(10) Synbolum Apostolccum; small quarto, seven leaves printed on one side caly, end containing twelve woodents with German inscriptions. Tbe only copy of it known is preserved in the library of Monich (Sotheby, ii. 148).
(11) The Legend of Si Meinrad; forty-eight leaves. The only copy known is preserved in the Munich library (Sotheby, ii. 150).
(12) The Acht Schalkheilen, of which eight leaves were in the Weigel collection (i. 112 ; Sotheby, ii. 154).
(13) The Fable of the Sick Lion; twelve leaves, preserved in the library at Heidelberg (No. 438; see Sotheby, ii 159, pl. Ixszvi).
(14) Defensarium Inviolate Virginitatis $b$. Maris V Vrginis; sixteen leaves fol. The onique copy is in the British Museum. On the first leaf are the initials of the printer F[riedrich] W[altheren] and the date 1470 (Sotheby, ii. p. 63).
(15) The same work, twenty-seven lcaves, large folio, with the imprint "Johannes eysenhiut impressor Anno ab incarnacōis dafice $\mathrm{M}^{\mathrm{C}}$ quadringentesimo septuagesimo $\mathrm{j}^{\circ " \text { " (cf. Sotheby, ii. 72). Copy }}$ in the British Museum.
(16) The Dance of Death (Dance Macabre; Dcr Doteri Dankz) twenty-seven leaves (Sotheby, ii. 156).
(17) Die Kunst Ciromantia of Dr Johan Hartlieb (Sotheby, ii. 842
(18) Der Beichespiegel or Confessionale; eight engravings (Sotheby, ii. 145). Copy in the royal library at The Hague.
(19) The Apostles' Creed; zeven leaves, folio. Copy at Wolfenbuittel
(20) The Credo, in German ; twelve leaves, quarto. Copy in the royal library at Munich.
2. Le Peintre-Graveur, 1. 27 ss. ${ }^{2}$ See Joh. Geffeken, Der Biddercatechtomus des 15 Jahrh., Lelpsic, 1855, quarto: Sotheby. fi. 180 .

Propugnacula, seu Turris Sapientix ; one sbeet, plano, Brit. Mus. (Sotheby, ii. 164).
Block-books of Netherlandish origin are:-
(i) Biblia Pauperum; ferty leaves (each bearing a signature; a to $v, a \cdot$ to $\cdot v$.). As many as seren editions have been distinguished by Sotheby (i. 43 ; see also Holtrop, Monum. Typo, p. 3).
(2) Ars Moriendi ; ${ }^{1}$ twenty-fonr leaves, small folio, thirteen containing text, eleven plates (see Sotheby, i. 69 ; Heltrop, p. 8).
(3) Canticum Canticorum, Historia seu Providentia B. Iirginis Mariz ex Cantico Canticorum ; sisteen leaves, in fol. (Sotheby, i. 77 ; Heltrep, 1. 6).
(4) Liber Regum, seu Historia Davidis; twenty leaves, folio (Sotheby, i. 120b). Some consider this to be a German work.
(5) Exercitium super Pater Nostcr, by Heuricus de Pomerio ; ten leaves, sma!l folio (Sotheby, ii. 137; Holtröp, p. 10). ${ }^{2}$
(6) Temptationcs Demonis Temptantis Hominem de Septem Peceatis Mortalibus; a single large felio leaf priated ou one side. Two cepies, one io British Mnseum, the other in the library at Wolfenbinttel.
(7) Vita Christi, or the Life and Passion of Christ; thirty-six cuts, originally printed in a press on six anopisthographic leaves, 8ve. In the library at Erlangen (see Campbell, Annales, 746).
(8) Historia Sancta Crucis; a fragment of oue leaf (with sigaature g), preserved in the Weigel collection (ii. 32), which seems to be a proef-sheet ouly.
(9) Alphabet io figures (Holtrop, p. 11 ; Sotheby, i. 122). ${ }^{3}$
(10) Pomerium Spirituale, by Hearichs de Pomerio or Heary Bogaert; twelve leaves, having twelve woodcuts accompauied by MS. test, in the library at Brussels (Heltrop, Mon. Typ., p. 9). It bears the date 1440 in two places; but seme contend that this refers to the date when the boek was written, ${ }^{4}$ not when the engravings were printed.

Conway, The Woodeutters of the Netherlands in the 15th Contury, Cambridge, 1884; Heineken, Idee Geinérale, Leinsic, 1771 ; J. Ph. Berjean, Facsimiles of the Biblia Pauperum, Cantieum Canticorum, Speculum, London, 1859-1861; and Id., Catal. Mlustré des Livres Xylogr., London, 1865.

## Early Printing at Mainz.

When we, for the moment, leave out of sight the question as to when, where, and by whom the art of printing with movable metal types was invented, and tako our stand on well-authenticated dates in such printed documents as have been preserved to us, we find that the first printed date, 1454 , occurs in two different editions of the same letters of indulgence issued in that year by Pepe Nicholas V. in behalf of the kingdem of Cyprus.
These two editions are distinguished respectively as the 31 -line and the 30 -line indulgence. The former, of which three different issues with the printed date mecceliiii., and a fonrth with the printed date meccelv., are known to exist, claims priority ${ }^{6}$ from a chronological point of view over the latter, of which one issue with the printed date mecceliiiii, and two issues with the printed date meccclquinto, are known to exist, becauso one of the sold copies that has been preserved was issued at Erfurt on 15th November 1454, whereas oi the 30 -line indnlgence the earliest sold cepy that has as yet come down to us was issued at Cologne on 27 th Fehruary 1455 , though it distinctly has the printed date mececliiii., but altered with the pen to mecceliiiij. In the 31 -line indulgence ocenr (1) a large church type usnally regarded as identical with that of the 36 -line Bible, and used for the rubrics of the abselutions, for the word with which the decnment commences, and for the Christian name of the pepe's legate ; (2) a smaller text or brief type, which was afterwards very clasely imitated, if not actnally userl, at Eltville, in priating the 1472 edition of the Vocabularius ex quo and an edition of the Summa de Articulis Fidei of Themas Aquinas; (8) a large initial $V$ and twe large initials $M$, which differ from each other. In the 30 -line indulgence occur (1) a large ohnrch type, which is used as in the 31 -line indulgence, and is usually reganded as identical with that of the 42 -line Bible; (2) a smaller text or brief type, of which as yet no further trace has heen found ; (3) a large initial $\mathrm{U}_{3}$, and two large initials $\mathrm{M}_{\text {, }}$, which differ from each other, the first being identical with the initial M of the secend absolution of a 33 -line indulgence printed by Peter Scheeffer iu 1489 for "Raymundus Peyraudi, archidiaconus Alnisicnsis in

1 Heineken enumerntes six editions, of which one has inscriptions in German. See also an article by Guichard, in Bull. du Bibliophile, Paris, 1841.
See also an article by Guichard, io Butl. du Bibliophile, Parig, 1841.
2 See also W. M. Conway, Notes on the Exercitium super Pafer Noster, 1887.
2 See also W. M. Conway, Notes on the Exercitium stiper Pater Noster, 1857.
3 There is one copy in the British Museum and another in the library at Basel,
this last baving the date 1464 engraved on the letter $A$, whicb is mutilated in the this last baving the date 1464 engraved on the letter $A$, which is mutilated in the
former. A similar alpbabet preserved at Dresden seems to be a copy made io Dermany.

4 Mr W. M. Conway is of a different opinion; aee Notes or Exercilium. Dumortier testifies to having acea another copy unaccompanicd by MS. ("Notes sar 1'lmprimerie," in Bull. Acrd. Roy. de Belg., vol. viil., 1841 ).
No inferences can be drazn from thls priarity, so it merely reats on the
date of a sold cony that has coms to this.
ecclesia Xanton," who issucd it at the order of Pope Innocent VIII., "pre tuicione orthedexe fidei contra Turchos." These twe different editions are usually legarded as having beeu printed ari Maiaz ; aud, so long as there is no evidence to the contrary, we may assume that such was really the fact. But we must at the same time conclude that ahent November 1454 there were at least two rival printers at work therc, - (1) the priater of the 31-line indulgence, whese name has not yet transpired, but whe may have been Johan Gutenberg, perhaps subsidized by Johan Fnst ; (2) the priuter of then 30-line indulgence, whe was no doubt Yeter (Schoeffer) de Gerase heym, on accoant of the connexion of this indnlgence with that of 1489 , which was nnquestionably printed by him. Latterly four writtee copies of the same indulgence have beex found, which respectively bear the dates,-Frankfort, 10 th April 1454 (in the pass. session of Herr Lais, Wiesbaden); Frankfort, 11th April 1454 (Frankfert archives) ; 11th July 1454 (place unknown; Darmstadt archives); Lübeck, 6th October 1454. As thcir dates precede by a ferw weeks only the earliest known printed date (15th November 1454), they mark, perhaps, the exact time when printing made its appearance at Mainz in an already advanced state of perfection.
In following up the basis afferded by the above indnlgences 䛌 Karly may give a shert chronological view of the early printing at Mainz, tJresmin so far as it is at present known, referring for minute details to J. H. hooks nis Hessols, Gutenberg: Was he the Inventor of Printing: 1882, p, Mainn, 150 sq .

Types I (arge church type) and 2 (smaller brief type), used by an noEnewa printer, 1454 .
(i.) 31-liae indulgence; three different issues ( $A, B, C$ ), witb the printed year mecceliiii, and oae issue (D) with the priyted yearmeccelr. Al printed oo vellum. or issues A to light. Three unsold conies of to light. Three unsold copies of wick, (2) Wolreabittel, and (3) Wick, (2) Wolreabittel, and (3) eight sold copiea are known toexist eight sold copiea are known toexist
in various libraries, with dates from Nov. $15 \$ 454$ to Apr. 30 1455. Also four unuscd copies have been disfour unuscd copies have been dis covered, of issue D ten sold copies
with dates from Mar. 71455 to Apr. with dates from Mar. 71455 to Apr.
$\$ 01455 \mathrm{sod}$ four uansed copies aro known.
Type 1, cortianed; for type 2 aeo hclow.
(ii.) Manung widder dic Durke. An almanac for Jan. 1455, in 4 to, leaves, 20 and 21 uneven lines. The only copy knewn was dis. covered at Allgsung, and ia nom in the Munich library.
(iii.) Conjunctiones et Oppositiones Solis ct Lurx. 1 calendar for 1457, a broadside sheet, printed on one aide. The upper half of the oaly copy Enown was discovered at library.
(iv.) Der Cisianus (nat Cialanus) Eu Dutsche. A broadside sheet, printed or one side, 36 lines, besides separatencere. The Tross copy, mentioned in suppl. to lanus"), was bought in 1870 for the Cambridge noiversity library.
(v.) and (vi.) Doratus. Two different editious of 14 (?) leaveseach, 27 lines (B. Mus., C. 18.0 1, Nos. 2and 5).
(vii.) Donatus of 30 lines, 12 (\%) leaves; a fragment of the sth ( ) in the Mainz library.
(viii.) 36 -line Bible. 2 vols. \{ol., 882 leaves, with 2 columas of 30 licea each on a pare. Some bibliographers call this the Pilster Bible, assuming that Paster printed it. The Paris library possesses a paper copy, and also a aeparate copy of the last leaf, which bearz the MS. date 1461. Other eopies exist in

Lord Spencer's librery, in the Brik Mins., at Jena, Leipsic, Antiverp. \&c. ${ }^{6}$

- Trpes 3 (large church type) and (smalier brief type), used by Pete
(i.) 30-line iudulgence; one issue (A) with the printed year mecceliiii. and twe jssues ( $B, C$ ) with the printed year meccelquioto. Al orinted on vellum. Of issce a only one copy has been discovered now is Lord Spencer'a library. It was seld at Cologne on Fel . 27 1455, the printed date mecceliait having becus sltered with the poliz to mecceliiiij. Of issue B two sold copies, with dates Apr. 11 and 29 1455, are ic the Berlin libiary and the Brit. Jlus. Of issue $\mathbb{C}$ two sold copies, with datea Feb 22 and $A$ pr. 24 1455, are $3 t$ Henover Culemazn) and Walfenbittel. Ar unsold copy is at Hagover (Culemann).
TYpe 3, continued (till about 1457);
of type 4 no furtber trice is found.
(ii.) Donatus of 24,25 , or 26 linees, 26 (7) leaves; one leaf (the sth or 9 th ? ) in the Mainz library.
(iii.) Donatus of 32 lines, 14 (?) learls, the 10 th (?) in the Mainz lihrary.
(iv.) Donatus of 33 lincs, twe leavers in the Paris library.
(r.) Donatus of 35 lines, folio; príated, according to the colophon, "Fer Metrum de Gernasheym, in . 42 ine Bible pla capilibus Bible) Dinted bifor Mus B1456, 1456, as the binder or the paper copy in the Paris library states
 on that day. 2 vole. fol., 641 leavew of 2 colmmna of 42 lices eacb, ercept that in seme copies the oaly, while the loth page has \& columns of 41 lines esch, thougb. the difference in the number of lines makes no difference in the space which they occapy. 7
(vii.) 42 -line Cantica ad Matutinas The first and only leat known in in the Paris library. It is printent on vellum, and corresponds it every respect to the 42 -line Bible haviog double colunms, 42 lides. \&c.

The above fonr types and the hooks priated with them (besiders a few others printed by Albreclit Pfister at Bamberg) are tho only ones that stand in closo connexion with the question regarding the introduction, or the possible invention, of printing at Mainz. It hats beca pointed ont shove that one of the initial M's of the 30-line indulgence of 1454 occurs again in an indn]gence of 1489 , printer by Schoeffer; heuce types 3 and 4 and the books printed with there must be ascribed to this printer, in spite of the fact that the capital $P$ found in the indnlgence does not seem to occur again in the $\mathbf{4 2}$ liee Bible. No further trace of the brief type 4 has Jet been found and perhaps Schoeffer melted it down for his other types. As Schoeffer, in the colophon of the Donatus (v.) which bears hive 6 See Hessels, Gutenberg, p. 160 ; and Bernard, Origine, ij. S1.
7 For other coples, see Bernard, Origine, I. 164, 17\%192; and Hessels, Gwen
berg, 1.0 .
wame aloue, says that it was printed "cum suis capitalibus," and the the capitals gradually disappear after 1459 and the type of the 12-line Bible is no longer found after 1456, wa must presume that the 68 ven incunabula mentioned abova were printed by Peter Schoeffer alona before he eatered (in 145\%) into partnership with Johan Fust. ${ }^{1}$

Phere is no such certainty as regards types 1 and 2 and the books printed with them. If the $31-l i n e$ indulgence may be assumed to have been printed at Mainz, its printer was in all probability Johan Gutenberg, though it would seem from a lawsuit of 1455 (see p. 690 below) between him and Fust that in that year. Gutenberg had not yet printed anything, and in 1454 (1455) Fust evidently called him to account for not having produced anything. Certain circumstances point to Albtecht Pfister as the printer of the eight incuna: bula in the left-hand column. First, he undoubtedly priuted with type 1 in that city as early as 1461 , for on 14 th February of that year be issued iu that typa an edition of Boner's Edelstein ( 88 leaves, fol., with mood eugravings), and printed with tha same type at least eight other works, ${ }^{2}$ ons of which was issued in 1462 , the meven others without a date. Secondly, most of the copies of the 36-line Biblo were at one time or another preserved in tho libraries of Bavaria, and a great number of fragments have been discovered in monasteries in that conntry, even in a register of the abbey of St Michael a Bamberg of the jear 1460. Thirdly, a transfer of type from Gutenberg to Pfister is contrary to all enelogy in the niancy of printing, when every printer started with a typa of his awn making. But, as there is no direct evidence as to who really possessed types 1 and 2 before 1460 , we have not felt jostified in assigning the 31-lins indulgence and the other sēven incunabula including the $36-\mathrm{line}$ Bible) to Pfister.

It is alleged that, in consequeuce of the lawsuit between Gatenberg end Fust, the former was deprived of all tools, \&c., which he had made, or is supposed to have made, with the money which the latter had advanced to him, and that afterwards a certain Dr Homery or Humery, a syndic of Mainz, lent him fresh money to enable him to establish another printing office. This allegation is made on the etrength of a letter of obligation (of 26 th February 1468), giveu by Dr Homery to Adolph, the archbishop of Mainz, by which-he acknowledges to hava receired from the aaid arch*ishop "several forms, letters, instruments, implements, and other things belooging to the work of printing, which Johan Gutenberg hiad left after his death, and which had belonged and atill did belong to him (Dr Homery)." It is presumed that with these types, which we may cell the Mainz type No. 5 , Gutenberg printed (i.) Joannes de Balbis, Catholicon, 1460,373 leares, folio, 2 columas of 56 lines each, copies of which exist in the Cambridge university Jibrary, thres in the British Museum, two in the Paris library, in Kord Spencer's library, in the Wolfenbüttel and Mainz libraries, Re: (ii) Matthæus de Cracovia, Tractatus Rationis, 22 leaves, 1to, 30 lines, three copies of which are in the British. Museum, one at Althorp, one in tha Cambridge library, two in the Paris library, *ce ; (iii. and iv.) Thomas Aquiuas, Summa de Articulis Fidei, twn editions in 4 to, the first of 13 leaves and 34 lines, -tro copies of which are in the British Museum, one in Lord Spencer's, the Camhridge library, \&c.-and the second of 12 leaves and 36 lines, -copies in the British Mussum and the Paris library ; and (v.) indalgence of 1461 of 15 lines.

On 18th January 1465 Adolph IT., archbishop of Mainz, appointed "Johan Gudenberg, on account of his grateful and willing service, his servant and courtier (dhiencr und hoffgesind) for life, promising to supply him with clothing and each year 20 'malter' of corn and 2 'fuder' of wine." It has always been inferred from this that Gutenberg had quitted Mainz and gone to Eltville (Elfeld) to reside at the archbishop's court, and that, his dignity as courtier preventiug him from printing himself, he passed the Catholicon types ou to Henry Bechtermuncze at Eltvilie. But recent researches have shown that Guteuberg remained at Mainz till his death in 1463 . We certainly find in 1467 the Catholicon type with come additions (already found in the indulgence of 1461) at Eltvills near Msinz, in the hands of Henry and Jicholas Bechtermunczs and Wigandus Spyes de Orthenberg, who finished on 4th November of that year (vi.) Voccbularius ex quo (a Latin-German vocabuiary) in sto, 166 leaves, 35 lines, the ouly known copy of which is iu the Paris library, and (vii.) Vocabulartus ex quo, second edition, with colophon dated 5 th June 1469, 4 to, 165 leaves, 35 lines, copies of which exist in Lord Speucer's library, at Blenheim, and in the Paris library. Now it is asked how ths Bechtermuuczes could pave been using.the Catholicon type in 1467, if Fe assume that it was this type to which Homery refers in his letter of obligation as being in his possession. Some, therefore, conclude that the Catholicon and tle four other works in the same type were printed at Mainz by Heury Bechtermuncze, who may afterwards have transfored his printing ollice to Eltrille. In that case it is difficult to seo what typo Homery could refer to, unless it were trpe 2 , a close smitation of which, if wot the actual type, was used by Nicholas

1 See for ictails. Heaselo, Gutenberg, p. 160 sq .
: See Hessets, Gutenbery, p. 101 sq.

Bechtermuncze at Eltvilie in prioting (12th March 1472) a third edition of the Vocabularius ex quo, 166 leaves, 35 lines, copies of which are preserved in the Paris and Hamburg libraries, and an evtition of Thomas Aquinas, Sumna de Articulis Fidei, 12 leaves, 35 lines (Munich library).
It is necessary to poiut out that for nearly saventy years eight books-(1) Prognositication or Calendar; (2) Hermaun de Saldis, Speculum Sacerdotum ; (3) Tractatus de Celebratione Missarum ; (4) a work in German treating of the necessity of councils; (5) Dialogus inter Hugonem Cathonem et Oliveriuns super Libertate Ecclesiastica; (6) Sifridus de Arena, Determinatio Duarum Quæstionum; (7) ld., Resporsio ad Qualuor Guesstiones; (8) Klagspiegel, or Newo grieutscht Rechtbuch-have been ascribed to Gutenberg on the streugth (a) of the date 1460, which was said to be found in the Prognostication in the Darnastadt library, and (b) of a so-called rubrication allered to be in a copy of ths Tractatus de Celebratione Missarum, in which "Johannes dictus a bono monte" and Johsunes Numeister are rejresented as offering this work on 19th Juns 1463 to the Carthusians at Mainz. But the date in the Prognostication has been falsified fuem 1482 into 1460 , and the rubrication in the Tractatus is a forgery. ${ }^{8}$ The eight books ars now considered to have been printed by Erhard Rouwich.

When we set aside the above worka, there is no further difficulty as regards the history of Mlainz printing. Fust and Schoeffer Forked together from 1457 to 1466 , starting in August 1457 with an editiou of the Psalterium, printed in large missal types, mhich, as far as we know, is the first printed book which bears a data, besides the place where it was printed and tha name of the printers. It Was reprinted with the same types in 1459 (the second printed book with date, place, and pams of printer), in 1490 , and in 1502 (the last work of Schaeffer, who had manufactured its types). In 1459 Fust and Schoeffer also published Gul Durantus, hationale Divinorum Officiorum, with the small type (usually called Durandus type) with which they continued to print long afterwards. In 1460 they published the Constitutiones of Pope Clement V., the text printed in a type (Clement type) abont a third larger than the Durandus. This type was, however, in existence in 1459, as the colophon of tha Durandus is printed with it.*

## Spread of Typogrophy.

Having explained the early printing of Mainz, iu ao far aa it Spreal bears apon the controversy (see below) as to where and by mhom of typi tha art of printing was invented, we can follow its spread to other graphy countries. After Mainz it was first established in 1460 at Strasburg, whers the first printers were,-1. Johann Mentelin, who completed a Latin Bible in that year, according to a rubrication in a copy at Freiburg in the Breisgau; 2. Adolph Rusch de Inguilen, who is presumed to be the printer of the undated books with a singularly. ahaped $\mathrm{R} ;{ }^{5}{ }^{c}$ c. 1464; 3. Henricus Eggestein, 1471; 4. George Husner ; 5. Martin Flach, \&c. In 1461 at Bamberg, where the first printar was Albrecht Pfister, who in that year published Boner's Edelstein, though it is atill doubtful whether ha did not print earlier (aee sbove); 2. Joh. Sensenschmidt, c. 1480. 1465 at Subiacn; first and only printers Conrad Sweynheym and Arnold Pannarts, who completed in that year an edition of Cicero, De Oratore, and Lactantins, and removed to Rome in 1467. 1466 at Cologne, the printers being-1. Urich Zell, who published in that year Chrysostom, Super Psalmo Quinquagesimo Liber Primus, though it is presumed that ha printed in 1463 ; 2. Arnold Ther Hoeruen, 1470; 3. Johannes Koelhoff of Liibeck, 1470 , who printed the Cologne Chronicle in 1499; 4. Nicolaus Götz 1474; 5. Goiswinus Gops, 1475; 6. Petrus de Olpe, 1476 (not 1470); 7. Conradus Winter of Homburg, 1476 ; 8. Joh. Guldenschaaf, 1477; 9. Henricus Quentel, 1479, \&c. ${ }^{6} 1467$ at Eltville; first printers Nicolas and Henry Bechtermuncza and Wygandus Spyes de Orthenberg, who completed in that year a Vocabularius exquo. 1467 at Rome ; first printers Conrad Sweynheym and Arnold Pannarts from Subiaco, who published an edition of Cicero's Epistolas ad Familiares, and Ulrich Hahn or Udalricus Gallus, who issued on 31st Decenber 1467 Turrecremata's Medilations. 1468 at Augshurg; first printer Günther Zainer or Zayner. Same year at Basel; first printer Berthold Rot of Hanau. Sama year at Marienthal; Brothers of the Common Life. 1469 at Venice ; printers,-1. Johannes of Spires ; 2. his brother Tindelinus of Spires ; 3. Christopher Valdarfer ; 4. Nicolas Jenson, \& \& . Tha further spread of typography is indicated by ths following data:-1470 at Nuremberg (Johan Senseuschmidt, Friedr. Creusner, Anton Koberger, \&c.), Berona or Beromiunster in Switzerland (Helyas Helya alias Ds Llouffen), Foligno (Emilianus de Orfinisand Johamnes Numeister), Trevi (Johamn Reynard), Savigliano

5 M. Fhilsppe, Origine de Ilmprimerie i Poris, p. 219, mentlans two bonks printed in this type, Which contain manuscript notea to the effect that they were purchased in $H 64$ and 1467, an thet Ingullen ahould be placed before Eggestein.
Johan Veldener, who is said to have printed at Cologne, was pever entab liahec there, but at Louvain (1478-77), Utrecht (1478-S1), sad Culenborg ov Kuileaburg (1 tis.84); see Holtrop, Mon. Typ , pp. 42, 47, 109
(Hans Glim), Paris (first printers the three partncrs Ulrich Gering, Michael Fribuiger, Martin Krantz); 1471 at Spires, Bologna, Ferrara, Florence, Milan, Naples, Pavia, Treviso, Savigliano(?); 1472 at Esslingen, Cremona, Mantua, Padua, Brescia, Parma, Monreale (Mondovi), Fivizzano, Verona, Lesi (?), St Ursino (?); 1473 at Lauingen, Ulm (perhaps as early as 1469), Merseburg, Alost, Utrecht, Ljons, Messina, Buda; 1474 at Louvain, Genoa, Como, Savona, Turin, Vicenza, Valencia (?); 1475 at Libeck, Breslau, Blaubeuren, Burgdorf, Trent, Cracom (?), Modena, Reggio (in Calabria), Cagli, Caselle or Casale, Pieve (Piove) di Sacco, Perugia, Piacenza, Saragossa ; 1476 at Rostock, Bruges, Brussels, Aagers, Toulouse, Polliano (Pogliano); 1477 at Reichenstein, Deventer, Gouda, Delft, Westminster, Lucca, Ascoli, Palermo, Seville; 1478 at Oxford, St Maartensdyk, Colle, Schussenried (in Würtemberg), Eichstädt, Geneva, Vienne, Trogen (?), Chablis, Cosenza, Prague, Barcelone; 1479 at Erfurt, Würzburg, Nimeguen, Zwolle, Poitiers, Toscolano, Pinerolo, Novi, Lerida, Segorbe; 1480 at London, St Albans (or in 1479), Oudenarde, Hasselt, Reggio (in Modena), Salamanca, Toledo, Nonantola, Friuli (?), Caen; 1481 at Passau, Leipsic, Magdeburg, Treves, Urach, Casale di San Yaso, Saluzzo, Albi, Rougement (?); 1482 at Reutlingen, Memmingen, Metz, Pisa, Aquila, Antwerp, Promentonr, Zamora, Odense; 1483 at Leyden, Kuilenburg (Culenborg), Ghent, Chartres, Chalons-smr-Marne (?), Troyes, Gerona, Stockholm; 1484 at Bois-le-Duc, Siena, Udine, Soucino, Winterberg, Klosterncuburg, Rennes, Londéac; 1485 at Heidelberg, Ratisbon, Pescia, Vercelli, Tréguier or Lantreguet, Salins, Burgos, Palma, Xeres; 1486 at Münster, Stuttgart, Chiavasco, Voghera, Casal Maggiore, Abboville, Brünn, Schleswig; 1487 at Ingolstadt, Gaeta, Rouen, Murcia; 1488 at Stendal, Viterbo, Gradịsca, Besançon, Constantinople ; 1489 at Hagenau, San Cucufat (near Barcelona), Coria, Pamplona, Tolosa, Lisbod; 1490 at Orleans, Grenoble, Dôle; 1491 at Hamburg, Nozzano, Gounilliéres, Angouleme, Dijon, Lantenac; l492'st Zinna, Valladolid, Leiria; 1493 at Liineburg, Cagliari, Freiburg (in Breisgan), Urbino, Acqui ; 1494 at Oppenheim, Monterey, Braga; 1495 at Freisingen, Freiberg, ; candiano, Forli, Limoges, Schoonhoren (monastery Den Hem), Wadstena, Cettinje ; 1496 at Offenburg, Provins, Granada; 1497 it Alunich, Barco, Carmagnola, Avignon; 1498 at Tiibingen, Perigueux, Schiedam, Tarragona; 1499 at Montserrat, Madrid; 1500 at Olmütz, Pforzheim, Sursée, Perpignan, Valenciennes, Jaen. Printing vas introduced into Scotland in 1505 by the establishment of Andrew Millar at Edinburgh, ${ }^{1}$ and into leland, at Dublin, in 1551. nos for non-European countries and towns, printing was established in Mexico in 1544, at Goa about 1550, at Tranquebar in 1569, Terceira in the Azores 1583, Lima 1585, Manila and Macso (China) 1500, in Hayti in the beginning of the 17 th century, at Puebla in 1612, Cambridge (Mass.) 1638, Batavia 1668, Tiflis 1701, Germantown 1735, Ceylon 1737, Halifax (Nova Scotia) 1766, Madras 1772, Calcutta 1778, Buenos Ayres 1789, Bombay 1792, in Egypt (at Alexandria, Cairo, and Gizeh) in 1798, at Sydney 1802, Cape Town 1806, Montevideo 1807, Sarenta 1808, Valparaiso 1810, Astrakhan 1815, in Sumatra and at Hobart Town and Santiago (in Cbili) in 1818, in Persia (at Teheran) in 1820, and at Chios about 1821. ${ }^{2}$

## Castoms

 chief towns of Germany, Italy, Switzerland, France, the Netherlands, Spain, England, not a single printer carried away with him a set of types or a set of punches or moulds from the master who had taught him, but, in setting up his printing office, each man cast a set of types for his own use, always imitating as closely as possible the handwriting of some particular manuscript which he or his patron desired to publish. When we compare Schoeffer's 30 -line indulgence of 1454 with a manuscript copy of the eame indulgence dated 10th April 1454 , now in the lands of a private collector at Wiesbaden, we see that the types used in printing that document were specially cast for the purpose after the model of the handwriting employed for the written copies. We know also that the types of the 36.line and 42-line Bibles and those of the psalter of 1457 are the closest possible imitations of the ormamental church handwriting customary at the time of their production. Also, when we compare the 31 -line indulgence of 1454 with the German blockbook called the Enndtchrist, and both in their turn with the German MSS. of that period (especially the manuscript portions in the printed copies of the indulgences), we see that the cutter of the text type of the indulgence, as well as the engraver of the blockbook, formed his characters according to some German handwriting (book hand) of the period. This imitation extended, not only to the shape of the letters, but likewise to all those combinations of letters (dquble $p$, donble $f$, donble $s$, st, $t i, t u, r \in, ~ c u, c t, s i, d \epsilon, c o$, $c i, t e, c e, o r, v e, p o, f a, h e, b c, \& c$. ) and contractions (for pro, -um, -em, - en, the-, uer, -bus, -bis, scd, am, tur, qui, quæ, quod, secundum, icc.) which vere then, and had been for many centuries, iu use by ocribes. In most, if not all cases, the MSS. which the printers 12 See Rob. Dickson, Introd, of Art of Print. into Scoll., Aberdfen, 1885 .On the introduction of printing in varions towns, consult Henry Cotton,
A Typog. Gazet., 8vo, Oxford, 1831 and (second series, $8 v 0$, Oxford) $1866 ;(\mathrm{P}$. Deschamps) Dict. de Géogr. à $l^{\prime}$ Usape du Libraire, 8vo, Paris, $1870 ;$ R. C. Hswkins, Titles of the First Books from the Earliest Presscs Established in Di.fe.*ni Cities in Europe, 4to, New York, 1884.
imitated were indigenous to the place where they settled. Thus the first printers of Subiaco, though they were Germans and had most probably learned the art of casting types and printing at Mainz, clearly cut their types after the madel of some Italian MS. which was free from any Gothic influence, but written in a pure Caroline minuscle hand, differing but slightly from the Caroline minuscles which the same printers adopted two years afterwards at Rome. The first Paris printers started in 1470 with a type cast in the most exact manner, on the model of the Caroline minuscle handwriting then in vogue at Paris. Jolm de Westphalia, who introduced printing into Belgium, used from the beginning a type which he calls Venetian. Where therefore there is a great similarity, but no absolute identity, between the types of two printers (e.g., Schoeffer and Ulr. Zell), it should be attributed to the similarity of the bandwritings which the printers followed rather than to any attempt on their part to imitate each other's types. To this universal system (clearly discernible in the first twenty-five years of printing) of each printer setting up business with a new type cast by himself, there are, according to the conjectures of a good many bibliographers, only two exceptions. One is Albrecht Pfister (see ahove) ; the other is the Bechtermunczes of Eltville (see above).
Another most important feature in the earliest books is that the printers imitated, not only the handwriting, with all its contractions, combined letters, \&ic., but all the other peculiarities of the MSS, they copied. There is in the first place the unevenness of the lines, which very often serves as a guide to the approsimate dato of a book, especislly when we deal with the works of the same printer, since each commenced with uneven lines, and gradually made them less uneven, and finally even. This unevemness was unavoidable in manuscripts as well as in hlock-books; but in the earliest printed books it is regarded as evidence of the inability of the printers to space ont their lines. If this theory be correct, this inability was perhaps owing to the types being perforated and connected with each other by a thread, or to some other cause which has not yet been clearly ascertained. But it is not impos. sible that the uneveuness was simply part and narcel of the system of imitating M1SS., and that only gradually (about 1473 or 1474 , but in some cases later) printers began to see that even lines looked better than uneven. This seems clear when we observe that the imitation of MSS. was carried 60 far that sometimes things which deviated from the work of the scribe, but had accidentally been printed in, were afterwards erased and altered in conformity with the MIS. The Paris library, for instance, possesses two copies of the Liber Epistolarum of Gasparinus Pergamensis (printed at Paris in 1470) in both of which the initial $G$ of the first line and the initial M of the fourth line were printed in, and, whilst they have been allowed to remain in one of the copies, in the other they were regarded as a fault and replaced by a rubricated $L$ and $M$.

In the secoad placo the initials of books or the chapters of book: in MSS., and again in block-books and the earliest products of printing, were always, or at least in most cases (they are printed in the indulgences of 1454), omitted by the scribe and the printer, and afterwards filled in by the rubricator. As the latter artists were sometimes illiterate and very often filled up the gap by a wrong initial, we find in a good many MSS. as well as early printed books small letters written either in the margin or in the blank left for the initial, to guide tle rubricator. In most cases where these letters (which are now called initial directors) were written in the margin, they were placed as much as possible on the edges of the pages in order that they might be cut away by the binder as unsightly; but in a rast number of incunabula they have remainerl till the present day. ${ }^{3}$ After a few years these initial directors were in a good many books printed in (in lower-case type) with the text. In all cases, whether written or printed, they were meant to be covered by the illuminated initial ; but, as a matter of fact, the latter very sfldom covers the initial director so completely as to make it invisible, and in a good many cases the iutended illamination was never carried into effect.

With respect to the hyphens, which were used in the 1454 indulgences and the 36 -line and 42 -line Bibles, always outside tho printed margin, some of the earliest printers did not employ them at the moment that they started their presses, and in the case of comu printers the non-use or use of hyphens, and their position outside or inside the printed margin, serve as a guide to the dating of their products. After about 1472 they becorae more uniform in their shape and more generally used.

The use of signatures is confined in MSS. mostly to mark the quires, and in hlock-books to mark each sheet or page ; they do not occur in printed books before 14 年 (at least in no earlier book with a date), when they appear in Joh. Nider's Praceptorium Diving Lcgis, published by Johan Koelhoff at Cologne.
Catchwords (custodes) were used for the first time about 1469 by Johannes of Spires, at Venice, in the first edition of Tacitus.

3 The university library of Basel possesses a collection of the farlient I'aris nonks still bound in their original binding, in which these initial diroctorn are an close to the back that they can cuis be seen by streteling the tuaks wide opea.

Pagination or rather foliation was first used by Arn. Ther Hoernen, at Cologne in 1471, in Adrianus's Liber de Rencdiis Fortuitoruni Casuum, having each leaf (not page) nambered by figures placed in the end of the line on the middle of each right-hand page.

The practice among early printers of imitating and reproducing MSS. Was not abandoned till many years after the first printed book (1451) made its appearance; and, looking at the books printed, say from 1454 to 1477 , from our present standpoint of daily improvement and alteration, tho printing of that period may be said to have been almost wholly stagnsent, without any improvement or modification. If some printers (for instsnee, Sweynheyrn and Pannarts at Subiaco and Rome, sad Nicolss Jenson at Venice) produced handsomer books than others, this is to be attributed to the beauty of the MSS. imitated and the paper used rather than to any superior skill. Generally speaking, therefore, wo shall not be very far wrong in saying that the workmanship of Ketelaer and De Leempt's first book, published st Utrecht c. $1 \pm 73$, and that of Caston's first book issued at Westminster in 1477, exhibit the rery same stage of the art of printing as the 1454 indulgences. If therefore sny evidence were found that Ketelser snd De Leempt and Caxton had really printed their first books in 1454 , there would be nothing in the workmanship of these books to prevent ins from placing them in that year. And conversely, if the indulgences of 1454 had been issued without a date or without any names to indieate their approximate date, their workmsnship would invariably indnce biblographers to sscribe them to circa I470, if not somewhat lster. Eren after 1477 the alterations in the mode of printing books proceeded very slowly and alnost imperceptibly. It csme to he 110 longer a universal system for printers to begin business by casting a type for themselves, but soune received their types from one of their colleagues. And, though there were atill many varieties of types, one sort began to make its appearance in two or thrce different plsees. The combinations of letters were the first to disappear; but the contractions remsin in a good many books even of the 15 th century.

- Some theories have been basod on, and others have been considered to be upset by, the supposition that the early printers always required as much type as printers of the present day, or at any rste so mueh as would enable them to set up, not only a wholo quire of 4 or 5 sheets ( $=8$ or 10 leaves $=16$ or 20 pages), but even two quires ( $=40$ pagos), Consequently ealculations have been msde that, for instsnce, $\mathbf{7}$ the pi uter of the $42-l i n e$ Bible required a fonnt of at least 120,000 characters. ${ }^{2}$ But, though the Spcculum Humanse Salvationis scems to have been printed by whale sheets (2 pages), there are numberless proofs that many early books were printed page by page, even when in small 4to. For instance, in some books it has been obserred that portions of the types with which the text of the first, seeond, or third psges of a quire had been printed were used to "lock up" the types employed for the later pages of the same quire, as is evident from the blank impressions of such portions being found on these later pages. Again, in some books two, three, or four blank leaves are found at the end, ehowing a misealculation of the printer. Noreover, the numerous itinerant printers of the 15 th century, who established a press for a short time wherever they went, prove that the furniture of the earliest printing offices must have been of no great extent.

## The Invention Controversy.

Now that we lave traced the art of printing from the moment ( 1454 ) that it mado its appearance in a perfect state at Mainz, and have followed its spread to all the chief places of Europe till 1500, we must take notice of the contreversy which has been carried on for nearly four hundred years as to when, where, and by whom the art was invented. For this purpose re will gather up into a chronological sequence $(a)$ a few of the most important expressions used by the earliest printers in their colophons, (b) whatever documentary evidence there may be on the subject, and (c) some accounts of the earliest authors on the subject. (The letters A, B, \&c., are for the sake of convenient reference.)

The earliest testimony (A) to which we may refer is the notarial instrument, dated 6 th November 1455, of the lawsuit hetween Fust and Gutenberg, whereby the former sought to recover 2026 guilders from the latter in repayment of 1600 guilders ( 800 advaneed in 1450 or 1449 and another 800 in 1452), with the interest thereon. Fust speaks here ${ }^{2}$ of "the work" (line 24), and of "our common work" (line 60); Gutenberg speaks of "tools" in preparation, "workmen's wages, house-rent, vellum, paper, ink, \&e." (lines 3740), of "such work" ( 41 ), and of "the work of the hooks" (42);

[^294]whereas the judges speak of "the work to the profit of both " (49), and "their common use" (60). (B) In the earliest" book published with a date (the Mainz psalter, issued 14th Aurust 1457 by Fust aud Peter Schoeffer) it is said that it was perfected at Mainz by an "adinventio artificiosa imprimendi ae caracterizandi absque calami ulla exaratione" (repeated and raried latcr ; see p. 681 above). (C) In 1460 the Catmolicon was published at Mainz, without the name of the printer; but the colophon, after stating that the book wa่s printed at Mainz, which town God's merey had deigned to prefer above other nations of the earth, adds (D) that the bock was printed and completed "non calami, stili, sut penne suffragio, sce mirs patronarum formarumque concordia, proporeione, et modulo." This work is considered to heve heen printed by Gutenberg, and the mention of God's merey is regarded as an allusion to the inrention of printing. The plarase is, bowever, also found in the Liber Sextus Decrelalium, in the Summa of Thomas Aquinas, and in the Clementina, published respectively on 17 th December 1465 , 6 th March, and Sth October 146 , by Fust and Schoeffer. (E) On 17th January 1465 Adolph II., archbishop of Mlainz, hy a publie decree, appointed Gutenberg as his servant in reward for "his eerviees," but he does not speak of him as the inventor of printing nor even ss a printer. (F) In the Grammalica Rhythmica, published in 1466 hy Fust and Schoeffer, the third line of the colophon runs: "Hine Nazsreni sonet oda per ora Johannls," whieh was formerly regarded as an allusion to Johann Fust or Johann Gutenberg, but which more probably refers to Joluann Brunnen or Fons, the author of the grammar. (G) On 26 th February 1468 Dr Homery wrote to the archbishop of Mainz the letter qusted above, from which it may be inferred that Gu+enberg lisd been a printer, though not a word is said as to his being the inventor of printing. (H) In 1468 Sehoeffer reprinted Fons's Grammatica, and in the colophon it is said: "At Moguntina sum fusus in urbe libellus meque (the book) domus genuit unde caragma venit." (I) Schoeffer published on 24th Msy 1468 the first edition of Justiniani Impor. Institutionum Juris Libri VI., cum Glossa. To this were added hy way of colophon some verses commencing: "Seena tabernaculi, \&c.," in which it is said that (the ornament of the chureh) Jesus "hos dedit eximios sculpendi in srte magistros. . Qnos genuit amhos urbs Moguntina Johannes, librorum insignes prothocaragmatieos," which is regarded as an allusion to Johann Gutenberg and Johaun Fust as first printers. (K) In the same year (1468) Johannes Andreas, bishop o! Aleria, says, in the dedieation of his edition of St Jeromes Epistles, published in that year (13th Deeemher) at Rome, to Pope Paul II., that "Germany is to be honoured for ever as having been the inventress of the greatest utilities. Cardinal Cusa wished that the saered art of printing, which then (under Cardinal Cusa, who died 11th August 1464) seemed to hare arisen in Germany, were brought to Rome." (L) In 1470 Guil. Fichet, in an octsstichon inserted in the Paris edition of 1470 of the Lellers of Gasparinus of Bergamo, exhorts Paris to take up the almost divine art of writing (printing) which Gcrmany is aequainted with. In the same year Erhard Windsberg writes to the ssme effect in an epigram inserted in tho Epistola Phalaridis published at Paris about 1470. (II) In 1471 Lindov. Carbo speaks, in the dedication of the Lelters of Pliny to Borso, duke of Modena, of the Germans hsving invented printing. Nieolaus Gupalatinus speaks (Venice, 1471) of a German being the inventor of printing, and Nicolans Perottus of the ar2 which had lately come from Germany. (N) On 21st May 1471 Nicolas Jenson published an edition of Quintilian, edited and revised by Ognibene de Lonigo (Omnibouus Leonicenns), who in the preface speaks of its printer as "libravire srtis mirabilis inventor, non ut scribantur calamo libri, sed veluti genma imprimantur, ac prope sigillo, primus omnium ingeniose denonstravit." (0) About 1472 the first three printers of l'aris published Gasparinus Perga. mensis's Orthographis: Libcr, to which is prefised (in the copy of the university of Basel) a letter, dated 1st January, from Guil. laume Fichet. prior of the Sorbonnc, to Robert Gaguin, in which lie says that "it is rumoured in Germany that not far from the eity of Dainz a certaiu Johann Gutenberg (Johannes, cui cognomen Bonemontano) first of all invented the art of printing (impressoriam srtem), by reeans of which hooks are made with letters of metal, not with a reed (as the ancients did), nor with the pen (as is donc at present)." (P) On 14th July 1474 Joh. Philippus de Lignamine publisbed at Rome Chronica Summorum Pontificum Imperal mumque, in which we find, between two enties, relating one to i4th July 1459 and the other to 1 st October 1459 , an undated paragraph io which it is said that Jacobus with the smrmane of Gutenberg of Strasburg and a certaiu other ono named Fustus, "iraprimendarum litterarum is membranis cum metallieis formis periti, trecentas eartas quisque eorum per diem facere ingeteseunt apud Moguntiam Germanie civitatem. "The same is said of Mentelin, and (nnder 1464) of Conrad Sweynbeym, Arwold Pannarts, and Udalricus Gallus. (Q) On 23 d May 1476 Peter Schoeffor issued the third edition of tho Iustitutiones of Justinian, with the same iraprint as in the edition

3 The earliest is perhaps the Donatus issued by Peter Schoeffer, possibly before 1456 , the colophon of which says that it was finished: "Arto novs imprimendi aeu caracterizandi . . . ebsque calanií caaratione."
of 1468 (see testimeny I), but with the addition that Mainz is the "impressoriæ artis invenirix elimatrixque prima." (R) In 1478 an edition of the Fosciculas Temportm was issued at Cologne, in which it is stated undes the year 1457 that the printers of books were multiplied on earth, deriving the origin of their art from Mainz. The carlier editions merely stated that the printers of books were multiplied on earth. (S) In 1483 Matthias Palmerius of Piss published at Veuice the Chron. Ehseb., in which under the year 1457 it is stated that students owe a great dobt to Germany, where Johannes Guttenberg zum Jungen, knight of Mainz, invented the art of printing in 1440. (T) In the same 5 ar Jac. Phil. Foresta of Bergamo published Supplementum Chronicorum, in which he says under the year 1458 that the art of printing books was first discovered in Germany, according to some by Guthimberg of Strasburg, according to othérs by Faust (see P), according to others by Nicolas Jenson (see N). (V) On 6th March 1492 Peter Scheeffer pullished the Nicdersachsische Chre itik of Comrad Betho, saying in the coloplion that it was "geprent . . . in ... Mentz, die eyn anefangk is der prentery." ( X ) At the end of 1494 two Heidel lierg professors, Adam Wernher and Joh. Herbst, composed some Latin verses in honour of Johannes Gensfleisch (a family name by which Gutenberg was knvenn, and which was turned into the Latin Ansicarus), whom they called "primus librorum impressor" and "impressorie artis inventor primus." (Y) In 1499 Jacobus Wimpheling (born at Schlettstadt 1450 , died 1528 ) published (at Mainz, by $P$. Friedberg) an Oratio ial Menoriam Marsilii ab Inghen (d. 1396), in which lie, on leaf 22 a , praises Joannes Ansicarus in verse on account of his invention at Mainz. (Z) These verses are preceded by an cpitaph on Johann Gensfleisch, "artis impressoriæ inventor" and "repertor," written in Latin by Adam Gelthus, a relative of Gutenberg. (AA) In the same year Polydore Vergil (De Inventoribus Rerun, Venice, 1499, lih. ii. cap. 7) aays that a certain Peter [Schoeffer ?], a Gemnan, iuvented in 1442 the art of printing at Mainz in Germany, as he had heard from the latter's countryman; this statement was repeated in a Venice edition of 1503 . In lster editions "Peter" was altered to "Joh. Gutenberg." (BB) In the same year Koelhoff, printer at Cologne, published Cronica van der hilliger. Stat van Cocllcn, in which on fol. 312b it is said: (1) The s1tt of printing was found first of all in Germany at Miva about the year 1440 ; (2) from that time till 1450 the art and what belonged to it were investigrated ; (3) and in 1450, when it was a golden year (jubilee), they began to print, and the first book that they printed was the Bible in Latin, in a large letter, resembling that with which at present missals are printed. (4) Alithough the art was found at Mainz in the manuer in which it is generally empleyed now, jet the first prefiguration was found in Holland from out the Donatuses which were printed there before that time, and from and out of them was taken the becrinning of the aforesaid art, and it was found much nore mastenty and exact (subtilis) than that other manner was, and las become more and more artistic. (5) Omnibonns wrote in a prefsce to Quintilian, and in some other hooks too, that a Walloon from France, named Nicol. Jenson (see N), discovered this art ; but that is untrue, for there are those still alive who testify that beoks were printed at Venice before Nicol. Jenson came there, and began to cnt and make letters. (6) Bnt the first inventor of printing was a citizen of Mainz, named Junker Johan Gudenburch. (7) From Manz the art was introduced first of all into Cologne, then into Strasburg, and 8 fterwards into Venice. (8) The origin and progress citto irt mere told to the writer verbally bj Ulrich Zell of Hanau, still printer at Cologne (anno 1499), through whom the said art came to Cologne. (CC) In 1501 Jacob Wimpheling (see Y), who stated in his Oratio Querulose contra Invasores Sacerdotum, Flrminum, \&ce., published at Delft c. 1495 , that chalcography hatl heen invented at Mainz, published a work (Gcrmaria, Straslurg, Joh. Prüss, 1501) in which he says (on p. 43) that the invention was cade at Strasburg by Johann Gutenberg of Strasburg, and that it *as perfected at Mainz (DD) In 1503 Johann Schocffer (the son of Peter Schoeffer and the grandson of Joliann Fust) puhlished an edition of Hermes Trismegistus, in which he represents himself as pae of the most distinguished citizens of Mninz, descendeal from the most fortunate race who invented the art of pinting. (EE) In 1504 Ivo Wittig, who was a relative of Gutenberg, and a canon and the keeper of the soal of the St Victor cathedral uear Mainz (of which Gutenberg had been' lay member), erected in the house "Zun (iutenlerg" a memorial stone and ar epitaph to Jolı. Gutenberg of Dainz, "qui prinus omnium litteras are imprimendas invenit." (FF) In 1505, in the German trauslation of Livy published by Johann Schoefler (see KK), the ledication to the emperer Maximilian, which was prolually written by Ivo Wittig (see EE), speaks of Joham Giittenbergk as inventor of printing (1450) and Johann Faust and Peter Schoeffer as inprovers of the art. This work was reprinted six times ( $1514,1523,1533,1551,1$ 153) with the same dedicatiod; but in 1509 the Brovirrium Mfogantinum says that it was printed at the expense sad trouble of Johann
1 These verses were nol published at the time, but in the 19th centnry by $F$. J. Mone, Que'lenswmpl. तer I.whesgesth, jii. 163, from the contemporary as of Cslam Wermier, preserven in the archis es of Carlsruhe.

Schocffer, whose grandiather (i.e., Jolıanu Fust) was the first inventor and anther of the art of plinting (see DD). (GG) In 1505 Jacob Wimpheling, in his Epithomi Germanoram (Straslurg, 1505), asserts (on leaf xxxviii b. and xxxix s.) that in 1440 Johann Guten. berg of Strasburg iuveuted there the srt of printing. And in 1507, in his Catal. Episcoporunt Argent. (Strasburg, 1507), he says that the art was invented, though in an imperfect manner, by a certaiu Strasburger, who afterwards went to Mainz and joined others working and trying the same art, where it was, under the guidance of Johann Gensfleisch, 1 yelfected in the house "boni montis" (Gutenberg). This he repeated in 1515. (HH) Abont 1506 Johsunes Trithenius wrote his Chronicon of Spanhein, published at Frank. fort in 1601, in which he gays (p. 366) that the art of printing Looks was discovered afresh at Mainz ly Johan Guterherg, who, after having spent all his prowerty in accomplishing the new invention, perfected it ly the advice and ossistance of Johann Fust. The first propagatel of the new art was, after the inventor, Peter Schoeffer. (II) In 1575 Johann Schoeffer pullished Joh. Trithenius's Comp-endium sive Coeviarinear Historiæe Fyancorum, and said in the colophon that the book was published at Mainz, the first inrentress of the art of pinting, by Johann Schoeffer, grandson of the late Johann Fust, the first autlor of the said art, who finally from his own genius commenced to excogitate and to investigate the art in 1450 , and in 1452 perfected it and eonmenced printing, assistel hy many necessary inventions of Peter Schoeffer von Gernsheim, his aervant and adopted son. Jolann Fust and Peter Schoeffer kept this art secret, binding all their selvants and domestics by oath never to reveal it ; but in 1462 it was spread by the same domestics into divers conncries. (KK) On 9th December 1518 the emperor Maximilian accorded to Johann Schoeffer the privilege of printing livy (1518-1519), and says in it that "he has learned and been sdvised on the faith of worthy testimonies that the ingenions iuvention of chalcography was effected by the printer's grandfather." (LL) In 1519 Joh. Thurmayer Aventinus (1474-1534) wrote that " in 1450 Joannes Faustus, a German, a citizen of Mainz, invented a new kind of writing, called chalcography, and completed it in two years; it was kept secret by him and Peter Schoeffer, his son-in-law, but divulged in Germany ten years afterwards by Faust's servant, Johannes Guttenherger, a Strasthurger." (MM) In a pedigree of Lourens Janszoon Coster of Haarlem and his descendants, drawn up not later than 1520 , it is asserted that in 1446 "he brought the first print into the world." This document, of which the date 1446 seems to have been altercd into I440, is preserved in the Haarlem town library. (NN) In 1520 Johan Schott, a printer at Strasburg and grandson of Johsn Meatelin, the fisst printer of that town, published an edition of Ptolemy, at the end of which he printed the arms of his grandfather with the following legend: "Insigne Schottorum Familiæ ab Friderico Rom. Imp. III. Joan. Mentelio primo Typographiz Inventori ac suis noncessum : Anno Christi 1466." Apart from the assertion that Mentelin was the inventor of printing, we may remark tliat the emperor Frederick III. raised Mentelin to the rank of a nobleman in 1466 and granted him new arms. (OO) About 1533 the Neapolitan Mariangele Accorso, who had resided at the court of Charles V., wrote on an edition of Donatus (in the possession of Aldus Manutius, jun.) that "Joh. Faust of Mainz first discovered the art of printing with metal types, which afterwards be made of lead; bis son Peter Schoeffer adder afterwards much to polish the said art. This Donatics and Confessionalia were printed first of all in 1450. Faust lerived the ouggestion from a Donatus printed before in Holland from an engraved block." This paragraph is found on p. 411 of the Biblioth. Apost. Vaticania of Angelo Roccha (Rome, 1591). Some consider its latter part to have been derived from the Cologne Chronicle (BB), and it seenis probable that it was a mixture of some of the ebove testimonies. ( CP ) In 1536 Johan Schott (see NN) published Historicn Hradt-Buch7ein (Strasbnrg, 1536), in which (on leaf $b^{1}$ and $b^{2}$ ) he says that "Hans Mentlii, of Strasburg iuvented the art, which, throngh infidelity, was brought to Mainz." On the strength of this and other statements (CC, GG, NN) the liceutenary of the Straslurg invention was celebrated there in 1640. (QQ) In 1541 Joh. Arnold (Bergel or) Bergellanus, who had settled as press-reader at Maiuz two years previously, 1ullished his Encomium C'halcograpliz (Mainz, Fr. Beliem, 1541, 4to), in which the lawsuit betwcen Fust and Gutenherg (A) is slluder to for the first time. Bergel had real Tritheim's Looks (HH), in which the invention is ascribed to Johann Gutenberg with twowcoadjutors, Johann Faust al.d Peter Scl.oerfer, which he (Bergel) had heard confirmel in cons crsations with Mainz citizens; he had also seen come old tools prepaled lor the work $\mathrm{b}_{\mathrm{j}}$ the oligiuaters which wore still in eaistence. Gntenberg in, vented it in 1450. (RR) About 1561 J 311 Van Zuren (hons at Haanlem in 1517) and Dirk Volkerts Coornhert (horn at An.sterdsm in 1522) established a printing office at Haarlem. Of the former it is alleged that he had compiled a work on, the invel.tion of puinting, which is presumed to have been lost during the siege of Haarlem in 1573. It was nat publicly spoken of till 1623 , when Peter Sciivelius published his Laurccranz voor Iaurens Coster. Scivelius had only found the
title, preface, and introduction, in which Fan Zuren contended that the first foundations of the art were laid at Haarlem, and that it afterwards accompanied a foreigner to Mainz. In this introduction he does not mention the name of the inventor, nor a date, but points in indefinite terms to the bouse of the inventor as still existing. (SS) In the same Jear (1561) Van Zuren and Coornhert published an edition of the Opfcia Ciceronis, in which the latter, in a de. dication to the magistracy of Haarlem, refers to the rumour that the art of printing books was invented first of all at Haarlem, and was brought to Mainz by an unfaithful servant and much improved there. He adds that very old and dignified persons had often told him, not only the family of the inventor, but also his name and surname, and had explained the first crude way of printing, and pointed out to him tbe house of the first printer. (TT) In 1566 Luigi Guicciar. dini, a Florentine nobleman who had visited the Netherlands and had resided many Jears at Antwerp, finished a description of the Netherlands (publisbed in 1567), in which, alluding to Haarlem, lie speaks of the inventiou there according to the assertions of the inhabitants, the evidence of some autbors, and other remembrances; the inventor died before the perfection of his art; his servant went to Mainz, where he perfected the art, and hence the report that it was invented there. (VV) About 1568 (it is calculated) Hadrianns Junius wrote his Batavia, published at Loyden in 1588, with tro prefaces, dated, the one from Leyden, 6th January 1575, the other from Delft ad annuem salutis 1575 . On p. 253 he says that the opinion that the forms of the letters whereby books are printed were first discovered at Mainz is very inveterate, but old and eminent inhabitants of Haarlem had assured him that they had heard from their ancestors that there lived at Haarlem, more than 128 years before, in a decent house then existing, near the marketplace, opposite the royal palace, Lourens (son of) Jan, surnamed Coster, who, while walking in the wood near Haarlem, began to shape beechen bark first into figures of letters, by which, reversely impressed one by one on paper, he composed one or two lines to serve as an example for the children of his son-in-law. When this succeeded, he began to contemplate greater things, and first of all invented, assisted by his son-in-law Thomas (son of Peter, a more gluey and substantial kind of ink (as the ordinary ink was found to blot), with which he printed whole tablets with pictures, with the letters added. Jnnius bad seen books of this kiod printed by Coster (the beginnings of his labours) on the rectos of the leaves only, not on both sides; the book was written (in Dutch) by an anonymons anthor, and entitled Speculum Nostrs Salutis, in which care was taken that the blank versos could be pasted together, so that the blank pages should not present any unsightliness. Afterwards (Coster) changed the beechen characters into leaden, end the latter again into tin ones. Very ancient wine-pota cast of the remains of these types were still to be seen in the house of Lourens, which was afterwards inhabited by his great-grandson Gerard (son of) Thomas, who had died an old man a few years before. When the new merchandise attracted purchasers everywhere, workmen were edded to (Lourens's) household, among whom was a certain John (whether, as was suspected, Faust, or another of the same name, Junius did not inquire), wbo was bound to the work of printing by oath. But, when lie thought he knesw the art of joining the letters and of casting the types, \&c., he stole away, when every. body had gone to church, the whole apparatus of the types and the tools prepared by his master, and hastened to Amsterdam, thence to Cologne, until he arrived at Mainz, where he could remain in eafety, and, having opened a work-office, issued within the space of one year, about 1442, the Docirimale of Alexander Gallus and the Tracts of Petrus Hispanus, printed with the same types which Lourens had used at Haarlem. Juning recollects that Nicolaus Gale, his tutor, a man of firm memory and renerable old age, had told bim that as a boy he had often heard a certain bookbinder Cornclis (a man of more than eirchty years of age, who had been an onder-workman in the same office) narrating the story of the invention (as he had heard it from his master), tho polishing and increase of the crude ert, se., and cursing those nights which he had passed, during some months, with tbe culprit in one bed. The burgomaster Quirinus Talesius admitted to Junius that he had formerly heard nearly the same from the mouth of the same bookbinder. (XX) In 1623 Scriverius in his Laurecranz (see RR) placed the date of the Haarlem invention os far back as 1428 , and mentioned as its inventor Lourens Janszoon, sheriff of Haarlem. Ho asserts that the art of printing appeared, "not in the manner as it is used now, with letters cast of lead and tin, but a book was cut leaf for leaf on wooden blocks," and the Haarlem inventor was robbed in 1440 by Johan Gutenberg. Scriverius based the dato 1429 npon a Hebrew Chronicle compiled by Joscph ben Meir (born 1496 , d. c. 1575 ), and published in 1554 at Sabianctta by Cornelius Adelkind, where, under the year of the Jewish cra 5188 ( $=1428$ ), the author mentions a book (without giving the title) printed at Venice and seen by him. Scriverius, bcing convinced that this could only refer to a bork printed at Haarlem, applied the entry ts a xylographic Biblua Paupcrum, of which he gave a description, tegether with several other block-books and carly printed books.
(XV) In 1639 Boxhora pushed the date of the Hasslem inveution back to $14 \Omega 0$, referring, as his authority, to the same Chronicle of Rabbi Joseph. Since that time the date of the Haalem invention has been variously placed between 1420 and 1430 .

Later testimonies are mere repetitions of earlier statements. ${ }^{1}$ We need not say much about the story of Antonio Cambruzzi, who asserted that Pamfilo Castaldi invented printing at Feltre, in Italy, in I456, and that Fausto Comesburgo, who lived in his house in order to learn the Italian language, learned the art from him and brought it to Mainz; this story, however, has found so much credence that in 1868 a statue was erected at Feltro in honour of Castaldi. Nor need we speak of Kuttenberg in Bohemia, where John Gutenberg is asserted to bave been born and to have found the art of printing. We may also pass over Johann Fust, later on called Faust (testimonies P, T, DD, FF, II, KK, LL, OO), as we know from the Mainz lawsuit of 1455 (A) that he had simply assisted Gutenberg with loans of money. We may also pass over Johann Mentelin of Strasburg (testimonies NN, PP), only remarking here that he had already printed a Bible in 1460 , and that he is mentioned in Strasburg registers as a chrysographer or gold-writer from 1447 to 1450 ; but of his whereabouts between 1450 and 1460 there is no record. That he had gone, or had been called, after 1450 by Gutenberg to Mainz has been asserted but not proved, and there is no reason why he should not be one of the two Johannes alluded to as the prothocaragmatici of Mainz in the Justinian of 1468 (testimony I.). That Nicolas Jenson came to be regarded in certain circles and for a time as the inventor of printing is owing to testimony $N$ being misunderstood. There remaitr, therefore, to be considered the testimonies which bear on the rival claims of Haarlem and Mainz. The controversy between Germany and Holland was publicly started as early as 1499 by the Cologne Chronicle (testimony BB), that between the two towns mentioned not publicly before 1561 (testimony RR); while no rival inventor to Gutenberg was mentioned publicly and in print earlier than 1588 (testimony VV).
Let us first consider the claims of Germany and Mainz as centred Claims of in tbe person of Benne ( = Hans or Johann) Gensfleisch, called Guten. Gutenberg or Gudenberg, the latter name derived from his motber, berg. whose maiden name was Elsa Wyrich, who lived in the "Hof zum Gutenberg " at Mainz. Ho is supposed to have been borm at that town about 1400. He is first mentioned in a Mainz document, dated 16 th Jannary 1430. In e document of 28 th March 1430 he is spoken of as being "not in Mainz." Documents from 14th March 1434 to 18th September 1444 prove him to have been at Strasburg during that time, and documents dated respectively 17 th October 1448, 6th November 1455, 21 st Jnne 1457, 10th April 1461, show that he was in or near Mainz on those days. By a decree of 17 th January 1465 the archbishop of that town rewarded him for "his services," and in the bond of Dr Homery, dated 26 th February 1468 , he is spoken of as dead. There are, moreover, six forged documents (including some relics of an ancient press bearing the date 1441) respectively dated 24 th March 1424, 1437, 3d July 1453, 20th July 1459, 19th June 1463, and an entry in an anniversarium which has been applied to Gutenberg, but does not conccrn him (see Hessels, Gutcnberg).
In former years, when printing was believed to have been invented in 1440, the records of the Strasburg larsuit of 1439 , between Gutenberg and sume Strasburg artisans about ccrtain indestrial undertakings (as the art of polishisg stones, the manufacture of looking-glasses), were considered to prove the invention of printing at Strasburg, not, however, by Mentelin, as lad been thought by some (testimonies NN, PP), but by Gutenberg. The records camo to light about 1740 , just when Sclioepflin, the principal discoverer, had been commissioned to acarch for documents of this kind. Doubts may bo suggested as to their genuineness, but they have all perished, partly during the revolution of 1793 and partly during the siego of Straslurg in 1870. However, nobody would nor assert that printing was invented in 1439 or at Strasburg; and those who still believe that Gutenberg was the inventor of printing refer to them only as showing that he was a mechanic as early as 1439 , and that lie understood the art of pressing. ${ }^{2}$

1 Over a hundred of thern have been collected by Ger. Meerman, Origines
Typagr, li. p. 58 s. .
2 Eee Hessels, Guterberg, pp. 23, 155, \&c.

The first document that connects Gutenberg mith the art of printing is the potarial instrument of 645 November 1455 (testimony A). But it says mothing of an invention or a new mode of printing. And yet the occasion was such as to make it almost imperative on Gutenberg to mention it, for he bad spent 1600 guilders of Fust's money, apparently without printing anything, ${ }^{1}$ and was on the point of being robled by the latter and having taken away from him all that he had made and done to give effect to his idea or invention. In the noxt testimony (B), i.e., the earliest Mainz books with printed dates ( $145 \%$ to 1467), there is evidence that the new art of printing is not only not zept secret but fully appreciated et Mainz, and its importance fully realized and advertised ; but, thongh they speak of a "nova are imprimendi" and an "adinventio mprimendi" these is not a syllable as to a Mainz invention or inventor. In testimonies C and D (the Cathalicon of 1460 ) there is agaín not one word about an invention or an inventor, or about Mainz. Fet Gutenberg is supposed to have printed the Ca,holican; and it is incredible that he, who had been wronged and robbed by his tro rivals (Fust and Schoeffer), should agree with them in axplaining and proclaiming the nerv art, but nerer with one mord assert his claim to the honour and profit of the invention;if he had made any, and should even omit his name, whereas he sav his two fivals never neglect to print their names in full on every book which they published. Those who believe that Gutenberg was the inventor of printing suggest that be kept silent, as otherrise his creditors would havs seized his copies and his printing office. But this explanation cemet bo sccepted; for the verbose colophon at the end of a gigantic folio book like the Catholicon, published at a time whon fhero were perhapg not more than three printing offices in the world, was calculated to draw attention to its printer and his residence, not to couceal him. Testimouy F (1466) is no longer regarded as having any reference to Gutenberg or the inven. tion of printing. H (1468) was formerly thought to mean: "I, the book, am cast (i.c., its typea are cast) in the Mainz city, and the house whence the type came ( $=$ where the type was invented) produced me." But of lato jears it has been shown that the author of the book, Johann Fons, was Peter Schocffer's press-corrector. And, as he no doubt resided in Schoeffer's horse, the two lines evidently mean: "I am a littlo book cast in Mainz, snd I was born (=written) in the same lonse whence the type comes ${ }^{2}$ ( $=$ where I am printed)." Testimony I (also of 1468) speaks of two Johannes (Gutenberg and Fust) as the "prothocaragmatici librorum quos gemuit urbs Moguntina." But this certainly means, not that the first printers of books were born at $M$ ainz, but that the two Johannes were the chief printers of books (born) produced at Mainz.

When wo now place together the clear documentary testimonies (A to I) of the first fourteen years of printing ( 1454 to 1463 ) st Mainz, we see that they all come from Mainz itself. Everybody connected with the art speaks of it in tho most public and unreserved manner ; its importance is co fully realized and advartised during that period as it is in the present dsy ; the German mation is even congratulated on possessing it; there is never any secreey about it ; once (about 1456) it is even called a new art. But, in the midst of all this publicity, the art which Jlainzand Germony possess is never said to have been invented at Mainz. The supposed Mainz inventor (Gutenberg) even speaks himself on two occasions (in the lawsuit of 1455 and in the Catholicon of 1460 ), but never says that he had made an inrention. Tho archbishop, too, speaks pablicly of Gutenberg in 1465 (testimony E), and rewards him for services, but does not spoak of him as the inventor of printirs, nor even as a printer. Nor does Dr Homery, in his letter to the archbishop (testimony G), in which le refers to. Gutenberg's printing apparatus, call him the inventor of priating.
In 1463 re enter on a new phase in the history of the invention. Even if we reject testimony I as being merely local, testimony K (1468) speaks of the art of printing ss having arisen in Germeny. This testimony, however, does not come from Germany, nor from Mainz, but from Italy, and is supposed to owe its inspiration to the two German printers who had established a printing office at Subiaco po 1465 , and in 1467 at Rome, and who most likely Icarned their craft at Mainz. But, $3 s$ the two printers are mentioned in the testimony, and as it docs not speak of Gutenberg, nor of Mainz, it is far more likely that it was merely dorived from the colophons of Fust and Schoeffer, or from something that Cardinal Cusa had heard during his embassics In Germany. To the Mainz colophons Tre must also ascribe (a) the two testimonies of $1470(\mathrm{~L})$ and (b) the three of 1471 (M), all five of which come from France and Italy. At last, in 1472, we find in testimony O the invention of printing ascribed to Gutenberg of Mainz, but it is mentioned as a rumour, and comes from France. Guil. Fichet of Paris, who gires it, is supposed to have heard the rumour from the three Gurman printers
${ }^{1}$ Io lina 42 Gutenberg distinctly declares that "ha hoped that he was under no obligation to Fust to devate the frst 800 guilders to tha work of the books; and, as Fust, by advancing the Becood 800 goilders io 1452, had become Gutea berg's partocr, it seems clear that the fotmer claimed in 1454, when tha trial is calculated to hava cormmeaced, his mocey sed interest because Guteoberg mad as yot act printed anything.

Venit is tiof dreseat aot the perfect tease.
who commenced printing at Paris in 1470 But, as two of them had resided, immediatsly before they eame to Paris, in the university of Basel, and are supposed to have learued their art there, the rumour is ascribed to "Bertolf von Hanauwe," who appeara in the lawsuit of 1455 as Gutenberg's servant, and who was printing at Basel in 1463. Perhaps it came rather from informatiou which Fichet obtained from the St Victor cathedral, near Msinz, as he speaks of the art having been inveuted not far from that town. Testimony P (1474) again comes from Italy, from Rome, and was perlaps derived from one of the Gepman pinters settled there st that time. It merely speaks of Gutenberg, Fust, and Meutelin as printers, but says not a word which even tonches upor the invention of the art. In testimony $Q(1476)$ Te have definite mention of Mainz as the inventress of the art ; it is giren as an addition to the Mainz colophor of 1468 (see I). In $14 \% 8$ Mainz is again mationed in a Colognc restimony $(R)$, which gives evidence of researeh, as it is sn amplification of an earlier one in which Mainz was not mentioned. Germany, Gutenberg, and Mainz are agsin mentioned in tho Venctian testimony, $S(1433)$, which gives for the first time 1440 as the date of the inrention. In the same year we hare two earlier testimonies ( P and N ) worked into one ( T ), +o the effect that printing was iuvented either by Gntenberg or by Fust or by fenson. Testimony V (1492), which states that printing commenced at Mainz, is practically equivalent to Q. In 1494 and 1499 Tre have threo German testimonies ( $\mathrm{X}, \mathrm{X}, \mathbf{Z}$ ) as to Gutenberg being the inventor of printing ; these, howerer, come, not from Mainz, but from Heidelberg. $\angle$ is given by a relatire of Guteuberg, Adam Gelthus ; and, as the latter resided at Heidelberg, it is clear that he was the real source of the other two Heidelberg testimonies ( X and $\mathrm{I}^{Y}$ ). Two years later, when Wimpheling, the author of testimony Y , bad left Heidelberg, he ascribed (CC) the invention of printing to Strasburg, thongh stating that Gutenberg was the inventor. Testimony AA is recorded sbove to show the great confusion that reigued in people"s minds about the inrentiou. We must add to these testimonies those of 1504 (EE) and 1505 (FF), which are owing to Ivo Wittig, a relative of Gutenberg, and a canon and the keeper of the seals of the St Victor cathedrsl, near Mainz, of rbich Gutenberg had been a lay member accordiug to ite liber fraternitatis. Thus in the period from 1468 to 1505 we have (1) several vague statements made in Italy and France as to the art of printing being known or practised or invented in Germany, statements which arose from the books and colophons published at Mainz; (2) one item of rumour in 1472 that Gutenberg invented it near that town; (3) two Mainz statements, of 1476 and 1492, and one Cologne statement, of 1478 , that it: was invented at Mainz; (1) three German statements, of 1492,1494 , and 1499 , that Gutenberg had invented it ; and (5) two Mainz statements, of 1501 and 1505 , to the $8 a m e$ effect. It is to be particularly notieed that the statements $(2,4,5)$ which speak distinctly of Gutenberg being the inventor can be clearly traced to Gutenberg himself and two of his relatives.

Seeing then how slender the basis is for the tradition that Contre printing was invented by Gutenberg at Mainz, and that eren this diction sleader basis was not laid till fourteen years after the art bad Gutenbeen fully established and proclaimed in that city, we cannot be berg's surprised to find the tradition promptly contradicted. This contradiction was made in 1489 (testimeny BB) in a Chronticle pulblished at Cologne. To facilitate the understanding of this testimony it is divided ahove into eight seetions. The first (taken from Hartmann Schedel's Chronicle, 1493), second, sixth, seventh, eud eighth are no doubt due to the compiler of the Chronicle, and must not be connected with the third, fourth, and fifth, which, according to the compiler, aro due to Ulrich Zell, a printer st Cologne, who had probably settled there about 1463, and had most likely learned hia art at Mainz, es he called himself "clericus Moguntinus." As Zell's testimony leares to Gutenberg nothing but the' honour of haring perfected the srt, various sttempts have been made to explain away this account. As long ss no typographically printed Donatus had been found that could be fitted into Zeil's account, it ras argued that he meant Donatuses printed from mooden blocks; and this argument is brought forward even at the present time. But a practical priater like Zell must have been able to express himself to that effect if he had really mesnt to say 80 ; and, as block-printing was not less practised in Germany than in Holland, re could hardly assume that things printed in Holland mould have inspired the German inventor rather than the same things printed in Germany. That testimony $C O$ speaks of a Donatus printed from wooden blocks may be ascribed to the notion arising at that time (c. 1533) that bloek-printing had given rise to typography. It has also been asserted that Holland in the Chronirle means Flanders; but the Chronicle ia usually very correct in geographical matters. It has also been suggested that Zell most likely learned his art in Fust and Schoeffer's office and invented the passage to injure the reputstion of Gutenberg, who had been their enemy. Finally it has been said that Zell did not suggest or write the passage at all ; but it is hard to see how this can be maintained in face of the com. piler's own statement to that effeat. 'iherefore, all these sugges.
tions failing to weaken Zell's testimony, we must see how far it can be brought into hamnony with other cireamstances and the testimonies MM, RR, SS, TT, VV, XX, II, which claim the honour of the invention for Haurlen in Holland. Testimonies RR and SS do not mention the same of the inventor. Bnt the former is a mere introduction destine 1 for a complete book that was lost during the siege of Haarlem in 1573 before it was printed; we are, therefore, not entitled to say that Von Zuren did not know the name. SS may lave omitted the name, because the publication of Van Zuren's rork was in contempla, ion at the time that it was written. That Guicciardini (testimony TT) in 1566 did not mention the name of the reputed Haarlem inventor cannot be considered as an in. dication that it was not known or had not yet been "invented" when lie wrote, as his accounts of the cities of the northern Netherlands are all very meagre and were for the most part derived from correspondence. In Junits's account (VV), however, we find every particular that could be desired. He begins by referring to the difficulty of vindicating the honour of the invention for Haarlem on account of the deep-rooted and general opinion that it took place st Mainz. Ho then mentions that Lourens (son of Jan) surnamed Coster resided at Haarlem "more than 128 years ago" and gives us to understand that in the year indicated hy that phrase he invented the art of printing. As Junius's book was not published till after his death, in 1588, and the two prefaces in it are dated 1575 (he died 16th June 1575), the numbor 128 is supposed to go back from the date when he actually wrote hid account, which he is calculated to have done about 1568. Thus me get the year 1440 as the supposed date of the Haarlem invention, though, if we based our calculation upon the date of the preface, the year 1446 or 1447 would have to be assumed. But, as Junius adds that Coster's types were stolen by one of his servants, who fled with them to Mainz, and establishing there a printing office printed within a year's time, in 1442 , two books, he must, if this latter date is correct, have meant 1440. By testimonies XX and YY we ses that in the 17th century the date of the Haarlem invention was first put back as far as 1428 , then to 1423 ; and since then it has usually been regarded as 1423 , especially after it was discovered that the Haarlem wood where Coster is said to lave cut his wooden letters was destroyed during a siege in 1426 .

The researnhes as regards the reputed Haarlem inventor have Bitherto not been made in a manner adequate for scientific purposes. It would appear that by the pushing back of the date of the iuven. tion, in spite of Junius, to 1420-1428, two inhabitants of Haarlen have been mixed up by the Dutch authors on the subject. (1) Lourens Janszoon, who never bore the surnams Coster, and whose existence seems to be anthenticated by documents from 1404 to 1439, was sheriff, and a wine merchant and innkeeper, and is supposed to have died in 1439. About 1870, however, researches brought to light that there had been (2) a Lourens Janszoon Coster at Haarlem, duly authenticated by genuine official documents as a chandler and innkeeper, from 1436 to 1483 , who went a way from Haarleñ in the latter year. The name of this man and some genealorical particulars known of him fit into the story of Junins, though there are certain particulars in Junius's account which camot yet be properly explained.

Junius bases his aecount of the Ilaarlem invention on three books, a Dutch celition of the Spcculum Humane Salvationis, the Doctrinalc, and the Tracts of Petrus Hispanus (Pope John XXI.). The first work, ho said, was printed by Coster himself as a first specimen of his art, and it would seem from his words that he considered the work to be printed vith wooden types. The two Dutch edjtio is of the $S_{z}$ culum, however, are printed, like the tro Latin edi icins $e^{+}$the samo work, witli ninvable metal tyle, thougl in ons of the Latin editions there are tweaty leaves the text of which is printed apparently from wooden blocks. The Doctrinale and the Tracts of Hispanus were printed, Junius sâys, at Mainz by Coster'e workman with the types which he had stolen from Coster. Of the Hispanus Tracts no cdition has yet come to light that wonld answer to Junius's description. But of the Doctrinale we have four editions, all printed in the same type (i.) as the four clitions of the Spechlum. With these same types are printed no less than six editions of the short Latin grammar of 左lius Donatus; and editions of this school-book printed in Holland were, according to Zell in the Cologne Chroniclc, the models for the priating at Mainz, which sonmenced about 1450. As there are no other cditions of Donatus printed. in Holland that conld be placed before the year 1450, the jlaims of Haarlem and Holland are based on them; and wo will, therefore, briefly descrilue the types and books which must be connected with the Speculc, Doctriralic, and Donatuses just mentioned. In one of the editions of the Specrlum in Dutch occur two leaves printed in a different type (ii.) from the rest of the work. This iype is in its tum so very much like another type with which a work of Laur. Valla (Facetiæ Morales) is printed that we link it (iii.) on to the two just mentioned. Then again type iii. is, in some of its capitals, identical with a type (iv.) used for a work of Ludowinus de Roma, Singularia Juris, at the cnd of which, on the last leaf, commences another work, printed in a different type (v.).

Type vi. is adentical with type v., except in its capital $\Gamma$, which is larger. We have also works printed in two different types (vii., viii.) which both show such a great family likeness to each other and to types i. to vi. that it would not be advisablo to separatu them without evidence that they do not belong to the same olfice, With these eight types, which we cannat at present separate, fortysoven different hooks were printed, so far ns we know at present. In type i.:-four editions (two in Latin, ${ }^{2}$ two in Duteh) of the Spcculum Humanze Salvalionis, a wark which consists of woulcuts with explanatory text underneath; a Dutch version of The Seven Peritential Psalms; one Donatus of 27 lines; two editions of Donatus of 28 lines; a Liturgical Book in 16 mo ; thice editions of Lonatus of 30 lines; ono Donatus, in French, of 29 and 30 lines on a page; four editions of Doctrinale of 32 lines; one Catonis Disticha of 21 lines. In type ii.:-two leaves only ( 49 and 60 ) of one of the Dutch editions of the Sprcullam. In type iii.-Laurentius Valla, Facetis Moralcs, \&c. In type iv.:-four editions of Donatus of 24 lines; Lnd. (I'ontsnus) do Koma, Singularia Juris ; Lud. (Pontauus) de Roma (?), Treatise on Canonical Law (?). In type v.:-Pins II., Tractatus ct Epitcephia (puinted at the end of the Singularia Juris) ; Guil. de Saliceto, De Salute Corporis; one Donatus of 26 lines; five editions of Donatus of 27 lines; ono Doctrinale of 26 lines; one Doctrinale of 28 limes; one Doctrinale of 29 lines; owe Doctrinale of 32 lines; Catonis Disticha; Cuil. de Saliceto, De Szlutc Gorporis, together with Turrecremata, De Salute Anima; Pius II., Tractales de Amore, \&c.; Pindar of Thebes, Iliados Homerices Epitome, cum Prefatione Pii II.; another edition of the same rork. In type vi.:-one Donatus of 26 lines; one Donatus of 27 lines. In type vii.:-one Donatus of 27 lines. In type viii.: -an Abecclarium of two leaves and a Donatus of 31 lines. ${ }^{2}$

Type v. must have been in existence before 13th September 1474, as there is evidence that a copy of the Salicclo, printed in that type, was hought for the monastery of St James at Lille by its abhot Conrad du Moulin, who filled that office from the end of 1471 to 13 th September 1474. As a work in this type (the Tracts and Epilaphs of Pius II.) is printed at the end of the Singularia Juris in type $\mathrm{i} \nabla$. , we may assume that this type existed a considerable time before type $v$. As the books printed in types iv. and v. show greater progress in style and work manship than the books printed in types i . to iii ., we must assign the latter to an earlier period than the former. There is indeed positive evidence that type i must have existed a considerable time before the end of 1473 , as fragments of a Donalus printed in that type were used by a bookbinder at Haarlem to strengthen the binding of an account-hook of the cathedral church in that town for the year 1474. From these facts alonewe may safely assume that none of the forty-seven books can bo dated after 1474, or, if any, only a few in types $\nabla$. and vii On the other hand, four of the works in type v. cannot be dated before 1458 , as they bear the name of Pius III., who was not elected pope till that year. When we consider that thera are twenty different editions of tha Donatus printed in these types, and placa an interval of about eighteen months between the successive editions, we get a period of some.thirty years from about 1445 to 1474 for the issue of the twenty cditions. That we reach the year 1445 by such a calculation is purely accidental ; but there is evidence that in 1446 and 1451 printed ${ }^{3}$ Doctrinalia wers bought at Bruges and Valenciennes ly Jean Le Robert, the abbot of Cambray, according to two entries in his diary, preserved in the archives at Lille. And, as we know positively that there was no printing done at Mainz before 1454 , nor anywhere olse so early, we can only apply these entries to the Doctrinalice printed in Holland in the same types as
 dir on if the -iairem vivention), and six editions of the Donatus, which we may fit into Zell's account. That the editions of the Spceztum, of the Donctus, and of the Doctrinalc in type i. may be dated as early as $1445-1454$ is clear when we compare them mith the earliest products of Mainz printing for which the Donatuses, according to the Cologne Chrunicle, served as models. For instance, no difference in workmanship can be detected between the Donatuscs printed in Holland and the three editions of Donatus in the 36-line, Bible type and the four editions of the same in the 42 -line Bibls type, all seren presumably printed at Mainz and before 1456. Nor is the workmanslip of the Spccula (in type i.) or of the Facclis Mroreles (in type iii.) different from or later than that of the Mainz Catholicon of 1400.

It has been pointed out above that the first products or the art of printing were not meant to be anything but faithfri imitations of manuseript Looks, and that no material deviations from the general plan hecome observable till about 1473-1'477. Nowhere is the plan of the MS. period more strictly adluered to than in the
${ }^{1}$ Twenty lenves of ona of tha Latin editions ara aypareatly printed from wooden blocks, the text $8 s$ well as the engravings.
${ }^{2}$ For a detailed list of these broks, and farther particulars regarding thern, aee J. H. Hessels, Haarlem, the Birthplace of Printing, Loodon, 1887, p. 25 87. ${ }^{3}$ The abbot aucaks of Doctrinalia "getto " or "jettez en molle," and the pbrase is, as Bernard (Origiue, i. 97 sq.) shows by eight examples from 147, the year
whed printing is first officinily spoken of in France-to 1593 , sad dowa to the present dsy, applied to typographically-printed books only.
forty-seven books of which we are speaking. They are all without signatures, mithout initial directors, without hyphens, without catchwords, that is to say, without any of those characteristics which we see gradually, one after the other, come into almost general use from 1473 (if not earlier) to 1480. The four editions of the Speculum are all entirely printed anopisthographically, the woolcuts at the top of the pages as well as the explanatory text (in type i.) underneath, which wonld hardly be the case if the books had been printed after 1471, when the printing of woodents, together with text in movable types, had already been known for cleven years. Their types have nothing in commonewith any of those used in the Netherlands after 1473, but remind us in every respect of the earlier period of the Dutch block-books and MSS. They are all, so far as we know, without any colophon (except such a word as explicit), which twould, for a collection of forty-seven books, be incompatible with a period after 1471, but not with the carlier period of the block-books and MSS. Mereover, out of the forty-seven books no less than thirty-five are printed on vellum, which is incompatible with a period after 1471, when printing on paper had become universal, but not with the earlier period of the MISS.
There is, therefore, no reason whatever to discredit Zell's statement in the Cologne Chronicle of 1499, that the Donatuses printed in Holland were the models, the "begimning" of the art of printing, at Blainz, nor that of Hadrianus Junius in his Batavia, that printing was invented at Haarlem by Lourens Janszoon Coster. The tro statements were made independently of each other. That of Zell must be regarded as a direct contradiction of the vague rumours and statements ahout an invention of printing at Mainz in Germany by Gutenberg, which gradnally crept into print in and. after 1468 in Italy and France, and which found their way into Germany about 1476, after Mainz and Germany had given the greatest publicity to the existence of the art in their midst for more than twenty-two years, but had been silont about an invention and an inventor. And, though Zell accords to Mainz the honour of having improved the art and having made it more artistic, he denies it the honour of having invented or began it, and this latter honour was never claimed by that town before 1476. Junius's account is the embodiment of a local tradition at Haarlem, the first arritten traces of which we have in a pedigree (testimony MM) of the farnily of the reputed Haarlem inventor, which must have existed at least as early as 1520. His account has been indirectly -onfirmed by the finding of several fragments at Haarlem, all belonging to the groups of books mentioned sbove, but still more by the discorery of eoveral fragments of the Donatuses printed in the Speculum type, all used as binder's waste by Cornelis, the bookbinder, the very man whom Junius alleges to have been the servant of Coster. As the case stands at present, therefore, we have no choice but to say that the invention of printing with movable metal types took place at Haarlem about the year 1445 by Lourens Janszoon Coster.

## Early Types and their Fabriccition.

We must now take notice of two theories or traditions which have been current for a long time as to some intervening stage between the art of block-printing and the urt of printing with movable cast types. ${ }^{1}$ One theory or tradition would have it that the inventor of printing, after the idea of single, individual, movable types had arisen in his mind, practised his new invention for some considerable time with wooden types, and that he came only gradually to the idea of movable types cast of metal.
Wooden
types.

Rocche asserted in 1591 that he had seen at V"cnice types perforated and jo1oed one to the other by a thread, but he does not aay whether they were of wood or of metal. ${ }^{4}$ In 1710 Panlus Pater asserted that he had seen wooden types made of the trumk of a box-tree, and perforated in the centre to enable them to be joined together by a thread, originating from the office of Fust at Mainz. ${ }^{5}$ Bodman, as late as 1781, saw the same types in a worm-eaten condition at Mainz; and Fischer atated in 1802 that these relics were used as a sort of token of honour to be bestorped on worthy apprentices on the occasion of theil finishing their term.

Besides those who believed. in these wooden types from the fact that the letters (especially in the Speculum) vary among themselves in a manner which would not be the case had they been cast from a matrix in a mould, there were authors and practical printers who attenpted to cut themselves or to have cut for them some such wooden types as were alleged to have been used by the early printers. Some of them came to the conclusion that such a process' would be quite practicable; others found by experiment that it would, in the case of small types, be wholly impossible. Up to the present time no book or document has come to light which can be asserted to have been prInted with anch single, novable, woonen types. But nearly all the experiments to which we have alluded Fere made with the idea that the inventor of printing, or the earliest printers, started, or had to start, with as large a supply of type as a modern printer. This idea is erroneous, as,it is hardly any longer denied that, for a good many years after the first appearance of the art, printers printed their books (large or small) not by quires (quaternions or quinternions) but page by page. ${ }^{6}$ Therefore, all considerations of the experimenters as to the impracticability of such wooden types, on account of the trouble and length of tinue required for the cutting of thousands of types, fall to the ground in face of the fact that the earliest printers required ouly a verysmall quantity of type, in spite of the peculiar forms (combined letters, letters with contraetions, \&c.) which vere then in vogue.

The other theory would have it that between block- Sodpto printing and printing with moveble cast types there was fun an intermediato stage of printing with "sculpto-fusi " types, types that is, types of which the shanks had been cast in a.quadrilateral mould, and the "faces," i.e., the characters or letters, engraved by hand afterwards. This theory was suggested by some who could not believe in wooden types and yet wished to account for the marked irregularities in the types of the earliest printed books.

Gerardus Meerman, the chief champion of this theory, based it; not only on the words of Celtes (Amores, iii. 3), who in 1502 described Mainz as the city "quæ prima scnlpsit eolidos wre characteres," but on the frequent recurrence of the ward sculpius in the colophons of the early printers (for Jenson and Husner of Strasburg, see p. 681 ahove). Sensenschmid in 1475 said that the Codex Justinianus was "cnt" (insculptus), and that he had "cut" (sculpsit) the work of Lombardus, In Psalterium. Meerman also explained the account of the invention of printing by Trithemius ${ }^{7}$ as nean. ing that, after the rejection of the first wooden types, the inventors discovered a method of casting the bodies only of all the letters of the Latin alphabet from what they called matrices, on which thoy cut the face of each letter; and from the same kind of matrices a method was in time discovered of casting the complete letters of suffleient hardness for the pressure they had to bear, which letters they were before-that is, when the bodies only were cast-obliged to cut. ${ }^{8}$ In this way Meerman explained that the Speculum was printed in sculpto-fnsi types, although in the one page of which he gives a facsimile there are nearly 1700 separate types, of which 250 alone are e's. Schoepflin claimed the same invention for Strasburg, and believed that all the earliest books printed there mere produced by this means. .Both Meerman and Schoepflin ggreed that engraved metal types (litera in are sculpta) were in use for many years after the invention of the punch and matrix, mentioning among others so printed the Mainz psalter, the Catholicon of 1460, the Eggestein Bible of 1403, and oven the Praccptorium of Nider, printed at Strasburg in 1476. But the great dificulty connected with the process of first casting the shanks and afterwards engraving the faces of the types has become apparent to those who have made experiments ; and it seems more probable that the terms sculpcre, exsculpcre, insculpere are only a figurative allusion to the first process towards producing the types, namely, the cutting of the punch, which is artistically more important to the fabrication of types than the mechanical casting, -all the more as Sclioeffer in 1468 rakes his Grammatica Vetus Rhythmica say, "I anl cast at

## 4 De Bibliotheca Vaticana, Rome, 1301, p. 412. <br> 5 De Germanize Miraculo, Leipsic, 1710 p. 10.

6 See, for instance, W Blades, Life of Caxton, I. 89.
7 Annales Hirsaugienses, ii. 421 : "Post hæe iuventis auccesserunt subtiliora; inveneruntque modum fundendi formas omaium Latini alphabeti literarum, quas ipsi matrices nominabant, ex quibus rursum æneos sive $\bar{s}^{+}$anneos characteres fundebat, ad omnem pressuram sufficientes, quos prius manibus sculpebant.'

Mainz," an expression which conld hardyr be anything but a figura. tive allusion to the casting of the types.

Granting that all the earlicr works of typography preserved to us are impressions of cast-metal types, there are still differences of opinion, especially among practical printers, as to the probable methols employed to cast them. It is considered unlikely that the inventor of printing passed all at once to the perfect lypography of the punch, the matrix, and the mould. Bernard ${ }^{1}$ considered that the types of the Speculum were cast in sand, as that art was certainly known to the silversmiths and trinket-makers of the 15 th century; and he accounts for the varieties observable in the shapes of various letters on the ground that several models would probably be made of each letter, and that the types, when cast by this imperfect mode, would require some touching up or finishing by hand. He exhibits a specimen of a word cast for him by this process which not only proves the possibility of casting types in this manner but also shows the same kind of irregularities as those observable in the types of tha Speculum.
But here again it is argucl that in types cast by this or any other primitire methol there would be an abscnce of uniformity in what founders term "height to paper." Some types would stand higher than others, and the low ones, unless raised, would miss the ink and not appear in the impression. The comparative rarity of faults of this kind in the Speculum leads oue to suppose that, if a process of aand-casting had been adopted, the difficulty of uneven heights hal been surmounted either by locking up the forme face domnwards, or by perforating the types either at the time of casting or afterwards, and holding them in their places by means of a thread or wire. To this cause Ottlcy attributed the numerous misprints in the Speculem, to correct which would have involved the unthread. ing of every line in which ans error occurred. And, as a still more striking proof that the lines were put into the forme one by one, in a piece, he shows a curious printer's blunder at the end of one page, where the whole of the last reference-line is put in upside down, thus:-

Soe buas bespot slapende enve nict buctende.

## 

A "turn" of this magnitnde could hardly have occurred if the letterg had been set in thic forme type by type.

Another suggesterl mode is that of casting in clay moulds, by a method very similar to that used in the sand process, and resulting in similar peculiarities and variations in the types.

Ottley, who was the chief exponent of this theory, suggested that the types were made by fouring melted lean or other soft metal into moulds of carth or plaster, after the ordinary manner usenl from time imuemorial in casting statues of bronze and other articles of metal. But the mould this formed could hardly avail for a second casting, as it would be scarecly possible to extract the type after casting withnut breaking the clay, and, even if that could be done, the shrinking of the metal in cooling would be apt to warp the mould beyoni the possibility of further use. Ottlcy thereforc suggests that the constant renewal of the moulds could be effected by using old types cast ont of them, after bein! touclied up by the graver, as models, - a process which he thinks will account for the varieties observable iu the siffercht letters, but which would really cause such a Eradual deterioration and attenuation in the type, as the work of casting progressed, that in the end it would leave the face of the letter unrecognizable as that with which it becan. It would therefore be more reasonable to suppose that one set of modela would be used for the preparation of all the moulda necessary for the casting of a sufficient number of types to compose a page, and for the periodical renewal of the moulta all through the work, and that the variationa in tho tgpes would be due, not to the gradual pariug of the faces of the models, but to the different skill and cractncss with which the successive moulds would be taken. It is evident that the sand and elay methods of casting types above olesuribed must be slow. The time occupied after the first engraving of the models in forming, drying, and clearing tho moulds, in casting, eatracting, toucling up, and possibly perforating the types required for one page, wnuld exceed the time required by a practised xylographer for the cutting of a page of text upon a block. But he that has gone throngh the trouble of casting separate movable types lias a clear gain over the wroodblock printer in haring a fount of movable types, which, even if tbe metal in which they were cast were only sof lead or pewter, might be used again and again in the production of any other page of text, while the wrod-block can onlw prolluce the one page which
it contams. Noreover, only one hand could labour on the xylo: fraphic block ; but many liands could be employed in the moulding and casting of types, however rude they might be. Bernard states that the artist who produced for him the few sand-cast types shown in liis work assured hin that a workman could easily produce a thousanul such letters a day. He also states that, though cach letter required souaring after casting, there was no necd to touch 11p the faces.

There remains yeu anotncr suggestion as to the method in which the types of the rude school may have been produced. This may be described as a system of what the founders of sixty years ago called polytype, which is a cast or facsimile copy of an engraved block, matter in type, de.
Lambinet, ${ }^{2}$ who is responsihle for the suggestiou, based upon a nem translation of Trithemius's narrative, explains that this process really means an early adoption of stereotype. He thinks that the first printers may have discovered a way of moulding a jage of some work-3n Abceedarium-in cooling motal, so as to get a matrix. plate impression of the whole page. Upon this matrix they would pour a liquid metal, and by the aid of a roller or cylimer press the fused matter evenly, so as to make it peuetrate into all the hollows and comers of the letters. This tablet of tin or lead, being easily lifted amil detachod from the matrix, would then apyear as a surface of metal in which the letters of the alphabet stood out reversed and in relief. These lettera could casily be detached and reudered mobile by a knife or other sharp instrument, and the operation conld be repeated a hundred times a day. The metal faceas so produced would be fixed on wooden shauks, type high, and the fount wnuld then be complete. Larabinet's hypothesis was endorscd by Firmin. Didot, the renowned type-founder and printer of Lambinet's day. But it is impossible to sujpose that the Mainz psalter of 1457, which these writers point to as a specimen of this mode of execution, is the impression, not of type at all, but of a collection of "casts" mounted on wood.

Whatever value there may be in the above theories with Shape regard to the movable types of the first printer, certain it earliest
is that the sliape and manufacture of the types used ${ }^{\text {type- }}$
as early as $c .1470$ do not seem to have differed materially from those of the present types.

This in evident (1) from the shape of the old types which were discovered in 1878 in the bed of the river Saône, near Lyons, opposite the site of one of the 15 th-century printing houses of that city, and which there is reason to believe belonged once to one of those presscs, and were usel by the early priuters of Ljons; (2) from a page in Joll. Niler's Lepra Moralis, printed by Conrad Homburch at Colome in 1476, which shows the accilental impres. sion of a type, pulle.l up from its place in the course of printing by the ink-ball, and laid at longth upon the face of the forme, tlus leaving its exact profile indentel upon the page ; (3) fooln an entirelys similar Mage (fol. $4^{\text {b }}$ ) in Liller de Lruedibus ac Fostis Gloriosæ Virginis, Colognc, $c$. 146s. From the sinall circle appeating in the two last-mentioned tyjues, it is jresumel that the letters were pie:end laterally by a circular hole, which did not penetrato the wholu thickness of the letter, aml servel, like the mick of nodern types, to enable the conpositor to tell by touch which way to set the Jetter in his stick. The fact that in these two cases the letter was pulled up from the forme scems to show that the line conld not have been threaded.
Vinc. Fineschi, Nolisic Storiche somm la Strmperia di Ripoli (Florence, 1781, 1. 49), gives an extract from the cost-book of the Ripoli press, about 1480, by which it appears that steel, lrass, copper, tin, lead, and iron wire were all uscd in the manufacture of types at that period. ${ }^{3}$

The history and nomenclature of the carliest types are practically a coutinutation of the history and nomenclature of the characters figured in the earliest block-books, woodengravingrs, and MLS. For instance, Gothic type was first seen about the year 1445 ; but it should not be formotten that the Gothic writing, of which that type was an imitation, was already known and used about the second hall of the 12th century. Again, the pure Roman type, which appeared about 1464 , is nothing but an initation of what in palæography is called the Caroline minuscule, a handwriting which was already fully deyeloped towards the end of the Sth century. Consequently, rletails as to the history and derelopment of the various types properly belong to the study of Pal.eography (q.v.).

[^295]The broad outlines of the history of the earliest types are as follows：－
Gothic type，of the angular or pointed kind，was first used by the Haarleni 1rinter of the Specalum，Denalus，\＆c．（see specimen No．1， taken from the British Museum copy of the Speculum Humana Saluationis，mixed Latin edition），presnmably c．1445．An entirely similar but larger type（No．2，taken from the British Museum copy of Lurlovicus［ $\mathrm{Pontanus]} \mathrm{de} \mathrm{Roma}, \mathrm{Singularia)} \mathrm{was} \mathrm{nsed}$, by tho same pruter，c． $1465-1470$ ．Gothic type appeared in Germany as a church typo in 1454，in the 31－line indulgence，pre－ sumably 1 rinted by Johan Gutenberg at Mainz（No．3，from the Gottingen copy），and in the 30 －line indulsence（No．4，taken from the British Museum copy），printed hy Peter Schoeffer at Mainz． Type No． 3 was also used aboot the same time for the 36 －line Bible and type No． 4 for the 42 －line Bible．Two much larger Gothic types appeared in the psalter of 1457，published by Fust and Sohocfer（see Bernard，Omigine，ph，nii）．In Italy Gotbic type appears in 1468 （No．5，take from the British Musenm copy of Cicero，De Oratore published at Rome by Uhr．Hebn，15th December $1 \& 65$ ，in mall Roman type，with imprint in Gothic），bnt in a more ronnded form；it is practically the orlinary Italiau writing infu－ encel by the Gothic．In France Gothic began to be used in 1173 ； in England it appears first in Caxton＇s type s．bat the year $1480 .{ }^{1}$ It was employed exteusively in a great many of the earliest presses all over Europe，and continued to be uscd largely at all times， especially for Bibles，lav books，royal proclamations，\＆c．，and oven to this day it is the national character of Germany．It is now usually called lettre de forme，black letter or English in English－ speaking countries，lellrs Fhamand in Holland，and frachir in Germany．

## Subsequent to 1500：

Though the Cologne Chronicle of 1499 denies to Mainz the honour of the invention of the art of printing，it was right in asserting that，after it had been brought there from Holland，it became much more masterly and exact． and more and more artistic．During the first half century of printing a good many printers distinguished themselves by the beauty，excellence，and literary value of their pro－ ductions．We may meution as such ：－Johan Fust：and Peter Schoeffer at Mainz；Johan Mentelin and Heinrich Eggestein at Strasburg ；Ulrich Zell at Cologne；Sweyn－ heym and Pannarts at Subiaco and at Rome；Nicolas Jenson at Venice；Anton Koberger at Nuremberg；Kete－ laer and De Lecmpt at Utrecht；Johan Veldener at Louvain，Utrecht，aud Kuilenburg；Gerard Leeu at Gouda； Johan of Westphalia at Louvain；and William Caxton （q．e．）at Westminster．

Very soon the demand for books increased，and with it cane a reduction in their prices．This caused a dccline in the execution of printing，which begins to be appreciable about 1480 in some localities，and may be said to have become general towards the end of the 15 th century．At all times，however，we find some printers raise their art to a great height by the beauty of their types and the literary excellence of their productions．Among the later printers we may mention the Aldi of Venice（ 1490 to 1597 ；see

Mavotius, vol. xp. p. 512) ; G. B. Bodoni of Parma (1768 1813 ; see vol. iii. p. 849) ; John Amerbach at Basel (14931516) ; John Froben at Basel (1496-1527; see vol. ix. p. 791) ; John Baskervillo at Birmingham (1750-1775; see vel. iii. p. 421) ; the house of Wechel, first at Paris (c. 1530-1572), afterwards at Frankfort; Christopher Plantin at Antwerp ( $1554-1589$ ), but rentinued long after under the firm Officina Plantiniana (see vol. xix. p. 176); the Elzevirs, first at Leyden, aftermards at Amsterdam (15801680 ; see rol. viii. p. 156 ) ; Antaine Verard at Paris (1485-1513) ; Josse Bade at Paris (1495-1535 ; see Badius, vol. iii. p. 228) ; and tho E'stiennes at Paris (1502-1598; see Stephens, vol. xxii. p. 534).

## History of Mrodern Types.

The Italic type ${ }^{1}$ is sail to be an imitation of the handwriting of Petrarch, and was introduced by Aldus Manntius of Tenice for the purpose of printing his projected small editions of the classics. Tha cutting of it was entrusted to Franceseo da Bologna, an artist Who is presumed to be identical with the painter Franceseo Trancia or Raibolini. The fount is a "lower case" only, the capitals being foman in form. It contains a large number of tied letters, to mitate handmiling, but is quite free from contractions and ligatures. It was first used in the Virgil of 1500 . Atdua produced six different sizes between 1501 and 1558 . It was comnterfeited almost immediately in Italy, at Lyons, and elsewhere. Originally it was callcd Venetian or Aldine, but subsequently Italic type, except in Germany and Holland, whers it is called "cursive." The Italians alsq aulopted the Latin name "characteres cursivi seu cancellarii." In England it was first used by Wynkyn de Worde in Wakefiold's Oratio in 1524. The character was at first intended and used for the eutire text of classical works. When it became more general, it was emplojed to distinguish partions of a book not proparly belouging to the work, such as introductions, prefaces, mdexes, notes, the text itself being in Romau. Later it was used in the text for quotations, and finally served the double part of emphasizing certaiu words in some works, and in others, chiefly sranslations of the Bible, of marking words not rightly forming a ${ }^{2}$ art of the text.

Greek type (minuseulcs) first occurs in Cicero, De Officits printed et Mainz in 1465 by Fust and Schoeffer. The fount naed is rude and imperfect, many of the letters being ordinary Latin. In the same year Sweynheym and Pannarts used a good Greek letter for some of the quotations in their cdition of Lactantius (see, for instance, leaves 11a, 19a, 36a, 139, 140) ; hat the supply was evidently short at first, as some of the larger quotations in the first part of the book were left blank to be filled in by hand. Tho first book wholly printed in Greek minnscules was the Grammar of Lascaris, by Paravisinus, at Milan in 147e, in types stated to have been cut and cast by Demetrins of Crete. The fount contains breathings, accents, and scme ligatures. The headings to the chapters are wholly in capitals: The Antiologia Greca of Lascaris was printed at Florence in 1494 wholly in Greek capitals (litleræ majusculx), and it is stated in the preface that they wore designed after the genuine modcls of antiquity to be found in the inscriptions on medals, marbles, \&c. But as late as 1493 Greck type was not common, for in that year tho Venice printer Symon Bevilaqua issned Tibullus, Cutullus, and Propertius with hlanks left in the commentary for the Gricek quotations. In England Greek letters appeared for the first time in 1519 in T. de Worde's edition of Whitenton's Grammatica, where a few words are introduced cut in wood. Cast types wero used at Cambridge in Galen's De Temperamoutis, translated by Linacra, and printed by Siherch in 1521, who styles himself the first Greek printer in Englaud; but tho quotations in the Galen are very sparse, and. Siberch is not known to have printed auy entire hook in Greek. The first priuter who possessed Greek types in any quantity was Reginald Wolfe, who helil a royal patent as printer in Greek, Latin, and Mebrew, and printed in 1543 two Honilics of Carysostora, edited by Sir Joln Cheke, the first Greek lecturer at Cambridge. In Edinburgh, in 1563, and as late as 1579, the space for Greek words was left hlauk in printing, to be filled in by hand. In 1632 Carnbridgo applied to Oxford for the loan of a Greek fount to print a Greek Testament, and the same university made an offer in 1700 for the purchase of a fount of the king's Greek at Paris, but withdrew on the Frencl! Academy insisting as a conditiou that every work printed should bear the imprint "characteribus Grecis e typograplico regio Parisiensi." It should not be forgotten that the large number of ligatures in the Greck of that day made the production of a fount a serious business. The Oxford Augustin Greek comprised no fewer than 354 matricea, the
${ }^{1}$ These paragraphs on the various types are for the most part tasen from
great primer 456, and even olle fount showed 776 different sorts. The Dutch founders effected a gradual reduction of the Greek typographical ligatures. Eariy in tho 19 tb century a new fashion of Greek, for which Porson was spousor and furnished the drawings, was introduced, and has remaincd the prevailing form to this day.
The first Hebrew typea aro generally supposed to have appearcu in 1475 in Petrus Niger'a Traclatus cuiutra Perfidos Judaus (leaf 10), printed by Conrad Fyuer at Esslingen. De Rossi etates that a Hobrew work in four folio volumes entitled Arba Turim of Rabbi Jacoo ben Asher, was printed in 1175 at Piere di Sacco in Austrian Italy, while in the aame year, a fow montha earlier, Salomon Jarchi'\& Comment. on the Pentateuch appeared at Regrio in ltaly, printed in the Rabbinical character. Numerous other Hebrew worke followed before 1488, in which year the first entire Hebrew Bible was printed, with points, at Soncino, by a family of German Jewa. The tirst English book iu which any quantity of Hebrem type was used was Dr Khys's Cambro-Brytannica C'yinrocave Linguab Instituliones, printed by Thomas Orvin in 1592, though already in 1524 Greek characters, hut cut in wood, were used by W. de Worde in Wakeficld's Oratio. But the Helrew fomet made nse of in Walton's Polvgloll in 1657 twas probably tho first important fount cut and cast in England, though there were as yet no matrices there for Rabbinical Hebrew. In the begin ning of the 18 th century Amsterdam was the centre of the lest Hebrew printing in Europe.

The first book printed in Arabic types is said to be a Diumale Græcorum Arabum, printed at Fano in Italy in 1514. ${ }^{2}$ T'iso yeara later P. P. Porrus's Polyglott Fsaller, comprising the Arabic version, was printed at Genoa; and two years later a Eoran in Arabic is said to have been printed at Tenice. In 1505 an Arabic Vocabulary at Granada had the words printed in Gothic letters with the Arahic points placed over them; and in other presses where there were no Arabic types the language was expressed in Hebrew letters or cut in Tood. De Gnignes and others mention a fount of Arabic used by Gromors in Paris in 1539-40 to print Postel's Grammar. In England some Arabio words were introduced in Wakefield's Oratio of 1524 , bet apparcntly cut in wood. In Minshcu's Ductor in Linguas, 1617, the Arabic words are printed in Italic characters. Land's gift of Oriental MSS. to Oxford in 1635, and tho appointment of an Arabic lecturer, frere the first real incentives to tho cultivation of the language by English scholars. Prerious to thia it is stated that the Raphelengius Arabic press at Leyden had been purchased by the English Orientalist, William Bedwell; but, if it mas brought to England, it doca not appear to have been immodiately maxle use of. The Arabic words in Thomas Greare's Oratio de Lingue Arabicx Utilitate, printed at Oxford in 1639, were mritten in by hand.

Syriac tyre, probably cut in wood, first appeared in Postel's Syris Linguarum XVIJ. Alphảcta, printed in Paris in 1538; but the characters are so rude in form and execution as to be acarcely legible. In $155 \bar{p}$, hovever, Postel assisted in cutting the punches for the Syriac Peshito New Testament, printed at Tienna in 4to, the first portion of the Scriptures, and apparently the first book, printed in that language. In 1569-72 Plantin at Antwerp included the Syriac New Tcstament in his Polygloul, and reissued it in a separate form in 1571. In England Syriac was usually expressed in the earlier works in Hebrem charactera. But in 1652, when the prospectus and preliminary specimen of Walton's Polygloll were issued, we find Syriac type in use.
Of the Armenian character the press of tho Vatican posscssed a Arme good fount in 1591, when Angelo Roccha showed a specimen in ian. his Bibliotheca Apostolica Iraiicana. A psslter is said to lare been printed at Rome in 1565 , aud Rowe Dores mentions doubtfully a litnrgy printed at Cracow in 1549. Armenian printing was practised in Paris in 1633 ; but the Armenian bishons, on applying to France for assistance in printing an Armenian Bible in 1662, were refused, and went to Rome, where, as early as 1636 , the preas of the Propaganda had published a specimen of its Armenian matrices. The patriarch, after fifteen montha' residence in Rome, removed to Amsterdam, where lee established an Armenian press, and printed the Bible in 1666, which was followed in 1668 by a separate edition of the New Testament. In 1669 the press was set np at Jarseilles, Where it continued for a timc, and was ultimately remored to Constantinople. In England the first Armenian type was that presented hy Dr Fell to Oxford in 1667. The alphabet given in the prolegomena of Walton's Pulyglutl was cut in wood.
Of Ethiopic the earliest type appeared in Potken's Psaller and Song of Solomon, printed at Rome in 1513. The work was reprinted at Cologne in 1518 in Potken's Polygloth Psalter. In 1548 the New Testament was printed at Romo by some Alyssinian priests. The press of the Propaganda jssucd a specimen of ita fount in 1631, and again in Kircher'a Prodramus C'ontus in 1836. Erpenins at Leyden had en Ethiopic fount, which in 1626 was acquired by the Elzevirs. Usher attempted to procure the fount for England; but, his attempt failing, punchea were cut and matrices propared by the London founders for tha London Polygloll, which showed the Psalms, Canticles, and New Testament in the Ethiopic version.

Of Coptic the press of the Prepaganda possessed a fount, and a specimen was issued in 1636, in which year also Kircher's Prodromus Coptus appeared from the same press. In England David Wilkins's edition of the New Testament was printed in 1716 from Coptic types cast with matrices which Dr Fell had presented to Oxford in 1667. The alphabets shown in the introduction and prolegomena to the London Polygloll of 1655 and 1657 were cut in woor.

Of Samaritan the press of the Propaganda had a fount in 1636, and the Paris Polyglott, completed in 1645, contained the eutire Pentateuch in type the punches and matrices of whicl had been specially prepared under Le Jay's direction. The fount used for the London Polyglott in 1657 is admitted to have been an English production, and was probably cut under the supervision of U'sher.

With Slavonic type a psalter was printed at Cracow as early as 1491, and reprinted in Iontenegro in 1495. The only Slavonic fount in England was that given by Dr Fell to Oxford, and this, Mores states, was replaced in 1695 by a fount of the more modern Russian character, purchased probably at Amsterdam. The Oratio Dominica of 1700 gives a specimen of this fount, but renders the Hieronymian rersion in copper-plate. Modern Slavonic, better known as Russian, is said to liare appeared first in portions of the Old Testament printed at Prague in 1517-19. Ten years later there was Russian type in Venice. A Russian press was estahlished at Stockholm in 1625, and in 1696 there were matrices in Amsterdan, from which came the types used in Ludolph's Granmatica Iussica, printed at Oxford in that year, and whence also, it is said, the types were procured which furnished the first St Petersburg press, established in 1711 by Peter the Great. Mores notes that in 1778 there was uo Russian type in England, but that Cottrell was at that time engaged in preparing a fount. It does not appear that this project was carried ont, and the earliest Russian in England was cut by Dr Fry from alphabets in the Vocabularia, collected and published for the empress of Russia in 1786-89. This fount appeared in the Pantograph:a in 1799.

## Etruscan

A fount of the Etruscan character cut by William Caslon about 1733 for Swinton of Oxford was apparently the first produced. Fournier in 1766 showed an alphahet engraved in metal or wood. In 1771 the Propaganda published a specimen of their fount, and Bodoni of Parma in 1806 exhibited a third in his Oratio Dominica.

Ranic types were frst used at Stockholm in a Runic and Swedis Alphabctarium, printed in 1611. The fount, which was cast at the expense of the king, was afterwards acquired by the univereity. About the same time Runic type was used at Upsala and at Copenhagen. Voskens of Amsterdam had matrices about the end of that century, and it was from Holland that Francis Junius is supposed to have procured the matrices which in 1677 he presented to Oxford. This fount appears in the Oratio Dominica of 1700, and in Hickes's Thesturus, 1703-5, and it remained the only one in England.
matrices of Gothic type were presented to Oxford by Francis Juniusin 1677, and a fount of them was used for the Oratio Dominica of 1700 and in Hickes's Thesaurus. A different fount was used for Chamberlayne's Oratio Dominica, printed at Amsterdam in 1715. Caslon cut a fount which appeared in his first specimen in 1734. This and the Oxford fount were the only two in England in 1820.

## Seandi-

## oavian.

Founts of Icelandic, Swedish, and Danish were included in Junius's gift to Oxford in 1677, and were, perhaps, specially prepared in Holland. The first-named is shown in the Oratio Dominica of 1700 and in Hickes's Thesaurus. Printing had been practised in Iceland since 1531, when a Brcviary was printed at Hoolum, in types rudely cut, it is alleged, in wood. In 1574, however, metal types were provided, and several works produced. After a period of decline, printing was revived in 1773, and in 1810 Sir George M'Kenzie reported that the Hoolum press possessed eight founts of type, of which two were Roman, and the remainder of the common Icelandic character, which, like the Danish and Swedish, bears a close resemblance to the German.

For the Anglo-Saxen language the first type was cut by John Day in 1567, under the direction of Archbishop Parker, and appeared in Alfric's Paschal Homily in that year and in the Alfrcdi Res Gester of Asser Menevensis in 1574. Angle-Saxon typo was used by Browne in 1617, in Ninsbeu's Ductor in Linguas; and Haviland, who printed the second edition of that work in 1626 , had in 1623 made use of the character in Lisle's edition of Ellfric's Homily.

The first fount of Irish character was that presented by Queen Elizabeth to O'Kearney in 1571, and used to print the Catechism which appeared in that year in Dublin, from the press of Franckton. But the fount is only partially Irish, many of the letters being ordinary Roman or ltalic. It was used in several works during the early years of the 17 th century, and as late as 1652 in Godfrey Daniel's Christian Doctrine, printed in Dublin. The Irish seminaries abroad were better supplied with Iriah type. 1 new typo was cut by Moxon, and appeared in 1681 in Boyle's New Testament, printed by Robert Everingham.

The earliest epecimen of music type occurs in Higden's Polychronicon, printed by $D_{\theta}$ Worde at Westmingter in 1495. The square notes apnear to bave been formed of ordinarv quadrats. and
the staff-linee of metal rules imperfectly joincel. In Caxton's culition of the same work in 1482 the space liad lieen Icit to bu filted up by hanc. The plain chant in tho Mainz psalter of 1490 , printed in two colours, was problably cut in wood. Hans Froschauer of Augsburg printed music from wooden blocks in 14\%3, and the notes in Eurtius's Opusculum Musiccs, printed at Bologna in 1487, appear to have been produced in the same manner ; while at Lyons the missal printed by Matthias Hus in 1485 had the staff only printed, the notes being intended to be filled in by hand. About 1500 a musical press was established at Venice by Ottavio Petrucci, at which were produced a series of mass-books with lozenge-shapell notes, each being cast complete with a staff-line. In 1513 he removed to Fossombrone, and obtained a patent from Leo X. for his invention of types for the sole printing of figurative song (cantus figuratus). Before 1550 several European presses followed Yetrucci's example, and music type was used, among other places, at Augsburg in 1506 and 1511, Parma in 1526, Lyons in 1532, and Nuremberg in 1549. In 1525 Pierre Hautin cut pronclics of lezenge-shaped musie at Paris. Round notes were user at Avignon in 1532. In England, after its first use, music-printing did not become geners till 1550, when Grafton printed Marbecke's Book of Common Prayer, "noted" in movablo type, the four staff. lines being printed in red and the notes in black. There are only four different serts of notes used,-three square and one lozenge. About 1660 the detached notes hitherto employed legan to give place to tlie " new tyed note," by which the heads of sets of quaver's conld be joined. Kut at the close of the 17 th century music-printing from type be. came less common, on account of the introduction of stamping and engraving plates for the purpose.
Printing for the blind (compare vol. iii. p. 826) was first intro- Printing Aluced in 1784 by Valentin Haiiy, the founder of the esylum for for the blind children in Paris. Ho malo use of a large script character, blind from which impressions were taken on a prepared paper, the impressions heing so dceply sunk as to leave their marks in strong relief and legible to the touch. Haity's pupils not only read in this way, hut executed their own typograplyy, and in 1786 printed an account of their institution and labours as a specimen of their press. Tbe first school for the blind in England was opened in Liverpool in 1791, but printing in raised characters was not successfully accomplished till 1827, when Gall of the Ediuburgh asylum printed the Gospel of St John from angular types. Alston, the treasurer of the Glasgove asylum, introduced the ordinary Roman capitals in relief, and this system was subsefuently improved upon by the addition of the lower-case letters by Dr Fry, the type-founder, whose specimen gained the prize of the Edinburgh Society of Arts in 1837. Several rival systems have competed in England for adoption, of which the most important are those of Lucas, Frere, Moon, Braille, Carton, and Alston; the last-named, as perfected by Dr Fry, seems likely to become the recognized mothod of printing for the blind in all European countries.

As regards initials in the earliest printed hooks, see above, p. 686. Initia The trouble and cost involved in the use of the initial director early suggested the use of mood-cut initials, and Erhard Ratdolt of Venice, about 1475, is gencrally supposed to have been the first printer to introduce the literos florentcs, called also lettres lourneurcs, or typi tornatissimi, which eventually superseded the hand-painted initials. Caxton introduced one or two kinds in 1484. Among the earliest to be used are the so-called Lombardic initials or capitals. The more elaborate initials, such as those used in the Mainz indulgences and psalter, by Aldus at Venice, by Johann Schoeffer at Mainz in 1518, by Tory and the Estiennes at Paris, by Froben at Basel, and by the other great printers of their day, were known as lutres grises. Besides these, the ordinary "two-line lciters" or large plain capitals came into use; and these were generally cast, whilst the ornamental letters were for the most part engraved on wood or metal.

Type ornaments and flowers began, like the initials, with the Ornailluminators, and were afterwards cut on wood or metal. The first ments printed ornament or vignette is suppesed to be the scutum or arms and of Fust and Schoeffer in their edition of the Bible of 1462. There flowery is no vignette in the Subiaco Lactantius of 1465 (as stated by MIr Reed, Leller Foundries, p. 82). In Holtrop's Monum. Typpgr. des Pays-Bas may be seen borders used by some of the earliest printers of Holland ( $1475-1490$ ) which would fot look bad even in the present time. Caxton in 1490 used ornamental pieces to form the border for his Fiflecn $O^{\prime}$ s. At the same time the Paris printers engraved still more elaborate border pieces. At Yenice entire frames were engraved in one piece, while Aldus as early as 1495 used tasteful head-pieces cut in artistic harmony with his lettres grises. Early in the 16th century we observe detached ornaments and flourishes which have evidently been cast from a matrix.

(J. II. H.)

## Part II.-Practical.

Printing has been defined to be the act, art, or practice of innpressing letters, characters, or figures on paper, cloth, or other material, the definition being lased on the etymology (Old Fr. empreindre, from Lat. imprimere). Technically the same definition might be applied to such arts as those of calico and oilcloth printing, and even of moulding, embossing, coining, and stamping; but in point of fact these aro vever understood when the word "printing" is employed. There is also printing without pressure, euch as photographic priuting. The use of a pigment or ink must be regarded as an indispensable element. . The application of the term is therefore confined to the use of pressure and a pigment for literary ond pictorial purposes. As thus defined, printing iucludes three entirely different processes-not inaptly called the polygraphic arts-riz., chalcography or copperplate printing (compare Exgravwo, rol. viii. p. 439 sq.), Lithogeafhy (q.v.) or chemical stoneprinting, and typography or letterpress printing. The lest-named is that to which the present articlo is confined.

The difference between the three methods lics essentially in the nature or conformation of the surface that is inked, and mhich afterwards gires a reproduction or image in reverse on the material to be impressed. In copperplate printing the whole of a flat surface is inked, and a portion of the ink sinks into an incision or trnch, in which it still remains after the surface is cleansed: Wheu pressure is brought to bear, this ink is transferred to the paper, gining an impression of a line. In lithographic printing the fiat eurface is protected except at certain places, where it is slightly coated with the ink, which practically leaves the stone quite level, but also marks a live when pressure is brought to bear. In typography the priuting surface is in relief. It akone receives ink, the remainder being protected by its lower level. Any kiud of printing done from a relief surface belongs to letterpress printing, such as a woodcut, a casting in metal, india-rubber, celluloid, xylonite, \&c. (or "stereotype"), or a depositiou by electricity (or "electrotype"), The typographic method requires a surface that is more dificult to form than either of the other tro. In lithography the surface may be obtained by merely writing or drawing en the stone; iu copperplate printing the line may be immediately inclsed into.or. scratched on the plate; but for letterpress printing the surface between the lines in relief has to be cut away. Hence the tediousness of wood-engraring, in which all the surface of the tlock has to be removed except those parts that are to be printed from and which form the black lines in the impressiou; and the conformation of a type surface is similar.

Typography, however, has many compensating adrontages. Impressions are taken with nuch greater facility. The inking oppliance glides over the relief lines to be printed from, whercas it rould cling to the entire surface of the etone or the metà ; hence much greater pressure wquld be required in these cases. The unprintable part of the stone in lithography has to be damped, so as to repel the ink; the same portion has to be inked and then cleaned off in copperplate printing; but in letterpress printing the ink only that has to be trausferred to the paper needs to be applied to the type. When the design has been drawn on the stone or scratched into the copper, the result does not admit of any further application beyond that at first contemplated: But in letterpress printing the surface moy he of a composito character. It mas be formed of single pieres represeuting the sevoral letters, and these, when once formed, may be emplosed in endless combinations. Only by such means are cheap newspapers and books possible. Before the inrentiou of typography (as in the East to the present day), the dif-
ferent pages of a book were minted from wooden blocks, cut after the manner of a wood-engraving. Blocks of this kind are of no use for printing after their first purpose has been fulfilled. They must necessarily be made very slowly aud with much labour. In forming a page of a book, on the other hand, by the typographic method there need (excluding necessary wear end tear) ouly be the cost of "composing" the types aud of "distributing" them into their proper receptacles, from which they may be re-taken many times to form other compositions.

## Types: thcir Material Characteristics.

Exclusive of such printing surfaces as wood-blocks and casts, the letter's, marks, and signs with which letterpress priuting is executed are called types, a proportioned quantity of each of the letters of the alphabet in any one body or face forming a fount. A bookwork fount contains single letters, diphthongs, ligatures (such as ff, fl), accented letteri, figures, fractions, points, referenco marks,
 aud signs (as \& \& 5 ). It also includes quadrats, - pieces of metal of various widths, which do not print, but are used to compensate for the shortness of occasional lines, as at the close of a paragraphand epaces, which separate words and letters. There are thus abont 226 separate characters in every ordinary English book-work fount. The table-used by type-founders to regulate tho number of each of the several sorts in a fount is called a bill of lype. The sorts are supplied by English type-founders in certain definite proportions, depending upon the uumber of lower-case m's. A bill of $3000 \mathrm{~m} \mathrm{~m}^{\prime} \mathrm{s}$ usually contains the following:-

| Lower-case. |  |  | Figures, \&c. |  |  | Capitals. |  |  | Small Caps. |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Large quads, one-tenth of fount. Italic, ove-tenth of Roman.
Such a fount rould weigh about 750 ib if of pica size, 480 th if long primer, 400 it if bourgeois, 330 tb brevier, 280 it miniou, 220 tb nonpareil. The numbers of the respective letters are based on the requirements of the English language; ${ }^{1}$ other languages of course require different proportions. In Latin and French, for instance, $q$ and $u$ rould be deficient, $h$ in excess, and $w$ needless. The number of the respective letters may be, and eometimes is, appor. tioned by weight ; for example, in one of the "schemes" of founts There is a tradition in ane of the oldest English foundries that this seale originated in a laborious calculstion of tha comparativa number of different letters nsed in setting up a lengthy debate iu the Houss of Commons, it being aupposed then that the purest English was spokes there. The acala ia, bowerer, frequently found defective in practice. It is a curious fact, for instance, that the matter of Gharles. Dickens's works will empty the vowel boxes long before thosa of the consonants, and that Lord Macaulay"s stateller style will run pith like persietency on consonsats.

- nzed by type-foumders a fount of $125^{\circ} \mathrm{lb}$ Roman mith, as ita complement, 10 Ht Italic, includes 8 oz . of $\mathrm{E}, \mathrm{M}, \mathrm{C} ; 9 \mathrm{Oz}$. of $\mathrm{T} ; 8$ to of $\theta$; 5 Ib each of $\mathrm{a}, \mathrm{h}, \mathrm{n}, \mathrm{o}, \mathrm{t} ;$ and so on, dowu to 3 oz , of z . To estimate the quantity of type required for a page, tho number of square inches it contains is measured and diviled by 4 , the quotient being the approximate weight of the matter in pounds. In small founts, however, 50 por cent. is acded, and in large ones 30 to 40 per cent., to allow for the letters generally left in the cases, not being required in the joh, and for sorts, \&c. These figures, although useful, are only approximative, the pronortion of the seversl ingredients of type-meta! used by different founders for the various sizes of type greatly varyin 5 the calculation.
Each of tho parts of a typo has a technical name. In the annexed diagram (hg. 1) of the capital letter M the darkest spaco $a, a$, $a, a$, is called the foce ; and only that part of the type touches the paper in printing. The face is divided into the stom, marked 1 , which comprises the whole ontline of the type M; the serifs, or the horizontal lines marked 2, which completo the outline of the letter; the beard, consisting of the bevel or sloping part marked $b, b$, and tho shoulder or flat portiou below $\delta$. The shank is the entire body of the letter, $d$, the front part (that shown) bcing known as the bolly and the corresponding part behind as the back. The spaces at $h$ and $h$ are the counters, which regulate the distances apart of the stems in a line of type. The hollow groove extendiug scross the shank at $c, \varepsilon$ is the nick, which enables the workman to recognize the direction of the type and to distincuish different founts of the same hody. The absence of this simple expedient rould retard the nperation of composing types by fully one-half. The earlicst type-founders did not kuow the use of the nick. In some letters, such as $j$ and $f$, a part of
 the face overhangs the shank; this is called the kern. The groove $g$ divides the bottom of the type into two parts called the feet. An impression from that part ol a type on which it stands vould bo as Types must be perfectly rectanguler, the minutest deviation rendering them useless. Any roughness st the sides is called burr, and any injury to their faces a batter. Smoothucss, sharpnees of sngle, and perfection of finish are slso prime requirements. A liue of types, when viewed along the back, presente the appearanco ef a solid har of metal.
Types which have the face cast in the middle of the ohsnk, as a, $\mathrm{c}, \mathrm{e}, \mathrm{m}, \& \mathrm{cc}_{\mathrm{c}}$, and thus leave an open space above them corresponding to that below, csused by the heard, are known as short letters. Those whose stem extends to the top of the shank, as b, d, f, \&cc., are called asecnding letters. Those that have a stom extending over the shoulder, as $\mathrm{g}, \mathrm{r}$, \&c., are called descending letters. Those that are both ssceuding and descending, and exterd over the whole of the shank, as $Q$ and $j$, are long lettcrs. Sinall letters and figures cast upon the upper part of the shank, as $1^{a}$, sre called superiors; those very low down on the shank sre inforiors, as $\mathrm{II}_{3}$. Types that are wery heavy and massivo in appearance are called fat-faccd; those that are fine and delicate, lean-ficed. A type whose faco is not in proportion to the dopth of the shank (e.g., a small pica cast on a pica body) is a bastard type.

## ypect.

jens of rineipal mies.

Types are of various sizes, ranging from those used in printing pocket Bibles to those for largo placards. The variation is confined to tine superficial dimensions of thoir ends, or bodies, as they are called. Each body has a distinctive name. The following are specimens of the princip3l bodies of ordinary types, and show the relation of the various bodies one to snother-

It is a confusing and inconrenient anomaly that the types made Size w by different English founders vary in size, slthough they bear the tspess same name. The above figures refer to the types of Messrs Miller and Richard, the royal type-founders for Scotland; but cther cminent makers supply, for instauce, long mrimer which is 898 , 90 or 92 lines to the foot. This has been remedied in America by an agreement on the part of the founders to adopt one stendard pica, to divide that pica into a certain number of equal parts, and to cast all their types as multiples of one of these parts. They divide the pica into twelve poirts, and the point is the unit upon Which the system is basod. There is aloo another practicsl adrantage in this mnlliple system : cach type bears a simple proportion to the athers, and therefore can be used in exset combination. Thus pearl is 5 , nonpareil 6 , minion 7 , brevior 8 , bourgeois 9 , long primer 10, emall pica 11, and pica 12 points. In Germany, France, and other countries of tho Continent a uniform system of points bas been sdopted, Eased on a scale of 133 "Ciceros" (corpus 12) to 60 contimetres. The types which most nearly correspond to those already mentioned aro:-

The number of lines given to the foot in the ahove specimeus of bodies is the theoretic and practically the only approximative standard. Tho height of types varies slightly with different founders, the mean being $\frac{29}{3} \frac{\mathrm{in}}{}$. The old Scotch height is about To in. higher. Types lower than the ordinary dimension are said to be low to paper, aud if surrouaded by higher types will not give a perfect impression. Spaces and quadrats were formerly only threefourths of an inch in height ; but, since electrotyping has become so common, thoy aro almost invariably cut high, i.e, up to the shoulder of the tJpe. Six lines of pica and twalve lines of nonpareil each cover an inch in depth. It is, however, not possible to know the size of a type is a pinted page by placing a rule measure upon it, as many books are not set solid: the lines are not close together, but lesded out with pieces of lead, to make them cover a larger space. A communication of great importance contributed to a newspaper may be set up in the ssmo type as the leading srticlo 7 but if not leaded it will appesr to the yon-technical reader to be in a smaller character.
The width of pages or columns, in the technical langugge of tha printing officc, is expressed according to the uumber of "ems,"

Clat $i$, of a pica $m$, the square of the depth of pica. As the lattor is whe-sixzh of an inch, the em is the same width, and a jage of twruty-Sour ems wile is equal to one 4 inches wide. The columns of this Eucycloperlirs are 19 ems wide.
A.ccriling to the purpose for which they are used, trpes are divilu' into two classes-book type, inclading Roman and Italie, anl jub type, including a multitude of fanciful forms of letters, chielly foumded on the ehapre of the Roman and ltalie letters, and intended to be more prominent, delicate, elegaut, \&c. It is inpossible to enumerate all the varieties of the latter elass, as additions are being constantly made and onee popular styles always going out of fashion. The leading varieties are the antiques, which aro Roman letters with strokes of nearly uniform thickness, as $\mathbf{M}$; sanserifs or grotesques, which have no serifs, as Al ; blacks, as ft ; and scripts, which rejresent the modern cursive or Italian handwriting, as Al. Black letter is now only a jobbing tspe in English. speaking countries, although, as stated in the historical section of this article, it was the first character used in printing. It is still used in Germany, with certain modifications, as the principal textletter for books and nemspapers. A comparison of the numerous reprodactions that have been issued of Caxton's works with any modern line of black letter will show how greatly the form and style bare been altered mithin a period of four centuries. The present style of Roman type dates only from about the first quarter of the 18th century. Previously the approved shape was as follows:-

## Printing has been defined to be the act, art, or

The use of this type was revired by Whittingham of the Chiswick Press about 1843, and it has since bocome a favourite form, under the name of olll style: Some of the punches cut by the first notable English type-fomder, William Caslon (1692-1766), have been preserved and types are being constantly cast from them. Nearly all fonnders nom produee modernized old style. For the recent revival of old style printiag, see ]. 710 below.

Large letters, such as are employed for large bills and posters, are made of mood, chiefly rock maple, eycamore, pine, and lime. These are cut up, planed to the required size, and then engraved, gencralls by special machinery, this being a business qnite distinct from that of letter-foundiug. The larger letters are designated as two line, threa line, fonr line, \&. , -meaning twice, thrice, or four times the depth of face of piea or great primer, \&c.

Type metal is an alloy, of which lead is the principal ingredient; bnt, owing to its softness, antimony and tin are added (sce vol. ii. 1. 129 and rol. xiv. p. 378). A patent type metal (Besley's) was inventel in 1855 in which the mixture consisted of lead, regulus of antinors, tin, nickel, copuer, and bismutl. Nearly all type is now made with some of these metals superadded. Ductility, hardness, and tonghness are the prine requisites of a type inetal.

I'be earliest printers made their own types, and the books printed from them can now be distingnished with almost as much certainty as handwriting can be identified. The modern printer bas recourse to the type-founder. The first step in the making of type is cutting the letter on the end of a piece of fue steel, forming the punch (see fig. 2), rhich is afterwards hardened. This is an operation requiring great care and nicety (thero beirg comparatively few that the various sor'ts in a fount may be ex. actly aniform in width, height, and general propertions to eacls
 otlie1. A separate Fro. 2.-Punch. Fio. 3.-Drive. Fio. 4.-Matrix.
punch is required for punch is required for cach character in every fount of type, and the making of them is the mest expensire brancli of type-fonnding. During the process of its manufacture the punch is frequenfly tested or measured by delicate gaures to insure its accuracy. When finished it is held orer a light, the flame of which blaekens the letter, and thus enables an inppression, called a smoke proof, to be stamped on paper. When the letter is perfect, it is driven into a picce of polished copper, called the drive or strike (fg. 3). This passes to tho justifier, who makes the width and depth of tho faces nniform throughout the fount. They mnst then be made to line exactly mith each other. When completed, the strike becomes the matrix (fig. 4), wherein the face of the type is made. This method of makinf a matrix has until now been in almost miversal use in Great Britain. It is, however, a very slow and costls process, In America the great majority of matrices are made otherwise. If the design of the fount to be produced is original, it is often cut by hand or by an engraving-machine on the piece of metal which is to ferm the matrix. If, on the other hand, an existing fount las to be copied, the matiex is made by electro-deposition.

A perfectly goon trpe is selected, and iuserted in a mould specially nuade, called a fusible mould (fig. 5). Sufticient metal of a more
fusible nature than the type is cast round it, and forms a sliape similar to tlat of the ordinary matrix. This fusible cast is then placed in a box pro. teeted by glass a nd gutta. percha, in order that the copper deposit may be kept square and to the proper dimensions. This arrangement also limits the deposition to the face. The box is inmersed in the copper electrotyping solution, in which it may be left until the deposit of metal has increased to

Fio. 5.-Mould. a thickness at which it
may be backed up witl copper, or it is left until it reaches the full thickness, which is about $\frac{8}{8}$ of an inch. It is then fitted iu line, eet, position, and height. The minutest imperfection or blemish is reproduced by the deposition, and the type cast from such a matrix is a perfect counterpart of the original. A school of type-engravere has recently sprung up in the United States, cutting exclusively on metal and producing ornamentation and finish which the punch-cutters cannot rival. It is expected that in the course of time the electrotype matrix mill nearly supersede that mode in the old-fashioned Way with the punch. In the ordinary method the mould in which the body of the type is fornied is rade of hardened steel m two parts; one part is fastened to the machine and is station. ary, while the other is morable so that it may be adjusted for the proper wadth of the letters, as one is wider than another. The combined matrix and mould are then adjusted to the trpe-casting maehine, which manufactures types of the rate of from 25 to about 120 per minute, according to the body. The metal is kept fluid by a little furnace anderneath and is injected into the mould by a pump, the spont of which is in front of the metal pot. The mould is movahle, and at every revolution of the wheel it comes up to the spout, receires a charge of metal, and fies back with a fully formed type in its ${ }^{\text {bosom }}$; when the upper half of the mould is lifted, a type is ejected. The spring in front holds the copper matrix in close proximity $t$, the mould. The letter 3 , for instance, stamped in the matrix is directly opposite the aperture in the monld which meets the spout of the pump. When a due propertion of a's are cast, another matrix with b stamped on it takes its place, and so on throughout the whole fount. The types, however, are not finished when they leare the macline. There will be found attaclied to each a wedge-shaped $j$ ct (fig. 6), oonewhat similar to that on a bullet cast iu a liand-monld. These are picked off by boys at the rate of from 2000 to 6000 per hour. A bnir Which still adheres to the shoulder of the type is taken off by the rubbers, who rub the sides on circular stones or on files. The types afterwards go to the sotters, who arrange them in long lines ready for the dresser, and be slips them into a long stick, turns thens on their face, and, after duly fastening thein, cuts with a plane a groove in the bottom, which forms the feet. (These processes are now frequently performed by a macline, which produces types that do not requite rubbing or dressing.) The types are then dressed and the pieker takes them in liand, in order to lick out each defective letter with the aid of a magnifying glass. They are finally made up into parcels of a conrenient size, called type-fourders' pages, weighing about $S$ th each.

Subjoined is a description of a machine for performing autonie. tically the various operations of easting and finishing type which was invented about twenty years ago by Messrs J. R. Johnson and J. S. Atkinson. In this apraratus the metal is fused, injected into the mould, the cast letter turned out, rubbed or planed, first on one side and then on the other, the feet cut out and smeptherl, the dressed sides planed alternately, and the finished letter set up on a stick ready for nse by the printer. The casting machine and the dressing machine are in reality distinct, though mounted on a com mon frame. The whole is driven by a steam-engine or other prime mover. The casting machine consists of a furnece covered br a shallom pot holding the fused metal. In this is a pump, and the monld is placed opposite its mozzle. The mould being adjusted and the matrix in its place, the molien metal is injected and then eolidifies, forming a perfect type, but with jet attached. This letter is then thrust out, and the mould closes egain for another jet of molten metal. All this ls effected by one revolution of the axle of the machine. The letters pass through a channel one by one into the dressing machine. Cn arriving there they have each of their sides planed in succession by being held sgainst eutters. When one side is made true with respect to the set of the letter on
ita face, it is passed over a second cutter, which planes tha second aida absolutaly parallel to tha first. After this the typa is carriad in a line at right angles to its former course past a saries of aimilar cutters, which plana ont the foot, furthar smooth its surface, and plane each of tha two dressad sides in succession; this complates the dressing or finishing of the typea, which, continuing on their course, pasa upon a composing atick and are ready for the printer. The line of typea presents the appearauce of a solid bar of metal, so true, flat, and equare are the surfaces of the several separate latters. This machine has been considerably immovad by Mr P. M. Shanks. The naw machine is of simpler construction and its parta ara more compact. It does not produce better type, nor work quicker, -the speed in all type machines baing regulated by the tima required to cool the volume of metal, which, when on the machine, is assisted hy having water percolating throngh the heated parts of the mould. The working of the new machine is more readily grasped by tha manipulator, and thera is considerable raduction in ita cost.

## Type-Setting or Composing.

We may now dascribe the manipulation of the types in the printing office, and for the aake of concisenass reference must ba made ouly to the oparations connected with ordinary book-work. These differ in details from the methods in uso in the other two departments of the printing business,-news-work and job-work.
「ype.
The types, received from the foundry in the packages called pages, are placed in ahellow traya called cases. These contain compartments or boxes, each of which is appropriated to some particular sort or character. The cases when in use stand on frames or sloping dasks. The case at the top is the upper case, and that below the lower case. Tha

 appropriated principally to the capital and small capital letters; the latter has fifty-thre ous eizes, appropri.
ated

to tha lower-case sorta. The diffarenca in the size of the bozes corresponds to the differenca of quantity of lettars in a fount, as alreaciy stated,-the lower-case a for instance having the largeat box. The localization of the letters, \&c., is a subject on which opinions differ, the object being to briug the letters most frequently required nearest to the hand of the compositor as he standa-at work. As a man picks out from the boxes aeldom lesa then 1500 letters per hour and distributes or replaces on the averaga about 5000 per hour, it is necessary that tha most economical allocation of the boxes ahould be adopted. The system of allocating the various types is called tha lay of the case; fig. 7 illustrates the plan used in the principal English book offices; but there are many deviations.
The types, When taken from the cases are arranged in lines or "composed" in an instrument called a composing stick, mado of iron, brass, or gun metal. The clids in the middle is movalle 60 as to accomrodato varying lengtha of lines. In the composing room the frames are arranged in rorse, supporting the cases. The compositor fizes the "copy," or document which ha is to repeat in type, in a convenient place before his eye, and on some part of the case that ia seldom used. In his left hand he holds the compoaing etick, and with the thumb and firat inger of the right hend lifts the latters from the boxes, and arrangea them in the compoaing etick, every letter, point, or aign baing picked out separately. In this operation he is much asaistad by the use of a setting-rule, a thin brass or ateel plate which, being ramoved as successiva lines ara completed, keeps the type in place. When so many words and parts of worda as will nearly fill the line havo been consposed, it is made the axact length required by inserting or diminishiug the space between the aeveral words. Thia is called justifying the lina and is effected by means of the spaces already mentioned. If the work is not "bolid"-that is, if the lines are not closa togatherthe strips of metal called leads are used. They vary in thickness, but almays form aliquot parta of pica body. A good compositor must possess intelligence and a reasonable amount of general knowledge : he must be ablo to read hia copy with readiness, and to understand its meaning, in order to punctuate it proparly. He stould be abla to spell correctly, as some copy is almost undecipherable in regard to separate lettera, while other copy is incorrectiy spelt. When the composing stick is filled, the type is lifted on to a galley, a shallow tray of wood or matal, two or threa sides of Which are flanged, for the purpose of supporting tha type, when the
galley is slightly inclined. Stickful after atickful of typa is placed on the galley until it is full. The matter is then fastened up, a proof taken at the proof presa, and the work of the reader or corrector of the press-described below-beging. The proof, marked with the necessary corrections, is given back to the compositor, in order that he may make the required alterations in the type.
The type, being duly correctad, is made up into pagea of tha 1mpor required length (unless the author has desired to see proof in ing slip). It is theh imposed, that ia, tlee pages are arranged in such a mauner that, when printed and the eleet folded, they will fall in due numerical sequence. The impression from any arrangement of pagea will ba the reverse of that in which they are laid down. If an ordinary four-paga newspaper supplement be opened and epread out with the first page uppermost, it will be found that on this sida the ordar of pages is 4,1 ; when turned the pagas are 2 , 3. Tha type pages must be ranged in the reverse way, as 1,$4 ; 3,2$. Thus the fourth page is placed alongside the first, becausa both must be priuted together on the outsido; the third page is to the left, and the second to the right, bacause in books the odd page-the verso-is always to the right. For a aquarto a sheat of papar is folded twice, that is once acrosa its breadth and then once in a perpandicular direction down the tiddle. It contains four leaves, and if these are printed on both sidea eight pages. The two sides of a sheat aro called the outer and inner formes respectivaly. A thect of octavo is folded three times, making 8 leaves or 16 pages. The aiza of a book depands, not only upon the number of timea the ahaet has been folded, and described accordingly as 4 to, $8 \mathrm{ro}, 12 \mathrm{mo}$, \& co, but upon the size of the sheets. The dimensiona of the papers commonly used in book-printing are:-imparial, $22 \times 30$ inches; super royal, $20 \frac{1}{3} \times 27 \frac{1}{2}$; royal, $20 \times 25$; medrum, $19 \times 24$; demy, $17 \frac{1}{2} \times 22 \frac{2}{3}$; double crown, $20 \times 30$; douhle foolscap, $17 \times 27$; post, 15羕 $\times 19$. Hence to eay that a book is a quarto merely gives no precisa indication of its dimensions, as a quarto of one size of paner may be smaller than an octavo of another ; it ia also necessary to know the size of the aheats of which it is composed.
When a printed book is opened, it will be found that at the foot sigus: of cartain pagea thera is usnally a letter and at the foot of another tures a letter and a figura, as B, B2; further on another letter and another letter and figure. On going through the book it will be aeen that the lettere are in regular alphabatical order, and occur at regular intervals of eight, twelve, aixteen, \&c., pegee. These designate the saveral eheats of which the book is composed and are called signatures, so that a shat may be designated B, and the pages of which it conaiats are thereby sufficiently indicated. (Occasionally, as in the present work, numbers ara used instead of letters.) These signatures assist the binder in folding, as they occupy a certain specified place in each sheet; hence to ascertain if the sheat has been folded properly it is only neceasary to examina the position of the signature. The binder also is thus assisted in gathering or collating together the sheets of a rolume in proper order. Sigua. tura A ia omitted, becauso it mould be on the title or first page, and would be both unnacessary and ansightly. By old custom J, V, and W are discarded, I and J, U and $V$ being originally ysed indiecriminately by printcre, while W was written UU or VV. When the alphabet is exhausted, a new ons is commenced, diatinguished by a figure precedent, as $2 \mathrm{~B}, 2 \mathrm{C}$, \& c

The pagas of typas are arranged in proper order on a flat table, Forma corered with stone or metal, called the imposing stone, and are then ready to bo made into a forme, that ia, in auch a state that they can bo accurely fastened up end moved about. The forma is en closed in an iron frama or chase, subdivided by a crosa bar. The portions of the type are separated by furniture, which may ba of metal or wood or both. It is of the same height as tha chase, but lower than the type, and therefore doas not print, but forms the margin of the printed pages. At the sides of the two gactione of the formea ara piecea of furnitura of a tapering ehape, called sidestieks, and at tha top and bottom corresponding piecea, called footsticks. Small wedges, celled quoins, are inserted and driven forward by 2 mallet and a shooting-stick, , that they gradually exert increasing preesure upon the type. Other mechanical maana for locking up are also occasionally adopted. When sufficiently locked up, the whole is quite as firm and portable, however many thousande of piaces of metal it may consiat of, as if it were a aingle plate. In this rapid sketch we purposely omit mention of eevaral operations whish, though important and indispensable, are ouly of interest to the workman.
For many years endeavours have been mads to conatract machinea for typa-setting which shonld ooviate hand labour. Picking out tha typea separately from their bozes and arranging tham singly in the composing stick is an irksome end monotonoue operation, and one which it might be thought comparatively eagy to perform by antomatic machinery. But of the many differat composing machines that have been invented lass than half a dozen have stood the test of practical experienca. Thase have been confined to special classea of work, and it ie open to doubt whether the nimble fingers of a good compositor, aided by the braina which no machinery can suoply, de not favourably sompare on the
groand of economy with sny possible mechanical arrangement: On the other hand, employers sad makers of machines allege that owing to the opposition of the men machine type-setting has not had fair play. However that msy be, it is undeniable that a composing machins is still rars in printing offices, and where omployed it is only as sa suxiliary to the ordinary lsbour of the men. It deserves to be mentioned that nesrly the whole of the Times, with the single exception of the advertisements, has for yesrs past been set ap by machinery, and thst mors than 10,000 pages of the present sdition of ths Encyclopedia Britannica havs also been so aet up. We hsve not apace to describe with any minuteness the construction of composing machiaes. In the Fraser machine (fig. 8), one of the simpleat of its clses, which has been mads use of to the extent already mentioned in the present work, the typea are contained in a asries of grooved traje A, in the apper part of the machine, the traye having previously been filled by complementary appsratus called the disiributor. In these traya the types sre kept in position, -and pressed towards the frout part of esch tray, by alips of metal attached by cords to the borwheels $B$; each of these contains a spring of sufficient atreagth to press the ling of
 ypes ateadily forward against the separators $C$, which are formed with an inverted shoulder, under which the front typo in esch lins passes. The keys are connected by levera to the sepsrators, and ths depression of any koy causss the corresponding aepar. ator to descend, carrying with it the froat type of ths line into the grooved face-plate, down-which it slides into the composing atick $G$. Immedistely the finger is lifted from the key the spiral spring D raises the separstor to its origiaal position, and the nsyt typs in the lins takes the place of the ons just released, and so in succession as fast es the keys can be pressed. Uader the keys ruas a rod conaected by a crank motion with the pusher $G$, which, with every depression of a kgy, pushes forward the lins of type in the composing stick, thus making room for the next letter. The matter is thus aet in one continuous line, ready to be divided into lines of the required length either by the operator at the mechine or by another haud working in conjuaction. The speed of the mschine varies from 6000 to 12,000 . types per hour, but is regulated solely by the skill of the operstor, as the machins will work as fest ss the keys can be pressed. The composing machines now employed at the Times office sre an improved form of 8 n apparatus invented by Charles Easfeabein, and introduced there in 1872. The operstor sits in front of four rows of keys one sbove ths other, sornething like the manuals of $8 \pi$ organ, but only sbout 3 feet wide. Esch of the keys corresponds to a type or character. The types are kept in tin tubes placed vertically st the tbp of the machiae. The depression of a key works a series of levers, and an iron finger pushes the undermost type from its tubs, wheu it falls into a groove formed in a couducting plate, narrowing at the bottom to its aper. Inmediately below is a receptacls, and by the sction of a treadle the type is iushed along a channel. Other letters follow, the matter being thus act up in a long line, on a groove of the width of an sm quad, and running from left to right. The type when it first comes into th: groore is in an upright position, but in passing along it becomes twisted, ao that the letters stand at an sagls of sbout $45^{\circ}$ when they reaid the point at which they are justified. This groove communcates at its dexter extremity with the justifying galley,-a simnls apparatus, something of the nsturs of a composing atick and galiey combined. Then the type is divided into portions or lines of the required length and justified in thag galley, which is ardjustable to the width of the required length: As the long line approaches him, ths justifier with a small bodkis erceleratea a portion large enough in his judgment to fill the wilth of his colienn. When this is done he presses his foot on the treadlo under him, and thereby causes the lins to bs pushed into the ga"cy. Tlie line is jnatified by apaces and quads, and enough typo is then taken for another line. The speed depencis on the operator, and varies frem 6000 to 13,000 types per hour, the average joing about $8-i=2$, with two operators, - a justifier and a compositor bciog also recessary These machines are worked in the Tines offics at fino rste of a columan of solid miaion an hour. The machine occupes a floor apacs of only about 4 fest wide by 2 deep.
Another machine at present in use is that of Mr P.obert Hattersley of Manchester. It probably furnished the general scheme of others in nes. Ons of the most ingenious machines of the kind is thet of Mr Alexander Mackio of Warrington, ita general princip'e being
the acoption to setting up types of the Jacquard card of the power loorn, which wesves automstically the most intricate patteras of cloth. The spparatus cossists of three parts, - two used for preparing the "card" or ribbon, whioh directs the third in the operetion of type composing. The perforstor ia like a small cottage pianoforte. When the kegs ars struck they produce a perforation, and the ribbon is msde to move sside a little, 60 thst a new surface may be presented for puncturing. Ths composer is a circular iron table, 4 leet in diameter, having round its periphery a number of boxes divided iato sections, esch of which holds one kind of type. On a slightly lower plane is a wheel carrying littls brass tables, hinged at one end. When ths machine is in motion, the types are pushed out on to the tabls, which passes with its freight round its courss until it comes to the point of delivery, when the types are awspt off. The rising of the table, and the drawing out of the types, are guided by the perforated paper. Hence the machine sets types without a haman compositor. When oncs the ribbon is perforated, it may be used over again for aubsequent editions of the sams work, which may be in a different sizs of type. These machines ars only in use in the office of the inventor.
As has been slready described under Reporting (rol. xx. p. 406), the parlismentary reports of aoms newspapers are set up entirely without copy,-by tis ear, not by ths cye. It hss been found that by the aid of the machino the mstter can bs set up half as fast again as it could be written out: ths average apeed of the composing msching is 230 lines per hour when the copy ia dictated to the operator, whereas the most akilful workman aetting at ease in the usus? way csa do but 50 lines per hour.
For msny years it was a favourite idea with inveators, especislly Loge those who were not practical printers, that grest economy might bs type" gained in composition by the use of word-charscters or "logotypes," instesd of singls lettera. The constant repetition of msay words seemed to suggest that they might be cast in ons piece. Combins. tions suitsbls for sffires and auffixes, as ad-, ac-, in-, -ing, -ment, \&c., it was also suggested, should bs used instesd of the single component letters. Ths auggestion has, howsver, nót been csrried out, at least to any considerable sxtent. Ths chief prectical objection to it is that it involves the use of cases with an inconveniently large num. ber of boxes. The more the variety of chsracters is multiplied the mors "ftravel" of ths compositor'a hsad over the cases is necessary for picking them up, sad by ao much is the apeed of his work retarded. Logotypes, too, ars mors liabls to accident; when one letter is damaged theocombination is raudered useless.

Ths correction of the typs is a subject thist should be understood Correct by all who have to do with printing, ss msny mistakes srs mads ing tyre on the part of authors which a little technicsl koowledge would prevent. In the courss of retting any copy or MS. Which may be given him the compositor unavoidsbly picks up some wrong letters, or mistakes the words in the copy before him, or fails to follow the atyls prescribed for the work. Thess als called printcr's crrors. When the compositor hes finished his task, © first proof of tho matter is taken. This proof is read through and compsred with the copy by the proof reader or corrector of the press sud an assistant, ths copy-holder or reading boy. The proof is then sent back to the compositor sud the lstter is required to correct all the inaccurscics indicsted therein-in fact, to attend to all the directions given by the reader-and this has to be done at his own cost if he is working on piecs-that is, psid by results according to work done -or by tha cmployer if he is working "on establishment wages" or psid by tims. Another proof called a revise is now taken; this is carefully compared with ths previous proof. If the corrections havs not sll been msde, ths revise is msrked accordingly, and sent back to the composstor, who is required to remedy the imperfections. When ths proof is deemed sccurate, or "clean," it is sent, gcnerslly along with the copy, to the author, -being now termed 8n author's proof. Finally, in the printing office the mstter is carefully re-read and compared with the last suthor's proof by the press reader, who signs it and on his responsibility the typs is priated off.
The operstion of distributing the types is the converes of that of composing: it is de-composing the forme and returning the soveral letters to their proper boxes in the case. It is done, as already mentioned, Fith rernarkable rapidity. The forme is first washed ovar mith an alkaline or other detcrgent to remove the ink from its aurface, and then laid down on the imposing surfacs, unlocked, and damped; this acsists the cohesion of the type, after the chase, furniture, side sticks, \&c., aro removed. The compositor then takes in his left haud, supported by a cetting rule, a porlion of type in linis, and wi.h tuo right hand takes a mord or so between the fioger and thumb, lettimg each letter drop separatoly into its proper box. There is hardly any operation which so atrikes a spectator as distribnting, for a competeat distributor litcrally shorrcrs the types into their recoptacles. The types are held upside down, that is, with the nicks uppermost; hencs the letters of each word are read from left to iught like ordinary mstter when printed, but the words are of comrse dealt with th the inverse order.

Diatributing machintz of many differeat kinds have been iavented.

They may be divided into two classes, - those worked entirely hy keys or notes, like the pianoforte, and those in which the distributing is to a certain extent done automatically. For the former class only the type in ordinary use in printing offices is required. For the latter the type requires to be specially prepared, each character hsving a distinctive nick or nicks upon it, which correspond with the panticular channel of the machine it is intended to occupy, and by which it is guided to its special compartment. Kastenbein has produced a distributor which may. be described as a composing machine reversed. The matter to be decomposed is placed at the top in its appropriate tray or fixed galley, the sides of which are adjustable to fit any measure, the back being so constructed that it may be advanced to keep the matter always up to the front. As the matter is pressed towards the front, the first letter of it is brought in contact with a steel pusher, behind it being an aperture communicating with the channel of the guide plate. The matter is read by the operator; and he tonches the key corresponding to the letter that comes first. Thus the types are conveyed one by one to the guide plate or conductor. It has grooves furnished with little gates or switches, like the points of a railway, and these direct the types into their proper channels. The tubes into which the types are deposited are placed at the foot of each groove. Thus every time a key is depressed the switches move, the pusher sends the type to be distributed out of the line, it falls through the aperture, and, passing down the channels in the guide plate, reaches the proper tube. The speed is to a certain extent dependent upon the skill of the operator, but averages between 3500 and 4000 per hour. A good compositor can by hand alone distribute as many letters as this. But for the purposes of the composing machine, hand distributed bypes rould have to be set mp again, as the composing machine is supplied not from ordinary cases but from tubes of type. In the Fraser distrihuting machine (fig. 9) the
 page of matter to be distriouted is placed on the upper part of the machine at $H$, whence by suitable apparatus it is moved line by line towards the separator I in front. The matter is there read by the operator, and as each letter comes in contact with the separator the corresponding key is pressed and the type is conveyed to the guide plate, where a series of switches guide it to its proper compartmentin the tray of the composing machine.

## stereotyming, Electrotyping, \&c.

1才vau-
Eageo of

## strea-

sreing.

The method of raproducing and multiplying letter-press printing surfaces by taking casts of them, or stereotypes, has greatly conduced to the progress of typography, - much more so, indeed, than might berealized by those who are unacquainted with the practical details of the art. Stereotypiug ( $\sigma \tau \in \rho \in \delta$ s, fixed or solid; tútos, type or forme) is the method of taking casts from a fixed or movable forme; thus, printing from stereotypes is distinguished from typography; in wlich impressions are taken from movable types. It does not supersede type-founding, but supplements it, for a page of reading matter requires first of all to be set up letter by letter, and then the casts or plates are taken, each of which may be priuted from with nearly as much perfection as from the original forme. Hence a printing surface may be reproduced to an almost infinite extent, and the means of production of impressions on the press or machine are increased in proportion to the number of casts taken. It ensures an accurate cony of an original text, whereas in reproduction by resetting the movable types there is a liahility to devia tion. When only a cast is worked from, any accident may be repaired by taking another cast, and the cost is slight compared with that of composing over again. A smaller quantity of type may be msed in an office where this process is used; a portion of a work may be set up, a cast taken, and the types returned to the cases. The plates are more easily stored than movable formes, and are not liable to the danger, as ui lize latter, of types falling out. Ahove all, tho monld may be hent to any curve required, and a circular cast obtained, which may be fastened round the cylinder of a machine (see infro in regard to rotary printing).

The process of stereotyping, divested of merely technical details, is as follows. From a formo of matter, which may be wholly or in part composed of movable types, a matrix or mould is taken The original is in rilievo; the mould consequently is in intaglio. From this the stereo plate is cast, and it of course is again in rilievo. This in turn may likewise become an original, and casts may be taken from a plate, or other casts from the same mould. The first books were printed from solid wooden blocks, each of which formed a page. Then came the era of typography, in which these pages
were composed, mosaic-like, of morable types. Now has sncceeded the period of stereotyning, in which pages formed of single block: —but of metal, not of wood-are used. The two essential parts are. therefore, the making of the matrix and of the cast, which is composed of an alloy something like that for type metal. The mould may he of plaster of Paris or papier-mâche; the latter being the simplest material, and that almost universally used, need alone he here referred to. The following account of the process, when carried ont on the smallest possible scale, is sufficient perhaps to show the general principles of the art. The papier-mâché for the mould, called fong, is made by uniting several sheets of paper with a pasto made of wheaten flour, starch, and alun, to which wliting is added. These ingredients are often varied; the general object in using them is to ohtain a paste which will stand a high temperatnre without burning. A sheet of brown paper is laid down on a smooth surfase and pasted over ; blotting paper is laid on that and pressed down, then pasted over, and a sheet of tissue paper added, which is also pasted, and enother sheet of tissue paper placed on the top. This is well emoothed and pressed to give the incorporated material greater firmness and cohesion. Next, to prepare the forme for being moulded, it is surrounded with metal "clumps" of the beight of the type, placed close to the matter, and then oiled to prevent the flong sticking to it. The latter is then thoroughly damped, to render it quite plastic. The forme being on a level surface, the fiong is laid upon it, and on that a piece of linen. The surface is next well heaten all oper with a long-handled brush, till the flong einks into all the declivities of the forme and receives a deep impression of it. This is a process requiring experience and practice. The linen being removed, a piese of very stout paper is laid on the top, and also beaten domn, so as to strengthen the flong, and the moulding is finished. The nest point is to dry the monld.

In the most rudimentary method a combined dirying and casting press is used. It consists of a flat iron surface, with a lid attached to one and by hinges. Over the surface is a cross-head fitted with a serew; pressure may be exerted on anything placed between, the arrangenient being like that of a screw letter-copying press. The cross-head can be moved to one side when it is necessary for the lid to be lifted up. Underneath the press is a series of gas. jets, by means of which the hed plate is heated. The press stands on supports, but is attached to them only by an axle, and it can be readily changed from the horizontal to the rertical position. The lid of the box is raised and the forme with the flong upon it placed on the centre of the iron eurface. After loeing covered with a blanket, the lid is screwed down upon the whole, and, the gas being lighted, the forme and mould are heated for a few minutes, after which the lid is raised, the steam evaporates, and the flong, which has nor become the matrix, is thoroughly dry. In large stereotyping foundries, after the flong has been well beaten upon the forme, until the impression of the types is plainly seen on the back, it is baked and dried (the forme still underneath) on a long thick iron slab, callod a hot chamber, hecause it is heated from mithin by steam. The matrix is then removed from the forme, and any superfluous margin cut away or trimmed; after this the matrix is dusted with powdered French chalk and is ready for being cast from. ${ }^{1}$ A method has lately come in to use for obriating the necessity of keeping the matrix on the type while it is being hardened by drying by beat, wherehy the type is injured. The matrix is dried separately, being removed when moist from the forme, as soon as the irapression is obtained. It is then placed on a bed of sand heated by gas. The forme is never heated, and there is a great saving of time, because the dryiug can be done in two minutes. The matrix is laid on the bed of the casting bor face upwards, with ganges around it to determine the height or thickness of the cast. The lid is put down and screwed tightly, and the position of the press altered from the horizontal to the upright. The metal is then poured in and the press restored to its former position. The matrix is carefully raised and the plate exposed. It has only to be "trimmed," the superfluous metal cut away, aud the back planed, to be ready for isount ing on a block of wood to make it type high.

In stereotyping for the Walter and similar presses the proces is as follows. The forme is laid on the table of the moulding machine and the flong placed on it and thoroughly beaten in 1,3, hand or passed through a moulding machine, which performs tl. same operation. The forme is next placed on a heating surfacd and when nearly dried the matrix is removed from it and agais dried. It is then placed in the casting box, which is curved to t1 circumference of the cylinder of the press. The box, being on. swivel, is get upright. The metal is now poured in from g ladle and the plate cast. It is allowed to stand a minute and ther taken out, still hot, and placed upon a "finishing saddle" of the same circular form as the back of the plate, and secored by clamps. and screws. An angular-shaped knife or chisel, fixed in a carti age, is moved by a handle in a semicircular direction across the surface of the plate, in order to remove superfuons portions o' metal and to form a bevel whereby the plate can be sulscquently, cess poitgoned until actually required.
elamped on the machine. If nocessary ths piato may be smoothed at the back by a groclally contrived planing machine. The plate Is now ready for being placed on the printing raachine. Each singlo operation can be performed with the utmost possible despatch. If tha organization is oufficieatly porfect, tho time for making a rlate, from the moment when the formocomes down from the machiae-ruem to that wherefa the porfect plate jo set on the machine, ueed ouly bs about eight minutee.

In aewspaper establishments whero stereotyping is thas adopted the pages are not. all made up ailuultaucously : sonie are kept open till the last for the latest telegrams. The moment a pace is cons. pleted and locked up ia its chase it is bent down to the foundry, and as many cests takea as there are priuting machines to be set going. Ore pars follows another with rapidity, the first being placed in position on the machine, whilo the later ones aro in the foundry. Whea all tho plates are finished and fisel in their places, eix, eirht, or toa machincs may be simultaneously printing at the rate of nearly 12,000 per hour eacb. Tho enormous increase in the circulation of the great: daily aesepapere would havo been impossible but for the extramlinary facilities for rapid prodaction provided by etercotypiag. This process is also of special ntility to the newapepar printer in the case of telegrams arriviag lato. Ia machines which printed from the type, late telegrams could only be inserted by a "stop-press"; that is, the priuting was inter. rupted while the alteration was leing madlo. But, when the papier-infich casts of the pages have been taken, the type itself is tiberated aud seat back to the counposiug room, so that, if later news arrives whilo the unachiucs are runuing, the foreman printer altere the pago, a fresh cast of it is takcn, aud a inachiae started without interrupting the prorlnction for a moment. The London crening papers havo usually five editious, and for evers edition fresh casts ace marlo of on:o or more of tho pages.
Quite reccutly the sulistanco callell coliuloid hes been introdúced instearl of tho metal referred to previously. A mould ia mado of yellow oxido of lead and glycerin formed into a semi-fluid pasto, which is applied to the surface of the type. Tho matris is piaced on a potwerful press and a heated shect of colluloid ahout is of en inch thick is lall on it. When pressure is applied, a perfect facsimile is obtained, and it is ready to bo priated from when mounted in the usual way. Whereas a good electrotypo from a wood block a verares oix hours in its proluction, a cast iu celluloid can be got in less than an hour. Theso blocks are rery tough and many thousards moro of impressions can be printed from them than from stercotypes without their showing simas of wear. For small stamps india-rubber is used as a stereotyping material, and afterwards ruleanized. Theso stamps, being flexible, luist on rough surfaces which wonld not take an impression from ordinary etereotypes. With a fexible ourface, too, much less pressura is required.

Machinee have been invented to do away with tho use of types sltogother. The principle is to punch tho charactere successively on some onbstance which will act like the flong and become a trehes. mould from which stereo plates may be cast. In an appsratus receatly introduced tha floag is a prepared niece of millboard, which is placed in front of tho steel puuches. Tho latter are driven into the flong with lightaing speed snd great accuracy. By turning a handlo all the Romar punchea are changed to Italic; by onother a eet of sanserif or other founts comes into play. For setting time-tables and logarithms the apparatus is said to save ninety per cent. over the ordinary system of hand-setting. The obstacle to the more general uso of it is the diffenlty of correcting errors. In another machine the punches are drivan into a block of teak mood. They are cast to thicknesses which are the miltiple of a "point"; hence by a simple calculation they may be opaced out to the exact namber of points chosen for the iength of the liae, and every line leaves the machiue justifed. Tho block when complete is removed and a stereotype taken, which can be printed as in the ordinary method of typograpliyy.
Frr the reproduction of wood engravings electrotyping has zearly supereeded stereatyping, as it prodnces mucla better copies. For obtaining platos of type matter it is also better than otereo. typing, as many thousands of impressions may be takon without reducing the ehariness of an eloctro, while ordinary stereotype would be almost worn out by priuting a mucle emaller number. This arises from the superior hardness and toughness of copper, of which tho surface of the electro is formed. Electrotyping, however, is costliar and slower.
The forme to be electrotyped is ulaced upon a lovel plate, and earrounded with type-high clumps or metal furniture, and then floated with plasier of Paris, which provents tho mould of was (to be sfterwards mado) from penetrating too far into the interstices of tha spaces. The forme is moxt brushed with finely jowdered blecklead or plumbago. Tho monlding composition is mado of moltecl max, with the aldition of a little blackiead. This is poured into a shallow metal ruoulding tray, to whirh two pieces of atout wiro are soldered, in order that it mas be afterwarda suspended in the deprositing trongh. After the composition is coolen and set its anface is brushed with blacklead, and it is theu resdy for moulding.

The moulding press may be sompling like a letter-copyag press or, in a largo establishmeut, may corsist of a powerful hydraulio or other press capable of excreisiag a pressure of mauy lons. The forme is placed exactly zinder the cantre of the platen, with the moulding trey coutsiniag the wax, slightly warm, ups it AI impression is then taken, and the mould afterwards seperated from the formo. The monld has uext to go through tha proceas of building, that is, heated wax ia dropjed upon sach portimps as shoald be mors deaply sunk in the fyished electrotypa flate, namely, ti:s flaces where "wlites" are 10 sppear in the print. Tho mould fiaving been finished, has to be blackleaded, plumhago being a couductor of electricity, while war is a uoy-conotuctor. The material is well brushed in, filling all the iateratices of the forme; aed the entire surfaco of the mould must be properly covered, to ensure a perfect deposit of the copper. To facilitate this operation, a blackleading machine is used in largo estallishments. Tho formo is placed upou a cartiago formed of transverse bars ono 28 mornd backwards and forwaris by a handle and rounce to bring it undia tho blacklead brush. After the monld is blackleaced, the back of the moulding pan is coated mith max, to prevent the copler from being deposited upon it. The mould is now quickly immersed in one of the compartmente of the battery. The process of depositing a copper colution upon the blackleaded surface of the mould 23 continued until a solid plate is formed, which, thongh it is scarcely thickar than a finger nail, being about $\frac{1}{2}$ inch, forma, when properly backed, the best and most cuduring ourface for lefterprese printing that has beeu discovered.

Tho moulding tray containing tho mould is hung on tho brass rod of tho depositing trough facing a plate of coppler, and tho connezion of the battery marle: that is, the mould is attached to ene polo of tho battery and the plato of copryer to the other. The copper, so to speak, is decomposed on tho oan hand and recemposed on tho other: in other words, the current of electricity being complete, and tho mould sulmerged in the sulphate of copper solution, tho deposition of coppler on the mould at onec commences. Here it remains until tho deposit is suffcient, the time usually occupied being from 8 to 12 lours, according to the state of tho solution aud the strength of the batteries. Tho dyamo-clectro machine, which is now employed in large houses, rery materially reduces this period; otherwise Smee's battorics aro generally used. When the deposit, or, as it is called, the shell, formed on tho was mould is of proper thirkness, it is discngaged from the wax, -the mould being placed with its back on an inelined board, and boiling water poured over the shell, which melts the surface of the wax, execpt a thin coating, tho removal of which is effected by placing tho mould and shell on a steam heating table. Thus the wax mould is destroyed, and it is not possible to obtain more than one shell from a mould, whereas the stercotypa process enables almost any number of casts to ho taken from the same matix. The shc!l, being too thin and fiamile to be priated from, is next backed, or flled ry with metal of a somernat softer kind than sterco metal. The ohell, after being further cleaned, is lowered on to tho tep of a ressel of molten type metsl ; and, when the solder previously used to unito the copper and the metal has fused, the latter is poured orer it in a molten state until it is covered. The plate is rashed, dried, and polished, the back ronghly planed to a surface parallel to the front, the edces squared, and all imperfections mado good: Tho thickness of a plate is usually a pica or th inch. It is mounted as an ordinary stereotype plate. Within tho last fer years the pro. cess las been greatly facilitated by tho employment of specially contrived apparatus, aud illustrations can be produced in threa hours from the time tho mould is made. Curved electros are produced, as well es curved stereos, for uso in rotary printing. Facing with nickel by the electroplating process is now largely adopted for hardening stereotypes and electrotynes and readering them more durable. This process also proveats the deterioratiou of such plates by the action of the acids or other chemical reagents oftea preseat in printing inks, such as cyazide of potassium in red iuk and nitric acid in some blue iuks.

Polytyping is a mothod invented in Franco about the end of the 18th century, but notv seldom practised in the United Kingdom. The apparatus somewhat resembles a nile-driver. It lias two npright suides about six feet high, and a pulley at the top, which elerates by means of a rope a heavy plate, on which the matrix is placed in an inverted position. At the foot of the machine there is a suls. stantis] iron bed, unon which the operator places some molten metal. Ho then pulls the ropo until the matrix, with ito weight attached, is elevated to the top of the machine, when it is suddenly allowed to fall. Tho result is simils to that made on a medal by means of a die, -a perfect reproduction of the matrix in relief, which is mounted on a metal stand to type height. The results are cxcelient, as the plastic metal is forced into the finest lines of the matrix. Duplicates of a block can bo thus prodnced more rapidly than by the ordiaary stereotype process; and snother ad. vantage is that the intaglio parts are much deeper, - a point of some importance in priating. The matrix may bo mado from tha black by the electrotyping process

## Substitutes for Wood-Engraving.

Formerly the only available method of ohtaining illustrations which could be printed on the letter-press in conjunction with type was that of wood-engraving. At the present time a number of comparatively new processes are in operation, in which the engraring is done almost antomatically by the adoption of chemical processes and the well-known principles of photography. Engrarings of this kind are called in the trade process blocks, or sometimes zincotypes, owing to the metal of which they are formed. There is space here for only the barest possible account of the processes.

In the first method, which is sometimes called typo-etching, the drawing is made with ordinary lithographic ink on stone, or on paper and transferred to stone. It is then re-transferred to a plato of polished zinc by the ordinary lithographio process. Zine is employed on account of its cheapness and its ready solubility in the acids used for etching. It has properties similar to those of the lithographic stone in taking up the ink and the water. The transfer is made to adhere to the plate by being passed through a lithographic press; the paper is then stripped off; ind the whole of the ink is left on the plate, which is inked up es a litho stone with a view to render the lines as solid and strong as possible to resist the acid. The covering of the lines is strengthened by dusting powdered asphalt or some other suitable material over the plate, which is warmed just sufficiently to incorporate the asphelt with the ink. The plate is next placed in a bath of acid (its baok and other parts, where the acid is not required to act, being protected by varnish), in order that the unprotected parts, or those which are to form the whites of the finished picture, may be dissolved away. In order to prevent the acid eating not only straight down into the plate hut on the sides of the furrows it forms, and thus undermining them, an ingenious device has been adopted. As soon as the etching has proceeded to a very slight depth, tho plate is removed from the bath, washed, and heated. The ink and other protective medium are thus melted and run down the sides of the little furrows formed by the acids and thereby protect them from further action. Inking and dusting with resivous material are repeated, and etching resumed, until the depressions of the hlock have been brought to the proper depth. The etching is carried on in tronghs to which a rocking motion is given, so that the acid flows to and fro in waves over the surface, and littlo bubbles of gas, \&c., are carried atway. Where large epaces of white occur, the metal is cleared away by a drill ; after the block has been mounted type high, it is ready for the rrinter.

This process is only available for the production of "line blocks," i. $\varepsilon$, those in which the original drawing is done in lines or dots, as for an ordinary woodcut. The highest achievement of process blocks has becn the production of tone blocks, which may be made direct from oil-paintings, water-oolours, photograpls, drawings in chalk, wash, pencil, \&c., or indeed from anything from which-a photographic negative can be taken. The exact nature of the processes is a trade secret, but the rationale is given in Mr Truman Wood's Modern Mcthods of Mlustrating Books (London, 1887), to which we are indebted for the following detalls. The prohlem is to translate, as it wers, the light and ehade of the negative into solid outlines of black and white. The shades mnst be lines of various breadths or of various distances apart, or spots. or grain of various dogrees of fineness or closeness. In a aurfaceblock any part that touches the paper prints, and any part that does not touch the paper does not leave any mark at all. The photographic irnage is continnous: there are no outlines in it, the picture being formed of graduated tints or shades, ranging from the white of the paper up to tho darkest colcur that the process employed can give. To make a block for letter-press printing the graduated tints of the photograph have to be broken up into stipple or grain, and it must be a stipple closest in the shadows, gradually becoming moro open throngh the lange of the intermediate tones, and vanishing altogether in the hirhest lights. To describe the ingenious methods adopted to secure this end would involve an account of several plotographic operations which would be out of place here. In one process, perfectod by Meisenhach of Munich in 1882, grained negatives are produced by placing a transparent screen, on which a staitable grain is imprinted, in contact with the negative or the positive to be copied, and then photographing the two together. The negative is transferred to a plate of suitable material, which is graved or etched in the usual manner, to form a typographic block. Another derice is to print from the original negative upon a piece of silk, the threads of which break up the picture into a regular grain. The positive on the silk is then photographed and a printing block made. Theso blocks require from their very low relief delicate and careful printing, but are made to give excellent results.

A process of typographic etching has been invented by Messrs Dawson, in which the design is drawn with an etching needle on a brass plate covered with a wax etching ground, In the same manner as for an ordinary etching. The metal is therefore bared at the lines, which are separated by ridges and spaces of wax. These spaces are
strengthened by the addition of melted wax, which runs up to the edges of the lines, but does not run over on to them as might he expected, filling them up The supply is continued until the spaces between the lines, representing the whites of the finished print, have been raised to a height sufficient to give the necessary relief, when an electrotype is taken. This electrotypo forms the printing surface.

Shanks's process is a device for producing pictures simply by the use of nechanism, and is an application of the eidegraph. The plate to be drawn upon is moved under the drawing implement, which is a rapidly revolving cutter, and the plate on its carrier is mounted on the end of a series of levers in the same way as the slide rest of a lathe, so as to have motion in two directions, one at right angles to the other, and consequently by a combination of the two to have motion in any direction in the game plane. If a plate of a suitable substance, such as hardened plaster of Paris, be mounted on the carrier, and the bracing point at the other end of the lever be moved over the lines of a drawing, the cutter will plough a little furrow, which will follow these lines. When the plate is finished, a stereotype is taken from it and forms the printing surface. The lines of the casts are remarkably strong owing to tho conformation of the furrow of the mould, and they can be ppinted on fast rotary machines. The weather charts given in some newspapers are produced by this process. A block with the recurring outlines being made, platee are moulded from it, 50 that the details slone have to be separately cut upon future plates. Mr Shauks's method is remarkably simplo and expeditious, and the resulte aro ecoromical and trustworthy.

## Press - Work and Presss.

The characteristic of printing, as already pointed out, is that the pigment-the ink-with which the printing surface of the type is coated is transferred to the paper or other material by pressure. The manner in which this pressure is exerted gives rise to two classes of machinery, -those in which the platen and the cylinder respectively are employed. After the paper is placed on the type, in the one case a flat plate of iron moves parallel to the forme and comes in contact mith it, cansing the impression on the paper, while in the other case a cylinder revolves over the surface, which travels in gearing with the cylinder.

Space does not permit of any sketch, however slight, of the origin and progress of type-printing machinery. We can only refer to what may be regarded as representative appliances in presont uss. In America all kinds of apparatus for printing are called "presses", in England, however, an appliance of a more automatic character than the hand-press is usually called "a machine." As the hand-press is now alnost ohsolete, this distiaction will probahly be abandoned, and the shorter and more expressive word "press" be applied to all. Venturing to adopt this suggestion, wo may say that of platen presses there are the hand-press, the treade platen press, and the steam or other powerdriven press.

Fig. 10 is a view of the Albion press. It is wholly of iron end steel Although this press is nearly superseded, it is desirsLle to point out its component parts, as they indicate tho genera! principles on which all typographic machinery is based. The flat plane on which the type is laid is called the bed of the press; the other flat plano which moves vertically and presses the paper on the type is the platen. These are the two essential parts of the press. 'The platen is perfectly smooth and level on its under surface, in order to give the whole of the type forme an equable pressure. It is mounted in a 6 trong iron frame, with a cross. piece or head. The platen is propelled by a piston, which moves up and down. The power is gained by bringing an inclincd bar of steel perpendicular to the direct line of pressure, and in doing 60 the piston is forced down. This stoel bar is the chill, shaped like an elbow. At one end is a har or handle which, on being pulled towards the operator, straightens the chill or brings it into the vertical position. At the sides are guide-plates fixed into the frame, to proserve the parallelism of the platen, for the slightest vibration or lateral movement would prevent a clear sharp impression being taken. There are appropriate applianccs, such as a helical apring, fixed on the head of the press, whereby the platen raises itself when the pressure is not required. In order to brine the forme readily unier the platen, and to withdraw it so that it may be inked and the sheet to he printed placed in position, the table is mounted on a carriage, that runs on two rails by turning a handle connected with two endless bends. The paper is ixed to certain marks on the tympan, a lind of metal frame hinged on to the carriage, when it is in a sloping position. This cusures the paper being printed in the exact place required The tympau, over which calico or parchment is strctched, is double, and contains within it a pad of paper or a piece of blanket, to moderate the force of the impression of the platen. To it is hinged another metal frame, the frisket, which is covered with paper, ent to correspond with the shape of the type forme on the press. The ink is applied with a cylinder or roller, which revolves in an iron frame, sud is
sorered about an inch thick with a compesition of glue and treacle pr of glycerin or other substance. The ink is spread out with a palette knife or similar applisnee on a table adjeining the press, and by repeatedly revolving the reller over it, it becomes eoated with an extremely thin film of ink. The reller is then moved over the surface of the forme en the press, until sufficient ink has been transferred to it. This is called rolling, and is a very impertant part of press-work, for if inefficiently perfermed there will be

Fio. 10.-Albiun press.
colded down on the trmpan, whieh is in gnides. The frisket is forme with the risht hand, while with the left fold down on the and the press carriage brought under the platen. The bar is pulled by the right hand, the bandle turned the reverse way with the left hend, the carriage brought out again, the tympan raised, the frisket opened, and the printed sheet removed, the tympan beiug ready to receire another white sheet. The frisket serves, among other things, to keep the edges and parts of the sheet not required to be printed from being discoloured by contaet with the ink or the sides of the forme, and to aid in steadying the sheet when the tympan is depressed and in the removal of the sheet when it is raised. Such is a bare cutline of the method of printing at a hand-press, - one necessarily imperfeet from a technical point of view, but sufficient to indicate the essentials of the operation.

Another press which has been much used is the Columbian, -a name given to it by its inventor, Clymer, an American. The power is gained by an iugenions combination of lerers. Two of these are connected by a rod mith the bar handle, which is in itself a lever. 3 The platen is attached to the head by a strong iron bolt, the descent heing made steady and regular by fertical guides. It is counterbalanced by a powerful lever or beam, having an adjustable weight shaped like an eagle, which raises it automatically. In the bar handle is a serem stop by means of which the length of the lever rod can be adjusted and its pressure, or the pull, perrectly regnlated
Nine distinet processes hare thus to bo gone through in order to print one side of a sheet of paper at a hand-press:-(1) inking the roller, (2) inking the forme, (3) laying the sheet on the tympan, (4) folding down the tympan, (5) running in the forme under the platen, (6) taking the impression by depressing the platen, and then immediately afterwards allowing it to raise itself by means of the counterpoise or spring, (7) running out the forme, (8) lifting the tympan and frisket, and (9) removing the sheet. The object of auccessive improvers of the printing press las been to render the npparatus more automatic, or to substitute for it a "maehine" that will reduce these nine operations to the minimum. In modern machines this has been effected to the extent of renderieg necessary only three of them-(1) laying on or "fceding" the sheets, (2) rpplying the motive porer, (3) taking off or delivering the sheets; and rotary machines both feed and deliver themselves automatieally. Nearly all eylinder machines hare a delivery apparatus, and quite recently an appliance for the antomatic feeding to them of single sheets of paper has been invented.

With respect to the platen press we lotice first that which is capable of being driven by a rotating shaft or wheel. It should be observed that the adoption of the rotatory prineiple was essential to the acceleration of speed. This was recognized by the projeetor of the machine ${ }^{1}$ press, William Nicholson, and by Frederick Koenig, who first brought the invention into use and construeted a practical

[^296]press. The essential arrangements of every machine are four, their respective objeets being (1) to feed in the paper, (2) to ink the forme, (3) to print the sheet, snd (4) to deliver or take it off.

The treadle platen press is the simplest of machine presses eapable of being worked by a wheel. When other motive power is not arailable it is driren by a treadle, like that of a lathe. The type forme is usually secured by clamps on an almost vertical bed (fig. i1), and tho platen recks backwards and forwerds, being thus brought in contact with the type on the ked. Just betore the impression is taken, the two surfaces are mo mentarily parallel. The inking is effeeted by small eomposition rollers, ad justed in a roller earrier swinging on a pivot. The rollers receire ink from a "fountain" or duct of ink at the top of the machine, below which is an arrangement, such es a revolving disk, for dis tributing the ink. The constant motion of the
 rollers and of the rerolving ink disk is equivalent to the manual movements of the operator who "rolls" at the hand-press. The rollers are carried by self-acting appliances over the face of the forme, and return to the iak table to be repleuished with ink, after which the impression takes place. The slaeet to be printed is placed in proper position on the platen, which is corered with paper or parchment, and is secured there during the more. ment of the platen by movable fingers ealled grippcrs. The platen on adrancing brings the paper in contact with the type forme; after the printing it returns to its original position, when the sheet is removed and another sheet adjusted ready for being printed. The treadle platen press is only adapted for work on paper of small size, up to half sheet demy, but within this limit it is greatly superior to the hand-press. If sufficiently strong and well built, it gives a far more powerful impression, and it occupies about a sixth of the space. Its great merit, however, is its superior speed. The hand-press, when worked ky two men, one rolling the types and one pulling the handle of the press, produces only about 250 impressions per hour. The treadle press is morked by a boy, who has only to depress the treadle with his foot, aud lay on and take off the sheets with his hands, and he ean work at the rate of more than $\mathbf{1 0 0 0}$ per hour. The treadle press is also superior to the hand-press in the uniformity of its resnlts, since the automatic inking ensures a greater regularity in the colour of the impressions than with the old hand-inking process.

The ordinary or "double" platen press nas, in principle, very Double similar to the hand-press. It was about 13 feet long. The platen, platen in the centre, was massive, as the machine printed sheets as large press. as double demy, and it had a perpendicular motion, being guided in grooves and worked by a connecting rod fixed to a cross beam and crank, which aequired its motion from the main shaft. In other respects the machine differed from the hand-press in having two type beds or coffins and two inking tables arranged at the ends of the carriage, which travelled backwards and forwards, being worked by a drum underneath. The paper to be printed was laid to marks on the frisket, and this was hinged on the tympan, which in turn was fastened to the end of the coffin by hinges or joints. The frisket -and tympan were opened by minning up bars at suitable positions. After a newly printed sheet was removed, another was placed on the frisket, which as the carriage moved ran domn the bars and closed on the shect, which tien. received its impression. This arrangement was dangerous to the bovs who had to lay on the sheets.

Formerly it was thought that the rery finest printing could not be done by a cylinder impressing a forme in the progress of its reciprocating motion, for that was liable to slur or blur the impression. Hence platen presses were employed for the best mork. Of reeent years engineers have brought the eylinder press to such perfection that there is net the slightest danger, under the superintendence of a capable man, of any slur. Working quite as well as the platen press, the cylinder press is enormously quicker and more productive; it requires less driving porser; and much better inking is obtained, which is all-important for fine woodeut printing. Accordingly, for ever the best illustrated book-work, the platen power-press is now almest catirely superseded by the cylinder.

Cylinder mschines are of two kinds, -(1) presses in which the type is on a flat plane and (2) those in which the type, or more eorrectly the impressing surface, is cylindrical. The first are called cylinder presses, the second - a development of the first - the rotary web presses.

- The simplest kind of mechanical press is ealled the singie.
cylinder or one-sided machine, which has been recantly hronght to the highest state of perfection by. Mr Ssmuel Bremper. It is generally used for commercial and fine book-worts on ono side of the paper. There are different varueties of cylinder maohincs, distinguished by trade-marks or the names of their makers; but the general principles, apart from details, ere practically identical. There is a strong east-iron frame, with bearing to carry the cylinder, which runs across the machine transverselj, pearly in the centro. The cylinder revolves by gearing connected with a main shaft, which also works the other moving parts. This shaft is turned by a wheel for hand

The table
for
upon the tympan and folding it down on the forme are superseded by the presentation of the paper to the grippers; and the taking-off of this sheet after rasing the tympsn is superseded by removing it when released by the grippers and laying it on the sdjacent table,both ummeasurably easier operaticns snd done much more rapidly. Indeed both laving-on and taking-off may be done sutomatically, as is explained belor. The result is that, while two men are reanired to print a skeet of book-work on one side of the paper at the speed of 250 an hour st the bsnd-press, ms chines of this class worked by one operstor printabout 1200 per hour Eveu per

Fio. 12.-Extra-colour Bremner machine, with sheet-fyers.
cut up into double crorm sheets, the pro-
carrying the type is slso provided with a flst inkiug bosrd of wood or iron, used for distributing the ink. It travels backwards and sorwards, that is, with a reciprocating motion. At one end of the machine is the fecding-boerd, on which the pile of paper to be printed is placed. The lsyer-on places each ohcet against metal marLes, consisting of rectangular pieces of steel or brass mounted on a har undernesth, which rises and falls according as the sheet is being luid to and taken sway from them. When placed against.these marks, ensuring corzect "lay," the sheet is seized by grippers or light metal clatre fixed on a bar inside the cylinder. These clutch the sheet and carry it forward round the cylinder, which in its revolution brings it forcibly in contact with the type forme moring forward underneath, when the impression is effected. Immediately after the grippers release their hold, snd the sheets are removed singly by an attendant called a taker-off, or by a mechanical automatic arrsngement called a flyer, and deposited on the taking-off board. At the end of the machine farthest from the lasiag-on bosrd is fixed a trough, which contains the ink; it-is fitted with the duct roller of cast-iron, which revolves by means of a band or ratehetwheel and pawl. A flat bar or knife with a thin edga is set up egainst the metal roller lengthways by adjusting screers, which regulate the passege of the ink, and permit a thin film to pess the knife. A composition roler, called a vibrator, is axed nuderneath, which takes off the ink that has already been deposited on the duet roller snd leaves a ridge or strip of it on the inking slab. As the carriage returns, this strip of ink is distributed on the inking table by rollers placed diagonally across the machine. The disgonal position gives them a waving motion; hence they are called wavers. The inking of the forme is done by another set of rollere called inkers, placed near the impression cylinder. The inking rollers receive their ink from what is distribnted on the tahle sad coat the type while it is passing underneath them.
Thus the nine operstions of the hand-press requisite to print one impression are greatly reduced. The bed carrsing the type to and fro from the point of umpression moves mechsuically, superseding the running in and out of the carriage by the rounce and handle of the hand-press. The inking table, although independent, forms part of the type table, and some of the rollers distribute and others ink, this agan being done mechanically and without a second operator. Ihe piaten and the tympan, as well as the levers by
 Hinder, which rotates by gearing, the pressua being applied suring the motion ef the table atse!f. Tha laytnaraz of the sheet
ductiveness of the machine to the press.would be, per hour, atout
8000 to 250 . 8000 to 250.
As already mentioned, a self-acting feeding apparatus bss becn iuvented for supplying single sheets to cylinder machines. The pile of paper is laid on a feeding board or table, betreen gauges A pncumatic tube takes up. one slied at a time; it is then run down tapes to a point at which india-rubber fingers bring it to the side lay of the machine, and it is priated with perfect sccaracy of register. Once started, the machine works automatically, and the services of both layer-on and taker-off are dispensed rith.
We may now describe that class of machines by which the paper is printed on both sides, of perfected, during one passage through the machine. The Applegath and Cowper or crdinary machine has tro impression cylinders, having a continuous rotary motion towserds each other. The frame is necessarily long, usually shout 15 feet, and the width of the machine sbout 5 feet, these dimensiony depending upor the size of the sheet to be printed. The table or carriage is donble, containing tro beds for ths two formes of type, to impress the tro sides of the paner, and two distributing tables for the ink. At cach end is a complete roller apparatus, consisting of duct, duct roller, vibrator, snd wsvers. Close to the largo cylinders on each side are the inking rollers. Ths table has a reciprocating motion, as in a single-cylinder machine. The distinctive feature is the ingenious manner in which the sheets arg printed first on one side sud then on the other. This is effected by carrying them over cylinders snd diums by-mesns of tapes. The pile of sheets etands on a ligh table placed at ons end. The sheet is fed into the apparatus and led round an entry drum; thence it is carried ronnd the large right-hand impressing cylinder, and undernesth this, on the table, which is moring at the ssmo speed as the cylinder, is the inner forme propedy inked. The paper thus receives an impression on one bide. It is next lef ap to the right-hand drnm, which it passes over, the printed side of the sheet being then downwards. Continuing, it is brought under the second or left-hand 'r rum and on to the left-hand impression cylinder, which it passes with the printed side still downwarde, or next to the cylinder, exposing the other side to the type of the outer forme on the table underneath. The drums have thas reversed the position of the paper: the side which was outside trhen pessing the first forme is inside when passing the second forme, Which accordingly prints the sheet on the opposite or blank side. The sheet is finally run out by the tapes and delivered in the sprace between the large cylinders, seized by a taking-off boy, and deposited
on a table or taking-off hoard. Tlis press is known as the dropbar perfocing muchine, owiug to a peculiarity of the arrangeraent by which the papor is eonreyed into the tapes. In front of the feeding table is a rod or bar of steel, along which ore fitted several matal disks or lousses about half an inch thieker than the bar itself. These can ba shifter, by means of small screws, to any position

and a small drum on to the inner formo cylinder, as already stated. coher timas of machines are distinguished as the web, having a web or a series of broad tapes which lie on the laying-on board and are fastened to a small drum undernosth it. The drum lias a aeries of amall cogs, and when it is forced forward it moves the web or tapes in the samo direction. Tho shect, haviug been laid to a back mark on tho tapes, is propelled between two rovolving rollers and thus taleu into the machine.

There are several distinet types of perfecting presses in use, but wo can only natice one or two. In the Anglo-
French mochine, which was in
vented in Eugland but it proved in France, grippers aro used instead of tapes and
blankats. Tho paper ncxt passes on to the printing cylinders $T, T^{\prime \prime}$, on which the printing surface- aot composed of movablo types but of stereo plates-is fixed, and to the impression cylinders $r, l^{\prime}$. The printing cylinders contain each the plate in curvilinear ihapo, constituting the forme for ono side of the paper. Tho wob s led between tho prioting and the impression cylinders, as shown by the dotted line. After being printed on one side by $T$, it travels ronad $I$ and receives an impression on the other side from 7 , thans being "perfected." It then passes on to the cutting cylinders $K$, $K$, one of which has a serrated knife, which enters the paper, aud on the application of tension divides the web, cansiog the pecnliar saw-like etlgc scen in copies of journals printed on rotary machines. Tho paper is next carried in over tapes to tho point where the complate severance takes place. Soon alter they encounter a pendilons frame, which delivers them in two piles on to the tables $x, x$, whence they are removed. There is an ink supply trongh $a$, which is connected with the distribnting rollers by a revolving metal roller $b$. The distributing rollers of metal are marked $f, g, h, i$, and tho rollers which ink the forms, made of the ordinary composition, are markel $\lambda, \lambda$.

The averago rate of speed of tho Walter press is 12,000 per hour, the sleests being printed on both sides. In this apparatus everything is automatic: thero is self-fecding aud aelf-lelivery, tho web of paper at ono end being transformed into properly priated single sheets at the other. The machine requires only ono man to superintend its general working, including the replacing of the web when printed and the romoval of the successive piles of eheets. In respect of speed, if the perfecting machine is to tho hand-press as 32 to 1 , the rotary will be to the hand-press as 96 to I. The Walter press, requiring a space of ouly about II fcet by 5 , is pot more remarkable for its speed and economy than for its simplicity of coustruction and its compactuess. And tho samo remark applies to soveral other machines, snch as the Victory, the Hoe, and the Prestonian, which have since come iuto use. Their gencral appcarance is that of a collection of small cylinders or rollers, through Which the paper scems to fly at railway speed, issuing forth in two descending torrents of shects accurately cut into lengths. Without such machinery tho prodigious issnes of some of the morning jonrnals would not be possible. One daily paper averages a circulation of more than a quarter of a million. This enormous aumber of sheets are printed in about four hours, owing to the type matter being stereotyped and placed on several presses.

## Printing

re ang from webs of paper instead of single shects will probably o. adopted io the flure for all newspapers and even books of large circulation. Haod-feeding is limited by the ability of the operator to lay the sbects on tho feeding-board with the necessary accuracy. One chicf obstacle to the wore general adoption of rotary printing is the expense of stercotyping tho type formes. Althongh a machine bas boen constructed in which movablo types can bo placed ronnd the periphery of an impressing cylinder, it cannot compete with tho Walter and other presses using stereo plates. The problezn of printing directly from flat formes of ordinary types, as wen as from stereotypes, with paper supplied in the roll, is one that may be commended to engiaeers. The saving in etereotyping in many cases would be very considerable; but, oven where this is not an object, the readiness and caso with which this type could be manipulated would ensuro for such an apparatus admission into offices where the large rotarics of the present day are inadmissible. It would also cuable illnstrated journals to be priated from the web. The pictures introdnced into some of onr daily jonrnals are very rude when compared with those in periodicals printed on flatbed machines. This is owing partly to the distortion that arises when the cast from a flat block is accommodated to a curved sarface, partly to the fact that stereotyping does not give the fino and delicate reproduction that electrotyping supplies, and partly to the imperfect inking pawers of the machines. Quite recently a plan has been patented whereloy curved electrotypes of pictnres can be fastencd to blank or depressed portions of an ordinary curved stereo plate; but the mothod is not always practicable. With a flat-bed machine tho formo to be printed from might be of a compositc kind,-partly movable types, partly stereotype, and partly electrotype. One difficulty of constructing a web printing machine With a flat bed is that of turning the sheet so that it may be printed almost simultaneonsly on botli sides. It wonld have to be reversed by the continued rotary movement of the cylinder. This, however, is quite within tho limits of practicability, and experiments are now being made to devise a machine with this feature.

For about thrce centuries after the invention of printing the formes were inked by leather balls. When machino presses were introduced, their earliest inventor tried to use cylinders covered witn leather ; but tho plan was most uasatisfaciory, until a oubsewas cast iato cylinders having an inner "stock" of metal or Food. For about half a century this composition was nsed exclusivcly for Loth hand and machine presses. Sinco then glycerin has'been introduced for roller making. Haasard's recipe, in use whea the 8 th edition of the present work was issued, was-glue 4 parta,
treacls 12 parts, Paris white 1 part. But a much better composition is मow formed of glue 10 parts, sugar 10 parts, and glycerin 12 parts. The glycerin has tho property of always keeping the roller moist and soft, while the tendency of glue and treacle is to dry and harden. A glycerin roller lasts much longer than ove of glne and treacle.

Printing ink has pecnliar quslities. It is required to change from Qualities a perfectly hard and dry substance after bed to the type to that of of priata perfectly hard and dry substance after being transferred to the ing ink. paper. 'I'his change of condition mnst be nader control, and when air is exclnded the ink should keep in good order any length of time. During its application to the type its solidification should be as slow as possible, and noaccompanicd by the emission of any nopleasant or deleterious odour. It onght not to affect the rollers, and, having been applied to the paper, its action should be confined to a very alight ponetration, just snfficient to prevent its detachment without injuring tho shurface of the paper. It mnst dry into a hard, inodorous, and unalterablo solid. Tho ingredients of ink are burnt linseed or other oil, resin, and occasionally coap, with varions colouring matters; that for black iak is usually lamp black, Ink is removed from types and blocks by detergents, such as potash and pearl ash; beazine is also well adapted for the purn as potash

## Colour Printing.

The apparatus previously described is iotended for monocinome Printing printing, whaterer be the shade of the ink. When two colonrs or in two more have to be printed in one composition, there mnst be a coloars, separate type forme or separate engraving, and a separate printing, for each. Nany attempts bave been made to print several colours simnltancously by dividing the trough or nauipulating the roliers. All these bave been more or less unsuccessful, with the exception of is press invented by $\mathbf{M}(\mathrm{F}$ W. Conisbee, which prints from type formes in two colonrs. In construction it is somewhat similar to the ordinary single-cylinder machine, but is provided with two sets of inking apparatus, inclnding ductor, wavers, and inkcrs, each of which acts totally independent of the rest. The cyinder is placed in the centre of the machine and makes two continuons revolntions, giving an impression for each colour. There are two ty; formes, each containing only the lines to bo worked in one of the colours. These are in two beds adjoining one another, and, the circnmierence of the cylinder being equal to the length of one bed, one colonr is printed by the first revolation and the other hy the second. The sheet is thus printed twice withont leing released from the grippers, whereby perfect register is ensurad. The speed is slow, averaging 300 to 400 completo impressions par honr.
The method by which the beautiful coloured supplements issued Chromo occasionally with illustrated ncwspapers are printed may be slightly typoreferred to. A copy of the artist's painting is first of all made, on graphy. a scale regulated by the size of the reproduction. This being supplied to the engraver, an outline or key block is made and proofs pulled. It is now necessary to determine the tones of colour to be ased, - a process demanding great experience. The key hlock will, if printed first, afford a guide for the registration of the subscquent printings ; sometimes, however, that is reserved for a later. stage. The colonrs on which the sabsequent printings are donc must be of a transparent nature. The blocks are sometimes prodnced by tite typographic etching process, which gives a softress, delicacy, and variety muattainable by the graver. The blending of the colours is the most delicate task the printer has to noder. take. A large picture is often printed in teu or more workings, some of them in their turn intensifying and bringing previous colonr workiags into stronger relief, others giving shape and form tu the picture. Almost to the end of the process, horever, the picture will want vitality ; its outlines will be hard and bare, or vague and undefined, according to the eequence of the colours. Another working may give grey" tones where wanted, and may increase the depth and transparency of varions parts. A deep flesh working may have a marked effect on the development ; and near the closo of the series, if the entire colonring is found to be too warm, it may be corrected by over-printing very nearly the whole subject. Chromo-typography has undonbtedly made great strides dining the past twenty years, its best results being shown in the colonred prints for ilnstrated journals. For the production of pictures for commercial and artistic purposes cbromo-lithography is geaerally resorted to on acconnt of its relstive economy. In lithography for typographic purposes the line has to be cut and the space on both sides reasored so as to leave the line alone to be
charged with the ink, or the white space has to le etched awav witl an acid. The printing of isolated points too is easily effected from a stone, whereas most minute labonr is necessary to engrave them. Eypographic etching bas here, however, been of great assistance. The differences of printing surfaco caused by the colours are met and overcome by the lithographic stone with great facility, eveu when the spaces are largest and most uneren; it is quite the contrary in regard to typography, wherein the work has to be charged with ink to a greater extent secording to its size, aud the quantity
of ink requisite varies with the fineness of the strokes and of their distance apart. Owing to this we see in most letter-press polychromatic !irints a deficiency of transpareney, of half-tints, of depth of ground, aud of general harmony. Even if it were possible to mako chromo-typograplyy as easy as chromo-lithography, there would atill be tha obstacle of its very much greater cost, owing to the expense of the engraving and of the casts from the key block. In chromo-lithography the designer can repeat the designs for the different stones by a process that costs almost nothing. Also in the brocess of multiplying the blocks the deviation in the register of the successive eolours is practically unavoidable. In lithography the surface to be printed is nearly level; hence the eheet is not shifted and twisted or stretched in places, as it is in typography, owing to the alternate closeness and abseuco of contact betweeu the sheets and tho raised and depressed surface of the block. Whatever success the letter-press method has attained of late is owing to tho invention of electrotyping and proeess blocks, and to the improvement of machinery. For to priat these pictures enormous strength and riridity, and tho inost perfect arrangements for securing register, are absolutely essential.

## Recent Changcs.

We will now give a cursory glance at the changes that have been effected duriag the last twenty-five years in the processes and the products of the art of printiog. That these have been of a most drastie kind may ba gathered from a comparison of the applianees figured and lescribed in the 8th or the previous editions of the Encyclopsedia Britannica with those referred to above. Tho hand.press has been almost completely superseded by the machino press. Cylindrieal impression las displaced platen impression, and the finest book-work and woodent work are done on a eylinder press. In book-work, indeed, other significant changes have taken place. Whereas formerly it mas deemed essential that the paper should be damped before printing, io order to get a delicate and perfect impression, some of the finest books and periodicals are now printed on dry paper, highly calendered, oven the illustrated journals and somo of the evening papers boing so worked. Then, it was thought necessary for the safety of the type to interpose a thick soft blanket between it and the pressing surface, whether cylinder or platen; now, it is found oquslly safe, and far more conducive to a good impression, to make the packing as thin and hard as possible. Then, fine moodcuts were "brought up" by tho use of many "overlays" and "underlaya" to corrcct juequalities in the surface of the bloekg and empliasizo somo of the parts; now, although the art of "making ready" has heen brought to great perfection, the fewer and thinner the oterlays employed the better. And it may not be irrelerant to point out that the printing of wood. cuts has improred in the same degree as the engraving of them.

Perhaps, however, the most remarkable ebange is that made in newspaper printing. The highest achievemeat mentioned in the artiele "Printiag" in tho Sth edition of tris wolk was the six. cylinder Hoe machine. The makers of that ayparatus subsequeatly contrived machines of eight and ten cyliuders. But they have now been wholly superseded by the rotary presses on the Walter principle. The hand feeding-in of single sheets is entirely dons away with, and all newspapers of considerable circulation are printed from long reels of paper, uncut, as originally made at the paper-mill. The maximum number of copies which a machine of this class would print with ten feeding attendants and four taking away attendents would be 8000 an hour. For folding the 8000 printed copies five folding machines and at least two attendants would be required to keep paco with the printing machines. Thus nincteen men were requrred to print and rold 8000 copies per hour with the best nachines as late as 1870. With a rotary machine doing the same or a larger quantity of work only two men aco required. The cost for printing and folding 1000 copies by the Hoe machine was estimated at 1s. Ad., whilo with the rotary it is only abnut $2 d$. Hence the saving of wages to a newspaper issuing 200,000 copies a day on 313 working days would be nearly $£ 3700$ in a year. This, in eonnexion with improvements in papor, or rather the discovery of cheaper materials, bringing the price of "news" down to about 2 d . per Ib -one quarter of its pries a very few years ago-accounts for much of tho enterprise of modern journalism. For somo time after the aholition of the paper duty there mas a loss on the eirculation of a large-sized penuy jourual ; now there is a considerabla gain. Lataly rotary presses for small jobbing work have been eonstructed; and hefora long the rotary prineipla will probably be rendered available for illustrated periodicals ancu tire book-work, printed from webs or reels of paper instead of singla sheets. Great improvements hava also been made in type-founding, and the Roman and Italic founte now used by English printers are equal to those of any country in tha world. It is sometimes said that English éditions de luxe are not equal to those of the French, and that this is owing to the inferiority of the founders. This is, however, not quita true: some of the best Freach books ara printed from English types or from types cut in the English manner. It is also tha ashion to compare modern printed books with those of the Elzevirs
and Baskervillo. Iet as a matter of fact their best faces have been reproduced with perfeet suceess by modern fouaders. From is mechancal point of view the impression given by the best machine presses to-day is undoubtedly superior to that of the hand-presses of the 17 th and 18 th centuries. If modern books suffer in any respeet on comparison with those of former times, which ara 80 highly prized by Libliophiles, it is owing to their want of general artistic cnscmble, and not to auy deficiency in mechanical execution. The artistic taste of Euglish printers has, however, beec greatly raised during the last fow years, and a very interesting movement is going on which must produce important results iu the future. In 1850 Mr Andrew W. Tuer of London organized the Printers' Specimen Exchange, a seheme inteaded to promote the technical education of the working printer. Each contributor to the exchange furnishes periodically o eertain fixed number of typographical specimens, all alike, which are collated into sets, and again distributed to the members, each of whom gets a solume, cousisting of ona copy of the work of each of his follow-contributors. By this plan they become acquainted with tho progress made by their brethren, and good tasto and good work are fostered and mutually encouraged. The eighth quarto volume, issued io 1887 , contains nearly 400 finc specimens of typography by as many differeut liands. It forms also the best criteriou of the character of the jolbbing work done at the present day, not only in England but abroad, for the scheme is of an internatioual eharacter. The resulte of tho revivel in artistie printing during the last decado are espocially noticeable in: jobbing work. Much of this improvement is due to the superior material with which the printer is furnished, and especially to the great variety of oraamental types which hare been introduced. The specimen books of the principal type-founders aro splendit volumes, eontaining several thousand different faees. The best work of German printers is noteworthy for its studied neatness and attractiveness, tasteful and harmonious arrangement of colour and tiut, a characteristic aud conscientious attention to details of finish, exact register, and beaty of impression. American work excels in nriginality of design, brilliancy of colour, and perfect finish. English priuters are closely following the best points of each of these schools of typography. There is a distinct leaning at present to the German style, but with little slavish imitation. The distinctaess of English typography is maintained, while tho beautiful German combination borders, produced with such profusion of late, are judieiously utilized, often in conjunction with American type. In the arrangement of colours English nrinters prefer the quiet harmonious tints of the Germans to the bold striking contrasts of the Awericans.
The vast extent of the operations of the printing fraternity at the preseat day is in remarkable contrast to those of the 15 f century, wheu the making of books was, an art like the sculpture of ctatues or the desiguing of buildings. Now, printing is a manu. facture in which large capital and the greatest division of labour aro essential. The old printers wero almost eatirely iudependent of other craftsmen. From the casting of the type to the mixing of the ink they did nearly everything for themselves. Gradually tho dilferent denartments of the art were constituted separate sod recognized trades. The type-founder was probably the first to secedo flom the concern; then printers delegated to others tho maining of presses; afterwards the ink and the rollers found separate and distinct manufacturers ; and there arose a class of persons who, though belonging to other trades, made pinting appliances a epecialty, such os priuters' gmiths, printers joiucrs, and priuters engineers. Subdivision again has tukea place in regard to tho operations which chiefly appertain to printing. The same rian was formerly able to set up and print ofl the types, to fold tho sheets perhaps, aded even to make them up into books. The operative printer has now becomo either a pressman or a compositop. If he is of the first denomination, he may be elassed according 35 he works at press or maehine. If he is a machinist, he may supera intend or be a "minder," or he may bo a :aycr-on or a taker-olf of the sheets. If he is a miuder, he nay understand only book maehines or only mews machimes; he may know all ahout plateus and littio about cylinders ; or of eylinders he may know only one kind. Entirely novel machines create a new class of artisans. There ara mear perfeetly competent to manago a Whalter press who are ignorant how to work two-colour or fine book-work machines. In the compositor'a departnent division of tabour is carried out to a still minuter depreo. An old-fashioned printer would set upinclitferently a placard, a title-paga, or a book. At the present day we have jobbing hauls, book hands, and news hands, the word "hand" sugresting thu factory-like nature of tha busitiess. There are jobbing bands who confine themselves to posters, and know little about general work aven in this department. Book hands comprise those who set up the titles and thoso who set up the body of the work. Of these latter again, while one man composes, ancthet, the "naker-up," arranges the pages. Even the art of fitting ul the furnitura of "dressing the ehasa" is miven to the "quein-drawer overscer." News hanis ineludo adrertisement hands and trenerail hands. Some mea work by day, sthers altogether by night; somo co generul
book-work composition ; others set up head-liues; others make up the galleys; others "prove" thera.

## Old Style Printing.

(Within the last few years there has been an interesting revival of the old style of book printing. It owes its origin to Mr Whittingham of the Chistrick Fress, who in 1843 was desirous of printing in appropriate type a work of fiction tho diction of which was supposed to be that of the reign of Chazles II. As the original "old faee" matriees of the first Caslon had been preserved, a fount was cast from them, and on getting a proof with grood ink, on good paper, from a modern press the impression was fonnd to be far superior to specimens printed from the original fount. Since ther the demand for old-faced characters has steadily increased, and all founders norr supply imitations of the old types. Comparing the old face and the modern characters, the latter are more regular in size, lining, setting, and colour, -nsing these words in the teehnical sense of the founder; they hare finer strokes and serifs, and produce in the page a more regular and sparkling general effeet, At the same time it may be coneeded that legibility has beea to a certain extent sacrificed to beanty and general effect. Ahout 1882 an emineut French printer made a number of experiments to ascertain what it is that constitutes legibility in type, and found that people read with less fatigue according as the letters-(a) are rounder, (b) are mora equal in thickness, (c) have shorter upstrokes, (d) are dissimilar to each other, and (c) are well proportioned to their own body. Drawings of letters from old books arere visible and legible at a distance at whieh modern letters could not be distinguished. The revival has also brought ahout tho re-introduetion of antique head-pieces and tail-pieecs, vignettes, and initial letters, which have been reproduced from old books by photography and typoctehing. For this kiud of printing whito paper has given placo to toned, of a stravy tint, which is often more agreeable to the eyes than the execssirely blcached paper which was hitherto the fashion. Also hand-made instead of maehine-made paper has to a large extent come into vogue. Its characteristic is the "deckle edge", which distinguishes it from the elean-cut edge of machino papers, and is highly prized by some bibliophiles. When extreme verisimilitude is required, this kind of printing is done on the blank leaves of real old books, some of which have been ruthlessly destroyed for this modern eraze. On the whole, however, the revival of old style printing has been beneficial: it has encouraged printers to stuly the more aristic attributes of the productions of the great printers of the past, and has cducated the public taste by presenting them with examples of the best kind of book-making.

## Priuting Establistiment.

Depart. A large book-printing establishment contains many distinet.dements of partments, some of which have not been previously referred to and : print-rgestab-times ishment. cach furnished with a desk, a couple of sfools, and a shelf for books of reference, and having for its occupants the reader and his reading-boy. There is also the warelionse, where all the printed and umprinted sheets (or "white paper" as it is called, whatever its colour) are stored. Adjacent to this are folding, cutting, hot and eold pressing, drying, and otlier branches, each employing separate classes of artisans. Another department is the machineroom, where, arranged in long rows with an wenue between, aro the varions printing machiues. The men in this part of the estalslishment wear cotton restments, covering all their otker apparel, and caps, invariably made of paper, something like clerical birettas. The machine overseer has his box and keeps an account of the produce of, eaeh machine. Under him are the persons whose business it is to cut out overlays for the cut or illustrated formes. These men are in their way artists, for to them is attributablo much of the beauty and perfection of working of each hlock that goes through their hands. They havo by them three or four prints or "pulls" of the block, and their tools consist of seissors, paste, a sharp krife or two, and perliaps a razor. like blade set in a rooten handle. Their work is to deepen the shadows, raise the lights, lower the edges, and perform a hundred other offices for a block. Standing sentry over each maehine is the machine minder; under hin are the takers-off and layers-on. The engine-roon and boiler-house are close hy, and himher up may be the hand-press-room, -provided these appliances are used. Here are the pressmen and their apprentires. There is the storekeeper's department, fitted up with shelves, saiks, and drawers, for the orderly storage of type and materials. Tue plate-safe or plate-room is the repository of tic stereo and electro plates, each plate being kept wrapped up in paper, with a distinetive index number marked thereon. There are also rooms for easting rollers, stereotyping rooms, drying rooms for paper, hydraulic press ing rooms, sinks for washing formes, and lifts for conveying them
from one departanent to another. There will possibly he sevela 3 composing-rooms, such as the 'stab, where all the men arv paid on established weekly wages, the piece room, where they are paid by results, and the apprentices' room. There may be rooms where particular jobs are doue, especially if reekly periodicale are turned out, and the names of these designate the rooms. At the end of each room is the overseer. It is also a common practice for a number of men to form themselves into a kind of husiness partnership ealled a compantonship or 'ship. All the transsetions of the compositor may be with his own clicker, - the workman who is seleeted to keep the accounts of the partmership? From him the compositor receives his portion of eopy and the neeessary directions, and to him he gives the matter when it is composed, $L$ L the end of the week he "writes his bill," delivers it to tho clicker. and from the latter receives at pay time the rages he has earned. The clicker gets the matter proved or "pulled" by the proofpuller, who usually does nothing else but pull proofs. Ho wilk then send the proof with the copy to the overseer, and the overseer sends it to the reading department to be comected. The proof, when corrected, is retumed through the overseer (rho retains the copy) to the eliekcr, and he gives it to the compositor who set it up: When tho type is corrected a revise is pulled, which goes. througta the same hands to the overseer again; and then it is de spatched to tho anthor, editor, or publisher. In a well-ordered. composing-room striet silence is enjoined upon the rorkmen. Among the industrial pursuits there is none more monotouous and more exacting, none demanding more latience, sustained industry, and power of endurance than the compositor's aft. In a large nemspaper office the quantity of types picked up in a few lours is marvellons. No better illustration of this could be given than the fact that several recent issues of the Times have consisted of three sheets or twenty-four pages, each page comprising six columns. In one of these issues $\delta 4 \frac{5}{5}$ of the 144 columns were filled with adrertisements, 2559 in number, $6 e t$ in extremely small type; the remaining $50 \frac{1}{3}$ columns contained articles, reviews, letters, leports, and paragraplis. The total length of the column aggregate wass 254 fcet ( 62 more than the leight of the London Monument). If the matter comprised io the paper, instead of boing broken up into columas, had been get in one continuous line it would have reached ono mile 950 yards." The number of separato types used in printing. this issue was calculated at over two millions, and the quantity of printed anatter was reckoned to be equivalent to that contained in tro actavo volumes of $4 S 0$ pages each. The literary and mechanical 6taff of a first-rato London daily nerrspaper, exeluding casual row porters and unattached witer's on various subjects; agesregates about 300 persous.
Biblingraphy, -On the practice of the art and its anxiliary proceases, ace SonthWard, Dictionary of Typography (3d ed., London, 1875 , Svo; with the Literart Almanadk by William Blarks), sod Practical Printing: a Findbook of the Ars of Tupography ( 3 d eli., London, 1857,2 vols., 8 vo ). This last is the fullest work on the subject in the Eaglish language, embracing camposition, press work,
stereotyniag, and electlotyping, and the warehouse department of a printing
 short iatrochuction by Sonthivand, glving a sketeh of the origin and progress of the different ty pographical proeesses aud appliances from the lieginning. Sce also F. J. F. Wilson, Tyjographic Printing Alachines ond Machine Printing (sd ed., Loador, 1883 , Svo): Lisi of Tech nical Terms relating to Printing Mfochancry (London, 1882, 8vo); Noble, Mach ine Printing (London, 1833, 8vo) and Principlee and Practice of Colour Frinting (London, 1881, 8 vo ); 8 ar 4 Wilson, Stereotrping and Electrotyping (London, 1880, 8vo). This last contains a history of atereotypiog aud electrotyping by Soutliward. The hest works io French areLefevre, Guide Pratique du Compositcur ct del' 'mpriment (Paris, 1855.i2, 8vo, two parta; ineludes machine work, stereoty pin $\quad$, and electroiypiog); Claye, Jfanued de $l^{\circ}$ Apprenti Compositerur (3d ed., İmo, Paris, 16s3); and Monet, Les Dfach inca et Appareils Typoograyhiques, suiti des Procides d'Impression (Paris, 1S7a, 8vo). The best Germio work, nad one which froin its completeness aupersedes ail others, is Waldow's Illustrierte Encyllopödie der graphischer Künste (Leipsic, 1SS4, lar. 8vo), containing 2798 srevicles and 5 S1 illnstratious, with a list of Gerwaa booka oo typograply, \&e.
Pcriodicals. - No trade or interest in the world has, perlinps, $6 n$ many repreacgtatives io the press as priating. The jourvals which record its progreas and describe its products are norivalled in their excellent meelanical attrior the most luxurious description. Their literary character is usnally worthy of their mechanical excellence and they and sneculations excellence, and they enmprise na immense colleetion of facts and apcculatioos oft the subjecta jnvolved. They also attract a class of writers Who in time beeome specialists and do the most valuabla work in histerica ovestigation. The Printers Registcr (monthly), begut in 1863, the oldest of the Esplish printing trade jouraals, coataios several raiuahle contrilutions by Mr William Blades, the biographer of Caxtyn, 6 eh as "Numismata. Typo. graphiea," "Bibliothees Typographica," "Books and their Enemies," "The Inveotor of the Steam Printing Press," and "Early Type Specimen Dooks." The Paper and Printing Trades Journal (quarterly), begun in 1872, is printe ${ }^{3}$ in old style fashion, and reproluces in tone as twell as in manner some of the hest examples of the French and Italian sehools io lead and tail pieceas rignettes, snd omamental initials. In Franca appear L'Imprimerie (semimonthly) and the Bulletin del'Inprimerie; in Germany, Archiv fir BuchdruckerNunst (monthly) and Journal fir Buchdruckerhunst: io Italy L'Arte della Stampa. The United States bas the Inland I'cinter (Chicago) and tho Americans Lookmaker (New York). The fullest list of such journals, past and present, fe Louis Mohr's Die periodische Fuchpresse der Typographie (Strashurg, 1879). There is also an extended list, nith historical annotationa, in Bigmore and
Wyman's Bibliogrophy of Printing.

Lour at the worth end of a peninsula, which till the time of Alexander's siege was an island. The mole which he coustructed to reach the island city has been widened by doposits of sand, so that the ancient island is now connected with the maialand by a tongue of land a quarter of $\varepsilon$ mile broad. The greatest length of tho former island, from north to south, is about $\frac{5}{8}$ of a mile and its aree about 142 acres, a small surfacie for so important a town. The researches of Renan seem to have completely refuted the once popular ides that a great part of the original island has disappeared by natural conrulsions, though he believes that tho remains of a line of submerged wall at the south cnd indicate that ajout 15 acres more were once reclaimed from the sea and have been again lost. Confined to this uarrow site-on which, noreover, place was found for the great temple of Melkarth with its courts and for all the uccessities of a vast trade, for docks and warehouses, and for the great purple factories which in the Roman time were the chief source of wealth aud made the town an uupleasant place of residence (Strabo, svi. 2, 23 ; Pliny, v. 70)-Tyre was very closely built ; Strabo tells us that the many-storied houses wero lofticr than those of Rome. Iu the Roman period the population overflowed its bounds aud occupied a strip of the opposite mainland, including the ancient Palxtyrus. Pliny gives to the wholo city, contineutal and insular, a compass of 19 Roman miles; but this account must be received with caution. In Strabo's time the island was still the city, and Palatyrus on the mainland wes 30 stadia off, while modern research indicateb an extensive lins of suburbs rather than one mainland city that can be definitely identified with Palætyrus. The ancient history of Tyre has been dealt with in the article Paenicia; the topography is still obscure owing to the paucity of Phcenician remains. The present harbour is certainly the Sidonian port, though it is uot so large as it once was; the other ancient liarbour (the Exyl,tian port) has disappeared, and is supposed ly Renan to have lain on the other side of the island, and to be now absorbed in the isthnus. The most important ruins are those of the cathedral, with its magnificent monolith columns of rosecoloured granite, now prostratc. The present!' building is assigned by De Yogut to the second half of the 1 Ith century, but the columns must be older and may have belonged to the 4th-century church of Paulinus (Luseb, $H$. E., 玉. 4). The water supply of ancient Tyre came from the powerful springs of lias al- Ain on the mainland, one hour south of the city, where there are still remarkable reservoirs, in connexion with which curious revivals of Adonis worship have been observed by Vciney and other travellers. Tyre was still an important city and almost imp regnable fortress under the Arab empire. From 1124 to 1291 it was a stronghold of tho crusaders, and Saladin limself besieged it in vain. After the fall of Acre the Christians deserted the place, which was then destroyed by the Moslems. Tho present town has arisen since the Metâvila occupied the district in 1766.

TYROL, a province of Austria, with the title of "county," lies between $10^{\circ} 10^{\prime}$ and $13^{\circ} \mathrm{E}$. long. and $45^{\circ} 40^{\prime}$ and $47^{\circ}$ $45^{\prime} \mathrm{N}$. lat., and is conterminous on tho north-west with the Austrian province of Vorarlberg, on the north with Bararia, on the east with Salzburg and Carinthia, on the south-east and south-west with Italy, and on the west with Switzerland. The last-named country forms in the lower Engadine an angle penetrating decply into Tyrol. Tho country is entirely mountainous, being traversed by the main chain of the Alps It may bo roughly divided into the valley systems of the Lech and the Inn to the north of the chain and of the Etsch or Adige (Vintschaau) and the upper Drave (Puster valley) to the south (see AIPs). Its area is 10,316 square miles; its population in 1880 wes 805,176 ,
inclusive of military, showing an increase of nearly 4 per cent. since 1869. Of these 432,062 spoke German, 300,975 Italian or some Romance dialect, and the remainder sọme form of Slaronic; 565,468 persons were able to read and write, 56,728 to read only, leaving about $22 \frac{2}{3}$ per cent. of the total population, ineluding children, wholly illiterate. Education is strictly compulsory; but the schools axe for the most part closed during the summer inonths, when all available hands are required in the field* and on the mountain pastures. Agriculture and forestry occupy about two-thirds of the entire population. Every householder owns a piece of cultivable land in the ralley, whild his goats, sheep, or cattle are driven with those of his neighbours to the mountain pastures (Alpen, Almen) which belong to tho commune. Each commune has a president chosen by an elected committee of housuholdcrs. The man selected cannot decline, but is bound to serve his term of office. The tenure of próperty is for the most part of the nature of absolate ownership. In 1880 100,393 persons of both seses were returned as proprietors, 10,283 as tenants. The chief products are milk, butter, and chcese. Of grain-crops maize, which is largely grown in the Inn velley and Vistschgau, holds the first place. Wheat is grown in the lower valleys, barley and ryo in the higher, the latter in favourable spots to a height of over 5000 feet. Potatoes aro found above 6000 feet. In the Etsch valley, or district about Meran and Botzen, red and white wine of excellent quality is produced (in $188 \pm$ about $6,500,000$ gallons). Of late years the cultivation of fruit has much developed, especially in south Tyrol. Silk is also produced (in 18851263 tons of cocoons). Glame is still plentiful in the remoter valleys. In every district there are a certain number of licensed hunters, the principal game being red deer, chamois, hares, blackcock, ptarmigan, \&ec. Mining occupies about one-fifth of the population. At Hall near Innsbruck are important salt works, and at Brixlegg in the same valley copper and lead are smelted. Iron is worked at Fulpmes iu the Stubai valley and at Prad in tho Yintschgau. Zinc is found at the head of the Passerr valley. In the Niddle Ages gold and silver wero found in sufficient quantities to make it worth while to extract them. About 4340 square miles of the country are covered with forest, chiefly pine, fir, and larch, which, horever, is felled in a recklessly wasteful way. The capital of tho county is Inssarece (o.v.).
The general average of comfort in Tyrol is high, and the cost of living is very moderate. 'The peasant and his family aro clothed in etuffe spun and woven at homo, from the wool and flax produced I their own neighbourhoorl. Tho people are for tho most part somowhat reserved in manoer, but courteous and hospitable. Tho sarage fights which used to be a favourite pastinio among the rounger mon are now almost, or quite, a thigg of the past. In amo valleye there is a good deal of musical talent; and companies of Tyrolese aivgers, particularly from the Ziller rallos, travel about all over Germany. The zither is a favourite instrument, especially in the southern valleys; in the northern the guitar is more fre. quent The religion is almost exclusively Fomao Catholic; but in Innsbruck there are some hcodreds of Protestants. The priests belong chiefly to the peasant class, and receive their education at Brixon and tho university of Innsbruck. This contains about 600 otudents in the various faculties and possessen a library of some 60,600 volumes. There is a diet. or landiag, with its seat at lunsbruck, consisting of thirty-four representatives of the peasants, thirteen of the citizens, four of tho prelates, ten of the nehles, three of the chambers of commerco at Ionsbruck, Botzen, and Roveredo, and ooe of the university of lunshruck. To the imperial reichsrath Tyrol sends eighteen members. Tyrol is garrisocied by troops Tecruited exclusively in Tyrol and Vorariberg, and Dever, cxcept in time of war, employed outside these prorincee. Besides this there are the landwehr end the landsturm or militia.

History. -The coustry corresponding to mndern Tyrol first ap. pears ia history when the Khetians were subdued by Drusus and Tiberius. This nation, by some held to have been cognste with the Etruscans, occupied tha valleya from the source of tho Rhine to that of the Drave. To the north of them were the Vindelici, and to the east the Norici ; the former were apparently soperascus.
from then by the ridges north of the Inn, the latter by the watershed between the Etsch and the Drave. Pliny ( $N_{0}$. $H_{0}$, iii. 24) gives the names of all the tribes. After their subjection by Rome These races became Romanized and shared the fortunes of the empire. Their position on and about the roads by which the central Alps are most easily crossed laid them especially open to inroads, and liefore the end of the $3 d$ centnry the Alemanui bad traversed the country. In the course of the next three centuries this people settied in the north western valleys. But the peopling of the greater part of the province by Teutons was effected by the Baiuvarii, who were by the ycar 600 established throughont nearly the entire remainder of German Tyrol, some of the Ronanized Rhætians probably leing left, mixed with a fevr Alemanvic stragglers, iu the upper Vintscligau, while the Lomhards pressed up from the southward and took possession of the district around Trent. The Alemanni and Baiuvarii, governed immediately by their own dukes, owned a kind of allegriance to the kinga of the Franks, and nltimately became in the time of Pippin and Charles incorporated in the Frankish monarchy. The country was then divided for administrative purposes into counties (comilatus, Grafschaflen), under counts, whose rank, at first merely officirl, in course of time became, with their office, liereditary. The most powerful among them appear to have been those of the Vintschgau, where a fertile soil and a climate less rigorous than that of the northern valleya allowed more development of wealth. In the 12th century the counts of Tirol. begin to be conspicuous. This was a small district near Mleran, taking its name from the ancient castle of Tirol, known in the later Roman time as Teriolis. These, in the course of the next century, acquired the lordship over nearly all the territory now contained iu the province of Tyrol south of the main chain of the Alps, besides the adracacy (Schirmvoglei) of the wealthy sees of Brixen and Trent. Meantime the valley of the Ina and those adjoining it had come under the dominion of the counts of Andechs, a Bavarian family, who were also titular counts of Meran. 'i'he last of these died without issno in 1248. His wife's aister, Adelaide, married to Meinbard, count of Görz, was left in sole possession of nearly the whole of the province. Their son Meinhard Il. (1257-1295) was connected with some of the most powerful housea in Germany; and, heing a man of great ability and equal unscrupulousness, he succeeded in acquiring the few ontlying portions. of territory and castles still belonging to the smaller nobles, and thus consolidated 'Iysol within the limits by which it has ever since been bounded. Carinthia and Styria also formed part of hla domains ; but their connexian with Tyrol has never been-other than a personal one. Meinhard 11. was succeedel in turn by his sons Otho and Heary. The latter (1310-1335), a weak and extravagant prince, seema to lave done much towards organizing the government of the country. His elder daughter Miargaret, known in Tyrolese history and legend. as Dic Manultasche, "the Pocket-mouth," the leiricss of his teritories, took as her second husband (in 1342) Louis of Brandenburg. Their son Meinhard 111., who succeeded to the county on his father's death in 1361, died in 1363. Margaret thereupon made orer all her possessions to the lonse of Hapsbnrg, and since that time Tyrol bas formed part of the hereditary dominions of the archdukes of Austria (see A ©strin). The fidelity of the Tyrolese to their connta has for many centuries been proverbial. The Brenser has more than once offered them a secure line of retreat and the mountains a rampart of defence. Maximilian I. (1 193-1519) had nn especial affection for Tyrol. He conferred on the province its present title of Die gofürstecto Graf. schaft; be profted on more than one occasion by the refuge it afforded ; he apent mutch of his time within it ; and at his death he directed that a sumptuous monument to limself shonld be erected in the Franciscans' church at lnusbruck. Tyrol has more than once been the scene of sharp fighting. In 1499 the men of Granbundeu or the Grisons (see SWirzerlavp) invaded the country and defeated the Tyrolese in the neighbourhood of Mals. In 1703 Max Emmanuel, elector of Bavaria, penetrated the upper 1nn valley, but was driven back. During the wars of the French Revolution French and Austrian armies net more than orice within the limita of the province. By the treaty of Pressburg, 1805, the province was transferred to Bavaria. On the renewal of war between Bonaparte and Austria in 1809 the people rose and expelled the Bavarians, and afterwards, under the leadership of Andrew Hofer, an ans, and afterwards, snder the leace of the Passcir valley, repeatedly defeated the Freneh, Bavarian, and Saxon forces. Innsbruck was more than once taken and retaken; and on 12 th August Hofer, after defeating Marshal Lcfebrre, vas installed in the capital as commandant. Sut the illsncessa of the Austrian arms elserliere prevented any support from being sent, and by the treaty of Schön bramn in October the Tyrolese were agaiu giten up to their nevv rulers. Hofer, being captured throngh treachery, was shot at Mantua, 20 th February 1810. On the fall of Bonaparte, Tyrol reverted to the honse of Hapsburg. See A. Jimer, Die Jerfissung Tirols, Innsbruck, 1881-S5: Egger, Die Tiroler und loravherger, luusbruek, 1sis-9; Steub, Drei Sommur in Tirol, Stuttgart, $18: 1$ (eal ed.)
(A. J. B.)

TYRONE, an inland county of Ireland, in the province
of Ulster, is bounded N. and W. by Donegal, N.E. by Londonderry, E. by Lough Neagh and Armagh, and S. by Monaghan and Fermanagh. Jts greatest length from north to sonth is 46 miles and from east to west 60. The total area in 1881 was 806,658 acres or about 1260 square miles. The surface is for the most part billy, rising into mountains towards the north and south, but eastrvards towards Lough Neagh it declines into a level plain. Running along the north-eastern boundary with Londonderry are the ridges of the Sperrin Mountains (Sawell 2236 feet and Meenard 2064 feet). Farther south there are a range of lower hills and Mullaghearn, to the north of Omagh ( 1890 feet). South of Clogher a range of hills ( 1265 feet) forms the boundary between Tyrone and Monaghan. On each side of the Mourne river near Omagh rise the two picturesque hills Bessy Bell and Mary Gray. The Foyle forms a small portion of the western boundary of the county, and receives the Mourne, which flows northward by Omagh and Newtown Stewart. The principal tributaries of the Mourne are the Derg, from Lough Derg, and the Owenkillew, flowing westward from Fir Mountain. The Blackwater, which is navigable by boats to Moy, rises near FiveMile Town, and forms part of the south-eastern boundary of the county with Monaghån and Armagh. With the exception of Lough Neagh, bounding the county on the east, the lakes are small, also few in number. Lough Fea is picturesquely situated in the north-west, and there are several small lakes near Newtown Stewart. The Ulster Canal runs along the southern boundary of the county from Lough Neagh to Caledon. The substratum of the northern mountains is mica slate interspersed with primary limestone. Yellow sandstone appears in the north-west, in the centre towards Omagh, and in the south-west, where it plunges into Fermanagh. The greater portion of the central area of the county is occupied by Old Red Sandstone. The Tyrone coal-field ( 6 miles long by I to 2 broad) extends between Lough Neagh and Dungannon, all the measures being represented. The coal-field is much broken by faults and has been worked chiefly near the surface, and generally in an unskilful manner; the principal pits are near Dungannon and at Coal Island. The coal is bitumincus. There are also indications of copper, iron, and leod.
Agriculture.-The hilly portions of the county are unsuitable for tillage ; but in the lower districts the soil is remarkably fertile, and agriculture is generally practised after improved methods, the county in this respect being in advance of most parts of Ireland. Tho excellent pasturage of the hilly districts afforda sustenance to a large number of young cattle. The total number of holdinga in 1855 was 27,958 , of which 16,469 or nearly two-thirds were each betweei 5 and 30 acres in extent ( 8365 between 5 and 15 and 8104 between 15 and 30 ). Only 43 were above 500 acres; 642 were between 100 and 500 acres, 2373 hetween 50 and 100, 3937 between 30 and 50,2573 hetween 1 and 5 , and 1921 did not exceed 1 acre. There were 237,528 acres under crops, including meadow and clover ( 255,281 acres in 1876), 318,550 acres under grass, 1765 fallow, 9378 woods, 72,071 bog and marsh, 109,539 barren mountaiu land, and 30,112 water, roads, fences, \&c. The area under corn crops decreased between 1876 and 1885 from 115, 738 acrea to 105, 343 ,oats from 114,223 acres to 104,040 , and wheat from 1166 to 1013. The areas nnder the other corn crops are very small and fluctuate considerably. The area uuder green crops between 1876 and 1885 diecreased from 64,971 to 59,387 acres, -potatoes from 44,001 to $40,6+9$, turnipa from 17,157 to 15,581 , mangel wurzel from 750 to 487 , and other green crops from 3063 to 2670 . Flax ( 23,901 acres in 1876) covered 16,364 acres in 1885 !. The area under meadow and clover in 1876 was 50,671 , and in 188556,434 , but there has been no increase since 1878. The number of horses decreased between 1876 and 1885 from 25,088 to 23,185 , of mules from 71 to 49 , of asses from $112 \pm$ to 921 , of cattle from 176,841 to 168,072 , of sheep from 45,274 to 44,434 , and of pigs from 49,012 to 39,530 . On the other hand, the number of goats increased from 7950 to 8984, and of poultry from 674,826 to 737,859 .
According to the latest landowner's Return (1876), the county was divided among 2787 proprietors owning 775,285 acres at a total annual ralue of $£ \pm 26,224$, the average value per acre heing nearl

11s. Ofthe proprietors 1070 owned less than 1 acre each, the total distributed amongst them being 272 acres. The estimated extent of waste land was 4000 acres. The following possessed over 10,000 acres each-duke of Abercorn 47,615 acres, earl of Castlestuart 32,615, earl of Caledon 29,236, commissioners of church temporalities 28,002 , Sir John M. Stewart 27,906, Arthur W. Cole Hamilton 16,683 , representatives of Sir William Mr'Mahon 16,326, Sir William Verner 16,043, earl of Belnore 14,359, Thomas Arthur Hope 13,996, Lord Dorchicster 12,608, Michael Smith 10,968, Lonisa Elizaheth De Bille 10,455, and Thomas R. Browne 10, 125 .

Conmunication.-Besides Lough Neagh and the Ulster Canal, Tyrono has the river Foyle, which is navigable for small craft to a point opposite St Johnstone, and thence by artificial cutting to Strabanc, and the Blackwater, which is navigable for boats to Moy. The Great Northern Railway intersects the county by Dungennon, Pomeroy, Omagh, Newtown Stewart, and Strabane.
Manufactures.-The manufacture of linens and coarso woollens (including blankets) is carried on. Brown earthenwarc, chemicals, whisky, soap, and candles are also made. There are a fem brewerics and distilleries, and several flour and meal mills. But for the lack of enterprise the coal and iron might aid in the development of a considcrable manufacturing industry.

Administration and Popllation.-The county comprises 8 haronies, 46 parishes, and 2164 tomalands. Formerly it returned two members to parliament, the borough of Dungamon also returning ono ; but in 1885 Dnngannon was disfranchised and the county arranged in fonr divisions-east, mid, north, and south - each returning one member. It is in the north-western circuit, and assizes are held at Omagh and quarter-sessions at Clogher, Dungannon, Omagh, and Strabane. There are fourteen petty sessions districts within the county and portions of four otleers. The.county is in the Belfast military district.

From 312,956 in 1841 the population had decreased by 1861 to 238,500 , by 1871 to 215,766 , and by 1881 to 197,719 ( 96,466 males and 101,253 females). In 1881 there were 109, 793 Roman Catholics ( 119,937 in 1871), 44, 256 Protestant Episcopalians (49,201 in 1871), 38,564 Presbyterians (42,156 in 1871), 3597 Methodists ( 3115 in 1871), and 1509 of other denominations (1357 in 1871). The number of persons in the county who could read and write in 1881 was 98,764 , who could read only 38,783 , the remainder $(60,172)$ being wholly illiterate. Twenty-two persons could speak Irish only and 9796 lrish and English. For the sepen years ending 1885 the average number of emigrants annually was 3085 . The nopulation of the principal towns in 1881 was-Strabane 4196, Omagh (the county town) 4138, Dungannon 4084, and Cookstown 3870.

History and Antiquities. - Auciently Tyrone was included in the portion of Ulstcr made "sword-land" hy the Scots. It became a principality of one of the sons of Niall of the Nine Hostages, and from his name-Eogain-was called Tir Eogain, gradually altered to Tyrone. From Eogain were descended the O'Neals or O'Neills and their numerous septs. The family had thcir chief seat at Dunrannon until the reign of Elizaboth, when it was burned by Hugh O'Neill to prevent it falling into the hands of Lord Mountjoy. The earldom of Tyrone had been conferred on Con Bacagh O' Neill hy Henry VIlI., but he was driven into the Pale by one of his sons Shan, who with the general consent of the people wirs then proclaimed chief. From this time he maintained a contest with English anthority, but his last remaining forces were completely defeated near the river Foyle in May 1567. During the insurrection of 1641 Charlemont Fort aud Dungannon were captured by Sir Phelim O'Neill, and in 1645 the Parliamentary forces under General Munro were signally defeated by Oweu Roe O'Ncill at Benburb. At the Revolution the county was for a long time in the possession of the forces of James II. Dungannon was the scene of the famous volunteer convention in 1782. Raths are scattered over every district of the county. There is a large cromiech near Newtown Stewart, another at Tarmlaght near Coagh, and another a mile above Castlederg. At Kilmeillie near Dungannon are two circles of stones. The mionastic remains are of comparatively little interest. There are still some ruins of the ancient castle of the O'Neills, near Benburb, and among other ruined old castles mention may be made of those of Newtern Stewart, Dungannon, Strabane, and Ballygawley.

TYliTNUS, Greek elegiac poet, lived at Sparta about the middle of the 7 th century B.C. . According to the legend current in later times, be wás a native of the Attic deme of Anhidnæ, and was invited to Sparta, on the suggestion of the Delphic oracle, to assist the Spartans in the Second Messenian War. It is difficult, if not impossible, to determine the element of truth in this story. Herodatus at least either did not know, or disbelieved, the tradition, which meets us first in Plato (Laws, i. 629A), to the effect that, although Tyrtæus was by birth an Athenian. he had the Spartan citizenship conferred upon
him (see Herod., ix. 35). From Plato down to Pausanias we can trace the gradual growth and expansion of the legend. Ephorus is the first to call Tyrtaus a lame poet; by later generations he is represented as a lame schoolmaster. Basing his inference on the gromed that Tyrtæus speaks of bimself as a citizen of Sparta ( $F r .2 \mathrm{v} .3$ ), Strabo (viii. 4, 10) was inclined to reject tho story of his Athenian origin, regarding the elegics in question as spurious. On the whole, perhaps, the conjecture of Busolt (Gr. Gesch., P. 166) comes nearest to the truth: the entire legend may well have been concocted during the 5 ih century in connexion with the expedition sent to the assistance of Sparta in lier struggle with the revolted Melots at Ithome. It is possible, as Busolt suggests, tlat Tyrtrus was in reality a native of Aphidna in Laconia. "However this may be, it is certain from the fragments of his poems that he flourished during the Second Messenian War (eirc. 650 B.c.) - a period of remarkable musical and poetical activity at Sparta (sce Terpander) - that he not only wrote poetry but took part in the actual service of the field, and that he endeavoured to compose the internal dissensions of Suarta by inspiring the citizens with a patriotic love for their fatherland and its institutions.

We possess in all about twelve fragments of Tyrtaus's poetry, varying in length from one to forty-four lines. They are preserved by Strabo, Lycurgus, Stobæus, and others. We may divide them into two varieties, according to the metre and dialect in which they are composed. The first class consists of elegies in the Ionic dialect, written partly in praise of the Spartan constitution and King Theopompus (Eivopia), partly to stimulate the Spartan soldiers to deeds of heroism in the field ${ }^{\text {' }}$ ' $\pi о$ 伊каь -the title is, however, later than Tyrtaus). "The interest of the fragments preserved from the Evivopia is mainly historical: they form our only trustworthy authority for the events of the First Messenian War (Fr. 5, 6, 7). The 'Yтоө̂̀кає possess considerable poetic merit, in spite of the occasional monotony of their versification. Addressed to a nation of warriors, they laint in vivid colours the beauty of bravery and the shame of cowardice; there are also lines in them which reveal the soldier as well as the poct, e.g., $F^{F r}, 10,31-32$. One striking fature is the genuinely Greek feeling for plastic beauty, showing itself in the beautiful picture of the youthful form lying dead upon the battle-field (Fr. 10, 27-30, and 12, 23-34; see also Symonds's Greet Poets, i. p. 74). The popularity of these elegies in the Spartan army was such that, according to Atheneus (xiv. 630 F ), it became the custom for the soldiers to sing them round the camp fires at night, the polemarch rewarding the best singer with a picce of flesh. Of the second class of Tyrtæus's poems, marching songs, written in the anapæstic measure and the Dorian dialect, the remains are too scanty to allow of our pronouncing a judg. ment on their poetic merit.
See Bergk, Focta: Lyrici Grreci, Vol. ii. 1p. 8-22, Leipsic, 1882.
 English rerse by Campbell.

TYTLER. The surname of thre Scottish_writers, principally on historical subjects.

1. Alexander Fraser Tytler (1747-1813), Lord Woodhonselee, Scottish judge, was the eldest son of William Tytler (see below), and was born at Erlinburgh on 15th October 1747: After passing through the High School, he was sent in 1763 to a school at Kensington taughet by Dr Elphinston, the translator of Martial's Epigrams. Ile returned to Edinburgh in 1735 , skilled in Latin verification, and with a comrietent linowledge of Italian, and a taste for drawing and natural history Se was called to the bar in 1770. His first work, a supplement to the Dictionary ${ }^{\circ}$ Derisions, undertaken on the suggestion $u^{f}$

Lord Kames, was published in 7778, and a continuation appeared in 1796. In 1780 Tytler was appointed conjoint professor of universal listory in the university of Edinburgh, becoming sole proiessor in 1786. In 1782 he published Outlines of his course of lectures, afterwards extended and.republished under the title of Elements of Gicheral fistory. The Elements has passed through many editions, and has been translated into several European languages as well as into Hindustani. The lectures themselves were published in IS34 in Murray's Family Lilrary. In 1790 Tytler was appointed judge-advocate of Scotland, and while holding this office he wrote a Treatise on the Lavo of Courts-Martial. In 1801 he was raised to the bench, taking his seat (1802) in the court of session as Lord Woodhouselee. He died at Edinburgh on 5th January 1813.

Besides the works already mentioned, he was the author of soveral papers in the Wirror, the Lounger, and the Trensactions of the Rowal Society of Edinburgh; he also wrote Life and IVrilings of Dr Joluns Gregory; Essay on the Principles of Tianslation, 1700; a dissertation on Final Causes, prefixed to his edition of Derlam's PhysicoTheology, 1799; a political pamphlet extitled Ircland profiting by Example, 1799 ; an Essay on Laura and Petrarch ; and The Lifo and Writings of Henry Home, Lord Ǩancs, 1807.
2. Patrick Fraser Tytler (1591-1849), as the son of Lord Woodhouselee and grandson of William Tytler, may be said to have inherited a taste for literary and historical pursuits. He was born at Edimburgh on 30th August 1791, and was educated chiefly at the High School and university, being called to the bar in 1813. His earliest literary effort appears to have been a chapter or tro contributed to Alison's Travels in France (1815) ; and his first independent essays were papers in Blackwool's Magazine. Inheriting the family talent for music, and with a facility in throwing off humorous little poems and songs, he made several contributions to Thomson's SelectMelodies of Scotland, 1821. In 1819 he published the Life of James Crichton of Cluny, commonly called the Admirable Crickton, a second edition appearing in 1823. This was followed by a Memoir of Sir Thonas Craig of Riccarton, 1823; an Essay on the Revival of Greek Literature in Italy, and a Life of John Wickliff, published anonymously, in 1826. The History of Scolland was undertaken at the suggestion of Sir Walter Scott, and occupied Tytler for nearly twenty years, in the course of which he remored to London for convenience of research. The first volume appeared in 1828, and the ninth and last in 1843. The original investigations on which the work was founded gave it an authority which no previous history of Scotland possessed, and the clear and graphic style made it interesting and popular. The last fer years of his life were spent in physical prostration and mental depression, and he died at Great Malvern on 24th December 1849.

During the progress of his History a large amount of other work camo from his pen, as tho following list shows:-Lires of Scoltish Worthies, for Mfurray's Family Library, 3 rols., 1831.33; Historical Tiew of the Progress of Discovery in America, 1832, and Life of Sir Waller Rabsigh, 1833, for the Edinburgh Cabinct Library; Lifc of Henry VIII., 1837 ; England under the Reigns of Edward VI. and Mary, from original letters, 2 vols., 1839 ; articie "Scotland" in the seventh edition of the Encyclopsdia. Eritannica (afterwards published separately as a school history) ; Notes on The Darmzey Sewel, 1843; on the Portrails of Mary Qucen of Scots, 1845 (privately printed) ; and Memoirs of the War carricd on in Scoltand and Ireland, 1689-91, by General Mrachay, edited in conjunction with Hog and Urquhart, and presented to the Bannatyne and Maitland Cluhs in 1833.
3. Willian Tytler (1711-1792), of Woodhouselee, writer on historical and antiquarian subjects, was the son of Alexander Tytler, writer in Edinburgh, and was born in that city on 12 th October 1711. He was educated at the High School and the university, and, having adopted his father's profession, was in 1744 admitted into the society of Writers to the Signet. While successfully practising as a lawyer, he found time to devote attention to historical
investigation. In 1759 he published an Inquiry, Ifistorical and Critical, into the Evidence against Mary Queen of Scots, and an Examination of the IHistories of Dr Hohertson and Mtr IIume with respect to that Evidence. Tlhis work, which warmly defended the character of the queen, mot with great success. Four editions, the later ones considerably eularged, were published in the author's lifctime; and it was translated into French. In 1783 be publishol the Poetical Rencrins of Jumes the First, King of Scotland, to which he added a dissertation on the life and writings of the royal author. He wrote an cssay on "Scottish Music," which was appended to Arnot's IIistory of Edinburyh. His "Dissertation on the Marriage of Queen Nary to the Earl of Totliwell." and "Observations on the Vision, a. Poem," appeared in the Transactions of the Sorizty of Antiquaries of srollend (1791-92). A paper in the Lo unger, on "Defects of Modern Female Education," and an Account of Fashionalle Amusements in Edinburgh in the Screnteenth Century complete the list of his works. He died at Edinburgh on 12 th September 1792.

TYUMEN, a district town of West Siberia, in the government of Tobolsk, is situated at a point where the chief highway from Tussia across the Urals touches the first navigable river (the Tura) of Siberia. A railway passing through Ekaterinburg and the principal ironworks on the eastern slopes of the middle Urals connects Tyumeñ with Perm, the terminus of steamboat trafie on the Kama and Volga. The Tura being a tributary of the Tobol, which joins the Irtish, a tributary of the Ob , Tyumeñ has regular stearn communication with Omsk and Semipalatinsk by the Irtish (steamors penetrating as far as Lake Zaisan in Inzungaria); with Tomsk, Barmaut, and Biysk, in the Altai, by the Ob and the Tom; with Irbit--the seat of the great Siberian fair-by the Tura and the Nitsa; and by the Tobol, the Irtish, and the Ob with the Arctic Ocean and the fisheries of the lower Ob. Tyumeñ stands also at the western extremity of the Siberian highway which goes via Omsk, Tomsk, and Krasnoyarsk to Irkutsk. In summer the Tura sometines falls so low that steamers have to stop 90 miles off, passengers and goods being taken thence to Tyumeñ in lighter rcssels. The tomn is well built, and stands on both banks of the Tura, which is here spanned by a bridge. The portion on the low left bank is inhahited by the poorest class and is often inundated; the best houses are on the high right bank. Thestrccts are unpaved, but the houses (pincipally wooden) are for the most part inclosed by gardens. The people, who are famed throughout Siberi? for their good looks, have always been renowned for their industrial skill. Woollen cloth, linen, belts, and especially boots and glores, are manufacturcd to a large amount ( 70,000 pairs of boots and 300,000 pairs of gloves annually). Tyumeñ carpets, although made in the simplest way and with the plainest tools, have a wide renown in Russia and Siberia, and recently have appeared in the markets of western Europe as of Oriental origin. All kinds of metal wares are made in small workshops. Sheepskins and various kinds of cloth are extensirely manufactured, and the leather prepared at the tanneries ( 100 in number) is extensively sold all orer Siberia, the Kirghiz steppe, and Bobbara. An establishment has recently been opened for the construction of barges, and a paper-mill, the first in Siberia, was opened in 15S6. The trade of Tyumeñ is exceeded only by that of Irkutsk and of Tomsk. In addition to its primary schools Tyumcñ has a "real" school. Tho population, which is of a fluctuating character in summer, is differently estimated at $13,000,14,500$, and 18,000 .

TZARSkoye selo. See Tsarskoye Selo.
TZETZES, Joannes, a voluminous Byzantine mater̄ ol the 12 th century. See Greece, vol. xi. p. 145 sq .

Uholds the trenty-first place in our alphabet. The corresponding place in the Greek alphabets was occupied $\mathrm{by}^{\mathrm{Y}} \mathrm{Y}$ (with some slight wariations of form). The form in the Italian alphabets was generally V. These three are only modifications of one original ; but they are independent symbols wiť us, though $Y$ does not represent auy sound otherwise unrepresented. It will bo nost con. venient to describe the three forms once for all.

With T we reach the end of the original Phoenician alphabet. The remaining symbols-no fewer than six with us, four in the completed Latin alphabet-are accretions, either modifications of old symbols for greater exactuess or old symbols themselses which had fallen out of their proper place and were added again. The first new symbol was needed to represent the important rowel sound $u$. We hase already seen that the Grecks cmployed the Phœenician syinbols for the breaths which they did not want as symbols for the vowels which they did want. Thus we should have expected that the Phoenician vau mould havo been used for $u$. Sut vau was already enployed for $v$, which was a living sound in early Greek; the form used was $F$ (the su.called digamma), the origin of our F . What then was the origin of the symbol for $u$ ? In the earliest Greek we find the two forms $Y$ and $V$, e.g., in inscriptions of Thera. Now the Moabite form of rau is $Y$, which resembles the Y more than F. It is difficult to see why the presumably oldest Phoenician fornı should appear, not in tho sixth place of the Greek alphabet, hut at the end, whero it must have been an arbitrary addition; and, although the $Y$ form could be derived from $F$ (middle steps are found), it is not easy to get $F$ from $Y$. We may suppose that the two symbols, $F$ and $Y$, were obtained by the Greeks from independent Phœenician alphabets, the first being kept by those Greeks who required a symbol for $v$, and did not at first need any special sign to distinguish $u$ (which in the earliest Greek times'knom'n to us had the value of German ii) from 0; while the others took the form $Y$ to express the modified $u$, and probably never really adopted the $F$; except as a numeral ; it does not appear eren in the very old Abu Simbel inscription written by the Ionian mercenaries of Psammitichus. It is noteriorthy that in that inscription doth the forms $Y$ and $V$ appear, whereas in those of Thera and Melos we hare sometimes the one sometimes the other, but not both in the same inscription, and a study of the writing leads to the conclusion that the $Y$ was felt to be the true (i.e., the older) form, but that $V$ was used more frequently for the sake of simplicity.

At Rome the siugle form V denoted both the vorvel $u$ and also the consonantal w. Fretained its place as sixth in the alphabet, but with the value of $f$, which was unknown to the Greeks; a peculiar form, C , in which the middle stroke has gone to the bottom, scems to have been affected by its neighbour $E$; this is found in Etruscan, Umbrian, and Samnite inscriptions; it has, however, the value of $w$; while a curious symbol 8 appears at the cod of the Etruscan alphabet, and is also used in the Eugubine tables, with the value of $f$; the origin of this is uncertain. It may be a rounded form of the second symbol in the digraph FB. (i.e., FH) by which the sound F is indicated in a very old inscription (see Rhein. Mus., xlii. 317) ; if this is so, the Latin alphabet has the first member of the digraph, the Etruscan has the serond. Next, the symbol $Y$ was added (together with $Z$ ) in the lst century p.c. to represent more exactly, in borrowed words, the sound of Greek upsilon.

Lastly, the form $U$ was differentiated from $V$. It is the uncial form, and so belongs to the general transition from the pointed to the rounded character which conduced to greater convenience of writing. Examples of it may be seen in the article on Paleugraphy; see the specimen of Latin uncial of the 5 th or 6 th century (vol. xviii. p. 153), and the half-uncial of the Lindisfarno Gospels, about 700 A.D. (ibid., ]. 159). It was clearly a matter of conrenience to have separate symbols to represent sounds so distinct as $u$ and $v$; but the application of the two symbols seems to have been due to chance rather than design. The form $V$ remained in use at the beginning of words, whereas $u$, which was the uncial and cursive form, naturally was used rather in the middle; by degrees the initial form was appropriated to consonants,-perhaps, as Dr Taylor suggests (Alphabet, ii. 189), because the consonant is commoner at the beginning of words, or for some other reason, while the medial form was conuected with rowels.

The sound which U denotes is produced by "rounding" the lips to the furthest extent cousistent with a clear vowel-sound, and by raising the back of the tongue higher than for any other rounded sound. It has two rarieties (like all other vowels) according as the position of the tongue is more or less tense, producing therehy a narrower or a wider aperture for the voice to pass through; whence the sounds are technically called "narrors" and "wide" respectively. The narrow sound is lheard in English only when the rowel is long, as in "book," "rule," but in northern English (Scotch) "book" may be heard short. The wide sound is heard in "full," "good." The digraph 00 is commonly used for the $u$ sound, and attests the fact that the original sound of $\bar{o}$ has frequently pessed into $\bar{u}$, as in "good," "food," \&c., written "gode," "fode" in Middl English ; sometimes, however, the co kas come by analogy into words where $\bar{z}$ is the original sound, as in "room," M.E, "roum," O.E. "rūn." Original ū has connmonly passed into the au sound, spelt in English on or our, as in "how," "house," "mouse," "bower," for O.E. "hū," "hūs," "mûs," "būr." According to Mr A. J. Ellis, words derived from the French lad in Chaucer's time the sound of French u; and Sir Joln Cheke's statement "cum duke, tuke, lute, rebake, $\delta \geq к$, тwк, $\lambda u t, ~ \rho є \beta u \kappa$ dicimus, Gracum v sonaremus," seems stronge for the same practice in the 16 th century. In the 17 th century the modern pronunciation of $u$ as ir in "muse," "duke," "mute," "pure" had come in. Hence also we may explain the substitution of $u$ for $y$ in some genuine English words, as "busy" (orig. bysig). At the same time begins the corruption of $u$ to the (sa-called) $\check{r}$ sound in "but," "sluut," $d \cdot \mathrm{c}$.; this is not a $u$ sound at all, but the neutral vowel as lieard indifferently in "but," "sun," "son," "blood"; it is often confounded by writers with the true 26 heard in "pull" and in the northera pronunciation of "but," "sliut." For the history of the German "modified" $u$ (spelt $"$, but originally ue) see under $I$.

UBEDA, a town of Spain, head of an administrative sublivision in the province of Jaen, stands on a gentle slope about 5 miles from the right bank of the Guadal. quivir, and about 22 miles to the cast of the Menjibar station on the railway from Madrid to Cordova. Unde the Moorish rule it was a place of considerable consequence, its population being said to have at one time numbered 70,000 . Some portions of the old walls, with towers and gates, still remain, but none of the public buildings are of sereat gge, the oldest charch, that of San.

Salsador, dating from $1510-56$. The population within the municipal boundaries in 1877 was 18,149

UDATPUR [Oodeypore], or Mewár, a native state in Rajputana, India, with an area of 12,670 square miles. It extends from $23^{\circ} 49^{\prime}$ to $25^{\circ} 58^{\prime} \mathrm{N}$. lat., and from $73^{\circ} 7^{\prime}$ to $75^{\circ} 52^{\prime}$ E. long., and is bounded on the N. by the British territory of Ajmere; on the E. by the native states of Bundi, Gwalior, Tonk, and Partt́bgarh; on the S. by Banswára, Dungarpur, and Mahi Kantha; and on the WV. by the Araralli Mountains, separating it from Marwar and Sirohi. The greater part of the country is level plain. A section of the Aravalli Mountains extends over the sonthwestern and southern portions, and is rich in minezals, but the mines have been long closed. The general inclination of the country is from south-west to north-east, the Banas and its numerous feeders flowing from the base of the Aravalli range. There are many lakes and tanks in the state, the finest of which is the Dhebar or Jaisamand, with an area of nearly 21 square miles; it is considered to be the largest sheet of artificial water in the world. There are only two metal roads in the state; the Nimach State Railway passes through the north-eastern part

In 1881 the population, exclusive of 51,076 Bhils, was $1,443,144$ (males 772,685 , fenaies 670,459 ); Hind is numbered $1,321,521$, Mohammedans 43,322 , Jains $\overline{78}, 171$, and Christians 130. The only torn with over 10,000 inha litants is Udaipur, the canital $(38,214)$. This city is picturesquely situated ou a lake 2000 fect above sealevel, and faces wooded liills. It contains the royal palace, whicl is a noble pile of granite and marble, built on the crest of a rocky ridge overlooking the lake, city, and valley. There are no manufactures of any importance in the state, and the crops as a rule only snffice for local wants. The principal iuports are salt, piece goods, groceries, metals, medicines, sngrar, ivory, and tobacco ; and the exports erg mostly confined to turmeric, gir, cotton, indigo, til, onium, and cattle. The total income of Udaipur in 1885-86 was $\pm 259,624$. The state was taken under the protection of the British Fovernment in 1817, and it pays an annnal tribute of $£ 20,000$. The fannily of the raja of Udaipur ranks highest in dignity among the Rajput cliefs of india.

UDAL (Danish odel) is a kind of right still existing in Orkney and Shetland, and supposed to be a relic of the old allodial mode of landholding existing antecedently to the growth of feudalism in Scotland. The udal tenant holds without charter by uninterrupted possession on payment to the crown, the kirk, or a grantee from the crowa of a tribute called scat (Danish skiat), or without such payment, the latter right being more strictly the udal right. Udal lands descend to all the children equally. They are convertible into feus at the option of the udallers.

UDALL, Nicholas (b. $1505-\mathrm{d} .1556^{1}$ ), author of the carliest extant regular English comedy. Udall was a typical man of the Renaissance in England, a schoolmaster by profession, a classical scholar, a translator of Terence anci Erasmus, and a writer of pageants and iuterludes. He was ligh in favour at court, wrote terses for the city pageant exhibited at Anne Boleyn's coronation in 1533, and was honoured by Mary in 1554 as one that had "heretofore showed and mindeth hereafter to show his diligence in setting forth of dialogues and interludes before is for our regal disport and recreation." The severity of Lis discipline at Eton, where he was headmaster, has been immortalized by the quaint lines of one of his pupils, Thomas Tusser. The exact history of the production of his comedy Ralphr Royster Doyster is not known. A printed cony wanting the title-page came to light in 1818, and we know that it was licensed to be printed in 1566. It is a distinct advance in construction on the Merry Interludes of John Heywood, but it is not a comedy in the strict English sense, being, like the interludes, essentially farcical

[^297]in motive, character, and meldent. Although an initation of the Latin comedy, it is far from being a servile initation, aud abounds in fresh fun and cleverness. It has been twice reprinted, -by the Shakespeare Society (with a memoir by Mr Cooper) and in Arber's Reprints.

UDINE, a tomn of Italy, in the province of Udine, in a wide plain near the foot of the Carnic Alps, ou the Roja, 84 miles by rail nortl1-east from Venice and 40 miles north-west from Trieste. It is enclosed by an imposing wall of considerable antiquity, some 4 or 5 miles in circumference, and fortified with towers. In the centre, on an eminence, stands the old castle, at one time the residence of the patriarchs of Aquileia, and now used as a prison. Grouped around this is the old part of the town, with narrow crooked streets, some of which are lined with arcades. The cathedral, which is a Romanesque building with fine pillars, and an hexagonal tower bearing 14 th-century sculptures, contains some interesting examples of native art (by Giovanni Martini da Udine and others). The clurch of S. Maria della Purita has frescos by Tiepolo. On the principal square stands the town-hall, built in 1457 in the Venetian-Gothic style, and skilfully restored since a fire in 1876 ; opposite is a clock tower resembling that of the Piazza di San Marco at Venice. The archiepiscopal palace and Musco Civico, as well as the municipal buildings, have some valuable paintings. Several of the palaces of the nobility lave striking architectural features, and the town is adorned by many beautifnl public walks. The leading industry of Udine is silk-spinning, but it also possesses manufactures of linen, cotton, hats, and paper, tanneries, and sugar refineries, and has a considerable trade." The population in 1881 was $23,254$.
Uline is the Vcrioum of Pliny: it was then a muncipinm, but quite an inconsiderable place compared with Forum Julii (Cividale) 11 miles to the cast, or Aquileia 22 miles to south -sonth-east. In the Middle Ages it became a flourishing and populons city; in 1238 the patriarch Berthold mado it the capital of Friuli (q.v.), and in 1420 it became Venetian.

UEBERWEG, Friedrich (1826-1871), best known by his History of Philosophy, was born on the 22d January 1826 at Leichlingen, in Rhenish Prussia, where his father was Lutheran pastor. His mother, left carly a widow, devoted her scanty means to the education of her only son. Ueberweg passed throngh the gymnasium at Elberfeld, and studied at the universities of Göttingen and Berlin. In 1852 he qualified himself at Bonn as privatdocent in plilosophy. His System of Lorfic, published in 1857 (English translation 1871), and his essay On the Authenticity and the Order of the Platonic Mritings, crowned by the Imperial Acadeny of Vienna (published 1861 ), contributed to draw attention to him as at once a scholar and a thinker. In 1862 be was called to Königsberg as extra! ordinary professor, and in 1867 he was advanced to the ordinary grade: He married in 1863, and on the 9th June 1871 he died prematurely.
The chief work of his later years was his compendions History of Philosophy, which is mumatehed for fulness of information combined with conciseness, accuracy, and impaitiality of treatment. The first part appearel in 1862. An Englisl translation, in twe volumes, was published in 1872 , and las gone throngh sereral rlitions. Ueberweg translated, in 1869, Perkcley's Principles of Humar Krovileclge, with notes, for Kirchmann's Philosophische Bibliothek. In philosophy Ueberwer was strongly opposed to the subjectivistic tendency of the Kantian system, maintaining in particular the objectirity of space and time, wbich involverl him in a somewhat violent controversy with sereral opponents. His own mode of thonght he preferred to describe as an ideal renlism, which refused to reduce. Ieality to thought, but asserted a parallelisin between the forms of existence and the forms of knowledge. Beneke anil Schleiermacher seem to liavo exercised most influence upon the development of lis thonght. A short momoir, by his friend F. A. Lange (unthor of the History of Afatcrialism), gives some account of what may be called personal opinions in philosophy and theology, which did not find expression in Ueberweg's publishec writings.

UFA, a government of south-eastern Russia, on the western slope of the Urals, has Vyatka and Perm on the N., Orenburg on the E. and S., Samara and Kazañ on the W., aod comprises an area of 47,112 square miles. In virtue alike of its physical characters and of its population, Which belongs chiefly to the Ural-Altaic stock, it forms an intermediate link between Europe and Asia, and it was only recently separated from the governwent of Orenburg, which is now limited to the eastern slopes of the Urals. Several craggy and densely wooded ridges, running from south-west to north-east parallel to the main chain of the southern Urals, occupy its eastern part. They aro separated by broad and long longitudinal ralleys, and riso to altitudes of from 2500 to 3500 feet above the sea; their lighest peaks-Iremrel ( 5040 feet), Nurgush, Urenga, and Taganai ( 3950 feet) -are above the limits of tree-vegetation, but in no case reach those of perpetual snow. The high longitudinal valleys of the Urals are the seat of an important mining industry. Southward Ufa extends over the slopes of the Obshchiy Syrt plateau, the angular space hetween the latter and the Urals being occupied by elevated plains (from 1000 to 1500 feet), deeply grooved by the river valleys and sometimes described as the "Ufa plateau." It slopes gently towards the depression of the Kama; and its undulating surface, especially its broad valleys (500 to 600 feet abovo the sea), corered as they are with a fertile soil, rire being rapidly colonized by Russiau settlers. Towards the Kama the fertility of the soil increases, and the blackearth regions of Meazelinsk and Birsk may be described as granaries for that part of Russia.
The geological structure or Ufa is very varted. The main ridge of the Urals consists of gneisses and various crystalline slates resting upon granites andsyenites ; next comes a broad strip of limestones and saudstumes, the fossil fauna of which is intermediate in its lowest parts between the Upper Silurian and the Lower Devodian. These form the highest ridges of Ufa. Farther west the Devonian deposits are followed by Lower and Upper Carbonifereus and "Artinsk schists," which, together with Yermian de. posits, cover western Ulia. Quatcrnary deposits are extensively developed in all tho valleys, most of which were occupied by lakes during the Lacustrine period. Ufa has not tho mineral resources of Perm; only traces of gold have been found in its valleys, and silver ores aro absent; but its wealth in iren (Devoniais) and copper (Permian) seems likcly to lave great mining importance in the future. The district of Ztatoust is celebrated for its granite, epidote, nephrite, and a variety of decorative stones and minerals. Conl is spread over a wide area, but only in layers too thin to make workiag remnnerative. Fire-elay, kaolin, and sandstone for making grindstones are obtained to some extent; naphtha, sulphor, and saltpetre have been observed in several places.
Ufa belongs almost entirely to the drainage area of the Byctaya, a. great tributary of the Kama, which rises in Orenburg, fows south aud west till it pierces a moustain chain at Bugutchan, and then runs nerth and north-west, watering the high plains and receiving a number of important tributaries, among which the Sim, the Tanyp, and the Ufa are also navigable. The banks of the Bychaya are thickly peopled, and it is an important channel for trade ; but it sometimes reaches so low an elbb in summer that steamers cannot proceed beyoud Birsk. The Kama flows for 120 miles along the western border of the government. Marshes lie aleng its course, so that its banks aro but thinly inhabited. Forests cover nearly half the area, but the plains on the left of the Byetaya are comparatively thinly wooded. The climate of Ufa is very continental. The average temperature at Ufa is $37^{\circ} \mathrm{F}$., and the winter is extremely cold (January $5^{\circ} \cdot 5 \mathrm{~F}$., July $63^{\circ} \mathrm{F}$.); at the Ztatoust observatory ( 1340 feet ) the average temperature is oaly $32^{\circ} \cdot 2$ (January $2^{\circ}$; July $61^{\circ} 8$ ). Even in the hilly tracts of Ztatoust the annual rainfall is ouly 19 inches. The rivers are frozen 158 days at Ufa, and 202 about Ztatoust.
The population of Ufa is now rapidly increasing ( $1,793,260$ in 1882, as egainst $1,291,020$ in 1865). Only one-third of the whole is Russian, the remainder leing chielly Bashkirs ( 50 per cent., including Mescheriaks and Tepters), Tartars ( 8.4 per cent.), Teheremisses, Tchuvashes, Mordvinians, and Yotiaks. In the sonth the Basbkirs, Tartars, and other Ural-Altaians constitute two-thirds of the population. Among the Russians two distinct elements mnst be distinguished,-some 100,000 peasants, who formerly were miaing serfs, and now support themselves chiefly by work in or for thio mines, and nearly 620,000 agriculturists, for the most part more recent immigrants. The latter carry on agriculture on an extensive
scale, and export large quantities of coru. The Bashkirs are chiefly eattle-breeders, but of late they have been driven more ond more to tillage, owing to the appropiation by speculators of their extensive pasture-lands. Bec-keeping is largely carried on, and bunting is still an important sonrce of iucome to the Bashikirs. In the north-cast the trado in timber and the manufacture of various wooden wares are largely engaged in ly the peasantry. The mining industry is advancing, notwithstanding many obstacles (see rol. xxi. p. 85); the iron-works of Ztatoust esjecially have a wide reputation. Flour-nills, distilleries, and tamneries come next in importance. The exporis of corn, linseed, timber, wooden wares, metals, tallorr, hides, and cattle are considerable, and trade is active, especially at the fairs of Menzelinsk, Ufa, and Zratoust.
There are six administrative districts, the chief towns of which (with populations in 1884) are-Ufa (25,660), Belebci (4200), Birsk ( 8000 ), Menzelinsk ( 6100 ), Sterlitamak ( 8940 ), and Ztatoust ( 18,990 ). The loading places Teletny and Berozovka on the Kama, and several iron and copper works (Satkinsk, Vurezan, Katav-Iranovsk, about 6000 inhabitauts each) onght also to be mentioved.

UFA, capital of the above government, is situated at the confluence of the Ufa with the Byetaya, on high crags intersected by ravines, which are covered with gardens and orchards. The better part of the town containo a few stone buildings counected with the administration, two cathedrals, and a few churcbes; the remainder is a scattered aggregation of small wooden houses. There are two classical gymnasiums for boys and girls, a theological seminary, and several lower schools. The town has a few good hospitals. The manufactures are insignificant in Ufa itself, but there are several iron and copper works of importance within the district. Owing to the fertility of the neighbouring regions, and the position of the town at the junction of two important rivers, the Ufa merchants carry on a brisk export trade. The population has rapidly increased of late, reaching 25,660 in 1884.
Ufa was founded in 1574, when a fort was built on the Byefaya, three other forts being erected about the same tume at Busk; Menzelinsk, and Berezovka, to connect Ufa with the Russtan settlements on the Kaina. The wooden kreml of Ufa, protected by wooden towers and an outer carthen wall, had to sustan the attacks of the revolted Bashkirs and Russian serfs in 1662 and at later dates; and in 1773 Tchika, one of the chiefs of the Pugatchel! revolt, lesieged it for funr months.

UGANDA, a country of eastern Central Africa, to the north-west of the Victoria Nyanza. It has an area of about 34,000 square miles, extending from $1^{\circ} \mathrm{N}$. lat. to the Kitangule river, and from $31^{\circ}$ E. long. to the Nile. The country bordering the lake and to the north-west is mountainous, the mountains being arranged in low parallel chains. The hills, covered with splendid timber and abundant underwood, rise to a height of 400 fect above their valleys, through which sluggish streams fiow to the lake. Farther north the country becomes a plain, and the eastern portion of Uganda, between Rubaga and the Nilc, consists of undulating country, varied by deep narrow valleys. The geological formation of the country is volcanic or metamorphic; two or three feet of rich black alluvial soil form the upper strata, covering a bed of red sandy clay, often 30 feet thick. In some places porcclain earth is found, as well as large masses of mica. Ironstone is present in considerable quantities, but as yet no other metals have been discovered. The climate is mild, and the temperature rcmarkably uniform throughout the year ; the thermometric range is from $50^{\circ}$ to $90^{\circ} \mathrm{F}$. ; but the mean annual variation is only $20^{\circ}$. The anaual rainfall is 50 inches, the greatest amount of rain occurring in March, April, May, and September, October, and November, when rain falls nearly every day, thunderstorms being freguent.
The population of Uganda is about five millions. The men are tall and well-built, and liave good fea tures and dark chocolate-coloured skin, with woolly hair. The women in their jouth are goodlooking. The country is divided into three provinecs-Uldu in the south, Singo in the west, and Changwe in the cast, to which must be added abnut $400^{\circ}$ islands in the lake. The gevernment of the country is feudal, the king being nomimally supreme. Succession to the throne is hereditary, but, the successor is usually a minor
chosen by three hereditary chiefs, who with the young king's mother carry on the government until he is of age. The reigning family in Uganda is descended from tho Wiahuma tribe; the late king Altesa professed to tracé back his descent to lintu (or Ham), the founder of tho dynasty. The country is ruled hy the king, thrce hereditary chiefs, and a conncil of minor chiefs, -two hereditary chiefs and a cortain proportion of the others being continually in residence at Rubaga, the capital of the country. The laws are strict, and the administration of justice is conducted in an orderly manner. There is no real taxation, but the people are compelled to render feutlal service to all their superiors. The Waganda nay be divided into fonr classes, the lowest class being the slave population, consisting of prisoners taken in war and their desceudants; next come the "bachopi" or peasants, who form the mass of the population; the third class are the "batongoli," or chicfs, who are recruited from the hachopi, but whose honours are not hereditary; they receive their rank for distinguished brarery in tho field or for services rendered to the state, and they are the governros of the villages. The highest class is that of the "bakungn," a superior grade of chiefs, all belonging to the "luchiko" or state council, and being governors of large districts of land. The three great hereditary cbiefs belong to this class, and they are supreme governors of the three great districts into which Uganda is divided. The Waganda are sery warlike; all adult inales are compelled to serve in the army when required, and the military orgauization, baring its licad. quarters at the eapital, ramifies throughout the wholo land. Gaz.e is very plentiful: elephants, buffaloes, zebras, Hhinocereses, wild boars, twelve species of antelopes, lions, leoprards, jackals, foxes, hyænas, hares, chimpanzees, and several species of moakeys inhabit the forest. Snakes are numerous; hippopotami, crocodiles, and otters abound in the lake and in the Nile, as also many water-rats. The principal hirds are parrots, gninea-fowl, owls, vultures, adjutants, goatsuckers, kites, eagles, ducks, geese, storks, cranes, herons, gulls, scarlet flamingos, darters, the sacred and glossy ibis, and brilliantly colonred honey-birds. The princinal insects are mosquitos, fleas, locnsts, whitc and driver ants, and butterflies of many species. The domestic animals are cows, goats, and a few sheep and dogs. The Waganda live chiefly upon a regetable diet, the banana forming the staple food; it gross every where, and requircs little or no cultiration. The sweet patato is the chief regetable cnltivated, but coffee, sugar-cane; cassava, maize, sesame, millet, tullabone, several snecies of leans, and two or three kinds of pumpkins are grown to a small extent. The principal fruits are the mpafu and a species of amomum. Strangers have introduced wheat, rice, guavas, papars, pomegranates, tomatoes, onions, and radislies. Wine is made from the banana tree, and is a staplo drink. Butter and cheese are also made. A good deal of manufacture is carricd on, for the people are ingenious and clerer workmen, and their work is tasteful, neat, and exact. Two kinds of pottery, a coarse and a fine variety, are manufactured in considerable quantities. The basket work is extremely good, and the metal work far superior to any seen among tho neighbouring trilies. The manufacture of bark-cloths, in which most of the people are clothed, is very extensively carried on, and their wood-work and boat-buihling are of very superior quality. Tanning, dyeing, and bead-work enviloy numbers of the people. There is not rery much home trado in Uganda; it ia-limited to the barter of mative namfactures. Several times a ycar caravans arrive from Zanzibar, bringing calico, guns, powder, fles, knires, \&c. The standard value of any article is reckoned hy 100 cowries or an arm's length of calico and heads; hoes, salt, and fish aje also cmployed as mediums of excha-ge. The anguage snoken in Uganda belongs to the great Bantu fanaly, and is rery rich in words. It has ten classes of nouns, the noun being the most important part of speech. Grammatical inflexions are formed by prefixes; the inflexions of verbs, adjectives, and pronouns vary according to the class of the governing noln. Adjectives agree with the substantive in number and case, and alwnys follow the noun. There are personal, possessive, relative, demonstrative, and interrogative pronouns, and several forms of verbs. The Waganda are rely good aritlemeticians. The root of all multiples is ten; tallies aro used as aids to the memory. The people are very musical; their voices are clear and melodious, and of considerable range. They have a great rariety of tunes, orchestral, dance, and rocal music having distinct charasteristics. Their musical instruments consist of harmonicons, rattles, drums, houns, whistles, flutes, and harps. The Waganda have no images or ontward symbols of their gods : and they think that the world is ruled by spirits or demons, to whom katonga, the great creator, has deputed his power. They worship Mrnkasa, the god of the lake; Naduala, the god of small-pox; Chiwuka and Nenda, the gods of war; and several of the former monarchs of Uganda, who are believed to bo demi-gods. A thunder spirit is also invoked. The gods of war are supposed to inhabit certain trees, and offerings are made to them before entering the war-path; like offerings are also made to the god of the lake before commencing a voyage upon its waters. The Waganda are courteous, cleanly, given to hospitality, but drunken, and to a certain extent indolent. Their standard of
morality, even judged by that of the surrounding tribes, is not high. Human life is little respected; they are untruthful and indecent. Unless moved by passion, they are not cruel; passionate, they are not revengcful. Chilluen are well treated, as are the aged mea. On account of the extensive prevalence of polygamy, women occupy a somewhat low social grade.

Uganda was first risited by Speke and Grant in 1860, and the country has since been visited by numerous Europeaus, chiefly missionaries. "The Clurch Missionary Society and the Koman Catholica have mission stations in the country. In 1886 some forty of their converts were burnt at the stake, and in the same year Bishop Hannington was murdered on the borders of the country by the orders of liing Mwanga.
See Speke's Journal, Grant's tralk across Africa, Stamey's Through the Dar': Contimens, and Wilson and Eelkin's C'gonda and the Eqyplian Soudan. Also, " monograph "On the Waganda Tribe, by R. W. Fe.kin, in Pioc. Roy. Soc. Ed., vol. रill, and an Outline Grammar of the Luganda Language, by C. T. Wilson.

UCLITCH, a district town of Fussia, in the government of Yaroslavl, is situaled on the upper Volga, principally on its right bank, 67 miles to the west of the capital of the province. Its historical remains are mostly assóciated with the prince Dmitri (see vol. xxi. p,93). The mooden house he occupied, a church of St Demetrius "on the Blood" erected at the spot where he was killed, and a kiosk on the site of the convent where his mother was forcibly consecrated a non,-all commemorate this chapter in the history of the rule of the boiars at Moscow at the beginaing of the 17th century. An old caihedral, erected in the 13 th century but subscquently restored, and containing the gravo of Prince Roman, recalls a still earlier period of municipal independence. Ugliteh has now become a commercial and industrial city with 11,930 inhabitants (1883), and has an important trade, being one of the chief loading places on the upper Volga. Its industries comprise the sewing of sacks for corn and flour (about one million every year) and the knitting of woollen socks; and it has a paper-mill. distilleries, copper works, and linen factories. Corn, paper, sansages with which the name of Uglitch has long beer associated, candles, d.c., are shipped at the town.

Uglitch is one of the oldest towns of Russia; its local annals go as far as back as the $9 t h$ century. Until the 14 th century it maintained its independence as a separate principality, whieh extended over eastern Tver, and elected its own rrinces. In 1329 the sons of Princo Roman the Saint renounced their independence in faronr of Noscow, and fifty years later the Uglitclı princes finally sold their rights to the great prince of Moscow. The Tartars plundered the town during their invasions of 1237,1293 , and 1408 , as also dav the Lithuanians at a later date.

UHLAND, Johavin Ludwig (17S7-1862), German poei, was born at Tübingen, on April 26, 1787. He studied at the university of his native place, taking jurisprudenco as his special subject, but also devoting much time to litarature. Having graduated as a doctor of laws in 1810 , $\}$ went for some inonths to Paris; and from 1812 to $151+$ ho worked at his profession in Stuttgart, in the bureau of tle minister of justice. He had begun his career as a poet in 1807 and $1 S 0 S$ by contributing ballads and lyrics to Seckendorf's Musenalmanrich; and in 1812 and 1813 he wrote poems for the Poetischer Almanach and for the Deutscher Dichterucald. In 1815 he collected his poens in a volnme entitled Gedichte, whiclı almost immediately secured a wide circle of readers, and gives him his prace in Gcrman literature. To every new edition he added some Iresh poens; and the sixtieth edition, published in $\mathbf{1 8 7 5}$, included a number of pieces found among his papers. He wroto two dramatic works-Ermst, Ilerzog von Schouden and Ludwig der Baier-the former published in 1817, the latter in 1819. These, however, are unimportant in comparison with his Gedichte. In some respects Uhland monst be classed with the writers of the romantic school, for, like them, be found in tlio Middle Ages the subjects which appealed most strongly to his imagination. But his style has a precision, suppleness, and grace which sharply dis-
tinguish his most characteristic writings from those of the ronantic poets. Ifis best lyries have the charm which belongs to the unaffected expression of delicate sentiment; and in almost all his ballads he displays a remarkable power of giving pieturesque form to his conceptions of claracter. He was a man of pime and noble impulse, and it was in presenting scenes which awaken love, or admiration, or pity that he did the fullest justice to his powers. Uhland's poetic sympathy with some characteristics of the age of chivalry did not prevent him from sharing the best aspirations of his own time. He wrote manly poems in defence of freedons, and in the states assembly of Wuirtemberg he played a discinguished part as one of the most vigerous and consistent of the liberal members. In 1829 he was nade a professor, at T'ibingen university, of German literature and the German language, but he resigned this appointment in 1833, when it was found to be incompatible with his political duties. In 1848 he became a member of the Frankfort parliament, in which he sat as one of the inost respected inembers of the liberal party.

Uhland was not only a poct and politician; he wass also an ardent student of the bistory of literature. In 1812 he published an interesting essay on Dus alffranzösische Epos; and ten years afterwards this was followod by an admirable work on Walther ron der Vogelweide. He was also the author of an elaborate study of Der Mylhus von IJôr nach nordisclen Quellen (1836), and he formed a valuable collection of Alte hoch- und niederdeutsche Tolkslieder; which appeared in 1844-45. He died on Norember 13, 1862. After his death his prose works were reprinted, with some additions, under tho gemeral title Uhland's Schriften zur Geschichte der Dichtung und Sure (1S65-73), and an edition of bis pooms and dramas, in three volumes. was issned in 1863.

UJIIJI, a town in eastern Central Africa, of considerablo importance, also known by the name of Ravele, is situated on the eastern shores of Lake Tanganyika, in $4^{\circ} 55^{\prime} \mathrm{S}$. lat. and $30^{\circ} 5^{\prime} \mathrm{E}$. long. It is the chief town on that lake, and is the centre of a brisk trade in ivory. Formerly it was a great slave-market. The town is of a stragerling character, Arab houses of sun-dried bricks being mingled with native huts. The population, which fluctuates considerably, is very mixed, being composed of Arabs and the rcpresentatives of numerous Central African tribes. Ujiji has been visited by various European travellers, who have made it their headquarters, and it was here that Stanley found Livingstone, on October 28, 1871. Opinions vary as to the salnbrity of its climate, but the balance of testimony appears to prove that during the greater part of the year it is very unbealthy.

UJJAIN, or Oosern, a town in the natios state of Gwalior, central India, situated on the right bank of the Sipra, in $23^{\circ} 11^{\prime} 10^{\prime \prime} \mathrm{N}$. lat. and $75^{\circ} 51^{\prime} 45^{\prime \prime} \mathrm{E}$. long., 1698 feet above sea-level. In ancient times Ujjain was the great and famous capital of Malwa, one of the scren sacred cities of the Hindus, and the spot which marked the first meridian of Hindu geographers. Though much decayed, it is still a large and populous city, with considerable sominerce. The modern city is surrounded on all sides by an almost uninterrupted belt of groves and gardens. In 1881 the population of the town numbered $32,932$. Its trade consists chiefly in the export of opium and the import of European goods, especially cotton fabrics.

UKRAINE ("frontier"), the name formerly given to a district of European Russia, now comprising the governments of Kharkoff. Kiesp: Pedolia, and Poltava (q.v.).

Ul.CER. Sce Straers, rol. zxii. p. 6 S 3.
ULFILAS (311-381), the apostle of Christianity to the Gothic race, and, through his translation of the Scriptures into Gothic, the father of Teutonic literature, was born among the Goths of the trans-Danubian provinces in the year $311 .{ }^{1}$ There is a tradition that his ancestors were Christian captives from Sadagolthina in Cappad,cia, who had been carricd off to the lands bejond the Danube in the Gothic raid of 267 ; but the evidence on which this rests is inadequatc. An authoritative record of the cutlines of his life has only been discovered within the last fifty years, in a writing of Auxentius, his pupil and companion.

At an early age Ulfilas was sent, cither as an envoy or as a hostage for his tribe, to Constantinople, probably on the occasion of the treaty arranged in 332. During the preceding century Christianity lad been planted sporadically among the Cioths beyond the Danubc. through the agency is part of Christian captives, many of whom helonged to the order of clergy, and in part of merchants and traders. Ulfilas may thercfore have been a convert to Christianity when ho reached Constautinople. But it was here probably that he came into contact with the Arian doctrines which gave the form to lis later teaching, and here that he acquired that command over the Greek and Latin tongues which equipped him for his labours as a translator. For some time before 341 be worked as a "Jector" or reader of the Scripturcs, probably among his own countrymen in Constantinople, or among those attached as foederali to the imperial armies in Asia Minor. From this work be was called to return as missionary bishop to his own country, being ordained by Eusebius of Nicomedia and "the lishops who were with him" in 341. This ordination of Ulfilas as missionary bishop by the chicfs of the semi-Arian party is at once an indication of their determination to extend their influence by active missionary enterprise and evidence that Ulfilas was now, if he had not been before, a declared adherent of the Arian or semi-Arian party. He was now thirty years of age, and his work as "bishop among the Goths" corered the remaining forty years of his life. For seven of these years he wrought among the Visigoths beyond the Danube, till the success which attended his labours, and the growing numbers of his flock, drew down the persccution of the still pagan chicf of the tribe. This "sacrilegus judex" bas been identified with Athanaric, a later persecutor, probably without sufficient ground. Tho persecution was so severe that, to save his flock from extinction or dispersion, Ulfilas decided to withdraw both himself and his people from its range. With the consent of the emperor Constantius, he led them across the Danube, "a great body of the faithful," and settled in Mosia at the foot of the range of Hromus, and near the site of the modern Timera (34S). Here they developed into a peace-loving pastoral people.

The life of Ulfilas during the following thirty-three years is marked only by one recorded inciucnt, his visit to Constantiople in 360, to atteud the council convened by the Arian or Homoian party: His work and influence were not, bowever, confined to his own immediate flock, but radiated by means of his writings (homilies and treatises), and through the dieciples he despatched as missionaries, among all the tribes of the Gothic stock beyond the Danube. By this time probably he had made some progress with his version of the Scriptures, and copies of parts of it would begin to circulate. Thus the church beyond the Danube, which had not been extinguished on Ulfilas's withdrawal, began to grow once more in numbers ( and importance, and once more lind tn undergo the fires of persecution. Catholic missionaries had not been wanting in the meanwhile, and in the indiscriminate persecntion by
${ }^{1}$ Krafft gives 313 as the late, Waitz 318.

Athanaric betrreen 370 and 375 Catholics and Arians stood and fell side by side. The religious quarrel either accentuated, or was accentuated by, political differences, sand the rival chiefs, Athanaric and Frithigern, appeared as champions of Paganism and Christianity respectively. Then followed the negotiations with the emperor Valens, the geueral adhesion of the Visigoths under Frithigern to Arian Christianity, the crossing of the Danube by himself and a host of his followers, and the troubles which culminated in the battle of Adrianople and the death of Talens (378). The part played by Ulfilas in these troubluus times cannot be ascertained with certainty. It may have been he whe, as a "presbyter Christiani ritus" conducted negotiations with Valens before the battle of Adrianople; but that he headed a previous embassy asking for leare for the Tisigoths to settle on Roman soil, and that he then, for political motives, professed himself a convert to the Arian creed, favoured by the emperor, and drew with him the whole body of his countrymen, - these and other similar stories of the orthodox church historians appear to be without foundation. The death of Valens, followed by the succession and the early conversion to Catholicism of Theodosius, dealt a fatal blow to the Arian party within the empire. Ulfilas lived long enough to see what the end must be. Hardships as teell as years must lave comhined to make him an old man, when in 381 ho was sent for to Constantinople. The emperor had summoned him, for what purpose cannot be clearly ascertained. A split seems to have taken place among the Arians at Constantinople. Party riots were too familiar there, and a fierce dispute orer a theological dogma, however abstruse, placed the peace of the city, if not the security of the palace, in jeopardy. Ulfilas was summoned to meet the invovators, and either by argument or by influence to induce them to surrender the opinion which caused the dispute. His pupil Auxentius describes how, "in the name of God," he set out upon his way, hoping to prevent the teaching of these new heretics from reaching "the claurches of Christ by Christ committed to his charge." No sooner had he reached Constantinople than he fell sick, "having pondered much about the conncil ${ }_{2}^{3 "}$ and before he had put his hand to the task which had brought him he died, probably in January 381. A few days later there died, also in Coustantinople, his old enemy and persechtor, Athanaric.

The Arianisu of Ulfilas was a fact of pregnant consequence for his pcople, and indirectly for the empire. It had been his lifelong faith, as we learn from the opening words of lis own testament"Ego Ulfilas semper sic credidi." 1f, as seems probable from the circuustances of his ordination, he was a Seni-Arian aud a follower of Eusebius in 341, at a later period of his life he departed from this position, and vigoreusly opposel the teaching of his former leader. He appears to lave joived the Homojan party, which took sbape and acquired influence before the couscil of Constantinople in 360 , where be adhered-with the rest of tho council to the creed of Arinninum, with the adjendun that in future the terms $\dot{\delta} \pi \delta \sigma \tau \sigma \sigma, s$ and oucia should be excluded from Cliristological definitions. Thus we learn from Auxentius that he condemued Homoonsians and Homoiousians alike, adopting for himself the Honoian formula, "filium similem esse patri suo." This Arian form of Christiauity mas imparted by Ulfilas and his disciples to most of the tribes of the Gothic stock, and persisted among them, in spite of the persecution, hatred, and political disasters it involved, for two centuries.

The other legacy bequeathed by Ulfilas was of less questionable value. His version of the Scriptures (see Gothio Language, vol. x. p. 852) is his greatest monnment as a way-breaker and a scholar. By it he became the first to raise a barbarian tongue to the dignity of a literary language ; and the skill, knowledge, and adaptive ability it displays make it the crowning testimony of his powers as well as of his devotion to his work.

The personal qualities of the man may bo inferred from his pupil's description of him as " of most upright conversation, truly a confessor of Christ, a teacher of piety, and a preacher of truth,-a man whom I am not competent to praise according to his merit, yet altogether keep silent I dare not."
Literature,-Waltz, Das Leben des Uifitas, 1840; Kraff, Kirchengeschichte der

 Language" under Gorts.
(C. A. S.)

ULM, an ancient and important commercial town in Würtemberg, and an imperial fortress of the first class, is situated on the left bank of the Danube, in a fertile plain at the foot of the Swabian Alps, 45 miles to the south-east of Stuttgart and 63 miles to the north-west of Munich. The town, quaintly built with narrow and confined streets, still preserves the dignified and old-fashioned appearanco of an ancient imperial town, and contains many medixval buildings, both of historic and of artistic interest. Among these, besides numerous handsome private liousea, are tho town-house, of the 16th century, in the Transition stylc from late Gothic to Renaissance; the Kornhaus and market-bnildings; the Ehingerhaus or Neubronnerhaus, now containing the industrial museum; the "new building," erected in 1603 on the site of a palace of Charlemagne ; and the commandery of the Teutonic order, built in 1712-18 on the site of a habitation of the order dating from the 13 th century. By far the most important and conspicuous building in Ulm, horever, is the magnificent early Cothic cathedral, next to the cathedral of Cologne the largest church in Germany, and capable of containing 30,000 peoplo. Begun in 1377 , and carried on at iutervals till the 16 th century, the building was long left unfinished; but in 1844 the work of restoration and completion $\begin{gathered}\text { was } \\ \text { undertaken, and has steadily progressed ever }\end{gathered}$ since. Ulur cathedral has double aisles and a pentagonal apsidal choir, but no transepts. Its length (outside measurement) is 464 feet, its breadth 159 feet; the nave is 136 feet high and $47 \frac{1}{2}$ wide; the aisles, which are co:cred with rich net-vaulting, are 68 feet in height. The massive and richly decorated square tower in the centre of the west façade, for centuries terminated by a temporary spire, is now being completed according to the original plans, by the addition of an octagonal story and a tall open spire, which is to be carried up to the height of 534 feet. The towers of the choir have also been rebuilt in the course of the present restoration; they are 282 feet high. The interior, which is unusually well lighted, produces an impression of much dignity from the great height of the nave, the absence of obtrusive decoration, and the massive manner in which the walls and piers are treated. It contains some fine stained glass, the largest organ iu Germany (1856), and a number of interesting old paintings and carvings by Syrlin, Engelberger, and other masters of the Swabian school. The cathedral belongs to the Protestant Church. Trinity Church dates from 1617-21; and there are also a Roman Catholic church and a modern synagogue in the town. The Danube, joined by the Iller just above the town and by the Blau just Lelow, becomes navigable at this point, so that Ulm occupies the important commercial position of a terminal river-port. The trade, especially in wood and grain, has an upward tendency; and the Ulm market for leather and cloth is also rising in importance. Ulm is famous for its regetables (especially asparagus), barley, beer, lipe-bowls, and sweet cakes (Ulmer Zückerbrot): Bleaching, brewing, and brassfounding are carried on, as well as a large miscellany of manufactures, including hats, metal goods, agricultural implements, tobacco and cigars, cement, paper, and chem.icals. The population in 1886 was 33,611 .

The various routes which converge at Ulm hape made it at all tunes a strategic point of great importance, and it has long been a fortress of tho first rank. In 1844-59 the German Confederation carefully fortified it with walls, ramparts, and ditches, and in 1876 the new German empire added a very comprchensive outer girdle of detached forts, culminating in the powelful citadel of Wilhelmsburg. The defensive works enibrace alse the Bavarian town on Neu-Ulm ( 7823 inhabitants), on the opposite bank of the Danube: united with the older city by two stone bridges. J'Ulm is thus the basis of operations for the German army behind the Black Forest,
and can easily shelter a force of $100,000 \mathrm{men}$; its pace grarisou is 5600 .

Ulm is mentioned as early as the year 854. It subsequently became a free imperial city, and the leadiag town iu Swabia. Io the 15 th century it attained the summit of its prosperity, and ruled over a district of maay square miles, with a population, rura and urban, of sbout 60,000. Towards the end of the Middle Ages it frequently appears at the head of various Swabian leagues. In 1530 it adopted the Augshurg Confession. In 1803 it passed to Bavaria, and is 1810 to Würtemberg. In 1805 General Mack, with 33,000 Austrians, capitulated to Napoleon at Ulm. Ulm is remarkable in the history of German literature as the spot where the "meistersz̈nger" lingered longest, preserving, without text and without notes, the traditional lore of their craft. In 1830 there were twelve " meistersänger" alive at Ulm; but in 1839 the four survivors formally made over their insignia and guild property to a modern singing society, and closed the record of "Meistergesang" in Germany. The last formal meeting of the Nureuberg "meister" took place in 1770.

ULPIANUS, Domitios, Roman jurst, was of Tyrian ancestry, but the time and place of his birth are unknown. He made his first appearance in public life as assessor in the auditorium of Papinian and member of the council of Septimius Severus; under Caracalla he was master of the requests. Elagabalus deprived him of his functions and banished him from Rome, but on the accession of Alexander (222) be was at once recalled and reinstated, and finally became the emperor's chief adviser and prefectus pretorio. His curtailment of the privileges granted to the pretorian guard by Elagabalus provoked their enmity, and several times he only narrowly escaped their vengeance ; ultimately, in 228 , he was murdered in the palnce, in the course of a riot between the soldiers and the mob.

- Ulpian's period of literary activity exteuded from about 211 to 222 A.D. His works includo Ad Sabinum, a commentary on the jus civile in over fifty books; Ad Edictum, a commentary on the Edict, in eighty-three books; collections of Opinions, Responses, and Disputations; books of Rules and Institutions; treatises on the functions of the different magistrates,-one of them, the Dc Officio Proconsulis Libri X., beiag a comprehensive exposition of the criminal law; monographs on various statntes, on testamentary trusts, and a variety of other works. His writings altogether have supplied to Justinian's Digest about a third of its conteuts, and his commentary on the Edict slone about a fifth. As $a:$ author he is characterized by doctrinal exposition of a high asder, judiciousuess of criticism, and lucidity of arrangement, style, and language. Domitii Ulpiani Fragmenta, consisting of twenty-nine titles, were first edited by Tilius (Paris, 1549). There are modern editions by Hugo (Berlin, 1834) aud Böcking (Bonn, 1836), the latter containing fragments of the first book of the Institutiones discovered by Endlicher at Vieuna in 1835.

UlRICI, Hermann (1806-1884), one of the most active philosophical writers in Germany since Hegel's death, was born at Pförten, Prussia, on March 23, 1806. Educated for the law, he gave up his profession upon the death of his father in 1829, and after four years of further study, devoted to literature, philosophy, and science, qualified as a university lecturer. In 1834 he was called to a professorship at Halle, where he remained till his death on the 11th January 1884. His first works were in the domain of literary criticism. His treatise On Shakespeare's. Dramatic Art (1839) has been translated into English. In 1841 he published a work Ueber Princip $u$. Methode der Hegelschen Philosophie, in which he subjected Hegel's system to a severe criticism. The critical attack was continued in the Grundprincip der Philosophie (1845-6), which at the same time expounds his own speculative position; to this must be added as complementary his System der Logik (1852). His later works, dealing with perennial problems of philosophy, have found a more extended circle of readers. Such are Glauben und Wissen (1858), Gott und die Natur (1862, 3d ed. 1875), Gott und der Mensch (2 vols., 1866-73, 2d ed. 1874). From 1847 onward Ulrici was associated with the younger Fichte in the editorship of the Zeitschrift für Philosophie. His philosophical staudpoint may be characterized as a reaction from the pantheistic tendency of Hegel's idealistic rationalism
towards a more prononncelly tleeistic position. The Hegolian identity of beiver and thought is also abandoned and the truth of realisn acknowledreet, an attempt being made to exlibit idcalisun and realism as respectively incomplete but mutually complementary systems. Ulrici's later works, while expressing the same views, are largely occupied in proving tho existence of God and tho sool from the basis of scieutific conceptions, and in opposition to the materialistic current of thouglit then popular in Germany.

## ULSTER. See Ireland.

ULTRAMLARINE, a magnificent blue pigment, which occurs in nature as a proximate component of Lapis LazULI (q.u.). Lapis lazuli has long been known as a precious stone, and highly valued as such, and as early at least as the 11 th century the art of extracting a blue pigment from it was practised. From the beginning of the 16 th century this pigment began to be imported into Europe from "over the sea," as azurmun altramarinum. To extract it, the stone, after having been powdered coarsely, is heated to redness and thrown into cold water to facilitate its conversion into a very fine powder, which is next treated with dilute acetic acid to remove the carbonate of lime which is present in almost all specimens. The insoluble blue residue is mixed up into a "dough" with a composition of resin, pitch, and linseed oil, and this dough is then kneaded under water, which is renewed as long as it runs off with a blue colour. The blue liquor, when allowed to stand, deposits a fine precipitate, which is collected, washed, dried, and sold as ultramarine. As the yield amounts to only 2 to 3 per cent. of the mineral used, it is not surprising to learn that the pigment used to be weighed up with gold. It was valued chiefly on account of its brilliancy of tone and its inertness in opposition to sunlight, oil, and slaked lime (in fresco-painting).

Lapis lazuli has the composition of a double silicate of line and soda combined with sulphates and sulphides of the metals named. Of the many analyses made (compare Lapis Lazuli) we quote the following, carried out by Schultz in Rammelsloerg's laboratory:combined sulphur (oot $\mathrm{SO}_{3}$ ), $3 \cdot 16$; combined sulphuric acid, $\mathrm{SO}_{3}$ $5 \cdot 67$; silica, $43 \cdot 26$; alumina, $20 \cdot 22$; oxido of iron, calculated as $\mathrm{Fe}_{2} \mathrm{O}_{3}, 4 \cdot 20$; lime, 14.73 ; soda, $8 \% 76$.
In 1814 Tassaer observed the spontaneous formation of a blue compound, very similar to ultramarine, if not identical with it, in a soda-furnace at St Gobain, which caused the "Société pour l'Eucouragement d'Industrie" to offer a prize for the artificial production of the precious colour. The problem was solved almost aimultaneously by Guimet and by Chistian Gmelin, then professor of chem. istry in Tiibingen ; but while Guimct kept his process a sccret (it has indeed never become known) Gmelin. published his, aud thus became the originator of an iutustry which flourishes to this day chicfly in Germany. There are very few ultramarine works in other countries, and none, as far as we know, in Great Britain. The raw materials used in the manufacture are-(I) iron-frce kaolin, or some otherkind of pure clay, which should contain its silica aod alunins as nearly as possible in the proportion of $2 \mathrm{SiO}_{2}: \mathrm{Al}_{2} \mathrm{O}_{3}$ demanded ly the formula assigned to ideal kaoliu (a deficit of silica, how. ever, il sppears can be made up for by additiou of the calculated weight of finely divided silica); (2) anhydrous sulphate of soda; (3) anhydrous carbonate of soda; (4) sulphur (in the stato of powder) ; and (5) powdered charcoal or relatively ash-freo coal, or colophooy in limps. The numerons modes of manufacture may be viewed as modifications or combinations of three processes.
(1) In the Nrurcmberg process the sodd is used as snlphate, or partly as sucl and partly as carbouate. The lollowing recipe gives an idea of the proportions iu which tho materials are used :-kaolin (ealculated as anhydrous matter) 100 parts; calcined sulphate of soda 83 to 100 (or 41 of sulphate and 41 of earbonate) ; charceal 17 powdered sulphur 13. These ingredients are mixed most intin mately; they are then rammed tight iuto fire-clay erucibles and kept at a uearly white heat for 7 to 10 hours, access of air being prevented as far as possible. The product obtained is a greyish or bellowish green mass, which is soaked in and washed with water the porons residue is ground very fine in mills, again washed, dried. and sainain ground io the dry state and passed through sieves. The product at this stage has a green colour, and is sometimes sold as "green ultratnarine," althoughl it has not a ligh standing smongst green pigments. For its conversion ints blue ultramaribe it is heated with sulphur in the presence of air to a relatively low temperature. Of the varius spparatus used for this important stage of the manufacture, the essiest to describe is a large muffle, lieated from the outside. On its floor the greed ultramarino is spread out to a depth of $2 \frac{1}{2}$ to 3 iaches, and heated (with closed doors) to a
temperature at which sulphur powder when thrown in catches fire spontaneously. This temperature being maintained, a shovelful of sulphur is thrown in and allowed to burn off while the mass is being constantly agitated with iron rakers. Another dose of sulphur is then added, and so on until a eample taken out is found to have come up to the highest attainable brilliancy and depth of blue. The product is then lixiviated with water, which removes a deal of sulnhate of sodi formed in the process; it is then ground np very fine, and finally subjected to elutriation to produce a graduated series of ultramarines of diflerent derrees of fineness. In some works the process of sulphuration is divided into two or more periods, after each of which tho product is washed, dried, and ground hefore being returned to the unuffe to produce a higher degree of homogeneity.
(2) In the carbonate of soda process the soda is used solely, or at least principally, in the carbonato form. The following is one of many recipes:-kaolin (calculated as anhydrous matter) 100 ; carbonate of soda 100 ; charcosl 12 ; sulphur 60 . The mixture is heated in a reverberatory furnace to form in the lirst instance a white mass, which is so porous that it readily passes, by oxidation, into green and partly oven into blue ultramariue. Green ultramarine, saleable as such, cannot be prodnced in this manner. The half-blue product is finisherl by sulphuration pretty much as explained above for the Nuremberg process. Well-mate soda-ash ultramarine has a richer colour than the Nuremberg variety.
(3) Silict ultramarine is soda-ash ultramarine in whose preparation a quantity of finely divicled silica, equal to 5 to 10 per cent. of the weight of the kaolin, has been added. It is distinguislied by a reddish tinge, which is the more fully developerl the greater tbe pronortion of added silica. It is more highly proof against the action of alum solution than non-siliceons nltramarine is.

Since 1873 the Nuremberg works have been producing four varieties of magnificently violet ultramarine. Tlso modo of manufacture has not transpired. At the Paris Exhibition in 1867 a mag. nificent block of ultramarine exhibited by the Kaiserslautern works attracted attention. In its manufacture the roasting (blueing) process is said to have been continued for three weeks.

Artificial, like natural, nltramarine has a magnificently blue colour, which is not affected by light nor by contact with oil or lime as used in painting. Hydrochloric acid at once bleaches it with liberation of sulphuretted hydromen gas and milk of sulphur. The natural pignient is proof against dilute acetic acid aud solution of alum ; the artificial pigment is even alum-proof only in a bigher or lower relative sense. Hence there is room for progress in one' directoon at least. The composition of the pigment is quite sintilar to that of lapis lazuli ; but the constitution of both is still a chenical engma. It is remarkable that even a sinall addition of zincwhite (oxide of zinc) to the redlish rarieties especially causes a considerable diminution in the intensity of the colour, while dilu* tion with artificial precipitated sulphate of lime ("annalin") or sulphate of baryta ("blanc fix") acts pretty much as one would expect. Ultramarine being very cheaps (it sells at 7 d. to 10 d . per lb), it is largely nsed for wall painting, the printing of paper hangings and calico, \&c., and also as a correctite for the yellowish tinge often present in things meant to bo white, such as linen, paper, \&c. Large quantities are used in the manufacture of paper, and especially for producing that kind of pale blue writing paper which is so popular in Great Britain. Only the very finest ultramarine can be used for paper tinçing, hecause the least admixture of coarse particles becomes visiblo in the paper as dark spots or stains.
ulugh beg, Mirza Mohamned bex Shay Rok (1394-1449), astronomer, grandson of Tmus (q.v.), sucseeded his father as prince of Samarkand in 1447, after having for years taken part in the government, and was murdered in 1449 by bis eldest son. He occupied himself with astronomical pursuits, and erected an observatory at Samarkand, from which were issued tables of the sun, moon, and planets, with an interesting introduction, which throws much light on the trigonometry and astronomical methods then in use (Prolégomènes des Tables Astronomiques d'Ouloug Beg, ed. by Sédillot, Paris, 1847, and translated by the same, 1853). The serious errors which he fonnd itx the Arabian star catalogues (which were simply copied from Ptolemy, adding the effect of precession to the longitudes) induced him to redetermine the positions of 992 fixed stars, to which he added 27 stars from Al Safis catalogue, which were too far south to be observed at Samarkand. This catalogue, the first original one since Ptolemy, was edited by Th. Hyde at Oxford in 1665 (Tabule Longitudinis et Latitudinis Stellarum Fixamem ex Observatione Ulugbeight, and in 1843 by Baily in vol. xiii. of the Menoirs of the Royal Astronomical Society.

ULVERS'TON, a narket-town in the north-west of Lancashire, England, is picturesquely situated near MLorecambe Bay, on the borders of the Lake district, 9 miles northeast of Barrow-in-Furncss, and 256 north-west of London. The town bears small evidence of its great antiquity. The principal streets branch from the market-place, and the houses built of stone are generally rough-cast and whitened. A rivulet flows turough the town. The church of St Mary, fornded in 1111, retains the south door of the original building in the Transition style, but the greater portion of the structare is Perpendicular, of the time of Henry VIII. It consists of chancel, nave, aisles, south porch, and embattled western tower, and contains an altar-tomb with recumbent figure of Walter sandys of Conishead, dated 1588. After the destruction of Furness Abbey, Ulverston succeeded Dalton as the most important town in Furness, but the rapid rise of Barrow within recent years has relegated it to quite a secondary place. Formerly it had a considerable trade in linens, checks, and ginghams, but this has greatly fallen off. It possesses, however, large iron and steel works (North Jonsdale Iron and Steel Company), a large chemical work, an extensive paper manufactory, a bolt manufactory, breweries, tanyards, and wooden hoop manufactories. The population of the urban sanitary district (area 3120 acres) in 1871 was 7607 , and in 1881 it was 10,008 .
Early in the 12th centary the lordship of Ulverston came into the possession of Stephen, earl of Eoulogne, afterriarls king of England, by whons it was presented to the mouks of Furness Abbey as part of the endowment. In 1196 the ville of Ulverston was granted by the abhat of Furness to William de Lancaster, first baron of Kendal. In 1280 it obtained the charter of a market. The town becamo escheated to the abbot of Furness as cbief lord in 1342, but this escheatment was suspended by Edward Il. in farour of John de Coupiand, who captured David II. of Scotland at the battle of Durham. After his death it reverted to the abbey. It is now in the possession of the family of Buccleuch.

ULWAR, an alternative form of ALWAR (q.v.).
ULISSES. See Odysseus.
UMAN, a district town of Russia, in the south of the government of Kieff, is now a small industrial and trading town, with 15,400 inhabitants, many of whom are Jews, who carry on an active trade in the export of corn, spirits, \&c. It has a remarkable park ( 290 acres), planted in 1796 by the orders of Count Potocki, in connexion with which a gardening school is maintained.

Umaǹ was founded towards the beginning of the 17th century 8s a fort against the raids of the Tartars. The Cossacks of the Ukraino, who kept it, revolted against their Polish rulers about 1665 , and had to sustain a fierce siege. In 1674 it was plundered and most of its inhabitants murdered by the Ukraimans and Turks, during the wars for the betmanship. In 1712 its last inhabitants were transferred by Peter I. to the left bank of the Dnieper. But by the end of the 18 th century, when it again became the property of the Potockis, it was repeopled and hecame one of the busiest trading towns of Little Russia. In 1768, when the Cossacks revolted anew against their Polish serf proprietors, they took Umaĩ and murdered most of its inhabitants.

## UMBALLA, an alternative form of AMBÁLí (q.v.). <br> UMEER. See Pigments.

UMBRELLA now means a portảble protector from rain, while the name parasol is given to the generally smaller, lighter, and more fanciful article carried by ladies as a sun-shade. But primarily the umbrella (ombrella, Ital. dim. from Lat. umbra, shade) was a sun-shade alone,-its original home having been in hot brilliant climates. In Eastern countries from the earliest times the umbrella was one of the insignia of royalty and power. On the sculptured remains of ancient Nineveh and Egypt there are representations of kings and sometimes of lesser potentates going in procession with an umbrella carried over their heads; and throughout Asia the nmbrella had, and still has, something of the same significance. The Mahratta princes of India had among their titles "lord of
the umbrella." In 1855 the king of Burmah in addressing the governor-general of Iodia termed himself "the monarch who reigns over the great umbrella-wearing chiefs of the Eastern countries." The baldachios erected over ecclesiastical chairs, altars, and portals, and the canopies of thrones and pulpits, \&c., are in their origin closely related to umbrellas, and bave the same symbolic significance. In each of the basilican churches of Rome there still hangs a large umbrella.
Among the Greeks and Romans the umbrella ( $\sigma \kappa \kappa$ ás, oxiádiciov, umbraculum, umbella) was used by ladies, while the carrying of it by men was regarded as a sign of effemioacy. Probably in these sonthern climes it never went out of nse, and we find from allusions by Montaigne that in his day its employment as a sun-shade was quite common in Italy. The umbrella was not unknown in England in the 17th centrry, and was already used as a rain protector. Michael Drayton, writing about the beginning of the 17 th century, says, speaking of doves:-

> "And, like umbrolas, with their feathers
> Shield jon in all sorts of weathers."

Althongh it was the practice to keep an umbrella in the coffee-houses early in the 18 th century, its use cannot have been very familiar, for in 1752 Colonel Wolfe, writing from Paris, mentions the carrying of them there as a defence against both rain and sun, and wonders that they are not introduced into England. The traveller Jonas Hanway, who died in 1786, is credited with having been the first Englishman who habitually carried an umbrella. That praotice he began thirty years before his death; at first he was singular; and his habit was derided, but bo lived to see his example commonly followed.
The ombrelle as at first used, based on its Fastern prototype, was a heavy ungainly article which did not hold well together, and no little ingenuity has been exercised to bring it into the olegant, compact, end etrong form which is now quite connmon. The early umbrella had a long landle, with ribs of whalebone or cane, very rarely of metal, and etretchers of cane. The jointing of the riba snd etretchers to the stick and to each other was very rough and imperfect. The covering material consisted of oiled silk or cotton, hesry in snbstance, and lisble to stick together in the folds. Ginghem soou ceme to be eubstituted for the oiled cloth, and in 1848 William Sangster patented the use of alpaca as an umbrells covering material. One of the most notable inventions for combining lighinness, strength, and elasticity iu the ribs of umbrellas was the "Paragon" rib pateuted by Samuel Fox in 1852. It is formed of a thin strip of steel rollad into a $U$ or trough eection, a form which gives great strength for the weight of metal. The use of such ribs, combined with the notehed rings and runners which give s separate hinge and joint to each rib and stretcher, and with the thin but tough covering materials now in use, has principally contributed to the strength, lightness, and elegance which ordinary nmbrellas now present. Unibrella eilk ia principally mado at Lyons and Crefeld ; but much of it is so losded in lyeing that it cuits readily at the folds. Textures of puro eilk or of eilk and alpaca mixed have hetter wear-resisting propertiea.
 early Greeks applied the name ' $\mathrm{O}_{\mu} \beta$ 倪к' to all central and northern Italy. Herodotus (iv, 49) speaks of it somewhat vaguely, as if it extended up to the Alps. The Umbrians probably extended across central Ttaly from sea to sea down as far as Latium. Pliny (iii. 13, 19) tells us that the Umbri were considered the most ancient artion of Italy (antiquissima gens Italim), by which he probably means, of the Italian stock. The Greek writers included under the name of Umbria the district known in later times as Picenum. Pseudo-Scylax makes Umbria march with Samnium, and describes Ancona as a city of Uabria. The Umbrians seem to have found the Siculi and Liburni in occupation of the land into which they advanced, the former Lolding the parts lying towards the interior, the latter, people the district along the Adriatic. The Urmbrians were one of the chief peoples of that branch of the IndoEuropean family who bad entered Italy from the north
and driven out and absorbed the older inhabitants. They were more closely connected with the Samnites and Oscans than with the Latin stock, as is shown by their language. Their possession of the fertile regions of upper Italy exposec. them to the constant assaults of fresb bodies of invaders, pressing on over the Alps, and perhaps likewise from the seaboard. Their force was extended over a wide area, and thus too weak to withstaod the attacks from varions sides to which they were exposed. Thus their extensive territory was gradually reduced by the successive encroachnents of other peoples. First came the Etruscans, who according to Herodotus (i. 94) were Lydians, who established themselves in the land of the Umbrians. From which side of Italy they made their invasion, whether from the mouth of the Po or from the western coast of what later became Etruria, or whether from both, we have no means of determining. That the Umbrians did not yield without a struggle we cannot doubt. It was only after three bumdred of their towns had been captured by the Etruscans that they succumbed. Nevertheless they still retained considerable influence in upper Italy, which, according to Strabo (v. 216), continued down to the time of the Roman conquest. For he says that there was a large Umbrian element in the Roman colocies in the region of the Po, as also some Etruscan. For, according to him, the Umbrians and Etruscans lived in a continual rivalry for the preeminence, so that if the one people made an expedition northwards, the other determined not to be outdone. So when the Etruscans had marched against the barbarians who dwelt near the Po , and had soon again been expelled owing to their effeminacy, the Umbrians in turn marched against the conquerors of the Etruscans. In consequence of this alternating struggle for these regions they planted many colonies, some Etriscan, others Umbrian. Most of the colonies were Umbrian because the Umbrians lay closer to the disputed territory. Thus, even though they lost the sorereignty, the Umbrian race probably continued to form a considerable portion of the population of a wide extent of country. At all events, at the time of the Gaulisi inroad the Etruscans seem to be in possession of the mouth of the Po. At this tine, therefore, Umbria as a state consisted of the region bounded on the W. by the Tiber, on the S. by the Sabines, on the E. by Picenum and the Adriatic, while on the N. it extended close up to the sonthern or Spinetic month of the Po. Scylax dcscribes the Etruscans as extending from the Tyrrhenian Sea to the Adriatic, and represents them as in possession of the ancient Greek town of Spina. How much farther soutl the Etrnscan sway had once reached wo cannot determine, but that they had once held this region, as far as Ravenua at least, is rendered probable by the tradition that Ravenna had been founded by a colony of Thessalians who, not brooking the insulting treatment which they received from the Etruscans, gladly admitted some Unbrians, who thus became the possessors of the city. When the great Gaulisb inroad took place at the beginning of the 4th century b.c. Etruscans and Umbrians alike suffered severely. Some of the Celtic tribes crossed the Po and formed permanent settlements. The Ananes settled in the Apennines, the Boii between the former and the Adriatic; next came the Lingones; and finally the Senones occupied the seaboard of the Adriatic as far as the Rubicon. This region in Roman times was known as the Ager Gallicus (Polybins, ii. 16). But it was not only in the north and west that the Uinbrians had been driven back. The early Greeks had included under the name of Unbria the dis. trict along the Adriatic, afterwards known as Picenum. This consisted of a fertile region, extending from beyond Ancona to the river Matrino. It is not improbable that the Picentes issued from 'the Sabine region. Tradition alleged
that the Picentes, led by the woodpecher (picus) of Mars, marched forth to occupy what is now the March of Ancona. But it was probably only after a long struggle that this conquest was effected, for from another tradition we learn that the Sabines, after carrying on war against the Umbrians for a long time, at length vowed a sacred spring, and dedicated all the produce of the year to the gods. Then at length they became victorious (Strabo, v. 250). Thus, by the advance of the Gauls from the north and the Picentes from the south, the Umbrians were shut off from the seaboard, and confined to the district known as Umbria面 historical times. ( When Rome began the consolidating of Italy, Umbria consisted of the region bounded by the Ager Gallicus on the N., by Etruria (the Tiler) on the W., by Picenum on the $E$, and by the Sabines on the S. The Umbrians kept a desperate bold of this district, which lies between the two arms of the Apennines. This position indicates of itself that they had beon driven before stronger foes. ${ }^{4}$ Henceforward they play but an insignificant part in Italian history. This is explained by the plysical formation of their country.- It is an extremely mountainous region, with a few small plains botween, which were noted for their fertility. Hence arose a number of small but thriving communities, none of which had the capacity of developing into a leading state such as Rome became for the Latins. I Their want of seaports likewise excluded them from trade, the mouths of all the rivers which flowed from their country being in the hands of their enemies.
Of the Umbrians' palitical and monicipal organization little is known. In addition to the city (tota) they $6 e \mathrm{em}$ to have had a larger territorial division in the tribus (trifu, aca.) as we gather from Livy (xaxi. 2, per Umbriam quam tribum Sapiuiam vocant; f. xxxiii. 37) and from the Eugubine Tables (trifor Tarsinates, vi. B. 54). From the fertility of their land thair commuitios were very prosperous. The olve and viue flourished in their valleys; they grew spelt abundently; and the boars of Umbria were famous. Ancient authors daseribe the Umbrians as leading effeminate lives, and as closely resembling their Etruscan enemios in their habits (Theopompus, fragm. 142; Pseudo-Scymnus, 366-8). It is almost certain that sach raeo influenced and modified the other to a large extent. Momn:sen has pointed out that the names of many towns in Etruria are Umbrian, a fact which ahows how persistent even after conquest was their infuence in that ragion. On the other hand, we have conclusive proof of strong Etruscan influences in Umbria. For instance, they undoubtedly borrowed their alphabet aod the art of writing from the Etruscans. Their writing runs from right to left. The alphahet consists of nineteen letters. It has no separate symbols for $O, G, Q$; the aspirates $\phi$ and $\chi$ are wanting; on the othar hand, it possesses forms for Z and V , and has likewisa the Etruscan $f(8)$. It also has a symbol d peenliar to tteelf for expressing the sound of palatal $k$ when followed by either $\varepsilon$ or $i$. It is also very probable that they borrowed the art of coining money from Etruria. Two towns are known to have issued coins, which consist entirely of bronze, and belong almost entirely to the series of $æ s$ grave. The most important is that of Tuder (Todi), which must have been a place of some note. It was e strong fortress on the left bsonk of the Tiber on the confines of Etruria. Iguvium (Gubbio), which struck coins after the standard of Tuder, was a strong place likewise on the western or Etruscan side of the Apennines. The fact that it is only in towns on the sido next Etruria that a coingge is found indicates that it was from the Etruscans they borrowed the art. The Umbrians counted thair day from noon to noon. But whether they borrowed this tikewisa from the Etruscans we do not know (Pliny, ii. 77). In their measuring of land they cmployed the vorsus, a masure common to them and the Oscans (Frontinus, De Limit., p: 30), $3 \frac{1}{5}$ of which went to the Roman jugerum. When the Romans undertook the conquest of lialy, the most feeble resistance of all was offered to them by the Umbrians. In the great atruggle between the Samnite confederacy and Rome Umbria played an insignificant part. It is probable that all through the Second Samnite War their sympathies were altogether oul the side of their Samnite klofmen, and that some assistance was afforded by individual communities. It is not unlikely therefors that it was with a view to keep the Umbrians in check that the Romans planted a colony at. Nequianm on the Nar, whose inhabitants were known as Nartes Interamnates, and who are included with the Etruscans, Iapydes, and Tadinates in the list of persons who were forbidden to be proent at the sacred rites of Tguvium. At length in 308 r.c. the Ombrians made a vigorous effort to aid the Samuites, which, had
ic takeu place earlior iu the war, ninght have had the most inuport ant iafluence on the rssue of the atrugele. As it was, it eamo too late; the Etruseans had alraady latd dowa their arms. The Umbrians, who threstened to march on Rome, ware intercepted by Rullianus with the Ronan army from Samnium on the upper Tiber, a atep whieh the Samnites now broken conld not pravent; and this was sufficient to disperse the Umbrian levies. When the Third Samnite War broke out, the Umbrians took no active part in its oparations; but how their aympathies lay is evident from their affording a ready lassage to the Samnite army under Gellius Egnatius on its march to Etruria, 296 b. o. When the battle of Sentioum (295) finally crushed the Sannites and Etruscans, Umbria remained in the hands of the Romans. Henceforward tha process of Latinuing went on steadily, for hy the 1st century B.c. we find them employing the Latin alyhabet iu copias of the aycient saeardotal litual of Iguvinm (see Eugubine Tanles). I We know that the Oscan language only finally expired in the 1st century of our era, and there is no rcason for belleving that the Umhrian had disappeared much earlier. When the Romans conquered the Senones, 280 R. 0 ., the Ager Gallicus was restored to Umbria, and hoth together formed under the empire the eixth region of Italy.

Strabo ( 7.227 ) regards Ravenna as the boundary of Umbria The Via Flaminia passed up through it from Ocriculum to Ariminum, along which lay the important towns of Narnia (Narni) Carsule (Carsigliano), Mevania (Bevagna), Forum Flammii, Nuceria, and Fornm Sempronii. To the 6 ast lay Interamna (Terni), the probable birthplace of Tacitns, Spoletium (Spoleto), and the most important town of Camermum on the side of the Apennmes towards Picenum. On the aide towards Etruria lay Tuder (Todi), Iguvium, whieh occupied a very advantageous position close to the main pass through the Apennines, Ameria (Amelia), and Hispellum (Spello) ; on the Clitumnus (Clitunno) was Assisium (Assssi), the birthplace of Propertius, whilst far to the north lay Sarsina, the birthplace of Plautns. For the position of the country iu the time ef Augustus, zes vol. xiii. Plate $V$.
See Breal, Les Tables Eupubines, $1875^{\text {; }}$; Bucheler, Umbrica, 1883 ; Kirchhoff, Jriech Alphabet, 4th ed., 1民87; Head, Historra Numorym, 1s87. (W R1.);

UMMERAPOORA, another iorm of Amarapuria (q.v.).
UNAO, a British distrnct in the Lucknow division of Oudb, India, under the jurisdiction of the lieutenantgovernor of the North-Western Provinces. The area of the district is 1768 square miles, and it is bounded on the N. by Hardol, E by Lucknow, S. by Rai Bareli, and W. by the Ganges. Unao is very flat, and has no features of particular interest. Rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barren usar, the whole being intersected with small streams, the water from which is extensively used for irrigation. The Ganges is the only navigable river in the district. The temperature varies from about $75^{\circ}$ to $103^{\circ}$ in the hot weather, and from $46^{\circ}$ to $79^{\circ}$ in the cold season. The average annual rainfall is about 34 nnches.
In 1881 the population was 899,068 (males 461,167 , females 437,902); of these 830,342 were Hindus, 68,677 Mohammedans, and 49 Christians. Unao, the capital and administrative headquarters, 9 miles north-east of Cawnpore, had 9509 inhabitauts. The cultivated area of Unao amounted in 1885-86 to 598,131 acres, and 289,356 acres were returned as cultivable. Tho principal crops are lice, wheat, and other food grains, cotton, sugar-cane, and indigo. The cultivatiou is mainly dependent ou irrigation. Tho principal exports are grain of all kinds, gúr, gli, tobacco, and a little indigo and saltpetre; and the chief imports are piece goods, salt, iron, cotson, spices, \&c. © The gross revenus of the district in 1885-86 amounted to $£ 183,083$, the land yielding $£ 144,914$. During the mutiny of 1857-58 Unao was the sceae of aeveral severe engagaments letween General Haveloek's little army and the rebels. On the death of Rajij Jasa Sinh, one of the leading rehels, and the capture of his two sons, the whole family estates were confiscated, and the villagee either restored to their former owners or given to other landholders for their loyalty.

## UNDULATORY THEORY.

## Theory.

UNGVAR, chief town of the county Ung, in the northeast of Hungary, stands on the river Ung. It is the seat of the bishop of Munkács, and has a fine Greek cathedral, an episcopal seminary, a lyceum, a gymnasium, and also a teachers' college, a county hall, and an interesting ancient castle. The town and district produce good wine in large quantity, and abound in mineral springs. There is a good trade in timber and china clay. The population in 1886 was $13,460$.

UNICORN, an anintatmene horn. . The name is applicable and has sometimes been applied to the rhinoceros, which is, for example, the Sumatran unicorn of Marco Polo. But the figure usually associated with the name is the well-known heraldic one of an animal with the form of a horse or ass, save that a long straight horn with spiral tristings, like the tusk of the narwhal, projects from its forehead. The belief in the existence of a one-horned animal of this kind goes back to Aristotle (Part. An., iii. p. 663), who names as one-horned "the oryx and the Indian ass." Later descriptions of the Indian unicorn, e.g., that of Ælian (Nat. An., xvi. 20), are plainly influenced to some extent by accounts of the rhinoceros, but the authurity of Aristotle determined the general form ascribed to the animal. The twisted horn, of which Elian already speaks, seems to have been got by referring to Aristotle's unicorn actual specimens taken from the narwhal ; see Yule's Marco Polo, ii. 273. The ancient and mediæval lore of the subject may be seen in Bochart, Hierozoicon, iii. 26. The familiar legend that the unicorn could be taken only by the aid of a virgin obtained currency through the Physiologus (see vol. xix. p. 7). The English Bible, following the Septuagint ( $\mu$ оуóкepws), renders the Hebrow rēm (0งา) by "unicorn." But two horns are ascribed to the reem in Dent. xxxiii. 17, and the Hebrew word reappears in Arabic as the nane of the larger antelopes, probably the Antilope leucoryx, mbile in Assyrian the rimu appears to be the wild ox. . There are recent fossil remains in the Lebanon both of Bos primigenius and Bison * urus, though both hare been long extinct in Palestine.

UNITARIANISM. The term Unitarianism in its widest sense includes certain lines of the great religious and theological movement or revolution of the Reformation in the 16 th century, when this is regarded as the commencement of the process of the humanization of theology and ethics on the basis of the autonomy of the human mind. In another sense the term stands for a set of theological opinions, more or less variable, and yet in their general drift connected, somo of them as old as Cbristianity, and one section of which only is indicated by the term when used as aynonymous with Antitrinitarianism. But there is another mearing of the term, a still narrower one, and to Unitarianism in this sense this article must be confined. Wo must limit ourselres to a brief account of Unitarianism as it appears in ecclesiastical organizations in separation from the orthodox churches. This treatment of the subject ${ }^{\prime}$ is of course incomplete, and would be misleading were the incompleteness not expressly announced. For a markod feature of the late listory of the Unitarian churches is the growing tendency they exhibit of working out to their logical results some of the wider principles of the Reformation to which they ultimately owe their origin, rather than the design of formulating and propagating systems of theology. To not a few modern Unitariain leaders the bond which connects them with a specifically Unitarian organization is the spirit and tendency of the larger movement for which it happens to provido freer play than the orthodox churches, while they repudiate the im. putation of belonging to a dogmatic sect. Modera Unitarians have also, both in Europe and America, emphatically and successfully resisted the inclination of some of their number to lay down, though in the most general terms, a creed of Unitarianism. Indeed, in opposing this inclination, it birght sometimes seem as if the only essential article of Umtarianism were the maintenance of free inquiry ln religion',-an impression, however, which a careful study of the history of Unitarian thought would remove. In the same way such a study would show that Unitarian churches are in agreement on many points of doctrine with aarly and recent theologians of all churches and sects.

This brief sketch of Unitarianism, as it has appeared in organized religious societies, takes us"into but a few countries, and covers but a limited space of time. Poland, Transylvania, England, and America aro the only countries in which Unitarian congregations have oxisted in any numbers or for any length of time. Elsewhere, either tho law of the land has rendered their existence impossible, or they have been unnecessary in consequence of the substantial adoption by the existing churches of their principles and doctrines. The former was the caso in Italy, Switzerland, Germany, and England in the 16 th and 17 th centuries, the latter to a certain extent in Eugland in the 18th century, still more in Germany in the 18th and 19th centuries, and in Holland in the present century as also to a large extent in France in the Reformed Church.
Poland (1565-1658). -The Unitarians, under the names of Ariaus, Samosatenians, Pinczowians, were formed into a separato church in 1565 by their exclusion as Antitrinitarians from the syneds of the Trinitarian Protestants. Yory early in the progrcss of the Refornan tion in Poland individuals had arrived at heterodox orinions on baptism and the Trinity, very much under the influence of the heterodox Italian refugees in Switzerland, some of whom visited Poland (Lelio Sozzini, 1551 and 1558 ; Pail Alciati, 1561 ; G. V. Gentile, 1561 ; Biandrata, 1555). Gnnesiua and Gregory Panli were the first to openly preach Antitrinitarian doctrine. After their separation from the orthodox, the Polish Unitarians developed divergent views as to the nature of Christ, as to the lawinlness of paying divine worship to Him, as to the subjects of baptism (infants or adults), and as to the relation of Cluristians to the state. On the first point some were Arians and others Hamanitarians, while those who claimed divine worship for Christ were called Adorantes and those of the opposite view Nonadorantes. An epoch in the listory of the party was made by the arrival of Fanste Sozzini at Cracow in 1579 (see Socinus). He sncceeded in converting the great majority of the churches to his views and in silencing the disscntients. Henceforth the Polish Unitarians adopted the Socinian practice of paying worship to Christ, the Socinian view of the necessity of baptism and of the Christian's duty towards the state. Thpy rapidly became a numerons and powerful' body in Poland, distinguished hy the rank of their adherents, the ability and learning of their scholars, the excellence of their schools, and the superiority and wide circulation of their theological literature. Racerv, thie theological centre of the Socinians, with its school and printing presses, ohtained a world-wide fame. It was there that the Racovian Catcchism mas published (1605 in the Polish language, 1608 in German, and 1609 in Latin). But before the death of Fausto Sozzini (1604) the situation of the Unitariaus became moto difficult, and in 1611 the Jesuits obtaincd their first open triumph over them. In the rapid course of the Cathelic reaction, which was not resisted by the orthodox Protestants as long as ture Socinian heretics only suffered, the church and school at Lublin, the most important place next to Racow, were first put down (1627) and Racow, with its church, school, and printing-press suffered the same fate in 1638 . The final blow to the whole body follewéd in 1658, when all adherents of "the Arian and "nabaptist sect" were cornmanded to quit the kingdom within two jears. A few renounced their faith, hut the large majority fled into.Transylvania, Prussia, Silesia, Holland, and England.

Transylvania (1568-1887).-Next to Polana Transylvania was tho most important seat of Unitarianism. It was there the name was first nsed by the sect as itsown desigaation, and it is there only that the sect has had a coutinnous existence dewn to our own time It is generally considered that the Italian refugee Biandrata was the founder of Transylvamian Unitarianism, but the present representatives of the body claim for il a nobler and domestic origu. Biandrata attended John Sirismund as a physician in 1563, and under his influenco Unitarianism mado rapid progress. In 1568 its professors, favoured by the king and many magnates, after senarating from the orthodox clurch, constituted themselves a distinct body nuder the distinguished man Francis David, who is now regarded as the apostle of true Transylvaniau Unitarianisu. Their priucipal centro was Klausenlurg (Kolozsvin), where they had a large church, a college, and a printing-press. But the stwo conflict between a more rarlical and a more conscrvative tendemoy which appeared amongst the Unitarians of Poland greatly distarbel the churches of Transylvania, particularly with regarl to the worship of Christ. On the side of the Adorantcs was Biandrata, and on that of the Nonadorantes David. The party of David succumbed to force and frand, and he himself died in prison a martyr to nis convictions. Gradually the Socinian view prevailed, thougt in 1618 an old order to worship, Christ reqnire I rciuforcement in the latter half of the 18 th centary the moro logical view of norid entirely disappeared. Uraler tha Austrian dynasty the Uniffriam
were often exposed to great trials, until Joseph II. secured to them their rights and privileges. An official confession of faith of the year 1787 remains, with some modifications, essentially Socinisn. But of late Jears the Traogylvamien Unitarians bave been in close relation with their co-religionists in England and America, some of the ministers having heen educated at Manchester New College, and in consequence their theology is becoming essentially modern. The number of members wes 32,000 in 1789, in 1847 40,000, distributed io $10 \pm$ parishes with 120 pastors. Their present numher is 53,539 in 106 parishes. Their chief centres are Kolozsvár, Thorda, and Keresztur, where they have excellent schools.

England (1773-1887). -For two and a half centuries previoas to the rise of organized Unitarianism in England, opinions commonly called by this name found numerous individual adrocates and sonie martyrs. John Bidle (1615-62) published catechisms of Unitariau doctrine, translated Socinien works, and pnblicly discussed and preached an Eaglish form of Socinianism. But the severity of the lav against Antitrinitarians, woupled with the gradual growth of free opinion in the Established Church and amongst the Presbyterian congregations, made the formation of eeparate Unitarian churches impossible, and, as was felt, less necessary for another hundred years. The adoption of a completely Humanitariau view of Christ's person by a few solitary individnals (Lardner 1730, Priestley 1767 , Lindsey 1773), assisted by the a wakened earnestmess of the time, led to their formation. Lindsey resigoed a valnable living in Yorkshire, and gathered the first professedly Unitarian church in London. Other clergymeo followed his example, and amongst the Presbyterians several ministers, like Joseph Priestley, exchanged their Arian for Humanitarian viewe. This process weot on with deep permeneat effects in sorne of the Dissenting seademies, In the year 1791 was formed the Unitarian Book Society for the distribution of literature, and several provincial nssociations originated about tle same time. In 1806 the Unitarien Fund Society was established, with the object of promoting Uhitarian Christianity by direct mission work. In 1818 arose another society for protecting the civil rights of Unitarians. These varions societies were consolidated in 1825 under the name of the British and Foreign Unitarian Association, which has now its headquarters in the building formerly used as Lindser's chapel and residence in Essex Street, London. Early in this century nearly the whole of the old Presbyterian congregatious, which, unlike those of the Baptists and Independents, had undogmatic trust-deeds, passed through the stages of Arminianism and various forms of Arianism into Socinianism in its peculiar English and mainly Priestleian form. The penal laws against Antitrinitarianism, which had long heen obsolete, were repealed in 1813, and in 1844 the right of Uniterians to the chapela which they held in succession from their Freshyterian forefathere was legally secured to them by the Disaenters' Chapels Act without altering their undogmatic trust-deeds. Though these congregations, popularly known as Unitarian, on principle declined to restrict the progress of thought by imposing on either their ministers or members any dogmatic statements of belief, the generality of them adopted with some modificstions the theological system of Priestley, which was a combination of Lockeंs philosophy with the crudest rationalistic superneturalisn. With the rise of a more spiritual philosophy in Germany, which bore fruit in England and A merica hefore the close of the second decade of tho century, the theology of Engligh Unitarianismanderwent a radical change, very much in the first instance under the influence of Dr Chamining's writings. Without at all sacrificiog its critical and rational bent, a decper emotional and spiritual element was introduced into it, which gradually, at the cost of some years of internal conflict, dispossessed the purely external and snpernaturalistic Socinian and Priestleian legacy. Eaglish Unitarian theology was thereby brought into closo sympathy with modern scientific theology in Gernany and elsewhere. This great and baving transformation was mainly due directly to Jamee Martinean, J. J. Tayler, and J. H. Thom, aided by the mritings of Chenning and then of Theodore Parker. One consequence of the grester subatantial agreemeat of the present theology of the larger number of the Unitarien churches with the scientific theology of the century is that not a few representatives of these clurches disclaim the name Unitarian as one tending to perpetuate divisions which have really no right to continned existence. The main reason for continued separation from the larger liberal churches, whether Established or Dissenting, earnestly urged by many Unitarians of this class, is the use in those churches of theological formularies which moderu theology regards as of historic interest only. The nomber of congrega. tions in Eagland and Walea generally described as Unitarion is Ghout 300 , ncarly half of which date from between 1662 and 1750 , and nearly all of which have nodogmatic trust-deeds. Their coustitution is purely congregational. For the education of their ministers they havo \$lanchester New College, London (strictly undenominational), the Unitarian Home Missionary Board, Manchester, and Carinartleu College, sujported and managed by the Presbyterian Board in London, but practically Independent and Unitarian. The nrgans of the body are The Inquirer, The Christian Life, The Uni.
tarian Herald (weeklies), and The Christian Reformer (monthly). In Scotland there are 7 Unitarian cungregations and 2 Universalist, the latter being, as in America, Unitarian in doctride. In Ireland the number is about 40, being nearly all Presbyterian in conetitution. They ere much stronger in the north than in the sonth of Ireland. In the porth Autitrinitarian views began to apread abont 1750; but the first coogregation at Dublin traces its Unitarianism back to Thomes Emlyn, who was imprisoned for his Arian opinions in 1702 at the instigation of orthodox Dissenters.

Uwited States (1815-1887). -In the United States Unitarianism had no organized existence provious to 1815, and as in England at the present time the name has always covered great differences of opinion within a common outliue of belief or common drift of religions thought Historical American Unitariauism represeuts "the liberal wiog of the Congregetional body." Of the existing 370 churches 120 or more were originally the parish churches founded hy the Puritan Congregationalists, which, like the Presbyterian congregations in Eagland, passed gradually from Calvinism through Arninianism to Unitarianism, of which Harvard College became the spiritaal centre. In 1812 there was but one church in America prolessedly Unitarian (that of King's Chapel, Boston), thoogh the ministers of Boston generally held Unitarian vierra. In 1815 Belsham's account of the "State of the Unitarian Churches in America" (in his Life of Lindsey, London, 1812) led to a controversy, the issue of which was the distinct avowal of Unitarian priaciples on the part of the liberal clergy of New England. Dr Channing came forward as the prophet and champion of American Unitarisnism, thoogh the older he grew the more emphatically he repudiated aectarianism in every form. The Congregational body wes thereby split into two sections, one of which styled themselves Unitarian Congregationalists. In 1825 the American Uuitarian Association was formed, mainly for the diffusion of Unitariar literatnre and the support of poor congregations At that time the Unitarian churches numbered about 122. Twenty years later they were eome 280, while now they are about 370 . The theological colleges of the body are the Divinity School of Harvard University; which is, like Manchester New College, undenominatioual, and the Theological School of Mealville. As in Englend so in America the theology of Unitarians has passed through marked cbanges, which have been atteuded by conflicts more or lese acute. From 1815 to about 1836 a Biblical, semi-rationalistic semi-snpernaturalistic theology prevailed, in the heart of which Clanniug's elevated ethical ideas wore fermenting ond slowly preparing a new birth. From 1836 forces such aa liblical criticism, Carlyle and Emerson's "transcendentalism," and Theodore Parker's "absolnte religion" opened the era of modern thcology, hringing American Unitarianism inte living touch witl the pliliosophy and theology of Germeny. An effort in 1865 to bring the right and left wings of the body into a closer coufedration mith a more pronounced profession of Claristianity led to the formstion of a Free Religious Association on the broad basis of the Iove of truth and goodness. In the Westero States the same controversy as to the basis of religious association liss been ragiog for more than ten yeare. In May 1886 a resolution was passed by the Westero Uuiterian Conference by a majonty of noore than three-fourths adoptiug a parely ethical and non-theological hasis. This led to a split in the body, and the formation of a new Western Association on a distinctly Christian platform. The left wing of American Unitarians show grcater sympathy with recent scientific speculation and less fear of pantheistic theories than is the case with English Unitarians. The of gans of the hody are The Unitarian Revicw (Bostou), The Christian Register (Bostou), and The Unitarian (Chicago).

## Unit.as fratrum. See Moratian Brethren.

UNITED BRETHREN IN CHRIST, a body of Pro: testant Christians in the United States of America, which in 1886 included 4332 organized churches ( 4078 in 1857), 185,103 menbers ( 143,881 in 1877), 1378 itineraut ministers, 890 local preachers, 3169 Sunday schools, with 28,547 teachers and 179,729 scholars. The total value of church property held by the denouination was $\$ 3,345,004$ : the sum raiscd for salaries, church bulding expenses, col-
leges, missions, and the like made a total of $\$ 842,700$. The organization of the church is Episcopal (six bishops, two of them missionary), but its polity combines features of the Methodist. Congregational, and Presbyterian systems. The creed may be described as Arminian. The members are prohibited from joining secret societies, and from using alcohol or engaging in its manufacture or sale. In connexion with the denomination are a theological institution ( 39 students), ten colleges, aud nine academies or seminaries of a highra grade, with 62 professors, 64 other teachers, and 2486 stadents. There are 49 annual conferences, 46 of them in t!e United States. Two missions in the Sherbro country in West Africa have 6 American missionaries, 9 churches, and 2031 nembers; in Germany there are 10 German'missionaries, with 20 churches and 615 members.

The denomination originated in the labours of P . W. Otterbein (1726-1813), a native of Germany, who came as a missionary to Lancaster, Pa., in 1752, and settled at Baltimore in 1774 . He became associated with Martin Boelnn, a Mennonite preacher, and also co-operated with tho Methodist preachers when they came to Peonsylvania, The first annual conference was beld iu 1800.

UNITED KINGDOM, The, of Great Britain and Ireland is the official title, adopted in 1801, now applied to England, Scotland, and Ireland (see Great Britain). The total area is returned as $77,657,065$ acres, or 121,339

square miles,- England and Wialez cubraciug 37.370.04] acres (whereof Wales $\cdot 4,721,633$ ), Scotland 19,467,077. and Ireland 20,819,947. Tho accompanying table gives the population of the counties according to the census of 1881, and their parliamentary representation as determined by the Redistribution Act of 1885. In the cnumeration of the Scottish merabers of parliament, groups of burghs are included in the counties containing the burghs whence they are respectively named, while it is to be observed that Kinross county is united with Clacknannan, Nairn with Elgin, and Selkirk with Peebles. The addition of the nine nuiversity representatives (England, 5; Scotland, 2; Ireland, 2) brings the total membership of the House of Commons to 670.

For the Islands in the British Seas the figures are as follows:-Isle of Man--141,263 acres, 1opulation 53,558: Channel Islands-48,322 acres, population 87,702.

UNITED PRESBYTERLAN CHUlCH, Tne, in point of numbers the third of the Presbyterian organizations of Scotland, was formod in 1847 by the nnion of tho United Secession and Relief Churches (see below). The doctrinal standards are those of the other Presbyterian churches of Scotland, aud the forinula employed at the ordination of ministers is similar to that of the Established and Free Churches; but adherence to the doctrinal standards is professed in view of the Declaratory Act of 1879 , according to which signatories "are not required to approve of anything in the standards of the church which teaches or is supposed to toach compulsory or persecuting and intolerant principles in religion," and are allowed freedom of opinion on all points which, in the judgment of the church, do not enter into the substance of the faith. The denomination in 1887 consisted of 32 presbyteries and 564 congregations ( 518 in 1847), with a total membership of 182,063 ( 175,066 in $1878 ; 178,195$ in 1883), thus representing about 14 per cent. of the population of Scotland. The number of baptisms in 1886 was 9894 ; there were 887 Sunday schools, with 11,994 teachers and 97,535 scholars, besides 788 advanced Bible classes, with 30,535 scholars. The total income of the church in 1886 was $£ 373,545$ (average for ten years from 1877 to $1886, £ 375,660$ ) ; of this total $£ 237,300$ was ordinary congregational income, and $£ 136,245$ nissionary and benevolent income. The average stipend paid to each minister was £259, 16 s . 10 d . There is a divinity hall in Edinburgh with 4 professors and (session 1887-88) 114 students. The term of study is three years. The United Presbyterian Church has missions in Jamaica (a syuod with four presbyteries), Trinidad, Kaffraria, Old Calabar, India, Clina, Japan, and Spain. The mission staff consists of 60 ordained Europeans, 22 ordained natives, 8 medical missionaries, 3 Luropean evangelists, and 19 female missionaries. Under these are 502 native evangelists, teachers, and other helpers. In 1886 the membership of the native congregations was 13,214 ( 10,215 in 1881). In Jamaica there is a theological institution. At the end of 1875 the denomination had 620 congregations, with 190,242 members, but in June 1876 98 of its congregations in England, with 20,207 members, were incorporated with the English Presbyterian Church.

History. - (1) United Sccession Church.-The general causes which led to the first great secession from the Church of Scotland as by law established in 1688 havo already been briefly indicaied under Presbyteriantsm (see vol. xix. p. 685 ; compare also Scotland, Church of, vol. sxi. p. 536 zq.). Its inmediate occasion rose out of an Act of Assembly of 1732 which abolished the last remnant of popular election by enacting that, in cases where patrons might naglect or decline to exercise their right of presentation, the minister was to be chosen, not by the congregation, but cnly by the eldere and Protestant
heritors. The Actitself had been passed by the Assembly, although the presbytcries to which it had been previously submitted as an overture had disapproved of it by a large majority; and in accordance with a previous Act (1730), which had taken away even the right of complaint, the protests of the dissentient majority were refused. In the following October Ebenezer Erskine (q.v.), minister of Stirling, who happened to be moderator of the synod of Perth and Stirling, preached a synod sermon, in the course of which he took occasion to refer to the Act in question as in his opinion unscriptural and unconstitutional. ${ }^{2}$ Some of his expressions were objected to by members of synod because "tending to disquiet the peace of the church and impugning several Acts of Assembly and proceedings of church judicatories," and after long and keen debate it was resolved that be should be censured for them. This judgment, on appeais was affirmed by the Assembly in May 1733, whereupon Erskine protested to the effect thaí he beld himself still at liberty to teach the same truths and to testify against the same or similar evils on every proper occasion. This protest, in which he was joined by William Wilson, Alexander Moncrieff, and James Fisher, ministers at Perth, Abernethy, and Kinclaven respectively, was regarded by the Assembly as contumacious, and the commission of Assembly was ordered to procure its retractation or to proceed to higher censures. In November accurdingly the protesting ministers were severed from their charges, their churches declared vacant, and all ministers of the church prohibited from employing them in any ministerial function. They replied by protesting that they still adhered to the principles of the church, though now obliged to "make a secession from the prevailing party in ecclesiastical courts," maintaining their continued right to discharge all the duties of the ministerial and pastoral office "according to the word of God, the Confession of Faith, and the constitution of the church," and appealing to the "first free, faithful, and reforming General Assembly of the Church of Scotland." In December 1733 they formally constituted themselves into a presbytery, but for some time their meetings were devoted almost entirely to prayer and religious conference. In 1734 they published their first "testimony," with a statement of the grounds of their secession, which made propinent reference to the doctrinal laxity of prerious General Assemblies. In 1736 they proceeded to exercise "judicial oowers", as a church court, published a "judicial testimony," and began to "organize churches in various parts of the country- Having been joined by four other ministers, including the , well-known Ralph Erskine, they appointed $\mathrm{Mr}^{2}$ Wilson professor of divinity. For these acts proceeding's were, again instituted against them in the Assembly, with the result that, having disowned the authority" of tliat hody in an "act of declinature," they were in 1740 all deposed and ordered to be ejected from their churches. Meanwhile the menbers of the "Associate Presbytery "and its adherents steadily increased, until in 1745 there were forty-five congregations nnder its jurisdicrion, and it was reconstituted into an "Associate Synod." A violent controversy arose the same year respecting the religious clause of the cath taken by burgesses in Ediuburgh, Glasgow, and Perth ("I profess and allow with my beart the true religion presently professed within this realm and authorized by the laws thereof"), and resulted in April 1747 in al"breach," when two bodies were formed, each claiming to be the "Associate Synod"; those who condemned the swearing of the burgess oath as sinful came to be popularly known as "Antiburghers," while the other party, who contended that abstinence from

[^298]it should not he made a term of comnunion, were desig nated "Burghers." The Antiburghers not only refused to hold further friendly conference with the others, but ultimately went во far as to pass sentences of deposition and the greater excommunication on the Erskines and other ministers who held the opposing view.

The Associate (Antiburgher) Synod held its first meeting in Edinburgh in the house of Adam Gib (q.v.) on April 10, 1747. It grew with considerable rapidity, and in 1788 had ninety-four settled charges in Great Britain and nineteen in Ireland, besides a presbytery in America. .For purposes of organization it was formed in that year into four provincial synods, and took the name of "The General Associate Synod." The "new light" controversies as to the province of the civil magistrate in matters of religion led to the publication of a revised testimony in the "voluntary". "sense in 1804, and in consequence M'Crie, the historian of Knox, with three other brethren, withdrew to form the Constitutional Associate Presbytery.

The Associate (Burgher) Synod held its first meeting at Stirling on June 16, 1747. The number of congregations under its charge rapidly increased, and within thirty years there were presbyteries in connexion with it in Ireland and North America, as well as throughout Scotland. In 1782 the American presbyteries took the designation of the Associate Reformed Church in America. About the Jear 1795 the "voluntary" controversy respecting the power of the civil magistrate in matters of religion arose within this synod also, and a large majority was found to have adopted "new light" views. This led in 1799 to the secession of the "Associate Presbytery," which in 1805 took the designation of the Associate Synod or Original Burgher Synod. ${ }^{2}$

In 1820 the General Associate or Antiburgher Synod (to the number of 129 congregations ${ }^{3}$ ) united with the 154 congregations of the Associate ir Burgher Synod. The body thus constituted, "The United Secession Church," had increased by 1847 to 400 congregations, the whole of which united in that year with the Relief Synod to form the United Presbyterian Church.
(2) Relief Church.-The Presbytery of Relief was constituted in 1761 by three ministers of the Church of Scotland, one of whom was Thomas Gillespie (q.v.), who had been deposed by the Assembly in 1752 for refusing to take part in the intrusion of unacceptable ministers. The number of congregations under its charge increased with considerable rapidity, and a Relief Synod iwas formed in 1773, which in 1847 had under its jurisdiction 136 congregations; of these 118 united with the United Secession Church in that year. The Relief Church issued no distinctive "testimonies," and a certain breadth of view was shown in the formal declaration of their terms of communion, first made in 1773, which allowed occasional communion with those of the Episcopal and Independent persuasion who are "visible saints." A Relief theological hall was instituted in 1824.

See M'Kerrow, History of the United Secession Churah, 1841 ; Struthers, History of the Relief Church, 1843 ; Mackelvie, Annals and Statistics of the United Presbyterian Church, 1873. ${ }^{4}$

## UNITED STATES．

PART I．－HIS゙MORL゙ ANH COIUN゙17．ATION．

I．DISCOV゙ERY AND SETTLEMENT UF AMEMICA．
THE date on which America was first discovered by Europeans is a matter of ancertainty．The legends respecting the early voyages thither are numerous，but the most ancient of them are doubtless fictions．No account of the discoveries， previons to the time of Columbus，can be relied upon， except of those made by the Icelanders，who，about the year 1000 ，attempted to colonize the country，but with－ out any permanent success．It was not until the coming of Columbus，in 1492，that any benefit ras derived by the old world from the discovery of the great continent of America．

The success of Columbus aroused the spirit of enter－ prise，and other voyages were made，notably those of the Cabots in 1497－98，Ponce de I．eon in 1512，and Ver－ razzano in 1523，under the auspices of the English， Spanish and French gorermments，respectivels．The Spaniards gave the name of＂Florida＂to North Amer－ ica，while the French called it＂Canada or New France，＂ and each of these two nations laid claim to the entire countrs．

2．But the English had not forgotten that the Cabots， with English ships，had first reached the mainland of North America，and from this fact they laid claim to the northern part of that continent．Many unsuccess－ ful attempts were made by Englishmen to found colo－ nies．The first of these was Sir Humphrey Gilbert，who inade tro efforts，one in 1575 ，and the other in 1583 ， without success，and lost his life in a storm while re－ turning home．Sir Walter Kaleigh，Gilbert＇s half－ lirother，obtained a patent from Queen Elizabeth，and in I584 sent out two ships，commanded by Amidas and Barlow，to fix upon a place for a settlement．They ex－ ，lored the coast of what is now North Carolina．Struch with the beauty and fertility of the conntry，they gave a most flattering account of it on their return home， and Raleigh named it Virginin．in honor of the＂virgin queen＂Elizabeth．In the spring of 1585 he sent out a colony which settled on Roanoke Island，but it was starved out in the same year．Again，in 1587，Raleigh sent out another calons，under White，to the same place， but it entirely disappeared，and no trace of it could be found when White came back three jears later．In 1602．Gosnola，with trenty culonists，took a short and direct route，and came upon the coast of Massachnsetts． He wintered upon an island in the vicinity and then went back，taking the colonists，who refused to stay any longer，with him． rism－3．In 1606 ，James I granted a charter to two com－ and panies formed in England．This charter gave them the whole continent of North America，from the thirty－ fonrth to the forty－fifth parallel of latitude．The one called the Plymouth Company was to take the northern half，and the other，the loondon Company，the southern half，and their nearest settlements must be a hundred miles apart．Moreover，each colony was to be governed by a resident council appointed by the king，with power to choose one of their own number for president．

4．The earliest attempts at colonization ander the pany，but the expeditions which they sent out in 1606 ， 1607 and 1608 ，were unsuccessful，and it was left for the London Company to found the first permanent English settlement in the new world．In 1606 this company sent out about a hundred men，mostly adventurers，in
a tleet of three vessels commanded by Christopher New－ port．1’xing driven by a storm into Chesupeake Bay， he found there a fine river which be mamed the James river，after the king，and chousing a low peninsula，he there planted the colony of Jamestown on \ay $13,1607$. But very $800 n$ the colonists hecame dissatisfied．Dis－ sentions arose，and Wingfield，president of the council， was deposed．They suffered from starvation，and had it not been for the indefatigable exertions of（aptain John Smith the settlement would have entirely broken up．The colonists experienced many vicissitudes，but after a few years thes became prosperous and the permanent settlement of Virginia was established． In the meantime，the policy of the London Company toward the settlers became more liberal，and a representative government was granted them in 1619, which was the beginning in America of govern－ ment by the people．In 1619 a Dutch vessel brought in some negroes purchased by the planters，and thus slavery was introduced into the English colo－ nies．

5．The first settlers of Massachusetts were a band of Plrmoutt Puritans，or Separatists，as they were called，because colony． they liad separated from the Church of England．Being driven from England，they sought refuge in Holland； but wishing to find a home in the new world for them－ selves and their children，they returned to England again，and from thence a band of 102 set sail in the Mayflower，and landed at Plymonth，in America，De－ cember 21，1620．The little colons survived the rig－ ors of a northern winter，the burden of poverty， and the lack of food，and became permanently estab－ lished．

6．In 162s，John Endicott，with a company，made a Massacha settlement at salem；other towns，also，sprang up setts Bay aronnd it，and these were all united under a clarter colong． obtained from Charles $I$ ，with the aame of the Massa－ chasetts Bay colony．These tro colonies，Plymouth and Jassachnsetts Bay，nere for many years independ－ ent of one another；but were at last united in bige， under the name of Massachusetts．

7．In 162t，the London Company surrendered its charter to the king．A districh was granted to Lord Baltimore in 163シ，and deceived the name of Maryland．Marsland． All the country between the English settlements of Vir－ ginia and the Spanish posts in Florida was granted by Charles Il，in 1663 and 1665 ，to a compans of English noblemen，Lords Proprietors，and was called Carolina．Carollna This territory comprised the present states of Nurth Carolina，South Carolina，Georgia，Alabama and part of Florida．In 1729 North and Sonth Carolina were organ－ ized，and in 1732 Georgia was colonized hy James Oglethorpe．Thus，out of the territory originally Georgia granted to the London Compans，five colonies had been formed．
s．To the territory granted to the Plymouth Com－Theother may，the name New England had been given by Cap－New tain John Smith in 1614．The founding of the Plym－colonies． outh and Massachusetts Bay colonies has already been mentioned．The greater number of the people who came from England in the great Puritan migra－ tion，settled in the latter colony．At the same time many found it expedient to seek other parts of New England．Not only did new－comers thus try new places，but the older settlements began to send out com－ panies．In 1623 New Hampshire was first colonized under a grant to Captain John Mason and Sir Ferdi－

Couneeti- nand Gorges. Connectient and Rhode Island also becut and Rhode tsland, came colonies, and were afterward chartered by the crown in $166{ }^{\circ}$ and 1663 . Thus. out of that part of the country originally granted to the Plymouth Company, were formed the colonies of Massachusects, Connecticut, New Ilanpshire and Rhode Island. Inane was considered a part of Massachusetts and was not counted as a separate colony among those that finally combined to form the original thirteen states. The territory now occupied bs Vermont was clamed in part by New Fork, in part by New Hampshire, and it did not become a sejarate state until after the revolutionary war.

Ashas been said, the charter granted to the london and Plymouth companies provided that their nearest settlements should be one hundred miles apart, thus leaving a strip of territory between the two main grants which was really neutral ground, and was never appropriated by either company. The spaniards had confined their explorations to the south and made settlements there, but thes claimed the whole contiment north of them. The French had established themselves in the north, and held Canada and part of the northern, states; they claimed everything south of them and called the whole New France. The Euglish settlements were midway between the French and Spanish, and the English claimed everything from New England and Carolina westward to the Pacific, maming it all Virginia. Thus, so far, North America was divided between the three European powers, England, France and Spain.
the sise of the Dutch one wite

End of the Dutch
power.
10. But a fourth power had appeared. In 1609, the Dutch East India Company sent Henry Hudson, an Englishman in their employ, in the ship named the "Half Moon," to make discoveries in America. He reached the continent and explored the coast as far south as Virginia, then turning to the north he entered the mouth of the river which bears his name, and sailed up the stream as far as the present city of Albany. Having completed his discovery he returned home. Upon the strength of Hudson's explorations, Holland laid claim to all the land along the great river, and called the whole territory New Netherlands. In I6.21, the Dutch West India Company was formed, and immediately received large grants of land on hoth sides of the Hudson, extending from the Connecticut river on the north to the Delaware river on the south. Previous to this, however, a Dutch settlement had been founded in 1614, on Manhattan lisland, the present site of New York City, which was afterwards called New Amsterdam.
The Dutch now began to establish settlements and trading posts in their pussessions, which included that neutral territory lying between the original grants to the London and Plymouth companies, In 1638 , Delaware was colonized by the Swedes, who founded a settlement on Delaware Bay, which was called New sweden. But disputes about a territory arose between the Swedish and Dutch colonists, which led to a war between them, ending in the final surrender of New Sweden to the New Netherlands in 1655 .
11. But New Netherlands was soon destined to change
bands. The introduction of a foreign element between hands. The introduction of a foreign element between nies had always been recognized as a source of trouble and danger, aud in fact the Dutch settlers, occupsing territory claimed by the English on both sides of them, were continually involved in disputes with their neighbors, especially with those of Connecticut. War having axisen between England and Holland, the English king, Charies II, determined to seize the Dutch possessions in North America; so in $166 \pm$ he granted the whote of their territory to his brother, the Duke of York. In the same year the duke sent out three vessels uuder the command of Colonel Nichols, who, upon arriving in the harbor of New Amsterdam, demanded a surrender of the territory to his English majesty. Governor Stugvesant, being unprepared for defense, complied with the demand, and the whole country passed into the hands
of the English. In honor of the duke, the name New Amsterdam was changed to New York, and the whole territory received the same name.
12. After the Duke of Iork had gained possession of the Dutclu territory, be in turn sold the southern part of it to two English noblemen, Lord Berkely and Sir George Carteret. This tract, in compliment to Sir George, who had been governor of the island of Jersey, was called New Jersey. A liberal constitution was New formed by the proprietors, and Philip Carteret ap-Jersey pointed governor. The Dutch had several small trading stations in this territory at an earlier date, and the Quakers, having buught the rights of Lord Berkely, came soon afterwards. In 1676 a division was made, the Quakers taking West Jersey and Carteret retaining East Jersey, which became Puritan. In 170: the colony was given up by the proprietors to Queen Anne, in order that a royal governor might be appointed, and the two provinces were then made into one.
13. The tervitory comprised within the limits of the Pennsy state of Pennsylvania was granted, in 1681, by Charles vania. II, to William Penm, son of Admiral Penn, in payment of an old debt due from the crown to the Penn family. In $165:$, the present state of Delaware, then known as Delawa the "Tervitories", was added to his domain, and regarded as a part of Pennsylvania, but in 1703 it became a separate colony, Thus, the formation of the original The thirteen colonies has been described. The London origina Company's territory fumished five, viz: Virginia, colonie I]aryland, North Carolina, South Carolina and Georgin. The Plymouth Company's grant, comprising New England, gave four, viz: Massachusetts, Connecticut, Rhode lsland and New Hampshire. The neutral territory included between the original grants to the two companies furnished fonn, viz: New York, New Jersey, Pennsylvania and Delaware.
14. It is in vain tolook for well balanced constitutions The cor in the earlier periods of colonial history. England tutions herself can scarcely boast of having a fixed constitution the cole previous to the revolution in the year 1688 , a period subsequent to the settlement of the colonies. The legal and constitutional history of the colonies, therefore, affords but lithle instruction. As has been shown, in less than eighty jears from the first permanent English settlement in North America, the (wo original patents granted to the Plymouth and London companies were divided and subdivided into ten distinct and unconnected provinces, and in fifty years more three new colonies were added to the southern extreme of the previous establishments. To each of these, after various changes, there was ultimately granted a form of government resembling, in its most essential paris, as far as local circumstances would permit, that which was established in the parent state. Without entering into details, it may be observed, in general, that agreeably to the spirit of the British constitution, ample provision was made for the liberty of the colonists. The colonial forms of government were, in the main, unhampered by the rojal prerogatives. In some of the provinces the inlabitants chose their own governors and all other public officers, and their legislators were under little or no outside control. In others, the crown delegated most of its powers to particnlar persons, who were also invested with the property of the soil. To those colonies which were most immediately dependent upon the king were granted the same rights and privileges as their fellow subjects in the mother country.
15. During the period of colonization, three forms of Forma' government were observable-proprietary, charter and govera. royal. The proprietors of land grants offered liberal ment. governmental privileges to those who were willing to settle on their lands, and thus several of the colonies became proprietary. These were Maryland, Carolina, Georgia, New York, New Hampshire, Pennsylvania (also including Delaware) and New Jersey. Some of the proprietors, becoming tired of their grants, surrendered them to the crown, and the colonies, established in such territory, became royal provinces, over which the king appointed governors with the power of abso-
lute verc on legislation. The colonies thus coming under the royal authority were, North Carolina, South Carolina, Georgia, New York, New Hanpshire and New Jersey. Virginia became a rojal province about 1620. Three colonies, only, remained proprietary down to the Revolution; these were Peunsylvania, belaware (now a separate colony) and New Jersey. The colonies organized under a charter government were Massachusetts, Connecticut and Rhode lsland. These charters were granted lig rojal authority, and gave the colonists the right of choosing their own officers, and making and enforcing their oirn laws as they thought hest. Upon tbe accession of Fames II to the throne, he held that all the colonial lands in New England belonged to the crown. Accordingly, he sent over Sir Edmund Andros, who was to revoke all the charters, and assume the governorship of the province of New England and New York. The charter of Massachusetts was annulled in 16St, but Connecticut and Rhode lsland retained theirs in spite of the royal authority. In 1693 a new charter was granted to Massachusetts, but under its conditions she partly became a royal province.
16. For the first century and a half after the settlement of the colonies, England, in the main, exercised a wise and liberal polics toward them. She allowed them to govern themselres by such laws as their local legislatures thought necessary, and left their trado open to every individual in her dominions. She alsogare them iull permission to pursue their respective interests in such a manner as they thought proper, and reserved little for herself but the benefit of their trade, and that of a political union under the same head. This indul. gence had a very marked effect upon the growth and prosperity of the colonies. They inereased in realth, numbers and resources with a rapidity never before equalled in ancient or modern histors. They extended their settlements $1,500 \mathrm{miles}$ along the sea coast, and 300 miles to the westward. In the short space of 150 years their numbers increased to three millions, and their commerce to sueh a degree as to be more than a third of that of Great Britain, although much restricted by the navigation laws imposed upon them by the mother country. The rapid increase in the population of the colonies was principally oring to internal causes, though somerthat accelerated by the inllux of strangers previous to 1630 : Jet, after that time, immigration formed but a small feature in peopling the country. The hardships of colonial life, which came to be better understood, and the constant struggles between the people and the home government respeeting rights and privileges, served as a check to the adrent of newcomers. Hence, the population of the colonies arose mainly from natural increase. In consequence of the equality of fortune and simplicity of manners which prevailed among them, their inhabitants multiplied far bejond the proportion of old nations, corrupted and weakened by the rices of wealth, ahove all, of vanity, than which. perhaps, there is no greater enemy to the increase of the human species.
17. In the settlement of a new country. many hard. ships and privations must of necessity be endured, and the American colonists experienced their shate of them, more especially those of New England. In that section the elimate was more rigorous than in the other parts of the country, and the cultivation of the soil more difficult. The habitations outside of the regular settlements were often far apart, so that intercommunication was infrequent. The dwellings of the settlers were of the ruder sort, being composed of logs, and so imperfectls constructed that they afforded a poor protection against the cold of a New England winter. While the colonists were poor there was necessarily great plainness of living among them. Luxuries were unknown to them, but there was an abundance of the coarser kinds of food. Pork and beans, boiled corn meal and milk, or pork and peas, formed the staple articles of diet, Bread was commonly made of "rye and Indian," and seldom of flour. Tea and coffee were not yet introduced,
but home-made beer and cider were largely used. Iieing principally of l'uritan stock, there were but few secular amusements among them. Dancing, and the theater, or anything approaching it, were forbidden; musical instruments were rare, and no one was allowed to own a set of dice or a pack of cards. In their desire to promote virtue, the Puritans, no doubt, were too austere in their mote of living, yet the standard of morality among them was certainly very high. In the southern colonies life was more ensy, as a general thing. A large proportion of the settlers there were men of good fanily, attracted to the new world by a desire to make mones and to enjoy personal freedom. Many of them secured patents for plantations of their own, instead of attempting to improve the lands in common, and brought out laborers to work them at their private expense. The soil was very productive, and the growth of tobacco, rice and indigo formed a great source of wealth, so that luxury abounded in that part of the country to a mueh greater extent than in any other. The existence of slavery among them eaused a great real of ignorance and idleness, as the wisest of them almitted; but there gren up an aristocratic class, among whom there were many men of high character and energy. The settlers in the region which now forms the middle states principally followed the oceupation of farming, the soil and climate heing well adapted for the growth of cereals.

> The religion of the colonists Was chietly Protes- The
tant. A majority of them, especially in the north, were relighons
of that class of men who, in England, were called dis- condition senters. In New England they were largely Congregational. All the other leading denominations also had their representatives in different parts of the country. In the royal colonies there was a strong tendency towards the Church of England. which became the prevailing religion among them. In Virginia it was estal,lished by lat. In fact, nearly every colony at the outset attempted to establish some form of religious belief on a governmental foundation, and on account of this. as is well known, persecutions at the first arose. But Religious genepal, men सere left at liberty to worship God according to the dictates of their own conscience.
19. The English colonists were, from their first set-Thespirl tlement in America, deyoted to liberty, according to of liburty. English ideas and English principles. After a long struggle between the king and his parliament, eulminat ing in the English revolution, the following fundament al principles were settled: "That it was the undoubted Pighs of
right of English subjects, being freenen or freeholders, Fnylish o give theirns arem freeholders, subjecta. the House of Copery only by their own consent. That the House of Commons exereised the sole right of granting the money of the people of England, Lecause that house alone represented then. That taxes were the free gifts of the people to their rulers. That the authority of sorereigns was to be exercised only for the good of their subjects. That it was the right of the people to meet together, and peaceably to consider their grievances, to petition for a redress of them, and finally, when intolerable grievances were unredressed, to seek relief, on the failure of petitions and remonstrances, by forcible means." Upon these fundanental principles, thus established, the colonists tonk their stand, and ali encroachments on their rights were met with a more determined spirit of opposition than would have been possible, had they emigrated from the mother country in the preceding century, when the doctrines of the divine right of kings and passive obedience to their will were generally accepted.
20. There were many causes farorable to liberty Causes among the colonists. Their removal to so great a dis- fovorable tance from the parent goremment greatly weakened their attachment to their sovereign, and with each suoceeding generation that affection became still less marked, and at length was almost patirely lost. Their religion also fostered a love of liberty. They were chiefly Protestants, and all Protestantism is founded on a strong claim to natural liberts and the right of private judg.
ment. The state of society in the colonies was favorable to a spirit of liberty and independence. Their inhabitants, nnaccustomed to the distinctions of rank which characterized European nations, were imbued with the idea that all men are by nature equal. All their impressions were calculated to inspire them with a belief that democratic forms of government were by far the best. With rank and titles they had notbing in commun; kings, nobles and bishops were unknown to them. They could not easily be persuaded that their grants of land or their civil rights were the gifts of princes. Many of them had never heard of Magna Charta, and those who knew the circumstances of the remarkable period of English history when that great charter was obtained, did not rest their claims to liberty and property on the transactions of that important day. They looked to the Parent of the universe as the source of all their rights. Their political creed was short but sound. They believed that God made all mankind originally equal; that He endowed them with the rights of life, property and as much liberty as was consistent with the rights of others; that all government was a political institution between men naturally equal, not for the aggrandizement of one or a few, but for the general happiness of the whole community. Impressed with sentiments of this nature, they grew up, from the earliest infancy, with that conficlence which is well calculated to inspire a love for freedom and a prepossession in favor of independence.

## 11.-THE CONTEST BETWEEN ENGLAND AND FRANCE.

Frauce in America.
21. While the English were establishing their colonies along the Atlantic coast, and gradually working their way into the interior, the French were penetrating the continent by the way of the St. Lawrence, taking adyantage of the discoveries made by Cartier, Champlain and others. The two great pioneers of French occupation were the fur trader and the missionary. It was about the time of the settlement of llassachusetts Bay that the Jesuit Fathers, who had already been laboring for many years among the Algonquins and Hurons of Canada and New York, began to push their explorations westward with renewed zeal and enterprise, accompanying, and often leading, the Canadian fur traders on their long journeys. Among the soldiers, also, who came to New France, as the Frencli possessions in America were called, were men who were intent upon enlarging their king's domains. Several of the Jesuits were martyred. Allouez made known the copper mines of Lake Superior. Dablon and Narquette founded Sault Ste. Iarie, the first white settlement in the nortbwestern States. Harquette, accompanied by the trader Joliet, first reached the upper waters of the Mississippi in 5673.
22. One of the greatest of French explorers was Robert de la Salle, who came out to Canada to seek his fortune. A tract of hand was granted him a few miles beyond Montreal but he was bent uponnew discoveries. He secured the aid of some rich men and of Count Frontenac, governor of Camada, and having built some vessels, be explored the upper lakes, made his way to the Illinois river, and erected a fort on the present site of Peorin. At last he made the great journey which he had for some time been planning. He set out from Fort Miami, on Lake Michigan, with a party of Frenchmen and Indians. He dragged his canoes from stream to stream until, after innumerable hardships and dangers, from which he never flinched, he launched them upon the waters of the Mississippi and floated down its corrent. He explored the great river to its mouth, and, in 1682, took possession of the vast territory drained by it and its tributaries, in the mame of Louis XIV, king of France, and named it Louisiana after him. He then retraced his course and bastened back to France. The king fitted out an expedition for La Salle, that he might establish a colony at the mouth of the Mississippi. The naval commander, Beaujen, handed LaSalle, and his company at. Matagorda bay, in Texas, which La Salle
supposed at first was the mouth of the Mississippi. Then Beaujeu sailed back and left the colonists to their fate. They built a fort, and La Salle set out to find the Mississippi, but ntterly failed. Dividing his men, he left one party in possession of the fort, and with the other endeavored to force his way to Canada, there to obtain relief. He never reached the end of his journey. After suffering terrible hardships, he was treacherously murdered (1687) by some of his own party when on his way. France sent out another expedition under Iberville, who (1702) founded Mobile. In 1718 the city of New Orleans was founded by the French Mississippi Company.
23. The French planted military posts at intervals French along the great river, and settlements rose up about milita them. The French colonies and outposts also extended posts. from New Brunswick and Nova Scotia, up the valley of the St. Lawrence, and through the region of the great lakes. Thus the English settlements became ericlosed ly a cordon of military posts, and at that time it seemed as though the whole continent was destined to become French rather than English. The Frencb also had an advantage from the fact that they had secured the good will of most of the Indian tribes, through their own prudent policy and the influence of their missionaries. The English settlers looked upon their French neighbors with jealousy and alarm, for they interfered with the extension of their settlements, especially in the north. In the southern colonies the inconvenience of the French occupancy was comparatively but litlle felt. Their social characteristics and the nature of their industry were not favorable to western migration, so, as there was nothing to tempt them away from their plantations into the wild interior they kept close to the seacoast. But in the north it was different. There the constant increase of commerce was followed by the increased wealth of the towns, and consequently the lands about them became more valualile. The great bulk of the emigrants tho came over landed at the northern ports since trade was more active in the northern colonies. Many of these, being unable to purchase homes near the great centers of trade and the many flourishing settlements, or being impelled by a spirit of enterprise, went in search of new lands farther from the coast. Thus the northward and westward growth of New England and the English conquest of New Netherlands brought the two great rivals face to face.
24. The great struggle between France and England King ${ }^{1}$ began in 1690. King James II had been detbroned liam's (1688), and William of Orange placed upon the English throne. The French king, louis XIV, espoused the cause of James, and a war followed, known as King William's War, in which the colonies became involved. Both the French and English colonists made use of Indian allies, and the warfare was marked by the most barbarous excesses. The Indians of Maine and New Hanpshire were incited by French traders to attack the English towns. In 1689 Dover was burned. Casco was attacked, but the timely arrival of reinforcements from Massachusetts saved it. All the settlements further east were broken up. In 1690 the war hecame more earnest. Three war parties of French and Indians were sent out by Connt Frontenac from Montreal, Three Rivers and Quebec. The first surrounded the settlement of Schenectady in the night, and put it to the sword. The second destroyed Śalmon Falls, New Hampshire, and then, in conjunction with the third party, captured Casco
The Englisb colonies became aroused and determined to punish the invaders. An expedition, fitted out under the united efforts of Massachusetts, Plymouth, Connecticut and New York, was sent out under Titz-John Winthrop, against Montreal. An attack made on the town was repuised by Frontenac. In the meantime, Sir William Phipps, with a fleet, sent out from Massachusetts, plandered Port Royal and other French settlements. Then, sailing up the St. Lawrence, he attempted to surprise Quebec. But Frontenac, having defeated the attack on Montreal, reacbed Quebec before
him, and the enterprise failed. The war continued antil 1697, when a treaty of peace was made between France and England. Both parties had suffered severely, and neither had gained any real advantage.
25. The truce between the two great rivals lasted about fire years, when war again broke out betreen them (1702). At once the French and English in America fell to fighting, and the war that followed is called Queen Anne's War. During the five sears of peace the French had continued to make settlements in the west. They never lost sight of the great idea which inflamed their ambition, which was to establish a great Frenct-American empire. Thes had founded Detroit, Mobile and numerous rillages on the Mississippi. In the east they had recovered all the places taken from them by the English in the 1ast war, inangurated new missions, and increased their influence over the Indians. At this time Spain was in alliance with France, and the English settlers found themselves opposed not only by the French in the north and west, but by the Spaniards of Florida in the south. The English colonists directed their first operations against the Spaniards. St. Augustine was captured ( 1702 ), but had to be abandoned. Three years later the Christian Iudian settlements of middle Florida were destroyed by the English, and the missions entirely broken up.

## warat 26. New England suffered greatly in this war. There

 was an atrocious massacre at Deerfield in 1704. Haverhilh. which had not fulls recovered from the inassacre of 1697 , was plundered and burned a second time, and mans of the colonists killed (1700), and the whole of that part of the country was harassed by barbarous foes. Receiving but little help from England the colonists for several years mere unable to undertake any important expeditions. An attack on Charleston. s. C. ( 1100 , by the Freuch and Spaniards, was repulsed. Port Rogal was again taken from the French (1110), and with it the most of Acadia, which now beame known as Nova Scotia.In 1711 an Fnglish fleet arrived in Poston to cooperate with the colonists in an attempt to conquer Canada, but all operations in that guarter proved a failure. In 1713 a treaty of peace was signed at Utrecht, by which the English acquired Newfoundland and Acadia. The eastern Indians were also induced to make peace about this time.
27. Many years of peace now followed, during which the colonies increased rapidly in population and adranced in material prosperity. The French still pursued their scheme of building up a great empire in the west. They controlled the valuable fur trade of the whole 11 ississippi valles. After their expulsion from Acadia, they had crossed to the island of Cape Breton, and erected the strong fortress of Louishurg. At Niagara they had a fort commanding the commonication between Lakes Erie and Ontario. Natchez was founded in 1i16. In 1710 New Orleans was luilt, and soon became the capital of Louisiana. The French missionaries also continued their conquests in the wilderness of the Mississippi. After sereral years of peace, France again declared war against England (17-H), and immediately began hostilities against the settlements. The campaign which followed is known as King George's War, because it occurred in the reign of George II.

2s. The colonists determined to carrs on the war by their own means without waiting the uncertain aid from England. An expedition was planned against Louisburg which was successful, and that strong fortress fell into the hands of the Americans (1745). This achievement of untrained soldiers was receired with enthusiasm by the colonies, and with astonishment in Europe. The treaty of Aix-la-Chapelle (1748) put an end to the war; and, greatly to the disgust of New England, Lonisburg was restored to the French in exchange for Madras, in Hindustan, which France had taken from England.
29. The colonists had but a short time to reap the benefits of peace, after the treaty already referred to, when the sound of approaching war filled the land
with anxiety and gloom, After an interval of about eight jears, Great Britain formally declared war against France. The causes leading to this war, which was called the French and Indian War, were the alleged encroachments of the French, on the frontiers of the colonies in America belonging to England. The French determined to connect their northern and sonthern possessions by a line of posts extending along the frontiers of the Euglish possessions, from Lake Ontario to the Ohio, and down the Ohio and Mississippi to New Orleans. Cp to the middle of the last century the English had not attempted to explore or settle the regions lying beyond the Blue Ridge and Alleghany mountains, but in 1749 a company of traders from Jondon and Virginia. called the Ohio Compans, obtained a grant from the The Ohro crown of 600,000 acres of land on the east bank of the Compans Ohio river, in mbat is now West Virginia and Pennsylvania. In the jears immediately following they made surreys and established a fer settlements. One of the surveyors was George Wasbington.
30. The French, regarding these operations of the Ohio Company as an encroachment upon their territory, strengthened the fort at Niagara, built another at Presque Isle (1753), now Erie, established posts at La Beuf and Venango (now Waterford and Franklin, in the oil region of northwestern I'ennsylvania), seized the English traders, and confiscated their goods. When rumors came of what the French had done, Governor Dinwiddie of Tirginia sent Washington, then not jet twenty-tro jears of age, to look into the matter, and expostulate with the French regarding their encroachments. After an arduous and perilous winter journey, Washington brought back such a report of the determination and activity of the French, that the Virginia Assembly at once took measures to build a fort (1754) at the junction of the Monongahela and Alleghany rivers; but while the fort was being erected the French suddenly appeared, drove the English away, and finished for themselves the fort which, they called Fort Du Quespe.
31. In the meantime, a body of 400 men had been raised in Tirginia and North Carolina, and sent out under Washington into the disputed territory. Meeting at Grand Meadows a French force which had been Washing. sent out to intercept him, he attacked and defeated skirmish. it (1754). Learning of the approach of a greatly superior force of the enemy, he erected Fort Necessity. Here he was attacked by the French, and compeljed to surrender, but on honorable terms. During this time, both the rival governments of France and England were making preparations for the coming struggle, though there was no formal declaration of war until 175 h.
32. In 1.55 General Braddock, with a force of Braddock's English and American troops, marched against Fort defeat. In Quesne, but was defeated with great slaughter. and but for the skill displaged by Washington the whole arms wonld have been annihilated. Braddock himself was mortally wounded, and died shortly afterwards. After his death, General Shirley took command, and made an attempt to reduce Fort Niagara, but accomplished nothing. General William Johnson was appointed to attack Crown Point. He deleated the French General Dieskau in the battle of Lahe George Sept. 5.1755$)$, but was unable to reach Crown Point. In the same year all the French inhabitants of Acadia were banished.
33. 1n May, 1756, war was formally declared hy Great Britain, and by France in the following month. Lord Loudoun was appointed commander-in-chief of all the forces in America, bnt, owing to necessary delay, General Abercrombie preceded him and took the conmand. The Marquis of Montcalna became the French commander. Abercrombie awaited the arrival of Loudoun before attempting anything. Both oflicers proved inefficient, and by their delays allowed the French not only time to strengthen their posts, but also to attack those of the English.
34. In August, 1756, Montcalm captured Fort Ontario Campaigns with a large number of military stores, guns, prisoners and 1757.

## The Treat

 of Paris.Pontiac's War.
and vessels. In June, 1757, Lord Loudoun organized an expedition against Louisburg, but ahandoned the attempt on learning that the garrison at that place had been strongly reinforced by a French fleet. In the meantime, Iontcalm, collecting his forces at Ticonderoga, marched against Fort William Henry, and compelled it to surrender. After the surrender, many of the garrison were massacred by the French Indian allies. Thus, after four years' hostilities, the incompetency of the British commanders still gave the French the advantage. But a change in the British home policy changed the aspect of the war. The celebrated William Pitt was called to the ministry, and immediately began to act with vigor. Abler officers were appointed to command, and expeditions organized against different points. Louisburg was captured July 27, 1758. Fort Du (luesne also was taken, and its named changed to Fort Pitt. General Abercromhie's attack on Ticonderoga (July, 175s), met with a bloody repulse, but Fort Frontenac was taken, with a large quantity of stores and goods.
35. Pitt now determined to dispossess the French of the whole of their American territory. His armies were directed at the same time against three of their strongest posts, Quebec, Ticonderoga and Montreal. General Amherst captured Ticonderoga Juls, 1759. Fort Niagara surrendered to Sir William Johnson July 25,1759 . But the most important feature of the campaign was the taking of the almost impregnable fortress of Quebec by the gallant Wolfe, who lost his life in the action. Soon after, Montreal surrendered to Amherst. In this campaign the French were driven from all the important posts in Canada, and their porrer in America was broken forever. The war was virtually at an end, though peace was not restored until the signing of the treaty of Paris, February, 1763. By this agreement, to which Spain and Portugal were also parties, France surrendered ererything east of the Mississippi, except Nerr Orleans, to England. New Orleans and that part of Louisiana beyond the Mississippi were ceded to Spain by the French. In exchange for IIarana, which had been captured by the British, Spain sielded Florida to England. In 1800 Spain restored Lonisiana to France, and Napoleon sold it to the United States in 1803.
35. When the treaty of peace was signed, it was trusted that there would lee an end to those horrid ravages which had desolated the interior of the country. But the month of May, 1763, proved the fallacy of such hopes. The Indians did not wish to see the country transferred by the French to the English. It was one thing to have the French trading among them, another to have the hated English occupying their lands. It was about this time that the famous uprising of the Indian tribes broke out. The Delawares and Shambees and other of the tribes of the Ohio were foremost in this conspiracy. Pontiac, an Ottawa chief, Was the prime mover and master spirit in this affair, and hence it is called Pontiac's War. Pontiac expected the French to join him, for they were secretly encouraging him. Nost of the western tribes were dramn by him into the plot, but Sir William Johnson prevented a greater part of the Jroquois from joining him. Pontiac's plans were deeply laid, and conducted with Indian craft and secrecs. At a concerted time, an attack was made upon all the posts from Detroit to Fort Pitt (formerly Fort Du Quesne). The Indians captured and destroyed eight of the twelve forts, but mere unable to take the important posts of Detroit and Fort Pitt, though Pontiac besieged the former place for five months. The frontiers of Maryland, Virginia and Pennsylvania were laid waste, and terrible havoc wrought in the frontier settlements. The English, surprised by the first attack, soon roused themselves and met the danger promptly. The power of the tribes became broken, and most of them sued for peace. Pontiac retired to the Illinois country, and made a stand there for some time longer, finally submitting in 1766.

## 111. CAUSES OF THE AMERICAN REVOLUTION.

37. The addition to the British empire of new provinces, equal in extent to old kingdoms, not only excited the jealousy of European powers, but occasioned doubts, in the minds of enlightened British politicians, whether or not such immense acquisitious of territory would conduce to the benefit of the parent state. They saw, or thought they saw, the seeds of disunion planted in the too widely extended empire. To combine in one uniform system of government the extersive territory then under British sway, appeared to men of reflection a work of doubtful practicability; nor were their conjectures at fault. The seeds of discord were soon planted, and speedily grew up to the rending of the empire. The high notions of liberty and independence which were nurtured in the colonies by their local situation, and the state of society in the new trorld, were increased by the removal of hostile neighbors. The events of the war had also given them some experience in military operations, and confidence in their own ability. Foreseeing their future importance from the rapid increase of their numbers and extension of their community, and being extremely jealous of their riglats, they readily admitted and indulged in sentiments and ideas which were favorable to independence. While combustible materials were daily collecting in the new world, a spark to kindle the whole was produced in the old.
38. In the first period of the settlement of English origiu America, the mother country regarded the provinces as the dis. instruments of commerce. She contented herself with a monopoly of their trade without taking upon herself the care of their internal policy, or seeking a revenue from them. Previous to the close of the war in 1755, the catalogue of grievances she imposed upon the colonists was undoubtedly small. The following appear to have been the chief: An act of the British parliament forbidding the cutting down of pitch and tar trees, not being within a fence or enclosure, and sundry acts which operated against colonial manufactures. By one of these, it was made illegal, after the 24th of June, 1750 , to erect in the colonies any mill or wher engine for slitting or rolling iron, or ans plating forge, to work with at tilt hammer, or any furnace for making steel. By another, hatters were restrained from taking more than two apprentices at a time, or any for less than seven years. The colonists were also prohibited from transporting lats and home manufactured woolens from one province to another. These regulations were, for the most part, evaded ; but if carried intoexecution, would have been but slightly inconvenient, and that only to a few. These restrictions, though seemingly a species of affront, and calculated to keep the colonists in a constant state of inferiorits and subjection, would have been overlooked and forgotten had not other grievances been superadded.
39. The real story of colonial oppression began in the year 1764. Great Britain then adopted new regulations colonta respecting her colonists, which, after disturbing the oppress: ancient harmony of the two countries for about twelve years, terminated in the dismemberment of the empire. These consisted in restricting their former commerce, but more especially in suljecting them to taxation ly the British Parliament. The imposition of duties, for the purpose of raising a revenue in Aunerica, was considered as a dangerous imovation, but the methods adopted for securing their collection were resented as arbitrary and unconstitutional. It was enacted bs Parliament, that whoever was caught violating the acts, should be tried in the courta of admiralty. Thus the defendant in such a case was deprived of the right of trial by jury, and subjected to the necessity of having the case decided upon by a single man, a creature of the crown, whose salary was to be paid out of forfeitures adjudged by himself. Moreover, the prosecutor was not called upon to prove his accusation, so the defendant was obliged, either to evince his innocence or to suffer. Thus the guards which the British constitution had placed around property, and the bar-
riers which the ancestors of both peoples had erected against arbitrary power, were thrown down, as far as they concerued the colonists thas charged with violating the laws for raising a revenue in America.
40. After the peace of Paris, 1763, the national debt of Great Britain amounted to $150,000,000$ pounds sterling. To aid in diminishing this hears debt, the British minister conceived the idea of raising n substantial resenue in the British colonies, from taxes imposed by the Parliament of the mother country. On the one hand it was urged that the late war had originated on recount of the colonies-that it was reasonable, since it had terminated in a manner so favorable to their interests, that they should help to defray the expenses arising from it. Thus far both parties were agreed; but England contended that her Parliament, as the supreme power, had the constitutionsll right to impose taxes on every part of the empire. This theory, phasible in itself, and in accordance with the letter of the British constitution, when all the dominions were represented in one assembly, was denied by the colonies as contrary to the spirit of the same government, when, on account of the extension of the empire, it was necessary to have many distinct representative assemblies. The colonists believed that the chief excellence of the British constitution consisted in the right of the subjects to grant or withhold taxes, and in their having a share in enacting the laws by which thes rere to be bound They conceived that the superiority of the British constitution to other forms of government was not because of the Parliament's forming the supreme council of the nation, but because the peonle had a share in it by appointing members who constituted one of its constituent branches, without whose concurrence no law, binding on them, could he enacted. In the parent state it was asserted to be essential to the unity of the empire, that the British Parlimment should have the right of taxation over every part of the royal dominions. In the colonies it was beliered that taxation and representation were inseparable, and that they, as colonies, conid neither be free nor happy if their property could be taken from them without theil. consent. The American people reasoned thus: That if the British Parliament, in which they had no representation, were able to take any part of their properts from them by direct taxation. then it might take as much as it pleased, and there would be no security, for ansthing that remained, from further spoliation.
41. The colonists claimed that they had the exclusive right of laying taxes on themselves, free from extraneous intuences, just as much as the British Parfiament claimed the peculiar privilege of raising money independent of the crown. The parent state appeared to the colonists to stand in the same relation to their local legishators as the monarch of Great Britain to the British Parlinment. His prerogative is limited by that palladium of the people's liberty, the exclusive privilege of granting their own mones. In fact, they claimed that though subjects of the king, they were not under the control of the British Parliament; that if the king required mones of the colonies, he must olatain it throngh colonial legishation jast as in England he would obtain it through the British Parliament. principles on which the colonies were founded, becatme the sulnject of serious investigation on both sides. One clanse was found to run through the whole of them except that which had been granted to William Pemn. This was a declaration, "That the emigrants to America should enjoy the same privileges as if they had remained, or had been born, within the realm;" but such was the subtility of disputants that both parties construed this general principle so as to fasor their respective opinions. The American people contended that, as English freeholders could not be taxed but by representatives, in choosing whom they had a vote, neither could the colonists : but it was answered that if the colonists had remained in England they must have
been bound to pay the taxes imposed by Parliament. It was therefore inferred that, though taxed bs that authority, they lost none of the rights of native Englishmen residing at home. The advocates of the British policy could see nothing in charters butsecurity against taxes by royal authority. The colonists, adhering to the spirit more than to the letter, looked upon their charters as a protection against all taxes not imposed by representatives of their own choice. The nature and extent of the connection between (ireat Britain and America was a great constitutional question, involving many interesta and the general principles of civil liberty. It was a vain attempt to decide the dispute bs ans recourse to parchment authorities, made at a time long past, when neither the grantor nor grantees foresaw anything like the present state of the two countries. It neaded great skill and tact to so manage affairs that everything might redound to the satisfaction and good of all concerned; to strike the middle line which would have secured as much liberty to the colonies, and as great a degree of supremacs to the mother country as their common good required. But this skill was lacking in Mritish statesmanship. On the one hand, the spirit of the Pritish constitution was opposed to the idea that the British Parkiament should exercise the same unlimited authority over the anrepresented colonies which it exercised over the inhabitants of Great Britain. The colunists, on the other hand, did not claima total exemption from its authorits, but allowed the mother country a certain undefined prorogative over them; and accepted the idea that Parliament had a right to make any acts binding them in many subjects of internal polics and regulating their trade. That nice point, which marked the end of Parhamentary authority and the beginning of the coloniat independence, was not ascertained. Had the question never been ngitated, or had a satisfactory compromise been effected, the American Revolution, undoubtedly, would never have become a part of our history.
42. The great French and Indian War, though crowned with success, had aroused a spirit of discontent in the colonies. From the beginning, as has been shown, the commercial policy of England toward the colonies had onnercial policy of England toward the colonies had Policy ol been wholly restrictive. "It was a system of monopoly." England Her navigation laws had closed their ports against foreign ressels; obliged them to export their productions onls to countries belonging to the British crown; to import European goods solely from England, and in English ships; and had subjected the trade between the colonies to duties. All manufactures, ton, in the colonies, that might interfere with those of the mother country had been either totally prohibited, or subjected tn intolerable restraints. The acts of Parliament, imposing these restrictions and prohibitions, had at various times caused great discontent and opposition, on the part of the colonists, especially among those of New England. But nothing so aroused the jealous sensililities of the colonists as any attemptson the part of the parent state to raise a revenue from them by taxation. They had ever mantained, from the parliest period of their estahlishment, that they conld onls be taxed by a legishature in which they were represented.
43. While the French whr was in progress, many projects were hatched in England with regard to the colonies which were to he put in force when peace was The Ardeclared. In 1760 , an attempt tras made in ljoston to tempito collect duties on foreign sugar and molasses imported rolleck into the colonies. Writs of assistance mere applied for Duties. by customhouse officers, empowering them to break open stores, ships and private dwellings, in search of goods that had paid no duts, and to compel others to assist them in carrying out their odions measures. The merchants opposed the writ on constitutional grounds. The question was brought into the courts, where James Otis argued so eloquently in favor of American rights, that all who heard him were ready to oppose all writs of assistance. John Adams, who was present, said: "Then and there was the first

 $=$
scene of opposition to the arbitrary claims of Great Britain. Then and there American Independence was born." In his speech, Otis used the words, "Taxation without representation is tyranny." This sentence became a watchword in America during the exciting times which followed.
The Stamp to. In I765, Lord Grenville, having previously given notice of his intentions to the American agents in London, introduced into Parliament a long cherished scheme for the purpose of raising a revenue from the American culonies by means of a stamp duty. Petitions poured in against it from the Americans, and at first it met with strong opposition in the Honse of Commons. But the remonstrances of the colonies could not change the avaricious feelings of Parliament, and the bill passed by a large majority. Those shortsighted legislators did not foresee that in the passage of an act so odious to the colonies, they were awakening an opposition and spirit of indepeadence among them which would materially weaken their own power. The night after the bill passed Benjamin Franklin, who was then in London, wrote to Mr. Charles Thomson, "The sun of liberty is set; jou must light up the candles of industry and economy." Mr. Thomson answered, "I was apprehensive that other lights would be the consequence, and I foresee the opposition that will be made.
46. By this act, no written instrument, such as com-

The Provisions of the stamp Act. mercial transactions, marriage licenses, deeds, suits at law, and the like, could be legal, unless stamped paper was used, which the colonists were compelled to purchase, at an exorlitant price, of the British agents. Moreover, it contained another startling provision, and that was, that the colonial legislatures were commanded to grant permission to billet the royal troops in America in inns, alehouses, harns, and vacant houses, and to fumish them with bedding, potables, candles, cooking utensils, etc. As soon as it became known that
The excite- the Stamp Act was passed, the colunies, from one end mentpro- of the land to the other, were full of indignation. the passage Parliament had turned a deaf ear to their petitions, and of the Act. showed by the passage of the Act a determination to treat them, not as English citizens, but as servants and slaves. Parliament, they said, might make laws to regulate the commerce of the empire, and so draw a revenue from America, hut it had no right to levy a direct tax like this. Only the colonial government, elected by the people, could do such a thing. Thes must either surrender without a struggle their liherty, or oppose strongly and firmly the grasping avarice of a nation, the most pormerful in the world.
Patrick 47. They Were not long in making up their decision Henry and proclaiming it to the world. The legislature of Virginia was in session when the news arrived. Patrick Ilenry, then a young man, but possessed of brilliant talents, opposed it with all the energy of his great mind. He brought before the house five resolutions Which were adopted, and which closed by declaring "That any person who, by speaking or acting, should assert or maintain that any class of men, except the general assembly of the province, had a right to impose taxation, he should be considered an enemy to his majesty's colony:" In advocating these resolutions, he holdly denounced the policy of the British government. and declared that the king hat acted the part of the tyrant. Warming $u p$ with his subject, and alluding to the fate of other tyrants, he exclaimed, with flashing exes and in thunder tones, "Casar had his Brutus, Charles I, his Cromwell, and George III" -"Treason! treason!" arose from every part of the house. Pausing a moment until the tumult had subsided, he added, "may profit by their example. If this be treason make the most of it." Similar sentiments flew like lightning through the other colonies. The tongues and pens of the citizens labored to kindle the latent sparks of patriotism. The press strongly opposed the innoration and called upon the citizens to resist it.
The Conti- 48. The expediency of calling a continental congress, nental congress.
of that province fixed on New York as the place, and the second Tuesday of October, 1765, as the time, for holding the congress, and invited all the other colonies to send delegates to the same. Nine colonies took part in it, and sent their most distinguished men. For the first time the whole country had a common cause, and there was need that the people should consult together. This congress drew up a declaration of their rights and a statement of their grievances. They asserted in strong terms their exemption from all taxes not imposed by their own representatives. They also concurred in a petition to the king, a memorial to the House of Lords, and a petition to the House of Commons. The colonies that were prevented from sending their delegates, forwarded petitions similar to those which were adopted by the deputies who attended.
49. On the Ist of November, the day on which the Stamp Act was to go into operation, the bells were tolled, and the flags hung at half mast, as if for the "funeral of liberty." The courts were closed; business was suspended. The houses of the British officials were attacked by mobs, and the effigies of the planners of the Act were carried about the streets in public derision and then burned, or torn in pieces by the enraged populace. In different parts of the country the stamp-masters were compelled to resign their offices to prevent being mohbed. The Stamp Act was so formed that the penalty of disobedience would be no less than the suspension of the whole machinery of the political and social order, and the creation of a state of anarchy. Neither trade nor navigation could proceed, no contract could be legally made, no process against an offender could be instituted, no student could receive a diploma, nor even could the estates of the dead be legally settled, or the marriage ceremony performed, until the stamp duty was paid. By degrees, however, things began to assume their usual course, and all kinds of business were transacted in open defiance of the Act.
50 . Associations, under the title of the "Sons of sons of Liberty," were formed in every part of the country. Liverty. They denounced the stamp Act as being an outrage on the British constitution, and resolved that they would defend those who fell into the hands of British ty1anny, on account of their clinging to their rights as freemen. Merchants resolved to import no more goods from Great Britain until the act was repealed, and the people generally denied themselves the use of foreign luxuries. No one would venture to carry the Stamp Act into execution; in fact, no stamped paper was to be seen; all had been either destroyed or concealed.
51. The information of the violent proceedings of the The Effer colonies was received in England with consternation. in Englan A small party in Parliament upheld the colonies. In the House of Commons, William Pitt uttered the memorable words: "We are told that America is obstinate -America is in open rebellion. Sir, I rejoice that Ameriru has resisted! Tbree millions of people so dead to all the feelings of liverty as voluntarily to submit to be slaves mould hare been fit instruments to make slaves of all the rest." In the meantine, Lord Grenville had "been dismissed, and the Marquis of Rockingham, a friend of the Americans, appointed in his place. Under his administration the obnoxious Stamp Act was repealed March 15, 1766 , for the English government Repeal of saw that it was impossible to enforce it. At the same the stawp time, Parliament took care to say that it "had a right Act.
to bind the colomies in all cases whatever."
52. The news of the repeal was received with the How the liveliest expressions of joy and gratitude. Public Kews was thanksgivings were held, English goods imported, and a general calm succeeded the storm which had raged so violently. By the people of New England and New York less joy was felt. They feared, from the passage of the declaratory act, that this was only a truce in the war against American rights. In the mirror of the past they saw reflected the future, and trembled at the picture. Nor were their suspicions unfounded.

Scarcely had the excitement over the Stamp Act died out, when other causes of complaint arose. In June, 1767, Charles Townsend, chancellor of the exchequer, brought into Parliament a bill imposing duties in the British colonies on glass. paper, painters' colors and tea, which became a law. Another law was also enacted, appointing officers of the navs as custombouse officers, to enforce the act of trade and navigation. Previous to this new act of tyranny, the legislative power of New York had been suspended, until it should furnish the king's troops with certain supplies at the expense of the colony
53. Early in 1768 the general court of Massachusetts sent a petition to the king, and addressed circular letters to the colonial assemblies asking their co-operation in obtaining the redress of their grievances. The British ministry was alarmed and demanded of the court that it should rescind the vote directing circulars to be sent. The assembly refused, and the governor dissolved it. This attempt to intimidate onls served to strengthen the opposition. Shortly after this, Mr. Hancock's sloop "Liherty" was seized for not having entered all the wines brought from Madeira. This act of the customhouse otficers was resented by the people. The houses of the officials were attacked, and they were compelled to seek safety in flight. The refractory spirit of the citizens of Boston had been displayed on so many oceasions that General Gage was directed to station one or more regiments there to overawe the citizens and protect the officers in the discharge of their duties. Two regiments were accordingly ordered from Halifax, who took possession of the atate house, and planted trro pieces of cannon at the principal entrance. All this only tended to increase the general indignation.
54. Early in the year 1769, Parliament passed resolutions censuring the conduct of the citizens of Massachusetts, and directing the governor to make strict inquiries as to all treasons committed in that province since the year 1767 , that the offenders might be sent to England for trial. The legislature of Virginia, on the receipt of that order, passed resolations denying the right of the king to remove an offender out of the col-ony-away from his home and friends-for trial. The governor, on hearing of the resolutions, immediately dismissed the assembly. The members met at a private house, and entered into a written agreement not to import any of the taxed articles. Their example was extensively followed. The assembly of Massachusetts convened, but refused to proceed to business while armed troops surrounded the state house. The governor refused to remove them, and the assembly adjourned to Cambridge. Toward the close of the season the governor requested it to provide funds to pay for the quartering of the troops, but the deputies refused, declaring they would never make ans provisions to support a standing army among them in times of peace. The governor, therefore, prorogued the assembly.
55. The presence of the soldiers in Boston was a constant cause of irritation, and the citizens had many quarrels with them. At length, on March 5, 1770, a serions collision nccurred between the troops and a mob, and the soldiers fired, killing five of the crowd, and mortalls wounding two others. The reports of this Boston masancre, as it was called, were greatly exaggerated, and filled the country with excitement. The citizens assembled in crowds, and could only be dispersed by the governor promising them that justice should be done. The troops were remored from the city, and Captain Preston, who ordered the firing, and his men tried for murder. Although the excitement was intense, yet such was the lore of justice that the soldiers, who were defended bJ John Adams and Josiah Quincs, were all acquitted except two, who were convicted of manslaughter.
56. In England, on the very day of the ontrage in Boston, Lord North mas called to the British Ministry, He introduced a bill into Parliament, which passed on April 12, removing the duties that had been laid
in 1767, excepting that on tea, but still declaring its right of taxing the colonies. For a long time no tea had been imported, and the effect had begun to be severely felt by the British merchants. By an act of Parliament, therefore, the East India Company was allowed to import its teas into America free of duty in England. The naked question of the principle regarding taxation was thus presented. The scheme was an insidious one, but it failed most completely. Lord North supposed that by reducing the tax on tea to three pence a pound, the Americans would buy largely, thus reliering the East India Company, who had large quantities of tea stored up in its English warehouses. Tea was accordingly shipped from England in great quantities to various parts of the colonies. This brought matters to a crisis. One sentiment prevailed throughout the wbole continent. Taxation was to receive its final blow. Whoever submitted to it was an enemy to his country. From New lork and Philadelphia the ships were sent back, with their cargoes, to London. In Charleston the tea was landed, but not permitted to be sold, and being stored in damp cellars, finally perished. Still more decisive action was taken in Boston. The ships anchored in the harbor, Some small parcels of tea were brought on shore, hut the sale of them was prohibited. The captains of the vessels would have made sail back to England, but they could not obtain the consent of the consignees, a clearance at the customhouse, or a passport from the governor to clear the port. To settle the matter completels, a company of men disgnised as Indians went on board the Destrucships during the night and threw the cargoes into the tion of Teo water. Three hundred and forty-two chests were thus at Boston. broken open and the contents thrown into the barbor (December 16, 1773)
57. When the news of this affair reached Englann. Tbe Bostoz Parliament, in order to punish the inhabitants of Bos- Port Bill. ton, passed the Boston Port Bill in 177t, which prevented the lading and unlading of goods, wares and merchandise in that town and harbor on and after June 1,1774 , and the seat of government was to be transferred to Salem. But the people of Salem refused to build their fortunes on the ruins of their countrymen, and the inhabitants of Marblehead generously offered the Boston people the use of their warehouses and harbor. In the following March, two other bills, equally tyran- Other Ty nical, passed both houses of Parliament. One subverted rannical the whole constitution and charter of Massachusetts, ${ }^{\text {Bills. }}$ taking all power ont of the hands of the people and vesting it in the crown. The other authorized the governor to send any person, indicted for morder or other capital offense committed in aiding the magistracy, to England or some other colony for trial.

5 . These laws, which were gross violations of the Popular rights and charters of the colonies, excited the deepest Agtation indignation everywhere in America. The people of Boston, reduced to distress by the stoppage of their trade, were regarded as martyrs of liherty, and contributions were made for their relief, not only in the thirteen colonies, but eren in London and Quebec. In Boston itself, although patriotic meetings were held almost daily in Faneuil Hall and the old South Cburch, all disorderly and unconstitutional proceedings were avoided, so that nothing was done for which the British anthorities could ponish the people. The friends of the crown about this time became known as Tories, and the popolar party as Whigs. The Quebec Act, which was passed among the other acts just mentioned, extended the boundaries of Canada over the whole territory situated north of the Ohio and east of the Dississippi. This was done to prevent Canada from joining the rebellious colonies. The colonies warmly protested against this concession to liberts of conscience, for the Act sanctioned throughout the province the free exercise of the Roman Catholic religion, and confirmed to the clergy of that profession their accustomed dues and rights, thus practicalls establishing the Roman Catholic system in the new territory. To such freedom the colonists were, on principle, opposed at the time, though somewhat later they found it expedient to
adopt nearly the same policy, and to promote a closer union among themselves by juster treatment of their Roman Catholic brethren.
59. Committees of correspondence had already been formed at the suggestion of Patrick Henry, Thomas Jefferson, Richard Henry Lee, and other Virginians, and by this means the colonies took counsel together for the common defense. Ir n!ay, 1774 , proposals were made by the assemblies of several of the provinces for a general congress of delegates. The scheme was taken up with great enthusiasm, and on September 5 , 1774, an assembly of fifty five delegates, representing all the colonies except Georgia, met in Philadelphia, under the presidency of Peyton Randolph, of Virginia. This was the first, or, as it is often called, the "old," continental congress. The action of this body was still mainly deliberatic. 't passed a resolution highly commending the conaret of Nassachusetts in the conflict with the wicked ministers, and exhorted all to press on in the cause of liberty. It drew up a bill of rights, entered into an agreement for the delegates and for all their constituents to cease all importations from Great Britain, ary adopted measures for organizing committees in evel; town and city to see that this agreement was enforced by every species of popular influence. The delegates voted an address to the king, one to the people of Great Britain and another to Canada. Their petition to the king entrested him, in eloquence the most affectionate and respectful, to restore to them their violated rights-their rights as English freemen. Provision was then made for another congress to meet in the following May, unless the grievances should neanwhile be redressed. When the proceedings of
Pitt's
Opinion. Congress were publisherl in England, Pitt (now Lord Uhatham) said: "For solidity of reason, force of sagacity, and wisdom of conclusion, under a complication of difficuit circumstances, no nation or body of men can stand in preference to the general congress at Philndelphia. The histories of Grece and Rome give us nothing equal to it, and all attempts to impose servitude upon such a mighty continental nation must be in vain."
60. These resolutions of the Continental Congress aronsed the indignation of the British ministers America, they said, had long wished to become independent, and to prevent this was the duty of every Englishman, and that it must be done at every hazard.
The People rake Arms In the meantime, the situation of affairs in Massachusetts became alarming. The people collected arms, enrolled themselfes into companies and prepared to turn out at a moment's notice, from which circumstance they were called "minute men." Public speakers and writers boldly defended the right of the people to withstand oppression. Royal nfficers were forced to resign. General Gage began to fortity Boston Neck, and the powder and other military stores in Cambridge and Charleston were, liy his order, removed to Boston. He had about 4.000 troops under him, and sent home a request for 20,000 more. An assembly was called in Massachnsetts, but dassolved by the governor. The members then met in Salem, appointed a committee of safety and sent messenger's to New IIampslire, Rhode Island and Connecticut, asking for their assistance in raising an army of 20,000 men to act in any emergency. England, although she could distinctly see the upheav. ing of the riolence of colonial indignation, shut her eyes to the sight. Chatham, Burke, Fox, Barré and other enlightened statesmen in Parliment, urged the zovernment to recede from its untenable position, but the obstinacy of the king prevented any conciliation; it was resolved that America was in rebellion and must be subdued; and so the revolution began.
61. It was a fortunate circumstance for the colonies that the royal army was posted in New England. The people of that morthern country have their passions more under the command of reason and interest than in a southern climate. One rash, offensive action against the royal forces at this early period, though successful, might have worked great mischief to the
friends and weakened the disposition of the other colonies to assist them. The patient and the politic New Conduct England men, fully sensible of their situation, submit- the Peop ted to many insults and festrained their feelings of resentment. In civil wars or revolutions it is a matter of much consequence who strikes the first blow. The compassion of the world is nearly alrays in favor of the attacked. For the space of nine months after the arrival of General Gage the behavior of the people of Eoston is particularly worthy of imitation by those who wisb to overturn established governments. They conducted their opposition with exquisite address. They aroided every kind of outrage and violence, preserved peace and good order among themselves, successfully engaged the ot her colonies to make common cause with them, and comnteracted General Gage so effectually as to prevent his doing anything for his royal master, while by patience and moderation they protected themselves from just censure. Though resolved to bear as long as prudence and policy dictated, they were all the time preparing for the last extremity by furnishing themselves with arms and training their militia.
62. Pruvisions had also been collected and stored in The Begi, different places, particularly at Concord, about twenty $\begin{gathered}\text { ning of ti } \\ \text { Straggle. }\end{gathered}$ miles from Boston. General Gage sent out a detacliment of 800 men, under the command of Colonel Smith and Major Piteairn, to destroy these stores. Notwitlustanding the precautions taken to prevent the spread of the intelligence, the march of the troops had been well made known by expresses and signal guns. Thus, when the British troons, early in the morning of the 19th of Arril, 1775 , reached Lexington, two-thirds of the was to Concord, they found a small body of Americans, under Captain Parker, drawn up on the common to dispute the way. Captain Parker had given orders not to fire unless fired upon. The Iritish troops rushed upon them, firing and calling upon them to disperse. Eight of the Americans were killed and Lexington several more wounded. The little band of patriots and conslowly retreated, returning the fire as they went, and the British kept on to Concord, where they destroyed a few stores. At a bridge near the village they encountered 400 Americans, hastily collected from the neighboring towns, and were so warmly received that they hegan a hasty retreat. The militia pressed thrm on all sides; the retreat became a rout, and when the British were at last rescued, by the arriral of Lord Perey with reinforcements, they had lost 273 men. They continued their retreat under Perey, Jearing their dead and wounded with them. All the way, from behind stone walls, fences and farmhouses, the angry farmers galled them with shot. They did not desist until the troops had crossed Charlestown Neck and were safe under the guns of the British vessels.
63. As arms were to decide the controversy, it was another fortunate circumstance for the Americans that the first blood was drawn in New England. The inliabitants of that country were so connected with each ether by descent, manners, religion, polities and a general equality, that the killing of a single individual interested the whole people and made them consider it a common cause. The blood of those who were killed at lexington and Concord proved to be the firm cement of an extensive union. Intelligence of these events spread like wild fire throughout the country; the torch of war had been lighted, blood had been offered on the altar of liberty, fearfully was the death of those patriots slain at Lexington and Concord to be avenged. Comriers galloped in every direction, beating drums, and shouting in tones that thrilled every listening ear, "To arms, to arms! liberty or death." The streets of Lexington and Concord had been soaked in blood, and the whole country was in a blaze of wrath. But amidst the intense excitement which prevailed, the still thoroughly English characteristies of the people manifested themselves. The Provincial Congress of Massachussetts, which was in session at the time of the fight, dispatched an account of it to Great Brytain, accompanied with many depositions to prove the British were the aggressors. The delegates made an address to the
people of Great Britain, in which, after complaining of their sufferings, thes said: "These hare not yet detached us from our rogal sorereign; we profess to be dutiful and loyal subjects, and, though hardly dealt with as we have been, are still ready with our lives and fortunes to defend his person, crown and dignity. Nevertheless, to the persfention and tyranny of his evil ministry, we will not tamely submit." From this commencement of hostilities, the dispute between Great Britain and the colonists took a new direction.
64. Up to this time no party in America had thought of a separation from the mother country, but nors the colonists were aflame with the spirit of independence. Mechanics left the shop, and farmers the plow, and hurried to the scene of conflict. In the course of one or two days the king's army found itself besieged in lioston by an irregular and ill-furnished, but large and determined. body of men, who marched to the scene of action from all parts of New England. The Prorincial Congress of Massachussetts cume together under the presidency of Dr. Joseph Warren, voted to raise 13,000 men, and invited the other New England colonies to make up the army to 30,000 . In a few dass a line of encampment stretched from Roxbury to the river Msstic, and the British forces in Boston were environed by an army of 20,000 soldiers. Benedict Arnold gathered about him a band of rolunteers, and rushed to Boston. Here he formed the bold plan of seizing the important fortresses of Ticonderoga and Crowu Point.
65. Haring received instructions from the committee of safety to raise a sufficient number of men for the purpose, he marched to Bennington, where be found that Colonel Ethan Allen had collected a large band for the same object. They marched on together at the head of three hundred men, and reached Ticonderoga on the I0th of Mas, I7T0. Adrancing to the gateway, Arnold and Allen entering side by side, Allen rushed to the governor's room and demanded his surrender. "In whose name?" stammered the terrified governor. "In the name," said Allen, "of the Great Jehovah and the Continental Congress." This was high authority, and the governor immediately surrendered. They were equally successful in obtaining Crown Point. By this fortunate expedition they gained possession of two important fortresses. and gave the American troops about Eoston a much-needed supply of arms and ammunition.
66. The second Continental Congress met at Philadelphia, May 10 , the day of the capture of Ticonderoga. Peston Randolph was at first the president, but John Hancock soon succeeded him in that position. Washington, Jefferson, Franklin, the Adamses, Patrick Henry and $R$. H. Lee, were members. The Congress was moderate, and asked only for a redress of grierances, not for independence; but it took active measures for carrying on the war. It formed a federal union, assumed the general authority of government, issued bills of credit to the amount of three millions of dollars for defrasing the military expenses, and pledged the faith of the Lnited Colonies for their redemption.

## iv.-THE TAR FOR INDEPENDEXCE, 17150 - 83.

67. In May, 1750, the British army in Boston received reinforcements from England, under Generals Howe, Clinton and Burgoyne, which, together with the garrison, formed an army of more than twelve thousand men. The Americans comprised a numher of independent commands under Generals Artemas Ward, of Massachussetts: Israel Putnam, of Connecticut; Nathanael Greene, of Rhode Island and other states, General Ward being recognized as chief. The whole number of men was about sixteen thousand. Upan the arrival of the English reinforcements, General Gage now proclaimed martial law thronghout the state, offering pardon, howerer, to all rebels who would return to their allegiances, excepting Samuel Adams and John Hancock. The Americans, learning
that General Gage was determined to penetrate into the country by the was of Charlestown Neck, issmed orders to Colonel Prescott, on the evening of the 16 th of June, to take one thousand men and form an intrencbment on Bunker's Hill, an eminence which commanded the neck of the Charlestown peninsula. By sone mistake they went further on, and occupied Breed's Hill. At midnight those stern-hearted men stood on the top while Putnam marked out the line of intrenchments. By daylight they had thrown up a redouht eight rods square, in which thes could shelter themselves. In the morning the English officers and the people of Boston could hardly beliere their eres as they saw this redoubt almost over their heads. The patriots on the hill were first seen from the ships, which immediately opened fire. All the artillery of the city and the floating battery were pointed against that single, silent structure. Still those bards heroes toiled on amid the storm of shot and shell which fell among them, until by noon they bad run a trench nearls down to the Mystic river on the north; then laying down their picks and shovels they twok up their muskets, and prepared themselves for the coming attack.
68. The cannonading having failed to dislodge the Battle of Americans, about noon Gage sent a bods of about three Bunker Hin. thonsund men, under Howe and Pigot, to carry the heigbt by assault. Having crossed the Charles river from Boston in boats, they advanced up the bill under cover of fire from the ships and batteries. The provincials stood firm. "Don't one of sou fire," was the command of Putnam, "till you see the whites of their eyes." The English advanced, stopping erery few jards to deliver their deep and regular volleys against the entrenchment; but not a shot replied. That silence was more awful than the thunder of cannon. When the hostile columns had almost reached the works, the stern order "Fire!" rang with startling clearness on the air. Suddenly a sheet of flame burst from that low, dark wall, and down went the enemy, rank by rank. Their lines wavered, then broke, and the troops fell hack in disorder to the landing place. There thes rallied and soon moved forward again to the charge, and again were driven back by the steady fire of the colonists. At this critical moment General Clinton arrived with reinforcements. BJ his exertions the troops were again rallied, and a third time adranced to the charge. Throwing aside their knapsacks and reserving their fire, the soldiers, with fixed baronets, marched swiftly and steadily over the heaps of their fallen comrades, up to the entrenchments. Only one volley struck them, for the Anmericans had fired their last round of ammunition, and were without hasonets. Clubbing their muskets, they still beat back the enemy, until the order was given to retreat, when thes retired slowly and made good their way over Charlestown Neck. At the beginning of the retreat, the brave General Warren was killed. The Americans lost 449 in killed, wounded, and prisoners, while the British loss was nearly I.500. The result of the battle was encouraging to the provincials. It gave them confidence in themselves, and consequence in the eses of their enemies. They had prosed to themselves and others that they could measure weapons with the disciplined troops of Europe, and inllict the most harm in the conflict. This dear-bought victory, won only through the exhaustion of the American's powder, was so little satisfactory to the British gorernment that General Gage was superseded by General Howe. This engagement. known as the hatile of Bunker H 11 , was the first real battle of the Revolutionary VIar.
69. In the meantime, Congress, on the 15 th of June, Wrashing at Philadelphia, elected George Washington, by a tonapunanimons rote, to the high office of commander-in pointed chief of the United Colonies. Washington, who was er-in-Cbief present, accepted the appointment, expressing a sense of the high bonor which be had received, and the vast responsibility of the station. He refused to accept any compensation for bis services, merely asking Congress to defray his expenses. Congress also acopted the unorganized force before Boston, naming it the Con-

## Attack on Canada.

## Privateer

number of privateers licensed, which scoured the seas and did great injury to the English commerce. General Washington employed in the service several cruisers to intercept the storeships of the enemy. Regular courts of admiralty were established for the adjudication of prizes, and by these timely measures much good was accomplished.
In the
South.
71. In the summer of 1775, Dummore, the royal governor of Yirginia, was driven out of Williamsburg, then the capital of the colony, and obliged to seek safety on board a British man-of-war. Collecting some ships and a considerable number of men, partly slaves and indented servants, to whom he promised freedom, he burned Norfolk (January, 1776), which was the largest and richest town in Yirginia, and made descents upon various parts of the coast. In North Carolina there was some sharp fighting between the Tory settlers and the patriotic militia, in which the Tories were worsted. In South Carolina, the gallant defense of Charleston (June, $177^{\circ} \mathbf{b}^{\circ}$ ), where a British fleet, under Sir Peter Parker, aided by a large land force, nuder General Clinton, was beaten off with great loss by a small body of men commanded by Colonel Moultrie, filled the colonists with encouragement.
72. During the year $17 / 5$ the royal government was generally terminated throughout the country, the king's governors abdicating their posts and taking refuge on board the English shipping. An act was passed by the English government prohibiting all trade and commerce with the rebellious provinces, and authorizing the capture of all American and other vessels found trading with the colonies, and the crews of the captured vessels were to be treated, not as prizoners, but as slaves. The colonists had sent over their last petition, styled the Olive Branch, to the king, but both houses of Parliament refused to hear it, alleging that they sould not receive any proposition coming from an unlawful assembly. Until nor they hoped for reconciliation with the mother country, but the rejection of this last petition determined the complete separation of Great Britain and the colonies.
Reremue of 1776 .
70. Meanwhile an expedition was organized for an attack on Canada, under the command of General Schnyler; but, Schuyler falling sick by the was, the command devolved on Richard Montgomery. This officer captured St. John's and Chambly, both on the Sorel river, and then made himself master of Montreal; but in making an assault on Quebec, December 31, 1775, he was repulsed, losing his own life, while Benedict Arnold, another leader, was wounded. Sometime afterward the British army in Canada was reinforced, and the Americans were obliged to abandou all designs in that quarter. While these events were taking place on the northern frontiers, English ships were laying waste towns and cities upon the Atlantic coast. Bristol in Rhode Island, and Falmouth in Massachusetts, were burned because they had taken part in the rebellion., Congress thought it time to turn its attention to the construction of armed vessels. Thirteen were accordingly fitted out, a navy established, and a large

tinental Army. In subordination to the commander-in-chief, Messrs. Ward, Charles Lee, Schuyler, and Putnam were appointed major-generals; Horatio Gates, adjutant-general, and Messrs. Pomeroy, Montgomery, Wooster, Heath, Thomas, Spencer, Sullivan and Greene, brigadier-generals. Soon after his election, General Washington, accompanied by Lee, proceeded to Cambridge to take command of the army, which amounted to about 14,000 men. He found them a crowd of brave, undisciplined soldiers, unprovided with arms, ammunition and provisions. His first business was to organize them into an arms, while he kept watch over the British in Boston.
overtures for peace, gave impulse to a bolder policy. All this time the second Continental Congress was in session at Philadelphia, and it agreed to consider definitely the question of independence. Then it took a recess of four weeks, to give the delegates an opportunity to go back to the people and learn what was the general judgment. When the members returned to their seats there mas no longer any doubt what course should be pursued. A committee had been appointed to propose a full declaration. The committee was elected ly hallot, and consisted of Thomas Jefferson, John Adams, Benjanin Franklin, Roger Sherman, and Robert R. Livingston. Mr. Jefferson and Mr. Adams acted as a sub-committee to prepare the draft, and Mr. Jefferson drew up the paper. The chief merit of the The Declar. document is his. Some changes were made in it, on ation of the suggestion of other members of the committee, and deace. by others in Congress while it was under discussion. On July 2, 1776, Congress adopted the resolution, "That these United Colonies are, and of right ought to be, free and independent states; that they are absolved from all allegiance to the British crown, and that all political connection betreen them and the State of Great Brition is, and ought to be, totally dissolved." Two days later Congress adopted the declaration written by Jefferson. It declared what were the natural rights of all men; it recited the acts of George III, King of Great Britain, by which he had abused his authority over the colonies, and deprived them of their rights and liberties. It reminded the world how patiently the colonies had born their injuries; of the petitions they had addressed to the king, which bad been disregarded; how the colonies had appealed, not to the king onls, but to their brethren, the people of England, but that all had been in vain. Therefore, as the representatives of the United States of Americu, in general Congress assembled, the delegates published this declaration of the independence of the states. The declaration was received by the people with demonstrations of joy. Washington caused it to be read to The Effec his soldiers in New York on the 9 th of July. On the af the De same evening the excited inhabitants pulled down a leaden statue of George III on horseback, which stood on the Bowling Green, and it was melted into bullets for the use of the patriot army. In all the other parts of the country the joy was intense.
75. The British ministry were confounded at what they alled the daring enormity of the colonists, in spurning the royal power and authority. They were surprised that rebels dared to show such temper and spirit. Forthwith they determined by augmented forces to crush them at a blow, and to coerce them into a sense of inty and submission to their king. Doubting the competency of its own power to subjugate the colonies, the Engish Parliament, at au immense expense, resorted vo the aid of foreign mercenaries to carry on its bloody work. Seventeen thousand troops, hired from the German states, were conveyed hither to aid in the subjugation of the colonies
76. When the British had failed to get possession of South Carolina in the early summer of 176, they turned their attention to New York. The American army was intrenched on Long Island and the heights overlooking New Iork when the British fleet entered the harbor and landed some of its troops on Stateu Island. General Howe and his brother, Admiral Howe, had been appointed commissioners to receive the submission of any rebels who might throw themselves on the king's mercy. Thes had been instructed to propose conditions of peace, but they had no authority to grant independence, and Washington refused any other terms. On the $22 d$ of August the British forces, under Generals Clinton, Cornwallis, Porter and Grant, landed on the southern shore of Lung Island. The larger part of the American army was posted in what is now the heart of Brooklyn. General J'utnam was in command of Long Island, but his army was greatly inferior in numbers and equipments to the enemy. On the morning of August 27, Putnam was attacked by the British and compelled to retreat to Brooklyn. Ilad the British general followed up his adyantage, he might have slain or captured all of Putnam's iorce. But at nightfall, under cover of the fog, Washington skillfully withdrew all the forces on the Brooklyn side and united them with the rest of his army in New York. He had completely foiled the enemy.

## Eracuation

77. It 世as impossible to bold New Iork, because it could be shelled from Brooklyn Heights and attacked on both sides by the English fleet, so Washington withdrew his forces to Harlem Heights, and fortified himself there. The British then entered New York, and it remained in their bands until the close of the war.
The condition of the patriots was now deplorable. The army, greatly reduced by losses in hattle, was still further weakened by desertions and insubordination Thousands of disheartened soldiers went home. But Washington succeeded in partly establishing discipline. and opposed so bold a front to the enemy that Howe did not venture to attack him directly. Lord Corm wallis, however, succeeded in gaining a position on the opposite side of the Hudson. Washington was compelled to withdraw across the river, knowing that the enemy rould aim for Philadelphia. The two armies crossed New Jersey in hot laste, Wrashington manenrering so as to defeat the British design of cutting bim off from that city. The armies, while in motion, were often in sight of each other. Washington continued his retreat slowly, followed by the enemy, until early in December be crossed the Delawsie river near Trenton. Howe now thought the campaign over. and went into winter quarters.
78. The succession of disasters, beginning with the battle of Long Island, greatly discouraged the Americans. The legislatures of New Jersey and Pennsylvania adjourned and left the states almost withont a governmeut. Congress, fearing for its safety in Philadelphia, remored to Baltimore, leaving Washington with almost dictatorial powers. Apathy and disorder prevailed among the troops, many of whom had to march*with bare, hleeding feet along the frozen roads. A great number of prominent persons, believing that the cause of independence was lost, hastened to make their peace with the British authorities. It was truly a time which "tried men's souls." Amidst the prevailing gloom, Washington stood firm. Strengthened by the arrival of Lee's division, now under command of

Sullivan, since the capture of Lee by the British, Washington determined to strike a blow that would res. vire the drooping courage of the people. He resolvea to fall upon a detachment of Hessian troops, stationer. at Trenton under Rhal, and chose Christmas night for the attack. Recrossing the Delaware with 2,400 men, he attacked the town while the Hessians were caronsing, and completely routed them, taking one thowsand misoners.
79. This brilliant exploit had a wonderful effect upon the people. The soldiers who were about to return home consented to serve six months longer; Congress, which had exhibited great firmness during these times of trial, put forth fresh efforts to strengthen the army, and Washington, invested for six months with the anthority of a dictator, crossed the Delaware again and occupied Trenton. Cornwallis now advanced toward that place with all his available forces, and Washingtou's danger was greater than before. But again his masterly genius prevailed. Leaving his camp fires burning, he abandoned his position, passed silently around the enemy, and at sumrise (January 3, 1717) fell upon the British reserves at Princeton, just as they The Batte were starting out to take part in the expected battle at of PrinceTrenton, and ronted them. Thus Howe, instead of oc- tou. cupying all New Jerses, was cooped up at lirunswick and Amboy, and Philadゃlphia was relieved of further danger from Cornwallis. After these splendid successes Washington retired with his army toward Morristown, which he made his headquarters, and arranged his troops in safe positions between that place and the highlands of the Hudson. Here he passed the winter, frequently making sudden and daring exploits, without risking a general engagement. By this means the enemy was compelled to abandon every post in New Jersey, except New Brunswick and Perth Amboy. Philadelphia being now in no danger from the British, Congress returned to that place.
80. Aware of the importance of inducing the French to espouse the American cause, and relying on the enmity of France against Great Britain, Congress approinted, as commissioners to the court of France, commis. Benjamin Franklin, Silas Deane and Arthur Lee. They sioners sen were instructed to procure arms and ammunition, and to France. to obtain permission to fit out American vessels in the French ports, to annoy the commerce of England. They also directed them to solicit a loan of $10,000,000$ francs, and to endeavor, by every means in their power, to prevail on the French government to recognize the independence of the United States. The commissioners were kindly receired and obtained the aid they requested, although the French government was not willing, as yet, to recognize the United States as an independent nation.
81. Commissions were offered to French and other Forelgu foreign officers who wished to serve in the American officers army, and a large number of ambitious soldiers consequently embarked for America. Washington was embarrassed by the arrival of such a large number, not all of whom were men of merit. Among the foreigners, bowerer, who thus gave their services to the American cause, were several distinguished officers: Baron De Kalb, an Alsatian; Kosciusko and Pulaski, the famous Polish patriots; Baron Steuben, an experienced and accomplished Prussian soldier, and the young French Harquis de La Fayette, who purchased a ship with his own means and sailed for America, to offer his sword, without pay, to the cause of independence.
s2. Tear the end of May, 1777, the American army, campange numbering about 18,000 men, moved from its winter of $17 \% 7$.
quarters at Morristown, and took a position at Middle-
brook, on which the British left their encampment and General Howe endeavored to induce General Washing. ton to meet him on equal ground. But Wasbington chose to continue his defensive warfare, and not to risk an open battle. Finding varicus feints and attempts ineffectual, Howe ordered a hasty retreat to Staten Island. He then embarked 16,000 troops, and leaving Sir Henry Clinton in command at New York, put to sea, keeping his destination secret. On the 20th os

August, the fleet entered Chesapeake bay, intending an attack on Philadelphia. Washington hurried to Philadelphia by forced marches, and on September 11, engaged Howe at Brandywine creek. After a hard-fought battle, the Americans were forced to retreat. After some days occupied in maneuvering and skirmishing, on the morning of Octoher 4, Washington made a suddem attack on Howe's position at Germantown. For a while the victory seemed in favor of the Americans, but, owing to a heavy fog, they became confused, and the British troops rallied and drove them hack with heavy loss. After these battles, the British became masters of Philadelphia, and Washington took up his winter quarters at Valley Forge, about twenty miles distant from that city.
83. While these events were occurring in the Middle states, in July, 1777, Burgoyne, with an army of Brit-
Burgoyne's ish, Hessians and Indians, entered the states from CanInvasion. ada, intending to seize the whole line of the Hudson river. While on his route, he sent out detachments on both sides, one under St. Leger against Fort Schuyler, and another under Colonel Baum, to seize the American stores collected at Bennington. St. Leger's enterprise failed, and Baum was completely routed by the Green Monntain boys at Bennington (August 16). October 7, Burgoyne was defeated by the Americans under Gates, at Bemis Heights, and October 17, was compelled to surrender at Saratoga. The surrender of Eurgoyne proved to be the turning point of the war. It gave artillery and arms to the American army, it encouraged the soldiers, and made a great impression in Europe.
St. In the meantime the winter was passing, and bringing with it severe trials to the American army at Valley Forge. The men were without shoes, and the snow was stained with the marks of their bleeding feet. There was no money to pay them. The bills issued by Congress had become so depreciated as to be almost worthless. Food was so scarce that Waslington was authorized to seize provisions wherever he could find them. About this time there was a phot to compel Washington to resign, and to have Lee or Gates put in his place. But the scheme failed, and Washington became more popular than ever. In the The Pros- spring of 1778 the condition of affairs improved. Robert pect Fight-Morris, of Philadelphia, afforded relief to the treasary, by raising large sums of money for the government. on his personal credit, and continued to serve the country in this way through the war. When the news of Burgoyne's capture reached France, that country entered upon an alliance with America (February

France. 6,1778 ), and sent out a fleet under Count D'Estaing to aid the colonies. The news of the treaty was received by the Americans with great joy. The British government now sent over commissioners to offer terms of peace, giving the Americans all thes asked for except independence, but all propositions short of that were refused.
85. General Howe was now instructed to concentrate all his forces in New York. Conserguently, the British suddenly left Philadelphia, and set out on their march. Washington instantly left Valley Forge, and pursned the enemy with 12,000 men. He came up with them at Monmouth, where a hotly contested, but indecisive, battle was fought. The encmy continued their retreat, and were enabled to gain New York. Having failed in their designs against New Eugland and the Middle States, the British now transferred their operations to the South. An expedition was sent by sea, and Savannah, Georgia, was taken at the end of the year 1778. Augusta was then oceupied, and Georgia was practically in the hands of the British. Thus ended the campaign of 1778 . General Lincoln received orders from Congress to take command of the southern forces, and the army under Washington retired to winter quarters near Middle Brook, New Jersey.
86. There were no great morements during 1779. Washington resolved to make the campaign a defensive one. General Clinton, who commanded at New York, sent out an expeditiou which captured the balf finished
fort at Stony Point, situated on the west bank of the Iludson river. Washington determined upon its recapture, and upon the night of July 16, it was carried at the point of the bayonet by the troops uuder the gallant General Wayne, or "Mad Anthony Wayne" as he was called. In October, the Americans, aided by the French, made an attack on Savamah in order to wrest it from the British. At the end of five hours' hard fighting, in which the brave Pulaski was mortally wounded, the French refused to continue the attack longer, and sailed for the West Indies, whereupon the Americans retired to Charleston. This brought the southern campaigu of 1779 to an end. This year was sigualized by the victories achieved by the infant nary of America, under the command of the intrepid Paul Jones, who fought with the "Serapis" one of the most desperate naval battles on record (SeptemLer 23).
87. The seat of the war was now mainly in the Operations South. The people there were nearly equaliy divided in the in allegiance. Savannah, the chief lown of Georgia, was already in possession of the British, and in May Charleston was captured by them. The enemy had how a large army in the field in that quarter. At first it was opposed by no united American army. The mitriotic planters gathered in companies, and rode here and there under the leadership of daring men like Marion and sumter. They harassed the British wherever they could find convenient points of athack. Clinton, having gained possession of South Carolina, returned to New Iork, leaving Cornwallis in command. Meantime an American force, under Baron De Kalh, had been sent by Washington to the South; but Congress interfered and put Gates in De Kalh's place. Gates, whose military capacity was much overrated. collected together about six thousand men, and marched hastily toward Camden, in the interior of South Carolina. Here he was met by the British under Battle of Comwallis, who inflicted a disgraceful and disastrous camden. defeat upon him (August 16, 1780). During the fight the heroic De Kalb lost his life. Gates fled to North Carolina, leaving his fugitive soldiers to take care of themselves. Soon afterward he was removed from command, and Greene appointed in his place. In Septemher, 1780, Arnold's treachery against the government was discovered, and he was compelled to flee to the Mritish lines. Major Andre, who had been arranging terms with Arnold, was captured on his return, tried as a spy, condemned, and executed October 2, 1780. Greene, being now in command of the American troops in the South, showed at once the qualities of a good general. He secured additions to the weakened southern army, and legan operations against Cornwallis. In December, 1780, Greene was at Charlotte, North Carolina, and Cornwallis was in South Carolina, moving northward. Greene divided his forces in two bodies. His plan was to get on each side of the British army, and, while avoiding a general Jattle, to annoy the enemy continually. Although Ge-neral Greene's men were scantily clad, half starred and dispirited, destitute of arms and ammunition, the ofticers under his command were as brave men as ever followed a leader. Morgan, Lee, Marion, Sumter and Colonel Washington formed a group to which the Fritish army could furnish no parallel. In the course of his movements, Cornwallis dispatched Tarleton against Morgan, who commanded one of the divisions of Greene's army. They met at Cowpens (January 17), The Baste and after one of the severest conflicts of the war of Cowpwns Tarleton was completely defeated, with the loss of the greater part of his force and all his artillery and baggage.
88. Morgan now hastened his march eastward to join Greene, and Cornwallis followed in hot pursuit. In order to move faster the British burned their stores and superfluous baggage, but Morgan succeeded in effecting a junction with Greene. Now followed a series of masterly movements by Greene, lasting through the winter, the spring, and the following summer, The hostile forces met at Guilford Court

House (March 15, 1781). Tbe battle was fought desperately for two hours, and all the advantages of a victory were on the side of the Americans. Notwithstanding Cornwallis chamed the victors, he retreated, closely pursued ly Greene. Cornwallis aroidnd a battle and retrented to Wilmington, und from there proceeded to Petersburg, Virginia. Greene moved to suoth Carolina, where be had a fight at Hobhirk's Hill (April 25), with a force under Lord Rawdon, whom Cornwallis hat left in command. Here cireene was compelled to retreat, but Rawdon's lose was so great that he soun after evacuated his man position at Camden. During April und Day, Greene swept throngh the country, carrying the British posts in sucession, until the enemy were confined to three points, Ninety.. $x$, Eutaw Springs and Charleston.
89. Having rested his army. (ireene marched against Eutaw Springs, where he found the British forers under Colonel Stuart (Rawdon having resigned and sailed for England) drawn up to receive him. A severe engagement took place (September 8, 1781), both sides claiming the victory. This was the last general action in South Carolina; the British, abaidoning the open country, retired to Charleston. Cornwallis armived in Virginia in May, 1781. Having received reinforcements, he fortified himself at Jorktown, on the south side of York river. Tarleton oceupied Cloncester Point, opposite Yorktown. The British force in Virginia at this lime was about 8,000 men.
90. Neanwhile Washington, having been reinforced hy a lately arrived body of 6,000 French tronps, under Kochambeau, was threatening New Vork. About this time the French admiral, De Grasse, who had been engaged against the English in the West Indies, came north to co-operate a little while will Washington, and it was resolved, instoad of carrying out an attack upon New York, which had been planned, to strike a hard blow at Cornwallis in Virginia. The army of Rochambeau marched from New port to meet Washington in the highlands. Their destination was kept secret, and the movements of both so artfulls contriped that Clinton supposed they were going to attack New York. lle did not discover their object until they had reached the Delaware. Sir Henry then sent out an expedition under Benedict Arnold to ravage Connecticut, hoping tberebs to cause Washington to return, but this manewver did not effect its object. Washington and Rochambeau pressed forward with the utmost alacrity. They received the gratifying intelligence that De Grasse had already arrived with his fleet and had blockaded the Cbesapeake, thus cutting off the escape of the British by water. On September 30,1781 , the allies invested Yorktown and Gloucester. After a siege of nearly three weeke, Cornwallis, finding it no longer possible to hold Yorktown. surrendered his whole army of nearly 8,000 men to Washington (October 19, 1781). On that day Clinton left New York to join Cornwallis. A week later, when off the Virginia capes, he heard of the news of the surrender. It was too late for him to be of any service, and he returned to New York.
91. The surrender of Cornwallis sent a thrill of joy through the country, and was the most decisive event of the war. The territory of the thirteen states was now restored to the jurisdiction of Congress, and the contest decided in favor of America. The surrender of Cornwallis was accepted both by the Americans and the English in America as the end of the war. Congress recommended the states to observe a day of thanksgiving to God for the signal success of the Americanarms. The people waited impatiently for the two governments to agree upon terms of peace. There were after this a few encounters lel ween the two armies, lut there was no general battle. The British still had possession of New York harbor and the surrounding country. General Washington went into camp with his army at Sewburgh, on the Ifudson. There be could keep open communication bet reen New England and the rest of the country. The French allies remained in Virginia. Generals Wayne and Greene drove such portions of the British forces as remained in the Carolinas and Georgia
down to the sea-coast. and shut them up in Sarammah and Charleston. There they were protected by their vessels. The people of Great britain became clamorons for peace. The obstinute king was still resulved " never to consent to a peace at the expense of a separation from America," but a resolution in favor of pence, supported by the lemding members, passed the Itouse of Commons February 27, 17ヶ.2. The king was comprlled to dismiss Lord North and aceept a ministry headed by the Marquis of lockingham, who was committed to the palicy of peace, and commissioners were appointed on both sides to uegotiate a treats, hostilities being stopped in the interral.
\$2. Much firmness and wisdom were shown by Massrs. The Treatg Juy, Franklin, Adams und Laurens, the Anerican com- of Peace. miseioners. Many questions were raised, an important onf of which was that of boundary, Fngland wishing to kew the Ohio ralley and part of lanine. The property of the Tories had been contiscated; the English wished it restored. England tried to exclude New England from the right to fish off the banks of Newfoundland. These and other questions caused delay. The delay was increused by the efforth of france and Spain to pustpone the final settlement unt il they shonld get alf which they demanded as nations from Great Britain. The preliminars article's of pence were zettled at Paris on the 30th of November, 1782 and in September, 1583, a formal treaty was signed. By this treaty (ireat Britain acknowledged the independence and sorereignty of the United States, and a new nation took its place among the governments of the earth.
93. The American army was now dishanded. During the progress of negotiations the temper of the ofticers and coldiers was far from satisfactory. They had received but a small portion of their pas, had often suffered from alsolute hunger, and were becoming restless under their wrongs and neglect. Some of then so far forgot themselves as to desire the estaljisbment of a military despotism, and Washington received a letter in which he was advised to declare himself king -a proposition which he indignantly refused to entertain for a single moment. Then anonymons lutters Were circulated among the troops in March, lis3, tending to inflame their minds and advising them to organize for the purpose of enforcing Congress to grant their demands. To counteract this morement Washington called all the officers together, and in his subsequent farewell address soothed them by kind words and promises, und appealed to the mobler sentiments of the

Thus the danger was dispelled, and on November 3 , still glowing with patriotism, the soldiers sepsrated, resolved to endure all necessary privations. The army certainly had been treated badly by both Congress and the states, but there was some excuse for their conduct in that the countrs was very poor, and that, after spending nearly $\$ 100,000,000$ during the war, the treasury was found at the end about $\$ 0,000,000$ in debt. This was exclusive of the outlay of the separnte states, which amounted to $\$(00,000,000$ or $\$ 0,000,000$ more.

On Norember 25, the British evacuated Nen York, Evacuatlos and Wrashington's troops marched in by the way of of New
King's Bridge. On November -, Washingion issued his farewell address to the army; on December 4 , with a heart full of love and gratitude, he bade his oflicers adieu. It was a dreply affecting scene, and men, who had braved the horrors of many a battle, now, as they approached their beloved commander-in-chief, were melted to tears and incapable of utterance. Washington then proceeded to Annapolis, at that time the seat of Congress, and tendered his resignation as command- Washing. er-in-chief of the anmies of the United States, and ton's Resis immediatuly retired as a private citizen to his home at natlon. Mount Vermon, on the lotomac, in Virginia.
F.-TILE FURNATION OF THE FEDERAL CONSTITUTION.
94. The states mere governed during the latter part of the $\nabla_{6} r$ b by "Articles of Confederation," proposed
by Congress at the time of the Declaration of Independence, but not adopted until several years later. Nearly all power was vested in the separate states, the federal union being loose; there was no president or other execntive chief. During the war for independence the army, which was called the Continental army, was under the authority of the Continental Congress, and it received its pay, when paid at all, in Continental cur rency. These two words, "Continental Currency," were placed at the head of the paper mones which Congress began to issue at the beginning of the war No other way of raising money to meet the military expenses seemed clear to Congress than to issue this currencs, since there would be no revenue from duties, as resolutions had been passed to have no trade with Great Britain. All the colonies represented in Congress agreed to redeem the bills which should be issued, just as each colony had been accustomed to redeem its own bills. At first the money was found to be very useful, and its value was not questioned, as nearly everyone thought that the war would soon be over. But the war dragged along; Congress had heen obliged to issue bills to the amount of $\$ 30,000,000$; whether or not the colonies would be able to win independence was a matter of doubt; the country was poor and it was not certain that the Confederation would last. Under these circumstances people began to refuse to take the money at the value printed upon it.
Powers of 95. Under the "Articles of Confederation," adopted Congress. in 1777, the powers of Congress were but small. The colonies were jealous of each other, and especially the smaller of the larger, and so they all wished to give the " Confederation," as it was called, just as little power as they could. The new government was to be merely a "firm league of friendship" between sovereign states, which were to retain every power not "expressly" delegated to Congress. At this time Congress consisted of but one house, in which each state had an equal vote. There was no national executive head. Congress retained the power to borrow money, but was not authorized to raise mones by taxes, or to fix the rate of duties on foreign goods imported, or compel obedience to any law. In fact, the provincial spirit which manifested itself in the several colonies, so prevailed over the spirit of nationality, as to completely take from Congress all power of action, even in violent emergencies, without the express consent of the several provinces. This was a result of the "Articles of Confederation," by which Congress was reduced from a prompt and energetic exercise of power, assnmed and used for the general good, to a mere advisory body, which, strictly speaking, had no authority at all. for the very first article, after that giving title to the instrument, made the following declaration: "Each state retains its sovereignty, freedom and independence, and every power, jurisdiction, and right which is not by this confederation expmessly delegated to the Crited Ntates in Comgrors assembled." Thus Congress was bound, hand and foot, by the narrow-minded jealousy of the several states. Important mensures required the votes of nine of the 13 states, and amendments the votes of all. Congress alone could decide upon the needed amount of money, bnt the power of collecting the taxes was vested in the states, only. Congress could decide disputes between the states, hut it had no power to compel respect or obedience to its decisions. It alone could make treaties with foreign nations, but no individual state was bound to respect those treaties, so far as Congress was concerned. Every state had the power of regulating its own commerce, both foreign and domestic. In truth, all the acts of Congress were simply recommendations to the state assemblies; and these recommendations were alwass largely debated, oftentimes rejected, and never assented to in reason to have their best effect. Washington and the army and the Revolutionary cause were thus nearly sacrificed by a states-right prejudice, as bad in principle as it was slow and injurious in fact.
96. When Congress tried to borrow mones in Europe,
it succeeded in getting some at high rates of interest. But in the present state of the country foreigners were slow to lend; they were not sure of getting their money back again. They knew they would not if the states failed in establishing their independence. And even if they did, the question was, would they pay if peace came? Under the then existing form of government it seemed doubtfol. The several states could raise money to meet their obligations by taxing their citizens; they could also impose duties on articles of trade. The government, as vested in Congress, could do neither ot These things; it could only apportion to the several states their share of the public expenses. If the states refused to pay, Congress bad no power to compel them. Foreign countries, also, did not like to make treaties with such a loose aud feeble government. Washington said: "We are one nation to day, and thirteen to-morrow; who will treat with us on these terms?" Thus, both Congress and the states struggled on, making more paper money and borrowing at high rate of interest. Laws were passed requiring the people to take the paper money in payment of debts. But the currency became more and more worthless, so that about the middle of the war, sixteen hondred dollars of it was asked for a suit of clothes. After the alliance with France. the prospect brightened. People had more confidence in the success of the United States, and it became easier to horrow money in Europe. About this time, also, Robert Morris, of Philadelphia, who thoroughly under- Robert stood the mistakes which had been made, was offered the position of superintendent of finance. He accepted the office only on condition that Congress should abandon the attempt to compel the people by law to take the paper money in payment of debts. In 1781 Congress passed a resolution that it would pay all its debts in solid coin, and recommended the states to do the same. It chartered the Bank of North America, and this bank lent money both to the government and to the people. At the close of the war the government found itself deeply in debt. Part of this money was due to foreigners, and part to the people of the country How this deht was to be paid, was the question to be settled by the Confederation.
97. One way was througl the sale of unoccupied lands. The Sale When the Confederation was forming there was much dispute and uncertainty about the western boundaries of the different colonies. Tirginia, for example, claimed the country now occupied by Kentucky, Indiana, Ohio and lllinois. It was proposed that the states should give up their western lands to the United States. V'irginia was the first to do this, and other states followed her example (1784). Congress used this property to pay the debts of the goverument. It gave lands to oflicerv and soldiers in payment of their claims. Many of these moved ont on their lands, and companies were formed for colonizing, especially in the Ohio valley. Congress conld not go mnch farther. It could say What taxes onght to be paid, and could recommend a uniform rate of duties throughout the country; but it was obliged to ask the states to lay the taxes, to levy the duties, and then to pay the money raised into the treasury of Congress.
48. It was perceived that this wonld never do, that a stronger form of goverument was necessary for the welfare and prosperity of the country. Disorders arose within the separate states, and a state of anarchy in general prevailed. The western counties of North Carolina undertook to form a state of their own, called Frankland. The part of Virginia which afterward became Kentucky, made a similar attempt. An extensive rebellion in Massachusetts, led by an ex-captain in the Continental army, named Daniel Shays (December $1786^{\circ}$ ), and directed against the collection of taxes, etc., for six months resisted the anthority of the state. It was finally put down by a military force under General Lincoln. The one act of authority which Congress could exercise was in providing for the government of the country which had been ceded to it by the states. This led to the passage of the important ordinance in ordinan 1787. By this ordinance all the district northwest of of 1787.
the Ohio was formed into one territory. Congress appointed a governor, a council and judges. The people of the territory were allowed to choose their own assembly and make their own laws. The most important provision of the ordinance was that by which slavery was forever excluded from the northwest territory.
99. It was impossible for the country to go on as it was. The states were separating from one another, and from Congress. Congress could with difficulty bring enough members together to form a quorum. Scarcely anyone outside paid attention to what it did. Least of all was it respected by foreign governments. John Adams, who had been sent as minister to England, could hardly get a hearing there. Ilany of the states refused or neglected to pay even their allotted shares of interest on the public debt, and Congress had not the power to compel payment. The national credit became worthless. Foreign nations refused to make commercial treaties with the United States, prelerring rather to take advantage of the impotency of Congress, and lay any burden upon American commerce that they thought fit. In 1785, Algeria declared war against the United States. Having no efficient nayy, Congress recommended the building of five ships of war, but as it had the power to recommend only, the ships were not built, and American commerce was left a prey to the Algerine pirates. Great Britain still refused to carry ont the treaty of 1783 , or send a minister to the United States. The federal government was despised abroad, and disobejed at home.
100. Amidst this discouraging and confused state of affairs, the more thoughtful of the people saw that some change in the form of government was necessary and so a convention of delegates was called to meet in

## ention

 to decide upon a new constitution, and make, if possible, a stronger government. without doing harm to the liberties of the people. The stares sent their ablest men to represent them. Dlany of the delegates had been members of the first Congress. Among others, Virginia sent Washington, Edanund Randolph, George Mason, Madison and George W'sthe; New York, Hanilton; Massachusetts, Rufus King, Strong and Gerıy ; Pennsylvania, Franklin, Robert Morris, Gouveneur Morris and James Wilson; New Jersey, Paterson; Connecticut, Sherman, William S. Johnson and Ellsworth; and South Carolina Rutledge and the tro Pinckness. Washington was appointed president of the convention.101. There was great difference of opinion among the delegates regarding the question at issue, but all agreed that it was necessary to give the government greater authority. After a long discussion, lasting many reeks, the convention drew up a constitution of the United States (September 17, 1787) which was to take the place of the Articles of Confederation. The conrention reported its work to Congress, and Congress submitted it to the several states. Py the terms of the constitution, it must be ratified by nine states before it could become the law of the land. Much opposition was manifested toward its adoption. It was discussed ererswhere, and its every article was earnestly debated. Hamilton, Madison and John Jay of New York published a celebrated series of papers called "The Federalist," in which they went over all its features with great thoroughness, showing the reasons for the action of the convention. By this means they did much to convince the people of the importance of the work done. Delaware was the first to ratify the constitution, which it did unanimously. Pennsylvania followed, ten days afterward, with a two-thirds vote in favor. Eight other states also ratified it, so that it went into effect in 1788. Of the three states which remained, New York accepted the constitution in time to take part in the first presidential election that same year. North Carolina accepted it during the jear following; and Rhode Island, last of all, in the year after that (1790). Thus the old "Confederation" came to an end and the new "Union" began.
102. The opening words of the constitution are as follows: "We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this constitution for the United States of America." This first sentence of the constiution is The Prearn. often called the preamble, but no such term was applied ble. to it by the framers of the constitution, neither is it found in the original manuscript. It is not a preamble in any sense, but is the enacting clause-an integral part of the constitution, stating that it was the neople of the whole United States who established it. A preamble gives reasons why a resolution sloould le adopted or enacted, but it is no part of the resolution or enactment. The enacting clause, on the contrary, is mandatory. No other part of a statute is more important. Thus, this introductory sentence gives the authority and the ends for which the constitution was made. It was ordained by the people of the United States as a nation, and for the purposes so admirably set forth in its opening clause ; and wherever in the constitution the words "United States" occur they signify the nation as a whole: wherever the word "states" occurs, it denotes the states considered separately, or as distinguished from the nation.
103. The constitution contains seven articles, which Articles of are subdivided into sections. Ibesides these seven ar- stitution. ticles, fifteen amendments have been made to the constitution. which are as binding as the original articles. By the first article all legislative power is vested in the Congress of the United States, which consists of a senate and house of representatives. Under the Confederation the whole governmental authority was vested in Congress. There was no executive department and no judicial. The first resolution adopted in the constitutional convention stated that a national government ought to be formed, consisting of supreme legislative, executive and judicial departments. Nost legislative bodies have two houses. This is true of all the existing state governments, and was true of all the states at the time the constitution was framed, except Pennsylvania and Georgia, which had but one each. The Continental Congress had but one house. While there is a general distribution of powers among the three great departments of government, the exercise of these powers is not absolutely exclusive.
104. The federal house of representatives is descended, through the state houses of representatives, from the colonial assemblies. It is an assembly representing the whole population of the country, as if the people were all in one great state. It is composed of mem- The Hoase bers chosen every second jear throughout the states. of RepreA candidate for election to the house must be at least seutatives. twenty-five years old, must have been seven jears a citizen of the United States, and must be an inhabitant of the state in which he is chosen. As the federal Congress is a taxing body, representatives and taxes are apportioned among the several states according to the same rule, that is, according to population. At this point a difliculty arose in the convention as to whether slaves should be counted as population. If they were to be counted, the power of the slave states in all matters of national legislation mould be greatly increased. The difficulty was adjusted by a compromise measure The Threeaccording to which five slaves were to be reckoned as Fifths three persons. Since the abolition of slavery this pro- Compro. vision has become ohsolete, but until 1860 it was a very important factor in American history.
105. In the federal house of representatives, the great states, of course.hare much more weight than the smaller ones. In 1790 the four largest states had 32 representatives, while the other nine had only 33. The largest state, Virginia, had ten representatives, to one from Delaware. These disparities have increased. In 1880, out of thirty-eight states, the nine largest had a majority of the house, and the largest state, New York, had 34 representatives to one from Delaware. This feature in the house of representatives caused the smaller states
in the convention to oppose the whole scheme of constructing a new government. They were determined that all the states, both great and small, should have equal representation in Congress. Their prolonged opposition threatened to ruin the whole plan, when a method of compromise was fortunately discovered. It was intended that the national legislature, in imitation of the state legislatures, should have an upper bouse or senate, and at first the advocates of a strong national government proposed that the senate also should repre-

The Con necticut Compro mise. sent population. But it happened that in the state of Connecticut an unique governmental method had been adopted. There it had always been the custom to elect the governor and upper house by a majority vote of the whole people, while for each township there was an equality of representation in the lower house. The Connecticut delegates in the convention, therefore, being familiar with a legislature in which the two houses were elected on different principles, suggested a compromise. Let the bouse of representatives, they said, represent the people, and let the senate represent the states; let all the states, great and small, be equally represented in the senate. Such was the famous "Connecticut Compromise." Had this not been adopted the convention would doubtless have broken up without accomplishing its purpose. After it was accepted, and the jealous fears of the smaller states allayed, the work yet to be accomplished was comparatively easy.
The Senate.
106. Thus it came about that the upper house of the national legislature is composed of two senators from each state. As they represent the state, they are chosen by its legishature and not by the people. They are chosen for a term of six years, and one-third of the number of terms expire every second year, so that, while the whole senate may be renewed by the lapse of six years, there is never a "new senate." The senate has thus a continuous existence and a permanent organization, whereas each house of representatives expires at the end of a two-years" term, which is usually known as a "congress," and is succeeded by a "new house." A candidate for the senatorship must be at least thirty years of age, must lave been nine years a citizen of the United States and must be an inhabitant of the state which he represents.
Eime of Assembling.
107. Congress must assemble at least once in every year, and the constitution appoints the first Monday in December for the time of meeting; but Congress can, if necessary, enact a law changing the time. The established custom is to hold the election for repregentatives on the same day as the election for president, the Tuesday after the first Monday in November. As the period of the new administration does not begin until the fourth day of the following March, the new house of representatives does not assemble until the December following that date, unless the new president should think it necessary to call an extra session of Congress at an earlier date. Each house is judge of the elections, qualifications and returns of its own members, determines its own rules of procedure and may punish its members for disorderly behavior, or by a two-thirds vote expel a member. Absent members may be compelled, under penalties, to attend. Each bouse is required to keep a journal of its proceedings, and at proper intervals to publish it, except such parts as for reasons of public policy sbould be kept secret.
108. Senators and representatives receive a fixed salary by law, which is paid out of the public treasury. In all cases, except treason or felony or breach of the peace, they are privileged from arrest during their attendance in Congress, as also while on their way to it, and while returning home; "and for any speech or de- bate in either house they shall not be questioned in any other place." During the session of Congress neither bouse may, without the consent of the other, adjourn for more than three days, or to any other place than that in which Congress is sitting. No person can at the same time hold any civil office under the United States government and be a nomber of eitber house of Congress.
109. The vice-president is the presiding officer in the Presid senate, with power to vote only in case of a tie. The officer house of representatives elects its presiding officer, who is called the Speaker. In the early history of the House of Commons, in England, its presiding officer was naturally enough its spokesman. He could spenk for it in addressing the crown. Instances of this kind occurred during the fourteenth century, until, in 1376, the title of Speaker was definitely given to Sir Thomas Hungerford, and from that date the title has always held. The same title was given to the presiding officers of the American colonial assemblies, and thence it passed on to the state and federal legislatures. The Speaker presides over the debates, puts the questions and decides points of order. He also appoints the committees of the house of representatives.
110. The house of representatives has the sole Powe power of impeachment, and the senate has the sole Impea, power to try all impeachments. When the president of the United States is tried, the chief justice of the supreme court must preside. As a precaution against the use of impeachment for party purposes, a twothirds' vote is required for conviction. In case of conviction the judgment cannot extend further than "to removal from office, and disqualification to hold or enjoy any office of honor, trust or profit under the United States;" but the person convicted is liable afterward to be tried and punished by the ordinary process of law.
111. The constitutional provisions for legislation are admirably simple. All bills for raising revenue must originate in the lower house, but the upper house may propose or concur with amendments as in the case of other bills. After a bill has passed both houses, it must go to the president for his approval. If he approves it, be signs it, and it becomes a law. If he disapproves it, le returns it to the house in which it originated, The pri with a written statement of his objections, which must dent's be entered in full upon the journal of the house. The power. bill is then reconsidered, and if it obtains a two-thirdss vote it is sent, together with the ohjections, to the other house. If it passes there by a two-thirds' vote, it becomes a law. Otherwise, it fails. If the president keeps a bill longer than ten days (Sundays excepted) without signing it, it becomes a law without his signature, unless Congress adjourns before the expiration of the ten days, in which case it fails to become a law, just as if it had been vetoed. This method of vetoing bills just before the expiration of Congress, by keeping it in one's pocket, so to speak, was styled a "pocket veto," and was first employed by President Jackson in 1829.
112. By the constitution, Congress has the power Powers "to lay and collect taxes, duties, imposts and excises, pranter to pay the debts and provide for the common defense congre and general welfare of the United States," but all duties, etc., were to be uniform throughout the United States. Other powers are naturally attached to thissuch as the power to borrow money on the credit of the United States; to regulate foreign and domestic commerce; to coin money and fix the standard of weights and measures; to provide for the punishment of counterieiters; to establish post-offices and postroads; to issue copyrights and patents; to establish courts inferior to the supreme court; to punish offenses committed on the bigh seas, or against the law of nations; to declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water; to raise and support an army and navy (no appropriation to be for more than two years), and to make rules for the regulation of the land and naral forces; to provide for calling out the militia to suppress insurrections and repel invasions, and to command the militia while actually employed in the service of the United States. The several states, however, were to train their own militia and appoint the officers. Congress may also establish a unform rule of naturalization, and uniform laws on the subject of bankruptcies. but it has not yet done so. It was also empowered to
establish a national capital or federal district (which is the District of Columbia, containing the city of II ashinton), to exercise exclusise control over it and over furts, magazines, arsenals, dockjards and other needful buildings, which it erects within the sereral states upon lands purchased for such purposes with the consent of the state legislature; and finally, "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers and all other powers vested by tbis constitution in the government of the United States, or in any department or oflice thereof." This last clause mas be called the elastic clause of the constitution. It lias been the subject of continued debate. and has undergone a great deal of stretching for one purpose and another. It was a profonnd disagreement in the interpretation of this clause which, after 1789 , divided the American people into two great political parties.
113. The national authority of Congress is further sharply defined by the express denial of sundry powers to the several states. The states are expressly forbidden to impose any duties on imports or exports, except for inspection charges, which must be passed over to the treasury of the United States; to make treaties of any kind; to lay any duty on tonnage; to keep tronps or ships of war in time of peace: to engage in war unless actually invaded, or in such imminent danger as will admit of no delay; to grant letters of marque and reprisal; to coin money; to emit bills of credit; to make anything but silver a legal tender; to pass any bill of attainder, ex post jucto law, or law impairing the obligation ol contracts, or to grant any title of nobility.
114. Some express prohibitions were laid upon the national govermment. Duties may be laid upon imports, but not upon exports. Duties and excises must be uniform throughout the country, and no commercial preference can be shown one state over another. The privilege of the writ of habeas corpus cannot be suspended except "when, in cases of rebellion or in rasion, the public safety may require it.". A census must be taken every 10 years in order to adjust representation, and no direct tax can be imposed except according to the census. No bill of attainder, or ex post facto law, can be passed. A bill of attainder is a special legislative act by which a person may be condemned to death, or to outlawry and lanishment, without the opportunity of defending himself, to which he is entitled in a court of lart. Congress can grant no title of nobility, and no federal - officer can accept a present, office or title from a fureign state without the consent of Cougress. "No religious test shall erer be required as a qualification to any oftice or public trust under the United States." Money is to be taken from the treasury only in cousequence of appropriations made by law.
115. No one is eligible to the office of president unless he is a native born citizen. The candidate must he at least 35 years old, and must hare been 14 years a resident of the United States. The president's term of office is four years. The constitution says notbing about his re-election, and there is no written law forbidding his being re-elected many times. Some of the presidents have served tro consecutive terms, and it seems to have become the established custom not to go heyond that. The president is solemnly sworn to execute his office faithfully, and " to preserve, protect, and defend the constitution of the United States" to the best of his ability. In case of his death, resignation, or inability to perform the duties of his office, the vice-president takes his place; and. in the case of the inability of both, the members of the cabinet succeed in the order prescribed in the Presidential Succession Act of 1886. The president is commander-in-chicf of the military and naral forces of the United States, and of the militia in the sereral states actually engaged in the service of the United States: and he has the prerogative of granting reprieres and pardons for offenses against the United States, except in cases of impeachment. He can make treaties with foreign powers; but no treaty is valid unless confirmed by a twotbirds'
vote of the senate. He appoints ministers to foreign countries, consuls, and the greater officers, such as the heads of executive departments and judges of the sumpeme court, and all other otficers whose appointment Congress has not vested in other officers; but all presidential appointments are to be confirmed by the senate. When vacancies occur during the recess of the senate, he may fill them by granting commissions to expire at the end of the next session. He commissions all federal officers. 1le recuives all foreign ministers. He mas summon either or both houses of Congress to an extra session, and $i$ : the two houses disngree in regard to the time of adjournment, he may adjourn them to such a time as he thinks best, but, of course, not beyond the time fixed for the beginning of the next regular session. The president must from time to time make a report to Congress on the state of affairs in the country, and suggest such a line of polics or such special measures as may seem proper to hinn. This report has taken the form of an annual written message. He may also call upon the heads of departments for an opinion, in writing, on any subject relating to such department. The president is paid by the United States, and his salary is not to be increased or diminished by Congress during his term of oftice. The uct authorizing any increase must apply only to the successors of the president who signs the act

11ヶ. The constitution made no express provision for Executu* the creation of executive departments, but lelt the depart matter to Congress. At the beginning of Washington's administration three departments were created-tbose of state, treasury and war, and an attorney-general was appointed. Since then the number of departments has been increased, until now (1890) there are eight: those of state, of the treasury, of war, of the navy, of the post-otlice, of the interior, of justice, and of agriculture. The chief officer of each department is called its secretary. The secretaries of these departments are the president's advisors, and constitute his calinet. They are selected by the president and are confirmed by the senate, but are responsible to no one but the president.
117. The secretary of state ranks first among the The Secre cabinet officers. He is the minister of foreign affairs, tary of and is the only officer who is authorized to communicate with other governments in the name of the president. He is at the head of the diplomatic and consular service, issuing instructions to the United States ministers abroad, and taking a leading part in the negotiation of treaties. He keeps the national archives, and superintends the publication of laws, treaties and proclamations, and he is the keeper of the great seal of the United States. The cabinet officer next in rank is the secretary of the treasury. He conducts the financial business of the country, superintends the collection of revenue, and gives warrants for the payment of moneys out of the treasury. He also superintends the coinage, the national banks, the customhouses, the coust-survey and lighthouse system, the marine hospitals, and lifesaving service. He sends reports to Congress, and suggests such measures as seem good to him. He is aided by two assistant secretaries, six auditors, a register, a comptroller, a solicitor, a director of the mint, comuissioner of internal revenue, chiefs of the bureau of statistics and bureau of printing and engraving, etc.
118. The trar and navy departments need no special Warand description here. The wrar department is divided into ten bureaus, annong which is the weather bureau, presided over by the chief signal officer. The nary department consists of eight bureaus, and among its many duties it has charge of the naval observatory at Washington, and publishes the nautical almanac. The de- Departpartment of the interior is divided into eight bureaus. ment of It deals mith public lands, pensions, patents, Indian affairs, education, public documents, and the census. The pustmaster-general's department has to do with the Postmaster postal affirs of the country. The attorney-general's Generaland department was organized in 1870 into the department of justice. Thattorney-general is the president's legal
adviser, and represents the United States in all law suits to which the United States is a party. The agricultural department, which was created in 1889 , superintends the agricultural interests of the country.
119. The best method of electing the president was a question which perplexed the constitutional convention as much as any other. To submit the election of an officer so exalted to the proper vote, was regarded with general distrust. At one time the convention decilled to have the president elected by Congress, but there was a grave objection to this; it would be likely to destroy his independence and make him the mere creature of Congress. At last the plan of an electoral college was devised. Each state is entitled to a number of electors equal to the number of its representatives and senators together; and the electors choose the president and vice-president, meeting at their state capitals for that purpose, and sending separate certificates di their choice of president and vice-president to the presiding officer of the Senate at Washington. No fedaral senator or representative, or any person holding aivil office under the United States, can serve as an elector. Each state may appoint or choose its electors in such a manner as it sees fit ; at first, they were more often then otherwise chosen by the legislatures; now they are always elected by the people. The day of election must be the same in all the states. By act of Congress the electors are to be chosen on the Tuesday after the first Monday in November.
Powers of 120 . It was the original intention that the electors should be left free to make their own choice, and there are instances in early years of electors of one party voting for personal friends of the opposite party. At first the electoral votes did not state whether the candidates named in them were candidates for the presidency or vice-presidency. Each elector simply wrote down two names, only one of which could be the name of a citizen of his own state. In the offcial count, the candidate who bad the highest number of votes, provided they were a majority of the whole number, was declared president, and the next highest became vicepresident. The natural result of this was seen in the tirst contested election in 1796, which gave the presidency to John Adams, while his antagonist, Thomas Jefferson, became vice-presilent. In 1800, Jefferson and his colleague Burr received exactly the same number of electoral votes. This thress the election into the house of representatives, and such intrigues followed for the purpose of defeating Jefferson that the country was threatened with civil war. This necessitated a change in the method of election. In 1804 , the twelfth amendment was adopted. The method by this amendment was changed so that the electors make separate ballots for president and vice-president. In the official count the votes for the president are first counted. if no candidate has a majority, then the house of representatives must immediately choose the president from the three names highest on the list. In this choice the house votes by states, each state laving one vote; a quorum for this purpose must consist of at least one member from two-thirds of the states, and a majority of all the states is necessary for a choice. Then if no candidate for the vice-presidency has a majority, the senate makes its choice from the two names highest on the list. A quorum for the purpose consists of two-thirds of the whole number of senators, and a majority of the whole number is necessary to a choice.
121. In 1877 an unforeseen difficulty arose, and one for which no provision had been made. During the presidential contest between Tilden and Hayes, Sonth Carolina, Florida and Louisiana had each set up riva\} governments. Ballots for Tilden and ballots for Hayes were sent in at the same time by the two hostile sets of electors in each of these states, each list being certified by one of the two rival governors in the same state. In the absence of any recognized means of deciding which ballots to count, the two parties in Congress submitted the result to arbitration. An "electoral commission" was created for the occasion, consisting of five sena-
tors, five representatives and five judges of the supreme court. By this expedient, a clumsy one perhaps, the difficulty was tided over. The question of contlicting returns has at length been set at rest by the act of 1887 , which provides that no electoral votes can be rejected in counting, except by the joint action of both houses of Congress.
122. The judiciary is the third of the three great departments of the general government. The constitution itself provides for one supreme court, but leaves it to Congress to determine how many inferior courts should be established. The organization of the supreme court is also left to Congress. The chief reason why a national judiciary is necessary in addition to the state Need for systems is that the state judges might be biased in favor federal of their own state. Laws of Congress often bear with judiciary greater hardship on some states than others, and public opinion, in those states upon whom the burden lay, might be so strong in opposition, that no judge elected and supported loy those people wonld sustain it. But if the judge belonged to a national system, and thus represented and was supported by the whole nation, he would have nothing to fear, and thus his decision would be more impartial. The experience of the Confederation tanght this. The national judiciary consists of three grades of courts: The supreme court, the circuit Courts. courts and the district cuurts. The supreme court is the highest in the land, and was established by the constitution itself. The others were estahlished by Congress. The supreme court consists at present of a chinf justice and eight associate justices, and its jurisdiction is almost wholly appellate; that is, cases are not tried in it, but it only hears appeals from other courts, and that only in the most important cases. It has original jurisdiction in a few cases. Of the circuit courts there are nine in the country. Each of the nine judges of the supreme court is also presiding judge of a circuit court. The area of the United States, not inclading the territories, is divided into nine circuits, and in each circuit the presiding judge is assisted by special district judges. The circuits are divided into fifty-six districts and in each of these there is a special district judge. The districts never. cross statelines. They cover each a state or a part of a state.
123. By the constitution, the judges hold office dur- Tenure o ing good behavior. In no other department of the gen- Oftice. eral government are offices held for so long a term. The parpose is to insure a correct and impartial administration of justice by making the judges independent of contlicting parties. The object of the framers of the constitution was to remove them as far as possible from undue political influences. As with the president, so in this case. Congress, though it fixes the salaries of Salary. the judges, cannot diminish them while in office. The jurisdiction of the federal courts does not extend to all Federal kinds of cases, but only to such as the constitution jurisdic specifies. The cases enumerated in the constitution in which the national courts have jurisdiction may be dirided into three general classes, (I) those arising under the constitution, the laws of Congress and treaties, (2) those affecting foreigners, and (3) those between different states or the citizens of different states. Cases which arise under the constitution, laws or treaties of Cases un the United States may be those where a person is given United a right by the constitution, etc., which he does not liave by the laws of his state, as, for instance, a right to sue an infringer of a patent granted to him, or where he violates a law of Congress or treaty, as in counterfeiting coin, or doing anything forbidden by a treaty, or where any question arises as to the meaning of the constitution, laws or treaties of the United States, or as to whether a law of Congress is constitutional or not. In these cases it makes no difference whether the parties are citizens of the same state or not. The jurisdiction is given to the national judiciary for two reasons: First, in order that, in the interpretation and enforcement of its own laws, it may not be dependent on the states; and second, in order that the interpretation may be uniform throughout the country.
124. In cases affecting foreigners the decision properly belongs to the federal courts, for the reason that if a foreigner is injured here, the nation, and not the state, is responsible to the foreigner's government; therefore, the nation, and not the state, should make redress for the injury. And where the foreigner is an ambassador, or other minister, the supreme court has criginal jurisdiction in the case. Admiralty jurisdiction is also given to the federal courts, for the reason that many admiralty cases affect foreigners. Another reason is that admiralty is a part of the regulation of commerce, which is a subject taken away from the states and given entirely to the United States.
125. The third class of cases in which the federal courts have jurisdiction, is where the parties on the two sides, plaintiff and defendant, are either two different states, or citizens of different states. The federal courts are to decide controversies between two or more states; because, domestic tranquility requires that the contention of states should be peacefully lerminated by a common judicators and because in a free country, justice ought not to depend on the will of either of the litigants. They are to decide controversies between a state and the citizens of another state; because, in case a state (which comprebends all its citizens) has demands against some citizens of another state, it is better that she should prosecute their demands in a federal court than in a court of the state to which those citizens belong, the danger of irritation and criminations arising from apprehensions and suspicions of partiality being thereby obviated. They are to decide controversies between citizens of the same state claiming lands under grants of different states; leecause, as the rights of the two states to grant the land are drawn into question, neither of the twostates ought to decide the controversy.
126. The judicial power of the United States extends to all cases of law and equity arising under the constitution and laws thereof, and to treaties made under their authority. But there are two kinds of jurisdiction, original and appellate. Original jurisdiction is jurisdiction of a cause from its beginning. If a party can begin his suit in the circuit court, for instance, then that court has original jurisdiction in the case. If he cannot bring his case into the circuit court until it has been tried in some lower court, then the circuit court is said to have appellate jurisdiction. Appeal lies from the district court to the circuit court when the matter involved is of a value greater than $\$ 500$, and from the circuit court to the supreme court when $\$ 5,000$ or more is involved.
127. No direct suit can be brought against the United States, either by a citizen or a state, without the authority of an act of Congress. But in 1855 Congress established a court, called the court of claims, in which those having claims against the United States may bring a suit in the ordinary way. The demand is presented to the court by petition, setting forth specifically its origin and nature, and the party is allomed to prove it by the same rules of evidence which are usually adopted in a court of justice. If a claim is established Congress makes provision for its pajment. An attornes, called the solicitor of the United States, appears before this court in behalf of the government.
128. In the constitution, treason is made to consist only in leving war against the nation, or in adhering to its enemies, giving them aid and comfort. The purpose was to make the meaning as definite as possible, so that all opportunity for constructive treason might be removed. It has been decided by the court that there must be an actual levying of war; that a conspiracy to subvert the government by force is not treason. But if war be actually levied, that is, if a body of men be actually assembled for the purpose of effecting by force a treasonable purpose, all those who perform any part, however minute, or however remote from the scene of action, and who are actually leagued in the general conspiracy, are to be considered as traitors. Conviction of treason requires the testimony of tro witnesses to the same overt act of treason, or a confes-
sion in open court. A private confession passes for nothing. To Congress is given the poser to declare the punishment of treason, " but no attainder of treason is to work corruption of blood, or forfeiture, except during the life of the person attainted." The attainder spoken of in this clause must be that connected with the judgment pronounced by a court, and not a legislative attainder, for we have already seen that Congress is forhidden, as also the states, from passing any bill of attainder. Congress might provide for a judicial attainder in the case of treason, but the effects of this attainder must be limited to the life of the offender.

As treason is a crime against sovereignty, a violation of one's allegiance, there can be no treason against a particular state. The states, however, have always asserted their power to punish for treason against them individually. It has never heen fully maintained in practice; but the theory had its effect in the secession period. If a state, by its courts, punishes treason, it must not he as treason against itself, but as treason against the union; and in this view the propriety of that state legislation which affixes to it particular penalties, is doubtful.
129. Article IV of the constitution contains a number of important provisions, most of which affect the rela-Relations tions of the states to each other, and to the general of state. government. The first one is in regard to the effect which the laws, records and judgments of one state shall have in another, and the provision is that they shall have full effect everywhere. No state can grant Privileges privileges to its own citizens, from which the citizens of of citizens. other states are excluded. There must be an equality of citizenship everywhere. Without such a provision, any state might deny to citizens of other states the right to huy and hold real estate, or to become voters after living in the state the prescribed time, or to enjoy equal privileges in trade or business. The subject of Fugitive delivering up fugitives from justice, is one which, criminals. among different nations, has involved some doubts. The coustitution of the United States, however, provides that they shall always be given up to those who, in the states, have a right to require it. By the com- Fugitive mon law, a slave escaping into a non-slaveholding state slaves.
became free. But the constitution provided that fugitive slaves were to be surrendered to their owners. Escaped slaves were, under this provision, returned to the South up to 1861. The clause is, of course, obsolete now.
130. The constitution provides for the admission of sew new states to the union, but it does not allow a state to states. be formed within another state. A state cannot "be formed by the junction of two or morestates, or parts of states, without the consent of the legislatures of thr states concerned, as well as of the Congress." Shortlis hefore the making of the constitution, the United States had been endowed for the first time with a public domain. The territory northrest of the Ohio river The had been claimed, on the strength of old grants and Northwest charters, by Massachusetts, Connecticut, Jew York and Territors. Virginia. In 1777 Maryland refosed to sign the Articles of Confederation until these states should agree to cede their claims to the United States, and thus, in 17st, the federal government eame into possession of a magnificent territory, out of which tive great states-Ohio, Indiana, Mllinois, Michigan and Wis-consin-have since been made. While the federal convention was sitting at Philadelphia, the Continental Congress at New Lork was doing almost its last, and one of its greatest, pieces of work in framing the ordinance of 1787 for the organization and government of this newly acquired territory.
131. In 1803 the rast territory of Louisiana, comprising everything (except Texas) between the Mississippi river and the crest of the Rocky Jountains, was purchased from France. A claim upon the Oregon territory was soon afterward made by discovery and exploration, and finally settled in 1846 by treaty with Great Britain. In 1848, by conquest, and in 1853 by purchase, the remaining Pacific lands were acquired from Nexico.

All of this vast region has been at some time under territorial government. As for Texas, on the other hand, it has nerer been a territory. Texas revolted from Mexico in 1836, and remained an independent state until 1845 , when it was admitted to the union. Territorial government has generally passed througb three stages: First, there are governors and judges appointed by the president; then, as population increases, there is added a legislature chosen by the people, and empowered to make laws subject to confirmation by Congress; finally, entire legislative indebendence is granted. The state is then ripe for admission to the union as a state
Guarantee clanse.
132. The national government was to guarantee to each of the states a republican form of government and to protect each of them against invasion or, on application of the legislature or governor, against domestic violence. This clause makes a republican government necessary in every state. It is eqnivalent to saying that no other shall be permitted to be established. This is the only instance in the constitution where the government has a duty enjoined upon it, while the particular department is not mentioned. Here the obligation is from the United States to the states; but whether it be exercised by the president or by Congress is one of the questions that has grown out of the reconstruction measures. In the case of Rhode Island the supreme court held: "It rests with Congress to decide what government is the established one in a state. For, as the United States guarantees to each state a republican goverument, Congress must necessarily decide what government is established before it can determine whether it is republican or not. And when the senators and representatives of a state are admitted to the councils of the union, the authority of the government under which they are appointed, as well as its republican character, is recognized by the proper authority."

The constitution does not define a republican government. The national government may be assumed to be republican in form, and thus a model for the states. Mr. Madison says: "We may define a republic to be a government which derives all its powers, directly or indirectly, from the great body of the people, and is administered by persons holding their offices during pleasure, for a limited period, or during good behavior." Farrar says: "The principle of republicanism is the equal right of the people, the citizens, all the members of the body politic. In theory it is the government of public opinion. The fundamental principles of right and justice for the government, the representative character of the governors, and their practical responsibility to the governed, are the essentials of republicanism.
134. The constitution indirectly requires rarious provisions in the state governments by enjoining duties The senators of the United States are to be elected by the state legislatures. Members of the bouse of representatives are to be elected by the same electors as vote for the members of the most numerous branches of the state legislatures. The executives of the states are often referred to. The judges are to take oath to obey the constitution of the United States. Thus, the states must have three great departments, the legisla tive, executive and judicial. The legislature must be in two branches, and the most numerous branch must be elected by the people. The states are supposed to have written constitutions.
135. One of the strongest objections urged by its apponents, against the adoption of the constitution as it came from the hands of the convention, was the want of a recognition of certain rights of citizens. To meet this objection, in September, 1789, the first ten amendments were proposed by Congress, and in December, 1791, they were declared in force. Theses ten amendments which are called a "Bill of Rights," because they contain a list of the rights deemed most important to the liberty of the people, do not change any original provision of the constitution. They act merely as restrictions and limitations upon the porere
of Congress, and were deemed unnecessary by those who framed the constitution for the reason that these rights were 80 generally acknowledged, and that the powers of Congress were limited to those expressly granted to it. But as several of the state conventions had, at the time of adopting the constitution, expressed a desire that declarations and guarantees of certain rights sbould be added in order to prevent misconstruction and abuse, the first Congress, at its first session, proposed twelve amendments, ten of which were ratified by the requisite number of states. Thesc amendments forbade the establisbment of any religion by Congress, or any abridgment of freedom of worship, of speech, or of the press, or of the popular right to assemble and petition the goverument for redress of grievances, the billeting of soldiers, unreasonable searches or seizures, or general warrants, trials for infamons crimes except through the action of a grand jury, subjecting a person for the same offense to be twice pat in jeopardy of life or limb, compelling him to witness against himseli in criminal cases, the taking of life, liberty, or property without due process of law or without compensation for property, and the demand of excessive bail, or the imposition of excessive or of cruel or unusual punishments. They confirmed the right of the people to keep and bear arms, to a jury trial from the vicinage in criminal cases or in cases involving more than twenty dollars, to a copy of the indictment, to the testimony against the prisoner, to compulsory process in his behalf, and to coursel for him. Finally, it is declared that "the enumeration of certain rights shali not be construed to deny or disparage others retained by the people," and that "the powers not granted to the United States by the constitution, nor prohibited by it to the states, are reserved to the states respectively, or to the people."
136. All the debts of the federation, and its engagements, were made binding on the new government; and the constitution, and the laws and treaties to be made under it. were declared to be "the supreme law of the land;" the judges in evers state were to be bound thereby, "anything in the constitution or laws of any state to the contrary notwithstanding." The language of this cause is clear and explicit. The people of the United states estahlished this constitution for the Lnited states. It was the work of the nation itself, and was linding in every part of the republic. This clanse was intended to aftrm the supremacy of the national government over the state governments. If the constitution was not the supreme law of the land it would not be a constitution, it would be a nullity. Its supremacy is necessarily involved in the instrument itself, get it was necessary to declare it, in order that all inight understand it and no room be left for controversy.

## wi. tie gofernmint under the constitution.

137. As soon as the constitution bad been ratifed by the requisite number of states, Congress named the first Wednesday in January, 1789, as the day for the choice of electors, the first Wednesday in February for the choice of president and vice-president, and the first Wednesday in March for the inauguration of the new government at New York city. The last date fell on the th of March, and this has been the limit of each president's term since that time. The election took place at the appointed time, and when the votes of the electors were counted before Congress it was found that George Washington had been unaninuously elected wabinz that John Adams, standing next on the first pres ist, was vice-president. Before the inauguration, the dent. old Confederate Congress bad "given up the ghost." On October, 1788, its record ceased, and for nearly six months the United States was witbout any national government. The contest for nationality had been successful, and the old order of things passed eway forever.
e condi. 138. The nation over which George Washington was n of the called to preside in 1789 was a third-rate power, inferior
intry. in population und wealth to Holland, for example, and about on a level with Portugal or Denmark. The first census was taken in 1750, and the population was then four millions. The people were thinly scattered throngh the thirteen states hetween the Atlantic and the Alleghanies, beyond which mountrinous barrier a few hardy pioneers were making the beginnings of Tenuessere, Kentucky, and ohio. Roads were few and bad, none of the great rivers were bridged, mails were irregular There were few nanufactures. There were mans
traders and merchant seamen in the coust towns of the $t$ raders and merchant seamen in the coust towns of the north, but the great majority of the people were farmers, who lived on the produce of their own lands, and seldom undertook long journeys. Hence, the different pa-'3 of the country knew vers little about each other, and entertained absurd prejudices, and the sentiment of union between the states was extremely weak. East of the Alleghanies the red man had ceased to be dangerous, but tales of Indian unassacre still came from regions no more remote than ohio and reorgia. Spain still held vast possessions west of the Mississippi. The only other power which had possessions in Nopth America was England. The feeling entertained toward the states in England was one of mortification and chagrin, accompanied with the bope that the halfformed union would fall to pieces, and its separate states loe driven by disaster to heg to be taken back into the British empire. The rest of Europe knew little about the United States, and cared less.
138. It was under these circumstances that the young government began its career, and it was fortunate for it that it began under the auspices of such an administration as Washington's. Congress met in Ner York, March 4, 1789 . It adopted twelve amendments to the constitution, ten of which. as has been shown, were ratified by the states. But the most pressing business before Congress was to obtain money to pay so successfully acconplished that This dificult work was so successfully accomplished that little change has leeen found necessary in fananeial methods from that das to this. Washington's cabinet consisted of Thomas Jefferson, as seeretary of state; Alexander llamilton, as secretary of the treasury; and Heury Knox, as secretary of war. John Jay was appointed chief justice, and Edmund Randolph attorney-general. The financial success of the government was mainly due to the organizing genius of Hamilton, assisted by the skill and tact of Madison, as leading member of the bouse of representatives. Hamilton saw, in the payment of the national debt, an opportunity to give
strength to the United States in the eyes of foreign strength to the United States in the eyes of foreign nations. He saw also that it gave an opportunity to bind the states in more perfect anion. He proposed three measures: First, that the government should assume the foreign debt of the confederation, and pay it in full; secondly, that the domestic debt, which seemed to bave been rirtually repudiated, should likewise be assumed and paid; thindly, that the dehts of the separate states should also be assumed and paid by the federal government. The first proposition was adopted unanimously. The specond was opposed on the ground that it would only benefit specnlators, who had bought up United States securities at a discount. Dut, by dint of forcible reasoning, the measure was es ried. The third measure caused great dehate, and met with violent opposition. There was a fierce and bitter fight over it, which at last was only setiled by great politieal
manipulation. manipulation.
139. There were already two parties in the country, the Federalists, who desired a strong general government, and whr had urged the people to aecept the constitution, and the anti-Federalists, who wished to give more power to the state governments, and less to the general government. Hamilton was the leader of the Federalist party, and the anti-Federalists united to defeat his last measure. At this time the site of a federal capital was to be selected. The northern people generally wished to have it not further south than the

Delaware river, while the southerners were determined to have it no further north than the Potomac. Hamilton was bent on carrying his point, and took adrantage of this dispute. Ile persuaded two Virginian Congress. men to ehange their votes and support his measure. In return, be promised to use his intuence to have the capital located or the banks of the lotomac, instead of at some northern point. This change of votes gave him the requisite majority. The assumption of state debts was a muster stroke of poliey. All those persons to whom any state orred money were at once won over to the support of the federal government. Muny of these persons were powerfal and wealthy; and all now felt a common interest in upholding the national credit, which, throngh these wise and vigumous measures of Hamilton, was soon completely resfored.
1 . The noxt step was to raise a revenue for the Revenue. carrying on of the government, and this must be raised hy fedral laxation. There were two ways in which this could be done-by imposing duties on goods importud into the country, or by levying internal taxes. Ps the first method, the Enited States would declare its right to tax foreigners; by the second, to tax its own citizens. The former method was mainly resorted to, becanse it was more indireet, and because the people, as yet, did not like the ider of being directly taxed to support the general government, even hough it had been estahlished by themselves. However, a tax was laid upon the manufacture of spirituous liquors in 1794 , and this caused serions trouble. The seitlers in the mountains of Peunsylvania and Virginia had long since found out that it cost more to carry their corn and Wheat to market than they conld sell it for, and accorlingly they distilled it into whisky. When Congress laid a tax on whisky, they bitterly opposed it, and when the revenue officers came to collect the tax, the settlers wriused to pay it, and threatened to take up arms. But Washington instantly sent an army of sixteen thousand men into the disuffected region, and the insurrection was summarily suppressed.
142. The Indian tribes on the Ohio beeame very Indian war troublesome to the settlers who now began to pour into the west. Ceneral Harmer, who was sent against the Envages in I790, was defeated near the present site of Fort Wayne, Indiana, and General St. Clair met witha similar disaster the next jear. General Wayne ("Mad Anthony") was then dispatehed to the Indian country. He devastated their villages, sweeping eversthing before bin, till he reached the Maumee river, in the nort $h_{1}$ west corner of Ohio. There he won a great victorry near the site of Naumee City, August 20, 1794, and obliged the Indians to sue for terms. By a treaty concluded in the folloming year, the United States acguired from the savages a large tract forsettlement in the present states of Ohio and lidiana.
143. About this time the divisions hetreen political Orimin of parties became strongly marked. The necasional irata. political tion shown in the debates in Congress is an evidence vartics. that the first ill-defined estimate of the new scheme of government was giving may to positive and settled opinions of its powers, and of the poliey which should he followed in managing it. As we have spen, people were first divided into two great national parties in the antumn of 1757 , when the question at issue was whether the federal constitution should be ratified by thestates. It is probable that a majority of the American people were anti-Federalists in 1789, although the Federnlists, by the active assistance of many of their natural opponents, had gained the executive, the house, the judiciars and most of the state legislatures, and were able to defeat the disagreping factions known collectively as anti-Federalists. Hamilton's measures as secretary of the treasurr eanbodied an entire system of punlie polies, and the opposition to them made the differences between the two parties still more prominent. Ilamilton's opponents, led by Jefferson, made the objection to his principal mensures that they assumed powers in the national government which were not granted to it hy the constitution. Hamilton then fell back upon the elastic clause of the constitution, and maintained that
$W h=k y$ in.
surrection.
these powers were implied in it. Jefferson held that this doctrine of "implied powers" stretched the elastic clause* too far. He clainsed that this clause ought to be construed strictly and narrorly. Hamilton conteuded that it ought to be construed loosely and liberally. Hence the names "strict-constructionist" and "loose-constructionist," which mark, perhaps, the most profound and abiding antagonism in the history of American politics.

14 . During the year 1792 , the various anti-Federalist factions had become cemented into one party througla their efforts in resisting the Federalists, but the party still lacked a name. That of anti-Federalist was no longer applicable, for its opposition to the federal unicn had entirely ceased, and the parties had become divided in the only sound and healnhy way possible in a free country, namely, into those who wished to extend, and those who wished to limit, the powers of government. Neither party had been consistent in applying its principles, but, in the main, Hamiton can be called the founder of the Federalist parts, which had for its successors the National Repablicans of 182S, the Whigs, of 1833 to 1852 , and the Republicans of 1854 to the present time ; while Jefferson mas be regarded as the fonnder of the party which, after discarding the old name of anti-Federalist, adopted that of DemocraticRepublican. This always was the official party title. They preferred to be called Republicans, while their enemies tried to call them Democrats, an epithet, which was then supposed to convey a stigma. However, the oorrect name for this party was Republican from about 1792 to about 1828 , and since then it has been known as the Democratic party.
145. At the request of both Federalists and Republicans, Washington consented to serve as president a second time, so that the party contest was narrowed down to the vice-presidency. For this office the antiFederalists, or Republicans, as they were now called, supported George Clinton, of New Iork, while the Federalists presented the name of John Adams. Jefferson would doubtless bave been put formard, but that would have cost Virginia her yote, for her electors could not have voted for Washington and Jefferson, both being from Virginia. The presidential election took place November 6, 1792, and resulted in a Federalist success and the re-election of John Adams. During Washington's first term, Vermont, by consent of Congress, was admitted into the Union (February 18, 1791), and kentucky became a state on the 1st of June, 1792. In the year 1791 a bill for the establishment of a national bank was introduced into Congress, and passed after a strong debate.
146. During the first years of the American Republic, the terrible scenes of the French Revolution were enacted. Jefferson and the anti-Federalists sympathized strongly with the French Revolutionists, and wished to aid them in their struggle against the European powers. This party apecialls affected the leveling principles avowed by the French Republicans, and the opposite party did not olject to these principles to a limited dpgree. Early in April, 1793, news was received that the French Republic had declared war against Great Britain and Holland. It excited the sympathies of the American people for their sister republic, even though that republic was the aggressor; and it needed a firm hand and indomitable will, like Washington's, at this time to control public affairs, for the country was in a position to drift easily into war as an ally of France. Washington consulted his cabinet, and by their unanimous adrice determined to regard the former treaty as nullified by the change of government in France, and to issue his proclamation of neutrality between the French Republic and her enemies. The proclamation at once called down a storm of rage and invective against the president. He was assailed by the pross and extreme Republicans, and accused of being an enemy to France and republican institutions, of 1 is-
regarding a solemntreaty, and of usurping the functions of Congress in regard to the announcement of peace or war.
147. The French expected the Americans to help them in their war with England; and in 1793 they sent over a minister to the United States to induce them to do so. This man was called Citizen Genet. He arrived at Charleston, South Carolina, in April, and was received with the most extravagant marks of public attachment. Misled by the warmsth of his reception, he entered on and persisted in a course which would Fonly have been pardonable if he had been still on French soil. He fitted out privateers from American ports to cruise against the enemies of France, and sought to embark the American people in the cause of his country whatever might be the determination of the government. Hany Republicans were disposed to uphold him in all his acts, but his insolence presently disgusted his own supporters. He violently assailed President Washington and the gorernment, and otherwise misbehaved himself until Washington sternly checked bis proceedings, and at length conplained of him to the French government, which thought best to recall lyim.
148. Abont this time war was apprehended between Tireat the United States and England. England bad never warwi accredited a minister resident to the United States, and had refused to carry out those articles of the treaty of 1783 which bound her to surrender her military posts on United States soil, and to pay for the slaves carried away by her armies. She had also issued orders which bore hard upon American nerchants and sailors. She claimed the right to lay hold of any provision for the enemy which she might find in a neutral ressel, to seize the product of French colonies wherever found, and to board any vessel to make seurch for seamen of British birth, and carry them off for her own service. It was also beliered that her agents hadinterfered to prevent treaties of peace with the savages of the northnest, and had incited them to renewed attacks upon the froutier settlements. Her refusal to evacuate the western posts was grounded on the alleged unjustifiable neglect of the United States to enforce that article of the treaty of 1783 which provided for the payment of debts due to British subjects. For her further offensive measures no justification was offered, except her sovereign will. Out of these circumstances war might easily have grown, and it required all the wisdom of Washington and his advisers to prevent it. So bitter was the feeling against England held by men of both parties, that Congress began at once to take measures to rase an army, equip a navy and to stop all commerce with her. War was imminent, and Washington determined to avert it.
149. He appointed John Jay, who was then chief justice, to be envoy extraordinary to England, for the purpose of preserving peace by a new treats, in which the points in dispute between the two countries should be settled. Jas concluded a treaty with England which did not satisfy hin, but which was the best he could secure. It reached America March 7, 1795, and was sent to the senate in special session, June 8. The treaty provided that the western posts be surrendered to the United States, that compeusation be made for illeg. I captures of American property, and British creditors be secured the means of collecting debts contracted prior to the Revolution.

But Eugland still retained the right of impressing American seamen of English birth, and of shutting off American commerce from the West Indian trade. When the conditions of the treats lecame known there was great excitement in all portions of the country, and the wrath of the Republicans rose to fever beat. Hamilton was stoned on the street, and scurrilous newspapers railed against Washington, calling him the "step-father of his country." But the senate ratified the treaty, and Washington signed it, because, imperfect though it was, it was better than none, and would ayert war. It was the first substantial recognition which England had made of the sovereign rights of the United States,
and the result proved Washington's wisdom, for peace prevailed, commerce revived, and many who had at first denounced the treaty, became its friends.
150. During Washington's second term, party con tests had become numerous in the sessions of Congress. After much opposition on the part of the Republicans, the Federalists succeeded in passing a system of indirect taxation to provide for the increased expenses of the goverument. A Federalist bill to prevent such practices as Genet's was opposed by the Republicans, but was passed with some nodifications. An attempt was made by some of the Kepublicans to secure the passage of resolutions censuring llamilton's management of the treasury, but it met with no success. The supreme court had decided that an action brought by a citizen of the United States would lie against a state, just as against any other corporation. This alarmed the Republicans. An amendment to the constitution was therefore adopted by Congress, securing states against suits in the United States courts. It was afterward ratified by the required number of states, and became the IIth Amendment, which has enabled so many states to repudiate debt with impunity. In June, 1796, Tennessee, formerly a part of North Carolina, became a state of the union.
151. The time for a new election of president was now at hand. Washington was importuned to accept a third term of office. Electors nominated by both parties were called upon to promise that, if elected, they would give their first votes to Washington, but he refused to accept. When he retired from the presidency he made a farewell address to the people of the United States. In that address, which is weighty with words of wisdom, he urged the people to prize the Union which they had formed; to remember that each part of the country bad free intercourse with all other parts, and that each could help the other. He begged them to suffer no parties to gain ascendancy in the
Union which should weaken its strength, and bade Union which should weaken its strength, and bade them to glory in the name of America. He reminded them that Europe had interests in which Anserica had little concern, warned them against the admission of any European or other foreign influence
into American councils, and urged them to into American councils, and urged them to make religion, education and public good faith the basis of government.
152. As Washington refused to be a candidate for a third term, the election of 1796 was warmly contested by the two parties. No formal nominations were made, but it was understood that the Republican electors rould cast their votes for Thomas Jefferson, of Virginia, and Aaron Burr, of New York, and the Federalist electors for John Adams, of Jassachusetts, and Thomas Pinckney, of Maryland. Hamilton, haring made so many enemies by his political zeal, was eprinci- not considered a suitable candidate. The principles of es of the the two parties were distinctly ninderstood. The Rethe rights of man, the advocates of poonomy and of the rights of the states. The Federalists claimed support as the authors of the government, the friends of neutrality, peace and prosperity, and the direct inheritors of Washington's policy. In Fehruary, 1797, the electoral votes were counted. and John Adams, the Federalist candidate, was found to be elected president, and Jeferson, according to the rule at the time, as second on the list, became vice-president. This was an unwise rule, since under it the death of the president might reverse the result of the election.
153. On March 4, 1797, Adams and Jefferson were sworn into office. Shortly after the commencensent of President Adams' admiuistration the French Jirectory, displeased with the strict neutrality which the United States had observed during its war with England, and also on acccunt of the treaty of peace which had been recently entered into between England and the United States, adopted resolutions highly injurious to American commerce, and refused to receive Mr. Pinckney, the American minister, until the United

States had complied with their demands. The first act of Mr. Adams was to call an extra session of Congress, to determine how a war with France was to be avoided. A special commission of three envoys was sent to France, John Marshall, afterward chief justice, Charles Pinckney and Elbridge Gerry, but the French government refused to receive then. Prince Taileyrand had the impudence to send secret agents to deal with the envoys. These agents demanded that a large sum of mones be paid the goverument before the envoys could be received at all. After that the United States must lend money to France to enable her to carry on her war. When this was done France would repeal some of the acts which injured American commerce.
154. The envoys indignantly refused to accept such terms and sent home to America an account of this infamous proposal, anả Mr. Adams laid the dispatches before Congress, substituting the letters X . Y. $Z$. for Talleyrand's emissaries. Hence, these papers have ever since been known as the "I. I. Z. dispatches." April 8 the Senate voted to publish the $X$. Y. Z. letters and the dispatches of the envoys. To England they seemed of such importance that they were sent to every part of Europe to excite feeling against France. One burst of indignation arose in America, and for the moment the Republican party seemed overwhelmed. Pinckney had declared, "Millions for defense, but not ane cent for tribute," and the wp-ds were taken up as a popnlar cry. The United Sía, es prepared for war. A few excellent frigates were built, an army was raised, and Washington was placed in command with the rank of lieutenant-general. It was during this excitement that the song of "Hail Columbia" was published. American men-of-war were ordered to seize any French vessels which should zommit depredations on American commerce, and some naval engagements took place with success on the Anserican side. lntercourse with France was suspended. The treaties with France were no longer binding upon the United States, and authority was given to the president to issue letters of marque and reprisal.
155. The country was now on the side of the government. The Federalists, who had been losing ground, were now stronger than before. They attempted to strengthen the government still further by passing in Congress two acts, called the alien and sedition laws. Allen an The first of these acts, passed June 25, 1798, author-sedition ized the president to order ont of the country any alien Whom he might regard as dangerous to the peace and liberty of America, and made provisions for the fining and imprisonment of such aliens as refused to obes the president's order. July 14 the sedition law was passed. By this act a heavy fine and imprisonment were insposed upon such as should combine or conspire together to oppose any measure of the government, and upon such as should utter any false, scandalous or malicious writing against the government, Congress, or president of the United States. This act was to remain in force until March 3, 1801. These laws placer a power in the hands of the government which alarmé the Republicans. They claimed that the laws were aimed against them. They opposed the action of Congress, not as friends of France, but as Americans. They believed that less power should be given to the federal government, and more to the separate states. This belief, which so nearly prevented the adoption of the constitution had never disappeared. It showed itseli on every occasion, and helped to shape the course ot the Democratic-Republican party. This party cane to be called the State-rights party, because it was jealons lest the states should not have all their rights under the constitution.
156. Thus, when the Federalists forced through Congress the alien and sedition laws, they called forth a vigorous remonstrance from the southern Republicans A series of resolutions, drawn un by Jefferson, was adopted by the legislature of Kentucky (1798), and a similar series, drawn up by Madison, was adopted in the same year by the legislature of Virginia. These

Rent at once agreed to the proposition, though he believed that the constitution gave the Federal government no power to purchase foreign territory and make it a part of the union. In this instance, an article for the ratification of the purchase was prepared as an amendment to the constitution, but was never offered, as the president's action met with a general acquiescence and has since been imitated in similar instances without question. The Louisiana purchase included everything west of the Mississipni not already occupied by Spain, and comprised the whole or part of the present states of Arkansas, Colorado, Iowa, Kansas, Louisiana, Minnesota, Missouri, Nebraska, Oregon, the two Dakotas, Montana, Washington, Wyoming. Idaho, and the Indian Territory. The effect of this great acquisition of territory, by such an active and prosperous people as the Americans, was to insure them the ultimate control of the continent without incurring any foreign warfare worth historic mention. It set the nation free for an indefinite length of time from European complications, but, on the other hand, it was the means of creating some new and fornidable fature in the rivalry between the free states and slave states.
163. The Barbary states on the southern shores of the llediterranean were in the habit of sending out piratical vessels to pres upon the commerce of other nations and reduce their sailors to slavery. All the great powers of Europe, as well as the United States, had adopted the custom of paying tribute to these petty governments, in order to secure immunity for their trade. But these pirates grew increasingly insolent, so that the patience of the American government became entirely exbausted. A small Heet was sent out to the Mediterranean, which bombarded Tripoli. After a desultory warfare extending over two years, the Tripolitans sued for peace. The English government then followed the example of the United States, and in a few jears more this abominable nuisance was suppressed.

In the latter part of 1808, during the first session of the VllI Congress, the manner of the presidential election was amended to the form which it has at present. The amendment having been ratified by the necessary number of states, this became the twelfth amendment to the constitution. Articles of impeachment were roted by the house against a federalist judge, Chase, of Maryland, for arbitrary and oppressive conduct in trying cases under the alien and sedition laws. At the next session of Congress in 1804, Chase was tried and acquitted.
164. In 1804 .Jefferson was re-elected president, with George Clinton for rice-president, in place of Aaron Burr, who had separated from his party. The federalists then made Burr a candidate for the governorship of New York, but here, as in 1801. Hamilton used his influence against him, and Burr was defeated. Resenting this opposition, Burr contrived to force Hamilton into the acceptance of a challenge. They met on July 11, 180t, and IHamilton was killed. The mourning of the country over the luss of this distinguished man was intense, and the wretched Burr found that his public career was at an end. Bankrupt infortume, and a fugitive from home, he visited Xew Orleans and other parts of the south and west (1805) for the purpose of arranging an enterprise whose exact object has never ljeen positivels discovered. He planned either the seizure of Mexico, or the establishment of a monarchy west of the Alleghanies. He was arrested by the federal government on a charge of treason, and was tried before Chief Justice Marshall in September, 1807, but after a long investigation he was acquitted in consequence of a defect in the chain of evidence. Afterward he became an outcast from society and died in obscurity.
165. On the 4 th of March, 1805, Jefferson and Clinton were sworn into office. Jefferson's second administration was the beginning of a stormy period which ended in war. The wars of Napoleon still continued, and France and (ireat Britain were using every expedient to cripple each other without regard to the rights
of neutral nations. In the beginning of these wars the C"nited States, being a neutral power, had acquired a valuable foreign commerce, but this was speedily destroyed by the arbitrary measures of the belligerents. With his famous Lierlin and Milan decrees, Napoleon sought to prevent neutral vessels from entering British harbors, and claimed the right to seize all ressels trading with England or her colonies (1806). England replied with her orders of council issued by the king, which forbade all commerce with the ports of Europe that were within the Freuch dominion or in countries ablied with France. If an American vessel touched at almost any port of continental Europe, the first British cruiser that came along deemed her its lawful prey; if she touched at a Pritish port, she was liable to capture by the first French craft that she slould meet. Jefferson had abandoned the policy which Adams had adopted of building a strong nars. He imagined it possible to defend American harbors lys meaus of gun-boats carrying each one gun, and had reconmended this, plan which Congress adopted. This "Gunboat System" was alwass hateful to the navy, and was a constant object of federalist ridicule and attack.
166. While the offensive measures of England and France made American mercbantmen a prey to both parties, England, in another respect, possessed a peculiar power of annoying the United States. She still Theright claimed and exercised the right of stopping American vessels and seizing all sailors, even naturalized citizens, who were supposed to be British suljects. In June, 1807, the insolence of this claim was carried so far that the British man-of-war, Leopard, stopped the United States frigate, Chesapeake, ofl the entrance of Chesapeake Bay, fired into her, killing or wounding twentyone of the crew, and took off four men, three of whom were Americans. President Jefferson demanded reparation for this outrage, and issued a proclamation ordering all British war vessels out of Auserican waters. The British government was ready to disavor the act of the Leopard, but there was no willingness shown to make reparation. Feeling unprepared for war, the United States government had recourse to an exceedingls stupid and dangerous measure. The president recommended a bill by which American vessels should be prohibited from leaving foreign ports, and foreign vessels from taking cargoes from the United Stater, Embargo and all coasting vessels should he required to give Bill. bonds to land their cargoes in the United States. This was the celebrated Embargo Bill, which did more harm to American commerce than all the cruisers of France and England were able to do. It also intensified party feeling and even threatened the existence of the union.
167. As time went on the Embargo Act became so unpopular that before the close of Jefferson's second term many of his friends forsook him. A great pressure was brought to bear upon Congress to repeal the act. It passed in its place the Non-intercourse Act. Non-InterThis act prohibited trade with England and France so course act long as their olmoxious measures should be kept in force, but it allowed free trade with other countries. Among the other important events of Mr. Jefferson's adminisuration were the passing of an act of Congress prohiliting the slave trade after Junuary 1, 1808 ; the beginning of the United States const survey, a valuable work which is still continued to the great credit ol American science, and the application of steam to navigation by Robert Fulton. Jefferson refused to be a candidate for a third term, and at the election in 180s, James Jadison, of Virginia, was chosen president by the liepulnican, or, as it now began to be called, the Jemocratic party. Clinton was re-elected vicepresident. The candidates of the Federalists were C. C. Pinckney and Rufus King.
165. The Non-intercourse Act went into force March madrons 4, 1809, when Mr. Madison succeeded to the presidency. adminne He belonged to Jefferson's parts and continued his tration. policy. l'arty feeling had grown very bitter. New England, which suffered the greatest from the breaking up of trade, was the stronghold of the Federalists.

They complained loudly that if it were not for the Embargo and Non-intercourse Acts there would be no trouble. The southern and western people, who were principally Democratic-Republicans, retorted that they had evidence of negotiations between the New England Federalists and England; that the Federalists were planning for a separation of New England from the union. This charge was indignantly denied, but it helped increase political hostilities. In 1810 Congress repealed the Non-intercourse Act, which had accomplished nothing in the way of intimidation. Congress then informed England and France that if either nation would repeal its obnoxious measures, the Nonintercourse Act would be revived against the other. Napoleon was studying how he might get the adrantage of England, and he withdrew, or pretended to withdraw, his decrees prohibiting commerce with England so far as the United States was concerned, but at the same time gave secret orders by which the decrees were to be practically enforced as harshly as ever. Congress at once revived the Non-intercourse Act against Great Britain alone.
Beginning
169. England and the United States grew more irritated with each other, and in 1811 hostilities actually began on sea and land. In May the United States frigate Pirsident hailed the British man-of-war Litlle Belt and was answered by a shot. The President then replied with a shot in turn, and a sharp action ensued in which the Little Belt was badly crippled, and lost thirty-one killed and wounded. Tecumseh, the famous Shawnee chief, had gathered a large number of warriors, and at the instigation of the British they were attacking the northwestern settlements. General Harrisou marched against them, and on November 7, he defeated them at Tippecanoe. The English continued to seize vessels and men. More than nine hundred American vessels had been seized since 1803 , and several thousand American seamen had been impressed into the British service. The people of the United States were exasperated at their losses and their inability to protect themselves. Madison wished to continue the general peace policy of Jefferson, but new leaders had sprung up in the Republican party who were in favor of war. Chiel among these were Henry Clay, of Kentucky, speaker of the house, William H. Crawford, in the senate, and John C. Calhoun, of South Carolina, in the house. These became the recognized congressional leaders of the party. The economical and retrenching policy of Jefferson was abandoned, and preparations were begun for hostilities. Bills were passed to entist men, to organize the militia and to enlarge and equip the army.
170. President Madison was given to understand that his nomination for a second term of office depended upon his adoption of the war policy, otherwise De Witt Clinton, of New York, would be nominated in bis stead. The president accepted the conditions, and on June 18, 1812, war against Great Britain was formally de clared. It was soon learned that the British government had revoked the orders in council five days after the declaration of war, but this concession came too late. Even if it had come in time probably nothing short of an abandonment of the right of search and impressment on Great Britain's part would have proved satisfactory. The war feeling was by no means unanimous. The New England Federalists bitterly opposed it. The chief support came from the south and west, which felt less keenly the effect upon their prosperity, caused by the breaking up of commerce. Immediately after the declaration of war the Federalist members of Congress had published their protest against it in an address to their constituents. When requisitions were made by the president upon the governors of the different states for their respective quotas of troops, according to the act passed by Congress to embody the militia, the governors of Massacbusetts and Connecticut refused to allow their militia to leave their states on the ground that it was unconstitutional for the Federal government to call out the militia except in case of an invasion or resistance to
the laws of the United States, and neither of these had taken place. April 30, 1812, Louisiana was admitted into the union of states.
171. The wrar opened by the invasion of Canada by General Hull, who was ordered to cross at Detroit and attack Fort Malden a few miles distant, but he was compelled to fall back again to Detroit. Here he was attacked by a large force of British and Indians under General Brock and Tecumseh. Believing he was not strong enough to defend the place he surrendered (August 16, 1812), not only Detroit, with its garrison and stores, but the whole territory of Michigan. Being exchanged, after some time he was tried by a courtmartial on charges of treason and cowardice. He was acquitted of treason and was sentenced to be shot for cowardice, but was pardoned by the president on account of his past good services. In October another attempt was made upon Canada, near Niagara. A small force crossed the river and attacked the British in a strong position on Queenstown Heights. At first Queens the Americans were successful, but were at last defeated Height with heavy loss.
172. To compensate for these disasters on land the Naval little American navy won imperishable glory on the exploits. ocean. The United States frigate Essex, Captain Porter, captured the British sloop-of-war Alert after a fight of eight minutes, without losing a man. The Constimtion, Captain Hull commanding, fought a famous action with the British frigate Guerriére near the Gulf of St. Lawrence (August 19), and in less than an hour completely destroyed ber. This victory dispelled the belief that the British navy was invincible, and the whole country was filled with transports of delight. On the 18th of October the sloop-of-war IFasp, commanded by Cuptain Jones, captured the British brig-of-war Frolic off the coast of North Carolina, but the same day the British ship Poictiers took both the captor and her prize. On October 25, the frigate Cnited States, under Commodore Decatur, fought a memorable action with the British ship Macedonian, which surrendered to Decatur after being nearly cut to pieces. This engagement took place off the Island of Madeira, but Decatur succeeded in carrying his prize to America. The Constitution, commanded by Captain Bambridge, in a two hours' fight off the coast of Brazil, knocked to pieces the British frigate Jara (December 29), which lost 230 men and had to be burned, while the Constilution lost but twelve men and not a single spar.
173. During the first six months of the war the despised American navy, of which even the Americans expected but little, became the admiration of the world. Privateers also were very active, and before the end of the year the captures from the British numbered about fifty vessels of war, two hundred and fifty merchant vessels, and three thousand men. Under the impulse of these successes the Federalists, who had been opposed to the war, were beaten in the autumn elections, and Madison was re-elected president, with Elbridge The re-el Gerry for vice-president. The American disasters on Man of land had led the government to collect a large army, which was placed under the command of General Harrison. He first made an attempt (January, 1813,) to re- The war cover Detroit and the territory of Michigan, but was the nort driven back to Fort Meigs by Proctor, who besieged him there, but unsuccessfully. So much of the frontier was occupied by the great lakes that it was of the greatest importance to get control of these, and for this purpose, both British and Americans were busily engaged during the summer of 1813 in building fleets. Captain Oliver H. Perry directed the building of the fleet on Lake Erie, and sailors were sent forward from the seacoast. He had just completed nine vessels, which were at anchor in Put-In-Bay, when he saw the British ap- Batte proaching. He at once moved out to meet the enemy Lake Er (September 10), and in a little more than two bours was able to send this dispatch to General Harrison, who was in command on the Sandusky: "We have met the enemy and they are ours; two ships, two brigs, one schooner, and one sloop." This victory turned the
scale of war in the northwest. Harrison shipped his army across the lake in Perry's Heet, and attucking Proctor at the River Thames (October 5), inflicted a crushing defeat upon him. This was a severe blow to the Indians also, for their great leader, Tecumseh, was killed. The American success restored the northwestern territory to the country.
174. In the spring of 1813 Tecumseh had visited and roused the Creek Indians of the southrest, and in August they took occasion to attack the frontier settlements, beginning with the terrible massacre at Fort Alimms, near Mobile. General Andrew Jackson, with the formidable Tennessee militia, marched into the Creek country, and won a series of telling victories, by which they were entirely subdued, and purchased peace by the surrender of two-thirds of their hunting grounds. In the meantime the British, after the defeat which they had suffered from the American navy in 1812, strengthened their Atlantic squadron. During the summer of 1813 they attempted to blockade the coast from Maine to Georgia. Congress, in turn, hastened to build new ships; and the courageous privateers continued to fight pluckily, and to bring prizes into the United States ports. In February, 1813, the American sloop Horme, Captain Lawrence commanding, destroyed the British brig Peacock, which sank before all of her crew could be removed. On his return to the U'nited States, Lawrence was promoted to the frigate 'hesupeake, with which, on June 1, he had a severe engagement with the Britisb frigate Shamon near Boston. Lawrence was mortally wounded at the beginuing of the action. As he was carried below, he exclaimed: "Don't give up the ship!" The "hesaprake, however, was captured by boarding, after she had lost a large proportion of her officers and men. The Argus, Captain Allen, was captured by the British man-of-war Pelican (August 14), after a gallant fight in which Captain Allen receired his death wound. Lieutenant Burrows, in the brig Enterprise, captured the British brig Boxer (September 5), after a short action. The frigate Essex, Captain Porter, made a brilliant and successful cruise during the year 1813, and did great damage to the British commerce. At length, however, she was attacked in March, 1814, by the British ships Ihoebe and Cherub, and after the bloodiest fight of the war, the Essex was compelled to surrender. The sloop Percock captured the British brig Epervier off the coast of Florida (April, 1814). The Hasp made a brilliant cruise, taking a number of British vessels. The old Constitution, Captain Stewart, engaged singly the British sloops-of-war Cyane and Levant of the coast of Portugal, and captured both in a remarkable night engagement, February 20. The Hornet captured the British brig Penguin in March, off the Cape of Good Hope, and in June, the Peacock closed the long record of victories by taking the British ship Nautilus. These last three actions took place after peace had been concluded.
175. In the summer of 1814, the Americans made a fresh attempt to invade Canada under General Brown, with whom served Brigadier-General Winfield Scott. They crossed the Niagara river and in four hard-fought battles defeated the British at Chippewa (July 5), Lundy's Lane (July 25), and Fort Erie (August 15 and September 17), but in spite of these successes, they could not establish themselves in Canada, and retired across the line before cold weather came. In March, 1814, Napoleon was dethroned and sent to Elba, and the European rar being over, England was enabled to spare more men for the war in America. Her policy was to march two armies into the United States. One was to descend from Canada by the route which Carleton and Burgoyne had followed, and the other was to land at New Orleans and move northward. To divert attention a fleet under Admiral Cockburn sailed up the Potomac and attacked the capital. There was scarcely any resistance, and the British wantonly destrosed puhlic buildings, books and papers (August, 1814). Nothing was spared except the patent office and the jail. The British then moved upon Baltimore. General Ross and bis troops were landed a few miles below the town, but
the Americans gallantls repulsed them. Then the fleets hombarded the forts which protected lialtimore (September 12 and 13). Fort Mchenry received the hottest fire from the fleet. It was upon seeing the flag still fly. ing from the fort, when the smoke cleared away, that Francis S. Kej wrote the national song, "'The Starspangled Banner." The fleet finally abandoned the attempt and sailed awas.
176. The British in Canada, having been reinforced by the arrival of fresh troops from England, advanced with an army of fourteen thousand men under Prevost, to attack Plattsburg, on Lake Champlain, while a Brittish squadron, under Captain Downie, sailed up the lake to co-operate with him. The Americans, under General Macomb, being only fifteen hundred strong, fell back behind the Saranac, and there made a vigorous defense. They had also a squadron of small vessels under Commodore Macdonough, and this was stationed at the entrance of Plattslurg bay. Captain Downie attacked Macdonough (September 11, 1814), at the same time that General Prerost attempted to force the passage of the Saranac, but the British fleet was annihilated ly Battle of Macdonough and Prevost, beaten at ever's point bs Ma- Platisburg comb, retreated in disaster to Canada. But while this attempt on New York proved a failure, the British succeeded in seizing the unoccupied wilds of Maine east of the Penobscot river, and thus created a panic in New England.
17. The expedition against Washington was designed The war m chiefly as an insult; the expedition against New Orleans the Soatb. was for conquest. If the British could gain this important position they would control the Mississippi and the western country. In December, a British army of 12,000 men under General Pakenham, landed below New Orleans. General Jackson hastened to that city with $6,000 \mathrm{militia}$ to oppose him, and fortified the town as best he could. After a fortnight's siege the British determined to assault the American works. Earls on the morning of January 8, 1815, they made the attack. Jackson's men, trained to ritle shooting and aided ly artillery, met them with great coolness, and in less than half an hour the British were in full retreat, leaving Pakenham and 2,600 men behind them, killed or wounded, while the American loss was but 8 killed and 13 wounded. This battle also occurred after peace was deciared.
178. Negotiations for peace bad been begun in August, 1814. The American government was anxious for almost any honorable peace in preference to continuing the war with England. The latter country had revoked the orders in council long before, but stil] England's demands were such that they could not be accepted with honor by the Federal government. The war feeling was thus continued among the republicans, and some of their leaders began to meditate measures which the strict constructionist principles of the party would not justify. I'ropositions were made to introduce the English system of impressment of seamen, and of allowing officers of the army to enlist minors over eighteen years of age without the consent of their parents or guardians. The Connecticut legislature ordered the governor to resist the execution of these and similar measures if they should become laws. In view of these things, and provoked by the British invasion of Maine, the legislature of Massachusetts had invited the other New England states to send delegates to Hartford, Connecticut, "to confer upon the subject of their public grievances." Delegates from Massachusetts. Connecticut and Thode Island, and from parts of Vermont and New Hampshire, met at Hartford The in December, 1814, to discuss the sithation of affairs Hartiord and decide upon the proper course to be pursued. Convention Among other measures thes recommended the adoption of several amendments to the constitution, chiefly with intent to restrict the powers of Congress over com. inerce, and to prevent naturalized citizens from holding oflice. As there was much secrecy in its proceedings. a popular suspicion was aroused that a dissolution of the union had been proposed, perhaps resolved upon, in its meetings. This suspicion completed the ruin of the the Federal party. From this period the few remaining Federalists ceased from any united party action. There was but one party, whose principles consisted of a combination of those which had characterized the originał Federal and Republican parties. The leading principle of the Federal parts, the estahlishment and continuance of the Federal government, had been quietly adopted by the Republicans, white the Republican principle of limiting the duties and powers of the government had been as quietly accepted by the Federalists after the Republican party had come into power. In the presidential election of 1816 , the Federatist candidate, Rufus King, received only 34 electoral votes against 187 for the Republican candidate. James Monroe. His administration lasted from 1817 to 1825, for in 18:2 the Federalists put no candidate in the field, and Monroe, being nominated for a second term, his election was practically unanimous. His administraThe era of tion has been called the "Era of good feeling." People laod feel- forgot the old quarrels in their joy at the end of the war and the revival of business. For a time the violent party feeling, which had flamed so high during the European strife, had quieted down. New occasions for political contest had not yet come. Congress occupied itself chiefly in the regulation of internal affairs. Taxes were reduced, and a slight increase was made in the tariff. The feeling was growing among the Republicans that the tariff ought to be so arranged as to afford protection to those manufactures which had been developed in the United States during the war, but were now suffering from a competition with the cheaper goods which were imported from England. But no action was taken on the subject.
181. As has been stated, the charter of the national bank, which had been granted during Washington's first administration had expired in 1811, and the Republicans, then in power, had refused to re-charter it. The attempt to carry on the war by loans had resulted in almost a state of bankruptcy. In A pril, 1816, a bill was passed. granting a charter for a national bank to expire in 1836. It was modeled upon the one which the Republicans bad formerly opposed. The Republican newspapers warmly adrocated the scheme, and repubished Hamilton's argument in favor of such a bank, hus showing how far loose constructionist ideas had
spread in the Republican party. The bank was organized with a capital of $\$ 35,000,000$, four-fifths of whict might be in government stock. It was to have custody of the government revenues, but the secretary of the treasury was empowered to divert the revenues to other custodians, giving his reasons for such actions to Congress.
182. In 1817 hostilities broke out with the Seminole Trouble and Creek lndians of Spanish Florida, Georgia, and Floridu Alabama; General Jackson being sent to the scene of disturbance, chastised the savages and destroged their villages. Jackson, with all bis admirable qualities, was not a cautious man. Satisfied that the Spaniards had incited the Indians to make war, he invaded Floride (April, 1818) and took possession of Spanish forts and built a fort of his own. Then he seized Pensacola and seni the Spanish troops and ciril authorities to llavana. Though Jackson's high-handed measures were not fully sustained by Congress, yet, so popular was be, that instead of being reproved by Congress, he was regarded as a great hero worthy of warmest praise. Spain vigorously protested against these proceedings as a gross violation of neutrality, but she was too weak to offer any effectual resisiance. The matter was finally arranged by the purchase of Florida by the United States for $\$ 5,000,000$ (1819).
183. The growth of the nation was so rapid that for Growtho six years after the close of the war of 1812 a new state the nation was added each year. Indiana was added in 1816, Mississippi in 1S17, lllinois in 1818, Alabama in 1819, Maine in 1820, and Missouri in 1821. The population now numbered nearly ten millions; the public revenne had ncreased from five million dollars during the time of Washington to twenty-five million dollars. Since 1790 the government had granted patents to its inventors. A few had been granted prior to 1812 , but after that the number increased rapidly. In 1836 the patent office was made a distinct burean under the secretary of state, and a commissioner of patents was appointed at its head. The great coal and iron regions lying in the Appalachian range were now yielding their riches. Charcoal was formerly used in smelting iron, but in 1520 the ironworkers of Pennsylrania began to make experiments in mixing anthracite coal with charcoal. When it was found that anthracite coal could be used alone the manufacture of iron received a new impetus and increased rapidly. With a country so large, and with a population spreading in every direction, the urgent denand of western settlers for some quicker and easier mode of inter-communication and transportation led to a variety of plans to accomplish the end. Private companies, and sometimes the state, built roads and canals. The greatest of these public works was the Erie canal, which owed its execution chiefly to the Erie Cans energetic governor of New York, De Witt. Clinton. It was begun in 1817, and opened for traffic in 1825. It extended across the state from Lake Erie to the Hudson, and was the largest canal in the world. When the enterprise was first undertaken, and until its comp!etion, it was called "Clinton's big ditch," but it was one of the principal means by which the city of New York hecame the chief commercial city of the new world. This was before the locomotive had been perfected, so that steam railroads were not jet iu operation.
184. In 1807, Robert Fulton had invented the steam- Steamboat. In 1811, a steamboat was launched on the Obio boats river at Pittsburg, and presently many like craft were traveling the western rivers, thus opening an easy means of communication between distant points. Just after the Erie canal was begun, a steamboat was Luilt, which was the first to navigate Lake Erie. The next year the steamer Sammah crossed the Atlantic, went as far as St. Petersburg and returned. Six years later, when the Erie canal was finished, the steamer Enterprise went from America to India by way of the Cape of Good Hope. In 1826, the first railroad in the United Railroan States was opened from Milton to Quincy, in Massachusetts. It was only two miles long, and was used for hauling granite, the cars being drawa by horses. In

1830, the first passenger railroad in America was opened, the Baltimore and Ohio Railroad, which was fifteen miles in length. The cars were at first dram by horses, but by another year a locomotive was used. The construction of railroads nors began in all directions, and during the next twenty sears nearly ten thousand miles rere built. By the application of steam to industry, the discovery of large tracts of coal and iron ore, the invention of labor-saving machines, the communication by steam and railroad, the means were given to an energetic people for transforming the wilderness of the southern half of North America into a rich and prosperous country.
185. In its international relations, the action of the government had become strong, quiet, and selfrespecting. Mexico and the Spanish colonies of South America had revolted against Spain, and established republics, and, in 1892, President Monroe acknowledged them as independent nations. During the revolt, it seemed likely that the "Holy Alliance" of Austria, Prussia, and Russia meant to assist Spain in bringing her revolted colonies to obedience. Great Britain had been gradually withdrawing her support from the alliance, and Canning, the new British secretary, determined to impress a check upon it by calling in the weight of the American government. A hint was given to the American minister, and in his annual message to Cougress, in 18:3. Jr. Monroe declared that: "We could not view an interposition for oppressing them (the South American States), or in controlling in any other manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition towards the United States." This statement announced the great fact that "the American continents are not to be considered as subjects for future colonization by any European power." This principle, so boldly declared, became known as the "Monroe doctrine," and, having the full sympathy of England, it proved effectual. The attitude of the national mind implied in such a declaration showed that our period of national weakness had come to an end.
186. Before the Revolution, all the colonies beld negro slaves, but north of Maryland these slaves were few in number, and were soon emancipated in all the northern states except Delamare. In the early jears of the Republic, many of the wisest men in the south were desirous of getting rid of slarery. All but three of the United States which made the confederation forbade the importation of slaves. These three were North Carolina, South Carolina. and Georgia; and they insisted when the constitution $w a s$ formed, that the right to import slaves should continue until 1808. At the close of the eighteenth century there was a strong antislavery feeling even in Virginia and North Carolina, and the supposition generally prevailed that the slavery system wrould gradually die out without causing any serious political trouble. In tro states onls, South Carolina and Georgia, was slavers looked upon with any narked degree of favor, and this was owing to the fact that these two states were mostly given to the cultivation of rice and indigo, which seemed to make slave labor indispensable. In 1753, the famous cotton-gin was invented hy Eli Whitney, a comnecticut schoolmaster living in fiengia. The construction of this machine was so simple that the slares could use it, and cotton could be cleaned and prepared for market with great rapidity. Hitherto very little cotton had been raised in South Carolina and Georgia, but with the advent of the cottongin, cotton-growing became a profitable industrs, and, in consequence, there was an increasing demand for slaves. As the importation of sluves had been prohihited by the constitution, after lans, the cotton-phanters could henceforth obtain slaves onls by purchasing them in such border states as Kentucky and Virginia. To the tobacco-planters of these states, this spemed to promise a source of great protit, and mayy of them gave their attention to the raising of slaves for the southern markets. Hence, anti-slavery sentiments were soon extingnished among them. There was no likelihood
now that slavery would die a natural death. The interests of the south seemed to be bound up in the slavery system, and the way was prepared for uniting all the slave states into a solid south, as opposed to a solid north. The greatest danger to slavery had been the growing conviction that it was wrong in principle, and that the nation ought not to permit it. But slavery existed under the laws, and the states where it did not exist were not at first disposed to interfere. Thes held that slavery was purely an allair of the states in which it was found. Besiles, the northern states were now engaged in a variety of enterprises, while the southern States were still chiefly employed in the few agricul tural industries of tobacco, cotton, rice, and sugar. The south thus looked to the north for clothing, tools, much of their food, and all the luxuries of life. The merchants of the nortl found a great market for their goods in the south; the manufacturers also needed cotton to keep their mills in motion. For these reasons, chiefly, the relations between the two great sections in regard to slavery had not been disturbed; but the time was at hand when this question of slavery was to be the paramount one in the whole republic.
187. In the northwest territory, slavery was prohib- The slaven ited by law; in all territories south of that domain it struggle. was permitted. There soon grew up a contest between the free and the slaye states for control of the government, the south wishing to extend the area of slavery by the admission of new slave states, the north seeking to confure the institution to the localities where it already existed, while the abolitionists of the North wished to put a stop to it altogether. Thus began the "irrepressible conflict" between free and slave labor, which ended, after more than forty years, in the great civil war. It Was nut until the Mlississippi was crossed, and settlements began to be made in the great territory originally called Louisiana, which Jefferson had added to the national domain, that the question arose whether the states made from it were to be slave states or free. The first discussion was over the admission of the territory of Missouri as a state. A kind of compromise had been kept up from the beginning by admitting a slave state and a free state by tarns, so as to counterbalance each other in Congress. Thus Vermont bad been connterbalanced by Kentucky, Tennessee by Ohio, Louisiana by Indiana, Mississippi by Illinois. In the same manner, the admission of Alabama, in 1819, should have counterbalanced the admission of Maine in the following year; but, as Missouri was also knocking at the door of Congress, the southern members refused to admit Maine until it should be agreed to admit Nissouri as a slave state.
189. When Missouri applied for permission to enter The Mis the sisterhood of states, and a bill was brought before promise. Congress to that effect (1819), an amendment was offered to the bill, forbidding slavery or involuntary servitude in Nissouri, except as a punishment for crime. At once party lines were broken. The members from the free states roted for the amendment, and the members from the slare states against it. It was carried in the house, but rejected by the senate, and the hill was lost. At the next session of Congress, Dlissouri again presented her plea for admission as a state, and Maine made her tirst application for the same privilege. The Maine bill passed without opposition in the house, but by a sectional rote of that bods slavery was again prohibited in Missouri. In the senate, the Haine bill and a Nissouri bill permitting slavers were united, and then passed by a sectional vote. As the case now stood, both bills were compelled to stand or fall together, and the responsibility of their acceptance or rejection was thrown upon the house. The house held to its first action, and rejected the combined bills as passed by the semate. The difliculy was at length settled by the famous Missouri Compromise of 1820, in which unch section gave up some of its demands, the house by permitting slavery in Missouri, and the senate by permitting Maine and Missouri to be voted npon separately. Thus Maine and Nissouri were admitted into
-he union, the latter as a slave state; but it was agreed गy both branches of Congress that slavery should be orohibited forever in all other territories north of the varallel of $36^{\circ} 30^{\prime}$, which was the southern boundary a Missouri.
189. In 1824, Congress requested President Honroe to invite La Fayette to visit the United States as a guest of the nation. The marquis, then sixty-seven years of age, spent eleven months in a tour of the states, receiving everywhere the highest honors. His great fortune had been lost during the French Revolution, and Congress voted him a present of a township of land and two hundred thousand dollars in money. On the 17th of June, 1825, the fitieth anniversary of the battle of Bunker Hill, General La Fayette laid the cornerstone of the Bunker Hill monument. There were present on the occasion about forty of the survivors of the battle and two hundred soldiers of the Revolution. A memorable oration was delivered by Daniel Webster.
190. In the presidential election of 1824 , there were no recognized parties, and political issues were so obscure that the contest turned chielly upon the personal merits of the candidates. The leading candidates were John Quincy Adams, of Massachusetts, secretary of state, William 11. Crawford, of Georgia, secretary of the treasury, Henry Clay of Kentucky, speaker of the honse, and Andrew Jackson, a private citizen of Tennessee. On account of the number of the candidates and the character of the contest, the presidential campaign of 1824 has been humorously styled the "Scrub race for the Presidency." All the candidates claimed to be Republicans. Crawford and Jackson were representatives of the strict constructionist principles, but Jackson was not in favor with the Crawford faction on account of his leaning toward a protective tariff. Adams and Clay were loose constructionists. The personal nature of the canvass is shown in the tendency of the supporters of the different contestants to designate themselves as "Jackson men "or "Adauns men "rather than by any real party title. John C. Calhoun, of South Carolina, was generally supported for the vice-presidency by the friends of all the other candidates. In February, 1825, the electoral votes were counted, and were found to be, for president, 99 for Andrew Jackson, 84 for John Quincy Adams, 41 for William H. Crawford, and 37 for Henry Clay, and for vice-president, 182 for John C. Calhoun, and 78 for various other persons. Calhoun was therefore declared elected vice-president. Jackson had received the greatest number of electoral votes for president, but no one had a majority; and so the election went to the house of representatives. As Clay stood fourth on the list be was not eligible, and only three names were open to choice in the house. The friends of Clay therefore-unable to vote for him-united with the friends of Adams and thus secured the election of the latter. The feeling excited by this result had a tendency to widen the breach between the two divisions of the Republican party, and before long they became openly opposing parties.
The Adams adminis. tration.

## The

accepted the invitation in behalf of the union. Congress, however, after a stormy debate, refused to send delegates. It was claimed that these South American states had abolished slavery, that they were near neighbors to the south, that they might include Cuba, which was still a part of Spain, make the island independent, and free the slaves there. The whole scheme was fraught therefore with danger to the slave states, and was rejected. The slave states were strong supporters of the doctrine of state sovereignty. They held that the states were independent of one another and of the federal government, a doctrine which had been held from the beginning of the union. The independent power of the state ras a safeguard against too great a power in the central government.
192. The first tariff act of 1789 involved the idea of protection to home manufactures. The duties, however, ranged only from $7 \frac{1}{2}$ to 10 per cent., averaging about 81 per cent. The system, too, which was introduced by Hamilton, seemedto be rather for political than economic purposes. Up to the passage of the tariff act, the laying of duties had been controlled by the states. The possibility of secession among the states in which the state-rights feeling was strong, was a feature that every statesman had to take into account. Hamilton wished to establish the new. Federal government as firmly as possible, and lis ohject in the tariff system seems to have been to create a class of manufacturers, running through all the states, but dependent for prosperity on the Federal government and its tariff. This would be a strong factor in support of the government against any attempt at secession, or any tendency to return to the old system of control by state legislatures. The war of 1812 had made it difficult to obtain manufactured goods from abroad, and many needed articles had begun to be made in the United States. After the war was over, American manufacturers wished to continue their business, but as they could not competesuccessfully with English manufactured goods, a higher protective tariff was thought necessary. In 1816 a tariff was instituted which imposed a duty of about twenty-five per cent. on imported cotton and woolen goods, and specific duties on iron imports. The English manufacturers nade far more clath than could be used in England alone, and they sold it to other countries. They could make the cloth better and more cheaply than it could be made in the United States. The people of the United States, therefore, would prefer to buy it of England rather than of the American manufacturers. Now England had established herself in India, and received at first most of her cotton from that country. She wished to favor her own merchants, who brought the cotton from India, and therefore she laid a tax upon the cotton from the southern states. Then the south began to send her cotton to the north, where they could sell it without paying duties, and favored a heavy duty on all cotton goods brought from England. By this means they thought that northern manufacturers could make up their cotton into goods which would cost the buyers less than English goods of the same kind. They reasoned thus: If the cotton has to travel across the Atlantic, pay a tax there, be made into cloth, cross the Atlantic again, and then pay a heavy duty at the custom-house, it will cost the merchant who buys it so much that when he sells it he must ask a higher price than for the cloth made perhaps in the next town to him. So the customer will buy the native cloth. This tariff on European goods, therefore, was called a protective tariff, because it was intended to protect the American planter and manufacturer. At first the northern people did not favor it. Their business was much more in ships than in mills; and if the tariff prevented the importation of European goods, their ressels would not be of much use.
193. There was nothing new in the principle of the protective tariff. As has been shown, Hamilton had urged it at the beginning of the government, and it was the method used by many countries for the protection of their own industries. But the tariff of 1816 in
the United States came at a time when it had a marked effect on the history of the people. If the United States could manufacture its own goods from its own products. and sell them to its own citizens, then one part of the country would help another, and the whole union would prosper together. Thus the tariff fell into its place as one of the plans adopted by the country when it settled down to the mork of possessing the land and improving it. But as time went on, the south, which had at first favored a protected tariff to ensure the sale of her cotion, now began to oppose any further increase of duties on foreigu goods. Thns, in 1822, a proposition for making the tariff more protective was defeated ly the southern section in Congress. The tariff of 1824 was adopted by very small majorities. It was an advance on all preceding tariffs in its consistent design of excluding foreign competing goods from American markets. It was passed by the northern members, except those from the northeast, against the almost unanimous vote of the southern members, who considered it unconstitutional, sectional, and unjust. In 1828, the Protectionists, as those who favored a high protective tariff were now called, succeeded, after a debate of six weeks, in passing another tariff bill Which was so protective as to be satisfactory to manufacturers but very objectionable in the southern states, where it was prononnced a legalized robbery. From this time the nullification doctrines of the Kentucky resolutions of 1799 began to gain strength rapidly in the south.
194. In the presidential canvass of 1828, the two factions of the great Republican party now assumed the character of two distinct and opposite parties. The supporters of Jackson assumed the name of Democrats, while his opponents, who favored the re-election of Adams, were known at first as National Republicans. But in the course of Jackson's administration, as they sam fit to represent him as a kind of a tyrant like George III, they assumed the name of Whigs; and henceforth, until 1854, Whig and Democrat were the names of the two great political parties in the United States. Without entering into a detailed history of these parties and their principles, it may be said in general that the questions which have divided them have been concerned with the powers of the national government. The Whigs wished to give the federal government the power to use the public money in the making of roads, improving rivers and harbors, etc., under the general head of fiternal Improvements; the Democrats claimed that these things ought to be done by the states or by private enterprise. The Whigs espoused the policy of laying duties on imports as high as revenue results would approve; within this limit the duties were to be defined for purposes of protection; and the superabundant revenues were to be expended on internal improvements. This was known as the "American system." This policy was opposed by the Democrats but not always intelligently. The Whigs also favored the contmuance of the national bank which had been chartered in 1816. The Democrats strongly opposed it, and on that question they achieved a complete and decisive victory under President Tyler. On the question of internal improvements also the parties were often in opposition, but most of its details have been settled by the great development of the powers of private enterprise during the past sixty years, and it is not at present a leading question. The question of the tariff, however, remains to-day as a "burning question," but it is no longer argued on grounds of constitutional law, but on grounds of political economy.
195. In the presidential canvass of 1828 Jackson was elected president with John C. Calhoun as vice-president, and on March 4 they were sworn into office. The eight following years have been called "the reign of Andrew Jackson," from the arbitrary methods which he seemed to assume in regard to money affairs in his administration. One of the greatest mistakes of the president was the use of government offices as rewards for his friends and adherents. As early as the begin-
ning of the present century a vicious system was growing up in New York and Pennsylvania. In those states the appointive offices came to be used as bribes or as rewards for partisan services. Ly securing votes for a successful candidate, a man with little in his pocket, and nothing particular to do, could obtain some office with a comfortable salary. It would be given him as a reward for political services, and some other inan, more competent than himself, would have to be turned out in order to make room for him. A more effective method of driving "good citizens" out of politics could hardly have been devised. The result was that the civil service of those states was seriously damaged in quality. politics degenerated into a wild scramble for office, salaries were paid to men who did little or no public service in return, and thus the line Which separates taxation from robbery was often crossed. About the same time the idea obtained that there is something especially democratic, and therefore meritorious, ahout "rotation in office." Government offices were regarded as plums at which ererjone ought to be allowed a chance to bite. The way was prepared in 1820 hy W. H. Crawford, of Georgia, who succeeded in getting the law enacted which limits the terms of office for postmasters, revenue collectors and other serrants of the federal government to four years. The importance of this measure was not understoad, and it excited very little discussion at the time. After Jackson olitained the presidency the methods of New Y'ork and Pennsylvania were applied on a national scale. Jackson cherished the absurd belief that the administration of his predecessor, Adams, had been corrupt, and he accordingly tarned men out of office with a keen zest. During the forty years letween Washington's first inauguration and Jackson's, the total number of removals from office was seventy-four, and out of this number five were defaulters. During the first year of Jackson's administration the number of changes made in the civil service was suid to be 2,000 . Such was the abrupt inauguration upon the broadest scale of the so-called "spoils system." The phrase The originated with W. L. Marcy, of New York, who, in a "spolls gry speech in the senate in 1831, declared that "to the national. victors belong the spoils." The author of the phrase did not, of course, realize that he was making one of the most infamous remarks recorded in history, and Jackson doubtless would have been greatly surprised could he bave foreseen that he was introducing a gigantic system of political knavery and corruption, which would help sustain all manner of abominations, from grasping monopolies and civic jobbery down to political rum shops.
196. Jackson made another mistake which, however, The United was trivial compared with the adoption of the spoils ${ }_{\text {Bank }}^{\text {States }}$ system. He was bitterly opposed to the United States bank because he believed that it was unauthorized by the constitution and a means of political corruption. As the charter was about to expire in 1836 he urged Congress not to renew it. An angry controversy followed. A hill renewing the charter passed in 1832, but Jackson retoed it. Subsequently he recommended that the public money should be removed from the bank, and when Congress refused to consent to this measure he took the responsibility of ordering the secretary of the treasury to remove it (1833), a measure which, at first, was followed by great distress among merchants. It was in this quarrel that the supporters of the bank became known as Whigs, while the partisans of the president kept the old name of Democrats. The bank was finally closed in 1836 wben it3 charter expired.
197. In 1832 hostilities with the Sax and Fox tribes Indian of Indians broke out in what is now Wisconsin. Their troubles chief, Black Hawk, was captured. and the Indians were removed beyond the Mississippi. Georgia wished to get rid of the Creeks and Cherokees remaining within the state; but they refused to go. The United States had made treaties with them, and these treaties acknowledged the right of the Indians to the land which they held. They were more civilized than the Indians

Rotatioz in offica"
in general and had farms which they cultivated. A few of their chiefs were persuaded to sign a new treaty with Georgia, giving up their lands. The other Indians at once put them to death; they declared that these chiefs had no authority to sign for the tribes, and that in consequence there was no treaty. Georgia would not wait for the Indians to yield, but ordered a surves of their lands to be made for settlement by the whites. It must be remembered that although the territory was within the boundaries of Georgia it was set distinctly under the control of the Indians by agreement with the United States. The federal government was very desirous of getting the Indians out of Georgia, and tried every means to persuade them to leave, and accordingly, in a tacit manner, suffered the state to crowd the Indians out. It was no less true that the state was taking to itself a power which belonged to the union. The wrangle over the Indians began in the administration of John Quincy Adams, and continued after Andrew Jackson was chosen president. Jackson had no love for the Indians, having fought them all his life, and be did not now interfere. Georgia had its own way, and the doctrine of state sovereignty was more firmily held than ever.
NullificaNon.
198. At this time the southern people felt that they were Virginians, Carolinians and Georgians, as well as

American citizens. Brought up in eager logalty to their native states, they regarded the states as sovereign and the union as their creature, existing only for the general protection, and they resented the federal theory of the supremacy of the national government and state subordination to it . Since slavery could be sustained only by state law, in opposition to the spirit of the age, the state must be made so sover eign as to be able to withstand all national interference. To make sure of this result at the time now before us, some of the prominent southerners met on a certain occasion to try the temper of President Jackson by an attempted defiance of the national authority. But the indignant and determined response of the president checked for a moment their designs, few men daring any longer to follow to their ultimate conclusions the teachings of the great southern leader, Johu C. Calhoun; and so, for nearly two years, but little opposition was openly undertaken. Calhoun, however, never ceased his efforts; and in 1832, such had been the progress of his plans, that be deemed himself strong enough to carry his state-rights doctrine triumphantly through, in sprte of the known hostility of the patriotic Jackson. Congress, as will be remembered, had enacted a tariff of a mixed character, mainly for revenue, but incidentally protecting some of the manufacturing interests of the northern states; and among the articles thus protected were conarse woolen goods, which were used in the south as clothing for its slaves. The price of those articles was thus made a trifle higher than it would have been without this protection; and the slave holders, always a unit for the state-rights doctrine, had to pas this higher price. The north was all the while under the same tariff, pafing an increased price for cot ton on every yard of imported cloth. This was not considered hy the sunth, and so, in 1833, a state convention in South Carolina declared the tariff acts unconstitutional, and therefore null and void, and resolved that any attempt to collect the duties at any port in that state should be resisted liy force of arms. Preparations were also made to take South Carolina out of the union. "Nullification" was the name given to this act by which the state declared certain laws of the general government to have no force in her territory.
199. The 1st of February, 1833, in case Congress did not repeal its protective system prior to that date, was fixed upon as the limit of the state's forbearance; for after that day, South Carolina, in the event of the noncompliance of the United States with her sovereign pleasure, was to consider herself as forming no part of the federal union. All she desired, she said, if her demands were refused, was "to be let alone," when she would proceed to gnvern herself, according to the alleged Jeffersonian doctrine, as an independent state.

The excitement was intense all over the union. Welster was in the senate and General Jackson in the presidential chair, and they worked together, though opposite in their party connections, like twin brothers, for the salvation of their common country. Webster pleaded for the union, claiming that the constitution was not a " compact of states," but a "nation," created by the whole people for their collective government and benefit. In the course of controversy in the sen-webster ate, he held his fanous debate with Mr. Hayne, lasting and Hay for several days, and presented the arguments against the right of secession with an eloquence and force never equalled in any discussion on that question. President Jackson firmly beliered that the states should manage their own affairs, but he also held that when laws were passed in Congress for the whole country, no one state had a right to refuse obedience to such laws. He declared that "the federal union must and shall be preserved," and sent an armed fleet to Charleston harbor, warning South Carolina at once that, if she resisted, the whole force of the union would be used against her. For a while it looked as if there would be a resort to arms, but Clay, who was the leader of the Protectionists, came forward and proposed a compromise by which the tariff was modified. South Carolina had won her point. The doctrine of nullification had not been put to the test of arms; but the doctrine of state sovereignty had established itself more firmly at the south.
200. After the fall of the United States bank many state banks had been formed, often with little capital, to supply the expected need of paper money. These banks issued notes which were largels used in the purchase of public lands from the United States, and the treasury was accumulating paper currencs of doubtful value. Soon after Congress had adjourned, the president directed the secretary of the treasury to issue the so-called specie circular, ordering the United States' agents to receive in future only gold and silver in payment for land. The demand for specie at once became pressing, and could only be met by the banks in which the revenue was deposited. Other banks fell into difficulties which culminated in the great "panic of 1837," which took hace under Martin Tan Buren's administration. General Jackson, having served two terms, was succeeded by Mr. Van Buren, who became president on March 4, 1837 . The administration of Mr. Van Buren (1837-41) was occupied chiefly with efforts to remedy the conmercial disasters of the nation. The new president had taken Jackson's cabinet, and had declared his purpose " to follow in the footsteps of his illustrious predecessor." He, therefore, caught the first full effects of the storm produced by Jackson's financial polics, from which even Jackson's popularity and admitted honesty would hardls have saved him. A spirit of reckless speculation had been excited by the excessive amount of paper money in circulation, and property had acyuired a fictitious value. Most of the banks which were not lucky enough to have gorernment deposits at command went down under the specie circular of 1836. The "pet banks." which had received the deposits of the public mones, had used them as loans to business men, and now, when a sudden demand for those deposits was made, many of these banks also were involved in the general ruin. The sudden calling in of these loans was the beginning The panit of this famous panic of 1837, the counterpart of which had never before been seen in the United States. Early in May the banks of New York city refused to pay gold or silver for their notes, and the New Tork legisIature authorized a suspension of specie pasments throughout the state for one year. This was followed at once by the suspension of banks in other cities. The president, by proclamation (May 15), called an extra session of Congress to meet September 4 , and consider and secure the financial interests of the government. lleanwhile the panic continued during the summer of 1837, causing widespread ruin among banks, corporations and business men, and violently reducing nominal fortunes to far less than their real value.
201. Finally, after some vicissitudes, the financial difficulties of the nation were satisfactorily adjusted bs the adoption of one phase of the National Bank question, that of the so-called sub-treasury system which was ultimately established in 1846, and has been in force ever since. By this system the public revenues are not deposited in any bank, but are paid over on demand to the treasury department bs the collectors, who are required to give bonds for the proper discharge of their duty. The establishment of this system was creditable to Van Buren's administration, hut the country was not prosperous during bis term of office, and he was defeated as a candidate for re-election ( 1840 ) after a remarkably exciting canvas. The Whigs, relsing upon the same kind of popular feeling which had elected Jackson, again put in nomination the plain soldier, Harrison, who had been Tan Euren's opponent in the preceding canvass, and who had lived in a $\log$ cabin. and had hard cider on his table. In the fumous "hard cider campaign" of 1840, Harrison won a swerping victory, obtaining 234 electoral votes to Van Buren's 60. John Tyler, of Virginia, a Democrat in politics, was elected vice-president. The election of Tyler was a political mistake on the part of the Whigs, for, in one month after his inauguration, President Harrison died, and Tyler succeeded to the presidency. Thas the government had a Democratic head, and the Whigs lost, in the main, the fruits of their victory.
202. Mr. Tyler retained llarrison's cabinet, and promised to carry out his policy. In an extra session of Congress, beginning May 31, a bill to abolish the subtreasury of the previous administration was passed by both houses, which now had a Whig majority, and wrs signed by the president. Both houses then passed a bill to incorporate the fiscal bank of the United States. llany of the objectionable features of the old United States bank had been discarded ; but the measure still met with great disfavor among the Democrats. The bill was vetoed by the president. He stated, as his objection, that the powers given to the bank were such as he and a majority of the people believed to be unwise and unconstitutional, to grant. An effort was made to pass the bill over the veto by a two-thirds' vote, but it failed. The Whig leaders then requested the president to present them with an outline of a bill which he would be willing to sign. After consultation with the cabinet, it was given, and passed by both houses. The president vetoed this bill also. A twothirds' vote could not be obtained to pass it over the veto. This action of the president in vetoing a bill which had been drawn according to his own suggestions, roused the indignation of the Whigs who had elected bim, and all his cabinet resigned. Daniel Webster, however, the secretary of state, retained office long enough to finish a negotiation with Great Britain for the settlement of a dispute regarding the northwestern boundary.
203. The northwestern corner of North America, down to the parallel of $54^{\circ} 40^{\prime}$, now known as the territory of Alaska, then belonged to Russia. The region known as Oregon, which lay between Russian America and California, was clamed by the United States on the ground of the discoveries of Lewis and Clarke. After the second war with England, when both countries claimed this region, it was agreed in 1818 that thes should hold it jointly for ten years. The Iludson Bay Company, which was fully equipped for the fur trade, increased its stations. At the end of ten years it seemed to have almost entire possession. In 1828 it was agreed to continue the joint occupation until notice of its termination should be giren by one nation or the other. When this agreement was renewed St. Louis was the rreat center of the fur trade of the west. Expeditions from that point into the disputed territory soon hecame common. The hunters brought back word of the fine farming and grazing lands which they had seen, and parties of emigrants began to make settlements in that direction. The Hudson Bay Company put every possible obstacle in the way of immigration. as they had wished to keep the country for lunting and
trapping. They managed to create the impression in the United States that the Rocky Mountains could not be crossed by wagons, and that the country on the other side was a barren wilderness. In 1836 Dr. Marcus Whitman was sent out with a company of missionaries to the Oregon lndians. He was a man of energy and foresight. Hr saw that it was practicable for emigrant trains to cross the mountains by good passes, and he knew that if be could make this generally known the people of the United States would soon occupy the country.
204. When Lord Ashburton came in 1842 to settle with Mr. Webster the boundary line between the British possessions and the United States, the Hudson Bay Company had succeeded in keeping out almost all American emigrants. It had laid its plans also to bring in English settlers from the Fied river country, so as to strengthen the British clam to all Oregon. As soon as In, Whitman learned (his, he set out in October of that year, and made his way across the entire continent to Washington. There he found that a treaty had been signed, but that Oregon had heen left out of consideration altogether. Dr: Whitman's errand was to make known to the administration at Washington the ralue of Oregon, and then to organize companies of emigrants to settle within its bounds. He did both. In the following summer he had a great body of setthers over the mountains, and at the close of 1844 there were three thousand Americans in oregon. The people were fast deciding the question of ownership. Congress now took up the matter in earnest. The American people claimed the whole western territory, and the Democrats went into the next presidential campaign with the allernative war-cry "Fifts-four, forty, "Fifty fou or fight," meaning that the parallel of $54^{\circ} 40^{\prime}$ must be forty or made the northern houndary. But the wiser men were fight." ready to compromisp, and a treaty was made with Great Eritain in 1846, by which the forts-ninth parallel was made the dividing line west of the Rocks mountains.
"05. In 1842 an affair known as "Dorr's Rebellion" Dorr's occurred in Rhode Island. The state was still governed rebellion under the old colonial charter, and a party led by Thomas Dorr was anxions to exchange it for a new constitution giving greater power to the people. Dorr assumed to be governor by the votes of his partisans; the lawful governor, under the charter, called for the assistance of the United States, and ciril war was imminent, when President Tyler sent troops into the state to uphold the old government. Dorr was convicted of treason and sentenced to imprisomment for life, but he was soon pardoned, and a more liberal constitution was afterward adopted.
206. Calhoun was steadily teaching the southern states that their safety lay in the doctrine of statesovereignty, and the slaveholders were beginning to think that the union was not worth much to them unless it protected the slave system. Meanwhile, a very different belief was hecoming common in the north, which was largels due to the influence of William Lhosd Gar- Oprostic's rison, of Massachusetts. He bad established a weekly to staters. paper in 1831, called The Lilueralor, which was devoted to the entire and immediate abolition of African slavers in America. 31 any others, men and women, came forward to support him, and in 1833 the National AntiSlavery Society had been formed, and its liranches had multiplied rapidls. The renemal of the slavery yuestion alarmed the southern people and also many of the northern people, who considered ans attack upon slarery dangerous to the peace of the union. From this time dates the existence of the party opposed to slavery in the United states, at first known as abolitionists. The abo? They did not, howerer, constitute a political party, hut thonists as individuals kept up an incessant attack upon the evil of slavery. They were persecuted in every way possible, but every attempt to intimidate them only gave a new opportunity for the discussion of the rights and wrongs of the slave. The slaveholders, and their friends at the north, declared that the abolitionists were destroying the peace of the country, and charged them

## Mob

violence.

Petitions to Congress.
with inciting the slaves to insurrection. Hence they called upon all friends of the union to put them down. Finally mob violence was resorted to in Boston and other northern cities to destroy abolition printing presses, break up abolition meetings and silence abolition orators.
207. These lawless outrages only served to fire the zeal of the abolitionists, and they began to offer petitions to Congress to abolish slavery in the district of Columbia, while the dissemination of abolitionist books and papers was greatly increased in every part of the country. Congress in 1835 had resolved to lay all future petitions on the subject of slavers upon the table. In 1836 the president's message to Congress made indignant reference to the practice of sending abolition doc uments through the United States mail. He recom mended a bill to prohibit the practice in future. Accordingly, a hill was introduced in Congress prohibiting any postmaster from knowingly putting any abolition documents or newspapers into the mails. The bill was rejected. The right of petition has been a right always held sacred by the people, and a chaumion for this right appeared in John Quincy Adams, who had been sent bach to Washington as a representative from his district in Massachusetts. He presented these petitions again and again. The slavery party refused to admit them, and in consequence multitudes of people at the north were gained over to the anti-slavery side.
208. The political parties had not yet openly divided on the question of slavery, but the opposition to the Democratic party had become firmer, which resulted, as has been shown, in the formation of the Whig party (1836). Since Missouri had been admitted into the union tro other states had been formed, Arkansas in 1836, and Michigan in 1837. Half of the states were now free states and half slave. But in population the free states were rapidly gaining on the slave states. In 1830 thes exceeded them by over a million; in 1840 the excess was nearly two and a half millions. Moreover, after the admission of Arkansas, Florida was the only territory which could he admitted as a slave state, whereas the north had still a vast space westward at its command. To southern statesmen it seemed likely that the north would presently far exceed the south in territory, population, wealth and political power and would steadily gain a majority in the senate and the house. It was, therefore, probable that before long the north would come to control the action of Congress, and might then try to abolish slavery. This the south naturally dreaded, and this feeling of dread was intensified and exasperated by the abolitionist agitation. The only safeguard for the south seemed to be the acquisition of fresh territory, and southern statesmen looked for this to the great country of Texas, which lay south of $36^{\circ} 30^{\prime}$, was suited to the institution of slavery and was already occupied by many southerners.
209. Texas was originally a part of the Spauish province of Mexico. In 1821 Mexico revolted from Spain, and formed a republic modeled after the United States. Like other Spanish states in America it abolished slavery. The south thus had for its neighbor a free country hemming it in on the south and southwest. Presidents John Quincy Adams and Jackson each had made the attempt to buy Texas from Mexico, but she had refused to sell. Meanwhile emigration had set in from the southwestern states, and many Americans had made their home in Texas. The most noted of these was General Sam Houston, the leader of an adventurous set of men. At his instigation Texas rebelled against Mexican rule, and, in the decisive battle of San Jacinto (1836), won her independence and set up a government of her cwn with Houston at the head. Texas then applied for admission to the mion. The importance of such an addition was seen at once. Out of this vast territory five states could be formed. If slaye states thes would greatly strengthen the slavery parts. The Whigs, under Webster and Clay, opposed annexation on the ground that
it would bring on a war with Mexico, which had not acknowledged the independence of Texas. The question of annexation was hotly discussed in the presidential election of 1844. Van Buren, who had opposed annexation, was rejected by the Democratic party, and James K. Polk, of Tennessee, who favored annexation, was nominated. The Whig candidate was Henry Clay; and there was a third candidate. This settled the result of the election. The abolitionists had put forward James Birney as a presidential candidate in 1840, who had received very few rotes. They now nominated him again. A close and bitter contest followed. The Democratic party was committed to the annexation of Texas, although the demand for the tariff of 1842 , and for "the whole of Oregon or none, with or without war with England," helped to gain votes. Nevertheless, the success of the Whigs seemed probable, until the weakness of Clay's moral fibre ruined it. He wrote a letter in which be tried to conciliate southern Democrats by saying that be would be "glad to see" the annexation take place at some future time. By this device he won no Democratic votes, for Polk was a warm advocate of annexation, hut angered a great many anti-slavery Whigs, who purposely threw away on Birney their votes, by which means New York was carried for Polk, and he was elected president. It was the most closely contested election in the bistory of the United States, except those of 1800,1876 and 1884 . The result in fourteen of the twenty-six states was doubtful for some days, and most of these chose Polk electors by very slender majorities. In several of them the small abolition vote would have turned the scale and chosen Clay electors. Thus Polk was elected, and, in December, 1845, Texas was annexed by resolution of Congress, and admitted into the union (December, 1845) with the understanding that it might be hereafter divided, so as to make several slave states. Florida had already ljeen admitted as a state in March of the same year. In spite of the strong opposition to the annexation by the anti-slavery party there was a general feeling of pride that the country had acquired so large an addition to its domain. Politicians in favor of annexation did their best to draw the popular mind away from the question of slavery, and to hold out splendid prospects of the rapidly increasing United States. They began to aver that it was the "manifest destiny" of the nation to possess the whole continent. But the slarers question could not be held in abeyance. With the election of Polk the north and south were finally arrayed in opposition to each other. The policy of the Democratic party now began to be shaped chiefly by the adherents of Calhoun, the representatives of slavery and nullification, though the latter political heresy was not likely to be pushed to the front so long as the control of the federal government was in their hands; but the slavery question hecame the "burning question" from that time on until it was decided by the civil war.
210. When Texas was annexed to the United States, The Mexi Mexico was so occupied with intestine dissensions and can war. revolution that her exhibition of resentment was at first confined to a formal protest, and the withdrawal of her minister from Washington. No aggressive movement was made by her even when the United States troops, under General Taylor, occupied the east bank of the Nueces riser, a part of the state which Mexico insisted had never belonged to Texas. In the meantime, in anticipation of trouble, a naval expedition had been sent by the American government to the gulf, December 31, 1845, and an act passed extending the United States revenue system over the doubtful territory beyond the Nueces river, to carry out which a revenue officer was appointed to reside in the new district. Eren then Mexico did not institute hostilities, but expressed her willingness to negotiate concerning the disputed territory between the Nueces and the Rio Grande. In March. 1846, General Taylor was ordered by the president to advance from the Nueces to the Rio Grande and occupy the debatable district. These measures, adopted by the president, by which our troops crossed the
boundary claimed by Mexico, were considered by a large portion of the people of the United States as impolitic, if not unjust, and the occupation by our troops of a territory, which at least was a subject of dispute, was deemed by many a belligerent act. General Ampudi so considered it, and notified the American general to retire beyond the Nueces within twenty-four hours. In April, General Arista superseded Ampudi in command and communicated to Taylor that he considered hostilities commenced. Early in May, Arista, with 6,000 Mexicans, crossed the Rio Grande, attacked General Taylor with his force of 2,300 at Palo Alto, and was badly defeated. The next day Taylor assumed the offensive, attacked Arista at Resaca de la Palma, and compelled him to retreat in haste across the Rio Grande.
211 . The United States goverament, before it could hear of these actions, declared war against Mexico (May 13, I846), and called for 50,000 rolunteers. Mexico likewise declared war against the United States for interfering in her affairs with Texas. Soon after the declaration of war, Colonel Stephen W. Kearny was purpose of separating that province from Mexico. Leaving Bent's Fort, he followed what was known as the Santa Fe trail, along the Arkansas river, across the Colorado mountains to the Kio Grande, and down that river to Santa Fe. Here he took possession of the country in the name of the United States, declaring New Mexico a territory of the union, and left a governor and some troops. Then he set off for California, to carry out the same design of separating a Mexican province from the Republic of Mexico and attaching it to the United States. Before war was declared, Captain fremont in John C. Fremont was sent on an exploring expedition to California. Some vessels of the navy also were sent to the Pacific coast to be in readiness. The United States had reason to think that England would make an excuse of the Mexican troubles to set up a claim to Californin. Fremont and his men, aided by officers of the navy with marines, made no delay when they learned that war was in progress. They easily took possession of one village after another. They expelled the Mexican soldiers, and finally seized Monterey, the capital of the province. There was a number of American settlers there, who proceeded to declare the independence of California and organize a government.
Doniphan's 212. When Colonel Kearny left Santa Fe , he ordered expedition. Colonel Doniphan, with about a thousand volunteers, to chastise the Navajo Indians. Having periormed this duty and compelled the savages to make a treaty of peace, Doniphan marched a thousand miles to join the army in Mexico. At Bracito, December 25, IS46, he defeated a large force of Mexicans, and near Chihuabua, February 28, gained a decided victory over an army four times as large as his own. Finally he reached General Wool at Saltillo, May 22, after a march which is considered as one of the most brilliant exploits of the war.
213. In the meantime Taylor had conquered the northern portion of Mexico; while Scott, landing at Vera Cruz, advanced and captured the City of Mexico. The United States soldiers were victorious over the Mexicans wherever they came into conflict, and whatsoever the disparity of numbers, as instanced in Doniphan's victors; while at Buena Vista, February 22, 1847, Taylor routed a Mexican army more than four times greater than his own. To the student of history the Mexican war will have great interest, as haring been the school in which most of our great generals. who made their mark in the civil war, received their practical training. The capture of the City of Mexico (September 14, 1847) put an end to the war. A treaty was entered into with Mexico, by which the Rio Grande was made the southwestern boundary of the United States, and the Gila river the northern boundary of Mexico. The United States paid Mexico $\$ 15,000,000$ for the territory which was thus added to its domain, exclusive of Texas. Five jears later, the United States
bought the Mesilla valley, south of the Gila river, for $\$ 10,000,000$. General James Gadsden was the agent in this purchase. By these two cessions Mexico transferred to the United States the country now comprised in California, Arizona, Nevada, Utah, and parts of Wyoming, Colorado, Kansas, and New Mexico.
2It. This immense acquisition of territory, though a fortunate one in many respects, had an immediate effect upon American politics, far more disturbing than anything which had occurred since 1820 . The general sentiments of the anti-slavery party had been opposed to the war, and these sentiments had been fully set forth in a series of remarkable political poems, entitled "The Biglow Papers," by James Russell Lowell. The The Bigsectional strife, which had been allayed for the time being by the Missouri Compromise, now began to be renewed. In the new territory acquired from Mexico, slavery had been forbidden by the Mexican law, and the north desired this prohibition kept in force, but the south opposed the idea. It was proposed by some, as the simplest solution of the difficurty, to prolong the Dissouri Compromise line from the Rocky mountains to the Pacific, but neither party was willing to give up so much to the other. The increased opposition to slavery in the north had created an increased ohstinacy in the south, so it was rapidly becoming a difficult thing to effect compromise between the two sections. In 1846 , David Wilmot, a Democratic member of the house, from Pennsylvania, offered an addition to a bill making appropriations for the purchase of the Mexican territory. This addition was the celebrated "Wilmot Pro- Th viso," applying to any newly acquired territory the Proviso. provision of the ordinance of 1787, "that neither slavery nor involuntary servitude sliall ever exist in any part of said territory, except for crime, whereof the party shall be first duly convicted." The Whigs and northern Democrats united in favor of the proviso, and it passed the house, but was sent to the senate too late to be acted upon.
215. In the same year that peace was made with Mexico (1848) came the presidential election. Several efforts had been made to pass the Wilmot Proviso, but without success, but it called into existence the Free Soil party, formed by the union of anti-slavery Dem- Th ocrats and Whigs with the abolitionists. As a compromise between the advocates and opponents of the extension of slavery, a bill had been passed by the senate establishing territorial governments in Oregon, New Mexico and California, with a provision that all questions conceraing slavery in those territories should be referred to the United States supreme court for decision. It was roted for by members from the slave states, but lost in the house. A bill was then passed in the house, by a sectional rote, to organize the territory of Oregon without slavery. This was passed by the senate with an amendment declaring that the Missouri Compromise Line extended to the Pacific ocean. The amendment was rejected by the house, again by a sectional vote, and, the senate withdrawing it, the bill passed.
216. The Whig National Consention met at Philadelphia, June 7, 1848, and nominated Zachary Taylor, of Louisiana, and Millard Fillmore, of New York. No platform was adopted, and resolutions affirming the Wilmot Proviso as a party principle were repeatedly roted down. The Democratic National Consention met at Baltimore, May 2?. It revised the strict constructionist platform of 1840 and 1844 , and nominated Lewis Cass of Michigan, and William O. Butler, of Kentucky. The National Convention of Free Soilers met at Buffalo, August 9. It adopted a platiorm declaring that Congress had no more power to make a slave than to make a king, and that there should be no more slave states and no more slave territories. It nominated Martin Van Buren, of New York, and Charles Francis Adams, of Massachusetts. The Free Soilers decided the election by drawing the Democratic vote from New York, and so Taylor became president. He was brave, honest and shrewd, and by far the ablest
president between Jackson and Lincoln. Though a Louisiana slaveholder, he was nnflinching in his devotion to the union.
217. The leading political struggle during Taylor's administration related chiefly to the admission of California as a state in the mion. Texas was the last slave state. The tide of emigration was moving steadily westward and nortbwestward. In 1846 Iowa was admitted into the union, and in 1848 Wisconsin. While the representatives of the people in Congress were struggling with the question of free or slave territory, the people themselves were rapidly increasing the influence of the free states. In the year that California became the property of the United States (1818) gold was discovered in the valley of the Sacramento, and a very hasty exploration showed that there was an immense deposit of the precions metal in the newly acquired territory. The news spread all over the world and immediately there followed a great rush to the gold region. In a little over a year the population had become large enough to entitle it to admission to the union, and there was need of a strong government to keep in check the numerous hordes of ruffians who had flocked in along with honest people. President Taylor was eager to bring. California into the union before the question of slavery in that territory should be discussed in Congress. He arged the people to call a convention and organize a state. They did this (1849), and since they were almost wholly from the north, they framed a constitution prohibiting slavery, and applied for admission. The sonth earnestly opposed the admission of California as a free state, and the extreme southern party even took some steps toward secession. The debates were conducted on both sides with great bittemess.
218. The controversy went on for a year, until it was settled by a group of compromise measures devised by Clay, who thirty years before had succeeded so well with his Missouri Compromise. He proposed that California should be admitted as a free state; that any new states properly formed from Texas should also be admitted; that the territories of New Mexico and Utab shonld be organized without the Wilmot Proviso (i.e., with squatter sovereignty, by which the people of eacb territory were left free to settle the question of the existence of slavery for themselves) ; that the slave trade shonld be abolished in the District of Columbia, and especially that a more rigid fugitive slave law should be enacted. The constitution expressly gave to alaveholders the right to recover their slaves if they escaped into another state, but the increasing hostility of the people in the free atates to the slavery system made it extremely difficult for slaveholders to find and recover runaway slaves when they had escaped into the northern states. This matter was one of great irritation to the sontherners. They complained that they were deprived of their rights in direct opposition to the constitution. The new fugitive slave law was therefore so drawn as to require the arrest, by United States officers, of fugitive slaves in the northern states, and it also gave the officers the right to call upon any citizen to help them in their search and capture. The law also imposed penalties on all rescuers and denied them a jury trial.
219. Webster gave his support to the Compromise of 1850. Like many others, he viewed with alarm the growing dissensions between the tro sections of the country. He worked with all his might to preserve the union against the attacks of the extreme proslavery men on the one band and of the abolitionists on the other. California was admitted to the union, and the fugitive slave law was passed. Instead of bringing quiet, as the Missouri Compromise had done, the Compromise of 1850 was the beginning of a more bitter and deadly strife. Perhaps the most important feature of the Compromise, in its bearing upon future events, was the fagitive slave law. The crnelties attending its execution aroused the fierce indignation of the north. The disgust and horror felt toward it caused the passage, by some northern legislatures, of
"personal liberty laws," intended to protect free Personal negroes falsely alleged to be fugitive slaves. During Liberty the discussion of Clay's Compromise Bill of IS50, Laws. President Taylor died, after a very short illness (July 9, 1850), and Vice-President Fillmore succeeded to the vacant office. He enforced the Compromise Act impar- Filmore tially, but the fugitive slave law was often evaded president. and sometimes forcibly resisted. It strengthened the anti-slavery party in the free states, while the agitation of the question of the morality and wisdom of slavery was hotly resented at the south.

220 . It was now the middle of the century, and the Developunion seemed full of prosperity. So varions had the ment of th interests of the people become that a new department in the administration had been created (1849), called the department of the interior, and comprising a number of offices, like the census office, patent othice, land office, and burean of Indian affairs, all of which had formerly been scattered among the other departments. The secretary of this department was made a nember of the cabinet. During Mr. Fillmore's administration postage was reduced, so that an ordinary letter could be sent to any place in the country for three cents. Iefore that it had cost ten cents to send a letter from Philadelphia to Boston. At once the number of letters transmitted through the mails was wonderfully increased. The extinction of Indian titles in northern Michigan brought about the discovery of the great copper mines of that region, whose existence had long been snspected before it could be proved. Railroads in the east were beginning to show something of a connected system, and the increase of railways in the west made it possible for the great farms to send grain and other provisions to the cities very cheaply. Railroads in the south had hardly changed since 1840 . In 1840 Samuel F. B. Norse, an American art ist, had received The a patent for an electric telegraph apparatus, and four telegraph years later he sent his first dispatch over the wires from Baltimore to Washington. This practical proof of the power of the telegraph was followed by a rapid extension of lines in every direction.
221. Several expeditions were ordered by the govern- Government to gain a better knowledge of the national domain. In 1848 and in I852 and 1853 Captain John C. Fremont was sent out with exploring parties to the Rocky mountains. The discoveries which be made, and the new importance of California since the discovery of gold there, induced the government to make more careful surveys. The war department undertook one to determine the most practicable and economical route for a railroad from the Mississippi river to the Pacific ocean. Captain Wilkes was sent to the Pacific ocean, where he explored the Antarctic continent; an expedition under Lieutenant Lynch explored the valley of the Jordan and the Dead Sea; and Commodore Perry was sent with a fleet to Japan, a comntry which had heretofore been almost unknown to Europe and to America.
222. Petween the east and the west, railroads were growing busier. Towns and cities sprang up along their routes, and where a new and fertile district was fonnd the settlers did not rest until they had a railway for the transportation of their produce; and very often the railroad itself was the pioneer of a new territory, being followed by the people who made claims along its route. Ships and steamers were constantly crossing the Atlantic. Improvements were made by American shipbuilders in the construction of sailing vessels, and the clippers, as they were called, were built, which were able to sail with a good wind almost as swiftly as steamers. The increased development of wealth in the country gave a fresh impetus to the spirit of invention. McCormick invented his reaping machine, and obtained a patent for it in 1834 . Its results have been hardly less in importance to the United States than the invention of the locomotive. Since then agricultural macbines and implements have rapidly increased. It was agricultural machines that made the western farms profitable, and enabled the railroads to fill the west so rapidly with population. Friction matches bad come
into use, and anthracite coal was now extensively used both in manufactures and locomotion. In 1839 Goodyear had devised his method of valcanizing india rubber. In $18+6$ came the sewing machine, the power-loom, and the use of anæsthetics in surgical practice. The rotary printing press was invented in 1847.
223. During this rapid change in all the conditions of life, it was not strange that there should be a corresponding change in the minds of men, and that their ideas should become somewhat unsettled. Hence, transcendentalism in religion, literature and politics began to flourish; visionary proposals of every kind were made; new communities were established, and new sets sprang up. In 1830 Joseph Smith had declared that he had received a revelation from God which was contained in a book called "The Book of Mormon." He formed a society of men and women Who were his disciples and called themselves Jormons, and they made a settlement in Missouri. In 183s, Smith, with his followers, was driven away to Nauvoo, in Illinois. Ten years later Sunth was killed, and the Mormons, under Brigham Young, remored beyond the western frontier, and settled on the broad plain abont Great Salt Lake, in the new Territory of Utah. Their missionaries traveled in the older states and in Eurnpe, making converts, and bringing them to the new Mormon home. They offered to people who were discontented, and to the hard-worked poor, a land of promise and plenty. They appealed to religious people, and declared that God was with them, as IIe had been with the Jews of old. Salt Lake City was founded, and became their capital. Since then, having rapidly increased in wealth and population, they became a dangerous factor in the American system. Their peculiar tenets, which consisted mainly in their polygams and submission to their sacred hierarchy, rendered it impossible to admit them as a state into the anion, while their numbers became so great that it was contrary to American ideas to deprive them of the right of self-government, and keep them under the power of Congress. A solution of the vexing question was ultimately reached bs Utah consenting to discard polygamy with a view to entering the union as a state.
224 . About the middle of the centurs, the American methods of education were greatly improved, and American literature began to attract the world's attention. There were publication societies formed by the thurches, which multiplied books, papers and tracts without number, and these fonnd their way to remote villages and homes. Educational societies helped establish schools and colleges in the thinls settled parts of the countrs. There was a Colonizatios Societs. which tried to answer some of the diflicult questions of slavery by sending free blacks to liberia, in Africa. This was the time when the lyceum system became popular. In the cities and towns courses of lectures were instituted, and the latest thoughts in science, art, literature, politics and philosophy, were given to the people. The newspaper had become a national institution, and was a familiar visitor to the great majorits of families of the republic. There were dails papers in all the cities and towns, and in many papers the contents of books were published, aside from the general news and topics which interested the country. American authors were taking their place among the great men of the ages in the realm of letters. Before 1830, Bryant, Irving and Cooper had become distinguished. In 1847, Edgar Allan Poe, the most imaginative of A merican poets, had died. In 1850, Washington 1 rving had written all his works except his "Life of Washington." The poems by which William Callen Bryant is best known had been written and given to the world. James Fenimore Cooper died the next year, leaving behind him a long list of norels, the best of which were descriptive of American life. Then came Longfellow, Whittier, Hawthorne, Holmes, Bancroft, Prescott and Emerson. The "Scarlet Letter," which made Hawthorne famous, had been given to the public. Longfellow had published "Evangeline," and many of his
most popular poems. Whittier had become celebrated as a poet: Oliver Wendell Holmes, as a poet and wit; William Gilmore Simms, as a novelist; Ralph Waldo Emerson had become known by his essays as one of the great masters of English prose; James Russell Lowell, poet and satirist, had issued his "Biglow. Yapers," which belped people to understand the meaning of the Mexican war, while they laughed over the verses. And besides these, there were many others who assisted in raising the standard of American literature, and making it a distinct voice of the nation.
225. All these things - churches, lyceums, poblic meetings, societies, newspapers, and books-had their influence in shaping public opinion; and as they increased, more earnest grew the discussion of the slavery question. Alout this time, when the administration of Fillmore was coming to an end, a book was brought out which had an enormous sale, and was translated into all the literary languages of the world. This book was "Uncle Tom's Cabin," written by Mrs. rncle Harriet Beecher Stowe, and it was for the time more Tom's widely read throughout the world than any other book. Cabin. It was a story claiming to show what negro slavery really was, and what it meant in the lives of men and women, white and black, in the southern states of the union. The book was candidls written, and in a wonderful spirit of fairness, rather understating than exaggerating the evils of slavers, and its truths were all the more convincing for that reason. Its influence was doubtless very great in strengthening the anti-slavery feeling at the north, and in finally extinguishing the distarbing evil of the country.

## VH.-THE APPROACUING CONFLICT.

226. June 1, 1552, the Democratic National Conven-Convention met at Baltimore. Its platform included the tions of strict constructionist platiorms of former conventions. 1852. endorsed the Virginia and Kentucky resolutions of 1798, and pledged the Democratic party to a faithful observance of the Compromise of 1850 , including the fugitive slave law, and denounced all agitation of the slavery question. It nominated Franklin Pierce, of New Hampshire, and William R. King, of Alabama. The Whig National Convention met June 16 at Baltimore. In its platform it adopted its usual loose constructionist principles, though somewhat more cautiously worded than formerls, and endorsed the Compromise of 1850 and the Fugitive Slave Law. It nominated Winfield Scott, of Virginia, and William A. Graham, of North Carolina. The Free Soil Democratic Conventiou convened at Pittsburgh, August I1. In ite platform it declared slavery to be a sin against God and a crime against man, and denounced the Compromise of 1850 , and the two parties who supported it. It nominated John P. Hale, of New Hampshire, and George W. Julian, of Indiana. Some of the Whigs, dissatisfied with General Scott, wished to bring forward Daniel Webster as an independent candidate, but Mr. Webster died in October of that year. Henry Clay had also died in June of the same year. These two great leaders of the Whig party were succeeded by such men as Sumner, Seward and Chase, arowed enemies of slavery. John C. Calhoun was also dead, and Jefferson Davis, afterwards to play sucb an important part in the nation's history, acquired the leadership of the slaveholders of the south.
227. The slavery question was the principal issue in the presidential election in November, 1852, and in the contest the Whigs met with a crushing defeat, which put an end to their party. When the electoral votes were counted in February, 1853, it was found that Pierce and King had received 25t, and Scottand Graham only 42. Mr. Pierce's administration (I853-57) was Pierce's chiefly occupied with the slavery dispute, in which he adminit represented the policy of the southern party. He chose tration. William I.. Marey for secretary of state, James Guthrie for secretary of the treasury, Jefferson Davis for secretary of war, and Caleb Cushing for attorney-general.

The slave power.

228 The slave power was now at a loss what to do for new territory in which to extend itself. The north had already a preponderance in the senate, consequent upon the admission of California, and from the rapid growth of the northwestern states, in which New Eng. land ideas and sentiments were lecoming predominant, the southern leaders recognized the fact that ere long the north would hold the power in the house. Webster had shown, in his memorable speech of March 7 , 1850, that there was no more termitory for slavers withiu the limits of the union. What, then, were the southern states to do? It seemed absolutely necessary at once to get a new slave state to balance California, but the available land south of $36^{\circ} 30^{\prime}$ was already occupied. New Mexico and the Indian Territory south of Arkansas presented themselves, but the westward movement of population along these lines rould be far too slow for their purpose.
229. Seeing no legitimate method to acquire territory, their former plan was repeated, if not by the sonthern states themselres, certainly under the instigation of many of their citizens, and by members of the State-rights party of the south, and for their advantage; for it was precisely at this period that William Walker, Filibuster- of Tennessee, the notorious filibuster, undertook to snatch Sonora for the sonth from Mexico, exactly as his predecessors had done with Texas. But he failed. In 1855, he and his band made the same experiment in Nicaragua. Here, for a time, he was successful. He overturned the lawful government, made himself president, and almost made the state in readiness for slavery and annexation to the federal government. But he was subsequently driven out, after which he returned home greatly disappointed and mortified. After two more unsuccessful attempts on Nicaragua, he planned his fifth and last expedition against Honduras. He was encouraged and assisted by his sonthern friends; mass meetings of his supporters were held even in New York, and in many other northern cities; and the state sovereignty party everywhere applauded his efforts to revolutionize and wrong a state. But Walker failed more fatally this time. He was defeated, captured and shot.
230. Having been foiled in the attempt to gain a foothold in Central America, the slave power now turned to another state as offering a solution of their difficulties. The southern states wished to annex Cuba. Mr. Pierce proposed to buy it, and at his suggestion a conference was held at Ostend, in Belgium (1854), between the American ministers to Spain, England and France, Messrs. Pierre Soule, James Buchanan and John Y. Mason to consider the question. A memorandum, drawn up by these gentlemen and submitted to
manifesto. deslared that Cuba was necessary to the United States; that it was the duty of this country to prevent the emancipation of slaves in the island; and that if Spain refused to sell Cuba, the United States would be justified in taking it from her by force. This declaration caused great indignation in the north. Nothing, how ever, came of it.
Tendencies
231. Meanwhile, the tendencies to disunion were becoming stronger. Texas, the last slave state ever admitted, had refused to be divided, hence the south could hope for no further increase of numbers. After 1850, the political power had passed out of the hands of the south. The free states now, by uniting, conld control both louses of Congress, elect the president and vice-president, dictate the appointment of judges and other federal officers, and make what laws they pleased. Thus the interests of the south depended upon the one question whether the free states would thus unite or not. Under circumstances so critical, it were better for the slave power that all questions calling public attention to the question of slavery should be avoided; this, however, was simply impossible. The numbers interested in its solution had become too great to be silenced. It was the question of the hour, disenssed in all ranks of society, breaking up party lines, and even disorganizing ecclesiastical institutions. The

Protestant church organizations of the United States had been greatly agitated by the irrepressiblequestion, and some of them became divided. In 1845, the Baptist church separated into a northern and southern branch, and the Methodist church shared the same fate the following year. The Presbyterian church managed to maintain its integrity until 1861, when it :lso yielded to the pressure; and the only churches retaining their national character were the Episcopal and Romain Catholic.
232. The southern leaders, strongly desirous of acquir- Kansas ing more territory in which to extend slavery, now Nebras concocted a seemingly practicable scheme to get con. trol of that part of the country lying west of Missouri and Iowa. This land lay to the north of $36^{\circ} 30^{\prime}$, and, according to the terms of the Missouri Compromise, was forever to be free soil. A plan was devised to ohtain, if possible, the repeal of that celebrated compact. With the aid of some of the northern members of Congress this might be done. The scheme proved successful, so far as legislation could go. In December, 1853 , a bill was introduced in the senate to organize the territory of Nebraska. A southern senator at once arose and demanded that the Missouri Compromise should not be so construed as to prohibit slavery within the new territory. The bill was at once dropped. But a sufficient number of free-state Democrats soon acquiesced in the southern demand to make it a success. One week later a new bill was brought in, known as the KansasNebraska bill. It divided the region covered by the previous Nehraska bill into two territories, one directly west of Mlissouri, and between the parallels of $37^{\circ}$ and $40^{\circ}$, to be called Kansas, and the other, north of this, and between the parallels $40^{\circ}$ and $43^{\circ}$, to be called Nebraska. Thus, two states were opened to the southern institution, instead of one, for this new bill distinctly declared that the Missonri Compromise had been swept away by the later Compromise of 1850. President Pierce had pledged himself to the south, in his letter accepting his nomiation, to acknowledge and execute this latest bargain with slavery, in case he should be elected.
233. The bill was enacted, but the position was now Squattes assumed that Congress had no authority to vote slavery in, or to rote it out, of either of these territories, since it belonged of natural right to their respective populations to decide for themselves the character of their own institutions. This idea was known as that of squatter sovereignty, and it was proclaimed in order to open Kansas to an immediate slave immigration from llissouri, while Nebraska might afterward be captured in the same way from slaveholding Kansas. It was a plausible doctrine, because it appealed to that strong love of local self-government which has always been one of the soundest political instincts of the American people. The plan was an astute one. It originated with Stephen A. Douglas, a northern Democrat, and laid bare the finest region of country which was open for settlement, as a battleground between the slave-labor and the free-labor systems.
234. This act was the most palpable blunder ever known in the history of American politics. Its practical result was to create a furious rivalry between north and south, as to which should first get settlers enough in Kansas to secure a majority of the popular vote. The issue, thus clearly defined, wrought a new division between political parties. The southern Democrats and southern Whigs united in favor of the Kansas-Nebraska bill, while the northern Whigs and Free Soilers united against it. The division between the northern and southern Whigs was final. The northern section at once repudiated their old party name, and, combining with all the northern men who were opposed to the extension of slavery, took the name of anti-Nebraska men, and succeeded in of the herse atives. A new party lad arisen in 1852, which was now an important factor in American politics. It assumed the form of a secret oath-bound organization, of whose name, nature and objects nothing was told, even to its members, nntil they had reached its higlier de-

[^301]
$\square$

grees. Their consequent declaration that they knew nothing about it gave the society its popular name of Know-Nothings," but it assumed the name of the "American party." Its design was to oppose the influence of the Roman Catholic church, the easy naturalization of foreigners, and to aid the election of nativeborn citizens to office. Its nominations were made by secret conventions of delegates from the various lodges, and its nominees were to be roted for by all its members, under penalty of expulsion in case of refusal. For a time it was quite successful in state elections, and was now aiming at a greater extension of its influence. At first it had intended to ignore the slavery fuestion, but, after a few years of existence, the complications arising from the discussion of this subject affected its organization and resulted in its division.
235. The old Whig party disappeared about this time. Some of its members joined the Americau party, and the majority, including the old anti-slavers men and Free Soilers, with many others, united under the name of the Republican party. The name was at once ecognized by the Democrats, who, in contempt, called them "Black Republicans," because of their alleged fondness for negroes. The Democratic parts, which had been practically the only party since 1852 , had now to contend with a political organization which adopted broad constructionist principles, declared itself in fayor of protective tariff, internal improvements, and a national system of bank currency, and added to them the further principle that the federal government has the power to control slavery in the territories. It affirmed, at first, that it bad no design to interfere with the institution of slavery in the states where it belonged, but simply intended to exclude it from the territories. But with the enunciation of its fundamental principles, it was at once recognized as an antislavery party, and the only one to which the southern slave could look with the faintest hope of aid in throwing off the chains of bondage. The Democratic party had quite thrown aside its original title-that of Repul)-lican-but the name was still popular. and the new party, by a skillful stroke of policy, took advantage of this feeling and assumed the old name. Thus, in 1856 , the two great parties which were to figure so largely for the succeeding jears in the history of the country, were arrayed against each other.
236. The attention of the whole country had now been turned to the struggle provoked by the KansasNebraska bill, and the repeal of the Missouri Compromise. Kansas had been offered as a prize to be contended for by free and slave states, and both had accepted the contest. As in the case of California, it was found a slow work to colonize the new territors, even from Missouri, by permanent settlers, for the people of that state had land enough of their own, still unoccupied, to absorb for years their surplus population. The only recourse, therefore, was to send their worst inhabitants across the border, not to settle, but to rote and fight for slavery. Consequently gangs of "border ruffians" poured into Kansas from Missouri and Arkansas. But the free states were not behind in a struggle. Anti-slayery societies subscribed money to hasten immigration into the contested territory, and people from the free states migrated thither in such numbers that in a few months they constituted a decided and lawful majority of the actual settlers. The administration took alarm at the ill success of its own plans. Many of the inhabitants of Missouri undertook to impede the passage of northern emigrants through their state, but the immigrants circumrented them by winding their way around through the free state of Iowa. In the meantime the government sent an army to Kansas, professedly to keep the peace, but it would seem in reality to compel the acceptance and establishment of slavers. The first election of a delegate to Congress took place Norember 29, 1854, and was carried by organized bands from Missouri, who crossed the border on election day, voted, and returued at once. In the spring of 1855 , the ruffians in this way voted to organize a territorial legislature, and this measure was
carried in the same lawless manner. In July, I855, this legislature, all pro-slavery, met at Pawnee, and adopted a state constitution. To save trouble, as well as to secure at once the establishment of slavery, they took a summary vote, adopting in their entirety the laws of slaveholding Missouri. At the same time they enacted a set of original statutes, which denounced the penalty of death for nearly 50 different offences against the institution of human bondage.
237. To defend themselves against these illegal pro- Free-state ceedings, the actual settlers held a free-state conven- governtion at Topeka, September 5,1855 , repudiating the ment. work of the pro-slavery party ; and on January 15, 1856, they elected state officers under the lawful constitution. Nine days afterwards the state-rights president, in a special message to Congress, endorsed the pro-slavery legislature, and pronounced the attempt to form a freestate goremment, without the approval of the federal authorities in the territory, to lie an act of rebellion. He then issned a proclamation warning all persons against such acts of resistance to the lawful government, and dispatched another hody of troops to enforce the constitution of the horder rutians. The struggle continued unabated. In the senate chamber Charles Sumner had been knocked down to the floor by sumner Brooks with a stick, so as to be severely injured, and Brooka for daring to criticise what he held to be unjust and one-sided proceedings. The assailant, Brooks, was expelled by northern rotes, but was immediately returned by his southern constituents. In Kansas, the free-state settlers refuse to recognize the territorial government of the slave party, and as the pro-slavery settlers and their allies would not render obedience to the other government, the contest passed into a real civil war, the two sides mustering considerable armies, fighting battles, capturing towns, and paroling prisoners. Two free-state towns, Lawrence and Ossawattomie, were sacked. The free-state legislature paaceably assembled at Topeka, and was dispersed by order of the president. Many of its members were arrested and imprisuned. Every free-state citizen's dwelling had to be guarded and defended by armed force, and no free-state man could plow or plant or gather in his crops without fighting for his life.

The free settlers still continued to maintain their position, in spite of the persistence of the slave partr, with the whole force of the administration at its back. Several pro-slavery governors - Shannon, Geary and Walker-were sent to represent the southern party and subdue the citizens to its purpose and control. A second slave constitution, made at lecompton, was offered to the people in a tricky and nefarious manner. It was to be voted for "with" or "without" slavery, but in either case there would be an affirmation of the doctrine of state-rights. The free settlers accordingly refused to vole. The constitution of necessity was adopted and the new document sent to Washington, was accepted by the president and State-rights party. But the measure failed to carry through the house. A nother territorial legislature was elected, and this body sent the Lecompton constitution to the polls to be voted for, or against, as a whole. It was defeated by a majority of six thousand. In spite of this, however, the president, in a special message, urged upon Congress the Lecompton constitution with its slavery features, declaring that the new legislature had no right to submit it so a second-vote. But he was not sustained. In July, 1859, the citizens of Kansas met again in couvention at Wyandotte, and adopted a resolution forever excluding slavery. It received a majority of four thousand at the polls.
239. In the heat of the Kansas struggle came the Presidenpresidential election of Isā6. The Democrats nomi- tial camnated James Buchanan and John C. Breckenridge, paign of adopted the strict constructionist platform of former conventions, and added to it an endorsement of the Kansas-Nebraska bill and the priuciple of squatter sovereignty. The Republicans nominated the western explorer, John C. Fremont, and declared the right and duty of Congress to prohibit slavery in the territories,
thus planting themselves upon the ground of the Wilmot Proviso. The small remmant of Whigs, including the Know-Nothings of the north and those sonthern men who wished no furtber discussion of slavery, nominated Fillmore, and tried to turn attention away from the great question at issue by protesting against the too hasty naturalization of foreign-born citizens. Buchanan received 174 electoral votes, Fremont 114 and Fillmore 8. The large Republican vote showed that the northern people were at length awakened to the situation, and the south in consequence was both astonished and alarmed. For the first time in the history of the country a distinctively nuti-slavery candidate had obtained an electoral vote, and had nearly gained the presidency. Though the Democratic party had been successful in this election, its triumph was seen to he far less complete than when it came out of the election of 1852 . It no unger controlled twent $y$-seven of the thirty-one states; all the free states hut five had cast their votes against it, and its candidate no longer had a majority of the popular vote, but was simply chosen by a majority of the electoral vote.
The strongest section of the umon was in the hands of its political opponent, through whose ranks a spirit of earnest enthusiasm was being increasingly diffused.

240 . The strength of the opposition manifested against the Democratic party in this election, more than ever convinced the south that the time was fust approaching when political power would pass from those who defended slavery to those who opposed it. Hence the slave power gathered up its forces for the great struggle vhich must inevitably ensue. It hecame more aggressive than ever. The African shave trade forbidden since Isos, was reopened extensively and with but scant disguise, many northern shipping merchants engaging in this revival of the pernicious traffic. During 1857 the British fleet on the African coast capt ured twenty-two slavers, and every vessellut one was American. By 1860 the tratic had consillerably increased and was widely advertised, while it is due to the south to say that she imported but few negroes from Africa, though her planters purchased many that were lrought over. Meanwhile this was not deemed sufficient. To insure the perpetuation of the "peculiar institution," it was necessary to enlist the active protection of the federal government in its favor. Squatter sovereignty had not served the purpose, for in the Kansas struggle, despite all the efforts made, slavery had been worsted. Squatter sovereignty was accordingly thrown aside, and a demand made that the federal government should protect slavery in all the territories.
The Ined scott de. cisio:.
241. Up to this time the constitutionality of the Missouri Compromise had never heen considered in the supreme court. The question was hrought to test in
state laws; that Congress was constitutionally bound to protect liberty as well as property ; and that its duty Wus to prohibit, not to protect, slavery in the territories. It wasplain that the decision of the supreme court would never be received as the law by the free states. A storm of angry dissent arose, of which the slaveholders hastened to take advantage. They maintained that the duty of Congress to protect slavery in the territories had been confirmed lyy the highest judicial authority in the land, and that the Republicans had refused to accept its rulings; therefore, whatever the result might be, the Republican party must accept the responsibility. At this time, as will be seen, the northern, or Douglas Democrats as they were called who had heretofore supported the south, now refused to follow the southern lead any further, but chose rather to divide the party.
242. In 1860 the slave states were sixteen in number, Slave stat namely, Delaware, Maryland. Virginia, North Carolina, and free South Carolina, Georgia, Alabama, Kentucky, Tennessee, Louisiana, Mississippi, Missouri, Arkansas, Florida, and Texas (admitted 1845). The free states were eighteen, namely, Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan (admitted 1837), Iowa (1846), Wisconsin (1848), California, Minnesota (1858), and Oregon (1859). Kansas had adupted a free-state constitution, but was not admitted until 1861. At this period the population of the United States was more than $31,000,000$, an increase of over $8,000,000$ in ten jears. The population of the slave' states was $12,000,000$, including $4,000,000$ slaves and 250,000 free blacks; but the colored element in the southern population could hardly be regarded as a factor of strength, but rather as a possible source of danger. No serious slave uprising had ever threatened the south, hut John Brown's raid and the alarm which it produced in the southern states betokened a danger which added a new terror to the chances of a civil war. Brown, a Connecticut man of the old Puritan type, had been an anti-slavery leader in the Kansas fights. $H$ is plan wasto raise an insurrection among the slaves of Virginia, and arm them to liberate their people by force. In October, 1859, he and his men surprised and seized Harper's Ferry, where there was a large store of muskets and ammunition ; but the negroes did not rise, and Brown was overpowered by national and state troops, and hanged (December 2) by the authorities of Virginia.
243 . The next election for the presidency was looked forward to as a critical time. Many persons of influence in the south declared that if the election should strengthen the preponderance of the north, the slave states would break up the union and form a confederacy of their own. The Democratic National Convention, which met at Charleston, S. C., A pril 23, 1860, was characterized ly its stormy session. The demands of the southern extremists produced a political schism, and the convention with the party was split into two The split 11 distinct portions. The Douglas Democrats refused to the Demojield to the wishes of the slave power, and stiM maintained the principle that the question of slavery in each territors should be decided by its settlers; hut they made a concession by offering a resolution that the party would abide by the decisions of the supreme court. The southern delegates offered resolutions affirming the doctrine of the Dred Scott decision, that neither Congress nor the territorial legislatures had a right to prohibit slavery in the territories. The convention adopted the Donglas platform, whereupon the delegates from many southern states successively protested and withdrew, and at once organized a new convention in Charleston, adopted their platform, and adjourned to meet again in Richmond, June 11. The original convention, after balloting fifty-seven times for candidates without a choice, adjourned to meet again at Baltimore, June 18. Upon reassembling at the appointed time, it seated some new delegates friendly to Douglas, whereupon the remaining southern delegates, who chiefly belonged to the border states, also withdrew, and

a case which was decided in 1857, two days after Buchanan's inauguration. One Dred Scott, a slave who had been taken by his owner from Missouri into free territory, and had therefore sued for his freedom, was sold to a citizen of another state. Scoft then transferred his suit to the federal courts, under the power given them to try suits between citizens of different states, and the case came by appeal to the supreme court. The decision was startling to the nortb. It declared, in sulistance, that, according to the constitution, no slave, or the descendant of slaves, conld he a citizen of the United States; that Blaves were not persons, but property, and that slave-owners could migrate from one part of the union to another and take their negroes with them, just as they could take their horses or any other property. It, moreover, pronounced the Missouri Compromise Act unconstitutional and void, slaves being private property, with which Congress had no right to interfere. And it further declared that it was the duty of Congress not to prohibit, but to protect, slavery in the territories. The mass of the northern people held the opposite of Chief Justice Taney's decision. They claimed that slaves were regarded by the constitution, not as property, but as "persons held to service or labor" by
joined their brethren at Richmond. Here they nominated John C. Breckenridge and Juseph Lane for president and vice-president. The remainder of the Baltimore convention nominated Stephen A. Douglas and Herschel V. Johnson. The Republican convention assembled at Chicago, May 16. It adopted a sonewhat broad constructionist platform: advocated the exclusion of slavery from the territories by congressional measure; declared in favor of a protective tariff, the homestead bill, internal improvements, and a Pacific railway. It nominated Abraham Lincoln and Hannibal Hamlin. There was a fourth organization called "The Constitutional Union Party," composed of the fragments of the old Whig and Know-Nothing parties. It declared as its political principles, "The constitution of the country, the union of the states, and the enforcement of the laws." Its candidates were John Bell and Edward Everett. Four parties were now in the field, and only two had the courage of their convictions, the southern Democrats and Republicans. The Bell party had adopted a "take it as you please" platform; it simply evaded the slasery question altogether; while the Douglas platform suught to throw the responsibility of a decision concerning the question upon any shoulders except those of the Douglas Democrats.
24. An exciting canvass now followed. The Republican party had been gaining confidence and enthusiasm, and the discordant efforts of the three parties opposed to it, only made Lincoln's election more certain. In the electoral college Lincoln obtained 180 votes, Breckenridge 72, Bell 39, and Douglas 12. No candidate received a majority of the popular vote, Lincoln standing first and Douglas second. The popular rote for Douglas, though large, was not so distributed as to gain a majority in any state except Missouri: beside the mine electoral votes in that state, he obtained three in New Jerses. Thus the election resulted in a decisive rictory for the Republicans. Its significance was far reaching. The interests of the south, and even of slavery there, would be safe enough under Lincoln, but the overthrow of the Dred Scott and squatter sovereignty doctrines was certain, and an immediate stop would be put to the extension of slavery in the territories. In such circumstances the course of erents was evident. Nullification was no longer feared by the nation. Secession, on the part of a fingle state even, was now almost out of the question. No one of the southerw states would agree to secede unless assured of support by the others; a combined action was necessary to assure the success of any secession plans.
245. During the discussion which preceded the election, the north heard repeated threats from the south, that if the Kepublican party were successful, the slaveholding states would leave the union; but these threats were looked upon as merely the angry declarations of a few heated politicians. Yet these disunion expressions were sincere. The southerm people had learned to look apon the north as thoroughly hostile to the south. They made little distinction between the Republican party and the abolitionists, and they felt instinctively that a government elected in a spirit of opposition to slavery would find many wass to injure it. The political habits, and the way of life at the south, made it easy for southern voters to believe in disunion as a cure for the evils with which they felt they were threatened. The doctrine of state independence had become familiar to them; it had been laid down in the Kentucky and Virginia resolutions of 1798 , and had been nuaintained by Georgia in the difficulty with the Indians, and by South Carolina in her Nullification Act. They had remained "Planting States;" they still had their own social life; the same families lived upon the same estates. There was no such constant movement from one state to another as at the north, nor any such introduction of immigrants from Europe. They were, in brief, much prouder of their seseral states than of the union. South Carolina took the lead in fulfilling the promase of secession. As soon as it Was announced that Mr. Lincoln was elected, her legislature ordered
(November 10, 1860), the assembling of a convention in December following. The senators from the state, and all office holders in South Carolina under the federal government, at once resigned. The convention met at the appointed time, aud, on December 20 , unanimously passed an ordinance of secession declaring "that the union now subsisting between South Carolina and the other states, under the arme of the United States of America, is herebs dissolved." As reasons for this course, the convention referred to the nullification of the fugitive slave law by the personal liberty hills, and the election of a president " Whose opinions and purposes were hostile to slavers." The convention then took all the necessary steps to put the state in readiness for war, and adjourned. A cops of the ordinance was sent to each of the slaye states, and several of them now rapidly followed this lold lead. Similar ordinances were passed by Mississippi, January 9, 1861; Florida, January 10; Alabama, Jannary 11; Georgia, Januars 19; Louisiana, January 26, and Texas. Fehruary 1. Tennessee, North Carolina, Arkansas and the border states still refused to join their more southern neighhors. One force, however, might be exerted which would compel them to a decision. Should the federal government attempt to coerce the seceding states, a state which did not wish to secede, but maintained the doctrine of state sovereignty and the right of secession, would be inclined to take up arms in its defence. Thus, in the following spring, four more of the slave states reinforced the original seren seceding states, making their final number eleren.
246. The act of secession, at first, met with opposition in the south, not from any sentiment that the act was wrong, but from the expediency of its exercise. Delegates had been elected to the state conrentions who were to rote against secession, but they were defeated through the idea which had obtained that the state "could make better terms out of the union than in it." It was held that it would be more adrantageous to their rights and interests to withdraw temporarily from the federal gorernment until proper guarantees for the observance of these should be given; and if all conditions were satisfactory, then they might deem it best to return. In planning secession, the southern leaders recognized many things in faror of independence on which they supposed they might reasonably flans or count.

To gain success, it was not necessary for them to conquer the uorth, or any part of it, but only to hold their own frontier; whereas, should the north attempt coercion, it would necessitate the military occupation, by its armies, of the whole vast area of the southern country, which would be a tremendous undertaking never at tempted before on a corresponding scale by any civilized government. Thes did not believe the United States authorities would really attempt such a measure. In this they fatally erred. They believed that all the slave states would join in the secession movement. This, howerer, was not done. Then they hoped that the action of the Republican administration would be so paralszed by Democratic opposition in the north, that its efforts at coercion would be rendered futile. In this they were doomed to disappointment; for when war came, the great majority of the northern Democrats loyally supported the government ; while those, nicknamed "Copperheads," who endeavored to impede its efforts, were too small in number to do any serious harm. Finally, they thought they might look for aid from England and France. "Cotton is king," was the cry, and while the English manufacturers were dependent for their cotton upon the south, it would scarcely le possible that the English government would allow the southern coasts to be blockaded. But the sentiment of the great majority of England's working people was found to be in favor of the north. The great mass of the English people, in spite of many aristocratic sympathizers with the south, felt that the action of great Britain, in the African slave trade question, would not permit her, without the most glaring inconsisteney, to give support to the principal slave power in the morld. With respect to France, the
case was just as hopeless. Napoleon III, it is true, was desirous of recognizing the independence of the south, for he had designs upon Mexico incompatible with the Monroe doctrine, but he was unwilling to make the move without the concurrence of England, and this he could not obtain. Thus the southern leaders failed in their expectations, and were thrown upon their own resources.
Organizalon of the Confederaey.
247. In February, 1861, a convention of delegates from the seceding states met at Montgomery, the capital of Alabama, and formed a government under the
name of the Confederate States of Americh. The title thus declared that the states formed a confederacy and not a union. The government was a provisional one for a year, since only seven of the southern states were represented. Jefferson Davis, of Mississippi, was chosen president, and Alexander H. Stephens, of Georgia, vice-president. A provisional constitution was formed, and an army, treasury, and other executive departments established. The permanent constitution, adopted in March, was copied from that of the United States, except that it made careful provision for slavery, and forbade a protective tariff or the maintenance of internal improvements at general expense. The seceding states at once took measures to take possession of the arsenals, forts and other property of the United States within their borders. Mr. Buchanan's secretary of war was John B. Floyd, of Virginia, a zealons secessionist, and by his orders an immense quantity of muskets, cannon, ammunition, and other warlike stores had been transferred from northern to southern arsenals. All this fell into the hands of the secession party. The army was scattered at remote posts where it could be of no use, and most of the navy was at foreign stations. General Scott urged President Buchanan to strengthen the garrisons of the southern forts, but Mr. Floyd protested, and nothing in that direction was done.
248. The forts throughout the south were mainly in the hands of southern men, who delivered them to the new authorities. The commanders of Fort Pickens, at Pensacola, and of the forts at Key West and Tortugas refused to give them up. The greatest interest, however, attached to the forts within the borders of South Garolina. The harbor of Charleston was commanded by Forts Sumter and Moultrie and Castle Pinckney. Fort Sumter was not get finished, and the garrison, under Major Anderson, was occupying Fort Moultrie, a weaker work. This officer secretly transferred his men and supplies to Fort Sumter during the night of December 26, 1860. South Carolina demanded the evacuation of the fort. President Euchanan refused the demand, and sent the steamer Star of the ITest with supplies and reinforcements for the fort. He intended the expedition to be a secret one, but it was known at once in Charleston, and when the steamer appeared it was fired upon and driven back (January 9, 1861). The South Carolinians had taken possession of the other forts in Charleston harbor, and now erected additional works. General P. G. T. Beauregard was placed in command of the harbor defences. President Buchanan was filled with perplexity. In his message to Congress he stated his inability to execute the laws in the seceding states, but Congress gave him no help. He condemned the doctrine of secession, and denied the right of the states to secede; he also denied the right of the government to coerce them when they did secede. Ilis cabinet was divided. The southern members dropped out as their states seceded, and General Cass, of Michigan, secretary of state, resigned in displeasure at Mr . Buchanan's inaction.
249. The resignation of the southern senators and representatives gave the Republicans a majority in Congress. That body now proceeded to admit Kansas as a state, and passed a protective tariff designed to encourage manufactures. Otherwise Congress did nothing but pass resolutions intended to pacify the south. Time which should have been spent in concentrating the energies of the federal government, and preparing it to assert its supremacy, was frittered away in vain discussions about measures proposed to avert the
disaster. Mr. Seward, senator from New York, and one of the most conspicuous of the Republicans was willing to give up congressional prohibition of slavery in the territories, to enforce the fugitive slave law, and to perpetuate slavery by a constitutional amendment. The people throughout the country were in a The po state of bewilderment. The government authorities larfee seemed to have no power to direct affairs. Great meetings were held in the principal cities of the north, denouncing abolitionism and urging extreme concessions. Prominent journals of both parties declared that armed coercion was madness and never would be permitted. At the suggestion of the Virginia legislature, a peace congress, composed of delegates from Peace thirteen fiee states and seven border states, met at Washington (February 4, 1861), and tried to bring about harmony between the sections, by proposing a number of amendments to the constitution. Nothing came, bowever, of any of these schemes. Disunion was now an assured fact, and was soon to pass into open hostility. It was during this state of affairs that the new administration of Abraham Lincoln entered upon its perplexing duties.

## VHI.-THE CIVIL WAR.

250. Mr. Lincoln was inaugurated March 4, 1861. In Lincols his address he declared that he had neither the right Inaugu nor the desire to interfere with slavery where it already existed ; that no state could lawfully go out of the union; and that he should maintain the laws and constitution of the United States to the best of his ability. The new administration was beset with difficulties on every side, and the condition of affairs seemed almost desperate. Many of those who for years had guided the "ship of state," and who understood its workings, were now foremost in advocating secession. Mr. Lincoln's oflicers were new to the business of the federal government. The treasury, by defalcation, was nearly bankrupt. Few troops were within call ; and the army had been almost broken up ly the surrender of detached forces in the Confederate states, and the capture of munitions of war. The vessels of the navy were sailing or at anchor in distant waters, and numerous officers of both the army and the navy were resigning their commissions on the ground that they owed allegiance first to the states from which they came. Seven states had already revolted, and others were ready to swell the number upon the first attempt to enforce the federal authority. The public offices were largely occupied by persons in sympathy with the secession movement, and every step taken by the new government was known at once to the leaders of the Confederacy, and to crown all, Mr. Lincoln was beset by a vast horde of office-seekers eager to take advantage of the change of administration.
251. The president waited a month and then notified Fort Governor Pickens, of South Carolina, that he should Sumte send supplies to Fort Sumter at all hazards. This anouncement precipitated an attack upon the fort. Major Anderson was first summoned to surrender, but he refused. At daybreak on the morning of April 12. 1861, the Confederacy began its open conflict with the United States. All the Latteries around the fort opened fire upon it; the fort replied, and the bomhardment continued for thirty-six hours without loss of life on either side. The ammunition in the fort was then exhausted, and the works inside were on fire. Thereupon the United States flag, for the first time in its history, was lowered to insurgent citizens, and the garrison capitulated. This event aroused the north as Effect if from a trance. Until now, the mass of the people had refused to believe in real danger; but the first shock of arms thoroughly convinced them that the south was ready to fight, and could not be curbed without war. It did more than this. In the northern states party distinctions were for a time swept aside; there was but one party worth the name-the party for the union. The southern states were no longer "erring to bear arms in defence of the union. In the south also, the effect of the first conflict was correspondingly great. To the ignorant masses it did not seem possible that any other power could be superior to that of their own state; while the more intelligent classes had, from their childhood, imbibed the doctrine that state sovereignty was the foundation of civil liberty. Hence all felt bound to follow the lead of their state; and when the president of the new Confederacy issued his call for men, it was answered, as in the north, by overflowing numbers.
252. Those southern states which had wavered were now compelled to make their choice. When Mr. Lincoln called for troops the Governors of Arkansas, Virginia, North Carolina and Tennessee refused to obey. North Carolina and Arkansas then seceded, and joined the Confederacy. In Tennessee and Virginia "military leagues" were formed with the Confederate states, by which Confederate troops were allowed to take possession of their territory, and by their aid the question of secession was submitted to popular vote. Thus the secession of these two states was accomplished in part. but not wholly. The people of the Alleghany mountains were loyal to the union; in eastern Tennessee they aided the Federals as much as possible; the opposition to secession was so strong in the western counties of Virginia that the inhabitants refused to obey the convention which passed the ordinance; they chose a legislature which claimed to be the true government and at last formed a new state which was admitted into the union in 1863 under the name of West Virginia Even thus curtailed, Virginia was a nost important accession to the confederacy; it increased its military strength greatly, and at once became the chief battle ground of the war. The confederate government was moved from Montgomery to Richmond: and since Washington was separated only by the Potomac from the confederacy, it was clear that the great contest would be fought in the country which lay between the two capitals. Moreover, Virginia was the richest and greatest of the slave states, and furnished the southern army with its ablest leaders, many of whom-such as Lee, Jackson, Johnston, and Ewell-were opposed to secession, but thought it right to shape their own course by that of their state.
253. There was a strong anti-union element in Missouri, Kentucky, Maryland, and Delaware, and the most momentous results-involving, doubtless, the success of the Union cause-were involved in the action they would now take. Aside from Virginia, Missouri was the most powerful slave state, and her geographical position, with that of Kentucky and Margland, was of incalculable military importance. Had these three states united with the confederacy it might have won the prize for which it was contending-independence. Missouri, however, did not break away, though the issue was for some time doubtful with her. Delaware cast her lot with the union. In Maryland and Kentucky efforts were made to maintain neutrality, but they were soon induced to declare in favor of the Federal government. Kentucky, however, had some of ber sons in the southern ranks, among whom was John C. Breckinridge, a former vice-president of the United States, who became an officer in the confederate army.
254. The Federal government was in no want of men, but the action of Secretary Flosd had almost stripped it of arms to equip them. Agents were sent
abroad to purchase guns, private manufactories were worked day and night to produce them, and in a short time the administration was able to call more men into the field. The northern people were unmilitary in their babits and thoughts. They had a militia, but it was poorly organized. The Mexican war had drawn few volunteers from this section, and the United States army was very small and imperfectly equipped. The early action of the Confederates also had weakened it. There was, however, a greater population to draw from than at the south. There was also a wider range of industry to supply the necessary funds to carry on the war. The agricultural products of the United States far exceeded in rolume those of any other country, and in merchant shipping it was only second to Great Britain. Between 1830 and 1860 American civilization had shown a wonderful growth in all directions-in facilities of trarel and exchange, in home comforts, in manufactures, in literature and art, and especially in the development and building up of that moral sense which enabled the country to pass so successfully through the trying times of the next four jears.
255. But this material progress was more largely made of the in the North. The South was far from developing an south, equal share of it. Her case was one of arrested adrancement on this line, not on account of a natural inferiority of her people but chiefly because slavery had blunted their spirit of enterprise. Labor was in many instances regarded as degrading; railroads and manufactures did not thrive. In the North men became distinguished either by successful business relations or high intellectual attainments; in the South only by oratory, literature, law or kindred professional pursuits which gave them position in good society and opened to them the avenues of state and national promotion. Thus the advance of civilization was checked, and whatever might have conduced to the naterial melfare of the south was kept away as far as possible. In the north the rising man was marked by the extent of his business relations; in the south by his ability to buy slaves, Which assured him nearly always an entrance into the ranks of the dominant class. This class furnished the representatives and senators in Congress, the governors, and incumbents of all offices which the slave power controlled. Thus its ablest and best men combined to defend certain tendencies which were foreign and hostile to those of the rest of the country, and of the world in general. UTh such odds against it, the struggle of the south during the four years of war showed of what heroic stuff its people were made.
256. The first blood of the war was shed in the streets first blood of Baltimore. Massachusetts and Pennsylvania troops of the war. on their way to Washington were attacked by a Baltimore mob (April 19, 1861), and some of the soldiers killed. The populace, which sympathized with the south, declared that no northern troops should pass through the city. The railroad was blocked up, bridges were burned, telegraph wires were cut, and all direct communication with the north was stopped, until the president sent a military force from Annapolis to occupy Baltimore and keep the rond open. In a short time the active hostility of the people was overcome, and the national capital made secure. By July 4 the confederates had pusbed their forces as far as Manassas Junction, about thirty miles from Washington. Their line of defence was already marked out, and its length has been estimated at eleven thousand miles, including the Atlantic and gulf coasts. It comprised the left lank of the Potomac from Fortress Monroe nearly to Washington; from thence it extended to Harper's Ferrs, on through the mountains of Western Virginia and the southern part of Kentucky, crossing the Mississippi a short distance below Cairo. From this point its direction was through southern Missouri to the eastern border of Kansas; then southwest, through the Indian territory, and along the northern boundary of Texas to the Rio Grande. The area contained within this interior line and the sea-coast was about 800,000 square miles, with a population of over $9,000,000$. It comprised, also, the territors devoted to the raising of cot-
ton. an article necessary to the manufacturing interests of the world. It was upon this production that the south relied largely for aid; all the munitions of war conld be procured in exchange for it; and she believed it would be a nowerful factor in preventing the blockading of her ports.
255 . In consideration of this fact, and also tbat the confederate line of sea-coast was over three thousand miles in length, with but one port of refuge for a blockading fleet about the middle of the line, it scarcely seemed possible that a blockade could be maintained with any marked degree of success. Nevertheless the president issued a proclamation (April 19, 1861; declaring a blockade of all the sonthern ports, and the Federal goremment proceeded to purchase and arm a large number of merchant vessels. But it could not at once bring together a nays powerful enough to keep vessels from entering or leaving the blockaded ports. The south not only sent out vessels laden with cotton to the West ludies and to Europe, but received in return military supplies of all kinds. Upon the appearance of Mr. Lincoln's blockade proclamation, Mr. Davis issued one also, granting letters of marque and reprisal to private ressels, against the commerce of the United States. The governments of Great Britain and France now issued proclamations of neutrality, thus making the contest between the north and the south a civil war, according to subsequent decisions of the supreme court. At the meeting of Congress (July t, 1861), the Republicans had a majority iu both branches only the free states and border states being represented. The house roted to devote its time solely to the business connected with the war. It supported the president's proclamation closing the southern ports against commerce. Bills were passed to define and punish conspiracs against the United States, and to confiscate all private property, including slaves, employed against the Federal government ; to authorize a loan; to call out 500,000 volunteers, and to appropriate money for the army and navy. During this session oceurred the first battle of Bull Rum (July 21, 1861). General Scott had been appointed conmander-in-chief of the union forces. The first militars movements were in the mountains of western Virginia, and the success of the union army there led many people to suppose that in a short time the rebellious states would be compelled to obedience. Mr. Seward, who was secretary of state, was especially cheerful, and promised that the war should be over in ninety days. The newspapers aad people generally urged an inmediate movement upon Richmond. Very few had any knowledge of the difficulties before them, and general Scott, pressed by public opinion, gave the order to adrance. This resulted in the first serious battle of the war. The union forces were defeated, and retreated in a panic upon Washington. Both armies were set so new in military training that the confederates gained nothing from their success.
7.ffect of
257. This disaster opened the eyes of the north, and the country settled down into a more serious temper. Congress was, more than ever, stimulated to increased energy, and pledged itself to vote any amount of money and any number of men necessary to maintain the union. Propositions to consider negotiations for peace were constantly offered by extreme Democrats, and as constantly rejected by large majorities, on the ground that negotiation with armed rehellion was unconstitutional. General Scott, having resigned the command of the northern armies on account of his age and infir-

## vicClellan

 uland.mity, was succeeded by General George B. McClellan, whose successful campaign in western Virginia had given him a high reputation throughout the arms. He had a gewius for organization, and possessed the unbounded confidence of the people. He immediately set about forming the first great army of the warthe Army of the Potomac-at Alexandria, in preparation for a second advance. But the advance was delayed much too long to suit the impatience of the people and the administration; and as the winter of

1861-62 passed away without any forward movement, the expressions of dissatisfaction became louder and more general. The confederacy also spent the summer Confer and autumn of 1861 in organizing its northern Army ate sra of Yirginia, under General Beauregard.
261. In the autumn of 1861 a portion of General Ball's Stone's command on the Upper Potomac was sent on a Bluff. reconnoissance into Virginia, under Colonel Baker, and, teing attacked by the confederate general, Evans, at Ball's Bluff. was disastrously defeated. Colone] Baker was among the killed. Although Nissouri had not seceded, a strong parts, with which the governor The ne was acting, wished to carry it orer to the confederacy. states. A confederate camp near St. Louis was broken up Uy Captain Lyon, of the regulars and the St. Louis arsenal was saved to the goverument. The state was afterward invaded by confederates from Arkansas, who were defeated by Ljon (now a general) at Booneville, June 17, and by Sigel at Carthage, July 5. A large force of confederates under McCullough and Price attacked Lyon at Wilson's Creek (August 10). Wilson Lyon was killed, and his command fell back toward Creek. the center of the state. Price with 20,000 men then attacked Lexington, which mas garrisoned bs 2,000 federal troops under Colonel Jlulligan. After an lieroic defense of three days the little garrison was compelled to surmender (September 20) after its water supply had been cut off for forty-eight hours. General Frenont was now appointed to the command of the western department. He drove Price into the south. west comer of the state, and was about to gire battle when he was superseded by General Hunter (Novenber 2). Ilunter retreated to St. Louis, with Price in pursuit; but in a fortnight Hunter was replaced bs IIalleck, and Price was driven into Arkansas. Ken- kentuc tucky, like Missouri, was distracted by dissensions among its own people, and bs armies on both sides. General Polk of the confederate arms occupied llickman and Columbus, tomns on the Dlississippi. There was also a confederate force at Belmont, Missouri, opposite Columbus. [Tysses $S$. Grant, recently appointed a brigadier-general of rolunteers, now first came into notice. Ife drove the confederates out of Belmont (November 7), but was unable to hold the town because it was commanded by the fortifications of Columbus.
262. From the beginning of the war, the federal Fugitio government was embarrassed by the question of fugi- slaves. tive slaves. Congress had passed the act confiscating slares emplosed in service liostile to the United States. While General Fremont was in command of the forces of the west, he had issued a proclamation declaring the slaves of Missouri confederates free men; but this was countemanded by President Lincoln, who did not wish to estrange those slave-holders, especially in Kentucky, who were still loyal to the union. In Virginia, General Benjamin F. Butler had declared that slaves were "contraband of war," and therefore liable to confiscation by military law. But as yet the disposition of the north was to subdue the south without interfering with slavery and some union commanders restored to their masters the slaves who had escaped into the federal lines.
263. Formidable expeditions were fitted out to Opera recapture southern harbors. A combined land and outbe naval force under General Butler and Commodore Stringham reduced and occupied two forts at Hatteras Inlet, North Carolina, at the entrance to Albemarle and lamlico Sounds (August 29), and Port Royal harbor, near Beaufort, South Carolina, was secured through the reduction of Forts Walker and Eeauregard by the fleet under Commodore Dupont (November 7 ), and a land force under General Thomas W. Sherman. These successes were of great value to the Federal government. They not only closed important southern ports, but they furnished conrenient stations for the blockading fleet. The "paper blockade," as it had been called, was soon made a rery effective one along the whole length of the southern coast from the Potomac to the Rio Grande, an achievement which by
many had been deemed impossible. Still, in spite of the watchfulness of the federal nayy, several confederate men-of-war and privateers sailed out of port, and did much damage to merchant ships. The practice of "running the blockade" became a very profitable business ; and notwithstanding the danger of capture, which always accompanied it, the profits on a single successful voyage were so great that adveuturers found they could afford to take the risk.
264. As has been stated, the south depended largely upon assistance from alroad, and the southern leaders still clung to the hope that they could prevail upon Great Britain and France to recognize the independence of the confederacy. Two commissioners, therefore, Messrs. Mason and Slidell, were sent by the confederate government to London and Paris. They ran the blockade, made their way to Havana, and then embarked for England in the British mail-steamer Trent. Some distance out, the Trent was overhauled by an American man-of-war under Captain Wilkes, the two commissioners were taken off (November 1861), and carried to Boston IIarbor, where they were imprisoned in Fort Warren. This action, which was illegal and unauthorized, caused great excitement in England, and came very near causing a collision between the two countries. Lord Palmerston made a peremptory demand for the surrender oi the prisoners. The American government had already disavowed the act of Captain Wilkes, which, though it was justified by the British claim of the " right of search," was contrary to American principles. The confederate envoys were therefore promptly released and sent to England. Just before this occurrence. President Linculn requested two confidential agents to visit France and England, in order to help the federal cause and avert the danger of foreign war by their influence with the governments and with persons of distinction. The persons selected for this delicate and important trust were Archbishop Hughes, of New York, and Mr. Thurlow Weed. They sailed in November and rendered very raluable service, Mr. Wreed in England, and the archbishop iu France.
265. At the beginning of 1862 , the war had assumed vast propurtions. The number of men under arms on hoth sides was nearly a million. The confederates held possession of the Mississippi ricer from the gulf of Texico to the southern boundary of Kentucky, and occupied a chain of strong positions extending thence through Tennessee and Kentucky to the southwestern corner of Virginia. Between the Alleghanies and the Blue Ridge was the fertile Shenandoah valley, often disputed by both armies. At the east, the confederates were posted in great force between the Totomac and the Rappahannock. Now that Delaware, Maryland, Kentucky and Missouri had been saved to the union, it was certain that the battle would be fought out in the territory to the south of them. The plan of the federal authorities was to open the Mississippi and penetrate the confederate line at the west, while, at the same time, Mcclellan attacked Richmond, and a land and naval force continued the process of capturing the southern ports on the Atlantic const. Simon Cameron, who had been secretary of war, resigned lanuary $20,186^{2}$, and Fas succeeded by Edwin M. Stanton. Al! the federal armies were to move simultaneously on the 22d of February, Washington's birthdas, but this order could not be strictly carried out.
266. The first adrance was made in the west. General Grant had entered Kentucky from Itlinois, and succeeded in securing the mouths of the Tennessee and Cumberland rivers, two strenms which were to serve as military highways by which the federal armies mere to penetrate into the heart of the confederacy. The chief zonfederate positions between the Mississippi river and the Alleghany mountains were Fort Henry on the Tennessee, Fort Donelson on the Cumberland (hoth in Tennessee), and Bowling (rreen and Mill Spring in southern Kentucky. This line of defence was in command of Gen. Albert S. Johnston, with heedquarters at Bowling Green. Here be was confronted by feneral Buell's army, the nidd one of the three great federal armies

Which came to be known as tho Arms of the Cumberland. Forts Henry and Donelsou formed the center of the confederate line, and were confronted bs Grant, Whose troops afterwards formed the Army of the Tennessee. 1 n January, 1862, General Thomas, with the left of Buell's force, thoroughly defeated the confederate right at Will Spring. General Grant, aided by the river Heet under Commodore Foote, now assailed the center. Fort Henry was first attacked and reduced by the gun-rorts Henry boats before Grant had time to invest it. The combined and Donelbrave 15,000 prisoners. The center of the confederate line was now pierced, and Johnston and Polk were compelled to retreat for fear of being cut off. Columbus, Bowling Green and Nashville were evacnated, and the whole of Kentucky and most of Tennessee was in the hands of the federals. General Buell occupied Nashville; a strong union party showed itself in Tennessee, and Senator Andrew Johnson was appointed military governor of the state.
267. The confederates formed their second line of defense along the railroad from 3lemphis to Chattanooga, and hegan massing their forces at Corinth. The armies of Grant and Buell were to unite and attack the enemy in their new position. Grant moved up the Tennessee river and halted at Pittsburg Landing, or Shiloh, about twenty miles from Corinth, there to apait the arrival of Buell. Here Johnston made a brilliant attack upon him with the intention of crushing him before Buell could come np. A terrible battle was fought (April 6 and 7), in which the confederate leader, who was one of the slain, came very near effecting his purpose. But the federal forces, though driven back at nearly every puint, stubbornly resisted, and at the close of the first day. Buell's adrance guard came upon the scene. The next morning, Grant, now reinforced, assumed the offensive; and, after a fight of several hours, the confederates were driven hack to Corinth.
268. While these operations were taking place in Ten- ou the Mis nessee, Commodore Foote, with his gun-l,oats, entered sissippl. the Ml ississippi with a small army under Pope, and captured Island Number Ten on the day of Grant's victory at Shiloh. Two monthe later, Fort Pillow was abandoned by the confederates, and Memphis at once fell into the hands of the union arms. The victory at Shiloh decided the fate of Corinth, an important railroad center, though it was not captured for several weeks afterward on account of the slow advances of General Halleck, who had assumed command of the federal forces at that point. Meanwhile a fleet under Farragut and Porter, with a land force under Butler, had been sent to attack New Orlenns. Farragut ran past the batteries and forts at the entrance of the river, attacked and destroyed the ironclads which met him, and captured New Orleans, which was occupied by the army xuw on under Butler. Farragut, with a part of his theet, then leanstabera. pushed up the river, clearing away all obstacles, passed the batteries at Vicksburg, and met the federal gunboats, under Captain Davis, alove. Thus, the war in the west had been, so far, marked by an almost unInoken series of victories for the federal armies. At the northern houndary of the state of Mississippi, the union adrance stopped for a time, but all was held that had been won. To gain control of the great river, it was necessary to take Vicksburg, with its outpost, Port Hudson, which, betreen them, commanded the entrance to the Red river, and thus kept open the communications of the eastern part of the confederacy with its states of Texas, Louisiana and Arkansas. To capture Vickshurg wonld cut off these states, and greatly cripple the fighting power of the confederate government. The occupation of Chattanooga was also neces:ary to the success of the union arms. It would open the way into Georgia, and prevent the confederates from recovering any of the lost ground in Tennessee.
269. While the south had met with defeat in the west, The Moniit was encouraged by a success in Hampton Roads tor and the The confederates had taken the Merimac, a former Merrimac. frigate of the United States nary, and transformed her
$\qquad$

#### Abstract

^[  ]

into an ironclad ram, with sloping sides and huge iron beak. On March 8, 1862, this strange looking craft entered Hampton hoads and attacked the federal fleet lying there, which consisted of five wooden ships of war. The Merrimac destroyed the Cumberland, and also compelled the frigate Congress to surrender. At night she went back to Norfolk. The next morning she Was seen conning out again to complete the work of destruction. Suddenly the Monitor, a turreted ironclad vessel, advanced to meet her, and after an obstinate engagement of several hours the llerrimac was compelled to retire. These encounters were remarkable as the first engagements between ironclads and wooden vessels and between two ironclads. The result caused a revolution in the navies of the world; the day of wooden war-vessels was seen to be over, and all the great porers began at once the construction of iron and steel vessels.
270 . The military operations in Virginia during the year I862 offered a strong contrast to the course of events in the west. This Ths owing partly, no doubt, to the superior ability of the confederate commanders, as compared with their antugonists, partly because on the union side military affairs were too much intermingled with politics. While General McClellan was organizing a splendid army of 200,000 men near Washington, General Banks was ordered to occupy the Shenandoah valley. He began his advance in February, and having, as he supposed, cleared the valley of the enemy, set out with his own corps proper to join McClellan. As soon as he was gone, Genera! Jackson, popularly known as "Stonewall Jackson," hastened to attack the division of Shields which remained in the valley. After a desperate battle at Kearnstown (March 23), Jackson was compelled to retire. Banks returned to the valley and Shields was sent to join McDowell at Fredericksburg. General Fremont now approached from the west, in order to unite with Banks near Stanton. To grevent this Jackson formed the plan of attacking the Federal forces in detail. He nearly succeeded in getting into the rear of the main body with a much larger army than Banks could muster. By a hurried retreat Banks reached and crossed the Potomac, with the confederate cavalry in close pursuit. Shields hastened back to the valley, but his advance guard was defeated at Port Republic (June 8) by Jackson, who, the same day, had checked Fremont at Cross Keys. Having thas saved the valley to the confederates, and obliged the government at Washington to detain for the defence of the capital a large body of troons which McClellan greatly needed for other duty, Jackson joined the confederate army in front of Richmond.
The A:my
Potomac between Westingtontrated the Arms of the Potomac between Washington and Manassas, as if intending to advance against Richmond by that route. He then withdrew his forces and went by water to Fortress Monroe ill order to advance up the peninsula between the James and York rivers. Here be was held in check for a month by Johnston at Yorktown, and when McClellan was ready to take the place, the confederates retreated toward Richmond. The union forces followed, and both armies concentrated around Richmond. NlcClellan gained the battles of Williamsburg (May 5), and West Point (May 9), and advanced within seven mikes of the city. A panic broke out in the southern capital, and the confederate Congress adjourned in haste. It was just at this time that Stonewall Jackson, by his brilliant and daring exploits in the Shenandoah valley, obliged the federal government to keep in front of Washington a corps under McDowell which was about to co-operate with McClellan by way of Fredericksburg. The movements of McClellan involved the separation of the two wings of bis army by the little river Chickahominy, which by a sudden rise was changed into a wide stream. The confederates under Johnston at once attacked the union left wing at Fair Oaks and Seven Pines. A fierce battle ensued, lasting two days: the result, however, was a union victory. Johnston was wounded, and was succeeded hy

Robert E. Lee, who retained command of the army of Virginia during the rest of the war.
272. The absence of McDowell, who was expected to support McClellan's right, compelled a change in the whole plan of operations. Although Lee had been repulsed in an attack on the Federal lines at Mechanicsville (June 26), he fell upon them again at Gaines Mill the day following, in overwhelming force, and drove them across the Chickahominy with severe loss. Jackson liad now reinforced Lee, and McClellan was cut off from his base of supplies on York river. Unable to reunite his wings and regain his base, the union general decided upon the difficult maneuver of establishing another base on the James river. While effecting this change, the union troops were hard pressed by Lee and Jackson, who, during the period from June 26, to July 1, attacked them at Golding's Farm, Savage's Station, The 'rove White Oak Swamp, Glendale, etc., and finally at Mal- Daysi vern Hill, where the confederates were signally repulsed. This was the last of a series of engagements known as the "Seven Days' Battles," in the course of which HcClellan lost over 15,000 men. Lee suffered almost as much. The union army had now reached the James river, and established itself in a position from which it could not he driven.
273. Lee and Jackson then turned their attention toward Washington, which was defended by an army under General Pone. Pope's forces stretched along the Rappahannock and Rapidan to the Shenandoah valley. General Lanks held a position at the westeruend of the line, and was attacked by Jackson at Cedar Mountain. Lee followed close behind, and the two generals forced Banks back and then attacked Pope. NeClellan received orders from Washington to join Pope, and a portion of his forces came up in time to take part in the second inattle of Bull Run, August 29. Pope's army The secon was put to rout, Washington was threatened and the battle of whole country was wild with excitement. Lee now led Bull Run his rictorious army across the upper Potomac and entered Maryland. McClellan, gathering up the remmants of the two defeated armies, followed and confronted the confederates at Antietam creek. A desperate struggle took place (September 17). It left each Battle of army exhausted, but the victory remained with the union forces. The confederates recrossed the Potomac and retired up the Shenandoab valley. The administration was dissatisfied with McClellan's course, and his command was given to General Burnside. The new commander at once moved toward Richmond, proposing to cross the Rappahannock at Fredericksburg. Here he found Lee posted upon the hills bebind the town. Burnside crossed the river, and, forming his army in three divisions, attempted to storm the heights (December 13). It was a day of terrible slaughter for the federal troops. They were repulsed with the loss Fredericks of twelve thousand men, the army was demoralized and burg. retreated to the north side of the river. Burnside was then superseded by General Hooker. The close of 1862 thus found the opposing armies in nearly the same positions as at the beginning of the war. At the north gloom and discouragement prevailed. At the state elections held in the autunin there was a majority against the administration in several of the northerm states, and the result of the campaigns on the Potomac gave great strength to the peace parts, which believed that the attempt to subjugate the south ought to be abandoned.
27. In June, 1862 the great union force at Corinth was divided, Buell's army marching eastward to seize Chattanooga, while Grant's remained at Corinth till it should be ready to start for Ticksburg. The campaign. was so badly managed by Halleck that the confederates, under Bragg, seized Chattamooga before Buell's arrival. They were thus enabled to press him so vigorously that he had to be largely reinforced from Grant's army. Thus weakened, Grant was unable to advance for several months. During the summer of 1862 the confederates made a great effort to repair the disasters they had suffered on the Tennessee and Mississippi rivers by an invasion of Kentucky. An army,
perstions under Kirby Smith, moved from Knoxville, East Tenn Ken. cky. nessee, while another, under Bragg, marched from Chattanooga. The confederate general, Smith, defeated

General Nelson near Richmond, Kentucky, August 30, and advanced toward the Ohio threatening Cincinnati. General Lew Wallace, however, compelled him to fall back to Frankfort. Bragg in the meantime hastened toward the city of Louisville. Buell, leaving Nashville, by forced marches reached the place one day anead of Bragg. Being reinforced, he slowly pushed the confederates back. Bragg formed a junction with Smith at Frankfort, and four days later a severe but indecisive battle was fought at Perryville (October 8). The confederates then retreated through Cumberland Gap.
275. During Bragg's campaign the confederate army in Mississippi, under General Van Dorn, made an attempt to turn Grant's left wing at Corinth, and thus force him back down the Tennessee river. This wing was commanded by General Rosecrans, who defeated Price at luka, a few miles from Corinth, September 19. On October 4, Van Dorn and Price together attacked Corintb, but were repulsed by Rosecrans with a loss of fire thousand men, and pursued forty miles. Soon after this Rosecrans superseded Buell in command of the army of the Cumberland. Bragg had adranced to Murfreesborough, in central Tennessee. There Rosecrans attacked him (December 31), and a bloody battle was fought, in which 40,000 men were engaged on each side, and each lost more than 10,000 . This engagement is generally known as the oattle of Stone river. It was indecisive. On January 2, 1863, Bragg renewed the attack with great rigor, but this time he was signally defeated and compelled to retire to Chattanooga.
276. While these battles were being fought, Grant had begun his first movement against the strong and important post of Yicksburg, on the Mississippi. His plan was to march from Jackson, Mississippi, while Sherman, with his 40,000 men, and Porter with a fleet of gunboats, descended the river from Memphis. The movements were made according to this arrangenent, but Van Dorn's cavalry succeeded in getting in Grant's rear and cutting off his supplies. This compelled Grant to abandon his march to Jackson. Strerman and Porter attacked the bluffs north of Vicksburg, but were repulsed with heavy loss (December 29). Hearing of Grant's misfortune they returned to Memphis.
277. After Hatteras Inlet to Pamlico Sound had been captured, it was next resolved to attack the confederate position on Roanoke Island, which commands the passage between Pamlico and Albemarle Sounds. A land and naval expedition, under General Burnside and Commodore Goldsborough, took the forts and batteries of the Island (February 8, 1862), captured a confederate flotilla, occupied Newbern, North Carolina (March 14), and reduced Fort Macon, at Beaufort, April 25. Expeditions from Port Royal, under Commodore Dupont, took possession of Darien and Brunswick, Georgia, and of Jacksonville, Fernandina, and Saint Augustine, Florida. April 11, 1862, General Gillmore captured Fort Pulaski, on the Savannah river. Thus the port of Savannab was compleiely closed, although no effort was made for some time to occupy the city.
278. During the morements of the armies in 1862, Congress had not been idle. It was chiefly occupied in measures connected with the prosecution of the war. Its most far-reaching action was in the provision for a uniform national currency. At the beginning of the war the government had borrowed large sums of money to defray expenses, and it continued to borrow, as new demands arose. The result was similar to that which occurred in the Revolutionary war. The promises to pay became less valuable as compared with gold, which was the standard of value throughout the civilized world. The banks in the several states could no longer obtain gold without paying a high price for it; and at the end of 1861 thes suspended specie payments. In order to nrovide a currency for the people, a bill
was passed by Congress, early in 1862, authorizing the issue of notes by the United States treasury. These notes received the popular name of "greenbacks," from the color of the paper on which they were printed; and to insure their success they were declared by Congress to be "legal tender" (February 25, 1862). Early in 1863 Congress passed an act establishing national banks. Heretofore the states had incorporated all banks, and the bills of each bank were seldom current except in its own neighborhood. By the national banking system, the banks were to be organized, and United States bonds deposited at Washington. The banks were then permitted to issue notes up to ninety per cent. of the value of the bonds deposited, and the notes, being thus secured, became current in every part of the country. The uational banks are still in operation. A homestead bill was passed, which assigned public lands to actual settlers at reduced rates. Congress also prohibited slavery in the District of Columbia; slaves of insurgents were ordered to be confiscated; and the army was forbidden to surrender fugitive slaves to their masters. It provided for the construction of a Pacific railroad and telegraph, and began a further development of the system of granting public lands to railway corporations.
279. Since the south had brought on the war in defence Emancipa of slavery, the abolition sentiment had spread very rapidly in the north, and it had now become supiported by the military needs of the hour. At the beginning of the conflict the union leaders and people generally bad not farored any interference with slavery, but circumstances had proved their position to be untenable. President Lincoln, who watched anxiously every movement, was convinced that the time had come when the federal government could no longer attempt to carry on the war successfully and spare the system of slavery, which was perceived by every discerning man to lue at the foundation of the confederacy. He therefore announced (September, 1862) that unless the revolting states should return to their allegiance by January 1, 1863 , he should declare the slaves in these states to be free. It was a formal notice given out of respect to law; no one serionsly expected that it would be regarded by the confederate states. Aud it was not. They only grew more firm in consequence of the action taken. On the first day of January, 1863, in accordance with his notice, the president issued his celebrated Proclama- Proclamation of Emancipation. This act caused much discussion. Mr. Lincoln could not, legally, issue such a declaration, for the constitution gave him no authority to abolish slavers. But he acted on the principle of military necessity, advocated by John Quincy Adams in his speech of April 14, 1842, in which he said: "Whether the war he civil, servile or foreign, I lay this down as the law of nations: I say that the military authority takes for the time the place of all municipal institutions, slavery among the rest. Under that state of things, so far from its being true that the states where slayery exists have the exclusive management of the subject, not only the president of the United States but the commander of the aray, has power to order the universal emancipation of slaves." However the case may be, the president's course was dictated by clear common sense and wise statesmanship. The events of the preceding summer had shown that the war was far from being at an end. The cutting off of the cotton supply had been a general calamity, and the distress produced in consequence created a fear lest England and France should unite in an attempt to put au end to the contest. But the proclamation changed all this. By it the struggle was converted into a crusade against slavery and in this light foreign intervention was now simply impossible, owing to Great Britain's attitude toward slavery. Moreover, should the federal government be successful, the question of slarery would practically be settled forever, for its abolition would be certain when the union was re-established. One of the first results of the act was the formation of regiments of negro sol- Negro diers. An attack made by one of these regiments, Soldiers. under Colonel Shaw, upon Fort Wagner, in Charleston
harbor, though unsuccessful, showed so much bravery that the prejudice against negro soldiers disappeared, and great numbers were enrolled.

## Third year

 of the war
## Battle of

 Chancelsorsville
## Yavasion of

tice. lee now repeated the maneuver he had practiced after defeating General Pope. Turning Hooker's right flank, he pushed on through the western part of Maryland into Pennsylvania, so as to threaten Philadelphia, Baltimore, and Washington. There was intense alarm at the north, and reinforcements were hurried into Pennsylvania from all quarters. In con sequence of a disagreement with General Halleck, Hooker resigned the command of the Alms of the Potomac, and it was given to General George G. Meade. The two hostile armies, each 100,000 strong, were now moving in parallel lines, with the Elue Kidge and South Mountain range between them. On the 1st of July they came into collision at Gettysburg. A tre--mendous battle was fought, lasting until the close of July 3. It resulted in the defeat of Lee, with a loss of nearly 40,000 men; Meade's loss was 24,000 . This lattle was one of the greatest of modern times, the loss on both sides being more than one-third of the whole number engaged. It was also the turning point of the civil war. The south was never able to collect so fine an army again, and never recovered from the exhaustion of the Gettysburg campaign. Lee moved slowly back to his old position on the Kapidan, where he and Meade held each other in check until the following spring. Many in the north were inclined to believe that Lee's former successes had been due to Stonewall Jackson's ability, and that he had lost his prestige upon the death of that brave commander. But the campaign of 1864 was to prove the contrary.
The 2S2. On the next day after the battle of Gettyslourg,
Vicksburg General Grant gained a decisive victory on the Missis-
campaign. sippi. Having failed in several attempts to take Vicksburg from the north, he now determined to transfer his army to the south side of this strongly fortified place. To do this it was necessary to cross the river, march down its west bank, cross again below Vicksburg, and march up the east bank, while the fleet, which had run past the batteries of Vicksburg after. the capture of New Orleans, would have to pass them again in order to transport the army over the river and protect the crossing. This plan was carried out in April. Commodore Porter performed his task successfully under a heavy fire, and on the 29 th of April opened a cannonade upon Grand Gulf, at the mouth of the Big Black river, where it had been determined to attempt a crossing. The confederate batteries here proving too strong, the fleet ran past them, also, and the crossing was made at Bruinsburg, a few miles below. Grant now pushed rapidly forward. The confederates were beaten at Port Gibson, and compelled to evacuate Grand Gulf. MePherson and Sherman captured Jackson, the capital of Mississippi, and a place of great military importance on account of its railmay connections. The union army thon turned, fell upon
the confederate general, Pemberton, who had marched out of Vicksburg to unite with Johnston, defeated hin at Champion Hills (May 16), and at the crossing of the Champio Black river (May 17), and at last shut him up in Vicks- Hillsack Ri burg. After a siege of forty-five days Pemberton surrendered, and the great confederate stronghold of the west, with 27,000 prisoners, fell into the hands of the victorious federals. Port Hudson, under siege at the sanue time, could no longer hold out, and the Mississippi, as President Lincoln said, "ran unvexed to the sea." This was the heaviest blow that the confederacs lind as yet received; its whole western zone was now virtually conquered, and it became possible to concentrate greatel union forces against its middle and eastern zones. The news of Gettysburg and Vicksburg made the Fourtl of July, 1863, a day of rejoicing in the north, and of mourning in thousands of bereaved homes.
283. The Vicksburg campaign marked the decline of the confederate fortunes in the west, as the Gettysburg campaign did in the east. In the meantime the people had learmed to give a more careful attention to the welfare of the soldiers who were bearing the brunt of the conflict. The Sanitary Commission, the Christian The SaniCommission, and other voluntary associations, had been thry and organized, and were doing a grand work for the moral Commisand physical needs of the men in the field; and this sions.
care was not confined solely to northern tronss, but was often extended to the confederates as well. The expenses of the National government for prosecuting the war now amounted to $\$ 2,000,000$ per day on an Goveraaverage, and notwithstanding the heavy taxation mentex imposed upon the country, the debt had increased to $\$ 500,000,000$ bs June, $186^{2}$; during 1863 it was double that amount; by June, 1864, it bad grown to $\$ 1,700,000,-$ 000 ; and at the end of August, 1865, it attained its maximum, ${ }^{2} 2,845,007,626$. But the best of care and judgment was exercised in the use of these vast expenditures. The army was constantly supplied with improved weapons and munitions of war; the blockading fleets were kept in perfect order, and everything was done to insure the success of the union arms.
284. As early as April, 1862, the confederate Con-Cougress had passed a monscription act, enrolling in the army all adult white males below a certain age, but, as the war went on, the demand for men became continually greater and the conscription was made more sweeping. Toward the end of the war every white man between the ages o: seventeen and filty-five was held liable to military service, and in practice the only limit was physical incapacity. The federal government also was compelied to take almost a similar course. In March, 1863 , Congress passed an act for the enrollment of all able-bodied male citizens between the ages of eighteen and forty-five, and the president was authorized to make drafts for military service, those between twenty and thirly-fire to be first called upon. Under this law a call for 300,000 troops was made in May. As the full number was not made up by volunteering, a draft was ordered to supply the deficiency. The first attempts to carry it out resulted in forcible resistance in many places, the most notable being the "diaft riots" in New. York city in July, just Draft rio after the battle of Gettysburg. These riots lasted four days in that city. During this time New York was in the hands of a lawless mob, many shocking murders were committed and $\$ 2,000,000$ worth of property was destroyed. All opposition was at length put down, but exemptions and substitute purchases were freely permitted, and the states endeavored to fill their respective quotas as far as possible by offering bounties as a stimulus to volunteering.

2s5. After bis renowned victory near. Murfreesborough, chats Rosecrans remained quiet for a period, preparing for a nooga new campaign. Late in June he began a series of skillful movements against Bragg which compelled the confederate general to fall back upon Chattanooga. Early in September, Rosecrans forced bim to evacuate the place by threatening his communications. The*
union general followed him across the Tennessee river and was thus beyond the strong position of Chattanooga．General Bragg，having been beavily reinforced from Virginia，turned at Chickanrauga creek to give battle．A severe engagement was fought （September $17-20,1863$ ）in which Longstreet routed the right of the union forces，but the wonderful skill and bravery of General Thonas，who commanded the left wing，saved the federal army and secured its retreat to Chattanooga．Bragg having gained possession of the mountains around the place cut off almost all avenues of further retreat and laid siege to Chattanooga．The government at Washington had committed the mistake of dividing the union forces，for while Rosecrans was left to face an army greatly superior in numbers，under General Bracg，General Burnside was sent into east Tennessee with an independent command．Bragg was now so sure of Rosecrans＇defeat that be dispatched Longstreet with a part of his army to attack Burnside at Knoxville．In October．Risecrans was superseded by Thomas，and Grant was put in command of all the western armies．He was joined at Chattanooga by two corps under Hooker from the l＇otomac．General Sherman came up from Vickshurg with a greater part of the army of the Tennessere．Bragg＇s positions on Lookout Mountain and Missionary Fidge were now assaulted．The former was successfully stormed by Hooker（November 24），part of the fighting taking place amidst a thick mist which covered the summit， hence this has been called the＂battle above the clouds．＂On the next day Missionary Ridge was car－ ried by the main army，llooker on the right，Thomas in the center and sherman on the left．Bragg was driven from all his positions back to Dalton and was soon afterward superseded by General I．E．Johnston． Longstreet raised the siege of Knoxville and retreated across the mountains into Virginia to join Lee．
－286．Many attempts had been made to reduce Charles－ ton，South Carolina，the strongest，as well as the most important of the southern seaports，but without suc－ cess．At length Fort Wagner was taken（September 7 ） after a tremendous bombardment by the federal fleet and Gillmore＇s batteries：Fort Sumter，also，was reduced to ruins．The blockading vessels were thus enabled tu enter the harbor，and the port of Charleston was entirely closed．Taking adrantage of every loophole in the British foreign enliatment act，the confederate authorities had succeeded in fitting nut several formida－
He cruisers，which，in the course of the year 1863 ，did immense damage to American commerce．Whenerer they were closely pursued by［＇nited states vessels they took refuge in meutral ports，and then put out to sea again upon the first favorable opportunity．The most active ones were the Floridn，the Alabama and the Georgia．The Florida，built at Liverpool，after having captured twenty－one ressels，was seized in the harbor of Bahia，Brazil（Octoler，186t）．The Geurgia，built at Glasgow，put to sea in April，but was captured after a short cruise by the United States frigate Niagara． The most important of the confederate cruisers was the Alabamu．She was built at Liverpool for the con－ federate captain，Semmes．The British government was urged by the American minister，Mr．Adams，to enforce its own laws，and prevent ber going to sea；yet she was allowed to set sail in July．After destroying more than sixty vessels，she was met by the United States steamer Kearsarge，commanded by Captain Win－ slow，off Cherbourg（J une 19，1864），and after an hour＇s action the Alabama was sunk．

287．At the beginning of 1864 ，several detached opera－ tions were carried on which，though attracting much attention at the time，had but little direct bearing upon the closing campaigns of the war．General Sherman made his raid nearly across the state of 11 ississippi，destroy－ ing railroads，bridges and supplies．General Seymour， leading a union expedition into Florida，was defeated． General Banks was sent up the Red river to attack Shreveport，and bring away cotton．The expedition ended in failure and disaster．General Rosecrans ras appointed to command in Missouri．He succeeded in
repelling an invasion by Price，who was fonally driven from the state．General Forrest，with a confederate force made a raid into Tennessee and Kentucky，and captured Fort Pillow（April 12），where a number of negro troops were massacred．

288．The success of Grant in the west had made him Grant the chief figure in the war．In March，186t，he super－in the east seded Halleck as commander－in－chief，with the rank of lieutenant－general．He at once took personal direction of the campaign against Richmond，while retaining Meade in immediate command．The army of the Potomac was re－organized in three corps，under Han－ cock．Warren and Sedgwick，to which was soon added another under Burnside，while General Philip Sheridan wascalled from the west，and appointed to the com－ mand of all the cavalry in the eastern army．Lee＇s forces，which comprised the flower of the southern troons，had likewise been divided into three corps， under Generals A．P．Hill，Ewell and Longstreet． Sherman had been left in command of the three western Sherman． armies of the Ohio，the Cumberland，and the Tennes－ see，and he was to oppose Johnston at Dalton．Accord－ ing to arrangement，a simultaneous advance was made in Georgia and Virginia，early in Nay．The army of the Potomac，numbering about 125,000 men（nearly twice as many as Lee＇s），crossed the Rapidan and entered the＂Wilderness＂on the other side．It was Grant＇s olject to push through this difficult country as rapidty as possible and get between Lee＇s army and Richnond．In pursuing the direct route through Fredericksburg to Richmond，the union army encoun－ tered a series of strong defensive positions，of which Lee arailed himself with consummate skill．The battles began on the 5 th，and continued until the I2th without interruption，both sides fighting with the utmost bravery and suffering severely．Lee was steadily forced back，and on the 9 gh Grant was clear of the Wilderness with his forces concentrated near Spott－ sylvania courthouse．Here there was furious and ob－ stinate fighting for ten days．With scarcely any inter－ mission．Then followed the battles of North Anna and Cold Harbor in which the union losses were ter－ rible．Haring now reached the Chickahominy，and finding it impossible to break throngh lee＇s lines of defence，Grant crossed the river and moving far to the right of his adversary，transferred his army beyond the James to assail Kichmond from the south．This involved the reduction of the strongly－fortified town of Petershurg，on the Appomattox，practically a part of Petersbure the defences of Richmond，from which it was twenty miles distant．It also brought the Federal lines into dangerous proximity to Lee＇s railroad communications with the south．At this point，therefore，the confeder－ ate commander stationed the best part of bis troops， and stubbornly resisted all Grant＇s efforts to extend his lines further to the soutbwest or to reach the rail－ rords．
289．A long siege of Richmond and Petersburg was now begun early in June，but neither army remained in－ active．In July，Lee sent Early into the Shenandoah ralley with a corps strong enough to menace Washing－ ton，hoping that Grant might be induced to call off troops from Petershurg．The chief result of Early＇s morement was the burning of Chambersburg，and the capture of a quantity of supplies．Grant put Sheridan in command of the valley，who defeated Gen．Early at Winchester（September 19），and at Fisher＇s Hill two days later，after which he destroyed all the rich crops in the valley and carried off the cattle，so that the con－ federates might not be tempted to reneat the raid．But Early，having obtained fresh troops，suddenly fell upon the federals at Cedar Creek（October 19），driving them Cedar back in great confusion．Sheridan was absent when creek． the battle सas fought，lut，getting intelligence of it，he rode rapidly up the ralley，rallied his men，who were， however，heing enheartened by their respective com－ manders，and scattered Early＇s forces，which never met Sheridan again as a compact army during the remainder of the war．
Mequwhile，Grant bad succeeded in getting possession
of a few miles of the Weldon railroad, upon which Lee depended for transportation, but the confederate general brought his supplies in wagons round that portion held by the federals. The two armies now remained in comparatively the same position until the following spring.
290. The western campaigu in I864 began at the same time as Grant's movement in Virginia. Sherman advanced from Chattanooga with 100,000 men under Thomas, McPherson, and Schofield, against Johnston's force of 75,000 . The objective point of the campaign was the capture of Atlanta, Georgia, a very strongly fortified place about one hundred miles south of Chattanooga, and the chief manufactory of the confederate military aupplies. Johnston, with his weaker force, dared not risk a regular battle, but he made the best use of the various defensive positions which the rough and mountainous country afforded. By a series of masterly Aank movements Sherman compelled him to evacuate one position after another. Severe battles were fought at Resaca (May 15), Dallas (May 25), Lost Mountain (June 14), and Kenesaw Mountain (June 27). By the 10th of July, Johnston was intrenched behind the defences of Atlanta, and the two armies were facing each other with the Chattahoochee river between them. Johnston's retreat had been conducted with great skill, but he was now superseded by Hood (July 17), who ras
Qperations known as a "fighting general." Hood at once proceeded to carry out the active policy of the confederate government, and assumed the offensive. Before the end of the month he had made three furious assaults on the union lines and was repulsed in every one of them. The federals, however, sustained a heavy loss in the death of General McPherson. At length, by fine manenvering, Sherman succeeded in gaining the rear of Atlanta, and cutting the supply railroads. This obliged the confederates to retreat in all haste, and on the $2 d$ of September, Sherman was able to telegraph to Washington that Atlanta was won.
Hood in
Tennessee
291. Hood, by the direct command of Davis, now made a fatal mistake, which materially hastened the downfall of the confederacy. He moved northwestward by Tuscumbia and Florence into middle Tennessee, thinking that Sherman would follow him in order to defend that state. But Sherman was no more to be controlled by this device than Grant had been by Early's raid into the Shenandoah. He divided his army, sending back part of it under Thomas to take care of Hood, while he himself prepared to continue his advance through Georgia. Hood, moving northward toward Nashville, was met and defeated at Franklin (November 30), with heavy loss, by Schofield. The confederate General arrived at Nashville with about 44,000 men. The union forces awaited him there behind the fortifications. Thomas, having completed his preparations,
Nashville. saddenly moved out of his works and fell upon the confederate lines (December 15). The battle lasted two days and ended in the utter route and demoralization of Hood's forces. Thus one of the two great armies of the confederacy was scattered, never again to be united. Of all the battles fought in the course of the war, this was the most complete victory.
292. While these things were going on, the presidential election of 1864 took place. Some of the more radical men, dissatisfied with what they called Mr. Lincoln's timid and irresolute policy, met in convention (May 31) at Cleveland, Ohio, and nominated John C. Fremont for the presidency. Mr. Lincoln and Andrew Johnson were nominated (June 7) for president and vice-president by the Republican National Conrention at Baltimore. The Democratic National Convention declared in its platform that the inability of the federal government to restore the uniou by war was demonstrated by four Jears of failure; that the constitution had been violated in all its parts under the plea of military necessity; and that a cessation of hostilities ought to be obtained. It nominated George B. McClellan and George H. Pendleton as president and vice-president. This declaration of the peace Democracy that the war was a failure, when all things were now pointing toward the final success
of the north, caused many doubtful votes to be cast for the Republican candidates, and assured their election. When the electoral votes were counted, Lincoln and Johnson had received 212, McClellan and Pendleton 21.
293. Sherman had burned Atlanta, destroyed the Sherme railroads and telegraphs in his rear, sent back the sick march and wounded, and much of the baggage, and set out (November 14) on his "famous march through Georgia." His army, 65,000 strong, was spread out over a breadth of forty miles, subsisting mainly on the produce of the country. For a month scarcely anything was heard of him at the north, when he suddenly turned up at Savannah, Ga. lle had met with but little opposition on his route. The confederates had numerous bodies of troops which might have been concentrated to oppose his march, but he had threatened so many points and kept the enemy in so much doubt as to his objects that they could not tell for which point he was making. On December 13 Fort Mcallister was taken by assault, and on the 20th Savannah Savana was evacuated by the confederates, Sherman sending the news of the capture to President Lincoln as a "Christmas gift." He also sent word that the confederacy was nothing but a shell, and that he was ready with his victorious army to mareh northward.
294. The only important ports, except Galreston, Mobile which remained open to the confederacy in the summer. Wilmin of I864, were Mobile, in Alabama, and Wilnington, in North Carolina. The forts commanding the entrance to Mobile Bay were captured (August 5) and the port was closed. On January 16, 1865, Wilmington, North Carolina, was taken by a combined land and naval force, under General Terry and Commodore Porter. On the day before this event, Sherman had begun his northward march, passing through Columbia, to Fayetteville, North Carolina. This movement had forced the eracuation of Charleston and other coast cities, and their garrisons had been concentrated under Johnston as a last hope. The military support of the confederacy now rested on the army which Lee commanded within the intrenchments of Kichmond and Petersburg, and on the remnant of the western forces with which Johnston was trying to check Sherman's advance. Some sharp fighting took place north of Fayetteville, but Goldsborough was reached 11 arch 21, and Johnston retreated to Raleigh. Sherman pushed on after him, but events in Virginia were fast rendering a contest in North Carolina unnecessary. While the union army occupied Goldsborough, Sherman took a steamer on the coast and hurriedly visited the James river, where he met the president, General Grant and General Meade, and iarranged with them the plan of operations for the future. During Sherman's march through North Carolina, Sheridan had led a column of cavalry up the Shenandoah valley to destroy Lee's communications in the rear of Richmond. He passed along the James jiver, doing great damage to the canal and railroads, and joined the main arms in front of Petersburg just as Sherman arrived there for his conference with the president and Grant.
295. The situation of Lee was now becoming des- Fall of perate. He determined to abandon Petersburg and confedRichmond, move by way of Danville, and effect a junction with Johnston. With this purpose he made one desperate attempt to break the center of the union lines at Fort Steadman, intending under cover of the aitack to withdraw his force. The effort failed, and Lee was repulsed with heavy loss. Grant resumed his attempts to push his lines further round to the south of Petersburg. Sheridan was put in command of the extreme left. Here he attacked Lee's right at Five Five fr Forks (April 1), destroyed the Southside railroad, and maintained his position. To aroid being outflanked, Lee was compelled to lengthen out his line, already too thin. The next morning (April 2), Grant made a general assault, and carried his army within the lines of the Petersburg defences. Lee retreated, with the intention of bringing his forces and Johnston's together for a final stand while the advance guard of the union army
achmondentered Richmond. The confederate authorities hastened to escape to Danville, having first set fire to the shipping, tobaceo warehouses, etc., at Richmond. No time was lost in celebrations of the victory. Grant pressed on in the pursuit of Lee with all vigor. He had so disposed the federal army that the escape of the confederates was almost impossible. The confederate forces were headed off at Appomattox Court House, where Lee surrendered (April 9, 1865). The terms of surrender offered by Grant were very generous: all private property belonging to officers and soldiers was to be retained, the men were even allowed to keep their horses, " because," Grant said, "they would need them for the work on their farms." Officers and men were at once set free on parole, with the understanding that so long as they did not violate their parole, nor break the laws, they would not be disturbed by the federal government.
296. Sherman had begnn his final operations against Johnston when the news arrived of the surrender of Lee. Johnston thereupon capitulated (April 26), on much the same terms that had been accorded to the confederate army in Virginia, after an unsuccessful effort at a more favorable settlement. All the other confederate forces in the field also surrendered, and the great civil war came to an end. The news was receired with an outburst of joy at the north. Mr. Lincoln had begun his second term on March 4, 1865. At that time the end of the struggle was plainly near, and the president in his inaugural address had already expressed the hope that there would be a reconciliation between the two sections. He said: "With malice toward none, with charity for all, with firmness in the right as God gives us to see the right, let us strive to finish the work we are in, to bind up the nation's wounds, to care for him who shall have borne the hattle, and for his widow and for his orphans; to do all which may achieve and cherish a just and a lasting peace among ourselves and with all nations."
297. The public rejoicings over the capture of Richmond were clouded by the death of the wise and noble Lincoln. He had gone to Ford's theater on the evening of April 14, and was sitting in his box, when an actor named J. Wilkes Booth entered unperceived and shot the president through the head, crying: "The south is avenged. Sic semper tyrannis." Almost at the same time one of Booth's accomplices named Payne attempted to assassinate Secretary Seward, who was ill at home, and wounded him seriously bnt not fatally. There had been a plot on the part of some desperate characters when the confederacy fell, to destroy the leaders of the federal government, but their plans were accomplished in part only. The chief parties implicated perished miserably. Booth and Pajne escaped for a time, but were soon caught. Booth was killed while resisting arrest. Payne and three others were hanged, and several persons concerned in the plot were sentenced to imprisonment. The president lingered a few hours, and died without giving any sign of consciousness. His death caused the deepest sorrow, not only in the north, but in the sonth as well, and throughout all the civilized world. He had won the abiding love and trust of the people, and his name will forever be linked with that of Washington; for he was in many ways the second founder of his country.
298. Jefferson Davis, while trying to escape, was captured by a detachinent of General J. H. Wilson's cavalry at Irwinsville, Georgia, and was sent to Fortress Monroe. Here he was confined a close prisoner for a long time on charge of treason. He was at last liberated on bail furnished by Horace Greeley and others, and all proceedings against him were finally abandoned. In fact, the glorious triumph of the government of the United States was in no wise sullied by any dismal executions for treason. The assassination of Lincoln checked for a time the moyement, which had already begun, for the restoration of the seceding states. People who had been ready in their joy to make peace with those who had been leaders in the con-
federacy were now ready to believe that the spirit, which had brought on the war was unchanged. There was a demand that the laws against treason, passed by Congress during the heat of the war, in 1862 , should be rigidly enforced. These laws prescribed that the punishment of treason and rebellion should be denth, or fine and imprisonment. But a wiser judgment prevailed. There was no hanging for treason. The leaders of the confederacy were never brought to trial. The president of the confederate states was suffered to go free; and the vice-president, before his death, became an efficient and respected member in the Congress of the United States. For a long time, however, all persons who had previously taken oath of allegiance to the federal government, and then had broken it by joining the confederacy, were debarred from holding any office under the government of the United States.
299. At the close of the war the federal armies num- Number of bered about $1,000,000$ men, of whom nearly 600,000 men in the were present in the field. The number of confederate ${ }^{\text {armies. }}$ soldiers surrendered and paroled was 174,000 , besides whom there were 63,000 prisoners in the hands of the federals. The whole number of men supplied on the noion side during the war was 2,778.304. Of these 110,070 were killed, 199,720 died of disense while in the service; many thousands more died by accident, or while in prison. The armies of the confederacy are supposed to have reached their strongest point at the beginning of 1863 , when they numbered about 700 ,000. There was great dissatisfaction among the southern people at the manner in which Jefferson Davis conducted the war; and the arbitrary attempts of the confederate government to force men into the ranks, aroused, at last, a spirit of opposition. During the latter part of the war desertions had become very frequent ; and this fact, taken in connection with the losses in battle, and from disease, caused a great reduction in the nnmerical force so that at the end of the struggle, it is doubtful whether the confederate armies contained more than 200,000 men. As soon as possible after organized resistance had ceased, the Federal armies began to be disbanded. The men were discharged at the rate of about 300,000 a month, 50,000 being retained in service as a standing army.
300. The expenses of the Federal government amounted at one time to three and a half million dollars a day. By August 31, 1865, the whole debt had reached its maximum, amounting to about $\$ 2,845,907,626$. Some $\$ 800,000,000$ of revenue had also been spent mainly on the war. Beside the regular outlay by the government enormous sums were spent by states, cities, counties and towns, in bounties to volunteers, and by the sanitary commissions and other societies for the comfort of sick and wounded soldiers, and for the whole army in general. The expenses of the Confederate government can never be known. Its debt was estimated at about $\$ 2,000,000,000$, but this was wiped out hy the failnre of the confederacy, all its bonds and notes becoming worthless. The amount of property destroyed by the union and confederate armies can scarcely be estimated, and the money value (\$2,000,000,000 ), of the slaves in the south fell a sacrifice to the war. In the United States funds were raised by the sale of bonds, the issue of paper money, of "greenbacks," and the imposition of heavy taxes, including for some jears a tax on incomes. The notes became greatly depreciated, so that in July, 1864, the price of gold in paper currency was nearly three dollars. Gold and silver almost disappeared from circulation.
301. The finances of the confederacy were in a ruin- Confedous condition long before the end of the war. It could erate make no drafts on the futare, by bond issues, and it finances. was a rery difficult matter to find purchasers for southern bonds. As expenses incrensed, they had to be met by paper issues, and each issue was accompanied by a corresponding decline in value, until a dollar in coin was worth fifty dollars in paper. Large sums were
required to buy eren the most necessary articles. Boots were worth two hundred dollars; shoes, one hundred and twenty-five dollars; coats, three hundred and fifty dollars; pantaloons, more than one hundred dollars; flour, two hundred and seventy dollars per barrel; potatoes. twenty to twenty-five dollars per bushel; Jacon, ten dollars per pound ; meal. sixty-five to seventy-five dollars per busbel; butter, sixteen dollars per pound. Other things were proportionately liigh in price ; lusuries of all kinds had disappeared, and almost the entire population was reduced to extreme porerts.

## FIII.-THE RESTORATION OF THE UNION.

302. At the beginning of the war the greater part of the northern people was opposed to ans interference with slavery, and the federal government announced its determination not to meddle with the question. But the progress of the war compelled it to a different course. Hence, first came the Proclamation of Emancipation ; then in February, 1865 , Congress proposed the Thirteenth Amendment to the constitution, abolishing slavery in the United States forever, and it was ratified by twenty-seven states and adopted. Those most prominent in putting down the confederacy desired that the Union should be restored as quickly as possible to its former state, with the exception of slavery. It was to be many years, lowever, before the warring seetions of the union could be transformed into a harmonious nation. The war had devastated the country in which it had been engaged. The people on each side had suffered in the loss of friends, hoime and property, and could not at once be reconciled. The great change which had taken place in the aloolition of slavery reached to the vers foundations of southern society and industry. wresident. 30h. Upon the death of Mr. Lincoln, Vice-President Johnson succeeded to the oftice of president, and to the difticult task of the reconstruction of the rebellions states. He had been selected by the Republican party as representing the union men of the south. He was not, however, in full sympathy with the Republicans, and it soon became evident that there was a breach between the president and Congress, which constantly widened. The first business engaging the attention of the government after the restoration of peace was the establishment of regular governments in the southern states. The president issued various proclamations, in which he declared all southern ports open to commerce except four in Texas, and yranted amuesty and pardon to all persons engaged in the rebellion, except fourteen specitic classes of leaders, who were to make special applications for pardon. About the manner of restoring the state governments, however, a serious quarrel arose between the president and Congress. The constitution made no irnvision for the readmission of a state which had witldrawn from the union, and Mr. Johnson, as a former state-rights Democrat, held that the southern states had never been out of the union; that the leaders were solely responsille; that as soon as the seceded states applied for readmission under such a form of government as the constitution required, the federal government was bound to admit then without imposing conditions upon suljects over which the constitution had not expressly given Congress jurisdiction. The Republican leaders held that the action of the seceded states had deprived them of their rights as members of the union; that in the relation they now occupied they were in the category of territories seeking admission to the union, in which case Congress could admit or reject them at will. The particular question which brought on the controversy was the civil gtatus of the negro. The Republicans held that slavers had been the cause of the war; that it was now abolished; and that only yy giving the freedman the right to vote could he be protected, and the results of the war secured. They also claimed that no state should be

Cougress.
admitted until it had granted the right of suffrage to the negroes within its borders. Johnson held this to be a matter of internal regulation beyond the control of Congress.
304. When Johnson succeeded to the presidency in A pril, 1865, he had a clear field before him, for Congress was not to meet until December. From May 9 to July 13, he appointed provisional governors for seven states, whose duties were to reorganize the governments. The state goveruments were organized, but passed such stringent laws in reference to the negroes that the Republicans declared it was a worse form of slavery than the old. When Congress met in Decembex, 1865, it was very largely Republican and firmly determined to protect the negro against outrage and oppression. The first breach leetween the president and the party in power was the veto of the first Freedmen's Eureau bill in February, 1866, which was designed for the welfare of the colored people. President Johnson objected that it had been passed by a Congress in which the southern states had no representatives. The bill failed to pass by a two-thirds vote. Congress then passed a civil right's bill in March, 1866, by which freedmen were made citizens of the United States, and United States officers were instructed to protect these rights in the courts. The president vetoed this hill also, the oljection being that it interfered with the rights of the states. This bill was passed over the reto. To make the bill stronger, Congress proposed the Fourteenth amendment to the constitution (June 16), The Fou and submitted it to the states, the necessary majority teenth of which ratified it. Both bouses then passed a joint ment. resolution that no delegation from any of the states lately in rebellion should be received by either the senate or the house until both mnited in declaring said state a member of the union.
305 . The president disapproved of these measures, and there was now open hostility between the executive and Congress. In February, 1867, a bill was passed admitting Nelraska as a state, with the provision that it should never enact any lan denying the right of suffrage to any person because of his color or race. This was vetoed, and passed over the veto. On March 2,1867 , the "bill to provide efficient governments for the insurrectionary states," which embodied the congressional plan of reconstruction, was passed over the president's veto. This bill divided the southern states into military districts, each under a brigadier-general, who was to preserve order and exercise all the functions of government until the citizens had formed a state government, ratified the amendments, and been admitied to the union. On the same day the Tenure Tenure of Office bill was passed over the veto. This provided Office bi that civil officers should remain in office until the confirmation of their successors; that the members of the cabinet should be removed only with the consent of the senate; that, while Congress was not in session the president might suspend (not remove) any official; and in case the senate at the next session should not ratify the suspension, the suspended official should resume his office.
306. On August 5, 1867, the president had requested Impeacl Edwin M. Stanton to resign his office as secretary of mecut of war. Mr. Stanton refused, was suspended, and General Grant was appointed to his place. When Congress met, the senate refused to agree to Stanton's remoral. General Grant then resigned the office, and Stanton again taok possession. The president removed him a second time, and appointed General Lorenzo Thomas to the place. Stanton held to his office, and sent notice to the speaker of the house ; thereupon the house passed a resolution (February 24, 1868), for the impeachment of the president. The articles of impeachment accused him of disobeying the tenure of office law, and of various other offences. The trial took place according to the constitution, members of the house appearing as accusers, and the senate acting as judges, with Chief Justice Chase, of the supreme court, in the chair. After the trial began the president made a tour of the north
and west, and delivered many violent and passionate speeches to the crowds which assembled to meet him, and denounced the Congress then sitting as "no Congress," because of its refusal to admit delegations from the southern states. On these speeches the house based additional articles of impeachment. The exciting trial lasted two montlis, and ended in May with a vote of thirty-five for conviction, and nineteen for acquittal. Thus there was not a two-thirds majority for conviction. The senate adjourned sine die, and a verdict of acquittal was entered.
307. The Russian possessions in North America, comprising a large and thinly populated territory at the northwest corner of the continent, were purchased of the Russian government by the United States in 1867 for the sum of $\$ 7,200,000$. This territory is known as Alaska. Nevada, the thirty-sixth state, was admitted during Mr. Lincoln's administration (1864); Nebraska, the thirty-seventh, was admitted in 1867. In 1868 General Grant was elected president, as the candidate of the Republican party, thus sealing the process of the reconstruction; schusler Colfax became vice-president. The Democratic candidates were Horatio Seymour, of New York, and Frank P. Blair, of Missouri. Virginia, Mississippi and Texas were the only states of the late confederacy which were excluded from this election; all the rest had been reconstructed and admitted by Congress in June, 1868. The Republican candidates carried twenty-six of the thirty-four voting states. In his inaugural address, General Grant declared that the government bonds ought to be paid in gold, advocated a speedy return to specie payments, and made many important recommendations in reference to public affairs. Regarding the good faith of the nation, he said: "To protect the national honor, every dollar of the government's indebtedness should be paid in gold, unless otherwise expressly stipulated in the contract." Congress acted promptly upon his recommendation, and on March 18, 1869, an act was passed, entitled "An Act to strengthen the public credit." Its language gave a pledge to the world that the debte of the conntry would be paid in coin, unless there were in the obligations express stipulations to the contrary.
308. On February 26, 1869, the Fifteenth Amendment to the constitution was proposed by Congress. Its adoption had been previously recommended by Grant. It guaranteed the right of suffrage withont regard to race, color, or previons condition of servitude. It was ratified by the requisite three-fourths of the states, and declared in force Marcl 30,1870 . In the meantime the foreign affairs of the country bad been favorably established. Its promptness in disarming at the end of the war had put it under no disadyantage in dealing with other nations. The successful completion of the Atlantic cable (1866) gave a promptness and dispatch to diplomacy which was well suited to American methods. The most important measure of foreign policy during President Grant's administration was the treaty with Great Britain (Mlay 8, 18i1), known as the Treaty of Washington. Soon after entering upon his office, the president had begun negotiations, looking to a settlement of the claims made by the United States against Great Britain,arising from the depredations upon A merican commerce by confederate cruisers fitted out in British ports, the questions growing out of the Canadian fishery disputes, the location of our northern houndary line at its junction with the Pacific ocean, and the settlement of the jurisdiction of the island of San Juan.
309. A high joint commission had assembled at Washington, composed of American and English statesmen, which formulated the Treaty of Washington, and by its terms the claims against Great Britain, commonly known as the "Alahama claims," were referred to a court of arhitration, which held its session at Geneva. Switzerland. $1 \mathrm{n} \cdot$ September, 1872 , it a marded the Uuited States the sum of $\$ 15,500,000$ which was subse-
missioners, one to be chosen by the I'nited States, one by Great Britain, and the third by the other two, provided they should make a.choice within a stated time, otherwise the selection to he made by the Emperor of Austria. The two commissioners having failed to agree, the third was named by the Emperor of Austria. The award was unsatisfactory to the United States. The decision of the commission was severely criticised by the people and the press, and the dispute has been reopened since from time to time, to the detriment of hotb countries. The San Juan question was referred San Juan. to the Emperor of Germany as arbitrator with sole power. His award fully sustained the claim of the United States.
310. President Grant's first administration had been vigorous and progressive, but a number of Republicans had become estranged, feeling that they were being
ignored by the executive. These persons formed themselves into an organization under the name of Liberal

Liberal ReRepublicans. This opposition resulted in the nomination of Horace Greeley for president, and B. Gratz Brown for vice-president, by the Liberal party (1872). These nominations were afterwards adonted by the Democratic party. The republican convention renominated President Grant, with Henry Wilson as nominee for vice-president. When the election took place Grant carried thirty-one states with a popular vote of $3,597,070$, the largest that had ever been given for any president. He received 286 electoral yotes, against 66 Re-clection which would have been cast for $\mathbf{M r}$. Greeley had he of Grant. lived. Mr. Greeley, however, died before the electors voted. The canvass had heen one of the most exciting and aggressive in the history of the country, and abounded in personal attacks on the candidates. During President Grant's first term of office the work of reconstruction according to the plan settled ly Congress had been steadily carried out, and by July, 1870, the work had been accomplished, and all the states were again members of the Union, although the votes of Arkansas and Louisiana were not received by Congress in 1872 , because of alleged fraud and illegality in the election.
311. The relations between the United States and RemationSpain were frequently disturbed by incidents growing with ; ; pains out of an insurrection in Cuba, which had lasted for a number of years. Several American citizens bad been arrested by the Spanish authorities, under the pretense that they had been furnishing aid to the insurgents, and American vessels plying in Cuban waters had been subjected to much inconvenience. Matters at length culminated in the seizure hy Spain (October, 1873), without justification, of the American steamer- lir- Casc of the gimins. The outrage created intense excitement in "rir. the United States, and many statesmen were clamorous ginius." for war ; luat the president took more pacific measures, and, by acting with promptness and firmness, soon wrung from spain ample apology and full reparation. Political troubles were still rife in certain states of the south. In Mareh, 1871, the disorders in the southern Political states, growing out of the conflicts between the whites trounliles in and the negroes, had assumed such proportions that the the south. president sent a special message to Congress requesting "such legislation as shall effectually secure life, liberty and property, and the enforcement of law in all parts of the United States." On April 20 Congress passed an act which authorized the president to suspend, under defined circumstances, the writ of habeas corpus in any district, and to use the army and navy in suppressing insurrections. He issued a proclamation (Mlay 4), ordering all unlawfil armed bands to disperse, and after expressing his reluctance to use the extraordinary power conferred upon him, said he wonld "not lesitate to use that porer to its full extent, whenever and wherever it should be necessary to do so for the purpose of securing to all citizens the peaceful enjorment of the rights guaranteed to them by the constitution and the laws of the United States." As this did not produce the desired effect he issued a proclamation of warning (October 12), and on October 17 suspended the writ
of habeas corpus in parts of North and Soutlı Carolina. He followed this by vigorous prosecutions, which resulted in sending a number of prominent offenders to prison, and the outrages soon ceased.

## Louisiana.

312. Soon after President Grant entered upon his second term of office, the disputes in Louisian a concerning the result of the election in 1872 became more bitter, and armed violence was threatened in tbat state. Early in 1873 the president called the attention of Congress to the inadequacy of the laws applying to such cases, saying that he had recognized the officers installed by the decision of the returning-board as representing the de facto government, and if he had exercised undue interference by such a course he urged Congress to an immediate decision in regard to the matter. Congress, however, took no action, and left with the president the sole responsibility of dealing with this delicate question. The next year the difficulty was renewed and a fierce contest arose between the Republicans under Kellogg, and the Democrats under MeEnery, the respective candidates of the two parties for the governorship, which resulted in armed hostilities. Kellogg, the de facto governor, called apon the federal government for protection, which it inmediately granted by sending troops thither, and the outbreak was for a time suppressed. But troubles again arose, and General Sheridan was sent to report upon the situation of affairs, and, if necessary, to take command of the troops and adopt vigorous measures to preserve the peace. Sheridan became convinced that his duty was to sustain the government of Kellogg, and on the demand of the governor he ejected some of McEnery's adherents from the state capitol. As Congress still omitted to take any action in the case, the president continued bis recognicion of the govermment of which Kellogg was the head until the election of a new governor. After this there was no serious trouble. Difticulties of the same nature arose in Arkansas and Texas, which were almost as perplexing to the executive as those in Louisiana; but these attracted less attention from the people. the "Infation lill" which increased the paper curreney of the country, and was contrary to the financial policy which the president had maintained and advocated in his state papers. Strenuous efforts were made by his warmest political supporters to convince him that the measure was financially wise and politically expedient. President Grant gave much thought and study to the question, and at length fully decided that the measure would in the end prove injurious to the true business interests of the country, and delay the resumption of specie payment. He, therefore, returned the bill to Congress with his veto (April 22). The arguments contained in his message were unanswerable, the bill was not passed over his veto, and his course was sustained by the whole country. The president now earnestly advocated the resumption of specie payment. In a letter addressed to Senator Jones, of Nevada, he gave a full statement of his views on the question. This letter was made public, and attracted much attention; and in January, 1875, the resumption act was passed, which to a large extent embodied the views that had been suggested by the president. There were doubts in the minds of many as to the ability of the government to carry it into effect; but it proved entirely successful, and the country was finally relieved from the stigma of circulating an irredeemable paper currency.
313. Great trouble was caused soon after the close of the war by the depredations of the Indian tribes of the west and southwest. The Sioux and Clieyennes having begun hostilities, an expedition was sent out against them under the direction of General Hancock in 1867 , and another in 1868 , beyond the Arkansas river, where General Custer gained an important victory. In an expedition against the Modocs of Oregon, in 1873, General Canby was treacherously murdered during a parley with the Indian chiefs. The Sioux had ceded to the United States a large tract of country in what was then Dakota territory, reserving to themselves
the district known as the Black Hills. When it was Black H . rumored that gold had been found on their reservation, the whites began to push into this region, regardless of the rights of the Indians. The Sioux were a warlike tribe, and they retaliated by attacking the frontier settlements in Nontana and Wyoming. United States troops were sent out against them, but met at first with a terrible disaster. In June, 1876, General Custer, with The custf about two hundred and fifty soldiers, was surprised, massacre and the entire force massacred. The war lasted into the winter of 1877 , when the Sioux, with their chiefs, Sitting Bull and Crazy Horse, went across the border into British territory.
314. During 1875, the president had reason to sus- Whiskey pect that frauds were being practiced by government frauds. officials in certain states, in collecting the revenue derived from the manufacture of whiskey. Ie at once took active measures for their detection, and the punishment of the offenders. He issued a stringent order for their prosecution, closing with the famous words, "Let no guilty man escape." Many indictments soon followed; the ringleaders were sent to the penitentiary, and an honest collection of the revenue was secured. The year for nominating a president was at hand, and the excitement ran high. Friends of the convicted, political enemies and rivals for succession in his own party, resorted to the most desperate means to break the president's power and diminish his popularity. The grossest misrepresentations were practiced, first in trying to bring into question the honesty of his purpose in the prosecution of offenders, and afterward in endeavoring to rob him of the credit of his labors, which had resulted in the purifying of the revenue service. But tbese efforts signally failed. In 1876 the United States celebrated the one hundredth anniver- The censary of the Declaration of Independence. There were independ great rejoicings throughout the country, and the ence. various battles of the revolution, as well as the signing of the Declaration, were commemorated by appropriate exercises. The centennial year was chosen for holding a great international exhibition at Philadelphia, to which all the nations of the world were invited to contribute. It was opened in May and closed in November, having been visited by about ten millions of people.
315. The changes at the south, and the dissatisfac- Election tion of many at the north with the rule of the Repub- of 1876. lican managers, were seen in the election of 1876 . The Democrats nominated Samuel J. Tilden and Tbomas A. Hendricks for president and vice-president; and the Republicans, Rutherford B. Hayes and William A. Wheeler. A national Greenback convention was also held, May 17 , composed of men who desired national paper money instead of national bank notes, and who opposed resumption of specie payments. It nominated Peter Cooper and Samuel F. Cary, The contest was very close, and a dispute arose as to the counting of the votes of certain southern states, both sides claiming them. The controversy was finally settled by the appointment of an electoral commission of fifteen, eight of whicl decided in favor of Mr. Hayes. In this year, Colorado, the thirty-eighth state (and the last up to 1887) was admitted in time to take part in the election.
316. The administration of President Hayes, altbougb The Kayr much attacked by the politicians of both parties, was, adminis. on the whole, very satisfactory to the people at large. By witlidrawing the federal troops from southern state bouses, and restoring to the people of those states practical self-government, it prepared the way for that patriotism among those lately estranged from the union, that fraternal feeling between the two sections of the country, and the wonderfu] material advancement of the south which we now witness. It conducted with wisdon and firmness the preparation for the resumption of specie payments, as well as the funding of the public debt at lower rates of interest, and thus facilitated the development of the remarkable business prosperity which continued to its close. While in its endeavors to pffect a thorough and permanent reform of
the civil service, there were conspicuous lapses and in. consistencies, it accomplished important and lasting results. Not only without any appropriations of money, and without encouragement of any kind from Congress, but in the face of the decided bostility of a large majority of its members, the system of competitive examinations was employed in some of the executive departments at Washington, and in some of the great government oflices in New York, thus proving its practicability and usefulness. The removal by President Hayes of some of the most poweriu] parts managers from their offices, avowedly on the ground that the offices had been used as part of the political machinery, was an act of high courage, and during his administration there was far less meddling with parts politics on the part of the government officials that at any period since Andrew Jackson's time.
317. The financial condition of the United States had been steadily inproving since the war. A few months after the conclusion of peace the public debt had reached its highest amount, $\$ 2,800,000,000$, and by the close of President Hayes' administration no less than one thousand million dollars of that amount had been paid off. The credit of the government rose, and the paper mones, once worth only a third of its denomination in gold, increased in value. The operation of refunding the debt had been begun July 14, 1870. At that time Congress passed an act authorizing the issue of five, four and a hall, ond four per cent bonds to take the place of those at higher interest. $\$ 500,000,000$ were issued in five per cent bonds, $\$ 185,000,000$ in four and one-half per cent, and $\$ 710,3+5,950$ at four per cent, thus reducing the annual interest charge from $\$ 81,639,684$ to $\$ 61,738,838$. This first refunding operation was completed in the year 1879, at the time when specie payments were resumed. In 1881 about $\$ 200,000,000$ of six per cent bonds fell due. Mr. Windom, secretary of the treasurs, took the responsibility of allowing the holders of the bonds to exchange them for three and one-half per cent bonds, redeemable at the pleasure of the government. Holders of other bonds to the amount of $\$ 300,-$ 000,000 also availed themselves of this privilege, thus saving $\$ 10,000,000$ interest. In 1875 Congress passed a law providing that the paper "fractional currency" used for small change should be redeemed at once in silver, and that after the 1st of January, 1879, the "greenbacks" sbould be paid on demand in coin.
318. At the elections of 1880 the Republican candidates were General James A. Garfield for president, and General Chester A. Arthur for vice-president; while the Democrats nominated General Winfield S. Hancock and William E. English. The Repuhlican ticket was successful, receiving the electoral votes (214 in number) of all the northern states except California -which was divided-Nerada and New Jerser. The Democratic electoral vote was 155 including 11 from Georgia, which, not having been cast on the day appointed by law, were objected to when the returns were opened. As they could not affect the result the question whether they should be counted or not was never decided. The new administration was inaugurated March 4,1881 , and the scramile for oflice which had marked each advent to the presidency since 1829, followed. There was bitter dissension in the party in New York over the distribution of offices. The New York senators, feeling aggrieved at certain appointments in their state, resigned, and then made efforts to be re-elected by their state legislature, in which thes failed. In the midst of it all President Garfield was shot (July 2, 1881) by a crazy, disappointed office-seeker. The avowed object was to promote to the presidential chair Vice-President Arthur, who represented the Grant or "stalwart" wing of the party. The president was not instantly killed. For three months he lay helpless while the nation watched anxiousls every turn in his condition. The sympathy shown by all parts of the country did much to draw the nation together and to lessen the old distrust. Garfield died

September 19, 1851, and was succeeded by Vice-President Arthur.

3:0. The prominent events of President Arthur's Arthur's administration may be here summarized. Shortly after adminte. his accession to the presidency he participated in the tration. dedication of the monument erected at Yorktown, Va., to commemorate the surrender of Lord Cornwallis at that place, Oct. 19. 1781. A convention was made with Mexico (July 29, 1882) for re-locating the boundary between that country and the United States from the Rio Grande to the Pacitic, and on the same day an agreement was also effected permitting the armed forces of either country to cross the frontier in pursuit of hostile ludians. The death of President Garfield called general attention to that reprehensible system under Which each party, while in office, had paid its party expenses by the use of minor offices for its adherents. The president's power of appointment could not be controlled; but the Pendleton Act (1883) permitted the president to make appointments to designated classes of offices on the recommendation of a loard of civil service commissioners. From the British government a full recognition of the rights and immunities of baturalized American citizens of Irish origin was obtained, and all such who were under arrest in England or Ireland as suspects were liberated. A bill passed by Congress prohibiting the immigration of Chinese laborers Chinese for a term of twenty Jears was vetoed (April 4, 1882), immigran as being a violation of the treaty of 1880 with China, which permit ted the limitation or suspension of immigration, but forbade its absolute prohibition. The yeto was sustained, and a modified bill suspending immigration for ten years, was passed, May $6,1852$. which received the executive approval. A law was passed (August 3, 1882) for returning convicts to Conviet Europe, and on Fehruary 26, 1885 , importation of contract laborers was ferhidden.
32h. The suspension of the coinage of standard silver dollars and the redemption of the trade dollars were repeatedly recommended; also, the repeal of the stamp taxes on matches, proprietary articles, playing cards, lank checks, drafts, and of the tax on surplus bank capital and deposits. These taxes mere repealed by act of Congress (March 3,1883) ; and by executive order Repeal of of June 25,1883 , the number of internal revenue col- Etamp. lection districts was reduced from 126 to 83. The tax on tobacco was reduced by the same act of Congress. On July 12, 1882, an act became law enabling the national banks, which were then completing their Nationad twenty year terms, to extend their corporate existence bank. The attention of Congress was frequently called to the decline of the American merchant marine, and legislation was recommended for its restoration, and the construction and maintenance of ocean steamships under the United States flag. In compliance with these recommendations, the following laws were enacted: June 26, 1884, an act to remove certain burdens from American shipping; Juls 5, 1884, an act creating a bureau of navigation, under charge of a commission, in the rres do the treasury department ; and March 3,1885 , an amend-aud turean ment to the postal appropriation bill granting $\$ 800,000$ of navigafor contracting with American steamship lines for the tion. transportation of foreign mails.
322. The reduction of letter postage from three to two cents was recommended, and was effected by the act of March 3,1883 ; the unit of weight was made (March 3, 1885) one ounce instead of a half ounce; the rate on transient newspapersand periodicals was reduced (June 9. 1884), to one cent for four ounces, and the rate on similar matter, when sent by the publisher to actual subscribers, was reduced to one cent a pound (March 3, 1885). The fast mail and free delivery systems were largely extended. Special letter deliveries were established March 3, 1885. The star service at the west was increased at reduced cost; the foreign mail service improved; and rarious postal conventions were negotiated. A law for the adjudication of the French spoliation claims was passed (January 20, 1885), and Freceh preparations made for carrying it into effect. On chaims.

Klection of 1884.

March 3, [855, a bill was passed retiring General Grant with the rank of general of the army, and witb full pay.

## 323. In 1884 the Republicans nominated James G.

 Blaine and General John A. Logan, and the Democrats Cleveland and Hendricks. The greenback and antimonopolist parties put forward the name of Benjamin F. Butler. The prohibitionists, also, had organized themselves into a party, and presented as their candidate Governor St. John. A small majority for the democratic candidates in the State of New York gave them its electoral votes, and decided the election in their favor. They were inaugurated March 4, 1885. The president announced in regard to official changes that, with the exceptions of heads of departments, foreign ministers, and other offices charged with the execution of the policy of the administration, no removals would take place except for cause. He therefore came into conflict with many infuential members of his party who advocated the speedy removal of Republican office-holders and the appointment of Democrats, in order to strengthen the party as a political organization. While that class of politicians objected to the slowness with which removals were made, and to the appointment of independents, and in a few instances Republicans, the Republicans and some of the civil service reformers complained of other appointments as not being in accord with the professions of the president."Offensive partisuaakip.' removal; and numerous Republican functionaries wele displaced under that rule, wlile the term itself became a by-word. On March 13,1885 , the presiflant issned a proclamation announcing the intention of
Oklahoma conntry. in Indian territory the white intruders who sought to settle there, which was done shortly afterwards by a detachment of soldiers.

30t. In his message at the opening of the XLIXth Congress, December 8,1885 , President Cleveland recommended the abolition of duties on works of art, the reduction of the tariff on necessaries of life, the suspension of compulsory silver coinage, more stringent laws for the suppression of polygamy in Utah, an act to prohibit the immigration of Mormons, and the extension of the civil service reform. In January, 1886, Congress passed the bill regulating the presidential succession in the event of a vacancy. Mr. Cleveland exercised the veto power beyond all precedent. Of 987 bills passed by both houses in the session ending August 5, 18S6, 115 were vetoed. Of these 102 were private pension bills, and six were bills for the erection of public buildings. Of the general measures which failed to receive his signature, the most important was the Morrison resolution requiring the secretary of the treasury to apply to the redemption of bonds any surplus to the treasury exceeding $\$ 100,000,000$. The river and harbor bill, containing appropriations, deemed by many useless and extravagant, and the bill taxing oleomargarine two cents a pound, which was considered an anjust discrimination against one class of producers for the benefit of another, were not vetoed. On signing the latter, the president sent a message to Congress, in which he gave as his reason that the stamps required by the act Would mark the character of the substance and prevent it being fraudulently sold.
325. The presidential campaign of 1888 was noted for the number of candidates in the field, who were as follows: Republican, Benjamin Harrison and Levi P. Morton; Democratic, Grover Cleveland (renominated) and Allen G. Thurman; prohibition, Clinton B. Fisk and John A. Brooks; union labor, A. J. Streeter and Charles E. Cunningham; industrial reform, Albert E. Redstone and John Colvin; united labor, Robert H. Cowdrey and W. H. T. Wrakefield; woman suffragists, Belva A. Lockwood and Albert H. Love. The main issue between the two leading parties, Republican and Democratic, was on the tariff question; the former favoring a modified protected tariff, while the latter demanded a tariff chiefly for revenue. The principles
of the other parties related to labor, national currency prohibition and woman's suffrage. The Republican party was successful, and Harrison as president, with Morton as vice-president, was inaugurated March 4, 1889. The administration of Mr. Harrison, thus far, Harri has been characterized by the passage of the McKinley tratio tariff bill, which both increases and diminishes the duties on many necessary articles and adds to the duties on luxuries, and by the regulation of pension matters. The invalid pension bill has lueen passed, granting pensions to all disabled soldiers without reference to the time when the disability was contracted. On the beginning of June, I890, the enumera- The ce tion of the general census for the last decade was begun, under the control of Superintendent Porter, and the returns of the census enumerators give the population of the United States at $60,250,000$, which is less than was anticipated. Many consider the returns as imperfectly made.
326. In the meanwhile the prosperity of the United The States las known no cessation, During the civil war prese? oi 186I-I865, the emperor of France, Napoleon Ill., ${ }^{\text {artior }}$ attempted to establish in Mexico a foreign government under Daximilian, an Austrian archduke, aided by a French army. The remonstrance of the United States and the resolution of the Mexicans compelled Napoleon to abandon the attempt. Maximilian was seized by the Mexicans and executed (1867). A new invasion of Nexico from the United States wrs begun, but it was the perceful invasion of commerce. Railways were pushed down along the great plateau which reaches Lrom the United States into the heart of the country, making thus a closer connection between the two peoples. In 1869 the first of the great railroads, the Central Railw Iracific, was finished, connecting the Atlantic and I'acific Oceans, and opening the country to settlement and travel. Since then other railronds have stretched their iron bands across the continent. Of the 290,000 miles of railroad in the world, there are, probably, about 135,000 miles in the United States. This country possesses, also, more than 550,000 miles of telegraph lines; Teleg and the American telephone lines arestill longer in the and ti aggregate. In 1866, a previous attempt in 1857 baving failed, a telegraphic cable was laid upon the bed of the Atlantic between America and Europe. This cable was Attan followed by others, so that now the citizen of the United States may know each day the principal events which oceur in the civilized world. The stimulus given to new territory possessing the requisites for settlement by the introduction of a new railway has been wonderful beyond description. Most of the western railways have had to build up their own traffic. The railway has leen mainly constructed under land grants from the government, and the sales of these lands have brought into existence the towns and even the states which support it.

327 . In the government reports of 1854 Nebraska was described as a desert country totally unsuited for agriculture, and in the maps of the time it was put down as a part of the great American Desert. It is now one of the leading agricultural states of the union with a population of over a million. Since the admis-New $\varepsilon$ sion of Colorado in 1876 six other states have been admitted to the union, namely; North and South Dakota, Washington, Montana, W'yoming and Idaho. There are jet five territories, including Alaska, not yet organized into states, and the District of Columbia. The mineral wealth of the country has become greatly developed. A few years after the discovery of gold in California, the precious metal was found also at Mine Pike's l'eak, Colorado (1858). Since then it has been discovered in most of the Pacific states and territories. In 1858 silver was discovered in Nevada, and this metal has been found widely distributed in the country hordering on the Pacific coast. The extent of the vast coal fields of the country has been pretty clearly ascer- Coal. tained. In 1883 it was estimated at over 200,000 square miles. Petroleum was discovered in 1859 in north- Petro western Pennsylvania, numerous wells were sunk and
vast quantities of the oil have been taken from the earth, but the reservoir seems to be unfailing. Manufacturing establishments of every variety have rapidly increased in every part of the country. The absolute free trade which exists between the states has resulted in a constant shifting of centers of production and an increasing development. Among the nations of the world, Great Britain, in 1870, stood first in wealth, France the second and the United States the third. In 1880 the United States had left France behind in the race and stood at least second. When all the census returns of 1890 shall be given, they will doubtless show that this country ranks with the first. The United States, whose population has been dereloped within less than three centuries, does already more than one-third of the world's mining and one-fourth of its manufacturing. It embraces also one-fifth of its agriculture.
328. In this wonderful progress and development the south, since the close of the war, has borne her share. Being relieved of the incubus of slavery she has come up "through great tribulation" to assume her rightful place as a most important factor in advancing the prosperity of an undivided nation. Under the stimulus of free labor her growth bas been extraordinary. New railroads have been built and new territory opened up. Southern railways occupy a leading position in the railway systems of the country. Southern manufactures began to effect northern markets. Cotton mills have been successfully established, which have the advantage of an immediate contiguity to the cottonraising states. The great mineral fields, over which contending armies fought fierce battles during the late war, have been brought to light and are being rapidly developed. Pennsslrania iron-masters have a new rival to contend with in the iron production of the sonth. The former slave is now a free laborer, and the white man is no longer ashamed to work. White labor produced ten per cent of the cotton crop of 1860 and fifty-five per cent of that of 1886 . Under slavery, cotton-seeds were waste material ; in $1886,600,000$ tons of them were crushed, yielding a new production in the form of cotton-seed oil valued at $\$ 12,000,000$ per annum.
329. Among the political and economic questions lemanding the attention of the government, no one of them is more important than the question of the reform of the civil service, but it is not avowedly made a party question. Twenty sears ago both parties laughed at the idea of civil service reform, now each one makes a show at least of treating it with respect, and the control of the immediate political future, probably lies with the party which will treat it in the most serious and practical manner. It is a question that was not distinctly foreseen in the days of Hamilton and Jefferson, when the constitution was made and adopted, otherwise the founders of the constitution might have had something to say concerning it. The question as to the civil service arises from the fact that the president has the power of appointing a very large number of petty officials, chiefly postmasters and officers concerned with the collection of the government revenue. Such officials hare properly nothing to do with politics; they are simply the agents or clerks or servants of the national gorernment in conducting its business, and if this business is to be managed on the ordinary principles of prudence which prerail in the management of private husiness, such servants ought to be selected for personal merit and retained for life or during good Lehavior. In 1883 Congress passed the civil service act allowing the president to select a board of examiners and make appointments upon their recommendation. Candidates for office are subjected to an easy competitive examination. The system has worked well in other countries, and under Presidents Arthur and Cleveland it was applied successfully to a considerable part of the civil service. It has also been adopted in some of the states and principal cities of the union. It is objected to by the opponents of reform, on the
ground that its examinations are not alwass intimately connected with the work of the office; but even if this were so, it remoses the offices from the category of things known as "patronage," and this alone endows the system with great merit. Then again, it relieves the president of much needless work and wearisome importunity. The executire and heads of departments appoint (in many cases through subordinates) about 115,000 officials. It is, therefore, impossible for the principals to know much about the character or competency of those appointed. It becomes necessary to act by advice, and the advice of an examining board is sure to be much better than that of political schemers intent upon getting a salaried office for their needy friends. The examination system has made a fair beginning and will doubtless be gradually improved and made more stringent. Something bas been also done toward stopping two old abuses attendant upon political canvasses, namely, that of forcing government clerks, under penalty of losing their places, to contribute part of their salaries for election purposes, and that of allowing them to neglect their work in order to take an active part in the canvass.
330. Another political reform promising excellent re- Ths sults is, the adoption by many states of some form of Ausirelas the Australian ballot-system, for the purpose of check ing intimidation and bribery at elections. The ballots are printed by the state, and contain the names of all the candidates of all the parties. Against the name of each candidate the party to which he belongs is designated, and against each name there is a small racant space to be filled with a cross. At the polling place the ballots are kept in an enclosure behind a railing and no ballot can be brought outside under penalty of fine or imprisonment. One ballot is nailed against the wall outside the railing, so that it may be read at pleasure. The space behind the railing is divided into separate booths quite screened from each other, each booth is provided with a pencil and a convenient shelf on which to write. The voter goes behind the railing, takes the ballot which is handed to him, carries it to one of the booths, and marks a cross against the names of the candidates for whon he votes. He then puts his ballot into the box, and his name is checked off on the register of voters of the precinct. This system is very simple, and it enables a vote to be given in absolute secrecy. It is favorable to independence in roting, and is unfavorable to bribery, because, unless the briber can follow his man to the polls and see how he votes, he cannot be sure that his bribe is effective. During the past few sears, complaints of bribery and corruption hare attracted especial attention in the United States, and it is highly creditable to the good sense of the people that preventive measures have been so promptly adopted by many of the states. With an independent and uncorrupted ballot, and the civil service taken "out of politics," all other reforms will become far more easily accomplished.

But a very few of the works treating of the History of the United States in its manifold plases can be bere given, as they are so numerous. The Mistories of the Thited States, by George Bancroft, David Ramsay, Richard Hildreth, Bryant, Higginson, Lossing, Lester, Frost, Schouler, Von Holst, Ridpath, Hamilton, Hassard, Gray, Leeds; American History, edited by Edward L. ## PART II.-PHYSICAL GEGGRAPHY AND STATISTICS.

## PRYSICAL GEOGRAPHY AND STATISTICS.

North America is very unequally divided between races speaking English and those whose otticial language is Spanish. From the parallel of $30^{3}$ south the continent harrows very rapidly, aud uearly all the country to the north of this parallel is under the control of English-speaking people. It is true that many emigrants from rarious portions of Europe, and some from Asia, as well as the descendants of Africans, are mingled with the descendants of the English; but this does not materially affect the truth of the statement, that north of $30^{\circ}$ the English language is not only dominant. but almost universal. This vast region, embracing an area of more than sered millions of square miles, is pretty equally dirided, so far as area is concerned, between colonial possessions of Great Britain and a conntry of which the nucleus was once colonial and English, but which for a Iittle more than a hundred years bas been indepeodent of the mother country, and which bas greatly iocreased in area since that change took place, by the absorption, as explained elsewhere, of laud formerly, to a certain extent, coutrolled by or in tominal possession of people speaking French and Spanish. The spanisb-speating iuhabitants of North America are known as Mexicans and Central Americans, the colovial Eoglish as Caaadians; and owing to the difficulty of making a courenient aod euphonious adjectireappellatife out of the name United States, the citizens of "the States " are being more aud more generalls desigaated by the term "Anericans."
Andartes The British possessions in North America, although about equal in area to the Crinted States, are much less densely populated than this country, and will in all probability ever remain so, since in regard to climate, soil, and mineral productions, the nortbern portion of the continent stands in a positiou greatly inferior to that of the more southern regiou. To the Cnited States belongs that portion of North America which br its position in Iatitude is, io large part, capable of supporting a dense population, add where the climatic cooditious are highly favorable to Intellectual and physical development.
The area embraced under the designation of "the United States" (of North America) extends from the Atlantic to the Pacific Ocean. Its boundaries, other than these oceans, are in part natural and in part artificial. The Gulf of Mexico forms the bouthern boupdary of the United States between the meridians of $33^{\circ}$ and $90^{\circ}$. Between Mexico aod the United States, the boundary is in part natural and in part arbitrary. The most essential feature of this boundary is the Rio Grande. from the mouth of which the division line between Mexico and the United States follows this river to the point where the parallel of $31^{\circ} 4 z^{\prime \prime}$ intersects it.
The boundary line between the United States and Canada fol lows the middle of the St. Lawrence River and the Great Lates from the point where the 45 th parallel cuts that river to a point on Lake Superior where the Rainy Lake River enters that lake, thence up that river to a point on the west side of the Lake of the Woods, and thence along the 49 th parallel to Puget Sonnd.
The triangular area between Lakes Ontario and Erie on one side and Lake Huron on the other extends far to the south of the remaining portion of Canada, and this southeriy area constitutes the most valuable and thickly inbabited portion of the dominion. The Uuited States, as thus limited, leaving ont of consideration the remote territory of Alaska, comifises an area of $3,025,600$ square miles. This jucludes 50,600 square miles of water surface, embracing the followjug items:

| C | 17,200 |
| :---: | :---: |
| Rirers and smaller streams | 14,500 |
| Lakes and ponds. | 23,900 |
| Leaving the total laud surface | 2,970.000 |
| Total.. | 3.0 |

Under the bead of "lakes and ponds," as giren abore, no portion of the Great Lakes is included. The area of Alaska is given in the Census Report of 1880 as being 531,409 zquare miles, which figures, however. can be only a rough ajproximation, and which differ greatly from those giren in the Report of the Commiesioner

Of the General Land Office for the sear ending June 30, 1886. The total of the possessions of the Uuited states is, therefore, approximately, $3,557,009$ square miles. The area of the British possessions in North America, including Newfonndlaud, hut not the Arctic Archipelago, is giren br Behm and Waguer at 3,248,077, and by Mr. Selwyn, goserument geologist of Canada, at 3.530.63 square miles-the latter estimate including Newfoundand, and also the jsladds in the Arctic Ocean and Hudsod's Bay. The area of Mexico is given by Behm and Wagner as $751,17 \%$ square miles, and that of Ceotral America 211,320 square miles. The total ares of North America, including the Aretic Archipelago and Central America, may therefore be approsimately stated as follows:

The area of the Uuited States lies between the 67th and 125 th degrees of longitude, and the 25 th and 47th degrees of latitude.
The form and character of the coast lines of the United States may properly first clam our attedtion io a topographic sketch of the area under consideration. The facilities for good harbors are lacking on both cossts. Tho $\rightarrow$, in this respect on this Pacific side is striking, .... velug only one important bay on this coast between San Diego and Puget Sound; namely, that of San Francisco. This, as compared with the mass of the land, is of insignificant size, but as furnishing a large, safe, and easily accessible harbor, is of the greatest importaoce. The jodentation at san Diego, js much smaller than that of San Francisco. but that also furnishes a commodious harbor. With these exceptions there are within the limits of the U'nited States no satisfactory harbors on the Pacific coast, except those of Puget Sound and Columbia River ill the extreme north.
The eastern coast of the United States is provided with several good harbors and some large bays. On the Maine coast there is the harbor of Portlaud, which may be taken as a type of a number of safe and commodious ports along the coast. In Massachusetts, Cape Cod incloses a large and safe bas, at the lowerend of which is situated the harbor of Boston. In New lork, the situation of the city by the same name makes that port the most important center of commerce in the United States.
The superiority and commodiousness of the barbor of New York depends in part on the breadth of the Hudson near its mouth this river beiug iu fact almost an arm of the sea-and also on the position of Long Island, the western end of which is soplaced $n$ ith reference to the coast of New Jersey and a closely contiguous small island (Staten Island) as to inclose a large land-locked area called the Upper Bay
Long fsland, off the cost of Conuecticut, has a length of $1: 0$ miles. It is the only island of any importance on the Atlantic coast. There are a number of smaller ones, such as Block Islaod, Nantucket and Martha's Vinerard,
South of Sew lork are the Chesapeake and Delaware Bays. The latter receives the water of the Delaware River, and the Chesapeake that of the Potomac add the Susquehanna. The largest jndentation on the coast of the Cnited States is the Gulf of Mexico.
It is into this great reservoir that the superfluous waters of the larger portion of the I'nited states are carried, chiefly by the Mjssissippi and Missouri, but also by direct drainage into the Gulf from the adjacent States. The peninsula of Florida, project ing from and extendiog five degrees south of the maiuluad, and forming the eastern boundary of the Gulf, is of more importance in its relations to the currents entering into the Gulf than it ia as an addition to the inhabitable territory of the country.
A large portion of the northern boundary of the United States is of a peculiar kind. It is nefther land, river, nor ocean, but fresb water: it being a line drawn through the ceatral portion of four of the so-called "Great Lakes"-Ontario, Erie, Huron, and suyerior. Lake Michigan, on the other hand, is mbolly within the limits of the L゙nitedstates.
The Great Lakes, which are fire in number, constitute a most
important feature in the topography of the country. They are re markable for their size. aud for the near approach to equality of altitude above the sea-level of the surface of the fonr largest ones. Navigation is entirely uninterrupted between Erie, Hurou and Michigan, and these have the following elevations: Erie, 573 feet; Huron, 582 ; Michigan, 582 . Lake Superior is twenty feet higher than Lake Michigau, but this ohstruction has been overeome by the building of a canal around the Falls of St. Mary (Sault Ste. Marie), with a siugle lock of sufticient dimensions to accommodate vessels and steamers of the largest size. Lake Ontario is 326 feet lower than Erie, and these two lakes are counected by a canal on the Canada side; while Erie is also thus connected, on the American side, with the Hudson River, and through this with the Atlantic.
As before remarked, the chicf drainage of the United States is to the Gulf of Mexico, through the system of the Mississippi Missouri and their tributaries, as will be seen by the followiug table, showing the extent of the various divisions of the draiuage area of the country, as giveu by the United States Census of 1830 :-

| Atlantic and Gulf. | 2,178,210 |
| :---: | :---: |
| Great Basin | 228,150 |
| Pacific Slope | 619,240 |

The drainage area, of the Misalssippi-Missouri River is estimated at 1,240,039 square miles, or somewhat over one-third of the entire area of the country. The drainage into the Atlantic and Gulf, as stated above at $2,178,210$ square miles, is divided as follows:-

| New England coast | 61,830 |
| :---: | :---: |
| Middle Atiantic coast | 83,020 |
| South Atlantic coast.. | 132,040 |
| Great Lakes | 175,340 |
| Gulf of Mexica | 1,725,980 |
| Total | 2,178,210 |

The drainage into the Gulf of Mexico is thus divided :-

| Into the Gulf direct. | 485,941 |
| :---: | :---: |
| Through the Mississippi River. | 1,240,039 |
|  | 1.725 |

Thia indication of the overwhelming preponderance of the drainage of the territory of the United States into the Gulf of Mexico naturally opens the way to a recognition of the most important fact in the topography of the country-namely, the existence of such an orographic structure as compels the waters to concentrate themselves into one great system of tributaries coming in from the east aud the west, aud uniting in a main north-and-south ehannel. The cause of tbis state oi things becomes evideut when we notice the general relief of the country, and the positions of the varions watersheds. To acquire the best geveral idea of the relief of the surface of the United States, we nay begin by supposing the Jaud to he depressed, or the level of the occan raised, to an amount equal to one thousand feet. By doing this we should flood a great strip oif country across the continent Mexico would remain on the west a great mass of land, while to the nortb of the United States the land would rapidiy dimiluish as higher latitudes were reached.

## GENERAL TOPOGRAPHY.

In deacribing the physical features of a country, it is necessary to consider its geveral plan, the skeleton or framework of mountains, to whieli its plaius, valleys, and river systems are subordinate, and on the direction and elevation of whose partsits climate is iu a very large degree, dependent.
The skeleton of the United States is represeuted by two great systems oi mountain ranges, or combinations of ranges, ane formIng the eastern, the otber the western side of the framework by which the central portion of our continent is embraced. These two systems are the Appalachian ranges and the Cordilleras of North America. These systems are of very different magnitude and extent. Betweeu them stretches agreat interior valley, ocen pied by the Misaissippi aud the great lakes.
The central portion of the United States is nearly a level area embracing a tract of country about 1250 miles east and west, and about 1200 miles north and south. It slopes gently downward to the center from the east aud west, and towards the gulf of Mexica from its northern limits. The mauntain regions, both on the east and west consts, are not embraced under one continuous range. but are complicated in their orographic structure.
The eastera and western elevated regions being made up of a great number of topographically more or less detached portions, ft was not until a comparatively recent period that these regions
recelved such general distinctive appellations as would evidently be required in any discussion or descriptiou of the country as a whole. At the present time, by general consent of geagraphera and geologists, the eastern elevated side of the continent is called the Appalachian Region; the western the Cormilleran, while the comparatively level country between these ranges is kuown as the Mississippi Valley.

The Great Basin of the Mississippi is blsected through its center by a aupreme artery, which, above St. Louis, has received thename of the Missouri, and below the Mississippi River.
This is 5,000 miles in length, and its surface is a continuous inclned plane, descending seren inches in the mile. Into this central artery, as into a common trough descend innumerable rivers coming from the great mountain chains of the coutinent.
All of the immense area thus draiued forms a single basin, of which the circumferent mountains form the rim. It may be also called an amphithcatre, embracing $1,500,000$ square miles of surface. This has been, during the antediluvian ages, the bed of a great ocean, such as is now the Gulf of Mexico, or the Mediterranean, above the surface of which the monntains protruded themselves aa islands. Gradually filled up by the filtration of the waters during countless ages, it has reached its preseut altitude above the other hasins, over which the oceaus now still roll, and into which the waters have retired.
The Basin of the Mississippi is, then, a pavement of calcareons Mississipp rock, many thousand feet in depth, formed by the aediment of the Basin. superiucumbeut water, deposited stratum upon stratum, compressed by its weight and crystallized into rock by ita chemical fermentation aud presalire. It is in exact imitation of this sublime process of the atural world that every housewife compresses the milk of herdairy into solid cheese and lutter. It is, therefore a homogeneous. undulating plain of the secondary or sedimentary formation, surmounted by a covering of soil, from which springa the vegetation, as hair from the external skin of au animal. Through this coating of soil, and into the soft surface atrata of rock, the descending fresh waters burrow their channels, converging everywhere, from the circumferent rim to the lowest level, and pass out to the sea.
The most noticeable facts in regard to this vast area are ita slight elevation above sea-level and the general plain-like character of its surface. These conditions are well illustrated by the statemeut that at Cairo, the juuction of the Ohio and the Mississippi, we are 1,100 millea from the Gulf, and yet only about 300 feet above the aea-level. At Pittshurgh, the head of the Ohio River proper, we have attained an elevation of only 699 feet. Going in the opposite direction, or following up the tributaries of the Mississippi and of the Missonri, which come in from the west we bave a similar coudition of thinge. One may travel up the Platte or the Kansas for huadreds of miles, rising so gradually and so imperceptibly that the country seems all the time a level plain. From Council Bjuffs to the souree of Lodge Pole creek, along the line of the Union Pacific railroad, the asceut averagea only 5 feet to the mile. From St. Paul, which is only 700 feet above the sea, we travel for 670 miles westerly before the mouth of the lellowstone is reached. and here we have attained an altitude of only 2,010 feet, with an average rise of only 2 feet to the mile.
The great lakes, those vart expausions of the upper waters of A rea a the St. Lawrence, are among the grandest of the geographical Great features of the North American continent. They are remarkable Lakea for their immease area, and for their unifarmity of elevation above sea-level, and the consequent facilities which they afford for commercial intercourse.
Their combined area is a littie more than 90,000 square miles, Lake Superior having over 30,000 , and Lakes Michigan and Huran each over 20,000 square milea of aurface. Erie, Huran, and Michigan are nearly on the same level, the extreme difference between the first and the last-named being only about 16 feet, whle Superior is Gnly 20 feet higher than Michigan, or 36 above Erie. The divide between the great lakes and the waters flowing into the Mississippi aud its tributarles is also everywhere low, and at the lower end of lake Michigan it is so trifing that only a small amount of excavation has been required to cause waters which iormerly flowed into that lake to run toward the fulf of Mexico. Lake Outario is, indeed, 323 feet lower than Lake Erie, about half the descent from one ta the other heing made in one single plunge of the fast body of water, forming a cataract which has, in all probability, no rival in the world.
The level and fertile region of the Mississippl valley is prolonged toward the far sonthwest, aromad the Gulf of Mexico and far into the interior of Texas, where it finally passes into the elevated, harren platean of the Liano Estacado.
All that partion of the Mississippi basin lying between the Mississippi River and the Atlantic, is densely timbered, excepting only a portion of Indiana, Illinois, and Wisconsin; ao also are the States of Loulsiana, Arkansas and South Missourl. Anirregular line from the head of Lake Erie, running toward the south and west iuto Texas, defines the cessation of the timher. Between this lime and the sea exists a continons forest region, perpetually moisteued by showers from the ocean. Beyond this line, and

deeper into the contineut. The upland ceases to nourisli timber which is replaced by luxuriant amual grasses, thongh uarrow lines of forest coutinue upun the saturated bottoms of the rivers and in the islands. This is the prable region of luxuriant annual grasses and soft arable soil, over which the fires aunually sweep after the decay of vegetation.
The termination of this belt is marked by an irregular line par allel to the first, where the rain ceases, and the timber eutirely disappears. It is ahout 450 miles in width, and withina It artificial irrigation is nat practiced nor wecessary, it being everywhere soft, arable and fertile
To this succeeds the immense rninless region obward to the mountains exclusively pastoral, of a compact soil, coated with the dwarf buffalo grass, without trees, and the abode of the aboriginal cattle. That no desert dues or cau exist withiu this basin, is manifest from the abuudance and magnitude of the rivers; the uniform calcareaus formation: the abseuce of a tropical sun; its longitudinal positiou across the temperate zone; and the greatness and altitude of the mountains on its western rim. The river system of the Mississippi Basin resembles a fan of palm-leaf. The stem in the State of Louisiana rests in the Gulf; above, the affuent rivers converge to it from all parts of the compass. From the east come in the Homochitto, the Yazoo. the Ohio, the Illinois, aud the Upper \fississippi. From the uest, the Red River, the Washita, the Arkausas, the White, St. Francis, and Osage Rivers, the Kansas, the Triple Platte, the L'Eau qui
Cours aud the Yellowstove, all Cours aud the Yellowstove, all navigable rivers of great leagth and importance. These rivers preseat a continuons navigable channel of 22500 miles, having 4,000 miles of shore-an amount of Davigation and coast equal to the Atlantic Oceau. The area of the Mississippi Basiu classifies itself into one-and-a-half-6ifths oi the compactly growing forest, the same of prairie, and two-fifths of great plains. Through all of these the river system is ramified as minutely complex as are the velus and arteries of the human aystem.
Beyond this great main river stretch out the vast prairiea of the west. These plains are not descrts; they are calcareous, and form the Pastoral farden of the world. Their position and area may be
easily uuderstood. The meridian line which terminates the states easily uuderstood. The meridian line which terminates the states of Louisiana, Arkansas, Missouri and Iowa on the west, forms their Between these two limits they accupy a longitudinal parallelogram of less than 1.000 miles in width, extending from the Texan to the Arctic coasts. There is no timber upon them. and siagie trees are scarce. They have a geutle slope from the wrat to the east and abound in rivers. They are clad thick with gutritious grasses, and swarm with animal life. The soil is not silicious, or sandy, but is a fine calcarcous mould. They run smoothly out to the navigable rivers, the Missouri. Mississipli, and St. Lawrence, and to the Texan coast. The mountain masses toward the Pacific form no serions barrier between them aud that acean. No portion of their whole sweep of suriace is more than 1 , mo niles from the most facile navigation. The prospect is everywhere gently undulating and graceful, being bounded, as on the ocean, by the horizon. Storms are rare, except during the melting of the snows upon The clinate is comparatively raing
The chinate is comparatively rainless; the rivers serve, like the Nile, to irrigate rather than drain the neighboring surface, and have few afluents. They all run from urst to cast, having beds sha!low and hroad, and the basins througb which they flow are flat, long andanarrow. The area of the Great Plains is equivalent to the surface of the twenty-four States between the Mississipni and the Atlantic sea. They are one homogeneous formatiou, anooth, uniform, and continuous, without a siagle abrupt monntain, timbered space, descrt, or lake. From their ample dimenslons and position they define thembelves to the the pasturc-ficids of the world.

The Pastoral Region is longitudinal. The bulk of it is under the Temperate Zone, out of which it runs into the Arctic Zone on the north, and into the Tropical Zone on the south. The parallel Atlantic arable and maritime region flawks it on the east; that of the Pacific on the west.
While, on the whole, so nearly a plain, this vast area, comprisIng over a milliou and a half square miles, has considerable diversity of surface, it being not altogether destitute of mountains, some of which slse to a considerable altitude. To describe, even With a moderate amount of detail the basin of the largest river system but one in the world would require many volumes. All that can be done is to indicate the sallent features of its gealogy, as supplementary to that which has beed said in regard to the structure of the great monutain systems by which thls geologically conparatively undisturbed region is iramed in.
The Tertiary and Cretaceous rocks, extedding along the (iulf . about one-half of Alahama and Arkansas, the entire State of Jississippi, Lonisiada, parts of Tennessee, Kentucky, a small corder of Missouri, aud bearly all of Texas. Thence this geolog. lcal formation follows the general trend of the Rocky Honntains, on their eastera side and underlles the western half of Kausas,
hearls all of Nebraska, Northand South Dakota, a portion of Iowa, aud the western purt of Minuesota.
Triasslc rocks stretch over a large area of Texas; they also ex tend into the Indian Territary and the southern part of Kansas. All but a small portion of the Northera Central group of Stutes aud portions of the sonthern Central group of states, are of the I'aleozoic rock formation, covered by post-Terthary and recent detrital formations. In sontheastern \$lysouri, the Azole area is important from an economical standpoist. Ironores of fimmense lrone occur in plifo fonnd fin the ab, Irou Mountain and other localities. Iron is also fonnd fin the Azole formations about lake Sulerior, In the States of Wisconsin and uorthwestern Minnesota. Sorth of this irou region is the copper beariug rock of the lower Silurlan age. Over Niw York, northern lennsylyanla, wad the country bordering on the Great Lakes is found a large amonnt of "drift." How this so-cnlled "drift" whs distributed over this area is a question which has long been s subject of discus-lon among geolthe subject ascribe the oripin of of those who have investigated the subject ascribe the orifin of this coarse detrital material to glacial causes. It is believed that at one time the northern fart of the continent was covered with Ice, aud that uhich we see on the present surface of the region that was thus covered, is the result of the action of these glaclers, or of the floods which werc pro-
duced when they melted.

## tile cordilleras region

The Cordilleras are a part of the great system or chain of monutains which borders the Pacific coast of both divlalons of the American contincnt. South and North America, and forms its dominating and most imposiug feature.
From Mexico the system of the Cordilleras enters our terrltory, widening and gaining in complexity. Just above the southery border of Arizoua, alodg the parallel of 35 , occurs the greatest dexico; and here the continent doaico; and here the continent mar be traversed without risiag to an elevation of arer 4,000 feet. The country aloug this line is a table laud, with many short and broken ranges of no great altitude built upon it, but decply excavated by unmerous cauons, ss the called of which the canon of the the Cordilleras are universally called, of which the canon of the Colorado may be taken as the
type. type.
On this plateau. in latitude $35^{\circ}$, is a group of extlnct valcanoes, similar to the ruge which traverses Mexico. These grand rol. The Cor canic cones of which sau Francisco mountain is the loftiest aud the dilleras best known, rise to uearly double the altitude of the plateau ou which they stand. The greatest width of the Cordilleras is along the line passing from the vicinity of San Francisco, by Great Salt Lake, to Fort Laramle, or between la:itudes $38^{3}$ and 420 . Here the mass of monatains and plateaus uttains a breadth of fully a thousand miles; and if the Black Mills, an ontller of the Rocky Mountains, in latitude $44^{\circ}$, are included-as they may broperly be-the total breadth of the complexus of ranges will be, in its maximum, over 1,100 miles. The whole area embraced within the mountainous belt which we call the Cordilleras is but very little, if any, short of a million of square nilles, or onethird the area of the country. Hence it may, with propriety, be called the greatest physical feathre of our territory.
To raughly indicute the shape of the mass of the Cordilleras we may consider it as having a lozenge-shaped figure, bounded by two parallel thorth and south sides and two northwest and soluthenst sides. The length of each side is approximately tioo miles. The westeru edge of the figure correspouds in trend to the line of the Pacific const, which, as a glance at the map will show, is northWest and southeast as far as Cape Mendocino, and from there to Fancouver lalad north and sonth pearly. The north and south trending portion of the Pacific edge of the Cordilleras is known as the Cascade range; the northwest and southeast range as the Nevada ranges, but still mearer the occan, are the coast ranges, parallel with the lofticr masses on the east, and funcoulating with them, at various points, in such a manner that a distinct equa. ration betweell const and interior ranges seens hardly possible. either on geographical or on geological gromuds
The Racky Nountains proper form the eastern rim of the Cordilleras. Throughout New Alexico, Colorado, and sonthern Wyoming their face ranges north and south. The northern fart of this system, lylng in worthern Wyoming and Montana, presents to the Mafns a northwest and southeast face, similar to that
of the Siorra Nevada. of the Sierra Nevada.
The lozenge-shaped figure thus indicated. Framed in. as it were, by the Cascade range and Slerra Nevada on the west and the through its center east and west incloses a bigh flateau, which, through its center east and west, has an elevation of from 4,000 to 10,000 fect abave aca level, falling of toward both the worth and the gouth from its central line.
Let us consider it in its great general features. It may be divided into-
Ist. The section of the Rocky Mountains.
2 d . That of the plateaus.

3d. That of the Great Basiu, and
4th. That of the Pacific.
The country lying east of the first section is a great plain, extending to an undefinable easteru limit, which may he set, however, roughly at the louth meridian. This plaiu is not strictiy level, but nodulating, like the swell of the sea. Most of the stream yalless are shallow depressiona, and the divides between them are hut slightly murked. These piains rise slowly westward, with an evengradient, to a height of 4,000 to 6,000 feet at the eastern base of the Rocky Nouutains, belog the highest in Colorado, decreasing thence northward and sonthward. They are covered with grasses almost throughout, aud form a grazing ground of almost incalculable capacity.

With the exception of the Missouri and the Yellowstone, none of the streans are of auy importance to navigation, and they are of use ouly for irrigation. The capacity of this region for supporting life is largely depeudent upou its rainfall, which will be discussed further on.
Rocky Mountains

The Rocky Monutains form the eastern member of the Cordilleran system,--a member made up of many subordinate ranges, each range or sub-group of ranges having a distinctive name. rec. ognized by those living near. while the name "Rocky Mountains" is in general use as the proper appellation when a number of these sub-gronps of ranges are intended to be included under one common usme.
From the south border of the United states to about latitude $43^{3}$ their general course is nearly north aud south, and from this point northward to the British line it is nearly northwest, thus forming the two eastern sides of the lozedge above slokeu of They consist of a number of ranges, bearly all of which trend parallel to one another-a few degrees east of south and west of borth, or roughty parallel to the northeastern side of this region.
In the southern portion, the ranges run out one after another into the plains, forming an echelon arrangement, thus giving to the system a nearly north and south face.
In Colorado the underlying ilatean attains a greater elevation than in any other part of the Cordilleran system, reaching an extreme height in the South I'ark of 10,000 fcet. Here, too, the ranges reach a greater altitude than in any other part of the Rocky monntain system. Numberless peaks rise from 14.000 to 14,500 feet abore sea level. There are few passes io the ranges at a height much helow timber-line, which is from II,000 to 12,000 lect. Northward and sonthward the plateau decreases gradually in height, carrying downward the rauges which stand uon it. Southward through New Mexico the rauges not only decrease in height, but hecome broken and sattering, while the extent of level plateau country becomes much greater. Towards the north, in southern Wyoming, all the ranges stop abruptly, leaving to represent the Rocky monntaiu system onif a line of plateans of an elevation of 6,000 to 7,000 feet stretching from Bridger puss, iu the aonthern part of the territory, northwestward to the Sonth pass, at the south eud of the W'ind River chain. In this latitnde a number of rauges rise abruptly from the platean. beginuing with the Big Horu ou the east, then the Wind River range, some of whose peaks are inore than 13.000 feet in altitude, and the multitudioous ranges which horder the beadwaters of the Saake River. From this point, as the system continues onward iuto Idaho and Montana, the uuderlying platean and the ranges also greatly decrease iu height, but not in complexity. In the northwestern part of Montaga and northern Idaho, indeed, the whole comutry is a mass of mountain ranges, whose elevation is from 8,000 to 9,000 feet, separated in most cases, by very narrow valleys, the whole area beiug densely covered with forests.

## the plateau province

The region of which the principal or more striking, topograph lal aud geological features are wext to be indicated, is that lying south of the Great Basin, and which is drained by the Colorado and its tributaries. It is included chietty within the houndaries of the Territories of Uitah aud Arizona; but, to a certain extent. similar characteristic features are found in the adjaceat portion of Colorado, New Mexico, and Nevada.
For convenience of geological discussion, that belt of country which lies betweeu the meridian of Deuver, Colorado, and the Pacific, and betweeu the $34 t h$ and $43 d$ parallels, is divided into provinces, each of which possesses topographical features which distinguish it from the others. The easternmost is pamed the Park Province. It is situated in the central and western parts of Colorado, and extends north of that State in Wyoming, aud sooth of it into New Mexico. It is pre-eminently a mountain region. haviag several long ranges of the second order of magoitude. The structure and forms of these mountains are not exactly similar to those of any other region now well known, but possess some resemblance to the Aips, though not a very close one.
To the westward of these ranges in Colorado, there are, ncar the western boundary of that State, regions having a very different topography. The mountains disappear almost wholly, and iu their stead there are platforms aud terraces nearly or quite hori-
zontal on their summits or floors, and abruptly terminated by long lines or cliffs. They lie at greatly varying altitudes, some as high as 11,000 feet above the sea, others no higher than 5,000 . and with still others occupying intermediate levels. Seldom does the surface of the laud rise into couical peaks, or into long, narrow, crested ridges; but the protiles are loug, horizontal lines, suddealy dropping downmany hundred or even two thousand feet, upon auother flat plain below. This region bas been vers appropriately named, by Professor Powell, the Plateau Proviace. It occupies a narrow atrip in the extreme western part of Colorado, a similar strip of western New Mexico, a large part of southern Wyomiug, and rather more than hall of Utah and Arizoua
This region may be roughly defined as comprising the drainage Draina basin of the Colorado River and its tributaries. The upper portions hasin of of its tributaries flow, however, iu the Rocky Mountains and the Colorso Wahsatch iange, and enter the Plateau region lower in their courses. This region lies west of the southern section of the Rocky Monntains and east of the Great Basin, aud constitutes a great depression or valley in the Cordilleran region of a ronghly triangular shape, its apex beiug in western Wyoming, near the head of the Green River, one of the forks of the Colorado. It is a region of table lands and canons; of table lauds horizootal or nearly so, stretching for many miles with searcely an undulation in the uniform surface, but suddeuly ending abruptly in a line of cliffs, perhaps thousands of feet in height, and exteoding iu an unbroken line for hundreds of miles. In this region every stream is in a gorge, cut bundreds, or even thousauds of feet below the surface by the action of water on the soft, stratified sandstones aud limestoues. Most of this region is uninhabited and uninhabitable, not ouly by reason of the climate, which forbids agricultural purguita, butifom its almost hopeless impassableuess.
Separating this region fron the Great Basin is the Wrasatch range, which may be considered as a spur from the Rocky Mountains. It is a rauge of considerahle breadth and altitude, extending from northern Utah nearly to the middle latitude of the State, aud descending to the general level of the country ou the south aud east by a series of plateaus, forming a verituble giaut's stairway. The elevation of this rauge in its highest portion is from 10.000 to 11,000 feet, one or two feaks ouly reaching an altitude of 12,000 feet. Joining this range in the northern part of Utah is that of the Uinta, which differs from nearly all the ranges of the Cordilleran region by having au east and west trend. It forms the southeru limit of the Greeu River basin, the region upon which the fugitive name "Great Amprican Desert" has beeu iateat bestowed, aud where it is probable it has at last found a final resting-place.
This range far exceeds the wahsateb in elevation, a number of its peaks extending skyward nearly 14,000 feet. and its broad, piateau-like summit being for a considerable extent at an elevation of 12,000 feet.
The Grand Canon District is a part of the Plateau Provinee. As Canons. already indicated, it lies between the Park and Basin Provinces, and its topography differs in the extreme from those divisions found ou either side of it. It is the land of tables and terraces, of buttes and mesas, of cliffs and canons. Standing upou ruy elevated spot where the radius of visiou reaches ont 50 or 100 miles, the observer beholds a strange spectacle. The most eouspicuous objects are the lofty and brilliantly colored cliffs. They stretch their tortuous courses across the land in all directions, yet not without system ; here throwiug out agreat promontory, there receding in a deep bay, and coutinuing on and on until they sink below the horizon or swing behiud some loftiermass or fade out in the distant haze. Each eliff marks the boundary of a gcographical terrace, and marks also the termination of some geological series of strata, the edges of which are exposed like courses of masomry in the scarp-walls of the palisades. Very wonderful at times is the sculpture of these majestic walls. Each geological formation ex hibits in its cliffs a distinct style of arehitecture which is not reproduced among the cliffs of other formations, and these several styles differ as much as those which sre cultivated by different races of men. The character which apfeals most strongly to the eye is the coloring. The gentle tints of an eastern landscape, the pale bive of distant mountains, the green of vernal or summer vegetation, the subdued colors of hill and meadow, are wholly wantiug here, and in their place is the brilliant red, yellow and white, which are intensified rather than alleviated by alternatiug belts of gray. Like the architecture, the colors are characteristic of the geological formations, eacb series having its own group and range of colors. They culminate in intensity in the Permian and Lower Trias, where dark, brownish red alteruate with bands of chocolate. purple, and laveuder, so deep, rich, and resplendent that a painter would need to be bold to venture to portray them as they are.

The Plateau country is also the land of canons, in the strictest meaniug of that term. Gorges, ravides, canados are found, and are more or less impressive in every high region ; and in the vernacular of the Hest, all such features are termed canons indiscriminately. But these long, narrow, profound treaches in the rocks, with inaccessible walls, are seldom found outside the plateaus. There they are innumerable, and are the almost universal
ainage. form of drainage channels. Nicurly everywhere the drsinage tannels. channels are cut from 500 to 3,000 feet below the general matform of the immediate country. They are abundantly ramified and every branch is a canon. All these drainage channels lead down to one great trank chamel cleft through the beart of the Plateau Irovince for elght bundred miles - the chasm of the Colorado, and the canon of fta principal fork, the Green River.
The region is for the most part a desert of the barrenest kind. At levels below 7,000 fect the heat is jutense, aud the air is dry in the extrense. Vegetation is very scanty, und even the ubicuitous sage is sparse and stunted. Ilere aud there the cedar is seeu, the hardiest of arborescent plants, but it is dwarfed and sickly, and seeks the shadiest nooks. At higher levels the regetation becomes more abundant and varied. Above 8,000 feet the flateaus are forest clad, and the ground is carpeted with rank grass and an exuberant grow th of beautifnl summer flowers. The summers there are cool auz moist; the winters severe and attended with heasy snow-fall. The Plateau Province is naturally divided into two portions, a Dorthern and a southern. The dividing harrier is the Uinta range. This fide mountain platform is, in one respectan anomaly smong the western ranges. It is the only important one which trends east and west. Starting from the eastern flank of the Wahsatch. the Vintas project eastward more than 150 miles, and nearly joiu perpendicularly the l'ark rauges of Colorado. Of the tiro portions into which the Plateau province is thus divided, the southern is much the larger. Both have in common the platean features; their topographies, climates, aud physical featuras in general, are of similar tryes, and thefr geological features and history appear to be closely related. But each has also its peculiarities. The northern portion is an interesting and already celebrated field for the study of the crctaceous strata, and the Tertiary lacustrine beds. The sonthern part of the Plateau Province may be regarded as a vast bnsin, everywhere bounded by highlands, except at the southwest, where it opens wide and passes suddenly into a regiou having all the characteristics of the Great Basin of Nevada. The northern half of its eastern rim consists of the Park ranges of Colorado. Its northern rim lies upoo the slopes of the Uidas. At the point where the Uintas join the Wabsatch, the boundary turus sharply to the south, and for 200 miles the High Plateaus of Utah constitute the elevated western margin of the Province. A crude conception of this region may be gained by imagining three lines, each 200 miles long, placed in the positions of three sides of a square; the fourth side being for the moment Deglected. Upon the eastern side, conceive the Fark Ranges of Colorado; upou the northern, the Uintas; and upon the western side, the southern portion of the Wahsatch and the lligh l'lateaus of U'tuh : aud all these highlands baving altitudes ranging from 9,000 to 12,000 feet above sea-level, while the included area varies from 5,000 to 7,000 feet in height. The space thus fartially hounded may represent the uorthern part of the southern Plateau Province. Along the line required for the fourth and south side of the complete square there is no boundary. The topography continues on beyond it to the southward, and also widens out both west and east and overspreads an additional area more than twice as great as that already defined. From the eastern coast of the Iligh Plateans may be olbained an instractive overlook of the northeru portion of the southera llatean country.

Throughout the great carboniferous age the entire area of the Plateau l'rovince was sulumerged beneath the ocean. Deposition of strata went on continuously, leaving at the close of this age a subaqueans surface, wheh was exceedingly fiat, and, except around the borders of the l'rovince, quitefree from any appreciable inequalities. The thickuess of the carboulierous system is from 4,500 feet to 5,000 feet in the interior of the Province, bat around its bordera, aud in the Uinta mountains, it is sometimes found in far greater volume. After the Carboufferous came the lermian age, in which were laid down from 800 to 1,500 feet of sandy ahales. The same state of affairs continued through the Trias, duriug which period sandstone beds were deposited. Drectly upon the Trias rests the Jurassic, -a wouderful bed of sandstone 800 to 1,200 adstone. feet thick, and very white and sugary. Next comes the Cretaceons system,-a mass of yellow sandstones with clayey and marly shales, aggregating from 4.000 to 5,000 feet thick. At the close of the Cretaceous period there are evidences that extebsive disturbances took place, resulting at some places in the dislocation and flexing of the strata.
The last period of deposition was marked by the accumulation of the Eocene beds. Aromud the sonthern finnks of the lintas their aggregate thickness exceeds 5.000 feet. bit southward the upper members disappear, and 80 miles north of the (irand Canononly ahout 1,000 to 1,200 feet make their appearance. In the course of geological history, this area, which had been a region of deposition and subsidence, became one of elevation and denudation. Since that change took place, the havoc wrought by crosion has been stupendous, the thickness of strata remover exceeding 10,000 feet in some considerable areas, and areraging probably 5,500 to 6,000 feet orer the entire Frovioce.

## tile great basin

West of the Plateau Province is the (ireat Basin, ao Damed by Fremont, becanse it has no drainage to the ocean.
The first gencral idea of the drainage and principal topograph ical features of the fireat fasin, is due to Bonneville, whofited ont a party which started from Green liver with the intention of makitg the entre circuit of Great Salt Lake. This, as lrving states, was a favorite idea of Ronneville's; and in frepariag for this expeditionall the resulures at his command were taxed. The party, consisting of forty men, did not, however, succeed in carrying out Bonneville's plaus, but were driven, by the diflicult topography und acter Larrenuess of the country on the south side of the lake, toward the west, traveling in which direction they soon came upon the head-watery of the river called upon lionneville'a maps " Mary or Ogden's," Lut which fanow kuown as the Humboldt. This river they follawed until they found that "it lost itself in agreat swamy lake (the sink of the limmuldt), to which there was no apparent discharge." From here the party crosed the slerra Nevada and made their way to Monterey. Bonmerlle'a party was thus the first to explore and map the route afterward generally followed ly emigrants, and along which the Central l'acific-the first trans-contibental railroad-was buit. The jeculjar course of Bear River, here already noticed, was shown on this map, and the general character of the drainage of the lucific coast was, for the first time, correctly indicsted by Bonneville. The first working out of any of the details of the topograpiny of the (ireat Basin is due to Butler Ives, a topographer in the employ of the Central Pacific liailrond, the directors of this work having been desirous of ascertaining whether there wss ans practicable route across the Basid other than that through the ralley of the Humboldt: which, however, was the one ultimately adopited, all other routes having been jound too difficult. Still further and more detailed explorations and surveys were made on the western side of the IVasin, first by the California Geological Surver, and Iater by the Enited States Fingineers; and a belt a fundred miles in width was also surveyed across this region, starting from the crest of the sierra Nevada and going east to the eastern base of the Rocky mountains. This belt was the field occupied by the Fortieth Yarallel Survey, under the direction of Clarence king,
The topography of the Great Basin is wholly peculiar, and bears Topography no resemblance to either of the two just mentioned. It contains of the a large number of ranges, all of which are very harrow and short. Great separated from esch other by wide intervals of smooth, barren Basia. plains. The mountains are of a low order of magnitude for the most part, though some of the ranges and peaks attain considerable dimensions. Their appearance is strikingly different from the noble and picturesque outlines displayed in Colorado. They are jagged, wild and ungraceful in their nspect, and, whether riewed from far or near, repel rather than invite the imagination.
The Wabsatch, nowever, is an exception. This nolle range is properly a part of the Basin Province, and is one of the finest and most picturesque of the west, but so completely does it contrast with the other luasin ranges that it may be reaarded as an anomsly among them. The topographical features of this region are also fonnd outside of the limits which Fremont assigned to the Great Basin, and reach sonthward towards Arizona, and northward towsrds Idaho avd Oregon.
This great basin is of enormous extent, comprising nearly all of Nevada and large tarte of Ctah, Wyoming. Idaho. Oregon, and California. Instead of beiug one great Lasilu, as its name implies, it cousists in reality of a number of smaller lasins. It is traversed by a series of Darrow ranges, which are in general highy continuous, extending sometimes for hund reds of miles, fiaving a general north and south trend. Between these ranges, lic narrow, fiat valleys Hoored with detritus from the monutains. The rainfall over this region is so light, and the atmosphere so dry, that there are few living streame within its whole expanse. The little rivulets which trickle down the monotain side in the spring are absorbed iu the vallegs at their bascs, so that cach valley in very many enses is a sink for its own watcrs. On the east and the west sides, however, at the bases respectively of the Wabsatch and the Sierra Nevada, is a lake, or a serles of lakes, into which flow considerable bodjes of water from these ranges.
On the east fo lirent Salt Lake, having an extent of 2.310 square Surromanmiles, and receiving drainage from an area of 32.400 syuare miles, iugs of the larger part of which consists of high momutalns. The rapidity Great
of evaporation in this dry climate ls so great that the Juke is kept Basin. at approximately the same level despite the liberal contrlbutions made to it loy its tributary atreams.

The middle portion of the basin, along a llne running down eastern Nevada, is more clevated than that of the east or the west side, forming a sort of division, or water-parting, between the two portions. such of the waters as do not immediately sink fiow of toward the Great Salt lake on the one sifie and the rinks at the base of the sierras on the other. The latter are known as the Caran lake and sink. Humboldt l.ake, Mtud and Pyramid Lakes, forming a linealong the western part of Nevada.

Into this system of sinks flow not only the streams from the
east slope of the Sierras, but the Humboldt River-a stream which rises iu northwestern Utab, and, flowing directly feross the trends of uumherless ranges, receiving more or less water from them all, reaches the Carsou siuk scarcely larger than at its head.

A third system of sinks may be mentioned, viz., that lyiug in central Oregon, of which Harney's lake is the principal one.
It remains to give a slight sketch of the ranges of the Pacific division. They cousist of the Sierra Nevada of Califoruia, the Cascade range of Oregon and Washiugton Territory, aud the system of cosst ranges which border the Pacific. These ranges hare one very marked feature in commou; they are almost precisely paralle! throughout to the line of the I'acific coast. Treuding in the southern balf considerably east of south, they turu at ahout the parallel of $42^{3}$ to a course almost directly north.
The great mass of the Cascade range has the form of a volcanic plateau of an elevation very little above the country on its castern horder. At intervals along its erest, however, are stationed high volcauic peaks, ranging from 8,000 to more than 14,000 feet above sea-level. Among these may be mentioned Mout Rainier, in Washiugton teritory, 14,444 feet bigh; Mount Shasta, 14,442 feet high, iu California; and Mount Hood, in Oregon, 11,225 feet iu height. In mortheru Califoruia, just south of Mount Shasta, the range is very much broken down, and at this point the Pitt River, the head stream of the Sacramento, has cut its why through the range into California. Beyond this gorge again the range coutinues, with but slight change in its characteristics, until we have passed the head of the Feather River, where its eharacter changes from that of a volcauic rauge to one of granite and gneissic rocks. With this change comes an increase in elevation, at first gradual, but ultimately attaining enormons proportions about latitude $36^{\circ} 30^{\prime}$. Here the range has a great bresdth, while most of the peaks reach elevations of more than 14,000 feet, and the passes have au clevation of about 12,000 feet. In this regiou is the highest reak of the sierras, Mount Whitney, which falls but little short of 15,000 feet, and is the culminating point of this group.
West of the sierras and the Cascades lies the grent valley, extendiug from Puget Sound southward into the lower part of California. It is walled in from the Pacilie on the west by the Coust ranges. In Washington territory it is drained by numerous minorstreams flowing throngh the Cascade aud the Coast ranges into the Columbia River and Puget Sound. In Oregon it comprises the valley of the Willamette aud the upper valleys of the Rogue and the Umpqua Rivers. In California it comprises the valley of the Sacrimeuto and the San Joaquin. These valleys are separated from one another ty cross-ranges of monntains, which have the character of spurs sent down by the Cascade range, joining the Cusst rauges on the west. The great valley is terminated hy the westward treud of the Coast ranges and their junction with the Sierra Nevada in sonthern California.
Of the Cosst ranges little need be said, except that they are of minor elevatiou compared with the eastern part of the system, rangiug from 3,000 to 4,000 feet south of the bay of San Francisco to 5,000 or 6,000 feet iu the uorthern part of the State. They bave, however, a very important effect in modifying the climate of the great valley-an effect quite as important as that of the Sierra Nevada and the Cascade rauges upou the climate of the region lying to the east of them. Want of navigability is the characteristic of all the streams which drain the Cordilleras. Iustead of vast stretches npen to steam navigation, as with the Mississippland its tributaries, allowing aecess to areas 2,000 and 3,000 miles away from its mouth, we have the Colorado, which is of little account for the purposes of navigation, the Columbia, with two portages before the Cascade rauge is crossed, and the Sacramento and the San Joaquiu, uavigable for moderate sized boats foronly a few score of miles. With these exceptions there is no stream of any importance opening access to the interior along the whole Pacific const. On the other hand, the amount of waterpower stored in the streams of the west is fabulous. All the streams fall rapidly through nearly their entire courses, and in and near the monutains there is an abundance of water.

## THE APPALACHIAN REGION

Leaving now the Cordilleras, we have next to consider the eastern border of our territory-the northeast and southwest-trendIng mass of rauges-known as the Appalachian region. In this portion of our brief resume of the physical features of the United States we shall have to rely mainly on the labors of others, and especially on those of Prof. Guyat and of Prof. J. P. Leslie, of the Pennsylvania Geological Survey, who have labored with great zeal and ability in making the topography of our eastern border Intelligible.
A glauce at the map shows that the central portion of North America, from the Gulf of Mexico to the Arctic ocean, is a regiou of great rivers and lakes, and not of mountains. A sinking of the land of less than 1,000 feet would open a water-way through from north to south; 2,000 feet of such a sinking, or an equivalent
rise of the ocean, would divide our territory into two distinct and remote portions. Ou the east we should have a comparatively narrow belt of laud, extending in a nortbeast and southwest directiou from Pennsylvania to Georgia, with groups of outlying islauds on the north, especially in about latitude $44^{\circ}$, where the tops of the Greeu, the White, and the Adirondack mountains would rise in the form of lofty and precipitous islauds above the waste of waters. On the west the mass of land remaining uncovered would be of graud, almost continental dimensions, for its breadth would be fully equal to 1.500 miles narrowing as we followed it northward, while in length, north and south, it would extend eutirely across our preseut territory. The breadth of the ocean separating these masses of laud would he not far from a thousand miles.
The Appalachian chain extends from the promontory of ciasur, Appal in a general sonthwesterly directiou, for a distance of about 1 , $\because n$ chian miles, into Alabama, where it dies out, and is buried under the horizontal strata of more recent geological formations, which cover nearly the whole surface of that state. The base from which this chailu rises on the eastern side is the Atlantie seaboard, which, in the early history of the United States, seemed to be the whole country, and which is still commercially the most important. and is the seat of our largest citjes. The plain is slightly inclined toward the Atlautic, and its elevation ahove the sea is incousiderable. In New Eugland it hardly exceeds 300 to 400 fect; bnt toward the south, after passiag the bay of New York, where it is uesrly at the sea-level, it gains in altitude aud also in width, finally attainiug a leight of a thousand feet at the base of the mountains and a breadth of some 200 miles. The western base of the Appalachiau range is a platean region, which desceudsgradually toward the great lakes aud the trihutaries of the Ohio, having a general elevatiou of a thousand feet or more, but deeply gushed by the streams which trayerse it and run in valleys depressed from 300 to 500 feet below the general level of the conntry
The Appalachian chain prescuts, iu many of its features, a most marked contrast to the Cordilleras just described. Prof. Guyot calls attention to a couspicuous feature of the most folded portion of the Aphalachians, characterizing the chaiu through its entire length; that is, the existence of a great central valley, running through the system from northeast to southwest, which can be traced without difficulty, althongh not perfectly uniform in its development. It is the Lake Champlaiu and lludson River valley in New York, the Kittatinny valley of Penusylvania, the great valiey of Virginia, aud finully, still farther south, the valley of East Tennessee. The ehain, or the system of chains, bordering this central depression ou the southeast is also a persistent feature of the Appalachiau system ; for it extends, with bnt few interruptions, from Vermont to Alabama, being kuown by a variety of names as it jasses from one state into another. It is the Green Mouutain range of Vermont, the highlands of New York, the soutb Jountains of Pennsylvauia, the Blue Ridge, of Virginia, and, finally, the Irou, Smoky and Unaka Mountaius of North Carolina and Teuuessee.
Possessing these features in common as a whole, the Appalachian chain preseuts three subdivisions, each exhilitiug its own well-marked peculiarity of structure. These are the northern, extending from Gaspe to the IIudson; the middle from New lork to the Kanawha, or New river, ju Vmgima; the southern from New river to the southwestern extremity of the system. Each of these subdivisions has its peeuliar curvature and general direction. The northern trends to the uorth from the Hudson river, to near the Canada line, there bends to the eastward, sweeping a great curve, so as to fresent on the whole its concavity to the southeast; the middle subdivision also curves quite regularly, the ridges trending from east and west around to southwest, so that the concavity faces the Atlautic shores, while the most southera portion of the range, from New river southward, bends to the west again, so as to form a geutie curve concave toward the northwest.
The most northern division of the three is quite distiuct from the oue next south, both geographically and geologically. It iucudes all the mountrin grouns and ranges north and east of the alleys of the Mohawk and the Hudson rivers, which make a complete break through the system, both vertically and longitudinally, forming the great natural highway between the east sud the west, or between the glast lakes and the Atlantic seaboard. This was the first route across the country which was traversed by canal and by railroad. So complete is the physical break here that a rise of the ocean of 400 feet only would separate all the extensive regiou included between the St. Lawreuce, the Atlantic ocean, and the IIudson and Nohawk valleys into a great island entirely detached from the rest of the continent. A rise of ouly 140 feet ouly would detach all that country which lies east of the fudson and Lake Champlain.
ill any geogrsphical treatment of this eastern group of the Geagr Appalachians the subdivisions takeu will necessarily be ratherica! tr artificial, for the mass of elevation is very irregular in its derelop- ment. ment. The most continuous ranges are the White mountains, the creen mountains, and the Adirondacks. Of the first-named group Mount Washington is the culminating point, 6,288 feet
bigh; of the last mentioned. Tahawas or Mount Marcy, with an ajtitude of 5,379 feet, is the domiuating peak. Greslock, ia Massachusetts 3,505 feet, and Mount Mansfield, in Vermont 4,430 leet, are the bighest points in those states.
The iine of summits extending through Massachusetts and New Ilampshire, heginaing with Wachusett, on the south, nud extead ing up to the White mountains, through Monadnock, suappee Kearsarge, and other peaks. is broken ami irregular. Both the White mountains and the Adiroudacken are rather isolated masres, while the Grenn monntains proper are in more intimate couneetion with the Camadian range, which terminates in Gaspé.
The Central division of the Appalachian chain extends from the Hudson river to the Kasawha, which makes an almost complete ent acrose the chaiv, heading in the Blue Ridge, and marking an importaut change in the character of the topography. This eentral division is ahout tiou miles in length. It is very uarrow toward its northeru end. but widens out in l'ennsylvauia, decreasins again in Virgiuin, It is composed of a considerable number of sibordinate chains, mach curved toward the west, and Femarkable for their regularity, their parallelism, their abrupt deelivitice, and their moderate elevation, both relative and absolute, which rarely rises to 2,500 feet above the sea-level.
West of this division of the Appalachian chaln is the great phatean, which occupies ali that part of New lork which lies sobth oi the Mohawk, and also the northwestern part of remasyivania, aud reaches an elevation mear Lake Erie of 2000 feet. From this tuble-land the draiuage descends by the grent lakes to the st. Lawrence, to the Gulf of Mexico by the Ohio, and to the Atiantic by the Susquebanoa, which breaks across the whoie chain, finding its way in the most unexpected bunner through gaps in the dif ferent ranges

The topography of the Appalachians in Pennsylvania has been earefuliy worked out by the state Geological surver, and it is so remarkable in its character that some addational details may with propriety be given in regard to that portion of the chain

According to Prof, H, D. Rogers, the mountaia-zone of Peunsylvania may be divided into tive weli-marked pratlel belts, which are as followa when enumerated in order from the enst toward the west: Ist. The South monntains, already mentioned as heing the continuation of the Highlands of New York, aud the equivalent of the Bhe Ridge of Virginia. 2d. The great Appalachian valiey. 3d. The ceatrai Appalachian ridges, or the Appalachian chaju proper. fth. The smb-dileghang ralley. 5th. The Alleghavy monntain, or the soutbeast escarpment of the Alleghavy plateau.

The South mountains have already been alluded to as part of the system of ranges bordering the great central depression of the Appaiachians on the east. In Pennsylvania this belt consists of two detached ranges of hills, oue of which is the prolongation of the New York Highlads, the other the Dortheastern termination of the Blue Ridge. Both of these groups of hils lave a moderate elevation in Pennsylvania, hardly exceeding 600 or 700 feet.

The Appalacbian valley, or kittatiuns valley, as it is msublly called in l'ennsylyaria, stretehen from the Delaware to Maryland. forming a jart of the great ceutrai vailey previously mentioned. It has an elevation of from 200 to 600 feet, and forms a broad, moderately undulating Hlain, baving a widh of from 10 to I miles. This valley is, beynnd doubt, one of the most favored parts of uns conntry-cimate, soil, mineral resourees, and scenery all combining to make it attractive to settlers.
The third division, or the Appalachime chain proper, may we thus described, usiug dearly the language of Professor II. D. Rogers: It is a complex cbain of long, arrow, very level mountain ridges, separated by long, Darrow, parallel valleya. These ridges sometimes end abruptly in swelliog knobs, and sometimes taper off in long, slender points. Their alopes are singularly uviform, being in many cases unvaried by ravide or gully for many miles; in other instances they are trenched at equal intervals with great regularity. Their crests are, for the most part, slarp, and they preserve an extremely equable elevation, being only hereand there interrupted by notchen or gapa, which sometmes descend to the water-level. so as to give passage to the rivers. The whole rauge is the combined result of an elevation of the strata in loug, slender, parallel ridges, wave-like in form, and of excessive erosion of them by water; and the preseut configuration of the surface is one which demonstrates that aremarkatle aud us yet little understood series of geological events bas been coacerned in its lomation. The ridges. which are but the remnants of the eroded strata, are fariously arrauged io groups, with lont, narrow crests, some of which preserve remarkuhle straicluthess for great distauces, while others bead with a prolonged and regular sweep. In mauy instances, two narrow, contignons parallei mountain crests unite at their extremithes and iuclose a deen. narrow, ovai balley, which, with its sharp mountain sidea, bears not unfrequently a marked resemblance to a long, alender sharppointed canoe.

Between the Appalachians and the Roeky mountaius there are within onr borders no condeeted masses of mountain rante-; isolated bill-ranges rise like fslands at various proints, as in missourí
and Arkansas, and there are a few sbort ranges on the South shore of Labesuperior.
North of the great lakes and the St Lawrence, bowever, there is the dividing ridge which separates the waters Howing into the last-bamed stream from those which rnn into lludson's bay. This is an imperfectly kuown region, wonderfully cut up by rivers and dotted with lakes. The highest point of the laurentian range, as these mountulis are called, is supposed to be where the saguenay cuts the chain, and 4,000 teft is given as the approximate elevation, while peaks in the parallel ridges bearer the st. Lawrence exceed hall that beight. Among the summits seen with such pietaresque effect from (gnebee. Mt. St. Ann is the higbest, and the elevation is aiven by Baytield at 2,68 feet.
This range falis off in elevation as we follow it west, and in the country between the ottawa and lake Haron the bighest summita do not appear to exeect 1530 to 1,700 fert. The rauge is made up of rounded hills, demsely wooded on its highest portions almost exclusively with couiferous trects. Its valleys are very wide and full of great jonds and lakes, so that one may traverse almost the Whole region with the aid of the birch eanoe. Sir William Logun noted, in 1863, that over a thonsund lakes have already been laid down on the maps of the Canadian portion of the Laurentian mountains, although the region had betn as yet only imperfectly explored.
Fast of the Appalachian system, and scparating it from the The Atlantic, is the strip of country known as the Atlantic plain. Atlantio This is the portion of the Cnited states first oceupied, und it is Plajns. ta-day the most densely settled jurtion of the country. In New England this region has a widely varying breadth and rough, irregular suriace, while its soil in geceral is not sulticiently rieh to equble the farmers of this regiou to compete suceessfally in the production of wheat or corm with thuse of the Mississippi yniley.
The breadth of the Atlantic piain is least about the bay of New York, the rabges of the Appalachian system here reaching nearly to the sen-coast. Sonthward from this point it increases gradnally in breadth, till it rencbes its maximum in south Carolina aud Georgia. This part, which comprises by far the larger portion of the Atlantic plain, has a very uniform, geutle slope from the foot of the mountains to the sea. The only feazure about it which requires notice is the line of separation between the metamorabic formations, extending eastward from the Appalachians, and the reennt stratified beds. This line is marked very generally by falls or rapids in the streams flowing seaward, which are in yery many cases the sites of valuable water-powers, and mark the head of navigation in all streams of auy considerable sloe, as in the Potomace at licorgetown, antio in the James at Richmond.
The general character of the enast-line may be briefly described. General In Maine it is bluff and rocky, with decep water immediately off character. the shore, which is deeply indented by uumerons bays and arms of the sea. These in tura are dotied by hundreds of islands of greater or less size. Proceediog southward, the character of the coast gradually changes from thls bluf, rocky Daure at first to sandy berches, as in Massachusetts and ou long Island, with small extents of coast swamp. This character develops farther in New Jersey, so that we have along the whole const a line of saudy ishands or reels, hack of which are coust marshes and swamps. The general character of these is briefly described tyy Protessor Cook in his volume on the geology of New Jersey, noder the bead of "Tide Marshes"
They are of very recent origin, and, in lact, are formed largely within the memory of the present generation. The futerval betweeus bigh-water mark on the shore and the beaches or harriera on the sea-side is mainly occupied bs marsh. Tbere are betucen 250,000 and 300,000 acres of marsh on the coast of Sew Jersers. Tho marshes are covered with grass, weeds, or coarse sedge; there is no growth of wood upon them; the upper surface is near the levei of high water, the parts near the water-course being high enough not to be covered by ordinary tides, whlle the parts moro remote from the water-course are lower, so as to be always wet. ['udcrneath, the sod which covers them is made of soft earth of various qualities, the depth of this underlying mud is variable: all, bowever, coming withinthe extreme depth of 40 feet.
Fartber southward the breadth of thls swamp section along the coast increases. On the castern shore of Maryiand there is fnside of the line of reels a section, several miles in lreadth, of swamp and overflowed lad-a paradise for sea-fowi and for the hunter.
in Corth Carolina tbe reef inclose, besides immense swamp rexions, large bays or sounds. such as l'amlico and Abemarle. The character of the swampa and reefs of this state is well given by trofessor W, C. Kerr (Givology of North Carolina, vol. 1, 1s75).
The chain ol long, linear sand fislands called "The Banks," which fringe the entire coast, constitutes a very remarkable feature of the region. Though composed of drilting sande, they form an impregnable barrier to the waves of the Atlantic. They are, in fact. sabd dunes of various elevations, from a few feet above tide level (fumang cases hroken over by stom tides) to 25 or 30 fect, atod sometimes more, as in Kibldevi] hills, along Corrituck somnd. The breadth of these islands varies from a few rods to more than two miles. The largest of them, and the widert, is known as Hatteras island, the easternmost point of whicb ls the
well-kuowa Cape Hatteras. These islanda are composed partly of flat marshes and partly of swells and ridges of beach saud, which the wiud has besped in ridges, often far begoud the reach of the highest waves.

As the sand and comminuted shells are rolled back in wayea from the beach hy the winds, they are in part caught and fixed by stragyling tufts of coarse grass, which has the power of continnous growth upward with the rise of the knobs and ridges of sand, and they are in part carried over into the flats and marshes and the ghallow sounds beyond, which are thus gradually silting up. The hanks are generally covered with low, serubhy thickets of cedar live oak, pige, yaupon, myrtle, and a number of smaller shrubby growths.
Surainps, porosins, and savannas.-There is a large aggregste of territory (between 3,000 and 4,000 square miles), mostly in the counties bordering ou the sea and the sonnds. known as swamp lands. They are locally designated "dismals." or " $\mu$ ocosins" of lands. The Great Dismal Swamp, on the borders of North Caroline and Virginia is a good uype. They differ esscutially in their and irginia is a good type. in ordiuary swamp. They are not characteristic features from un ordiuary swamp. They are not alluvial tracts, or subject to overflow. On the contrary, they occur on the divides or water-sheds between the rivers and sounds, and are frequently elevated many feet above the adjacent streams, of
which they are the sonrces. Some of them are iu large part mere Which they are the sources. Some of them are iu large part mere peat swamps or bogs heing characterized by the occurreuce of au accumulation of decayed and decaying vegetation, from I os 2 to 10 feet deep and even more, which, with the growing plants, acts as a sponge, arresting or retarding the escape of the rain water whether by evaporation or effiux. The promineut ingredients are peat and fine sand, in various proportions.and, wheu of any agricultural value at all, there are also small proportious of clay, irou, lime, and alkalies. The vegetation varies with the character of the soil, and serves, therefore, as an index of its fer tility. The prevalent growth of the best swamp soils is black gum poplar, cypress, ash, and maple. As the soil becomea nore peaty the proportion of cypress increases. Where juniper abounds wea is in excess, and the soil of little value or none. Ou the best lands there is often hesides a rank growth of canes; but such a growth is also often found on aoils too peaty to be of any value Much of the poorest and most worthless tracts of swamp which are covered with several feet of half-decased wood and other are covered vegetable matter satnrated with water, is occupied by a stunted and scattered growth of bay, swamp pine, and other scrubay rege tation; or, if the arainage be a ittle better, with a thickety growth of bays, gallberries, and a few other shrubs, with an occasiona pine and maple. Most of the large bodies of swamp contaiu lands belonging to all these descriptions, and inclose, besides. Within their boundaries, knolls, bummocks, belts and ridges, like islands, of firm land, and some of them large areas of barren, anady soil, covered with a tangle of brambles and tufts of sedge, and in the middle of several of them occur fresh-water lakes of considerable extent.
These swamps are, taken as a whole, quite well settled, a large portion of the inhabitants being colored. This is particularly the case in South Carolina, in which state much of the swampy lower coast region is utilized for rice plantations. The Okeefenokee swamp, of Georgia and Florida, is rather an inland swamp, and is described elsewhere. The Everglades of Florida, which appear to offer great difficulties to settlement, are also sketched iu another part of this report. The swampy region along the coast extends with but few minor interruptious all the woy down the Atlautic coast and around the Gulf. It is not hoverer the Atrautic coast and around the Gulf. It is not, however, so markedy characteristic along the Gulf coast in Ahamam and Mississippi as farther west. In Lollisiana it has a great breadth, and is almost continues to be the sameso far as relates to the line of low sand contini outlying islands, yet the area of the coast swamp becomes very much less, being confined to a small patch about the Sabine lake and narrow strips along a number of the streams. Whether it is due to geological canses, or to the lighter rainfall upon this aection of the coast, is a question which there is not space to discuss here.
The broken, irregular course of the whole Atlantic and Gulf coast affords many excellent harhors, particularly on the New England coast, where the harbors are large, deep aud well sheltered; farther southward the entrances are barrow and shelving, and are liable to be choked upby sand dritted in by storma. The gtreams, iu nearly all cases, form bars across their mouths, formed by the detritus brought down from the upper waters
The Pacific corst. as compared to the Atlantic, ls extremely simple. It contains few harbors of any value to navigation. Those of San Diego and San Francisco are the principal and almost the only ones. The coast is, in general, bluff and rocky, and the water is deep immediately off shore.

THE POLITICAL AND NATURAL SUBDIVIGIONG
Having given a description of the physical character of the area covered by the United States, withont refereuce to politleal divisious, it becomes necessary to state how this region is divided politically, aud how these divisions can be grouped, in a manner as natural as possible.

Some difticulties are thrown in the was of such a subdivision of the country as shall meet with general acceptance by the fact that gome of the States and Territories are so large that they include areas of very different physical character; and also because a nomenclature was introduced, and extensively made use of, when one-half the uresent area of the country wss so little known or considered that a mame for it was not thought of as heing necessary
The area of the Unlted States is at present divided into forty nine subdivisions, excluding Alaska. There are forty-four States. three Territories, and two other subdivisions, neither states nor Territories-the District of Columbia and the Indian Tertitory.

Ans Terrltory is likely, at any time, to be received into the Union as a State; and this may be done by subdividing the Territory, making a state of one portion aud allowing the remainder to remalu in a Territorial condition, or by admitting the whole as one State, or by dividing it into two or more States. Only once has a state heen divided after having been received juto the Union-namely, Virginia-and this was the result of the Civil War; and it is not possible to say under what circumstauces such a thjug is likely to happen again. Nor has any State been remanded back to the Territorial condition after having been received into the Union; although one State-Nevada-has les than half the population required for the election of one repre sentatlve to Congress, according to the last apportionment, based on the census of 1880 . There is, in fact, no provision in the Constitutiou for this exigency
The desirability of grouping these forty-nine political division (Alaska being omitted as not continuous with the rest of the United States) according to their geographlcal situation and topographical and climatic conditions, so that different regions may be spoken of by some collective name, will be erident to all The plan suggested for the snbdivision of the area included Within the United States by Mr. Ginnett, geographer of the census of liso, was " to divide the country into three great divisions, corresponding to the three primary topographical divisions of the country: the Atlantic region, the region of the Great Valley, and the Western or Cordilleran region." The physical character a these different regions has already been indicated at some length Phyeical in the preceding pages. The region of the Great Valley is called by Charact Mr. Gaunett the Central Region, which is again subdivided into two parts-the Northern Central and the Southern Central-the Ohio river and the southern houndary of Nissourj and Kansas being the dividing linc. The Atlantic Division is also divided by him into two anbdivisions by a line following the south boundary of Pennsylvania and New Jersey-these two subdivisions being called respectively the North Atlantic gnd Sonth Athutic divi aions. On the east, the western or Cordilleran division is marked by the eastern boundaries of New Mexico, Colorado, Wroming and Montana. The following table shows the area of each of these Political divisions in square miles and in percentage of the entire area of diviaion the United Statea:

North Atlantic
South Atlantic (including Delaware Bay)
Norther Ueatal
Western.
Total.
AREA.

## 5.6 <br> 9.4 <br> 20.3 39.4 <br> 100.0

[1n the Western Division, as here limited, Mr. Gannett includea an area of 5,740 square miles of "unorganized territory." lying north of Texas and west of the Indian Territory.]

The adoption of thls scheme of subdivision of the country does not the less render desirable and convenjent for varioua purposes a different nomenclature for certain regions, hased more excluaively on geographical position. Thus the States bordering on the Gulf of Mexico will naturally often he spoken of as the Gulf States; the region of the Great Lakes will be so desigusted, and this again subdivided into the Upper and Lower Lake Regious while each great river will give a name to its own adjacent region, as the Ohio Valley, the Upper and Lower Mississippi Valley, the Upper Missonri, etc. Appended is a statement of the namea of the political divisions included in each subdivision of the United States, as suggested by Mr. Gannett:

| division. | SUBDIVIEION. | STATES WITHIN SUBDIVISION. |
| :---: | :---: | :---: |
| Atlantie. | North Atlantic. | Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut. New York, New Jersey. lennsylyania. |
|  | South Atlantic. | Delaware, Maryland, Virginia, West Virginia, North Carolina, Snuth Carolina. Georgia, Florida. |
|  | NorthernCentral | Ohio, 1 ud 1 ana. Illinota, Michigen, Wisconsin, Minnesota, North Dakota, South Dakota, Iow a, Nehraska, Kanses, Missouri. |
| Central. | Southern Central | Kentucky, Tennessee, Alabama, Mississippf, Arkansas, Indian Territory, Louisiang, Texas. |
| Weatera. |  | Montana, Idaho, W yoming, Colorado, New Mexico, Utah, Nevada, Arizona, Washington, Oregon, California. |

The tabular statement following gives for the States and Terri tories a rєвume of their areas, population in 1850 and 1830 , populaton per aquare mile at the latter date, and the increase per cent during the decade 1881-90. The Territories are given ju falies in the table.

POLITICAL AND NATURAL DIVISIONS.

"This includes "["normanized Territory." tEstlmate.

chumate.
In endeavoring to set fortin the principal features of the climate faenerited States, it will be assumed that the reader has made himself arquainted irith the fonography of the conatry, as brietly himselt arguainted wiented fin the loreeding fares. The great influence which cer-

rainfall, and the temperature will be auflictently apparent from that which follows
The United stutes extends from the tropics north geross the temperate zone, and fromser-level to an elcration of over 14.no feet-an elevation which carries with it an aretic elimate. The mean annual tempernture ranges over more than $40^{-}$F., while the extremes of recorded temperature run from 55 ' below zero up to a maximman above 115. The mean temperature of the hottest month of the year, July, ranges from below tiv to alove $90^{\circ}$, while the mean temprature of the coldest month ranges from zero to more than ins. Were the country a plain, the mean temperature of the year would be almost purely a gisestion of latitude; a difference of elevation, however. especially when it takes the form of a monntain range, causes a deflection sonthward of the isothermals, an abrupt rise of about 300 feet of elevation implying a decrease of annual temperature of one degree. Thus we fibd that the Appalachian system causes a very marked deflection to the sonthward of the isothermals. On the puns, however, where the urward slope Is very gradual, it is to be noted that the elevation causes little or no deflection gonthward of the lines of temperature, the plans and phateans generally having a mean amual temperature nearly or quite as blgh as polnts in the same latitude in the dississifli valley or on the Atlantic const. The temberature of the great western flains and plateans is however, modified loenlly to a marked extent by the exposure to west and northwest winds, which have an mbroken sweep in some places for handreds of milea, acquiring remeudous foree. Attention should be called here to the well snown fact that the climate of central Montana. Including most of the settlements an the upper Missonri, is abnormally warm. It lies at a comparatively low elevintion, belng only 3,000 to 4,000 feet above sea-lerel, and is sheltered from the fierce westerly winda by the Missourl range, while the aortherly winds. to which it ia exposed, come from the maisture plains of the saskatchewan.
The two maps showing the mean temperature of the warmest month, July, and the mean temperature of the coldest month, January, as given in the linted states Census for 1840, Vol. 1-ilfustrate, though only to a limited extent, the range of temperature in different sections of the country. The former shows a comparatively limited aumber of grades, runaing from $60^{\circ}$ to $90^{\circ}$. the lines following approximately the parallels of latitnde. excelit where deflected by mountain masses. The influence of the coast in averaging the climate is distinctly perceptible on this map. There is apparently a Dorthward movement of the tomperature lines in the Cordilleran region, showing that in the summer the temperature is abnormally high in this arid section. These charanteristies are illustrated converseir br the January map, whieh also shows the infnence of the sea and other large bodies of water, while in the Cordilleran regiou the temperature lines are borne southward by the aridity and consequently extrme character of the climate. The fourth of these tumperature mapa, showing a generalization from the highest recorded readings of the thermometer, cougled with the fifth map. which showa a similar generalization with regard to the minimum temperature, Illustrates the extreme range of the thermometer in different parts of the conntry. In the former we see $a$ belt rmming along the seacoast from Jaine to Texas, where the thermometer never risea above 100 , While within it is a regiod, stretching from New lork bouthward along the Alsantic pana and the lower Mississippi valley, where the maximum reaches 100 , thus illustratiug in the clearest manner the cffect of the sea in averagiog the temperature. The same thing is illustrated, though not so markedly.upon the mapoiminimum temperatures.
The fonrtu map shows also sdother peculiar characteristic, viz., the fact that as we pass up the slope of the flains the maximum temperature increases, not on a parallel, as in the case of the mean annual temperature but approximately on a contour or on a meridian, beiog apparently proportional to the uridity of the atmosphereand the amount of rainfall. Thls characteristic is, to a certain extent, disyuised in the heart of the cordill.ran region by reason of the great diversity of surface which is encountered there, but in general it holds good throughout.
The map showing minimum temperatures is not so clear on these points. Its lines follow parallels more nearly ; but there fa a marked dellection toward the southwest as we pass westward from the Mississippi valley. The characteristies of thls map are still further concealed by the effect of the detalls of topography in the Cordilleran region. A marked change in temperature, as Well as in raintall, tates place at the crest lime of the slerra Nevada and the Cuscade range. This change is not particnlarly apparent in the ment anmal temperature, but on the map showing the temuratnre of July und Janury it is quite apparent being shown by the slight differesce between these maps. At the bay of sun Francisco the dimerence between the mean tomperature of July and that of January is bat 10 . This effeet is still more marked in the last two maps, where, In the Misslesippi val ley, the runge between maximumaud minimam averages $110^{\circ}$ and in the Cordilleran region $125^{\circ}$. On the lacific coast it decreases to only 60 , showing that this section of the conntry enjoys by far the most uniform cllmate as regards temperature.
The materlal for these temperatore and rainfall maps was drawn mainly from "Temperature Tables" and "Rainfall Tables" prepared by I'rofessor Charles A. Schott, und publlifhed by the mithsonian instimtion. The map of mean ambual temperature was compiled, vers largely, directly from Mr. Schott's admirable chart in the first of the above-mentloned volumes. The rainfall maps were prepared previons to the publication of the last edition of the smithsonian "Rainfall Tables" and, as much new materia had been collected in addition to that published in the first edition, the mans were ploted from original sources.

No lese than gaper cent. of the total population lires between a0 and 70 F . of mean anmal temperature, leavige a rery smal pronortion to be distribnted among the other sections. Of these grouns, those baving a temperature ntove sit eontaln the entire cotton recion those above io, the sucar add rice regions: while between $50^{\circ}$ and $\omega^{\circ}$ is comprised most of the tobaceo reglon. The
prairie region of the Mississippi ralley lies almost entirely below $55^{\circ}$. while the great wheat region of Minnesota and Dakota is mainly below $40^{5}$ of mean annnal temperature.

The hottest part of the conntry is, naturally, the southern end of Florida, while sonthern Texas and southwestern Arizoua come next in degree of temperature.
A rough computation shows that the mean anuual temperature of the collntry is about $53{ }^{\circ}$., to which the location of the population almost precisely corresponds, differing from it by only a fraction of a degree.
We give below a table prepared by selectiou from the roluminous records of the recent work on American temperature, shownog the mean annual temperature of the atmosphere at a given point in each of the forty-nine States and Territories of the tivion. point in each of the forty-mine States and Territories of the nion. town where observations hare been most continuously kept:

|  |  |

The position of the isothermal lines in the United States may now be noticed; and in this connection the influence of the topog. raphy of the country becomes at once extremely appareut. The raphy of the country becomes at once extremely appareut. Tbe marked regularity from the Atlantic coast west to the foot of the Rocky Mountaius, being in gencral only slightly modified in their direction, which is nearly east and west. Tbis indication of a change of temperature, cssentially dependent on that of latitude, change of temperature, cssentially dependent on that of latitude,
is in striking contrast with the condition of things on the Pacific is in striking contrast with the condition of things on the Pacific
coast, as will be seen farther ou. But as soou as the Cordilleran region is reached, the isothermal lines are bent awsy from their east and west course, aud become irregular and often concentric in their passage across the various mountain ranges.
By the character of these isothermal lines, three climatic divisions of the United States are suggested: 1. The Eastern Region, including all the territory lyiug east of the foot of the Rocky Mountains; 2. The Plateau and Moutain Region of the Cordilleras; 3. The Narrow belt on the Pacific coast, west of the Cascade and Sierra Nevada Ranges.
The Easteru diyision is, of course, by far the most inportant aud best known in its details, siuce it is that region where the wealth go hack the farthest, and where the population and first he considered. As the torographical features of this division are simple, and do not anywhere interpose any very decided or not easily overcome harrice to the movement of the people, so the climate partskes of a similar character, the passage from one type c.imate partskes of a similar character, the passage fromone type to another being gradual and decidedly uniform, although rapid.
The isothermal lines of mean annual temperature of $44^{\circ}$ aud $72^{3}$, laclude nearly the entire area of the United States. The corresponding degrees of latitude are about $45^{\circ}$ and $29^{\circ}$, so that the average change of temperature wath the latitude is a triffe over
$I^{2} 6$ for each degree of latitude. The importance of this rapid change of temperature lrith the latitude, with reference to the intellectual and commercial develoment of the country is obrious, and has been already pointed ont by eminent climatologists.
The isothermal of 523 passes through the center of Florida; then, eutering Texas, is suddenly deflected southward, running parallel With the isothermals of $60^{\circ}$ and $64^{\circ}$ to the boundary line of Mexico. The isothermal of $76^{\circ}$ crosses the extreme south end of Florida, almost on the parallel of $25^{\circ}$. The isothermal of $65^{\circ}$ enters Florida just below the parallel of 31, and crossing the state in an almost direct east and west line, passes through the southern part of Alabama, Mississippi, and Louisiana, and into ward to the meridian of $102^{\circ}$, where it is suddenly deflected sonththe United Sound the south Caroliug coast. anses euters the dired erly direction rery ucariy ou deflected sonth and fir west as the meridiau of 100 , when it is deflected sonthward, like the other isothermals, by the gradually increasing elevatiou of the Plateau Region. The isothermal of $60^{\circ}$ is, in its geueral course, parallel with that of $64^{2}$ except that the deflection to the south between the meridians of $80^{\circ}$ and $87^{\circ}$ is greater, owing to the iufluence of the lofty southeru extremity of the Appalachlans. It traverses North Carolina, South Carolina, Alabama; passes into the southern part of Tenuessee: is defected into Mississipm; then enters Tennessee again, passing across Arkansas and the Indiau Territory into New Mexico, when it is deflected toward the south, making two loops as it runs mearly coincident with the meridian of $101^{3}$ to the parallel of $81^{\circ}$ in Texas, when it again heuds to the west, and, alter a southwest course, is deflected toward the northwest. The isothermal of $50^{\circ}$ euters the United States on the Maryland coast. Its general direction to meridiau of $87^{\circ}$ is southwest. Here, in ceutral Alabama, it is deflected to the northeast, following this general direction to the parallel of $3 s^{3}$ in Kentucky, when it beads again to the west and runs in analmost direct westerly course to the meridian of $101^{3}$, where it is detlected to the south, passing through New Mexico iuto Texas, where it suddeuly bends back to the worth, and, after making a long loop in New Mexico, passes in a northwestcrly course across Arizoua. The isothermal of 52 , West of the Appialachiaus runs almost coincidently with the Ohio river as far as Cincinuati, then in au undulatiug course passes in a nearly westerly direction through Indiana, Hllinois, Northern Missouri, aud near the northern boundary of Kansas to the easteru border of Colorado, where it is deflected to the south, and runsin a directiou yearly south by west for a distance of fully five hundred miles along the eastern base of the Rocky Mountains. A large area is included between the isothermals of $44^{\circ}$ and $52^{\circ}$ It comprises: New Englaud, except the larger part of Maine, New Hampshire aud Vermont; the southern and central portious of New lork: Peuusylvania; nearly all Ohto the northern twothirds of Iudiuna and Illinois; the southern half of Michiran and Wisconsin; nearly ail of Lowa; the southeastern corner of Minuesota; nearly the whole of Nebraska; and the southern third of Dakota. The isothermal of $40^{\circ}$ enters the Enited States on the esstern border of Maine, aud, passing through the center of the state, trarerses the northern end of Ner Hampshire and Ver mont. It then passes out of the United States. but enters the country gain at the western end of Lake Superior crossing the central part of Mianesota, bendiug to the south on the meridian of 97 , a ad making a large loop in Easteru Dakota, then turning of 97 , aud making a large loop in Easteru Dakota, then turning
to the northwest, and again passing ont of the United States at he merldian of $100^{\circ}$
West of the meridian of $105^{\circ}$, withiu the secoud climatic division or the Cordillerau regiou, the course of the isothernal is lurgely determined by the position of the several monutain ranges embraced in that area of complicated topography to which the name of Cordilleras is giren. These ranges, unlike the Appalachians, are lofty enongh to produce a decided inuence upou the climate. althongh nowberc reaching what may be called the region of perpetual snow. This deficiency of lasting accumulations of suow. precinitation ery considerable part due to the smallness of the is iu the Sierra Nerada, the former ranges covered to a large exteut with permaneut snow-fields and glaciers descending from them Obscrutions of neen temperature, hov. ever, on the higher ranges are extremely deficicut, so that only a few genaralizations cau be given with regard to the nosition of the isothermals iu that portion of the territory of the United the 1so
The isothermal of $44^{\circ}$ follows a course iu the Cordilleran regiou Which embraces within a great loop to the south, the eutire higher portion of the Rocky Nountains, as far south as parallel 34. The tops of the Sicrra Nevada, Blue Mountains, and Cascade Ranges are also included withiu the loop of the 44 . The Central portion of the Cascade Range, and the Rocky Mountains in the southwestern corner of Colorado, have a mean annual temperature of $40^{\circ}$. The highest part of the Rocky Monntains is indicated as having a nean temperature of less than io. Accurate and long continued observatious iu this region wonld, howerer, furuish an extremely complicated system of isothermal curves, since the ranges are uumerous, and many of them high.
As the land assumes a more decidedly phatean character iu Arizona, Utah aud Nevada, the mean anmiral temperature rises in this portiou of the country. In Nevada, the isothermal of tiz extends as ar north as the parallel of $30^{\circ}$, and the isothermal of $52^{\circ}$ reaches to the Trinity Monntaius in parallell $40^{\circ}$. In this Cordilleran region, We find that a great change may be made in the latitude with tut arery moderate one in the mean annual temperature. as shown by the parallelism of the isothermals with the coast line. The temperaon the higher aud more miform along the Pacific coast, than it is on the Atlantic coast of the runs nearly parallel with the coast, and not far from it from the Cosst from parallel nearly to the 35 th. The isothermal of 520 follows the oast from San Francisco as far north as the parallel of $46^{\circ}$
The isothermals for the summer months-June, July and August -show greater irregularity ou Mr. Schott's chart than those of the

Whr．This holds true especially in the eastern region of the ivuutry．The aummer lsothermals all hend to the north in a very －haracteristic manner，owing in great measure to the sontherly wiuds，which are heated by the Gulf of Nexicu．The summer isothermal of $s 0^{\circ}$ bounds ou the gorth an irregular area，iucludiag Florida，the southern part of Georgia，Alabama aud Mississlppi： Louisiana，the southeastern corner of Arkansas：the southeastern half of Texas；and a tougue of land in New Mexlco．Within this area the mean summer temperature ranges from $80^{\circ}$ to $8 s^{\prime}$ ．The southwestern half of－rizona，and patches in southera and central California have a like summer temperature of from 80 to $85^{\circ}$ ．A stripincluding the greater liart of North and South Carolina，por Minsouri，Arkansas，Kansas，the Mexico．Colurado，Utah．Arizona，and（alifornia，ljes hetweenthe mean summer isuthermals of $\mathrm{i}^{-}$and an＇．The belt near the Ohio extending north as far as the Great Lakes，and south aloug the Appalachian tahle－land ioto Teunessee，Mississipni．Alabana， and Georgia，and west through Indiana，hllinois，lowa，portions of Wisconsin，Minuesota，Dakota，and Montana．Nebraska，and northern Kansas，lies hetween the sumnaer isothermals of 68 and $76^{2}$ ．Ou the Pacific coast the summer isothermals approach more nearly to the mean annual isothermalsjn their characterand pusi－ thou than do those on the Atlantic const of the vited states． The resion of the Vnited states lyiug uorth of the states anmed above has a mean sumber temperature ranging from $54^{\circ}$ to th
The isotbernals for the winter months－December，Jauuary and Fehruarr－in the eastern region of the＂nited states，are more regular than the summer curves，thas appoaching in this respect sotheracter of the mean ammal sothermals．The wine isothermal of 6is．It rans parallel with，and at a little distance from．the Gulf of Mexico．The winter curse of $48^{\circ}$ correspouds rery closely with that of $61^{\circ}$ for the sear aud the winter curve isothermal of $32^{\prime}$ enters the（＇nited states at the sonthern end of Massachusetts，and passes in a southwesterly course across long Isassachusetts，and passes in a southwesterly course across Long Island，just south of New lary cits，through New sersey and across the northern end of Maryland．Where it is detlected to the
south，and makes a long loop aronnd the Appalachians；then near south，and makes a long loop aronnd the Appalachians；then near the Ohio，throngh Indiana，Illinois，Missouri，and Kanses，into
New Mexico，where at the meridian of 105，it is deflected to the New Mexico，where at the meridian of 105 ，it is deflected to the southwest and passes around the Rocky Mountains and through the center of the Great Basin．On the Pactic coast，the winter isothermals also closely coincides with the mean annual isother－
mals．For example，the winter isothernal of 5 ？corresponds in mals．For example，the winter isothernal of $52^{2}$ c
The pecularities of the North American climate which most strongly impress themselves on newly arrived visitors，and which are not so apparent in geveral statistical statements as they are in Nature，may be best sct forth and discussed after the more essential facts regarding the other priucipal climatic elements have been presented．

And it would seem to be next in order to state the principal facts regarding the distribution of the winds in the United $=$ tates， sioce a knowledge of these will he esseutial to an understanding of the important subject of the amount and distribution of the precipitatiou．
The prevaling winds of the Enited states，as of all countries lying in the middle latitudes，are westerly．At the 40 th parallel as an arerage position，and on the mean annual isothernal of $50^{\circ}$ the evidences of this prevalence and constancyare overwhelming． Dr．Gitbous has noticed，with great care at san Francisco．the course of the higher strata of clonds－the cirrus，and the very high stratus－where they were visible，and has fonnd them to come unifarmly from some westerly point．During three years of sery careful registry directed to this particular point in western New York，but three instances of a contrary direction were ohserved． During storms the lower clouds are from various foints，and the wind is quite rariable during the greater storms；two strata of different movement often lying beneath that from the west，yet the stratum from a westerly point usually deposits the rain，and when it ceases the rainfall ceases，though the lower strata may when it ceases the rainiall ceases，thongh the or even longer．
Below the 35 th parallel and on the Gulf coast ouly，do the show ers of summer take a different movement，showing that the stra－ ers of summer take a different movement．showng that the stra－ move from the west，but from the east or sontheast－an inflection of the trade－wind mingling with a local coast wind
The following tahle．arranged from data firmished hr the signal Service Burean，gives an idea of the direction of the wiud in vari－ ous parts of the country：

The winds along the whole extent of the Athatic Coast region have a marked resemblauce in their important features, wotwithstanding the great difference iu latitude. Westerly winds predominate duriug the entire year; but they are
erly in summer, and worthwesterly in winter. In the district between the Appalachians and the Mississippt Westerly aud scnthwesterly wadsare prevalerritory in the southsummer. Ont the other hand, over a large territary ine the southwestern portion of the ern Wyoming and Colorudo, Arkausas. Texas, (Ttah, New Mexico and Arizona, the summer wiuds are from the sonth, while the winds of winter are north and northwest. In northern Michigan, Wisconsin, and Minnesota, this reversal of the winter winds is less marked. In New Mexico and among the Rocky Mountains generally, the winds are of the most extremely irregnlar character. At the passes of the sierra Nevada, and at all eutrances from the coast of the Facific to the jnterior, arid districts and deserts, there are violent and continnous westerly winds. On the eoast of Califoruia, the inward draft of air produced by interlor this us the locality of the "Mexican Mousoou," blowidg alternately up and down this coast, or northwest and southeast. The duration of the northern mousoon is from December to May; the currents of air are from the northwest, and nearly parallel with the May to september the carrents of air are from the sonth and sonthwest. These are the stormy months, attended with great explosions of electricity, and with coplous and constant preeipitaexplosions of electricity, and with coplous and constant preeipitabring a northwest wiad on the coast from the daud to the sinth prinallel, and thenth or southwest wind for a long distance below parale, and the entrance to the Gali of Californig-lines which, if projected to the interior, would eross nearly at right angles over the central areas of the dry interior. On the other side of the continent the southeast monsoou of Texas blows direetly toward the northwest wind of Califoruia-all proving how great and important this agency of interjor rarefaction is in producing the surface winds of the latitudes below the well-determined belc of westerly winds. To sum up what has hecn said in regar

1. The influence of the trades is hat very slightly felt in the extreme sontbeasterly portion of the country
2. The prevailing wiads elsewhere are, ju geacral, westerly 3. On the Atlantic coast. east of the Appalachians, northwesterly winds mevail in winter; sonthwesterly in summer winds gouthwest and west winds prevail both in winter and summer. 5. Orer a wide area, extending from sonthenstern California to Missouri, and along the hase of the Rocky Mountains from New Mexico to southern Dakota, the winds of summer are nearly the
reverse of those of winter, being south, soutbeasterly or sonthwesterly, with a great predominauce of southerly; but north and westerly, with agre

Ratufall.
The prosperity of a country depends largely upon its rainfall, as, to a very great extent, the primary industry, that upon which ish in a degree directly promortioned to the amount of moisture of rainfall, this countiry receifes in its different parts a very different supply. Throughout the easteru half of the Uuited states, the rainfall is ample fol all purposes of arriculture, while in the western half, with the exception of a narrow strip along the Pacife coast, the supply is very defieient. With the exception of Ge cordileran region, the rainfall is nearly all derived irom the Gulf of Mexico and the Atlatic ocean. Of the two, the principal
source is the Gulf. The wara, moist currents whichaccompany source is the Gulf. The waran, moist currents which accompany the Gulf Stream Irom the Caribbean sea are not deflected toward the eastward in the Gulf of Mexico, as tiue great oceanic rirer is,
but pass northward and eastward over the laud in a hroad helt 3xtending from the coast of Texas to the peninsnia of Florida. Judging from its effects in the form of rainfall, the central portion of this eurreut passes over eastern Iouisiana and Mississiplyi and western Alabama. The natnial result of leaviug the warm oeean surface and entering the continent is to cool these air euralong the northern shore of the Ger vapor. The heaviest deposit is Nississippi and Alabana, and the western parc of Florida, where the rainfall reaches 60 iuches per annum. Were there no monntains or other irregular topogriphical features to modify the raiufall, this waye would inovéinland in \{ northesterly direction, the precipitation deereasing eastward, northward and westward, the This form we see roughly ontlined in the western part of the Mississippi valley, the rainfall decreasing regularls to the northward and westward. To the northeastward, however, these moistureladen currents encounter the southern end of the Appalachian laden curreuts encounter the sontheru end of the Appalachian
chain, and are dricen atonce up to bigh altitudes, where they are forced to disgorge their vapor, giving to this end of tbe moumtain system a heavy raiufall; while farther along the chain, toward the northeast, the rainfall diminishes, becoming even less than that of the lower country on the east and west. The portion of the moisture-laden current which passes to the eastward of the Appalachian chain meets and mingles with moist air enrrents
parts of North and Sonth Carolina, an area of obnormally heavy ainal. A second source of moisture is the atlantic ocean. of heavy rainfull along the Athatic coast. reaching from Florida to the nuighborhood of the bay of New lork. This strip is quite narrow, being confined to the coast and its immediate neighborhood. Back of that, and over the greater portion of the Atlantic plain, the preclpitation is notably less. The conditions of the coast as regards rainfall are somewhat ehanged north of the latituda last mentioned; that is, near the bay oi New York. The Gulf Stream, whieh has been gradually treading off shore, is here at a considerable distance from the coast. Between the coast and the Ginlf stream has appeared apolar current flowjug southwesterly. The contact between the warm air currents of the Gulf tream and the cold winds accompanying this polar current undoubtedly causes the heavy fogs which prevail on the banks of Newfonndland and St. George's Banks, exteuding, jn a greater or less degree, to the New England coast. Althongh there is a decrease in the rainfall of this part of the coast from that farther sonth, yet it is not particularly marked. The precipitation is, however, greateat on the coast, and decreases inland.

Learing now the eastern half of the country, let us trace the rainfall westward. The lines indicating a smaller degree of rainfall succeed one another at interfals more or less regular as we go west, out of the course of the great contimeatal wave of moisture, and up the slope of the plains. The country bere is noiform and geaerally level, and there is nothing to interrupt the regular decrease in the amount of precipitation until we reach the base of the Rocky Mountains. From this line westward to the Sierra Nevada, we find the conditions of rainfall which are iucident to a monntan country accompanied by a dry atmosmhelp. Thang the Cordilieran region as a whole, with the exception of that part ying west of the Sierra Nevada and Cascades, the rainfall prohahly does not weragemore than 10 or 15 inches unnually. This, however, is not deposited uniformly over tine conntry ; there are certain conditions under which the rainfall in some parts of this region is much greater thay in others. Other things heiug equal, the higher the latitnde aud the greater the altitnde, the greater will be the rainfall. Uuder this rnle the more northern parts of the Cordineran region enjoy agreater rainfall than the conthernparts. The monntains and high plateans are better watered than the low lands. The best-watered parts of this region are the northern marts of Washington and Idaho, the western Fart of Montama, northwestern $W$ yomius, which includes the elevated region known as the Ypllowstone National Park and the high fateans and ranges of central Colorado. The most arid portions, and those which receive the least rainfall, are western drizona, southern Vevacia, and sontheastern California. Althongh thronghout this region we have but few and scattered observations of rainfall the
 certainty by the eharaeter of the vecetatom Everywhere arbo certanaty be the edaracter or the yegetation. Ererywhere arborecordingly we find the higher plateans, the mon of randall, nud accordingly we fiud the higher plateans, the monntains, and tho regions in the higher latitudes covered with forests. A second zone of rainfall is indjeated by the bunch and gama grasses which cover the plains and most of the mountain ralleys. Theyindicate a rainfall not ingeacral sufficient for the neuds of qgriculture. A
third zone is indicated by Artemisia. or "gage brush," as this characteristic westurn shrub is popularly called; while a fourth zone is indieated by the eqetus, the yucca, or by an absence of all vegeation whatever.
As has been suggested heretofore, the rainfall in the Cordilleran region east of the sierra Nevada is in general insufficient for the needs of agrienlture, excepting in a few isolnted areus where locab topograpby indues a rainfall greater than the normal one. In of ceral crops. Generally it engere necessary for the production rainfall than 20 inches, or less rainfall than $121_{2}$ inches durjng the rowing season of crops-that is, during the spring and summersinsullieient for their successful cultivation; and where this sup py is not furnished uatnrally, an equivalent must be supplied by means of irrigation. This limit is reached along a line rumning approximately on a meridian, and passing through the midde of
Dakota, western Neluraska, western Fansas, and central Texas. In the neighlorhood of this linestan hansas, alld central cexas. In the neighloorhood of this line, and extending perhaps a degree on each side of $2 t$, is a delatable ground, where, in ome seasons, the
rainfall is suffient for all crops, while in others it is insuflicient. rainfall suficieut for all crops, while in others it is insuflicient.
This is Powell's subhumid region. As a rule, wherever irrigation is becessary, the possible extent of agriculture, and in consefuence the possible density of settlement, are dependent upon the amoont of water carlied in the streams. In most jarts of the Cor. ailleran region, there is apparently a far greater amonnt of lana suitable for cnltisation than ean ever be irrigated, even under the most conomical distribntion of water. Concerming this point, however, we are at present much in the dark, the eajacity of few streams having heen measnred, even approximately. ©nder the Wasteful system of irrigation at present jraeticed throughout the West (except in some porlions of southera California), the limit of settlement will very soon be reached, so far as the popinlation is dejendentapon agriculture.
A questjon which has assumed practical importance of an almost ational character is the effeet of the planting of trees and the caining that thcse causes prodimee an increase in rainfall, and conaining that these causes prodnce anincrease in rainfall, and cousequently that it is possible to redeem the whole Cordillesan region hy a judicions system of cultivation and tree planting, par. lieularly of the latter. It is doubtful whether that effect can lie woduced hy this or by fny other means within the power of man. dilleran region do not sulustantiate the theory, the records showing hat the rainfall has not increased in the regions cove ed by our border settlements siuce their earliest formation. At the same time, it seems highly probable that a change has been produced, which, while not affecting the climate, has modified decidedly the condi. tions of moisture. The effects of cultivation wpon the soil in cov-
ering it with vegetation, and eapecfally with trees, has in general fing it to run directly offinto thestreams ar to s, fustead of allow. byg evaporation. In other words.andreams, or to be taken up at once bainfall is rendered eflective for agricultural aner wrolortiou of the fainfall rendered entective for agricultural yurposes. Tbiseffeet and even to some extent inoughout Dakota, Kansas, and Nebraska,
and eren to some exteut in L'tah and Colorado.
respects peculiar, and different from the Pacific coast. It Is in all There along the whole coserent from that of the rest of the country. Sierfa Nevada and the Cascade range, well-defined wot and dry aeasans-the former corresponding to the easteru wiuter alhe dry to the eastern summer. Taking the jear through, the rainfall is very much bearier in the northern part of this section than iu the southern. In westera Washington Territory, it rains almoat conthe supuly of rain in southern calf, while even in the wet seasom, an explanation of this peculiar climate is to
ocean currents and the prevailing winds. to be fonma in the ocean curreats and the prevailing winds. The winds on the west and southwest. These winds pass, on nearing the const, over the great Japanese current, which morth of Oregon, is relatively to the land, a warm current, while south of Oregon it is, rulatively, a cool current. In passing over this portion of the sea, the atmos phere becomes anreharged with moisture. In reaching the cuast depends upon the chauge of temperature which it encounters North of Oregon, the land being, as stated above, colder than the Gea, there is great precipitation, while south of that state the land belug the warmest the precipitation decreases, till in southern California, where the differenee between the sea and land temperature is the greatest, it is almost oothing. The line of demarkranging northerd inerent temperatures varies with the seasou thus giving the alteruations between the wet and dry seasons peculiar to this cosst. The influence of the mountains of the nomeaa of this climate. still plays a cery sccount for all the pheascent of the warm eurrents up the mountain sides of conrse cools them Fery greatly, and causes them to deposit whatever remaining molsture they may contain. To illustrate the extent of the action of monntaiu ranges, it may be stated that. althongh in the ralley Sierras it has been found toinfall is very light, yet, upon the hjgh The colder months in the reach 90 inches in a single year.
The colder months in the United states, including May and Sep tember of the warmer months. precipitate most of the raiu aud
anow which falls in what are called general atornis. Mosi of the anow which falts in what are called geueral stornus. Most of the ton is in storms of two or three days' duration. A south or south east wind, with high temperature and a palpable sense of prepara tion, usually beging the change; east and vortheast winds follow next for a day or more, during which most of the rain falls, aud *est and northwest winds blow with unusual strength for two days following, restoring the equable and averuge weather for the month. In the Northern States, a greater number of mouths is inoluded in those of general rains, which may occur in evers month of summer, though they rarely do so. Inthe Gulf states the period of aummer showers is more extended geuerally, though where the hurricanes of August and September occir, as they do in all the Sonthern States bordering the Gulf and the Atlantic, the number of extended rains ju the summer is more nearly equal to that jn
New York and New England. In the southweat, at adistance from New York and New England. In the southwest, at adistance from the coasts, thes are rare from the elose of April to the middle of October; in the interior fartber west they are equally rare, and on the Pacific coast they belong only to the rainy months. But ou the Pacific the rains have little, if any, corresnondence at any scaan with those east of the Rocky Monntains.
Some geveral distinctions should be made at the outset of the examination of storms in the temperate latitudes. The hurricanes, typhoons and tornadoes, each of whieh more gemerally be long to the tropies, frequently enter these latitudes in their origi asi forms, and subsequently become blended with the forms which originate here, either by eucountering one of these. or by putting on such forms by a gradual process of change. The West lndia burricanes $\operatorname{mmpress}$ their character ou a series of successije or their approach to temperate latitudes, aud the tracks of these in the western Atlantic and along the coast uresent the most frequent jnstances of the mingliug of storms which were oricinally wholly different with the widely extended rains abore the $35 t h$ wholly
The observations with respect to the general winter storms of the United States may be stated as follows

The general winter storms of the Cnited states often cover an area of from three to five hundred miles in digmeter, which area is usually oblong or ovol, wjth its greatest jeagtl from southwest to northeast.
2. They all more eastward with the westerly winds of the belt where they are formed, and in a line with the isothermals of the mouth in which they occur-coming from a lloint north of west at the Mississippi river, and leaving the Atlantic eoast in a direetion Dorth of east. This course eonforms in both eases to the course of the isothermals; or, in other words, they do not leave the measure of beat where bey orisinate to go into colder or warmer climates.
3. Their movement is generally at the rate of movement of the air in these latitudes, or uearly tweuty miles per hour: but it may he much grester, or yery little
meridian and an an and an this belt, and at ant meridian. and they have egually no polnt at which thes are more

The average snow fall in central Connectient and nver a large part of easteru New York exceeded farty inches, and in flaces this was iiled up in drifts of from fiften to forty feet in height. The maximum precipitation re. ported (5.7s inches) was at Middletown, Conn. This remarkab?:
storm was the result of a conflict between a cyelone advancing from the couth, hut deflected to the west
and a cold wave coming from the west.*

## the forests of north america.

The North American continent, or that part of it situated north of Mexico. which will aloue be considered here, may be conveniently divided, with reference to its forest geography, into the Antlavic and Pacific regions, by a line following the eastern base Athatic and Mountains and ius ontlying easteru ranges from the Arctic circle to the kio Grande. two divisions of the consibutiou as the clinate and topography of A eatern America differ from the climate and topograpasimilar facific slope. The canses which have produced is the clilomatic pitions of a geological era carlier than our own and in the uditions of a geological era earlier than our own and in the be discussed here
The forests of the Atlantic and Pacific regions, dissimilar in omposition io the ceutral part of the continent, are united at the contioent north of the fiftieth degree of latitude. One-half gi the speeies of which this northern forest is compused exteuds ironn the Atantic to the Pacific; and its geveral features, although differing east and west of the continental divide, in conformity with the climatie conditions peculiar to the Adantic and the Picific sides of the continevt, still possess considerabic also united at the south by a narrow strip of the flora peculiar to the flateau of northern Nexico, here extending northward into he vited states. Certaid characteristics species Pacific, and bhile the peculiar features of the eastern and the western slopes of abile the pechountain sustem of the continent are still majotained here, the Atlantic and Jacific regions of the Mexican forest belt possess many geaeral fatures in common. Typical North Araerlean specjes. moreover, peculiar to the Lorest of the Atlantie or of the pheific. minge other monutains of western Texas, the exthe Guadarupe and of the Rocky Mountain range, and the outtreme eastern ridges of the Rocky Foumtain range
The Atlan yosts between the A tlantie and the Pacific regions.
fe forests of the Atlantic rege uoder six natural divisions: the Northeru Forest, the northera Pine Belt, the Southern Maritime Pine Belt, the Deciduous Forest of the Nisissippi Busia, and the Atlantic Plain, the Semi-tropical Forest These natural divisions, although composed in part of species Cound in other divisions and fossessiog many general features in common, are still for the most part well charactera separation naturai and convenient.
The Northern Forest stretches along the northern shores of Labrador nearly to the sixtieth degree of north latitude, swecps to the south of huisod ary, and then nortends sonthward to the fiftieth degree of north latitude on the Atlavtic coast, and the fif the forth degree the louth meridian. It occupies nearly to the fity-tourth aegree at tlantic sea-board and nearly a 10 degrees or degrees in its greatest extuntaios. The region occupied by this Northero Forest, except towards its sonthwestere linits, enjoys a copious rain-fall; it is divided by inmmerable streams and lates, and abounds in swamply areas onten of great exterature eheck the of the surface and the low abnual mean temperature check the species of whe growth, and is composed, to cight. Of these, fonr cross to the Pacific coast. while the remainder, with a single exception, are placed west of the continental divide by closely allied forms of the Pacific forest. The white and the black sprucer are characteristic trees of this region; they orm an open, staje forest upoo the low divides of the water-sheds, and reach a higher latitude than ady other arborescent species of the contideut; the valleysaud wide bottoms are clothed with broad sheets of poplars, dwarf birehes and willows. The forest of this entire region is seattered, open, stunted, and of vo great economic ralue. It embraces, south of the sixtieth degree of borth latitude, the northern bracesion of the great mideontinental plateau, which will be extension of the gre

## Northern

 pine belt.fouth of the Northera Forest the Northernerian of longitude. east of the apalachian Monutain system it exteods soulh over nearly 6 degrees of latitude with a loog, narrow spur [ollowing nearly 6 degrees of latitude. with a lodg, narrow spur collowing the higher Alleghany ridges for mearly 3 degrees farther sonth; west of the Alleghany Mountains, in the region of the great lakes, the pioe forest is replaced sollth of the forty-third degree of tatitude by the deciduols grow th of the Mississlppirasin. ond division of the Atlantic forest may be characterized by the white pine (Pinus ATobus), its most important not its most geoerally distrihuted species. East of the Appalachiau system this tree often forms extensive forests upod the gravelly drift plain of the St. Lawrence basin, or farther south and west appears io isolated groves, often of considerable extent, scattered through the deciduous forest. Forests of black spruee are still an important feature of this region, especially at the north; and withio its boundarics the hemlock, the yellow cedar, the hasswood, the ulack and white ash, the sugar-maple and several species of birch and elm fiod their northern limits, and the eenter of their most important distribution. The bickories and the oaks, characteristic features of the deciduous forests of all the central portion

[^303]of the Atlantic region, reach here the northern limits of their dis tribution, as do the chestnut, the sassafras, the tulip tree, the magnolia (here represented by a single species), the red cedar, tupelo, the sycamore, the beech, and other important genera The Southern Marilme Pine Brll extends froon the thirty-sixth Soutbery degree of north latitude aloug the coast in a narrow belt, varying pine lelt from one hundred to two hundred miles in width, as [ar soutb as Cape Malabar and Tampa bay; it stretches across the Florida peniusnla and along the coast of the Gulf of Mexico until the alluvial denosits of the Mississippi are eacountered; it reappears west of that river in Lonisiana, worth and south of the Red river and he gradually mingles with the decidnous forests of the Mississinpi basin in Arkansas and eastern Texas. This belt is well chracterized by the almost contionous erowth, outside of the brond river hottoms and the immediate neighborhood of the the broad the long-leaved pine ( $P$. palustris), coast. by the oped orest The live oak, the palmetto, and various species of pide charac. terize the coast forest of this region, through the rathrough the and along the borders of the shallow fonds, scattered tarough the pine iorest, different gums, water oaks, hickories add ashes, attain ooble dimensions. The soltherd cypress (axodnm), although extending far lxyond the limits of this uatural division, here attains its greatest development and ralue, and, next to the
long-leared pine, non be considered the characteristic species of the maritime pine belt.
The Decirluous Forst of the Mississippi Busin and the Athmtic Decidona Plain occupies, with two unimportant exceptions to be considered forest. hereafter, the remainder of tho Atlantic region. Through this deciduons [orest, where peculiar geological fatures have favored the growth of Comifuair, belts of mine, groving gregarionsly or mised with oaks and other broad-leaved trees, occar especially upon some portions of the Athantic plain and toward the limits of the Sonthern Maritime Piue Belt, west of the Missiesippi river. the sormer The characteristic bower, in the broad-leaved species of which it is largely composed. Oaks, hickories, waluuts, magoolias, and ashes give composed. Oaks, hethis forest; aud here with the exception of a few species peculiar to a more northera latitude, the deciduous trees of the Atlantic region attajo their greatest develomment and ralue. Trou the slopes of the southerw Alleghany mountains aud io the vallev of the lower Red river, regions of copious rainfall and rich soil, the deciduous forest of the continent attains unsurpassed varicty aud richness. Upon the Alleghany monntaids northern and sonthern species are mingled, or are only separated bs the altitude of these monntains; rhododendrons, laurels, and magnolias here attaining their maximum derelopment, eniven the forests of borthern pines and hemocks which chothe the danks of these monotains, or are scattered throngh forests of other broad-leaved species. The cherry, the tulip tree, and the chestrut here reach a size unknowd iv other parts of the country. The forest of the hed river falley is hardly less varied. The mortheru speckes hrich the clevation of the Amegany mon to the southern Atautic add ciulf coasts are here miosled with plants of the sonthern deciduous forest. The seven species of Carya (the hickories) are wowhere else closely associated. A great fariety of the most importaut oaks grow here side by side; here is to ceatel distribution of the North American hawthorns, orange is peculiar where attain region; the red cedar, the most widely distributed of American (onifica, the sonthern and the yellow piae (Pinus paluctris and mitis) here reach their best development. Just ontside of this region, upon the "bluff" formation of the lower Mississippi valley and of western Louisinna, the stately southern magnolia, perhaps the nost beantiful of the North American trecs, and the beech, assume theirgreatest beauty, aud give a peculiar charm to this southern forest.
The westero third of the Atlantic region is subjected to very different climatic couditions from those prevailing in the eastern portion of the continent; it consists of an elevated plateau, which ialla away [rom the eastery base of the Roeky Mountains, Corming what is kinown as the Great Plains. This great interiot region, on account of its remoteness from datural reservoirs of moisture, receires a meager and mucertain ranfall, sufficient to losure a growth of herbage but not suflicient to support, outside the nar grow botmoms of the infrequent streams, the scauticst forests This treeless plategn extends north to the fifty-second degree of north latitude; it follows southward the trend of the Rocky Mountains far into Mexico, extending eastward at the point of its greatest width, in about latitude $40^{\circ} \mathrm{N}$., Dearly to the videtysetcoth meridian. This whole region is generilly destitute of forest. The harrow bottoms of the large sireans are lined, however, with willows, poplars, elms, aud hackberrics-trees adapted to flourish under such unfarorable conditions. These dimioish in size and number with the rajnfall, and often disapuear entirely from the banks of even the lagest streams toward the western limits of the platean, south of the forty-fifth degree of latiude. Forth and east of these central treeless plains a belt of prairie exteuds from the sixtieth degree of north latitude to southern Texas. The average width east and west of this prairie region, through much of its extent, is not far [rom 150 miles. Its eastern extension, between the fortieth and forty-lifth degrees of latitude, is much greater, however, here reaching the westera shores of lake Michigan, add forming a great recess in the western liue of the heary forest of the Atlantic region with a depth of nearly 600 miles The transition from the heary forest of the easterl and centra portions of the Atlantic region to the treeless plateau is gradual The chate prairie regions. Here is the strip of debatable pround, where a continuous strugale between the fores 1 deliata ground were a there ishere suficient precipitation ol and the flain takes place. There is here sufticient precipitation of moisture to cause, under normal condations, a grow interference forest; but, so nicely balanced is the struggle, that any interfereace
quickly thros the scale. Trees planted within this pralrie belt quickly thros the scale. Trees planted within this prairie belt thrive if protected from fire and the encroachment of the tough
prairie sod, and so exteod the forest line westward; if the forest

Which fringe the eastern edge of the prairie is destroyed, it does not soou requia pus.
The eastern line of the Main, where mrboreacent vegetation is confined to the river bottons and which divides it from the prairie where trees grow uaturally, to some extent, outside of the couditions everywhere, is determiued by the raiusall enjoyed by couditions ererywhere, is determined by the raiuiall cbjoyed by this line is found, npon the fortieth tegree of north latitude, near the uorthern bonndary of the state of Kansas. North of the fortieth degree it gradinaly treads to the west. rearlinge the eastera base of the Roeky, Monutains in about latithate
borthwestern trend of the easteru plain line may be ascribed to the comparatively small evaporation which takes filace during the shorter summer of the north, and to a slight local increase spring and summer rainiall. south of the fortieth degree
phaiu line gradually treuds to the southwest ander the influme
of the Gulf of Mexico, remehing its extreme western point in Texas upon the one hundreth meridiau.
Other causes, however. than insufticient rainfall and a uicely balanced straggle between the forest and the riaib, have wrevithted the general growth of treesin the prairie region cast of the ninety the growth of a heavy forest. The rain falling lupon the prairies of Aliuuesota. Wiscousin, Lowa, Illinois, and Missonri equals in amonnt that enjoyed by the Michigan peninsula aud the whole region sontho lakes Ontario and Erie, while frairics want of suflicient hear, or of sufficient or equally distributed moisture. Which has checked the general sprend of forest over these prabies. The soll of which the miniries are composed, as is and rapidity, is not uasuited to treegrowth. It is wot, jerhapg improbable that the forests of the Allantic recion once extended coutiunously as far west, at least, as the nimety-fifth meridian, athough circumstautial evidunce of such a thory does not exist and the canses which first led to the destruction of the forests iu this region, supposing that they ever existed, cunnot, with the present howledge of the subject, be even guessed at. it is, how ever, fair to assume that forests once existed in a region adapied oy climate. raiufall, and soil, to produce forests, and that then It is not difficult to understand that the forest onee destrosed over such a vast area conld not easily regain possession of the soil protected by an impenctrable covering of sod and subjected to the aunual burnjogs which have occurred down to the present time: while the force of the wiud. whelected by eny forest have made the spread of forest growth slow and difficult. The have made the spread of forest growth slow and diflicult. The
assumption that these eastern praicjes may have once been covered with forests is strengthened by the fact that since they covered with forests is strengthened by the fact that since they
have been devoted to agriculture, and the annual burning has beeo stopped, trees which were formerly confined to the river bottoms have gradually spread to the uplands. Small prairie situated just within the western edge of the forest bave catirely disappeared within the menory of persons still living; the oak openings-open forests of large oaks through which the aunual fires phyyed without greatly injuring the full-grown trees-once the characterstic feature of these prairies, have diappeared They are replaced by dense forests of oak, which only require protection from fire to spring into existeace. In wostern Texas, the mesquit, forced by unmal burning to srow almost entirely below the surface of the ground, is, bow that prairie fires are less common and destructive, sureading over what a few years aco was treeless prairie. The prairics, the or the eastern portions of them situated in the region of abundant rainiall, are fast losing their treeless character, and the forest protected from fire is gradually gaining in every dircction: regions which fifty yerrs ago wering 10 or even 20 per ceat of their ares covering 10 or even 20 per ceat. of their area. These eastern well watered prairies must not, however, be confounded with their
dry western rim adjoining the plains- the debatable gronnd tedry western rim adjoining the plains-the debatable gronnd be-
tweenforest and plain-or with the plains themselves. There is twew no gradual, constant spread of forest growth npon the plains They are treeless ou account of insufficient moisture to develop forest growth; and while trees may, perbans, if planted, survive during a few years beyond the westera limits of the prairle as here lald down, the permanent establishment of forests there does not seem practicable, and, sooner or later, a period of unnsual drought must put an end to all attempts at forest cultivation in a region of such insuficient and uncertain rainfall
It remaios to consider the Semi-tropical Forest of Floridu and the Mexican Furest of Southern Tceas

A group of arborescent species of West Indian ongin occupies the arrow strjp of coast and islands of southern Floricla. This belt of semi-tropical vegetation is coufined to the immediate acighborhood of the coast and to occasional hummoeks or islands of high ground situated in the savanuas whicli cover a grent portion of southeru Florida, checkiog, by the nature of the soil and want of drainage, the spread of forest growth across the peniusula. This
semi-trouical forest belt reaches cape Malabar on the east and the semi-tropical forest belt reaches cape Malabar on the east and the
shores of Tampa bay on the west coast, while some of its representshores of Tampa bay on the west coast, while some of its represent-
atives exteud fully 2 degrees farther north It fis rich iu cumpoatives exteud fully 2 degrees farther north It is rich iu cumposition; nearly a quarter of all the artorescent species of the
Atlantic forest are fond within this insignifieant region. The Atlantic forest are fonnd within oriety, is of flttle economic semi-tropical forest, in spite of hich it is composed here reacher ionportance. The species of of their distribution: Chey reachen the extreme northern limit of then eraly smal, stuataio respectable proportions; the mahogans sue mastle, the roval phim, the manqrove, the sen-grape, the Jamaica doowood, the manchiueel, and other species bere becone considerable and important trees
In western and southern Texas the trees of the Mississippl

Lasin, checked by insufticrent moisture from farther extension -ubthward outside the river bottoms, are renlaced by suecies of the phateau of northern Mcxico. The streans flowing into the Galf of Mexicoure still lined, however, enst of the one-huodredth meridian, with the sjecies of the Athantic basin. Which thus reach sullhward to beyoud the lio Graude. The sexican forest belt of Texas exteuds from the valley of the Colorade river, near the nimety-eighth meridian, to the lio Grande. It touches the coast not far from the Nisere, river, and extends to the eastern base of the mountain ranges west of the l'ewos; bere the species of Which it is componed miugle with those jeculiar to the lacificMexican forest. The furvst of this region. hike that of all conntries of insufficieut moisture is opurn, stumt d, and comparatively of litile value. It is characterlzal by enormons areas covered with chaparral (deuse mad oftenimpeneirable thiekets of thorny shrubs and small trecs), by a stunted nud occasional arboresceut grow th upon the hills and plains, and by fringes of heavier timber along the river bottoms. The most ralizable and lerhajs the most charHeteristic siecies of this whole region- the mesyuit-exteuds to the Prefic const. The Pacific forest region is coextensuve with the great Cordille- Pacific ran Bonntain system of the contincot. The causus which bave region. iullumeed the present positiounud density of these forests must lie sought in the peculiar distribution of the rainiall of the region. The precipitation of moisture upon the northwest coast is unequaled by that of any other part of the continent. It
gradually decreases with the latitude until, in sonthern calior nia, the tensperaturc of the land so inr exceeds that of the ocean that precipitation is impossible through a large part of the rear The iuterior of all this great regiou, shat of by the bigh montata ramges which face the ocenn along ito cutare exteut, is very imper fectly supplied with moisture. It is a region of light. uncertuiu, unequaly distrbuted railah, havier at the acth, as dion the coast, ank decrensig. armat nearly the same proportion. This entirel separatiag lon tand gencrally narow valleys. The precinitation of moisture within the interior region is largely regulated fy the position of the motatain chains. Warm currents ascrading their sides hecome cold, and are forced to deposit the moisture they contain. It follows that, while the interior valleys art rainless or nearly so, the munutain ranges, and especially the high ones recelve during the rear a considernble precipitation of both rain
and suow. If the distribution of the forests of any region is dencudent upon the distribution and amount of mofsture it re cen the continent would be found upon the northuest coast they would gradually diminish toward the south, and eniircly disnppear near the southern boundary of the luited states: while the forests of all the ítuterior region, from the summit of the prancipal Const Langes to the eastern base of the Rocky Monntains, would be contined to the flanks and summits of the monntains. These forests would be heary upon the high range: espucially toward the north; they would disappear entirely from the valleys nod low mountain ranges. An exanination of the forests of the lacific region will show that, in general distribution and density, they actually follow the distribution of the rainfali of the region. These forests well fllustrate the influcnce of mois ture npon forest growth. Within the Jacific region. the heavieat and the lightest forests of the continent coexist with its heavicet and forests of for
The forests of the Pacific region may be considered under four The Pacife divisioos: the Northero Forest, the Coast Forest, the Juterior For Forest. est, and the Mexican Forest
The Nurthern Forst of the Pacific resion extends from nearly the seventieth to about the fifty-eighth degree of north latitnde, or,
immediately nuon the const, is reniaced by the Coast Forest nearly 2 degrees farther north; it extends from the continental divide heremingled with the Northern Furest of the Athantic region, to the shores of the Pacific. The southernlimit of this open, scanty Northeru Forest.composed of spectes whicheatend heruss the continent, or of species closely alljed to those of the Sorthern Forest of the Atlantic region, is still imperfectly hnown, esperially in the interior. determination of the sonthern range in Alsaki and British Columbia of several sucits, as well hs the borthern rauge here of a few others, must he still left to further exploration. The white spruce, the most important sud the most northern species of the forest of the North Athatie region, is here also the most important sjecics. It attains a considerable size as fit north as the sixty-fifth degree, forming, in the valley of the lukon forests of no little locnl fmportance. The eance bireh the Lalsam pophar, and the aspen, familiar trees of the North At Inmic refotalso accur here. The gray pine nud lhe halsam fir Eeners. The larch alone, of the denizens of the extreme Northern Forest of the Atlantic ceast. find wo congener here fin the uorthern Pacific forest
The Pacific
-aried, folcat of fircst, the heaviest, although far from the most and harrow strip from the sixtieth to the fiftieth parallel: liere it Waras, embracing the shores of Puget somad and extcoding castward over the high mountain ranges north and south of the Cobst form follo carriad urehuard over the Gold, selkirk, and other interior ranges of British Columbia. in a narrow spur exteudiog north
nearly to the fifty-fourth parallel. It reaches sonthward along the Cour d'Alene, Bitter-Roat, and the western ranges of the Rocky Moubtalu system Washiugton Teritory, Idaho, and portions of western northeru
Montana. Coast Forest south of the fiftieth degree of latitude aceupies the region between the ocean and the eastern slopes of the Cascade Range; in Califormia the summits of the princlpal sauthern prolongation of these molibtains, the sierra Nevada, mark the easters of the thirty-fiith parallel, although still carried by
 ern boundary of the United States. The Coast Forest. Hike the forests of the whole Pacific region, is largely composed of n few couiferous species, generally of wide distribution. The absence nif braad-leaved trees in the Pacific region is striking; they nowhere form great forests, as in the Atlantic region; when they acenr they are confined to the vallegs of the coast and to the banks of mobutain streams, and, economically, are of comparatively little value or importance. The characteristic and nost valuable species of the northern Coast Forest are the Alaska cedar (chamacyparis), the tide-land spruce, and the hemlock. These form the principal farest growth which covers the ranges and islands of the coast between the sixty-first and fiftieth parallels. Other species of the Coast Forest reacll here the norihern Jimit of their distribution, although the center of theirgreatest development is fouud farther south
The red fir
The red fir (Pscudotsuga), the most important and widely distributed timber tree of the Pacific region, reaches the casst archipelago in latitude $51^{\circ}$; farther inland it extends fully 4 degrees arther north, and in the region of Puget sonnd and throngh the ing forest tree. The characteristic forest of the northwest coast
 although represented by several species extending son south of as cape Mendicino, uear the fortieth parallel, is replaced sor to the the Rogne River valley by a forest in waich forms pecular to the south rather than to the north gradually predomimate. The farest of the northwest coast reaches its greatest density and variety in the narrow region between the summits of the cascade cange and the oceun. North of the fifty-first paralied. fin density, rud sonth of the forty-thira paralel position and character. This belt of Const Forest is ondy surpassed $1 u$ density hy that of some portions of the redwood forest on the Caiformin coast. The red fir, the great tide-land spruce, the bemlack, and the red cedar (Thuya) reach here enormous dimensions. The wide river bottoms are lined with a heavy growth of maple, cottonwood, ash, and alder, the $n$ rrow interior valley with an oven growth of ark. In this great coniferous forest the trunks of trees two or three hundred feet in height are often only separated by the space of a few feet. The ground, shaded throughout the rear by the impenetrable canopy of the forest, never hecomes dry; it is densely covered by a thick carpet of mosses and ferns, often of enormous size. The more open partions of tals forest are choked by an impenetrable growth of various Hucincse of almost arborescent proportions, of bazel, the vinemaple, and other shrubs. The soil which has prodiced the maximup growth of thin, pores luches in depth; the luxuriance of vegetable growth, thereiare, illustrates the in
The general character of this forest in the interior, although composed largely of the species pecular to the fonst, aiter what from the Coast Farest proper in composition and largely in natura, features. The dense, lmpenetrable farest of the corst is replaced, east of the summit of the Cascade Range, by a more apen growth, generally largely destitute of nudelgrowth. The red fir, the hemlack, and the red cedar ( Thuya) are still important elements of the forest. Less valuable species of the Const Forest -the white fir (Abies grandis), the sew, the alders, the mountain bemlack (Tsuga Pattoniana), the hawthorn, the buekthorn, and the white pine (Pimus monticola)-are still represented The latter, a local species upon the coast, only reaches its greatest develop, Coast Forest, the maples, the ash, the oak, the arbutus, and the Aastere do not extend east of the Cascades. The ide-land Alaska cedar allied species of the interior tegion. The
 sented in the northern portions of the immediate Coast Forest, be comes, east of the mountains, one of the most important and char acteristic elements of the forest. The Coast Forest south of the forty-third degree of latitude changes in composition. The tideland spruce, the hemlock and the Thuya are gradually replaced by more southern spectes. The sugar pine ( $P$. Lambcriana) here first appeals. The California lanrel (lombrlulari) covers with magnificent growth the braad river hottoms. The Libocrdrus several aaks, and the chinquapin here reach the vorthern bimits of their distributian. The change nom the therthero orford ceda (Chamacmoris Lausonitana), adding variety and value to the forests of the southern Oregou coast. Farther south, near the northern boundary of Califormia, the redwood forests (Scruoia) appear.
Const of ${ }^{\text {a Ppear }}$ Toast Forest of California will he most conveniently dis cussed under three suodivisions: the forest of the coast Range the farest of the state, extends to the const covering the mass of mountains which here unite the sierra Nevada and the Coast Range: and, third, the open forest of the Nevada long, narrow valleys lying betwer the Sierra Nevada sollth of this northern cammecton the important feature of the Casst Range, as far sonth as the thirty-seventh decrep on latitude, is the hermped strip of territory facing the ocean, and bardjy exceed-
ing thirty miles $1 n$ widuh at the joints of its greatest development The heaviest growth of the redwood forest occurs darth of the bay an francisco: and here, along the slopes and hottom or the narrow canons of the westeru slove of the Caast Range, the maxi mum productive capacity of the forest is reached. No ather forest of similar extent equals in the amount of material which they contain the groups of redwaod scattered along the coast of northern California. The red fir reaches, in the Califormia Coas Range, a size and value only surpassed in the more northern for ests of the caast; the rellow pine is an important tree in the northern partions of this region, and here flourish ather specses o. the genus endemic to this regjon. The forest of the Canst Range is marked hy the presence within its limits of several species o siugularly restricted distrihutiou, C'pressus macrocarpa hua Pinus insiguis are confined to a few isolated groves upon the shores of the bay of Monterey; ibics bracteata ocellpies three o four canons high up in the Santa Lincia mountains; it is found nowhere else; and Pinus Torieyana, the most local arborescent species of North America, has veen detected only in ane or two small groups uron the sand-dmues just vorth of the bay of sam Diego The eharacteristic iorest of the Coast Fange is checked from forther sonthern develomment a little helow the thirty fifth warallel by insufticient moisture the scanty forests which clothe the high declivities of the Coast Range farther south beloug in composition to the Sierra forests.
The heavy forest which covers the western slopes of the Sierra Tevada a forest only surpassed in density by the redwood belt of The sie Nerada, $九$ forest the coast and the fir lorest of Puget solnnd, occupies, in its forests greatest development, a belt situated uetweez 000 and, 000 feet elevation. This forest belt extends from abont ionnt Shasta at the north to the thirty-fifth parallel; iartaer gonth it diminishes in density and disappears upan the southern ridges an the Coast Range just north of the southern boundary of Califormia. Its greatest width occurs in northern Californin, where to the sonth of Monnt Shasta, the sierra system is broken down into a braad mass of low ridges and peaks. The characteristic species of this forest is the great sugar pine ( $P$. Lambertinf), which here reaches its greatest development and भalue, nud gires unsur yassed beauty to this mountaill forest. With the sugar piae are associated the red fir, the rellow pine, two noble fuics, the Isibocidrus; and, toward the central part of the state, the great souvia appenring first in small, isolated groups, and them, farther south near the headwaters of Kera river, in a nalrow belt extending more or less continmonsly far several niles. This heave forest of the Siurns, of the sicis, arown it shows the intluence of warm climate grow a azd and unevenly distributed raimal upan corestgrowt. The trees often remote from one abother, have attained an enomous size; but they have grown slowly. Above this owth. It is here substreches upward to the limits of tree growth. It is here subalpine and alpine in character, and of little economic value. Different pimes and firs, the mountain benlock, and the western juniper, are scattered in open stretches of forest upon the high ridges of the Sierras. The forest below the belt of heavy growth gradually becomes more open. Individual trees are smaller, while the number of shecies iocreases. The small pines of the upper foot-hills are mingled witb oaks in considerable variety. fually dianally
The forest of the valleys is composed of oaks, the individuals falley ften widely scattered and of great size, but howhere forming a foresta continuous, compact growth. The Coast Forest of the Pacific region, nosurpassed in dunsity, is composed of a comparatively small number af species, aflen attaining enarmous size. It presebts the same gencral features throughout its entire extent, except as madified by the elimatic couditious of the regious which t covers. The species whjeh compose this forest range thraugh nearly 26 degrees of latitude, or northern species, are replaceed in the south by elosely allied forms; and, as in the Atlantic region. the so
The Intcrior Forest extends from the southera linits of the northera subarctic forest to the Jlatean of oorthern Mexica; it accupies the entire regton between the eastorn limits of the Iacific Coast Forest and the extreme wistern limits of the Atlantic region. The forests of this cntire region, us compared with the forests east and west of it, are stumtod und remarkanle in their poverty of composition. They are confined to the bigh slopes and canons of the numerous monntain ranges composing the interior egion while the vallevs ate treesess, of antaike of the narrow river bottoms, nearly treeless. The interior forest attains its greatest development and considerable importance nhon the Western slone of the Chliforma siejras and upon the flanss of the high peaks of the santhern Rocky Mountain system, fram Colo13,500 feet 1s.00 reet, to soutche antside the abselutely absolutejy treeless reglans, both in the the proportion or Corest Jountains and the Sierra Nevada, known as the Great Basin. Here the onen, stunted forest is confined to the highest ridges and slopes of the infrequent canons of the low mountaio rauges which occupy, with a general porth and south trend, this entire region The individuals which compose this forest are small, althongh often of great age, and everywhere show the marks of a severe strug gle for existence. seven arborescent species only hase been de tected in the forests of the northern and ceutral portions of thi: region. The mountain mahagany (Corcacarpus), the only braad leaved species of the region, with the exception of the aspen, which throughont the entire interjor region horders, above all elevation of 8,000 feet, all mountain streams, reaches here its greatest characterizes this region. Stunted junipers are seattered over tho

lowest slopes of the mountains, or farther south oftur cross the high valleys, and cover with open growth the mestre, as the lawer foot-bills are locally known. An open orest of riburescent
 characteristic and pecular teature of the red fir and the yellow pine, widely distributed region. The red fir and the yenow pondif region, do not oceur upon the monntain aoges of the Great Basiu.
The leavy iorests of the interior region, found aloug the western slopes of the Calliornia sierras und njon the Rocky Monntain aystem, are, for the most part, situated south of the forty-aecond degree of latitucle. The forests oi the whole nurtheri futerior portion of the continent, outside the rexion oceupied in the northern Rocky Mountains bs the eastern developncint of the Casst Forest, feel the influence of iusufficient moisture: the number of species of which they are composed is not large; the iadividuals are often small and stanted, while the forests are open, scattered, without undergrowth, and coufaed to the canous and high slopes of the mountalas. The most generally distributed species of this northern region, a serub pine (Pinus Murrayama), occuples $₹$ ast areas, almost to the exclasion of other fiecies, and is gradually taking possession of around cleared parallel the red fir (Psrudotsugn) and the yellow pine (Pinus ponderosa) appear: (Psrudotsugn) and the gellow Blae Mountains and in someof the With theni is associated, inacky Mountains. the western lareli ranges of the northern locky Mountains, the western arch
(Iriric occidentalis), the largest and most valuable tree of the (Uriric occidentalis)
The forest covering the eastern slope of the Sierra Nevada corulsts almost exelusively of various species of pine, often of great size and value. The characteristic suecies of this region are the rellow pine aud the closely allied Pinus Jiffryi, here reaching greatest development. The red fir is absent rron this forest,与hile the oaka, mnltiplied in many forms on th

The forests of the southern Rocky Hountain repion, less heavy and less generally distributed than those of the western slope of the sierras, are, as compared with those of the Great liasin, heavj beuse, and valuable. They owe their existeuce to the compara tively large precipitation of moistare distributed over this ele Fated region. The characteristic species of the Colorado monmrins is a suruee (Picir Engrlmanni) it forms, at hetween $\delta, 000$ aud 10, an eet siderable density and great eaury tir of wide northern distribution, and various alpine and subalpine cpecies of pine; at lower elevations forests of yellow pine and red fir eover the mountain sloges, while the bottons of the streams are lined with cottonwood, alder and maple, or with an oped frowth of the white fir (.lbics concoln ), a speejes of the cons Forest, here reaching the eastern limits of its distribution; the 'oot-hills above the treeless plain are covered with scantgroves or tue nnt-pine (Pinus edulis), stunted junipers, and a small oak. which in many formsextends through a large area of the southera nterior region. A forest simes of the same species, exteuds over the blah mountains of New Mexico to those of western Texas aud westeru and northwestera Arizona, where a heavier forest of pine covers the elevated region lying along the thirty-fifth parallel. culminating in the high forest-clad Sau Francisco mountaius of northern Arizona

The species of the interior Hacific region mingle along its sontharn borders with the species peculiar to the platean of nortbern Mextco. The Pacife-Mexiern Forest, althongh differing widely in natural features from the Atlantic-Mexican Forest, bossesses several species pecnliar to the two. The forests of this region are confined to the bigh monntains and their foot-hils, and to the bunks of the rare water-eourses. They disappenr catirely from .he Colorado desert and from the valleys and low mountain ranges of southwestern Arizona. The most important and genetaly distributed species peculiar to the vallegs of this region is the mesquit, the characteristic species of the Atlantic- Mexican region. The suwarrow, however, the great tree cactus, is purhaps the most remarkable species of the region, giviug an unusual and striking apperrance to the dry mesas of central and southern Arizona. appenrance to the dry maxas of central and the boundary of the United States, between the one hundred and filth and the one hundred and eleventh meridinns, enjoy a larger and more regnlarly distributed rainfall than the regions east, and especially larty distributed rainiall than the reghons caser these southerמ wnonntaln ranges are often dense and varied. Upon their summits monntain ranges are often dense and varied. find and pines of the and almost inaecessible npper siopes the firs and arbutus, and Pacifaregion are mingled with wnes, a junijer, un arbutis, and Various other species peculiar to the Mexican patean. Exteasive forests of a cypress of Mexican origin also characterize flif mountain vegetation. The bottoms of the canons are hmed anash. densegrowth of cot tonwood, backberry, a noble sycamore, an ash. a cherry, and other deciduons trees. The high foot-bills and mesas are coveretl with open groves of various oaks, peciliar to Sates Mexlcao-l'rcific region, here reachi
Suchare some of the prominent forest features oi North America dense forest, largely composed, except at the north, of a great variety of broad-leaved species, and extendiug from the Atlantic sea-hoard in one nearly unbroken sheet until checked hy insufticient molsture from further western developmeat-the forest of the Atlantie region: a foreat of conifers, occurying the ranges in the great Cordilleran mountaln system. insurpussed in ithasidy terior-the forest of the l'acific region.
terior-the forest of the lacific region the distribution of North A more detailed examjartion of the distribution of intrate American arborescent genera and species wind serve the comparathe the wealth of the forests of the Atlantic It will show, too, more plearly how wldely the farests of these two great regions differ in composition.

The cconomical importance of the forests of the Enited Statca The economs very freat, but can hardly be expressed by figures. sume facts, icalimporthowever, may be stated in this counectlon. The wood trom the anee of the drest is used in the main for fuel. Although coal exlsts in abun- oreata. dance over certain reglons, and although there are parts oi the thekly settled regions where Iorusts art scanty, there is no district where
Eame woud-even those whleh are lu the Immediate vicinity of coal-a fost-eved deal of wood is necessarlly consumed lu the form of kindfing deal of wood is necessarly consumed in thertant item where anthracite is the cosl sufflled: and, moreover. ojen fires are exteusively used by the weralthier class, In eonjutuction with coal ln furuaces. In other regione where coal is abundant, forests are also abundant, and as these must be cut down to be anwa lnto lumber, or to cluar the land for cultivation, there is a barge sinply of wood available fas fuel, but not fit to be used for buliding or manufacturlug. Fixcebit in the large eitlea, and occasionally lin the towns of second aja third raik. wool is used almost exclusively for the bullding of hoases and barns in the Tnited states. Fences also consume n very large amonnt of wood, this material tellig fn common nae for this purfose wherever timber is abundant, and often where it in not, bs in the prafic states, where, however. Within a few years, wire has begun to be veryextensively used for fenets. Thert in also a bery large consumption of wood for firmlture and for those portions of rafious fmplemeats, especially agricultural, which are man for hoxes and liartils in which farious artleles of merchandise are transported. The cansumjtion of wood in the form of barrels, as renuired by the two articles flour and salt, Ia very larke.
Thegreat demand for chealy wooden ware, and the extenslve use cheap of wood fil billding houses, and for rarions bortions of the tinisb-wooden ings and fitings of houses and barns, has led to the invention of hare. ings and fitings of honses and barns, has led to the in contion of into almost every varietyof forms with very bittle direet beljfrom buman hands. This mukes the coarser kinds of furniture hnd of housebold fmplements exceediugly elecap. As an exanmpe. it may be mentioned that barrels strong enough to hold in transfortation two hundred and eighty pounds
so small a sum as twenty cerits.
The Luilding of $\log$ honses-that is, of such dwelliugs as are Log bousee made hy plling trunks of trees on each other, either in their aatural shape, or partly squared with the axe-ls almost a thing of the jast, although once extremely common. Very few districts in the reglon of abundant Iorests are so far uway from sew-mills and railroads as to make a log house the most comomicul form of dwelling. Oceqsionally some large, substantlal and well-finished buildings ure erected " log-house fashlow." elther as a matter of fancy, or to attract atcuntion by an exterlor of excejtional appearance.

Some idea of the importance of the forests from an economical point of view can be gainerl from the following fighres given by the census of $16 \omega_{0}$, in reference to the manufacture of sawir lumber:

| Number of establishments | 25,708 |

## SCENOGRAPIHICAL.

The great extent of the territory occupied by the United States is a sunficieat reason why there should be a corresponding variety in the scenery. In the early history of the country, when only the Atlantic coast and the eastern side of the Appalachian belt were known to travelers, the landscape was generally considered monotonous by those who visited this region as tourists, or with a view to the enjoymeat and description of its scenery. This impression of uniformity and munotoay was further confirmed, as the Mississippi Valley and the region of the Great Lakes were added to the tourist's range. Mamy persons visited the prairies of Mnnois aud the adjacent Statcs for the purpose of getting au idea of a vast expanse of almost mubroken country such as could hardly be outained elsewhere in the Northern Hemisphere without visit ing southeasteru Russia and the country east of the Urals. The general resemblance of the Apmachian Monntain scenery to that of parts of Northerb and ceutral Elarope-as, for instance, that of the White Monntains to that of the Erzebirge, or that of
Northern New England to that of Scandinavia-conld hardly Northera New England to that of Scandinavia-could hardly escape notice, similarity of topographical features being suplemented in mayy cases by the absence of any specially marked dif fereaces in the floras of the regions in question. Thus the writer having spent a summerib a geological cxploration of New Hamp shire, fonnd himself after a very shortinterval of time trayeling thrangh Southern Sweden. The impression of the sceuic similarity of the two regions was extremely interesting. Not ouly were the rocks, rock-forms and topographical features the same, but the regetation-although, of coursc, not identical so far as the suecies were concerned-made, from the scenic point of view, almost exactly the same impression on the eye in the scandinavian combtry that it did over large portions of New Eugland
In those early days of travel. especially of English travel, to the United States, the dommating idea was to see Niagara Falls which was the preat point of attraction Occasionall an adren turous traveler went farther west and down the Mississippi; but for uiuety-nine out of a hundred tourists who visited this country and described its scenery, Niagara was the fllima Thule. The opening of the "Frarthest West" by roads and railroad, the scieutific exploration of the Cordilieran regiou, the develomment of its mineral resources, and the rapidly growing desire on the part of many to see as much of the world as possible-all this has very greatly enlarged the range of experience in the enjoyment of scenery, while the art of photography has rendered it possible for those not cariag to travel to understand and enjoy the seenic features of distant countries, and to compare understandingly the landscapes of regions widely separated from each other
To attempt to describe the principal features of the scenery of a country having an area of more than three million square miles, is, of course, something not to be thought of in the present con aection. All that can be done is to marate some of the point most visited, and most worthy of being visited, by tourists, and to compare in ageneral way, some of the more striking features of the laudscape of this cuuntry with those of regious of similar scenic character in other parts of the world
Appalachan Mour In doing this we mas begin with the momatains. The Appala chian Monntaia scenery is only to be compared with that of the minor chains of Europe, since these eastera ranges never rise to the snow-line, and are almost always wooded to their summits. The principal features of Appalachian topography have bee already dwelt upon to as great an extent as space would allon; often of exceediag interest to geologists and other close students of nature, they do not exhibit any forms which in grandeur can be compared with those of common ocenrrence in the Cordilleras or the Alps or, still more, in the Himalaya. There are from the scenic point of vew few, if any, uniquc tigures in the Appalachian ranges. The uearest approach tosuch is perhaps the Natural Bridge in Virgizis-an arch of limestone gracefully spanuing a chasm about two hundred feet deep aud sixty feet wide-and the Profile in the Franconia Notch, in which messes of rock are so disposed as to represent, in gigantic dimensions and with striking approach to accuracy in general outline, the profile of a human face. Fully as fine a profile as that in the White Nountains is to be seen in Colorado; but as this later locality is not easily accessible, and is surrounded by an abundance of grand scenery, it is hardy kuown to the geueral tourist, and seems never to have been described, while of the Profile in the White Mountains the descriptions are nmmerons. To the trained eye of the topographer and geologist the extraordinary, intricate and exceptional forms of the ranges and valleys in Central Pennsylvania are of vastly greater iuterest than such accidental and fanciful occurrences as the Profile in the Franconia Notch.

A purely American name for something which is not of uncom mon occurrence in mountaia regions is the word, "flume," which as applied in the United States, and chiefly in the White Monatains, means a uarrow passage or defile between nearls perpendic ular rocks, through which runs astream, and usually Hith a suc cession of cascades. The White Monntain flume. in the Francomia Notch, is the locality of this kind most visited. It is about four
huadred feet in length, and the walls are from twenty to fifty feet
in beight. A deep cut in the sandstone at Keesville, New York, hear Lake Champain, on the Au Sable River, is called a chasm. The term " potch" is used in the White Monntains, and to a lim ited extent in the Alirundacks, for pass or mountan valley. Sim thar passes or depressious in the Appalachiad ranges farther South especially in Pennsylvauia, are called "gals." Those which are deeply cut down, so as to give passage to streams, are called "watc"-gilus;" those in which the depression in the ridge is not sutticienty deep to give passage to a water-conrse, are known as "wind-gaus." The gorge at the great bend of the Delaware whers this stream traverses the Kittatiuny Rauge, and which is known as the "Delaware Water-Gap." is a prominent scenic feaknre of this kind
The puints in the New England portion of the Appalachian sys. New Eng ramic vicws which thes afford are Jount Washington-the ouly point over six thousand feet in elevation in the Appalachians north of sorth Range ( 5290 feet): Mousilnuke ( 4.790 feet), a little farther south; Monadnock, near the southern border of New Hampshire (3,169 feet): Mount Mansfield, in the (reen Mouatain Range in Ver mont ( 4,309 feet): Greylock, in the northwest corner of Massachusetts ( 3.505 feet). The Adirondacks also attract great numbers of visitors, where the lakes and streans afford opportunities for boating and hishing, and where the scenery is extremely attractive especially in the antumu after the leases have begun to change their colol, most of this region beiug stili corered with the prime val forest. Monnt Marcy or Tabawas sum feet, and linteface (1.. 1 eet) are the poiuts most frequeuty ascended in this region fcet in elevation, which offer fine views, and are not at all dificult of access. The Catskill group, is also a region much resorted to br tourists, partly on acconat of the beanty of the scenery, and fartly hecanse it is oo ensily reached from New York. I be high mountain region jn North Carolina is too remote to attract may visitors from the Northera and Eastern states: and the farilities for travel in that region are as yet extremely deficient, in striking contrast with the condition of things in this respect in the monntain dis tricts of New Eugland and New Vork, where almost evers point can be reached by railroad, and where hotels are numerous and commodiaus, and the business of receiving and taking care of "summer boarders" seems to be a most important one for the permanent residents.
The mountain scenery of the Cordilleran region is extremely Cordille varied iu character, as has already been made evident to the Mounta reader in the sketch of the topograpiny of that part of the country sceuery. given in the preceding pages. Only a few of its more important features can here be indicated
In elevation the Cordilleran ranges are comparable to the $S w i s$ Ahn, althongh there is no point in the United States proper quite
 culminuting point of the Beraese Oberland (It 0ag feet -and there are a large number which hase a oreater elevation than the Jung frau (13, fil feet) A very curions feature in the cordilleras is the clow with which clostude os a follo the altitule, as shown by the following table of elevatious of all the threc hundred feet high, all of which are in the Kockr Mountains, and all in Colorado with the exception of the two rolcanic cones, Shasta and Raivier

EA LEVEL.

The above are all the points in the Cordilleras believed to he orer fourteen thousand three bundred feet in elevation, with the excention of Mount $W$ hiter, which has been several times measured, with rather discordant results. ranging all the way from 14,600 to 14,598 ieet; there is good reason, however, for believing this to be the highest point in the United States, not includiug Alaska. All the beights given above, with the exception of Kainier, were obtained by the aid of the harometer, and are not to be taken as being absolutely accurate. The elevations in colo- Eleratis rado by the Hayden Suryes. which are the result of a combination in Colore of barometrical and trigonometrical measurements, are pribably pretty close approximations to the truth. The measurement of Rainler, depending as it did on trigonometrical measurements made at a great distance, are-in the writer's opindou-mot to be accepted as final, and may be farther from the truth than a single barometrical observation wonld have been; but this monntain, althongh seseral times ascended, has not been measured barometrically.
The essential difference between the Cordilleran ranges and the Compart Alps is that the latter are minch more extensively covered with of Cordil snow that are the former, and that this snow gives rise to perma-leras a descending har below the enor-line, and constitut- Alps. scenery of the Iligher Alps, llith the exceptiou of the great vol-

A portion of the conatry which has within the jast few years become the resort of travelers iasegreb of the pieturesque，and which is now quite aceessible by railrosi，is the liesser region of the lellowstoue．Here the sclentitically inceresting and the use－ turestuc unite to furdish a type of situery wlthunt a risal of \％erlaud．The Jellowstone l＇srk，as it is frequently called，be eansereserved by the Cuited states and devoted to public use as a visiting ground or park，with the idea or frotecting it from specth－ lators mad mischief－makers，was early kaown to some of the more adsellturons of the fur－hniters who roancd over the freat North－ west；hat it is only within a few regrs that deserintious of it have bect l＂mblished，and its extraordinary character so clearly estatblished as to induce travelers to nudertake the long jonrdey necessary fut its inspection．Thurmal spriogs in great bumber，Thermas many of whicharethe［eriodically spoutiug，or geyier type；pools Springs． of hot water，both large and smoll，the sides and bottoms of which are lined with the must exquinituly and brilliautly colored micro scopic vegetation；remarkable deposits from the hot springs，some of whichexbibit curjons forms，seen nowwhere elsu，exceftin Asis Slinor Hnd in New Zcaland as it was before the volcanic eruftion of 1 mad ；grand monntain secomery，with water．falls，lakes and deep canons，whase walls are fantastically colored by valcanic deposita and sulphurons emanations－these are the prinejpal features of the lellowstone reglon．It can lie reached by the Northern Pncifie rajlroad，frons a station on which road，called Livingstont ten bundred aud tbirty－ewo miles fromst．Paut，a branchfiftyone miles in length runs io Cinnabar，on the houndars line of the so－ called ellowstone sational Park．Ibere are numerons ex cellent photographs of thls reglon．which has also been finelyillus． trated in a folio volume withe hramo．lithograjhs from paintings by Thonas Joran．The geological and sernic pečularitien of the f゙ellnwstone reeion have lewn fully theldated in varions［＂nited states geological reports，and esuccially in a voluminous one by

Dr. A. C. Peale, included in the second volume of Hayden's Report for the year 1878.
There is a type of scenery of a remarkable character well exhibited along the hase of the Rocky Mountains at various points, and especially at a locality called the Garden of the Gods, near Pike's Peak, and easily accessible by railroad. The attraction here is the remarkable effect of the erosion and withering of the saft sandstones, which occur in beds of great thickness. Many fantastic shapes, such as colnmus or ohelisks, of large dimensions, oceurring ither singly or in clusters, and often capped in the most curions aanner by great flat tables of harder rock, are seen in this intering region. Indeed, all along the eastern base of the Rocky Iountains in Colorado are many strange and picturesque forms, partly the result of direct uplift, and partly of erosion, which are like interesting to the lover of the picturesque, and the studeut of cology. The lang crested uplifts of sedimentary rock worn it ocurved ontlines, and often of grand dimensions, which characterize this region are known by the familiar name of "hogbacks," and the region itself as the "hog-back country.
Of the sacnic effect of the vegetation of the country, and especialiy its forests, notice bis already heeu taken to as great an extent as space bere permits.

## MINERAL RESOURCES

Fron ore was smelted at Falling Creek, Virginia. as early as 1620. The raids upon the whites at this time, made by the Indians, puta stop to the industry. From 1o4s to 101 the business or smefting aud manufacturing iron was successfully carried on at Lynu, Nassachusetts. Abont 1769 there were fourteen furnaces and niore than thirty forges in operation in Pemnsylvauia.
The business of mining for other metals than irou withiu the territory of the United States is of much more recentarigin. To this statement, however, an exceptiou must be made in reference to the metal conper, which had been extensively mined in the Lake Superior region loug before the first visit of the English to these shores. Iudeed, so ancieut are thesc workings that no pasitive knowledge existg as to the people or tribes by whom they were executed. When the regiou in question was apened to the whites for settlement in 1844 , it was found that the copper-bearing rocks aad been mined through their whole extent along the southern shore of Lake Superior and even on the almostinaccessible islaud called Isle Royale. There is no reason to suppose that these ancient workings, which in some places had beencarried to a depth of more than fifty feet in solid rack, were known to the Indians inhabiting that region at the time of the first visit of the Jesuit Fathers iu 1659 -60; and the appearance of the excavations indicates, heyond possibility of doubt, that they had been made long before that time.
Hovernor Winthrop

Ahout the middle of the seventceutb century the metalliferons j= ications commou in New lingland, and especially iu Connectiut, eugaged the attention of Governor Winthrop, hy whom mineralogical notices of that region were sent to England and puhlished in the Transactions of the Royal Society.
Just at the beginuing of the eignteentn century a Frenchman, Le sueur, explored the region of the UPper Mississippi, and sent back to France, rock which he had muned. supposing it to be an ore of copper ; but it proved to be of no value. Later in 1719 and 1720, the French again attempted to explore what was then called the western portion of the conntry, along tac Mississippi near the function of the Missourl; nud some mining of the lead ore, which at that time had already bccomc known, was attemptcd. The precious metals being what was sanght for, and there being noue found in the region, the euterprise was soon ahaudoned.

At the beginniag of the present century, as it appears from what has heen stated, all that had beun done in the way of discovering and developing the metalic weal th of the | mited states |
| :---: | was the mining gad smelting of the ores of iron on a limited scale, in the Atlantic states, and a suall production of lead in the mining region of Missouri. Exact statistics of these metals at the heginuing of the nincteenth century are wanting. The amount of iron produced in 1 sio has been estimated at fifty thouand tons; the production of lead about that time may have becn approximately one thousand tons a year

Gold.
An event of great importance took place almost immediately after the value of the Lake superior copper mining district had heen fully ascertained, in the rear 1844. This was the demonstration of the fact that gold existed in large quantities along the western slope of the sierra Nevada.
The accurence of gold on that portion of the Pacific coast, called by the Hexican-spanish Upurir Caliornia, had been known for several years prior to its discovery by immigrants from the dnited States and workings had been carried on for this metal in the Const Ranges, far south of the lacality where it was discovered in 1848
The demonstration of the fact that aver a vast extent of that distant country gold was to be had in almost unstinted quantity, as it at first-not witnout reason-appeared, led to an extraordinary excitement thronguout the olace states, and to an emigration from all parta of the world toward the newly discovered land of gold on an unprecedented scale of magaitude.

## coal.

The area underlain by the coal-measures in the United States is very large, as will he seeu from the following table, which represents approximately the coal areas of Carboniferous age east of the Cordilleran region. That different portions of the areas here designated are of very different value, as respects quality aud quautity of coal, is certain; and that portions of them do not contain coal-heds of sufficieut thickness or of good euough quality to be
worked with profit, either at present or at any future time, is also an undoubted fact, although these unproductive portions are, except perhaps, in the case of the Western and Michigat fields, of comparatively small extent:-

## Name of the field.

Area. Coal

500 sq. milea.
Rhode Island

Central (Illinois, ludiana aud Keutucky)......... Texas)
Michigan.
59,165
47,250
78,430

Total.
192,045 sq. miles

Of these fields the Appalachlan is at present by far the most im portant, and is likely to remain in this position for an indefinite period. The coal field of Khode island is not now, nor has it ever been, worked to such an extent as to be of special importance. The Michigan coal-field has also no present value, the quality of the caal being inferior, and the conditions not such as to allow successful competition with the coal of adjacent regions. The present relative importance of the different states as regards the production of caal aud the yield of the various fields will be easily recognized from an inspection of the following table:-

Coar. Producen in the Several States and Teqritorieg, not
Incluming the Local and Colliery Consumption, and
the Value of the mines in 1885.

| States <br> and Territoaieg. | 1882. | 1883. | 1884. | 1885. |

The commercial product. exclusive of that which is cousumed at the mines, kaown as colliery consumption, during 1*85, was: Penusylvania authracite $36,137,272$ short, or $32,265,42 t$ long tons, the market ralue of which has beeu estimased to have been $\$ 72,2,4,544$; bitumidous, brown cosl, lignite, and small lots of au. thracite, mined iu Colorado aud ArliansRs, $71,195,328$ short, or $63,5 i 7.2 y+$ long tons, the market value of which bas been estimated
 ahort, or $9 ., 8,32,705$ long tons, valued at $\$ 152.915,264$. The total production, including colliery ronsumption. was liennsylvania anthracite $38,335,973$ short, or $34,224,54 \mathrm{~s}$ long tons, all other coals i2., 621.519 short, or $4,840,668$ dong tons, makiug the total absolute troduction of the coal mines of the Uuited States for the year, $110.957,522$ short, or $99.069,216$ long tous.
The coul areas of Carbouiferous age in the l'uited States are five iu number. They are:
The Massachusetts-Rhode Island area, comprising approxinately 500 square miles :
The Alleghany area, about 59,000 square miles:
The Michigau aren, ahout 6,500 square miles:
The lllinois, Indiana and West Kentucky ajea, about 47,000 aquare miles; and
The Iowa. Missouri, Kansas, Arkansas and Texas arca, about 78.000 square miles:

Forming a total of ahout 191,200 square miles, underlaid by coalhearing strata, of which wot over 120,000 square miles contain workable coal-beds
Two geveral classes of coal are recognized, viz, anthracite and bituminons, the latter heing often subdividedjuto bituminous and semi-bituminous coal.

Anthracite forms the whole of the coal found in the Massachu setts-fhode fsland area and in that portion of fendsrlvaula occurring in the nelghborhood of Pottsville, Mahauoy City, Shamokin, ring in the nelghborhood of Pottsville, Mahauoy City, Shamokin,
Hazletod, Nauch Chunk, Wilkes-Bare and Ecranton. It also Hazletod, Mauch Chunk, WilleceBay
Bituminous coal occupies the rest of the districts just named.
A glance ou a map of the coal-felds shows how unequally the coal areas are distributed over the United siatea. While New England and the seaboard Atlantic states contain practically no coal. the greatest developmeat of the workable coal strata is in the Alleabany Mountains aud to the west of them, extending from Peunsylvania and Onio in an unbroken line to Alabama.
Next to the one just mentioned the most important field is the one occurriog in lllinois, Indiaua and Western Kentucky. The coal area which extcuds from Iowa to Texas is of much lesaimportauce and exteut, and the Michigan coai-field has acarcely been opeoed.
The Massachusetts-Rhode Island Abfa --The coal is coufined to eastern Rhode Island and Bristol and Plymouth countics in month, Rhode island, where F, one of the the worked is at lortsexploited. The coal-beds in this area seem to rary from one to thir teen fu number, but the explorations made in the past have been so unsystematic and pecturiarils, so unsatisfactory, that the data so whsystematic and pecunaris, so unsatisfactory, that the data acter of the coal is the hardest kind of anthracite, often containing spaugles add plates of graphite disseminated through it, which spaugles add plates of graphitc disseminated through it, Which
characteristics are due to the highly metamorpbic action it has uncharacteristics are due to the highly metamorphic actionit has un-
dergone. To this same action is due in agrat measure the pecnldergone. To this same action is due in a great measure the pecul-
iarly folded character of the deposits, which has locally caused iarly folded character of the deposits, which has locally cansed
expausious and contractious of the coal-heds. so that in sorne expausious and contractious of the coal-bens, so that in some suaces an irregularity renders the cost of mining the coal very great, owiug to the large amount of "dead work" required. and to this cause mar in part le ascribed the slight progress which has beed made in the development of the region. The working is now colltined to a single mine.

The Alleghant Abea, the most importadt in the Cuited statea

In its extent in the number of workable coal-beds aod in the qualitvund variety of the cuala fonud, is eituated in I'eunsyluania Ono, Wext Tirginia. I Cghina. enstern hentacky, East Teunessee and northery Alabama. This nrea is divided into numerous different fields. more or fess contiguous to one another, and of which a brief meutlon follows:

The Anthracite: Coal-Fielns of Eastern Jfessifliania.These anthracite fieldsare confined to a limited area of not over $46:$ quare miles, sithated in the rollathes of Carbon, schuylkill, Northumberlaud, Columbia, Davplin. Luzerne and Lackawanua. Three districts are commouly recognized in this region, known as the first. second and third coal-fields. The Coal Mensures within this regiou are almost universally surronnded by two mountain ridges, the exterior one cousinting of sub-Carboniferous \&andstone. This is sejarnted from the interior ridge by a valley. mare or less broad, of easily decomposing red shale, overlyiag which oecurs the true conglomerate, holding fin its bosom the valleya or baslus the true conglomerate, holding in its bosom the valleys or bashas
in which the fathracie oceurs. The two geriea of ridges were in whichent protectars of the conl from the denudiag agents, which
the efthen removed it from the jutervening barren districts, separating the different anthracite basias from each other and from the bitumiwous conl-fields of Ceutral lemusylvania.
North of the authracite coal-heldsproper, is the semi-anthracito emi-an of the lfernice basin insullyan comnty, Peunsylvania, where the thraclte princlpal coal bed, ejght to nine feet thick, contains eight to nine percent. volatile matter. The coal, while classed asan anthracite facks the briliant anthracite luster and conchoidal fracture, reth erally breaking in culues; in consumption it closely resembles the semi-authracite of Lyheus Valley, in Dauphin connty. The whole of this coal is carricd North and West for distribution and consumption.
The Broad-Top-Coal-Fiflid of Pexisyivania.- The coals of this batin, which occuples about twenty-five spuare miles, all bclong to the Lower l'rotective Coal Measinres, of which more presently, with the exception of a few neres of conl of the मiltsturgh bed. The mensuresin this coal-field have been mueb disturbed, so that the relatiens of the strata are not fully understood, and consequently frequent crrors have been made in identifying the conl in different portions of the district. There are apparently three workable beds. The conl of this district, while actually bituminous in cbaracter, is commonly called semi-bituminous on aceonnt of the comparatively small hmonnt of volatile matter it contains, oftea as low na eiglit fer cent. At one time the matues of
and this district were actlyely worked, he coal heing nsed for steamraising and rolling-mill purposes. since the oneding of the clearfield cual-district and the more active exploitutions of the cumherland coal-beds the mining iuterests of this district have languished, owiog in part to an inferiority in quality of this coal to eitber of the others, in part to the greater cost of extraction due to the more disturbed condition of the strata.
The Bituminous Coal-Fievis of Pennsyivanja.- While the hituminous conl-fields of penusylvania are contiguons to those of Ohio and West Virginia, the laticr being actunlly but extensions of the former, they are, for the sake of deacription, sepmrated geographically
In the binminous coal area of Pennsylvadia, Ohio and West Virginia geologists and engincers bave recognized (1) U'pher lar ren Mensures; (2) Euper Mroductive Coal Measures; (3) lower Barren Measurcs: ( 4 ) Lower l'roductive Coal Measures; (j) Interconhlomerate conls.
The following conl strata occur in the "gper l'roductive coal Neasures, commencing with the upher lied: Waynesburg coal-hed, , Redstone com-bed. .itc: the others are locally of importance
Iu the Lower Barren Measures are a few heds whlch are most uncertain in character and of litele economical value; they are most unreliable jn character, and while locally they thicken, so as to be of some local value, they sucedily thju out agaln.
Below the Lower Barren Measures are found the following coal strata, Viz.: Cpper Frechort coul bed. Lower Freeport conl-hed, Coal-hed aud Brook coall-hed. lower Kittanning coal-bed, Clariou coal-hed aud Brookville conl-bed.
Conglomerar, geologically, are the coals occurring in the cireat Conglomerate, which include the Clariongronn, C, the Quakertown bed of Lawrence county, nd the sharon bed of Merewo county. These coals occur in six different basins, of which the sixth js the most southwesterly in position and least distinct as to jis division. Each basid is separated from its atighbor by anamticlinal

[^306][^307][^308][^309]wave. or Jather by a series of separate antlclinals, the cuds of which lappast ench other.
Having the Alleghany mountafna as an castera barrice, the coal fieldsextend westwardly in a more or less unbrokeu succession into this area the coal-heds are by no means equally distributed over lifted, hy geoloidate peansylvania and midale dew hork were than southwestern Pennsplrania, Ohio and Virginia were, the destraction of the coal measures has been greatest in the North and Northeast, gradually diminishing toward the southwest. Only the lowest, or two or three lowest, beds of com have been left as lsolated patches on the molintaln tops of Wyomiag, sullivan. Lycom. ing, Clinton, Bradford, Tioga, Potter, Camerou, Mckeau and Warren conaties.
The great productive bituminous coal-field may he said to commence in the belt of connties composed of Clearfield, Jeffer:ou, Clarion, reuango and Mercer counties-a distauce of 140 miles to the Ohio line from the crest of the Alleghanles. In the countles last mentioned, as well as in Cambria, Indiana, Armstrodg. Butler. Lawrence, Beaver, Someret (with the exception of the Salisbury patch), eastern Westmoreland, and eastern Fhyette. only the 1.ower Productive coal-beds, aud in places the inter-conglomers te conls have been left, while the Cpper Productive Neasures have
been swept assay. These latter are found in a great part with ali

[^310] all
the Lower Productive Coal Measnres in Alleghany，western West－ moreland and western Fayette counties，while the whole of the Upper and Lower Productive Measures occur in Washington and Greene counties．In trief，the coal Neasures are most eroded towar
The Oh1o coal field

The Coal－Fields of Ohio．－The Ohio coal－fields are but the western extension of the bituminous coal－region of Pennsylvania； consequeatly，the coal－beds which are found in them are the same， with local modifications，as those of the latter state．Commenc ing at the Peunsylyania－Ohio line we find that＂the margin of the coal besin forms a torthous line，commencing in the northermpart of Trumbuil county，passing theuce southwesterly to the Mabou－ ling Valley，where it is deflected far town it runs through the southern townships of Trumbull county，where it is deflected north wearly to the center of Geauga county，where it incloses a long tongue and two or three small islands of coal．Thence retnrning into Portage，it passes south－ easterly through the southern part of Summit，where it is deflected to the nortbwest．From bere it runs southwesterly again to the southwest corner of Holmes．Thence it passes nearly southward along the western margin of Holmes and Coshocton；thence south－ westerly through the eastern part of licking．From here its coursc for fifty miles is nearly south to the center of Hocking，where it turns slightly westward，and passes throngh Viuton，Jackson，Pike and Scioto to the Ohio，where it crosses＂into Kentucky．The counties more or less nnderlajd by coal in Ohio are Mahoning Columbinna，Portage，Stark，Holmes，Carroll，Tuscarawas，Jeffer son，Harrison，Belmont，Guernsey，Coshocton，Muskingum，Perry， Noble，Morgan，Washiugton，Monroe，Meigs，Athens，Jackson， Gallia，Lawrence．Trumbull，Summit，Medina，Wryne，Licking， Hocking，Pike and Scioto
Virginian The Coal－Fields of West Virginia and Virginia．－No State in the Union surpasses West Virginia in the variety of coals it contains，nor does any contain au equal amount in proportion to its ares；for of the fifty four counties it the State，but six are entirely destitute of this important fuel．In msay of them，how－ ever，the coal is so deeuly buried，and in others the means of transuortation are so inadequate，that it will be many years be－ fore the mineral wealth thes contain will cren commence to be developed．In Virgioia，on the other hand，there are but six conoties which contain coal of Carboniferons age，and they are in the extreme sonthwestern corner of the state，adjoining West Virginis and Kentncky．The coal－field of West Virginia nod Virginia is but an extension of the Appalachian coal－field from Penasylvania，Maryland and Onio，and the general system of the measures is the same，with the exception that locally some of the coal－beds in the Great Conglomerate are of a sufficient thickness to be profitably worked．
Maryland coal field．

The Martland Coal－Field，better known as the Cumherlaud coal－basin，is but a prolongation of the Potomac basin mentioned under uest irginis．This corl－field is one of the most important in the Tinited states，due to the thickness of the main bed，its good quality，and the large aunnal production．The coal is most extensively used for rolliug－mill and steam－raising purposes．its chief and only competitor among the bituminous conls being that from the Clearfield region of Pennsylvania．This coal－field is an outlyer of the main Alleghany coal area，of which there are several others in Pennsylvania，such as the Brond－Top，Snow－ shoe，Ralston and Blossburg basius．The coal is semi－bitnminous in character，and does not coke quite so readily as those which contain moregas．
The Eastern Kentucky Coal－Field ia but a continuation of that described in Ohio aud West Virginia．The western bound ary of the Alleghany coal area in Kentucky is approximately as follows，in a qorth－south direction：Starting at the Ohio river near Tygart＇s creek，the line runs through Greenup，Carter， Rowan，Morgan，Powell，Estill，Jackson，Laurel，Pulaski，Wasne and Clinton connties to the Teunessee line．This coal－field nnder－ lies the whole of fifteen counties aud a portion of five others，con－ tainiog 8,983 square miles．The houndary line is very erooked， hrowing off numerous spurs，extending west of the line mentioned．

The Tennessee Coal－Field is but a prolongation southward of the eastern Kentucky field．Its ares is co－extensive with that of the Cumberland mountain or table－lsnd．The Cumberland monntain crosses Tennessee obliquely，and although much in－ dented by valleys and coves，is nowhere completely cut in two by them．The eastern border of this table－land is comparatively a nearly direct or gracefully curving line，the indentations made by the streams on this side being scarcely noticeable．It is rery iregular，however，along its western border，being cut out and notched by deep valleys and coves，separated from each other hy longs purs jutting to the West．These deep indeutations give the western outline a very ragged appearance．Along the Kentucky line the coal－field is about seventy miles wide，while it narrows along the Alabrma line to fifty miles．

The georgia Coal－Field．－The Tennessee conl－field west of the Sequatchie valley extends over the border into Alathana，and then soon dies out．That on the eastern side of the valley，on the contrary，extends through Dade，Walker and Chattooga counties in Georgia into Alabama．Almost the whole of the former is underlaid hy an excellent quality of bituminous cosl，while there is not quite such an extent of it in the other two counties．
The alabama Coal Regiox is an extension southward of the Georgia into northern Alahama．It is divided into three fields， the Black Warrior，the Cahaba and the Coosa．Of these three the first is much the largest．
The jllinois，indiana and West Kentucky area．－The coal measures of this portion of the United states form but one measu
area．

Thf，Indiana Coal－Field．－The Carboniferous Measures occur in the counties of Possey，Vanderburgh，Warwick．Spencer，Perry， Crawford，Gibson，Fike，Dubois，Knox，Daviess，Martin，Sullivan， Greenc，Clay，Owen，Vigo，Jarkt，Vermiliion，Fountain and War－ ren；or，in other words，in the southwestern part of the State， There sre three beds of coking coal in this field，varying from four and a half to ten leet in thickness，sud three sesms of open－ burning or splint coals that range from twic and a half to five feet in thickoess，the average thickness being four feet．One hed of cannel coal occurs in Daviess county．abont four and a half feet thick．The principal coals mincd with this exception are the block coals from Clay county

## PETROLEUM

Petroleum has beew known to exjst in this country almost from its first settlement．The records of travels，especially through the region west of the Appalachian chain，in what was then known as the Grat Ohio Valley，coutain coustant evidences of the existence of this material in the reports of burning springs and the oil that accompaoied them．
It was not，however，until 1859，at the time of the drilling of Drkke＇s first well，that it began to assume any commercial impor－ tance．The excitemeut attending the discoveries in the Pennsyl－ vania oil field led to explorations in many States，and developed the fact that petroleum existed in many localities．These locali－ ties are chiefly on the the western slopes of the Appalachian chain， reaching from Petrolea in Ontario to jnst across the Tenuessee State line in Alabama．Some quite extensive fiolds are also found in Caljfornia and in Whyming，and later evidences of the exist－ ence of oil have been discorered in other States，bnt the Appala－ eniau and the California oil fields are at present the only ones of commercial importance
The most important of these fields are what are descrithed fur－ ther on as the l＇enasylvamia and New York oil fields．Next in tmportance to these is the Macksturg field in Ohio，near Marietta， the third in importance being the California field．West Virginia produces some small amounts of heavy oil for lubricating purposes， its light oil having been comparatively exhausted some yefrs since． There are also oil fields that with beiter facilities for transporta tion might be of importance in both Tennessee and Kentucky． The Wyoming oil fields described farther on in this report are also of importance in the amount of petrolemm that can some day be made available；but of this field，as of all others outside of the Pennsylvsnia and Macksburg regions，with the exception of Cali－ fornia，it will be found that the expense of producing and trans－ borting the oil to market will effectually prevent any great pro－ duction in these fields until the price of Penasylvania petroleum shall materially advance．
In the following table will be found a consolidation of the statis－ tics of the production of petroleum in the various fields of the country，so far as the same could be obtained from the hegiuning of operations in these fields：－

| $\begin{aligned} & \stackrel{\circ}{\infty} \\ & \stackrel{8}{7} \\ & 8 \end{aligned}$ | $\begin{aligned} & \text { ت゙ } \\ & \stackrel{5}{0} \\ & \text {. } \end{aligned}$ |  |

More than 50 per cent. of all the oll prodnced in the United States is from the Bradford and Alleghany fields, these two districts being credited with $11,099.512$ of the $21,42,041$ barrela produeed in the country in 1885 . The froductiou in these fields. however, is kept up only by the liberal use of aitro-glycerine, and even with the use of explosives to an extent belore unknown the production is ralliag off, aud it is a question if the vigor of these old fields ean be restored.
From the time of the first settlement of Califoruia by the whites there have been evidences, in the form of spriugs and seepage from the asphaltum beds, of the existeuce of petraleum in the State. No attemits, however, were made to utilize these deposits uatil the excitement fallowiag the Pennsylvania oil discoveries led to prospecting these surface depositis and the enger gearching for others. During the years $180^{\circ}$ aud $18 t 6$ upwards of beventy conpanies, each with a large nomiual capital, were incorporated io Califoraia for the purpose of searching for petroleum. While a majority of these companies froceeded no further than to organize, having never expended any money iu actual operations, some of them began active operations, binking wells and driviug tuonels iu their search. Most of the work at thls time was iu Humboldt, Colusa, Cautra Costa, Sata Clara, and Los Angeles counties.
About 1875 the oil business in California look on new life. Two welis putdownilat year slelded eome 13 or 20 barrels each per day. Drilling by steant began to be more generally used in pace oi the spring pole. In 1877 the Ventura and the I'ico Canon wells produced daily 80 and 40 barrela respectively. Some co barrels of refived oil were made daily at the Pico refinery at the latter place. The nextyear 60 barrels of crude oil were for a mamber of days tabeu from the Boyer well, iu the santa Cruz mountains, every 21 hours. The oil bere, ths in most cases in Colifornia, whs lironght to the surface by pumplng, no fowing wells having as yet beeu ta the suriace by pu
From this time there has been a steadily increasing output of oil in Califorula.

There are, as far as now known, two oll fields in this state, probably origiually the same, but now divided by the range of mountains in which the headwaters of the North llate and Wind rivers find their sources
As jet no valuable depasits of petroleum or its concomitant, asphaltum, have been found anywhere in the far west. except in Califoruia. Recently euconraging indicatious of mincral oil are reported to have been met with at Puyallup, in Washlugton.

## NATURAZ GAS.

According to Mr. Swank, natural gas was first used as a fuel In connection with the manufacture of iron and steel at Leechburg, Armstrong county, Peunsylvania, it 1874. when it was taken fron a well twelve huindred feet deep, and where it at that thme fur-
nlahed all the fuel required for fudding, beatha, and making steam at the rohing-mill of Messrs. liogeraand Darehfield. Between
 establishnemts for pucting and rollug. The usce of this new fuel spread so raplaly, that in 1807 there were mhety-six rolling-mallz athd steel woras cither wholly or in part using uatural gas: and Mr. Swank states that at the present time nearly one-fourth of all the establishment: of thiskind in the thlted states are thus enjplied with fuel. The territury in wheln are lacated iron and steel works using untural gas exteuds as fareast as Johnstown, seventyniue miles cast oi l'ittsburg. Nome gas is nsed in olllo, plped froin wells in the adjacent repion of tenuculvania, and sonic is also obtained from local wells. Pemnsylunla gas is also used to a limited extent iu West Virginia. Nntural gas has also been obtained at various localities in Indiana.
According to Mr. Ashburner, of the lennsylvanda Survey, thera were, in liky, no less than 150 dwellings, iG glass factorics, $3 t$ roiliug mills, and t5 other industrinlestablishments sumplied with natural gas in the eity of Pittshurg alone; and this was estimated as representing or displacing an anount of coal equal to tern thousand tons a day. In the following table is given the amount and value of the coal displaced by uatural gas thronghout the comtry, as vearly as it could be estimated, for the years 1s55-87:

| 1585 | Amount. 2,5iki,000 to11s | Value. $4, \$ 57,200$ |
| :---: | :---: | :---: |
| 1886 | 5,761,000 -. | 10.012,000 |
| 1887 | S, 500,000 | 15,8029500 |

The rapld inerease in the amount of natural gas consumed during the past few years ls easily seeu in the above table. The surpassing importance of Peunsylvanis in general, aud of the Pittsburg District in particular, as consumers of this klud of fuel, and the progress which has heen made in other states in the development of this branch of indistrs may be seen in the following table, in which the detailed statistics for the sear 185 are given:

Amount of Coal Disilaced by Nitigal. Gas.

| Locality. | Cual Displaced. | Value. |
| :---: | :---: | :---: |
| Penusylvania : |  |  |
| Allcghany County. | 4,8,0,000 tons. | \$1, 516,250 |

| thinais | 2,500 ". | 6,000 |
| Kausas | 4,460 | 15.000 |
| Elsewbere | 4,460 | 15,600 |
| Total. | 8 804,520 tous. | \$15,838,500 |

The development af the irom and steel busiuess In the luited Iromana States during the lasthan century has been as rapid as that of ateel. the mining of coal. In man the total production of iron throughout the worla was aloout six million cons, of wheh fully half uns to be eredited to Great Britain: that of the frited states was ghout one million cons of one sixth of the whole amount in the
 the worla raried tutwew uivetwen and twentrewo millous the worla tous, averaging a little over twenty millions, of whichabout four. iltha here due to Englama, the culca satcs Rna ciermayy in the last filteengears the proportional produetiou of Eugiand has gradually declined: for the five years endiug $1 \times 85$ it was very nearly five-twellths, aud it 1 saz a very little over one-third of the total. England aud the [ nited states togethermade in 1No vers neary tive-eighths of the total.
In regard to the geograjuical distribution of apecial producta, the Sinelal Agent of the Census of liso in charge of this depart ment-Mr.J. M. Swank-makes the followlmy statencont:

A glunce at the stutistics for lha shows that New England now makes but little pigiron, and that the santh mones considerable pik iron and searcely any rolled ron; that the west hus largels enharked in the manufacture of stecl of the Bessemer process, while N゙ew Jork cannot bonst of a sjugle Bessemer establishment, but has jreferred the opeu-hearth process: that New Jork makes most of the blooms that are made from ore, and jennsylvauia most of the blooma that aremade from fifgud seraf-iron; that Michiguv is the leading producer of charcoal mg-iron, and now makes $n 0$ uther kiad; that West Virginla has develoned a remark. ably active interest in the manufacture of cut nalls: that only five States muke Bessemer steel; and two states, tenusvirauia and Finf Jersex, mate nearls all of our crucilio stecl; and that leun.
 sylvania has made a greater effort t!
fucture all kinds of ironaad steel."
ficture all kinds of iron and steel."
At the clase of the rear 1*s7 there wert 613 hlast furnaces, then either completer or linilding (not connting any of which had been abaudoned, iu the (ulted sintes and they were this distributed.

| Divislon. | Subdivision. Number. | Total. |
| :---: | :---: | :---: |
|  | (North Atlautic.... ....... 315 |  |
| Athantic. | Middie Atlantic...... ..... 54 |  |
|  | (South Atlautic ........... 6 | 375 |
| Central. | (Northeasteru Central ..... 147 |  |
|  | Northwestern Central..... 13 |  |
|  | Southeasteru Ceutral ..... 71 |  |
|  | (Southwestern Central..... 2 | 233 |
| Cordilieran | (Rocky Mountain.......... 2 |  |
|  | Plateau...................... 0 |  |
|  | (Pacific Coast............... ${ }^{3}$ |  |
|  | Total...................... 8 | 613 |

Of the 613 blast furnaces, 213 were in Pennsylvania, Ohio coming next in order with seventy-eight. In the Northern States there were 459; in the southern 15t, of which forty-four were in Alabama (tventr-four completed and twenty bnilding). Of 414 iron and steel rollug mills, 169 were in Penasylranja, Obio coming next with fifty-fire. Of Bessemer and Clapps-Griffiths steel works there were forty-three, of which nineteen were in Hennsylvania and six in the sonthern States. Of open-hearth steel works there were fifty, of which tweuty-seven were in Pennsylvania and two in the Southerustates. Of crucible steel worss there were forty-one, of whieb twenty-oue were iu Penusylvania, and two in the southern States
The production of pig iron and of Bessemer steel ingots and raile in the United States since 1880 is stated in the following table, compiled from the statistics collected by the Aolerican Iron and Steel Association:

Pig-iron.
Bessemer steel ingots
Bessemer steel rails.

Pig-iron
Bessemer steel ingots
Bessemer steel rails
1851.
$4,144,253$
$1,374,247$
$1,187,769$

623,323 4 595,510 4, 1884. $1.514,687 \cdot 1,477.345 \ldots 1, \ldots 375317$ $1,284,066 \ldots 1,145,709 \ldots . .996,465$
1885.1886.
$4,044,526 \ldots 5,683,329 \ldots .6,417,148$
$1,519,426 \ldots 2,269,190 \ldots 2,396,033$

From the ahove tahle it will be seen that 1882 and 1883 wereyears of large productiou, both of iron and steel: that in 1844 and 165.5 , of lare was a considerable falling off in the amonnt of pig-iron mare was a considerable while the production of steel remained nearly the sane: made, while the production of stee remarned nearly the sanje: and it will also be noticed that in lss6 there was alarge increase in both iron and stee, waren inerease was continued in 1887-the production of the latter year being more than a million and a half of tons qreater than it was in 1884 . The increased use of Bessemer steel for purposes other than the mannfacture of rails is also clearly indicated in the following table:-
1852. 1883.1884.

$$
1885 . \quad 1886 . \quad 1857
$$

Production of Bessemer stcel........ 1,519,426 . . 2,269,190 . . 2,936,083 Percentrge used in rails

Bessemer
The production of Bessemer steel was forty-nine per cent. larger in 1886 than it was in 1885 , und 29 per cent. larger in 1857 than in 18i6. The total numher of eompleted Bessemer steel works in the Caited states at the close of 1880 was thirty-three, with sixty-aine converters. Pennsylvaniain that year made fifty-aine per cent. of the ingots produced: 1llinois, 21 : and other States, 20.
The rapid growth and present inmportance of the steel industry in the United States will be appreciated on examination of the fol. in the cuited siates whe the amount of steel of all kinds prodnced is given for each fifth year from 1870 on and also for the years 1586 is given for each
and $10 s 7$, in tons:

| Year. | Bessemer steel ingots. | Open-hearth steel ingots | Crucible steel ingots. | All other ateel. |
| :---: | :---: | :---: | :---: | :---: |
| 1870... | 37.500 | 1.339 | 31, |  |
| 1875.. | 335,283 | 8.080 | 35.179 | 11,256 |
| 1880.. | 1.074,261 | 100.850 | 64.664 | 7 7,558 |
| 1885.. | 1,519.430 | 133,375 | 57,599 | 1,514 |
| 1886... | 2.269 .190 | 218,973 | 71.972 | 2,306 |
| 1887... | 2,936,033 | 322.069 | 75.376 | 5,593 |

Production The production of rails of all kinds in the United States is given i. rails. In the following table for the year 1867 , in which the manufacture
of Bessemer steel ralls began, and also for 1870 and for each succeeding tifth yeur, as well as for the yuars 1886 and 185\%:

The ores of iron are widely disseminated over the Unitcd States General and are of very diferent qualities; but there arecertain regionsul survey greaty predominating importanee, and certain geologica hori varions ores is derived. To each of these a few words of descrivtion mas iron ore he devoted
The great coal field of the Central United States is surrounded on the north east and south by the unlifted older rocks of the Wisconsin-Michigan, the Appalachinn and the Ozark regions
This hasin and its border contain the fucl and the ore on which and with which the material prosperity of the Undted States of the tweatieth eeatury must be built. It bccomes, therefore, of importance to ohtain a general survey of the distribntion of the various kiuds of iron ore both geogiaphically and in the geologjeal column
On the extreare edge of the border that incloses the coal basin we find in the north and east the Archean with its immense development of magnetic and specular ores. Next within this and overlying it is the Canadian-Cambrian series, the substructure of the first great longitudinal valley of the Appalachiansextending fromCanada to Alabama. This valley is not less remarkable for its enormons wealth in limonite ores than for the fertility and durability of its soil. Still fartherinward the shales of the Clinton age mark a belt of hematite ore extending from Central Alabama to aud throngh eastern New lork, and thence westward across the state. The belt thus ontlined will be seen, on the map, to have a breadth of from fifty to orer one hundred milcs. Within it, but less persisteat in longitudinal representation, are deposits of iron ores occuring-some here, some there-in strata of almost every age from the Archana to the Conl Jeasures, and the great coal field thus iron-bound, is itself rich in carbonate ores, generally accurfing either as clay iron stone, or as black hand, or in plaecs as a erriferons limestone altered to limonite. The map docs not attempit to represent the actual distribntion of the ores of the coal Measures, but only the areas within which they were sampled for this investigation.
On the South the Archacan rocks come to the surface only in eastern 11 issouri, and they here exhihit a great development of magnetic and specular ores. But they oecupy only a small area in the broad irou-bearing bolt on the map that stretches with a breadth of oue hundred miles or more northwesterly from Alabama to western Missouri. With the exeeption of the Missonri Archean ores this belt consists whojly of later ores, yiz.: specular and limonite ores of the Cambrian in Missouri, and limonites on the Subcarhoniferous limestones of Missouri, Tennessee and Kentucky.
On the North, far remored from the coal-field, are the extensive and numerous deposits of rich specnlar and magnetic ores of the Haronian in Northern Minnesota and northern Michigan. Farther eastward the northern border is represented beyond our field of Investigation by ores of dimerent kinds, but especially Arehrean in that part of the territory of the Dominion of Canada Iying north of the great lakes.
Iron lil various mineral conditions, and especially as an oxide, is among the most widely disseminated of the elements. It is a hase with a strong aftinity for the acids wost frequent in the waters circnlating in the upper crust of the earth, viz.: carhonic sulphuric and the organic acids. It also has a stronger affinity for oxygen, and in the presence of this it forms the nearly indestructible and-in the ordinary processes of Nature-in the absence of organic matter, almost insoluable sesquioxide. As a sesquioxide, in the presence of organic matter, it provides the onygen for decay, and its residuary protoxide is itself dissolved by the resulting organic acid, and enters into circulation. If the laboratory is a marsh or fond, the iron protosalt is reoxidized at the surface of tbe water and returis to the bottom as the higher oxide to again part with part oi its oxpgen and agaiu to be dissolved as a protoFalt, and this is coutinued until the organic matter is cousumed: then the iron aecumulates on the Lottom as a hydrated oxide, or limonite, or "bog ore."
Rock strata containing organde matter and diffused iron oxide have lived through similar urocesses, except that the iron, after furnjshing Its oxygen to the decaying matter and forming a solu-
able protosalt with the resulting organic acid，baa entered fito more extended eireulation
The most common solvents of iron in Nature are carbonte ucid and sulphurjc acid；the fatter becomes sulmportant agent in moving and concentrating iron，under eertain circunstances，as in solfatarie action and in the oxidation of pritiferona rocks like the Devonian shales of Pennsylvania and Virginia．Jut，doubtless， earbonic acid is the most gederal seme．Besides urising from the oxidation of organic מuatter coofined in sedimentary strata，it eaters the eartb as an accessory of rain wster，and more is taken up by the water from the decaying vegetablomonid；it is alsolib erated in depth from limestone by the aetion of chemicul processes and enters the ascending currents．However formed，it becomes an ucessory constituent of the water tbat jermeates the rocks， aud alone，or in connection with other agents，it decomposes the silicates and carries oft the irod as a biearbonate．It icllows the channels of flow unijlit reaches an arresting cause．One sucb arresting eause，of ultimstely great veononic importance，is the carbonate of lime in limestoncs and dolomites and calcareons sand－ stones，resulting in the replacemerat of lime by tron：unother of efual importance is oxygen．whether st the surface．where the soluable iron protosalt，emerging jn sprimg weter 1 s oxidized 0 a limonite，or In caverns or small cavities，where it is oxidized，and parting with its scid，is denositud in succuscire thin films to iorm stalactitic and namimillare masses of bydrated sesquioxide．there fore when we eonsicker the penerul dinusion of rour in trital and erystalline rocks in all sediments rod nll cruptions，and trital and erystanime rocksinall sediments add nif erujuinons，and remarkabse reciprocating relation in the most commonadd essen－
tial wrocessus of Ninture，it la not strange that we shonld find tial wrocessus of Natnre，it ls not strange that we shonld find it represent

ficial chancla of timber．The sands and gravels thus exposed were tbe most productive＂placers：＂aud those whotirst got hold the rich lars on the Americnb，Yubs．Featber，Stamsians，and other emaller streams th the heart of the gold region made some times from one to five thousand dollars a day jer man．Thest very rich spots were，bowever，soon worked ont，and It might be dayis or weeks before another of equsl richness was fonnd．Froms． the sprimg of 1848 to 1801 nearly all the minjog was of the e baracter thus indicated，that in the river－beds belug called＂wet－dig． gings，＂and that jn the rayjuce or gulches adjacent to the rjoce ＂dry－digeings．＂
The yleld of gold in California during the ten years of fts great－Jeadof est productivencss－namely，from 1850 to 1859 ，inclusive－bas been gold in
 During the pentad， 1 sio－Gt，there was a rapld falling off in the yicld，whlel may be acconted for not only by the aprosehing exhanstion of the river diggings，but also by the fact that the dis． covery of the Comstock Lode turned the attention of the miners in the direction oi Nevada，whiftherereat numbers of stamp－mill were transported hodily in the course of the years 1 m61 nad 1862, these mills beidg such rs bad been worked in California with little or no profit to the owners．

From $2 \not \subset 65$ on．the gold mining business in California nssumed a certain degree oi permanence；at least，the yfeld of the preclous metal became，for a number of years，pretty neary stationary， never falling below fifteen millons，nor rising quite as high as twenty millions；the average for the fifteen years，18\％5－79，being about seveuten millions．The figures for the years 1581－8\％，as gived in the reports of the Director of the Mint，are asfollows：

| 1881. | \＄18，200．000 |
| :---: | :---: |
| 1882 | 16.800 .000 |
| 1853. | 14．120，000 |
| 1584. | 13，600，000 |
| 1585. | 12．700，000 |
| 1886. | 14，725．000 |
| 1 m 7 7． | 13，400，000 |

The most powerful impulse to mining operations，and the im－ medinte eanse of a somewhat lengthy period of wild exeitement and speculation，was the discoveryand guccessful opening of the so－called Comstock Lode－a metallferous deposit，which，consid－ ering all the circumstances and conditions eonuected with ft，may be truthfully said to be the most interesting one ever discovered． The conditions whieb have gived this lode ita pre－eminence are： the great extent sod depth of its workings；the rapldity with which they have been carried on ；the lurge amount of the preclous metals produced；the extraordinary temperature encountered： and．finally，the very fulf record which has been kept of the facts observed．
The Comstoek lode lies on the east slope of the Virglnla Range．The Com－ a northeasterly offshoot from the range of the Surranceadn．The stock region fs a desert．supporting scarcely any vegetation besides the suge brush．Potable water is found only in quantities too small to supply a settlemeut，and the town now depends for its snppiy ou frst opened in this inbospitsble region in ins9，but have since been pushed with sueh Vor that their produet is supposed seri－ busly ously to have affected the silver market of the world．They have produced ahont $\$ 315,000,000$ wortb of bullion，of wbich $\$ 175, n 00,000$ wield 115 at hoe rate on dishursed in dividends．
yield，$\$ 115,571,000$ bas been dishursed in dividends
The last great ore body discovered ylelded $\$ 111.707 .609 .39$ of which $\$ 74,250,000$ was paid in dividends．The number of men em－ ployed fil the mines on JuDe 1，1\＆80，was 2 ，5 70 ，and the sum an－ nunlly disbursed in wges is now \＄4．550，000．The ageregste horse jower of the machinery of the mines is 24．130．The total ledgth of shafts and gallerles exceeds 150 miles and the greatest depth reached is abore 3.000 feet．
The gold regions of the Cinfted States are divided into three see． tlons，the Parific，Rocky Mountain and Eastern．These three great divisions will be taken upand treated fuorder．

## statistics of the pacific mivision．

In production of gold Caltfornfa still holds the first place．The Califorate fat deposits oi auriferous gravel contidne to yfeld largels，though their final exhaustion in view of the enormour bydraulle opera－ tions now belug prosecuted，is to be looked for at no distant day． previous to the discovery of the Bodie district the placer mines furnished more than two－thirds of the total gold output of the Sthe：but the large fleld of that distriet，amounting to over two sud tirce－quarter inilliong fu gold during the years in addition to the conslderable sllver product，has placed the deep mines about on a psr with the placers in point of productiveness．
on a pr with the placers in point of produetireness．
Callfornfa furnisthes 71.47 per cent．of the total ylacer produet of the Unlted states，and 40.09 per cent．©！ibe total gold jroduct of the decf mines，or 51.38 per ecnt．of the gold product of the country（from all sources）．
The produetinn of this Stato showe a considerable decline as Nevac
compared with that of the preceding six years. This is uot due to f the state, but to the decrease the suld of the leadig source. the Comstock Lode.
The bulliou product of Nevada represents an average of $\$ 4.16$ gold, $\$ 112.29$ silver, and $\$ 156.45$ gold aud silver for each square ile of its area. In this respect Nevada is surpassed hy Colorado, the figures for which are $\$ 25.98$ gold, $\$ 159.22$ silver, and $\$ 15.20$ otal.
The bullion product of (Tah is remarkably steady, varying laterly hut little [rom year to year while a marked impulse has been given to the mining industry of Arizona by the fine showing of the new Tombstoue district, iu I'ima county.
gate then, a very large portion having passed through private refaeries and thus losing their identity wp to the close of the fisca, year ending June 30,1850 , are stated by the director of the mint to have been $\$ 24,137,417$ gold. $\$ 727,296$ silver, gad $\$ 24,864,713$ total. This amount is farless than the actual output up to that date. Fague unotlicial estimates placiug the total yield as high as $\$ 00,-$ (0),010.

Of the gold product for the census rear $1880,59.42$ per cent, is rom placers and 40.58 per celut. from the deen milles. Idaho furbishes 7.32 per cent of the placer outpont of twe cnited States, 2.10 per cent of the deep mioe gold, and 4.43 per cent of the total gold: 13 per cent of the silver, and 2 bo ver cent of the entire product of the precious metals in the whole country. As a gold producer orodicer ield per squer mile is $\$ 17$ j5 geld $\$ 50 \mathrm{silver}$ and 40275 totgl Un this respect Idahostands fifth in noint of gold, seventh in silver. and sisth iu developed richness in gold aud silver.
Oregon is one of the oldest of the western miniug states, the discovery of gold within its limits haviug followed closely upou but in Califoruia. Its output bas never been very large in comparison with the yield of its neighbor state, but althongh the mines laye become secondary to its agricultural resources in point of importance, they still furnish oceupation and profit to many of its inhabitants. The quartz reins of Baker Coumty, in the astern portion of the State, adjoining Idaho Territory, coutinue to yield the larger portion of the total deep mioe jroduct of this State. The prevailing type of the Oregou ores is a free goid quartz, though rebellious gold ores, requiring special treatment, fre found a some localities, and a small amoubt of sllyer is produced iu Grant couluty
Of the small product reparted from the deep miues of Washingon, nearly the whole comes from Peshaston district. in lakima county, where gold quartz mioing is conducted on a small scale.
The Upper Columbia placers furnish over one-hulf the total placer field of the State
This vast territory. occupying an area of over half a million square miles, is for the most part still an unexplored regiou. The small amonat of prospectiug whicb bas been done has developed the Iact that Alaskacontains many gold beariag localities, none of which however, have get yielded any considerable output.

## STATISTICS OF THE DIVISION OF THE BOCEY MOUXTAINS.

From an average anoual production of only three or four millivns, Colorado has suddenly risen to the first rank as a producer of the rrecions metals among the States and Territories for gold and siver combined, as well as for silver alowe, wbile for gold it holds the fourth rauk. In the relation of prodnction to area it holds the first rank likewise for gold aud silver combined, and for silver alone, and the third for gold alone. In the relation of production to popmlation, bowever, it ranks only third for gold and silyer together, secoud for silrez alone, and sixth for gold aloue. The total value of its product during the census year in gold and silver was, in round numbers, niuteen and aquarter million dollars; and, if we add to this the value of lead and copder in crude metal produced, we have a total ralue of metalle product of twenty-two and three-quarters million dollars.
The metallic production of Dakota is derived from the region of the Black Hills, and in greater part from Lawrence county, wbere Iree milling gold quartz ores of low grade are reduced in amalgamating mills of great size.
Montana bas within its boundaries the elements favorable to a large production of the precious metals-rich and taried ores and abundant fuel, both corl and wood. As yet. liowerer. owiug to lack of develomment and want of sufficient tramsportation facili. ties, it has not takeu its prover rank as a producer.
The mines of New Nexico bave heen attracting much attention hail thear practical development is awaitiug the completion of the railroads which are about to intersect it, regions borders.

The following table shows the yield of the states of the Eastern division, for the year 1880 :-

## EAATEAN DIVISION

The relative quota contributed by each of the tbree great arbltrary divisious into which the country has been apportioned is indicated in the following table:-

| Pacific Division | \$25,261,828 | \$21,143,881 | \$46,405,709 |
| :---: | :---: | :---: | :---: |
| Division of the Rocky |  | - |  |
| Mountains............ ... | 7,878,189 | 19,917,490 | 27,795,679 |
| Easteru Division. | 259,646 | 49,586 | 289,23\% |
| Total. | \$33,379,663 | \$41,110,957 | \$74,490,620 |

The following table shows the production of gold and silver for each state and Territory during the year 1885:-

| Alaskr | \$ 300,000 | \$ 2,000 | \$ 302,000 |
| :---: | :---: | :---: | :---: |
| Arizona | 880,000 | 3.800,000 | 4,680,000 |
| Califoruia | 12,700,000 | 2,500 000 | 15,200,000 |
| Colorado. | 4,200,000 | 15,800,000 | 20,000,000 |
| Wakota | 3,200,000 | 100,000 | 3,300.000 |
| Georgia | 136,000 |  | 136,000 |

| 1.386. | 35,000,000 | 51.000,000 | $39,445,315^{5}$ |
| 1587. | 83,000,000 | 53,357,000 | 40,450,000 |

The \&unexed table still Iarther lllustrates this hrazch of the subject by showiug the consumptiou of the precions metals in the Lnited states in the industrial arts, as reported by the Mint, for the Jears 1850, 1881, 1883 and 1855:-

|  | Gold. | Silver. |
| :---: | :---: | :---: |
| 1850 | \$ 8,684,198 | \$3.464,169 |
| 1851. | 10,086,723 | 3,388,421 |
| 1883 | 14,459,464 | 5,556,530 |
| 185 | 11.152,120 | 4,598,413 |

Nearly alf the quicksilver prodneed in the United States comea rom Califoruia．The total produce of the Californian maces．

No oew discoveries of localities of importance have been made durivg the past iew years，and the mines which are now worked in California have beelt of late years in a rather depressed condi－ tion，owing to the low price of the metn］，the increased expense of froduction consequent on the greater depth of the workings，and paid any dividend in 18sas：but sinee that tinue there has bech a rise iu the price of the metal，and a somewhat lacressed activity in its exploitation．Two mines phid divlleads in lave：the dew Almaden，$\$ 118,010.25$ ，and the Etim，$\$ 0,000$ ；the former also juid． in $1885, \$ 2 n 2.663$ ．A considerable portion of the quieksilver mined in Califormia is used in that and the adjacent Cordilleranstates． a part goes to Mexico，aud there is a small und varying expout to China．The low price of silver bas materially affected the profits The ore of tia has beven disco
Tuited states，and there discovered in several tocalities iu the Tuited states．and there bave beell many attempts made to open mines in various parts of the country，bit up to the present time the amount of this metal produced has beea entlrely iusignificant． Amoug the loculities in the Appalachan region where mining for tin has been attemptel are，Winslow，Jhine：Jnckson，New Hamp shire：one on the northwestern slape of the mhe lidage，in liock－ bridge county，Virginia：hod one near Ashland，in Clay connty Alabama．The veins in the first wo localitios meutioned are un－ questionably too small for successfu！working．In regard to the other places，it docs not yet seewa to he known whether the to the tions there existing art sufticiently favoralle to whrant the pectation that they will become prof table．The fact that there are no apparent indications－judying from the descriptions which have been published－of superficial dejosits which could be suc－ cessintly streamed for tin seems a strong reasonfor bulieving that in no ove of these loealities conld there be asuccessful comperti－ ion carried on with the stanuiferons districts of the East Indies and carried onliath the stanuilerous districts of the Enst Indies and of Australia，where the detrital ores of tin exist in the great－ est abundance．Of course tin mining could be made protitable in this country if a sufficieotly high duty were laid upouthis metal． The stauniferous region from which the most has been experted is the Black Mills of Dakota，ai a locality of about twenty miles southwest of Rapid City．
Accordiug to the otticial report of Mr．A．Williams，Jr．，nn the Mineral resonrces of the United states，for the years inhess，a large amount of money has been expended in opening and jros－ pectiog the Ettamiae．and in crecting mills and reduction

So far as kaown，however，up to January，las！，there has been no prodisction of the commercial iniportance is Dhkota，nor Tin orehas also ments of this metal from that resinn been begun． Californas，aud sereral attempts bave seen minde of the state of ulion the market the abservatione been made to piat the minus region in dstu，did not lead him to the conclusion that it was likely region in 18iu，did not lad him to the conclusion that it was if
Zinc has become within the past few years au juportaut article of production in tbe Linted states
The busivess of making metalic zinc had not hecome of any im－ portance previous to 1575 ．Since that time it has increased ut t moderate aud jrecty umiform rate．
Thelatest and most reliable statistics af zine are those given by Mr．C．Kirchoff，Jr．，in the＂，Mioeral Resources of the Cnited States for 1855 ，＂as follows，in tons

| State． | 1いい。 | 12：33． | 1－st． | 12．45． | 2isvi． | $1.5 \%$ \％ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

－Mineral Resonrces of the U＇uited States，for the jear 1857.
great that space may be found here for a few remarks on the geological mode of occurrence of salt, and the geographical distribution of the salt industry.
'the common salt of the world is obtalued for use in four different ways: namely, the evaporation of the ocean water, the evaporation of the watur of saline lakes, the evaporation of saline water or hrine ohtajued by horiug, and the mining of solid or rock-sult. By each of these methods salt is, or has been, produced in the United Statea; but the third of these is at present by far the most important source of supply of this substance in this conntry.
In the early history of the conntry the salt used was in purt imported from England, adod in part produced by the evaporation of sea-water on the islands adjaccut to the const in a low latitude, and especially Turk's Island.
The present sonrees of supply for comper iu the thited states are chiefly the Lake smperior region and the Territorics of Mouthat and Arizona. The produce of the other States is comparaively insiguificant.
The mines of Lake Superior, of the date of the opeuing of which mention has alreudy been made, are of a peculiar character From these mines only is copper taken exclusively in its aative state.
The "Cliff Mine," on the Keweenaw Point, which was worked from 1940 to 1872 to a depth of nearly 1,500 feet, is of historieal importance jn the development of the mining industry of the conntry, as being the first permanent dcep mine worked, and as being the first mine of any ore other than that of iron to pay regular dividends. The Ninnesota mine, near the Ontonagon river was another one of interest, and, like most of those to the west of Keweenaw Point. of a somewhat different character from that of the Cliff mine, since the cupriferous lode ran parallel with the formation instead of across it. These longitudinal occurreacca are, apharently, intermediate in character bctween contact deposita and segregated reina.
The Lake superior region, soon after it was first opened, in $\mathbf{1 8 4 5}$, began to produce largely and for many yeurs it aupplicd from seven to mine-teuths of the copper furnished by the Uuited States.
Thegrowth in the production of comper in the United States compled up to 1885 , raclusive from the best data ayallable, is shown ju the following table. It proves in a striking manner how preponderating was, until the past few seara, the influence of the Lake Superior district ; and again of one great mine in it, the Calumet and the Hecla, for more than a decade. In order to point out more clearly how prenonde rating has been the outpat of the Lake district from 1867 to 1880 , a column has been added giviog its percentage of the total product from year to 5ear. it shonld be stated that the yield of copper from pyrites is not here included.

Production of copper in the United States from 1845 to 1855 inclusire.

| Yeara. | Total producthon. | Lake Superior. | $\begin{gathered} \text { Calumet } \\ \text { and } \\ \text { Hecla } \end{gathered}$ | Percentage of Lake Superior of total product. |

The following ia, io detail, the out , ut of the Lake Superiormines. In the majority of cases it is the othicial product, based ous smelting works returns: in a few instances it is an official estinnte oi the ingot product based on the known output of mineral. The Mass is the ouly larger mine in the case of which the ingot was estimated from the published statement of the ontput of mineral. The total is accurate, therefore, within a few thousand pounds.

The Production of Lake Superior Copper Mincs, 1880 to 1885.

Genelai fommary

The astonishing rapidity with which the mineral and metallifErons resonrces of the cordilleran region have been developed
 duriug the past thirty fears will have been made apprarent to the reader who bas examined the freceding pages. In 1854 the present writer estimated the total value of the metals produced in the United States at $\$ 79,827.000$, of which nearly $\$ 50,000.000$ was to be credited to gold. $\dagger$ The change which has taken plaee since that time will be seen on examining the foliowing tahles, which give, in compact form, resultsobtajned and fublished by the Chief of the Division of Mining Statisties, of the Thited States Geological Survey. The first table shows the total value of the now-metallic products of the United States for the years 1582 to 1887 , and a!so
*By W. A. Raborg, in Minerai Resonrees of the Uuited States for the year 1887, p. 611. A barrel is five bushels of fifty-six pounds each.
tSee Metallic Wealth of the United States, pq, 505-510.
the grand total of the metallic and non-metallic products for the same years. The second shows the amount and value of the metal. lic products of the United States for the years 1882-s7. The value of the iron is the snot value; that of the gold and silver, the coining value: that of the copper, lead, and zinc, the value ut New York; that of the quicksilver, the vaine at san Francisco:-
was eight miles weat by south Irom Cincinuati, In Iatitude : $\mathrm{m}^{\prime}$ 4. $1^{\prime}$, having moved westward 457 miles in niuety years. The mosontherly point reached was that of 1830 , when the center was In latitude $3^{5} 57^{\prime} .9$, the most rapid movement whs in the period 1siotio-namely, efghty-one miles, this being due to the rapid transfer of a considerable populatlon from the liastero to the Pacitic States, consequent on the discovery of the kold of calilornia.
The division of the population by sexes, as shown by the census of 1880, was as follows
Males
Females
250114.220
I4, 4

The number of females for each 100.000 males in 1850 and $1 \times 80$ was is follows:

## Tumber of females to 100,000 males

As a natural resuit of the conditions Infuencing emigration diunog As a malder to the newer states, it is fonnd that femmles are lencing from the older the the newer sates, it ine fonnd that femanes are Khode Ishand and Massachusetti, the excess of femates over male, is five per cent. or more; in Connerticut, New llampshire, North Carolina, South Carolina, New York, lirginia and Ahbama, it is from two and a hall to five per cent.: In Maryland, (ieorgin, New Jersey, Lonisiana, Tennessee, Peunsylvania and jaine it is less than two and a half per cent. The states, ou the other hand, in which the males are cousiderably inexcess of the females are those sitnated in the Cordilleran region, where minag is the chief fursult and wherc the conditons of life are such as are more easily borne by men than by women. In Michigan. Munuesota, Kansas and Nehraska, whicb are not Cordilleran states, but whichare on the extreme northern, western, or sonthwestern horicers of the Ceutral region, the number of females is from cighty to mhety her cent. of that of the males, and New Mexico is in tbosame cutcgory. In the Paclice corst states the aumber of females is from lifty to eighty per cent. that of the males; and thesame is trne of Colorado and Dakota, which are situated on the eastern bordere of the koeky Mountains, and which are partly agricultarm mud partly mining States. In those states in which minlng and stock-rinising are by far the predominating interests, and whicbare cutirely inclosed in the Cordilleras, vamely. Idaho, Xevadi, Wroming and Montana, the inequality in the numbers of the sexes is greatest, there being in these territories less than half as many females as malcs. The same inequality exists in the territory of Arizona.

Of the colored population the ceusus of 1880 showed the number to be $6,540,793$ to $43,402,970$ whites, or 15,162 colored in cvery 100, , 50 whites. The slight increase in this ratlo from that given by the census of 1870 ( $14,5 \leq 5$ to low, 0nv) is believed to be chicily, if not entirely, due to the impertection of the carsus. of ind. The colored populatiou is stil, in spite of some sight "anigration, of them-south courolina Uississinpi and Louisians- whe colore are in access of the whites. In Alamama, Florida, (icorgin, Virgiula, North C'arolina and the District of Columbia the colored element runs from fisty to nimety per cent. of the white; in Arkanelementruns trom fisty to muety per cent.on thenty-nine to thirtysas, Texas, Tennessce and Maryland, irom twenty-nine to twentyfive percent.; in Delaware and kentucky, frominine $\begin{aligned} & \text { mer pent. in Missouri, Kansas, Weat Virginia, New Jersey, }\end{aligned}$ Ohio, Rhede Island, Penusyl vania aud Indiana, from two to seven per cent.; in all the remaining States it is less than two per cent.; and in most of them, especially the more northern ones, it is less than one per cent.

The distribution of the popinlation in reference to ehe topographical mud climatic features of the conntry is sinchas uaturally arises from the eonstant operation of two causers, hoth seting jn the stme direction. Fmigration and overfow from a morethickiy settled region toward one more thinly inhabited takea hlace, wlih insignificant exceptions, from the enst townrd the west. Immigrauts arrive from Europe, are landed on the A thatic coant-ahont three-fourths atome point, Jew York-and thence in larre part
find their way westward in the direction of lands unoccuried or only thinly settled. To the east of the M1ssi<airpi the land is aluost everywhere exeeptionally fertlle, the the elimatic conditions are, over a large urea, a- cxplaned elsewhere, very moch the sume, aud on the whole highly favorable. Soon after crossing the Miscissippi, we find that this farorable condition of things begins to change. Not only is the immigrant getting farther and farther irom his home, but he fa finding his envlronment less and lesa sulted to the develomment of those conditions which favor the exinteuce of a dense population. Niever, by any fossibility, can the region of small rafnfall, and, in large part, of rugged mountains, exteming from the first helt of states heyoud the Mississippi to the belt lying directly on the lacific coase, berome a densely pornTated bortion of the comatry. Thas dryer region is also the most elevated, as has already been fully cxplained. The reanle of the conditions thas fudicated are buftieleatly shown in the above table and the following:

The larger dirisions of the country are represented as follow, hoth ns to the aggregate population and its different clements:-

| Region. |
| :---: |
|  |

In regard to the distrihution of the population of the linited Stutes in towns and cities, and the positious of those centres, the following may be stated:-
In 1780 there were in the country four citlea having a population of from 8,000 to 20,000 and two nhove 20.000 , but not out aurpassing Fi, 000 in number. Fifty years later, there were forty-four towns and citles laving a poniulation of 8,000 and over, and one of about $50 n \mathrm{n} f 0$. In 1880 there were 2sti towns with over 8,000 Inlabitanta
the lollowing statement gives the names and popmlatlon of all the eities having, in 1890, a jopulation of over 100,000:-

[1u this and the following table notice must be taken of the fact that for the last half of lias and for 1880 and 1887 the Immigration from British North America aud Mexico is vot iucluded.]

Still further light will Le throw on this subject by the following table, in whjeh the vatiouality of the immigration into the United States is giren in cousiderable detail Ior the rears 1881 to 1887, in percentages of the total amount. From this table it will be seen that Germany has Inrnished during the past seven years somerbat less than one-third of the total mmongration: Great Britajn and Ireland somewhat more than a quarter: Norway and Sweden abont a tepth; British North America about a teuth: Aus-
 from four to five per cent.; and Italy nearly the same. These nationalities together have furnished during the past six years about vinety-fire per ceut. of the total. The immigratiou from taly and Russia shows a moderately rapid, but pretty uniform,inerease rom jear to jear:-

The immigration into the United States is very unequally distribnted over the surface of the country. An insuection oi the census tables and the accompanying maps shows that inmmigrants in very large proportion seek Northern regions. In the Sonthers States, with the exceptions of Florida, Loulsisna, aud Texas, the States, with the exceptions of Florida, Loulsiana, and Texas, the
forefgn element is practically uull. Virginia, North Carolioa. South Carolina. Alabama, Georgia, and Mjssissipul have less than one per ceat. of foreign-borm notulation; and no state south of leunsylvania and the Ohio River and east of the Mississimul has as much as four per cent. In the belt of States between the parallels oi $41^{\circ}$ and $45^{\circ}$, on the other hand, the foreigu element is most gtrougly represented. Thns in Massscbusetts. Connectlcnt. Rhode Island, New York. Michigan, Wisconsin. Minnesota, und Dakota the ioreign-born population is over twenty-fie per eent. of the native, and in the two last-named states over fifty per cest. Iowa. Nebraska, and Kansas, forming n belt of states extunding sonthwesterly from Wisconsin and Jimnesota to the 37th parallel, bave a loreigithoria population ranging between tell and twenty-five per cent, of the native, except jn the rase of Nwuraska, where the ioreign is a little over twrity-five jer eent. In some of the thinly inhubited States fartber west the foreignelement is still more prominent, as in Colorado, fah, Nevada, Arizona, and Califormin. Lorn inhahitauts were to the natives fn tbe ratio of \%ovarb to 100,000 . But it must be remembered in this connection that the entre popalation of Nevadaat that time was ooly fi2, 2tif, and that entire popalation of Nevaduat that time was ooly tha, 2tif, and that
of Arizona 40,440 . In no state or Territory does the forefgu cleof Arizona 40,440 . In no state or Territory does the forejgn ele-
ment equal the mative, and only in Nevada, drizons. Inkota. Ment equal the native, and onis in revada, arioons, wakota, the two last-named States it is but little more tians bulf. Texus forms an exceptiou to the other southern States, the forelga element being of importance, especially in the southuestern portion of the State. Thestate as a whole has, however, only a little less than eight per cent. of foreign-born inhabitaots
The percentage jncrease of the native white element of the fommIation was, for the threr decades $1851-\mathrm{N}$, as follows:-

Garly in 1882 an Act was passed by Congress snspeuding Chinese immigration Into the lnited'states for the term of twenty years. This was vetoed by the President, and abother one was pussed having nearly the same provisions as the first, but limiting the time of its operation to ten rears. This Act was not vetoed; but became a law May 6, 18s2. This second Act is entitled "AD Act to execute certain treaty stipulations relating to Chinese." From and after vioety dajs after the jassage of this Act the entrance of Chinese "laborers" into the luited states was forbidulu, aud any master of a ressel bringing them bere was punishalso by a the of $\$ 500$ ior each laborer so bronght, and also by imprisonineut for aterm not exceeding one year. the pretrxt for this nnprecedented Act whs "that the coming of (himese laborers to this country endancers the good order of certain loanlitios" within the territory of the Tnited states. The terns "laborerg" was held to mean "both skilled nud unskilled laborers, and chinese held to mean boyed in mining."

Further legislation relating to the exclusfon of the Clinese from the United States was had by Congress in likx. The two Aets were lussed, the first hariag beed approved sept. 13 , ink and a sucond supplemeatary to this, Oct. 1 , of the same yesr. The object of these two Acts was to prevent the Chimese who were then the the Vnited States from returaing after lisving left this conntry. The first Act (approred sept. 13\}. allowed a mative of chana to re-
*The immigration 1 aio the Coited Statec arriving at the six princlual ports (embracing sbont ninety-eight per cent. of the chtire imnigratiou) was, for the first mine months of the year inat. 432,802 , a slight increase over that of the corresponding months of the preceding year.
turll wrovided he had a "lawíul wife, child or parent withta the foited states, or braperty therein of the value of one thousand dollars, or debis ol like amoust due htm and preading settlement." This privilege was entlrely cunctlled by the suphementary Act. approved (ect. 1: und as the matter now stands. ouly "Chinese Excluslon oflicials, temehtors, students, merchanta, or travelers for pleasure or of Clidest curiosity are fermitted to enter he ("nitud sutes." Furtbermare, if is provided that lin arder to Lecome entitled to such entrance they must "obinis the iremissifon uf the f hiuece Govervment or other fovermment of whirh they may at the time becitlzens or sulyecte." This luermisiona, and the personal identfer of the party having obtafued it. muat lie suthentiented by the diplonatic or consular reyre-cntatise of the t"nated states at the port or place from which the fisrty eomes. It is further provided that any master of a cessel landing. or attumpting to land. sur Chinese lnborer 's in contravention to the wrovisions of this det shall be deemed gullty of a :nisicmemior, aud, on cumviction tbereof, shall be punished with a lime of not less than tive hundred nor more than one thomsand doliars, in the dicereton of the court for ucry Chmese laborer or other Chinese person so bronglit, and may" glso be imprisomed for a ferm of mot leks than one year, dor more than five gears, in the diseretion of the Court."
I'rovisiuns have also ucen made by det of Congress for the regu. lation of the immigrant "arrying fusine as and rules have been Firescriber as to food, water, light, space occinnied, etc. A tax of fifty ceuts is also imposted an ull immigrants lameling in this country to be lhed " fa defraying the expenge oif regulating inmigration mader this Act, and for the core of immigrants arsivitge in the ( nited sitates. for the relief of such as are fu distress. ete"
13y an Act of Comgresin. Hiluroveri Ang. 3. 14*2, it ls provided that Rnles for anconvict, lunutic, filut, or person "thable to ake care of him. immiswlf or herself without heroming a fullic charge" shall be permit- grants. ted to lsnd. Under the provlsivns of this Act it appesrs thst from 1, Wh to sept. 25. JAhi, T.7ni immigrants bad been recurned from the Cnited States to their own conntriez-or an average of abont 1.300 rersons a rear. Of those thas returued from 183 to 1468 tuclusive, there were 27 convicts, 371 lumutles, and 131 fdiots. The remainder ( 2,25 persous) were returned as " liable to liecome a public charge." +

## THE PURLIC LANDS

The cmjgration irom Europe and other coluntrles consistslargely of people secking lonnes in the New Worlal: and this want is chlelig supplied by the purchase of govermment luma-.. public lumds" as tismally designated by the anthorities-mat is, of suen lamd as is offered forsale ly anthority of the (icueral Government nader the direction of the ficueral fand ollice-a hranch ur suldeanatment of the Departmont of the Interior. It is desirable Extent fhercfore, that the wayln which the licaersl (iovernmant came in and possession of thesc lands shonld be brifily stated, and some jdea lositior fossession of hesi hands shomat be brielly stated, and some idea rlie bonndaries of the finited st

 the (irent Lakes and east of the sljusissiphs, as far sonth an the burallel of si and the southern boundary east of the Nississippi. as thus establishcd, nearly along the sist parallel. was, in 1795, reallirmed ly treaty wath spais, by whlels the line between the tnlted state and the Florldas was fixed; but dificulties soon arose in regsed to the northeru boundary, loth in its enstern and western furtions. Which were, during ninny years, the subject of herater discussion, and wheli more than once threatened to involve the two countries, (irant Liritain and the Lnited states, in war. The mastimportant bolnts, were, bowever, peaceably settled in lslfi, gud the jast point in dispute fimally disposed of, by refereace to the Fmperor of Germany na arbitrntor, in $1 \times-2$.
At the time of the adoption of the constitntion by the ariginal thirtewn states. most of them had claims, rather vague, and in many cases decidedly coullicting, to a more or less indefinte area of condtry west of theirscttlenedts, and extending back to the IIfsissimpi River. After much discussion, the siates baving these clalms, infoenced by the distmet realization of the tronthe which would ensue in came an attempt was made to maintain them, did. in response to a resolution of Congress, eonsent to a transfer of in response to a resolutiou of Congress, eonsent to a transfer of
these claims to the E'nited States. The first cession of this kind was that of New York, In 17s1, Aind the Jast, that of tieorgla, in 1N0:. The region thus ceded was diviled finto two territories, one of whinh was ealled the "Jerritory Northwest of the Kiver Ohio." the other the "lerritory Nonth of the Liver Ohio." This region formed the Inclens of the public lands of the Inited States. This did mat inelude the prescint sitates of Kentucky and Tennessee. the former having been admitted to the Union without any elalm on the part of the United sitates to proprletorshly, in the soil, and similar rights in regard to the later having beed relimqulshed by Act of congress. The total area of the Tnited states at this time was ahout $=0,000$ equare milles. The first addition made to this Was ly the French cresion of the undutermined areaknown as Loulsfana. This was bronght abont ly Jefferson, who secogalzed the fact that France would not be uble to hold the region against the English, with whom Homaparte, nt the time (1n(0;-1:04) First
*This tax is not collected from imnigrants coming irom Canada or Nexileo.

This Actcan have little practieal effert on the number ofifmmigrants arriving in this cominty, mur bas the writer feemable to grocure any definite information asto whether any jersons have ever been sent back under its provisioas.

Cousul, was about to go to war. The treaty of cessiou with Bous partegave no precise limits to the territory ceded. but ony de scribed it as beiug the same as that ceded by span to France accordiug to the treaty of salllderonso. this lagueness was, 10 doubt agreeable to the wishes of the American negotiators, who did not lack foresight, and who must easily have compreheuded the fact that the anore vague the terms of the cession the better the chance of a future extension of the claims of the Tinited states westward. Fu point of fact the French cession did not include the wes west to as it was afterwardheld to do for the French hat no clam whaterer to the region west of the bead of the Missouri. As a consequence of this cession, however, this vast the . 1 regin did come in posses ary having been finally settledin 1sid. after ninety years of discus sion. The final settlement was by a reference of the point in dispute to the Emperor of Germany, who decicled in favor of the linited States; the main question with regard to the extension of the boundary along the line of the 19 th parallel to the Pacific, baving been settled in 1846 by the Weloster-Ashburton treaty, which fxed the boundary asfar west as tbe Straits of Fnca. Thiscession of Louisiana, as firally settled by treaty with England, added largely to the aren of the United Staten, extending its limits to the Pacific ocenn, and giving that comntry complete posscssion of the Ceutral Piver system of the continent. The cost of this cession to the Uuitel states was about twenty-three aud a balf milliou dollars in principal and interest
A further addition to the territory of the Inited States was by a cession from smain of the territory comprised in the present state of Florida. Whicb took place in 1si9, the area thins convered bome about $5 x, 680$ square miles, and the cost about six and of half mil lions of dollars. Previons to this ression, however, the United lions of dolars. Previous to this c'ssiom, howeter, the unted not promulgated until isls, taken possesiou of au gria of ghout not promilgated until ish. taken posisession of au arta ol flout ish doverumeut as its property, but wbich claim was relinquisbed ish hoverumeut as its
by the cession of $1 \times 14$.
The bext acquisition of territory by the United states was the result of the aduission into the [miou of the fepmblic of Texas.a former province of Mexico, baviug an area of atin.7su synare milus This annexation led to a war with the country to which Texas had formerly belonged, the result of which was the conquest of Nexiro the occupation of its capita] by the [taited States urmy, and the dictatiun of a treaty of peace called the "treaty of Gatidalupe Hidalgo." which was proclaimed July 4. 1848. By this treaty the southeru boundary of the United States was established; but sub sequently, Dec. 30,1853, a purchase was made of a strip of land lying sonth of the dila River in New Mexico and Arizonu, and contaiuing about 47,300 square miles. This is known as the "Gadsden purchase.
Glaimo of The clai
Great Brit
West of Fague, it is not possilile to state, with any aprioach to precision what portions of this area originally belonged to the two powers in question. All that can be said is that, remotely, in consequence of the nurchase of "I ouisigna" from Bougarte and more directly as the result of treaties with Great Pritain and Mexico, settling the northern aud sontheru boundaries of the United States, the the northern aud sontheru boundaries of the United States, the last named conntry came miles of land, as shown in the following statement of the square miles of land, as shown in the following statement of the
mature and size of the aleas added from time to time to what was uature aud size of the aleas added from time to time to what was ment as au iudependent goverument :

Obe other addition to the area of the United States was made in In 1867, namely, by the purchase from the fussiau Government of the region known as Alaska, Which comprises an area of abone 530,000 square miles. The price paid for this piect of land was $\$ 7,200,000$. The purchase oi this territors, the nearest point of which is four hundred aniles distant from the uorthern line of Washiugton, was an entirely unprecedented act on the part of the United states, all the rest of the possessious of this countrs form ing one compact mass of land. Whenever, in the conrse of this work, mention is made of the Cnited States, it will be understood that Alaska is not included, unless a statement to that effect is syecially made in the savie conmection.

The entire area of the public lands of the U'nited States (exclu sive of Alaska, no portiou of which has yet been snryeyed) is esti mated by the Commissioner of the hemeral Laud Oftice, in his re port for the year $1 \times 26$, at $2,836,-25$ square miles, or $1,815,504,147$ acres Of this area there bad been surveyed, up to June $30,1886,971,174, i 73$ acres, leaving $844,329,269$ unsurveyed. In reference to this un survesed portion the Commissioner made the following remark "The volume of land in the unsurvered portion of the publio domain suitable for bomes and suliject to settlement under the laws of the United States is of comparatively small proportions.
Of the public lands of the İnited States a large quantity has beeu sold for cash, and a much larger amount taken, inder variou: Acts of Cougreas, for scbools and other edncational murposes: as mjlitary hominy; as "swampland. given to the respective states where it occurs, or has been claimed to occur; as a bonns for the
coustruction of various lines of railroad, especially those travers ing the contiuent from east to west: as "homesteads" to actual settlers, and for various other purposes. It is impossible to state the exact amonut of the public land which has been thus disposed of, but it is certain that nearly all the ralnable portion of the aation's great iuheritauce bas been taken up already, or bas Hassed ont of the control of the Governmeat. Hn regard to this point, the following quotation may be made from the introduction to the volume eutitled "Statistics of Agriculture," forming a part of the report of the census of 1850 , and published in $1880^{\circ}$, the remarks bere quoted being from the pen of Guveral Walker, formerly superateadent of tbat censis:
"It thus appears that, notwithstanding the imposing total of Valuab $1,400,000$ squaremiles of still unsettled territory, the amount of land land available for occupation for ordinary agriculture is uot large. The already Public land (omimission in their report of 1880 , say: "It was esti-gone Public band commission in their report of 1880 , say: it was estiStates) of lands over which the survey and disposition law's had extended, lying in the West, the Fnited States did not own, of arable agricultural public lauds, which could be cultivated with out irrigation or other artificial appliances, more than the area of the preseut State of Ohio, namely, $25,5610,960$ acres. The quantity of land taken up in the arable region during the year ending June 30,1880 , was about $7,000,000$ acres. The commission, therefore, reaches the startling conclusion that, at the same sate of absorp tion, the aratle lands so situated will all be taken up within three years, or by Jnne $30.188 \%$.
"It is indeed an astonishing amnouncement that the public land sfstem, so far as relates to agrucultural settcrs, has virtually come to an end; that the bomestead and pre-emptiou acts are practically exbausted of tbeir contents.
Profescor A. B. Hart has compiled from pablic cocuments the following approximate statement of the manner in which the pubic hands had lreen disposed of unto the frarious periods mentioned The numbers gaven indicate acres

| Date. | Sales. | Grants to individual: other than for internal improvements. | Grants to States other than for internal imHrove ment. | Grants for internal improvements to states anct (orporations. | Total. |
| :---: | :---: | :---: | :---: | :---: | :---: |

| 1801 | 1,:14,917 | 2, 134, (titio | . .. ... | - . | 2.734, 577 |
| 1820-21 | 19,423,212 | 7.2ti0.152 | . ... . |  | 33.375 .901 |
| 1841 | 93,043,927 | (1), 7 ( $5,0,0 \% 3$ | $8, \times, 0.604$ | 1.780.70. | 118.420,119 |
| I*61 | 161.796, 16 | $75,16 i 6,345$ |  | 31. $600, \mathrm{Si}^{(2)}$ | $3 \mathrm{k} 2.426,5024$ |
| 1381 | 181,837,35\% | 140,524,032 | 154,187.144 | 162,230,09! | 642.765.681 |
| 1884 | 192,544,116 | 167,483,506 | 158,417,594 | $162,230,099$ | 680.715 .315 |

Fu reference to the wasteful and reckless manner iu which the mblic lauds of the United States had been given away, until but ittle of value remains, Professor Hart makes the following re marks:-

Experts in the Land Office assure us that, making all deduc. tions and allowances, the remaining lands are worth npwards of a thousand million dollers. There is no evidence in the past policy of the government for believing that we shall actually net one enth of that amount. The greater part of the region is officially classified as 'desert lands, and is for sale in tracts of six bundred and forts acres, at \& dollar and a quarter sn acre. Nothing but the temporary increase of pre-empticn enables the Labd Office at prestrit to pay its rumbing expenses ont of income. The golden time is past; our agricultural land is gone, our timber lands are fast going; our coal and mineral lands will be sampped up as fast as they rrove raluable."*
*Quarterly Journal of Economics, vol. 1, p. 181 (number for Janu ary, 18*7).

## AGRICL＇ITC＇RE

The followiug statements and tables present a suncinct vew of the uature and importance of the urricultural interests of the I：aited states，begiuning with the cereals．

## I．－THE CEREALS

The following table shows the production of the cerenle in rash－ els，as returned by the census of 1 sinu：－

The production of barley was largest io Calitornia（twelve and a half million busbels）；otber states producing considerable quan－ tities were：New York，Iowa，Minnesota．Nebraska，Ohio other State produced as much ss one million bushels．In wat the total production of harley fin the［＇nited states was 59.42 w ．wo bush－ els：of that anount California produced $16.058,000$ busbels；and Cew York，Minnesota，Wisconsin and lowa each over five million and less than ten milliou turhels；while Sebraska，Michigan and Whkota each produced over one million mad less than five million bushols．

The total production of buckwheat within the I＇nited States，ac－ cording to the ceusus of 1,40 ，was $11,217,327$ bushels ：of this amonnt New York and lennsylvania produced respectively， $4.461,200$ Hinl 2．at 320 bushels．No other State producci as much as halif a mil－ lion bushels；the production of this cereal in the fiulf states bejnif lextremely snall，that of the Pacific states being also very insig extremely small，that of the Pacific States being also very insig
nificant．Lo one of the States，other than Nw lork and Penasyl－ vavia，produced as much as half a million bushels．
In tow the total production of buckwheat was 11 ，wion 000 busbels， or almost exactly the same as in the last censva year（isis）．
Indian coru is the most bulky crop among the cereals，the total
 The principal production of this crop is in the helt of atates lying north of the Ohfo，and in the same latitude on the west of the Nississippi，as will be seen from the following thble：－

The estimate of the Agricultural Department of the gletd of wheat for the year 1,45 is 415, ，misi，（M0．
The grass crop is well uuderstood to he the grentest of all the crops of the＂ulted siates．Altogether．In addition to the very large amount cousumed from the gronnd durlug the grazlug sea．

[^312]son, the value of the bavested hay reaches nearly to that of the greatest of the cereal crops. The following statistics are pre-seuted:-

The area mown in 1879 was $30,631.054$ acres; in 1886, 36,501.6Ns acres. The valne of the hay cut in the latter year was $353.437,699$. ${ }^{*}$ ln one State (New Jork) the value amonnted to over fiftymillions of dollars; in one (Pennsylyania) to over thirty and less than forty millious; in three States (llinois, Ohio and Iowa), to over wenty and less than thirty millions.
The grass and hay producing industry decrenses in importance as wego from the North toward the South. Thus, the thirteen Statesin each of which (in 1879) more than a million of acres were mown, are all north of the parallel of 37 ; and all but two (Missouri and Kansas) north of $39^{\circ}$, exceptiug very small fractious of Obio, 1ndiana and Illinois.
Animals dairy prod cta.
was as follows:-

|  | Horses |
| :---: | :---: |
|  | Mules |
|  | Milch cows |
|  | Oren and other cattle |
|  | Sheep. . . . . |
|  | Hogs . |

The importance of the crop of Indian corn has given a great development to the business of fattening swine, and an average of about fifteen per cent. of this production has, during the past twenty-seven jears, heen exported. The average value of "hog prodiscts" (live hogs, bacon, bams, pork and lard) exported has been, during the years $1851-87, \$ 73,671,607$ per annum, as againgt $\$ 65,196,496$ in the decade 1871-80.

The statistics of dairy products given in the agricultural Report of the Census of $1 \times s 0$ for the year 1879 are presented in a very coudensed form, as follows :-

```
Milk sold, or sent to butter and cheese fac
    tories.
    530,109,755 gals.
Butter made on farms
Cheese made on farms
\(77,250,287 \mathrm{lbs}\).
\(27,272,489 \mathrm{lbs}\).
```

The very great exteat and importance of the ponltry industry in the United states is made apparent by the following statement of facts gathered by the census of $1580:-$

At twelpe cents a dozen the annual value of the egg product to the farm would reach nearly $\$ 50,000,000$, rnd the value of the fowls consumed as food may fairly tee estimated at $\$ 20,000,000$. The aver. age yield of eggs jer fowl is fully twice as great in the Northeru States as it is in the Southern.

## Dothon. <br> The cotton production of the United States is of great inpor-

 tance, both from the extent to which this material is manufact ared within the conutry, and because it is the first on the list in value among the exports.Cotton is mentioned in the records of the Colons of South Carolina as early as 1664 , and a snall quantity was exported in 1747. The invention of the cotton-gin by Eli Whitney, in 1794, was followed hy a rapid development of the cotton-raising business throughout the sontherustates. The first crop of sea-ialand cotton was raised in 1790 , from seed that cane either from the Bahama or Barhadoes Islands.

The total production of the country in the year 1579 is given by the census of 1880 at $5.737,257$ hales. of 375 pounds: this baving been assumed to be the weight of the bale, in 1879-the arerage proportion of seed to fibre, or lint, in the crop as it comes from the field being given as two to one. The stated number of bales is equivalent, therefore, to $1,362,599$ tons (of 2,000 pounds) of lint or fibre, and 2,725,197 of seed.

This prodnction was divided among the States as fallows:

|  | Field. Bales. | Av. Prodnet per acre. Fraction of bale. |
| :---: | :---: | :---: |
| Mississippí. | 955,808 | 0.46 |
| Georgia | 814,441 | 0.31 |
| Texas... | 803,912 | 0.37 |
| Alabama | 699,654 | 0.30 |
| Arkausas. | f108,256 | 0.58 |
| Sauth Carolina | 522,548 | 0.38 |
| Lonisiana.. | 505,569 | 0.59 |
| North Carolina | 389,598 | 0.44 |
| Temmessee. | 330,644 | 0.46 |
| Florida | 54,997 | 0.22 |
| Missouri | 19,733 | 0.60 |
| Indian Territary | 17,000 | 0.49 |
| Virginia | 11.000 | 0.46 |
| Kevtucky. | 1,367 | 0.51 |
| Total. | ,737,257 | -. 2v. 0.40 |

From the above table it will be seen that the limit of profitable cultivation of cotton is pretty sharply drawn at about the parallel of $37^{\circ}$; the production of Virginia and Kentucky-the sonthern border of which states is in the latitude $36^{\circ} 30^{\prime}$-being exceedingly small. The production of Missouri is limited to a highly fertile

This includes only bay cut on farms, and not that cut on public fands and lauds of non-residents.
legion lying in the extreme southeastern portion of the State: While that of Kentucky Yertains to the country lying adjacent to Western Tenuessee and the rich bottom-lunds along the Mississippi River. It does nut appear that any cotton is produced nortb of the Ohio River
According to Professor E. W. Hilgard, Special Agent of the Census of 1880 , in charge of the subject of Cotton Production, the high production of Mississippi is due in part to the great fertility and large area of the " bottom-land " along the Mississippi River within the limits of that State, and in larger lart to the fertility of the "uplands," or table-land bordering the Mississippi bluff, and the "prand resplt that cotorloultio the one pursult resmlt of this state devotes itself. It is rather great ing oral popuiation of this state devotes itself. It is rather great natural adyantages that the skin and place in the production of cotton. Professor Hilgard thinks that by eularging the area of tillable land in the lazoo bottom, by aim. ple exclusion of the overfiows of the Mississippi, withont any change in the methods of culture, the produce of the State might be raised to two and a quarter millions of bales; and that with improved cultivation the production might be brought up to five millows, so that under these conditions Mississippi alowe could producc the entire crop now grown in the rinted states.
Georgia stands second in total production among the States, but Georgia the average production per acle is but two-thirds that of Missis- a cotton sippi. The area of what would be called in the last-named State producia first and second class cotton soil is in Georgia quite limited-far state. more so than is the case in the neighboring state of Alabama; yet the former state is slightly in adyance of the latter in the average product ver acre The high position of (ieorgig as a cottor producing State is due thereiore, not to matural adwantares, lut to better cultivation of the soil, the use of fertilizers, and the thrit of an industrious papulation.
Texas-much the largest in area of the catton-producing states. and also slighty larger in population than ans of the other Gulf States-stands third on the list of total prodiction. In the arerage product per acre it is among the very lowest. This fact seems to be due, in large part at least, to the position of Texas in reference to precipitation. In this State the total amonnt of ralnfall is considerably less than in the otber Gulf States, owing to its position in reference to the prevalling winds; and the diminution of rainfall is rapid as we recede from the coast. The precipitation is Iargest in the extreme northeastera portion of the State, and here -north of the sed parallel and east of the 98 th meridian-more tban half the cotton product of the state is grown. The fact that Texas is so mucb larger than the other cotton producing States must also be borne in mind in connection with its position as the third on the list. It has, in fact, an area more than five times as great as the average area of the six otber principal cotton States
Alahama is naturally as well suited for the grow th of cotou as Alabam the two states adjacent to it on the east and west, Georgia and Mississipni: and its position as follth on the list, and as inferior to both these States, is considered by Professor Hilgard to be due to the fact that Mississippi is still within the period of the first flush of fertility, while Georgig has reached the stage where her fields are being renovated by the use of fertilizers; while the soil of Alabama has legun to be exhausted, hut this exhaustion bas not yet proceeded so far that the cultivators realize the necessity of making good this deficiencs by proper modes of cultivation. as is done to a certain extent in Georgia.
In South and North Carolina the average cotton production per south a: acre is high as compared with that of Alabama and Georgia, and North in the case of North Carolina ayuroaches that of Mississipplitself. Curolid: The reason for this condition of things is to he found ehiefly in the introduction of improved methods of culture, and the use of fertilizers. In South Carolina the so-called sea-island cotton is produced-a variety of cotton of great value although small in amonat, the production of it for the year 1880 being set down in the Ceusus Report as 9,966 bales. The finest cotton ever known to have been produced is the long-staple cotton of Edisto lsland, which sold for twa dollars a pound when other cottonswere only brimging nine cents. The islands where this crop is grown liue the coast, sometimes forming three or four farallel belts, having thejr greatest development at the mouth of Broad River, from which in each direction along the coast ther diminish in numWhich
bers. bers Arkana important cotton-prodneing states with the exception of Atlantio and Tennessee. He elmer on the Gulf of Mexico or the Atlantic coast: but the principal cotton-producing areas in the case of each of these states are at a considerable distance from the coast. Thus, in Mississippi hy far the greater portion of the area planted in cottan lies in the northern and western part of the State, while In the extreme south there is an area where coton cultureis either vers subordinate or practicallf non-existent; nor is this decrease of cotton culture accompanied by a corresponding ibcrease of some other production, $1 n$ Loulsiana an abrious fact-reudered apparent by a glance at the map showing the relative areas given to cotton culture in the state-1s the decrease of cotton culture Rs we advance sonthward. In Alabama the central prairie recion, five backsoll belt, a narrovis strjp of country only ataut State more that a per ceut of the entire cottou crop. Adjacent to this particul per cent. Of the entire cotton crop. Adjacent to this particuiarly ductiveness, making the total width of the central cotton belt about seventy-five miles; and here at least sixty per cent. of the about seventy-five miles; and here at least sixty percent. of the
cotton af the State is raised. In (reorgia the principal cotion-praducing belt runs nearly parallel with the coast, and at adistance of from one hundred to one hundred and fifty miles from it. A similar conditiou of things is clearly indicated in both North and South Caralina.

Un compring the facts here stated with the position of the isothermal and isohyetal curves in the region where cotton is grown, it will lee seen that nearly the entire production of cotton
comes from the area Included hetween the isothermals of $60^{\circ}$ and Gs，uad there is mone coltivated in any region of lower uncau an－ nual texperatire than 5 ．It also aynears that the cotcou－pro－ duciug area is oot of comparatively large irceipitation，being no－ where less thas thirty－eight inches，aud gencrally considerably over tbat amomat；amanco that this precimitation is uretty umi－ formally distributed thronghont the year．From this it is seen that the climatic conditions favoring the growth of cotton are of such at auture as to limit its successinl production to a eomarara－ tively small area，differing in thin respect materially，from monte of the other staples of the country，cspecinly Indian cornand wheat． It will also be evident that the comditions existang on the l＇acific coast do not favor the successful caltivation of catton in that region．
The followiug table exbibitz the produceion of cotton and the smonntexported for each year from linu to lwi．The average al

## MANUFACTUAEs

The most important facts connected with the mannfacturing interests of the United states, as revealed by the census of 1 sso and those of the precediug decades, may be stated, in the most condensed form, as follows:-
First, a table is givel showing certain of the frincipal items connected with mandactures in the form of totals for the whole dnited States, for the three census years 1860,1570 , and $1880:-$

TABULAR STATEMENT OF MANUFACTURES IN THE CNTED StATEA

|  | 1860. | 1570. | 18.40. |
| :---: | :---: | :---: | :---: |
| Number of Establishments | 1411,433 | 252,148 | 253, 554 |
| Cajutal Invested | \$1.009.855.715 | \$2.118.206.769 | \$2,790,272, 206 |
| Average Number of Ilands Employed |  |  |  |
| Males above 16 year's. |  | 1,615.598 | 2,019,035 |
| Females above 15 yeara. |  | 223,770 | 531,639 |
| Childreu and louths |  | 114.625 | 181,921 |
| Total amonnt paid in wages during the year | \$378.875.966 | \$775,524,343 | \$917.953,795 |
| Value of materials nsed | 1,031,605,092 | 2,488,427,242 | 3.396, 823,549 |
| Value of Products. | 1,485,861, 676 | 4,232,325,442 | 5, $569,579,191$ |

The proportion ju whicls the various branches of manufacture are geographically distributed over the country, according to the celisus of 1880, is shown hy the following percentage statemeut:-

Table of Geographical Distribition of Manufactures in THE UNITEDSTATES.

Next may follow a statement of the various most extensive mannfactaring industries arranged in the order of their importance, with reference to the value of their products. In this table all branches of mannfacture are included in which the total prodnction exceeds $\$ 40,000,000$ in value :-
 STATES, ACCORDING TOTHE CENSI'S OF 1880 .

| bilk and silk Goods. | 9,146,705 | 22,467,701 | $41,033,045$ |

The remarkable concentration of the manufacturing interests of the [risted States in the extreme northeastern portion of the country will treevjent irom the above table. New England, New Vork, New Jersey, and Pennsylvanin, tombracing only a little over olle-twentieth of the area of the whole country. produce six-tenths of the total gross wrodnct of its malunactures, similar condiditions ase shown in tontrasting the northern with the southern sections of the country. The North Atlantic and North Celltral divisions, with thirty-one ner cent. of the tota] ares, furnish over eighty-eight leer cent. of the gross uroduct. The Western or Cordillerau region, will mearly lorts per cent. of the total area of the country. farnishes only a little over two aud a balf per cent. of its manufactures.

The Census Report of 1882 gives a great mass of statistics in reference to the manufacture of cotton in the country, from which the followiug are selected as representing the most cssential features of this extremely imfortant business:-

| Number of spindl |  |
| :---: | :---: |
| Vumber of looms. | 225.759 |
| Rales of ectton consumed. | 1,570,344 |
| Number of He? sons employed | 172,544 |
| Wages paid | 12,040.510 |

These are said to be the final figures of the specific manufacture of cotton yaru and woolen fabracs. inclnding some cotton hosiery: and by the tern "specific" is meant cotton "worked into a fabric knowil and sold under that name
Including the cotton nsed in mixed goods and upholstery, the total consnmption is estimated at $1,760,000$ bales. The total number of operatives employed, including those engaged in print and dye works and bleacheries, and also in manufacturing special
fabrics in which cotton forms a part, is 198.338 . The operatives fabrics in which cotton forms a part, is 198.338 . The operatives
employed in the specific cottou mills arethus classed as to age and sex:-

The average wages earned in the cotton mills amonnt, for 300 days in the year, to 81 cents per day. Since 1840 the hours of labor have been reduced from 13 or 14 to 10 or 11 , and the average earnjags per hour are now more ihan donble what they were at that time.
The manufactire of cotton is carried in nearly all the Atlantic, Central, and Sonthern States, hnt is principally developed in and nenr Massachusetts. This Statealone consnmed eonsiderably more cotton in 1880 than all the other States ontside of New England. Oi $1,570.544$ bales consumed in "specific" cotton mammfacture in the country, in $1880,1,129,498$ were taken by New England. \$assachusetts and Rhode Islaud, having together about ten thousand square nilles of area. consumed $742,337 \mathrm{bales}$, or nearly balf the whole consumption af the rinted states. Some cotton cloth is still made by hand in the mountalnons
sections of the south, some two or three hundred thousand persons
being supplied in this way，As a measure of their work，it is said by Mr．Atkinsoll．Afecial Ageut of the Census in charge of the subject of Cotton，that＂twu carders，two eninners，and owe weaver conld produce eight yards of coarse cotcon cloth in a day of ten hours．＂To this he adds：＂Of the whole force engrgeal in the specific cotton manifactures，alout 1 fon，（m0 are employed on goods for home collsumption．It would take 1 ，ta0， 140 to make the same number of yards by hand－work，and the cloth wonld te of a far different kind－more dnrabje，it is trile，but coarie and unsightly．
The following table will furnish the necessary data ior an muder－ standiug of the importance of the petroleum business in the（＂uited States：－

From a comparison of the facts given in the various tables berewith presented, it will beevident that, with the exception of those items called "manufactures" in the Census Reports which are not properls manufactures, but the conversion of articles of food into properls manufactures, a more suitable and convenient form for shipment to ioreign conntries-8s. ior instance, slaughtering of animals, and grinding States are intended aud used for bome consumption. The amonnt States are intended aud used for bome consumption. The amonnt
of these exported is very small as compared with the total of the of these exported is very small as compared with the total of the
exports. There is no one manufactured article of which the Exports. There is no one manufactured article of which the
Enited States has anything like a mononoly abroad, or which Gnited States has anything like a monopoly abroad, or which
greatly pretominates in innortance as an article of export over greatly pretomin
any otber article

The following data, compiled from the reports of the Bureau of Statistics. will give a sufficientls complete and comprebensise view of the pature of the ininorts in to the (rated states.
The imported articles, including those admitted free of duty and the dutiahle, are thus classitied :-
A. Articles of food and lizer animals.
B. Articles in a crude condition which enter into the various proccescrs of domestic iudustry.
C. Articles u'fully or prerially mannfactured for use. as materials in the manufartures and mechanic arts.
I. Articles mannfacturad roudy for comsumption.
E. Artictes of roluntary use, hesuries, ctc.

The following table gives the amonnt in ralue of each of these classes imported during the years 1084 and 1.55 , and the average classes imported during the ycars $1 n 84$ and 1855 and the average
for the five jears ( $1 \times 81-5$ ) : also the ad valorem rate of duts on the for the five fears ( $1 \times 81-5$ ): also the ad valorem rate of duts on the
dutiable articles of cach class, and the percentage relation of the ad valorem dnty to the entire duts collected:-

| Year. | 1884 and 1885. |  |  |  | A verage of l'ears 1881-85. |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

JUNIVERSALIST CHURCH, a religious-body in the United States of Ameriea, especially in the New England States, which lias for its distinguishing tenet. the doctrine of the final salvation of all souls from sin through Christ. The pioncers of Universalism in America were Dr Gcorge Do Benneville, whe taught from 1741 principally in Peansylvania; Dr Charles Clauncy, of the First Chureh, Boston (notably in The Salvation of All Men, published in 1784); Lr Joseph Huntington, of Coventry, Conn. (whoso Catvinis.n Improved was published after his death in 1796); John Murray, Elhanan Winehester, Caleb Rich, and, very specially, Hosea Ballou. Murray is, however, regarded as "the father of Universalism in America." In 1750 James Relly had avowed bimself a Universalist, basing his belief on a theory quite peeuliar; Murray, who bad preached as a Methodist in England and Ireland, was Relly's most distinguished convert. In 1770 he came to Ameriea, and, under circumstances so strango that most Universalists regard then as providential, overcoming a deep reluctance, he preached at Good Luck. New Jersey, and organized a society, "The Jodependent Christian Church," at Gloucester. Massachusetts. Hosea Ballou-a convert from the Calvinist Baptists-took up the cause io 1790 , and published the work that is regarded by Universalists as
epoch-making, A Treatise on Alconement. The number of ministers inereased, and societies rere formed. These in due time became the constitucnts of larger organizations, till a "New England convention" sal occasion, in 1803, to adopt a "profession of faith," which in three short articles avowed belief in the Bible as making known in a Divine revclation the nature of God, the mission of Christ, the final holiness of all souls, and the necessity of grod works. In 1866 a general convention, composed of delegates from the State conveations, was incorporated It has jurisdic. tion throughout the United States and Canada. It has a "Murray fund" of about $\$ 135,000$. Under the anspiecs of the Universalist Church are the "woman's centenary association," the "Universalist historical society," several organized charities, four colleges, threc theological schools, and five academies, - the total value of the schools, inelnding endowmeats, being hardly less than 3 inillion dollara. It publishes eight periodicals. The J'car Book for 1887 gives the following summary:-1 general convention; 22 State conventions; 945 parishcs, 38,429 families: 696 churches, 35,550 members; 634 Sunday schools, 51,871 members; 789 church edifices; value above indebtedness, 87,493,927: 673 clergymeu in fellowship and 120 licensed lay preachers.

## U N IVERSITIES ${ }^{1}$

Orktoal THEE mediaral Latin term universitas (from which the neasing 1 English word "university" is derived) was originally of the employed to deuote any community or corporation re"erm garded under its colleetive aspect. When used in its resity " modern sense, as denoting a body devoted to learning and education. it required the addition of other words in order to complete the defivition, -t the most frequent form of axpressiou being "universitas magistrorum et scholarinm" (or is 4 m !. "discipulorum"). In the course of tinee, probably towards Lationts the latter part of the 14 th century, the term began to be used by itself, with the exclusive meaning of a community of teachers and scholars whose corporate existence had been reeognized and sanctioned by civil or ecclesiastical authority or by both. But the more ancient aud custonary designation of the university in mediraral times (regarded as a place of instruction) was "studium generale" (or eometimes "studiun" alone), a term implying a centre of iustruction for all. ${ }^{2}$ The expressions "universitas studiu" and "universitatis collegium" are also occasionally to be met with in official documents.
It is necessary hewever, to bear in mind, on the one hand, that a university often had of rigorous virtual existonce loug before it obtained that legal reeogaition which entitled it, teehnieally, to take rank as a "studium generale," and, on the other haud, that hostels, halls, and colleges, together with complete courses in all the recognized brauches of learoing, were by no means neeessarily involved in the earliest conception of a uaiversity. Tho uuirersity. in its earliest stage of development, appears to have been simply a scholastic guild,-a spontaneons combination, that is to say, of teachers or scholars, or of both combined, and formed probably on the analogy of the trades guilds, and the guilds of alieas in foreiga cities, which, in the course of the 13 th aud 14th centuries, are to bo fonnd apringing np in most of the great European centres. The design of these organizations, in the first instance, was 1. II is the design of the present article 10 exhibit the anversitics io thoir hilytoricel dovelopmeut, each beiog hronght nader wotice, ns far as practicable, is the onder of ts originnl foualalion. Ia the alphabetical enunueralion is the table at the eull, the dhate of fouodetion shus serves to inlicate opproxiunately tho phace where any univerity is firt referred to
'EDoslife. Die C'urcrosienten des Jithedalcrs, i. 38.
little more than that of seeuring mutual protection,--for the craftsman, in the pursuit of his special calling, -for the alien, as lacking the rights and privileges inherited by the citizen. And so the university, composed as it was to a great extent of students from foreign countries, was a combination formed for the protection of its niembers from the extortion of the townsurea and the other annoyances incident in medirval times to residence in a foreiga state. It was a first stage of develppment in connexion with these primary organizations, when the chaneellor of the eathedral, or some other authority, began, as we shall shorlly sce, to confer oa their masters the right of teaching at any similar centre that either already existed or might afterwards be formed throughout Europe, -"facultas ubique docendi." It was a still further development when it began to be reeognized that, without a licence from either pope, emperor, or king, no "studinm generale" conld be formed possessing this right of conferring degrees, which originally meant nothing more than liecnees to teach.
In order, hewever, clearly to understand the conditions Chief under which the earliest universities came into existenee, facts it is necessary to take aceount, not only of their organiza- in the tion, but also of their studies, and to reeognize the main learning influenees which, from the 6th to the 12 th century, served beforo to modify both the theory and the practice of education, the urIn the former century, the schools of the Roman empire, veraty which had down to that tinue kept alive the traditions of ${ }^{\text {era }}$ pagan cducation, had been almost entirely swept a way by the barbarie invasions. The latter century marks the period when the iustitutions which supplied their placothe episeopal sehools attached to the eathedrals and the monastic schools-attained to their highest degree of infaence aud reputation. Between theso and the pehools of the empire there cxisted an essential difference, in that the theory of education by which they were pervaderl was in complete contrast to tho simply secular theory of the schools of paganism. The cathedral school taught only what was supposed to be necessary for the eduention of the priest; the monastic seliool taught only what was supposed to be in harmeny with the aims of the monk But between the pagan system and the Clisistian system by which it had been superseded there yct existed some?
thing that was common to both : the latter, even in the narrow and meagre instruction which it imparted, could not altogether dispense with the ancient text-books, simply because there were no others in existence. Certain treatises of Aristotle, of Porphyry, of Martianus Capella, and of Boetius continued consequently to be used and rtudied; and in the slender outlines of pagan learuing thus still kept in view, and in the exposition which they necessitated, we recognize the main cause which prevented the thought and literature of classic antiquity from falling altogether into oblivion.

Under the rule of the Merovingian dynasty even these scanty traditions of learning declined throughout the Frankish dominions; but in England the designs of Gregory the Great, as carried ont by Theodorus, Bede, and Alcuin, resulted is. a great revival of education and letters. The influence of this revival extended in the Sth and 9th centurics to Frankland, where Charles the Great, advised and aided by Alcuin, effected a memorable reformation, which included both the monastic and the cathedral schools; while the school attached to the imperial court, known as the Palace School, also became a famous centre of learned intercourse and instruction.

But the activity thus generated, and the interest in learning which it served for a time to difuse, well nigh died out amid the anarchy which characterizes the 10th century in Latin Christendom, and it is at least questionable whether any real connexion can be shown to have existed between this earlier revival and that remarkable movement in which the university of Paris had its origin. On the whole, however, a clearly traced, althongh imperfectly continuous, succession of distinguished teachers has inclined the majority of those who have studied this obscure period to conclude that a certain tradition of learning, handed down from the fanous school over which Alcuin presided at the great abbey of St Martin at Tours, continued to survive, and became the nuclens of the teaching in which the university took its rise. But, in order

General causes of formation of first axuersisien. adequately to explain the remarkable development and novel character which that teaching assumed in the course of the 12 th and 13 th centuries, it is necessary to take account of the operation of certain more general causes to which the origin of the great majority of the earlier universities may in common unhesitatingly be referred. Theso causes are-(1) the introduction of new subjects of study, as embodied in a new or revived literature ; (2) the adoption of new methods of teaching which were rendered necessary by the new studies; (3) the growing tendency to organization which accompanied the development and consolidation of the European nationalities.

That the earlier universities took their rise to a great extent in endeavours to obtain and provide instruction of a kind beyond the range of the monastic and cathedral schools appears to be very generally adinitted, and this general fact has its value in assisting us to arrive at a conclusion with respect to the origin of the first European

versity of Salerno. aniversity, -that of Salerno in Italy, which became known as a school of medicine as early as the 9 th century. The circuinstances of its rise are extremely obscure, and whether it was monastic or secular in its origin has been much disputed. One writer ${ }^{1}$ derives its origin from an independent tradition of classical learning which continued to exist in Italy down to the l0th century. Another writer ${ }^{2}$ maintains that it had its commencement in the teaching at the famous Benedictine monastery of Monte Cassino, where the study of medicine was undoubtedly pursued. But various facts may be urged in contraven-

[^313]tion of such a theory. The school al Salerno, so far as its history can be traced, appears to have been entirely a secular community; it was distinguished also by its catholic spirit, and, at a time when Jews were the object of religious persecution throughout Europe, manbers of this nationality were to be found both as teachers and learners at Salerno. Situated, moreover, as it was on the seacoast, its communication with the neighbouring island of Sicily was easy aud frequent; and it would accordingly seem far more probable that it was owing to the new knowledge gained from the Saracens, after their occupation of that island, that Salerno acquired its reputation. It was by a band of these invaders that Bertharius, abbot of Monte Cassino, and the author of certain medical treatises, was massacred along with his monks in the year o 83 . The Saracens were famed for their medical skill, and, by their translations of Galen and Hipporrates, did much to advance the study; and, according to Jourdain, ${ }^{\text {s }}$ there were translations from the Arabio into Latin long before the time of Constantine the African, but these versions hare perished. In the course of the lith century, under the teaching of Constantine the African (d. 1087), the celebrity of Salerno became diffused all over Europe. Ordericus Vitalis, who wrota in the first half of the 12th century, speaks of it as then long famous. In 1231 it was constituted by the emperor Frederick II. the only school of medicine in the kingdom of Naples.
It was at a considerable interval after the rise of the Teachi school at Salerno, about the year 1113, that Irverius com- of menced at Bologna his lectures on the civil law. This instruction, again, was of a kind which the monastic and cathedral schools could not supply, and it also met a new and pressing want. The states of Lombardy were at this time rising rapidly in population and in wealth; and the greater complexity of their political relations, their increasing manufactures and commerce, called for a more definite application of the principles embodied in the codes that had been handed down by Theodosius and Justinian. But the distinctly secular character of this new stady, and its intimate connexion with the claims and prerogatives of the Western emperor, aroused at first the susceptibilities of the Roman see, and for a time Bologna and its civilians were regarded by the church with distrust and even with alarm. These sentiments were not, however, of long duration. In the year 1151 the appearance of the Decretum of Gratian, Decret largely compiled from spurious documents, invested the of Grat studies of the canonest with fresh importance; and numerous decrees of past and almost forgoten pontiffs now claimed to take their stand side by side with the enactments contained in the Corpus Juris Civilis. They constituted, in fact, the main basis of those new pretensions asserted with so much success by the popedom in the course of the 12 th and 13 th centuries. It was necessary, accordingly, that the Decretum should be known and studied beyond the walls of the monastery or the episcopal palace, and that its pages should receive authoritative exposition at some cominon centre of instruction. Such a centre was to be found in Bologna. The needs of the secular student and of the ecclesiastical student were thus brouglit for a time into accord, and from the days of Irnerius down to the close of the 13th century we have satisfactory evidence that Bologna was generally recognized as the chief school both of the civil and the canon latw. ${ }^{4}$ It has indeed been asserted that university degrees were instituted there as carly as the pontificate of Eugenius III. (1145-53), but the statement rests on no good authority, and is in every way improbable. There is,' however, another tradition which is in better harmony

[^314]Barba.
with the known faets. When Barbarossa marclicd his forces into Italy on his memorable expedition of 1155 , and reasserted those imperial claims which had so long lain dormant, the professors of the civil law and their scholars, but more especially the forcign students, gathered round the Western representative of tho Roman Cæsars, and besought his intervention in their favour in their relations with the citizens of Bologna. A large proportion of the students were probably from Germany; and it did not escape Frederick's penetration that the civilian might prove an invaluable ally in the assertion of his imperial pretensions. He receired tho suppliants gracionsly, and, finding that their grievances were real, especially against the landlords in whose houses they were domiciled, be granted the forcign students substantial protection, by canferring on them certain special immunities and priviliges (Novenaber 1158). ${ }^{1}$ These privileges were embodied in the celcbrated Aullenticu, Habila, in the Corpus Juris Civilis of the empire (bk. iv. tit. 13), and were eventually extended so as to include all the other universities of Italy. In them wo may discern the precedent for that state protection of the unirersity which, howerer essential at one time for the security and freedom of the teacher and the taught, has been far from proving an unmixed beuefit,the influence which the civil power has thus been able to exert being too often wielded for the suppression of that very liberty of thought and inquiry from which the carlier universities derived in no small measure their importance and their fame.

But, though there was a flourishing school of study, it is to be observed that Bologna did not possess a university so early as 1158 . Its first nniversity was not constituted until the close of the 12 th century. The "universities" at Bologna were, as Denifle bas shown, really student guilds, formed under influences quite distinct from the protecting clauses of the Authentica, and suggested, as already noted, by the precedent of those foreign guilds which, in the course of the 12 th century, began to rise throughout ,western Europe. They had their origin in the absolute necessity, under which residents in a foreign city found themselves, of obtaining by combination that protection and those rights which they could not claim as citizens. These societies were modelled, Denifle considers, not on the trade guilds which rose in Bologan in the 13th century, but on the Teutonic guilds mhich arose nearly a century earlier in north-western Europe, being essentially "spontaneous confederations of aliens on a foreign soil." Originally, they did not include the native student element.

The power resulting from this principle of combination, when superadded to the privileges conferred by Barbarossa, gave to the students of Bologna a superiority of which they were not slow to avail themselves. Under the leadership of their rector, they extorted from the citizens concessions which raised them from the condition of an oppressed to that of a specially privileged class. The same principle, when put in force against the professors, reduced the latter to a position of humble deference to the very body whom they were called upon to instruct, and imparted to the entire university that essentially democratic character by which it was afterwards distinguished. It is not surprising that such adrantages should have led to an imitation and extension of the principle by which they were obtained. Denifle considers that the "universities" at Bologna were at one time certainly more than four in

[^315]number, and wo know that the Italian students alone were subdivided intotwo, - the Tuscans and the Lombards. In other the centres formed by secession from the parent body $n$ sinilar like subdivision took place. At Vercelli there were four command "universitates," composed respectively of Italians, Eng. Lies in lish, Provençals, and Germans; at Padua there were lity. there were comprising both English and Normans), Provencals (including Spaniards and Catalans). When accordingly we learn from Odofred that in the time of the cminent jurist Azo, who lectured at Bologna aloont 1200, the number of the studeats there amounted to some ten thousand, of whom the majority were foreigners, it seems reasonable to conclude that the number of these confederations of students ("societates scholarinm") at Bologna was yet greater. It is certain that they were not formed simultaneously, but, similarly to the free guilds, one after the other,-the last in order being that of tie Tuscans, which was composed of students from Tuscany, the Campagna, and liome. Nor are we, again, to look upon them as in any way the outcome of those democratic principles which found favour in Bologna, but rather as originating in the traditional home associations of the foreign students, fostered, howerer, by the peculiar conditions of their unirersity life. As the Tuscan division (the one least in sympathy, in most respects, with Teutonic institutions) was the last formed, so, Denifle conjectures, the German "university" may have introduced the conception which was successively adopted by the other nationalities.

In marked resemblance to the guilds, these confederations The were presided over by a common head,-the "rector schola. rector. rium," an obrious imitation of tho "rector societatum " or "arlium" of the guild, but to be carefully distinguished from the "rector scholarum," or director of the studies, with whose function the former officer had, at this time, nothing in common. Like the guilds, again, the different nations were represented by their "consiliarii," a deliberative assembly with whom the rector habitually took counsel.

While recognizing the essentially democratic character of Mature the constitution of these communities, it is to be remen- ase of the bered that the students, unlike the majority at Paris and students later universities, were mostly at this time of mature years. As the civil law and the canon law were at firsi the only branches of study, the class whom they attracted were often men already filling office in some department of the church or state,-archdeacons, the heads of schools, canons of cathedrals, and like functionaries forming a considerable element in the aggregate. It has been observed, indeed, that the prermission accorded them by Frederick I. of choosing, in all cases of dispute, their own tribunal, thus constituting them, to a great extent, sui juris, seems to presuppose a certain maturity of judgment among those on whom this discretionary power was bestowed.

With the middle of the 13 th century, these various con- amatga federations became blended, for the first time, into one or mation o other of the two great divisions already referred to",-those of the "nni the Ultramontani and the Citramontani, Johannes de Varanis tates" bcing rector of the former and Pantaleon de Venctiis of the into twe latter. Innocent IV, in according his sanction to the new divisions statutes of the university in 1253, refers to them as drawn up by the "rectores et universitas scholarium Bononicnsium." With the commencement of the 16 th century, the troo corporations were combined under one rector.

About the jear 1200 rere formed the two faculties of, med.cine and philosophy (or the arts ${ }^{2}$ ), the former being

[^316]
## Study of

response to new wants the commencement of the university of Paris supplies us with a further illustration. The study of logic, which, prior to the 12th century, was founded exclusively on one or two meagre compends, received about the year 1100, on two accasions, a powerful stimulus, - in the first instance, from the memorable controversy between Laufranc and Berengar; in the second, from the no less famous controversy between Anselm and Roscellinus. A belief sprang up that an intelligent appreliension of spiritual truth depended on a correct use of prescribed methods of argumentation.
somewhat the earlier. It was devoloped, as that of the civil law had been developed, by a succession of able teachers, among whom Thaddeus Alderottus was especially eminent. The faculty of arts, down to the 14 th century, scarcely attained to equal eminence. The teaching of theology remained for a long time exclusively in the hands of the Dominicans; and it was not until the year 1360 that Innocent VI. recognized the university as a "studium generale" in this branch,-in other words, as a place of theological education for all students, with the power of conferring degrees of universal validity.
In the year 1371 the cardinal legate, Anglicus, compiled, as chief director of ceclesiastical affairs in the city, an account of the university, which he presented to Urban V. The jnformation it supplies is, however, defective, owing to the fact that only the professors who were in receipt of salaries from the municipality are mentioned. Of these there were twelve of civil law and six of canon law; three of medicine, three of practical medicine, and one of surgery; two of logic, and one each of astrology, rhetoric, and notarial practice. The professors of theology, who, as members of the religious orders, received no state remuneration, are unmentioned.

Colleges existed at Bologna at a very early date, but it is not until the 14 th century that we find them possessing any organization. They were designed solely for necessitous students, not being natives of Bologna. A separate house, with a certain fund for the maintenance of a specified number of scholars, was all that was originally contemplated. Such was the character of that fonnded by Zoen, bishop of Avignon, in February 1256 (O.S.), the same month and year, it is to be noted, in which the Sorbonne was founded in Paris. It was designed for the maintenance of eight scholars from the province of Avignon, under the supervision of three canons of the church, maintaining themselves in the university. Each scholar was to receive 24 Belognese lire annually for five years. The college of Brescia was founded in 1326 by William of Brescia, archdeacon of Bologna, for poer foreign students without distinction as to nationality. The Spanish college, founded in 1364, for twenty-four Spanish scholars and two chaplains, is noted by Denifle as the one college founded in medirval times which still exists on the Continent. Dialectic was looked upon as "the science of sciences"; nad, when, somewhere in the first decade of the 12 th' century, William of Champeaux opened in Paris a school for the more advanced study of dialectic as an art, his teaching was attended with marked success. Among his pupils was Abelard, in whose hands the study made a yet more notable advance; so that, by the middle of the century we find John of Salisbury, on returning from the Fronch capital to England, relating with astonishment, not unmingled with contempt, how all learned Paris had gone well nigh mad in its pursuit and practice of tho new dialectic.

Abelard taught in the first instance at the cathedral school at Notre Dame, and subsequently at the schools on the Montagne Sainte-Geneviève, of Which he was the
founder, and where he imparted to logic its new development. But in $11 \pm 7$ the secular canons of Ste Geneviève gave place to canons regular from St Victor ; and henceforth the school on the former foundation was merely a school for the teaching of theology, and was attended only by the members of the house. ${ }^{1}$ The schools out of which the university arose were those attached to the cathedral on the lle do la. Cité, and presided over by the chancellor, -a dignitary who must be carefully distinguished from the later chancellor of the university. For a long time the teachers lived in separate houses on the island, and it was only by degrees that they combined themselves into a society, and that special buildings were constructed for their class-work. But the flame which Abelard's teaching had kindled was not destined to expire. Among his pupils was Poter Lombard, who was bishop of Paris in Lomban 1159, and widely known to posterity as the compiler of Sentences the famous volume of the Sentences. The design of this work was to place before the student, in as strictly logical a form as practicable, the views (sententix) of the fathers and all the great doctors of the church npon the chief and most difncult points in the Christian belief. Conceived with the purpose of allaying and preventing, it really stimulated, controversy. The logicians seized upon it as a great storehouse of indisputable major premises, on which they argued with renewed energy and with endless ingenuity of dialectical refincment; and upon this new compendium of theological doctrine, which became the text-book of the Middle Ages, the schoolmen, in their successive treatises super Sententias, expended a considerable share of that subtlety and labour which still excite the astonishment of the student of metaphysical literature.

It is in these prominent features in the history of these Rise of early universities-the development of new methods of other instruction concurrently with the appearance of new early und material for their application-that we find the most probable solntion of the question as to how the university, as distinguished from the older cathedral or monasti schools, was first formed. In a similar manner, it seems probable, the majority of the earlier universities of ItalyReggio, Modena, Vicenza, Padua, and Vercelli-arose, for they had their origin independently alike of the civil and the papal authority. Instances, it is true, occur, which cannot be referred to this spontaneous mode of growth. The university of Naplea, for example, was founded solely by the fiat of the emperor Frederick II. in the year 1224; and, if we may rely upon the documents cited by Denifle, Innacent IV. about the year 1245 founded in conncxion with the curia a "studium generale," ${ }^{2}$ which was attached to the papal court, and followed it when removed from Rome, very much as the Palace School of Charles the Great accompanied that monarch on his progresses.

As the university of Paris became the model, not only Early for the universities of France north of the Loire, but also for the great majority of those of central Europe as well as for Oxford and Cambridge, some acconnt of its early orge. Such on account sity of organization will here be indispensable. Such an account Paris. is readered still further necessary by the fact that the recent and almost exhaustive researches of Denifle, the Dominican fatber, have led him to conclusions which on some important points run altogether counter to those sanc-j tioned by the high authority of Savigny.

The original university, as already stated, took its rise entirely out of the movement carried on by teachers on the
${ }^{1}$ The view oi Thurot (De l'Organisation de l'Enseignement dans $l$ Universite de Paris, pp. 4-7) that the university arose out of a com. b' ation of these several schools is rejected by Denifle (see Die Uni. vc sit, ten, \&c., i. 653-694).

* Where the words siudium generale are plsced vithin marks o quotat in they occur in the original charter of foundation of the uni versity roferred to,

The teacling that formed its nucleus.
island, who taught hy virtue of tho licence conterred by the clanicellor of the cathedral. In the second decade of the 13 th century, it is true, we find masters withdrawing themselves from lis authority by repairing to the left bank of the Scine and placing themselves under the jurisdiction of the abbot of the monastery of Ste Genevieve ; and in 1255 this dignitary is to be found appointing a clancellor whose duty it should be to confer "licentia docendi" on those candidates who were desirous of opening schools in that district. But it was around the bestowal of this licenco by the chancellor of Notre Dame, on the ille do la Cité, that the university of Paris grew up. It is in this licence that the whole significance of the master of arts degree is contaived; for what is technically known as admission to that degree way really nothing more nor less than receiving the chancellor's permission to "incept," and by "inception" was implied the master's formal entrance upon, and coinmencement of, the functions of a duly licensed teacher, and his recognition as such by his brothers in the profession. The previous stage of his academic carecr, that of Bachelor bachelordom, had been oae of apprenticeship for the of arts. mastership ; and his emancipation from this state was symbolized by placing tho magisterial cap (biretta) upon his head, a ceremony which, in imitation of the old Roman ceremony of manumission, was performed by his former iastructor, "under whom" he was said to incept. He then gave a formal inaugural lecture, and, after this proof of magisterial capacity; was welcomed into the society of his professioaal brethren with set specches, and took his seat is his master's chair.
The uni- This community of teachers of recognized fitness did not versity is itself sulfice to constitute a universitf, but some time rormed. between the years 1150 and $11 \% 0$, the period when the Sentences of Peter Lombard were given to the world, the university of Paris came formally into being. Its first written statutes were not, however, compilcd until about the year 1208, and it was not until long after that date that it possessed a "rector." Its earliert Tccogaition as a legal corporation belongs to about the year 1211, when a brief of Inaocent III. empowered it to elect a proctor to be its representative at the papal court. By this permission it obtained the right to sue or to be sued in a court of justice as a corporate body.

This papal recognition was, however, very far from im-

## Diff.

 calties attending its 6irst development. plying the episcopal recognition, and the earlier history of the new community exhibits it as io continual conflict alike with the chancellor, the bishop, and the catbedral chapter of Paris, by all of whom it-was regarded as a ceatre of insubordination aud doctrinal liceece. Had it not been, indeed, for the papal aid, the uaiversity would probably not lare survived the contest; but with that coverful assistance it came to be regarded as the great Sransalpine centre of ortbodox theological teaching. Successive pontiffs, down to the great schism of 1378 , made it one of the foremost points of tbeir policy to cultivate friendly and coofideotial relations with the authorities of the university of Paris, and systematically to aiscourage the formation of theological facalties at other cen res. In 1231 Gregory IX., io the bull Parens Scienl.arum, gave full recognition to the right of the several faculties to regulate and modify the constitution of the entire university, - a formal sanction which, in Deniffe's opinion, rendered the bull in question the Jagna Charta of tho university.In comparing the relative antiquity of the universities of Paris and Bologna, it is difficult to give an unqualified decision. The university of masters at the former was probably slightly anterior to the university of students at the latter; but there is good reason for believing that Paris, io reducing its traditional customs to statutory form,
largely availed itself of the procedents afforded by the already existing code of the Transalpine centre, while its rectorship, proctorships, and four " oations" are all clearly distinct adaptations of the corresponding divisions at Bologna. These nations, which iacluded both professors The and scholars, were-(1) the Freach nation, composed, in "Eatione addition to the native clement, of Spaziards, Italians, and Greeks ; (2) the Picard mation, representing the stadents from the north.cast and from the Netherlands; (3) the Norman nation ; (1) the English nation, comprising, besides students from tho provinces under English rule, those from England, Ireland, Scotland, and Germany. These several nations first came into existence some time before the year 1219, and all belonged to the faculty of arts; but the fully developed uaiversity was divided into four faculties,-thrce "superior," viz, those of theology, canon law, and medicine, and one "inferior," that of arts. The head of each faculty was the dean; the head of each nation was the proctor. Tho rector, who in the first instance was head of tho faculty of arts, by whom ho was elected, was crentually head of the whole university. Each of the nations and each of the superior faculties, while subject to the general authority which he represented, was, like a royal colony, in a great measure self-governed, and made statutes which were linding simply on its own members. Coagregations of the faculty of arts were presided over by the rector, who discharged the same function when geaeral congregations of the whole academic community were convened. Ia the former the votes ou any question were taken by nations, in the latter by faculties and aations. Only "regents," that is, masters actually engaged in teaching, had ans right to be present or to rote in congregations. Neither the entire university nor the separate faculties bad thus, it will be seen, originally a common head, and it was not until the middle of the lyth century that the rector became the head of the collective university, by the incorporation under him, frst, of the students of the canon law and of medicine (which took place about the end of the 13th century), and, secondly, of the theologians, which took place about balf a century later.
Apart from the broad differeuces in their organization, Paris and the very conception of learning, it will be observed, was Bologna different at Bologna from what it was at Paris. In the $\theta$ tran-ed former it was entirely professional,-designed, that is to say, to prepare the student for a defioite and practical career in after life; in the latter it was sought to provide a general mental traiaing, and to attract the learaer to studies which rere speculative rather than practlcal. In the sequel, the less mercenary spirit in which Paris cultirated knowledge added immensely to her iafluence and reputation. The university became known as the great school where theology was studied in its most scientific epirit; and the decisions of its great doctors upon those abstruse questions which absorbed so much of the highest intellectual activity of the Midalo Ages were regarded as almost final. The popes themselres, although arerse from Papal theological controversies, deemed it expedient to cultivato policy ie friendly relations with a centro of such importance for the relation purpose of securing their influence in a yet wider field. aniverDown therefore to the time of the great schism (1378), sitiea they at once conciliated the university of Paris and consulted what they deemed to be the interests of tho Roman sce, by discouraging the creation of faculties of theology elsewhere. The appareat exceptions to this policy are easily explained: the four faculties of theology which they sanctioned in Italy - Pisa (1343), FHorence (1349), Bologna (1362), and Padua (1363)-were designed to bencfit the ltalian mooastcries, by saving the monks the expense and dangers of a long journey beyond the Alps; while that at

Tonlouse (1229) took its rise under circamstances entirely exceptional, being designed as a bulwark against the heresy of the Albigenses. The popes, on the other hand, favoured the creation of new faculties of law, and especially of the canon law, as the latter represented the source from which Rome derived her most warmly contested powers and prerogatives. The effects of this twofold policy were sufficiently intelligible: the withholding of each charter which it was sought to obtain for a new echool of theology only scrved to augment the numbers that flocked to Paris; the bestowal of each new charter for a faculty of law served in like manner to divert a certain proportionate number from Bologna. These facts enable us to understand how it is that, in the 13th and 14th centuries, we find, even in France, a larger number of universities created after the model of Bologna than after that of Paris.

In their earliest stage, however, the importance of these new institutions was but imperfectly discerned alike by the civil and the ecclesiastical power, and the frst four universities of Italy, after Bologna, rose into existence, like Bologna itself, without a charter from either pope or em-
Founda- peror. Of these the first were those of Reggio and tion of Modena, beth of which are to be found mentioned as oniversities of Reğio and
Modens, schools of civil law before the close of the 12th century. The latter, throughout the 13 th century, appears to have been resorted to by teachers of sufficient eminence to form a flourishing school, composed of students not only from the city itself, but also from a considerable distance. "Both of them would seem to have been formed independently Vicen2a, of Bologna, but the university of Vicenza was probably the outceme of a migration of the students from the former city, which took place in the year 1204. In the course of the centary Vicenza attained to considerable prosperity; its students were divided into four nations, each with its orra rector ; and in 1264 it included in its professoriate seachers, not only of the civil law, but also of medicine, grammar, and dialectic. The university of Padua was founded in 1222 as the direct result of the migration of a considerable number of students from Bologna. Some writers, indeed, have inferred that the "studium" in the latter city was transferred in its entirety, but the continued residence of a certain proportion in Bologna is proved by the fact that two years later we find them appealing to Honorius III. in a dispute with the civic authorities. In the year 1228 the students of Padua were compelled by circamstances to transfer their residence to Vercelli, and the latter city guaranteed them, besides other privileges, the right to rent no less than fire hundred lodgigg-houses at a fixed rental for a period of eight years. At first Padua was a school only of the civil and canon law; and during the oppressive tyranuy of Ezzelin (1237-1260) the university maintained its existeace with some difficulty. But in the latter part of the century it incorporated the faculties of grammar, rhetoric, and medicine, and became known as one of the mest flourishing schools of Italy, and a great centre of the Dominicans, at that time among the most active promoters of learning.

The university of Naples was founded by the emperor Frederick II. in the year 1225, as a school of theology, jurisprudence, the arts, and medicine,-his design being that his subjects in the kingdom of Naples should find in the capital adequate instruction in every branch of learning, and " not be compelled in the pursuit of knowledge to have recourse to foreign nations or to beg in other lands." In the year 1231, however, he decreed that the faculty of medicine should cease to exist, and that the study should be pursued nowhere in the kingdom but.at Salerno. The university never attained to much emincace, and after the death of Frederick came for a time altogether to an end, but was restored in 1258 by King Manfred. In 1266 its
faculty of medicine was reconstituted, and from 1272-74
Thomas Aquinas was one of its teachers of theology. The commencement of the university of Vercelli' beloags to Vercellu ${ }_{2}$ about the year 1228 ; it probably included, like Naples, all the faculties, but would seem to have been regarded with little favour by the Roman see, and by the year 1372 had ceased to exist, although inention of colleges of law and medicine is to be found after that date. The two universities of Piacenza and Pavia stand in close con-Piacenss nexion with each other. The former is noted by Deaife as the earliest in Italy which was founded by virtue of a papal charter (6th February 1248), although the scheme remained for a long time inoperative. At leagth, in the year 1398 , the university was reconstituted by Gioranni Galeazzo Visconti, duke of Milan, who in the same year cansed the university of Paria to be transfcrred thither. Piacenza now became the scene of a sudden but shortlived academic prosperity. We are told of no less than twenty-seven professors of the civil law,-among them the celebrated Baldus; of twenty-two professors of mediciae; of professors of philosophy, astrology, grammar, and rhetoric; and of lecturers on Seneca and Dante. The facnlty of theology would appear, however, never to have been duly constituted, and but onelecturer in this faculty is mentioned. With the death of Galeazzo in 1402 , this precarious activity came suddenly to an end; and in 1404 the university had ceased to exist. Its history is, indeed, unintelligible, unless taken iu coajunction with that of Pavia. Even before Paria Irnerius taught at Bologna, Pavia had been widely known as a seat of legal studies, and more especially of the Lombard law, although the evidencs is wanting which would serve to establish a direct connexion between this early scheel and the university which was founded there in 1361, by virtue of the charter granted by the emperor Charles IV, The new "studium" included faculties of jurisprudence, philosoply, medicine, and the arts, and its students were formally taken under the imperial protection, and eadowed with privileges identical with those which had been granted to Paris, Bologna, Oxford, Orleans, aad Montpellier ; but its existence in Pavia was suddenly suspended by the removal, above noted, of its students to Piacenza. It shared again in the declino which overtook the university of Piacenza after the death of Giovanni Galeazzo, and during the period from 1404 to 1412 it altogether ceased to exist. But in October 1412 the lectures were recommenced, and the university entered upen the most brilliant period of its existeace. Its professors throughout the 15 th century were mea of distinguished ability, attracted by munificent salaries such as but fen other universities could offer, while in the numbor of students who resorted thither from other countries, and more especially for the study of the civil law, Pavia had no rival in Italy lut Padua. Arezzo appears to have been Arezza known as a centre of the same study so early as 1215, and its earliest statutes are assigned to the year 1255. By that time it had become a echool of arts and medicine also; but for a considerable period after it was almost eatirely deserted, and is almost unmentioned until the year 1338, when it acquired new importance by the accession of several eminent jurists from Bologra. In May 1355 it received its charter as a studium generale from Charles IV. After the year 1373 the school gradually dwindled, although it did not become altogether extinct until about the year 1470. The university of Pome (which is to be carefully distinguished from the school attached to the curia) owed its foundation (1303) to Boniface VIII., and Tras especially designed by that pontiff for the benefit of the poor foreign students sojourning in the capital. It originally included all the faculties; but in 1318 Joln XXII. decreed that it should possess the power of confer-
ring degrees only iu the canon and civil law. The unirersity maintained its existence throughout the period of the residence of the popes at Avignon (see Poppdexs), and under the patronage of Leo X . could boast in 1514 of no less than eighty professors. This imposing array would seem, however, to bo but a fallacious test of the prosperity of the academic community, for it is stated that many of the professors, owing to the imperfect manner in which they were protected in their privileges, were in the receipt of such insufficient fees that they were compolled to combine other employments with that of lecturing in order to support themselves. An appeal addressed to Leo X. in the year 1513 represents the number of students as so small as to be eometimes exceeded by that of the lecturers (" ut quandoque plures sint quil legan't quam qui audiant"). Scarcely any of the universities in Italy in the 14th Perugis, century attracted a larger concourse than that of Perugin, where the study chiefly cultivated was that of the ciril law. The university received its charter as a studium generale from Clement V. in the year 1308, but had already in 1306 been formally recognized by the civic authorities, by whom it was commended to the special care and protection of the "podestai." In common with the rest of the Italian unirersities, it suffered severely from the great plague of 1348-49; but in 1355 it received new privileges from the emperor, and in 1362 its first college, dedicated to Gregory the Great, was forinded by the bishop Treriso, of Perugia. The university of Treviso, which received its charter from Frederick the Fair in 1318, was of little celebrity and but short duration. It is doubtful, indeed, whether it continued to exist after the city became subject to the republic of Venice in the year 1339 ; but in 1409 the Venetian senate issned a decree that no subjects of the republic should resort for study to any city in its dominions sare that of Padua, and from this date the studium at Treviso must be held to have been no longer in existence. The circumstances of the rise of the university
Florence, of Florence are unknown, but the earliest evidence of academic instruction belongs to the year 1320. The dispersion of the unirersity of Bologna, in the March and April of the following year, afforded a favourable opportunity for the creation of is studium generale, but the necessary measures were taken somewhat tardily, and in the meantime the greater number of the Bolognese students bad betaken themselves to Siena. The charter of foundation for Florence was accordingly not granted until 3ist May 1349, when Clement VI. decreed that there should be instituted a studium generale in theology, jurispridence, medicine, and every other recognized faculty of learning, the teachers to be professors who had obtained the degree of doctor or master either at Bologna or Paris, or "some other studium generale of celebrity." On 2d Jnnuary 1364 the university also obtained the grant of imperial privileges from Charles TV. On 14th February 1388 it adopted a body of statutes which are still extant, and afford an interesting study in connexion with the university history of the period. The university now entered upon that brilliant period in its history which was destined to so summary an extinction. "It is almost touching," says Deniffe, "to note how untiringly Florence exerted herself at this period to attract as teichers to her schools the great masters of the sciences and learning." In the year 1472 , bowever, under the influence of Lorehzo de' Medici, it was decided that Florence was not a convenient seat for a university, and its stadents were removed to Pisa. The commencement of the university of Siena belongs to sbout the year 1241, but its charter was first granted by the emperor Charles IV., at the petition of the citizens, in the year 1357. It was founded as a studium generale in jurisprudence, the arts, and medicine. The
imperial charter was confirmod by Gregory XIL in 1408, and the various bulls relating to the oniversity which he subsequently issucd afford a good illustration of the conditions of neademic life in these times. Fesidence on the part of the students appears to have been sometimes dispensed mith. The bisliop of Sicna was nominated clancellor of the university, just as, exys the bull, ho had been appointed to that oflice by the impcrial authority. The graduates were to be admitted to the eame privileges as those of Bologaa or Paris; and a facults of theology was added to the curriculum of studies. The university of Ferrara owes its foundation to the house of Este,-Alberto, marquis of Este, baving obtained from Boniface IX in 1391 a charter couched in terms precisely similar to those of the chartcr for Pisa. In the first half of the 15 th century the university was adorned by the presence of several distinguished humanists, but its fortunes wero singularly chequered, nud it would appear for a certain period to have been altogether cxtinct. It was, bowerer, restored, and became in the latter part of the century one of the most celebrated of the universities of Italy. In the year. 1474 its circle of studies romprised all the existing faculties, and it numbered no less than fifty-one professors or lecturers. In later times Ferrara has been noted chiefly as a school of medicine.

Of the universities modelled on that of Paris, Oxford Oxiorl, would appear to have been the earliest, and the mannei of its development was probably similar. Certain schools, opened $\cdot$ within the precincts of the dissolved nannery of St Frideswyde and of Oseney abbey, are supposed to hare been the nucleus round which the university grew up. In the year 1133 one Tobert Pullen, a theologian of considerable eminence (but whether an Englishman or a Breton is nncertain), arrived from Paris, and delivercd lectures on the Bible. He was followed a few jears later by Vacarius, a native of Lombsrdy, who is a student at Bologna had inherited the tradition of the teaching of Imerius. AIthough both the pope and King Stephen regarded the civil law at this time with considerable distrust, Vacarius maintained his ground, and the study became one of the recognized faculties at Oxford. Tomards the close of the 12th century- Giraldus Cambrensis describes the town as a place " where the clergy in England chiefly flourished and excelled in clerkly lore." In one respect, indeed, Oxford was more favoured than even Paris, for the town authorities could not pretend to assert any right of interference with the university such as that to which the French monarch and the court frequently laid claim. In the 13th century mention first occurs of university "chests," especially the Frideswyde chest, which were benefactions designed as funds for the assistance of poor students. Halls, or places of licensed residence for students, also began to be ectablished. In the year 125T, when the bishop of Lincoln, as diocesan, had trenched too closely on the liberties of the commanity, the deputies from Oxford, when preferring their appeal to the Ling at St Albans, could venture to speak of the university as "schola secunda ecciesixe," or second only to Paris. Its numbers ebout this time were probably some three thousand; tut it was essentially a fluctuating bods, and whenever plaçe or tumult led to a temporary dispersion a serious diminution in its numerical strength gencrally ensued for some time after. Against such vicissitudes the foundation of colleges proved the most effectual remedy. Of these the three earliest were University College, founded in 1249 by William of Durham; Balliol College, founded about 1263 by John Balliol, the father of the king of Scotland of the same name ; and Merton College, founded in 1264. The lastnamed is especially notable as associated with a new conception of unircrsity education, namely, that of collegiate
disciplino for the secular clergy, instead of for any one of the religious orders, for whose sole benefit all similar foundations had hitherto been designed. The statutes given to the society by Walter de Merton are not less noteworthy, as characterized not only by breadth of conception, but also by a careful and discriminating attention to detail, which led to their adoption as the model for later colleges, not only at Oxford but at Cambridge. Of the service rendered by these foundations to the university at large we have significant proof in the fact that, although representing only a small numerical minority in the academic community at large, their members soon obtained a considerable preponderance in the administration of affairs.

The university of Cambridge, although it rose into existence somewhat later than Oxford, may reasonably be held to bave had its origin in the same sentury. There was probably a certain amount of educational work carried on by the canons of the chi cn of St Giles, which gradually developed into the insuuction belonging to a regular studium. In the ycar $11 i 2$ the canons crossed the river and took up their residerte in the new priory in Barnwell, and their work of instruction acquired additional importance. Then, as early as the year 1224, the Franeiscans established themselves in the town, and, somewhat less than half a century later, were followed by the Dominicans. At both the English universities, as at Paris, the Mendicants and other religious orders were admitted to degrees, a privilege which, until the jear 1337, was extended to them at no other university. Their interest in and influence at these three centres was consequently proportionably great. In the years 1231 and 1233 certain royal and papal letters afford satisfactory proof that by that time the university of Cambridge was already an organized body with a chancellor at its head; and in 1229 and 1231 its numbers were largely augmented by migrations from Paris and from Oxford. Cambridge, however, in its turn suffered from emigration; while in the year 1261, and again in 1322, the records of the university were wantonly burnt by the towasmen. Throughout the 13th century, indeed, the university was still only a very slightly and imperfectly organized community. Its endowments were of the most slender kind; it had no systematic code for the government of its members; the supervision of the students was very imperfectly provided for. An important step in the direction of reform in this last respect was, however, made in the year 1270 , when an ordinance was passed requiring that every one who claimed to be recognized as a scholar should have a fixed master within fifteen days after his entry into the university. But the feature which most served to give permanence and cohesion to the entire community was, as at Oxford, the institution of colleges. The earliest of these was Peterhouse, first founded as a separate institution by Hugh Balsham, bishop of Ely, in the year. 1286, with a code which was little more than a transcript of that given by Walter de Merton to his scholars at Oxford. About forty years later was founded Michaelhouse, and at nearly the same time (1326) Edwàrd II, instituted his foundation of "king's scholars," afterwards forming the community of King's Hall. Both these societies in the 16th century were merged in Trinity College. To those succeeded Pem. broke Hall (1347) and Gonville Hall (1348). All these colleges, although by no means conceived in a spirit of hostility to either the monastic or the Mendicant orders, were expressly designed for the benefit of the secular clergy. The foundation of Trinity Hall (1350) by Bishop Bateman, on the other hand, as a school of civil and canon law was probably desigued to further ultramontane interests. That of Corpus Christi (1352), the outcome of
the liberality of a guild of Cambridge townsmen, was con ceived with the combined object of providiug a house of education for the clergy, and at the same time securing the regular performance of masses for the benefit of the souls of departed members of the guild. But both Trinity Hall and Corpus Christi College, as well as Clare Hall, founded in 1359 , were to a great extent indebted for their origin to the ravages caused among the clorgy by the great plague of 1349 .

Turning to France, or rather to the territory included within the boundaries of modern Erance, we find Montpellier a recognized school of medical science as early as the 12 th century. William VIII., lord of Montpellier, in the year 1181 proclaimed it a school of free resort, where any teacher of medical science, from whatever country, might give instruction. Before the end of the century it possessed also a faculty of jurisprudence, a branch of learning for which it afterwards became famed. The university of medicine and that of law continued, however, to be totally distinct bodies with different constitutions. Petrarch was sent by his father to Montpellier to study the civil law. On 26th October 1289 Montpellier was raised by Nicholas IV. to the rank of a "studium generale," a mark of favour which, in a region where papal influence was so potent, resulted in a considerable accession of prosperity. The university also now included a faculty of arts ; and there is satisfactory evidence of the existence of a faculty of theology before the close of the 14th century, although not formally recognized by the pope before the year 1421 . In the course of the same century several colleges for poor students were also founded. The university of Toulouse Toulouse is to be noted as the first founded in any country by virtue of a papal charter. It took its rise in the efforts of Rome for the suppression of the Albigensian heresy, and its foundation formed one of the articles of the conditions of peace imposed by Louis IX. on Count Raymond ofToulouse. In the year 1233 it first acquired its full privileges as a "studium generale" by virtue of a charter given by Gregory IX. This pontiff watched over the university with especial solicitude, and through his exertions it soon became a noted centre of theological and especially oí Dominican teaching. As a school of arts, jurisprudence, and medicine, although faculties of each existed, it never attained to any reputation. The university of Orleans Orleans had a virtual existence as a studium generale as early as the first half of the 13 th century, but in the year 1305 Clement V. endowed it with new privileges, and gave its teachers permission to form themselves into a corporation. The schools of Orleans had an existence, it is said, as early as the 6th century, and subsequently supplied the nucleus for the foundation of a university at Blois; but of this university no records now exist. ${ }^{1}$ Orleans, in its organization, was modelled mainly on Paris, but its studies were complementary rather than in rivalry to the older university. The absorbing character of the study of the civil law, and the mercenary spirit in which it was pursued, had led the authorities at Paris to refuse to recognize it as a faculty. The study found a home at Orleans, where it was cultivated with an energy which attracted numerous students. In January 1235 we find the bishop of Orleans soliciting the advice of Gregory TX. as to the expediency of countenancing a study which was prohibited in Paris. Gregory decided that the lectures might be continued; but be ordered that no beneficed ecclesiastic should be allowed to devote himself to so eminently secular a branch of learning. Orleans subsequently incorporated a faculty of arts, but its reputation from this period was always that of a school of legal studies, and in the 14 th century its reputation in this respect was surpassed by no other uni-
${ }^{1}$ See Ch. Desmaze. L' Université de Paris (1200-1875).
versity in Europe. Prior to the 13th century it had been famed for its classical learning; and Angers, which reccived its charter at the aame time, also once enjoyed a like reputation, which, in a similar manner, it exchanged for that of a school for civilians and canonists. The roll of the university forwarded in 1378 to Clement VIL containa the names of 8 professors utriusque juris, 2 of civil and 2 of canon law, 72 licentiates, 284 bachelors of both the legal faculties, and 190 scholare The university of Avignon was first recognized as a "studium generale" by Boniface VIII. in the year 1303, with power to grant degrees'in jurisprudence, arts, and medicine. Its numbers declined somewhat during the residenco of the popes, orwing to the counter attractions of the "studium" attached to the curia; but after the retarn of the papal court to Rome it became one of the most frequented universities in France, and possessed at one time no less than seven colleges. The university of Cahors enjoyed the advantage of being regarded with especial favour by John XXII. In June 1332 be conferred upon it privileges identical with those already granted to the university of Toulouse. In the following October, again following the precedent estallished at 'Toulouse, be appointed the scholasticus of the cathedral chancellor of the university. . In November of the same year a bull, couched in terms almost identical with those of the Magna Charta of Paris, assimilated the constitntion of Cahors to that of the oldest university. The two schools in Fratice which, down to the close of the 14 th century, nost closely resembled Paris were Orleans and Cahors. The civil immunities and privileges of the latter university were not, however, acquired until the year 1367, when Edward III. of England, in Lis capacity as duke of Aquitaine, not only exempted the scholars from the payment of all taxes and imposts, but bestowed upon them the peculiar privilege known as privilegium fori. Cahors also reeeived a licence for faculties of theology and medicine, but, like Orleans, it was chiefly
urenolle, kñown as a school of jurisprudence. It was as a "studium generale" in the same three faculties that Grenoble, in the year 1339, received its charter from Benedict XII. The university never attained to much importance, and its annals are for the most part involved in obscurity. At the commencement of the 16 th century it had ceased altogether to exist, was reorganized by Francis of Bourbon in 1542, and in 1565 was united to the university of Valence.
in the south, stood in the relation of a kind of subsidiary Salaochool, having been founded in 1254 by Alfonso the manco Wise, simply for the study of Latin and of tho Semitic Serfle, languages, espccially Arabic. Salamanca was founded in 1243 by Ferdinand III. of Castile as a "studium generale" in the three facultics of jurisprudence, the arts, and medicine. Ferdinand extended his special protection to the students, granting them numerous privileges and immunities. Under his son Alfonso (above named) the university acquired a further development, and eventually included all the faculties sare that of theology. But the main stress of its activity, as was tho caso wlth all the earlier Spanish universities, cecepting only Palencia and Seville, until the commeacement of the 15 th century, was leid on the civil and the canon law. But, notwithstanding the favour with which Salamanca was regarded alike by the kioga of Castile and by the Roman see, the prorision for the payment of its professors was at first so inadequate and precarious that in 1298 they by common consent suspended their lectures, in consequence of their scanty remuneration. A permanent remedy for this difficulty was thereupon provided, by the appropriation of a certain portion of the ecclesiastical revenues of the diocese for the purpose of augmenting the professors' 8alaries. The earliest of the unmerous colleges founded at Salamanica was that of St Bartholomew, long noted for its ancient library and valuable collection of manuscripts, which nom form part of the royal library in Madrid.

The one university possessed by Portagal had its geat Crimbra, in mediæra! times alterately iu Lisbon and in Coimbra, until, in the year 1537 , it was permanently attached to the latter city. Its formal foundation took place in 1309, when it received from King Diniz a clarter, the provisions of which were mainly taken from those of the charter giren to Salamauca. In 1722 the universitv was entirely reconstituted.

Of the German universities, Prague, which existed as a Prague, "studium" in the 13 th century, was the earliest, and was at first frequented mainly by students from Styria and Austria, countries at that time ruled by the king of Bohemia. On 26th January 1347, at the request oil Charles IV., Pope Clement VI. promulgated a bull authorizing the foundation of a "studium gencralo" in all the faculties. In the following year Charles himself issued a charter for the foundation. This document, which, if original in character, would have been of much interest, has but few distinctive features of its own, its provisions being throughout adapted from those contained in the charters given by Frederick II. for the university of Naples and by Conrad for Salerno,-alnost the only important feature of difference being tiuat Clarles bestows on the students of Prague all tho ciril privileges and immunities which were enjoyed by the teachere of Paris and Bologna. Charles Lad himself been' a student' in Paris, and the organization of his new foundation was modelled on that university, a like division- into four "nations" (although with different names) constituting one of the most marked features of imitation. The aumerous students-and none of the medieval unirersities attracted in their earlier history a larger concourse-were drawn from a gradually widening area, which at length included, not only all parts of Germany, but also England, France, Lombardy, Hungary, and Peland. Contemporary writers, with the exaggeration characteristic of medixeral credulity, even speak of thirty thousand students as present io the university at one time, -a statement for which Denifo proposes to substitute two thousand as a more probable estimate. It is certain, however, that Prague, prior to the foundation of Lcipsic, was one of tho most frequented centres of learning in Europe, and Paris suffered a considerable diminution in
her numbers owing to the oounter attractions of the great studium of Slaronia.

The university of Cracow in Poland was founded in May 1364, by virtue of a charter given by King Casimir the Great, who bestowed on it the same privileges as those possessed by the universities of Bologna and Padua. In the following September Urban V., in consideration of the remoteness of the city from other centres of education, constituted it a "studium generale" in all the faculties save that of theology. It is, however, doubtful whether these desigos were carried into actual realization, for it -is certain that, for a long time after the death of Casimir, there was no university whatever. Its real commencement must accordingly be considered to belong to the year 1400, when it was reconstituted, and the papal sanction was given for the incorporation of a faculty of theology. From this time its growth and prosperity were continuous; and with the year 1416 it had so far acquired a European reputation as to venture upon forwarding an expression of its views in connexion with the deliberations of the council of Constance. Towards the close of the 15 th century the naiversity is said to have been in high repute qs a school of both astronomical and humanistic studies.
vienas,
The Arignonese popes appear to have regarded the establishment of new faculties of theology with especial jealousy; and when, in 1364, Duke Rudolph IV. founded the university of Vienna, with the design of constituting it a "studium generale" in all the faculties, Urban V. refused his assent to the foundation of a theological school. Owing te the sudden death of Duke Rudolph, the university languished for the next twenty years, but after the accession of Duke Albert III., who may be regarded as its real founder, it acquired additional privileges, and its prosperity became marked and continuous. Like Prague, Vienna was for a long time distinguished by the comparatively little attention bestorred by its teachers on the study of the civil law.

No country in the 14th ceatury was looked upon with greater disfavour at Rome than Hungary. It was stigmatized as the land of heresy and schism. When, accordingly, in 1367 King Louis applied to Urban V. for his sanction of the scheme of founding a university at Fünf-
kirchen, kirchen, although theological learning was in special need of encouragement in those regions, Urban would not consent to the foundation of a faculty of theology; he even made it a condition of his sanction for a " studium generale" that King Louis should first undertake to provide for the payment of the professors. We hear but little concerning the university after its foundation, and it is doubtfu! . Whether it survived for any length of time the close of the century, having been about that period absorbed in all Ofer, probability in the university of Ofen. The foundation of this university is also involved in considerable obscurity, and its original charter is lost. We cnly know that it was granted by Boniface IX., at the request of King Sigismund, in the year 1389. In the first half of the 15th century it ceased for a long period to exist, but was revived, or rather founded afresh, by King Mathias Corvinus, an eminent patron of learning, in the last quarter of the century. "The extreme east of civilized continental Europe in medireval times," observes Denifle, "can be compared, so far as university education is concermed, only. with the extreme west and the extreme south. In Hungary, as in Portugal and in Naples, there was constant fluctuation, but the west and the south, although troubled by yet greater commotions than Hungary, bore better fruit. Among all the countries possessed of universities in mediæval times, Hungary occupies the lowest place-a state of aflairs of which, however, the proximity of the Turk must be looked upon as a main cause."

The university of Heidelberg received its charter ( 23 d October 1385) from Urban VI. as a "studium ginerale" in all the recognized faculties sare that of the civil law, the form and substance of the document being almost identical with those of the charter granted to Viensa. It was granted at the request of the elector palatine, Rupert I., Who conferred on the teachers aud students, at the same time, the same civil privileges as those which belonged to the university of Paris. In this case the functionary invested with the piver of bestowing degrees was nonresident, the licences heing conferred by the provost of the cathedral at Worms But the real founder, as he was also the organizer and teacher, of the university was Marsilius of Inghen, to whose ability and energy Heidelberg was indebted for no little of its early reputation and success. The omission of the civil lave from the studies licensed in the original charter would seem to show that the pontiff's compliance with the elector's request was merely formal, and Heidelberg, like Cologne, included the civil law among its faculties almost from its first creation. No mediæval university achieved a more rapid and permanent success. Regarded with favour alike by the civil and ecclesiastical petentates, its early annals were singularly free from crises like those which characterize the history of many of the mediæval universities. The number of those admitted to degrees from the commencement of the first session (19th October 1386 to 16th December 1387) amounted to 579.1

Owing to the labours of the Dominicans, Cologoe had Cologne, gained a reputation as a seat of learning long before the founding of its ubiversity; and it was through the advocacy of some leading members of the Nendicant orders that, at the desire of the city council, its charter as a "studium generale" (21st May 1388) was obtained from Urban VI. It was organized on the model of the university of Paris, as a school of theology and canon law, and "any other recognized faculty,"-the civil law beiug incorporated as a faculty soon after the promulgation of the charter. In common with the other early universilies of Germany-Prague, Vienna, and Heidelberg-Cologic owed nothing to imperial patronage, while it would appear to have been, frem the first, the object of special favour with Rome. This circumstance serves to account for its distinctly ultramontane sympathies in mediæval times aud even far into the 16 th century. In a report transmilic. to Gregory XIII. in 1577, the university expressly derive, beth its first origin and its privileges from the Holy See, and professes to owe no allegiance save to the Romau pontiff. Erfurt, no less noted as a centre of Franciscan Frfurt than was Cologne of Dominican influenie, received its charter (16th September 1379) from the anti-pope Clement VII. as a "studium generale" in all the faculties. Ten years later (4th May 1389) it was founded afresh by Urban VI., without any recognition of the act of his pretended predecesoor. In the 15 th century the number of its students was larger than that at any other German uni-versity-a fact attributable part'y to the reputation it had acquired as a school of jurisprudence, and partly to the ardour with which the philosophic controversies of the time were debated in its midst.
The collegiate system is to be noted as a feature common to all theso early German universities; and, in nearly all, the professors were partly remunerated by the appropriation of certain prebends, appertaining to some neighbouring church, to their maintenance.

Throughout the 15th century the relations of the Roman Relatioza pontifis to the universities continued much the same, of the although the independent attitude assumed at the great nopes to councils of Constance and Basel by the deputies from the the uni-
versities,

[^317]muivarsities, and esjecally by those from Pars, could not fail to excite therr apprehensions. Their bulls for each new \{o indation becin again to indicate a certain jealousy with respect to the appropriation of prebends by the foriders. Where such appropriations are made, and more particularly in France, a formal sanction of the transfer generally fiads a place in the bull authorizing the foundation ; while sometires the founder or founders are themselves enjoined to provide the endorments requisite for the establishment and support of the university. In this inanner the control of the puntiff over each newly-created seat of learning assumed a more real character, from the fact that his assert was accompanied by conditions whicl rendered it no longer a mere formality. The imperial intervention, on the other hand, was rarely invoked in Uermany,--Greifswald, Freiburg, and Tübingen being the only instances in which the emperor's confirmation of the foundation was solicited. ${ }^{1}$ But whatever induence the Roman see may have gained by increasing intervention was more than counteracted by those other tendeneics which came into operatios in the second half of the century. These were of a twofold character:- the first directly modifyiag the studies themselves, as the results of the discovery of printing and the new spirit awakened by the teach. ing of the lumanists; the second affecting the external conditions, such as the multiplication of schools, and the growiag demand for skilled physicians and learned civilians, -circumstances which afforded increased employment for the services of men of academic trainiag. In northern Germany and in the Netherlands, the growing wealth and prosperity of the different states especially favoured the formation of new centres of learning. In the flourishing duchy of Brabant the university of Louvain (1426) was to a great extent controlled by the municipality; and their patronage, although ultimately attended with detrimental results, long enabled Louvain to outbid all the other universities of Europe in the munificence with which she rowarded her professors. In the course of the next cencury the "Delgian Athens," as sie is styled by Lipsius, ranked second only to Paris in numbers and reputation. In its numerous separate foundatioas and general organiza-tion-it possessed no less than twenty-eight colleges-it closely resembled the Eaglish universities; while its active press afforded facilities to the author and the controversialist of whieh both Cambridge and Oxford were at that time almost destitute. It embraced all the faculties, and ne degrees in Europe stood so high as guarantees of general acquirements. Erasmus records it as a common eaying, that "no one could graduate at Louvain withont knowledge, manners, and age." Sir William Hamilton speaks of the examination at Louvain for a degreo in arts as "the Dest example upon record of the true mode of such examinatioa, and, until. recent times, in fact, the only exanple in the history of universitics worthy of consideration at all." He has translated from Verauliens the order and method of this examination. ${ }^{2}$ Is 1783 the faculties of jurisprudenee, medicine, and philosophy were removed to Brussels, and in 1707 the French suspended the university altogether. When Belgium was formed inte an independent state io 1831, the university was refounded as a Roman Catholic foundation.

The circumstances of the fondation of the university of Leipsic are cspecially noterrorthy, it baviog been the result of the migration of almost the entire German element from the university of Prague. This element comprised (1) Bavarians, (2) Saxons, (3) Poles (this lastnamed division being drawn fron a wide area, which included Meissen, , Lusatia, Silesin,"and Prussia), and, being

[^318]represented by; taree votes in the assemblies of the university, while the Bolemians possessed but one, had acquired a preponderance in the direction of affairs which the latter could no longer submit to. Religious differences, again, evoked mainly by the preaching of John IIuss, further intensified the existing disagrecinents; and eventually, in the year 1409, King Wenceslaus, at the prayer of his Bohemian subjects, issued a deeree which exactly reversed the previons distribution of votes, -three votes being assigned to the Bohemian nation and only one to all the rest. The Germans took deep ombrage, aud seceded to Leipsic, where, a bull having Leen obtained from Alexander V. (9th September 1409), a new "studium generale" was founded by the landgravo of Thuringia and the margraves of Meissen. The members were divided iato four nations-composed of natives of Meissen, Saxony, Bavaria, and Poland. Two colleges were founded, a greater and a smaller, but designed, not for poor students, but for masters of arts, -twelve being admitted on the former and eight on the latter foundation. The first university Rostock of northern U'ermany was that of Rostock, founded by the dukes Jolin and Albert of Mecklenburg, the scheine receiving the sanction of Martin Y". in a bull dated 13th February 1419 as that of a "studium geaerale" in all the faculties excepting theology. The faculty of theology was added is the jear 1432 . Two colleges were also founded, with the same design and on the same scale as at Leipsic.

No little illustration is afforded by the circumstances attending the foundation of the French universities of the struggle that was going on between the crown and the Foman see. The carliest foundation in the 15 th century Poitlere was that of Poitiers. It was instituted by Charles VII. in 1431, almost imnediately after his accession, with the special design of creating a centre of learning less favourable to English interests than Paris had at that time shown herself to be. Eugenius IV could not refuse hits sanction to the scheme, but he codeavoured partially to defeat Charles's design by conferring on the new "studium generale " only the eame privileges as those possessed ly Toulouse, and thus placiug it at a disadrantage in consparison with Paris. .Charles rejoined by an extraordinary exereise of his own prerugative, conferring on Poitiers all the privileges collectively possessed by Paris, Toulouse, Montpellier, Angers, and Orleans, and at the eame time placing the university under special royal protection. The Crea, foundation of the utiversity of Caen, in the diocese of Bayeux. was attended by conditions almost exactly the reverse of those which belonged to the foundation of that at Poitiers. It was founded under English auspices duriag the short period of the supremacy of the Eaglish arms in Normandy in the 15 th century. Its charter (May 1437) was given by Eugenius IV., and the bishop of Bayeux was appointed its clancellor. The university of Paris had by this time completely forfeitcd the favour of Eugenins by its attitude at the conncil of Dasel, and Eagenius inserted in the charter for Caca a clanse of an entirely novel character, requiring all those admitted to degrecs to take an oath of fidelity to the see of Rome, and to bind themselves to attempt sothing prejudicial to her interests. To this proviso the pragmatic sanction of Bourges.was the reply given by Clarles in the following year. Oa 18th May $14 \pm 2$ we find King Henry VI. writing to Eugenius, and dwelling with eatisfaction on the rapid progress of the new university, to which, he Eays, students had flocked from all quarters, and wera still daily arriving. ${ }^{3}$ On 30th October 1452 its charter was given afresb by Charles in terms which left the original charter unrecognized; both teachers and lcarners twere made subjcct to the civil authorities of tho city, while all privileges conferred in the former charter
${ }^{3}$ Bekynton's Correspondence, i. 123.
VXIIJ. - 106
in cases of legal disputes were abolished. From this time the university of Caen was distinguished by its loyal spirit and firm resistance to ultramontane pretensions; and, although swept away at the Frencl Kerolution, it was afterwards restored, owing to the sense of the services it had thus once rendered to the national cause. ${ }^{1}$ No especially notable circumstances charecterize the foundation of the university of Bordeaux (i441) or that of Valence ( 1452 ), but that of Nantes, which received its charter from Pius II. in 1463, is distinguished by the fact that it did not receive the ratification of the king of France, and the conditions under which its earlier traditions were formed thus closely resemble those of Poitiers. It seems also to bave been regarded with particular favour by Pius II., a pontiff who was at.once a ripe scholar and a writer upon education. He gave to Nantes a. notable body of privileges, which not ooly represent an embodiment of all the various priviloges granted to universities prior to that date, but afterwards became, with their copious and somewhat tautological phraseology, the accepted model for the great majority of university charters, whether issued by the.pope or by the emperor, or by the civil authority. The bishop of Nantes was appointed head of the university, and was charged with the special protection of its privileges against all interference from whatever quarter.2 The bull for the foundation of the university of Bourges was given in 1465 by Paul II. at the request of Louis XI, and his brother. It confers on the community the same privileges as those onjoyed by the other universities of France. The royal sanction was given at the petition of the citizens; but, from reasons which do not appear, they deemed it neces. sary further to petition that their charter might also be registered and enrolled by the parlement of Paris.

In Germany, the first of the universities representing the new infuences above referred to is that of Greifswald. A wealthy burgomaster, who bad graduated as a master of arts at Riostock, was the chief mover; and, his proposal being cordially socondod by the city council, the duke of the province, and certain abbots of neighbouring monasteries, the necessary bull was obtained from Calixtus III. (29th May 1456). The first session was commenced in October of the same year. Three colleges were at the same time founded, 一two for masters of arts, as at Leipsic and Rostock, and a third for jurists. The chairs in the different faculties were distributed as follows: theology 3 , jurisprudence 5 , medicine 1 , arts 4 ,-the number of jurists showing that the study of the civil law still ohtained a Eriburg, certain preponderance. The university of Freiburg was, founded by the archduke Albert, brother of the emperor Frederick III.,--the papal bull being given 20th April 1455, and the imperial ratification in the following year. The first session was opened in 1460 , under the presidency of Matthew Hummel, a privy councillor, aud the original numbers soon received considerable additions by sccessions from Vienna and from Heidelberg. The ondowment was further augmented by an annual allowance from the city council, and by certain canonries and livings attached to neighbouring parishes. In the same year, and probably in a spirit of direct rivalry, was opened the university of Basel. The cathedral school in that ancient city, together with others attached to the monasteries, afiorded a sufficient nucleus for a "studium," and Pius 11., who, as Atneas Sylvius, had been a resident in the city, was easily pre vailed upon to grant the charter (12th November 1459). In the character of its endowments, and in the relative importance attached to the study of the civil law, Basel much resembled Greifswald, but its succeess throughout the 15th century was marred by tho languid character of the

[^319]support aforded it by the civic authorities. Before he had sigued the bull for the foundation of the university of Basel, Pius II., at the request of duke William of Bavaria, had issued another bull for the foundation of a university at Ingolstadt (7th April 1459). But it was not until Ingol) 1472 that the work of teaching was actually commenced otudt, there. Some long-existing prebeads, founded by former dukes of Bavaria, were appropriated to the endowment, and the chairs iu the different faculties were distributed as follows:- theology 2, jurisprudence 3, inedicine 1, arts 6, -arts in conjunction with theology thus obtaining the preponderance. As at Caen, twenty-two years before, an oath of fidelity to the Roman pontiff was imposed on every student admitted to a degree. ${ }^{3}$ That this proviso was not subsequently abolished, as at Caen, is a feature in the history of the university of Ingolstadt which was attended by important results. Nowhere did the Reformation meet with more stubborn resistance, and it was at Ingolstadt that the Counter-Reformation was commenced. In 1556 the Jesuits made their first settlement in the university.

The next two universities took their rise in the archi- Trem episcopal seats of Treves and Mainz. That at Treves received its charter as early as 1450 ; but the first academical session did not commence until 1473. Here the ecclesiastical influences appear to have been unfavourable to the project. The archbishop demanded 2000 florins as the price of his saaction. The cathedral chapter threw difficulties in the way of the appropriation of certain livings and canonries to the university endowment; and so obstinate was their resistance that in 1655 they succeeded in altogether rescinding the gift on payment of a very inadequate sum. It was not until 1722 that the assembly of deputies, by a formal grant, relieved the university from the difficulties in which it had become involved. The Maing university of Mainz, on the other hand, was almost entirely indebted to the archbishop Diether for its foundation. It was at his petition that Sixtus IV. granted the charter, 23d November 1476 ; and Diether, being himself an enthusiastic humanist, thereupon circulated a letter, couched in elegant Latinity, addressed to students throughout his diocese, inviting them to repair to the new centre, and dilatiog on the advantages of academic studies and of learning. The rise of these two universities, however, neither of which attained to much distinction, represents little more than the incorporation of certain already existing institutions into a homogencous whole, the power of conferring degrees being superadded. But the university Tubiu of Tübingen, founded by charter of Sixtus IV. (9th gen. Novenber 1476), represents an entirely new creation. Its real founder was Mathilda, the motber of Count Eberhard of Würtemberg, who appropriated fivo livings and eight prebends to the endowment. Of the chairs, 3 were for theology, 3 for the canon and 2 for the civil law, 2 for medicine, and 4 for arts. The general financial condition of this university in the year 1541-42, and the sources from whence its revenues were derived, bave been illustrated by. Hoffmann in a short paper which shows the fluctuating, character of the resources of a university in those days,liable to be affected, as they were, both by the scasons an the markets. ${ }^{4}$

Nearly contemporaneous with these foundations were those of Upsala (1477) and Copenhagen (1479), which, although lying without the political boundarics of Germany, reflected lier influence. The charter for Copenhagen was given by Sixtus IV. as early as 1475 . Tho-students

[^320]attracted to this uew centre were mainly from within the radius of the nnirersity of Cologne, and its statutes were little more than a transcript of those of the latter foundation.

The electorates of Wittenberer and Drandenburg were now the only two considerable German territories which did not possess a studiuna generale, and the university founded at Wittenberg by Maximilian I. (6th July 1502) is notable as the first established in Germany by virtue of an imperial as distioguished from a papal decree. Its charter is, however, drawn up with the traditional phraseology of the pontifical bulls, and is evidently not conceired in any spirit of antagonism to Rome. Wittenberg is constituted a "stadium generale" in all the four faculties, the right to confer degrees in theology and canon law having been sauctioned by the papal legate some months before, 2d February 1502. The endowment of the university with church resenues duly received the papal sanction, - a bull of Alexander VI. authorizing the appropriation of iwelse canonries attached to the castle church, as well as of eleren prebends in outlying districts-ut sic per onnen modum unme corpus ex studio et collegio proNictis fiat et constituatur. No university in Germany attracted to itself a larger share of the attention of Europe at its commencement. And it was its distinguishing merit that it was the first academic centre north the Alps where the antiquated methods and barbarous Latinity of the scholastic era were oserthown. The last university founded in Germany prior to the Reformation was that of Frankfort-on-the-Oder. The design, first conceived by the elector John of Brandenburg, was carried into execution by his son Joachim, at whose request Pope Julins II. issued a bull for the foundation, 15th March 1506. An imperisl charter, identical in its contents with the papal bull, followed on 26th October. The university received an endowment of canonries and livings similar to that of Wittenberg, and some houses in the city were assigned for its use by the elector.

The first university in Scotland was that of St Andrews, fouoded in 1411 by Henry Wardlaw, bishop of that see, and modelled chiefly on the constitution of the university of Paris. It acquired all its three colleges-St Salvator's, St Leunard's, and St Mary's-before the Reformation, the first having been founded in 1456 by Bishop James Kennedy; the second in 1512 by the youthful archbishop Alexander Stuart (oatural son of James IV.) and Jolin Hepburn, the prior of the monastery of St Andrews; and the third, also in 1512, by the Beatons, who in the year 1537 procured a bull from Pope Paul III. dedicating the coilege to the Blessed Vi.sio Mary of the Assumption, and adding further endnwinents. The most ancient of the universities of Scoiland, with its three colleges, was thus reared in an atmosphere of medixval theology, and undoubtedly designed as a bulwark against heresy and schism. But "by a strange irony of fate," it has been observed, "two of these colleges bceame, aimost from the first, the foremost agents in working the overthrew of that church which they were founded to defond." St Leonard's more especially, like St Joha's or Queens' at Cambridge. became a noted centre of intellectual life and Reformation principles. That he "had. druak at St Leonard's well" because a current expression for implying that a theologian had imbibed the doctrines of Protestantisn. The university of Glasgow was founded as a "studium generale" in 1453, and possessed two colleges. Prior to the Reformation it acquired but little celebrity ; its discipline was lax, and the number of the students but small, while the instruction was not only inefficient but irregularly given; no funds were provided for the maintenance of regular lectures in the higher faculties; and there was no adequate executive power for the uaiateance of discipline. The uni-
versity of Aherdeen, which was founded in 1494, at lirst possessed only oue college,-namely, King's. Marischal College, founded in 1593 by George Keith, fifth Earl Marischal, was constituted by its founder iudependent of the university in Old Aberdeen, being itself both a college and a university, with the power of conferring degrces. Bishop Elphinstone, the funnder both of the university and of Kiog's College ( 1505 ), had been educated at Glasgow, and had subsequently both studied and taught at Paris and at Orleans. To tho wider experience which be had thus gained we may probably attribute the fact that the constitution of the university of Aberdeen was free from the glaring defeets which then characterized that of the university of Glasgow. But in all the medixval universities of Germany, England, and Scotland, modelled as they were on a common type, the absenco of adequate discipline was, in a greater or less degree, a common defect. In connexion with this feature we may note the comparatively suall percentage of matrieulated students procceding to the derrrees of B.A. and M.A. when compared with later times. Of this disparity the following. Degreen table, exbibiting the relative numbers in the university of taken at Leipsic for every ten years from the year 1427 to 1552 , Leipsic. probably affords a fair average illustratioo, - the remarkable fluctuations probably depending quite as much upon the comparative healthiness of the period (in respect of freedom from epidemic) and the abundanco of the larvests as upon any other cause :-

| Years. | Matriculatlons. | Y cars. | P.A. | 3. A. | Percentage of |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | B.A's. | M.A's. |
| 1427-1430 | 737 | 1429-1432 | 151 | 28 | 20.4 | $3 \cdot 8$ |
| 1437-1440 | 715 | 1439-1442 | 199 | 50 | $27 \cdot 8$ | 6.9 |
| 1447-1450 | 808 | 1449-1452 | 274 | (50) | $33 \cdot 9$ |  |
| 1457-1460 | 1,447 | 1459-1462 | 559 | 81 | $38 \cdot 6$ | 50 |
| 1467-1470 | 1,137 | 1469-1472 | 410 | 61 | 36.0 | $5 \cdot 4$ |
| 1477-1480 | 1,163 | 1479-1482 | 453 | 49 | $39 \cdot 4$ | $4-2$ |
| 1487-1490 | 1,858 | 1489-1492 | 714 | 62 | 88.4 | $3 \cdot 4$ |
| 1497-1500 | 1,288 | 1599-1502 | 497 | 59 | $38 \cdot 5$ | $4 \cdot 6$ |
| 1507-1510 | 1,948 | 1509-1512 | 510 | 65 | 26.1 | $3 \cdot 4$ |
| 1517-1520 | 1,445 | 1519-1522 | 247 | 35 | 17.0 | 2.4 |
| 1527-1530 | 419 | 1529-1532 | 77 | 33 | 18.4 | $7 \cdot 9$ |
| 1537-1540 | 686 | 1539-1542 | 122 | 27 | $17 \cdot 8$ | $3 \cdot 9$ |
| 1547-1550 | 1,318 | 1549-1552 | 200 | 72 | $15 \cdot 2$ | $5 \cdot 5$ |
|  | 14,969 |  | 4418 | $67^{2}$ | 29.5 | $4 \cdot 5$ |

The German universitics in these times seem to have General adinitted for the most part their inferiority in learning to aspecto af older and more favoured centres; and their conscionsness German of the fact is shown by the efforts which they made to udiverattract instructors from Italy, and by the frequent resort sitiee of the more ambitious students to schools like Paris, Bologna, Padua, and Pavia. That they took their rise in any spirit of systematic opposition to the Roman see (as Meiners and others have contended), or that their organization was something external to and indepeadent of the church, is sufficiently disproved by the foregoing evidence. Generally speaking, they were emioently conservative bodies, and the new learning of the humanists and the new miethods of instruction that now began to demand attention were alike for a long period unable to gain adnission within academic cireles. Reformers such as Hegius, John Tessel, and liudolplus Agricola carried on their work at places like Deventer remote from university influences. That there was a considerable amount of mental activity going on in the universities themselves is not to be denied; but it was mostly of that uaprofitable kind which, while giving rise to endless controversy, turned upon questions in connexion with which the implied postulates and the terminology employed rendered all scientific iavesti-

[^321]gation hopeless. At almost every university-Leipsic, Greifswald, and Prague (after 1209) being the principal caceptions-the so-called Reaiists and Nominalists represented two great parties occupied with an internecine struggle. At Paris, owiag to the overwhelming strength of the theologians, the Nominalists were indeed under a kınd of ban; but at Heidelberg they had altogether expelled their antagonists. It was much the same at Tienna and at Erfurt,-the latter, from the ready reception which it gare to new speculation, being styled by its enemies "novorum omninm portus." At Basel, under the leadership of the eminent Johannes a Lapide, the Realistswith difficulty maintained their ground. Freiburg, Tübingen, and Ingolstadt, in the hope of diminishing controversy, arrived at a kind of compromise, each party having its own professor, and representing a distinct "nation." At Mainz the authorities adopted a manual of logic which was essentially an embodiment of Nominalistic principles.
Abandou. ment of logical studies in Italy.

In Italy, almost without excepition, it was clecided that these controversies mere endless, and that their cffects were pernicionst. It was resolsed, accordingly, to expel logic, and allow its place to be filled by rhetoric. It was by virtue of this clecision, which was of a tacit rather than a formal character, that the capounders of the new learning in the l5th century, men like Emmanuel Chrysoloras, Guarino, Leonardo Bruni, Bessarion, Argyropulos, and Valla, carried into effect that jmportant revolution in academic studies which constitutes a new cra in university learning, and largely helped to pave the way for the Reformation. ${ }^{1}$. This discouragement of the controversial spirit, continued as it was in relation to theological questions after the Reformation, obtained for the Italian universities a fortunate immunity from dissensions like those which, as me shall shortly see, distracted the centres of High re- learning in Germany. The professorial body also attained putation of Italian profes. yors. to an almost unrivalled reputation. It was exceptionally solect, only those who were in receipt of salaries being permitted, as a rule, to lecture; it was also famed for its ability, the institution of concurrent chairs proving an excellentstimulus. These chairs were of tro kinds-"ordinary" and "extraordinary,"-the former being the more liberally endowed and fewer in number. For eacli subject of importance there were thus always two and sometimes three rival chairs, and a porerful and contimuóus emulation was thus maintaiued among the teachers. "From the integrity of their patrons, and the lofty standard by which they were judged," says Sir W. Hamilton, "the call to a Paduan or Pisan chair was deemed the highest of all literary honours. The status of professor was in Italy elevated to a dignity which in other countries it has never reached; and not a few of the most illustrious teachers in the Italian seminaries were of the proudest nobility of the land. White the universities of other countries lad fallen from Christian and cosnopolite to sectarian and lecal schools, it is the peculiar glory of the Italian that, under the enlightened liberality of their patrons, they still coutinued to assert their European universality. Creed and country were in them no bar,-the latter not even a reason of preference. Foreiguers of every nation are to be found among their professors; and the most learned man in Scotland (Denpster) souglit in a Pisan chair that theatre for his abilities which he could not find at home."2

The Reformation represents the great boundary line in the history of the medieval universities, and also, for a long time after, the main influence in the history of those new foundations wlich subsequently arose in Protestant countries. Even in Catholic countries its secondary effects

[^322]were scarcely less perceptille, as thicy found expressínn in connexion with the Counter-Reformation. In Germany the Thirty Jears' War was attended by consequences which were felt long after the 17th century. In France the Revolution of 1789 resulted in the actual uprooting of the university system.'

The influences of the New Learning, and the special character which it assumed as it made its way in Germany in connexion with the labours of scholars like Erasnus, Johu Reuchlin, Ulrich von Hutten, and Melanchthon, augured well for the future. It was free from the frivolities, the pedantry, the inmoralities, and the scepticism which characterized solarge a proportion of the corresponding culture in Italy. It gave promise of resulting at once in a critical and enlightened study of the masterpieces of classical antiquity, and in a reverent and yet rational interpretation of the Scriptures and the fathers. The fierce Per bigotry and the ceaseless controversies evoked by the pro- nicious mulgation of Lutheran or Calvinistic doctrine dispelled, and otherwise have become the tranquil abodes of the Mnses ism. into gloomy fortresses of sectarianism. Of the manner in which it affected the highest culture, the observation of Henke in his Life of Cclixtus (i. 8), that for a century after the Reformation the listory of Lutheran theology becomes almost identified with that of the German universities, may serve as an illustration.

The first Protestant university was that of Marburg, Marburg. founded by Philip the Magnanimous, landgrave of Hesse, 30th May 1527. Expressly designed as a bulwark of Lutheranism, it was mainly luilt up out of the confiscation of the property of the religious orders in the Hessian capital. The house of the Dominicans, who had fed on the first rumour of spoliation, was conrerted into lecturerooms for the faculty of jurisprudence. The church and convent of the order known as the "lingelierrn" was appropriated to the theological faculty. The friary of the Barefooted Friars was shared betwenn the faculties of medicine and philosophy. The university, which was the object of the margrave's peculiar care, rapidly rose to celebrity; it was resorted to by students from remote countries, even from Greoce, and its professors were of distinguished ability. How much, however, of this popularity deperded on its theologival associationsis to be seen in the fact that after the jear 1605, when, by the decree of Count Maurice, its formulary of faith was changed from Lutheran to Calvinistic, its numbers greatly declined. This dictation of the temporal power now becones one of the most notable features in academic history in Protestant Germany. The universities, having repudiated the papal authority, while that of the episcopal order was at an end, now began to pay cspecial court to the temporal ruler, and sought in c:ery way to conciliate his goodwill, representing with peculiar distinctuess the theory,--cujus regio, ejus religio. This tendency was further strengthened by the fact that their colleges, bursaries, and other similar foundations were no longer derived from or supported by ecclesiastical institutions, but were mainly dependent on the civil power.

The Lutheran university of Königsberg was founded 17 th August 1544 by Albert III., margrave of Brandenburg: and the first dnte of Prussia, and his wife Dorcthea, a Danish princess. In this instance, thr, religious character of the foundation nol having been determined at the commencement, the pajal and the imperial sanction were botli applied for, although not accorded. King Sigismund of Poland, however, which kingdom exercised at that time a prutectorate over the Prissian duchy, ultimately gave the necessary clarter (29th Septemuer 1561), at the same time ordaining that all students who graduated as masters in the faculty of philosophy should rank as nobles of the

Polish kugdom. When Prussia mas raiscd to the rank of a kingdom (1701) the university was made a royal foundation, and the "collegium Fridericianum," which was then erceted, received corresponding privileges. In 1862 the university buildings were rebuilt, and tho number of the students is now nearly one thousand
Tho Lutheran university of Jena had its origin in a gymnasium founded by John Frederick the Magnanimous, elector of Saxony, during his inprisonment, for the express purpose of promoting Evangelical doctrines and repairing the loss of Wittenberg, where the Philippists had gained the ascendency. Its charter, which tho emperor Charles V. refused to grant, and which was obtained with some difficulty from his brother, Ferdinand I., eventually enabled tho authorities to open tho university, 2d February 1558. Distinguished for its vehement assertion of Tutheran doctrine, its lostility to the teaching of Witteuberg was hardly less pronounced than that with which both centres regard Roman Catholicism. For a long time it was chiefly noted as a school of medicine, and in the 17 th and iSth centuries it was in lad repute for the lawlessness of its students, among whom duelling prevailed to a scandalous extent. The beauty of its situation and the cuninence of its professoriate have, however, generally attracted a considerable proportion of students from other countrics. Its numbers in 1885 were 566.
The Lutheran university of Helmstadt, founded by Duke Julius (of the house of Brunswick-Wolfenblittel), and designated after him in its official records as "Academia Julia," reccived its charter, Sth Nay 1575, from the emperor Maximilian II. No university in the 16 th century commenced under more favourable auspices. It was munificently endowed by the founder and by his son; and its "Convictorium," or college for poor students, expended in the course of thirty years no less than 100,000 thalers, an extraordinary expenditure for an institution of such a character in those days. Beautifully and conveniently situated in what had now becomo the well-peopled region between the Weser and the lower Elbe, and distinguished by its comparatively temperate maintenance of the Lutheran tenets, it attracted a considerable concourse of students, especially from the upper classes, not a few being of princely rank. Throughout its listory; until suppressed in 1809, Halastadt enjoyed the sjecial and powerful patronage of the dukes of Saxony,

The "Gymnasium Egidianum" of Nuremberg, founded in 1520, and remored in 1575 to Altdorf, represents the origin of the university of Altdorf. A charter was granted in 1578 by the emperor Rudolph II., and the university was formally opened in 1580 . It was at first, however; emporered only to grant degrecs in orts; but in 1623 the emperor Ferdinand II. adden the permission to create doctors of law and medicine, and also to confer crowns on poets; and in 1697 its facultics were completed by the permission given by tho emperor Leopold I. to creato doctors of theology. Like Louvain, Altdorf was nominally ruled by tho municipality, but in tho latter university this nower of control remained practically iLoperative, and the consequent freedom enjojed by tho community from evils like those which brought about tho declice of Louvain is thus described by Hamilton :-" The decline of that great and wealthy seminary (Louvain) was mainly determined by its vicious patronage, both as vested in the university and in the town. Altdorf, on tho other land, was about the poorest university in Cermany, and long ono of the most eminent. Its whole endowment never rose above $£ 800$ a year; and, till the period of its declension, the professors of Aldorf make at least as distinguished a figure in tho history of philosophy as those of all the cight universities of tha British enpuire together. On looking
elosely into its constitution the anomaly is at once solved. The patrician senate of Nuremberg were too intelligent and patriotic to attempt the exercise of such a function. The nomination of professors, though formally ratified by the senate, was virtually made by a board of four curators; and what is wortlyy of remark, as long as curatorial patrouago was a singularity in Cermany, Altdort maintained its relative pre-eminence, losing it only when a similar mean was adopted in the moro Iavolured universities of the empire."1

The conversion of Marburg into a school of Calvinistic doctrine gave occasion to the foundation of the universities of Giessen and of Rinteln. Of these the former, founded by the margrave of Darmstadt, Louis V., as a kind of refuge for the Latheran professors froin Marburg, received its charter from the emperor Rudolph II., 1941 May 1607. When, however, tho margraves of Darmstadt acquired possession of lfarburg in 1625 , tho univetsity was transfered thither; in 1650 it was mored back again to Giessen. The number of matriculated students at the commencement of the century was about 250 ; in 1887 it was 484. In common with the other unirersities of Germany, but with a facility which obtained for it a specially unenviable reputation, Giessen was for a long time wout to confer tho degree of doctor in alsentia in the different facultics without requiring adequato credentials. This practice, however, which drew forth an emphatic protest from tho eminent historian Mommsen, has within the last few years been entirely abandoned. The university of Rinteln was Rintelm founded 17 th July 1621 by the emperor Ferdinand II. Almost immediately after its foundation it became the prey of contending parties in the Thirty Years' War, and its carly development was thus materially hiodered. It never, however, attained to mucl distinction, and in 1819 it was suppressed. Tho university of Strasburg was founded in Stras 1621 on tho basis of an already existing acadeny, to which burg. the celebrated John Sturm stood, during tho latter part of his life, in the relation of "rector perpetuus," and of which we are told that in 1578 it included more than a thousand scholars, among whon were 200 of the nobility, 24 rounts and barons, and three prinees. It also attracted students from all parts of liurope, and especially from Portugal, Poland, Denmark, I'rance, and England. Tho method of Sturu's teaching became the basis of that of the Jesuits, and through them of the pullic school instruction in England In 1621 Ferdinand II. conferred on this academy full privileges as a university; in the language of the charter, "in omnibus facultatibus, doctores, liecentiatos, magistros, et bnccalaureos, atque insuper poctas lawreatos creandi et promovendi." ${ }^{2}$ In 1681 "Strasburg becamo French, and remained so until 1870.

Tho university of Dorpat (now Russian) was founded Dorval. by Gustarus Adolphus in 1632, and reconslitutcd by the emperor Alexander I. in 1802. A special iuterest attaches to this university from the fact that it has for a long time been the scene of the contending infuences of Teutonism and Slavonianisn. Situated in Livonia, which at the time of its foundation represented a kind of debateable land between Iiussia and Yoland, its gradual monopoly by the former countay las not been without resistanco and protests on tho part of that Teutonic element which was at one lime the nore potent in its midst. The study of the Slavonic languages has here received cousiderable stinnulus, and by a decrec in Mary 1887 the use of the liussian language having been mado obligatory in all places of instruc. tion through tho Baltic prorinces, Tussian has now taken the place of German as the language of the lecture-room. Dorpat possesses a fine library of over 80,000 volumes, and is also noted for its admirable botanical collection. Tbr

[^323]Russian minister has also recently instituted a professorship of the comparative grammar of the Slavonic dialects (now filled by J. Baudouin de Courtenay). The general influence of the university has been rapidly extending during.the last few years far beyond the Baltic provinces. The number of students, which in 1879 was 1106 , in 1886 was 1751.1 A like contest between contending nationalities has recently met with a final solution at Prague, where a Czech university has been established on an independent basis, the German nniversity having commenced its separate career in the winter session of 1882-83. I'he German foundation retains its endowments, but the state subvention is divided between the two.

The repudiation on the part of the Protestant univerbities of both-papal and episcopal authority evoked a counter-demonstration among those centres which still adhered to Catholicism, while their theological intolerance gave rise to a great reaction, under the influence of which the mediæval Catholic universities were reinvigorated and reorganized (although strictly on the traditional lines), while new and important centres were created. It was on the tide of this reaction, aided by their own skill and sagacity, that the Jesuits were borne to that commanding position which made them for a time the arbiters of educa-

## Bam.

 tion in Europe. The earliest university whose charter represented this reaction was that of Bamberg, founded by the prince-bishop Melchior Otto, after whom it was named "Academia Ottoniana." It was opened lst September 1648 , and received both from the emperor Frederick III. and Pope Innocent X. all the civil and ecclesiastical privileges of a mediæval foundation. At first, however, it comprised only the faculties of arts and of theology; to these was added in 1729 that of jurispradence, and in 1764 that of medicine. In this latter faculty Dr Ignatius Döllinger (the father of the historian) was for a long time a distin-guished professor. The university of Iacsbruck was founded in 1672 by the emperor Leopold I., from whom it received its name of "Academia Leopoldina." In the following century, under the patronage of the empress Maria Theresa, it made considerable progress, and received from her its ancient library and bookshelves in 1745 . In 1782 the university underwent a somewhat singular change, "being reduced by the emperor Joseph II. from the statns of a university to that of a lyceum, although retaining in the theological faculty the right of conferring degrees. In 1791 it was restored to its privileges by the emperor. Leopold II., and.since that time the faculties of philosophy, law, and medicine have been represented in nearly equal proportions. In 1886 the number of profesBreslau. sors was 74, and of students 869. The foundation of the university of Breslay was contemplated as early as the year 1505, when Ladislaus, king of Hungary, gave his sanction to the project, but Pope Julius II., in the assumed interests

The
Jesuits in the nini-uni- of Cracow, withhold his assent. Nearly two centuries later, in 1702, under singularly altered conditions, the Jesuits prevailed apon the emperor Leopold I. to found a university without soliciting the papal sanction. When Frederick the Graat conquered Silesia in 1741, he took both the university and the Jesuits in Breslau under his protection, and when in 1774 the order was suppressed by Clement XIV. he established them as priests in the Royal Scholastic Institute, at the same time giving new statutes to the university. In 1811 the university was considerably augmented by the incorperation of thateat Frankfort-on-the-Oder. At the present time it possesses both a Catholic and a Lutheran faculty. Its medical faculty is in high revnite. The total number of students in 1887 was 1347.

In no country was the influence of the Jesuits on the

[^324]universities more inarked than in France. The civil wars in that country during the thirty years which preceded the close of the 16 th century tald with disastrous effects upon the condition of the university of Paris, and with the commencement of the 17 th century its collegiate life seemed at an end, and its forty colleges stood absolutely deserted. To this state of affairs the obstiuate conservatism of the academic authorities not a little contributed. The statutes by which the university was still governed were those which had been given by the cardinal D'Estouteville, the papal legate, in 1452 , and remained entirely unmodified by the influences of the Renaissance. In 1579 the edict of Blois promulgated a scheme of organization for all the universities of the realm (at that time twenty-one in number),-a measure which, though productive of unity of teaching, did nothing towards the advancement of the studies themselves. The eminent lawyers of France, unable to find chairs in Paris, distributed themselves among the chief towns of the provinces. The Jesuits did not fail to profit by this immobitity and excessive conservatisin on the part of the university, and during the second half of the 16 th century and the whole of the 17 th they had contrived to gain almost a complete monopoly of bath the higher and the lower education of provincial France. Their schools argse at Toulouse and Bordeaux, at Auch, Colleges Agen, Rhudez, Périgueux, Limoges, Le Puy, Aubenas, of the Beziers, Tournon, in the colleges of Flanders and Lorraine, Jesuits ip Douai and Yont-a-Mousson,-places beyond the jurisdiction of the parlement of Paris or even of the crown of France. Their banishment from Paris itself had been by the decree of the parlement alone, and had never been confirmed by the crown. "Ljons," says Pattison, " loudly demanded a Jesuit college, and even the Huguenot Lesdiguières, almost king iu Dauphiné, was preparing to erect one at Grenoble. Amieus, Rheims, Rouen, Dijon, and Bourges were only waiting a favourable opportunity to introduce the Jesuits within their walls." ${ }^{2}$ The university was rescued from the fate which seemed to threaten it only by the excellent statutes given by Richer in 1598 , and by the discerning protection extended to it by Henry IV.

The "college of Edinburgh" was founded by charter Edin of James VI., dated 14th April 1582. This document hurgh contains no reference to a studium generale, nor is there ground for supposing that the foundation of a nniversity was at that time contemplated. In marked contrast to the three older centres in Scotland; the college rose comparatively untrammelled by the traditions of mediævalism, and its creation was not effected withont some jealousy and opposition on the part of its predecessors. Its first course of instruction was commenced iu the Kirk of Field, under the direction of Robert Rollock, who had been educated at St Andrews under Andrew Melville, the eminent Covenanter. "He began to teach," sajs Craufurd, "in the lower hall of the great lodging, there being a great concourse of students allured with the great worth of the man; but diverse of them being nat ripe enough in the Latin tangue, were in November next put under the charge of Mr Duncan Narne, . . . who, upan Mr Rollack's recoinmendation, was chosen second master of the college." ${ }^{3}$ In 1585 both Rollock and Nairne subscribed the National Covenant, and a like sulscription was from that time required from all who were aduritted to degrees in the college.

Disastrous as were the effects of the Thirty Years' War upon the external condition of the German universities, resulting in not a few instances in the total dispersion of the students and the burning of the buildings and libraries, they were less detrimental and less permaneut than those which were discernible in the tone and temper of these

[^325]S'raufuri, ITist. of the Uibiv. of Eilinburgh, [1]. 12-28.
communities. A formal pedantry and unintelligent method of study, combined with a passionate dogmatism in matters of religious belief, and a rude contempt for the amenitios of social intercourse, became the leading characteristics, and lasted throughout the 17 th century Fut in the year 1693 the foundation of the university of Halle opened up a eareer to two very eminent mea, whoso influence, widely different as was its character, may be *ompared for its effects with that of Luther and Melanchtloo, and scrved to modify the whole current of German philosophy and German theology. Hallo has indecd been described as "the first real modern university." It was really indeloted for its origin to a spirit of rivalry between the conservatism of Saxony and the progressive tendencies of the house of Brandenburg, but the occasion of its riso was the removal of the ducal court from Halle to Magdeburg. The archbishopric of the latter city having passed into the possession of Brandenburg in 1680 was changed into a dukedom, and the city itself was selected as the ducal residence. This clange left unoccupied some commodious buildings in Halle, which it was decided to utilize for purposes of education. A "Ritterschule" for the sons of the nobility was opened, and in the course of a few years it was decided to found a university. Sarony endeavoured to thrvart the scheme, urgiog the proximity of Leipsic; but Ler opposition was overruled by the emperor Leopold I., who granted (19th October 1693) the requisite charter, and in the following year the work of the university commenced. Frankfort-on-the.Oder had by this time become a centre of the Reformed party, and the primary object in founding a university in Halle was to create a centre for the Lutheran party, but its character, under the influence of its two most notable teachers, Christian Thomasius and A. I. Francke, soon expanded beyond the limits of this conSeption to assume a highly original form. Thomasius and Francke had both been driven from Leipsic owing to the 'disfavour with which their liberal and progressive tendencies were there regarded by the academic authoritics, and on many points the two teachers were in agreement. They both regarded with contempt alike the scholastic philosophy and the scholastic theology; they both desired to see the rule of the civil power superseding that of the ecclesiastical power in, the seats of learning; they were both opposed to the ascendency of classical studies as expounded by the humanists-Francke regarding the Greck and Roman pagan writers with the old traditional dislike, as immoral, while Thomasius looked upon them witlicontempt, as antiquated and representing only a standpoint which had been long left behind; both again agreed as to the desirability of including the elements of modern crlture in the education of the young. But here their agrecment ceased. It was the ain of Thomasius, as far as possible, to secularize education, and to introduce among his countrymen French habits and French modes of thought; his own attire was gay and fashionable, and he was in the luabit of taking his seat in the professorial chair adorned with gold chain and rings, and with his dagger by his side. Francke, who became the leader of the Pietists, regarded all this with even greater aversion than he did the lifeless orthodoxy traditional in the universities, and was shocked at the worldly tone and disregard for sacred things which charactcrized his brother professor. Both, hovever, commanded considerable following among the students. Thomasius was professor in the faculty of jurisprudence, Francke in that of theology. And it was a common prediction in those days with respect to a student who proposed to pursue his acadenic career at Halle, that he would infallibly, become either an atheist or a Pictist. But the uervices rendered by Thomasius to learning were genuine 6nd lasting. He was the first to set the example. soon.
after followed by all the universities of Germany, of lecturing in the vernacular instcad of in the customary Latin; and the discourse in which he first departed from the traditional method was devoted to the consideration of how far the Cicrman nation might with advantago imitate the French in matters of social life and intercoursc. His more general views, as a disciple of the Cartesian !hilosoply and founder of the modern Pationalisunus, exposed hin to incessant attacks; but by the establislıment of a monthly journal (at that time an original idea) he obtained a clannel for ex: pounding his views and refuting his antagonists whicli gave him a great advantage. On the influence of Francke, as the founder of that lietistic school with which the reputation of Halle afterwards became especially identified, it is unnecessary here to dilate. ${ }^{1}$ J. C. Wolf, who followed Thomasius as an assertor of the new culture, was driven from Halle by the accusations of the Pictists, who declared that his teaching was fraught with atheistical principles. In 1740, however, leo was recalled by Frederick II., and reinstated in high office with cvery mark of consideration and respect. Throughout the whole of the 18 th century Halle was the leader of academic thought and cnlture io Protestant Germany, although sharing that leadership, after the middle of the century, with Göttingen. The university of Göttingen (named after its founder "Georgia Augusta ") was endowed with the amplest privileges as a university by George II. of England, elector of Hanover, 7th Decenber 1736. The imperial sanction of the scheone had been given three years betore (13th January 1733) and the university was formally opencd lith September 1737. The king hiniself assumed the office of "rector maguificentissimus," and the liberality of the royal endowments (doubling those of Halle), and the not less liberal character of the spirit that pervaded its organization, soon raised it to a foremost place among the schools of Germany. Halle had just expelled Wolf; and Göttingen, modelled on the same lines as Halle, but rejecting its Pietism and disclaiming its intolerance, appealcd with remarkable success to the most enlightened feeling of the time. It iacluded all the faculties, and two of its first professors-Mosbeim, the eminent theologian, from Helmstadt, and Bühmer, the no less distinguished jurist, from Hallo-together with Gesner, the man of letters, at once established its reputation. Much of its early success was also due to the supervision of its chicf curator (there were two), -Daron Miinclausen, limself a man of considerable attainments, vilo by his sagacious superintendence did much to promote the general efficiency of the whole professoriate.: - Not lenst among its attractions was also its splendid library, located in an ancient monastery, and now containing over 200,000 volumes and 5000 MSS. In addition to its general influence as a distinguished scat of learning, Gïttingen may claim to have been mainly instrumental in diffusing a more adequate conccption of the importance of the study of history. Before the latter half of the 18th century the mode of treatment adopted by university lecturers was singularly wanting in breadtly of vicw: Pros fane history was held of but little account, excepting so fart as it served to illustrate ecclesiastical and sacred history; while this, again, was invariably treated in the narrow spirit of the polemic, intent mainly on the defence of his own confession, according as Le represented tho Lutheran or the Reformed Church. The labours of the professors at Göttingen, especially Putter, Gattercr. Schlözer, and Spittler, combined with those of Mascov at Leipsic, did much towards promoting both a moro. catholic treatment and a wider scope. Not less beneficial was the example set at Göttingen of securing the appointment of its profes: sors by a less prejudiced and partial body than a university
${ }^{1}$. See Paulseu, Gesch. des gelehrten.UnterrichLs, \&c., Pp., 948-858.

## U N_I V ER S I_I'I E S

board is only too likely to become. "'The great Münchausen,' says 'an illustrious professor of that seminary, 'allowed our university the right of presentation, of designation, or of recommendation, as little as the right of free election; for he was taught by experience that, although the faculties of universities may know the individuals best qualified to supply their vacant chairs, they are seldom or never" "lisposed to propose for appointment the worthiest within their knowledge." 1 Thesystem of patronage adopted at Göttingen was, in fact, identical with that which had already been instituted in the universities of the Netherlands by Douza (see infroc, p. 850). The unlversity of Erlangen, a Lutheran centre, was founded by Frederick, margrave of Baireuth. Its charter was granted by the emperor Charles VII., 21st February 1743, and the university was formally constituted, 4 th November. From its special guardian, Alexander, the last margrave of Ansbach, it was styled "Academia Alexandrina." In 1791, Ansbach and Baireuth having passed into the possession of Prussia, Erlangen became subject to the Prussian Government. The number of the stidents, which at the commencement of the century was under 300 , was 880 in 1887.

On comparison with the great English universities, the universities of Germany must be pronoinced inferior both in point of discipline and of moral control over the students. The "superiority of" the formel in these respects is partly to be attributed to the more systematic care which they took, from a very early date, for the superrision of each student; by requiring that within a certain specified time after his entry into the miversity he should be registered as a pupil of some master of arts," who was respoinsiblo for his conduct, and ropresented linn generally in his relations to the academic anthorities. Maiburg in its earliest statutes (those of 1529) endearoured to establish a similar rule, but without success. ${ }^{2}$ The development of the collegiato system at Oxford aud Cambridge materially assisted the: carrying out of this discipline. Althongh again, as in the German universities, feuds were not unfre'quent, especially those between" "north" and "south" (the natives" of the northern and sonthern counties), the fact that in elections to fellowships and scholarships only a'certain proportion were allored to be taken from either of these divisions acted as a considerable. check upon the possibility of any one college representing either element exclusively. In the German universities, on the other hand, the ancient division into nations, which died ont with the 15 th century, was revived under another form by the institution of national colleges, which largely served to foster the spirit of rivalry and contention. The demoralization induced by the Thirty. Years' War and the increase of duelling intensified these tendencies, which, together with the tyranny of the older over the jounger students, known as "Pennalismus," were evils against which the authorities contended, lut ineffectually, by various ordinances. The institution of "Burschenthum," having for its design the encouragement of good fellowship and social feeling irrespective of nationality, served only as a partial check upon these excesses, which again received fresh stimulus by the rival institution of "Landsmannschaften," or societies of the same nationality. The latter proved singularly provocative of duelling, while the arrogant and even tyranni-

[^326]cal demeanour of their members towards the unassociated students gave rise to a general combination of the latter for the purposes of self-defence and organized resistance. " At all the great German universities both theso forms of association are to be fornd existing at the present day.

The political storns which marked the close of the last Extineand the commencement of the present century gavo the tion of death-blow to not a few of the ancient universities of Ger- German many. Mainz and Cologne censed to exist in 1798 ; sitiesBamberg, Dillingen, and Duisberg in 1801; linteln and during Helmstält in 1809 ; Salzburg in 1810 ; Erfurt in 1816. 1798Altdorf was united to Erlangeu in 1807, Franktort-on- ${ }^{1814}$ the-Oder to Breslau in 1809, and Wittenberg to Halle in 1815. The university of Ingolstadt was finst moved in 1802 to Landbhut, and from thence in 1826 to Munich, Munich where it was united to the academy of sciences which was founded in the Bavarian capital in 1759. Of those of the above centres which altogether ceased to exist but fow, however, were much missed or regretted,-that at Mainz, which had numbered some six hundred students, being tho one notable exception. The others had for the most part fallen into a perfunctory and lifeless mode of teaching, and, with wasted or diminished revennes and declining numbers, bacl long ceased worthily to represent the functions of a university. Whaterer loss may have attended their sup: pression has been far more than compensated by the activity and influence of the three great German univer: sities which have risen in the present century. Munich has become a distinguished centre of study in all the faculties; and its numbers, allowing for the two great wars,' bave been contmonsly on the increase. The number of its professors in 1887 was over ninety, and that of its students at the commencement of the session 1886-87 3209.

The nuiversity of Berlin, known as the Royal Friedrich Berlm Wilhelm university; was founded in 1809, immediately after the peace of Tilsit, when Prussia had been reduced to the level of a third-rate power. Under the guiding influence of Wilhelm von Humboldt, however, the principles which were adopter in connexion with the new seat of learning not ouly raised it to a foremost place among the universities of Europe, but also largely conduced to the regeneration of Germany. A notable characteristic in the university of Berlin at the time of its foundation was its entire repndiation of attachment to any particular creed or school of thought, and professed sulservience only to the iuterests of science and learning. "Each of the eminent teachers with whonn the university began its life-F. A. Wolf, Fichte, Saivigny, Reil-represented only himself, the path of inquiry or the completed theory which he had himself propounded. Its subsequent growth was astonish. ing. In 1813 Berlin harl only 36 teachers altogether; ir 1860 thero were 173 in all, -97 professors, 66 privatdo. centen, and 7 lecturers." In 1886 there were 296 teachers and 5357 students; and among the former a large pro portion of the names are already of world-wide reputation' while its classical school stands unrivalled in Europe.
The university of Bonn, founded in 1818, and known bonn as the Rhenish Friedrich Wilhelm university, has 88 pro fessors and 1125 students. Equally distinguished as \& school of philosoplhy and a school of theology, it is notable for the manner in which it combines the opposed schools of theological doctrine, -that of the Evangclical (or Luth: eran) Church and that of the. Roman Catholic Church here standing side by sile, and both adorned by eminent names. This combination (which also exists at Tiibingen and at Breslau) has been attended with completo success and (according to Dr Döllinger) with unmistakable advant. ages. When tried, however, a generation before, at Erfurt and at Heidelberg, its failure was not less conspicuons: and Erfurt was ruined by the experiment.

Dr Conrad, professor of political science at Halle, has recently made the statistics relating to the German universities the subject of a careful investigation and analysis, which offer some interesting results. The total cost of the universities of the German empire is shown to be much smaller than the total revenues of the English universitics and colleges, although the number both of professors and studeuts is much larger; and although 42 per cent. of the total expenditure is upon establishınents, such as hospitals, museums, and so forth. But in Cermany 72 per cent. of the cost of the universities is defrayed by the state, the stodents paying, in the shape of fees, only $9 \cdot 3$ per cent. To a great extent, however, the Gernan univcrsities are to bo looked upon as professional schools, giving an education which directly fits a man to carn his bread as a clergyman, a lawyer, a judge, a physician, a schoolmaster, a chemist, an engineer, or an agriculturist. Notwithstanding the rapid growth in the numbers of the students, the growth of the professoriate has fully kept pace with it. In 1880 there were 1809 teachers at work in the German universities, more than half of whom (967) were full professors ("ordinarii"), -the proportion of teachers to students being 1 to 11. This is a much higher proportion than that of Oxford and Cambridge, although in them there is a large staff of college lecturers, which is practically more important than the university staff. It is higher again than the proportion of the Scottish unirersities, where there are only some 105 professors to between 5000 and 6000 students, a proportion of 1 to between 50 and 60 students. Tho increase in Germany has taken place partly by adding on fresh teachers for the old subjects, such as Latin and Greek, but still more by founding new chairs for new subjects, such as Oriental and Romance languages, goography, and archæology, and by subdividing departments Which have been recently developed, such as those connected with political economy, political science, physiology, and biology. Owing to the great development of natural acience, the faculty of philosophy has at some centres increased to such an extent ss to equal in numbers all the other faculties put together. This inconvenience has been
differently met at different universitics. In those of Switzerland, no further remedy has been devised than that of appointing separate syndicates or boards of management for the two main divisions, - the philosophico-historic and the mathematical and aatural-scientific ; at Dorpat, Tübingen, and Strasburg, on the other hand, these divisions have been represented by the formation of two distinct faculties; while Tübingen, Munich, and Würzburg have created, in addition, a third faculty under which are grouped the several snbjects of political economy, statistics, and finance.
The following table (taken from Conrad) exhibits the average of tho total number of matriculated studeats at the German uaiversities for every five years from 1831 to 1884 ; it brings the teadeney to form large centres very forcibly before the viow. The tbree largest ceatres-Berlin, Leipsic, Munich-even in the first quiaquennium appear as absorbing no less than 35 per ceat. of the etudeats, and in the last as many as 42 per cent. At the same time, there has Iately beea a no less notable increase among tho centres of accoud magnitude. A quarter of a century ago only two universitieg had more than a thonsand students; st present there ore nine.

The following table, taken from Ascherson's Deutseher Unirer. silits-Kalender, 1887, supplies the most recent statistics respecting both the teaching and the otudent bodics in the different faculties of the German-speaking universities on the Coutinent.

In 1878 a comparison of the numbers of the students in the different faculties in the Prussian universities with those for the year 1867 showed a remarkable diminution in the faculty of theology, amounting in Lutheran centres to more than one-half, and in Catholic centres to nearly three-fourths. In jurisprudence there was an increase of nearly two-fifths, in medicine a decline of a third, and in philosophy an increase of one-fourth. During the last few years, however, the faculties of theology have made some progress towards regaining their former numbers.

The universities of the United Provinces, like those of Protestant Germany, were founded by the state as schools for the maintenance of the principles of the Reformation and the education of the clergy, and afforded in the 16 th and 17 th centuries a grateful refuge to not a few of those Huguenot or Port-Royalist scholars whom persecution compelled to Hee beyond the boundaries of France, as well as to the Puritan clergy who were driven from England. The earliest, that of Leyden, founded in 1575 , commemorated the gallant and successful resistance of the citizens to the Spanish fleet under Requesens. Throughout the 17 th century Leyden was distinguished by its learning, the ability of its professors, and the shelter it afforded to the more liberal thought associated at tliat period with Arminianism. Much of its early success was orving to the wise provisions and the influence of the celebrated James Douza :- "Douza'sprinciples," says Hamilton, "were those which o'ight to regulate the practice of all academical patrons; and they were those of his successors. He kneiv that at the rate learning was seen prized by the state in the academy would it be valued by the nation at large.
. He knew that professors wronglt more even by example and influence than by teaching, that it was theirs to pitch high or low the standard of learning in a country, and that, as it proved easy or arduous to come up with them, they awoke either a restless endeavour after an even loftier attainment, or lulled into a self-satisfied conceit." Douza was, for Leyden and the Dutch, what Münchausen afterwards was for Göttingen and the German universities. "But with this difference: Leyden was the model on which the younger universities of the republic were constructed; Göttingen the model on which the older universities of the empire were reformed. Both Münchausen and Douza proposed a high ideal for the schools founded under their auspices ; and both, as first curators, laboured with paramount influence in realizing this ideal for the same long period of thirty-two years. Under their patronage Leyden and Göttingen took the highest place among the universities of Europe; and both have only lost their relative supremacy by the application in other seminaries of the same measures which had at first determined their superiority." The appointment of the professors at Leyden was vested in three (afterwards five) curators, one of whom was selected from the body of the nobles, while the other two were appointed by the states of the province, - the office being held for nine years, and eventually for life. With these was associated the mayor of Leyden for the time being. The university of Franeker was founded in 1585 on a somewhat less liberal basis than Leyden, the professors being required to declare their assent to the rule of faith embodied in the Heidelberg Catechism and the confession of the "Belgian Church." Its four facultics were those of theology, jurisprudence, roedicine, and "the three languages and the liberal arts." 1 For a period of twelve years (circ. 1610-1622) the reputation of the university was enhanced by the able teaching of William Ames ("Amesius"), as Puritan divine and moralist who liad been driven by Bancroft from Cambridge and fion Encland. His fame and ability are said to have
attracted to Franeker students from Hungary, Polaud, and Russia.

With like organization were founded-in 1600 the university of Harderwijk, in 1614 that of Groningen, and in 1634 that of Utrecht. The restoration of the House of Orange, and establishment of the kingdom of the Netherlands (23d March 1815), was followed by important changes in connexion with the whole kingdom. The universitics of Franeker and Harderwijk were suppressed, while their place was taken by the newly-founded centres at Ghent (1816) and Lićge (1816). A uciform constitud tion was given both to the Dutch and Belgian universities! It was also provided that there should be attached to each a board of curators, consisting of five persons, "distinguished by their love of literature nnd science and by their rank in saciety." These curators were to be nominated by the king, and at least three of them chosen from the province in which the university was situated, while the other two were to be chosen from adjacent provinces. After the redivision of the kingdom in 1831, Ghent and Liége were constituted state universities, and each received a subsidy from the Government (see Belgium). The university of Brussels, on the other hand, founded in 1834 , is an independent institution, supported by the liberal party; while the reconstituted university at Louvain represents the party of Roman Catholicism, and is almost exclusively a theological school for the education of the Catholic elergy. The universities of Belgiunı are, however, somewhat heterogeneous bodies, and present in their organization a singular combination of French and German institutions. In Holland, the foundation of the university of Amsterdam (1877) has more than repaired the loss of Franeker and Harderwijk, and the progress of this new centre during the ten years of its existence has been remarkably rapid, so that it bids fair to rival, if not to outstrip both Utrecht and Leyden. The higher education of women has made sume progress in the Netberlands; and in 1882-83 there were eighteen women studying at Amsterdam, eleven at Groningen, four at Leyden, and seven at Utrecht.

In Sweden the university of Lund, founded in 1668 and modelled ou the same plan as its predecessor at Upsala, has adhered to its antiquated constitution with remarkable tenacity. At both these universities the medirval division into "nations" is still in force among the students, the number at Upsala reiug no less than thirteen. The professoriate at both centres is much below the modern requirements in point of numbers. The university of Christiania in Norway, founded in 1811, and the Swedish universities are strongly Lutheran in character; and all alike are closely associated with the ecclesiastical institutions of the Scandinavian kingdoms. The same observa-' tion applies to Copenhagen,-where, however, the labours of Rask and Madvig have done much to sustain the reputation of the university for learning. The university of Kiel (1665), on the other hand, has come much more uraler Teutonic influences, and is now a distinguished cencre of scientific teaching.

In France the fortunes of academic learaing were even less happy than in Germany. The university of Paris was distracted, throughout the 17 th century, by theological dissensions, -in the first instance owing to the struggle that ensued after the Jesuits had effected a footing at the Collége de Clermont, and subsequently by the strife occasioned by the teaching of the Jansenists. Its studies, discipline, and numbers alike suffered. Towards the close of the century a certain revival took place, and a succession of illustrious names-Pourchot, Rollin, Grenan, Cotinn, Demontempuys, Crevier, Lebeau-appear on the roll of its teachers. But this improvement was soon interrupted by the controversies excited by the promulgation
of the bull Unigeaitus in 1713, condemnang the tenets of Quesnél, when Rollin himself, although a man of singularly pacife disposition, deened it his duty to bead the opposition to Clement XI. and tho French episcopate. At last, in 1762, the parlement of Paris issucd a decree (August 6) plaeing the collnges of the Jcuits at the disposal of the university, and this was immediately followed by another for the expulsion of the order from Paris. Coneurrently with this measure the prospects of the university assumed a more favourable character, the curriculum of its studies was extended, and botu history and natural science began to be cultivated with a eertain success. These better prospeets were, however, soon obsenred by the outbreak of the Revolution; and on the 15 th September 1793 the universities and colleges throughout France, together with the faeulties of theology, medicine, jurisprudence, and arts, wero abolished by a deeree of the Convention The Collíge de Franee, when restored in 1831, was reconstituted maiuly as a school of adult instructiou, for the most part of a porpular charater, and entirely dissociated from the miversity. It now numbers thirty-nine chairs, among which is one of the Slavonic languages and literature. The university of France (which succeeded to that of Paris) is at present little more than an aistract term, signifying the whole of the professional body under state control, and comprising various faculties at different centres-Paris, Moutpellier, Nancy, \&e., together with tirenty-seven aeademical reetorates. Each of these rectors presides over a local "conseil d'enseigueusent," in conjunction with which the eleets the professors of lycées and the communal seboolmasters, whose formal appointnient is then made by the minister of public instruction. There are ecelesiastics in some of the conseils d'enseignement, but the rectors are all iasmen who hare graduated in one of the faeulties. The grent schools bave also in no stnall measure supplewented the work of the universities by their advance in the direction of seientific instruction. Auong the munber the "Ecole Pratique des Hantes Etudes" in Paris (31st July, 1868) and the "Ecole Polytechuique," which traces its origin as far back as the year 1794, are esjecially distinguisled. The course of instruction at the former is divided into five sections-(1) mathematics, (2) physics and elemistry, (3) natural history and physiology, (4) history and philology, (5) economic science. At the latter the instruction is conceived solely with regard to the application of scientifie priuciples to all braneles of the public serviec, but more especially the military and mercantile. In 1875 the National Asserubly passed an Aet whieh enabled the Roman Catholic body to establish free universities of their own, and to confer degrees which should be of the same validity as those of the state university. At Lille and Angers such centres have been already organized. The unirersity of Strasburg, whieh in the latter part of the last century had been distinguished by an intellectual activity which becanlo associated with the nantes of Goethe, Herder. and others, was also swept a way by the lievolution. It was, however, restored lst Nlay 1872, after the eity had reverted to Germany, and was remodelled eutirely on German prineiples. Since then its suecess has been marked and continuous.

In Switzerlaud all the Ligher ellucation is supported mainly by the German and Protestant cantons. The four universities of Pasel, Eern, Zurieh, and Genera have an aggregate of some 1400 or 1500 students, and all pessess faculties of philosophy, jurisprudence, theology, and medicine. Basel is, howe er, the chief centre for theology, as is Bern for jurisprudence and Zurich for philosophy. At Genera the fanious academy of the 16th and 17th cenzaries, loug distingnished as a ceutre of Calviaistic teaching, is now represented by a university (first formed in 1876).
where the instructiou is gitcu (uainly in the Freach Language) by a staff of forty-ono professors, and where there ${ }^{\circ}$ is a rising school of science. Switzcrland alanost takes the lead in connexion with female entucation on the Continent, and in 1852-83 there were 52 romen at the miversity of Geneva, 36 at Bern, and of at Zarich.

In Spain the universities at present existing aro those of Barcelona, Granada, Madrid (transferred in 1837 from Alcala), Oriedo, Salamanca, Santiago, Seville, Vialencia, Valladolid. and Zaragoza. They are all, with the exception perhaps of Madrid, in a lanentably depressed condition, and mainly under the inflnence of French ideas aud arolelled on I'rench examples. But in Portugal, Coimbra, wheh narrowly escaped suppression in the 16 th century as a suspected centre of political disaffection, is now a flomrishing school. Its instruction is riven gratis; but, as all members of the higher courts of judicature and administration in the realn are required to have oraduated at the university, is is at the same timo ono of the most aristocratic schools in Europe. There are five faculties, viz., theology, jurisprudence, medicine, mathematies, aud philosoply. Of these, that of law is by far the most llourishing, the umber of students in this faculty nearly equalling the aggregate of all the rest. There is a valuable library, largely composed of collections formerly belouging to suppressed convents. As a school of theolory Coimbra is distinetly anti-ultramontane, and the progressive spinit of the university is shown by the fact that the rector has been instrueted by the government to deviso a scleme for the admission of women.

In Italy the universities are mmerically much in excess of the requirements of the population, there being no less than sixteen stato universities and four frce universities. Very few of these possess theological faculties, and in no country are theological studies less valued. Edneation for the charch is almost entirely given at the numerous "seminaries," where it is of an almost entirely elementary character. In 1875 a laudable effort was made by Bonghi, the minister of education, to introdnce reforms and to assimilate the universities in their organization and methods to the German type. His plans were, howel er, to a great extent reversed liy his successor, Coppino.

In Austria the universities, being modelled on the snme systein as that of Prussix, present no especially noteworthy features. Vienna is chiefly distinguished for its school of medicine, which enjoyed in the last century a reputation almost unrivalled in Europe. The other facnlties were, however, suffered to languish, and throughont the first half of the present century the whole uuiversity was in an extremely depressed state. From this condition it was in a great measure restored by the exertions of Count Thun. The number of the matriculated students in 1887 was $1<93$, and that of the professors 138 ; among the latter the natues of Zschokke, Mlaassca, Sickel, Jellinek, and Bi: linger are some of the nost widely knowu. The unirersity of Olmütz, founded in 1581 , was formerly in possession of what is now the imperial library, and containerl also a valunble collection of Slaronic works which mere carried off by the Swedes and ultimately disperser. It was suppressed ia 1853 , and is now represented ouly by a theological faculty. The university of Graz, the capital of Styria, was founded in 1586 , and is now one of the most flourishing centres, coataining some 1200 students. The university of Salzburg, founded in 1623, was suppressed in 1810 : that of Lemberg, founded in 1784 bs the emperer Joseple tI.. was removed in 1805 to Cracow and naited to that university. In 1816 it was opered on an iudependent basis. In the bombardunent of the town in 1848 the uoiversity buildings nere burnt down, and the site was changed to what was formerly a Jesuit convent. The fixe Library and natural history museum were at the same time
munest cntirely destroyed. The university at the present time numbers orcr a thounand students. The most recent foundation is that of Czernowitz, fornded in 1875, and numbering about 300 students. The universities of the Hungarian kingdom are three in number:-Budapest, priginally founded at Tyrnan in 1635, now possessing four faculties-theology, jurispridence, medicine, and philosophy (number of professors in 1885180 , students 3117 ): Kolozsvar (Klausenuarg), now the chief Magyar centre, founded in 1872 and also comprising fonr faculties, but where mathematics and natural science supply the place of theology (number of professors in 1877 64, students 391); Zagráb (Agrain), the Slovack university, in Croatia, fonniled in 1869 but not opened until 1874, with three faculties, viz., jurisprndence, theology, and philosophy. The chief centre of Protestaut education is the college at Debreczin, founded in 1531, which in past times was not unfrequently subsidized from England. It now numbers over 2000 students, and yossesses a fine library.

Russia possesses, besides Dorpat (supra, p. 845), seven other universities. (1) Helsingfors, in Finland, was originally established by Queen Christina in Abo (1640), and removed in 1826 to Helsingfors, where the original charter, signed by the celebrated Oxeustierna, is still preserved. It has four faculties, 38 professors, and 700 students. (2) Moscow is really the oldest Russian university, having been founded in 1755 ; it includes the faculties of history, physics, jurisprudence, and medicine; the professors are 69 in number, the students about 1660. (3) The university of St Vladinir at Kieff, originally founded at Vilna in 1803, was removed from thence to.Kieff in 1833; the students number alout 900 , and the library contains 107,000 volumes. ( 4 ) Kazan (1804) includes the same faculties as Moscow ; the students are about 450 in number, and it has a library containing 80,000 volumes. (5) Kharkoff (180t) numbers 600 students, and its library 55,000 volumes. (6) St Petersburg (1819) includes the four faculties of history, physics, jurisprudence, and Oriental languages, and numbers 1500 students. (7) Odessa, founded in 1865, represents the university of New Russia Generally syeaking, the nniversities of Russia are not frequented by the aristocratic classes; they are largely subsidized by the Government, and the annual fees payable by students are less than $£ 7$ a head. In 1863 the statutes of all the universities were renodelled; and since that time there has been a tendency to impress upon them a more national character, as distinguished from mere imitation of those in Germany.

The university of Athens (fonnded 22d May 1837) is modelled on the university systems of northern Germany, on a plan originally devised by Professor Brandis. It includes four faculties, viz., theology, jurisprudence, medicine, and philosophy. The professors (ordinary and extraordinary) are nuwards of 60 in number, the stadents about 1000. There is also a school of pharmacy, chemistry, and anatony, and a library of 130,000 volumeè, with 800 mannscripts.
The history of the two English universities during the 16th and following centuries has presented, for the most part, features which contrast strongly with these of the Continental seats of learring. Both suffered severely from confiscation of their lands and revennes doring the period of the Reformation, but otherwise hare generally enjoyed a remarkable immunity from the worst consequences of civil and political strife and actual waffare. Both long remained centres chiefly of theological teaching, but their intimate connexion at once with the state and with the Church of England, as "by law established," and the modifications introduced into their constitutions, prevented their becoming arenas of fierce polemical contentions like
thosc which distracted the l'rotestant uuiversities of Germany.

The influence of the Renaissance, and the teaching of Erasmus, who resided for some time at both universities, exercised a notable effect alike at Oxford and at Cambridge. The names of Colet, Grocyn, and Linacre illustrate this influence at the former centre; those of Bishop Fisher, Sir John Cheke, and Sir Thomas Smith at the latter. The labours of Erasmus at Cambridge, as the author of a new Latin yersion of the New Testament, with the design of placing in the hands of students a text free from the errors of the Vulgate, were productive of important effects, and the university became a centre of Reformation doctrine some years before the writings of Luther became known in England. The foundation of Christ's College (1505) and St John's College (1511), through the influence of Fisher with the countess of Richmond, also materially aided the general progress of learning at Cambridge. The Royal Injunctions of 1535, embodying the views and designs of Thomas Cromwell, mark the downfall of the old scholastic methods of study at both universities; and the foundation of Trinity College, Cambridge, in 1546 (partly by an analgamation of two older societies), represents the earliest conceution of such an institution in Englend in complete independence of Roman Catholic traditions. Trinity (1554) and St John's (1555) at Oxford, on the other hand, founded during the reactionary reign of Mary, serve rather as examples of a transitional period.

In the reign of Elizabeth Caınuridge became the centre of another great novement-that of the earlier Puritanism, St John's and Queens' being the strongholds of the party led by Cartwright, Walter Travers, and others. Whitaker, the eminent master of St Joln's, although he sympathized to some extent with these views, strove to keep their expression within limits compatible with conformity to the Church of England. But the movement continued to gather strength; and Emmanuel College, founded in 158t, owed much of its early prosperity to the fact that it was a known school of Puitan doctrine. Most of the Puritans objected to the discipline eniorced by the university and ordinary college statutes-especially the wearing of the cap and the surplice and the conferring of degrees in divinity. The Anglican party, headed by such men as Whitgift and Bancroft, resorted in defence to a repressive policy, of which subscription to the Acts of Supremacy and Uniformity, and the Elizabethan statutes of 1570 (investing the "caput" with larger powers, and thereby creating a more oligarchical form of government), were the most notable results. Oxford, although the Puritans were there headed by Leicester, the chancellor, devised at the same time a similar scheme, the rigid discipline of which was further developed in the Laudian or Caroline statutes of 1636 . It was under these respective codes-the Elizabethan statutes of 1570 and the Laudian statutes of 1636 -that the two universities were governed until the introduction of the new codes of 1858. During the Commonwealth the Puritan occupation and administration, at either university, were accompanied by little injury to the colleges, and were far less prejudicial to learning than the Royalist writers of the Restoration would lead us to suppose. William Dell, who was master of Caius College from 1649 to 1660 , advocated the formation of schools of higher instruction in the large towns, a proposal which was then looked upon as one of but faintly masked hostility to the older ceatres.

During the 17 th century Cambridge became the centre of another movement, a reflex of the influence of the Cartesian philosophy, which attracted for a time considerable attention. Its leaders, known as the Cambridge

Platonists, among whom Henry More, Cudworth, and Whicheote were especially conspicuous, were men of high character and great learning, although too much under -ie influence of an ill-restrained enthusiasu and purely specu!ative doctrines. The spread of the Baconian philosophy, and the example of a succession of eminent scientific thinkers, among whon were Isaac Barrow, master of Trinity (1673-i7), the two Lucasian professors, Isaac Newton (prof. 1669-1702) and his successor William Whiston (prof. 1702-11), and Roger Cotes (Plumian prof. :707-16), began to render the exact sclences more and more au object of study, and the institution of the tripos examinations in the course of the first half of the 18 th century established the reputation of Cambridge as a school of mathematical science. At Oxford, where no similar development took place, and where the statutable requirements with respect to study and exercises were suffered to fall into neglect, the de'generacy of the whole community as a sclool of academic culture is attested by eviderce too emphatic to le gainsaid. The moral tone at both universities was at this time singularly low; and the rise of Methodism, as associated with the names of the two Wesleys and Whitefield at Oxford and that of Berridge at Cambridge, operated with greater_effect upon the nation at large than on either of the two centres where it had its origin. With the advance of the present century, however, a perceptible change took place. The labours of Simeon at Cambridge, in connexion with the Erangelical party, and the far more celebrated movement known as Tractarianism, at Oxford, exercised considerable influence in developing a more thoughtful spirit at either university. At both centres, also, the range of studies was extended: written examinations took the place of the often merely formal viva roce ceremonies; at Cambridge elassies were raised in 1824 to the dignity of a new tripos. The number of the students at both universities was largely augmented. Further schemes of improvement were put forward and diseussed. And in 1850 it was decided by the Government to appoint commissioners to inquire what additional reforms might advantageously be introduced. Their recommendations were not all carried into effect, but the main results were as follows :-"The professoriate was considerably increased, reorganized, and reendowed, by means of contributions from colleges. The colleges were emancipated from their medirval statutes, were invested with new constitutions, and acquired new legis?ative powers. The fellowships were almost universally thrown open to merit, and the effect of this was not merely to provide ample rewards for the bighest academical attainments, but to place the governing power within colleges in the bands of able men, likely to promote further improvements. The number and value of scholarships was largely augmented, and many, though not all, of the restrictions upou them were abolished. The great mass of vexatious and obsolete oaths was swept away; and, though candidates for the M.A. degree and persons elected to fellorships were still required to make the old subseriptions and deelarations, it was enacted that no religious test should be imposed at matriculation or on taking a bachelor's degree." 1

In 1869 a statute was enacted at Cambridge admitting students as members of the university without making it imperative that they sbould be entered at any hall or college, but simply be resident either with their parents or in duly licensed lodgings.

The eutire abolition of tests followed next., After several rejections in parliament it was eveutually carried as a Government measure, and passed the House of Lords in 1871.
${ }^{1}$ Brōdrick, Universily of Uxford, pp. 136, 137.

In 1877 the reperts of two new commissions wers followed by further changes, the chief feętures of which were the diversion of a certain proportion of the revenues of the colleges to the uses of the university, especially with a view to the encouragement of studies in natural science; the enforcement of general and uniform regulations with respect to the salaries, selection, and duties of professors, lecturers, and examiners ; the abolition (with a few exceptions) of all clerical restrictions on beadships or fellow ships; and the limitation of fellowships to a uniform amount.

That these successive and fundamental changes have, on the whole, been is unison with the national wishes and requirements may fairly be inferred from the remarkable increase in numbers during the last quarter of a century, and especially at Cambridge, where the number of undergraduates, which in 1862 was 1526 , was in 1887 no less than 2979. In the academic year 1862-63 the number of matriculations was 448, and in 1886-87 1009.

Scarcely less influential, as a means of recovering for the two universities a truly national character, bas been the work which both have been carrying on and aiding by the institution of local examinations and of university extension lectures. Of these two schemes, the former was initiated by both Oxford and Cambridge in the year 1858; the latter had its.origin at Cambridge, baving been suggested by the success attending a course of lectures to women delivered by Mr (now Professor) James Stuart, in 1867, in Liverpool, Manchester, Sheffield, and Leeds. By the former the standard of education throughout the country has been raised, both in public and in private schools. By the latter, instruction of the character and method which characterize university teaching has been brought within the reach of students of all classes and ages throughout the land.

So long ago as the year 1640 an endearour had been made to bring about the foundation of a nortbern university for the benefit of the counties remote from Oxford and Cambridge. Nanchester and York both petitioned to be made the seat of the new centre. Cromwell - howeser, rejected both petitions, and decided in favour of Durbam, Here be founded the university of Durbarn (1657), endowing it with the sequestered revenues of the dean and chapter of the cathedral, and entitling the society " Tbe Mentor or Provost, Fellows, and Scholars of the College of Durbam, of the foundation of Oliver, de." This scheme was cancelled at the Restoration, and not revived until the present century; but on the 4th July 1832 a bill for the foundation of a university at Durban received the royal assent, the dean and chapter being thereby empowered to appropriate an estate at Soutl Shields for the establish. ment and maintenance of a university for the advancement of learning. The foundation was to be directly connected with the cathedral ehorch, the bishop of the diocese being appointed visitor, and the dean and chapter goverrurs; while the direct control was vested in a warden, a senate, and a convocation. A college, modelled on the plan rit those at the older universities, and designated University College, Durbam, was founded in 183i, Bislop Hatfield's Hall in 1846, and Bishop Cosin's Hall (which no longer exists) in 1851. The university includes all the facalties, and in 1865 there was added to the faculty of arts a school of physical science, including pure and applied mathematics, chemistry, geology, mining, engineering, dc. In 1871 the corporation of the university, in conjus :tion with some of the leading landed proprietors in the adjacent counties, gave further exteosion to this design by the foundation of a college of physical science at Newcestle-ipon-Tyne, designed to teach scientific priuciples in their application to engineering, mining, manufactures, and agriculture

Students who had passed the required examinations were made adinissible as associates in physical science of the university. There is also a medical college which stands in similar relations to Durlam, of which university Codrington College, Barbados, and Fourah Bay College, Sierra Lenne, are likewise affiliated colleges.
The university of London bad its origin in a movenínt initiated in the year 1895 by Thomas Canipbell, the poet, in conjunction with Henry (afterwards Lord) Brougham, Mr (afterwards Sir) Isaac Lyon Goldsmid, Joseph Hume; and some influential Dissenters, most of them connected with the congregation of Dr Cox of Hackney. The scheme was originally suggested by the fact that Dissenters were practically excluded from the older universities; but the conception, as it took shape, was distinetly non-theological. The first council, appointed December 1825, comprised names representative of nearly all the religious denominations, including (besides those above mentioned) Zachary Macaulay, George Grote, James Mill, William Tooke, Lord Dudley and Ward, Dr Oliiuthus Gregory, Lord Lansdowne, Lord John Russell, and the duke of Norfolk. On 11th February 1826 the deed of settlement was drawn up ; and in the course of the year seven acres, constituting the site of University Collegg, were purchased, the foundation stone of the new buildings beiug laid by the duke of Sussex 30th April 1827. The course of instruction was designed to include " languages, mathematics, physics, the mental and the moral sciences, together with the laws of England, history, and political economy, and the various branches of knowledge which are the objects of medical education." Iu October 1828 the college was opened as the nniversity of London. But in the neeantime a certain section of the supporters of the inovement, while satisfied as to the esscntial soundness of the primary design as a devclopment of national education, entertained considerable scruples as to the propriety of altogether dissociating such an institution from the national church. This feeling found expression in the foundation and incorporation of King's College (14tb August 1829), opened 8th October 1831, and designed to combine with the original plan instruction in "the doctrines and duties of Christianity, as the same ire inculcated by the United Church of England and Ireland." This new plase of the movement was so far successful that in 1836 it was deemed expedient to dissociate the university of London from University College as a "teaching body," and to limit its action simply to the institution of examinations and the conferring of degrees, -the collage itself receiving a new charter, and being thenceforth designated as University College, London, while the rival institution was also incorporated with the university, and was thenceforth known as King's College, London. In the charter now given to the uuiversity it was stated that the king "dcems it to be the duty of his royal ofice to hold forth to all classes and denominations of his faitlful subjects, without any distinction whatsoever, an encouragemeut for pursuing a regular and liberal course of education." The charters of the university of London and of University College, London, were signed on the same day, 28th November 1836. In 1869 both the colleges gave their adhesion to the movement for the higher education of women which had been initiated elsewhere, and in 1880 ladies were for the first time admitted to degrees.
The Victoria University took its origin in the institution known as the Owens College, Manchester, - so called after a wealthy citizen of that name to whom it owed its foundation. The college was founded 12th March 1851, for the purpose of affording to students who were unable, on the ground of expense, to resorb to Oxford or Cainbridge an aducation of an equally high class with that given at thlose
centres. The institution was, from the first, unsectarian in character. In July 1877 a memorial was presented to the privy council.praying for the grant of a charter to the college, conferring on it the rank of a university, to be called the "university of Manchester." The localization implied in this title having met with opposition from the Yorkshire College at Leeds, it was resolved that the university should be called the "Victoria University." Under this name the foundation received its charter 20th April 1880. "The characteristic features of the Victoria Umiversity, as compared with other British universities, are these:--(a) it does not, like London, confer its degrees on candidates who bave passed certain examinations only, but it also requires attendance on prescribed courses of academic study in a college of the university; (b) the constitution of the university contemplates its (ultimately.) becoming a federation of colleges; but these colleges will not be sitnated, like those of Oxford and Cambridge, in one town, but wherever a college of adequate efficiency and stability shall have arisen. University College, Liverpool, and the Yorkshire College, Leeds, Laving fulfilled these requirements, havo become affiliated with the university. The university, like the older bodies in England and Scotland, is at once a teaching and an examining body, and there is an intimate rapport between the teaching and the examining functions. To give it a general or national character, the governing body consists partly of persons nominated by the crown and partly of representatives of the governing and teaching bodies of the colleges and of the graduates of the university. External examiners are appointed, who conduct the examinations in conjunction with examiners representing the teaching body. The graduates of the mniversity meet its teachers in convocation to discuss the affairs of the university. Convocation will elect future chancellors, and a certain number of representatives on the court" (Thompson, The Owens College, \&c., p. 548). Like the Johns Hopkins University in America, the Victoria University Las instituted certain fellowships (styled the Berkeley fellowships) for the encouragement of research.

In Scotland the chief change to be noted in connexion with the university of St Andrews is the appropriation in 1572 of the two colleges of St Salrator and St Leonard to the faculty of philosophy, and that of St Mary to theology. In 1747 an Act of Parliament was obtained for the union of the two former colleges into one. Glasgow, in the year 1577, received a new charter, and its históry from that date down to the Restoration was one of almost, continuous progress. The restoration of Episcopacy, however, in volved the alienation of a considerable portion of its revenues, and the consequent suspension of several of its chairs. In 1864 the old university buildings were sold, and, a Government grant baving been obtained, together with private subscriptions, the present new buildings were erected from the joint fund. The faculties now recognized at Glasgow are those of arts, theology, jurisprudence, and medicine. At Aberdeen an amalgamation, similar to that at St Andrews, took place, by virtue of the Universities Act of 1858, of the two universities of King's College an 4 Marischal College. In conjunction with Glasgow, this unif versity returns a member to parliament. The peculiar constitution of the college at Edinburgh, as defined by its charter (the government being vested entirely in the lord provost, magistrates, and council, as patrons and guardians), involved the senate in frequent collisions with the town council. The latter, being a strictly representative body, included elements with which the senate of the university sometimes found it difficult to work harmoniously, and its disposition to dictate was strongly resented by the dis: tinguished metaphysician and professor Sir William Hamilton. On the other hand, the council sometimes
exercised a beneficial discretion by appointing professors of ability whom the semate might have regarded as ineligible on the ground of their religious tenets. Tho Disruption of $\mathrm{J} \delta 43$ emancipated the lay professors from subscription to the Established Church of Scotland, and resulted in many of the important changes which were subsequently introducel in the Universities Act of 1858 . On the 2 Sth October 12.59 the town council, notmithstanding that their powers were already terminated by the provisions of the Act. availed themselves of a technical right to appoint a principal. - their choice falling upon Sir David Brewster. The creat landmark in the listory of the Scottish as in that of the English universitice is represented by the remodelling of the several constitutions of these bodies in the year 185 S . The commissiouers of $185 \mathrm{~S}-62$ left the university of Edinburgh in the possession of constitutional autonomy, with its studies and degrees regulated Ly ordinances. The students also received the rectorial franchise, hut were uot, as at Glasgow aod Aberdeen, divided into nations. In arts the B.A. degree was abolished, the M. A representing the only degree in this faculty, as at the other Scottish noirersities. The course of study was divided into three departments :-(1) classics; (2) mathematics, includiog catural philosophy; (3) mental science and English literature. In each dejartinent it was required that there should be an additional examiner besides the professor, 8 that the candidates should not be entirely examined by their own teachers. It was also provided that, instead ef one examination for the degree at the end of a student's course, examinations in each of the departments might be passed separately. In the twenty years begiuning with 1863 , 1400 M.A. degrees have Leen conferred, as against 250 in the trenty years preceding. In the faculty of medicine, the origiual single degree of doctor of medicine gave place to three classes-bachelor of medicine (M.B.), master in surgery (C.M.), and doctor of medicine (M.D.). In 1866 it was further laid down that theses should no longer bo demanded from candidates for the lower degrees of $\overline{\mathrm{I}}$.B. and C.Mi., and, on the other band, that the degree of II.D. should not be conferred on persons not showing any evidence of medical study after leaving the university, but that a thesis should be intariably required. Since the enactment of these ordinances the cumber of the mucdical students has increased from about 500 to orer 1700 . In the faculty of law the title of the degree was to be LL. B., and it was to be conferred only on those tho had already graduated as M.A. But the minor degree, that of "bachelor of law" (B.L.), might be conferred if the candidate had attended one course of lectures in the faculty of arts, and passed a preliminary examination in (1) Latio, (2) Greek, French or German, and (3) any two of the three subjects-logic, moral philosophy, and mathematics. The chair of public law, which had fallen into abeyance in 1832 , was reconstitnted, and the chair of universal civil bistory was converted into a professorship of history and constitutional law. The degree of doctor of laws was left, as before, a purely honorary degree. Clairs of Sanskrit, engineering, geology, commercial and political cconomy, education, fine art, and the Celtic languages have also bcen founded. Dy the Representation of the People (Scotland) Act, 1868, the unisersities of Edinburgh and St Andrews were enupowered to retura jointly a meniber to the House of Commons.

A parliamentary return for the tea years ending 30th March 1883 showed that the sums roted annually by parliament or chargeable on the consolidated fund to the four unirersities had amounted during that period to $£ 65,821$ for Aberdeen, $£ 85.906$ for Edinburgh, $£ 66,182$ for Glasgorr, and £3S,111 for St Andrews. In addition to these sums Edinburgh had received $£ 80,000$ and Glasgow $\dot{£} 20,000$ in the form of arecial grants in aid

Trinity College. Dublin, was founded in 1591, under the auspice of Sir Joln Purrot, the Irrsh vicerny. A royal charter nominated a prorost and a umnimurs ni mber of three fellows and three scholars as a lody corporate, empowered to estailish amone themselves "whatever luwa of cither of the universities of Catalridse or Oxford they nay judge to loo apt and suitable ; aud especially that no other persons shonld teach or profcss the liberal arts in Ireland withont the queen's sluecial licence." The first fise provosts of 'Crinity College were all Canbridge men, and under the inflnewce of Archbishop Loftue, the first provost, and his successors, the fonndation recerved a stroncly Puritan bias. Prior to the year 1573 the provostshil, fellowships, and foundation ocholar=hipa could be beld only by nembers of the rhurel of Ireland; but all such restrictions were abolisbed by Act 36 Vict. c. 21, whereby the requirenient of sub:cription to any article or formulary of faith was finally abrogated. As at present constituted, the ordinary govermment is in the lands of the prorost and senior fellows in conjunction with the visitors and council,-the supreme authority being the crown, except so far as limited ly Act of Parliament.

The first departure in Ireland frou the exclusive systim of education iormerly representell by the foundation at Dublin, dates from the creation of the Qucen's U'niversity, incorporated by royal charter 3il Septomber 1850. By this charter the general legislation of the university, togetber with its government and administration, was vested in the university senate. In $186 \pm$ the charter of 1850 was superseded by a supplementary charter, and the unirersity reconstituted "in order to render more complete and satisfactory the courses of education to be followed by students in the colleges "; and finally, in 1880, by virtue of the Act of Parliament known as the Cniversity Education (Ireland) Act, 1579, the Queen's Caiversity gave Jlace to the Royal University of Ireland, which was practically a reconstitution of the former foundation, the dissolution of the Queen's U'aiversity being decreed so soon as the newly constituted body should be in a position to confer degrees; at the same time all graduates of the Qucen's University were recognized as graduates of the new university with corresyonding degrees, and all matriculated students of the former as catitled to the same status in the latter. The university confers degrees in arts (B.A., D.A., D.Litt.), science, engineering, music, medicine, surgery, obstetrics, and law. The preliminary pass examinations in arts are held at annually selected centres, -those chosen in 1885 being Dublin, Belfast, Carlow, Cork, Galway, Limerick, and Londonderry. All bonour examinations and all examinations in other faculfies are held in Dublin. The Queen's Colleges at Belfast, Cork, and Galway were founded in December 1845 , under an Act of Parliament "to enable Her Majesty to endow new colleges for the advancement of learning in Ireland," and were subsequently incorporated as colleges of the university. Their professors were at the same time constituted professors in the university, and conducted the exanioations. But in the reconstruction of 1880 the chief share in the condnct of the examinatious and adrising the senate with resrec: to theus was vested in a board of fellows, clectod $b_{j}$ the senate in equal anmbers from the non-denuminational calleges and the purely Catholic institutions. The colleges retain, I owever. their independence, being in no way subject to the control of the university senate except in the regulati ns with respect to the requirements for degrees and ctber academic distinctions. On the other band, the obhigation formerly imposed of a preliminary course of study at one or other of the colleges before admission to degrees was abolished at the foundation of the lioyal Ciniversity, the exaninations being now open, like those of the universit?
of London, to all matriculated students on payment of certain fees.
There is at present no university of Wales, although the bestowal of a royal charter before long is confidently anticipated. The oldest college, that of St David's at Lampeter, possesses the right of conferring degrees. It was founded in 1822 for the purpose of educating clergy men in the principles of the Established Church of England and Wales, mainly for the supply of the Welsh dioceses. The number of the professors in 1887 was 8 , and the number of the students 120 . The next college in order of foundation is Aberystwith. It was founded 9th October 1872, but possesses no charter, and is mainly supported by the Dissenting bodies. The staff of professors numbers 13, and the students number 150. The University College of South Wales and Monmouthshire at Cardiff was founded in 1883. The number of professors in 1887 was 9, lecturers 4, demonstrators 2 ; number of students 140. The University College of North Wales at Bangor received its charter 4th June 1885, its object being to "provide instruction in all the branches of a. liberal education except theology." Its staff consists of a principal, 8 professors or lecturers, and 2 demonstrators; the number of the students is 127 . There is also a hall of residence for women students. At each of these three last-named colleges students proceeding to degrees have to go through either a London, Edinburgh, Glasgow, or Dublin course of study, but at Edinhurgh, Glasgow, and Dublin a certain proportion of the term of residence ordinarilv reouired is remitted in thelr favour.

In India, the three older universities all date from 1857, -that of Calcutta haviug been incorporated Jenuary 24, Bombay July 18, Madras September 5, in that year. At these three universities the instruction is mainly in English. "A university in India is a body for examiniag caadidatee for degrees, and for confarring degrees. It has the power of prescribing text-books, etandards of instruction, and rules of procedure, but is not on institution for teaching. Its goveraance and management ero vested in a body of fellows, 60 me of whom are ex officio, being the chief European functionaries of the state. The romainder are appointed by the Government, being generally chosen as representative men in respect of eminent learoing, aciontific attainment, official position, oocial status, or personal worth. Being a mixed body of Europeans and netives, they thus comprise all that is best and wisest in that division of the empire to which the university belongs, and fairly represent most of the phases of thonght and philosophic tendencies observable in the conatry. The fellows in their corporate capacity form the senate. The affairs of the university are conducted by the syodicate, consisting of a limited number of members elected from among the fellows. The faculties comprise arts and philosoply, law, mediciae, and civil engiacering. A degree in natural and physical science has more recently been added" (Sir R. Temple, India ins 1880, p. 145). The Punjab university was incorporated in 1883, -the Puajab University College, prior to that date, having conferred titles only and not degrees. The main object of this university is the encouragement of the stndy of the Oriental languages and literature, and the rendering accessible to native students the results of European acientific teaching through the medium of their own vernacular. The Oriental faculty is here the oldest, and the degree of B.O.L. (bacheler of Oriental literature) is given as the cesult of its examinatione. At the Oriental College the instruction is given wholly in the native languages. In 1887 the senate at Cambridge (mainly on the represeatations of Mr C. P. Ilbert, formerly vice-chanceller of the university of Calcutts) adopted resolutions whareby some forty-nine collegiate institntione already affliated to the latter body were affiliated to the naivorsity of Cambridge, their stadents this becoming entitled to the remission of one year in the ordinary statutable requirements with respect to residence at Cambridge. It is at these inotitutions, and the colleges of the first or aecond grade in the other presidencies, that the instruction is given.
In Australia, the nnivereity of Sydney was incorporated by an Act of the colonial legislature which received the royal assent 9 th December 1851, and on 27 th February 1858 a royal charter was granted conferring on graduates of the univeraity the same rank, style, and precedence as are enjoyed by graduates of universities within the United Kingdom. Sydney ie also one of theinstitutions associnted with the university of London from which certificates of having received a due conrse of instruction may he received with
a riew to admission to degrees. There are four facnlties, viz. arts, law, medicine, and acionce. The design of the university is to supply the nzeans of a liberal education to all orders and denomina. tions, withont any distinction wheterer. An Act for the purnose of facilitating the erection of colleges in connexion with different religious bodies was, however, passed by the legislature during the session of 1884, and since that time colleges representiag the Episcopalian, Presbyterian, and Roman Catholic Churches liave been founded. In 1885 the total number of students attencling lectures in the university was 206. The university of DIelbourne, in the colony of Victoria, was incorporstell and endowed by royal Aet 22d Jenuary 1853. This Act was ameaded 7th June 1881. Here also no religious tests are imposed on admission to any degree or election to say office. The council is empowered, after due examination, to coafer degrees in all the faculties (excenting divinity) which can be conferred in any miversity within the British dominions. It is alse autherized to affliate colleges; and Trinity College (Church of England) was accordingly founded in 1870 and Ornood College (Presbyterian) in 1879. The founding of a nniversity for Queensland is at the present time in contemplation. The university of Adelaide in South Australia (founded mainly by the exertions and munificence of Sir Walter Watson Hughes) was incornerated by an Act of the colonial legislature in 1874, in which year it was further endowed by Sir Thomas Elder. In 1881 letters patent were granted by the English crown whereby degrees conferred by the university were conatituted of equal validity with those of any university of the United Kingdom. The faculties in the university are these of arts, medicine, law, science, and music. The number of matriculations siace the foundation amounted in 1886 to 284, the number of undergraduates in that year being 90 .
The university of New Zealand, fonnded in 1870, and reconstituted io 1874 and 1875 , is empowered by royal charter to grant the several degrees of bachelor and master of arts, aud bachelor and docter in law, medicine, and music. Wromen are admitted to degrees. To this the Auckland University College, Nelson College, Canterbury College, and the university of Otago atand in the relation of affiliated institutions. This last-named institution wes founded in 1869 by an order of the previncial council, with the power of conferring degrees in arts, medicine, and law, and received es an endowment 100,000 acres of pastoral land. It was opened in 1871 with a staff of three professora, all in the faculty of arts. In 1872 the provincial conncil further oubsidized it by a grant of a eecond 100,000 acres of land, and the university was now enabled to make considerable additions to the ataff of professers and lecturers, to establish a lectureship in law, and to lay the foundations of a medical school. In I874 an agreement was made between the naiversity of New Zealand nad that of Otago, whereby the functione of the former were restricted to the examiantion of cendidates for matriculation, for schelarships, and for degrece; while the latter bound itself to become affiliated to the university of New Zealand, to hold in abeyance its power of grantiug degreee, and to waive the claim which it had advanced to a royal charter. As the result of this arrangement, the nniversity of Otago became possessed of 10,000 acres of land which liad been aet apart for naiversity purposes in the former province of Southland. In 1877 a school of mines was established in connexion with the university.

In Canada the M'Gill College and University at Montreal wes founded by royel charter in 1821 (amended in 1852) on the founde. tion of the Honourable James M'Gill, who died at Montreal 19th Decomber 1813. A number of colleges and achools throughout the prevince stand in the relation of affiliated institutions. The uaiversity is Protestant but undenominational. It includes the faculties of arts, applied sciences, medicine, and law. In 1885 the tetal number of etudente, iacluding women, was 526 . The university of Toronto was originally established by royal charter in 182\%, under the title of King' $\theta$ College, with certain religious restrictions, resembling those at that time in force at the English nniversities, but in 1834 these restrictions were abolislied, and in 1849 the designation of the university was changed into that of the university of Toronto. In 1873 further amendments were made in the constitution of the university. The chancellor was made elective for a period of three years by cebvecation, which was at the same time reorganized so as to include all gradnates in law, medicine, and surgery, all masters of arts, and bachelors of arts of three years standing, all doctor's of acience, and bachelors of ecience of three years standing. The pewers of the senate were also extended to all branches of literature, ecience, and the arts, to granting certificates of proficiency to women, and to affiliating colleges. The work of instruction is performed by University College, which is maintained out of the endowment of the provincial university, and governed by a council compesed of the residente and the professore. Its several chairs include classical literature, logic and rhetoric, mathematics and natural philoophy, chemistry and experimental philosophy, history and English literature, mineralogy and geology, metaphysics and ethics, meteorology and natural history, and lectureshipe on Oriental literature, German. and French. Other niversities and collegee with power to confer
degrees are the Victoria University at Cobourg (1830), supported by the Methodist Church of Cenada; Queen's University, Kingston (1841), representing tho Presbyterian body; and the university of Trinity College, Toronto, founded in 1851 on the suppression of the faculty of divinity in King's College. Lennoxville is a centre for university instruction in conformity with Church of England principles.
In Africa, an Act for the incorporation of the university of the Cape of Good Hope received the royal assent 26th June 1873, the council being empowered to grant degrees in arts, law, and medicine.

In the United States of America university education has received a great extension, without, however, exercising in Europe that reflex influence discernible in so many other relations. The report of the commissioners of education for 1883-84 gives a list of no less than 370 degree-giving universities or colleges ; but of these a large proportion are sectarian, others represent only a single faculty, and nearly nine-tenths have been fourded within the last thirtyfive years. - Although a higher education has unquestionably been thus very widely diffused, the undue multiplication of centres has, in some provinces, lowered the standard of attainment and led to a consequent depreciation in tho value of university degrees. This tendency it was sought to counteract in the State of Ohio, some twenty-fire years ago, by an organization of the different colleges. The instruction given is, in most cases, almost gratuitous, the charge to each student being less than 30 dollars a year. This cheapening of a bigher education is not, howerer, attended with quite the same results as in Germany (where lads with little aptitude ior a professional carcer are thus attracted to the professions), the rapidly increasing population and the wider scope for mechanical or agricultural pursuits probably exercising a beneficial counteracting influence. The distinguishing cbaracteristics which belong to these numerous centres are described by the president of the Johns Hopkins University, $\quad$. an address delivered at Harvard in 1886, as sugges ${ }^{\text {t }}$ - of four different classes of colleges, -(1) those which 1 ...eed from the original historic colleges, (2) those established in the name of the State, (3) those avowedly ecclesiastical, (4) those founded
by private benefactions. To the first class belong Harvard College and Yale College with their offshoots. Of these two, the former was founded in 1638 at Cambridge, Massachusetts, by a former fellow of Emmanuel College at Cambridge in England, and represented the Puritan tenets for which the parent society was at that time noted ; the latter was founded in 1701. by the combined action of a few of the ministers of the State, a charter being given in the same year by the colonial legislature. It was for a long time chiefly supported by the Congregationalists, but is now unsectarian. The total number of students at Harvard in 1882 was 988 , at Yale 692. The university of Pennsylvania was founded in 1751 by Thomas Penn and Richard Penn, on the lines of a scheme drawn up by Benjamin Franklin, and was from the first placed on a basis comprising all denominations. It is distinguished by the liberality with which it has opened its courses of instruction to the inhabitants of the city generally; the degree of Ph.D. is conferred on all comers after due examina. tion. At Harerford and Lafayette Colleges, and also at the Lehigh university, "advanced degrees" are offered "only for higher study, prolonged beyond the collegiate course," instead of being conferred as a matter.of routine after a certain term of years. The Johns Hopkins University, also an unsectarian body, was founded at Baltimore in 1867, and is already a school of established reputation, and especially resorted to by those designing to follow the profession of teachers. It is also distinguished by the possession of fellowships, to be beld only by students intending to pursue some especial line of original research. Other steadily growing centres are Columbia College in New York, founded in 1754 ; the Cornell University, also unsectarian, recently enriched by the acquisition of a considerable endowment ; Brown's University in Providence; and those of Princeton, Michigan, Virginia, and California. At A unherst College, where the number of students in 1882 was 339, the experiment has recently been made of partially dispensing with examinations during the course of

atudy, where the students give evidence of having made satisfactory progress. Considerable modifications hare also taken place in the courses of studj, aearly all the colleges having now adopted the system of "parallel courses," and the principle of selection between these. Female education has received in America an extension which it has attained in no other country, and one of the colleges (that of Wellesley) numbers several hundred students. Since the war of 1861 a greatly increased attention bas been giren throughout the universities to physical training and athletic exercises, aud excellent gymnasia, constructed on German models, hava been erected.

The accompanying table (p. 857), prepared by the council of education for the year 1853-84, shows the distribution of these centres in the different States, together with their numbers, revenues, libraries, and the estimated value of their endowments.

UNTERWALDEN is one of the Forest cantons of Switzerland, ranking as sisth in the Confederation. It is composed of two valleys throngh which run two streams both called the Aa, and which are called Obwald and Nidwald from their position with regard to the great forest of the Kernwald in which they are situated. In old documents the inhabitants are always described as "homines intramontani," whether "rallis superioris" (Obwald) or "vallis inferioris" (Nidwald). The total area of Obwald is 183.3 square miles, 154.2 of which are classed as productive (forests 37.6 ), while of the remainder 3.8 are covered by glaciers and 4.3 by lakes. The area ci Nidwald is $112 \cdot 1$ square miles, $84 \cdot 1$ being productive (forests 27.7 ); of the rest the cantonal bit of the Lake of Lucerne covers 12.8 . The bighest point in the canton is the Titlis ( 10,627 feet) in Obwald.

The census of 1880 returned the population of Obwald as 15,356 , an increase of 941 on 1870 , and that of Nidmald as 11,992, an increase of 291. In both the Fomen bave a small majority over the men. The native tongue of practically the whole population is German (15,254 in Obwald, 11,869 in Nidwald), and they are nearly all Roman Catholics (15,078 in Obwald, 11,901 in

Nidwald). Till 1814 the cauton was in the diocese of Constance ; since that time it has (like Uri) formed legally part of no diocese, though it is provisionally administered by the bishop of Chur. The capital of Olwald is Sarnen (4039 inhabitants), Kerns (2500) being the ouly other place which is more than a village; that of Nidivald is Stanz (2210). The population is purely agricultural and pastoral. In Obwald the forests are remarkable, in Nidwald the fiery energy of the inhabitants. In educational matters the standard is not rery bigh, but is being gradually raised. At the head of the Nidwald valley (but legally in Obwald) stands the great Benedictine momastery of Engelberg, founded in 1121. There are no ruilmay:, but one is being made fron Lucerne throngh Obwald orer the Brinig Pass to Meyringen in Dera.
Kistorically Obwalu was part of the Aargau, and Nidwald of the Ziirichgau. In both there were many great landowners (specially the abibey of Murbach and the Hapsburgs) and few free men; while the fact that the Hapsburgs were counts of the Aargau and the Zirichgau further delayed the development of political freedom. Both took part in tho risings of 1245-47, and in 1248 Sarnen was threatened by tho pope with excommunication for opposing its hereditary lord, the count of Hapsburg. The alleged cruelties committed by the Hapsburgs do not, bowever, appear in histuly till

Justinger's Chronicle, 1420 (sce Tell). On April 16, 1291, Ruliolph the futurc emperor bought from Marbach all ito estates in Uaterwalden and thus miled this district as the chief landowner, as count, and as emperor. On 1st Angust 1291 Nilmald formed the "Everlasting League" with Uri and Schwyz (this being the first known cald in which its common seal is used), Obwahl joining a little later on. In 1304 tho two valleys were joined together under the same imperial bailiff, and in 1309 Henry VII. confirmed to them sll the libertiee granted by his predecessor-thongh nono are known to have been granted. However, this phaced Unterwahlen on an enual political footing with Uri aud Schwyz; and as such it took part in Morgaten fight (also driving back an invasion over the Lrrinig Pass) and in the renewal of the Everlasting League at Brumuen (1315), as well as at Sempach (1386), and in driving hack the Gngler or English freebooters (1375). For physical reasons, it wis diffienlt for Unterwalden to enlarge its territories. Yet in 1383 it acq: ; vel Alpmach, and in 1378 llergisuyl. So too Ohwald shared siuk Uri in the conquest of the Val Leventina (1103), add in the purchase of Bellinzona ( $1+19$ ), se well as in the loss of both (1426). It was Nilwald that, with Schrryz and Uri, finally won ( 1500 ) and ruled (till 1798) Belliuzona, hiviera, and Val blegno; white toth shared in conquests of Aargan (1415), Thurgmu (1460), anil Locarno, sic. (1512), and in the temprary ocenpation of the Val d'Ossola (1410-14 to 1417-22). In the Burgundian war Unterwallen, like the other Forest cantons, long hung back through jealousy of Bern, but came to the rescne in time of need. In 1481 it wias at Stanz that the Confclerates nearly broke up the League for rarious reasons, and it was only by the intervention then of the holy hermit Nicholas yon der Flie (of Sachscin in Obwaid) that pance ras restord, and the great federal ggreement known as the compact of Stanz conclnded. Like the other Forest cautone, Cnterwalden clnng to the old faith at the time of the Reformation, being a member of the "Christliche VereiDigung" (1529) and of the Gollen League (15s6).
In 1798 Unterwalden resisted the Helvetic repulilic, but, having formed part of the short-lived Tellgau, became a district of tho canton of tho Waidstatten. Obmald susmitted at an early date, bat Nidmald, refusing to accept the oath of fidelity to the constitution mainly on religious grounds, rose in desperate revolt (Soptember 1795), and was only put down by the arrival of 15,000 armed men and by the storming of Stanz. In 1803 its indenendence as a canton was restored, but in 1815 Nilmaid refused to acecpt the ners constitution, and federal troops had to bo employed to put down its resistance, tho prnishment inflicted being tho transfer to Obwald of the juristiction over the abbey lanis of Engelberg (since 1421 " protected" by both ralleys), which in 1798 has fallen to the lot of Nidrald. Since that time the history of Unterwalden has been like that of the other Forest cantons. It was a member of the "League of Sarcen " (1832), to oppose the reforming wishee of other cantons, and of the "Sonderbund" (1843); it was defeated in the war of 1847 ; sucl it voted against the acceptance of the federal constitutiou both in 1848 and in 1874 . It forms at present two half cantons, esch sending one representative to the federal "assembly of states." In local mattere tho tro valleys aro independent. In each the supreme authority is the "landsgemeinde" (mecting on the lest Sunday in April), composed of all male citizens of twenty (Obwald) or eighteen (Nidwald) years of age, while the cantonal council, which drafts measures and eanctions the expenditure of sums below certain fixed small amounts, is composed in Obrall of 80 members (including the execntive courcil) elected by the people for 4 years, and in Nid rald of 48 (besides the executive council) chosen in the same tray for 6 years. Tho executive council is in both coses electat by the "landsgemeinde"; in Obwald it consists of 3 olficiais and 4 ordinary members, and in Nidwald of 0 otticials and $\overline{0}$ orlinary members, -the official members being chosen every year, thie ordinary crery 4 or 3 years respectively. The existing constitution of Ohwald is that of 1867 ; that of Nidwald is dated 1850 , sud was amended in 1877-78.
It is very remarkable that in both rallers the ohl "eommon lands " are still in the hands of the oll guilds, and "gemeinlen" sonsist of natives, not merely residents, though in Obwald these oontribute to the expenses of the mew "prolitical communes" of residents, while in Nilwald the latter have to raise special taxes. In Engelberg (which still retains some indepeadence) the poor aro greatly favoured in the division of the common lamels aad their procceds, and unmarried persons (or widowers and widows) reccive only half the share of those tho are married.
See J. Businger, Die Geschichuen des Foltes rons Cubrriatien, 2 vols, $1927-23$.
UNYORO, a kingdom of Central Africa, boundel on the N. and E. by the Nile, on the W. by the Albert Nyanza, and on the S.E. by the kingdom of Uganda. Its area is about 1600 square miles. The country is very fertile, well-watered, and thickly wooded; for the most part it is hilly in character, especially on the borders of the Albert Lake and in the neighbourhood of Massindiaud

Kiroto, where the mountains have an altitude of from 5000 to 6000 fect. The population is abont $1,500,000$. The Wanyoro are of a dark reddish-brown colour, and aro fully clothed, but are not so fine in physique, nor so bigh in intellectual development as their neighbours the Waganda, to whom, however, they appear to bo very nearly related. The reigning family in Unyoro belongs to the Wahuma tribe, and is probably the oldest reigning Wahuma family in this jart of Africa. The country is governed on the feudal system. Numerous tribes to the cast and north of the Nilc, and also on the western side of the Albert Nyanza, jay a spall tribute to the Wanyoro. The latter possess large herds of cattle, and are very good herdsmen. The land, too, is cultivated to a considerable extent,-bananas, sweet potatoes, and dhurra being grown in large quantities. Coffee and tobacco aro cultivated to a small extent. The people are very superstitions, and the numerous medicine men and women reap a rich harvest from their credulity. The TYanyoro huts are dome-shaped, small, and extremely filthy and full of vermin, although the people theinselves are cleanly. Polygamy is universal, even the poorest man possessing two or three wives. Not withstanding this, the people are fairly moral; but U'ayoro is remarkable amongst Central African tribes for the existcnce of a definite class of courtesans. The Tranyoro are moderately skilful workmen, and their iron-work, pottery, and wood-work are both neat and tasteful. The only article they export is salt, which is obtained in considerable quantities at Kibiro on the shores of Lake Albert.

UPANISIIADS. Sco SAxskrit, vol. xxi. p. 280, and Brahmantsm.

UPAS, a Javanese word meaning poison, and specially applied by the Malays and people of western Java to the poison derived from the gum of the anchar tree (Antiaris toxicariat, , one of the Artocarpeex, which was commonly used in Cclebes to envenom the bamboo darts of the natires. The name of the ujas tree las beeome famous from the mendacions account (professedly by ono Foerseh, who was a surgeon at Samarang in 1773) published in the London Mayazine, December 1783, and popularized by Erasmus Darwin in "Loves of the Plants" (Dotanic Garden, pt, ii.). The tree was said to destroy all animal life within a radius of 15 miles or more. The joison was fetched by condemned malefactors, of whom searcely two out of twenty returned. All this is pure fable, and in good part not even traditional fable, but mere invention.
For a scientific account of the Antiaris, see Horsficid's Plantax Jaramica Rariorcs (1838-52) and Blinne's Ramuphia (Brussels, 1833), and for the legenil Yule, Ánglo-Indiant Gussary, r. i26 sq.

UPPER SIND FRONTIER, a district of British India forming the northernnost portion of the province of Sind, in the Bombay presidency. It comprises an area of 2139 square miles, and lies between $27^{\circ} 56^{\prime}$ and $25^{\circ} 27^{\prime}$ N. lat. and between $68^{\circ}$ and $69^{\circ}$ 44. E. long. It is bounded on the N. and W. by the Derajat districts of the Punjab and the territory of Khelat, on the S . by Shikarpur distriet, and on the E. by the Indus. In the north-cast the country is hilly; the remainder consists of a narrow strip of level plain, one lalf being cosered with jungle and subject to inundation, from which it is protected by artificial embankments. The land is watered by canals from the Indus, of which the chief is the Begari ( 85 miles in length), navigable throughout by large boats, and the Desert Canal, which irrigates the country west of Kasbmor. The district contains several thriving timber plantations. The wild animals comprise an occasional tiger and hyænas; wild hots and jackals abound; foxes are occasionally met
with; and antelopes, hog-deer, and a suecies of sambluar Aeer are found in the dense jungle tracts adjoining the Iudus. The climate is remarkable for its dryness and for Its extraordinary variations of temperature. The arerage annual rainfall at Jacobabad is less than 5 inches. There are numerous roads of all descriptions, and the Frontier Military Railmay from Sukkur via Jacobabad to Sibi crosses the district.
The census of 1881 returned the population as 124,181 (males 70,166, fermales 54,015 ), -Hindus aumbering 9894, Mohaminedans 109,183 , and Christians 230 . The chief town is Jacobabad, with a population of 7365 . In $1885-86$ the cultivated area was estimated at 361,415 acres, of which 137,149 were cropped, and of these again 8163 were cropped more than once. The principal crops are wheat, joar, bajra, rice, barley, nustard-seed, snd a little cotton and gram. Salt, lacquered work, leathern jars, embroidered shoes, woollen carpets, and saddle-bugs are the principal maunfactures. The internal trade is principally in graiu, the greater part of which is sent to the Punjab, snd the transit trade from Centra! Asia into Sind crosses the district, bringiug wool and woollen goods, fruits, carpets, snd horses.

UPSALA, a city of Sweden, the seat of its oldest university and residence of the archbishop of Sweden, is situated on the small river Fyris, 42 miles north of Stockholm. In spite of its position in a vast and fertile plain, Upsala was a rather insignificant little town till the opening of railway communication in 1866. . The population, which in 1840 was only 5100 , had at the end of 1885 increased to more than 20,000 (vith students, scholars, and others, 23,000). The industries of the place are still nnimportant, but its trade by sea (navigation being open for six or seven noonths of the year) and by rail is somewhat livelier. Upsala owes its fame to its university, which was founded in 1477 . In 1624 Gustavus Adolphus endowed it with 300 farms, the revenue of which formed its entire income for more than two hundred years. Parliament now contributes nearly the half of its whole revenue ( 393,300 crowns, or about £21,800, in 1885 ). The professors numbered 58 in 1887, with 61 "docents" and assistant teachers, and there were 1928 students. The last-named are divided into 13 "nations" (based on the old ecclesiastical division of the country), almost every one of which possesses a house of its own, with a ball, readingrooms, and library. About $£ 7200$ is distributed yearly in "stipendia" or scholarships. The new / university house, above the cathedral, on the site of the former archbishop's castle, is in the Renaissance style, and was built in 1879-87. It has a great hall capable of holding 2000 persons, eleven lecture-rooms, \&c. The vestibule, lighted from above by three large cupolas, and surrounded by open galleries, is particularly fine. The library building (called Carolina Rediviva, in remembrance of the Carolina which formerly existed near the cathedral) was erected in 1819-41. The library, which has a rigbt to a copy of every book printed in Sweden, at $\mu$ resent (1887) contains 250,000 volumes and 11,000 MSS., anorg which is the famous Codex Argenteus of Ulfilas's translation of the Gospels. The "Gustavianum," built by order of Gustavus Adolphus for a university house, is now wholly occupied by the zoological institution. The botauical garden (which
formerly belonged io tiut castle) was presented by Gustavus III. to the university in 1787, -the former garden (in the northern part of the city), where Rudbeck and Linnæus worked, and where the residence of the latter is still to be seen, having been found too small and inconvenient. The medical faculty possesses a hospital and anatomicai, chemical, and $\mu$ athologico-physiological institutions; and about a mile from the town there is a magnificent lunatic asylum. The astronomical and meteorological institutions, as well as those of chemistry and physics, have also special buildings, all of recent date. The Royal Society of Sciences, established in 1710 by Eric Benzelius, the younger, occupies a honse of its own, and has a valuable library. Of the buildings the cathedral, founded in the latter pait of the 13th century and completed in 1435, is the most remarkable. The material is brick, but the proportions are uncommonly noble and harmonious; the length is 390 feet, and the beight inside 88 . It has suffered considerably from repeated fires, but since 1886 an extensive restoration has been going on. The castle, on the summit of a long ridge above the town, was founded in 1548 by Gustavus I., but not finished till a century later, when it was often nsed as a royal residence. It was destroyed by fire in 1702, and for more than forty years remained a ruin. At present only a small part of it is habitable, and that part is chiefly used by the provincial government and as a residence of the governor. Apart from the cathedral and a few insignificant hcuses, there are no remains from the mediæval period, the city formerly having consisted almost entirely of wooden houses.
The дame of Upsala originslly belonged to a place nearly 2 miles to the north of the present city, which is still called Old Upsala This Upsala, mentioned as early ss the 9th century, was famous throughout Scandinavia for its splendid beathen temple, which, gleaming with gold, made it the centre of Svithiod, then divided nato a great namber of kingdoms; three hage grave monnds or larrows etill commemorate old times. In the eame place the first cathedral of the bishops of Upsala was also erected (abont 1100). On the destruction of this building by fire, the incouvenient situation caused the removal in 1273 of the archiepiscopal see to the present city, then called Ostra Aros. ${ }^{1}$ hut within a comparatively short time it csme to be generally called Upssla. During the Middle Ages the csthelral and the see of the archbishop made Upsala a kind of ecclesiastical cspital. There the kings were crowned, after the election had taken place at the Mora stones, 10 miles sooth.east of Upsala." $\Delta s$ early as the 14th centary, hewever, Stockholin became the proper residence of the king. In 1567 Erik XIY. murdered to the castle five of the most emineat men of the kingdom, three of them belongng to the family of Sture. In 1593 was held the great synod which marks the final victory of Protestantism in Sweden; in the same year the university was restored by Charles IX. In the castle Christina, daughter of Gustavus Adolphno, resigned her crown to Charles X. in 1654." In" 1802 nearls the whole city, with the castle snd the cathedral, was burnt domn. Among the teachers of the university who have carried its name beyond the boundaries of their own country, the following (besides Lianæus) deserve to be mentioned:-Olof Rudbeck the elder, the author of the Allantica (1630-1702); Torbern Bergman (1735-1784), the celebrated chemist ; and Erik Gustaf Geijer (1783-1847), the historian.

[^44]:    ${ }^{1}$ At a meeting of the Royal Astronomical Society held on 9th Mny 1886 a legal document, signed by Chester Moor Hall, was presested by Mr R. B. Prosser of the Patent Office to the socicty. On the same occasion Mr Ranyard made the following interesting statement respecting Hall :-
    "Some years ago very little was known ahaut Moor Hsll. It was known that, about seven years after the patent for making achromatic object-glasses was granter to Dollond, his ciellil to the invention was disputed by other instra. ment-1nakera, amongst them by a Mr Champness, an instrument-msker of Cornlill, whn began to infringe the patent, sheging that John Dollond was not the real inventor, and that such telescopes had been made twenty tive years lefore the granting of his patent by Mr Moor Hall. John Dollond, to whom the Copley medal of the Royal Society had been given for his invention, was then dead, and his son brourht an action for Infringing the patent arainst Chsinpness. There is no rebort of the case, but the facts are referred to in the reports of subsequent cases. It appears that workmen who had been emp'oyed by Mr Mor Hall were examined, and pmved that they had made achromatic ebject-glasses as early as 1i33. Dollond'e jatent was not set aside, thongh the evidence with regam to the prior manufacture was accepted by Lord Mansfielil, who tried the case, as having been satisfactorily proved. Mr Hall was a bencher of the Inner Teanple, and was alive at the time of the action. He was a man of some property, and is spoken of on his tonibstone as an excellent lawyer and matl ematician. Ile was not a fellow of the Royal Eocicty, but unst certainly have known of the gift of the Copley medsl to Dolloni. It is very curinus the conflicting evidence we lisve te reconcile, but I itink the balance of evidence is in favour of there heving beeo a prior in. vention of aciromatic object-glasses before the date of Dollond'e patent" (Astron. Register, May 1886; see also the Observatory for same diste).
    ${ }^{2}$ Centloman's Maguzine, 1790 , part ii. p. 890.

    - By E. Negrette, in his Mistoire de La Littératurz Latine.

[^65]:    2 An Italian word meaning literally "baked earth."
    2 See list at tho end of the present article.
    ${ }^{s}$ See Bull. Com. Inst. Arih., 1874, p. 120. Nany thousand tombs have been opened at Tanagra, partly cut in the rock and partly built of masonry. The statuettes were either arronged round the body or packed in large vases. The costume of the female figures is the same as that described by classical writers as being peculiar to the neigbbouring city of Thebes. The finest of the Tanagra figures are from 8 to 9 iuches ligh.

[^66]:    ${ }^{1}$ A good example of a terra-cotta relief of the first part of the 5th century B.c. is figured in vol. ii. p. 352.
    ${ }^{2}$ Some very beautiful fragmenta of reliefs in terra-cotta are pre. served in the musenms of the Lourre, of Copenhagen, and the Kircheriano in Rome. These represent on a small scale parts of Phidias's Panathenaic frieze, which have all the appearance of being worts of the 5 th century B.o., but may possibly be forgeries or Roman copies ; see Waldstein, Art of Pheidias, Cambridge, 1885.
    ${ }^{3}$ In some the most hoinely sort of genre is represented,-a girl milking a cow, a cook or a barber at bis work, \&c. Even portrait Ggures occur, as, for example, a wonderfully lifelike gronp of a man and his pife in the collection of Mr Ionides, recently lent to the sodth Kersincton Museum.

[^67]:    ${ }^{1}$ Fine examples of all these existed in the callection of M. Lecuyer, which is now dispersed (see Lenormant, Coll. Lecuyer de terre-cuites. Paris, 1884, which is well illustrated with phatographs).
    ${ }^{2}$ In a few other examples objects of bronze sma placed in the hands of the figures.
    ${ }^{3}$ The lovely $e$ eries of little figures of dancing cupids from Tanagra,日ome of which are in the Lauvre and otbers in the Sauth Kensington Museum, were wholly gilt, but the larger statuettes of Tanagra sppear to have had gold applied only for epecial ornamente.

    - For many reasons both finders and dealers usually wish to keep eecret where valusble finds are made. In most museums the labela simply repeat the desier's account (for want of better information), oc that the statement of the provenance must usually be accepted with csution.

[^68]:    ${ }^{1}$ Seb Journ. of Hellenic Shudies, vol. vi., 1836, p. 243.
    ${ }^{2}$ The British Museum possesses some line caricatures of actors from Canino, rery skilfully modelled and of a deculiar fabrique.

[^69]:    ' A very larga ascua from Canosa in the British Museum is decorated with no less than five statuettes of women and Victories, two large masks of Medusa, and air projecting figures of borses.
    ${ }_{2}$ Compare a aimilar representation of the omphalos on a Greek vase Ulluatrated by fahn, Vasenbilder, Hamburg, 1839.

    ${ }^{5}$ The South Kenalngton Mnseum posseases a very fine collection al Florenfine terra-cottas of the best period.

[^71]:    ${ }^{1}$ See Vasari, ed. Le Monnier, xii. 281.
    2 This interesting building is now threatened with destraction.

[^72]:    Very clever forgeries of terrs-cotta are being manufactured, and in many cases real epecimens have genuine heads whioh do not beloug to them. The colouring has frequently been touched op and falaified While in the dealers' bands. Even the celehrated Campans collection contained many clever forgeries of terra-cotta reliefs.

[^73]:    Compare also the judgment of Bilary and of Vincent of Lerins,

[^74]:    1 This article deals mainly with the history of the textile art; for practical information as to modern processes, see Weavino; eee also Embroidert, vol. viii. p. 160 sq.
    ${ }^{2}$ These dividing sticks are called in French "hatons a denx"; in the simplest kind of weaving only one is required. The use of treadles and "spring staves" is more applicable to the low loom, in which the warp is strained in a harizontal postion

[^75]:    ${ }^{3}$ Lat. spatha. ${ }^{4}$ Lat. pecten; modern English batten or lay
    ${ }^{5}$ See Mon. Inst. Arch. Rom., vol. ix. pl. 42.
    ${ }^{6}$ See the modern Faroese loom figured by Worsaae, Afbildninger fra det k. Mruseum for Nordiske Oldsager, Copenhagen, 1854, p. 123.

    A fresco by Pinturicchio-911 in the National Gallery, Londonhas a careful representation of the mediæral low loom ; the subject is the return of Ulysses to Penclope.
    ${ }^{8}$ Dr Schliemann found 22,000 in the plains of Troy alone.

[^76]:    ${ }^{1}$ In the time of St Louis (13th century) in France some sorts of weaving, such as "tapisseria Saracenois," were dene only by men.
    a Some exisling specimens have io each joch 152 threads in the warp and 70 in the weft; in modern stuffs the proportion is the other way. A coarsely woren piece of Egyptian stuff in the British Muscum has a horder with a man swimming, supported by \& flowt

[^77]:    : A rery magnificent royal dress, with woven patterns of deities, kings, animals, and tha sacred tree, nuuch resembling those on tbe metal bowls of Assyria, is figured by Layari, Menuments of Assyria, series $\mathrm{i}, \mathrm{pl}$ ix.

    - One remarksble example of tapestry from a tomb in the Crimea is supposed by Stephani to date from the 4th century B.c.; see Comp. Rend. Com. Arch., 1878-79, po 40, M. v.

    3 Il., iii. 125 , viii. 288 , ix. 200 , x. 156 , xiv. 178 , xxii. 440 ; Od., ii. $93, \mathrm{x} .220$, xiv. 61 , and many passages in books xviii. to xx . Homer describes (Oit., xix. 225-225) a cloth of purple wool with a hunting scene in gold thread, woven by Penelope for Ulysses.
    ${ }^{\circ}$ Il., 1 vi. 224 , xxiv. 230,645 ; Od., iv. 124,298 , vii. 337. Many Greels vases, especially those with black fignres and inciscd lines, have representations of rich woven dresses, - -.g., an amphora in the Vatican with Achilles and Ajax playiog ot a game like draughts, c. 460 z.c. A rather later vaso in the British Nuseum has a fine figure of Demeter clad in a palliom covcred with figures of cbariots and winged mer and horses.

[^78]:    - See De Ronchaud, Le Péplos d"Athèné, Parıs, 1872, and La Tapisserie, Paris, 1885. The treasuries of most Greek temples appear to have contained large stores of rich woven stuffs.
    ${ }^{2}$ See alsn Hor., Siel., ii. 6, 102-6 ; Ovid, Metam., vi. ; and Lucr., iv. 1026.
    ${ }^{3}$ This fragment is illustrated by Müntz, La Tapisserie, Paris, 3882, p. 53.

[^79]:    See Raine, Saint Cuthbert, Darham, 1828, plate iv. ; in his taxt the enthor lo wholly wrong as to tho provenance of theso staffis.

[^80]:    ${ }^{2}$ This is urually called the pine-apple patforn ; but it wes invented long befora the discovery of Anserica had introduced the pfine-ryple into Europe.

    3 Italian and Flemish picfures of the 1 th th the 36 th centory ofteu give most valuable representationa of rich textiles; see Fecher, Fiflemth Century Italian Ornameni, Lomdon, 1886, e seriee of coloared plates of textiles taken from Italiaa nirtores.

[^81]:    ${ }^{2}$ A raluable belp towards astablishing the dates of carpot pattarnes is given by meny medireval Italian pictures, in which Oriental carperes are often represented with wonderful minuteress and approolatler

    8 Tapisserie in Freach meass ald corth of pattereed wturis.

[^82]:    ${ }^{1}$ In tapestry the weft etitches are put in loosely and carefnlly pressed home, so that the warp etrings are completely hidden.
    ${ }^{3}$ Seo Riaño, Tapestry of the Palace at Madrid, London, 1875 ; of all countries Spain is the richest in tapestry of the 15 th and. 16 th centuries. The royal collection contains 2000 large nieces. Rich etoree also belong to the priucipal cathedrals, euch as Tolcdo, which on the feast of Corpus Christi is completely hung round with tapestry outside as well as inside. In the 17 th century tapestry loome were worked in Spain under royal patronage. One of Velazquez's finost pictures in the Madrid Gallery (Las Eilanderas) represents tho visit of eome court ladies to a tapestry fabrique, io which women are work. ing the looms.

[^83]:    ${ }^{3}$ An earlier fabrique was started in 1630 by Urban VIll．，but it soon ceased to bo worked．

    4 Tho largo collection in the Gobelin Suceum was burnt in 187.

[^84]:    "Occasionally to stey, down from the platform, and talk about them: if they are good and kindly, to love and slake them by the hand ; if thoy are silly, to langh at them conlidentially in the reader's sloevo; if they are wicked and heartless, to abuse them in the strongest terms politngess adnits of. Othervise you might fancy it was I who was sncering at the practico of derotion, which Miss Sharp finds so ridiculous; that it wes I who laughed goodhumonrolly at the roiling old Silcmus of a baronot-whereas the laughter comes from ore who has no revorenco except for prosperity, snd no cye for anything beyond success. Such people there are living and flomishing in the world - Faithless, Ifopoless, Charityless: let us have at thom, dear friends, with might and main. Some there are, and very successful ton, more quacks and fools: apt it was to combat and exposo surh as thogn. ne doubt. that baughter was mallo."

    As to anether accusation which 'was brought against the' book when it first came out, that the colours were laid on

[^85]:    ${ }^{2}$ Bretschacider（Dic Geom．zor Euklides，p．40），without stating his authority，gives＂between $5 \$ 5$ and 583 B．C．＂as the date of the archonship of Dabiasius．In this he is followed by some other recent writers，who infer theace that the namo＂wise＂was conferred on Thales on account of the success of his prediction．The date 5Se B．O．，given above，which is taken from Cliuton，is adopted by Zeller． 2＂On the Eclipses of Agatbocles，Thales，and Xerxes，＂Phil． Trans．，vol．cxliii．p． 179 sq．， $1853 . \quad$ A Athenaum，p．919， 1852.
    －Astronmaische Cntersuchungen der aciehtigeren Finsternisse，\＆ia， p．57， 1853.

[^86]:    ${ }^{1}$ Assyrian Discoveries, p. 409.
    ${ }^{2}$ Cf. Pamphila and the spurious letter from Thales to Pherecydes, ap. Diog. Luer. ; Proclus, In primum Euclidis Elementoruan L:brum Commentariz, ed. Friedlein, p. 65 ; Pliny, II. N., xxxvi. 12 ; Iamblichns, In Vit. Pytiag., 12 ; Plutarch. Sept. Sap. Conviv., 2, De Iside, 10, and Plac. i. 3, 1.

    This is unquestionably the meaning of the statement of Pamphila (temp. Nero), ap. Diog. Laert., i. 24, that he was the first person to dascribe a right-aggled rriangie in a circle.

[^87]:    ${ }^{1}$ The well-preserved theatre at Tauromenium, in Sicily, still bas these niches, which are contrived in the dwarf wall on which the columns of the upper gallery sto ${ }^{2}$.
    ${ }^{2}$ Earthenware vases, which ere sometimes found onder the floors of mediæval church stalls, were probably placed there through a mistaken notion thet this was carrying out Vitrurius's recommendation.
    ${ }^{3}$ The central door, used by the chief actor, was "the royal door."

    - Hence the Roman proverbial phrase, "deus ex nachina."
    - This is ohown by Jacobs, Ferm. Schriften, iv. p. 272, and Passow in Zimmermann's Zeitschr. fo. d. Alterth., 1837, No. 29.
    - These thrones are of verious dates, ranging from the reign of Augustus or even earlier to that of Hadrian; sce Papers of the Anerican School of Classical Stuties at Athens, vol. 1. p. 123. Similar Greek theetre seats of earlier date still exist in the choirs of some churches in Rome, where they were once used for the episconal or celebrant's throne. These were probably brought to Rome during tho imperial period for use in the Roman thentres or amphitheatres. The finest exemple of pure Hellenic mork is in S. Pietro in Vincoli; it is decorated with delicete honeysuckle scroll-worl in relief.

[^88]:    ${ }^{7}$ See Texier and Pullar, Asia Minor, London, 1865.
    8 There was also a wooden pent-roof corbelled out orer the stage.

    - See Vitruvius, iii, 8 (Greek thestre) and iii 2 to 7 (foman).

[^89]:    1 This design was also adopted for their amphitheatres, such as the colossea of Rome and Capua, the plan of which resembles the cavea of two theatres set together so as to enclase an oval space.
    ${ }^{2}$ Accordiog ta Livy (xl. 51), the theatre of Marcellus was huilt on the site of an earlier one erected by Æmilius Lepidus.
    a This theatre was dot hegun when Pausanias wrote his boak Attica, and was complete when he wrote the Achaica (see Paus., vii. 20). It is illustrated ia Mon. Inst., vi., plate 16 .

[^90]:    © The pit and stalls in a modern theatre occupy an analogons

[^91]:    "tireynge-howse." The upper galleries or boxes completely surrounded the stage, even the space over the green-room being occupied by boxes. This being the arrangemert, it is easy to see why the ectagonal plan was selected in most cases, though not in all, -the Fortune theatre, for example, was square. An interesting specification asd contract for the building of the Fortune theatre is printed by Halliwell-Phillipps (op. cit. infra, p. 164\% In all its details the Fortune is specified to be like the Globe, except that it is to be square in plac, and with timbers of heavier scantling. The walls ars to be of wood asd plaster, the roof tiled, with lead gutters, the stage of oak, with a "shadow" or cover over it, and the "tireynge-howse" to have glazed windows. Two sorts of boxes are mentioned, viz., "gentlemen's roomes" and "twoo-peanie roomes." A woodcut showing this arrangearent of the interior is given ia a collection of plays edited hy Kirkman in 1672 .
    Much valuable information abont the early thestres of London is given by Wilkinson, Londina Mlustrala (1819), in whish are eagravings of some of them. See also Collier, Hisl. of Dramatic Poetry, 1879; Halliwell-Phillipps, Life of Shakespeare, 1883 ; Molone, History of the Stage, 1790 , republished by Boswell ia 1821 ; the publications of the New Shakspere Socicty; the Ninth Roport of the Historical MSS. Commission ; and a series of articles out earls London theatres, by T. F. Ordish, in The Antiquary, vols. xi, xii., and xiv.: 1885-86.。

[^92]:    1 This derice was practised by the mediæral architects in most European countries, who frequently made the floor of cathedrals in ? other large churches to slope upwards from west to east, sometimes as much as from two to three feet.
    ${ }^{2}$ Other varisties of this, auch as the "vampire trap," allow an actor to vanish through sn apparently solid wall.
    \$ In 1883 M. Reyer'a Sigurd was rafused at the Paris Opera Honse mainly on account of the absence of the necessary mechanical appliances.

[^93]:    I Scene paintings are usually executed in distemper, frequently in an ateller formed in the roof of tha theatre; tha artist psitly werks with his canvas laid apon the floor, or, where space allows, the painting is hang agsinst a wall
    and the artist works from a scaffold, wish tiers of boarding arranged so that he can reach to any part of the great canvas.

[^94]:    1 Thus destruetion of a letter by a servant, with a view of suppressIng inquiries into ber claracter, makes the sorrant guilqy of larceny in Englidh law.

[^95]:    ${ }^{1}$ Among works in which the hypothesis of primitive monotheism ie anpported, the following may be mentioned:-Steaco, De Percnni Philosophia, 1540; Herbert, De Religione Gentilium, 1645; Gale, Court of the Gentiles, 1669-78; Cudworth, True Intellectual System, 1678 ; Bryent, Ancient Mythology, 1774-76; Creuzer, Symbolik u. Mythologic, 1819-21; De Boneld, Légistation Primitive, 1819; Lüken, Traditionen des Menschengeschlechls, 1858 ; Gladstone, Homer and the Homeric Age, 1860; Ebrard, Apologetik, pt. ii., 1875; Zökler, Lehre vom Urstand des Menschen, 1880; Cook, Orisins of Religion and Language, 1884 ; Rawlinson, Early Prevalence of Monotheistio Beliefs (No. 11 of Present Dar Tracts).

[^96]:    ${ }^{1}$ The view opposed in the ebove paragraph is that maintained In the following works (as well as those mentioned in the previous note), -De Rougé, Études sur le Rituel Funéraire, 1560; Renonf, Mibbert Lechures, 1879 ; Brugsch, Religion u. Mythologie d. alten Aegypter, 1894; Legge, Religion of the Chiscse, 1880 ; Renan, Ifist. des Langues Sónitiques, also Considirations sur le Caractere Gen. des Peuples Semiliques, and Nourelles Considerations; Pesch, Der Cottesbegriff in den heidnischen Religionen des Alterthums, 1886. Among the many replies to Reasn, Max Mäller's ("Semitic Monotheism," in Chips, vol. i.) and Steinthal's (in Z. I.S. IF", i.) epecially merit to be mentioned.

[^97]:    The best literature relating to the subject of the preceding paragraph is indicated in the lists of books giveu in connexion with the relevant eections in Tiele's Outlines of the History of Religion, and particularly in the Freach translation by M. Vernes. Hegel's Philosophy of Religion, Buusen'e Cod in History, Freeman Clarke's Ten Great Religions, the St Giles Lectures on the Faiths of the WVorld, still more the series of Sacred Books of the East, and of ancient texts published under the title of Records of the Past, and the volumes of the Rev. de l'Hist. des Religions, will be found useful to those wish. ing to make a survey of beathen thought regarding God so far as is approximated to the theistic idea. For the conceptions of the Divine entertained by non-civilized peoples, see especially Waitz's Anthroa pologie, and Réville's Religions des Non-Civiliste, who both aivo extensivg lists of literature.

[^98]:    ${ }^{1}$ See Zeller，Die Entwielielung des Monotheismus Ici den Griechen （in Vorträge，vol．i．）；and Cocker，Christianity and Greek Philosophy， 1875；Elso，Meiners，\＃istoria Dnctrina de V＇ero Deo， 1780.
    ${ }^{2}$ See the O．T．Theologies of Oehler，Schultz，Kayser，Piepenbring， とc．；Ewald，Lehre der Bibel von Goll；Baudissed，Stud．zo Semit． Religionsgeschichte；Kuezcn，Hibbert Lecture；Duhm，Theotogie d． Propheten；W．Robertson Smith，Prophets of Israel，\＆c．．As to the umen＂Jahveh，＂an instructive summary and examination of views is given by Prof．Driver in his article＂Rccent Theories on the Origin end Frature of the Tetragrammaton，＂in Studia Bi\}?ica, Oxford, 1885.

[^99]:    ${ }^{3}$ The New Testament representation of God is treated of in the Niero Testament Theologics of Schnuid，Reuss，©osterzee，and Weiss ；also in Wittichen，Die Idee Gottes， 1865.

[^100]:    ${ }^{1}$ Baur. Ch. Lehre n. r. Dreieinigket, \&e., 1841-43; Mcier, Lehre v. d. Trinitat in hist. Enturicki, I\&4t.

    Roesler, Pkilosophia l'cteris Eccl. de Deo, 1;82; and the histories of Christian doctrine by Hagenbach, Neander, Shedd, Bonifas, Sheldon, Harnack, \&c.; Gangauf, Des h. Augustinus speculative Lehre von Gnt, 1894.

[^101]:    ${ }^{1}$ See MoeanmbDanism, and authorities there mentioned; also Kuenen, Hibbert Lectures, lect. 1, with authors and woriss there indicated.

[^102]:    For the history of mediæval theism may be consulted the histories If philosoply by Tennemann, Ritter, Erdmann, \&c.; the special bistories of mediæval philosophy by Stockl and Haureau, and of later scholasticism hy K. Werner; the histories of the Trinity and of Christian doctrine already mentioned; and a multitude of monographs, e.g., those of Christlieb, Huber, and Stöckl on Erigena; of Hasse, Remnast, Bouchitté on Anselm or his ontological argument; Delitzsch's Kritische Darstellung der Gotteslehre des Thomas Aquinas; Ritschi's "Gesch. Studien z. ch. Lehre von Gott," in Jahresb. f. dertsche Theol., x., referring chiefly to Aquinas and Scotus, \&c. Mediwval mysticism has found in Schmidt, Lasson, Preger, Jundt, admirable Listorians. On Eckhart there are good works by Martensen, Lasson, and others; see slso a paper by Prof. Pearson in Mind, No. sli. On mediraval prodestinarianism conenlt chapter in Mozley's Treatise on the Augustiniar Doctrine of Predestination. The keenest hostile celticism of medizval theism is that of Pasquale D'Ercole, 16 Teismo Filasqioco Christiano, 1884.

[^103]:    - ${ }^{1}$ Schalirastani'в Geschichte der religiösen u. philosophischen Secten bei den Arabern, Germ. trans. by Gaarbrücker, 1850-51; Wustenfeld, Die Akademie der Araber u. ihre Lehrer, 1837; Schmolders, Essai sur les Écoles Philosophiques chez les Arabes, 1842; Munk, Mdanycs de Philosophie Juive et Arabe, 1859; Steiner, Dis Mutaziliten oder Freidenker in Islam, 1865; Ronan, Averroés et L'Averrotsme, 1852, \&c. [^143]:    1 Thomson calls this a dissipation of accuracy. It may be illostrated thes. Consider the equation $x^{2}-3 x+2=0$, which may be written elther $x=3+\frac{1}{3} x^{2}$ or $x=3-2 / x$. Now let $x_{n+1}=3+3 x^{2}{ }_{n}$, end suppose we etart with sny valne $x_{0}$, lese than unity, and compute $x_{1}, x_{2}, \ldots x_{n}$. Then, starting with $x_{n}$ in the equation $x_{n-1}=3-2 / x_{n}$, if we work back werds, we ought to come to the original velue $x_{0}$ In fact, however, we chsil anly do so if there io infinite accuracy in sll the numerical values. For, start with $x_{0}=1$, then $x_{1}=75, x_{2}=8542, x_{3}=-9029$, $x_{4}=9527, x_{5}=9692$; and the values go on approximating to 1 , which is \& root of the eqnstion. Next start hackwerds with $x_{5}=-97$, snd we 太nd $x_{4}=9938, x_{3}={ }^{\prime} 868$, $x_{3}=696, x_{1}=\cdot 127, x_{0}=-12 \cdot 75, x_{-1}=3 \cdot 157, x_{-2}=2 \cdot 367, x_{-3}=2 \cdot 155, x_{-4}=2 \cdot 072$; and the values go on spproximatiog to 2, the other root of the equation.

[^144]:    ${ }^{1}$ Fused with $2 \boldsymbol{\gamma}-\sigma+\bar{w}$.
    $2 m$ is the ratio of the moon's mean motion to the sun's.
    3 In these three cutries the lower number fives the salno when the coefficients of the evection and variation have thear full salues as derived from lunar theory.
    1 Indicated by 2 MS аз a compound tide (sec below, \& 24).
    s A fusion of $\gamma-\sigma \pm$, of $w$ hich the latter is the dide named.
    e The upper number is the meas value of the cocflicicut of the tide $\gamma-\sigma-\bar{\infty}$ : the bwer applics to the tide $\mathrm{M}_{1}$, compounded from the tides $\gamma-\sigma-\bar{\omega}$ and $\gamma-\sigma \div \boldsymbol{\sigma}$.
    7 The lower number gives the value when the coefficients in the evection have their full value as derived from lunar theory.
    8 The menn value of thas cocfficient is $\mathfrak{h}\left(1+1 c^{2}\right)\left(1-\frac{1}{3} \sin ^{2} i\right)\left(1-\frac{1}{2} \sin ^{2} \omega\right)=\cdot 25$, and the variable part is approximately $\left(1+1^{i}\right) \sin i \cos i \sin \omega \cos \omega \cos N^{\circ}=$ - $0325 \cos$. ${ }^{\circ}$.

    9 The lower of these two numbers gives the value when the cormelents in the evection and variation have their full values as derived from luar theory.
    to indicated by MSS as a compouod tide.

[^145]:    1 The tide has been referred by Lubbock and others to an earlier tranait,
    and not to the one 1 minedistely preceding the time under eonsideration. In this case we cannot admit wath great aceuracy that $d a / d t=\sigma$, aince the interval may be 90 or 40 hours.

    The evidence on which the accused might be tortured was ex. presserl in Foman law by the termis argumentum and indicium. Tha latter term, as will be seen, afterwards became one of the most important in the law of torture, but the analysis of indicium is later than Roman law. Indiciun was not quite the same thing as semiplenr probatio, thongh tho terms appear to be occasionally user as synouynis. Indiciun was rather the foundation or cause of $p$ robatin, whether plena or semiplenc. An indicinth ar a concurrence of indicia might, according to circumstances, constitute a plena or semiplera probalio. The difference between the worls may be illustrated by a passage from Justin, "An cujus rei probationem immittit iodices," xxxii. 2.

[^221]:    "See N. 7arudnyi, "Les Oiseaux de la Contréa Transcaspienne," In Bull. sure. Nat. Mosc., 1885

    It is to be observer that on the original Russlan map of the Transcaspian. drawn Immediutgly affur the survey of the Uzbol had been completed, the Uzboi hav nor the continuity whicil is given to it on subsequent maps.

    Their niminal papers ale printed in the treestia ot the Pusslan Geogr. Soc., 1.433 to 1887 , as also in the Journal of the Russian Ministry of Roods and Communleations.
    6 According to A. E. Fedroitz and A. M. Konshin the old Tonu-Darla bed of the Amu contnins shells of molluses mow living in the Amu (Cyrena fuminalis, Dr issena polymorpha, and Anodom( $\beta$ ). The Sary-kamysh basin is characterized by deposits containing Neritina liturafa, Dreissena polymorpha, and Lymmeus, characteristic of this basin. Below the Sary-kamysh there are no more deposits containing shells characteristic for the Amu; Anodontex are found quite occasionally on the surface, not in beds, in company with the Caspian Cardium (Didacna) trigonoides, var. crassum, Cardium piramidatumb Dreissena polymorpha, D. rostriformis, Hydtobiw caspia, Nertina liturata, and Drcissena brardia; the red clays with these fossils extend for 130 miles to the east of the Caspian (Frestia of Russ, Geog. Soc., 1883 and 18863.
    ds by Jenkinson, who mentions a sueet-water gulf of the Caspian within six day" march irnm khwarezm, by" which gulf he could mean nothiog but the Sarykanysh depuession.

[^222]:    ${ }^{6}$ In connexion with this southern "old bed, " it is wortlsy of notice that the Ersari-Turcomans call it Unghyuz or Onguz ("diy old bed"), and thercean be no doubt that when the Bolshoi Tclsertezh of the lGth century (speaking from anterior information) mentions arlver. Ugliyuz or L'gus, flowing to the west from the Amu towards the Cospian, it is merely desclibing as a livel what its very name shows to have been a dry bed, only supposed to have been once occupied by a river. The similarity of the names Ongus and Ugus with the Ogus and Ochms is so striking that one is incllned to aee in the ogus or Ochus nothiog but the mention of a dry old bed. Compure Petruseritch, "The Soutl. East Shores of the Caspian," in Zapiski of the Caucasian Geogr. Soc., vol. xi, 1850 .
    7 Such an intermingling of modern data wilh older truditions is nut unknomn to geomraphers, A striking instance of it ds glven in the suppused comnexion of Lake Aral with the Arstic Ocean dusing historical times ; plysical clunges ara proceeding so rapldly in Asia that we find traces of likeaurwvals of troditiona eveo in this age of accurate furveys.

[^223]:    ${ }^{1}$ No Russian sea shows 80 rapid a growt h of navigation as the Caspian Sea during the last fifteen jears. In 1884 no less thsn 1945 stesmers ( 611,000 tons), engaged in foreign trade, entered the Fussian porta of the Caspian, as agsinst 409 (113,000 tons) in 1876.

    3 Radlof, for instance, thinks that the name U-ssun, and perbaps romnante of the people denoted by it, survive in the present Uisuns, a division of the Grest Horde of the Kirghiz. At the time of Alexander the Great'e expeditions against the Scytniana lieyond the Jarsitee, we find in that region certain traccs of the Thrkish langaage in names of places and persons (cp. vol. xviii. p. 582, note 4). It is therefore certain that long before the age of the Hiong-nu Turkish tribes had apread to the borders of the Jazartes, and even along the northern coast of the Caspian to the rivers Ural and Volga, But the othnical danominations of antiquity-Scythisns, Parthians, Massagetw, Sace, \&c. -do not convey to our mind clear ethnical diatinctions, no that the trae nationality of these peoples hes been much dobated. Neither are the pre-Samitic culture of Babylonia and the aupposed
    "Taranian" origin of the Accads facts of such character that from them we can infer the presence of Turks in these regions in remote ontiquity.
    4 On the Petchenegs see below.

    - From their Chinese name it may be inferred that the Juen-Juen Fere a Mongolian people, in which case the Avars, who are suppoeed to hsve been a diviaion of them, were also Mongola.
    - See Nöldeke, Geschichte der Perser und Araber, p. 158. The first part of this nsme is withont doubt the Turkish sünju, süngu, which means "lance," a Turkish proper name of the asme kind as Kilij= "sword," which in its Peraian form, Nizek, was afterwards borne hy a prince of Transoxiana, often mentioned in the accounts of the Arnbic conquest.

[^284]:    ${ }^{2}$ Turner's father died in I830, and the loss of "poor oll Dad," as lea used to call him, left a terribla void. He had lived in his son's housh for nearly thirty years, looling after tho frugal affairs of his household, and making himself useful in various ways. It is said that be used to prepara and strain hia son'a canvases and rarnish them when finished, which may explain a saying of Turner" that "his father used to bergin and finish his pictures for him." He also attended to the gallery in Queen Anne Street, showed in visiters, and took cara of tha dinner, if he did not himself cook it. Turner was never the aames man after his father'a death, living a lifs of almost complete isolation.
    ${ }^{2}$ This spirit of rivalry showed itself carly in his career. He began by pitting himself against his contemporaries, and afterwards, when his powers wera more fully developed, against some of the old masters, notably Vandervelde and Claude. During these yeara, while he kept up a constant rivalry with arrtists living and dead, he was continuing his unresting and untiring study of nature, and, while seemingly a mera follower of the ancients, was accumulating that immense store of knowledge which in after years, when his true genius assertcd itself he was to use to such purpose.

[^285]:    1 "The strange unity of vertebrated action and of a true bony conloar, infinitely varied in every vertebra, with this glacial outline, sogether with the acloption of the head of the Ganges crocodile, the

[^286]:    ${ }^{1}$ Crossing the Brook was a grest favourite with Tumer. It was painted for a patron, who, dissatisfied with it, left it on the painter's hasds: The price asked ( $£ 500$ ) seems to have been part of the objectha. Turner subsequently refused an offer of $£ 1600$ for it.

[^287]:    ${ }^{1}$ The name seems to appear first in Willoghby's Ornithnlogia (p.' 231) in 1676 ; but he gave as av alias that of Sea-Dottrel, nuder which aame a drawing, figured by him (pl. 58), was seat to him by Sir Thomas Browne.
    ${ }^{2}$ Linnæus (CEl. och Gothländska Resu, p. 217), who first met with this bird on the island of Gottlaad, 1st July 1741; was uader the mistaken belief that it was there called Tolk (=interpres). But that ame properly belongs to the Redshank (q.v.), from the ery of warriag to other animals that it utters on the approach of dacger.
    ${ }^{3}$ The anthors of The Water Birds of North America (i. p. 123) in reference to this faet raise the ingenious question, "Do lirris, after they lige becomc old, efrete, or barreu, prefer to stay in a warrs cliroate ""

[^288]:    ${ }^{1}$ There ia little external difference between the eexes, and the orightly-contrasted coloars of the keu-bird seem to require some kind of concealment.

[^289]:    ${ }^{1}$ Dionysius ( $x .20$ ) states that Tusvulum was only 100 stadia (about 121 $\frac{1}{2}$ miles) from Rome ; but the fifteenth milestene on the Via Latina was close to the walls of I'usculum.

[^290]:    From rúpos, emoke or mist, in allusion to the stupor of the disease.

[^291]:    ${ }^{1}$ A bacillua frequently noticed in certaiu tissues in cases of typhoid fever has not ret been satisfactorily proved to be an organism characte=Litic of that disease, nor even to be constantly present

[^292]:    ${ }^{3}$ Orig. Typogr., i. p. 32, nete cx.
