana forms for a short distance the south-western frontier, and its tributary the Giguela waters the eastern part of the province. The country is rich in minerals, as yet almust entirely onworked, containing veins of gold, silver, lead, iron, quicksilver, copper, and tin. Coal, alum, cinnabar, \&c., are also found. The soil produces corn, pulse, potatoes, oil, wine, flax, oranges, lemons, chestauts, and melons in fair abundance, but the trade in agricultural products is alınost confined to the province itself. The number of sheep and goats is few, of horses and mules still less; while the ouly oxen aro those uscd in agriculture. Bees and silkworms aro kept in considerable number. Manufactures once flourished, but are now in a very low state,-silk and woollen cloth, earthenware, soap, oil, chocolates, wine, rough spirit (aguarcliente), guitar stringe, and arms being almost tho only articles made. The province is traversed by three lines of railway, that of Madrid Seville.Cadiz in the east, Madrid-ToledoCiudad Fieal through the centre, and Madrid-CáceresLisbon in the north. There are 12 partidos judicisles and 206 ayuntamientos, and threo scnators with cight deputies are returned to the cortes. The total population in 1885 was 332,000 ; tho only towns with a population exceeding 10,000 are Toledu ( 20,251 ) and Talavera de la Reina (1],986). Somo of tho most brillisat fighting of the Peninsular War took place in Toledo and the neigh bouring province of Cáceres, tho battle of Talavera de la Reina being fought on the 27 th and 28 th of July 1809.

TOLEDO, the capital of tho above province, and once of the whole of Spain, stands upon a circle of seven hills, 2400 feet above the sea, and waslicd on threo sides bv the Tagus. It is 37 miles west-south-west of Madrid. The river is spanned by two fine stono bridges,-the Aleíntara, a Moorish bridge of a eingle arch, giving entrance to the city from the east, and the other, that of San Martin, from tho west, whlle between them the river makes a sweep southwards. The place is enclosed on the land side by two walls, still in fairly perfect condition,-the inner one being built by King Wamba in the 7 th century, the outer by Alfonso VI, in 1109. The gates ere numierous and well preserved, the most noteworthy being the fanous l'uerta del Sol, the Puerta Visagra, and the Cambron. Somo Roman remains (a circus, \&c.) lic without the walls, on the plain to the north-west. The apjearance of Toledo from a distance is imposing in the extreme, from its noble situation and tlie terraced lines of its buildings; but upon a nearer spprosch it reveals itself as dull and decayed enoogh, witb little or no traffic in the streets, and a strange silence broading over all its ways. The houses are large, massive, and gloomy, generally Moorish in style, of the 12 th, 13 th, and 14 th centuries, with a great contral patio (courtyard), and yiclding abundant traces of Arabic decoration. The principal poblic square is the Zocodover. It forms the favourito promenade, and from it the one fairly wide street of the city leads to the cathedral. The latter is the glory of Toledo, and one of the finest monuments of art in Spain. Built upon the site of an aneicnt mosque, and comeneaced in 1227, it was completed in 1492; and, though sacked over snd over again,-finally lyy the French under La Houssaye in 1808,-it is atill, with the exception, perhaps, of the cathedral of Soville, the riehest and most megnificeat foundation in the Peniusula. The cxterior is unfortunately hiddca to a great extent by mean surrounding buildings, bat the fane western façade, with its two towers, one rising 325 feet, is cifective. Tho interior is somewhat dwarfed in 风]pearanec by the immense width. It is 404 fect long by 204 Scet broad, and is divided by 84 pillars into five naves, with contral lentern and choir, and a completo ecrics of side chapels. Most of these latter are lato additions, of the 15 tb and $16 t \mathrm{~b}$
senturies, and are very magnificent in dotail. The 16thsentury stained-glass windows, chiefly of Flemish work, are superb; and the treasury, reliquaries, and library, notwithstanding their repeated despoilings, are not unworthy of the ses which atyles itself the "first of all the Spains." In the Muzarabic chapel the ritual known by that name is still performed daily. Within the precincts of the cathedral are interred the archbishops and cardinals Tenorio, Fonseca, Mendoza, Ximenez, the great constable Alvaro de Luna, and a long array of kings and heroes. The archbishop is primate of Spain, and has for suffragans Coria, Cuenca, Siguenza, and Palencia. Besides the cathedral Toledo still possesses a great number of fins churches and other religious buildings, together with numerous Moorish and Jowish monuments. The most important church is the 15th-century florid Gothic San Juan de los Reyes, bnilt by Ferdinand and Isabella. The best Moorish work is to be found in the old Jewish synagogues of Santa Maria la Blanca and El Tránsito, in the mosques of Cristo de la Luz and Las Tornorias, in some private houses, and in the later churches of San Roman, Santo Tomé, Saatiago, and Santa Leocadia. The patio and staircase of the hospital of Santa Cruz present same of the finest Renaissance work extant. Seen from afar, the Alcazar, or royal palace, is one of the most conspicuous features of the city. It stands upon a commanding position overlooking tho Tagus, and was originally built by King Wamba, but has been repeatedly altered and pulled about. It was almost entirely rebuilt by Charles V. and Philip II., under the architects Covarrubias and Herrera, and has lately been converted into a huge military academy. The city is provided with numerous elementary achools, a public library, museum, town-ball, and several large hospitals. The woll-known manufactory of ewords is about a mils to the north-west, beyond the Cambron gate. It is in excellent order, and produces blades as parfect aa over, but is no longer of great importance, employing only about 120 bands.

Toledo existed in the time of the Romans, who conquered it In 193 b.C. They etrengthened the fortifications, and built an aqueduct to eupply the place with water. By the Goths, who captured the city in 467 A.D., these works wera kept up and improved ; and, under the Moorish domination, from 714 to 1085 , Toledo was eecond only to Cordova in rank and importance, with a population of 200,000 eouls. Alfonso V1. of Castile and Leon recovered the stronghold in 1085; and under him and his auccessors it continued to flourish until the permanent establishment of the court at Madrid gave a deathblow to ita prosperity. The population now is no more than 20,000 .

TOLEDO, a city of the United States, the county aeat of Lucas county, Ohio, is situated in $41^{\circ} 40^{\prime} \mathrm{N}$. lat. and $83^{\circ} 33^{\prime}$ W. long., chiefly upon a peninsula batween the Naumee on the south and the Ottawa upon the north, just above their points of discharge into Maumee Bay, and 5 miles from Laks Eris. A small part of it, formerly known as Maumee City, lies south on the Maumee. Toledo includes an area of 21.5 square miles within its corporate limits. The bay and river form arr-excellent harbour and roadstead. The harbour is easily made and is well sheltered, and the bottom affords good holding ground. Besides being open to the navigation of the Great Lakes, Toledo is the terminus of the Miami and Eris Canal, convecting it with Cincinnati (184 milea distant). Seventeen railroad lines enter it, making it one of the principal railroad centres of the country. The site of Toledo and the surrounding country are very level, and only slightly elevated abovo Lako Erie. The soil is very productive, and is highly cultivated, being largely devoted to market gardening. There are three public parka, having a total area of 41 acres. The city is well sewered. Water is obtained by pumping. The city, which is divided into eight rards, had in 1880 a population of

50,137. The number is probably now (1887) not tar from 65,000 . In $1840,1850,1860$, and 1870 respectively the population was returned at $1224,3829,13,768$, and 31,584 .
Besides its largo commercial interests, as one of the principal ports upon the Great Lakes, and its importance as on of the leading railrosd centres of the country, Toledo kolds high rank as a menufacturing city. The capital invested in thie class of industries in I880 excceded $\$ 5,500,000$, and the producte were valued at double this sum. They employed nearly 7000 persons, and paid in wages over two and a quarter millions of dollers. These industries are very varied in cbaracter, but consist largely in lumber menufactures, brewing, and iron and steel manufactures.

The first settlement witbio what are now the corporate linits of Toledo was made, ebortly after the war of 1812, upon the south bank of the Moumee. North of the river no eettlements were attempted until 1832, when the villages of Port Lawrence and Vistufa were cornmenced in what is now the heart of the city. In the following year they were united under the present name. The city was incorporated in 1837. In 1852 it was made the conuty eeat, and in 1874 its corporate limits were considerahly enlarged.

TOLL is a aum of money paid for the use and enjoy. ment of a privilege. In Eagland it ia now always or almost always a sum of money; but formerly tolls in kind were not unknown. An instance is afforded by the Act of 36 Geo. III. c. 85 , substituting a money payment for tolls of conn in kind taken by millers, with an exception in favour of tolls taken by custom in aoke mills. Such customary tolls, if any such now exist, are apparently the only examples remaining of tolls in kind. The Weights and Measures Act, 1878 , enacts that all tolls are to be charged and collected according to imperial weights and measures.
The word toll, in its earliest use, appears to have signified a franchise enjoged by lords of manors, and is defined by Glanvill as the liberty of buying and selling in one'e own land: "tol, guod nos vocamus theloneum, acilicet libertatem emendi ot vendendi io terra sua." The word then becsme used to denote duties payable to the crown, especially oo wool, generally with an inseparable epithet indicative of unpopularity. It thus took the form of "maletote" or "malum tolnetrm," against which many early atatutes were directed, from the Magna Carta of John till the final abandonment of the duty by F.dward JIl. In modern English law toll is either en incident of a Franchise (q.v.), as of a market or fair, or is independent of franchise. In tha latter cass it is claimod by prescription, as toll traverse or toll thorough, or is created by Act of Parliament, as in the case of turapikes, railwaye, harboure, navigable rivers, and canels. Toll traverse is paid for passing over a private way, bridge, or ferry. No consideration need be proved. Toll thorough is paid for the use of a highway. In this case, if charged by a privata person, some consideration, euch as repair of the highway, must le shown, as such a toll is against common right. Io one case, that of the Cornish custom of tin-bounding, the right to tin tolls may depend upon custom. At common law a toll must be reasonable. The same principle appears in various Acts of Parliament. The Statute of Westminster tha First, 3 Edw. I. c. 31, inflicts a penalty for taking excessive toll. The Railway Clauses Consolidation Act, 1845, and most apecial Acte of railway companies provide, by what are known as "the Shaftesbury cleuses," for the equality of tolls, that is, that all persons and classes of goods ehall under like circumstances be treated alike as to charges. A right of distress is iacident to the right to impose tolls, but the distress cannot be sold unless an Act of Parlisment expressly authorizes the sale. Tolls are rateable for the relief of the noor where they are appurtenant to land, but not where they are extrinsic profits not arising from the possession of land. Exemption from tolls may be claimed by the prerogative, by grant or prescription, or by Act of Parliament. The king pays no toll, and may grant to another exemption from toll. The exemptions by Act of Parliament mainly affect persons in the public service, clergy on their parochial duty, and persons going to or returning from their usual place of religious worship. Most of the exceptions from turnpike tolls will be fonud io 3 Geo. IV. c. 126. Turnpike tolls, bridge money, and causeway mail were abolighed ia Scotland by the Roods and Bridges Act, 1878, as from the 1st June 1883. In England there hes been no such general abolition, but the abolition of tolls hes been facilitated by eeveral recent Turnpike Acta, and their entire diaspearace is only a question of time.
Ia the United States tolls are a subject for Stato legislation,
${ }^{1}$ The aame term was known in mediæval Italy. Dante, in Inferno, xi. 36, alludes to "tolletta dannose."
excent in a few instances in which Acts of Congress have dealt with tolls in rivers and harhoms (sce Fevised Statutes, tit. Ixili.).
Tho question of tells was at one time an impertant one in international law. Tolls were cxacted on ccrtain straits and tidal rivers by virtue of the sovereignty of a particular state. Such tolls have mostly ceased or been redeemed. Notable iustances were tho Scheldt tolls and the Sound duea levied by Denmark. See Navigation Laws.

TOLUCA, or Toloccan, a city of Mexico, the capital of the state of Mexico, on the Mexican National Railway, 45 miles sonth-west from the federal capital. It lies on the west side of the Anahuac tablcland, at the foot of Mount San Miguel de Tutncuitlalpillo, at an elevation of 8653 feet above the sea, being the highest town in the republic next to the mining station of Ameca-meca (which is 8800 feet). Tolnca bad in 1886 a population of about 12,000 , and is usually described as a well-built flourishing town, with fine buildings and clean well-drained streets. Lut T. M. Brocklehurst, who visited it in 1880 , gives an unfavourable impression of the place, which presented nothing attractive beyond the Portales, a fine arcade running round a large block of central buildings, with a number of good shops under the arches (Mexico To-day, p. 222). There is also a good theatre, and in the Plaza de los Martires a. well executed white marble monument to the patriot Miguel Hidalgo y Costilla. Bnt the Carmen, Vera Cruz, and one or two other churches are dirty and tawdry, without presenting any striking architectnral features. The oity is traversed by a foul stream flowing at the bottom of a barranca or deep ravine, along whose banks are herded numerous swine in a half-wild state, which supply the hams and sausages for which the place is noted. Here also soap and wax candles are manufactured and supplied to the surronnding districts. In tho south-west the Nevado de Tolnca, an extinct snow-clad volcano with a flooded crater, rises to a lueight of 15,156 feet above sea-lovel.

Although Toluca appears to have been one of the earlicat Toltec gettlements in Analuac, its foundation dsting probably from the 6th centnry, it has preserved no remains of its ancient grandene, nor have any monuments been discovered in the district in any wny comprable to those of Cholula, Tula, Tcotihuacan, and other ancient centres of Toltce culture. According to M. Charnay, Toluca formed one of the chief starting points of the great migrations which, after the overthrow of the Toltec empiro by the Chichimec irruption in the litlicentury, moved in two parallel streams sonthwards, converging at Copan and spreading their arts and industries over Chiapas, Yucatan, and Guatemala (Ancicnt Citics of the Ncuo World, 1887, p. 125).

TOMATO. See Horticulture, vol. xii. p. 288.
TOMPA, MiHALY (= MichaEl) (1817-1868), one of the best and tenderest Hungarian lyric poets, was born in 1817 at Rima-Szombat, in the connty of Gömör, of very humble parentage, his father being village bootmaker. He studied law and theology in Sáros-Patak, and subsequently at Budapest; bnt, feeling little inclination for the first-mentioned career, after many vicissitudes he, at the age of thirty, accepted the post of Protestant minister in Beje, a small village in his native county, whence, in two years, he removed to Kelemér, and four years later to Hanva, in the county of Borsod, where be remained till his death in 1868.

At the age of four-and-twenty Tompa pullished his first poems in the Athenerum, which soon procured for him a high reputation. His first volume, Népregek és Népmondik ("Folk-Legeods and Folk-Tales"), in 1846, met with great success, and the same may be said of the first volume of his "Poems" in 1847. In 1848 ho took part in the war of independence, acting as ficld chaplain to the volunteers of his county and sceing scveral battles; but the unfortunato close of that heroic struggle silenced his poetic vein for a considerable time, and, when in 1852 aod 1853 he gave vent to his patriotic grief in somo masterly allegories on the stato of oppressed Huncary, he was twice arrested by the Austrian authorities. After being released ho published lis Virogregik (" legends of Flowers"), a collection of poems of the highest order, showing great imagiuation and lovo of nature, and displaying the lofticst
humanity and great noclitative power. Soon after this ho became oppressed with melancholy and abandoned this brandi of poctry. Indeed fiom this time he produced comparatively little. He pub. lished threo volumea of sermons, "which," says his biographer, Charles Szasz, Protestant bishop of Budapicst, "are amoner the best in Hungarian literature, and will favomably comparo with those of Robertson, Monod, or Parker." His collected poetical works, in six volunes, were publishol at Rudapest in 1870. and again, in four volumcs, in 1885.

TOMSK, a government of Western Siberia, extending from the Chinese frontier to $60^{\circ} \mathrm{N}$. lat., is bounded by Tobolsk on the N.W., by Yeniseisk on the N.E., by the Chinese province of Khobdo on the S.E., and by Semilalatinsk on the S.W. Its area, 329,040 sqnare miles, is fully one and a lialf times that of France. The surface is most varied, including in the soutle cast the high alpine tracts of the Altai Monntains, with an elevated step]e which skirts these, and in the north-west and west the lowlands of the Irtish and the marslay tracts of the Ob.

The Altai Monntains, which cover within the limits of the Rnssian empire an area of 53,000 square miles, or three times that of the whole of Switzerland, althongh visited by many geologists, still remain very imperfectly known, even as regards their orography\%. The country lias been mapped only aiong the rivers and the course of a few footpaths, and great confusion still prevails with reference to the directions of the different chains of the Altai and their mutual relations (compare Siberla). The best descriptions, however (including the most recent by M. Potanin), ${ }^{1}$ indicate in that part of Asia the very same leading orographical features that are seen in the Tian-Shan Mountains farther south, and in the West Sayan range farther north. A plateau with an average altitude of more than 4000 feet, watered by the tributaries of the upper Yenisei, all flowing in open valleys 3000 to 4000 feet above the sea, is known to rise in that part of north-western Mongolia which is drained by the upper Yenisei and Selenga. The surface of this platean is diversified by ridges, and by clepressions like that of the Ubsa-nor-a relic of what was formerly a much larger lake. A lofty monntain chain, which has its soutli-east foot on the plateau and its north-west foot in the valley of the UTs, fringes the platean, and has all the characters of a border-ridge. The present writer las proposed to call this Erghik-shan. It runs from north-east to sonth-west along the Russo. Chinese frontier, and is pierced by a deep gorge through which flows the Yenisei. A belt, some 200 miles in width, of alpine tracts, made up of three or four chains parallel to the border ridge, fringes the outer border of the plateau, and fills up the Minusinsk region. The structure of the billy tracts (watered by the Kemtchik) between the Yenisei and the Altai remains quite unknown, no scientifie man or topographer having ever visited it. But the very same orographical features as those already described reappear in the Altai region. There is now no doubt that the backbone of the Altai is a buge and lofty border-ridge, the Sailnghem, which includes the small alpine plateans of Ukek, the upper Tchuya, and Juvlu-kul, and runs from south-west to north-east, being a continuation of the border-ridge of the West Sayan. Its flat dome-shaped summits rise to about 10,000 feet, and the small alpine plateans just named range from 7800 to 8200 fect in clevation. It has a very stccp slope towards the northwest, i.e., towards tho broad valleys of the upper Bukb. tarma and Tchuya, and a refy gentlo slope towards the sonth-east, and its south-eastern hillfoots are on the level of the plateau of Khobdo (from 4500 to 5000 feet). A broad alpino region spreads to the north-west of the borderridge, but in the imperfect state of our knowledge it is
${ }^{1}$ Jivopisnaya Rossiya, rol, xi.; Stetches of N. IF. Momgotia, vols i. and iii. ; Addenda to Ritter's Asia.'
difficult to discriminate the real directions of 1 ts chains. Nevertheless, another lofty chain, containing the snow-clad Alps of the Katuñ (Katunskiye Byetki) and those of the Tchaya, and running also from south-west to north-east, parallel to the Sailughenı border-ridge, can be distiuguished iu the labyrinth of confusedly scattered mountains seen on our present maps. It is one of the most picturesque chains of the region, and contains the Byelukha peak, estimated at 11,000 feet, and the Alas-tu, of nearly the same height. It is pierced, however, by so many rivers, which rise on the north-west edge of the plateau, and find their way to the lowlands by a series of gorges, that its continuity could De easily overlooked. Farther to the north-east it joins, in the opinion of the present writer, the high chain on the left bank of the Kemtchik, which is continued by the picturesque Alps on the northern bank of the Us. A third system of mountain chains, also parallel to the above, can be distinguished in the succes. sion of the Terektinsk Mountains, those which are pierced by the Tchulyshman and those which follow the right bank of the Abakan; while traces of a fourth plication of the rocks may be discovered in the Tigeritsk Mountains, those pierced by the Biya below Lake Teletskoye, and the Kuznetskiy Alatau, ou the leit bank of the Abakan. A number of smaller, much lower, and shorter chains faintly appear as outer walls of this extensive alpine region. As for the Great Altai, or Altain-Nauru, our knowledge of which has been greatly increased by the recent explorations of M. Potanin, ${ }^{1}$ it may be regarded as a south-western border-ridge of the Khobdo plateau, with its steep slope facing towards the wide Dzungarian depression, or rather to the broad trench of the Ulungur. Its direction is nearly at right angles to the above, running from northwest to south-east, like the Tarbagatai Mountains (see Turiestan), and it is continued farther to the south-east by the Irdyn-ula and Artsa-bogdo Mountains, which separate the eastern Gobi from the Tarim depression. It is most probable that upheavals, having the same northwestern direction (which, according to M. Mushketoff, are in Central Asia more recent than the north-eastern ones), have to a certain extent modified the old nortl-eastern chains of the Altai, and complicated the chains of its alpine region. If so, the structure of the Altai would be very similar to that of the Turkestan mountains. A chain having a north-western direction-the Salair Mountainsshoots off from the main ranges of the Altai, between the Tom and the Tchumysh; it is about 170 miles in length, with a width of nearly 60 miles, and contains the best silver-mines of the region, as also several gold-washings. lts upheaval belongs to a more recent epoch than that of the Sailughem ridge, and (like the mountains of Turkestan, baving a north-west direction) it is due to dioritic rocks. In the Kuznetsk depression it is covered with deposits of the Lower and Upper Carboniferous, containing beds of coal. The Kuznetskiy Atatau, in which Humboldt saw one of his meridional upheavals, consists of a series of ridges rumning south-west to north-east, with further continuations within South Yeniseisk. ${ }^{2}$

The alpine region of the Altai is most picturesque; most of its chains, rising over 8000 and 9000 feet, are suowclad, and a great glacier descends from the hollows under the Byelukha peak; several other less known glaciers occur in the different "byetkis" (snowclad chaius). A thick forest vegetation clothes the mountain slopes, while beautiful valleys, often of great length, such as that of the Bukhtarma ( 180 miles ) or that of the Uimoo and Koksu, offer on their fertile end well-shelterel floor's most favourable conditions for agriculture. Several lakes are met with. some, like the Juvlu-kul and Keudykty-kul on the small alpine platenus, at heigbts where anly the diwarf birch grows and the polar marmot takes up its abode,

[^184]while two others, Lakes Livtyranskoye and Teletskoye, respectivelyे 1170 and 1600 feot above the sea, from theil position anidst steep and picturesyue inountaius, orecall those of Geneva and Lucerne.

The Altai flora is veryrich. Althourh the European flora (iup cluding the beech) which clothed the Altai at a recent period has disappeared, and the Siberian flora invades its hillfoots from the north-west,' while the steppe flora is advancing from the south, still in a zone ranging from 1000 to 6000 feet ahove the sea the botanist has to admire a flora rich in briglit flowers, tall grasses, and shrubs, several of which are now conmon ornamestal plants in European gardens; and the zoologist discovers in the Altai tho meeting-place of the northern fauna (iucludiag the reiadeer) with that of the high Central-Asjan platcau (iucluding the tiger aud the two-bumped camel of Eactrianal
A strip of elevated plains or grassy steppes, also about 200 miles in breadth, girdles the alpine region upon the north-west. Its outer border can be roughly indicated by a line rumning north-east from Lake Gorkoye to Tomsk.' They have an average. altitude of from 700 to 1000 feet above the sea, and are covered with a luxuriant grass vegetation; the conditions for agriculture are excellent, and Russian villages are rapidly springing up. The south-west portion is known as the Kuruandinsk steppe. An innumerable succession of small lakes-rivers in the process of fornation-cover this steppe, where we have a system of parallel undulations, resulting in tributaries of the Ob , all flowing north-eastward with remarkable regularity.
Beyond the high plains, that is, all over north-western Tomsk, are the lowlands, which may be subdivided into two portions,-thio Baraba steppe in the south-west (see Tobolsk), and the marshy region of the Ob (the Vasyugan and Narym regions). The latter is one boundless marsh, a ferv settlements of native hunters occurring only along the rivers. The interior is for the most part inaccessible alike to boats and to human feet. Low hills, or rather swellings, intersect it, but eveu the highest points, barely 200 or 300 feet above the sea, are covered with marshy forests. The forests themselves grow on marshy ground; but where the trees disappear one sees for hundreds of miles nothing but green flowery carpets, which, when trodden on, treacherously yield under the unwary traveller. Similar in character must have been the marshes in which the Siberian mammoths and rhinoceroses of the Quaternary epoch found their graves. Only the light and broadhoofed reindeer, but not the elk, can cross them. This inhospitable region is inhabited only by Ostiaks, who have been driven into it by stress of circumstances, and support themselves partly by fishing and partly by hanting.
The Sailughem ridge, and tha high Khobdo plateau as well, consist of granites, syenites, porphyries covared only with the oldest metamorphic slates belonging to the Archaic formation (Huronian and Laurentian). Tho structure of the outer chains of the Altai is more complicated. Their back bone is alse composed of granites, porphyries, and porphyrites covered with metamorphic elates whish are intersected by layers of erystalline limestones, breccias, and veins of jade. ${ }^{3}$ Diorites, diabases, mugitic porpbyries, and hyperathcuites also a ppear, but they are of a more receat arigin. Silurian clay-slates are widely spread in the southern Altai. Devenian slaies and limestones are also developed in the southern Altai, and the metalliferons dcposits of Zmeinogorsk, Petrovsk, Riddersk, sec., belong to that age. Carboniferous dolomitic limestones and slates are widely apread both in the southern and northern Altai. After the Carboniferous epoch the southern Altai was oot agaia sub. merged, while the northern Altai was covered by the Jurassic sea, and has thick Jurassic deposits containugg a copious fossil flora and rich beds of coal. Basaltic eruptions, dating from the Jurassic period, have been found in the Salair MIountaius. Thick diluvial deposits cover the whole area, and in mauy valleys ere traces of immense former glaciers; in fact, the whole of the Sailughem ridgo must at one tinve have been clothed with an ice-cap. ${ }^{4}$

The couthern Altai is rich in silver, copper, lead, and ziuc; while in the Atatau are concealed its chief auriferous alluvial (or diluvial) deposits, iron-ores, and coal-seams. The mineral wealth of the Altai is really immense, hut only a very few of the mines already knowu are worked. Iu 18814030 th of gold, 14,820 tb of silver, 13,100

[^185]cwts. of lead, 6720 cwts. of copper, $240,000 \mathrm{cwts}$ of coal, 330,000 cwts. of ealt, and $30,000 \mathrm{cwts}$. of bitter salt were obtained. In the same year only 3000 civts of iron were mannfactured, and that metal is still imported from the Urals. The jade, beautiful porphyries, and the like of the district, which are cut into works of art at the crown works of Kolyvañ, are well known through the urns and vases ahown at the St Petersburg Hermitage. The mioeral waters of the Altai are of high quality.

Tomsk is watered mainly by the Ob end ita tributsries, only its south-east corner draining into the Abakan, a tributary of the Yenisei. The Ob, formod by the union of the Biya and Katui, has within the government a course of more than 800 miles, and is navigated as far as Barnant and Biysk. Its tributaries, the Tom ( 450 miles), the Vasyugan ( 530 miles), the Ket ( 230 miles), and the Tym ( 200 miles), are all navigablo. The Tchulym and the Tchumysh are also great rivers. Of tribntaries of the Irtish, the Bukhtarma, the Om, the Uba, and the Tara are worthy of notice. As many as 1500 lakes have been counted on the maps, but this number is exceeded by tho reality. Some of them are alpine; others dot the steppes or the marshy tracts. Lake Tcheny, notwithstanding its rapid desiccation, still covers 1265 square miles. Many brackish lakea, Kutundinsk, Kutchuk, \&c., attain a great size, and some small aalt lakes yield about $100,000 \mathrm{cwts}$, of salt.
The climate is very severe, and has, moreover, the disadrantage of being very wet in the morth-west. The average jearly tempera. tures at Tomak, Kainsk, and Barnant are $30^{\circ} \cdot 2,31^{\circ}$, and $32^{\circ} \cdot 7$ (January, $4^{\circ},-6^{\circ} \cdot 2$, and $3^{\circ} \cdot 7$; July, $65^{\circ} \cdot 5,68^{\circ} \cdot 5$, and $62^{\circ} \cdot 2$ ). The Altai steppes, enjoying a much drier climate than the low. lands, are covered with a beautiful vegetation, and in the oheltered valleys corn is grown to heights of 3400 and 4250 feet.

The population, which is rapidly incrensing, in 1882 reached 1,134,750. The Russians are in a large majority, the indigenons inhabitants numbering in 1879 only 63,600 , or 6.6 per cent. of tho aggregate population. They include 23,600 Altaian Tartara, 5730 Teleutes, 17,020 Mountain Kalmucks (see Tartars), 10,000 Tomsk Tartars, 2920 Samoyedes, and 4210 Ostiaks. The prevailing religion is Greek-Orthodox, but there are also nome 50,000 Nonconformists, 7320 Catholics, 2600 Jewa, 10,700 Mohammedans, and about 28,000 pagans.

Agricultare is the prevailing occupation. It is most prodnctive on the elevated plains of Tomsk, Mariinsk, Barnaut, Kurnetsk, and Biysk. Cattle-Ureeding is much developed, especially in the Kutundinak steppe; and bee-keeping is an important source of wealth. Fishing and hunting are extensively carried on in the forest region. Nining occupies aeveral thousands of men in the Altai. Manufactures are insignificant, the aggregate production -chiefly from distilleries and tanneries-hardly amounting to $£ 250,000$. Trade is actively carried on at Tomak and Barnaut, which are two great centres for the export and import trade of Siberia with Russia. The Biysk merchants enrry on exchange trade with Mongolia and China. There are eight gymnasia ( 696 boys and 569 girls in 1883) and 225 primary scbools ( 5680 boys, 1730 girls). The government is divided into aix districta, the chicf towna of which (with populations in 1884) are Tomsk $(31,380)$, Baruaut (17,180), Biyak (18,960), Kainsk (4050), Kuznetsk (7310), and Mariinsk ( 13,090 ). Narym ( 1600 ) also has municipal institutiona; it is the centre for the administration of the vide Narym region. Of the above towns only Tomsk and Barnant have the aspect of European towns. Barnant, capital of the mining district of the Altai, which belongs to the "Cabinet of the Emperor," is a wealthy city, with a mining echool and laboratory, a botanic garden, a museum of mining and natural history, and a meteorological observatory. Kotyvañ, with a atone-cutting manufactory, has 12,250 inhabitanta. Several mining villages are more important than the district towns:-Zyryanovsk (silver-mine; 4500 inbabitants), Riddersk, Zueinogorsk (6160), Suzunsk (540)), and Salairsk (3500).
(P. A. K.)

TOMSK, capital of the ahore government, is situated on the Tom at its confluence with the Ushaika, 27 miles abcro its junction with the Ob , and 2377 miles from Moscow. It is one of the chief cities of Siberia, second only to Irkutsk in population and trade importance. The great Siberian highway from Tyumeũ to Trkutsk passes tbrough Tomsk, and it is the terminus of the navigation by steamer from the Urals to Siberia. It has, moreover, communication by steamer with Barnaut and Biysk in the Altai. The position of Tomsk determines its character, which is not that of an administrative centre, like so many Russian cities, but that of an entrepôt of wares, with many storehouses and wholesale shops. Before 1824 it was a more village; but after the discorery of gold in the district it grew rapidly ; and, although the immense
wealth that accumulated suddenly in the hands of a ferm proprietors of gold diggings was as rapidly squandered it continued to maintain its importance, owing to the navigation on the Irtish and the Ob , which meanwhile had grown up. It is built on two terraces on the high right bank of the Tom, and is divided into two parts by tho Ushaika. The streets are rather narrow and steep ; many houses of the richer merchants are of stone, but rather heavy in appearance, and altogetber the aspect of the strects is not attractive. The best building is that of the future aniversity, which is a spacious and elegant structure, with ample accommodation for library, museums, and clinical hospitals. The Government has not as yet given permission to inaugurate the building. A large cathedral, begun some fire-and-twenty years ago by proprietors of gold diggings, collapsed after considerable progress had been made. The industries are almost entirely confined to tanning and the manufacture of carriages. The trade is of great importance, Tomsk being not only a centre for traffic in local produce, in which sledges $(50,000$ every year) and cars are prominent items, but also for the trade of Siberia with Russia. The population in 1884 was 31,380 .

## TONGA. See Friendly Islands.

TONG-KING, Tung-King, Tonquin, or, as it is cafled Sè man by the Annamese, Dong-king, consists of that portion of xri, Annam between $18^{\circ} \mathrm{N}$. lat. and the frontiers of the IX Chinese provinces of Kwang-se and Yun-nan, with an area of 60,000 square miles. On the W. it is bounded by the Tran-ninh range, which forms the limit of the Lao states, and on the E . by the sea. In shape it resembles, roughly speaking, an isosceles triangle, having its apox at its juncture with Annam and its base along the Chinese houndary. The name Tong king, "the eastern capital," was originally applied to Hanoi, but was eventually adopted as that of the whole country. It is the same word as Tokio (q.v.).

Geographically Tong.king is divided into three welldefined areas. First, there is the delta of the Song-kei ("Red river") and its affluents, which, beginning at Sontay, widens out into the low lands which constitute the most fertile district in Tong-king, and within which are situated the principal cities of the country. Here is grown the rice which constitutes 39 per cent. of the total exports from Tong-king, and which is reckoned in the Hong-Kong market to be equal in quality to the rice from Siam and superior to that from Cochin-China. During the rainy season this part of the country, with the exception of the embankments, is under water, but notwithstanding this the climato is fairly healthy, and the prevalence of ferer and dysentery is not so great as might be expected. From the delta northward and westward rise plateau districts, while westward of $103^{\circ} \mathrm{E}$. long. there stretches a forest region about which very little is known, but which is said by the natives to be inhabited only by savages and wild beasts.

Politically the country is divided into sixteen provinces, of which the following seven are in the delta mentioncd :-Bac-ninh, Sontay, Hanci, Hai-Dzuong, Hung-yen, Nam. Dinh, and Ninh-Binh. Five provinces constitute the upland districts, viz., Cao-Banh, Lang-son, Thai-Nguyen, Tuyen-Kwan, and Kwang-yen; while the forests form the prorince of Hung-hoa. The main geographical feature in the country is the Song-koi, which, taking its rise near Tali Fu, in Yun-nan, enters Tong king at Lao-kai ("the Lao boundary"), and flows thence in a southeasterly direction to tho Gulf of Tong-king. It was this river which mainly in the first instance attracted the Frencb to Tong king, as it was beliered by the explorers that, forming the shortest route by water to the rich province of liun-nan, it would prove also to be the most convenient and expeditious means of transporting the tin, copper, silver and
gold which are known to abound there. This belief has, however, proved fallacious. The upper course of the stream is constantly impeded by rapids, the lowest being about 30 miles above Hung-hoa. Beyond this point navigation is impracticable during the dry season, and at all other times of the year goods have to be there transferred into flat-bottomed boats built for the purpose. Within the limits of Yun-nan the navigation is still more difficult. Near Sontay the Song-koi receives the waters of the Black river, the Clear river, and other streams, and from that point divides into a network of waterways which ompty themselves by countless outlets into the sea.

Hanoi, the capital, is a fine city, and stands on the right bank of the Song-koi, at a distance of 80 miles from the sea. The commercial town extcuds along the water face for a distance of a mile and a half, while behind it stands the citadel, which encloses within its walls the palace, the treasury, the court of justice, the royal pagoda, the prison, the barracks, public offices, and official residences. Embroidery and mother-of-pearl work are the principal industries of Hanoi, which never has been and probably never will be a great commercial centre. But, notwithstanding this, the population is said formerly to have numbered 150,000 , a number which has of late years probably been reduced by at least one-third.

Next in importance to Hanoi is Nam-Dinh, on one of the lower branches of the Song-koi. It is the centre of an extremely rich silk and rice district, and was before the war a great resort of Chinese merchants. But the chief place of trade is Hai-plong, on the Song-tam-bac Canal, It miles from the sea. This is the port of Tong-king, and its trade represents the foreign commerce of the country. In 1880, the last year of anything like normal trade, goods were imported to the ralue of $5,467,315$ francs, and the exports amounted to $7,507,528$ francs. Of the imports 34 per cent. consisted of English cotton goods and yarn, 21 per cent. of opium, 11 per cent. of Chinese medicines, 9 per cent. of Chinese water-pipe tobacco, 5 per cent. of tea, and 20 per cent. of miscellaneous goods. From 97 to 98 per cent. of these goods came from Hong-Kong. Saigon furnished about $\frac{1}{2}$ per cent., and rather more than 2 per cent. represented the trade from Annam and elsewhere. The exports were in the following proportions :rice, 39 per cent.; raw silk and silk piece goods, 21 ; tin, 16 ; lacquer oil, 6 ; and miscellaneous goods, 18. Of these 79 per cent. were shipped to Hong-Kong, 16 per cent. went to Saigon, and the remaining 5 per cent, were distributed among the coast ports.

The mineral wealth of the country is doubtless considerable, though so little has been done in the direction of working it that it is impossible to form any idea of its richness. According to Major-General Mesny, there are flourishing gold-fields in seventeen districts, while silver and copper mining occupies a great deal of native and Chinese labour. Ouly very small quantities of these minerals, however, are produced in evidence.

The population of Tong-king is estimated at about 12,000,000, and consists of Tong-kingese, Chinese, and an admixture of Lao from beyond the western frontier. The Tong-kingese belong to the Indo-Chinese stock. They are taller and a finer people than the Annamese, and they are more frivolous and excitable than their northern neighbours, the Chinese. Their intelligenre is, generally speaking, of a very low order; they are dirty in their habits; and their natural timidity serves to make them deceitful. As traders they show little enterprise, and are quite unable to compete with the Chinese, into whose hands the commerce had, before the arrival of the French, entirely fallen. Their spoken language is allied to the Cambodian, while Chincse forms the medium of literary communication.

The Chinese records carry the history of Tong-king as far hack as the 22d century b.c., but, as the data are neither well sutkeaticated wor particularly interesting, we need not dwell apon them. There is, however, one mention of Tong-king, or Yueh, as it was then called, in the 12th century B.c., which acquires inportance from the fact that ambassadors from that country ale said to have arived at the Chinese court, bringing with them "aonth-pointing. chariots." These are supposed by some to have been mariner'a compasses, but it is difficult to prodounce any opinion on a statament so obscure. During the reign of Che Hwang te (218 в.c.), the emperor who maile himself famous by building the Great Wall of China and burning the books, a Chinese army invaded Tong-king and captorcd the town of Luliang, possibly the modern Hanoi. The occupation, however, was only temporary, and it was not until the rise to power of the Han dynasty that any serious attempt was made to subjugate the conntry. At that tione a Chinese general, Choou T"o, who hat established a principality consisting of the two modern provinces of Kwang-tung and Ǐwang-se, with his capital at Canton, invaded Tong-king, but wes defeated and driven out of the couatry by the ruler, An-yang, whose victeries were achieved mainly by the help of a foreign "diviue mechanic." This man, whoever he may have bcen, seems to have been thrown aside after serving his immediate purposo; and, having. thus deprived himself of his right hand, An-yang fell an easy victim wheo attacked by a secoud army sent by Chaou T'o. On the oubjugation of the empire by the Han sovereign, Clazou T'o's principality nas absorbed with the rest, and in 116 B.o. Tong-king became a lependency of Clina.

But this connexion brought no peace to the country, and for centuries rebellion followed on rebellion. A particular uprising io the 1st century is noticeshle from two sisters, Chêpg T'sêh and Chêng Urh, leading the rehel forces against the Chinese garrisons, with ouch snccess that the celebrated Ma Yuen hat to be sent against the malcontents. After an arduous campaign Ma dispersed the rebels and captured and cxecuted the two sisters, thus patting an end to the rebellion. The next fourteen centuries furnish a perpetual record of wars and rumours of wars, the disconwectel uarrative of which is generally uninteresting and sometimes unintelligible. In 1427 Li Loi acquired the throne, as so many of his predecessors had done, by violent means, but, uulike them, he established aome degree of peace and order in the land. In the following century, however, the spirit of revolt broke ont, and one of his successors owed the maintenance of his throne to the skill of his general Ngujen Dzo, on whom the title of hereditary viceroy was consequeatly conferred. This viceroy gradually assumed the supreme authority in the district under his contiol and virtually separated Tong-king from Anoam, holding the first under his own sway and leaviog the southero portion of the country to the roi faineant. In this disunited condition the two countries remained during the 17 th century and part of the 18th, till a successor of Nguyen invaded Annam, captured the imporial city of Hué, and dethroned the king, Gia Long, who fled to Siann. The Siamese sovereiga entertained the fugitive with hospitality, but declined to help him to recover his throne. It happeod, however, that at this time (1787) the Jesuit establishment of Bangkok was presided over by Bishop Pigneaux de Betaine, who thought he saw in the political condition of Annam a means of establishing the power of France in the eastern portion of Indo-Clina. With this object he proposed to Gia Long that he shonld accomany him to Paris to enlist the aid of Lous XVI. for the recovery of his throne. This the king declined to do, but as a compromise he sent his eldest son. The young prince was cordially received by Louis, before whom the bishop land the following reasons for the interference of France on hehalf of Gia Long. "The balance of political power in India appeare at the present moment to be largely in favour of the English, and one may be justified in looking upon it as a matter of no little dificulty to restore the equilibrium. In my opinion the establishment of a French colony in Cochin-China will be the surest and most efficacious means to the end. . . . The most certain way of damaging the English in India is to ruin, or at any rate to weaken, her commerce in time of peace. Being situated nearer to China, we should undoubtedly absorb much of her trarle. . . . In time of war it would be still more easy to stop all commerce between China aud any hostile nation. . . From such a coign of vantage it would be easy to interfere with the designs which the English evidently have of extending their frontier more to the cast."
The embassy resulted is a treaty with Gia Long, by which the French king engaged to restore that monarch to his throne on condition that he accepted the virtual protectorship of France over Annam. But even before the initial steps towards the fulfilment of this contract could be carried out, the political uprising which finally brought the French king to the scaffold made all interference in the East impossible. In these circumstances the bishop determined to raise a sufficient force from the French and other adventurers who then frequented India and the neighbouring countrics, and, with an army so recruited, he landed in Annam. The Anna: mese resistance was of the_feeblest kind; the usurper's ${ }^{\text {power was }}$
broken at the first encounter, and Gia Long once again ascended his throns. As a reward for the services thus rendered to him, he extended a liberal protection to the Roman Catholic missionaries and their colnverts, and engaged French officers to fortify his towns and to drill his troops. He soon found, however, that his new allies had more smbitious desigas then could be satisfied lyy doing him scrvice. He therefore vitndrew his countenance from them, and emphasized his displeasure by leaving his throne array from his eldest son, who had pleaded his cause in Paris, and by giving it to his youngest son. This change of policy told, as was natural, with greatest forcc on the missionarics and their converts in the interior of the country. From $1833^{2}$ to 1839 eleven missionaries were put to death, and thousands, it is said, of the native Christians suffered martyrdom. Neither change of sovereiga nor varying circumstances brouglit any relief to the persecuted Christisns, until in 1859 the French Government determiaed to intervene on their behalf. In that year Admiral Rigault de Genouilly took Saigon by assault, and was attempting to open negotiations with the king of Annam, when the outbreak of the China war compelled him to satisfy himself with holding the captured town. So soou, hovever, as the Peking treaty was signed, the French resumed active operations in the neighbourhood of Saigon and took possession of the provinces of Mitto and Bienhoa in Cochin-China. These victories led to the conclusion of a treaty with the king, Tu Duc, which, lowever, did not prevent the French from adding the provinces of Kinhlnong, Chandoc, and Ha-tien to their acquired territory.

Having thus frmly established themselves in Annam, tleey began to turn their attcation to Tong-king, attracted by the roported richaess of its mineral wealth. They found a ready pretext for iutcrfering in its affairs in the disturbances arising from the invasion of its northern provinces by the disbanded followers of the Tai-ping rebels. Acting on the protectorship which they professed to excrcise over all the territories of Tu Duc, they proposed to him that a joint expedition composed of Fronch and Aunamese troops should be sent to quell the disturbances. On Tu Duc declioing to accede, the French adanial was on the point of starting "to protect" Tong.king, when as before the outbreak of war put an end to the enterprise. The events of 1870 forbade any advance in the direction of Tong-king, but the return of peace in Europe was once more the signsl for the renewal of hostilities in the East. The appearsace of Garnier's work on hisexpedition up the Mekong aroused sgain an interest in Toug-king, and the reported wealth of the country added the powcrful motire of self-interest to the yearnings of patriotism. Already MI. Dnpnis, a trader who in the pursuit of his calling liad penctrated into Yun-nan, and had thus discovered that the higher waters of the Song-koi were navigable, hsd visited Hanoi with e small force of desperadoes, and was attompting to negotinte for the passage up the river of himself and a cargo of military atores for the Chinese outhorities in Yun-nan. Meanwhile Captain Senez appeared from Saigon, hsving received instructions to open the route to French commerce. But to meither the trader nor the naval officer wonld the Tong-kingese lend a favourable ear, and in default of official permission Dupuis determined to force his way up the river. This lie succeeded in doing, but arrived too late, for he found the rehellion crushed and the stores no longer wanted. On his return to Hanoi, Dupuis found that the oppositien of the authorities had gathered strength during his absence. His arrival served to restore the position of the French, and, not wishing to nake an open attack upon them, the Tong-kingese general wrote to the king, begging him to induce the goveraor of Saigon to rcmove the intruder. An order was thereupon issued calling upon Dupuis to leave the country. This ha declined to do, and, aifter sonse aegotiations, Garnier with a detachment was eent to Hanoi to do tho best he could in the difficult circumstances. Garnier threw himself heart and sonl into Dupuis'a projects, and, when the Cong-kingesa authorities refused to treat with him except on the sulject of Dupuis's expulsion, he attacked the citadel on November 20, 1873, and carried it by assault. Having thus secured his position, be seat to Saigon for reinforcements, and meanwhile seat small detachments against the five other importaut fortresses in tho delta (Hung-yen, Phu-ly, Hai-Dzuong, Ninh-Binh, and NomDinh), and captured them all. The Tong.kingese now called in the help of Litl Yung-fu, t.sa leader of the "Black Flags," who at once marched with a large forca to the scene of sction. Within a few days he recaptured several villages near Hanoi, and so threatening did his attitude appear that Garnier, who had hurried hack after capturing Nam-Diah, made a sortio from the citadel. The movement proved a disastrous one, and resulted in the death of Garnier and of his second in command, Balny d'Avricourt.

Meanwhile the news of Gernier's hostilities had alarmed the governor of Saigon, who, having no desire to be plunged into $B$ var, seat Philastre, an inspector of native affaira, to offer apologiea to the ling of Annam. When, however, on arriving in Tongking Philastre heard of Garnier's death he took command of the French forces, and at once ordered the evacuation of Nam.Dinh, Ninh-Binh, and Hai-Dzuoag,-a measure which, however advan. tagrous it may have been to the French at the moment, was most
disastrons to the native Christian population, the withdrawal of the French being the signal for a general massacre of the converts, In pursuance of the same policy Philsstre made a convention with the authorities (Februsry 6, 1874), by which he bound his couatrymen to withuraw from the occupation of the country, retaining ouly the right to trade at Hanoi and Hai-phong, and agreed to put an end to Dupuis's aggressive action. On the 15 th of March a treaty was signed at Saigon.

For a time affairs remained in statn quo, bnt in 1882 Le Myre de Villers, the goveruor of Saigon, sent liviere with a small force to open up the route to Yum-nan by the Song-koi. With a curious similarity the events of Garnier's campaign were repested. Finding the authorities intrsctable, Riviero stormed and carried the citadel of Hanoi, and then, with very slight loss, he captured Nam-Diah, Hai-Dzuong, 'and other towne in the delta. And once again these victories brought Lin Yuag-fn and his Black Flags into the neighbourhood of Hanoi. As Garnier had done, so Riviere hurried back from Nam-Dinh on news of the threatened danger. Like Garaier also he headed a sortie against his enemies. and like Garnier he fell a victim to his own impetuosity.

In the meantime the Annamese conrt had been seeking to enlist the help of the Chinese io their contest with the French. The tio which bound the tributary nation to the sovereign state hed been for many generations slackened or drawn closer as circumstances determined, but never had it been entirely dissevered, and from the Annamese point of view this was one of the occasions when it was of paramount importance that it should be acknowledged and acted upon. With much more than usual regulsrity, therefore, the king despatched presents and letters to the court of Peking, and in 1880 he sent a special embassy, loaded with unusually costly offer. rags, and with a letter in wnich his position of a tributary was emphatically asserted. Far from ignoriag the responsibility thrust upon him, the emperor of China ordcred the publicstion of the letter in the Peking Gazelle. The death of Riviere and the defeat of his troops had meanwhile placed the French in a position of extreme difficulty. The outlying garrisons, with the exception of Nam-Dinh and Hai-phong, were at once withdrawn to Hanoi, and that citadel was made as secure as circuastances permitted. The Black Flags swarmed round its walls, and the reinforcements brought by Admiral Courbet sad General Bouet were insufficient to do more than kecp them at bay. So continued was the pressure on the garrison that Bonet determined to make on advance upon Sontay to relieve the blockade. After gaining 60 me trifligg saccesses, ho attacked Vong, a fortified village, but he met with ouch resistance that, after suffering considerable loss, he was obliged to retrest to Hanoi. In the lower delta fortune sided with the Freuch, and slmost without a casualty Hai-Dzuang and Phu-Binh fell into their hands. These snccesses led to an ultimatum being sent to the king of Annam, in which were demanded the fulfiment of the treaty of 1874 and the acceptance of the protectorate of France over the whole of Aanam, iucluding Tong.king. This docunent met with no favourable reception, and, as at this moment is reinforcement of 7000 men srrived from France, Courbet, determining to supersedo diplomacy by arms, appeared with his fleet before Hué. He found that, though Tu Duc was dead, his policy of resistance was maintained, and he therefore stormed the city. After a feebla defence it was taken, and the admiral concluded a treaty with the king (August 25, 1883), in which tha Freach protectorate was fully recognized, the king further binding himseli to recall the Annamese troops serving in Tong-king, and to construct a road from Saigon to Hanoi.

Though this treaty was exactec from the king uader pressure, the Freuch lost no time in carrying out that part of it which gave them the authority to protect the country, and on the let September Bovet again advanced in the direction of Sontay. But again the resistance he met with compelled him to retreat, after capturing the fortified post of Palan. The e日rious nature of the opposition experienced in these expeditions iaduced the Freach commanders to swait reinforcements before again taking the field. Mcanwhile, on the determination to attack Sontay becoming koown in Paris, the Chinese ambassador warned the ministry that, since Chinese troops formed part of tha garrison, he should consider it ss tantamonnt to a declaration of war. But his protest met with no consideration. On the arrival of reinforccments an advenca was agaiur made; and on the 16 th December, after some desperate fighting, Sontay fell.

The immediate object of the Fronch commsnders was at this time to make themselvee secure in the delta, and to inflict buch chestisement on the Black Flags aud their allios as would prevent their disturbing the peace of the garrisons. This could not be attained so long as Bac-Ninh remained in the hands of the enemy. Geaersls Négrier, Brière da l'Isle, and Millot accordingly marched against tha town, and began to shell it. But it was already deserted, and Millot entered the gates withont striking a blow. Thus, while ona part of the progranme was fulfilled to the letter, the other part, which was to have scaled the fate of the garrison, failed conspicuously. In, these circumstances it was though
advisable to push on along the great northeeastern road to China; and Négrier advainced about 30 miles towards Lang-son, captured a village there, and then returaed to Bac-Ninh.
Meanwhile Briere de l'Isle followed up that pertion of the BacNinh garrisou which had escaped along the northern road in the direction of Thai-Nguyeu. He captured the fort of Yen-Te, and marched on to Thai-Nguyen, where, as on so many occasions, there was a great display of martial ardour so long as the French were beyond firing distance, but the discharge of a few shells completely discomfited the defenders, who fled out of the north gate as the French marched in at the south. As Brière de l'Isle had positive orders not to hold the town, he burat some of the buildiugs, and evacuated it. The Chinese troops immediately returned, and again were driven out a month later, only to return again on the withdrawal of tho French. Once more, however, a column was sent against the city, which on this occosion was burnt to the ground.
The whole of the lower delta was thus made accure in the hands of the French. Hung-Hos (a town about 15 miles north-east of Sontay) and Tuyen-Kwan (a fortified place about 40 miles farther north) both fell hefore the invaders, but from both the garrisons escaped practically unscathed.
In the meantime M. Fouraier, the Freach consul at Tientsin, had been negotiating for peace, so far as China was concerned, with Li Hong-cheng, and on Mey 17, 1884, had signed and sealed a memorandum by which the Chinese plenipotentiary agreed that the Chinese troops should evacuate the northern provinces of Tongking "inmediatsment." This expression was undeniably vague, and the Freach general in Tong-king, impatient of delay, in June dispatched Colonel Dugenne at the head of a strong force to occupy Lang-sor. The expedition was badly arranged; the baggage train was far too unwieldy; and the pace at which the men were made to march was too quick for that scorching time of the year. They advanced, however, within 25 miles of Lang-son, when they suddenly came upon a Chinese camp. An irregular engagement commenced, and, in the pitched battle which ensued, the Chinese broke the French lines, and drove them sway in headloog flight. This brought the military operationa for the season to a close.
During the rainy. season fevers of all kinds became alarmingly prevalent, and the zumber of deaths and of men invalided was very farge. In the meantime, howerer, an expedition, led by Colonel Donnier, against the Chiuese garrison at Chu, abont 10 miles aoutheast from Lang-kep, was complately auccessful; and in a battle fought near Chu the Chinese were defeated, with a loss of 3000 killed, the French loss being only 20 killed and 90 wounded. In the skirmishes which followed the French were generally victorious, but net to such a degree as to warrant any enlargement of the campaign.
The arrival in January 1885 of 10,000 men having brought up the force under Brière de l'Isle to 40,000 , he ordered an advance towards Lang-son. The difficulties of transport greatly impeded his movements, still the expedition was successful. On the 6 th Februsry three forts at Doag-Song, with large supplies of stores and ammunition, fell into the hands of the French. Three days" heavy fighting made them masters of a defile on the read, and on the 13th Lang-son was taken, the garrison having eracuated the tewn just before the eutrance of the conquerors. With his usudl energy Négrier pressed on in pursuit to Ei-hea, and even ceptured the frontier town of Cua-ai. But Briere de l'Isle bad now to hurgy back to the relief of Tuyen-Kwan, which had been attacked by a Chinese Lorce, and Négrier was left in command at Lang-son. The mithdrawal of Briere do l'Isle's division gave the Chinese greater confidence, and, though for a time Negrier was ablo to hold his own, on the 22d and 23d of March he sustained a severe check between Lang-sou and Thatke, which was finally couverted into a complete roat, his troops being obliged to retreat precinitately through Leng-son to Than-moi and Dong-Song. Brierc de liIsle reached Tuyca-Kwan on the 3d of March, and found the Black Flags and Yuaman brares atrongly pested on the side of an almost inaccessible pass. After having sustained a succession of attacks for eighteen days, and seven actual assaults, the delight of the garrisou at geeing Brire de l'Isle'e relieving force may be imagined. It was while matters were in this position that Sir Robert Hart succeeded in regotiating pasce betreen the two countries. By the terme agreed ou (April 6, 1895), it was stipulated that France was to take Toug-king under its protection and to cracuate Formosa. The Chinese undertook st the same time to oxpend $80,000,000$ frsnes on the construction of rosds in South China
The future fortanes of the colozy must depend greatly on the administrative ability of the governors selected to rule over it. The death of Panl Bert was in this respect a great loss to Tong-king. See France and Tonj-King, by J. G. Scoti, 18s5; Tondin, by C. B. Norman, 1884: Tunating, by 7 . Mesnéa, 18S4.
TONGUE. Soo Anatomy, vol. i. p. 895, and Taste.
TONNAGE, Register Tonfage, or International Register Tonnaar, is the unit on which the assessment of dues and charges on shipping is based. The system at prebent in force is known as the Moorsom system. A register
ton is 100 cubic feet of internal volume. Thus a vessel of 100,000 cubic feet of internal space within the points of measurements prescribed by the law is 1000 tons register. Vessels are sometimes bought and sold under this unit. The tonnage rules, which are very full and elaborate, are contained in part ii. of the Merchant Shipping Act, 1854, sections 20 to 29 inclusive, and in section 9 of the Merchant Shipping Act, 1867, the latter being a special section in reference to a deduction from the gross tonnage in respect of crew space, which space must be fit for the proper accommodation of the men who are to occupy it to entitle to such deduction. This enactment has led to great improvement in seamen's quarters.

Sestion 60 of the Merchant Shipping Act, 1802, provides on the point of international tonnage as follows:"Ships belonging to foreign countries which have adopted the British system of tonnage need not be remeasured in this country." The British system has been adopted by the following countries at the dates named :-United States, 1865 ; Denmark, 1867; Austria Hungary, 1871; Germany, 1873 ; France, 1873 ; Italy, 1873 ; Spain, 1874 ; Sweden, 1875; Netherlands, 1876 ; Narway, 1876; Greece, 1878; Russia, 1879; Finland, 1877; Hayti, 1882; Belgium, 1884; Japan, 1884. It is also under consideration by China.

There are slight differences in the rules for deduction for engine room in some of the countries, but owners or masters of foreign steamships, where this difference exists. may have the engine-rooms remeasured in the United Kingdom if they desire; in other words, their net tonnage may bo reduced to exact English measure.

The British system was also mainly adopted by the International Tonnage Commission assembled at Constantinople in 1873, the rules of such commission forming the basis of dues levied on the ships of all conntries passing through the Sue之 Canal. A special certifcate is issued in the respective countries for this purpose. The main point of difference from the British system is with respect to the deduction for engine room.

There are three terms used in respect of the tonnage of ships,-namely, tonnage under decks, grosis tonnage. and register tonnage.

In obtaining the gross measurement the space under the tonnage deck is first measured-sections 20 and 21 (1), (2), and (3); then the space or spaces, if any, betweec the tonnage deck (the tonnage deck is the second deck from below in all vessels of moro than two decks and the upper deck in all other vessels) and the upper decksection 21 (5) of Act ; and finally the permanent closed-is spaces above the upper deck available for cargo, stores. passengers, or crew-section 21 (4) of Act.

The allowance for engine room is governed by the percentage the net engine room-that is, the space exclusive of the coal bunkers-hears to the gross tonnage, and varies in paddle- and screw-steamers as laid down in section 23 of the Act.
Io obtaining the tomage ander tonnage deck, snips are dividec in respect of their length into five classes as follows:-

$$
\begin{aligned}
& \text { Class 1. Length } 50 \text { feet and nnder.................. Snto } \frac{4}{6} \text { equal parts. }
\end{aligned}
$$

The following is an epitome of the rule for tomnage under the tomage deck:-
Length is taken inside on tonnage deck, from inside of plank at .ern to inside of midship stern timber or plank; the length so taken, allowing for rake of bew and of atern in the thickness of the deck, and one-third of the round of beam, is to be divided into the prescribed number of equal parts "(which determines the stations of the areas), eccording to the length of vessel, as ebove.
Area 1 is at the extreme linit of the bow. Ares 2 is at the first point of division of the leagth. The rest are mumbered in succession, the last being at the extrime liznit of the stern.
Depths are taken at cach point of division of the leag th, or station
of each area, from the underside of the tonnane deck to ceiling at inuer edge of timber strake, deductiug therefrom one-third of the round of the bean. The depths so taken are to be dirided into four aqual narts, if midship depth should not axceed 16 feet; otherwise into aix equal parts.

Breadths are taken at each point of livision of tha depths aod also at the upper and lower points of the depths. The upper breadth of each area is to be set domn in its respectiva column in a lize with No. 1 (left-liand numerals), and the rest in succession.
Tho number of columns for areas will vary according to the length, as in the several classes, and will be equal to the number of parts into which the length is divided plus one.

The spaca or spaces betreen decks above the tonnege deek are dealt with by a similar formula. A mean horizontal area of the space, or cach spaca if mora than ona, is found and multiplied by the mean height.
The permanent closed-in smees above the upper deck availabla for cargo, stores, passengers, or crew are measured in the samo manner by finding a mean area and multiplying by a mean heiglat.
The measurement of net engine room is governed by the arrange ment of the space, and is measured as a mhole or in parts as may bo required by its particular form

The following is an examplo under class 2, depth under 16 feet, of tomnage under tonnage deck:-

This formula is also applinable for fioding displacement tonnage of ehips, that is, the external disphacement measured by taking transerse areas to the height of the load water-line to find tho cubic content, which coutent divided by 35 givea the displacement in tons weight, the diference between the light and load dispiacement repiesentiog the carrying powers of a vessel in tons.
"The rule," asye Mr Moorsom, "is founded on the parest mathematical principles. It was first published io the Philusophical Transactions of the Royal Society of 1798 hy Attwood, in his ' Disquisition on the Stability of Ships,' who there descrihes it as one of those formale invented by Sterling for measuring spaces bounded by irregular curres, founded on Sir Isaae Nowton'a dis. covery of a theoren-a discovery which the imarertal nutbor himself considered anongst his happiest inveutions-by mhich the areas of all enrvilinear spaces not grometrieally quadrible nor discoverable by any known rules of direct investigation are so closely approximated as to amouat to geometrical exactuess."
Mr Allan Gilmour at tha midule of tha present century expressed bis opinion, after a careful consideration of the tonagge question, which ras receiving much attention at that time owing to the law 8 and 9 Vict. cap. 89, which had been arlopted in place of the old tonage law 13 Geo. III. cap. 74, net giving satisfaction, that the "system framerl by Mr Moorsom mill as it were compel every one to build strong fast-sailing, and good scagoing ships, and that, in fact, it will stand as long as the world remains. ${ }^{\text {. }}$ It will be adnitted that great progress has been mado in every way in British shippiag of late jears, and for tl is due praiso must ba given to the influence of the present tonnage laws. (W. $\mathrm{M}^{*}$.)
TONNAGE AND POUNDAGE were customs duties anciently imposed upon exports and imports, the former being a duty upon all wines imported in addition to prisage and butlerage, the latter a duty imposed ad valorem at the rate of twelrepence in the pound ou all merchandise imported or exported. The duties were levicl at first by agreement with merchants (poundage in 1302, tonnage in 1347), then granted by parliament in 1373, at first for a limited period only. They were considered to be imposed for the defence of the realm. From che ctigs of Henry VI. until that of James I. they were usually granted for life. They were not granted to Charles I., and in 1628 that king took the unconstitutional courso of levying them on his own authority, a course denounced a few years later by 16 Car. I. c. 18 , when the Long Parliament granted them for two months. After the Restoration they were granted to Charles II. and his two
successors for life. By Acts of Anne and George I. the duties were made perpetual, and mortgaged for the public debt. In 1787 they were finally abolished, and other modes of obtaining revenue substituted, by 27 Geo . III. c. 13.
Poundage also signifies a fee paid to on officer of a court for his services, c.g., to a sherifi's officer, who is entitled hy 28 Eliz. c. 4 to a poundagy of a ahilling in the pound on an cxecution up to £100, and sixpeuce in the pound above that aum.
TONQUA BEAN. The Tonqua, Tonka, or Tonquin bean, also called the coumara nut, is the seed of Dipterix odoruta, a Leguninous tree growing to a height of 80 fect, native of tropical South America. The drupe-like pod contains a single sced possessed of a fine sweet "nerrmown hay "odour, due to the presence of a crystallizable principle called counarin, to which also the dried stalks of Melilotus officinalis and the verhal grass Anthoxanthum odoratum owe their odour. Tonqua beans are used principally for scenting snuff and as an ingredient is perfuase sachets and in perfumers" "bouquets."

## TONQUIN. See Toxg-kina.

tonsillitis. See Thro.it Disfases.
TONSURE. The reception of the tonsure, in the Roman Catholic Church, is the initial corconony which marks admission to orders and to the rights and privileges of clerical standing. It is administered by the bishop with an appropriate ritual. Candidates for the rite must hare been contirmed, be adequately instructed in the clements of the Christian faith, and bo able to read and write. Those who thave received it are bound (unless in exceptional circumstances) to renew the marh, consisting of a bare circle on the crown of the head, at least once a month, otherwise they forfeit the privileges it carries. A very early origin las sometimes been claimed for the tonsure, but the earliest instance of an ecclesiastical precept on the subject occurs in can. 41 of the council of Toledo ( 633 A.D.): "omnes clerici, detonso superius capite toto, inferius solam circuli coronam, relinquant." Can. 33 of the Quinisext council (692) requires even singers and readers to be tonsured. Since the 8th century three tonsurces have becn more or less in use, known respectively as the Roman,
the Greek, and the Celtic. The first two are sometimes distinguished as the tonsure of Peter and the tonsure of Paul; in the latter the whole head was shaven, but when now practised in the Eastera church this tonsure is held to be adequately shown when the hair is shorn close. In the Celtic tonsure (tonsure of St John, or, in contempt, tonsure of Simon Magus) all the hair in front of a line drawn over the top of the head from ear to ear was shaven.
TONTINE. This system of life insurance owes its name to Lorenzo Tonti, aa Italiaa banker, born at Naples early in the 17 th century, who settled in France about 1650: In 1653 he proposed to Cardiaal Mazario a new scheme he had devised for promoting a pablic loan. His plan was to the following effect. A total of $1,025,000$ livres was to be subscribed in ten portions of 102,500 livres each by ten classes of subscribers, the first class consisting of persons under 7, the second of persons above 7 and under 14, and so on to the tenth, which consisted of persons between 63 and 70 . The whole annual fund of each class was to be regularly divided among the survivors of that class, and on the death of the last individual the capital was to fall to the state. This plan of operations was authorized under the name of "tontine royale" by a royal edict, but this the parlement refused to register, and the idea remained in abeyance till 1689, when it was revived by Louis XIV., who established a tontine of $1,400,000$ livres divided into fourteen classes of 100,000 livres each, the sabscription being 300 livres. Although the classes were not quite filled, this tontine was carried on till 1726, when the last beneficiary died,-a widow who at the time of her decease was deriving from this source an annual income of 73,500 livres. Several other Goverament tontines were afterwards set on foot; but in 1763 restrictions were introduced, and in 1770 all tontines at the time in existence were wound up. Private tontines continued, however, to flourish in France for some jears, the "tontine Lafarge " having been opened as late as 1791.
Tho tontine principle has often been applied in Great Britain, chiefly to the purchase of estates or the erection of buildings for which the necessary funds could not be procured by ordinary methods. The speculative element in the system has proved an attraction. The investor etakes his money on the chance of hia owa life or the life of his nomioce enduring for a longer period than the other lives involved in the speculation, in which case he expects to win a large prize. The only thing which will aerve to distinguish this from an ordinsery lottery is the assumption that some may apply greater care or skill in the aelection of lives than others of the players. The tontine principle is nearly the converse of ordinary life assurance, where it is the man who dies early who obtains an advantage for his heirs at the expense of the long liver. But it has been occasionally introduced into life assurance in the distribution of profits or surplus, and so far it teads to redress the inequalities of the original contract, the profts being assigued to the longest livers to a larger extent then in the common life assurance system. The tontine principle has been brought into considerable prominence ky some American life offices (see IneukANCE, vol. xiii. p. 183). All that is wanted to meke the system fair is that every one should understand that in order to secure a dis. proportionste share of profits in the event of his surviving and keeping up his policy he must make a correspondiog earribice if he dies early or discontinues his insurance.

TOOKE, John Horne (1736-1812), an ardent politician and an erudite philologer, was the third 60 of John Horne, a poulterer in Newport Market, whose business the son, when a pupil at Eton with other boys of a more aristocratic position, in early life happily veiled under the title of a "Turkey merchant." He was born in Newport Street, Long Acre, Westminster, on 25 th June 1736. Some portion of his school days was passed, when he was about seven years old, in "an academy in Sobo Square," and when three years older he went to a school in a Kentish village. For a time (1744-46) he was at Westminster School, but the greater part of his education was got st. Eton, and then under private tuition
first at Sevenoaks in Kent (1753) and then at Ravenstone in Northamptonshire. In 1755 he was entered at St John's College, Cambridge, and took his degree of B.A. in 1758, as last but one of the senior optimes, Beadon, his life-long friend, afterwards bishop of Bath and Wells, being among the wranglers in the same year. Strange to say, the object of all this care and expense found hinself doomed to the drudgery of ushership at a boarding school at Blackheath, and the pleasures of bis lot were not enhanced by his father's strongly expressed desire that he should take orders in the Church of England. A strange vaciliation marked his career at this period, a vacillation probably due to a constant struggle between his owa iociination and the wishes of his father. He was admitted to the diaconate of the church, and almost at the same time was entered at the Inner Temple. He studied for the bar for some time, mostly in the company of Dunning and Kenyon, and then was ordained as a priest of the national church by the bishop of Salisbury. After this event his father obtained for him the next presentation to the small vicarage of New Brentford, to which Horne was duly admitted, and he retained ite scanty profits until 1773. During a part of this time he was absent on a tour in France, acting as the bear-leader of a son of the miser Elwes. To his credit be it said that while he resided at Brentford he discharged with exemplary regularity all the duties of his profession, and that, reviving a practice of the previous century, he studied medicine for the benefit of his poorer parishioners. Under the excitement created by the actions of Wilkes and the blunders of his ministerial oppoaents, Horne plunged into politics with consuming zeal. The newspapers abounded with his productions, but his chef effort was a scathing pamphlet on Lords Buto and Mansfield, setting out the "petition of an Englishman." In 1765 he again went abroad as tutor, and on this occasion he escorted to Italy the son of a Mr Taylor, who lived near his Middlesex parish, a young maar subject to fits of insanity. It was while passing through Paris on this tour that he made the persoaal acquaintance of Wilkes, and it was while at Montpellier, in January 1766, that a letter addressed by Horne to Wilkes laid the seeds of that personal autipathy which afterwards grew so rapidy. In the summer of 1767 the travelled parson landed again on English soil, and, in spite of his latent distrust of the so-called "patriot," his exertions quickly obtained for Wilkes that seat for the county of Middlesex which ensured his fortune. Horne was deeply concerned in all the proceedings of the corporation of London in support of the popular cause, and he advised, if he did not actually draw up, the celebrated speech which Alderman Beckford addressed' to his sovereign. As an incidental act in this struggle with the court and the majority of the House of Commons, Horne involved himself in a dispute with George Onslow, the member for Surrey, which culminated in a civil action, nltimately decided in Horne's favour, and in the loss by his opponc at of his seat in parliament. An influential association, called "the Society for Supporting the Bill of Rights," was founded, mainly through the exertions of Horne, in 1769, but the members were soon dlvided into two opposite camps of the thick and thin partisans of Wilkes and of those who refused to be labelled by the aame of any combatant, and in 1770 Horne and Wilkes broke out into open warfare. Into this controversy, carried on with that unflagging zeal which always springs from personal hatred, none will now care to enter; it benefited the fortunes of neither of the combatants, and it- damaged the success of the cause for which they had both laboured energetically. In 1771 Horne obtained at Cambridge, though not without some oppositiou from membere of both the politica.
parties, his degree of M.A., and in the same year he embarked on a more laborious and costly undertaking, that of vindicating the right of printing an account of the debates in parliament, in which, after a protracted struggle between the ministerial majority and the civic authorities, the right was definitely established. The energies of the indefatigable parson knew no bounds. In the same year (1771) he crossed swerds with Junius, and ended in disarming his masked antagonist. It is a curious corollary to this controversy that more than one speculator has identified him with Junius. Horne had now passed more than Lalf the alletted span of life, and his only fixed inceme consisted of those scanty emoluments attached to a position which galled him daily. He resigned his benefice, and betook himself to the study of the law and to his studies in philology. An accidental circumstance, however, occurred at this moment which largely affected his future. His friend Mr William Tooke had purchased a considerable estate south of the town of Croyden in Surrey, part of which seems to have consisted of Purley Lodge in Coulsdon.' The possession of this preperty brought about frequent disputes with an adjoining landowner, and, after many actions in the law courts, the friends of Mr Tookc's opponent endeavoured to obtain, by a bill forced through the Houses of Parliament, the privileges which the law had not assigned to him. Horne thereupon, by a bold libel on the Speaker, drew public attention to the case, and, although he bimself was placed for a time in the custody of the sergeant-at-arms, the clauses which were injurious to the interests of Mr Tooke were eliminated from the bill through the publicity which bis conduct had given to the matter. Mr Tooke's gratitude knew no bounds; he declared his intention of naking his friend the heir to his fortune, and, if the design was never carried into effect, Horne derived from the generous old man during his lifetime large gifts of money. No sooner had this matter been happily settled than Horne found himself invelved in a more serious trouble than any that bad yet befallen him. For his conduct in signing the advertisement soliciting subscriptions for the relief of the relatives of the Americans murdered by the king's troops at Lexington and Concerd, he was tried at the Guildaall in July 1777 before Lord Mansfield, found guilty, and committed to the King's Bench prison in St George's Fields, from which he only emerged after a year's durance, and after a loss, in fine and costs, amounting to $£ 1200$. Soen after his deliverance, as he had thrown off, as he thought, his clerical govn, he applied to be called to the bar, but his application was negatived on the ground that his orders in the church were indelible. To return to the church was now impossible ; and Horne tried his fortune, but without success, in farming some land in Huntingdonshire. Two tracts which were penned by him, one before and the other after this failure in practical life, exercised great influence in the country. One of them, criticizing the measures of Lerd North's ministry, passed through numerous editions; the other set out a scheme of 'reform which he afterwards withdrew in faveur of that advocated by Pitt. On his return from his veluntary banishment in Huntingdonshire, he became once more a frequent guest at Mr Tooke's house of Purley, and in 1782 assumed the name of Horne Tooke, which is now invariably assigned to him. In 1786 Horne Tooke conferred perpetual fame upon his benefactor's country house by adopting as a second title of his elaborate philological treatise of "Eтєа IItєро́єта, the more popular though misleading title of The Diversions of Purley. The treatise at once attracted attention in England and the Continent, was universally read by the vulgar as well as the learned, and, while its conclusions, if not always carrying conviction to the erudite, were
deemed by them worthy of consideration as proceeding from a mind of extensive learning and singular acutoness, the fame given to Purley by the choice of the title gratified its ewner. The first part was published in 1786, the second in 1805. The bést edition is that which was published in 1829, under the editorship \& Richard Taylor, with the additions written in the author's interleaved copy.

Betwcen 1782 and 1790 Tooke gave his support to Pitt, and in the election for Westminster, a constituendy in which Fox was vitally interested, he threw all his energies into the ministerial cause. With Fox he was never on terms of friendship, and Samuel Rogers, in his Table T'alk, asserts that their antipathy was so pronounced that at a dinner party given by a prominent Whig not the slightest notice was taken by Fox of the presence of Horne Tooke. It was after the election of Westminster in 1788 that Tooke depicted the twe rival statesmen in his celebrated pamphlet of Two Pair of Portraits. At the general election of 1790 he came forward as a candidate for that distinguished constituency, in opposition to Fox and Lord Hood, but was defeated; and, though he again sought the suffrages of its voters in 1796, and his spceches at the hustings were never exceeded in ability, he was again at the bottom of the poll. Meantime the excesses of the French republicans had unhinged the minds of all sections of society in England, and the actions of the Tory ministry faithfully represented the feelings of the country. Horne Tooke was arrested early on the morning of 16th May 1794, and conveyed to the Tower. His trial for high treason lasted for six days (October 17-23) and ended in his acquittal, the jury only requiring the short space of eight minutes to settle their verdict. The evidence which the crown could adduce in support of the charge proved to be of the slightest description, and the demeanour of the accused throughout the proceedings furnished abundant proofs of the resolution of his mind and the force of his abilities. His public life after this event was only distinguished by one act of importance. Through the influence of Lord Camelford, the fighting peer, he was returned to parliament in 1801 for the pocket borough of Old Sarum. No sooner was he returned to, the House of Commons than Lord Temple endeaveured to secure his cxclusion on the ground that he had taken orders in the church, and one of Gillray's caricatures delineates the two politicans, Temple and Camelford, playing at battledore and shuttlecock, with Horne Tooke as the shuttlecock. The ministry of Addington would not support this suggestion, but a bill was at once introduced by them and carried into law, which rendered all persons in holy orders ineligible to sit in the House of Commons. The parliamentary life of the member for Old Sarum was preserved through one parliament, but at its exniration he was excluded for ever.

The last years of Tooke's life were spent in retirement in a house on the west side of Wimbledon Common, and there he was visited by the leading members of the party of progress. The traditions of his Sunday parties bave lasted unimpaired to this day, and the most pleasảnt pages penned hy his biograyher describe the politicians and the men of letters who gathered round his hospitable board. His conversational powers rivalled those of Dr Jehnson; and, if more of his sayings bave not been chronicled for the benefit of posterity, the defect is due to the absence of a Boswell. Through the liberality of his friends, his last days were freed from the pressure of poverty, and he was enabled to place his illegitimate son in a position which soon brought him wealth, and to leave a competency to his two illegitimate daughters. Illness seized him early in 1810, and for the next two years his sufferings were acute. : He died in his house at Wimbleảen on 18th March 1812, and his body
was buried with that of his mother at Ealing, the tomb which he had prepared in the garden attached to his house at Wimbledon being found unsuitable for the interment. An altar-tomb etill stands to his memory in Ealing churchyard. A catalogue of his library was printed in 1813.
The Life of Horne Tooke, by Alexander Stephens, is written in an auattractive atyle, snd was tha work of an admirer only sidmitted to bis acquaintance at the close of his days. Its msin facts are feproduced with more brightness in an esssy by Mr J. E. Thorold Fogers in the second saries of his Historical Gleanings. Msny of Hoine Tooke'a wittiest sayings sre preserved in the Table Talk of Samuel Rogers and S. T. Coleridga.
(W. P. C.)

TOPAZ. It appears that the stone described by ancient writers ander the name of romáfios, in allusion to its occurrence on the island of Topazion in the Red Sea, was the mineral which we now know as the chrysolite or Peridote (q.v.). The topaz of modern mineralogists was nnknown to the ancients. Topaz occurs either crystallized, in association with granitic rocks, or in the form of rolled pebbles in the beds of streams. The crystals are ortho rhombic prisms, with a perfect cleavage parallel to the base, or transverse to the long axis of the prism. This cleavage is recognized by the lapidary as the "grain" of the stone. It is notable that crystals of topaz are commonly hemimorphic; in other words, the prisms are terminated by dissimilar faces. This hemimorphism is associated with the property of pyroelectricity (see Mineralogy, vol. xvi. p. 376). The chemical composition of the topaz has given rise to much discussion, but the mineral is now generally regarded as a silicate of aluminium associated with the fluorides of aluminium and silicon. When strongly heated it suffers considerable loss of weight. Brewster, examining the topaz microscopically, detected numerous fluid cavities, whence he concluded that it had been formed in the wet way. Two of the fluids obtained from these cavities liave received the names of brevosterlinite and cryptolinite. Some of the finest topazes are almost colourless, and may be occasionally mistaken for diamonds. The topaz, however, is inferior in harảness; it lacks "fire"; and it becomes electric wher heated-a property not possessed by the diamond. Colourless topazes are known to French jewellers as gouttes deau, and in Brazil as pingas d"agoa-names which refer to the limpidity of the stone-while in England they pass in trade ander the curicus name of minas novas. The beauty of the stons is best developed when in the form of a brilliant. The topaz is cut on a leaden wheel by means of emery, and is polished with tripoli. Coluured topazes are usually either yellow or blue. The pleochroism of the stone is very marked: thus the colour of the sherry-yellow crystals from Brazil is resolved by the dichroiscope into brownish yellow and rose-pink. The colour is unstable, the yellow topaz especially being liable to suffer bleaching by exposure to sunlight. Hence the fine series of crystals of Siberian topaz from the Kochscharow collcetion, now in the British Museum, is carefully protected from light by means of opaque pasteboard caps. In 1750 a Parisian jeweller named Dumelle discovered that the yellow topaz of Brazil, when exposed to a moderate heat, assumed a rose-pink colour. It is generally believed that all the pink topaz occurring in jewellery owes its tint to artificial treatment. Formerly it was the practice to lieat the stone in a sandbath, but the change of colour is now generally effected by wrapping the stone in German tinder, which is then ignited. This "burnt topaz" is sometimes knowa to jewellers as "Brazilian ruby." In like manner the blue topaz occasionally passes under the name of "Brazilian sapphire," and the pale green as "aquamarine"-a name which is strictly applicable only to the sea-green beryl. The largest knuwn cut topaz is a fine brilliaut, weighing 368 carats, and termed the "Maxwell Stuart topaz."

The topaz is oceasionally fonad in Britain, but uanally in amall crystals unfit for jawallery. It occurs in granita at St Michael's Mount in Cornwall, in Lundy Island, and in Arran, but the firiest British spacimena aro obtained from the Highlands of Scotland. Ben-a-hourd, one of the Cairngorm group, vields good blue crystals. Topaz occurs in colourless and blue crystals in the granito of the Mourne Monntains in Ireland; and microscopic crystala are not uncommon in certain other granites. The famoue topaz-rock of the Schneckenstain, in Sazony, yíelds psle yellow crystals of great beanty as mineralogical apecimens, but not snited for cutting. Tha yallow Saxon topaz does not scem to change colour on exposure to heat. Some of the finest topaz comes from near Odon Tchelon, in Siberis; while the well-known deep-yellow crystals of Brazil occur near Villa Rica (Ouro Preto). Fine topaz, palo blue and colourless, is found, as rolled crystals, in Tasmania aud on Flindere Island in Bass'a Strait. It also occurs in the tin-drifts of New South W6les ; and beantifully-formed limpid crystals, of small size, secompany stresm-tin at Durango, in Mexico. Fine topaz fit for jewellery has recently been worked at the Platte Mountain, noar Pike's Peak, Colorado. One stona, weighing 125 carate, has been described as boing "as fina a gem as America has produced of any kind " (Kunz, 1885). Topaz also occurs iu cavities in rhyolita at Nathrop end Chalk Monntain, Colorado, and in trachyte near Sevier Lake, Utah. It is likewiso fond in Arizona, in New Mexico, and at Stoneham, Msina.

Oriental topaz is the name aometimas givan to yallow corundum, a mineral which is resdily distinguished from ordinary topaz by its euperior hardness and density. The yellow and suoky varieties of quartz, or cairngorm, are often known in trade ss Scocch topaz, but these are inferior to true topaz in hardness aud in density. The chief differences between tha three may be thua axpresaed:-

|  | Scotch Topaz. | Trua Topaz. | Orlental Topaz. |
| :---: | :---: | :---: | :---: |
| Hsidness | 7 | 8 | 9 |
| Spacific gravity .... | 2.6 | 3.5 | 4 |
| Crystallization....... | Heragonal. | Orthorhombic. | Hiragonal |

TOPEKA, \& city of the United States, the county seat of Shawnee county and the capital of the State of Kansas, is siluated ( $39^{\circ} 3^{\prime} \mathrm{N}$. lat. and $95^{\circ} 39^{\prime}$ W. long.) for the most part upon the soutll bank of the Kansas or Kaw river, upon a level prairie bench considerably elevated above the river. A small portion, known locally as North Topeka, lies upon the north side of the river. Besides the State capitol, which is an imposing building in the midst of an extensive park, the city contains the State insane asylum and the reform school. The Atchison, Topela, and Santa Fe Railroad Company has its offices and workshops here, and the city is also intersected by a branch of the Union Pacific line. In 1860 Topeka had only 759 inhabitants; in 1870 the number had risen to 5790 . In 1880 tho population was 15,452 ( 8140 males and 7312 females) ; and in 1886 the number is returned at 25,005 , making Topeka the second largest city in the State. The assessed valuation in 1886 was $\$ 6,547,079$, and the debt of the corporation only $\$ 422,900$.

TORCELLO, a small island 6 miles north-east of Venice, now almast deserted, but once a place of much importance. Torcello was one of the parent islands from which Venice was colonized, and possessed a cathedral church long before St Mark's was founded. In the 11th century Torcello had already begun rapidly to decline. The existing cathedral of S. Maria is a building of the highest ecclesiological importance, unique in Europe as a perfect example of the arrangement of the choir in the 6th or 7 th century, when the original cathedral was built, and, though most of the upper structure was rcbuilt by Bishop Orseolo ${ }^{1}$ about 1008 , the plan of the church and the fittings of the choir still exist as they were originally designed. The church consists of a nave, with ten bays of arches on marble monoliths, and three aisles each terminated by an apse. Round the walls of the central apse are six tiers of seats for the officiating clergy, and, in the centre, raised above the others, a marble throne for the bishop, approached by a flight of steps (eee vol.

[^186]iiii. p. 418, fig. 16). The high altar stood in front of the steps, and the celcbrant stood with his back to the apse, louking over the altar towards the congregation. An pxactly similar arrangement still exists in many of the carly Coptic churches of Old Cairo: the church of Abiu Sergeh is a specially perfect examplo. ${ }^{1}$ When the church was reconstructed in luU3, Bishop Orseolo did not interferc with the older and then olsolete arrangements of the choir, but added a later choir, formed by marble screens, projecting three bays into the nave, with seats along three sides of the enclosure,-an arrangement like that wh:ch still exists in the church of S. Clemente in liome (see Rome, vol. xx. p. 833). The present choir-stalls date from the 15 th century. A fine marble ambo was at the same time placed outside the cancelli, and the position of the celebrant at the high altar was reversed. The vaults of the three apses are covered with nine glass mosaics, added probably in the 12 th century: in the centre is a large figure of the Virgin, with the twelve apostles below; other mosaics cover the vaults of the aisle-apses and the whole eutrance wall. The latter, much restored, has scenes of the Crucifixion, the Doom, and Heaven and Hell. The sculpture of the nave capitals and on the marble cancelli is very gracelul work of By zantine sty le, closely resembling similar panels at Raveuna. - One remariable peculiarity of this church is the marble shutter which closes each window on the right wall ; these have pivots which revolve in projecting corbels-a very early method of closing windows of which very ferv examples still exist. Even when the shutters were closed some dim light passed through the semitranslucent marble slabs. ${ }^{2}$ An octagonal baptistery, also built by Bishop Orseolo, stood outside the main entrance to the church, but has been rebuilt on a smaller scale. The crypt under the central apse of the cathedral is probably part of the original church, unaltered by any later changes. ${ }^{8}$ The sinall church of S. Fosca, which is connected with the cathedral by a loggia, is also a building of exceptional interest, dating from the 10th century. It is purely Oriental in plan, and much resembles that of St Mark's at Venice and S. Vitale at Ravenna, on a small scale. It has a cruciform nave, with a large dome supported on sight columns, and a projecting choir with three apsess Externaliy it is surrominded by a loggia, supported on marble columus with rich Byzantine capitals. S. Fosca was partially rebuilr in the 1 2th century, and has since been much modernized, but its original very interesting plan still remains but little changed.

TORGAU, a fortified town in the Prusstan province of Saxony, is situated on the left bank of the Elbe, 30 miles north-east of Leipsic and 26 niles south-east of Wittenberg. Its most conspicuous building is the Schloss Hartenfeis, on an island in the Elbe, begun in 1481 and completed in 1544 by the elector Joln Frederick the Magnanimous This castle is one of the largest Renaissance buildings in Germany, and contains a chapel consecratzd by Luther in 1544. The town-house is a quain! building of the middle of the 16 th century, and thcre are several other large and fine buildings, chiefly modern. The parish church contains the tomb of Catherine von Bor 1 , Luther's wife. The once flourishing weaving and brs ving industries of Torgau have declined in modern t'r.es; but the town bas manufactures of gloves and

[^187]iniscellaneous articles, and carries on trade in grain, \&c., on the Elbe and by rail. The fortifications, begun in 1807 at Napoleon's command, arc largely surrounded with water; they include a tête-de-pront at the end of the bridge across the Elbe. In 1885 the population was 10,988 (in 1783 4000), a large proportion of them soldiers.
Torgall is saill to have existell as the cayital of a distinct principality in the time of the enperor Henry li, but ly $^{2} 305$ it was in the possession of the margrave of Jluissein lt was a frequent residence of the electors of Saxony. In Reformation tinses Torgar appears as the spot where Joha of Saxony and Plilip of Hesse formed their league against the Romau Catholic innerial cstates; and the Torgau Articles, drawn up here by Lnther in 1530 , were the basis of the Angsturg Confession. The Thirty Ycars' War intlicted great suffering on the town. In 1760 Freilorick the Great defeated the Austrians in the ucighbounhool of Torgan. The town capitnlatod to Tauentzien on Jauuary 10, 1814, after a siege of three montlis.

TORONTO, the capital of the proviuce of Ontario end the second largest city in the Dominion of Canada, is situated on a large and finely sleltered bay on the north shore of Lake Ontario, between the rivers Don and Humber. The naguetical and meteorological observatory, in the university grounds, sfands at a height of 108 feet above the lake, and approximately 342 fcet aloove the level of the sea, in lat. $43^{\prime} 39^{\prime} 35^{\prime \prime} \mathrm{N}$., long. $79^{\circ} 23^{\prime} 39^{\prime \prime} \mathrm{W}$. Toronto is 39 miles north-east of IImilton, at the bead of Lake Ontario, and 310 miles west-south-west of Muntreal. The bay is formed by a peninsula or island about 6 miles loug, enclosing a fine basin of 3.44 square miles, with a narrow entrance at the west end. This forms a safe and comroodious harbour. The city stands on a thick deposit of boulder clay, overlying slaly gandstones of the Cincinnati or Hudson River group, practically cquivalent in

position to the Caradoc horizon of British geology. These thin-beaded sandstones crup out on the lake shore, and have been quarried for flagsing and building purposes at the mouth of the Humber. In the northern part of the city the boulder clay is overlaid by stratified clays of the Post-Glacial age, largcly used in the manufacture of bricks, of which many of the honses are built. The site slopes gradually from the margin of the bay for a distance of 3 miles to a tcrrace or ancient lake margin immediately outside the northern limits of the city, which occupics an area of 12.83 square railes, or of $17 \cdot 99$ square miles including the barbour and island. The streets cross each other at right angles. Yonge Street, the main tiorough-
fare running north and south, was constructed as a great military road in 1796, and extends under the same name, for upwards of 30 miles, to Lake Simcoe. It constitutes the dividing line of the city, the streets being reckoned east or west according to their relation to it.

The city is the seat of the provincial Gevernment, with the official residence of the lieutenant-governer, the parliament buildings and Government offices, the courts of law, and the educational departmental buildings for Ontario. The provincial legislature occupies the old parliament buildings erected in 1849, when Toronto was the capital of Upper Canada; but they have long been recog. nized as inadequate for the purpose. Plans have accordingly been prepared, snd the new buildings are now in process of erection. The site is in the centre of the Queen's Park, a finely wooded park of upwards of 30 acres, originally laid out for the provincial university, and on which the old buildings of King's College stood. The new university building occupies a fine site immediately to the west. It is an imposing structure, of great architectural beauty, in the Norman style, with a massive central tower. The buildings of the provincial school of practical science, and of the magnetical observatory, are also erected in the university grounds. The observatory is one of the meteorological stations established by the British Government, on the recommendation of the Royal Society, in 1840. It is now maintained by the Dominion Government.

The unirersity, University College, and the school of practical science embrace in their conjoint teaching a comprehensive system of training in arts and science; and in them upwards of 500 students receive their training in arts, in the natursl and applied eciences, and in engineering. There is also a medical faculty, reorganized under a recent Act, in conjunction with the department of science in the university. The university and college constitute unitedly the state institution maintained by public funds, and strictly secular. But it is surrounded with the theological and training colleges of different denominations in affilistion with it, the students of which pursue their andergraduate course in the university for a degres in arts. The affiliated colleges, some of which give degrees in divinity, include Knox College (Presbyterian), Wycliffe College (Church of England), St Michael's College (Roman Catholic), Macmaster Hall (Baptist), and Victoria College (Methodist). Besides the provincial university and its affiliated colleges, Trinity College (Church of England) gives instruction in divinity and arts, and confers degrees in all the faculties. Toronto and Trinity medical schools occupy convenient buildings in the immediate vicinity of the genersl hospital, the Burnside lying-in hospital, and the Mercer eye and ear infirmary. The students in medicine number nearly 500 , including a small number of lsdy students, for whom special instruction is provided. Upper Canada College, founded in 1829, is a provincial institution analogous to one of the great English public schools. It has about 300 students. The Collegiate Institute occupies a fine building immediately to the west of the horticultural gardens. It is the higher school, forming an important feature in the provincial system of education, and is maintained, along with the free public schools, from local taxes. Its students number 443 , of whom 182 are females.

Osgeode Hall, the seat of the superior courts of law and equity, is an ornate Italian building, extended at various dates. The provincial asylum for the insane affords accommodation for upwards of 700 patients; it is sarrounded with recreation grounds extending to 50 acres.

The city charities are numerous and well organized. The churches include some large and handsome buildings. Among the mere important public buildings are those of
the educational department, including a museum and gallery of art, normal and model schools; the custorshouse, a fine Renaissance building, with extensive warehouses attached; and the post-office, also of tasteful architectural design. The free city library occupies a commodious building in Church Street, in addition to branch libraries in different parts of the city. It contains upwards of 47,000 vols. There are 35 city public schools, occupying large and commodious buildings, with 262 teachers and 20,213 children. The separate (Roman Catholic) schools number 13, with 60 teachers and 3792 children.

Teronto is the seat of many flourishing industries, including foundries, tanneries, furniture, stove, shoe, and other msnufactories, flour-mills, breweries, \&c. The site of the city is favourable to commerce. It is the centre of a rich agricultural district ; and its harbour is of easy access to the largest vessels that navigate the lakes. It lies directly opposite the mouth of the Niagara river, distant 40 miles; and throughout the season of navigation wellappointed steamers maintain communication with the principal routes of travel in the United States and Canada. By means of the Grand Trunk, the Great Western, the Northern, the Canada Pacific, and other railways, it forms an important commercial centre for distribution; and it is the seat of the head offices of most of the banks and of the chief wholesale trade of western Canada. The direct route from the lower lakes to Lake Superior and the great North-West is by the Northern Railroad to Geergian Bay, where lines of steamers maintain constant communication from Collingwood and Owen Sound to Prince Arthur's Landing and the railways to Manitoba and the North-West.

In 1861 the populstion numbered 44,821 ; in 1871 it had increased to 56,092 ; in 1881 to 86,415 ; and in 1887 it is believed to amount to 146,000 . The actual number on the assessment rolls is 111,800 . The estimated value of real estate in Toronte is $\$ 105,000,000$. The assessed value in 1886 was $\$ 83,556,811$. The annual revenue of the city is estimated for 1887 at $\$ 1,812,941$. The amount of customs duties for the fiscal year ending 30th June 1887 was $\$ 4,273,038$. The value of exports to the same date was $\$ 3,192,157$, and of imports $\$ 21,020,528$. The city returns three members to the Canadian House of Commons. and three to the provincial legislature of Ontario.
In the deapatches of Canadian officials of Louis XIV. in the 17th century Toronto means the country of the Hurons, a region lying between Lake Simcos and Lake Huron, about 40 miles north. The river Humber, which euters Lake Ontario immedintely to the west of the Bay of Toronto, though navigable only for a short distance eveu by canoes, formed with its portages a line of communication between Lake Ontario and the Huron country. Hence the station near the mouth of the river became the common landing-place for trading and hanting parties bound for the region known of old as Torunto, and so received its name. A French trading post, built there in 1549, and origirally named Fort Rouille, after the French colonial minister Anvine Louis Rouillé, comte de Jouy, was familiarly known as Fort Toronto. Tho Northern Railway, the first one constructed in Upper Canada, followed the route of the old Indian trail, and established a direct line of communication, by means of steamers from Collingwood, with Lakes Huron, Michigan, and Superior. The railway passcs through a fine agricultural country, and is uow extended into the Muskoka and Nippitsing districts, bringing an extensive lumbering region into direct comannication with Toronto.

The site for the town was survejed in 1793 by Surveyor-General Bouchette, under the instructicn of the lieutenant-governor, General Simcoe; and in his narrative of the original sarvey Bouchette describes the untamed aspect of the scene, with the group of wigwams of a little band of Mississaga Indians who conatituted the sole occupants of the lond; while the waters of the bay and the neighbouring marshes were the haunts of innumerable coveys of wildfowl. The first parliament of Upper Canada held its eecond session in May 1793 at the town of Newark, at the mouth of the Niagara river; but iu the following August the seat of government was transferred to Toronto, to which General Simcoe gave the name of York, in honour of the duke of York, the second вon of George III. Under its new name tho embryo me:tmpolis
"Elowly progressed as the surrounding ceuntry was cleared and settled. The entrance to the harboar was guarded by two block houses; provision was made for barracks aud garrison stores; luildings were erected for the legislature;, and there the membere of parliament, anmmoned by royal proclamation to "meet us in our provincial parliament in our town of $\bar{l}$ ork," assembled on the lst of June 1797. Sixteen fears later the population numbered only 456 . The town was twice ascked in the war of 1812. General Dearborn captured it at the head of a force of upwards of 2000 drawn from the neigh bouriog Statee. On their advance to the outworka of the garrison, the magazine of the fort expladed, whether by accident or design, killing mauy of the invaders. The halls of legislature and other buildings were burnt, and the town pillsged. On the restoration of peace the work of creating a capital for Upper Cansda had well nigh to begin anew. But tho city advaoced with the general progress of the country. Trade centred in the little capital; the population increased; and needful manufactures wele established. The organiza. tion of Upper Canads College in 1830, with e staff of teachera nearly all graduates of Cambridge, gave a great impetus to the city and pro. vince. In 1834 the population of York numbered fully 10,000 ; and an Act of the provincial legislature conferied on it a charter of incorporstion, giring it for the first time an efficient aystem of municipal government, with a mayor, aldermen, and councilmen, eutrusted with the administration of its affairs." Uuder this charter it was constituted a city, with the name of Toronto.
(D. W.)

TORPEDO. Torpedoes may be briefly described as charges of some explosive agent, enclosed in water-tight cases, and moored or propelled under water at such depths that by their explosion they may sink or seriously damage a. vessel in their vicinity. The use of torpedoes in naval warfare was proposed and even attempted in the end of the last and beginning of the present century, but no successful application of them was made until the American Civil War of 1861-64. The word "submarine mine" is generally substituted for "torpedo" when speaking of defensive or stationary mines, the latter term being reserved for locomotive torpedoes, or others used in offensive operations.

1. Submarine Mines. - Submarine mines are divided into three classes:-(1) observation mines, fired by an electric current when the enemy is observed to be within the destructive area of the mine; (2) electro-contact mines, which, when struck, fire by automatically completing the electric circuit from the battery ashore; (3) mechanical mines, which, when struck, fire through the action of some contrivance withln themselves, and are not connected with the shore. Mines of the first class are used in places where a channel has to be kept clear for screw steamers to pass, the eecond class in those parts of the channel where there is little traffic, and the third class in channels which it is intended to bar equally against friend or foe.

Flectrical mines have the advantage over mechanical that by the removal of the firing battery the passage of a ship is rendered perfectly safe, and that the condition of the mine can be ascertained by electrical tests, but the electric cables are liable to damage, and add greatly to the expense of the defence.

Gun-cotton and dynamito are the explosives generally used in mines, the charges varying from 30 tb to 500 lb , according to the description of mine. In all mines the charge is exploded by means of a detonator con. taining fulminate of mercury. In mines loaded with gun-cotton the detonator is inserted in a priming charge of dry gun-cotton, this priming charge being in a metal case, closely surrounded by the wet gun-cotton comprising the remainder of the charge. Where dynamite is employed the priming charge is not necessary. Experiments made to determine the horizontal distance at which an ironcled will be vitally injured by different charges have vielded the following general results :-

| Charge. | Submergence. | Distance. |
| :---: | :---: | :---: |
| 150 to mine. | 10 to 15 ft . | 4 [t. |
| 250 to ground mine | 30 ft . | 10 ft . |
| 500 th ground mine | 60 ft . | 15 ft . |

The explosion of 500 Jb of gun-cotton at a horizontal distance of 30 feet would seriously injure a vessel, and 30 tb in contact with the bottom below the armour would probably blow a bole through the outer and inner skin. The depths given above are approximately the best depths to get the fullest effect out of the charges mentioned. When the water is so deep that if the uine were placed on the bottom it could not esert its full destructive effect on the bottom of a ship, it is given enough buoyancy to allow it to float above its moorings, - a mine on the bottom being termed a "ground mine," and a mine floating above its moorings a " buoyant mine."

If mines are placed ton close together the explosion of one will damage those near it, the interval which must be left between them being-for a 100 D mine, 100 feet; for a 250 tb mine, 250 feet ; and for a 500 db mine, 300 feet. There is therefore alwaye a porsibility of a ship passing through a single line of mines without coming within the destructive area of any. Mines are therefore generally arranged in. two or more lines, the mines of one line covering the spaces left between the mines of the next, or several mines may be laid close together, and the whole exploded simultaneousiy.

The electric circuit of all electrioal mines is very similar. A voltaic battery ashore has one pole put permanently to earth and the other pole joined to the electric cable leading to the mine. This cable passes into the mine case through a water-tight joint, and is connected up to one pole of the electric detonator, the other pole of the deton ator being connected to the month-piece of the mine and consequently to earth. To prevent the mine being fired until the proper moment has arrived, this circuit must be broken somewhere, and means provided for completing it when the mine is to be fired. In the case of observation mines this is done by inserting a fring key in the electric cable uear the battery, and in electro-contact mines by a circuit closer in the mine.
The right moment to fire an olservation inine is determined by obsertwo observers ashore, who have each adjusted two sights in line vation with the mine, as it was lowercd into position, -the stations for mine these observers being chosed so that their lines of sight may be as nearly as possible at right angles to each other. The clectric cable from the mine is led past both observers and comected to a fring battery, oue pole of which is put permanently to carth. A firing key inserted in the circuit at the station of each observer renders the aimultaneous pressure of hoth keys necessary to explodo the mine. If each observer depresses his firing key as the centre of the enemy crosses his own line of sight, both keys can only be pressed simultaueonsly if the enemy arrives at the intersection of the two lines of sight, and conscquently over the mioe. When many mines are placed in one chamel, it is usual to moor them in three lines, the prolongation of cach line converging to su olserving statiou, where the direction of each line is nnsrked by sights. The electric cables from all the mines come to snother observing station, and are there connected to scparate firing keys, cach of which has one pole joincd up to a firing tattery. The observer at this station is slso provided with a separate sight marking tho direction of each mine in all the lines. The former station is termed tho "converging" and the latter the "firing" station. The obscrver at the converging station telegraphs to the firing station the instant at which tbe contre of the encmy is ou one of tho lines of mines, the observer st the firing statiou determining by means of his sights which individual mine the enemy is over, and he can fire it by pressing the corresponding key.

Insteac of separate sights for each pine, obscrving urcs may be used. These instruments are furnished with a telescopo, whicb can be constantly directed on the encmy, a bar attachmeot automatically clesing the circuit when the direction of the coeny corresponds to a mine. The camera oliscura has also been used for determining the positios of an enemy in the mine field.

Electrocontact mines aro buoyant mines moored about 10 fect below the surface, and are in connexion with an electric baftery ashore. They are arranged to explode on bcing struck by a lassing ahip, by mesns of an sparstus contaiued in the mine itself, called a circuit closer. Many different kinds of circuit closers aro in use, but they all depend upon there being a break in the clectric circuit while the circuit closer is at rest, the circuit closer completing the circuit when the mine reccives a blow. That most commonly used umes.

Wlectro
(fig. 1) consists of a stcel spindle a carrying a weight $b$ on ats upper cnd. This steel spindle carries an insulated brass ring $c$, to which the wiro from the dotonator $d$ is attarhed, the other pole of the detomator being connected to the cable e leading to the electric battery. Po the mine beirgstruck the inertia of tho weight causes the steel rod to vibrate sufficiently to bring the insulated ring in contaet with brass springs in connexion with the earth, thus completing the circuit of the electric battery through the detonators. Anotlier form of circuit closer is a tube of mercury, which by splashing up when the mino is struck completes the electric circuit between two previously insulater points.

- A single main cable from the battery may have several electro-contact miues attaches to it ; the expense of leading a separate wire from each mine to the battery is therefore avoided. If one mine was fired tho broken thd of its branch wire from the main cable would be left in the water, and on mother mine being struct it wonld only rece e i

Fig. 1. portion of the current, as the battery would be connceted to enrth through the broken branch. Each lranch wire must therefore lave a disconnector in circuit, clear of tho explosion. The disconnector consists of a platinum wire fuse contained in a streng iron case, and the same current which fires the detomator in the mine fuses the platinum wire bridge of the disconncotor, and the circuit to the bwoken branch remains insulated.

Mechanical mines, of which there are many different patterns, contain the means of ignition within thomselves, and aro unconneeted with any apparatus ashore. They may bo ignited by percussion, friction, chemical action, and electricity.

A simple form of mechanical mine has a heavy top, which, on being pushed off by a passing ship, either pulls out a pin and releases a plunger, which is then forced by a powerful spring iuto a detonator, or a friction tube is fired when the weight falls on a line attached to it. Another form, known as Abel's mechanical exploder, consists of a glass tube containing sulphuric acid, and surrounded by chlorate of potash and sugar. The whole is contained in an india-rubher tube, which projects from the top of the mine, the lower end being in communication with tho charge. When struck, the india-rubber tube bends, and, the glass tube breaking, the sulphuric acid mixes with the chlorate of notaslı and sugar and inflames the charre.

Electro-meclanical mines can bo mado by placing a voltaic
closer, the circuit closer completing the circuit when the mine is struck. Another form of electro-mechanical mino (fig. 2) has several projecting horns ( $a, a, a$ ) of lead tubing Inside each born is a glass tubo containiner bichromate of potash, and immediately under it a sow of small zinc and carbon plates, $b$, in a containinge cell. On any one of the lead horns ocimer bent, the glass tube is broken, and the hichromate of potasle dropis into the cell, converting the arrangement into a
 roltaic battery, which, being already connceted to the electric fuse $c$, fires tho mine.

All meehanical and electro-mechanical mines are provided with some contrivanco to guard against accidental explosion during the jrocess of layincr. In mechanical mines a safety pin can be withdrawn after the mino is in position, or, in the case of A bel's exploder, the projecting tube is surrounded by iron serments which fall off when the mine is in position. In electro-nechanical mines two of the wires forming plart of the circuit inside tho mine may bo broucht through to tho outside and kepit apart till the mine is in position, theso vires being long enough to allow of the operator retiring clear of the explosion before joining them up and rendering the mine dangerous.

Meclianical mines have the advantage over electrical that they
charges in an enemy's mine field. Mines containing heavy charge. would be used for the purpose, several of these mines being droppped in succession from a bout towed by a fast steamer, tho whole lino being exploded together as soon as the last mine had been droppel. Numerous experiments lave provel that tho explosion of a 500 H mine vill effectually destroy any mine within a ralius of 100 feet: the countomines would therefore bo dropped at duuble this distance apart, aud tho chamel so cheared inarked by buoys. Electric cables can also bo caucht and raised to the surface by grapmels; or the grapnel may have a case of explosive between its arms, so that, instead of raising the wire, it may bo cut by firinr the charge.
2. Lacomotive Torpedoes.-Locomotive tornedoes are a numerous class, the principal being the Whitehead, Lay, Sims, Brennan, and Ericsson. The Whitehead is the only one whicb can be considered a well-devel bed a aval weapon.
This torpedo (fig. 3) is made in different sizes, varying Whitr from 12 feet to 19 feet in length and from 12 to 15 hoan, inches in diameter; the cross scction is circular, tapering tuepe to a point at each end. It is capable of being so adjusted that on being discharged it will travel at any depth between 5 and 15 feet below the surface, and it will maintair. this depth for its entire run. The torpedo travels at a uniform speed for the whole of its range, the speed and range varying for different patterns; the latest type has a speed of 24 knots fer $6 r, 0$ yards. The torpedo can be ses so that, in the event of its not striking the ship aimed at, it will stop at the end of its range and sink. For exercise it can be set to stop at any distance within the limits os its range, rise to the surface, and float. The torpedo is divided into several compartments. The foremost A con $\frac{1}{4}$ tains a charge of from 30 to 100 tb of gun-cotton, according to the size of the torpedo. This charge is fired on tho torpedo striking a ship by a pistol which screws into the nose of the torpedo. On impact the point of the pistol is driven inwards and forces the point of a steel striker into a detonator. By means of powerful air-pumps air is compressed into the air-chamber B to a pressure of 1000 th on the square inch, and actuates a three-cylinder engine, whick drives two propellors revolving in opposite directions in the tail. The meclanism in the balance-chamber C works two exterior rudders on each side of the tail, which keep the torpedo at a uniform depth during its run. This devico has never been patented, but is a secret; the details of it, however, have been purchased by all prominent maritimd nations.
The tail $F$ is fitted with four broad fins, which tend te keep the torpedo on a straight course and prevent it rolls ing. The horizontal tail fins carry four rudders, two horid zontal and two vertical. The horizontal rudders worked from the balance chamber keep the torpedo at its sef depth; the vertical rudders are permanently adjusted so as to causo the torpedo to travel in a straight line.
The air-chamber of a torpedo is usually made of fluid compressed steel, the remaining compartments of thin steel plate, and the interior mechanism of phosphor-bronze In Germany torpedoes are now made entirely of phosphorbronze.
The torpedo can be discharged from above or below require fewer trained men for their manipulation, are cheaper, and can be placed in position very rapidly. But no really efficiont method has yet been devised that vill ensure a mechanical mine, after it has been placed in position, boing safely taken up again for examination or removal, nor can any tests be applied to ascertain if it remains in an efficient condition.
, All mines, especially thoso with elcetric cables attached, must te protected by gun fire or guard boats, as, if the mine field is ungrotected, they can be easily destroyed oy countermining or creeprng. \& Countermining is carricd ont by exploding a succession of

water. From above water it is shot out of an alp-gun (fig. 3) mounted on the deck of a ship and pointing througb the side. The air-gun consists of a metal tube $a, a, a$, of the same length as the torpedo, the rear end being closed by an air-tight door. The gun carries a reservoir e of
,ompressed air, the contents of which, by means of a suitable fring valve $d$, can be instantaneously admitted into the gun. When the torpedo is to be discharged tois firing valve is opened, and the compressed air in the reservoir forces the torpedo out at a high velocity, a tripper $b$ projecting through the top of the gun throwing back the starting lever of the torpedo on its way out. From below water the torpedo is discharged through a tube, the muzzle of which forms part of the stem of the ship, the tube being fitted with an outside valve which prevents the water from entering while the torpedo is placed in the tube. Lattcrly powder has been used instead of compressed air for the ejecting force.
'The Lay torpedo is a bost of cylindrical form, the fore part being charged with an explosive. The notive power is carbonic acid gas generatod in the usual wey. As only a very small portion of the boat is visible on the surface, two guide rads, one on each end of the vessel, mark its position at any part of its run. Tho boat can bo started, stopped, and steered by pieans of an electric cable, containing screral insulated wires, which is paid out from the boat as it tre rels.

The Sims torpedo is cirgar-shaped, and is suspended to a boatshaped float. The torpedo is propelled by screwe driven by an supplied from u unamo ashore. The electric cable is coiled on a drum in the torpedo, and pays out as the torpedo advances. The torpedo is also steered from the shore bv an electric curreat. Its speed is about 12 knots.
Brennan The principle of the Brennan torpedo is as follows. The torpedo torperlo. contains two drums unon which a large amonnt of pianoforte wive is wound. One end of the wire from each drum is taken to large drume ashore, which aro revolved by a steam-engine. By winding np on the large drums ashore a rotatory motion is imparted to the drams in the torpedo, which by means of gearing revolve two screw propellers, and these drive the torpedo through the water. The torpedo can be stecred from the shore in any direction, by winding on ono drum faster than the other, which alteration in motion moves a rertical rudder on the torpedo.
Ericsan The Ericason torpedo is a long fish-shaped weapor, made of torpeds. Wood, and weighted so as to have little or no buogancy. The cherge is contained in a metal case at the fore end. It is propelled by a charge of gunpowder, out of a submarine gun fixed in the bows of a ship. Its range is about 300 feet, and it fires on impact.

## Out. Outrigger, Drifting, and Towing Torpedoes. - Before the introduc-

 rigger, tion of the Whitohead, vessels armed with torpedoes were princidrifteng, pally 6upplied with the outrigger torpedo. The explosive is conand tow- tained in a metal case secured to the end of a ateel or wooden pole, Log tor- which lies fors and aft in the vessel carrying it. The pole can bo padoes. rigged out until the torpedo is subuerged a ahort distance ahead of the ressel, and is fired on contact with the enemy's side, either by en operator in the boat compheting the electric circuit, or by the circuit being completed by a circuit closer in the torpedo. In rivers, or places with a current, drifting torpedoes can be used. They should be suspended from floats, and arranged in groups or paire connected together by a rope, oo that they may catch across the bows of a vessel at anchor. They can be fired after a given lapse of time by clockwork sad other devices, or can be so arranged that tho firing arrangement is relcascd on a catch being withdrawn by the action of a propeller whecl, which remaine stationary as long as the tornedo drifts with the cnrrent, but is revolved by the force of the current when the torperln is stoppes. Towing torpicdoes are constructed to diverge frou either side of a ship when tomed, wbich is effected by sheping the torpedo like an otter. The torpedo tows on the surface, and, on striking s ship's side, the head containing the charge drops off, sod fires as its weight tautens a line connecting it to the body.Torpelo Boals. - The sreat improvements made of late ycare in machine gnos have rendered the outrigger and towing torpedo of little value for torpedo boats, as it rould bo almost impossible to approach a vessel near eoough to nse them before the boat would be destroyed by the storm of missiles which would be fired at her. All torpedo boats under construction, and most of those already completed. are therefore armed with the Whitehead torpedo. A modern torpedo boat is built entircly of steel, the plates often not exceeding 1 inch in thickness, as, in order to get the necessary bigh speed, the minimmm of weight consistent with the necessary strength is of the first inportance. There aro three classes of boats, known as first, sccond, and third. The first are capable of keeping tho sea on their own account; tho sccond are for harbour defence; and the third can he cerrich ou board a ship.

The following table gives the dimensions and other detaile of a boat of each tyre:-

| Type of Boat. | Length. | Beam. | Dis. place. ment. | Full <br> Speer <br> 10 <br> Knots. | Indicated llorsePower at Full Speed. | Bolfer Pressule, to per Square Inch. | Dlstance Boat can steam with Coal carrled at |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Euld Speed. | Half Speed. |
| 1st class.. | ${ }_{135}{ }_{\text {Ft }}$ |  | Ton9. | 23 | 11.50 | 140 | Knots. | Knots. 2000 |
| 2d class... | 88 | 110 | 30 | 20 | 450 | 125 | 159 | 400 |
| 3d class... | 64 | 76 | 12.5 | 16.5 | 150 | 120 | 100 | 250 |

The boilers and machinery are protected by coal, and sa armoured tower protects the stecring gear and telegraphs for controlling the engines.

Torpedo Nets. - The introduction of the modern tormedo boat bas caused great attention to be 'paid to any means which will protect a ship from tho torpedo. Mlost nations are sdopting steel-wire netting, suspended from booms attaehed to the ship's side, the bcoms keeping the nets sufficiently far off to prevent any damage being donc to this bottom by the explosion of the larcrest charge carricd by a Whitchead. This nettiog, besides being cumbersone and heary, cannot be used unless the slrip is stationary or nearly so, so that is many cases it would be useless, but for ships at anchor it is of great value. Increased cellular subdivision is also being given to ships under construction, and opecial vessels, called " torpedo catchers," are being built by most nations. A torpedo catcher is a vessel of superior size and otrengtl, but with the amme high speed as a torpedo boat, the principal arm of the torpedo catcher being machive guns.
(E. P. G.)

## torquatus. See Manlius.

TORQUAY, a watering-place of England, is finely situated on the northern recess of Tor Bay, Devonshire, and on the Dartmouth and Torbay branch of the Great Western Railway, 12 miles north of Dartmouth, 23 south of Exeter, and 220 west-south west of London. Owing to the beauty of its site and the equability of its climate, it is the favourite watering-place of Devon, and, being screened by lofty hills on the north, east, and west, and open to the sea breezes of the south, it has a high reputation as a winter residence. The temperature seldom rises as high as $70^{\circ}$ in summer or falls below freezing point in winter The lower ground is occupied by shops, hotels, and the plainer class of houses, while mansions and villas occupy the picturesque acclivities of the well-wooded limestone cliffs, commanding great variety of

Environs of Torquay. fine views. There are still some remains of the original Torre abbey, founded for Premonstratensians by William, Lord Brewer, in 1196. They stand to the north of the modern mansion, but, with the exception of a beautiful pointed-arch portal, are of comparatively small importance. On the south of the gateway is an old 13th-centary building, known as the Spanish bara. On Chapel Hill are the remains of a chapel of the 12th century, dedicated to St Nichael, supposed to have formerly belonged to the abbey. St Saviour's parish church of Tor-Mohun, or Tormoham, an ancient stone structure, was restored in 1874. The old church at St Mary Church, to the north of Torquay, bas been rebuilt in the Early Decorated style; and in 1871 a new tower was also crected as a memorial to Dr Phillpots, bishop of Exeter, who with his wife is buried in the churchyard. St John's church, by Street, is a very fine example of modern Gothic. Among the principal

Eecular buildings are the town-hall with square tower (1852), the post-office (1865), the museum of the natural history society (1874), the theatre and opera-house (1880), the county police court, the market, and the schools of art and science (extended in 1887). There are a number of benevolent institutions, including the Torbay infirmary and dispensary ( 1843 ), the homœoopathic dispensary (1848), the Western hospital for consumption (1852), Crypt House institution for invalid ladies (185t), and the Mildmay home for incurable consumptives (1886). In 1886 the local board purclased from the lord of the manor, at a cost of $£ 85,000$, the harbours, piers, baths, assembly rooms, \&c., including 60 acres of pleasure grounds and open spaces. The town is supplied with water from the Dartmoor hills, 16 miles distant, at a cost of $£ 120,000$. There is a convenient barbour, extended in 1870 at a cost of $£ i 0,000$, and having a depth of over 20 feet at low water. The principal imports are coals, timber, and slates, and the principal exports are stones of the Transition limestone or Devonshire marble, which is much valued for building purposes. In the town are a number of marble-pulishing works. Terra-cotta ware of very fiue quality is also manufactured from a deposit of clay at Watcombe and at Hele. The population of the uilan sanitary district (Tormoham with Torquay, area 1465 acres) in 1871 was 21,657 , and in 1881 it was 24,767 .
There was a village at Torre even before the foundation of the abbey, and in the neiglbourhood of Torre are remsins of Roman occupation. The manor was grantell by William the Conqueror to Richard de Bruvere or de Brewere, and was subsequently known as Tor Brever. After the defeat of the Spanish Armada, Don Pedro's galloy was brought into Torbay; and Williann, prince of Orange, landed at Torbay 5th November 1688. The bay was a rendezvous for the British fleet during the war with France, and the frrst good houses at Torquay were built for the officera. Until half a century ago it was an insigniticant fishing village.
See Blewltt's Panorama of Tor ruauy, 1832 , and White's history of Torguay, 1878 .
TORQUEMADA, Juan de (1388-1468), or rather Johannes de Turrecremata, cardinal, was born at Valladolid in 1388, and at an early age joined the Dominican order, early distinguishing biinself for learning and devotion. In 1415 he accompanied the general of his order to the council of Constance, whence he proceeded to Paris for study, and took his doctor's degree in 1423. After teaching for some time in Paris, he became prior of the Dominican house first in Valladolid and then in Toledo. In 1431 Pope Eugenius IV. called him to Rome and made him "magister sancti palatii." At the conncil of Basel he was one of the ablest and most prominent supporters of the view of the Roman curia, and he was rewarded with a cardinal's hat in 1439 . He died in 1468.

His principal works are In Gratiani Decretum Conmentariz, 4 vols., Venice, 1578 ; Expositio Brevis et Utzris supcr Toto Psalterio, Mainz, 1474; Questioncs Spirituales super Evangclia Totins Anni, Brixen, 1498; Summa Ecclesiastica, Salamanca, 1550. The lastnamed work has the following topics:-(1) De Universa Ecclesia; (2) De Ecelesia Romana et Pontificis Prinatu; (3) De Universalibus Conciliis ; (4) De Schismaticis et Herreticis.

TORQUEMADA, Toscas. DE, inquisitor-general for Castile and Leon, was born early in the 15th century, and died in 1498. When called to the work with which his name is so unenviably associated he was prior of the Doninican honse in Segovia. See Inquisition.

TORRE ANNUNZIATA, a town of Italy, in the province of Naples, $12 \frac{1}{2}$ miles south-east from that city, on the Bay of Naples, at the sonthern base of Vesuvius. The inbabitants are mainly occupied in fishing and in a brisk coasting trade; there are also manufactures of arms, paper, and macaroni. The population in 1881 was 20,060.

TORRE DEL GRECO, a town of Italy, in the province of Naples; $7 \frac{1}{2}$ niles to the south-east of that city; lies
at the south-west foot of Vesuvius, on the shore of the Bay of Naples. It is built chiefly of lava, and stands on the lava stream of 1631 , which destroyed two-thirds of the older town. Great damage was done by the eruptions of $1: 37$ and 179t, when inmmense streams of lava. fiowed through the town into the sea; the earthquake of 1857 and the eruption of December 8,1861 , were even more destructive. After each disaster the people have returned and repaired the rnin, the advantage derived from the rich land on the flanks of the volcano and the proximity to the sea and to Naples being more than enough to overcome apprehensions of danger. In the outskirts are many beautiful villas and gardens. The inhabitants are largely employed in fishing (tunny, oyster, sardine, and especially coral), and the neighbourhood is famed for its fruit and wine. The population in 1881 was 21,588 .

TORREY, Jobn (1796-1873), a distinguished American botanist, was a member of an old New England family which contributed several officers to the War of Independence. He was born at New York, and spent his school days there, save for the concluding year at Boston. When he was 15 or 16 years of age his father received a prison alpoirtment at Greenvich, and there he made the acquaintance of Amos Eaton, one of the foremost pioneers of natural history studies and popular science teaching in America. He thus learned the elements of botany, as well as something of mineralogy and chemistry, so determining the studies of his life. In 1815 he commenced the study of medicine, meanwhile finding time to prepare his first catalogue of plants, and to establish a correspondence with Anerican and foreign botanists, and in 1818 he commenced practice. Stimulated by Elliott's account of the flora of South Carolina and Georgia, Torrey commenced a systematic account of the botany of the Northern States, of which the first and only volume appeared in 1824. In the same year he obtained the chair of chemistry and geology at West Point military academy, whence he was translated three years later to the chemical professorship in the college of physicians, New York. He next described the collections of the first exploration of the Colorado Territory, so laying the foundation of all subsequent work upon the flora of the Rocky Mountains. In these years he also monographed the sedges, and did good service in substituting the natural for the Linnæan system. In 1836 he was appointed botanist to the State of New York, producing his Flora of the State in 1843; while from 1838-4.3 he carried on the publication of the earlier portions of Flora of North Americt, with the assistance of his pupil Asa Gray. Becoming more and more immersed in chemical labours, which from 1857 passed partly and soon completely into those of U.S. assayer, be notwithstanding continued to accumulate and work up masses of material for this vast undertaking, which still awaits completion at the hands of his colleague aud successor, Prof. Gray. He evinced a continued interest in botanical teaching, and made over his valuable herbarium and library to Columbia College two or three years before his death. He will be remembered not only as the father of American systematic botany, and an accurate and faithful, if somewhat excessively cautious, investigator, but also as an eminent teacher, aud for an excellence of personal character and simplicity of beliefs much resembling Faraday's. His memory is literally kept green by the beautiful Coniferous genus Torreya, and his labours commemorated and continued in the valuable memoirs of the Torrey Botanical Club.

## See Gray, in Silliman's Journal, 1873.

TORRICELLI, Evaygelista (1608-1647), physicist and mathematician, was borh at Faenza, October 15, 1608.

Left fatherless at an early age, he was carefully educated ynáer the care of his uncle, a Camaldolese monk, who in 1627 sent him to Rome to profit by the scientific teachings of Benedetto Castelli. The perusal of Galileo's Dialoghi delle Nuove Scienze (1638) inspired his fertile mind with many fresh developments of the new mechanical principles there set forth, which he embodied in a treatise De Motu (printed anıongst his Operr Geometrica, 1644). Its conmunication by Castelli to Galilco in 1641 led to the adoption as a disciple by the Florentine sage of one who seemed not unworthy to become bis successor. Torricelli accordingly, repairing to Florence, October 10, 1641, resided with Galileo, and acted as his amanuensis during the three remaining months of his life. On its close his contemplated return to Rome was anticipated by his nomination as grand ducal nathenatician and professor of mathematics in the Florentine academy. The discorery which has perpetuated his fame was made in 1643. Galileo had failed to perceive why water refuses to rise above 33 feet in a closed tube. It occurred to Torricelli to try the experiment in a more compendious form. The anticipated result ensucd that the suspended column of mercury was shorter than that of water in the proportion of its greater specific gravity. He immediately concluded both to be sustained by atmospheric pressure, and constructed the "siphon-barometer "expressly for the purpose of measuring its fluctuations. By this monentous discovery the obscure notion of a fuyg vacui was banished from physical science, and its progress most notably yuickened. The mercurial barometer was long knowu as the "Torricellian tube," and the vacuum it includes is still designated the "Torricellian vacuum."

The publication amongst Terricelli's Opera Geometrica (Florence, 1644 ) of a tract on the properties of the cycloid involved hin in a controversy with Roberval, who accused him of plagiarizing his earlier solution of the problen of its quadrature. There seens, however, no roon for doubt that Torricelli's was arrived at independently. "The matter was still in debate when he was seized with fever and pleurisy, and died at Florence, after twenty days illness, October 25, 1647, at the age of 39. He was buried in San Lorenze, and a conmemorative statne of him erected at Faenza in 1864. He was of a singularly amiable disposition, and possessed qualities the most felicitous for the investigation of nature. Among the new truths detected by him was the valuable mecluanical principle that if any number of bodies be so connected that, by their motion, their centre of grarity can meither ascend nor descend, then those bodies are in equilibrinm. He also discovered the remarkable fact that the parabolas described (in a vacuum) by indefinitely unmerous projectiles discharged from the same point with equal velocities, but in all directions, are situated within a paraboloid which is a tangent to all of them. His theoreni that a fluid issues from a small orifice with the same velocity (friction and atnospheric resistance apart) which it would have acquired in falling through the depth from its surface is of fundamental importance in hydraulics. He greatly improved both the telescope and microscope, and invented the simple microscope composed of a globule of melted glass. Several large object lenses, engraven with his uame, are preserved at Florence. He used and developed Cavalieri's method of indivisibles.
A selection from Torricelli's manuscripts was published by Tommaso Bonarentura in 1715, witl the title Lexioni Accadenichic (Florence). They include an address of acknoyledgment on his admission to the Accadenia della Crusca. His essay on tho inundations of the Val di Chiana was printed in Racolln d'Antori che trattano del Noto dell' Acque (vol. iv. p. 115, Florence, 1668) snd amongst Opuscoli Idrautici (vol. iii. p. 347, Bologna, 1822). Por his life, see Fabroni. Vita Italorum, vol. i. 1. $345^{\circ}$; Glinassi, Zetlere fin qui Inodile di Evangelista Tornicclli (Faedza, 1864);

tORRIGIANO, Pietro (c. 1470-1522) -a Florentine sculptor, was, according to Vasari, one of the group of talented youths who atudied art under the patronags of Lorenzo the Maguificent in Florence. Ben. Cellini, report, ing a conversation with Torrigiane, relates that he and Michelangelo, while both young, were copying the frescos in the Carmine chapel, when some slighting remark made by Michelangelo so euraged the violent temper of Torrigiano that he struck lim on the nose, and thus caused that disfigurement which is 80 conspicuous in all the portraits of Nichelangelo. Soon after this Torrigiano visited Rome, and helped Pinturichio in modelling the elaborate stucco decorations in the Appartamenti Borgia for Alexander VI. After some time spent as a hired soldier in the service of different states, Torrigiano was inrited to England to execute the magnificent tomb for Henry VII. and his queen which still exists in the lady clapel of Westminster Abbey. This appears to have been begun before the death of Henry VII. in 1509, but was not finished till 1517. It consists of two colossal recumbont effigies in gilt bronze on an altar-tomb of black marble, decorated with very graceful medallions of the patron saints of Henry and his wife, and other enrichments in bronze. The two effigies are well nodelled, and have life-like but not too realistic portraits. © After this Torrigiane received the commission for the altar, retable, and baldacchino which stood at the west, outside the screen of Henry VII.'s tomb. The altar had marble pilasters at the angles, troo of which still exist, and below the mensa was a life-sized figure of the dead Christ in painted terra-cotta. The retable consisted of a large relief of the Resurrection. The baldacchino was of marble, with enrichments of gilt bronze ; part of its frieze still exists, as do also a large number of fragments of the terra-cetta angels which surmounted the baldacchino and parts of the large figure of Christ. The whole of this work was destroyed by the Puritans in the 17 th century. ${ }^{1}$ Henry VIII. also commissioned Torrigiano to make him a magn:ficent tomb, somewhat similar to that of Henry VII., but one-fourth larger, to be placed in a chapel at Windsor ( $q \cdot v$. ); it was, hewever, never completed, and its rich bronze was melted by the Commonwealth, together with that of Wolsey's tomb. The indentures for these various works still exist, and are printed by Neale, IFestminster Abley, London, 1818, vol. i. p. 5t-59. These interesting documents are writiten in English, and in them the Florentine is called "Peter Torrysany." For Henry VII.'s temb he contracted to receive $£ 1500$, for the altar and its fittings $£ 1000$, and $£ 2000$ for Henry YIII.'s tomb. Other works attributed from internal evidence to Torrigiano are the tomb of Margaret of Richmond, mother of Henry VII., in the soutb aisle of his chapel, and a terracotta effigy in the chapel of the Rolls.

While these royal works were going on, Torrigiano visited Florence in order to get skilled assistants. He tried to induce Ben. Cellini to come to England to hel $\mathrm{l}_{3}$ him, but Cellini refused, partly from his dislihe to the brutal and swaggering manners of Torrigiano, and also becauso he did not wish to live among "sucl, heasts as the Eng. lish." The latter part of Torrigiano's life was spent in Spain, especially at Seville, where some terra-cotta sculp, ture by him still exists. His violent temper got him into
${ }^{1}$ An old elrawing still exists showing this elaloorate work ; it is engraved in the Jicruryia Anglicoun, London, 1848, p. 26\%. Many hnodrede of fragments of this terra-cotta sculpture were found as few years ago hioden under the floor of the triforium in the abbey; they are unfortunately too much broked aud imperfect to be fitted together.
difficullies with the authorities, and he ended his life in 1522 in the prisons of the Inquisition.

TORSHOK, a district town of Russia, in the government of Trer, on the river Tvertsa, 3 S miles by rail to the south-west of the Ostashkovo atation of the St Petersburg and Moscow railway. It dates from the 11 th century, and the very name (" market-place") shows that thie dependency of Novgorod was a commercial centre. It was strongly fnrtified with a stone wall, which, however, only partially protected it from the attacks of Mongole, Lithuanians, and Poles. Torshok is now celebrated in Russia for its embroidered leather-work and manufacture of travelling bags, and for its trade in corn and flour. The population in 1884 was 12,900.

TORT, as a word of art in the law of England and the United States, is the name of civil wrongs (not beiog merely breachos of contract) for which there is a remedy by action in courts of common law jurisdiction. It may be said to cerrespond approximately to the term "delict" in Roman law and the aystems derived from it. . But this is ouly a rough approximation. For in English usage tort includes, not only those matters which in Roman law are classed under obligations quasi ex delicto, but various others which Roman or modern Continental lawyers would refer to the law of ownership or real rights, and not to any such head-as "delict." The truth is that the actual development of tort as a legal geaus has been purely bistorical and to no small extent accidental. Nothing can be learnt, of course, from the word itself. It is merely the French word for "wrong," specialized into a technical meaning by a process which was completed only in the latter years of the 17 th century and the earlier of the 18th.
The early common law had no theory of obligations in the Roman sense, and hardly any theory of contract. Its remedies were directed either to the restitution of something which the defendant unjustly detained from the plaintiff-were it land, goods, or money-or to the repression of violent wrongdoing. Only the former class of remedies was purely.civil; the latter included a penal element of which formal traces remained long after the substance had vanished. A man who trespassed on his neighbour with force and arms offended the king as well as his neighbour, and was liable not only to pay damages to his neighbour but to make a fine to the king. Gradually the category of "force and arins" was held to include all manner of direct injuries to person, land, or goods, though the force might consist in nothing more than the bare setting foot without lawful cause on the soil poseessed ty one's neigbbour. But this was still a long way from meking room for the modern growth of the law of torts. The decisive opening was given by the Statute of Westminster, which enabled actions to be framed " on the case "- in consimili casu, -that is, allowed legal remedies to be extended by analogy to the forms of action already recegnized. Now those forms and their incidents were archaic and inelastic: the procedure was cumbrous, and plaintiffs were liable in many ways to irrational and irreparable discomfiture The more modern action on the case was free from these drawbacks. Hence it was the aim of ingenious pleaders to extend the action on the case as much as possible ; and so successful was this movement that in the 16 th century a special form of "trespass on the case" became, under the name of assumpsit, the common and normal method of enforcing contracts not made by deed, and remained so till the middle of the present century. It still holds its place in those American States where the old forms of action have not been abolished. Note that "assumpsit" had become a substantive title of the lew, and was consciously referred to
its proper genus of contract, before the genus or order of torts was formed. Meanwhile other actions on the case, framed mostly on the analogy of trespinss, bit partly on that of other genericelly similar remedies of the old law, were applied to the redress of miscellaneous injuries to person or property which for one and another reason could not be touched. or could not be conveniently dealt with, by the old action of trespass itself. Some of these actions on the case acquired fixed forms of their own and became distinct species; others did not; there remained (and there still remains in theory) an undefined region of possible new actions applying the principles of legal right anc duty to nerv exigencies of fact.
The extension of forms of remedy grounded on trespass caused those forms which were grounded on restitution ts fall into the hackground, with the curious result that in the modern common law nothigg is left enswering to the vendicatio of the Roman law. We have an elaborate lav of property, but when it comes to the practical protection of our rights we find that we can recover our property only by complaining of a wrong done to our possession or right to possession. The law puts the actual possessor in the first line, and allows an owner definitely out of possession to sue only for "injury to the reversion," thoughe ar owner who can resume possession at will is indeed more favourably treated. Its remedies are made efficient, but at the cost of straining the theory at various points. Hence many difficulties of detail and much olscurity of principle. The distinction between dominium and obligatho exists, of course, in English law, but it is peculiarly hard for an English lawyer, with the usual unsystematic training, to grasp it with certainty or trace it with accuracy

There is aiso a region of considerable obscurity about the points of contact between contract and tort. The questions thus raised are too technical for discussion here. Since pleadings have ceased to be formal they are much less likely to arise; on tha other hand, they are more likely, in the exceptional cases where they may still arise, to be unexpected and baffling.
For the practical purposes of modern law wo may aivide torts into three groups, -wrongs of a personal character, wrongs affecting property, and wrongs affecting person and property, either or both. Under the first group come the wroxys of physical violeoce and restraint, natruly, assault and false imprisoniuent; then the wrong done to men'a good nanie by libel and slander, in which kind there are sundry curious and not wholly rational distinctions; and wo must hera rather than elsewhere count deceit, and a somewhat illdefined class of wrongs of a like nature, of which the geeeric mark is tbo neeessary presence of a frandulent intention, or at feast reckless disregard of good faith. In oue case, that of maliciouns prosecution, evil motive must be shown; in fact, the much-tormented word "malice" has yery nearly its natural and ordinary meaning. So-called alander of title belongs to this class, beiag in trath a opecial form of deceit. Wilful interferenco with the exercise of public or private rights may be an actionnilo wrong, though the competitive exercise of like rights is none; and it is beld, thouglt not without doubt, that procuring a person to break bis contract for one'a own advantage (for oxaniple, a singer angaged by a rival opera manager, or a specially skilled workman in a rival factory) is on this principle a wrong io the other contracting party.
With regard to property the broad rule of the commion law is that a man meddles with whatever belongs to others at bis peril. This bas beco established and worked out only througla a series of intricate formal distinctions. But the resilt is that, special exceptions excepted, even tha most innocent assumption of dominion witbout a real title makes one liable to the true owaer.
Wrongs of the mixed kind alfecting both persou and property, arise frem the use of one's own property, or the doing of acts lawfuly in thersselves, in a manuer inconsistent with the safety and con? venienco of others. The accustomed heads of such wrongs are nuisance and negligence. Generally some failure in due diligence is involved; but in some cases the law has, on grounds of general policy, imriosed an absoluta or all but absolute duty of avoiding harmful results. One must do certain things at one's peril, if at all, though the doing of them is not in itself uula lafful; others are done not at oue's peril, and yet under a wider responsilility than
the common run of lawful acts It is not wrong to make au artificial reservoir of water on one's own land; but the landowner who doca so nust answer for all damage, thongb no failuro in duo diligence be shown, if tho water escapes by any cause which reasonable human caro could prossilly have provided against. Again, the occupien of a place of buslness must keep it in affe repair, for the bentht of customens anl others lawfully coming there; and, if harm is sune through the want of repair, it is 110 excuse for him to say that he liad engaged an apparently competent nerson to keep things in order. These aro modern principles in the law, and beelu to have harilly yct reached their full development. Tho dectrine of nesligenco is also mostly modern. Questions of manch interest and difficulty are raisel by "contributory дegligence," i.e., when it is alleged by way of defence that the party complaining suffered wholly or mainly by his own want of care. The true principle appears to bo that, if wader the circumstancea the harm suffere. by the plaiutif was the natural and probable cousequence of the defendant's want of carc, the defendant is liable, -and this whether tho plaintiff, or some third person, has or has not in any degreo contributed to tho final result by want of caie oll hia own mart, or even by a voluntary act, provided that the act be such as might liavo been foresecn and cxpected. IJut if the plaintiff has doze something which, though induced by tho defendant'a default, was not a natural and probablo conseguence of it, or if the harn suffered is due 10 some act of a third person which could not have been reasonably foreseeu or expectod, then the defendant will not be liable.

A great number of special dutiea have been imposed on different classes of percons-public officers, undertakers of public occupations, and so forth-by molern Acts of Parliament, and arc enforcable by penalties. In nome cases the breach of such a duty confera a aeparate right of action upon a person who thereby suffers danage, in others not, accordiog to what apjears to be the intealion of tho euactment. No general rule can he laid down.

In practice, a largo proportion of actionabla injuries, especially injuries by negligence, are due to tho acta or defaults of scrvants or workmen, from in bom no suhstantial redress could be obtained or expected. It is held in the common law, and appears to be held in all modern systems, that a master is liable for the acts and defaulas of the servants cmployed by hin, proviled those acta or defanlts occur in tho conrse of the servant employment, that is, while the servaut is ahout the master'a busidess, and acting with a view to the master's interest, and not for some differeut private purpose of his own. But a man 15 not generally liabla for the conduct of an "independent contractor" - a person who underlakes to do or get done certain work, but not to be under the employer's control as to tho manuer of doing it. One may be so liable, however, in virtue of spcciel duties attached to particular ailnations by positive rules of law. When a servant is injured by the act or default of another servant working under the same employer, the general rula of liability bas been largely modified in the employer's favour, on grounds which have neither been consiatently expounded nor geacrally reccived as हatisfactory. The Employers' Liability Act of 1850 has remedied tha most obvious hardships consequent ou the decisions, but only by way of particular exceptions, so that the law as a whole, if nore just than it was, is much mors iotricate, and does not appear to rest on any intelligiblo priaciple. Tho Scotrish courts were in a way to develop a more rational doctize, latt the House of Lords, instead of adopting it, forced the law of Scotlaud into conformity witb judyments which were still of only recent authority in England. The subject, however, has miven trouble everywhere, and legislative experiments have been tried in nanj" Continental countries. See Perliamentory Papers, Commercial, No. 21, 1886.
Liferoture.-There are several modern English and Amertcan text-books on the law of sits:-C. G. Addlson. Wiangs and itheir, Remedies, being a Treakise on the Law or Tors, Gth ed, by Howacc Smith, London, 1837, la, 8vo; M. M. Bigelow.

Tha genarsl Institutional books (Blackstone and Kent, and the later adoprations of Blackstons developed and modified by the decialons of the last fifty yeais.
(F. PO.)

TORTOISE. Of the three names generally used for this order of reptilcs, viz., Tortoise, Turtle, and Terrapin, the first is derired from the old French word torlis, i.e., twisted, and was probably applied first to the common European species on account of its curiously bent fore-
legs. Turtle is believed to be a corruption of the same word, but the origin of the aame terrapin is unknown: since the time of the navigators of the 16th century it has been in gencral use for freshwater species of the tropics, and especially for those of the New World. The name tortoise is now generally applied to the terrestrial members of this group of animals, and that of turtle to those which live in the sea or pass a great part of their existence in fresh water.

Tortoises and turtles constitute one of the orders of Reptiles, the Chelonia. They are characterized by having the truok of tho body incased in a more or less ossified carapace, which consists of a dorsal more or less convex portion, and of a flat ventral one, the so-called plastron: These portions are generally more or less firmly united on the side, but leave a wide opening in front through which the head and neck and the fore-limbs protrude, and one behind for the tail and hind-limbs. The dorsal carapace is (with the exception of Sphargis) formed by the dorsal vertebre, by the ribs which are so much expanded as to form sutures with each other, and by a number of lateral dermal ossifications (marginals). The plastron consists of from eight to eleven more or less dilated dermal bones, the sternal elements of higher Vertebrata being absent. This osseous case or shell receives in its interior the organs of the chest and abdomen, the humeral and pelvic bones, and the muscles for the humerus and fernur. In many species, especially those of the family Testulitidx, or tortoises proper, the neck and head and the limbs can be withdrawn within the shell, the cervical and the proximal caudal vertebre retaining their mobility. In the majority of Chelonians the osseous shell is covered with a hard epidermoid coat, which is divided into large symmetrical plates (commonly called "tortoise-shell". in those species from which the article of commerce is obtained), which can bo detached from the underlying bones. These epidermoid plates do not correspond in arrangement or extent with the bones of the carapace; they vary considerably in form, and are therefore generally noticed in the deseriptions of suecies. Their arrangement and- terminology may be learned from the accompanying illustrations (figs. 1, 2).

The integuments of the head, neck, tail, and limbs are either soift and smooth or tubercular or scaly, the tubercles and scales having frequently an osseous nucleus.

Other parts also of the skeleton show remarkable peculiarities, so that the sometimes very fragmentary remains of Chelonians can almost always bo recognized as such. All the bones of the skull are suturally united, with the exception of the mandible and hyoid bone; the dentary portion of the mandible consists of one bone only. The pectoral arch is composed of the scapula, with which the precoracoid is united, and the coracoid. Clavicles (epiplastra) are represented by the anterior elements of the plastron. Two pairs of limbs are invariably present.

All Chelonians possess a tail, whicl is generally short, but sometimes elongate, and always provided with strong muscles at the base. No Chelonian possesses teeth; but their jaws are provided with horny sheatis, with hard and sharp edges, forming a beak like that of a parrot.

The number of Chelonians known at present nay be estimated at about 220, the freshwater species being far the most numerous, and abundart in well-watered districts of the tropical and subtropical zones. Their number and rariety decrease beyond the tropics, and in the north they disappear entirely about the 50 th parallel in the western and about the 56 th in the eastern bemisphere, whilst in the southern lemisphere the terrestrial forms seem to advance to $36^{\circ} \mathrm{S}$. lat. only. The marine turtles, which are spread over the whole of the equatorial and subtropical seas, sometimes stray beyond those limits. As in other
orders of Reptiles, the most specialized and the largest forma are restricted to the tropics (with the exception of Macroclemnys) ; but, unlike lizards or snakes, Chelonians

are unable to exist in sterile districts or at great altitudes. Chelonians are strictly animals of plains, or at least of low country.

Chelonians show a great divergence in their moda of life, -some living conatantly on land, others having partly terrestrial partly aquatic habits, others again rarely leaving the water or the sea. The first-mentioned, the land tortoises proper, have short club-shaped feet with blunt claws, and a very convex, heavy, completely ossified sheil. In the freshwater forms the joints of the limb bones are much more mobile, the digits distinct, armed with sharp claws, and united by a membrane or web; their shell is less convex, and is flattened, and more or less extensive areas may remain cartilaginous to lessen its specific gravity. As a rule, the degree of development of the interdigital wab and of conrexity of tha shell indicates the prevalence of aquatic or terrestrial babits of a species of terrapin. Finally, tne marine turtles have paddle-shaped limbs resembling thosa of Cetaceans.

Land tortoises are sufficiently protected by their cara pace, and thereiore have no need of any special modi fication of structure by means of which their appearance would ba assimilated to the surroundings, and thus give them additional aecurity from their enemiey. These, how
